THE ART-JOURNAL.

LONDON, JANUARY 1, 1850.

PROSPECTS OF BRITISH ART.
THE EXPOSITION OF 1851.

OCTOBER 17th, 1849, will be a day often referred to in the history of the Progress of Industrial Art. It will be said, "A Prince, the descendant of a race among the first to achieve and to defend the freedom of the mind, the foundation of all real progress,

had, that day, summoned the 'magnates' of a city,—by its wealth and commercial intercourse far more the metropolis of the world, than from these circumstances alone the capital of Great Britain,—to consider and determine upon a plan for the exhibition of works of Industry and Art, the result of the genius or the skill of every clime, manufactured from the produce of the globe. The time was well chosen; the place no less so. A visitation more terrible than any which had desolated the land since the days of the Great Plague,—the memory of which still rested like an unhallowed fear upon the heart,—was even then, though with abated strength, sweeping onwards in its flagging course. What so natural as to seek to revive the drooping spirit, to re-awaken industry, to nerve the palsied energy of those who had been spared? What period more appropriate, if this were not? What place more suited for the development of such a plan, if London were not so? It might have been proposed in a year of unusual prosperity, and have been smiled down by the affluence of success: of the strife of party spirit, and looked upon with suspicion: of languor and indifference, the result of unhealthy speculation, and have been shrunk from as if another stricken with the same leprosy taint. But the plan was proposed when no other pre-occupied the mind, no adverse motive restricted feeling, no interested desire could malign its import. It was to further the development of the intellectual faculties, to advance the arts of social life, to stimulate industry, to provide for it new channels, by the advancement of the ARTS OF PEACE. By all men it was welcomed, considering the time, as a gleam of light which fringes the receding outline of a troubled sea, from which he who has escaped henceforth looks back with hope. Prosperity separates, Affliction unites, mankind. Here was a ground on which the richer met to promote the Arts by which even the poorest prosper; and, according as they prosper, add to the luxuries, the pleasures, and the refinements of the rich. If interest alone stifled all other considerations, no plan was better suited to win the attentive ear of those who look abroad upon the world as a table of speculation, and who only value the human race according as they influence the market."

Considering the present and the future influence of the proposed National Exhibition, we shall, in this, and in succeeding papers, record the history of its rise and progress, and enforce on all uniting or acting towards its ends, that sincere, honourable, and unselfish spirit which every upright mind feels is due alike to the

Prince who proposed, and to the people on whose behalf and for whose moral and social good he has sought its advancement. The road which conducts to the object he desires is full of increasing pleasure, the struggle for success is preceded and followed by a succession of interests, of which the least is allied to intellectual power, and the lowest associated with the most beneficent feelings. Of how many benefactors had not mankind been deprived, if emulation had not encouraged effort. This Exhibition will be emulation of the highest kind. It must, however, be conducted with the most honourable integrity. Self-interest, selfish ability, and the keen pursuit of gain are ever apt to insinuate themselves, so as to become the hidden but active agents of public bodies. This must be carefully watched. A great agitator said, "He who commits a crime injures his country." In the same spirit we say, He who in this case, by self-seeking throws suspicion on this Exhibition, slurs the generous designs of the Prince and stains the National honour. Let such an act be proved, and we will, for our own part, brand the offender in the face of Europe.

On the 30th of June, 1849, it would appear, "There attended at Buckingham Palace, H.R.H. Prince Albert, and, by special command, Messrs. T. Cubitt, H. Cole, F. Fuller, and J. Scott Russell, of the Society of Arts; when His Royal Highness communicated his views regarding the formation of a great collection of works of Industry and Art in London, in 1851, for the purposes of exhibition, competition, and encouragement. His Royal Highness considered that such collection and exhibition should consist of the following divisions:—raw materials, machinery and mechanical inventions, manufactures, sculpture, and plastic art generally. It was a matter of consideration whether such divisions should be made subjects of simultaneous exhibition or taken separately; it was ultimately settled that on the first occasion, at least, they should be simultaneous. It was a question whether this exhibition should be exclusively limited to British Industry: it was considered that whilst it appears an error to fix any limitation to the productions of machinery, science, and taste, which are of no country, but belong, as a whole, to the civilised world, particular advantage to British industry might be derived from placing it in fair competition with that of other nations.

It was further settled that, by offering very large premiums in money, sufficient inducement would be held out to the various manufacturers to produce works which, although they might not form a manufacture profitable in the general market, would, by the effort necessary to further accomplishment, permanently raise the powers of production, and improve the character of the manufacture itself. It was settled that the best mode of carrying out the execution of these plans would be by means of a royal commission of which His Royal Highness would be at the head. His Royal Highness proposed that inasmuch as the Home Trade of the country will be encouraged, as many questions regarding the introduction of foreign productions may arise, and also relating to crown property and colonial products; the Secretaries of State, the President of the Board of Trade, &c. should be *ex-officio* members of the commission, and for the execution of the details, some of the parties present, as members of the Society of Arts, and who have been most active in originating and preparing the execution of the plan, should be suggested as members, and that the various interests of the community also should be fully represented therein. It was settled that a subscription for donations on a large scale would have to be organised immediately. It was suggested that the Society for Encouragement of Arts, under its charter, possessed the requisite machinery. On the 14th July the second meeting was held at Osborne, when His Royal Highness judged that the importance of the subject was fully appreciated, but that its great magnitude would necessarily require some time for maturing the plans essential to ensure its complete success, and communicated that he had also requested Mr. Labouchere, as President of the Board of Trade, to give his

consideration to this subject. * * * * It was urged by the three members of the Society of Arts, that one of the requisite conditions for the acquirement of public confidence was that the body to be appointed for the exercise of these functions should have a sufficiently elevated position in the eyes of the public, should be removed sufficiently high above the interests, and remote from the liability of being influenced by the feelings of competitors, to place beyond all possibility any accusation of partiality or undue influence; and that no less elevated tribunal than one appointed by the Crown, and presided over by His Royal Highness could have that standing and weight in the country, and give that guarantee for impartiality, that could command the utmost exertions of all the most eminent manufacturers at home, and particularly abroad; moreover, that the most decided mark of *national sanction* must be given to this undertaking in order to give it the confidence, not only of all classes of our own countrymen but also of foreigners accustomed to the Expositions of their own countries, which are conducted and supported exclusively by their governments. The general outline of the plan thus comprised, 1. A Royal Commission, to determine the nature of the prizes, and the selection of the subjects for which they are to be offered. 2. The definition of the nature of the exhibition, and the best manner of conducting all its proceedings. 3. The determination of the method of deciding the prizes, and the responsibility of the decision. The Society of Arts to organise the details of raising funds for prizes, and provide a building, and to defray the necessary expenses. The value of the money prizes was also considered, but as this will be a matter to be hereafter definitely settled it is unnecessary to mention the sums then proposed. The plan thus far matured, it was requisite to ascertain by preliminary inquiry how far the manufacturers would be willing to support periodical exhibitions of this kind, for which, and Mr. Henry Cole, and Mr. Francis Fuller, members of the Council of the Society of Arts, received instructions to travel through the manufacturing districts, in order to collect the opinions of the leading manufacturers. Either jointly or singly these gentlemen visited all the larger manufacturing towns in England, and Edinburgh, Dublin, and Belfast, and on their return drew up in a report the results of their inquiries to the 5th October, 1849.

The plan they adopted was most judicious; their inquiries necessarily, at first, considered as "private," as upon a matter still under investigation, were converted by the enthusiasm of their auditors into "public meetings," that at Dublin assumed the form of a parliament, wanting but the opposition and a division. Nor were manufacturers alone visited; inquiries were prosecuted into the probable feeling of the agricultural districts, and places where the inhabitants were likely to be exhibitors of Raw Materials, and were consumers rather than producers of manufactures. The result was in all places the same; there was one uniform expression of gratitude to H.R.H. Prince Albert for the interest he showed in the commercial prosperity of this most favoured land. Messrs. Kershaw, extensive spinners of Manchester, considered the benefits of the Exhibition would be great, individually and nationally. At Newcastle it was said "the Exhibition would be of universal benefit; and the larger the competition the better; that it would teach not only the manufacturers *how to make*, but the public *how to buy*, and furnish the best elements for criticism." Edinburgh and Dublin presented similar returns, indeed Scotland seems to have met the proposal alike with the caution, the sagacity, and the abiding warmth of the national character. Nor can we omit to notice an opinion which so fittingly closes this part of the report: "It would tend to the advantage of industry, not only in this kingdom but in the whole world, and might prove one of the means of an inscrutable Providence in hastening the period when 'they shall beat their swords into ploughshares, and their spears into pruning-hooks.'" The question whether the scope of the exhibition should be exclusively national or universal was carried in all places in

favour of the "universal principle," for, it was well observed, "It is very necessary that all parties should know what the French and all nations, are doing, and should compare their manufactures with our own: the comparison would show what our manufacturers could do, and, by generating increased knowledge and appreciation in our consumers, would induce the production of a much higher class of work."

Equally unanimous was the opinion of all parties that the funds should be provided by voluntary subscription, equally encouraging the general willingness to exhibit. As an illustration of this, Messrs. Hollingsworth, paper manufacturers, of Turkey Mills, near Maidstone, volunteered to send up, if possible, complete machinery which should exhibit the whole process of paper making from the rag to the production of the perfect sheet. With respect to the prizes, their amount and distribution, all thought that a Royal Commission was the only means of securing the utmost practicable impartiality, and that its appointment was indispensable towards securing public confidence. The amount of these prizes naturally occasioned some diversity of opinion, but two points appear to be generally conceded, that the prize for discovery should be in accordance with its value, considered also with reference to the expense incurred in its production, and that they should be sufficient to attract the attention of the highest scientific men, not only in this but in other countries. To the opinion expressed by Mr. John Stuart Mill we do most heartily subscribe, that every jury appointed to adjudge the prizes should have some "foreigners" upon it. The decision must be above suspicion, beyond the chance of erroneous judgment, arising either from partial information or unacquaintance with the general condition of the manufacture in other countries, or excellence in this. All judgment is relative; a prize should be adjudged with reference to works of the same class universally found; with regard to the general requirements of the Arts employed in their production, and the results chiefly sought to be obtained. This includes design, excellence of manufacture or of construction, and the specific end sought. If we invite foreign artists to compete, the jury must be *de mediocritate lingue*. Is there a manufacturer who would object to the names of Arago, Dupin, Blanqui, Chevalier, Chevreul, of Firmin Didot, Leon de Laborde, Payen? Any who would demur to others similarly qualified to represent Berlin, Munich, Vienna, Prague, or St. Petersburg? We feel assured not; he who competes with the world courts the judgment of the world. It must be with England in this respect, as with Athens in the days of Pericles. The competition was between the highest genius; the greatest excellence: the competitor had the most cultivated talent of his day for his jury, and the world for his auditors. The man who appeals to universal criticism, has need of it for his reward; the tribunal by which he is judged should not be less he the authority for its expression. We can conceive cases where it may be difficult to obtain an entirely competent tribunal, others in which it would be impossible to express more than a qualified decision; each manufacturer showing equal points of excellence, one in design, another in execution, others in which the disparity is but of degree. We believe, nevertheless, rules meeting the general requisitions to obtain a decision just towards the manufacturer, sufficient to ensure him a well-merited patronage of opinion, can be defined. Let it be remembered all excellence is, in such cases, conditional, as regards details; it is absolute only in essential principles. Whatever is requisite to perfection in the Fine Arts, is requisite also in Art applied to manufactures; the difference is in the special application of certain rules. In Fine Art we seek dignity, simplicity, truth; in Manufactures, design, elaboration, both subservient to utility. As all degrees of created beings are adapted to their external condition, so should all productions of the Technical Arts be designed with special reference to their end. Fine Art reads poetically the spirit of Nature; Art applied to manufacture should seek to breathe Spirit into matter, to impart to it beauty, and significance. Even as a good picture cannot be judged with-

out reference to its theme, so can no manufactured work be considered without reference to the quality of its material, this being frequently the test of merit. Originality, simplicity, perfection of form, harmony of colour, imitation which embodies the spirit of Nature, are precepts for all. Whoever founds his claim to attention upon imitation of any particular master or age, must seek his reward in those alone who are its followers. We are threatened at the present day with the imitation of Medieval Art, calculated to render popular forms and ornaments totally at variance with existing customs, dissociated from all ideas, that impart to the age its form and pressure, never successful to the eye of the experienced—which only produces a proportionate excellence, and that generally in the manual part. For all these reasons we trust manufacturers will be associated with artists in the adjudication of prizes. No effort of the nature of this Exhibition will, however, be successful unless it be met with an enlightened appreciation on the part of the public. We are afraid great misapprehension exists among many as to the capabilities of the English artist, the manufacturer, and artisan. That they are inferior as to design in many respects, cannot be denied; that they are so inferior as to imply what some seek to establish—their inability to excel—we utterly deny. Let us but recall what has been the condition of our industrial progress, and take the commencement of the reign of George III. as our point of review. Dating from 1760, we shall find that the system of intercommunication, so essential to manufacturers, was everywhere improved. Roads were planned, and executed, and finally perfected by the genius of McAdam and Telford. Canals were made under the auspices of the Duke of Bridgewater, the works of Brindley, Whitworth, Smeaton, and Telford, to the extent of more than two thousand miles. Discoveries of the utmost importance were announced in chemistry, pure and applied. From Black to Faraday there is one illustrious succession of great names. They met equal competitors in men who applied science to mechanical power. By Watt, Fulton, Miller, Taylor, and Symington, that mighty agent was organised and directed which gave to Steam dominion over space, which enables it, alike defiant of tempest and of tide, spurning the fickleness of wind and the faithlessness of waves, to bear the produce of commerce on every sea, which it has made the high-road of nations. By Watt, also, the steam-engine was organised into a machine of boundless power, infinite in its application, capable of the most delicate manipulations; the prime mover of manufacturing operation; the no less moral cause of progressive civilisation. Second in importance to this alone, in 1765, John Harrison claimed and received the reward offered by the nation for the best chronometer, which the genius of others has now made common. Pottery, to the close of the seventeenth century, produced nothing but coarse wares; in 1763 Josiah Wedgwood originated the Staffordshire ware, which was carried by his knowledge, skill, and perseverance, to a degree of excellence which, in several points, has never been surpassed, and in some has never been equalled. His success was the spirit that evoked the talent since displayed, and which has secured to this country a most important branch of internal and foreign commerce. The rise and progress of the Cotton Manufacture is, perhaps, the most extraordinary page in the annals of human industry; it was advanced by men in the humble condition to a system exhibiting the utmost degree of intellectual contrivance. From 1750, when the fly shuttle was invented, to 1787, when Watt brought the power of steam into operation, every year had been marked by improvement, and there are few names more honourable in the history of invention, if we judge of them by their results, than those of James Hargreaves, Richard Arkwright, Samuel Crompton, and Dr. Carpenter. In 1835 the number of self-acting looms was 109,626, whilst the entire manufacture afforded occupation for 1,200,000 to 1,300,000 persons. The quantity of cottons printed in 1796 was 20,621,797, and in 1830, 347,450,299, being more than ten times the quantity printed

at the beginning of the century, whilst it is less by 55,971,101 yards than the quantity exported in 1844. In 1801 Birmingham contained 73,670 inhabitants; in 1841, 181,116; the number of houses in 1821 was 23,096; in 1841, 40,291, an increase occasioned by improvements in mechanical methods of production. The same results may be shown as regards Sheffield, Glasgow, and Liverpool, the offspring of cotton. Glass, the especial object of former legislation, which tried its "penitence band" at every scheme for its ruin, happily survived, and now feels its course uncheck'd, the genius of its manufacturers being unfettered by the happier influence of the legislation of Sir Robert Peel. We can now rival the foreign artist; in a few years, perhaps even in 1851, it will be shown we have surpassed him. Similar results might be obtained from every branch of the Industrial Arts. There are some yet lingering amongst us who may remember the dawn of this progress; there are none, the least observant, who cannot bear witness to its rapid course. We could have wished to trace it more accurately to the present day, but this our present space precludes; in a future number we shall return to this subject. Our readers cannot but remember how frequently we have called attention to the necessity and importance of such exhibitions, how often we have sought, by criticisms and elaborate illustrations, to show not only what Continental nations could execute, but what we must be prepared to rival, if we would not lose the place we occupy amongst those by whom the Arts of Peace have been advanced, nor our position in the commerce of the world. It is not three years since that we asked the assistance of an able public minister to effect what is now sought under happier auspices: it is but justice to say, if we failed, it was because, upon due consideration, the period then seemed inopportune. The details of this we shall present to our readers. Our task has been now to place before them the position in which the manufacturer, the artist, and the public occupy in respect to the object sought by the promoters of the Exhibition of the Industrial Arts in 1851.

MURAL PAINTING IN ENGLAND.

BY MRS. MERRIFIELD.

THE impulse recently given to mural painting in this country by the commission on the fine Arts, and the frescoes with which the new Houses of Parliament are now being decorated, may be considered as having led to the revival of an old Art in which our ancestors delighted, rather than to the introduction of a new one. Although painting in buon-fresco, as it was practised by the best Italian artists of the sixteenth and seventeenth centuries, may have been but partially known in England, yet mural painting has been practised here from an early period, and perhaps there are few nations which during the fourteenth and fifteenth centuries afforded greater encouragement to the Arts than our own. It was too much the fashion in Italy to regard the *ultramontani* with contempt; and from certain expressions of Benvenuto Cellini we collect that the English in particular, who lived on the western boundary of Europe, almost on the confines of the habitable world, were looked upon by the Italians as barbarians; but the specimens of English medieval Art that are now frequently brought to light from the obscurity in which they have lain so long concealed, might perhaps, if they could have been placed before him, have induced the great Florentine to have formed a better opinion of the civilisation and technical skill of our ancestors in the decorative Arts. The English, who had not the advantages of the Italians in possessing so many of the sculptured remains of antiquity, were, it must be acknowledged, far inferior to them in design; but in mechanical skill our artists of the middle ages were fully equal and in some cases superior to the Italians. In illuminating and missal painting they were at least their equals, in glass painting they surpassed

* A Report of the Progress of the Exposition will be found at p. 32 of this number of the *Art-Journal*.

them: they were acquainted with and practised a chemical process for painting and staining garments, which was communicated as a secret by a Flemish embroiderer, with whose business it may have interfered, to a French artist or amateur, (Johannes Archerius) in Italy. Enamelling, which was practised in the reigns of the first two Edwards, (Walpole says, without mentioning his authority, by Greek artists,) was, however, known to the Anglo-Saxons. In ecclesiastical architecture of a bold, original, and peculiar style, the works of the English will not suffer by a comparison with edifices of the same age in Italy, either for the grandeur of the design, or the beauty of the details. The Cathedrals of York, and Salisbury, and Westminster Abbey, were erected as early as the first half of the thirteenth century. We had sculptors of our own as well as painters and architects, and one of the former, described as Magister Guglielmus Anglicus, who flourished in the fourteenth century, was possessed of sufficient skill in his art, to obtain employment in the court of the Prince of Savoy, where he modelled a whole-length figure of the Countess of Savoy in wax. Nor should we omit to mention the excellence of the English medieval embroidery, which as it was sometimes employed in portraying historical subjects on the robes of princes, may perhaps be included among the arts of design. That the English were not behind their Continental neighbours in their fondness for mural paintings although inferior to them in design, is evident from the specimens of medieval Art still existing in this country, and from the instructions for executing them contained in MSS. preserved in our public libraries.

While admitting the inferiority of the English in design, we must not overlook the fact that it was the custom of the great Italian painters, and especially of the earlier ones, to visit distant places, which they decorated with their works, thus promoting the cause of Art by multiplying good examples. The Florentine, Giotto, visited Pisa, Padua, Rome, Naples, and, as some say, Avignon; Leonardo da Vinci, in the prime of life, divided his time between Florence and Milan, and died in France; and there is scarcely a painter of celebrity in Italy who was not invited to paint in the principal cities of the different states, whose he not only profited by the example of his predecessors, but left specimens of his own skill for the instruction of future artists. But England had not this advantage, the country was considered so distant, and the people so barbarous, that few Italian artists of note, especially the *frescoists*, could be persuaded to visit it; mural painting, therefore, although generally practised in this country up to a certain period, made but little progress in attaining the higher qualities of Art, and at length was superseded by the influence of the Reformation, and the encouragement afforded to many Flemish artists who visited this country, and painted pictures on panel and canvass. These pictures had, in some respects, an advantage over mural paintings, inasmuch as they were portable, and, on that account, possessed of a certain marketable value.

Mural paintings of historical subjects were executed in this country at least as early as the reign of Henry III.; they were employed in the decoration, both of churches and of royal palaces. The paintings hitherto discovered here, belonged, with very few exceptions, to ecclesiastical edifices, and there is reason to believe that the churches of Italy were scarcely more decorated with paintings than those of England; at least, those of the southern and midland counties. Scarcely a month elapses but the necessary repairs of churches bring to light some of the old mural paintings, with which it appears that it was formerly the custom to decorate the whole of the interior, even of village churches. In the immediate neighbourhood of Brighton, the churches of the villages of Preston and Portslade are known to have been so decorated. A painting has recently been discovered beneath the whitewash in the interior of Linfield Church; and many others might be mentioned, but it is unnecessary to refer to them here, as they have already been described in the *Archæological Journal* and other works. I shall now

confine my observations to the paintings in the churches of Sussex. In point of execution these pictures are not deserving of high praise; they consist of little more than outlines,—and those not the most accurate,—drawn with a dark red earthy pigment; the draperies are sometimes relieved with yellow ochre, sometimes coloured with the same dark red pigment, and sometimes left white. But it must be remembered that these paintings occur in *village* churches, and there are no historical records to show that the villages to which they belong were ever of more importance than they are at the present time. The early histories of Italian Art speak only of the productions of the best masters of the period in the principal buildings of their cities; the Duomo of Orvieto, that of Siena, the church of S. Francis of Assisi, and the Campo Santo of Pisa, were decorated by the first painters of the age. In judging, therefore, of the skill of the English artists, we must not compare the fragments of their works which still remain in village churches, with the productions of Oragna and Giotto. Perhaps, if the Italian village churches of the fourteenth century, (if any such exist) were stripped of their whitewash, they might exhibit paintings of no higher order than those which once covered the walls of our own village churches.

Many of the paintings in ecclesiastical edifices in Sussex are supposed to be of the time of Edward III.; the subjects are such as were usual at that period; a gigantic S. Christopher; a S. Sebastian, pierced with arrows; a S. Michael, with his wings of peacock's feathers, weighing the souls of the departed, with Satan on one side waiting for his prey, and on the other the spirit of the deceased praying at the feet of the Virgin, or of some saint, for her intercession and protection. In Preston Church there is, in addition to these subjects, a painting representing the death of Thomas à Becket, in which the lengthened figures, with their small heads and large feet, remind one of those in the Bayeux tapestry. The pointed shoes of the figures may afford a clue to the date of the picture; Becket, while kneeling before the altar, is represented as wounded by the sword of one of his assailants; Brigo, the last of the four knights, turns away his head as if he repented of the crime he had intended to commit; on the other side of the altar an angel stretches his arms as if to intercede for Becket. In Chichester Cathedral a painting of a higher order was discovered some years since, and preserved by the care of one of the prebends, who caused it to be covered with a glass; the subject is the Virgin and Child, with angels scattering incense: the expression of the figures is pleasing, the proportions are better observed than in the paintings at Preston, and the colouring is particularly lively and gay: red, blue, green, of the brightest hues, are set off with gilding, and the long robe of the virgin is covered with gold fleurs-de-lys. This painting also is considered to be of the age of Edward III. The victories of Edward abroad secured peace to his subjects at home, and gave them leisure to cultivate the Arts, which were disseminated in the provinces, and continued to exist in spite of the disastrous civil wars of the Red and White Roses. The tranquil priests, located in districts removed from the scene of contest, held on the even tenor of their way, and continued to fill their churches with pictures. Those in Linfield Church were probably executed during the reign of Edward IV. or Edward V. The Reformation, begun by Wickliffe, and established under Henry VIII., by condemning pictures in churches as papal superstitions, contributed not a little to the decline of mural painting in this country, and perhaps rendered us as a nation not altogether undeserving of the contempt with which Cellini was accustomed to speak of us. An expression (preserved by Sir W. Monson, in his account of the Acts of Elizabeth) of a member of the House of Commons, shows that in the time of this queen the custom of decorating public buildings no longer existed, and that some, at least, among that assembly would have been pleased to see the practice, the decay of which they attributed to the Reformation, again restored, and their churches and palaces decorated with paintings as they were wont to be in the olden time.

The durability of mural paintings in this country is sufficiently proved by the present condition of those to which I have alluded. Neither whitewash nor damp seems to have been able to destroy them; but in many cases they appear after their long concealment with their colours as bright as when first employed, and as firmly attached to the wall as if they actually formed a part of it. There are some old mural paintings in the Duomo of Parma, which, after having been long covered with whitewash, have been recently restored to light; yet their colours, with the exception of the blue, are bright and fresh. What is still more extraordinary, the operation of removing the whitewash has recovered in several places part of the surface of the old pictures, and disclosed to view others of still greater antiquity, the colours of which are equally bright and fresh, and which, from the similarity of the style appear to have been painted by the same hand as those first discovered. How desirable must it then be to ascertain in what manner these old pictures which have survived so many paintings of more recent date, were executed. It is generally believed that the mural pictures of the middle ages were painted either partly in fresco and partly in secco, in the manner described by Theophilus and Le Begue, or in tempera only. The art of painting entirely in fresco, or as it was usually called in *bona-fresco*, was introduced at a later period. Wax, which was formerly used in painting by the ancients, and by the early medieval artists, has been considered to have fallen into disuse in Italy in the fourteenth century, but it can be traced in France by documents until the first quarter of the fifteenth century; and in Greece, as appears from the MS. of Mount Athos, published by M. Dixon, until the present time. Subsequent discoveries have, however, proved that the use of wax in painting was revived in Italy, and it has been detected by chemical analysis on Italian mural paintings of the sixteenth century. The pictures by Gio. Batista Trotti, otherwise called Malosso, in the Palace del Reale Giardino, and those in the Rocca di S. Secondo at Parma, having been analysed by Sig. Belloc, at the request of Professor Vigioli, were ascertained to have been painted with wax. Too much praise cannot be given to the Italians for the zeal with which they have prosecuted these enquiries on the only sure basis—chemical analysis. It is greatly to be desired that those persons who may hereafter discover mural paintings in this country, would, if possible, subject a portion of them—and a small portion would be sufficient—to this ordeal. If this be impracticable, the discoverer can at least cause the paintings to be examined by some person conversant with the subject, and allow drawings to be made before they are destroyed. It is a common error to call, without proper examination, all mural paintings discovered in this country by the general name of *frescoes*; it should be ascertained whether they are so or not, and if they are not—which is most probable—then, the manner in which they really are painted, and the means taken to secure their durability, should be positively determined for the instruction of artists. As this subject is of great importance not only to the artist, but to the amateur, to whose zeal and love of Art we are generally indebted for these discoveries, we shall resume the subject in a future number of this Journal.

To return from this digression. The fine taste of Charles I. again restored for a time the love of the arts in this country, but it was stifled by the furious and indiscriminating zeal of the Puritans. Classical subjects were condemned as immoral; religious subjects as idolatrous; and even the cartoons of Raffaele might have been irrecoverably lost to this country, but for the liberality and good sense of Oliver Cromwell, who purchased them for the nation, probably with the view of causing them to be imitated in tapestry, the purpose for which they were originally designed. Portrait painting was still suffered to exist, for the Roundheads did not object to leaving representations of themselves on canvass or panel, as a remembrance to their descendants. But these pictures were movable, and what was painted to adorn the dining-room

of one generation, was banished by their tasteless descendants to the staircase or garret, in order to make room for fresh favourites.

After the Reformation, mural paintings were of course limited to the decoration of palaces. Rubens painted some ceilings at Whitehall for Charles I.; others were painted at Hampton Court and Windsor by different artists; and at a later period Sir James Thornhill painted the hall at Greenwich and the cupola of St. Paul's. Some of the mansions of the nobility were also decorated with paintings. But these were all oil-paintings, and the deep and strongly defined shadows and highly varnished surface, rendered them, in a decorative point of view, but an indifferent substitute for fresco paintings, which from the absence of all gloss, and their peculiar lightness of effect, could be seen conveniently in every light.

We have no accounts of frescoes executed in England until the middle of the last century, when Giuseppe Borgnis, a Milanese artist, decorated with frescoes the interior of the porticos and south colonnade of West Wycombe Park, the seat of Lord le Despenser. The greater part of these paintings are yet in good preservation, a proof among others still existing, that the action of the air is not necessarily destructive of fresco paintings. In the present age of archaeological research, it is by no means impossible that frescoes by English artists of the seventeenth century may yet be discovered in this country. That the English actually painted in this style may be inferred from the directions for fresco painting contained in a MS. written by John Martin in 1699, which is now in the Soane Museum. These directions are written apparently by a person conversant with the practice of the art, and as none of the technical terms are borrowed from a foreign language, and there are some few points in these instructions which do not correspond exactly with the practice of the Italian or Spanish masters, there is reason to suppose that the English painters occasionally practised this art. Since the commencement of the present century, successful attempts have been made at different times to restore the art of fresco painting in this country; and recently the example of the German school of fresco-painters, and the encouragement afforded by the commission of the Fine Arts, have given it an additional stimulus. We earnestly hope that the time will soon come when the best painters of this country, following in the path so successfully trodden by Messrs. Dyce, Machie, Cope, Herbert and others, will devote their best energies to the attainment of this most noble art. The interest taken by the public in the frescoes by our native artists in the Houses of Parliament, already great, is daily increasing, and we may venture to anticipate that before long the removal of the scaffolding which conceals the newly painted pictures from the ardent gaze of the spectator, will be desired with as much eagerness as it was in Rome when the "Last Judgment" of Michael Angelo was about to be exhibited for the first time to the expectant and admiring crowd.

ART-MANUFACTURES IN THE CLASSICAL EPOCHS.

BY DR. EMIL BRAUN.

INTRODUCTORY.

Art affords to the human mind a peculiar mode of expression, which can be obtained by no other means. The power of plastic representation possessed by man alone, of all created beings, is able to bring before our senses objects and ideas, which neither the language of the most gifted poets, nor any of the many idioms adopted by science, can express by words. We find, accordingly, artists at all periods within the memory of man, although their mode of proceeding in giving utterance to their feelings, or, rather, in acting upon their contemporaries, is very different. In the attempt to discover what first called into existence those wonders of artistic creation amongst the works of the an-

cients, which have obtained the highest meed of praise, we perceive at once that the magic power of Greek Art lies especially in a wise system of adaptation, a just proportion between means and ends—between the human want seeking gratification, and the method adopted to attain the end. Not a single product of ancient workmanship exists unmarked by a certain stamp which Greek Art endeavoured to impress upon every thing created by the hand of man. From the slightest trait of handwriting, up to the highest creations of human genius, we are enabled to recognise throughout one pervading spirit, one peculiar feeling characterising the Greeks.

Even those who derive no pleasure from the poetical language inscribed by Greek Art upon all objects of ordinary use, in the richest variety of ornament and figurative representation, must receive a striking impression from the just balance preserved between the material of which an object is composed, its ultimate purpose, and the particular mode of decoration, conferred upon it. Utility is the most characteristic attribute of Greek manufactures, and it would be difficult to find a single example amongst articles of classical workmanship, of which it might be said that it was merely tasteful and elegant, without being adapted to the especial object for which it was intended. Taste and utility are always identical in works of Greek handicraft, and it is on this account that we find men, who are exclusively devoted to Fine Art, occupied with the study of those monuments of old, which were originally considered as the offspring of the merely practical faculties of man.

In modern times this intimate connection between art and manufactures is almost entirely destroyed, or at least fatally disturbed. Those who interfere in matters of taste are generally ill looked upon both by artists and handicraftsmen. The latter entertain the prejudice, that to aim at beauty has a tendency to weaken what is called good and solid work, whilst artists consider such persons calculated to corrupt and degrade the highest and most noble faculties of the human mind.

Dissimilarity of principles exercises a very dangerous influence not only upon distinct classes of society, but even upon whole nations; and, whilst it may be said of English manufacturers that they enter into a successful rivalry with the Greeks themselves, in every quality relating to practical utility, they have, on the other hand, systematically cast aside every trace of the ornamental character which has for many thousand years embellished this extensive department of Art. At first sight indeed it appears consolatory to be relieved from all those senseless and useless accessories which luxury, since the sixteenth century, has lavished upon objects of every-day utility, no less than upon the splendid residences, which are the peculiar prerogative of kings and noblemen. Experience has at last however shown, that so complete an abstraction of all decoration is repugnant to persons of refined taste, who are instinctively prompted to desire from objects designed for ordinary use, that same outward stamp impressed by the Almighty upon the productions of nature, as a symbolic indication of their inward meaning.

English manufacturers may in this respect be compared to the useful essences and extracts obtained by chemistry from a thousand plants and inorganic substances, all uniform and monotonous in aspect, and requiring each a labelled superscription even for those conversant with their real nature. French workmanship produces a totally different impression. On entering a Parisian warehouse containing specimens of any branch of industry, we are delighted by a smiling variety of forms and colours, seeming almost to rival the brightness of a flower-garden prospering under wise and friendly culture. Persons, however, who are accustomed to the minute and impartial analysis of objects of this kind, are generally able to detect a want of just adaptation in the productions of French industry, sometimes even serious defects of construction, so that its more artificial flowers, their bright colours destitute of perfume, only cheat the eye with a false semblance of nature, without

representing the essential idea of the objects imitated in so futile and illusory a manner.

Proceeding further in this kind of comparison, we perceive that French manufactures, distinguished solely by the external attributes of beauty, are of an ephemeral character, and are scarcely entitled to the praise of solidity and fitness, even when entirely remodelled; while English inventions always present an excellent material of which may be said, what Michael Angelo, in one of his sonnets, has asserted of every block of marble; each one of which, as he declares, conceals within itself an image of surprising beauty, awaiting only the divine artist who may be able to draw aside the rough mantle cast upon it by Nature. Thus, all English manufactures appear to wait for such a master, capable of revealing to the world their inward, but often deeply hidden, beauty.

To show that we are speaking, not theoretically, but from experience, I shall describe the impression which the Germans received from the first specimens of English manufactures brought over to the Continent, when the communication between the two countries was re-established after the peace of 1815. The family connections into which the Coburgs entered with the Royal House of England, are of an importance to the history of commerce, not much inferior to that ascribed by the Greeks to Amasis, who, as it is universally known, opened Egypt for the first time to the national intercourse of the people of the West. This memorable event occurred at a time when all Europe was morally exhausted, even in regard to matters of taste. The tendency of Napoleon's court had converted the whole of the higher classes of society into a masquerading party. Simplicity and truth were no longer to be found. Even the implements required for daily use were become totally unmanageable by being overloaded with decorative elements, which, instead of being an improvement, were really an impediment to their useful application. Comforts were converted into torments, and instruments invented for economising time and power, caused rather a waste of both.

It was with a general shout of joy that sensible men hailed English improvements, the real value of which was concealed from the eyes of the ignorant crowd, but was quickly discovered and highly estimated by those who had, in vain, attempted a similar reform. At first the delight produced by the highly practical character of such inventions, made even men of taste entirely forget that taste itself was absent. It was not till after a longer acquaintance that they began to discover a certain want of life which did not admit of that feeling of, so to speak, friendly companionship with which every man of scientific practical pursuit is accustomed to regard the instruments he habitually employs. They arrived at last at the conclusion, that to effect an harmonious union between such implements and the every-day purposes of life for which they are required, another feeling is requisite than that of practical utility only.

Some examples will illustrate the psychological process upon which all such reformations depend, and without the just knowledge and thorough understanding of which the study even of Greek Art-manufacture is a mere trivial occupation leading to no useful result. Arms are regarded by those who make use of them, almost as inseparable companions, which become invested, in their imaginations, with a living form, and are generally addressed and spoken of as fellow-creatures. Every nation has, even in modern times, a system of its own for adorning implements of war and the chase, and nothing therefore could be so striking, sometimes even so heart-stirring, as the effect produced by the introduction of British fire-arms, the marvellous improvements on which threw every sportsman on the Continent into raptures, when these weapons were brought over at the period we have alluded to. These highly perfected instruments, like the lyre in the hand of Arion, when made use of by practised hunters, became instantly endowed with life. Soon afterwards, however, the extreme plainness of their construction, destitute of all outward ornament; caused the feeling of their being deficient in

some important respect. Comparison with the pottically adorned fire arms of old heightened the feeling of this want in implements otherwise well constructed. They were finally looked upon rather in the light of philosophical instruments than as objects connected with the pleasures of the chase or the association of the days of chivalry. They were of course imitated, and on this occasion became nationalised. But here a very important fact was observed. The external form was improved, only when foreign manufacturers applied themselves thoroughly to understand the system of proportion, and the solidity and good sense of the whole method of English construction. As soon as an attempt was made to invest them with ornaments, laid on without being organically connected with the weapon itself, they looked as awkward as an English gentleman attired in French costume before his manners have become adapted to Continental taste and fashions.

If we look back to the past, and ask from history whether Art and Manufactures sustained in ancient times a similar separation without being forever discovered, we meet with a remarkable and highly important fact, afforded by Roman history, which affords to us a most striking analogy with the present state of Art in England, in opposition to its development in the south of Europe. Before the Romans were intimately acquainted with Greek Art, their taste must have followed a direction very similar to that of the English even in the present day. Their mental faculties had an exclusively practical aim. Greece and beauty were at first repugnant to them, and were held to be no better than a spiritual poison by those Quirites of old, who looked upon the Greeks much in the same light as thorough-going practical Englishmen of business now consider the French. Later, however, they changed their system, and it is difficult to say what might otherwise have been the fate of this powerful and truly great nation, had she continued to despise Greek culture and to direct her attention only to the material and outward interests of life.

Nations follow their instinct like individuals, and it must be attributed to that bias of good sense which characterises the British public, that it has now become more desirous of instruction in matters of taste, than even those nations who for many centuries have been devoted to the Fine Arts and Art-Manufactures. The *Art-Journal*, in which we now write, is a living proof of our assertion: while the number of its subscribers daily increases, similar publications on the Continent either drag out a languid existence or actually die of inanition.

The cause of a fact so contradictory is manifest. As a building, however massive and splendid, cannot maintain its equilibrium without resting on a solid foundation, neither can Art take root firmly without that basis afforded by national well-being, peace, and commercial prosperity. Whilst England, happily, possesses these indispensable requisites, in France and Germany such conditions are at present wanting. In addition to these disadvantages, journals, having for their especial object the diffusion of artistic knowledge, are conducted in both countries upon a plan which necessarily circumscribes their power of influencing the public mind. They treat the subject in a manner neither so purely scientific as to interest and instruct the connoisseur, nor yet sufficiently popular to engage the attention of the many, by connecting Art with the universal and every-day wants and necessities of life.

In the endeavour to give an account of the Art-manufactures of the ancients, we find that by far the greater part of Greek and Roman monuments are products rather of a manufacture-like multiplication or reproduction, than the offspring of High Art in the stricter sense. In proof of this assertion, which at first cannot fail to appear somewhat paradoxical, it will be necessary to enter into details better avoided at the present moment, as it is much more important to obtain, on first setting out, a clear understanding of the argument, rather than to heap up facts which ought only to be admitted in their proper place. To reduce the question to all the simplicity requisite for practical purposes,

we must be allowed to extend our prefatory introduction far beyond the limits generally assigned to such a preliminary exposition. The ground on which we propose to erect the system of Archaeological instruction, is still occupied by prejudices which have done much greater injury to the cause of true knowledge, than can be counterbalanced, for some time to come, by the most learned demonstrations. An over-estimation of the material part of Greek workmanship has confused the heads both of the artist and of the public.

The admiration, in itself just, yet carried to an undue extreme, of the fundamental principles of Greek Art, has brought ridicule upon the antiquarians of the old school. Practically speaking, the idolatry of which classical Art has been made so exclusively the object, has been, and still is, an impediment to the true understanding and appreciation of the surpassing excellence which characterises every production of the Greek poets. The real and enlightened admirer of Hellenic Art will, at once, admit the never-to-be-forgotten fact, that the whole amount of the Archaeological treasures put together, does not possess half the value of that portion of ancient literature, for which the present times are indebted to the sound criticisms of the Alexandrine grammarians; and that there is scarcely a single monument of antiquity which, judging it impartially, can be compared, in the excellence of its execution, with the perfection attained by Raphael and Michael Angelo. The actual originals, of which all present existing monuments of classical antiquity are but a faint reflection, are for ever lost, and we possess nothing which enables us to make a fair and just comparison between the country of Raphael and the period of Phidias and Praxiteles. Even the remains of the Parthenon cannot be compared with any of the highly-finished works of Leonardo da Vinci or Albert Dürer. But the impartial eye of the real connoisseur in the highest department of Art, may discover in the marbles which will bear henceforward Lord Elgin's name—our acquaintance with them, and, perhaps, their salvation from eventful destruction being due to him—traces of that absolute perfection spoken of by ancient writers. Nay, further than this, we find in even inferior works of the classical period a soul and spirit in the conception of the subject, a fundamental good sense in the carrying out of thoughts the most poetical, and a skilful adaptation of all ornamental finish, which throw into the shade, by comparison, the most exquisite monuments of the cinque-cento.

Even Raphael, when he endeavoured to introduce higher Art into the inferior regions of common life, did not attain the simplicity of the Greeks. Benvenuto Cellini too, who is the worthy representative of the school of Michael Angelo, was the propagator rather of a deteriorated than of a high tone of taste. Luxury diffuses widely everywhere the seeds of degeneration, and eventually, of utter destruction, even through the fertile domain of Art and Poetry. The sixteenth century is a striking proof of this assertion, and those employed in the production of Art-manufactures might easily be misled by adopting as their guide the prevailing taste of that splendid epoch, despite its high qualifications. Classical Art, on the contrary, presents a rich abundance of elements which, thoroughly and practically studied, enable the manufacturer to produce everything required by the wants and refinements of modern civilised life.

To those who have gone through the discipline of such an education may be applied the saying of a celebrated German scholar, Reyssog, who, when called upon in 1813 to bear arms in common with all the learned men of Germany, left his comrades far behind him by the rapid progress which he made in military accomplishments. In answer to the question, "how can you, a man of Greek and Latin, perform so well the part of a soldier?" He replied, "I am a philologue, and a philologue is a man who can do everything!"

Bestowing a rapid glance upon the history of Greek Art, we are at once struck by the remarkable fact, that Athens, though the very centre of High Art, was by no means the chief place for

Art-manufactures. This prerogative was reserved for Italy, where all manifestations of Greek genius found a practical application. We point out as a striking example the numismatic splendour of Magna Græcia and Sicily, which was as brilliant as the coinage of Athens was simple and old-fashioned. No one looking at these rude, and for the most part, tasteless emblems of Minerva would be inclined to suppose them produced by the country in which the full power of Phidias was developed, while the almost inexhaustible abundance of the most exquisite representations on the coins of Naples, Tarento, and above all, Syracuse, are the only remains which can convey to us anything like an approximate idea of that refined mode of treating metals, which the gold and ivory statues of the period of Pericles must certainly have shown.

Medals and coins constitute the most brilliant portion of the Art-manufactures of the ancients, and deserve particular attention under this point of view. By the examination of such treasures of Art, adapted for immediate and common use, we shall learn much that is curious, and which may likewise serve as a guide for those who are occupied with the practical application of High Art to purposes of practical utility. Not that we consider it possible that our modern system of coinage, which is now, in all probability, for ever ruined, should be improved by this study, but it may, perhaps, be advisable to become acquainted with those principles which the ancients unconsciously followed in the employment of the high symbolical language of Art, in preference to dry literal inscription. Were no other advantage to be derived from such a study than that of obtaining a more accurate acquaintance with the coin of our own times, such an advance in self-knowledge might prove of the highest utility, by placing forcibly before our eyes those deficiencies and weaknesses which at present deprive Art of all hope of success.

Next to the numismatic department comes that of engraved stones, belonging also to Art-manufacture. Many of these gems must be considered as specimens of the most refined workmanship, but their origin is still of a secondary character; being due to that tendency towards the multiplication of the noblest and most renowned creations of artistic genius, which, in ancient times, was furthered by numismatic reproduction, as in modern days by steel and copper-plate engraving. The criticism required by this branch of ancient Art-manufacture, will become more interesting by comparison with the mode of treating the same, adopted by the gem-engravers from the period of the cinque-cento up to the present time, when it has been almost entirely superseded by the use of intagli.

The same classes of Art are not always identical in ancient and modern times; there are even instances where no analogy whatever exists between branches of Art-manufacture bearing the same name. It will appear strange when we assert that such a difference is to be found between ancient and modern pottery, the system of treatment being entirely dissimilar. We shall endeavour to inquire into the principles adopted by the ancients for the management of such materials, by means of which they were enabled to invest ordinary gifts with the spiritual gifts and attributes of high Art. Some knowledge of the manufacturing processes employed by them would prove highly interesting, were we so fortunate as to succeed in obtaining some traces of their methods by the aid of critical investigation.

Clay is one of the cheapest but most useful substances for which Art is indebted to nature. The ancients have displayed wonderful skill in adapting it to every purpose, and architecture, as well as sculpture, has derived great advantage from its use. In the middle ages it was not neglected, but since the bright epoch of the cinque-cento, it has been almost forgotten, and it is reserved for our century to revive the employment of so economical and convenient a material. An exact enquiry into the method of working and applying it will make us acquainted with a great many particulars, which may, perhaps, interest those of our manufacturers who are occupied with the restoration of terra-cotta work. The commerce

in every kind of metal-work was, in antiquity, as great as in that of earthenware. Bronze-casting occupies the first rank, and we shall become acquainted with a great variety of processes and modes of application which, even in the present day, must be of some interest to the practical manufacturer, who is well aware that success depends, in great measure, upon simplicity of means, and the discreet and judicious use made of well-assured modes of manufacturing processes. The fact that Athens received her bronze candle-labra from Etruria, and, more especially, from Tarquinii, is sufficient to show that similar advantages existed even in ancient times, and it would be interesting enough to inquire into the particular causes of such a commercial conjuncture. Almost every monument discovered at Herculaneum and Pompeii belongs to Art manufacture, notwithstanding the high perfection which is justly admired in many of these valuable remains. It is a common prejudice that mechanical work is necessarily in hostility with higher Art. Without the process of multiplication obtained by mechanical means, the full power of which Art is capable cannot be considered as developed, as it must, without this aid, necessarily remain limited to a very small number of privileged persons possessed of the means of procuring its enjoyments.

Art is, like human existence itself, composed of body and soul. The harmonious union of the two can alone claim to be a highly perfected and complete work. But the spiritual part may be conveyed by a sort of shorthand process, which consists not so much in copying as in making extracts from the greatest and most powerful creations of artistic genius. To this kind of re-production we are indebted for the numerous, and under present circumstances, truly invaluable wall-paintings of Pompeii, which belong, almost without exception, to Art-manufacture, and have no connection whatever with that high Art of which ancient writers are full. A picture gallery composed of such decorative paintings, when studied under this point of view, instead of losing interest in our eyes, will be only the more highly valued, and, perhaps in time, some speculative manufacturer may arise with intelligence enough to divine the real wants and wishes of the present times, and who, by the comparative study of old and new modes, may qualify himself to minister to the exigencies of the day. The exertions of our greatest artists to introduce a better system of taste, will prove utterly useless and unsuccessful, so long as they continue to despise the employment of such short-hand methods as we have indicated. If Mozart, Weber, and other great composers had felt disgusted at hearing their divine compositions converted into waltzes and quadrilles, they would not have obtained half the popularity they now enjoy. These great men went even further—they appreciated popularity so justly as to meet it on any terms; deeming nothing too mean that could contribute to cheer and gratify the undistinguished many. It is to this secret that Greek Art owes her everlasting youth, and modesty may be asserted to be her constant attribute and accompaniment, whilst literature on the other hand, gradually laid claim to higher pretensions, and became in consequence more and more wearisome.

Not to speak of mosaics and other industrial branches of Art, we conclude by recalling the services which have been rendered to common life even by sculpture. The emblems demanded by affection for the adornment of those receptacles where the last remains of beloved parents, relatives and friends, have found a place of rest, were furnished by her friendly aid, and the afflicted mourner found comfort and consolation in the poetic symbols of that figurative language which in its expressive silence speaks more eloquently than words.

It is to be understood that we have been compelled to omit in the present sketch many points of high importance, (though of an episodic character), which indicate a long series of monuments. When we are able to enter more deeply into the subject, we shall endeavour to be as explicit and explanatory as, in this first article, we have been compelled to be cursory and allusive. Our present aim has merely been to clear

the ground and, trace out the outlines of the groups, which will, afterwards, claim our whole attention. For the present it is enough to have pointed out the direction which we purpose giving to our thoughts, and if we are, at times, obliged to enter into the labyrinths of comparative analysis, our readers may feel satisfied that such apparent digressions have no other aims than to simplify the principal subject, and to assure ourselves as much brevity as possible in the elucidation of arguments which may truly be said to speak for themselves.

SPECIMENS OF ORNAMENTAL ART,

IN EIGHTY PLATES, BY LEWIS GRUNER,
WITH A PREFACE AND EXPLANATORY NOTES,
BY DR. EMIL BRAUN, OF ROME.

BY MRS. JAMESON.

NOTHING could be more opportune than the appearance of this magnificent work in its present completed state; all the aids that can be given to our artistic manufactures, during the next few months, will be eagerly sought; and this is one of the best. That it should be given to us at a price which, our French neighbours would term "fabulous"—a price, which brings either the complete collection or the separate prints within reach of the student or workman, in all the various departments of ornamental Art, is owing to the enlightened patronage of the Government. Here are eighty plates, measuring twenty-four inches by twenty each, of models and patterns from Gothic and Classical authorities, chiefly Antique and Italian, some of them outlines, exquisitely exact and highly finished, and half of them at least most vividly coloured, for twelve guineas. Wood-carvers, bookbinders, china-painters, calico-printers, house-decorators, ecclesiastical architects, may all find something here to hear on their respective pursuits or professions. The plates have been prepared by Mr. Lewis Gruner, well-known for his work on the fresco decorations of the palaces and churches of Italy, and are introduced by a preface, with explanatory remarks on each plate, by Dr. Emil Braun, who has achieved a European reputation, not only as a profound scholar and antiquarian, but for the exquisite taste and skill with which he has advocated and carried out the application of classical Art to modern purposes of utility and ornament;—not with that formal, theatrical pedantry which made a classical taste some time ago so supremely ridiculous, and by its reaction, threw us into all the vile vagaries of the Rococo mania; nor yet with that heedless commixture of styles in which what was beautiful and choice in itself became absurd from misapplication; but with the profoundest feeling of beauty, grace, and fitness. In the sense of fitness lies the morality of Art, as inseparable from it as good morals from true religion. Dr. Braun in his well written and suggestive preface says—

"A just comprehension of Art cannot be attained by the exclusive study of ancient monuments. A power of universal sympathy is required for its development in the present day. It is not enough to direct our attention solely to the manner in which Art may be brought to bear upon the wants and refinements of every-day existence; we must learn fully to understand the great social conditions, upon which the direction taken by fine Art, in particular branches, and in matters of individual and private taste, always depends."

That is to say, to put the same thought into a familiar form, because we have Greek vases and Greek cornices, we need not have Greek fenders and fire-irons, nor Attic paper-boxes.

Dr. Braun tells us, that "to study these influencing conditions was formerly possible only at Rome and at Paris;" a truth confirmed by the number of our young students who can in any degree afford it, who even now go to those schools to learn the higher branches of their profession.

In this book, taking the plates and letterpress together, two accomplished foreigners have united to bring some of the principles of taste in Ornamental Art, ready analysed and illustrated, to our hand, and to make them available for home study.

We, who have opened our forthcoming Exhibition of Art to all the workmen in the whole world, may admit foreigners to aid us in our generous contention; to help us to excel them if we can, in that especial department of Art in which we have been held most deficient—the harmony of adaptation. It is here that we blunder so atrociously—it is here that we have so much to learn. The misapplication of forms and ideas in themselves beautiful, is one of the signs of the uneducated eye and servile hand. But why waste words?—one example is better than a hundred objurgations; and it shall be intelligible, as the phrase is, "to the meanest capacity." Lately I saw a model for a chair-leg, in which a winged scarp was made to do duty as a brass-caster; and this was praised as *novel*. Very novel it may be to see the angel-form and spirit-enblen grovelling on the earth under a chair-leg! Nothing can be more beautiful as an ornament, surmounting, or hovering amid, other ornaments, in ecclesiastical decoration, for implements of music, and such religious or poetical purposes; but even as a mere ornament, the angel-head winged has a meaning in its beauty; it is the emblem of light, thought, heavenward movement. Is its proper place under the leg of a chair or a table? There is a passage in Ezekiel, in which he describes the cherub head and wings with wheels beneath. Was this in the workman's mind who turned a cherub into a caster? Or was anything in his mind but the aim to catch the eye by something new—something fitted to attract those travelling "buyers for the market," who stand between the manufacturer and consumer, and whose total want of all the capabilities which such a medium might seem to require, has been well set forth in a late number of this Journal:—"As for a knowledge of the principles of taste and design, they would jeer at the very mention of them. Their chief standard for selection is the resemblance of a pattern to what is at the time in vogue; excellence in design is not heeded by them at all, for they are insensible to it." And these are among the patrons of Ornamental Art!

This is only one out of a thousand instances of such solecisms, shocking to a just and cultivated taste, and amounting, in this instance, not merely to the misapplication but the absolute profanation of a beautiful and, in its origin, a scriptural idea. The student of Mr. Gruner's book would not be likely to fall into such errors, because the principles laid down are analysed as well as illustrated; the conditions under which each ornament may with propriety be imitated or applied—its elementary forms in their combination, either luxuriantly developed or chastely simplified—all this the intelligent pattern-drawer will be made to feel and comprehend; and this, let us confess it at once, is what the foreign artisans have hitherto understood far better than ourselves.

No—we are not, after all, so very selfish, we English, as our Continental neighbours believe us to be. The intense impression of our national and trading selfishness which exists on the Continent, must have been modified by late events. How much it has injured the interests of our manufacturers, and the consumption of our home produce, cannot be conceived but by those who have travelled through France and Germany, or resided long in the large towns of those countries. All the more intelligent portion of our traders and manufacturers begin to be ashamed of this narrow spirit, and the almost unanimous response, when the question was placed before them, "Whether the ensuing competition and inspection should or should not be open to all nations?" is a proof that we are outgrowing some of our distasteful prejudices. There may be pride in this response, but there is also generosity. It is some comfort that the English people are beginning to define in a better sense those words so common in their mouths, and so seductive to their ears, *Patriotic* and *Practical*. We can all remember the sense of those words some twenty years ago, when to be patriotic was not only to

* No. cxxxviii., p. 374. It does not become the *Art-Journal* to praise the contents of its pages, but I am not the *Art-Journal*, and therefore may be allowed to point to the article on the "Government Schools of Design," as being most admirable in courage, taste, and feeling.

prize everything that was English, but to despise everything that was not English. Instead of inviting enlightened foreigners to aid us in advancing the general style of our Art-manufactures, by opening to us such means and models of improvement as the state of the Continent had shut out from us for a quarter of a century, we set our faces against them. To think it possible they could help us was to insult British Art: to ask them to do so was to discourage British industry. We inundated all Europe with our restless, curious, *envieux* travellers, and vainly did the moralist cry out against the unpatriotic absentees who lavished our English gold on foreign fancies; while we set our faces against the only thing that made us some amends, the employment of a few foreigners, who brought with them what was of more worth than handfuls of gold, the power of making our manufacturers rich *there* where we were most poor, and offered to us suggestions of hearty and taste which might have rendered the productions of our ingenuity and industry a thousand times more valuable. To be practical, as I well remember, was to discard all theories; to oppose the untried; to go on blundering as our fathers had done before us, wasting our energies in producing the false, the clumsy, and the ungraceful. The boldest speculators in gold or in trade could not raise their thoughts high enough to perceive that there was another branch of speculation which, had we been earlier in taking up and following out, would have placed us years ago far beyond where we are now. But the light has broken in upon us at last: no one can walk through our streets, look into our shop-windows, or recollect in our houses twenty years ago the gimcrackeries which went under the name of *objets de gout et de luxe*, without perceiving with wonder how far the sense of beauty and fitness has improved among us.

Dr. Braun, in his preface, says, "Not many years ago manufacturers looking for help to science would have been ridiculed as mere theoretical enthusiasts, (they would have been unpractical); the maker of soap would have been regarded as unpractical for inquiring too closely into the mysteries of chemistry, and farmers who were not satisfied with the unthinking observance of the routine of their ancestors would also have been looked upon as mere unpractical schemers. The case is now completely changed; experience is referred to rational principles, and in every department of industry rude empiricism has been found to yield to scientific intelligence. It must be confessed that in the Fine Arts we are not so far advanced; still it may be said that even this sphere of creative power has become to a certain degree subject to a philosophic treatment instead of mere prescriptive rules: there is a desire for well understood principles; we learn to feel more and more that science may clear the way even for genius itself."

We had a striking example of the English sense of the word practical, and the really unpractical character of our workmen, when the famous Berlin "Book of Design" was first brought over to England. The history of this book is curious and edifying. Nearly thirty years ago the Prussian government associated two men, singularly well chosen for the purpose, to consider and carry out the best means for educating the taste, the eye, and the hand of the students in the Schools of Design (which were first established in that country) and the introduction of a better style of Art into the different provinces of common life, dress, utensils, furniture, decorative architecture, &c. The architect, Schinkel, emobled by the late king, was one; Beuth, the director of the Industrial Schools, was the other. This first was a most accomplished artist in various departments; the latter was an admirable man of business,—a practical man in the best sense of the word. Between them was produced the Berlin book of design, at the sole expense of the government; it was not put into the hands of booksellers, but given to the higher class of students, and copies were sent to all the foreign academies. Wherever it was made known on the Continent, it not only awakened a taste for the more refined treatment and more intelligent application of every style of ornament; the patterns and examples were applied practically, with great advantage, by those who minister to

the wants of every day life. "It is," says Dr. Braun, "a well-authenticated fact, that all who had been so fortunate as to obtain possession of this choice collection of models distinguished themselves greatly both in their own individual profession and in the application of Art to the wants of real life." But when copies of this much celebrated work were brought to England some years ago, our manufacturers were not prepared for it; they were really incapable of either appreciating or applying it. They decided that it was of no use to the pattern-drawer, because instead of giving patterns fitted for some particular and transient purpose, and which might be transferred at once to the panel or the porcelain,—the silk or the muslin,—it took higher ground; laid down the principles by which all that was most beautiful and most original in ornamental Art had been called into being, and sought to communicate to the student the power of creating, multiplying, varying, and adapting for himself, according to the immediate want or occasion, whatever it might be. But at that time—I speak of some years ago—the servile and uneducated workmen were unable to make this use of the book, therefore it was pronounced useless.

"To render any system of instruction really available for the improvement of youth, the teachers themselves must be thoroughly conversant with the subject. To others it was rather an impediment than a help, making them feel all the embarrassment of ignorance."—*Preface, p. 4.*

But since the production of the Berlin book, Industrial Art has made such progress in England, that in producing a work of the same kind and purpose, an extension of the plan has been found indispensably necessary; "More especially as the mechanical means have been rendered easier and cheaper, while the increased knowledge of the history of Art has opened new stores of instruction and improvement capable of being adapted to more refined and varied wants."—*Preface, p. 4.* The theory of colours has been popularised by Mr. Hay, and the theory of forms by some excellent papers and examples in this Journal; while the art of printing in colours, and multiplying impressions, has been perfected: but we have still much to learn. Even at the Exhibition of Art, at Birmingham, in the midst of so much that was really beautiful and ingenious, I was struck, every now and then, by the misapplication of ornament and colour,—by the absence of simplicity and real elegance,—by the want of a more just eye for forms. There is a plate in this work of Mr. Gruner's, (Plate 2, that which exemplifies the forms of the Etruscan Vases), showing the profoundly scientific principles on which the lines and curves, which so delight our eyes,—flowing like music,—have been designed and modelled. Mathematics and Etruscan vases, are, it seems, allied; were it not better then that our artists, instead of merely imitating the forms, should learn to apply the principles on which these forms are constructed?—should be able to prove to themselves why they cannot, arbitrarily, deviate from these immutable principles, without deviating into deformity, meagreness, or clumsiness?

The announced exhibition for 1851, open to all nations, will probably call forth among us inventive and creative power of every kind. There is even danger lest the desire to achieve novelty and excite wonder should lead to some excesses of bad taste and exaggeration, unless a more cultivated knowledge of the theory of truth, beauty, and fitness in Art should restrain the fancy, and direct the capabilities of those who are spurred on by the pride, the interests, and the enthusiasm of the moment.

I repeat therefore that nothing could be more opportune than the appearance, as a whole, of this most magnificent and suggestive book.

But conscientiously to review a work on Art is not to make it a text for an "Essay on things in general," but to say first what it is—what are its pretensions;—and then to give an opinion as to its merits and defects.

The whole work consists of four separate parts comprising eighty plates.

The first part embraces architectural ornaments—door-ways of the classic orders, the more valuable because so few specimens remain to us:

the doors, as Dr. Braun observes, "being the first feature of an ancient building which yields to time—as in an antique bust, the nose is the first part to be injured;" Candelabra; chased silver, antique and *cinque cento* work, flowers from nature ornamentally arranged and in colours, &c.

It is impossible to particularise each of the twenty-nine plates of which this division consists; but I cannot help calling attention to a few of them; for instance, the friezes from the unequalled collection of Campana at Rome,—what can surpass them in genuine classic feeling and airy grace? The eight specimens of Tarsia (inlaid wood) are of surprising elegance and beauty, and the patterns capable of being applied to an endless variety of purposes. They are chiefly from the church of Santa Maria in Organo, at Verona, and designed by the famous Fra Giovanni, who worked in the fifteenth century, and is mentioned with praise by Vasari.

The tessellated pavements from the early Christian basilicas, are wonderfully elaborate and beautiful, and of the simplest materials, worked into a pattern and most richly coloured: one specimen of antique pavement lately discovered at Brescia is very peculiar both in colour and arrangement. The effect and brilliancy of these varied pavements must have depended greatly on care and cleanliness, and in this example there is the reiterated inscription, large and legible: LAVA BENE (*wash well*); which must have been edifying to the antique housemaid as a perpetual memento.

"The natural flowers ornamentally grouped and arranged," of which there are four or five examples in this part, splendid for size and colour, must also be mentioned.

The second part exhibits in seven plates the Pompeian system of mural decoration; Dr. Braun, in his remarks on these, points out the luxuriant and fantastic combination of colours and objects, and at the same time the absence of all that trickery, those contrivances for perspective illusion, all that waste of ingenuity which distinguished the architectural decorations of the *decadence*, and which was vainly deemed an *improvement* on the classic models: such trickery is one of the vulgarities of Art, and if it produce a transient wonder, it also leaves behind a permanent sense of disappointment. The student will remark that in the specimens given of Pompeian ornament, there is the imitation which excites the fancy, without the trickery which deceives it.

The third division of the work, comprises plates of ornaments in the ecclesiastical style. As we are now threatened with a surfeit of the northern gothic—glorious as it is—it is useful to the student, and generally refreshing to find here specimens of what has been called Italian gothic, chiefly from the old Lombard and Unhrian churches. The ornaments from Assisi, designed by Giotto, display the singular and intricate but most harmonious use of prismatic colours in decorating a solemn place of worship, leaving it all its solemnity.

Dr. Braun says—

"Churches are intended to seclude man from common every-day existence, and to procure to the worshipper that state of mental rest which enables him to partake of such blessed consolation as religion only can bestow. The fine Arts may in various ways greatly contribute to this transfiguration, as it were, of the human mind."

Why, indeed, should we fancy that in the harmonious combination of sounds there should be something associated with piety, and particularly pleasing to God, and in the beautiful arrangement of colours something the reverse? Did not God make both? The tints of the rainbow as well as the song of the lark show forth His praise who clothed his world with light and beauty as well as cheered it with music! Both are His, and sanctified by being devoted to Him. Not to dwell too long on this, I yet must point out to especial notice a specimen of the application of coloured terra-cotta to the exterior embellishment of a building. It is well known that coloured brick-work, in which the tints are well burned in, rivals stone in its durability; but though introduced successfully of late, the use

of terra-cotta has been limited to ornamental tiles or a few mouldings. Now, the whole of the grand facade of the *Spedale Maggiore* (the great hospital) at Milan, is made of brick, moulded into a variety of forms—graceful festoons, cornices, medallions, architraves—all brick; and how beautiful they are! how sharp and fine to this day are all the delicate lines, projections, and angles! I used to go day after day to look upon this building with ever new pleasure and astonishment, and with a wish that in our country we could substitute bricks of varied tints and cast in various moulds for the everlasting monotony of our houses of square red bricks. And that wish is likely to be gratified: the reform has begun. Already we may see in some of the new-built churches terra-cotta mouldings of great beauty, most accurately imitated from approved models. Colour, however, has not yet been tried. I believe the specimen given here is from Bramante's facade of the Santa Maria delle Grazie. We might have such forms of tinted brickwork if we had a race of bricklayers capable of putting them together. Bramante, who was Raphael's near kinsman, was also the architect of the "*Spedale Maggiore*" in 1492.

The fourth division comprises eighteen brilliant examples of domestic and palatial decoration. We are here struck by the superiority, in all respects, of the work of the fifteenth over that of the 17th century. Examples are given here from every school, in every variety of taste, as long as it is *good* taste and that the elementary principles of Fine Art are not lost sight of. Some of these are surprising for the quantity of *mind* which has been expended on them. There are two divisions to be noticed here. The one comprehends the original manifestations of the Italian national taste, of which the plates after *Luini* are perhaps the best examples; the other, those elegant inventions produced by the discovery of the antique frescoes among the ruins of Rome. Both styles are frequently blended together with that wonderful combination of the romantic and classical elements which characterises every production of the Italian mind, from Dante downwards.

I cannot conclude this notice without repeating that the Preface and remarks of Dr. Emil Braun add greatly to the value of the prints. A few years ago, such a preface to a book of ornamental patterns, an essay so profound in its views, so full of new and suggestive thought, would have been deemed quite out of place, too fine in quality, too learned for the occasion, and quite beyond the comprehension of those for whose use the work is intended. Nothing can more strongly prove the general progress made by our Art-workmen than the admiration which this short preface has excited,—the feeling that it will be appreciated, and if not wholly understood at once, that it will be studied and read till it is understood, till the mind has taken it in. Dr. Braun begins, by styling "Ornamental Art the offspring of High Art." I should have thought that Ornamental Art must have preceded High Art, for I have seen productions of early Art in which the ornamental portion was perfectly charming in taste and design, while all that related to the human form and expression was as rude as possible. Yet "High Ornamental Art," where the leading idea appeals to the intellect and the fancy as well as to the eye, and the harmony and relation of parts has been strictly observed, could only have sprung up in the best periods of the best schools of Art. At this time, as Dr. Braun observes—

"Ornamental Art enters into a not unsuccessful rivalry with sculpture and painting. Yielding to them, without dispute, the honours belonging to the more elevated department of historical composition, it surpasses them in regard to its wider range of influence; and in proportion to the humility of the position it assumes, does its own peculiar value become more conspicuous."

But, it may be asked, what has a pattern-drawer or an artisan to do with High Art,—with Raphael and the Cinque-cento? We might ask, with the same reason, why do we put into the hands of the literary student the highest models

of literature, instead of confining him to phrase-books and word-books? Is it that he may learn to manufacture a poem of his own by transcribing their best passages; by taking a line from Shakespeare, a line from Pope, a line from Wordsworth, another from Byron, and so compounding an original stanza?—No; but that he may learn easily to appreciate what is best, and be led in the spirit beyond mere imitation.

In conclusion, Dr. Braun says,

"Let us hope that this work may become useful to the various societies now in operation for the encouragement of Art in its application to manufactures, under the patronage of the illustrious Prince who has taken the lead in their advancement; these associations have already widely influenced and improved public taste, and are rapidly bringing within the sphere of graceful and refined artistic decoration, even the most common and ordinary objects of daily utility."

THE TRIUMPH OF LOVE.*

AUTOBIOGRAPHY OF P. MACDOWELL, R.A.

DEAR SIR,—I have, according to your request, endeavoured to sketch a few particulars of a life (like most others) much chequered with light and shade, yet I fear possessing little to render it interesting. I was born in Belfast, August 12th, 1799. My father was a tradesman of that town. Unfortunately he was not satisfied with moderate success in trade, but was persuaded to dispose of his business and of several houses which he possessed, to become a partner in some speculation which eventually proved ruinous. His losses preyed greatly on his mind, and dying soon after, he left my mother in possession of little more than the house she lived in, and myself, then an infant. At about eight years of age I was sent to board at an academy in Belfast, kept by an engraver of the name of Gordon, with whom I remained until I was twelve years old. It was during my stay with that gentleman, that I first acquired a love for Art. When my school duties were over for the day, I amused myself by trying to copy a miscellaneous collection of prints, in the possession of my master. I was indebted for this privilege to his having one day discovered on the back of my slate something more than vulgar fractions, viz., a sportsman, I remember, in full costume, accompanied by dogs, of which I had seen a print in a shop-window, and to which I had paid many stolid visits for the purpose of sketching. This performance, for which I expected, and no doubt deserved, a thrashing, had, on the contrary, the effect of opening his portfolio to me for the future.

When I was twelve years old, my mother came over to this country, where she had some friends. I was sent to board in Hampshire, with a clergyman, for two years, at the expiration of which time it was resolved I should become a coach-builder, the pursuit of the Arts, to which I was so much inclined, being considered too precarious a means of living. I was accordingly sent to London, where I was placed under a coach-builder. After I had remained with this person about four years and a half, he became a bankrupt and I went to lodge in the house of Chenu, a French sculptor, residing in Charles Street, Middlesex Hospital. Whilst I remained there, having much idle time on my hands, I amused myself by endeavouring to sketch from the various plaster-casts by which I was sur-

* It is scarcely necessary to direct attention to this fine work, the beauty of which is sufficiently shown in the annexed engraving. As the reader will perceive, in the Autobiography of Mr. MacDowell the group was executed for his earliest patron, the late Mr. T. W. Beaumont, formerly Member of Parliament for the County of Northumberland. To say that it is one of the most charming compositions of modern times, in poetic sculpture, is, perhaps, saying even less than it deserves. It was executed by Mr. MacDowell in 1831. The figures are of the size of life, and have been carved from one block of marble—a work involving labour and difficulty, which will be at once understood when the many delicate points of the work are considered. The movement, elasticity, and spirit of the figures are beautifully sustained in every passage, and the flow of line from the lowest to the highest points of the composition is wrought out with the happiest effect. The group is accompanied by pastoral trophies, and the general feeling of the figures refers more markedly to the antique than others of the works of the artist.

rounded. My master, the coach-builder, decided on going to Ireland, and wished me to go with him. This I was determined not to do. Having no one to advise with on the subject, I went to Marlborough Street, and inquired of the magistrate whether I could be compelled to go with my master out of the country, more particularly as he had not instructed me in his business according to agreement. I received sufficient encouragement to strengthen me in my resolution, and after some differences succeeded in getting my indentures from him.

While living at Chenu's, I was continually asking questions as to how a knowledge of sculpture could be acquired. Having a most ardent desire to learn, on leaving Chenu's I applied myself assiduously to drawing and modelling the different parts of the human figure. At length I ventured to make a copy of the whole figure. The first I attempted was a Venus with a mirror; I believe the original is by Donatelli. I made a small copy, about a foot and a half high, which, when finished, I showed to Chenu. To my surprise he liked it well enough to purchase it of me. I was not a little pleased at this, and continued to work incessantly to improve myself, disposing of my models when I could. This went on for some time until, having lost my mother, I went to live in Seymour Street, Euston Square. I there became acquainted with two young Scotchmen, who one day called to tell me they had seen in the public papers an advertisement, in which artists were invited to compete for the execution of a monument to be erected to the memory of Major Cartwright, lately deceased. They urged me to make a design for it; this I thought sleek folly, knowing that in nine cases out of ten, success depended much more on having friends in the committee, than on the merits of the design. This method of managing matters with regard to public statues has led to the production of works which have been the laughing-stock of every foreigner who has visited this country. Until within a fortnight of the time allowed for sending in the sketches, I had no intention of trying, but at last, reflecting that at some future time I might reproach myself with not having made every effort to get on in the profession, whilst there was the slightest chance of success, I set vigorously to work, and working night and day completed a model of the figure, a pedestal, moulded and painted it, and sent it to the house of Peter Moore, Esq., M.P., where the committee was sitting. Arriving there late, they had already selected a model; however, they eventually chose mine, and asked me if I would object to allow the artist, whose design they had previously chosen, to model the basso-relievo which he had on his pedestal, on mine. I thought it but fair that he should do the entire pedestal; this was agreed on, but the sum subscribed at this time did not amount to more than seven hundred pounds, being about half the sum necessary.

My brightening prospects were thus thrown into shade for the present. Some members of the committee (personal friends of the deceased Major), wished me to show my sketch to his widow; I accordingly waited on Mrs. Cartwright, but not finding that lady at home, I left the sketch in her drawing-room. I was told afterwards, that, on seeing it, she burst into tears. I received a note from her the next day, expressing her strong approval of the likeness, and requesting me to call upon her. When I waited on her, she gave me an order for a cast, requesting to have the original model if possible. I can never forget the great kindness of that benevolent and amiable family, who were unwearied in their efforts to serve me in my profession, at a time in my life when their kindness was most useful to me. Unfortunately for me, the subscription for the monument never amounted to the sum necessary for its execution. In the meantime an artist, a Mr. Clarke, I believe from Birmingham, came to London and offered to execute it for the sum already subscribed, his connexions in Birmingham giving him advantages which I had not. This artist did not, however, succeed in pleasing the committee with the likeness, and the family, with my consent, allowed him the use of my model. He com-

PLATE I
SCULPTURE
THE GROUP OF FIGURES
BY THE SCULPTOR

[The text on this page is extremely faint and illegible. It appears to be a multi-column layout, possibly containing a list or a detailed report. The content is too light to transcribe accurately.]

THE THREE GRACES
BY ANTONIO CANOVA
1787

S. MacDowell

pleted the work, and became shortly after a bankrupt.

From the circumstance of my having modelled a bust of Major Cartwright, I acquired, and for many years enjoyed, the friendship of the late lamented Caon Riego, a man most esteemed by those who knew him best. I believe he never lost an opportunity of furthering my interests.

When not engaged on portrait-modelling, I employed myself on ideal subjects. The first group I attempted, and I shall never forget the pleasure I felt while doing it, was from Moore's "Loves of the Angels," the figures about three feet nine inches high. It is now in the possession of George Davison, Esq., of Belfast. My next work was a group from Ovid, of Cephalus and Procris. I was commissioned to execute this in marble for E. S. Cooper, Esq., member for Sligo. After that I modelled a group, life-size, of a Bacchus and Satyr; I then commenced a model of a "Girl Reading," which, when finished, I sent to the Exhibition, which was the first Exhibition in the new Academy, in Trafalgar Square. Sir Francis Chantrey had that year the arrangement of the sculpture, and I feel bound to speak of this distinguished sculptor with gratitude.

Assuredly no struggling artist could tax him with being influenced by any mean or ungenerous feelings towards his less fortunate brethren; his nature, his talents, and his circumstances placed him far above it. I have been told that he took the greatest pains to select a place in which my model could be seen to the best advantage, and that he took pleasure in pointing out to the other members what he considered its merits. The morning after the private view of the Exhibition, I think, I received a note from Sir James Emerson Tennent, in consequence of which I called on him; he was pleased to speak to me in praise of my work, and asked me under whom I had studied. I replied I had not studied under any one, and that I had been intended for a coach-builder. "Oh, indeed, may I ask you what part of England you come from?"

"I am, sir, an Irishman." "Indeed, from

what part?" "From Belfast." "You are! so I find I have been talking to a townsman of mine all this time."

This interview ended with a promise on the part of Sir James to call next day to give me a first sitting for a bust. He did so, and having succeeded in pleasing him with the likeness, I had the honour of modelling the bust of Lady E. Tennent also, and afterwards executed them both in marble. Sir James was indefatigable in his efforts to serve me; he called on his friend, T. W. Beaumont, Esq., who was then in London, and urged him to go to the Exhibition to see my statue. The result of this gentleman's visit to the Academy was, his sending to me to request I would call on him at his house in Hyde Park Terrace, Piccadilly. I went the following day full of hope, and was not disappointed. After some conversation and a variety of questions about myself, he gave me commissions for two large groups in marble, from any subject I should choose, also an order for a marble statue of the "Girl Reading;" stipulating, at the same time, that I should do nothing for any one else for the space of three years. Observing, I suppose, that I did not much relish this restriction, he immediately added, "You know you can but have employment, and if I am pleased with your work, I shall take care you never shall want it." I parted from him with feelings of gratitude and hope; the sun was once more shining on me, and I determined that no efforts of mine should be wanting to deserve success. The following year I exhibited the "Girl Reading," in marble, and the morning after the private view I received a note from Lord Francis Egerton, now Lord Ellesmere, requesting me to call on him, which I did, and I was honoured by that nobleman with a commission for the "Girl Reading," finding that the first was sold. I did not forget Mr. Beaumont's stipulation with me, although I did not mention that circumstance to his lordship. I called on Mr. Beaumont and told him that my statue had attracted his lordship's attention and approbation, and that from his lordship's well-known taste, I felt certain that my executing one for him would serve me very much. Mr. B. replied, "I think his lordship

shows his judgment, and you may set about it as soon as you like."

I had now the honour of being elected an Associate of the Royal Academy. I cannot forbear here remarking, that although much has been said of the interested partiality of the members of that Institution in awarding its honours, I can most conscientiously assert, that at the time of my election I was not acquainted with a single member of that body, nor had I made a single advance to become so. My election took place on the 1st of November, 1831. Having nearly completed my first large group for Mr. Beaumont, viz. "Love Triumphant," he was desirous that I should visit Italy, and said that he would supply me with ample funds for that purpose. I need not say that a journey to that glorious land, which teems with all that is most beautiful and exalted in the arts, was entirely to my taste, and that I accepted, with gratitude, his generous offer. After remaining abroad for eight months, visiting every church, palace, and museum, famed for its treasures, whether in painting or sculpture, I returned to England. I completed my group of "Love Triumphant," and various other works in marble for Mr. Beaumont, namely, "A Girl at Prayer," "Cupid," "Girl going to the Bath," and "Early Sorrow."

I had the honour of being one of the sculptors selected by Sir Robert Peel to execute one of the national statues of the British admirals. The statue of Lord Viscount Exmouth fell to me to execute; it is now placed in Greenwich Hospital. I had the honour some time before this, in February, 1846, of being elected a Royal Academician.

It is with most painful feelings I have to conclude this rough sketch by alluding to the death of a gentleman who has had a powerful influence upon my fortunes, namely, that of T. W. Beaumont, Esq., my ever lamented friend and patron. I cannot express myself in terms sufficiently strong of his noble disposition and genuine kindness of nature, the generous friend of Science, Literature, and Art. Many there are who have reason to mourn his death.

I remain, dear sir,

Yours very faithfully,
PATRICK MACDOWELL.

[In autobiography there is a charm which a narrative in the third person does not possess, though the latter has an advantage which can never belong to the other form—and that is, the power of saying of the subject that which he cannot say of himself. We offer no apology for adding a few lines to this memoir—we only doubt our power of speaking in a manner sufficiently worthy of the author and subject. The demand for essentially poetic sculpture in England is unusually disproportionate to that for sculptural portraiture; and the greater number of departures from the latter are of the monumental and statuesque character, and hence it may be said he is unusually daring who devotes himself to poetic sculpture, and he who succeeds must achieve success by transcendent talent. Mr. Macdowell mentions in their successive order his "Girl Reading," "Girl at Prayer," "Love Triumphant," "Girl going to the Bath," "Early Sorrow," &c. Had he executed no other than the first mentioned of these, his name have ranked among the highest names in the history of British Art. There are in progress two admirable works to which no allusion is made in the preceding sketch; these are his "Virginus" and "Eve," both of which are being executed in marble. The great and distinctive power of this artist is that of investing his subjects with a profound and touching sentiment, which is always supported by a faultlessly graceful and elegant design. In the works of the greatest European sculptors we are continually reminded of the antique, but in the works of Macdowell we do not forget the antique, but we also remember animated nature; and this is refreshing after doing continual homage to the majesty of the Rhodian Art. Almost all the works of this artist we have had occasion to mention in terms of praise, and we trust that for years yet to come there will be a current series demanding similar notice at our hands.]

THE DEATH OF CORDELIA.

Lear. "Howl, howl, howl, howl!—O you are men of stones;
Had I your tongues and eyes, I'd use them so
That heaven's vault should crack.—O, she is gone for ever!—
I know when one is dead, and when one lives;
She's dead as earth:—Lend me a looking-glass,
If that her breath will mist or stain the stone,
Why, then she lives."

A REMINISCENCE.

"Mark yon old mansion frowning through the trees,
Whose hollow turret woos the whistling breeze;
That casement, arched with ivy's browest shade,
First to these eyes the light of heaven convey'd,
The mouldering gateway strewn the grass-grown court.
Once the calm scene of many a simple sport,
When Nature pleased, for life itself was new,
And the heart promised what the fancy drew."

ROGERS. *Pleasures of Memory.*

R. S. Lauder

ROBERT SCOTT LAUDER, R.S.A., was born at Silver Mills, near Edinburgh, in the year 1803. Like most who have attained distinction in the Arts of design, the instinctive desire to represent external objects by the pencil, developed itself in young Lauder at a very early age. While yet a mere child, the pleasure he derived from the first perusal of the Arabian Nights, sought to give itself vent in drawings of the gorgeous scenes they conjured up before him. The middle classes in Scotland were at that time even less prepared to regard Art as a worthy or available pursuit in life, than those in the southern parts of the island, and consequently the boy's turn for drawing met neither with encouragement nor direction among the circle of his relations. David Roberts, who had already given proofs of the ability, energy, and enthusiasm which have placed him in the high position he has attained, was the first who came to Lauder's assistance. He communicated to him his earliest distinct notions of the aim of pictorial Art, and the means by which it is accomplished; he put brushes in his hand, explained to him the mixing of colours, and gave him some notion of drawing.

This happened when Lauder was in his ninth or tenth year. He still continued, however, for several years, to be principally occupied by the ordinary educational pursuits of boys of his own class. Drawing and painting were the occupation of his unemployable hours, in which he met with neither encouragement nor the reverse. An exhibition of the works of Scotch painters which was opened in Sir Henry Raeburn's gallery, about the year 1817 or 1818, had, however, such an effect upon him, that disregarding every other consideration but his passionate desire to become himself a painter, he resolved to make that his profession. For a time the obstacles to the attainment of his wish seemed insurmountable; in the whole range of his acquaintances he found none who could advise him what steps to take for obtaining the necessary instruction. At last having been introduced to Sir Walter Scott, he was, by his assistance, admitted as a student to

the Trustees' Gallery in Edinburgh, then under the direction of Mr. Andrew Wilson. This Gallery, it may perhaps be necessary to state, for the information of English readers, contains an excellent collection of casts from the best antique statues. The Trustees, under whose auspices it has been collected, are a body of gentlemen, at whose disposal was placed in the latter part of last century, a portion of the funds realised by the sale of estates forfeited in 1745, for the purpose of establishing an academy of design to promote taste and invention among the mechanics of Scotland. As has been uniformly the case in this country, the students in the Academy have more frequently been found aspiring to become artists, than satisfied with the humbler task of imparting more taste and originality to manufacturing designers. Perhaps Mr. D. K. Hay is the only one of its *élèves* who has acquired honourable distinction by showing how much of taste and refinement may find worthy employment in embellishing private edifices. On the other hand Wilkie and other names high in Art obtained their first elementary instructions in this Gallery.

Here Lauder prosecuted his drawing studies assiduously for four or five years. A better school in so far as mere drawing is concerned can scarcely be imagined. The habit of drawing on a large scale from the round formed both his eye and hand. And the exquisite grace and beauty of the models by which he was surrounded, insensibly developed a naturally delicate susceptibility to the charms of form. Thus prepared, he proceeded to London, where he continued for three years, drawing in the British Museum, and painting from the life in an Academy, which was supported by the contributions of young painters. When Lauder was a pupil in the Trustees' Gallery, Edinburgh had no public collection of paintings; it was at a later period that the small, but well selected gallery of the Royal Institution began to be formed. In London he, for the first time, had opportunities afforded him of studying the excellencies of the best painters of our own and other countries. An

appreciation of the beauties of colour thus came to be superadded to the taste in regard to form that had been impressed upon him in his first school.

Lauder returned to Edinburgh about the year 1826. A warm interest was at that time taken in art by the Edinburgh public, partly owing to a real taste for it, partly to the spirit of controversy and partisanship. For a considerable time yearly exhibitions of paintings by modern artists had been opened in Edinburgh, managed by an association of amateurs, incorporated as the Royal Institution. The leading members of this body were connected with the Trustees' Gallery. In 1826 a number of the Edinburgh artists, dissatisfied with the manner in which the affairs of the Institution were conducted, seceded from it and founded the Scottish Academy. Rival exhibitions were opened for several years; ultimately, however, an arrangement took place, in consequence of which the artists who had adhered to the Institution joined the Academy, and the Institution confined itself to exhibitions of the ancient masters. The controversy, while it lasted, had the advantage of awakening increased interest for and attention to the exhibitions in the Edinburgh public. A more lasting beneficial result was the commencement of the collection of old paintings already adverted to, by the Institution, and the foundation of a gallery of modern art by the Academy, its first purchases being Elty's "Judith," his "Benahin," and his "Mercy interceding for the Vanquished."

Lauder was elected an Associate of the Institution soon after his return. He also resumed his studies in the Trustees' Gallery, then under the direction of Sir William Allan, who, appreciating the merits of the rising artist, admitted him to his intimacy, and when unavoidably absent, entrusted to him the teaching of his pupils. But though Lauder thus became the friend and associate of the amateurs and the artists who adhered to them, his gentle and amiable character kept him on the best terms with the independent party. The alliance of the two bodies, which soon followed, removed any difficulties that might have existed in the way of cordial intercourse. There were then in Edinburgh artists whose conversation and example were well suited to stimulate his exertions and inform his mind. There was also an intimate admixture of the literary and scientific circles with the artistical, eminently advantageous to both.

The terms on which Lauder stood with Sir William Allan have already been noticed. But he now formed an intimacy destined to exercise a much more important influence over his future career. The Rev. John Thomson, of Duddingstone, was a man of genius in the highest sense of the word. Had he, instead of being an amateur, been a professional painter, he would have stood on the very highest level of his art. As it is, his landscapes, for their rich beauty of colour, for their truthful perception and reproduction of the elementary phenomena of nature, are rarely equalled; and what is more, they are uniformly imbued with the soul and sentiment of poetry. But Mr. Thomson was more than a mere painter; he had an exquisite taste for music, and was no mean performer; he was an accurate and elegant classical scholar; and, above all, he possessed an immense fund of shrewd practical observation, quaint humour, and warm benevolence. Recognising a congenial spirit in the young artist, Mr. Thomson admitted him to his intimate friendship. From that time the manse of Duddingstone was ever open to him, a privilege of which he was not slow to avail himself. From this era a new and higher sense of the aims and destinies of his art dawned upon Lauder. In the pictures which he painted about this time, an intellectual and poetical character, not to be found in his earlier productions, promising though they were, may be discovered; and a breadth and mastery of execution, akin to that of the great masters of Italy and the Netherlands, developed itself. A number of cabinet portraits executed at this stage of his career may be cited in support of this opinion; still more a painting intitled "The Sentinel," and his first painting of the "Bride of Lammermoor," in which the figure of Edgar Ravenswood stands amid the bridal guests like

a dark-threatening spectre at mid-day, an incarnation of gloom in the midst of sunshine.

In 1833 Lauder proceeded to the Continent. He remained abroad five years. The greater part of these years was spent in Italy. He studied assiduously at Rome, at Florence, at Bologna, and at Venice. On his return he spent some time at Munich. The example and conversation of Thomson had prepared him to feel in their full force the Titanic efforts of Michael Angelo in the Sistine chapel; natural temperament had predisposed him to be deeply impressed by the colour of Titian and Giorgione. A deep and lasting effect was produced upon him by the unrivalled wealth of Rubens at Munich.

Since his return to England in 1838, Lauder has resided principally in London. In 1839 he exhibited his "Bride of Lammermoor" in the Royal Academy, which was immediately purchased by Lord Francis Egerton. He subsequently contributed the "Trial of Effie Deans," now the property of E. N. Deans, Esq.; the "Glee Maiden," purchased by Lord Northesk; "Meg Merrilies," the property of W. Murray, Esq., of Henderland, and various other pictures. His last great work, "Christ teaching Humility," has been re-purchased from a member by the Royal Association for the encouragement of Art in Scotland, and is intended to be the nucleus of the contemplated Scottish National Gallery of Art.

The most prominent characteristic of Lauder's paintings—that which first attracts the eye—is his rich yet ever tasteful colour; and his management of light and shade at once imparts a reality to his painting, and is full of truthful sentiment. He is also happy in his expression of character, as many figures in his works testify, above all, his "Louis XI.," in a yet unfinished painting of that monarch in conversation with the Astrologer. He has entered thoroughly into the spirit of his great countryman, Scott; and his "Christ teaching Humility," and his "Christ walking on the waters," show that he is equally capable of rising to the moral sublimity of biblical subjects.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

THE CHEMISTRY OF MIXED METAL CASTINGS.

THERE are few subjects of greater importance, in a practical view, than that which relates to our ornamental metal manufactures. The beauty and the durability of the numerous articles of utility produced from the mixed metals, and of those which minister to the improvement of taste, are entirely dependent upon the chemistry of their combination. When it is remembered that under this general heading must be classed all the varieties of Mosaic gold—the brasses, bronzes, ancient and modern,—the productions of our own country and of other parts of the world,—the German plate, Nickel silver, and all other white metal compounds; it will be seen that a wide field of examination opens before us. The present article may be regarded as preliminary to others, which we hope, from time to time, to give in the pages of the *Art-Journal*, and which will include all the practical information we may induce the manufacturers to render us; and for which in return we promise all the advantages which chemical analysis and physical examination can afford. In this manner a large amount of interesting information will be conveyed to our general readers, and at the same time as experience lends its assistance as a guide to experiment, the results of the laboratory will be rendered available to the necessities of the workshop.

The improvement of our ornamental metal castings is to be desired. The advances made within a few years have been very important; and both as regards the composition of the metals employed and the general character of the castings, a decided superiority is evident. Notwithstanding the favourable circumstance, that our island holds, as "a guarded treasure," in its rocks, all the metals we require, and that our beds of fossil fuel are unequalled in the

world, thereby placing us in a position to outstrip any other civilised community, the result is not what it should have been. Foreign productions,—foreign castings from our own metals, with our own coal,—have had sufficiently the advantage of our native productions to take their place in the market. If we examine into the reason of this, we shall find that it is referable to two or three causes, happily gradually ceasing to be a reflection on our intelligence; and becoming every day less evidently a blot upon our industrial skill. To these we shall briefly refer.

Manufacturers have been satisfied with the production of articles of utility merely, and so long as the material with which they worked was physically capable of being moulded into the required forms, and sufficiently durable to answer the required end, they were satisfied, and sought not to incur the expense and inconvenience of experiments to improve their material. An iron pot and a bell-metal kettle demanded but little attention on the part of the manufacturer; and these fairly represent the class of articles sought for by the public generally, up to the commencement of the present century. This being the case, but little attention was given to improve our metallurgical processes. Our copper smelters and our iron makers found, by experience, that certain mixtures of ores, produced in different localities, gave rise to a superior kind of metal, both in appearance and for wear, from that which they could produce from any one of them used alone. The smelters, therefore, contented themselves with this knowledge, and they rarely or ever sought to know the cause of the differences; which must have been due to some peculiarities of chemical constitution. The importance of such an examination as may determine exactly the character of the ores employed, and the reducing agents necessary, is now generally admitted, and the knowledge of the chemist is made available. To give one instance out of many familiar ones, we will refer to the condition of the copper sheathing for the bottoms of ships. Where we have such an abundant supply as that which Cornwall produces from her mines, it will be, at first, difficult to understand how in smelting these ores of copper, any great differences in the metals resulting should arise. When it is, however, considered that the copper pyrites, the most abundant ore of copper, is a compound of copper, iron, and sulphur, and that it is almost always mixed with arsenic, sometimes with phosphorus and carbon, and often with other metals, as zinc, lead, silver, cobalt, and nickel, it will be understood that there must be considerable difficulty, on the large scale of manufacture, to separate the copper in a state of purity from those bodies with which it is associated in nature. Consequently, most singular differences are found to exist in the conditions of the metal produced by different smelters, from different lots of ore, at various times; these differences arising entirely from the admixture of very small quantities of these adventitious metals. We have many instances in our navy of the copper sheathing remaining almost free from corrosion for half a century, and we have numerous examples of a ship returning after her first voyage with her copper corroded to holes over every part. This question has lately been claiming the attention of chemists, and from the satisfactory mode of examination which is now being instituted,—as an example of which we might quote the communication of Dr Percy and of Captain James, R.E., to the chemical section of the British Association, at its late meeting at Birmingham,—there is no doubt but an improvement will be effected. This is an instance merely of the necessity of chemical knowledge in the production of a simple metal. We might also adduce, in proof of our position, the differences to be found in the various ornamental iron castings of our country. Much depends doubtless, upon the kind and character of the moulds employed to receive the fluid metals; much also rests upon the manipulatory processes employed by the manufacturer, by which in one case a greater fluidity is insured than in the other, but still more, the beauty and sharpness of the resulting casting depends upon minute,—often exceedingly minute,—chemical differences

in the material itself. The iron castings of Berlin have long been famous; those of Colebrook Dale have been also noted, and we are aware of other iron-founders who are producing castings which now equal those produced on the continent. But we also know that in many cases foreign workmen are employed, and that these men profess to have little secrets upon which, they say, the superiority of the articles they produce depends. This ought not to be, and that it is so is a disgrace to a country professing to stand proudly in the van of civilisation. Up to the present time, however, our workmen have never had the opportunity of receiving anything like that scientific information which alone can fit them for the practical duties of their calling. By their industry and intelligence they have worked out a path for themselves; and it is really a matter of surprise that through the difficulties of their position they have risen to the condition in which we find them.

To learn to read and write has been called education, whereas the education really required for the workman is one which should cultivate habits of close observation, and the acquirement of such an amount of scientific information as would aid him in his technical applications. On the Continent we find combined, the artist and the workman; the man who designs is often the manufacturer of his own designs, hence the superiority of that production in which the mind directs the hand, and the hand follows the guidance of original thought, over that which results from a divided labour; the copyist rarely realises his original. This applies with equal force, and possibly more powerfully, to the union of science and skill, and it is clear that the manufacturer should have a manufacturer's education. Signs to express ideas are not to be neglected, but ideas should not be regarded as inferior to the knowledge of signs.

In considering the character of our mixed metal manufacture all that has been said on the necessity of scientific knowledge in immediate connection with manufacturing skill, bears still more strongly. All the characters of the mixed metals are due to the proportions in which these metals are combined. Yellow brass, for instance, is produced by a mean proportion of thirty parts of tin to seventy of copper. By varying those proportions almost every variety of metal can be obtained; pinchbeck is usually formed by an addition of two parts of copper to the above yellow brass, and or-molu or mosaic gold is a similar alloy, differing only slightly in the proportions of the simple metals employed by the metallurgist; and tomback, or red brass, is made by using not more than twenty per cent. of zinc. Prince Rupert's metal, as it is called, is equal parts of zinc and copper. English brass wire, in which we have to ensure great tenacity and a certain amount to ductility, is composed of about seventy parts of copper and thirty of zinc, combined with a very small percentage of lead and tin.

The brass manufacture may be regarded as the staple of Birmingham, and the varieties of brass, cast into ornamental and useful articles of all kinds, which are manufactured in that town, are a proof of the attention there paid to this branch of industry. We have heard with regret that the brass founders have had to contend with a difficulty of no mean order; the competition of trade has led unprincipled men to produce inferior articles, which, by selling at a cheap rate, they have forced into the colonial markets; the result has been an attempt to meet this apparent necessity, and brass articles of the most trashy description have consequently been sent out of the country. The injury inflicted on the honest manufacturer are manifold, but the result to be dreaded is lest the very low quality of the article produced should drive our colonial brethren and our foreign customers to direct their attention to the manufacture themselves, and that thus we lose our market; in America this result has followed the deterioration of one branch of British manufacture; it may follow in another. To produce an article cheaply, and to ensure its good quality at the same time, it will be necessary to lay hold of all the advantages which modern science offers. By such means only can we hope to

secure those staples of trade, upon the retention of which the prosperity of such large communities as those of Birmingham depend.

Bronze appears to have been among the most ancient of the manufactures of mixed metals. The earliest coins, statuettes, warlike weapons, and agricultural tools, were of bronze. It has been stated that the ancients were ignorant of brass, but this is now known not to be the case, for we have examples of combinations of copper and zinc, although it is quite certain that neither the Greeks nor the Romans knew of the latter metal in its pure state: the oxide of zinc, tin, or calamine earth, was known to them, and employed for making yellow metal; and much brass is still made by stratifying sheets of copper and calamine, and exposing them thus arranged to the heat of a furnace.

Those curious tools, or weapons, whichever they may be, called "celts," which are so frequently found in Ireland and often in England, are all bronzes. The Roman swords, and ancient British arrow-heads, after the Britons abandoned those of flint, are invariably bronze. Now, since tin and copper occur so abundantly and so near together in Cornwall, it is quite natural that the combination of these metals should have been tried at a very early period, when even the calamine earth was unknown, and hence the antiquity of bronze.

Nearly all the swords, celts, &c. yet examined, are composed of the metals in those proportions which will produce the greatest degree of hardness; namely, one part of tin to ten parts of copper; or, according to equivalent proportions, of nearly one atom of tin to eighteen atoms of copper. For bronze medals we now employ from eight to ten parts of tin to ninety-two or ninety parts of copper. It is said, a slight addition of zinc to those proportions improves the colour of the metal. Lead is also often added for the purpose of giving more fluidity to the melted mass, by which, of course, the mould is more perfectly filled, and the resulting casting improved.

The bronze statues at Versailles have been shown by analysis to give the following constituents:—

Copper . . .	91.40
Tin . . .	1.70
Zinc . . .	5.32
Lead . . .	1.57
	100.

And a bronze statue of Louis XV. is composed of

Copper . . .	82.45
Tin . . .	4.10
Zinc . . .	10.39
Lead . . .	3.15
	100.

These two analyses afford a very good illustration of the various proportions in which these metals are mixed, and also show the importance of attention to the laws of their combination.

Our cannon metal, of which we have several bronze statues in the metropolis, is usually of ninety parts of copper and ten of tin, to which in the second casting a quantity of zinc and lead is almost always added.

The speculum metal, employed for the reflectors of telescopes, is generally made of one hundred parts of tin added to about two hundred and fifteen parts of copper; and the composition of the white metals, German and Nickel silver, Albata plate, and the like, are usually in the proportions of about one atom of tin to from five to ten atoms of copper, combined in equally varying proportions with nickel, zinc, lead, and sometimes with other metals.

Of these combinations it is our purpose to speak more fully; at present we have only sought to indicate the variety of combination to be found in our mixed metal manufacture, and to call attention to the importance of seeking the aid of the chemist and of the experimental philosopher, if we aim at the improvement of our native manufactures. This is of the utmost importance to us as a nation. We have the world for our rivals, but, possessing within our island inexhaustible stores of mineral wealth, it is our own fault if we allow any nation to surpass us in the excellence and beauty of our metal manufacture.

ROBERT HUNT.

COPYRIGHT OF DESIGNS.

The rights and rewards of labour have of late undergone much discussion, both in Parliament and through the Press. They are at this moment the subject of deep anxiety to every statesman, and they may be considered as yet but imperfectly defined by political economists. The equitable adjustment of this great question, indeed, may be considered as the source of future tranquillity in Europe. The permanent prosperity of the Arts, in connexion with the manufactures of the world, is intimately bound up with it. If this be true in reference to mechanical labour, it is infinitely more so, as it affects the more rare inventions of genius and the productions of intellectual labour. The interests of the artist are identical with those of the manufacturer and his customers. The protection given by the legislature to artistic designs is, in the language of political economists, the result of a contract, or compromise, between the producer and the consumer. The effect of it is to confer a temporary monopoly upon the artist, and, in a great degree, to suspend ordinary competition. It is only in very modern times, as civilisation has advanced, that the principle of patents and copyrights has been conceded as one justly due to the intellectual labourer; like all measures founded upon justice, it has been attended with the happiest results.

The subject of "Property in Art" has already been treated so fully in the columns of this work* that we should have allowed it to remain, for the present, without farther notice had we not been favoured with a communication from a correspondent at Birmingham, especially calling our attention to the practical working of the Copyright Designs Act (5 & 6 Vict., c. 100, passed in 1842). It may be collected from that communication, which appeared in our October number, and which was signed "Ornamentor," that, it is considered, the act in question admits of considerable amendment, in respect, chiefly, of the fees payable on registration, and of the term of copyright granted. The matter seems to be one of much national importance, and to deserve consideration by all whose interests are dependent upon the success of Arts and Manufactures. The rights of individuals, in these, as in all other branches of national industry, of course, must be governed by public policy and principle.

It may be convenient to consider this subject very shortly, in the following order:—1. The past and present protection given by Parliament to Copyrights of Design. 2. The price paid by artists, for this protection, in the shape of fees; and 3. The duration of the term of Copyright.

1. The legislative protection given to artists for their original designs, was, in the first instance, of a very scanty and imperfect nature. Although royal grants of "monopolies," as they were termed, and of patents, existed so early as the reign of Henry IV., it was not until 1737, by the 27 Geo. III., c. 28, that encouragement was attempted to be given to the arts of designing and printing linens, cottons, calicoes, and muslins, by vesting the properties, that is, the copyrights of them, in the designers, printers, and proprietors, for a limited time. Our readers will be surprised to learn that the "encouragement" which the legislature of that day thought adequate to the Arts, was the exclusive permission of printing and re-printing the new and original patterns for "two months," so lightly had the legislature estimated what was due to the artist, and, at the same time, to the national prosperity. This Act continued in operation for two years. It was afterwards further continued until 1794, when it was made perpetual, one additional month being given to the artist, making altogether three months' protection for original designs. It is possible that the subject of protection to inventions of designs and patterns may have been forced upon the attention of Parliament by Sir Joshua Reynolds and other artists, by whose co-operation the Royal Academy had been established, under royal patronage, in 1768. At an earlier period of our history, we know that a severe struggle had taken place between the

French and English linen-manufacturers. This, however, had reference probably more exclusively to the fabric than to the designs or ornaments, which might render it attractive to the customer or creditable to the nation. It seems scarcely credible, that artists should have been left so destitute of any protection, or, to use the more preferable Parliamentary phrase, "encouragement," until 1839. Such, however, is the fact. In that year the subject was very carefully considered, and especially by Mr. Poulett Thomson, afterwards Lord Sydenham. The result of this was the 2 Vict., c. 13 and 17. These enactments were, in substance, to this effect:—To extend the operation of the preceding Acts to Ireland, and to silk, wool, and mixed fabrics, the 17th chapter, which is called the "Registration Act," giving protection for a year "to the original inventors of all articles of three classes, and three years' protection to the inventors of designs upon articles composed of metals and mixed metals, excluding from its operation the printing of linens, cottons, calicoes, muslins, articles of silk, wool, and hair, and any printed fabrics composed of two or more of any of those articles." It is difficult to account for so limited a protection as this, and especially for the exclusion of the articles last mentioned. The statutes 2 & 3 Vict., c. 13 and 17 were passed in 1839. We learn that three years previously, the want of protection was loudly complained of by several artists who were examined as witnesses in 1836, before the Committee upon Arts and Manufactures. So strongly was the injustice of the existing state of the law felt, that a bill for extending the copyright of designs was prepared afterwards, but was referred in 1840 to a Committee of the House of Commons, of which Mr. (now Sir) Emerson Tennent was chairman, and by whom such extension was recommended. To the resolution of that committee artists are indebted for the existing act (5 & 6 Vict., c. 100), passed in 1842, and which is the governing law upon the subject, all the former acts having been thereby repealed.

It may be worth reminding our readers that Mr. Tennent, on moving the second reading of the bill, and urging its necessity, mentioned that by the existing law at that time, a sculptor making a bas-relief upon marble, was entitled to claim a copyright in his design for fourteen years or for twenty-eight, if he so long lived, "but, if he chased the same design on a wine-cooler, it became 'a design for manufactures,' and could only claim three months' protection." The bill received the support of the present Earl of Ellesmere, (then Lord F. Egerton) and was also recommended by Mr. Gladstone. It was opposed by Mr. W. Williams and Mr. Shiel. It did not however pass into a law without some opposition, although of no very formidable character. The protection given to the various articles enumerated in thirteen classes varies from nine months to three years, the fees on registration being one shilling for designs applied to woven fabrics, such as shawls, yarn thread, warp, linen, cotton, wool, silk, or hair; and not exceeding 10s. for a design to be applied to a paper-hanging; the fee for the registrar's certificate not exceeding half-a-crown. The commissioners of the Treasury are empowered to fix the fees from time to time to be paid for the services of the registrar and for the expenses of the office. They are also authorised to regulate not only the amount, but the manner in which they shall be received, kept and accounted for, and they have power to remit or dispense with the payment of fees where they may think it expedient to do so.

2. Such being the existing protection given to artists in respect of designs for manufactured articles, the question is whether the FEES payable on registration are or are not, upon the whole, reasonable; regard being had to the circumstances of those who produce designs, and the various kinds of patterns or inventions, which from time to time, are the subject of registration.

It does not appear that the amount received from fees is more than sufficient to cover the actual expense of the office, or that the fees paid or payable, in any way contribute to the revenue of the country. It is scarcely to be expected that registration should be allowed to be effected gratuitously, although in certain cases, power is given to the Treasury to remit

* Vide Art-Journal for May 1849.

the payment of fees. There can be no doubt that the prosperity of the country, and consequently its revenue, is materially promoted by the successful application of original and beautiful designs to our manufactures. To this extent, the nation itself is interested in affording every facility to registration of such designs. But, it must be remembered, that registration is a formal and solemn act conferring exclusive rights, and is required as evidence of priority of invention, and of identity of design; the rule of law and practice being, *Qui prior est in tempore, potior est in jure*. It was well observed by one of the members in examining Mr. Morrison, a merchant of London, and a member of the Committee on Arts and Manufactures, "One of the most important results to obtain is, rapidly in the recognition of the right, and economy in obtaining the monopoly of it." The fees for registration, when compared with those payable for obtaining a patent, appear merely nominal. The great difficulty of the question, both as to patents and as to copyright of designs, appears to be not so much the fees as the want of a tribunal capable of deciding conflicting claims upon such subjects, in a reasonable, economical, and expeditious manner. We have, however, made inquiries into the subject, and have ascertained that the fees have been classified by the Treasury; the first table being applicable to designs for manufactures having reference to *utility*—the second, to designs for *ornament* merely. These tables of fees are as follows:—

No. I.—TABLE OF FEES FOR DESIGNS FOR ARTICLES OF UTILITY.

	Stamp.	Fee.	Total.
	£ s. d.	£ s. d.	£ s. d.
Registering Design	5 0 0	5 0 0	10 0 0
Certifying former Registration	5 0 0	1 0 0	6 0 0
Registering and Certifying Transfer	5 0 0	1 0 0	6 0 0
Cancellation or Substitution	—	1 0 0	1 0 0
Inspecting Register, Index of Title and Names	—	0 1 0	0 1 0
Inspecting Designs (expired Copyrights) each vol.	—	0 1 0	0 1 0
Taking Copies of Designs (expired Copyright each Copy)	—	0 2 0	0 2 0
Inspecting Designs (unexpired Copyrights), each Design	—	0 5 0	0 5 0

No. II.—TABLE OF FEES FOR ORNAMENTAL DESIGNS.

REGISTERING DESIGNS:—		£ s. d.
COPYRIGHT.		
Class 1 3 years		3 0 0
Class 2 do.		1 0 0
Class 3 do.		1 0 0
Class 4 do.		1 9 0
Class 5 do.		0 10 0
Class 6 do.		1 0 0
Class 7 9 months		0 1 0
Class 8 3 years		1 0 0
Class 9 9 months		0 1 0
Class 10 do.		0 1 0
Class 11 3 years		0 5 0
Class 12 12 months		0 5 0
Class 13 do.		0 5 0
Transfer		1 0 0
Certifying Design same as Registration Fee, but for Class 1		1 0 0
Cancellation or Substitution		1 0 0
Search		0 2 6
Inspection of all the Designs of which the Copyright has expired, each Class		0 1 0
Inspection of all the Designs registered under the Act 2 & 3 Vic. c. 17		0 1 0
Taking Copies of expired Designs, each		0 1 0

It must be admitted that some of the fees, namely, those of 10*l.*, 6*l.*, and 3*l.*, appear to be unwisely high, when it is remembered that the maximum period of copyright endures only three years. Compared with the fees payable in France, they present a striking contrast. It was stated by Dr. Bowring, in his evidence before the committee upon Arts and Principles of Design, in 1836, that at Lyons, "when the pattern is deposited, the manufacturer pays, into the hands of the receiver of the Commune, a certain sum, which is fixed by the Conseil de Prud'hommes, and which must not exceed one franc per annum, during the period for which he wishes to preserve the copyright of his pattern; ten francs are the payment for a perpetual copyright. These councils are specially charged with the recognition of the copyright of the pattern that any manufacturer shall desire

to register; and secondly, they are required to afford him prompt redress if his copyright be invaded." In other towns, as well as Lyons, such as St. Etienne and Rouen, it is understood from the same testimony, that "the fee for a certificate of registration of patterns is three francs;" whilst in cases of dispute, which are settled by the Conseil de Prud'hommes, the fee for summoning any party to the tribunal is one franc and twenty-five cents; "and for the announcement of a judgment, two francs, and a witness is allowed the amount of a day's labour." It must be admitted that the French rate of fees is extremely low, and as the system is in practical operation at Lyons and Rouen, the great seats of manufactures, it has in it much that is attractive. Cheapness, however, is but a relative term. We believe, that the present scale of fees hardly covers the expenses of the office and its officers. It has been stated, indeed, in the evidence before the Copyright of Designs Committee in 1840, by eminent manufacturers, that even the fee of 2*s.* is too much, as applicable to the whole trade of calico printing, and that in fact the fee should be merely nominal, but, at the same time, it is admitted that it would be altogether impracticable. The suggestion of an *ad valorem* fee has been made in some quarters, but this seems too vague to be practicable.

It certainly would be very desirable to ascertain the exact amount of receipts and expenditure at the Registry Office, and the total actual number of designs registered, distinguishing the particular classes. We know, for instance, that in France the number of patents for designs is very great; ten years ago they were stated to amount to seventy thousand, or eighty thousand; but in France Art may be said to be indigenous, and we cannot expect, at present, to overtake that country in her march of invention, so far as it relates to designs. Whether it is better to have one nominal fee for all designs for patterns, without classification, or to try the existing system for some time longer may be a question of some utility. In one department, viz., paper-staining, it is admitted that the reduction of fees was followed by a very great increase in the number of registrations. It appears, from the evidence of the Registrars of Designs, that in 1839, or 1840, the receipts were £556 2*s.* 6*d.*, and the expenditure £424 11*s.* 6*d.*; but this was exclusive of the rent of the office, and it did not appear at that time that the receipts were very rapidly augmenting. In addition to the fees it must also be remembered that expense is incurred in preparing the designs of patterns, especially for furniture, although it has been stated that the copies are made at a very cheap rate in the School of Design. It may be questioned whether so many as three copies of a pattern are necessary to be deposited. The reduction of the number, if practicable, would certainly be received by artists and manufacturers as a mitigation of the inconvenience and expense which form the present subject of complaints, which complaints have been stated to proceed chiefly from the manufacturers of figured silks. What elucidation the experience of the last nine or ten years may give to the question of the reasonableness or unreasonableness of the fees, founded on the increase or decrease of registration, cannot be predicted without further information; we can only suggest that in the ensuing session of parliament some return connected with this subject should be moved for. The subject is one of great importance not only to British Art but to the commerce of the country, particularly when we have reason for believing that not less than five hundred thousand designs, upon an average, are produced from Manchester alone, exclusive of other parts of England, as well as Scotland and Ireland.

It cannot be denied that the amount of fees now exacted for registration is considered by practical men as capable of much diminution. It is contended that this, if conceded, would be beneficial to Arts and Manufactures, by encouraging a class of persons to become designers who are now deterred by a species of exaction which is of very questionable policy. To many working men, who may feel a desire to become inventors, the fee is itself felt to be a difficulty which is quite insuperable. One decided objec-

tion to the present division in the scales of fees is that a higher rate is fixed for designs for articles of utility than those for ornament. The highest fee demanded for ornamental designs is £5, whilst for registering designs for articles of utility the sum of £10 is exacted; for certifying a former registration £5 is payable for the stamp, and a fee of £1 is taken, and the act of registering and certifying a transfer cannot be censured at a less sum than £6. The most obvious policy would seem to be to give encouragement, by preference, to designs for articles of utility, inasmuch as these have a wider circulation throughout the country, and affect the happiness of a greater number of the population. But if this preference is thought too great a boon to be conceded, we may at least urge that the scale of fees for useful designs may be reduced to the amount fixed for those which are ornamental. We might go further, and contend that no fee above £1 should be demanded for either class of designs; so great is the importance of removing every barrier in the way of national improvement, and leaving quite unfettered the progress of invention, that it might be worthy of consideration by the Lords of the Treasury whether the sanction of parliament might not be asked in favour of a grant to an amount equal to the fees taken at Somerset House, chargeable to the same fund as the British Museum and the National Gallery. The annual amount would be trifling as an item of national expenditure, although to persons from whom designs are likely to be expected it is large enough to be discouraging. The true policy seems to be to make the Registry Office as accessible as possible to the intelligent classes of artisans and draughtsmen, with whom improved designs most frequently originate. The industry of the artist, no less than that of the mechanic, contributes to the wealth of nations, and both must have their full development, before any country can be said to have attained the summit of its political greatness.

3. We confess that we are inclined to attach very great importance to the question of the DURATION OF THE TERM OF COPYRIGHT. To this point we think both the artist and the manufacturer may more successfully direct his attention. If the fees on registration are to be allowed to remain according to the present scale of amount and classification, it seems but equitable as was suggested by some eminent men before the committees on Arts and Manufactures, and on the Copyright of Designs, that the term of protection should vary "according to the talent displayed, and the importance of the object." Probably the course adopted in reference to patents, might be followed in the case of designs, by allowing an extension of the term of copyright, according to the discretion of some tribunal, such as the Industrial Committee of the Privy Council, or the Board of Trade. One distinguished artist has suggested that the privilege should last as long as the life of the inventor of the design, and in some cases, should descend to his heirs. We cannot accede to this. It is known that exclusive privileges, at this time, are regarded by many statesmen, and by the public generally, with much jealousy. This arises not from selfish principles, but from an enlarged view of public policy. It has been stated that in America, the exclusive privilege of copyright takes away all energy and exertion from the citizens: "It has become," says one of the witnesses before the Committee on Arts of Design in 1835, "scarcely worth while for an American to produce works of talent, when the bookseller can get them abroad for the price of a single copy." As to the exact period for which protection should continue, our readers may be aware there is a great conflict of opinions. A different term may be necessary for articles which are consumed in the home market from that, for those which are chiefly destined for the foreign market, as also for the different branches of trade. On the one hand it has been said that the term of copyright is insufficient, by reason of the time necessary for delivery, publication, and sale; that orders are withheld in the expectation that superior designs will be copied and sold at a lower price; that the shortness of the period of protection neither encourages the

artist nor remunerates the manufacturer. It must be admitted that these objections were directed against the duration of protection existing prior to the act of 1842, and that they may be considered as partially removed by the statute, which gives three years copyright to eight classes out of thirteen, the duration of the protection for the other classes being nine and twelve months. The term of three years seems to have been considered by all parties in 1840 as a sufficient maximum. The great danger from an extension of the period seems to be apprehended from the foreign competition; indeed, by others, it is feared as dangerous to the home trade. Our competitors abroad are chiefly the French, the Swiss, the Germans, and the Belgians. At home, the extension of the period would operate as a temptation to piracy, which could only be checked by expensive litigation.

Upon the whole, we feel inclined to urge both artists and manufacturers to submit to the minor inconveniences of the existing law, rather than hazard their present privileges by further demands upon the legislature. But even if success in the attempt at extending the term of copyright should be achieved, it is very problematical whether art and trade would not be seriously injured by raising prices and lessening the demand. It must never be forgotten that all copyrights however just as regards inventors, are viewed by political economists, no less than by the public, as a species of monopoly, and that as such, they would not be tolerated, unless for merely temporary purposes. We look to the progress of the Fine Arts in this country, among the middle and poorer classes, as that which more especially promises to enhance the value of our manufactures. The increased multiplication of designs may enable the authorities to reduce the existing amount of fees, and it is probable, that at no very distant period, some means may be found, as education and civilisation advance, of establishing reciprocal and extended protection, by means of an international copyright of designs, to which efficiency may be given, by some amelioration in the tribunals necessary for deciding contesting claims to priority and originality of invention.

THE VERNON GALLERY.

THE SCANTY MEAL.

J. F. Herring, Painter. E. Backer, Engraver.
Size of the Picture, 2 ft. 5½ in. by 1 ft. 9¼ in.

THE various engravings which, within the last few years have been made from Mr. Herring's pictures, and the success that has followed their production have familiarised the public with his style—one that cannot fail to be popular in a country where such attention is paid to the breed of horses, and to the tenants of the farm-yard. It is in subjects sketched chiefly from the latter that his pencil exhibits its greatest versatility, and his creative genius its highest powers; his straw-yard scenes are admirable compositions, and approach as nearly to nature as art can do; horses, cows, pigs, goats, poultry, pigeons, are depicted in their various phases in the most striking and attractive form, and with a richness of colouring which attests his close study of their habits, and his skill as an artist. Two of his finest ideal works are "Duncan's Wild Horses," and "Pharaoh's Chariot Horses;" the latter of these has been engraved, and both show the painter to possess qualities of mind which place him far above the mechanical copyist.

The "Scanty Meal" is one version of a story that the artist has before told in several different ways; a group of three horses heads, variously engaged, has long been a favourite theme with him, yet although we sometimes recognise the same animals, their occupations are so diversified as to dispel the idea that he has copied himself. The attitude assumed by the horse when feeding is exceedingly well rendered in each of the heads here engraved; there is a kind of dreamy listlessness about them that shows their relish for the dry fodder is not equal to its abundance, or in other words, that they are making a "frugal meal" in a land of plenty. The beautiful pigeons introduced into the picture make an agreeable variety in the scene, and afford the artist an opportunity of giving to his work some brilliant bits of colour.

THE FRESCOES OF THE NEW HOUSES OF PARLIAMENT.

Now that we see the effect of a state approaching to completion, of the House of Lords, we fear that as a decorative element, painting will be there found secondary to carving and gilding; as, in seeking the great prelections of Religion, Justice, Chivalry, and Mercy, the eye is fretted by the endless system of gothic points which is preferably present to it. This may be as a reproach at the door of no individual, but it is nevertheless, a nationally collective assent, in preference of a vulgar magnificence, to that which still is the "medicine of the soul." The artists have had none of the aids of distinctness in their favour, and yet their works will better bear out a close inspection than many boasted productions of the most experienced continental schools. The compartments in which these works are painted are fourteen feet high on the walls of the galleries at the extremities of the House of Lords. Of the two last of the frescoes, of which we have now to speak, one, "Justice, illustrated by the Committal of Prince Henry by Gascoigne," the work of Mr. Cope, occupies the compartment behind the throne; the other that of Mr. Maclise, entitled the "Spirit of Justice," is in the compartment immediately opposite, and in a light much less favourable. Difficulties of position and circumstance are additional obstacles to the execution of works of Art according to ordinary rules, and even inasmuch as to cause failures, of which splendid examples are not wanting. Imperfect light demands a generous breadth of treatment, magnitude and free development of parts, simplicity of composition, and hence, the avoidance of all minutiae. Anything having the appearance of a work of Art, comparatively small, should have been avoided in the House of Lords. The space, however, which has been allotted to these admirable works renders them comparatively small, and the light by which they are seen, does not allow them their value.

Mr. Cope's work, "Justice," is based upon a fact illustrative of the impartial administration of the law. The lord-chief-justice is seated on the left of the composition, and before him, in the custody of an armed constable or serjeant, is the companion of the prince, having his hands bound behind him. The right of the composition is occupied by the confederates of the prisoner, who, about to unsheath their weapons, are rushing forward to release him; but the prince is in the act of repressing the threatened outrage. The respective characters of the prince, the judge, and the lawless companions of the former, are carefully and successfully distinguished. The self-possession and severe dignity of Gascoigne, are those of a man who would not hesitate in his line of duty, even though the son of his king stand as a culprit before him. The principal figure is, of course, Prince Henry; who turns to his menacing associates with the air of one accustomed to control them by a word; and such is the influence that such a man as Henry V. might well be supposed to exercise among men compelled to respect, at least, muffling and indomitable courage. The prince is the principal light in the picture; as high a tone as possible having been necessarily given to this figure, from which those of all others are graduated, and the impersonations are all moving and thinking entities of the kind that gives reality to historical Art. The surface of the work is uncommonly fine, and the junctions have been so effectually concealed as to escape the closest observation.

Mr. Maclise's "Spirit of Justice" is a composition distinguished for less of academic zest and more of subdued sentiment, than are found in preceding works. When we stand before his "Spirit of Chivalry" we feel that we mingle in a throng where every hand is ready for achievement,—that we tread a ground whereon lies a gauntlet and that the challenge is to all comers. But the "Spirit of Justice" is subtle in its argument and more mature in its style—it is a didactic allegory, in which we read of the darkest passions of the soul, and the most exalted attributes of which it can conceive; and to this end we are

made to ascend from much that is human to much that is divine. The paraphrase shows the Spirit of Justice supported on her left by the Angel of Justice, and on her right by the Angel of Mercy,—three figures at once determinable by the usual symbols. Below the Angel of Justice is a man accused of murder, in evidence of which, his captor shows a knife yet reeking with the blood of his victim. On the opposite side are the widow and children of the murdered man, together with an executioner and officials. Besides these, are two remarkable figures on the right; one, a Negro slave, and another, who pleads for his liberation—a tribute of honour to the sustained exertions of this country to effect the suppression of the Slave-trade. The Spirit of Justice holds the scales, and the two angels are respectively distinguished by symbols. These figures all wear white robes, and although there is no more shade in the work than is necessary to give sufficient force to the composition, the light is so low that a very small portion of this beautiful fresco is discoverable. The feeling, however, and the harmonious play of line which pervade it, are obvious, and every passage that can be distinctly seen is abundantly eloquent. The artist succeeds admirably as an exponent of the pure source of Justice, and the narrative had not told so effectively in any other form than in that of mixed allegory. Justice and her primary ministers, the two angels, being associated with earthly beings, the narrative comes more immediately home to the spectator than if the whole of the impersonations were ideal. With respect to colour, it appears that the artist has departed from a drawing in black and white, only enough to constitute a coloured work—and the mechanical execution is equal to that of the most vaulted professors of fresco-painting.

This work addresses itself to the intelligence in a manner distinct from any other that has preceded it from the same source. The subject is one which Mr. Maclise would not have treated under circumstances similar to those, in which the works whereon his reputation rests have been executed. The chivalrous *à plomb* and dramatic bearing which so strongly characterise his best pictures, could in no wise with propriety he made to qualify a subject worked out in a manner to exhibit humanity as dross, contrasted with a more exalted essence. If we revert to his "Macbeth," his "Hamlet," "Ordeal by Touch," or any other of his more important productions, he is ever the same weird master of the writhings of the human heart. But in "Justice" these salient points were inadmissible, and others by which they are supported have been subdued. The human impersonations are few, but the majesty and dominion of the "Spirit" and her angels, could not be more felt had they a numerous crowd lending in homage before them.

There are, it will be remembered, six compartments in the House of Lords—the works which have been executed in the others we have already noticed—being, "The Baptism of Ethelbert," by Dyce; "The Spirit of Religion," by Horsley; "The Spirit of Chivalry," by Maclise, and the former fresco by Cope; wherein, with these that are just finished, the essentials of the British Constitution are embodied. There is another work in progress, by Herbert, in another part of the building—"The Poets' Chamber," but it is not yet sufficiently advanced for notice. The subject is "Lear disinheriting Cordelia," of which an oil study was exhibited at the Academy last season; and in the same room, "Saint Cecilia," a composition from Dryden, is in progress by Tenniel. This work is known from a lithograph which has been executed for private circulation; but the artist has made in his cartoon some most judicious changes since this print appeared. It will also be remembered that a cartoon and a coloured sketch, by Cope, were exhibited at the Royal Academy last year. The subject was "The Trial of Griselda," from Chaucer. Thus in the House of Lords the destined compartments are filled, and the work of fresco-painting is progressing in other parts; but it is to be hoped that the light will be more favourable than in the Upper House. The other frescoes are in such an advanced state of progress, that we shall shortly be enabled to speak of them in their finished state.

Three Horses
By J. M. W. Turner

London: J. M. W. Turner

A DICTIONARY OF TERMS IN ART.

[A taste for the Arts has, of late years, received so great an impulse as to have brought the Vocabulary of Art from the Studios of the Artist and the Commoissour into the familiar use of all ranks of society: yet, up to the present time no book exists in any language in which all these terms are collected and explained. The Dictionaries of Art we have consulted appear to belong to a past age, when pedantry and dilettantism usurped the places of practical knowledge, technical skill, and scientific principles. In this Number of the Art-JOURNAL we commence an attempt to supply the deficiency; our aim is to give the definition of every term used in Ancient, Medieval, and Modern Art, that relates to Sculpture, Painting, Engraving, and their auxiliary topics. Architecture is omitted from our plan, because an excellent Glossary of Architecture is already extant. Our Dictionary will be compiled from every available source, and embody the accumulated knowledge of the past with the discrimination and taste of the present, in every subject treated; and, we trust, will be found as acceptable to the general reader as to the artist and commoissour.

Every article which admits of illustration will be illustrated from the best authorities, by F. W. Fairholt, F.S.A.; and we hope and expect with some confidence that our Dictionary will be found to supply a desideratum, the want of which has been universally felt and deplored. We shall bear in mind the value of brevity, and endeavour to render it as intelligible as possible to all classes of readers. It may be right to add that as accuracy in these definitions is above all things necessary, our Dictionary will be submitted, previous to publication, to three or four of the most competent authorities in the kingdom, on the several subjects of which it principally treats. In all cases in which cuts are introduced, the authorities from which they are taken will be given—not only with a view to the establishment of their authority, but in order to act as a guide to artists who may need or desire further information on the subject referred to.*

A.
ABACULUS. (*Lat.*) A small tile of glass, marble, or other substance, of various colours, used in making ornamental patterns in mosaic pavements. The engraving represents a pavement of such various shaped tiles placed together, and forming a continuous geometric pattern, and is a pavement discovered at Herculaneum. The use of tiles in churches and public buildings has been much resorted to in the present age; its restoration is indeed one of the more marked features of the time; and imitations of ancient examples have been made in great profusion.

ABACUS. (*Lat.*) A rectangular slab of marble, stone, porcelain, &c. of various colours, used for coating the walls of rooms, either in panels or over the whole surface.

ABDUCTOR MUSCLES are those which draw back, or separate the limbs to which they are attached: the *abductor longus pollicis manus* serves to extend the metacarpal bone of the thumb when it is bent towards the palm of the hand; it also assists in drawing the wrist inwards and forwards: the *abductor brevis pollicis* serves to draw the whole thumb from the hand inwards, and also a little backwards. Fig. 1, in the appended cut, shows the adductor muscles, which move the thumb and little finger. Fig. 2 shows the adductor muscles described on the next page. Our illustration is copied from Cheselden's Anatomy.

ABEZZO. (*Olio di Abezzo. Ital.*) The resin which exudes from the *Terebintha abietina*, OR, the *Pinus picca*, or silver fir of Linnaeus; the abete of

* As it will be impossible for even the greatest care and industry to render this Dictionary entirely free from errors, we shall gladly avail ourselves of any suggestions we may receive for its revision.

the Italians; the *sapin* of the French. Diluted with naphtha, drying linseed, or nut oil, it forms an excellent varnish. It was also called Strasburg Turpentine.

ABNORMAL. Contrary to the natural condition. In Art, the term *abnormal* is applied to everything that deviates from the rules of good taste, and is analogous to *tasteless*, and *overcharged*.

ABOLLA. A loose woollen cloak made of a rectangular or square piece of cloth, of similar form and use as the **TOGA**, but smaller, and is almost identical with the **PALLIUM**: it was fastened upon the top of the shoulder, or under the neck, by a brooch or **PITULA**. Although originally worn by the Roman soldiers, it subsequently became part of the ordinary costume of civilians of all classes. It differs very little from the **SAGUM**, but was of smaller dimensions and much finer material. Our illustration exhibits its ordinary form as given on a Roman bas-relief.

ABOZZO. (*Ital.*) The first sketch or dead colouring, to which the French give the term *frotté*; the term is applied indiscriminately, whether the sketch is made in one colour, as amber, or whether the colours are thinly applied, or rubbed in as they are intended to remain when the picture is finished.

ABSOLUTE. Whatever is in all respects unlimited and uncontrolled in its own nature: it is opposed to the *relative*, and to whatever exists only conditionally. Thus the absolute is the principle of entire completion, the universal idea and fundamental principle of all things. The question of absolute beauty, i. e. the prototype of the beautiful, is the most important within the reach of Art, involving the foundation of Aesthetics, and of the philosophy of the beautiful.

ABSORBED. In Italian, *Prosciugato*; in French, *Sèche*. When the oil with which a picture is painted has sunk into the ground or canvas, leaving the colour flat or dead, and the touches indistinct, it is said to be *absorbed*. This term is nearly synonymous with **CHILLED**, or **SUNK IN**.

ABSORBENT-GROUNDS are picture-grounds prepared in distemper upon either panel or canvas; they have the property of imbibing the redundant oil with which the pigments are mixed, of *impacting*, and are used principally for the sake of expedition.

ACADEMIC—ACADEMY FIGURE. In the first sense, we call a figure of academic proportions when it is of little less than half the size of nature, such as it is the custom for pupils to draw from the antique and from life; any figure in an attitude conventional, or resembling those chosen in life-academies for the purpose of displaying to the students muscular action, form, and colour, to the greatest advantage. In the second sense we employ the term *Academy-figure* to describe in a composition a figure which the artist has selected and posed with skill, in such a manner as to exhibit his skill in design, but without due regard to the character of the personage and the voluntary action of the subject of the picture or statue. Sometimes **ACADEMY-FIGURE** is understood to be one in which the action is constrained, and the parts without mutual connection with each other, as frequently happens to those who model from a study which was only intended to exhibit the development of certain muscles or members of the body.

ACADEMY-FIGURE is also the name by which we designate a figure drawn, painted, or modelled from the nude solely, without any other intention than that of studying the human form, and as a part of academic studies.

ACADEMICIAN. One who is a member of a society called *Academy*, which has for the object of its discourses and labours the Arts, Sciences, and general Literature; and to whom the care and cultivation of these objects is, in some degree, intrusted.

ACADEMY. This term was applied to all great schools, scientific societies and institutions. It was first given to schools of Art in Italy, and, besides the old Florentine Academy, which was only a kind of learned Aesthetic Society, we must mention the Academy of San Luca, still existing at Rome, founded by Frederick Guiccherio in 1593; but whose real existence, after slumbering a hundred years, began with Marratti.

ACANTHUS. The bear's claw, a plant used in Greece and Italy on account of its beautiful indented leaves and graceful growth for garden plots, and also in works of Art for the borders of embroidered garments, the edges of vases, for wreaths round drinking cups; and in Architecture, for ornamenting the capitals of columns.

particularly those of the Corinthian order, and the Roman, or Composite, which sprang from it. The type of the Corinthian capital may be found on numerous Egyptian capitals, which resemble it, as is shown in the annexed woodcut. The decoration is here also obtained from a study of the vegetable tribe.

ACCESSORIES. Objects and materials independent of the figure in a picture, and which, without being essential to the composition, are nevertheless useful, whether under the picturesque relation, to fill up those parts that without them would appear naked, to establish a balance between the masses, to form the contrast, to contribute to the harmony of colours, and so add to the splendour and richness of a picture; or, under the relation of poetic composition, to facilitate the understanding of the subject, recalling some one of the circumstances which have preceded, or which will follow the action; to make known the condition and habits of the figures; to characterise their general manners, and through them the age and country in which the action takes place, &c.; such are draperies variously adjusted, trophies affixed to the walls, devices, sculptured divinities, furniture, carpets, lamps, groups of vases, arms, utensils, &c. Every object and material not absolutely necessary to the direct narrative, is *accessory*. Of a painter who employs and executes these objects effectively we say that he is successful in his accessories, which also includes all the parts of the adjustment of the figures, the draperies excepted. Some authors rank among the accessories all which is not an essential part of the subject of the composition, as well as the figures which are not necessary to the action; but in this sense the word *accessory* is used adjectively, ceases to be technical, and takes a general acceptance.†

ACCIDENTAL COLOUR. Is the name given to that which an object appears to have when seen by an eye which at the time is strongly affected by some particular colour: thus, if we look for a short time upon any bright object, such as a wafer on a sheet of paper, and then direct the eye to another part of the paper, a similar wafer will be seen, but of a different colour, and this will always be what is called its **COMPLEMENTARY COLOUR**; thus, if the wafer be *blue* the imaginary spot will be *orange*; if *red*, it will be changed into *green*; *yellow*, it will appear *purple*. The elucidation of this interesting subject belongs to the science of Optics.

ACCIDENTAL LIGHT. Secondary lights, which are not accounted for by the prevalent effect;

* Fig. 1, illustrates the fancied origin of the Corinthian capital in Greece. An offering to the manes of a dead child, was placed over its grave, and covered with a tile to protect it from birds. The basket stood upon the root of an acanthus, and the plant grew and spread its leaves around it, thus suggesting the form of the capital. Fig. 2, shows that the idea of constructing a capital from the leaves of a plant is much more ancient. The leaves of the palm are much changed to the necessities of a capital. It is from the Temple of Edfon, in Egypt, but there are several other ancient Egyptian buildings which exhibit the same thing.

† In the early ages of Art, few accessories were employed, and those of the simplest kind; but in later times the accessories have become more and more important, till we find the figures tell the story merely by themselves; and its form and disposition of architecture, as in Wilson's 'Noble' (N. G. 110), in Caravaggio's picture of 'Christ and his Disciples at Emmaus' (N. G. 172), the supper on the table, which is a mere circumstance, divides our attention with the principal action. When accessories are introduced without any meaning or motive, and in direct opposition to the sentiment of the subject, it is an instance of bad taste: Paul Veronese perpetually sinned in this manner, as did Rubens, and as do, generally, the Dutch and Flemish painters. Hogarth is very remarkable for the ingenious use of accessories, though apt to overload with them his subject for the sake of being intelligible."—Mrs. Jameson.

effects of light other than ordinary daylight, such as the rays of the sun darting through a cloud, or between the leaves of a thicket of trees, or such as penetrates through an opening into a chamber otherwise obscure; the effect of moon-light, candlelight, or burning bodies.

ACCIDENTAL POINTS. *In perspective*, vanishing points that do not fall on the horizontal line.

ACCIDENTALS are those unusual effects of strong light and shade in a picture, produced by the introduction of the representations of artificial light, such as those proceeding from a fire, or candle, &c.* In landscape the term is applied to the representation of such effects as may be supposed to be transient, whether of light or shadow.

ACERRA. (*Lat.*) A censer in the form of a pan, used by the Romans at their sacrifices, and particularly at feasts and funerals; like all vessels used at sacrifices, it is of importance in Art, and is met with on many bas-reliefs. According to Festus, the Acerra was also a small portable altar on which incense was burnt to the dead; but Virgil and Ovid mention it as a box in which the

incense was kept: the twelve tables of the law forbade the use of the Acerra as an unnecessary luxury. *Acerra thuraria* is the vessel used in the church to keep the incense in.†

ACETABULUM. (*Lat.*) In Roman antiquities, a vessel of porcelain, silver, bronze, or gold, in the form of a goblet or tea-cup, in which vinegar and other liquids were brought to table: also the goblet which the Roman jugglers (*Acetabularii*) used. Properly the word means a measure, and corresponds to the Greek *Oxybaphon*.

ACHROMATIC. A term derived from the Greek, signifying "free from colour." Objects viewed through a lens in which no provision is made for the correction of the chromatic aberration, are always fringed with colours. An *Achromatic* lens is one so arranged that the coloured or chromatic aberration of the rays passing through it is corrected, and the light passes undecomposed, and is therefore free from colour. The better class of telescopes and similar optical instruments have always Achromatic lenses, and in the camera obscura, when used for photographic purposes, achromatic lenses are indispensable.

ACINACES. A short straight dagger, worn on the right side, peculiar to the Scythians, Medes, and Persians. It is seen on the figure of a Persian prince in the celebrated Pompeian mosaic of the Battle of Issus. This weapon was not a sword, but a dagger, and worn on the opposite side of the body, suspended from a belt round the waist, so as to hang against the right thigh. Our illustration is copied from Ker Porter's plates of the Persepolitan Sculptures, among which are numerous examples of this peculiar mode of wearing the dagger, which appears to have been entirely confined to the nations above named.

* In the celebrated *Notte* of Correggio is a fine instance of an *accidental*, in which the light appears to emanate from the infant Jesus. In almost all Rembrandt's pictures these effects are exhibited in a very striking manner.

† Our cut exhibits the *Acerra* as a box with a lid; and standing on legs fashioned like those of an animal. It occurs in a bas-relief representing sacrificial implements, preserved in the Museum of the Capitol at Rome.

‡ An utensil of this kind is represented in the cut. The original is preserved in the Museum at Naples, and is of a fine red clay, with its name inscribed beneath it.

ACKETON (*Fr.*) A quilted leathern jacket worn under the armour, probably derived from the Asiatics at the time of the Crusades. The Greek term for a tunic is *ho-kiton*, whence the numerous corruptions, *hoketon*, *hauqueton*, *hauckton*, *aketon*, *actiōne*, *acton*, &c.

ACROLITHES. (*Gr.*) Extremities of stone. Those statues of the earlier Greek artists, which were made of wood and stone. The sculptors antecedent to Phidias, says Vitruvius, made only the extremities of their statues of marble; the head, hands, and feet were of stone, while the body was of bronze or gilt wood, and in order to make the extremities conspicuous, the whitest marble was selected. It is an error to suppose that these Acrolithes were invented by the later artists to give greater variety to their work, and to lessen its cost. These statues certainly belong to the early age of Hellenic Art, in the first efforts of which marble was only used for the extremities; but as skill increased, the figures were formed entirely of that material. Acrolithes existed long before the time of Phidias, who executed a *Pallas* at Plataea in this style. The Greek artists departed only by degrees from the wood first in use. To the clothed or even gilded bodies of wood were attached arms and feet of stone; ivory also was joined to the wood, or it was entirely overlaid with gold.—*Vide MULLER'S Ancient Art and its Remains.*

ACROTHERIA. A Greek word, generally used to signify the pedestals placed on the summit and angles of a pediment, to receive statues or other ornamental figures. It sometimes means the wings, feet, or other extremities of a statue.

ACTION. The effect of a figure or figures acting together. In the general acceptance of this term it signifies the principal event which forms the subject of a picture or bas-relief. We also say that a certain figure or personage takes, or takes no part in the action, and that a figure has action when it has the attitude, muscularity, and physiological expression of a person acting naturally, giving the idea of an action more or less vivid.

ACUS. A Latin term, signifying a pin or needle, represented in ancient works of Art as employed in dressing the hair (*Acus comatoria*), and in fastening garments. They were made of various metals, of wood and ivory, and varied in length from an inch and a half to eight inches. Numerous examples are found in the works of Art taken from Pompeii. It also signified a needle for sewing, and the tongue of a brooch or buckle. Our cut represents three Roman hair pins. The first of bone of the most ordinary form, and about six inches in length. The second is of bronze with ornamental pendants, and was recently discovered in the ruins of a Roman villa, at Hardlip, Kent. Fig. 3, is of bronze, and was found in London.

ADDUCTOR MUSCLES are those which draw one part of a body to the other. They are opposed to the *Abductors*.*

ADHERENCE. The effect of those parts of a picture which, wanting relief, are not detached, and hence appear adhering to the canvas or surface.

ADJUSTMENT. In a picture, is the manner in which draperies are chosen, arranged, and disposed.

ADRIAN, St. In Christian Art is represented armed, with an anvil at his feet or in his arms, and occasionally with a sword or an axe lying beside it. The anvil is the appropriate attribute of St. Adrian, who suffered martyrdom, having his limbs cut off on a smith's anvil, and being afterwards beheaded. St. Adrian was the chief military saint of northern Europe for many ages, second only to St. George. He was regarded as

* Fig. 2, in the preceding cut, to illustrate the Adductor muscles, will exemplify the present. It represents the Adductor pollicis, which moves the thumb inwards.

the patron of soldiers, and the protector against the plague. He has not been a popular subject with artists. St. Adrian is the patron saint of the Flemish brewers.

ÆGIS. (*Gr.*) In its primary sense this word means a goat-skin, which, besides otherskins, the primitive inhabitants of Greece used as an article of clothing and for defence. According to Homer, the shield of Jupiter was covered with the hide of the goat Amalthea. It was worn over the back, and tied by the front legs over the breast, but as this condition was too rude for ideal sculpture, it was transformed by the artists of Greece into a breastplate of small and elegant proportions, covered with scales to imitate armour, and bearing in the centre a Gorgon's head. Subsequently it was used to designate the ordinary cuirass worn by persons of distinction, of which the armed statue of Hadrian in the British Museum is an example.*

AERIAL. This term is employed particularly to specify that part of perspective resulting from the interposition of the atmosphere between the object and the eye of the spectator; the gradation of the distinctness of form and colour.

AERIAL FIGURES are those by which painters seek to represent the fabled inhabitants of the air; dreams, demons, gnomes, such as are conceived in the brains of poets and philosophers. In these figures the painter dispenses with, as far as his art permits, the weight, solidity, and opacity of bodies, and of the effort necessary to action.

AERIAL PERSPECTIVE is that branch of the science of Perspective which treats of the diminution of the intensity of colours of objects receding from the eye, in proportion to their distance from the spectator, by which the interposition of the atmosphere is represented. Although subject to laws it is more completely under the control of the painter than linear perspective. It enables him to keep the several objects in their respective situations, and to impart a natural reality to the most complicated scenes.†

ÆRUGO, ÆRUGA. The name given by the Romans to that bright green rust produced by the action of the atmosphere on bronze and other metals, of which copper is a component part, thereby increasing the beauty of statues, &c.; it varied according to the quality of the metal, and was frequently imitated, on account of which, we find the term *ÆRUGO NOBILIS* used in later times to distinguish the true from the factitious. This distinction arose at the period when the ancient art of coinage was invented. The CORINTHIAN BRASS, used for coins and small figures, took a bright green colour, so that a later ancient author speaks of *monetae virides*—green money; but this coat, called by the Italians *FATINA*, was not so rapidly deposited on this brass as on the other metallic amalgamations. It is difficult to account for this, as we do not know exactly the mixture which the Corinthians used; the beautiful green on coins and small figures must have been produced by accidental circumstances, as it is not universal on those of the same date. There are but few large works on which the *ÆRUGO* is clear and smooth; the statues and busts in the Herculaneum Museum have a dark green colour, which is factitious, for they were found much damaged, and the means by which they were soldered destroying the *ÆRUGO*, it was artificially replaced. As the beauty of the colour increased with the age of the work, the ancients preferred the older statues to the more recent ones. *ÆRUGA*, the artificial copper rust, was formed by the action of wine reflux upon copper; it is an acetate of copper, (*VERDIGRIS*), while the genuine copper rust, *ÆRUGO*, is a carbonate of copper.

ÆS. (*Lat.*) *CHALKOS.* (*Gr.*) This word appears to be equivalent to our modern term *bronze*, the employment of which was very extensive among the ancients for money, vases, weapons, utensils, &c.

* The example we engrave is copied from an antique statue of Minerva, at Florence.

† "Aerial Perspective" says Burnet, "is made use of to designate those changes which take place in the appearance of objects either as to their receding or advancing, from the interposition of the atmosphere, therefore to the application of this quality the artist is mainly indebted for the power of giving his work the space and retiring character of nature; but although the eye is at all times pleased and gratified with the power of viewing distant prospects, yet objects require a certain definition to lead the imagination without perplexing or troubling the mind."

It is frequently translated *brass*; by the Italians in the words *ottone* and *rame*; and by the French *airain*, but no ancient works of Art in brass similar to the modern composition of that name, have yet been discovered. Brass is a compound of copper and zinc, while bronze is a mixture of copper and tin. See the articles BRASS, BRONZE.

ÆS CYPRIUM. The name by which copper was first known to the ancients, afterwards it became *cyprium*, then *cuprum*.

ÆSTHETICS. A term derived from the Greek, denoting *feeling*, sentiment, imagination, originally adopted by the Germans, and now incorporated into the vocabulary of Art. By it is generally understood 'the science of the beautiful' and its various modes of representation; its purpose is to lead the criticism of the beautiful back to the principle of reason. In beauty lies the soul of Art. Schelling declares that the province of Æsthetics is to develop systematically the manifold beautiful in every Art, as the one idea of the beautiful. But pure Æsthetics must be defined by one who is at the same time poet and philosopher: he will be able to give a theory suitable to the philosopher, and still more suitable to the artist. But as yet no philosophic poet has appeared to meet this demand of Jean Paul's. Schelling, the only philosopher of our time who rose to an active contemplation of the beautiful, and to whom all looked expectingly, gave instead of Æsthetics, only an 'Æsthetic confession; ' this we find first developed in his admirable essay 'On the relation of the plastic arts to nature,' which is invaluable as regards Æsthetics.*

ÆS USTIA, or *Cuprum ustum*, called also Ferretta di Spagna was, according to Cæsalpino, calcined copper, or the peroxide of that metal.

AFTER. Modelled or drawn *after* the antique, after Raphael, or some other great master. It is to copy an antique statue, or some work of the great masters.

AGATHA, Sr., when represented as a martyr, is depicted crowned, with a long veil, and bearing the instruments of her cruel martyrdom, a pair of shears, with which her breasts were cut off. As patron saint, she bears in one hand a palm branch, and holding with the other a plate or salver, upon which is a female breast. The subject of her martyrdom has been treated by Sebastian del Piombo, Van Dyck, Parmigiano, and others.

AGGRAPPES. Hooks and eyes used in armour or in ordinary costume.

AGNES, Sr. This saint is represented as a martyr, holding the palm-branch in her hand, with a lamb at her feet or in her arms, sometimes crowned with olives, and holding an olive-branch as well as the palm-branch. At Windsor is a splendid altarpiece by Domenichino, in which St. Agnes is represented as a young girl, standing, leaning on a pedestal, in rich costume, with her long hair confined by a tiara. An angel is descending with the palm branch; another is caressing a lamb, her attribute, and symbol of her name and purity (*Agnus, a lamb*). In a picture, by Paul Veronese, at Venice, she appears as the patroness of maidenhood, and presunts a nun to the Virgin Mary. Domenichino has also painted the martyrdom of St. Agnes, in which she is represented kneeling on a pile of faggots, the fire extinguished, and the executioner about to slay her with a sword. Representations of St. Agnes in Christian Art are of the highest antiquity, as high almost as those of the evangelists and apostles; but the introduction of the lamb as an attribute is an addition of modern times, when she became recognised as the patroness of maidenhood and maidenly modesty.

AGNUS DEI (LAMB OF GOD.) Thus are called the oval medallions, which are made either from the wax of the consecrated

Easter candles or of the wafers dough. They are also sometimes made of silver, and have on one side the Lamb, with the banner of Victory, or St. John, and on the other the picture of some saint. They were first made about the fourteenth century, and being supposed to prevent

* Our limits do not permit of an extended examination of this interesting subject. The student may readily find further information on this head in the works of Hœgel, Schelling, Herbart, and others, in German, and in the English translations of Schüller's *Æsthetic Letters*, Schlegel's *Æsthetic Works*, &c.

misfortune, were consecrated by each new Pope at Rome, from the Easter Tuesday until the following Friday in the year of his accession to the Papacy; but lately they were solemnly consecrated every seven years and distributed among the people.*

AGILETS (properly *AGULETTES, AGIOTTES, AGOLETT.*) The tags or metal sheathings of the ribbons so constantly used to fasten or tie the different portions of dress worn during the sixteenth and seventeenth centuries. The works of Holbein, and the numerous fine portraits of his time, furnish abundant examples of their form. They were frequently formed of the precious metals, and enriched by the art of the chaser. The works of our elder dramatists abound with notices of them, and the plays of Shakspeare contain allusions to their general use. Our engraving, from a print of 1650, exhibits the ribbons and agilets used to draw together the slashed sleeve, then fashionable.

AILETTES, or AILERONS (Fr., little wings). The prototypes of the modern epaulettes. When designed for actual service they were made of leather, and usually displayed the arms of the wearer or some personal badge or device; they were attached by laces or arming-points to the hauberk, and their object was to furnish additional protection to the shoulders and neck. They came into fashion early in the reign of Edward I., and ceased to be worn during the reign of Edward III. Dress ailettes were formed of leather covered with cloth or silk, and bordered with fringe, and were laced to the shoulders of the hauberk with silken cords.

AIM, INTENTION. The spontaneous endeavour to create something actual. It has been a disputed point with philosophers of ancient and modern times whether works of Art be voluntary or involuntary, i.e., whether they be called forth by the mental will, or by the power of necessity. We cannot here state all that has been written upon the subject; we will merely notice the three great divisions of opinion: the first party contend that a work of Art is voluntary, since that only can be called Art which is created in freedom; a work of Art must be the result of thought, and thought is a free and voluntary exercise. The second party contend that a work of Art is involuntary, because it is the result of genius, and genius is a secret miraculous power, working instinctively and unconsciously. History, they say, confirms this, for the greatest works of Art were brought forth before the theory of Art existed. The third party maintain that Art is both voluntary and involuntary; the technical part of Art works intentionally and consciously, the imagination and feeling of the beautiful work unintentionally and unconsciously, and technically united to genius and beauty, constitute a work of Art. In support of this opinion the following passage is quoted from Schelling: "If we investigate the forms of mental action and find in the conscious that which is generally termed Art, but which is only a part of it, namely, that which is executed with consciousness, deliberation, and reflection, that which is taught and learned, and which can be acquired by transmission and practice; so shall we find in the *unconscious* which accompanies Art that which is not to be obtained by practice or in any other way, but which can be conferred upon us by nature only."

AIR, ATMOSPHERE. The imitation of the effects of the atmosphere regarded as a fluid medium through which forms are visible. When the objects represented in a picture are well detached from each other and from the background, in such manner that the eye appears to measure the space in which the painter has winded them, to appear isolated, we say such a picture has *air*. This effect demands the skilful union of linear and aerial perspective, but it

* Our cut is copied from an Italian sculpture of the thirteenth century, engraved in M. Didron's *Iconographie Chrétienne*.

† The brass of Sir Robert de Septvans, in Chartham Church, near Canterbury, Kent, furnishes the above excellent illustration of this fashion. Sir Robert died in 1306, (34 Edw III.) and upon each *ailette* is depicted one of the window-fans, several of which he bore upon his dress as a rebus of his name, five emblazoned on his surcoat, and two on the *ailettes*.

proceeds essentially from the latter. Air deserves the most careful and accurate study of the artist, as it is the medium through which all objects are seen, and its density or transparency determines their appearance both in respect to size and colour; it softens the local colours and renders them more or less decided or characterised, producing what is technically called *tone*. By happy imitation of the appearances produced by the interposition of the air, which differ with the climate, the season, the time of the day, &c., landscape painters, who, in other respects are not masters, have given the greatest charm to their pictures, even where the objects painted possessed in themselves very little attraction.

AIR, CARRIAGE, applied to the human figure, especially the head. Air is one of those words of which the sense is readily understood by their application, but not so easy by equivalent expression. It is nearly synonymous with *carriage*, action, or movement; thus the action is bad, the movement is false; it finds, in *style*, a somewhat analogous term, equally vague, but nearly so significant. Of portraits we say the carriage is noble, or graceful, or affected; of the head, it has a good, or a manured, or an affected air.

ALABASTER (Gr. *Oyza*, ROM. *Marmor onychites*) is a variety of marble, known to mineralogists as *gypsum*, of which the compact granulous species is plaster of Paris (sulphate of lime). It is the softest of all stones, being easily scratched by the nail, of uniform texture, generally white, but sometimes red or grey; is found in large quantities at the quarries of Montmartre, near Paris, whence the name plaster of Paris; in Italy, and in Derbyshire in England. It is translucent, the degree of transparency varying according to its goodness. Beside the one described above, there is another kind of alabaster, so called, the *STALACTITE*, but this is a carbonate of lime, identical in chemical composition with statuary marble. It is easy to ascertain of which kind of alabaster a vessel is composed, for carbonate of lime is hard, and effervesces if it be touched by a strong acid, such as sulphuric or muriatic; but the sulphate of lime does not effervesce with these acids—besides it is soft, and in fact, it is to this kind only that the term alabaster is properly applied. Many of the ancient vessels used for holding perfumes, &c. are made of *STALACTITE*, the compact crystalline mass deposited from water holding carbonate of lime in solution, of which many springs are found in almost every country.* The most beautiful alabaster (called "*Gesso Volterrano*," much used in Italy for the grounds of pictures), is found at Volterra, near Florence, where it exists in great quantities, and whence it is exported in large blocks. The softness of alabaster renders it easy to work, and instead of the mallet and chisel, sharp iron instruments are used, such as saws, rasps, files, &c. the marks of which are removed by polishing. The partiality of the ancients for alabaster is proved by the use they made of it for their articles of luxury, for columns and for other ornaments. The Etruscans employed it for burial urns, many of which were found at Volterra. In the baths of Titus, and in the ancient Roman aqueducts, works in alabaster have been found. Oriental alabaster was of still greater importance in the Fine Arts: it was quarried at Thebes, and the Egyptians executed large figures in it. In the Villa Albani there was an Isis, larger than life, seated with Horus on her knee; and in the Museum of the College at Rome is a smaller sitting figure, both of which are of alabaster. Many ancient vases of ornamental alabaster are preserved, one of the most beautiful of which is among the Antiques in the Royal Museum at Berlin. Many of the collections in Italy and elsewhere contain *Torsos*, figures of *Hermes*, busts with *trapezy*, &c., of alabaster. The Museum at Dresden possesses several such specimens. The classic nations appear never to have made whole figures of any kind of alabaster; the extremities (head, hands, and feet) were of marble or bronze. A head, wholly of alabaster, is preserved at Rome. Crystalline and granular gypsum (sulphate of lime), is burned and ground to prepare plaster of Paris. Moulds and statues are formed from this valuable material, and also a very strong cement for the use of the sculptor

* Many of the varieties of the *Stalactite* alabaster are mentioned in descriptions of museums, &c. Among the most important are *ALABASTRO COTIGNINO (quince)*, from its resemblance to the colour of that fruit. *ALABASTRO DORATO*, of which there are many kinds, such as *dorato a macole*, &c. *ALABASTRO BORGHESE*, in which resemblances of trees, plants, &c., are strongly marked. *ALABASTRO FIORITO*, a striped variety, in which the lines are of every possible colour. *ALABASTRO A ZIBONELLA*, from the resemblance the white blotches upon a red ground bear to a flock of sheep. *ALABASTRO POMATO*, a dappled-grey variety. All these, and many other varieties are described in Head's "Rome," Appendix, vol. 1.

and mason to form the close joints of marble; it is also much used by plasterers, particularly for mouldings and foliage.

ALABASTRUM. A box, vase, or other vessel, to hold perfumes, formed of alabaster, was called by the ancients *alabastrum*; Horace calls them *onychites*. The alabastrum is always among the attributes of the Bathing Venus. Oriental alabaster was the most sought after for the purpose of making these vessels. They were sometimes made of gold, and of a peculiar pear-like shape. The cut exhibits a good specimen of a vase of the kind from a bas-relief engraved by Montfaucon in his elaborate and beautiful work on Classic Antiquities.

A LA GRECQUE (Fr.) An architectural ornament resembling a variously twisted ribbon, when it is merely a narrow continuous stripe, forming right angles, either raised or cut in, and sometimes only painted. This ornament, called also a labyrinth, may be used for rectilinear mouldings. If it be only one stripe, it is called the simple labyrinth, but if two stripes be twisted into one another it is called the double labyrinth.

ALB.—ALBE. An ecclesiastical vestment of great antiquity, formerly worn by all ecclesiastics, but now only used in sacred functions. It is of sufficient length to reach the heels, and envelope the entire person of the wearer, and is constructed of white linen; but during the middle ages other colours than white were worn, as well as silks. It is open in front like a surplice, girded at the loins, with sleeves comparatively tight. In front, at the foot, embroidery, or **ONFRERY-WORK**, of a form usually square or oblong, is attached to the albe, and at the wrists several enrichments appear; these are called the *apparels* of the alb. Many of the figures of ecclesiastics on monumental brasses are represented in albs.*

ALBA CRETA. This term, when used by the early writers in Art, sometimes indicates *gypsum*, at others, white chalk.

ALBAN, St. In Christian Art is represented (as also is St. Denis), carrying his head between his hands. His attributes are a sword and a crown.

ALBANI STONE (LAPIS ALBANUS). Now called *Peperino*. A black volcanic tufa, which, as well as the harder tuffaceous limestone or sinter of Tiber—the so-called *Tiburinian stone*, now *Travertine*—was much used at Rome before building with marble became common. The Italian name *peperino* is derived from *pepe*, "pepper," which it resembles in colour.

ALBUS (WHITE). When this word occurs in the early writers on Art, it appears to signify *white lead*.

ALCATO. A protection for the throat, used by the Crusaders, probably of the nature of a gorget of mail.

ALCOHOL or spirits of wine enters into the laboratory of the artist, as a solvent of resins in the preparation of varnishes, &c. On adding water to a solution of resin in alcohol, the resin is precipitated; advantage of this is taken to render gambaoge serviceable in oil-painting. This gum-resin is mixed warm with strong alcohol, and after it is dissolved in it, rain or boiled water is added, which precipitates the resin in a pure state. The object of this process is to remove the gum, and so render the resin fit for oil-painting.

ALEXIS, St. The patron saint of beggars and pilgrims. In Christian Art he is usually represented in a pilgrim's habit and staff; sometimes as extended on a mat, with a letter in his hand,

* Our engraving of the Alb is copied from Pugin's *Glossary of Ecclesiastical Costume*.

dying. St. Roch is also represented as a pilgrim, but he is distinguished from St. Alexis by the plague spot on his body, and in being accompanied by a dog.

ALITHINA, or VERANTIA, according to Theophilus, was the *true red* of the Byzantines.

ALLA-PRIMA* (Ital.) AU PREMIER COUP (Fr.) A method of painting in which the pigments are applied all at once to the canvas, without impasting or retouching. Some of the best pictures of the great masters are painted in at once by this method, but it requires too much knowledge, skill, and decision to be generally practised.

ALLECRET (HALLECRET). A light armour for light cavalry and infantry, consisting of a breast-plate and gussets, which reached sometimes to the middle of the thigh, and sometimes below the knees. It was much used in the sixteenth century, particularly by the Swiss soldiers, who are commonly depicted in it in paintings and prints of that period. The engraving is a copy of a figure in Meyrick's celebrated armoury, at Goodrich Court, Herefordshire, and is a good example of the peculiarities which characterised this convenient defence to the person.

ALLEGORICAL PICTURES are of two kinds; the one comprehends those in which the artist unites allegorical with real persons, and this is the lower rank of allegorical painting. Such are those of Rubens, in the Gallery of the Luxembourg, representing the stormy life of Mary de Medicis. The other, those in which the artist represents allegorical persons only; and by the position of single figures, the grouping of many and the composition of the whole, conveys to the mind of the spectator one thought or many thoughts, which he cannot convey by the common language of his art: this is allegorical painting in the true sense of the term.

ALLEGORY. Properly, a figure having another meaning besides that expressed, therefore, in a general sense, the intentional notification of a thing by means of another resembling it; in a more limited sense, the declaration of an abstract idea by means of an image,—the rendering general ideas perceptible to the senses. Every allegory has a double signification, a general and a particular; the former refers to the usual meaning of the signs chosen for the representation of an object; the latter is a higher and concealed meaning which is to be discovered, and which, the comprehension of the intellect in the scientific, is the foundation of Allegory, and the result of creative phantasy. Consequently, Allegory may be made use of in poetry, rhetoric, painting, and the plastic Arts. As belonging to the Fine Arts it is essentially different to Allegory as a figure in rhetoric; the latter is not a whole, but simply a part, not the end of the poet and rhetorician, but a means to that end. Allegory in Art, is a whole, existing in itself, the end of the artist, and complete without farther reference. Allegory in Art, is also distinct from an emblem; the aim of the latter refers to the intellect, acting thereupon, to make abstract ideas and general truths visible, and thence evident to the understanding; Allegory in Art, has a different meaning; the ideas which it represents ought, of course, to be acknowledged, but its great aim is beauty of form, and by rendering it perceptible to the senses, to excite a feeling of love to the idea (**EMBLEM**). Allegory expresses a fanciful state of the mind when the imagination calls up all its treasures to explain an idea by means of suitable representations, and it is perfect in proportion to the identity of its forms and images, and to the beauty of the collateral circumstances which we annex to the principal idea. The feeling of the beautiful must ever be the principal effect of allegorical representations. The accessory parts of an allegorical figure, which directly or indirectly convey its intellectual or moral meaning, or contribute to its better expression are **ATTRIBUTES**; these are either *essential* or *probable*; the former produce the recognition of

the allegorical figure according to its true meaning, and when founded on resemblance or analogy are called *symbolic*, but when merely the accidental union of certain images with certain ideas, *conventional*. Thus, the scales of Justice, the sceptre, or club of Power, the serpent and mirror of Prudence, the breasts of Nature, the poppy of Sleep, the finger on the mouth of Harpocrates (Horus) are all symbolical. The Cap of Liberty, the serpent of Medicine, and the Lily of France, are conventional attributes. The subject of Allegory ought to excite reverence, admiration, love, and the feelings allied thereto, and beauty must be the result of the representation as a whole; the subject ought to touch our own feelings immediately, needing no long study to be acknowledged or felt; all those subjects must be excluded which excite disgust as the prominent idea, but these may be used as subordinations when the general effect can be increased by their particular effect; poverty, avarice, treachery, with their attributes, are in themselves no subjects for the Fine Arts, but they may appear in a work as parts or episodes. The perfection of an Allegory consists in three things—first, the invention of the principal idea; the second is the marking figures by means of attributes, symbolical rather than conventional; the third thing to be observed is the style, which must be thoroughly ideal. ALLEGORY is personified as a female wrapping herself in a veil.

ALLUME SCAGLIUOLO. (Ital.) A kind of stone resembling talc, of which, when calcined, is made the *gesso da oro*, or gesso of the gilders, and which is also used for the grounds of pictures. Hect readers it opaque like gesso, and causes it to split into layers. It has been observed that this was probably the pigment called *alumen* by Eraclius.

ALLUSION. Allusions are either real or metaphorical; the former consist in a slight hint of something not to be expressed, but which is to be present to the mind; it depends greatly on the imagination. Metaphorical allusion approaches more to comparison, and is the offspring of the understanding. We make use of both kinds in the plastic Arts. Thus Göthe says of Abraham, in Raphael's "Dispute of the Sacrament," that "the flowing tears and the grief which he tried to restrain are a beautiful allusion to the sacrifice of Isaac. Obedience and subjection to the will of God are in this manner more nobly expressed than they could have been by the recitent object of the victim." This is an example of real allusion. In Correggio we find many instances of metaphorical. "Correggio has sometimes by accessories hinted at the characters of his personages; thus the white hare in the so-called 'Zingarella' or Gipse, and the goldfinch in the 'Marriage of St. Catherine.'" The presence of such shy animals, and their forgetfulness of fear, is intended to enhance the idea of innocence and purity in the figures represented, and to denote the repose and quiet of the scene. The artist cannot exercise too much prudence and moderation in the use of allusions, particularly metaphorical; since unimportant allusions, which too easily present themselves, disturb the course of ideas and proper frame of mind.

ALMAGRE.—ALMAGRA. (Span.) A red earthy pigment, probably a variety of hematite.

ALMAYNE RIVETS* Overlapping plates of armour for the lower part of the body, similar to

those seen upon the thighs of the Swiss soldier engraved in the preceding column; they were held together by rivets, and invented in Germany, whence its name (*Allemayne*). They were introduced in the seventeenth century.

ALMOND SHELLS, when burnt, yield a black pigment. It does not appear to be used in the Arts at the present time.

* Skelton's engravings of the Goodrich Court armour furnishes our authority for a representation of this improvement in ancient armour. The rivets, moving in the shells, allowed of freer motion to this defence than it had before.

* The method of Prima Painting is fully described in "The Art of Painting Restored," by L. Hunderpfund. London, 1849. D. Bogue.

THE GRAVE OF LADY RACHEL RUSSELL.

HE experience of every day confirms us more and more in the belief that women who make a great outcry about their rights have given but small attention to their duties. A woman's DUTIES are her RIGHTS; and if we consider either her individual or her social position,—the duties which belong to her as daughter, wife, or mother, give her actual power, power of the highest and holiest kind,—power to form the minds and characters of men, and that without overstepping the charmed circle within which Nature ordained her to move.

Women, blessed as was the LADY RACHEL RUSSELL, with a friend, a councillor, and a lover, in a husband,—women, so circumstanced, can, perhaps, form no idea of the perpetual misery a high-souled woman endures, upon whom the knowledge of a husband's unworthiness comes, after all efforts have been made to have faith in him. To see, one by one, the feigned or imagined virtues vanish; to find that he who had wooed and wed for a purpose, at length, seems even to assume the qualities he never cared to possess; to obtain from experience the terrible knowledge that the companion for life, in whom the hopes of the future were treasured, the husband of her choice, the father of her children—is worthless in the sight of God and man,—is a grief so full of anguish, that no wonder the weak-minded either sink into helpless slavery, and in time become 'like what they loathe,' or, forgetting the solemn obligation of the vow, (unconditional as it is) break into impotent rebellion and perish, the victims of opinions,—to alter which would be more fatal to the good order of society than their contumace, harsh as they are, and hardly as they hear upon the 'weaker vessel.'

But the right-minded, and above all the Christian, woman, should be most careful to avoid judging her own sex harshly. Silence towards an erring sister is more seemly than condemnation; and one of the most touching passages in the letters of the Lady Rachel Russell, —whose Life should be in the library of every daughter of England—is that in which she points to her own unworthiness; never implicating those whose follies and vanity led her 'to like well the esteemed diversions of the town.' The woman who is so happy as to find a wise and worthy friend in her husband, one whom it is impossible not to reverence and love, whom she may delight to honour, and whose faults are but as dust in the heavy balance of his virtues, will do well to keep steadily in view the duty of the covenant made at God's altar, rendering thanks that she cannot choose but 'love, honour, and obey' what is so worthy of easy and pleasant service. But if she does well in this matter, she will do better to show by her actions what is the duty of a good and loving wife, than by heavily railing at women less blest than herself, who, having none of her consolations, forget the duty they owe even to a bad husband, and with peevish discontent would invert God's order of things, and think they could more rightly perform man's duty than man himself. Such women ought to be especial objects of pity, for they are most unhappy. We never knew one of those who are for upsetting the Christian order of man's precedence, who was not a restless, discontented person, and even more to be pitied because more unhappy, than the meek and suffering woman, who, hearing her cross in humble imitation of Him who, when 'reviled, reviled not again,' presses onward in her thorny path of duty, looking forward to the future, while enduring

the present, and not infrequently rewarded by winning back, even at the eleventh hour, the wandering heart. We owe much of the well-doing of society to those silent, patient, loving sisters,—wives and mothers,—who, with no pretensions to lofty intellect, but with a desire to do right, and the rich treasure of a loving nature, are the guardian angels of many homes, which, but for them would run as wildly to ruin as their masters. How frequently a timid, shrinking woman, whose nerves have been shattered by the loud voice and midnight orgies of a brutal husband, 'keeps the house together,' one can hardly tell how; by instinct rather than reason. And yet, how can those whose homes are the temples of domestic peace, where happiness disposes its richest triumphs, judge of the temptations of her who hears no music in a husband's step, and whose every spar of hope has been shipwrecked by the reckless and cruel nature of him who swore to shield her from all sorrow?

It is interesting to know what were the preparations which sanctified the name of Lady Rachel Russell, and gave to her so high and prominent a place in English history. Let

us, first, pause a moment to say, that while it has been the custom to portray the virtues of the lower and middle class females of England, so as to excite sympathy and admiration, the female aristocracy of England have had no faithful portrait-painter, either with pen or pencil of late years, to do them justice. The so-called 'fashionable' novels, have, with few exceptions, been written either by individuals of at least doubtful morality, acquainted only with the coarser features of rank, or by persons who knew nothing of its movements, except from public records; and who have fallen into the error of confounding the so-called man or woman of fashion—mere 'fashion,'—the actually vulgar notoriety hunters—with the high-bred and high-born aristocracy, whose women are as remarkable for great beauty as they are for great talent and great virtue—describing the 'man about town' as the English gentleman, and the woman with the fig-end of an old, or the gaudy freshness of a new title, who exhibits her lolling sleepiness in 'the Ring' at Hyde Park, and scorns the name and duties of an English mother—as a type of those noble and high-bred ladies, who,

SOUTHAMPTON HOUSE, BLOOMSBURY.

rallying round the court of their Royal Mistress, devote, as she does, their thoughts, their time, and their talents, to the cultivation of those very domestic duties which we are so often told belong to a class and not to our country.

Surely it is high time for some one with genius and knowledge so to picture the female aristocracy of England, as they might be pictured with truth and honesty—as exemplary wives, devoted mothers, and zealous friends; with hands open as day to melting charity, thoughtful of the dependants who surround their mansions; foremost to establish schools and support dispensaries; ever ready with the counsels that produce virtue. It is far too much the vice of our age to give notoriety to corruption in high places, and to forget the large balance of good that is to be found among the great.

Happily the example of the Lady Rachel Russell is by no means rare among the high-born women of England.

We have walked more than once up and down the north side of Bloomsbury Square, where Southampton House once stood, and where Lady Rachel and her husband resided, and felt half inclined to quarrel with this noble lady's grandson, Wriothesley, Duke of Bedford, for changing its name to Bedford House; and still more grieved that Francis, Duke of Bedford, should have caused it to be taken down; such buildings should be considered sacred; they are monuments which no hands should touch to desecrate or to injure.

We can now but contemplate the site of the dwelling, where Lord William Russell lived with one in all respects so worthy of him;*

* On Lady Russell's death, in 1723, it descended to her grandson, Wriothesley, Duke of Bedford, and received the name of Bedford House. It was pulled down by Francis, Duke of Bedford, in 1820. Our view is copied from an old print in the illustrated Pennant, now in the British Museum.

yet it is some satisfaction to know that the Duke of York, his malignant foe, and the pusillanimous enemy of all civil and religious liberty, did not achieve his wicked will that this most injured nobleman should have been executed there—at his own threshold. But it is not upon 'houses built with hands' that the memory of Lord William and Lady Rachel Russell depends; their names have imperishable renown in their country's history—watchwords they are of liberty, of truth, of uprightness, of dignity, of all and everything that can add lustre to human nature!

Lady Rachel Russell, who in every situation of life is so eminent an example of what a woman can be, and ought to be, was the child of an illustrious father—Thomas Wriothesley, the Lord Southampton, who, during the first dispute between Charles and his Parliament, kept so honestly aloof from court, that he was considered as one of the Peers most attached to the people—yet was so struck by seeing the course of justice perverted on the trial of Lord Straford (whom, be it remembered, he had never favoured), and noting how the current set against a monarchical government, that he felt himself impelled by his desire for the peace of England to attach himself to the Royalists. The violence of one party, and the mad obstinacy of the other, rendered his efforts at a reconciliation between the King and the Parliament abortive; but when all was over, he did not desert even the remains of his royal misguided master. He was one of the four faithful servants who asked and obtained permission to pay the last sad duty to his master's remains, divested of all ordinary ceremonial. Lord Southampton had married before these troubles a Huguenot lady, Rachel de Rivigny, who soon died, leaving two infant daughters, of whom Lady Rachel was the youngest. There is to be found in Lady Rachel's character the exalted

and enduring piety which so eminently belonged to the Huguenots of those days; blended with the tolerant spirit of universal charity which distinguished her father. It seems also to us that though the crude imperfect style of her early letters, proves that her mere education, so called, was not strictly attended to, yet, during her father's retirement at Tichfield, in Hampshire,* her mind and heart were both strengthened and refreshed. Nothing does this so effectually with women as early intercourse with high-minded and right-thinking men; the piety and purity, the unflinching integrity of the father, were unconsciously imbibed by the child—healthful and invigorating to her soul as was the fresh country air to her constitution.

She was betrothed, according to the custom of the times, in childhood, to Lord Vaughan, whom she married, but soon became a widow; and then, richly dowered, young and lovely, she chose wisely, in choosing from among her suitors, a younger brother of the right noble house of Russell. During their lives these two were seldom separated; and when we first turned over all that is published of her few letters to her husband, we were sensibly struck by their *homeheartedness*; their appreciation of happiness born of rational as well as passionate affection; bearing the fruitage of cheerfulness and joy, yet prepared—as people seldom are—alike to bask in the sunshine, or meet the storms, of life. Lady Rachel's tender and almost prophetic exhortations both to her husband and herself, to merit the continuance of God's goodness, as much as we can be said to merit anything, assure us how perfectly she understood the great principle of the *balance of life*, which is exemplified as much in the peasant's cottage as in the prince's palace; while his entire and absolute confidence in her character was only equalled by his affection and attachment to her society. Thus were they *united* in the holiest and highest sense of the word; united in principle, in intellect, in views, and in all noble dispositions; pursuing, according to the different means appropriate to their sex and situation, one common end—sustaining and strengthening each other; no harshness, no tyranny, no depreciation on the one hand, no affection, no small arts, no deceit or struggling for unwomanly power, on the other—each finding a candid and a brave judge in the understanding, and a warm

diffuse no warmth out of their own narrow focus; while others again appear endowed with an almost boundless capacity for every virtuous affection, which contracts undiminished to all

the minute duties of social life, and expands unexhausted to all the great interests of humanity. Such was the heart, the large, full heart of Lady Rachel Russell, in which her husband, her three

THE RYE HOUSE.

children, her family, especially her sister (whom she so exquisitely terms 'a *delicious friend*'), her friends, her country, and, above all, her religion, all found space.

How delightful it is to read the manner in

pation in them. Above all others, she was impressed with the most perfect trust in the goodness of God, bringing her faith into daily exercise—her sweet faith; for surely it sweetened all her cups of bitterness from first to last.

The one thing generally known and universally appreciated is Lady Rachel's conduct on her husband's trial, for a pretended connection with the Rye House Plot.* Of the events which preceded and followed this most disgusting mockery of justice, she herself has left no record. Her confidence in her husband's purity of intention and action, of course, could not be shaken; and her mind, instead of being overwhelmed, expanded into more than human majesty. The dastardly policy of the court would have rejoiced if Lord Russell had fled; it would have been a relief from the degradation of his death. They could have vilified his character with show of reason, and this would have led to the more easily disposing of others, whose greater activity, as well as fewer scruples, made them, in fact, more dangerous enemies. It is on record that Lady Rachel was even sent to, to consult with Lord William's friends, whether or not he should 'withdraw himself'. But no: she loved his honour better than his life—loved that which *must* live, better than that which *must* die. No fears for the safety of her life or lives led

RUINS OF TICHFIELD HOUSE.

and devoted advocate in the heart, of a dear companion.

It has been justly remarked, that there is as great a variety in the powers and compass of human hearts as of human intellects. Some are found hardly equal to the modified selfishness which produces attachment to their most immediate connections; some have naturally strong feelings concentrated on a few objects, but which

which she requites the 'tender kindness' of her husband; how her letters are filled with words of love and most delicate fondness! Yet with all a woman's care for the small domestic things, of a *right* woman's carefulness, are ever to be seen the brave energy and thoughtfulness of her nature—the indelible marks of an animated interest in her lord's pursuits, a mind open to all great public objects. Dear as was his society to her, there was no pitiful, vexatious whining after it, when his duties called him away, but every effort was used to strengthen him in his strength. Her account of the debate in the House of Commons on the king's message, in April, 1687, is clear and well given—a proof of the improvement of her style; wherein are to be found passages intimating her minute acquaintance with political affairs, and with Lord Russell's partici-

* This conspiracy, which appears to have originated among some disaffected London tradesmen, was to have been carried out at the house of one of them, Rumbold a maltster, who was to lodge the conspirators in his house called 'The Rye,' near Hoddesden, in Hertfordshire. The Rye House is an old brick building situated in a picturesque spot on the river Lea, and has upon its exterior some ornamental features, which show it to have been once a building of some importance. All that now remains is but a fragment of the original building, and the house has been so entirely altered to suit it to the exigencies of the parish workhouse, as to have no feature of interest remaining. It was afterwards an inn and fishing-house. The foundations are everywhere insecure, and the house is rapidly crumbling away. It cannot be expected to last many years longer. As a memento of one of the most interesting events in our history, it is well worthy of a visit before its fall. The names of Russell and Sidney for ever make it famous, and their judicial murders give a thrilling solemnity to its name.

* Tichfield House, Hampshire, was originally an old monastic foundation given by Henry VIII. to Lord Wriothley, who built the mansion. At this house Charles I. was concealed after his flight from Hampton Court in 1647. It was then one of the seats of the Earls of Southampton, where his mother lived with her family: here Charles was met by Colonel Hammond, who was fetched by Sir John Berkeley and Ashburnham, and from thence set out for the Isle of Wight. The view was taken in 1781, when great part of the mansion had decayed or been pulled down.

this heroic woman to counsel what she did not consider would be consonant with her husband's innocence and honour. History, blushing at the perversion of justice, details what followed. During the fortnight—the bare fortnight which elapsed between Lord Russell's commitment to the Tower and this base mockery of jury-trial—Lady Rachel was unceasingly occupied in procuring information as to what was likely to be urged against him, and in adopting every means of precaution. She found it difficult to believe with her lord, that, once within the poisoned coil of his enemies, his doom was fixed. A thrill of anguish ran through the court when, in reply to the Chief Justice's intimation that Lord William might employ any of his servants to assist in writing anything he pleased, she simply said, 'My wife is here to do it.' And she, pure, holy, and strengthened for such a task by the direct power and grace of God, that 'sweet saint' arose from her lord's side, and seated herself with most wonderful calmness and self-possession, to take notes of the proceedings that were to issue in his life or death. No heroism ever surpassed this. How many there present must have recalled her father's services, her husband's unsuspected patriotism, the excellence of their lives, their domestic happiness. It shook the hearts of their hitter persecutors, for even the 'atrocious judge' assumed a milder tone, and said, 'If my lady will give herself the trouble.' How she could have supported herself—how she could have controlled her feelings—during the feeble and most iniquitous mass of compounded nothings that were urged against her noble lord, especially by the pitiful Lord Howard, we know not. She had also to bear up against the news of the suicide, in the Tower, of Lord Essex—her relation and friend. She heard this in the midst of the trial, tolling through the court like a death-knell, yet did she give no voice to the torture of her heart, nor distract her husband's attention by a single murmur. Day and night did she labour, after his condemnation, for a mitigation of his sentence; but the unforbearing James gaped for blood; the facile Charles laughed at mercy; the venial Duchess of Portsmouth feared to risk her power over the king, even for the mighty bribe which Lord William's father, Lord Bedford offered her; every plan was tried, save a desertion from those high principles which formed Lord William's sole crime in the eyes of his relentless enemy, the Duke of York. Now mark how she strengthened her husband's noble nature. While offering to accompany him into exile, never did she propose that he should purchase his life by a base compliance, or the abjuration of those glorious truths for which he endured persecution. How deeply he felt this, is proved by his mention of her in his last interviews with Burnet, who tells us that Lord Russell expressed, even in his last hours, 'great joy' in her magnanimity. 'At eleven o'clock on Friday night,' he says, 'they parted; he kissed her four or five times, and she kept her sorrow so within herself, that she gave him no disturbance at their parting; There was,' he said, 'a signal providence of God in giving him such a wife, where there was birth, fortune, great understanding, great religion, and a great kindness to him. But her carriage in this extremity went beyond all; and it was a great comfort to him that he left his children in such hands.' And truly can we believe it. Well might he trust her upon whom in this world he should look no more; safely might he confide to her those dear pledges of unsurpassed love, who to the last moment, by a continuation of woman's sacrifice—a sacrifice of self-indulgence—a suppression of every selfish feeling—which nothing but the deepest tenderness could dictate to the most exalted mind—parted from his last embrace—looked her last look upon the honoured, the beloved, of her true heart, without permitting a single sob of anguish to disturb his serene composure. Away she went to the home which had known him for fourteen years, but should know him no more. Away—away—to count the fleeting minutes that were to elapse before his children were fatherless and his wife a widow.

Her beloved sister, that 'delicious friend,' was dead; her infant children were incapable of

thought or consolation—her half-sister, Lady Northumberland, was abroad—her cousin, Lady Shaftsbury, could only offer 'pity and prayers'—her father-in-law!—they could but gaze upon each other. In those cruel moments she was left 'alone with God'; this holy companionship enabled her to support her great agony, and feel, what many years after she avowed, that there was something so glorious in the object of her greatest sorrow, that in some degree prevented her from being overwhelmed.

She did not even for a moment, when all was over, sit down with sorrow, but roused by a knowledge of her duties to the dead, as well as the living, defended the memory of her husband, when his unsatiated enemies endeavoured to deny the authenticity of the paper he had delivered to the sheriffs on the scaffold—this, and the summoning of Tillotson and Burnet before the king and the Duke of York, who were taxed as the advisers of the declaration, drew forth Lady Rachel's memorable letter to Charles—a brave letter it was, the fearless expression of duty and innocence resolved to repel falsehood and assert truth. We may wonder how the Duke of York felt when it was read; as for the vacillating Charles, he gave immediate permission that the mourning escutcheon for

CHESIES.

her friends laments her 'mighty grief'; how it has wasted her body, though she struggle with it 'ever so hardly'; Bishop Burnet congratulates her on having resolved to employ so much of her time in the education of her children, that they should need no other governess. It irks us to hear the excuses mothers make to rid themselves of their maternal duties, leaving their children to hired teachers and low-bred menials, gadding abroad after new friends, new pleasures, and new whims—their children will not bless them in their graves. How different was this from Lady Rachel, training her two daughters, from whom she was never separated; and strengthening her own mind, that she might strengthen that of her son. We remember one passage where she says—'I am very solicitous, I confess, to do my duty in such a manner to the children of one I owe as much as can be due to man, that if my son lives he may not justly say hereafter, that if he had a mother less ignorant or less negligent, he had not then been to seek for what, perhaps, he may then have a mind to have.'

Her son's education was a matter of deep interest to her; and the skill with which she parried Lord Bedford (his grandfather's) cares, lest she should put him to 'learn in earnest' at too early an age, is, as every thing else, a proof of how her judgment regulated her affections. Her eldest daughter's marriage with Lord Cavendish drew her at last from her retirement, and her interest in all the world's doings was kept painfully alive by the trial of the seven Bishops, and the stirring events of the times. Time passed on, she received the assurance of profound respect from the Prince and Princess of

the murder he had been pleased to sanction should be placed over Lord Russell's house, and sent a kind word to Lady Russell, intimating that he did not mean to profit by the forfeiture of Lord William's personal property—poor fluttering shred of royal frippery! Is not *this* a great glory to woman? Is not *this* her genuine power, the power of superior virtue? Is not *this* her great, her mighty strength, the strength horn of a purified nature? What woman's influence could have holier exercise? Just consider the power she (long since dust and ashes) holds at this moment over every well-regulated female mind. Her name is as a talisman—the watchword of truth, and virtue, and vigilance—of domestic love, and lofty heroism. In her the moral power is most perfectly exemplified. She was not beautiful, nor 'witty' (for that her husband blessed God, nor learned. Now-a-days she would hardly have been called educated. And yet, surely, we behold a PERFECT WOMAN. Would any wish more love, more gentleness, more truth, more trust, more virtue, more heroism, more religion—and all without assumption or pretence. Does not this show that, however ornamented may be the structure, there can be no true glory for woman unless there be a righteous foundation? One of

Orange, and at last, when the Revolution settled into a new Monarchy, its first act was the reversal of Lord Russell's attainder; his execution being termed a 'murder' by a vote of the House of Commons! She lived to see it! A less firm and comprehensive mind than her's might have been elated at the extraordinary respect paid to her, not only by the court, but by the intellect of the country. Dr. Fitzwilliam referred to her his conscientious resignation of preferment under the new government. Tillotson applied for her sanction to his acceptance of the dignity offered him by King William; and even the stout, sturdy, man-woman, Sarah, Duchess of Marlborough, would not dare an important step without consulting with 'the Lady Russell, of Southampton House.' Lady Rachel's energy and influence were constantly exercised for the good of others. She never suffered her friendly repeated trials to interfere with her friendly duties, nor did her feelings become blunted either by age or sorrow. Immediately after the death of her half-sister, Lady Montagu, and her nephew, Lord Gainsborough, she makes this touching observation in one of her letters—'Every new stroke to a wearied and hattered carcass makes me struggle the harder; and though I lost with my best friend all the delights of living, yet I find I did not lose a quick sense of new grief.'

The honours we are justly proud of, the dress and ornaments of virtue, were showered upon the two noble houses she best loved; Devonshire and Bedford were elevated to dukedoms, and most worthy mention was made of Lord William Russell in the royal letters patent. Lady Rachel's dread of blindness, with which she had

struggled for years, had been removed; 'she had seen the government which had oppressed, proscribed; the power which she had found implacable, fallen in the dust; the religion, whose political predominance she dreaded, in circumstances to require that toleration it had been unwilling to allow; the man whose vindictive spirit had inflicted the greatest misfortune of her life, himself an exile, after leaving, with characteristic meanness, implored the assistance of him whom he had persecuted—the assistance of the father of the man he had murdered. She had seen the triumph of those principles for which her beloved Lord had suffered, the blessed effects produced by a steady adherence to them, and his name for ever coupled with the honour and freedom of his country.' Tried both by adversity and prosperity she remained unchanged. And so, she became old in years; yet her heart was green within her, and she slumbered not, but actively and enduringly busied herself about her orphan grandchildren, enjoying in the depths of her chastened spirit the respect and honour due to the experience and the wisdom of length of days. No trace of the prejudices, peculiarities, or selfishness of age lingered around her. She scrutinised none so severely as herself; and her personal inquisitions were directed not to the forms, but to the feelings of Christian piety—to the Christianity which, to quote her own 'delicious' words, could not be distinguished by 'outward fashions, or by the professing a body of notions differing from others in the world, but by the renewing of our minds, by peaceableness, charity, and heavenly love.'

A halo of glory encircles her name: every spot where she resided is to us consecrated. We have filled a large space with poor words concerning one, of whom it seems to us we have said nothing. Lady Rachel Russell died on October the 5th, 1723, at Southampton House, her age being 86 years; and she was buried at Chenies, in Buckinghamshire,* with her most dear lord.

Chenies, the once happy home and the last resting-place of Lady Rachel Russell and her martyred Lord, is situated in a secluded corner of Buckinghamshire; the little village is environed by trees, and the quiet dells and waving corn-fields give a favourable picture of the fertile spots of our country. The old mansion is nearly deserted; a greater part is used as a stable, and pigeons find a home in the upper stories. It is now inhabited by farmers, and used as the farmhouse. Yet externally it retains the features of its original beauties. To some of the gables are still appended the carved corbels, which speak of the elaboration and beauty of the old house in its palmy days. The ivy-covered turrets and gables, and the lofty firs, complete a picture of much interest—even apart from the glorious history with which it is associated.

The church is immediately beside the house.

* Iselhamstead, or Iselhamstead-Chenies, is on the borders of the county. 'It is now,' says Lysons, 'generally called Chenies, its original name is almost lost, having been exchanged for that which was first given to distinguish it from the neighbouring village of Iselhamstead-Latimers, this place having been for many years the manor and seat of the ancient family of Cheyne.' It was, originally, a royal palace, and was given by Edward III. to Thomas Cheyne, the first of the family who settled in this county, and who was his shield-bearer. It ultimately descended, by marriage, into the family of the Russells in 1560. Lord Russell upon coming into possession of the estate, rebuilt the greater part of the manor house, and made it his principal seat. 'The old house of Cheynes is so translated,' says Leland, 'by my Lord Russell, that hath his house in right of his wife, that little or nothing of it remaineth untranslated, and a great deal of the house is even newly set up, and made of bricks and timber.' Queen Elizabeth was entertained here by Francis, Earl of Bedford, in 1570. When the Bedfords fixed their principal residence at Woburn they deserted this house, which was converted into a farmhouse.

In the parish church are some memorials of the Cheynes, and in the adjoining chapel, built by the heiress of the Sapcotes, by whom the estate was conveyed to the Bedford family—Anne, Countess of Bedford,—is the monument for herself and her husband, John, first Earl of Bedford. There are also monuments of Francis, Earl of Bedford, who died in 1588, and his Countess; Anne, Countess of Warwick, their daughter, and Lady Francis Bouchier, their grand-daughter; Francis, Earl of Bedford, who died 1641, and of his Countess; that of the first Duke of Bedford, and a medallion of William, Lord Russell, who was buried here August 2nd, 1683, as well as some modern monuments to others of the family.

It is a work of the sixteenth century, and the principal part is the large Mausoleum and Chapel, built by the first Countess for the Bedford family. Within the church is much to

interest; the roof is of open timber-work, and very ornamental; there are a beautifully carved pulpit, and an early circular Norman font. In front of the communion-table are some interest-

CHENIES CHURCH.

ing brasses of the Cheyne family, the original possessors of the estate. In the chapel adjoining are many magnificent tombs to the members of

the Russell family. The principal one is shown in our engraving, and may be considered as an historical memento of the principal members of

THE BEDFORD MAUSOLEUM.

the family. In the centre are full-length figures of the first Duke and Duchess, leaning upon a column, supporting the dual coronet, in attitudes of reflective sorrow. Above them is a medallion of Lord William Russell, the victim of Charles II.; at the sides are similar medallions of six other members, male and female, of the family, whose names are inscribed around each head; above, cherubims are seen supporting the arms and crest of the house. This tomb is sumptuously executed in coloured marbles. Immediately in front is the grated entrance to

the burial vault, where nearly sixty of the family lie. The Lady Rachel Russell has—strange and sad to say—no memento in this chapel; her monument is the History of her country.

And behold what lustre the exercise of 'DUTIES' bestows upon a WOMAN! The celebrity of her character has been purchased by the 'sacrifice of no feminine virtue, and her principles, conduct, and sentiments, equally well adapted to every condition of her sex, will in all be found the surest guides to peace, honour, and happiness.'

ON TRANSITIONS OF STYLE.

BY W. HARRY ROGERS.

The present century is one of such determined action and research, that there are very few fields in Art or Science which it has left untrodden. There are few mechanical processes, known to our ancestors and afterwards forgotten, which have not now been restored, and even improved; few materials, used by the ancients, which have not recently been supplanted by others, evincing more valuable qualities or greater facilities for their usefulness. But in nothing of late years has a more ardent spirit of investigation been shown than in the study of ancient architecture and manufacture; the latter, in its various branches, has furnished models for many of our best productions, and the former has been carefully classified and arranged into styles and divisions of styles for the better guidance of the modern imitator in avoiding incongruity of design.

The term "style," as applied to the arts, signifies any peculiar conventional treatment of design and execution. Thus it is evident that a pure style should, like the Grecian, the Norman, the Gothic, be possessed of sufficient individuality to render it at once distinguishable to the general observer, while it remains the province of the more initiated to classify and arrange, and by dividing each style into various sections, to secure harmony in the erection of modern,* and historical accuracy in the examination of ancient structures. The appearance of certain minor details and the introduction of slight varieties in form or idea are enough to form a class, but not to constitute a distinct style. Upon one or other ground, most of the styles of Art have in this way been subdivided; as for instance the Gothic or pointed, which in British nomenclature comprises "Early English, Decorated, and Perpendicular," while these again spread into more minute ramifications. In looking back at the remains of mediæval art which have been handed down to us, it invariably appears, that while the great styles—the *genera*—succeeded each other by violent shocks, the divisions or *species* of those styles were gentle and gradual, coming on by almost imperceptible progressions. It was impossible that it should have been otherwise. Upon the adoption of a style, which adoption then influenced every class of art and manufacture, certain treatments, the result of a multitude of differently formed minds working in concert, were popularised by the judgment or fashion of the day, and these again were discarded when more favourite novelties developed themselves. But positive changes of style were considerations of higher magnitude, and more universal importance. They originated in powerful convulsive movements on the phase of society. Such changes were (as regards England in the middle ages) the introduction of the pointed arch in the twelfth century, and its desuetude in the sixteenth. The first of these epochs was marked by the extraordinary passion for crusades evinced by all classes of men. The communication thus brought about between Europe and the East, as well as the contact into which the sovereigns of our own country were brought so frequently with foreign courts, were productive of the best results to Art. The monastic treasuries of Europe were now thrown open to receive gems of Saracenic industry; the works of the goldsmith were covered with imitations of Eastern filigree; Arabic inscriptions were unconsciously applied as the ornamental borderings to miniatures and enamels; churches were built as representatives of the Holy Sepulchre at Jerusalem; while every branch of architecture bore symptoms of the all-pervading spirit of the times—spires, pinnacles and arcades, rising in elegant lightness, where before stood only the massive tower and the sullen Norman arch. And so the new style (the "*novus modus edificandi*" of William of Malmsbury) made its way with wonderful rapidity, for it must be

* This is not the place to discuss the benefits or disadvantages which would result from an abandonment of all the influence of "styles" in modern productions. The question, for each side of which there are warm partisans, may hereafter be entertained by the *Art-Journal*.

remembered how short a period elapsed between the first application of the pointed arch in England, and the completion of the plan for Salisbury Cathedral. There was, nevertheless, a period of transition, however limited, from the Norman to the early English, nor are examples wanting that exhibit a strange medley of the two styles; but these rather evince a restlessness, an uncertainty of design, a desire to discard familiar principles, and a longing after novelty, than an attempt to adapt to the style of composition previously in vogue, some hints derived from the experience of foreign schools. Thus no imaginative architect can be entirely satisfied with the existing productions of this transition

period. Yet to what excellent advantage might have been turned a union of the pointed arch with the sublime and substantial details of its predecessor, realising a magnificence of effect, of which old Shoreham Church furnishes some foretaste! and under the present rage for novelty, why may not even yet the combination suggested be employed in some of the numerous

churches which are springing up in every quarter of England, and also in the ecclesiastical accessories which are now being manufactured on so extensive a scale?

The second great general transition was that which accompanied the dawn of intellectual day at the close of the fourteenth century, when active and earnest men were co-operating through-

out Europe to dispel the prejudices of centuries, and paving the way for the various startling events which resulted in this country in the establishment of the Reformation, and with it in the abandonment of Gothic Art, and Gothic associations. The movement with reference to

Art, was greatly aided by our increased communication with foreign courts, and our employment of foreigners, both as artists and as workmen under Henry VIII. Before the Italian style thus introduced had hung aside all its Gothic trammels, the exquisite carved woodwork of King's College Chapel, Cambridge, and the stone wall decorations of Bishop Alcock's Chapel in Ely Cathedral, were executed, and remain evidence of the splendour which a harmonious arrangement of the Gothic and Italian styles cannot fail to produce. It is the object of the present observations to call the attention of

designers and manufacturers to this period of transition, of which it is believed far more might be made than was ever attempted during the sixteenth century.

With the same view the accompanying designs have been prepared. They are all for circular compartments of carving or ceiling decoration, or for the small circular panes of stained glass

which would be appropriated for staircases in a building of the style under consideration. For many other purposes in manufacture they might prove applicable. The peculiarity in their composition consists in the fact that they are all directly or indirectly based upon forms which are frequent in Gothic panelling, so far, at least, as general outline is concerned. For

"cusps" foliaceous and scrolls are substituted, and stems occupy those positions in which originally hollow mouldings would have been introduced. With the assistance of the study of mediæval tracery, both English and Continental, it is astonishing how endless a variety of orna-

ment for circular compartments, treated in the Italian style, might soon be realised. But the capabilities of the mixed style proposed are far from resting here. In the works of the goldsmith and silversmith, the sculptor, the wood-carver, the enameller, the decorator, and, perhaps, above all, of the brass-founder, it might be made eminently available for a thousand different purposes, and possibly a greater originality of effect might thus be gained than would be practicable in the adoption of any of the pure styles. It will be readily seen that such a combination of

Gothic and Italian as has been employed in a large portion of the church of St. Eustace at Paris, is far from being that which is here intended; for in that remarkably curious specimen, Gothic forms and principles have in almost every instance been strictly adhered to, with simply the insertion of Italian enrichments in a discordant manner, and the Italianisation of the

mouldings chiefly by placing "beads" or "half beads" to supersede "hollows."

It may here be noticed that, in general, transitional styles were so ephemeral, that their capabilities were not sufficiently studied or appreciated at the time, while moderate neglect of them arises partly from a feeling among architects, that from their hybrid nature, they must neces-

sarily be unworthy of imitation, and partly from the rarity of good specimens to be used as models, but the writer of the present short paper will feel pleased if, in calling attention to the subject, he should be the means of the re-creation of any one beauty in Art, or if the accompanying illustrations should prove of utility or suggestiveness to the British manufacturer.

CLERGET AND HIS DESIGNS.

In accordance with a promise given in our Report of the Exposition of Arts and Manufactures in the French Capital, it becomes our duty to introduce to the English public some specimens of the admirable creations of M. CHARLES CLERGET; an ornamental designer of the highest powers of invention and performance, but upon whom the pressure of the times in France has weighed with more than ordinary severity. The gentleman, of whose works we have now to treat, has a most versatile pencil, and in every species of design to which he directs his attention, he displays a thorough knowledge of style and an admirable feeling for harmony of arrangement, with reference to both form and colour. He has composed patterns for carpets, he has repeated by the *burin* some of the choicest bijoux of Virgilius Solis, the Brossamers, the Hopfers, and Daniel Marot, &c.; he has designed many of the most graceful little arabesque vignettes in the style of the sixteenth century, used in Parisian typography, and he has made many copies from the decorations of oriental MSS., for the use of the students in the manufactory at Sèvres. It is in the latter style, especially the Persian mode of rendering it, that M. Clerget displays his extraordinary facilities to greatest advantage. The enthusiastic study he has devoted to the treasures of Eastern Art, preserved in public and private libraries, has taught him the graceful combinations of colours, and the perfect adaptations of vegetable forms, for which they are so justly remarkable. He has drunk deeply of this well-spring of invention, and, as a result, has perhaps produced original transcripts of their excellencies which have never been excelled, if equalled, by European pencil. We desire to do ample justice to these accomplishments, and to bear out our remarks to the students to present them with a selected series of M. Clerget's sketches, partly taken from the Paris "Exposition" and partly from the Artist's private portfolio. These should have earlier made their appearance in the *Art-Journal*, but it was impossible that engravings so complicated and elaborate could be prepared in time to accompany the illustrations of the French National Exposition, and we have, therefore, preferred that they should form a separate subject, in the full conviction that the public will consider they eminently merit the place we have awarded them. By such introductions to the English reader, and more especially the English manufacturer, we advance the cause of Art; whatever difference there may be as to the policy of buying in the cheapest markets, there can be no second opinion as to the wisdom of learning in the best schools.

M. Clerget's life has been a chequered and eventful one, and it appears that under no circumstances has he attained a position due to his extraordinary abilities. Born in 1812, he at a very early age evinced an earnest longing for the Arts, and at six years old looked forward to a pursuit which he has never forsaken. At a subsequent period he devoted his time to making studies from architectural books and subjects in his father's possession. He was next apprenticed to various jewellers, as were indeed, most of the celebrated ornamentalists of the "Renaissance," and it certainly appears that this department of the Arts has always been a most productive one in the development of artistic genius. We next find him the beloved pupil of M. Anqueton Le Grand, the last of the engravers *au pointille*, under whom he zealously studied geometry and the sciences most intimately connected with it. It was here that he first secured the friendship of the celebrated Brongniart, who took much pains, unsuccessfully, to obtain for him a permanency in the "Jardin du Roi," and afterwards introduced him to the atelier of M. Chenavard, to whose style of design he partly adhered, excepting in the important particular that he never found himself able to master the human figure. His compositions were confined to geometrical decorations, and so natural to him was the beautiful in balance and in quantity, that when for the first time he saw the illuminations of an Oriental MSS. they appeared to him as something that he had known in his life. But he was so deeply struck with their treatment, that at every opportunity he made fac-similes from the best of them, and gradually acquired the power of distinguishing the various characteristics of the Eastern schools. Under the patronage of the amiable and gifted Princess Mary of France, M. Delcroix in 1835 published a series of ornaments after the old designs, in which M. Clerget's name for the first time was placed before the public. The artist then engaged with a publisher, M. E. Leconte, for the dissemination, not of copied engravings, but of original designs. Some only however of the plates

were executed, and three of them were exhibited at the recent Exposition. In 1838 M. Clerget was entrusted by the administration of the "Imprimerie Royale" with the task of making designs for the "Bhagavata Purana." The failure of many praiseworthy undertakings next drove him to seek employment of manufacturers of carpets, textile fabrics, &c. Our artist's signal misfortunes date from the year 1840, when a project which concluded abortively for him forced him to part with his fine collections of engravings of books, of medals, and of natural history. In the following year, and almost in desperation, he availed himself of an opening in the office of the "Revue générale de l'Architecture et des Travaux publics," where he continued for three years, expending only his leisure in his favourite pursuit, and studying at home the laws of harmony in form and colour, according to the system of M. Chevreul. He also made a collection, in the prospect of doing something still greater, of about one hundred copies of fine ancient typography, the chief of which necessity compelled him to sacrifice before he could realise the object of his labours. At the expiration of his clerkship of three years, a more congenial pursuit presented itself, when he was called on by M. Ovide Reynard to co-operate in collecting and engraving specimens of all the old masters of ornamental design from the invention of engraving to the eighteenth century. The unhappy death of M. Reynard however in 1846 put a period to the progress of the work.

Clerget was at the lowest ebb of despondency when the unexpected benevolence of a fellow-artist on whom fortune had bestowed more lasting smiles, once more raised his hopes of being able to publish to the world the fruits of his pencil. His generous friend M. Violon (an engraver on zinc for the frontispieces of music) offered to advance him money for immediate use, to supply him with thirty-five francs per week and to defray all expenses that might be necessary to assist Clerget in preparing a set of engraved plates to be published in his name at the commencement of a work on original geometrical design—and this moreover without requiring any interest for his kindness. Our artist worked vigorously night and day at the new scheme, and among the designs he made under these circumstances may be mentioned the exquisite arabesque *rosace* of which the centre portion is engraved in the following page.—The entire plate contains forty-three varieties of pattern, all beautiful, all harmonious. But so little were Clerget's designs appreciated, that with the result of the part he completed, he was scarcely more than able to repay M. Violon the 680 francs he had already advanced. The continuation of the work was a failure. M. Clerget now determined to abandon the Arts of drawing and engraving altogether, and he attached himself to a society then established for simplifying the use and study of music, hoping that the ground which had proved sterile for the culture of one Art, might yield a full harvest from another.

But now the Revolution came, and with it all its sad disasters. To Clerget everything was lost, and after having narrowly escaped murder from the populace during the performance of the functions of "greffier," which had been imposed on him at the National works, he returned home a penniless man, and he has since struggled between misery and desperation to get together as a last resource the engravings and drawings suitable for the Exposition. Let us hope that the verdict of the French Jury on M. Clerget's claims may assist in placing him in the position he ought to occupy among the artists of France.* We have thus given a short sketch of the man who has projected and planned the publication of five important works on Decorative Art, who has decorated one of the great French Theatres, who has engraved 300 plates and executed designs for three National establishments, the "Imprimerie Royale" and the manufactories of Sèvres and Gobelins, and who has nevertheless been kept by adverse circumstances in a state of more than poverty, and is now only gaining a precarious livelihood by making drawings for a manufacturer of embroidery. We earnestly trust that such a state of things will not continue. What is to be said of public taste and public feeling, when a man of high artistic and intellectual attainments, and of energy not unequal to his profession, is starving unnoticed and unemployed? There are hundreds to whom his service might be eminently useful, and we think there are few manufacturers of carpets who would not reap a benefit from securing Clerget's co-operation.

* Since this article was in type we have learned with much pleasure that M. Clerget has received a silver medal from the jury of the Exposition. Several of M. Clerget's works may at the present moment be seen at the Exposition of French manufactured articles, at George Street, Hanover Square.

The seven engravings, from drawings by Clerget, which we have gladly introduced into our pages this month, are, first, two small friezes in the moorsque style, of exquisite beauty and originality; their usefulness for application to a

hundred different purposes will at once strike the eye of a manufacturer. The next subject is the centre portion of a magnificent design for a salver in the same style. We deeply regret that the subject, as it was forwarded to us, was so large as to preclude the possibility of our giving it entire, the more so as we feel

that the design loses much of its vigour and harmony by being deprived of the rim, or border. In this composition, to which, in the early part of the article, we have already alluded, all the minutie are so diversified that it exhibits forty-three different designs; all are, however, so happily blended and balanced

that a cursory observer seldom notices the numerous varieties. Beneath this silver is an oblong square compartment, which we have selected partly from the many suggestions it offers to the decorative artist and the manufacturer, and partly in order to show the great source from which M. Clerget has derived his facility of invention; it is taken from one of that gentleman's drawings after an oriental illuminated page in the Bibliothèque

Nationale, at Paris; the original, in those portions represented by flat tints, is enriched with gold of various hues, while the principal field is of a bright blue colour, and the rest of the composition of crimson, pink, and white. On the next page are two original designs for carpeting, the lower one being almost purely geometrical in form and arrangement, and the upper one, which is more flowing, and intended to be upright, equally applicable for the

purpose intended or for wall-hanging, brocade, &c.; this would have excellent effect in execution, and if it could be possible to introduce gold, or any representative of it, into some portions of the ornament, the *tout ensemble* would be greatly improved in magnificence. The remaining illustration is a second copy from the Persian school of illumination, but so chaste and harmonious that we are sure many will thank us for having introduced it: our engraving represents, of course, only one fourth of the design: the original is on a gold ground, heightened with traceries in various colours, while the foliated lines which meander across the field are of a dazzling purple. In point of execution there is no apparent difference between the vellum page and M. Clerget's transcript of it. It would be well if our English designers followed M. Clerget's example in studying from so pure a source. The address of the artist,

our notice of whom we have now brought to a close, is Paris, Rue Albouy, 10. We consider that in making such a man known to English manufacturers, we are rendering them such service as may be turned to practical use.

THE VERNON GALLERY.

THE VILLAGE FESTIVAL.

F. Goodall, Painter. J. Carter, Engraver.
Size of the Picture 5 ft. 6 in. by 3 ft. 5 in.

WHEN the picture from which this engraving is taken was hung on the walls of the Royal Academy in 1847, it attracted universal attention, and drew daily towards it crowds of admirers, as one of the most interesting works in the gallery, both in subject and in treatment, more especially as the production of a young painter.

The genius of Art appears hereditary in Mr. Goodall's family. His father is the celebrated engraver, and a brother and sister have also contributed many very clever pictures to our annual exhibitions; it is not therefore surprising, that with such examples before and around him, the painter of "The Village Festival" should have proceeded, at a somewhat rapid pace, to place himself in a high position among his brother artists. The work in question was suggested by the lines in "L'Allegro":—

"And young and old come forth to play
On a summer holiday."

The scene of the "right merric-making" is the favourite old ruin beside of "The Royal Oak," a sign that was everywhere adopted at the Restoration to show the loyalty of the rustic Boniface. The house itself is a genuine relic of that period, and beyond it are other residences of the villagers, closed in by the parish church. The most prominent group of figures is that on the foreground, surrounding a Jew pedlar, who exposes his glittering wares to the admiration of a knot of old women, maidens, and children, and expatiates with the eloquence of his tribe on their value and beauty; and apparently with so much success as seems likely to draw forth some pence from the little embryo ploughman before him, diving his hand to the very bottom of his trowsers' pocket, in search of the purchase-money. This portion of the story is capitally told; the Jew is worthy of the younger Teniers. To the right of this group is another equally full of character; a woman of the true Saxon blood, after, it may be presumed, having eaten and drunk to his heart's content, is listening to the landlord, who counts, on his fingers, the various items for which he demands payment, and which, to judge from the countenance of the debtor, are surprisingly numerous; at the same table is one who seems to have much work to do in little time, so energetically he plies the knife and fork. Behind these, and in the house and about it, the votaries of fun and frolic are busily occupied, but the characters here introduced appear of that time of life which indisposes them to join hands with those in the centre of the picture:—

"Many a youth, and many a maid,
Dancing in the chequered shade."

These are footing it with an earnestness and zest in which Sir John Lubbock de Coverley would have delighted had he witnessed the merry spectacle.

We have thus enumerated the principal features of Mr. Goodall's pleasant picture of an old English holiday; it remains for us only to notice its execution, which is no way inferior to the composition. The work is one of most careful labour; the faces of the figures are wrought up with extraordinary nicety; each one is, indeed, a separate study; the various groups are well balanced, and the eye of the spectator is carried insensibly, as it were, round the entire circle of the *dramatis personæ*. The colouring is brilliant yet perfectly harmonious and firmly painted; in fact, the picture is altogether an honour to the artist and to the English school.

It would almost seem unnecessary to point attention to the beauty of Mr. Carter's engraving, but we cannot pass it by without awarding him the praise so justly his due. He has worked almost incessantly at it for nearly ten years, and the result of his industry and skill is a print of rare excellence. We may safely affirm that no modern engraving of this class of subject and of somewhat similar size is worthy of comparison with it. Each figure will bear the closest microscopic scrutiny, and will be found an exact copy of the original, while the breadth and power of the entire composition are truthfully preserved. Mr. Carter has hereby earned a reputation that will not soon be forgotten by the admirers of really good engraving. We rejoice especially at this result of his labours; for nearly the whole of his "hard-working life" has been spent in the atelier of a master engraver (not in the high but in the low sense of the term); he is by no means a young man, and although he has produced many admirable engravings, he has not hitherto had his name affixed to one that did him credit, or was calculated to confer upon him professional fame.

LETTERS

TO AN ENGLISH LADY AMATEUR.

BY G. F. WAAGEN,

Director of the Gallery of the King of Prussia, and Professor of the University of Berlin.

I HAVE learned, Madam, with much pleasure, that you approve of my proposition for the promotion of a taste for Art among the lower classes of society, with a view to their participation in the intellectual improvement derivable therefrom. Considering the accomplished education of Englishwomen, their independent position, and in short, the extensive resources which they have at command, it would be for them an admirable enterprise, and one in every way worthy of them, to establish among themselves a society for the furtherance of this great end, by means of the multiplication of celebrated works, and by the engagement of competent persons to deliver popular lectures in the British Museum and the National Gallery. To the irresistible influence of women over men it were an easy conquest to effect the opening to the public of so many private collections in England which contain such inestimable treasures in the noblest productions of every department of Art. I know perfectly the difficulties in the way of realising such a project, since all works of Art are distributed in the ordinary apartments for the daily enjoyment of their possessors; but the consideration, that a beautiful work of Art, like a scientific work, is the property of the entire human race, ought to determine the possessors of such productions to admit the public on certain days and at certain hours; such permission, when I was in England, was granted with respect to his own noble gallery by that excellent nobleman and accomplished patron of Art, Lord Ellesmere. By such means would the entire nation acquire an improving knowledge of the extraordinary wealth in Art which was thus rendered accessible. I am now about to fulfil the promise made to you at the end of my first letter;—that is, to show how far the Arts contribute to the perfection of the education of the higher classes. A knowledge of these is especially necessary to the reading of many of the most esteemed poets; what a difference is there between a reader of Homer who is entirely ignorant of the merits of antique sculpture, and one to whom the gods and heroes present themselves with all the beautiful and definitely marked character, with which they have been represented by the great Greek sculptors. If the latter read of Apollo sending his pestiferous arrow into the camp of the Greeks, the impersonation is at once realised by the noble form of the Belvedere Apollo; if the name of the proud Juno occur, at once the colossal bust of the Juno Ludovisi is presented; if he read of Jupiter granting the petition of Thetis, he remembers the noble mask in the museum of the Vatican. In like manner is Virgil's masterly description of the fate of Laocoon assisted by a knowledge of the celebrated group. The exalted patios of Sophocles in his Antigone, in his Oedipus at Colonus, is rendered sensibly effective by an acquaintance with the statues of Niobe and her children. Thus we see many of the terrible figures of the Inferno, a Charon, a Minos, first embodied in the Judgment of Michel Angelo, so nearly related to Dante in spirit. Even many of the spiritual dramas (Autos) of Calderon win upon the mind by observation of the religious extasy of some of the *Madonnas* and *Saints of Murillo*. But I will now proceed to those most important relations of Art whereby it operates equally powerfully upon the uneducated as upon the educated classes. The highest of these, and that for which all those nations the most highly gifted in Art, have done their utmost, is Religion. This question is the most difficult which the human mind can propose to itself. Man so transient and infirm in his own earthly form, even so limited in intelligence, proposes by the work of his hands to realise the palpable representation of the Deity—to call forth semblances of the eternal, the immutable, and the super-human. And yet this has in a wonderful degree been effected by the soaring inspirations of

highly gifted intelligences, through the medium of architecture, sculpture, and painting. But that which is necessary to this, is the deepest penetration of Beauty in its most refined character. The architect attains to this end through the harmony pervading the work of many classes of artists, and, in the expression of pure beauty, he employs refined forms in certain relations and proportions. And both may be very different according to the temperament and religion of various nations. If we believe in the accounts of travellers, the ancient Egyptian experienced a holy thrill, signifying to him the presence of his god, as he entered the immense temple of Karnak, as the Christian does when he enters the threshold of the Cathedral of Cologne or that of York. Of the Greek temples, as the Parthenon, we can conceive the same thing even at this time; but it is expressly evidenced by the Greek writers. The sculptor and the painter attain that exalted end when they communicate that holy sentiment to those natural forms which they employ to contribute to their purpose, and the spiritual signification of which they set forth. In such manner was the idea of the Homeric Zeus as the "father of gods and men" realised by the marvellous genius of Phidias, and endowed with a benevolence and majestic beauty, inasmuch that the old writers assert that he gave a new impulse to their religion; and every Greek deemed it a misfortune to die without having seen this wonderful work. And within the cycle of the Christian religion, we are not less moved by the exalted inspiration of the prophets in Michel Angelo's representation in the Sistine chapel—the elevation of the commiserating but also chastening divinity of the Sistine Madonna and the Infant Christ by Raffaele, the greatest treasure of the Dresden Gallery. Seeing from such examples what Art in its highest sphere can effect, we must deeply deplore that through the severe form which the Reformation in England assumed, religious painting is altogether excluded from her churches. In this exists a chief cause wherefore a monumental style of art, or such a one as might be identified with a definite architectonic system, has not yet been perfected in England. I hope, however, that the time may not be far distant when the English clergy will no longer entertain their prejudice against the religious significations of Art, and paintings of subjects purely biblical will be admitted into churches.

Next to the glorification of Religion and the Church in the relations of Art, is that of the State. It affords sensible expression in beautiful form to the elevated sentiment of a nation as of one great unity. In this direction of Art have originated the Propyleum at Athens and the Hall of Columns; in Venice, the Palace of the Doge; in Florence, the Palazzo Vecchio; in the Netherlands, the numerous beautiful Halls of Guild, of which I will mention only those of Brussels and Louvain. But where a prince is at the head of a nation, his position is distinguished, as exalted above that of all others, in the most sumptuous manner, by a palace which, in the extent of its proportions, exceeds the habitations of all other men. This has been acknowledged by princes and nations from the most ancient times even to our own days, and the immense but quite formless remains of those of the rulers of ancient Babylon, (Birs Nimrod), the newly discovered palaces of the kings of Assyria, and the imperial palaces of Rome, afford abundant evidence of this. I content myself with citing the Vatican, the Louvre, and the Castle at Berlin, especially from their vast proportions, as characteristic monuments of later times. But at the present time England, with a sovereign at the head of her government, has the good fortune to have acquired through her historical development at the same time the great institutions of a common freedom; and to her, before all other nations, is due the glory, in both relations of wealth and power, of erecting monuments worthy of the State. Although knowing the new Houses of Parliament only from plates and descriptions, it appears to me that the architect, Mr. Barry, will produce in them,—a work, which, in extent, beauty of proportion, and admirable execution, even from the walls to the rich interior orna-

mentation, will far exceed every thing that has for a long period been done in England,—a work which affords an equally favourable and lasting evidence of the greatness of the nation and the state of Art at this period. And not less important, though entirely differing in style, is the residence of the sovereign at Windsor; but of this edifice I will not repeat what I have already said in my book, "Art and Artists in England." For the exterior as well as the interior of all such architectural monuments, sculpture and painting supply a rich field wherein to celebrate most worthily the memory of the greatest deeds and the most distinguished personages of a nation, and in this manner, as it were, to re-animate them for succeeding generations. And thus for centuries was consecrated to the Athenian, through the picture of Polygnotus representing the "Battle of Marathon," the most glorious military feat of his country; and thus will the Catholic Church and the Pope, the head of that church, be glorified by the *Stance di Raffaello*—those of the Disputa, of Heliodorus, of the Fire in the Trastevere, and of Constantine. It is by means of sculpture in open spaces that great men are especially commemorated; but in modern times this must yield to the surpassing riches of the Greeks and Romans, although, in numerous instances, many works of importance have been executed. Yet in my opinion England has in this respect a great national debt to pay in the erection of a fitting monument to Queen Elizabeth, the foundress of her existing greatness. And may the nation soon agitate the subject, and find a sculptor as well qualified to carry out such a work as Barry is to erect the Houses of Parliament.† Permit me, madam, respectfully to conclude with this wish, which equally expresses my reverence for Art, and my regard for the English nation.

BELMIS, December, 1849.

THE PUBLICATIONS OF MR. ALDERMAN MOON.

THERE is a class associated with THE FINE ARTS to whom both artists and the public are largely indebted, and who may be regarded as the medium of communication between the two. It is this class who serve the interests of the former by disseminating their productions, and thus extend their popularity, and who offer to the latter the means of acquiring the best examples of the artistic genius of their fellow-countrymen, though in another form than that wherein they originally appeared. In our constant and earnest endeavour to uphold the interests of Art in all its diversified ramifications, we feel that the class to whom reference is here made, have a claim on our attention, and deserve at our hands continual notices of what they have done, and are doing, not only to justify the encomium we have passed upon them, but also by way of encouragement in reference to future efforts. Those to whom we allude are the *print-publishers*, not mere print-sellers, but the parties who invest large sums of money in what is frequently a "venture," in bringing out the most important engravings which the talent of the nation can supply. It may, perhaps, be argued that these transactions are only trading speculations, undertaken with no other view than that of individual profit; such may be, and, strictly speaking, is, the case, yet hundreds are benefited thereby, who, for lack of this enterprise, might have remained in obscurity, if not in penury. Art, to prosper, must have patrons, as manufacturers must have customers. The print-publisher must be a man of taste and judgment, as well as a capitalist, to select such works as are adapted for engraving, and such as will be likely to afford him a return for the large sums invested in bringing them out. Public taste in these matters is oftentimes capricious, so that some of the finest productions

* On the Acropolis.

† Surely Her Majesty Queen Victoria would patronise such a project, having for its object an honourable commemoration of such a predecessor on the Throne of Great Britain.

that have appeared have turned out the least profitable, or it might with more truth be said, have realised only a considerable loss; small encouragement thus for speculating in what is termed high Art.

Among the Publishers of the last twenty years who have signalled themselves by spirited speculations in engravings, the name of Mr. Alderman Moon stands second to none. A glance at our advertising sheet, which contains a list of nearly one hundred and fifty of his publications, will testify to the truth of this remark; for it will be seen that this list includes many of the best and most popular examples of our school of engravings, and these works are the greater part engraved by the most eminent men of the epoch,—Doo, Robinson, Watt, Cousins, Ryall, Willmore, Miller, &c. &c.

Mr. Moon has worthily supplied the place left vacant by that most excellent civic dignitary Mr. Alderman Boydell; and if the works which the former called into existence have been of a totally different class from those created by the latter, it must be borne in mind how much the circumstances of the times and popular taste have altered popular feeling in these matters. When Boydell circulated, from his house in St. Paul's Churchyard, the beautiful engravings of Sharpe, and Strange, Woollett, and others, England was waging a long and sanguinary Continental war, and some of the choicest specimens of these distinguished engravers were illustrations of the battles in which we were engaged; but this did not prevent the publication of works of a higher and less exciting nature from the great pictures of the old masters, which then were closed against personal inspection. It is astonishing how many fine engravings were published by Boydell, when we consider the circumstances of the times, and the consequent restlessness and excitements of the public mind. The Arts of Peace rarely flourish in the midst of War.

Pence has now been prescribed to us for upwards of thirty years, and it has given the arts of our country a new direction, of which Mr. Moon has, with great judgment, availed himself; his list of engravings, to which we again refer the reader, show the turn they have taken. We find here illustrations of such scenes in which it is presumed the public now feel the greatest interest, more especially those referring to the public acts of her Majesty, such as the "Coronation," in two different incidents: the "Royal Christenings," the "Queen's First Council," "Royal Portraits," &c.; the "Waterloo Baquet." These are all works of great historical importance, and, inasmuch as they contain authentic portraits of the most distinguished personages in the realm; they, will, hereafter, be used by British historians as valuable references, independent of their pictorial merit. But the list includes also subjects which are commonly regarded as of a higher range in Art,—ideal themes, yet partaking of the character of historic truth; such are the exquisitely touching and beautiful print, after Eastlake, of "Our Saviour weeping over Jerusalem," "Italian Pilgrims coming in sight of Rome," "The Preaching of Knox," &c. Some of the best engravings from Landseer's pictures have, likewise, been issued from the same establishment; besides a host of others after Wilkie, Turner, Collins, Webster, Newton, Uwins, Harding, Prout, Hillou, Callcott, &c. &c. Of these we may pause to pay special attention to two, "The Shoeing of the Horse," after Edwin Landseer, a work unsurpassed for wonderful accuracy of details and broad truth to nature, and "Napoleon and the Pope," a striking picture by Sir David Wilkie, engraved with marvellous skill and power by Mr. J. H. Robinson. We have allotted to ourselves but a limited space in which to do justice to Mr. Alderman Moon; but it is not too much to say that two-thirds of his enormous list are valuable to artists and connoisseurs, and honourable testimonials to the glory of British Art. Nor must we omit to mention those magnificent serial lithographic publications, Roberts's "Holy Land" and "Ancient Egypt," to produce and complete which a fortune was required, and which must have entailed on the publisher a vast amount of labour and anxiety. This is a work, indeed, of which too much cannot be said; it will be a

lasting monument to the memory of this enterprising publisher, no less than to the two great artists, Messrs Roberts and Haghe, who have produced it.

Of the works that Mr. Moon has just issued or is preparing for early publication, we would point attention to that of "Christ Blessing little Children," from the fine picture by Eastlake, in process of engraving by J. H. Watt, painted four or five years back; it has been very long in the hands of the engraver, and we have no doubt will prove one of his best works. This picture is unquestionably one of the most meritorious and deeply interesting of modern Art—an eloquent sermon following a deeply touching text, and teaching a lesson in all that is beautiful, pure, and good. Another is the "Christening of the Princess Royal," after Leslie, the proofs of which, we believe, are already published; it is a fine work of its class. This artist, who holds rank among the very highest of his contemporaries, has triumphed over many difficulties inseparable from the subject, and has produced a work of true national interest, to which the engraver has done ample justice. Other works, among which may be noticed, "The Royal Family," after Winterhalter, will in due course claim at our hands the attention they deserve.

The state of the country for the past year or two, with reference to business transactions, has not been such as to offer strong inducement for publishers to speculate in large and costly undertakings; the publisher, therefore, who, in spite of adverse circumstances, risks his capital and devotes his energies to the furtherance of Art, merits every encouragement from us. Not one in a thousand of those who throng round the windows of our print-shops, can form the remotest idea how much of both are required ere one important work is placed before the public; this too with the chances that neither capital nor labour will meet with its due recompense. Alderman Moon, like his prototype, Alderman Boydell, will be ever remembered, as one who has done good service to Art, and has, thereby, earned all the success that has hitherto attended his exertions, and which, we trust, will still follow his future projects.

THE EXPOSITION OF 1851.

ALTHOUGH we have elsewhere dealt at some length with this subject—important and universally interesting—the publication of the first official document concerning it makes it necessary again to refer to it.

A Report made to his Royal Highness Prince Albert, President of the Society of Arts, &c. &c., of preliminary inquiries into the willingness of manufacturers and others to support *periodical exhibitions of the works of industry of all nations*, has been recently printed. It emanates from Messrs. H. Cole and F. Fuller, the gentlemen appointed to travel through the manufacturing districts of the country to ascertain the feelings and opinions of the leading manufacturers on the subject, and it gives the result of their proceedings up to the 5th of October, 1849.

In pursuance of the authority with which the delegates were invested, they proceeded to Manchester, the Potteries, Sheffield, Bradford, Huddersfield, Leeds, Nottingham, Derby, Newcastle-upon-Tyne, Coventry, Birmingham, Kendal, Maidstone, Canterbury, and Dover, in Scotland, to Edinburgh, Glasgow, Paisley, Stirling, Perth, Dundee, and Greenock; and in Ireland, to Dublin and Belfast. As a basis for their investigations it was submitted to the manufacturers, according to the views entertained by the Prince, that the Exhibition should consist of Raw Materials, Machinery and Mechanical Inventions, Manufactures, Sculpture, and Plastic Art generally, in their respective divisions, with other matters of secondary import. The Report is arranged under various heads, and embodies the result of the opinions collected during the above extensive tour. First, "The general expediency of such periodical exhibitions." On this point, the Report states: "We have met with perfect unanimity throughout the whole of our visitations. In some cases we heard expressions of surprise, if not regret, that our country should have been so tardy in instituting such an Exhibition; at the same time a feeling was expressed, that the features of the proposed plan were so

much broader than any other which had preceded it, that it became invested with an originality of its own. And we have reason to believe that there will be a considerable amount of national pride and exertion on the part of individuals to contribute to its success." On the question, "Whether the scope of the Exhibition should be exclusively national or universal?" the testimony of several eminent manufacturers was, that "the comparison with foreigners would show what our manufacturers could do, and by generating increased knowledge and appreciation in our consumers, would induce the production of a much higher class of work." The next point to which attention was drawn, was "Whether such exhibitions should be supported by funds voted by the House of Commons or by voluntary subscription?" and the preponderance of opinion was certainly in favour of the latter plan. With respect to the "willingness to exhibit," it was found that objections were raised in various quarters to show productions to any but *bona fide* customers, and that these objections arose from apprehensions of piracy, the Copyright Registration Act not being deemed an adequate protection to the manufacturer; still, many who thus argued were willing to exhibit special productions, to show their capabilities.

So far our abstract of the document—which, progressing of an official character, reports the progress that has been made in this great national undertaking up to the present time: it is not improbable, however, that before our Journal is in the hands of the public a step still more decisive may have been taken—possibly the Royal Commission will have been appointed by the Queen; and although, of course, the Society of Arts will continue to act as the executive body, the Commission will no doubt superintend, direct, and confirm.

It is impossible for us not to listen to the various rumours that are afloat in reference to this all-engrossing topic; suspicions are unquestionably entertained in some quarters; and complaints have been already uttered in others. But we cannot for a moment believe that a course will be adopted which does not receive the sanction of His Royal Highness Prince Albert, and will not ultimately obtain that of the Royal Commission. We know well that the great experiment will be a great failure—a national disaster—that the country will be dishonoured, and the interests of Art irreparably injured—if there be the slightest departure from a straight path, a path of policy as well as of rectitude; and we are bound to conclude that all the parties who are arranging the plan take this view of the case as strongly as we do.

We may perhaps be called upon at some future time to notice these rumours, and we hope to confute them: for ourselves, we shall be above suspicion of lending our aid to either Council or Commission, unless we be fully convinced that all the plans will be carried out in good faith—in pure impartiality—with no regard to individual interests—or any thought to promote the projects of any individual, unless it be clearly shown that in doing so the great end and object of the Exposition be thereby advanced.

To two of the objections already made public we may briefly refer. The one regards the Society of Arts, objected to (somewhat strangely) as being too prominent in the affair. Now to us it is clear, that if the Society had done nothing, nothing would have been done. Any similitude was as able as Columbus to make the egg stand, when how to do so had been taught him. No one stirred in the matter (except, indeed, ourselves; and as we have shown, we did not feel in a position to do more than suggest), until the Society of Arts warmly, and in earnest, took it up. To that Society, and especially to its most active member, Mr. Henry Cole, we are unquestionably indebted for the prospect which now gladdens this country and is cheering to all Europe. It is only common fair play to give to that gentleman the credit which belongs to him for his energy, and perseverance; and it will be quite time enough to censure him (which we shall be perfectly ready to do), if we find any solid and just drawback from the merit which, up to this time, at all events is unquestionably his. Another matter for comment regards the appointment of a secretary, it is understood, at a salary of 700*l.* a year. This appointment has been, we think, premature; and

we should have been pleased to see *Pro Tem.* affixed to his official signature; but there will be no second opinion as to Mr. Digby Wyatt's entire fitness for the task. He has amply proved this by his published works, which are of the highest and best order, on "Ornamental Art," and by his masterly report of the Paris Exposition. The salary fixed, if it be fixed, is by no means too large; with reference either to his position, capabilities of making income, or the labour he will have to undergo. We have never seen this gentleman, but if his manners be courteous and conciliating, we may consider, indeed, the acquisition of such a secretary as a great point gained, and an augury of entire success for the Exposition. Yet another point for comment is the selection of missionaries to the manufacturing towns. We believe they have not been the best that could have been found; that several of them knew little of Art, nothing of Manufactures, and are ignorant of the localities they had to visit; but very possibly they were the best to be procured at the moment. As respects the mode of raising funds, the estimates for building, the ultimate charges for admission, fees to be paid by exhibitors, per centages upon orders for articles, and various other important items, we reserve for ourselves the right to speak freely when something more intelligible than the "thousand tongues of Rumour" shall have furnished to us a guide.

We trust, however, that no manufacturer, no real lover of Art, no true patriot, will make us an excuse for not coming forward—with countenance, and if need be, with subscriptions—the plea that his own particular views are not precisely those which the Council of the Society of Arts, and the Royal Commission design to carry out. There must be confidence to secure even a prospect of success; we repeat we cannot fear that such confidence will be misplaced; if we find our hopes without good basis, our readers may be assured we shall be at hand to warn them—that we shall be the first to expose a transgression and to brand the transgressor.

Since the above was written, the following important documents have been transmitted to us; they confirm us in our conviction that there is a watchful eye over all the proceedings, and that the public interests will be maintained and preserved. We received these documents too late in the month to do more than print them; but next month the whole of the affair will be in its completed state before us for scrutiny and criticism; the Commission will have been appointed; and, in a word, the vessel will have been launched.

TO HIS ROYAL HIGHNESS THE PRINCE ALBERT,
PRESIDENT OF THE SOCIETY OF ARTS.

4 Guildford, December 7, 1849.

SIR,—I have had the honour to receive by your Royal Highness's commands the following extract from the Minutes of the Executive Committee of the Exhibition of Industry of all Nations:—

"The Prince inquired whether Mr. Cole was prepared to report on the willingness of the contractors to place a limit on their profits, and was informed that the contractors had stated they were disposed to entertain at all times any wishes of His Royal Highness, and to refer them to arbitration.

"His Royal Highness expressed his great satisfaction at this proof of confidence, and thought it expedient that the contractors should write a letter to accompany the deeds, agreeing that the Council of the Society of Arts should have power to determine the contract by arbitration on the 31st March, or at any time His Royal Highness might think desirable.

"Resolved—That a copy of the Minutes entered on Friday last, referring to the contract, be officially sent to Mr. Drew, with a request that he obtain an answer to it from the contractors as early as possible."

"To the two proposals above mentioned, respecting, first, the willingness of the contractors to place a limit on their possible profits, and, secondly, to assent to a further extension of the term for determining the contract, I have to inform your Royal Highness, that I am authorised by the contractors, Messrs. Munday, to reply on their behalf as their nominee.

"Before considering the first proposal, I submit it is necessary to dispose of the obvious preliminary question, whether the Minute implies that the Government or the Society of Arts, or any body else, in desiring to limit the possible profits, is prepared to limit the possible losses that may be sustained under this contract. As the Minute does not allude to this contingency, I have taken it for granted that no one is so prepared. Under this view I proceed to discuss this proposal, which I am authorised to say the contractors are quite prepared to consider in accordance with your Royal Highness's suggestion, because they fully sympathise in the desire of your Royal High-

ness to protect to the utmost the public interest in this matter. They admit the full force of the fact, that the undertaking now appears under an aspect very different from that which it wore in July last, when it was first propounded by your Royal Highness. At the same time the contractors submit it should be borne in mind, in considering their position, that, before the proposition for holding the Exhibition, accompanied with the offer to the world of prizes to the amount of 20,000*l.* could be published, it was obviously necessary that there should be some guarantee that the proposal would become a reality. The contractors apprehend that there can be no doubt that the Government, the Society of Arts, or some one, must have taken the preliminary risk before any public steps whatever could be taken, and the contractors, for certain considerations, were then willing to undertake that risk. If a contract had to be made now, in the month of December, for the first time, the present information as to the expression of public feeling might, perhaps, cause the terms of that contract to be different.

"The contractors, however, do not wish to take advantage of the state of uncertainty which existed in July last, and are willing that the better knowledge and experience in this matter, which has been obtained at their risk and by their expensures should be fairly considered. But in so doing, I submit that the circumstances of the early period when the agreement was made ought not to be forgotten. In July there was no evidence at all to indicate how far the public would respond to the proposal, and there was no pecuniary guarantee whatever to secure its eventual success, as indeed there is none certain even now.

"The contractors were invited to enter into an engagement binding themselves to carry out this great work, involving a certain liability of 75,000*l.*, to be prepared at once when called upon to deposit 20,000*l.* for a prize fund; to advance all necessary capital for preliminary expenses, and to make an outlay immediately without any tangible commercial security whatever. If they had viewed this proposal simply as tradesmen, they would probably have declined it, as I know that others had already done, but they were induced to entertain it principally by my knowledge (obtained from the perusal of Minutes of meetings held at Buckingham Palace and Osborne House, and shown to me by Mr. Fuller) of the interest taken by your Royal Highness in the plan, and of the confidence displayed by your Royal Highness in this matter in Messrs. Cole, Fuller, and Russell, from whom (then personally unknown to the contractors), the latter received an assurance of willingness to co-operate in the Executive Committee.

"Upon such moral rather than commercial security the contractors entered into this arrangement, binding themselves to carry out the proposal, which was not indeed defined in its extent, but was to be carried out to such an extent and in such a way as your Royal Highness or a Royal Commission, if issued, should direct.

"The receipts by which the outlay was to be repaid, either as respects the amount, or the regulations for obtaining them, were to be altogether beyond their control. How and whence they should arise they could not determine; this point resting with the public themselves and with the Royal Commission. It was agreed, when the receipts were sufficient to repay the 20,000*l.* advanced for the Prize Fund, the expenses of the building, and some expenses mentioned in the deed, that the residue of the receipts, if any, should be divided in certain proportions between the Society of Arts, as trustees for the public in this matter, and the contractors. Out of their share the contractors undertook, further, to pay the expenses, necessarily very considerable, of all management, salaries, offices, advertising, printing, &c.; and the Society of Arts, as understood, would hold their proportion in trust for future similar exhibitions; so that even after the Prize Fund and the building had been paid for, the contractors still had a risk, whilst the public were sure of a future fund, if the receipts from the undertaking afforded any surplus whatever beyond the outlay for prizes and the cost of the building. During the preparation of the deeds for giving effect to the arrangements already mentioned, a still further protection of the public was asked of them, and they consented to the proposition made by Mr. Cole, that the contract should be altogether cancelled upon arbitration before February 1, 1850, if the Government desired it; thus practically assenting that, if a better arrangement for the public could be devised, there should at least be an opportunity of making one.

"I have now to state to your Royal Highness that, as the contractors still entertain the same confidence towards the undertaking and its promoters as they did when they came forward in July, and by so doing enabled the proposal to be announced to the world, so they are now willing that an arbitration shall determine, when the Exhibition is closed, the proportion of any surplus, after payment of all expenses whatever, to be allotted to them as remuneration for the capital employed, the risk incurred, and the exertions used.

"With regard to the wish of your Royal Highness that the contractors should agree to a still further extension of the time within which Her Majesty's Government shall be at liberty to determine the contract, and the suggestion made, as I understand, by your Royal Highness, that the period of extension should be the end of two months after the first meeting of the Royal Commission, I have to state that the contractors consent that the contract shall be liable to be determined at any time within the period suggested, upon the desire expressed by the Lords of the Treasury in the manner in all other respects provided in the deed.

"In conclusion, I beg leave to submit to your Royal Highness that, while I have no wish to parade the willingness of the contractors thus to make further concession or to submit to further modification in the terms of the contract for the public benefit, I think it only fair to call to mind the position in which they now place themselves.

"Your Royal Highness has the guarantee that the proposal will be carried out in such a way as a Royal Commission may direct. The Society of Arts have the honor of being the organ for executing the proposal without any risk or loss to themselves. The public not only have no risk or loss, but will have in fact all the profits of the under-

taking, because I submit that a fair remuneration for risk and employment of capital cannot be considered as any other than an ordinary charge. In fact, the contractors are the only parties unprotected, and are liable to all the risks whatever.

"I have the honour to be, Sir, with the greatest respect,
"Your Royal Highness's most obedient
and faithful servant,
(Signed) "GEORGE DREW."

"Osborne, December 10, 1849.

"Sir.—I am commanded by His Royal Highness the Prince Albert to acknowledge the receipt of your letter of the 7th December, and to express to you His Royal Highness's sense of the public spirit, and confident readiness which were displayed by the contractors in the original acceptance of the contract at a time when the risk of the undertaking could in no way be ascertained or limited.

"His Royal Highness has no hesitation in acknowledging that it was owing to the liberality and public spirit thus displayed, that it became possible for him to bring the scheme of the Exhibition of the Industry of all Nations, before the Government and the public in a shape insuring the practicability of its execution.

"His Royal Highness is happy to trace the same feelings in the answer which he has received from you on the part of the contractors, under the present much altered circumstances of the undertaking; and the Prince is induced to hope that the position in which the present contract can be held before the Government and the public will prove satisfactory to both.

"Firstly. Because the present agreement enables the Royal Commission, should it decide that the present contract will not be conducive to the public benefit, to determine that contract, within a limited time, upon equitable terms.

"Secondly. Because the contractors have consented to an arrangement by which the share to be assigned to them of any profits that may be realized from the Exhibition, after payment of their expenses, shall be determined by arbitration, under the then existing circumstances of the case, whilst they still remain liable for any possible losses, arising solely to the benefit of the public, and in a scheme which they have already so warmly received.

"It is in appreciation of this fact that His Royal Highness feels it a duty to furnish to them the earliest information with regard to the scheme in which His Royal Highness, as President of the Society of Arts, in conjunction with the British public, stands now morally pledged to the world; and therefore the Prince is pleased to direct that the contract, with the modifications agreed to in your letter, together with this answer written by His Royal Highness's command, shall be published without delay.

I have the honour to be, Sir,

Your obedient humble servant,
(Signed) "C. B. PIPERS."

"George Drew, Esq."

AN ABSTRACT OF TWO INDENTURES entered into between THE SOCIETY OF ARTS, of the one part, and JAMES MUNDAY and GEORGE MUNDAY, of the other part, being a Contract for providing the necessary Funds and Buildings for carrying out the GREAT EXHIBITION OF INDUSTRY IN 1851.

This Contract may be cancelled at any time within Two Months after the first meeting of the Royal Commission; the claims of the Contractors for present advances, &c. being referred to Arbitration.

The various recitals, covenants, and other arrangements contained in such Deeds, are as under:—

DEED NO. 1.—RECITES THAT HIS ROYAL HIGHNESS PRINCE ALBERT IS PRESIDENT OF THE SOCIETY OF ARTS, THAT HIS ROYAL HIGHNESS AND THE SOCIETY WERE DESIROUS FOR THE PROMOTION OF THE ARTS, MANUFACTURES AND COMMERCE OF THE COUNTRY, TO INSTITUTE A GREAT EXHIBITION IN 1851, AND FOR THIS PURPOSE THAT PRIZES TO THE VALUE OF 20,000L. AT THE LAST SHOULD BE AWARDED. THAT (IN ACCORDANCE WITH A PREVIOUS UNDERSTANDING) A SITE WOULD BE PROVIDED BY THE COMMISSIONERS OF WOODS AND FORESTS—THAT IT WAS DEEMED NECESSARY BY HIS ROYAL HIGHNESS AND THE SOCIETY THAT THE SUM OF 20,000L. FOR PRIZES SHOULD BE LODGED TO SECURE THE PAYMENT OF SUCH PRIZES—THAT HER MAJESTY SHOULD BE PETITIONED TO ISSUE A ROYAL COMMISSION OF WHICH HIS ROYAL HIGHNESS SHOULD BE PRESIDENT—THAT CAPACIOUS BUILDINGS SHOULD BE ERECTED, THE DESIGN FOR WHICH IS CONTEMPLATED TO BE OBTAINED BY PUBLIC COMPETITION—THAT PROSPECTUSES OR OTHER DESCRIPTIONS AND ANNOUNCEMENTS OF THE PROPOSED DESIGN, AND ALL OTHER NECESSARY MEANS FOR PROMULGATING, ADVANCING, AND COMPLETING IT, SHOULD BE CIRCULATED AND ADVERTISED—THAT IT WAS NECESSARY, IN ORGANISING THE ARRANGEMENTS, THAT MEMBERS OF THE SOCIETY SHOULD VISIT THE PRINCIPAL CITIES, &c.—THAT MANAGERS, SECRETARY, AND OFFICERS IN GENERAL SHOULD BE PROVIDED—THAT AS THE FUNDS OF THE SOCIETY WERE INADEQUATE TO SECURE PAYMENT, AND THROUGH IT WAS ANTICIPATED THAT A CONSIDERABLE SUM WOULD BE RAISED BY SUBSCRIPTION AND OTHER MEANS, STILL IT WAS DOUBTFUL WHETHER THE SUMS SO RAISED WOULD BE SUFFICIENT, THAT, IN ACCORDANCE WITH THE AGREEMENT, WAS ENTERED INTO BETWEEN THE SAID CONTRACTORS AND THE SAID SOCIETY FOR CARRYING OUT THE DESIGN; FOR PROVIDING 20,000L. FOR PRIZES, AND FOR IMMEDIATELY PAYING 5000L. WITH PRELIMINARY EXPENSES, AS WELL AS SUCH FURTHER SUMS AS SHOULD BE REQUISITE, AND FOR INDEMNIFYING THE SOCIETY AGAINST EXPENSES—THAT THE SAID SOCIETY HAD APPOINTED AN EXECUTIVE COMMITTEE, INSTEAD OF A COMMITTEE OF THE PART OF THE CONTRACTOR, AND ALSO TRUSTEES FOR THE 20,000L. AND OTHER MONIES ALLOTTED FOR PRIZES, WITH TREASURERS OF EXHIBITION FUNDS. THAT IT HAD BEEN AGREED THAT IF BEFORE THE 1st OF FEBRUARY 1850, A ROYAL COMMISSION SHOULD NOT HAVE BEEN ISSUED, THE CONTRACTORS MIGHT REFER FURTHER PROCEEDINGS TO ARBITRATION.

THAT IN PERFORMANCE OF SUCH AGREEMENT, THE CONTRACTORS ON THEIR PART HAD PAID 5000L. ON THE 30th OF AUGUST, AND A FURTHER SUM OF 20,000L.; AND IT HAD

ALSO BEEN AGREED THAT THE EXHIBITION SHOULD BE CARRIED OUT IN THE MANNER EXPRESSED IN THESE PRESENTS, AND IN ANOTHER INDENTURE OF EVEN DATE—THAT TRUSTEES, &c. OF 20,000L. AND 5000L. ACTUALLY PAID, AND ALL OTHER MONIES TO BE PAID, SHOULD BE DECLARED—THAT CERTAIN PAYMENTS MADE, AND LIABILITIES INCURRED, BY THE SOCIETY, SHOULD BE CONSIDERED AS PART OF THE EXPENSES OF THE EXHIBITION.

The Contractors then covenant to pay from time to time, until the 1st November, 1851, all such money as may be required for the Exhibition, and that they will within three months after the Exhibition shall have been carried out, pay such a sum as, together with monies previously paid, shall be adequate to pay all expenses whatsoever, of advertisements, printing, agents, offices, superintendents, clerks, workmen, buildings, insurances, decorations, and all other the costs, charges, and expenses of every kind whatsoever, to which the Society may be liable, and will indemnify the Society from such expenses, except the cost of the preparation of the deeds and premiums for designs for buildings. It is then declared that the said 20,000L. shall be invested in the names of the Trustees in Government or other Securities, as His Royal Highness may direct; and that the 5000L. already paid, and all monies to be hereafter paid by the Contractors, as also all donations, &c. shall be invested. And it is provided that if the donations and subscriptions shall exceed 30,000L., then, and in addition thereto, certain further sums may be set apart for Prizes. And that the Society shall hold the receipts to repay to the Contractors 20,000L. advanced for Prizes, with interest at 5 per cent.; also all such sums they shall be entitled to receive from their covenants, with interest, as aforesaid, except certain expenses which are to be exclusively paid by the Contractors;—But it is agreed that, if the receipts shall more than cover all such payments, the residue thereof shall be held upon trust, one-third to be retained by the Society of Arts, for the Establishment of future Exhibitions, and the remaining two-thirds to be paid to the Contractors, out of which the Contractors are to pay the salaries of managers, officers, attendants, salaries, advertisements, printing and other incidental expenses. That if a Royal Commission shall not be issued before the 1st February, 1850, the Contractor may refer the matter to arbitration, that if the Contractors neglect to fill the covenants, the Society shall stand possessed of the said 20,000L. and all other sums paid by the Contractors, for the further indemnifying the Society from all expenses and liabilities in relation to the said Exhibition, the Society's right to demand the performance of the Contract to indemnify, not however to be prejudiced; that the Society shall be enabled to determine the Contract, upon receiving on or before the 1st February, 1850, a request to do so from the Lords Commissioners of Her Majesty's Treasury, and that the Society is not to be answerable for any future losses.

DEED NO. 2.—RECITES THAT THE CONTRACTORS HAVE PAID 20,000L. FOR PRIZES MENTIONED IN DEED NO. 1, AND 5000L.; AND HAVE COVENANTED TO PAY SUCH OTHER SUMS AS SHALL BE REQUIRED. IT HAS BEEN AGREED BETWEEN THE SOCIETY AND THE CONTRACTORS, THAT CERTAIN SPECIFIED ARRANGEMENTS RELATING TO THE EXHIBITION ARE TO BE UNDER THE CONTROL OF THE EXECUTIVE COMMITTEE, UNLESS A ROYAL COMMISSION SHALL BE ISSUED. THAT ON OR BEFORE THE 1st MAY, 1850, PLANS, &c. OF BUILDING, ARE TO BE SUBMITTED TO HIS ROYAL HIGHNESS—THAT THE PLANS, &c. APPROVED BY HIS ROYAL HIGHNESS SHALL BE DELIVERED TO THE CONTRACTORS ON OR BEFORE THE 1st JUNE, 1850, WHEN THE CONTRACTORS ARE TO BE PUT IN POSSESSION OF SITE. THAT THE CONTRACTORS WITHIN ONE MONTH DELIVER A STATEMENT OF QUANTITIES AND A TENDER—THAT IF THE CONTRACTORS TENDERS BE DEEMED EXCESSIVE, THE PLANS, &c. AND THE TENDERS BE REFERRED TO ARBITRATORS—THAT THE PRICE REPORTED BY THE ARBITRATORS SHALL BE THE PRICE TO BE PAID TO THE CONTRACTORS FOR THE BUILDING—THAT THE CONTRACTORS SHALL COMPLETE THE BUILDING ON OR BEFORE 31st MARCH, 1851. THAT THE MATERIALS SHALL BE THE ABSOLUTE PROPERTY OF THE CONTRACTORS AFTER THE TERMINATION OF THE EXHIBITION ON THE 1st OCTOBER, 1851; THAT BOOKS OF ACCOUNTS AND OTHER BOOKS SHALL BE KEPT; THAT ALL REQUISITIONS TO THE CONTRACTORS, AND ALL TRANSACTIONS BE RECORDED IN BOOKS, AND DULY SIGNED AND AUTHENTICATED; THAT ANY ACT, DIRECTION, &c. BY THE SOCIETY, COUNCIL OR COMMITTEE, NOT RECORDED, SIGNED AND AUTHENTICATED, AS AFORESAID, MAY BE DISOBEYED BY THE CONTRACTORS; THAT IF ANY DISPUTE SHALL ARISE BETWEEN THE SOCIETY AND ARBITRATORS, AS TO THE CONSTRUCTION OF THE DEEDS, OR AS TO ANY OTHER MATTER RELATING TO THE UNDERTAKING, SUCH DISPUTE BE REFERRED TO ARBITRATION, AND THAT SUBMISSION TO ARBITRATION MAY BE MADE A RULE OF COURT.

In this "contract" there will no doubt be some points for comment—that perhaps more particularly which gives to the contractors two-thirds of whatever profits may accrue; but upon this and other matters we reserve ourselves until the whole of the affair can be brought under review—merely observing at present, that, although personal and private interests may be sought and obtained they cannot be considered as unjustifiable or unexpected. Direct gain is the most sure, if it be not the only, stimulus to exertions which may be made universally and largely useful; in a commercial country like ours it is generally a wise application. Let it be remembered, however, that under any circumstances, the risk is great: it can be lessened, or avoided, only by honourable and liberal conduct.

* This investment has been made in Exchequer Bills, in the names of the Marquis of Northampton, the Earl of Clarendon, Sir J. P. Boileau, Bart., and J. C. Peché, Esq.

MINOR TOPICS OF THE MONTH.

[We venture, this month especially, to direct the attention of our Subscribers and Readers to the Volume of Advertisements which accompanies this number of our Journal. They cannot fail to be read attentively, and they ought to be so, inasmuch as they exhibit the "form and body of the time," and supply a mass of information interesting, as well as practically useful, to all classes.

It is a truth, almost universally known, that in a leading periodical work, the advertisements are its sustenance. The expenses incident to any well-conducted publication, in which all matters are liberally paid for, usually, if not invariably, preclude the possibility of profit from the mere circulation. In our case it will be, we think, obvious that if, by any misfortune, we were deprived of this source of income, our Journal must cease to exist; we therefore refer, with no small degree of satisfaction, to the proof supplied by this department of our Journal of the estimation in which we are held and the support we receive.

It is unnecessary to state that no advertisements of a questionable character ever appear in our columns. We believe those pages are read, as generally, as the original portions of our Journal; and it is our study so to arrange them that they may become useful guides to those who seek either the luxuries or the necessities of life.

The very extensive circulation we enjoy—such circulation being through the best channels of the country—will readily account for the large resort made to these pages by those who desire to communicate the productions which learning, taste, ingenuity, and commerce are continually offering as ministers to the wants of mankind.]

ROYAL ACADEMY OF ARTS.—On the 10th of December, being the Eighty-first Anniversary of the foundation of the Royal Academy of Arts, a general assembly of the Academicians was held at their apartment, in Trafalgar Square, when the following distribution of premiums took place, viz.—To Mr. John Alfred Winter, for the best Historical Painting, the Gold Medal, and the Discourses of the Presidents Reynolds and West. To Mr. Edward James Phycell, for the best Historical Bas-relievo, the Gold Medal, and the Discourses of the Presidents Reynolds and West. To Mr. Ferdinand Pickering, for the best Painting from the Life, the Silver Medal. To Mr. Edmund Eagles, for the best Drawing from the Life, the Silver Medal, and the Lectures of the Professors Fuseli, Howard, and Flaxman. To Mr. Charles Rolt, for the next best Drawing from the Life, the Silver Medal. To Mr. Leonard Charles Lyon, for the next best Drawing from the Life, the Silver Medal. To Mr. William Jackson, for the best Model from the Life, the Silver Medal. To Mr. Alfred Francis Young, for the best Drawings of the South Portion of St. Paul's Cathedral, the Silver Medal. To Mr. Charles Rolt, for the best Copy made in the Painting School, the Silver Medal, and the Lectures of the Professors Fuseli and Howard. To Mr. Samuel Barling Clarke, for the next best Copy made in the Painting School, the Silver Medal. To Mr. Arthur Hughes, for the best Drawings from the Antique, the Silver Medal, and the Lectures of the Professors Fuseli and Howard. To Mr. Charles Wright, for the next best Drawings from the Antique, the Silver Medal. To Mr. William Short, for the next best Drawings from the Antique, the Silver Medal. To Mr. Charles Summers, for the best Model from the Antique, the Silver Medal and the Lectures of the Professors Fuseli and Flaxman. In consequence of the continued indisposition of Sir Martin Arthur Shea, the President, the premiums were distributed by George Jones, Esq., the Keeper, who delivered a short address to the students. The General Assembly afterwards proceeded to appoint officers for the ensuing year, when Sir Martin Arthur Shea was unanimously re-elected President.

COUNCIL.—New List: Richard Westmacott, Jun., Daniel Maclise, William Frederick Witherington, and Solomon Alexander Hart, Esqs.—Old List: Charles West Cope, William Dyer, Edwin Landseer, and Richard Cook, Esqs. VISITERS IN THE LIFE ACADEMY.—New List: Abraham Cooper, John Rogers Herbert, Patrick Macdowell, Wil-

Ham Frederick Witherington, and Richard Westmacott, Esqs.—Old List: Charles West, Esq., William Dyce, Frederick Richard Lee, and Charles Landseer, Esqs.

VISITORS IN THE SCHOOL OF PAINTING.—New List: William Mulready, Charles Lock Eastlake, George Jones, and Thomas Webster, Esqs.—Old List: Abraham Cooper, Charles West, Esq., William Dyce, Frederick Richard Lee, and Charles Landseer, Esqs.

ADVISORS RE-ELECTED.—William Mulready, Esq., Sir Richard Westmacott, and Philip Hardwick, Esq.

THE LATE W. ERY, R.A.—The citizens of York, the birthplace and final resting spot of this great painter, have not been unmindful of the duties they owe to their illustrious fellow-townsmen. At the first meeting of the Town Council after his decease, before proceeding to other business, the Lord Mayor called the attention of the court to the event which had cast a deep shade over the minds of the inhabitants of that ancient city, and which called for some marks of public recognition. It was therefore unanimously agreed upon that the Corporation should attend officially on the day of the funeral, and accompany the remains to the churchyard of St. Olave's, in Marygate, their place of destination. Accordingly, at the appointed time, the funeral was attended by a very numerous assemblage of the citizens, headed by the Lord Mayor, with his officers, the other members of the Corporation, the Council of the Yorkshire Philosophical Society, and the pupils of the York Government School of Design. Most of the streets through which the procession passed had their shops closed; and the passing-bells of the noble Minster, and of the deceased's parish-church, St. Martin's-le-Grand, were tolled. This general feeling of respect to the memory of so distinguished an individual is no more than might have been expected, and was due to him. Genius demands homage, and who so meet to do it reverence as those among whom it was cradled?—Seven citizens of Greece contended for the birthplace of Homer; Stratford-upon-Avon glories in having reared Shakspeare; York may be proud of having witnessed the infancy and youth of Elty, one of the noblest painters of modern times. But we trust the admiration of her citizens will not terminate with the respect paid to his lifeless body; a higher and more enduring record of his genius and moral worth should, and doubtless will, be accorded him; for we understand it is proposed to erect, by public subscription of his fellow-townsmen, a monument to his memory, and we trust it will be one worthy of his great name and honourable to the donors. When statues and columns are reared in the native places of successful military and naval commanders, surely we may hope to see a veteran in the Arts of Peace similarly honoured.

GOVERNMENT SCHOOL OF DESIGN.—Mr. George Wallis, lately of the Manchester Branch School, delivered a lecture on the 21st of December, at Somerset House, "On the Conditions of Design as applied to Embroidery by Hand and by Machinery." In consequence of our sheets being very early at press, we can only thus briefly allude to the subject.

EXPOSITION AT BIRMINGHAM.—This Exposition, which it has been our pleasant duty to describe and illustrate in the pages of our Journal, closed on Saturday, December 15. It has continued throughout to be singularly attractive, and during the three first days of the last week's exhibition, the visitors amounted to no less a number than 7792. We have no means this month to do more than notice the close of this valuable record of the Arts of Birmingham.

BELFAST SCHOOL OF DESIGN.—One of the most gratifying incidents connected with this institution is the determination announced by the President, Lord Dufferin, to offer a prize of 50*l.* for the best design for a damask table-cloth, the prize to be awarded by competent judges, and the cloth manufactured at Belfast. We hail this announcement with pleasure as a step in the right direction, and one which sets an admirable example for the improvement of Irish manufactures.

THE INSTITUTE OF THE FINE ARTS.—A meeting of members took place on the evening of the 6th of December; called with a view to the winding up of the affairs of the Society. The meeting was convoked at the "Bedford Statuary Gallery," in Store Street, Bedford Square; and was but thinly attended. The evening was oc-

cupied in auditing accounts, items of which were debated with great animation; and whereby the business was protracted till a late hour. We cannot regard the failure of this attempt to establish communion among artists with the common sentiments with which might be contemplated a well-directed and well-supported effort, succumbing to ordinary causes. Whether the Institute may have been well and harmoniously directed, or otherwise, we will not here inquire; it is evident that it has not been honourably supported by all who gave their adhesion to it. The ordinary bye-laws of most associated bodies prescribe the advanced payment of all subscriptions, but it appears that the books of the Institute have had the benefit of names without the payment of subscriptions; the amount in default is, we believe, some hundreds of pounds, and it is this that has caused the extinction of the Institute. According to the books, a numerous list of persons, it is said, availed themselves of the conveniences of the establishment in Marlborough Street, without the payment of subscriptions, the result of which is that the honourable few who believe themselves bound to settle the accounts, are necessarily left minus the means; although, if the subscriptions due were paid, all claims, we believe, could be met. There is among us no profession less bounded by *esprit de corps* and *esprit de cœur* than artists; the ultimate difficulties of this Institution supply one more example of this—and of something more. There are men in all professions, more or less, touched with the Arcadian taint, but such defections as this are rarely met with. Other meetings must be called, and the settlement of the affairs will not be so speedily accomplished as there was reason to expect. We shall recur to this subject when the "accounts" are finally "made up," and we are able to report the resolutions agreed to at this last meeting.

THE "FREE" EXHIBITION.—The building in Regent Street, near the Polytechnic Institution, is so far advanced as to afford a hope of its completion in a few weeks. Propositions were, it is understood, made to this body on the part of the Society of British Artists, relative to a junction of the members; but the question is no longer entertained. Mr. Catmole, we believe, purposes exhibiting in the new rooms; and Mr. Dippa, who has been for some time resident in Italy, has joined the Society.

THE OLD AND NEW WATER-COLOUR SOCIETIES.—On the accession to the Old Society from the New of four recently-elected associates, it was understood that an action was commenced by the latter Society for the recovery of certain fines payable on the secession of members. The claims of the Society were resisted upon certain grounds, and the action has been settled in favour of the defendants. At a recent session of the New Water-Colour Society, the election was in favour of Mr. Cooke, a resident at Plymouth.

THE SOCIETY OF BRITISH ARTISTS.—The school which was opened by this society will not meet this season, in consequence, we believe, of the little hope afforded of ultimately establishing an academy worthy of the body. We continually hear complaints of the difficulties of obtaining instruction in drawing, but in this case, when a valuable opportunity presents itself, it is met with total indifference, and yet our exhibition teem with pictures shaming in defects, of which faulty drawing is among the most conspicuous. Nothing could be more liberal than the terms on which this school was opened, and nothing could be less satisfactory than the result of the experiment.

THE CLESTONE STREET SOCIETY.—It was contemplated by the members of this Society to institute this season a course of anatomical lectures, illustrated by the subject and the living model, but the proposition is now no longer entertained. The regularity with which the affairs of this Society are conducted renders it a desirable school of Art, inasmuch as the limited number of subscribers is always maintained, and there are always applications for admission. The Friday evening sketching meetings are well attended, and many of the sketches are productions of a high degree of merit.

THE OUTLINES BY MR. MACLISE to illustrate "The Seven Ages," announced for publication by the Art-Union of London, were not designed for that purpose; and it is scarcely fair to the accomplished artist to put them to a use never contemplated by him. It has been done, we understand, without consulting him, and he is, it is said, somewhat indignant at his works being thus forced out of a course for which they were intended. The exquisite drawings referred to (and few have been ever executed which more entirely realise the famous pictures of the poet), were made to embellish a porcelain card-tray. For this they may be admirably fitted; for this, at least, they were produced; and we may presume that the artist was not unwilling to stake his high reputation upon this association with the Art-manufacture of the country. As a published series of engraved plates, however, the case may be otherwise; and while we submit that the council of the Society are not free from blame in making a purchase with a view to applying these works in a manner never thought of by the artist, we may lament that so fine an opportunity of inducing so eminent a painter to design for British Manufactures has been lost to the country; unless, indeed, after publication, they be (as we presume they may be) made to serve the purpose for which they were originally conceived and drawn.

THE CRADLE FOR HER MAJESTY.—We have seen with much pleasure the progress of this important specimen of the Art of Wood-carving, and augur most favourably of the effect the whole will produce in a state of completion. The sides, which are finished, are carved in the choicest box, the difficulty of procuring which wood has been one of the causes for the delay attending the work. In the upper portion are friezes in relief, having an alternate introduction of roses and poppies, designed and executed with the purest feeling of Italian taste. Beneath them is a bold torus moulding with pinks, inserted in fluted hollows. The two ends remain to be produced, and to them the utmost delicacy of finish will be imparted. The interiors of the rockers are ornamented with foliated dolphins, and even the flat edges of the foot and head are elaborately carved into scroll-work. It is a great satisfaction to all who feel interested in this (until recently) neglected Art, that Her Majesty has given the commission for so splendid an example of it; and we feel assured that when completed, it will reflect high credit on the artist, Mr. Rogers, and add greatly to the fame he has already established.

THE STOLEN SKETCHES.—We stated several months ago that Mr. MacLise had been robbed of a number of sketches and unfinished drawings in a very mysterious manner. These sketches, or at least the major part of them, have been recovered by the artist, through the indefatigable perseverance of Mr. Inspector Haynes, one of the most intelligent officers of the police.

PANORAMA OF THE NILE.—This Exhibition which was closed in September, is now re-opened with some additional tableaux of great interest. In the panorama the spectator views the right bank of the river as far as the second cataract, at which station the traveller quits his boat and mounts the camel. To the historian, the antiquary, all those who dwell on the relics of the past history of mysterious Egypt, this bank is thronged with mementos pointing to a period of grandeur so transcendent as to excite the astonishment of all, even in these days. It is on this side the traveller passes the everlasting pyramids, which yet stand in mockery of crumbling cities and temples—Egyptian, Greek, and Roman. The first tableau shows the cutting the channel dyke at Cairo, to admit the waters of the Nile, a ceremony presided over by Mehemet Ali, attended by the late Ibrahim Pacha and Abbas Pacha. The last tableau is the great Sphinx in the Libyan Desert, the view being given with an effect which renders the picture extremely impressive. This is an admirable subject for a panoramic exhibition, and the character of the river and the face of the country have been most faithfully represented.

THE ROYAL BENEFIT ANNUITY SOCIETY, for Granting Annuities to decayed Merchants, Bank-

ers, Professional Men, Master Manufacturers, Tradesmen, their Widows, and Clerks, and to single Females, their daughters, from all parts of the United Kingdom.—This most necessary Charity appeals with more than usual claims to those engaged in prosperous commerce. The perpetual changes that take place all around us are so frequent as to be but little noted; fluctuations from riches to poverty follow each other like the waves on the sea shore, without our giving them the consideration they absolutely demand, from a thinking, much more a Christian, people. The young and prosperous tradesman, is stricken by the band of death, and his wife and children pass from beside his grave, ere the grass is green thereon, to the Workhouse; and ever after the brand of incurable poverty is stamped upon their brows, unless (we treat our readers to mark and remember that there is an alternative), unless some charity worthy our great national resources, stand between them and the grave of whatever (in the world's esteem) is high or holy. Misfortune, over which in a mercantile country, a man has frequently no control, comes upon the merchant in his prosperity. He struggles, at first hopefully, manfully, but his credit is shaken—he is doubted—refused trust—he sinks gradually from his position, and when old age comes, but for such a society as that, the cause of which we advocate briefly, but earnestly, he must perish in absolute want. It is really heart-rending to read the list of candidates, whose claims and age—they are all past sixty—are simply stated, and yet know that this month, out of the one hundred and ten applicants for annuities, only seven—three men and four women—can be elected—only seven! and all having passed through sixty years of toilsome fluctuation and sad suffering. Is our great city slumbering?—Will she not waken when one hundred and ten aged citizens bend outside her golden gates, and cry—"Help, or we perish!"—Those who have been saved from pestilence, who have still the luxury of ministering to the necessities of others, cannot bail the New Year with a truer jubilee than that of almsgiving: like Mercy—

"It bleaseth him who gives and him who takes."

And we are not without good hope, that "The Royal General Annuity Society," will soon benefit largely by the charitable oblations of the good and liberal citizens of London.

HAMPSTEAD CONVERSAZIONE SOCIETY.—We are not surprised to find from the last report of this Institution, which has been lying on our table for some short time, that it is progressing most favourably; we should, indeed, have been much disappointed had it proved otherwise, considering the high respectability of the neighbourhood, and the large number of artists of talent, on whom it must chiefly depend for contributions, who are resident in and about the locality. It appears that four of these pleasant and instructive *re-unions* were held during the past season, at all of which a very numerous collection of paintings, drawings, engravings, and sketches were supplied by the liberality of various distinguished amateurs and artists. Lectures on matters connected with Art have also been delivered. The increasing list of members is a good augury for the future, and however successful the career of this society may prove in years to come, we are sure it will be richly earned, for the generous feeling which prompts the subscribers to admit, at certain hours, those who are not in a position to augment its funds; for on the evening that succeeded each conversation, the rooms were opened gratuitously to the trading and operative classes of the inhabitants, on the production of a member's order. The average number of those who were thus permitted to inspect the contributions has been about 250 on each evening; and the Committee bear testimony to the good order and the intelligence observed by all who were able to avail themselves of this indulgence. The ensuing season will shortly re-open; it will rejoice us to chronicle its future prosperity, as evidence of the increasing love of Art, and as a reward to those who have taken upon themselves the task of direction and management; at all times one of much trouble, and often of great difficulty.

THE NELSON MONUMENT.—One of the alleviations intended for the ornamentation of the base of the Nelson Column, to which we alluded in our last number, is at length in its place. It is the work of Mr. Carew, and the subject is the "Death of Nelson at Trafalgar." The point of time is that when he is being removed from the quarter-deck by three seamen and a sergeant of marines; and he announces to Captain Hardy that "they have done for him at last." Captain Hardy is on the left of the group, and his attention is directed to some other points. On the extreme right is a group of sailors, apparently lowering the mizen-yard. On the extreme left is a group of seamen, one, a negro, looking up, as about to fire at the man who had shot Nelson. The style of the work is broad and free, and the prominence and character of the linear composition forcibly describes the excitement of the scene. The metal for the work was given by Government, that is, five mortars, and one thirty-two pounder, and the weight is five tons. The remaining three subjects were given for execution respectively to Woodington, Watson, and Termonth. The two latter sculptors are dead, and the design of Watson will be finished by Mr. Woodington.

JENNY LIND.—Since this lady left England she has enjoyed the repose she so much needed amid the beautiful scenery of Switzerland and the Tyrol.—Her health having been previously re-established by the baths at Ems: her voice is more powerful and flexible than ever. Russia and England are both wooing her return to the exercise of her profession; and the King of Sweden has sent a special messenger to entreat her presence in her native city, when she was able to undertake the journey. It will be a matter of deep regret if she does not visit England next season: she is well known to cherish the warmest affection for this country, where she has a nation's admiration, and many devoted friends. The death of the lamented Bishop of Norwich was almost as great a trial to the fair songstress as the death of her friend Mendelssohn had been: in one of her latest letters she entreated the friend to whom she wrote, to place a chaplet of ivy, which she enclosed, upon the grave of Dr. Stanley "as her tears;" this simple offering is in accordance with one of the customs of her country. Miss Lind is now at Lubeck, but will soon proceed thence to Berlin.

THOMAS MOORE.—The Poet is in the enjoyment of good health, physical and intellectual, at his cottage at Sloperton; takes his daily walks along the terrace which borders his pretty garden; and drives as usual each day in a small pony-carriage: he is not living in more than the ordinary retirement in which he has passed the last seven or eight years of his life.

ELASTIC GROTESQUE FACES.—Thousands of these amusing toys (tons of thousands, perhaps), have been imported from Germany, and sold as gutta percha figures, but there is not a grain of gutta percha or of India rubber in them. They are casts in *gutta* and *treacle*, the composition of which printing rollers are made, which is singularly elastic. Gutta percha is not elastic, and India rubber too elastic for a squeeze. These faces of expression after a squeeze. These faces are readily soluble, and in warm water soon melt, which cannot be done with either gutta percha or India rubber; a touch of the tongue, where the added colour will not be removed to spoil the toy, will instantly betray its composition. Surely some of our ingenious modellers can, upon this hint, make them, and profitably too, at one-third of their present cost.

THE EXPOSITION OF M. SALLANDROUZE is to be regarded only as a trade speculation. The objects are changed daily, inasmuch as sales are daily made—made too, as the vendor at the sales in nearly all cases says to buyers, "*très bon marché*." Among the rarer specimens of jewellery, &c., are some cheap imitations offered for a few shillings, and *dear*; in short, the whole of the arrangements are respectable enough for a Bazaar, but altogether undignified—indeed, unwholesome—if the concern is to be regarded as an Exposition.

WATER COLOURS PREPARED WITH WAX.—We are glad to see the house of Messrs. Reeves and Sons—one of the oldest as Artists' Colourmen—if

not the oldest in the trade, sustaining its reputation by improvements of great importance to artists and Art. Whatever may be the secret of their process in preparing wax for water colours, its result is to produce a colour in cake which works at least as freely as the best moist colours, without the disadvantage of hardening or mildewing, and produces a velvety depth of colour of unequalled richness, which will wash out to the most delicate tint. They have also added a new preparation of madder which they call scarlet, but it is rather orange, and one of the most valuable additions that has for a long time been made to the palette. The same spirit has prompted them to become the actual manufacturers of pure Cumberland Lead-pencils. This material, the most perfect in a fine state ever known in the Arts, had long been unavailable, from the difficulty of procuring it free from grit, but when Mr. Brockden's patent mode of purifying and reconducing Cumberland Black Lead, (a valuable invention to which we have more than once adverted in the *Art-Journal*), assured them that they could rely upon the most perfect material, they determined to make cedar pencils on their own premises to insure its purity, and this led to Mr. Harding's allowing Messrs. Reeves and Sons to be one of the three houses to make the pencils referred to in his work, "Lessons on Art."

ART IN MODERN COSTUME.—We are called upon as Journalists of the progress of Art—in all its branches, from the highest to the very lowest object upon which its influence may be beneficially exerted—to offer some remarks upon the great improvements which have been of late years introduced into the ordinary dresses of gentlemen. At first sight to make note of such matters may appear undignified or out of place in a Journal of Art, but the fact is really far otherwise; our task is to record all improvements in the Industrial as well as the Fine Arts, and we have no right to pass by those which more or less concern every man of every grade in society. In olden times, the "costumier" held a high place; when dresses were elegant and picturesque, his business was more strictly that of an artist, than it has been in more recent epochs. But it is beyond question that the spirit which pervades all articles capable of being improved by Art has made its way, and that in a very marked manner, into the workshops of our modern "makers of men's chaperies." We have been repeatedly called upon to notice patterns and designs for ladies' dresses; there can be no just reason why we should not notice those for men. Taste as well as judgment, and fitness as well as ingenuity, have been, in our time, largely exercised by several of those who a few years ago proceeded upon the "old jog-trot" plan of doing only as their fathers had done, or rather deteriorated as they descended. A glance into any of the tailors' warehouses of London will show at once how much of skill and ability has been brought to bear upon objects of dress. The form has been better studied; elegance has been made to associate more closely with comfort, and skill has been allied with taste in designs that go far to remove the awkward, ungainly, and, in some instances, odious, character of the dresses of the past, and earlier portions of the present century. There are many persons to whose productions of this class we could, and perhaps ought to, refer; but our more immediate purpose is to bring under notice two of them—first, because we are given to understand they *lead* in their trade, and next because for a long period they have sought public attention through the advertising columns of this Journal, claiming thus the regards of persons they consider best able to appreciate their exertions. We allude to Messrs. Nicoll (one of whom is at present one of the Sheriffs of London) and Mr. Sayce of Cornhill: we shall take some earlier opportunity of making more direct reference to those articles of dress to which they have paid most particular attention, which they regard as most creditable to the Industrial Art of their establishments, and which we ourselves regard as most creditable to their ingenuity and most evidence good taste.

ENGRAVED BY ROLLS

SPECIMEN PLATE
SCENES FROM THE LIFE OF MOSES.

DESIGNED BY J. M. W. TURNER

REVIEWS.

SCENES FROM THE LIFE OF MOSES. Designed in Outline by SELOUS; Engraved by ROLLS. Published by HALL, VIRTUE, & Co.

This is a series of twenty outline engravings, the subjects of which are striking events in the life of Moses; and such is the merit of the work that we avail ourselves, with much pleasure, of an opportunity of presenting to our readers an example of the art which the enterprising publishers have supplied to us for that purpose. Upon each and every occasion that outline composition, of our own school, has come under our notice, we have welcomed the effort, with the hope that the taste for this kind of Art is extending; for after all, in high class outline resides the essence of Art: and inasmuch as outline is the severest trial of the artist, so is a predilection in favour of it a certain evidence of cultivated taste. We have before had occasion to speak favourably of the fine and vigorous drawing of the artist, but we have never yet seen any production of his, marked by characteristics so aspiring and so well supported by artistic learning and power, as those of which we now speak. Since it demands, for this kind of Art, the highest accomplishments that the painter can possess, it is certain that few are qualified for outline composition; and in numerous attempts there would be numerous failures, since errors in drawing are at once detected by the eye, and hence, it may be, that most inexperienced artists, and those who are few and far between, there are not many who have the power of endowing a line with that eloquence and expression which is the soul of outline; but we are sure, that if there were more of those who could appreciate the sentiment of the highest style, we should see more productions qualified with the rarest excellence of Art. The plates which we shall first describe are Nos. 1, 2, 5, and 12; one of which has been selected to accompany this notice, as an example of the work. The first illustrates that passage of Exodus which has so frequently supplied subject-matter to the painter,—“And when she could no longer hide him, she took for him an ark of bulrushes, and daubed it with slime and with pitch, and put the child therein, and she laid it in the flags by the river's brink.” We see, therefore, the infant lying in the ark, and the mother kneeling, and yielding to an agony of grief at such a parting with her child. Her right hand rests upon the ark, and the left is raised to her head, which is thrown back, the features being expressive of the most poignant sorrow, but without any distortion; the hair is dishevelled, and is expressive of the wailing movement of the figure. A pointed allusion is made to the cause of apprehension, by the attendant, who is looking at the figures approaching in the distance. The composition is, throughout, distinguished by the utmost propriety, inasmuch that it must be pronounced the abandonment of the child Moses, and nothing else. Egypt is sufficiently symbolised by the distant pyramids; and a sphinx immediately behind the group, and the bulrushes, form a very important feature in the scene. The subject of the second plate is from the second chapter of Exodus,—“And the daughter of Pharaoh came down to wash herself at the river, and her maidens walked along by the river's side; and when she saw the ark among the flags, she sent her maid to fetch it. And when she had opened it, she saw the child. Then said his sister to Pharaoh's daughter, shall I go and call to thee a nurse of the Hebrew women.” This plate is, of course, entirely composed of female figures, of whom there are eighteen; the princess is leaning on one of her attendants, looking at the infant, which is presented to her by another, having just been removed from the ark. In this composition the artist has availed himself fully of the subject in order to the repetition of beautiful form in every practicable pose. It is in such a subject, thus treated, that we see the inimitable ripple of the line which describes the human form. The scene is, as we are told, at the brink of the river, and some of the attendants of the Egyptian princess are still in the water; others are assembled round their mistress, and the attention of all is directed towards the child. The Nile and Egypt are indicated by the pyramids, the sphinx, a palm tree, and the everlasting pyramids. The subject of the fifth plate is Moses at the well, assisting the seven daughters of the priest of Midian against the shepherds. The passage is found in the second chapter of Exodus, the seventeenth verse.—“And the shepherds came and drove them away, but Moses stood up and helped them, and watered their flock.” The daughters of the priest occupy the right of the composition, clinging to each other in terror at the conflict going on between Moses and the shepherds. The action of the former

displays an irresistible force, which is fully supported by the agitation of the drapery and the effects of his staff upon the shepherds, some of whom have fallen on the left under his determined attack. The shepherds are semi-nude, and the figures are drawn with accuracy and great power of expression. But Moses is the principal figure; he is fully draped, and the drapery is made very skillfully to contribute to the powerful action thrown into the impersation. The subject of the twelfth plate is derived from the twelfth chapter of Exodus, the particular passage being,—“And the children of Israel did according to the word of Moses, and they borrowed of the Egyptians jewels of silver, and jewels of gold, and raiment.” This is upon the occasion of their departure from Egypt after the smiting of the first-born. The groups here are composed of male and female figures; of the latter, some of the Egyptians are giving their jewels to others of the Hebrew women: all the other components of the groups are either bearing burdens or preparing for their departure. In the background are seen numerous figures already on their journey, and heavily laden. Many among the other plates are of extraordinary merit, and are freely qualified with every paintable property. Moses at the well with the seven daughters of the priest is well adapted for painting: others are, Moses receiving Zipporah to wife; the appearance of the angel “in a flame of fire out of the midst of the bush” is a passage that could not well be omitted in a work like this; here he is alone upon Horeb, and is in terror hearing the voice from the midst of the bush. The departure from Egypt of Moses with his family is a point also dwelt upon with the happiest effect; the two principal figures, Moses and Jethro embracing each other, form an admirable group. The miracle described in the tenth and following verses of the eighth chapter of Exodus has frequently been painted, the changing of the rod of Aaron into a serpent: there is much grandeur in the treatment of the subject; the time is the instant the serpents appear, and that which had been produced by the rod of Aaron is about to swallow the others; Moses and Aaron occupy the centre of the composition; the Egyptian king is seated on his throne, and wise men and sorcerers stand around.—“And the hail smote throughout all the land of Egypt all that was in the field, both man and beast; and the hail smote every herb of the field, and brake every tree of the field.” This subject is treated more fully than some of the others; the foreground is occupied by a crowd of dying Egyptians, and as far as the eye can see there are discernible the dread effects of the dread visitation. This is succeeded by the Death of the First-born of Pharaoh; the Ordinance of the Passover; and the Passage of the Israelites across the Red Sea, the waves of which have divided, and the tribes are visible to the uttermost distance; the Destruction of Pharaoh and his host is an admirable plate, possessing the rarest qualities of Art, as is also the Smiting of the Rock of Horeb. Other subjects are Joshua discomfiting Amalek, and the Return of the Men who were sent to search the Land—indeed in every plate there is evidence of power, research, and mature study. It may be right to add that the publication, of which we have here given a review and a specimen, is printed of a much larger size than our pages. The work is “got up” with considerable taste; and we hope and expect for it the public patronage, to which its merits unquestionably entitle it.

FLORIATED ORNAMENT: A SERIES OF THIRTY-ONE ORIGINAL DESIGNS. By A. W. PUGIN. London, H. G. BOHN.

Mr. Pugin has here given us another of those remarkable publications by which he is so well and usefully known. Its origin is best told in his own words, which we gladly quote, because they practically confirm the theories we so continually endeavour to enforce. He says—“On visiting the studio of Mons. Durif, the architect of Antwerp Cathedral, and designer of the new stalls, I was exceedingly struck by the beauty of a capital cast in plaster, hanging amongst a variety of models, which appeared to be a fine work of the thirteenth century. On asking if he would allow me to have a squeeze from it he readily consented, but at the same time informed me, to my great surprise, that the foliage of which it was composed had been gathered from his garden, and by him cast and adjusted in a geometrical form, and capital composed of solid mouldings. This gave me an entirely new view of medieval carving, and, pursuing the subject, I became fully convinced that the finest foliage work in the gothic buildings were all close approximations to nature, and that their peculiar character was chiefly owing to the manner of their arrangement and disposition. During the same journey I picked up a leaf of dried flintstone from a foreign soil, unobscured at once, and I should usually term Gothic foliage, the extremities of the leaves turned over so as to produce the alternate interior

and exterior fibres, exactly as they are worked in carved panels of the fifteenth century, or depicted in illuminated borders. The more carefully I examined the productions of the medieval artists in glass painting, decorative sculpture, or metal work, the more fully I was convinced of their close adherence to natural forms.”

“It is absurd, therefore, to talk of Gothic foliage, the foliage is natural, and it is the adaptation and disposition of it which stamps the style; the great difference between ancient and modern artists in their adaptation of nature for decorative purposes is as follows: the former disposed the leaves and flowers of which their design was composed into geometrical forms and figures, carefully arranging the stems and component parts so as to fill up the space they were intended to enrich, and they were represented in such a manner as not to destroy the consistency of the peculiar feature or object they were employed to decorate, by merely imitative rotundity or shadow; for instance, a parallel, which by its very construction is flat, would be ornamented by leaves or flowers drawn out or extended, so as to display their geometrical forms on a flat surface. While, on the other hand, a modern painter would endeavour to give a fictitious idea of relief, as if bunches of flowers were laid on, and, by dint of shades and foreshortening, an appearance of cavity or projection would be produced on a feature which architectural consistency would require to be treated as a plane; and instead of a well defined, clear, and beautiful enrichment, in harmony with the construction of the part, an irregular and confused effect is produced, at utter variance with the main design.”

Bearing in mind the peculiar treatment which gives character and style to Medieval Art, Mr. Pugin has designed from natural flowers and plants a series of striking ornaments applicable to various ornamental purposes, most of which are very beautiful, and all “after the ancient manner” so entirely that they fully bear out his views as given above, and prove this position that “Nature supplied the medieval artists with all their forms and ideas.” The plates to this beautiful book are executed by the Messrs. Hanhart in gold and colours, so that the work is a rare combination of beauty and utility.

PORTRAIT OF SIR CHARLES J. NAPIER. Engraved by H. ROBINSON, from the picture by R. WILLIAMS. Published by A. WHITCOMBE, Cheltenham; and P. & D. COLNAGHI, London.

This is an extraordinary portrait of an extraordinary man,—a work of real art. It was the last taken of the gallant general, a few days only prior to his departure for India, and to which, it is stated, he gave his testimony of approval by saying, “it was the only true portrait of him yet taken.” It represents him habited as a civilian, and sitting at a table with his pen in one hand and his spectacles in the other; the absence of the latter from his face, where they are seen in all previous portraits, reveals the entire countenance, with its remarkable expression of indomitable perseverance, and an eye that nothing can escape. Mr. Williams is a provincial artist, residing at Cheltenham, whose portraits have been beforetime favourably noticed in the *Art-Journal*; but we think this surpasses all his previous efforts in the artistic excellence of the work and its unquestionable fidelity to the original. To Mr. Robinson belongs no small honour for his engraving; it is one of exquisite delicacy, power, and freedom. We have rarely seen a work of the class that has pleased us so much.

THE FINE ARTS ALMANAC FOR 1850. Edited by R. W. BUSS. Published by ROWNEY & Co., London.

Much labour and care seem to have been expended on the compilation of this Almanac, which contains a large amount of information that will be found valuable to others than the class who, it may be presumed, would be more especially interested in it; as, for instance, to literary men desirous of knowing in what public institutions they may find works of reference upon topics of art, costumes, &c. While to the provincial artist and amateur it supplies all he would wish to learn respecting the various metropolitan and other exhibitions, the schools of design, drawing classes, galleries and collections open to students. The Almanac, in fact, fully bears out its title, and has our perfect approval.

MOUNT ETNA, TAORMINA, AND MOLA. Lithographed by F. W. HULME, from the picture by W. LINTON.

As there is no publisher's name attached to this print, we presume it is intended, for the present at least, for private circulation. The picture was painted for Richard Ellison, Esq., of Lincoln, and the selection from the artist's portfolio so magnificent a scene does credit to his taste. The view is taken from the eminence whereon stood the theatre of Taormina (the Taurominionum of the Romans), the noble ruins of which edifice form a prominent feature in the foreground of the picture; the city itself, extending for a considerable distance to the right, on the same elevation, but

along the base of a high mass of rock on which its castle is situated. Still farther on, the village of Giardini follows the shore below, and that of Mola is perched, like the eyrie of an eagle, on the highest summit overhanging Taormina. Beyond all this rises *Etna*, gigantic but peaceful, clad in the various hues of an Italian sunset. The waters of an extensive bay occupy almost the entire left of the picture. The whole prospect is one of extreme beauty, and composes into a charming picture, which has been excellently lithographed by Mr. Hulme, who has undoubtedly caught the painter's feeling in transferring it to the stone. We rejoice to encounter so excellent an example of the artist's great abilities; the readers of the *Art-Journal* are familiar with Mr. Hulme's admirable original drawings on wood; we cannot supply them with a specimen of his powers in another class of Art, but they will readily credit our report that his talents in lithography are of the very best order.

THE JUDGMENT OF PARIS. Painted by W. ETTY, R.A.; Engraved by C. W. WASS. Published by GAMBART & Co., London.

In the list of principal pictures painted by Mr. Ety, to which reference was made in his autobiography published in the *Art-Journal*, in February last, appears "The Judgment of Paris," and we then remarked that this picture was in process of engraving by Mr. Wass. This plate is now just on the eve of completion, requiring only a few finishing touches here and there before it is ready for the printer. Having had an opportunity of seeing a proof we are in a position to form an opinion of its merits, and can truly affirm that a worthier tribute to the genius of the painter, and a work more honourable to the engraver has rarely come before us. There are those who can see nothing in Ety but a splendid colourist, and think that by this magic alone he won his way to fame; let such then, inspect Mr. Wass' engraving, and, if really capable of appreciating Art in all its excellencies, they must acknowledge how erroneous has been their judgment. The reduction of the noble picture to black and white proves the power of its most effective composition, which, in variety of form and character, in beauty of expression, and in *chiaroscuro*, is infinitely superior to Rubens' picture of the same subject in the National Gallery. This is high praise, yet is it no more than truth, as a comparison of the group of the Three Graces, in each work, must convince; nor is it too much to say that had Mr. Ety's picture suddenly come to light from some obscure locality on the continent, with the accumulated dust of a century or two upon its surface, it would have found a multitude of enthusiastic worshippers who reverence *nil nisi antiquum*. The defects of the painter we can perceive and forgive, for they are, generally, of minor import, and are soon forgotten amid the poetry and lustre of his art. Mr. Wass has contributed a fitting homage to the genius of the lamented artist, by producing an engraving that cannot fail to attract universal attention; it is the first appropriate offering laid on his sepulchre,—the praise we trust, to what will abundantly follow.

THE BABES IN THE WOOD. Published by J. CUNDALL, London.

In the January number of our last year's publication we noticed, at considerable length, the first appearance of these admirable designs, the work of a lady of distinguished rank. That series of plates consisted of etchings coloured by hand; the present, which are on a smaller scale, have been most beautifully executed in chromo-lithography by Mr. Brandard, and are equal to anything of a similar kind we have ever met with. It may, perhaps, be necessary to state for the information of those unacquainted with the process, that in all coloured lithographs printed at the press, or, in other words, not coloured by the hand after the simple black and white effects have been taken off, a separate drawing must be made on the stone for each tint intended to be used, and, of course, a separate printing from each stone; it will thus be evident how much trouble and care are requisite to perfect a single impression. In the instance of the book before us *thirteen* stones have been used by Mr. Brandard to produce the necessary effect, and without one touch of hand-workmanship; and yet each subject is as delicately executed as if the most skillful artist had painted it in his most brilliant colours. Our previous notice renders unnecessary a further allusion to the character and composition of these illustrations, which are, in all respects, as beautiful as Art can make them. A word of praise is justly due to Messrs. Hanbart, for their excellent printing of the work.

"THE KEEPSAKE." Edited by the COUNTESS OF BLESSINGTON.

Although this volume is to our eyes as is a funeral knell to our ears, the series, so long presided over by Lady Blessington, would be incomplete without it; (during a number of years "The Keepsake" was as necessary on every drawing-room table as a Christmas rose or a bunch of holly); and though of late its artistic merit crumbled towards decay, yet its literary character was supported not only by aristocratic talent, but by much of the best talent of England; and it was certain to contain more than one engraving worth the price of the volume. The sudden and lamented death of the brilliant and beautiful woman who influenced its destiny, left the task of selection for the present volume only half completed; but her niece, Miss Power, whose taste had been formed by Lady Blessington, felt bound to finish what her aunt had commenced, and has brought both knowledge and industry to the task, which, considering all things, has been ably performed. Lady Blessington's acute perception of excellence fostered many a youthful aspirant to literary distinction in the pages of the volume under her control, and she never conveyed a pang with a refusal; her sympathy was kind and generous, and her enthusiasm excited by whatever was excellent in Literature and Art.

THE BOOK OF RUTH. Illustrated by the LADY AUGUSTA CADOGAN. Published by J. CUNDALL, London; for the benefit of Charitable Institutions in the Parish of Lower Chelsea.

The taste which selected the Book of Ruth as a subject for illustration, at once proves the refinement and elevation of the artistic feeling that prompted the Lady Augusta Cadogan to such an undertaking, and the purpose of its publication would have sanctified an inferior subject. We congratulate the accomplished lady on her illustrations of this most holy and touching story, and still more that she dedicates her pencil to such an object. The beautiful volume now before us has a double claim upon our consideration—the claims of artistic excellence and actual charity; and it is highly gratifying to see the talents with which so many of the female aristocracy of our land are endowed, put forward so frequently to effect some object of national benevolence. Lady Augusta is well acquainted with the necessities of the parish of Lower Chelsea; and we trust that this noble effort to relieve want will receive public confidence and encouragement. The eloquent and pathetic Book of Ruth has furnished Lady Augusta with material for eight finely conceived and admirably executed subjects.—"The Journeying of Elimelech and his Family into Moab;" "Naomi and Ruth;" "In two incidents; "Ruth gleaning in the Field of Boaz;" "Boaz and Ruth;" "Boaz and the Elders;" "The Birth of Obed;" and "The Marriage of Boaz and Ruth," which forms the frontispiece. The composition and the drawing of these several groups show much fertility of invention, and a hand well able to carry out the ideas; the etchings are freely yet delicately executed, and with the accompanying black-letter text, form an elegant and instructive volume, which we shall be happy to know has realised the wishes of the benevolent and accomplished lady-artist.

FRUITS FROM THE GARDEN AND THE FIELD.

The Poetry by O. A. BARON. The Designs by OWEN JONES. Drawn on Stone by E. L. BATEMAN. Published by LONGMAN & Co. This is one of the bright "gift books" of the season, gorgeous and beautiful as can be, and may be considered the perfection of the species of art which it illustrates. Fruits are more difficult to arrange gracefully than flowers, but Mr. Owen Jones has suggested an improvement to nature, and rendered the flower and the fruit twin-born! This certainly adds to the beauty of the composition, and may be termed a "poetic licence," rendering the volume as *picturesquely* attractive as the one which we noticed last season. The cover and the *inside* adornments are charmingly designed, and Mr. Bateman's lithography is beyond all praise. Such volumes excite our admiration of, and sympathy with, the beautiful, in Nature and Art; and this renders them necessary adornments of the tables of those who can afford such elegant enjoyments.

SPRING AND AUTUMN. Engraved respectively by

T. W. HUNT and B. EYLES, from Drawings by A. BOUVIER, LLOYD, BROTHERS. Two graceful compositions by a French artist, long domiciled here, whose works of a similar character have frequently been before the public and deservedly appreciated. "Spring" is represented by

a young girl, of the aristocratic class, with her lap full of flowers, fresh gathered from the garden in which she is walking. Her face is charmingly expressive, and her light and elegant costume highly picturesque. "Autumn" is similarly characterised, but she is standing in the attitude of contemplation, the object of her thoughts being

"The last rose of summer
Left blooming alone."

The subject is beautifully rendered, and both drawings are most delicately engraved by the respective engravers in the chalk style, as it is termed; and are certainly two of the prettiest subjects of their class we have seen for some time.

THE ARTISTS' ALMANAC. Published by ACKERMANN & Co., London.

The observations we have made on the Almanac published by Messrs. Rowney & Co., apply with equal justice to this—that it will be found a valuable book of reference and information. The contents of each vary in some respects, so that what cannot be met with in the one, will most likely be contained in the other.

"LORD, HAVE MERCY UPON US." Painted by H. BARRAUD. Engraved by W. T. DAVEY. Published by HEBING & REMINGTON, London.

This is the companion print to that entitled, "We praise Thee, O God," which within the last few months has obtained an unexampled popularity; and there can be little doubt that the present work will be as eagerly sought after. Three charity-girls are kneeling behind an old cancer-book-desk, in the interior of a church, adorned with holly and other evergreens, symbolical of Christmas-time; a happy introduction on the part of the artist at this period of the year. The reverential attitude and devotional feeling expressed by the children, as they repeat the beautiful responses of our Church Service, are well rendered by the artist, and the engraver has done the subject full justice. All who possess the first of this pair of interesting prints should certainly have the other; the two should not be separated.

THE NILE BOAT; OR, GLIMPSES OF THE LAND OF EGYPT. By W. H. BARTLETT. A. HALL, VILTUE, & Co., London.

The mysterious land of Egypt—the land whose history is intimately connected with our earliest Bible-reading, the cradle of Moses, the bond-place of the Israelites—where Art first reared its head, and civilisation achieved an astounding eminence while the world was yet young—who can write of this land and its people without awakening the sympathies of all who own the belief by which we hope for an hereafter? The corroborations of Scripture history which its monuments offer have invested them with an interest of the most extraordinary kind. The philosopher may study their laws; the soldier their military tactics; the historian their hieroglyphics; and all find instruction in their records, the imperishable works of those wondrous men, whose sculptures are literally "sermons in stones." Since the famed work, published by Denon, under the auspices of Napoleon, Egypt has been visited and its antiquities descanted upon by the most eminent European scholars, who have found here ample room for their most careful investigation and judicious comments. Our artists have not been behindhand in the work of utility, and we owe to David Roberts a series of picturesque and truthful delineations, unsurpassed by the labours of any previous traveller. To an artist also are we indebted for the present agreeable and beautiful book; Mr. Bartlett is well-known for the zeal and assiduity with which he has journeyed over many countries, indefatigably employed in the delineation of their peculiarities or beauties; he is also favourably known as the author of "Forty Days in the Desert;" and he has in the present instance given us a vivid picture of a journey down the Nile, describing the wonders of the olden time, which greet the astonished eyes of the traveller, and enchant those of the scholar and the antiquary. He paints with his pen as well as with his pencil, and both are worthily displayed in the volume before us. The engravings are very beautifully executed, and exhibit the more remarkable points of the wondrous erections which make the banks of the Nile famous. The Memnonium, the two Colossi near it, the approach to Karnak, the Great Temple at Edfo, the lovely and far-famed Island of Philæ, and the extraordinary Rock Temple at Abu Simbal, are all singularly striking and beautiful; while the descriptions of each are clear and sensible descants on their history and peculiarities, written with a freshness which gives value to much that has been described before.

THE ART-JOURNAL.

LONDON, FEBRUARY 1, 1850.

ON MURAL PAINTING.

BY MRS. MERRIFIELD.

IN the last number of this Journal, I alluded to the importance of ascertaining, as far as it is possible to do so, the manner in which mural pictures were formerly executed; for the mechanical processes which, for upwards of three hundred years have withstood the ravages of time and the vicissitudes of the seasons, must assuredly be deserving of our consideration, if not of our imitation. The question of the durability of mural paintings appears to be satisfactorily settled. It is ascertained to depend, not upon climate, but upon the goodness of the materials employed, the perfection of the processes adopted, and their skilful adaptation to the peculiar localities where they are intended to be introduced. These are points of the utmost importance to the painter; for upon them, whatever may be his merits in the higher qualifications of Art, must ultimately rest his hopes of transmitting his name to posterity. The mighty genius of Leonardo da Vinci could not preserve his admirable Cenacolo from the decay which resulted from the imperfections of the ground on which he worked, and the perishable nature of the materials he employed; while the fresco of Montorfano, painted in 1495, on the opposite end of the Refectory, exists in an almost perfect state, and is a convincing proof of the excellence of the technical processes of the artist.

Much information of a practical kind may be obtained from an examination of the present state of mural paintings; I shall, however, take another opportunity of returning to this subject. On the present occasion I propose to make a few observations on the various methods of mural painting practised at different periods in Italy—so far, at least, as we are at present acquainted with them;—and to offer a few suggestions as to the adoption of some of those technical processes and modes of decoration in this country.

The anonymous author of the "Notizia d'opere di disegno nella prima metà del Secolo XVI. esistenti in Padova, Cremona, Milano, &c.," speaking of the old fresco paintings (as he called them) in the Cortile of the Archbishop's palace at Milan, the Castle of Pavia, and elsewhere, states that they "shone like mirrors," and he adds "even now one can see oneself in them." The old paintings in the Castle of Pavia, to which he alludes, may have perished, but those at Milan are yet in existence, and the glassy surface they still present, after a lapse of upwards of three centuries, attests the truth and accuracy of the writer's observation. The very fact, however, of his making the observation, proves that the writer was a stranger in that part of Lombardy, for the glassy surface is not peculiar to these pictures, but it may be seen on the mural paintings of Ambrogio Borgognone, Luini, Gaudezio Ferrari, and others of the Milanese

school: it may also be seen on parts of the old paintings by Avanzi and Aldighieri in the chapel of S. Felice, in the church of S. Antonio at Padua, and also in the old part (for the paintings have been restored) of the mural pictures in the Scuola of S. Antonio, and the small church of S. Giorgio, at Padua. In the Cortile of the Archiginasio, at Bologna, is a portrait of Carlo Borromeo, painted by Bernardino Luini. It has been sawn from the wall and removed to the situation it now occupies; this painting has the same glassy surface, which neither age nor accident seems capable of destroying; it differs in this respect from the frescoes of the Bolognese school which surround it on all sides, and which, as far as my observation extends, have not the polished surface. The glassy surface may also be traced on the mural-paintings by Lattanzio Gambara, a pupil of Autouio Campi, of Cremona; and the interesting portraits of Correggio and Parmegiano, painted by Gambara between 1568 and 1573, just within the principal door (on the left hand as you enter), of the Duomo of Parma, perhaps owe their preservation to this circumstance. The outline of these pictures is indented with the style, a proof that they were certainly begun in fresco. That this peculiar polish was not confined to paintings in interiors, is proved by the old mural picture on the south face of the wall which encircles the town of Bassano, which, in spite of exposure to the air, still exhibits a glassy lustre where the surface has not been broken up and destroyed by the hand of man.

I am not aware whether this glassy surface is to be found on mural paintings in other parts of Italy; the observation of the anonymous writer would lead us to infer that it was not: neither Comini nor Vasari allude to it, whence it may be concluded that it is not general, if indeed, it existed at all, in Tuscan; Armenini also, who travelled through Italy for nine years, studying painting, and obtaining information from the best masters, is silent upon the subject. It is, however, certain that the custom of polishing mural paintings was common, if not general, in the Milanese, and that it existed in the Venetian territories as late as the early part of the sixteenth century: as the glassy surface is not seen on the frescoes of Correggio, at Parma, it may be concluded that it was not generally adopted in the Parmesan at the time Lattanzio Gambara was painting at Parma. Early frescoes and mural-paintings have, however, a smooth surface and a fine intonaco, while those executed at a later period are rough and granular, as if the intonaco were composed of very coarse sand. The Diana of Correggio, in the Convent of S. Paolo, at Parma, has a smooth but not a glassy surface, and an indented outline. The modern frescoes of Appiani, at Milan, and those of Paoletti and Damini, at Padua, are rough and granular. A shining surface is generally considered a disadvantage to mural decorations, but it is to be observed that the glassy polish of the old pictures, to which I have alluded, does not reflect light like varnish, or prevent their being viewed conveniently from all points; and where paintings are exposed to dust and smoke, as they will certainly be in this country, some degree of polish may be a great advantage to them, by preventing the accumulation of dust, and by permitting them to be wiped or washed without injury. Vitruvius informs us that the ancients were so well aware of the injury arising from smoke and dust, that they were accustomed to polish the walls of the winter apartments, which were exposed to damage from this cause, while those appropriated to summer use were adorned with ornaments in relief and paintings. Among the ancients, a plain white surface was probably polished by friction, but vermilion was protected from the action of the air by a coat of punie wax liquefied with oil. Leon Batista Alberti suggests the addition of other ingredients to the oil and wax. After describing the mode of preparing the intonaco and of applying it, he says—"It must be smoothed and made even with smoothing boards, floats, and other things of that kind, while yet soft. If the last coat of pure white be well rubbed, it will shine like a looking-glass; and if when the same is nearly dry, you anoint it with wax

and mastic, liquefied with a very small quantity of oil, and then heat the wall, so anointed, with a chafing-dish of lighted charcoal, it will surpass marble in whiteness. I have found by experience that such intonachi never cracked, if in making them, the moment the little cracks begin to appear, they are rubbed down with handfuls of twigs of the marsh-mallow, or of wild broom. But if, on any occasion, you have to apply an intonaco in the dog-days, or in very hot places, pound and cut up very finely, some old rope, and mix it with the intonaco. Besides this, it will be very delicately polished if you throw on it a little white soap dissolved in tepid water." It will be observed, that Alberti directs the wax and mastic to be applied before the intonaco is quite dry, so that they may combine intimately with the intonaco, and thus be more firmly united. There appears, however, no reason why this polish should not be applied upon a dry surface, to which it will adhere, especially after the application of the anaterium, which will probably cause the wax and mastic to penetrate to a certain depth the material on which it is applied. The addition of white soap cannot be recommended, as it contains a salt, which must be always injurious to paintings. The general resemblance of the whole composition to the "eau composite," which Le Beau mentions (*Ancient Practice of Painting*, p. 307), as a vehicle for all kinds of colours, will not escape the notice of the reader. The difference lies in the substitution of water in the latter recipe for the oil recommended by Alberti. Mastic mixed with wax is the composition with which Agnolo Gaddi repaired the old mosaics in the Church of S. Giovanni at Florence. Vasari tells us how successfully it was employed, and that no further reparation had at any time been necessary. A mixture of wax with white sand and water, applied to the surface of a plaster cast, and afterwards polished with a soft cloth, although it does not exactly give the plaster the appearance of marble, adds greatly to its beauty. There seems little doubt that the use of wax in the arts was more general, and that it continued to be employed down to a much later period than is commonly believed.

Mr. Wilson, in his very interesting Report on Fresco Painting, mentions having been informed by Signor Marini, a distinguished fresco painter, that in cleaning some of the frescoes by Ridolfo Ghirlandajo at Florence, he observed that they had been glazed with something "unctuous." Might not the glazing of which he speaks have been the polish recommended by Alberti?

It appears to me, that this polish is calculated to be extremely useful in mural decoration of all kinds, since it may be applied upon all surfaces, and will afford an effectual and durable protection from the injuries arising from smoke and dust. If it be liquefied in a fixed oil, it will be more durable than if an essential oil be used, but at the same time not so pale in colour; and although a little mastic will be a decided improvement, the smaller the proportion that is employed, the more likely will the polish be to preserve its colour and firmness. Mastic, how pale soever it may be at first, in process of time acquires the yellow hue of the dry resin, while wax, on the contrary, bleaches by exposure to the air. Paintings in distemper may, by this application, be rendered as durable as fresco, perhaps more so, for tempera paintings of the fifteenth century with a polished surface are found in as good a state of preservation as fresco-paintings of a much later date without it. It is true that the actual composition of the polish on the mural paintings of Lombardy is unknown. It cannot be the result of friction, for that would efface the finer touches of the painting, and the marks of the brush are visible in many early pictures which have the glassy surface. The preservation of the whites and other delicate colours, proves that it cannot be attributed to a coat of fixed oil, or of oleo-resinous varnish; and the solid and uniform surface of the paintings, which is never defaced by cracks, as well as the date of some of the pictures, which is anterior to the introduction of spirit or essential oil varnishes, may be considered evidence that the latter have not been used.

The practice of painting in buon-fresco is at

tended with acknowledged technical difficulties, and the great skill and facility of execution on which such paintings require, the inability of working on them at all times of the year, and the uncertainty of employment which at present exists, may, to a certain extent, and in spite of its manifest advantages, prevent the practice of this branch of the art from becoming so general as could be wished. But painting in distemper is not attended with the difficulties and inconveniences incident to fresco-painting; it may be employed on a small scale; it may be altered at pleasure; and it can be executed at any time of the year. It has, it is true, the disadvantages of drying inconveniently fast, and of the colours being liable to be disturbed by water. The former defect may be remedied by adding honey to the size used in painting; the latter by applying wax to the surface, either alone or with mastic, as recommended by Alberti; or where a resinous varnish is not objected to, the painting may be varnished in the usual manner. Painting in distemper is taught in the Schools of Design, and under the instruction of these most useful institutions, a class of artists is now rising, whose skill and taste will, we trust, be exercised in the decoration not only of our public buildings and the mansions of the nobility, but of the private habitations of the middle classes. It is the custom in Italy to decorate the white walls and ceilings of the apartments of country hotels with arabesques of various colours,—the rooms are in consequence always clean and light, and if the surface were smooth and polished, instead of being rough and granular, this simple and inexpensive kind of embellishment would last for ages. The advantages of a decoration of this kind will be appreciated in this country, where the smoke and dirt soil the full-coloured paper hangings, and so, diminish considerably the brief and subdued light of the days in winter. The fashion of adorning the mansions of private gentlemen with elaborate and rich arabesques in the Italian fashion, has already been introduced into this country by Sir Robert Peel, to whose liberal and enlightened patronage and encouragement the Fine Arts in this country are so deeply indebted. The staircase in the house of Sir Robert, in Whitehall Gardens, has been painted by Mr. Gruner with great taste and ability, and we hope that ere long this mode of decoration will entirely supersede those which have been hitherto in use, in all cases where fresco or fresco-secco is not admissible, and where cabinet paintings are not intended to be introduced. Decorations of this kind cannot fail to be of the greatest advantage to art in this country by furnishing to the young artists educated in the Schools of Design an employment, which, while it affords scope for the development of their taste and ability, will yield them an honourable and lucrative means of subsistence.

Our knowledge of the different methods in which mural paintings were formerly executed is as yet extremely limited. Much has been done towards discovering the methods of painting formerly in use; much still remains to do. In oil painting we find a diversity of grounds, a diversity of vehicles, and a diversity in the method of working. A similar diversity seems to exist with regard to mural paintings, which, some years ago, were classed, in this country at least, under the general name of fresco-paintings, unless they were known to have been actually painted in oil. Increased acquaintance with works of art, together with the diffusion of Art-Literature, has supplied us with better information on this subject. It is now well known that the art of painting in buon-fresco without re-touching in secco, is not of early date, and that it arose out of the earlier methods to which it was deemed superior; for the old painters did not possess sufficient skill and facility of execution to enable them to complete their pictures while the wall remained damp, and they were forced to finish them in secco. It is generally considered that there does not exist any picture in buon-fresco which was executed previously to the revival of the art by the Carracci. This opinion, however, can scarcely be correct. The terms in which Vasari (whose work was completed in 1547, eight years before the birth of

Ludovico Carracci), speaks of this Art, show the importance attached by him to the completion of frescoes without re-touching in distemper. Not only does he deprecate this practice in his Introduction, but he takes occasion to allude to it in various parts of his "Lives of the Painters," and always with disapprobation; and he never omits to praise those artists who painted entirely in buon-fresco. The instances of the latter are however rare, and it is impossible to arrive at any other conclusion from the perusal of Vasari's work, than that the practice of beginning pictures in fresco, and finishing them in distemper, (that is to say, with colours mixed with size), was general previous to the time of the biographer, and so common at the period when he wrote, that painting in buon-fresco might be considered as the exception, and not the rule of the contemporaries and predecessors of Vasari. Indeed, the practice of re-touching seems to have been so general, as to have been resorted to sometimes unnecessarily, or to speak more correctly, the picture was painted throughout with the common colours used in fresco, and then the more brilliant colours, and, in some cases, gilding, were afterwards touched upon these. As instances of this may be mentioned the "Last Judgment," by Michael Angelo, which was exhibited by order of Pope Paul III., before Michael Angelo had added certain re-touchings in secco which he contemplated, and which the painting never afterwards received; and also the fresco by Franciabigio, in the S. S. Annunziata at Florence, which was exhibited in a similar manner, without the knowledge of the artist.*

In spite of its technical difficulties, fresco-painting was sometimes practised by women. There is an external fresco, protected however by an arcade, in the Cortile of the Archiginnasio at Bologna, painted by Teresa Moneta Muratori. The picture is in good preservation, and the execution evinces considerable skill; but as the lady was assisted by some painter, it is not easy to decide how much of the work was really her own.

The earlier paintings were begun in fresco and finished in distemper, which was sometimes used sparingly in re-touching and finishing, and at others was employed so extensively that the pictures were half temper-paintings. Sometimes they were begun and finished entirely in distemper, and not unfrequently the draperies were finished with oil, but there appears to be no well authenticated instance of the painting of flesh entirely with oil, on walls or otherwise, in the fourteenth century; at a later period mural-paintings were sometimes painted entirely in oil. We have written descriptions of all these processes by different authors, but there is in mural-paintings such a similarity of appearance that a close examination is frequently insufficient to determine in what manner certain pictures were painted. And where no direct documentary evidence exists of the way in which they were painted, it is only when

* Michael Angelo appears to have submitted quietly to the impatience of the Pope, Franciabigio, on the contrary, was violently irritated at the liberty taken by the monks in exhibiting his picture without his consent. Vasari's account of his anger is interesting in a historical point of view, because it shows that at the period when this event occurred the Inquisition had not attained in Italy that terrible power by which it was so fearfully distinguished in Spain. The contrast between the fate of Franciabigio and that of the sculptor Torrigiano is no less striking than instructive. The offence of both artists was the same. Franciabigio vented his anger at the liberty taken by the monks, by defacing some of the principal figures, especially the representation of the Virgin, breaking up the surface with a mason's mallet; the monks, apparently more alarmed at the probable destruction of the picture than shocked at the insult offered to the Virgin, sought to restrain his violence by simply holding his hands, and offering him double payment to restore his works. Franciabigio turned a deaf ear to their solicitations, and the picture remained as he left it; and, according to Vasari, either from reverence of the work or of the artist, no other painter could be induced to complete it. The fate of poor Torrigiano was more melancholy. His disappointment at receiving in payment for his beautiful statue of the "Virgin and Child," the paltry sum of thirty ducats, paid in the small brass coin called *maravedi*, (which, to make them appear of more importance, were brought to him in two sacks), was so great, that, forgetting the sacred character of his image, he broke it suddenly to pieces. As the consequence of his sacrilege, he was thrown into the prisons of the Inquisition, and condemned to torture and death. But his cruel persecutors were followed—he expired under the horrors of his impending execution.

they have been obliged to undergo the dangerous process of cleaning and restoring, or when some parts have been submitted to chemical analysis, that the mode in which they were executed has been ascertained. In addition to the different processes alluded to above, recent investigations have shown that wax was, at least occasionally, employed, not only at a very early period, but in the sixteenth century. Whether it was so used in pursuance of the traditional practices which have descended to us, or whether by way of experiment, is unknown. The Italian artist who has recorded the result of the analysis of the pictures by Trotti (Malosso) at Parma, has neglected to inform us whether the wax which was discovered in them was dissolved in fixed oil, in an essential oil, or in an alkaline solution, or whether it was combined with a resin. These are points which it is important to ascertain. It is also uncertain whether the wax was used in the painting, or whether it was applied to the surface of the picture when finished, and then melted into and incorporated with it, by the application of heat. This last question must probably remain undecided. Chemists have declared that it is impossible to distinguish, after a lapse of years, whether oil had been actually mixed with the colours in painting, or whether the picture, when finished, had been saturated with oil; and this will probably be the case with wax, for this substance, when assisted by heat, will even penetrate marble to the depth of the sixteenth part of an inch.

Fresco-secco has been practised from a very early period in Italy; its durability is unquestionable; the facility of employing various colours which are inadmissible in fresco, is a decided advantage, but it is inferior to fresco-painting, inasmuch as it cannot be washed, at least without the application of a protecting varnish. Some of the beautiful pictures by Luini in the Monastero Maggiore at Milan, were formerly considered as frescoes, but they are now stated on good authority to have been painted "in the ancient manner on white stucco." The art of painting in buon-fresco is undoubtedly more difficult of attainment, as it requires greater skill and power in the artist; but the method of Luini, whatever it was, is so beautiful, and it is so well adapted not only for paintings on a large scale, but for smaller works which are intended to be viewed closely, such as the decorations of private dwellings, that if it could be ascertained, it might be revived with great advantage. The process adopted by Luini was probably not peculiar to himself. The stucco, for instance, may have been derived partly at least from the ancients, whose methods were preserved by Vitruvius, and the painting executed in the manner usual in Lombardy at that period, the lakes and finishing touches being added before the final polishing of the surface. The last process may have been conducted in the manner recommended by Alberti.*

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

PHOTOGRAPHY ON GLASS PLATES.

PHOTOGRAPHY advances steadily towards perfection. In 1839 the attention of the scientific world was called to a "Process by which natural objects may be made to delineate themselves without the aid of the artist's pencil;" and they deemed it of the utmost importance as a physical discovery. Nor were they deceived. From the suggestions naturally arising from so very interesting a fact, as that the solar rays, however weakened in intensity, were capable of shorter space of time, we have discovered many remarkable facts connected with the influence of sunshine on the organic and inorganic states of matter, and arrived at a knowledge of the laws regulating some great natural phenomena, which were previously involved in obscurity.

At that time the public regarded the production of a faint, but delicate, shadow of an external

* To be continued.

object, formed in a dark box by rays collected in the focus of a lenticular piece of glass, as the perfection of natural magic; but now we have presented to us sun-drawn pictures, as decided in their characters as any Sepia drawing, comprehending the most minute detail and great breadth of effect. They have, however, still wanted the charm of aerial perspective; and as differently coloured bodies radiate the chemically active principle with degrees of intensity which bear no relation to the luminous character, they have been defective as faithful transcripts of nature under all conditions. The first of these objections to Photographic pictures on paper appears to be now removed. All the productions obtained on glass plates which we have examined have their distances correctly preserved, and the magic of a "painted air" lends its sweet enchantment to the "heliographic landscape." The second objection still exists, and until we find some sensitive body which shall be uniformly influenced by the rays proceeding from either a yellow or a blue surface, it must continue a defect in all photographic delineations.

In our Journals for May and August, 1843, we described the peculiarities of the most important Photographic processes on paper, and explained the differences between the *negative* picture—with lights and shades reversed—and the *positive* one copied from it, having its lights and shadows correct, as in nature. In copying from a negative on paper, the resulting Photograph always presented a certain woolliness and want of sharpness, which arose from the circumstance that the texture of the paper on which the negative picture was obtained, was copied, with the positive image, to a greater or less extent, according to its want of transparency. By the use of glass plates, which ensure perfect transparency where required, this defect is entirely overcome; and the Photographs copied from originals on glass possess a degree of sharpness, superadded to the beauties of the ordinary pictures which can scarcely be excelled.

The French have certainly taken the lead in bringing forward this recent improvement, but at the same time it is but justice to notice that glass plates were first used, and, to a certain extent, with success, by Sir John Herschel in 1839. Previously to describing the methods now employed, we shall give the processes as detailed by Herschel, believing that they will be found equally valuable, under some modifications, as the more recent methods of manipulation. The paper from which we quote will be found in the *Philosophical Transactions*, Part I, for 1840:—

"With a view to ascertain how far organic matter is indispensable to the rapid discoloration of argentine compounds, a process was tried which it may not be amiss to relate, as it issued in a new and very pretty variety of the Photographic Art. A solution of salt of extreme dilution was mixed with nitrate of silver, so dilute as to form a liquid only slightly milky. This was poured into a somewhat deep vessel, at the bottom of which lay horizontally a very *clean glass plate*. After many days, the greater part of the liquid was decanted off with a siphon tube, and the last portions were slowly and cautiously drained away, drop by drop, by a siphon composed of a few fibres of hemp, laid parallel, and moistened, without twisting. The glass was not moved till quite dry, and was found coated with a pretty uniform film of chloride of silver, of delicate tenuity and chemical purity, which adhered with considerable force, and was very little sensible to light. On dropping on it a solution of nitrate of silver, however, and spreading it over, by inclining the plate to and fro (which it bore without disturbing the film of chloride), it became highly sensitive, although no organic matter could have been introduced with the nitrate, which was quite pure, nor could any, indeed, have been present, unless it be supposed to have emanated from the hempen filaments, which were barely in contact with the edge of the glass, and which were constantly abstracting matter from its surface in place of introducing new.

"Exposed in this state to the focus of a

camera, with the glass towards the incident light, it became impressed with a remarkably well-defined negative picture, which was direct or reversed according as looked at from the front or the back. On pouring over this cautiously, by means of a pipette, a solution of hyposulphite of soda, the picture disappeared; but this was only while wet, for, on washing in pure soda and drying, it was restored, and assumed the air of Daguerreotype when laid on a black ground, and still mere so when smoked at the back, the silvered portions reflecting most light, so that its character had, in fact, changed from negative to positive. From such a picture (of course, before smearing), I have found it practicable to take Photographic copies; and although I did not, in fact, succeed in attempting to thicken the film of silver, by connecting it, under a weak solution of that metal, with the reducing pole of a voltaic pile, the attempt afforded distinct indications of its practicability with patience and perseverance, as here and there, over some small portions of the surface, the lights had assumed a full metallic brilliancy under this process. I would only mention further to those who may think this experiment worth repeating, that all my attempts to secure a good result by *drying* the nitrate on the film of chloride have failed, the crystallisation of the salt disturbing the uniformity of the coating. To obtain delicate pictures, the plate must be exposed wet, and when withdrawn, must immediately be plunged into water. The nitrate being thus abstracted, the plate may then be dried, in which state it is half-fixed, and is then ready for the hyposulphite. Such details of manipulation may appear minute, but they cannot be dispensed with in practice, and cost a great deal of time and trouble to discover."

Sir John Herschel then offers some remarks on the advantages offered by glass plates, as the only effectual means of studying the habitudes of the sensitive Photographic preparations; he then proceeds:—

"I find that glass coated with iodide of silver is much more sensitive than if similarly covered with the chloride, and that if both be washed with one and the same solution of nitrate, there is no comparison in respect of this valuable quality, the iodide being far superior, and, of course, to be adopted in preference for use in the camera. It is, however, more difficult to fix the action of the hyposulphites on this compound of silver, being comparatively slow and feeble. When the glass is coated with bromide of silver, the action *per se* is very slow and feeble, and the discoloration ultimately produced far short of blackness; but when moistened with nitrate of silver, it is still more rapid than in the case of the iodide, turning quite black in the course of a very few seconds' exposure to sunshine. Plates of glass thus coated may be easily preserved for use in the camera, and have the advantage of being ready at a moment's notice, requiring nothing but a wash over with the nitrate, which may be delayed till the image is actually thrown on the plate and adjusted to the correct focus with all deliberation. The sensitive wash being then applied with a soft flat camel hair-brush, the box may be closed and the picture impressed, after which it requires only to be thrown into water and dried in the dark to be rendered comparatively insensible, and may be finally mixed with hyposulphite of soda, which must be applied hot, its solvent power on the bromide being even less than on the iodide."

Experience enables us to add a few particulars of manipulation to these processes, by which they may be greatly improved. The film of chloride or other salt of silver thus formed, is exceedingly thin, and it becomes desirable, where the original negative picture is to be used, to print off positives. Sir John Herschel has remarked, that we cannot allow the wash of nitrate of silver to dry upon the coating of chloride or iodine. If, however, we dip the glass, coated with any of these insoluble salts of silver, into a solution of the same salt as is employed to decompose the nitrate of silver in

the first instance, and having removed it, allow all the surplus moisture to flow off by placing the plate nearly upright, we may then by washing it with a solution of the nitrate considerably thicken, and that with much uniformity, the sensitive layer on the glass.

Mr. Towson has employed glass plate prepared in this manner, with much success. The method he adopts, is to have a box the exact size of the glass plate, in the bottom of which is a small hole; the glass is placed over the hottem, and the mixed solution is poured in. As the fluid slowly finds its way around the edges of the glass, it filters out, leaving the fine precipitate behind it on the surface of the plate; by this means the operation of coating the glass is much quickened.

Experiments have been made with some success, to produce films of silver on glass plates by Drayton's silvering process, which has been already fully described in the *Art-Journal*, Nov. 1848, and then, by acting on these metallic films with iodine or chlorine, to form adherent chlorides or iodides.

There are so many valuable points about these methods of experimenting, that although they have not hitherto been rendered available in practice, we feel certain they must become so as soon as proper care is directed to these forms of manipulation. The attention of the public being turned to the albuminised plates, and considerable discussion having arisen, from the circumstance that the patentee of the Calotype process is about to secure a new process, said also to be on glass, by a patent, we have been induced to give all the particulars connected with this new form of Photography with which we have become acquainted.

The most satisfactory mode of proceeding appears to be as follows—which is not exactly the plan adopted by either Niepce or Everard. The whites of two or three recently laid eggs are well beaten, and all the stringy, opaque portions taken out; the fluid should then be allowed to stand until it is perfectly clear. Dissolve fifteen grains of iodide of potassium in about two teaspoonfuls of a solution of good gelatine (isinglass), add this to the whites of the three eggs, again well beat together, and set the mixture aside to become clear. Take a perfectly flat piece of glass, which is free of air bubbles, and clean one surface by rubbing it with cotton and a few drops of spirits of wine; then spread the albuminous mixture over the plate as uniformly as possible, and place the glass to rest upon one corner, so that the superfluous fluid may flow off. By this means a very thin and uniform coating of albumen will be left on the glass plate, and it must be allowed to dry in a warm, but not a hot place. In this condition the glass plates may be kept for use. To render them sensitive, take a solution of nitrate of silver, thirty grains to three fluid ounces of distilled water; pour this solution into a flat dish, and holding the glass plate by the edge, care being taken not to touch the albumen with the fingers, dip the prepared face into it; the silver immediately combines with the iodine, and forms over the entire surface of the albumen a uniform layer of iodide of silver, the albumen at the same time contracting slightly from the action of the caustic salt of silver upon it. In this condition the plate may be placed in the camera, and the photographic image impressed. But if it is desired to render the plate more sensitive, it is the best practice to allow the plate to dry, and then give it a second wash of nitrate of silver combined with a few drops of gallic acid, or of the sulphate of iron; the plate having remained in the camera the proper time—of this experience must be the guide—it is treated in precisely the same manner as if the picture was on paper. If the calotype form of manipulation be preferred, it is washed with the gallo-nitrate of silver. It must, however, be remembered that this process, though glass plates may be used, is still subject to the operation of the Patent Laws. The sulphate of iron, as employed in the *Energiatype*, and which has been shown to possess the property of developing pictures from surfaces prepared with any of the salts of silver, is, however, perfectly untrammelled, and may be employed by any one. The very sensitive process of Dr. Woods, the Cata-

lysotype, is also peculiarly applicable to these albuminised glass plates, and we believe it will be found to be far more certain than it has proved to be on paper, and this process is also free from any patent restrictions. Whichever of these processes may be employed, the process of fixing is first to plunge the plate into clean water, and then to wash with a solution of the hyposulphite of soda.

We understand that several improvements upon the above methods, on glass, have already been effected by several gentlemen, some of them members of the Photographic Club, which however they decline publishing until the period allowed for specifying the patent now sought shall have expired.

Our patent laws are in every respect adverse to the progress of improvement, and they really afford a very insufficient protection to an inventor, unless he is prepared to incur a large expenditure of money on law.

No person can for a moment object to any man, who has made a *bona fide* discovery of a useful process or object, endeavouring to secure to himself the advantages which may arise from the public employing the same—this is strictly legitimate. But the false position in which all parties are placed by the present patent laws, is well shown by the case at present under discussion. A discovery is made in France, and very shortly after the publication of that discovery on the Continent, a patent for a new process of photography on glass plates is applied for. This may or not be a discovery by the applicant—we are assured that it is so in the present case. He is however allowed six months from the date of his application to the sealing of his patent, and six calendar months for enabling him to specify. The object of this is to enable the patentee to render his discovery as perfect as possible; but it not unfrequently happens that the patentee reserves his right of specifying to the very last moment, that he may include within his specification every process, subject, or matter—every information he may obtain privately or publicly, and thus secure a monopoly. The result of this is, a determination on the part of those gentlemen who have been most active in improving the Photographic processes, to refrain from publishing anything until the specification of this patent is enrolled. Thus the public are prevented from receiving such information as many men of science and photographers would be but too ready to communicate, but fear to do so, lest they may have to incur the risk of a lawsuit, for using processes of their own discovery. It is not unusual for parties applying for a patent—not merely to state the materials employed in their process—but to include in their specifications every material that can be substituted for those they employ. Every man should be protected against any infringement of his right, if such an infringement can be shown to be merely a dishonest substitution of some one element for another; but it is commonly attempted to speculate upon materials which may possibly answer the end desired, and, without having tried a single experiment, to include a long list of articles in the specification which the patentee never intends using, many of which he cannot employ, solely for the purpose of hampering investigation. This, we find upon inquiry, proves often a fatal mistake, a patent being more frequently declared to be invalid from claiming too much, than from any deficiency in the claim.

A reform of our patent laws is much to be desired; the entire practice of the courts is unsatisfactory; and many of the most experienced of our patent agents exclaim against the continued practical injustice to which real inventors are subjected.

Many of our best artists are now employing Photography with the greatest advantage in their studies. With a camera, rendered portable by many ingenious methods now adopted, the lover of Nature is enabled to select his subject, and by the delay of a few minutes only to carry off a transcript. This he can transfer to canvas at his leisure, preserving all the beauties arising from delicacy of detail and accuracy in the general result. Paper has presented many

difficulties; at the same time, as from its convenient portability, it has many advantages. Glass plates, however, offer such a perfect transparency, and manipulation upon them will be found to be really so easy, that we doubt not they will be generally employed. From results we have seen, we have no hesitation in predicting that as soon as the patent law allows a free publication, we shall have to put our readers in possession of many greatly simplified manipulatory processes, by which pictures may be readily obtained far exceeding anything yet produced, either in England or on the Continent.

ROBERT HUNT.

LETTERS

TO AN ENGLISH LADY AMATEUR.

BY G. F. WAAGEN,

Director of the Gallery of the King of Prussia, and Professor of the University of Berlin.

SINCE the last communication, Madam, which I had the honour of making to you, my thoughts have been much engaged with the subject of the monument, which is still due from the English nation to their great Queen Elizabeth. In order that such a monument should be sufficiently popular and universally intelligible, I think the realistic element should greatly preponderate throughout; that it should partake therefore of the portrait character, and that the costume of the period should be adopted. The monument of Frederic the Great, which the celebrated sculptor Rauch has just completed in Berlin, affords ample proof that a first-rate artist is all that is necessary to overcome the greatest difficulties of costume, and produce a work that shall satisfy the requirements of the artist and connoisseur, as well as those of the amateur and the uninitiated. I think, then, the Queen should be represented in royal robes upon a pedestal of moderate height. The four corners of the latter should be cut off, to admit the statues of Lord Burleigh, Sir Francis Drake, Lord Bacon, and Shakspeare; the representatives respectively of statesmanship, maritime supremacy and navigation, science, and poetry. As Bacon was indisputably the greatest genius of his age in the department of science, it would appear to me little and undignified after the lapse of more than two centuries, to exclude him on the score of his moral character. The sides of the pedestal would be admirably adapted for reliefs representing the most important events of the great Queen's reign. The whole should be executed in bronze in order to secure its durability, and erected in some convenient central situation in London, open to the public, but not of too large extent.

Besides the important relation in which the arts of painting and sculpture stand to church and state, they are eminently calculated to elevate and refine private life in all its various gradations. In the dwellings of the rich this end may be attained by the beauty of the proportions, the taste and richness of the architectural ornaments, as also of the furniture. But with the assistance of the arts of sculpture and painting the same object may be gained therein, in a much higher degree. Here, indeed, the artist's creative fancy draws objects of the most various natures within its magic circle. At one time some great event of ancient story, as for instance, "Alexander's entry into Babylon," by Thorvaldsen, in the Villa Sommariva on the lake of Como, is made to pass before our eyes in all the reality of life though beautified by Art. At another, the subject of a fable is presented to us clad in some rich dress, as for instance, the myth of "Cupid and Psyche," which Raphael executed for that lover of Art, the merchant Agostino Chigi, in the villa of the latter, now known under the name of the Villa Farnesina. Where, however, the means and space are too limited to permit of a display of Art on this monumental scale, sculpture may always have recourse to the exposition of single statues, for which purpose, simple but graceful and attractive subjects are the best calculated. I may cite as examples of

such subjects, "The Youth extracting a Thorn," in the Capitol; "The Boy at Prayer," in the Museum of Berlin; or reliefs borrowed either from the region of mythological poetry, as for examples, the "Abduction of Hecuba," and "Phaon begging the body of Hector," by Thorvaldsen; or again such subjects from the department of allegory, as the "Day and Night," and the "Seasons," all by the same master, in which he has succeeded in infusing a degree of life and individuality very much opposed to the offensive coldness and generality usually found in this class of subjects. If we do not absolutely insist upon the costliness of the material, but are willing to content ourselves with plaster casts, a very small outlay only is necessary for the enjoyment of this ennobling species of ornament for our dwellings. We may sacrifice this point of the material the more readily, as its consideration is a very secondary one in the province of Art, and was quite unknown to the most flourishing period in Greece, as also to the middle ages. In painting, the whole wealth of easel compositions is open to our choice. A taste which has taken an ideal direction will most readily find its gratification in the glorious works of the Italian school and in many of the Spanish. On the other hand, the taste for the realistic side of Art, which is far more generally diffused, will find ample food in the masterly productions of the Netherlands school in the various departments of *genre* subjects, landscapes, sea-pieces, architecture, fruit, and flower-pieces. As deserving the next place to these, may be mentioned the works that have been and are yet to be produced in our own days by such men as Sir David Wilkie, and Edwin Landseer, in England; Horace Vernet, and Paul de la Roche, in France; Wappers, and Gallait, in Belgium; Peter Hess, and Meyerheim, in Germany; besides many other excellent artists in each of these countries. These treasures, it must be confessed, are only accessible to comparatively a small number of amateurs. But persons of limited means will find abundant materials for the gratification of their taste for Art in the engravings from copper, steel, stone, and wood, which long since have been made of most of the finest of these works, and now indeed of all.

Independently of the instruction to be derived from such objects, and of the formation of taste, they exercise upon all persons, who from a pure love of Art make them their study, several important influences, which I shall now proceed to mention.

The world of sense, in which the immortal soul of man during its sojourn upon earth is imprisoned, as it were, by Divine decree, exercises upon too many a most pernicious influence. Many abandoning themselves entirely to the allurement of sense, make the mind its slave, and thus degrade themselves below the animal. Others, on the contrary, wishing to avoid this fatal error, endeavour to withdraw themselves entirely from the dominion of sense, and thus rush into the opposite extreme, manifesting itself spiritually in fanaticism, corporeally in self-mortification. Now the Arts of painting and sculpture strike out a new path which mediate between and reconcile these two extremes, recognising in the objects of sense, the revelation of the divinity under the form of beauty, and applying the latter to the most diversified expression of spiritual relations. In this purifying and ennobling influence, which it exercises within the sphere of sense, lies the whole lofty moral signification of Art. It was in this spirit that Michael Angelo in the Sistine Chapel painted Adam naked as he had come from the hand of his creator, and Eve also, in all the innocence of childhood, offering up her thanksgivings to Him who had made her. It was in this sense that Raffaele conceived those figures of which we meet so many in the *Stanzas* and *Loges* of the Vatican, and of which some are entirely naked, and others very partially clad. Nothing therefore is so well adapted to cut off all false prudery, and to preserve that true innocence which takes no offence at the representation of the naked figure, as an early acquaintance with those genuine works of Art, in which this representation is employed in the chaste service of beauty, and as a pure expression of a spiritual relation,

makes it impossible for merely sensual relations to suggest themselves to the mind. Should however a "Venus" by Titian ever awaken in the mind other sensations than the pure pleasure arising from the contemplation of beauty as a divine quality, and admiration of the Art with which it is represented, we must look for the cause, not in the intention of the artist, but in the morally depraved state of the spectator's feelings. Nevertheless I am far from wishing to deny, that Art, alas, in too many cases forgetting her noble and lofty calling, has degraded herself to the service of a low and degrading sensuality. But the starch moralist, who passes a sweeping condemnation on her on that account, is most assuredly wrong. For the abuse to which many things very excellent in themselves are occasionally exposed, furnishes no argument against the things themselves. What indeed has been more glaringly abused than the highest and holiest of all human possessions,—I mean, Religion? And yet no reasonable man would think of rejecting it on that account.

Art exercises another very important influence in the loftier but more harmonious and softer tone which the beauty of feeling evokes it to infuse into many of the passions, more especially the expression of pain. The man whose own heart has apprehended within its innermost recesses all the sublime depth in the expression of pain in the mother "Nöhe," all the touching pathos in the suffering mother of Christ, in Raphael's *Spasimo*, will never even in the most trying circumstances of life abandon himself, as many do, to the loud wailings of grief. Thus we see the effect of Art, is ennoblement and purification of the passions, which Aristotle considered as the great end of tragedy, in regard of the feelings of compassion and fear.

Very great importance must also be attached to the influence which Art exercises, by increasing our susceptibility to, and refining our perception of, beauty in all its manifold forms and spiritual significations in the world of reality. As every great artist, to whatever department he may belong, from the lofty sphere of a Phidias to the humble one of a flower-painter, conceives his own particular subjects in a manner peculiar to himself alone, so indeed the attentive student of works of Art may learn by degrees to penetrate the spirit of these different styles so thoroughly as to recognise them again in the appearances of the real world. I shall content myself with citing a few of the greatest masters in the most important departments. The man who has made the works of Raphael a subject of enthusiastic study will meet at every turn the various spiritual significations in human forms, the different expressions of features, the grace of attitudes and gestures, as they are found peculiar to this artist, and will derive from them a source of the purest gratification: he only who is well acquainted with the works of a Metz, a Francis, a Micris, and a Netscher, will have his eyes fully open to the picturesque charms with which the daily life of the wealthy and middle classes abounds. Among the latter must be reckoned the rich stuffs employed in the dresses of the women, the various domestic utensils, with all that exquisite play of the light in reflection and shadow which those masters have represented with such wonderful truth and delicacy. In the same way a lover of Cuyt, Potter, and Adrian Vanderveelde, will find many new charms in the scenes and circumstances of country life, as, for instance, luxuriant meadows, enlivened by cattle, appearing sometimes in the fresh light of morning, sometimes in the warm glow of evening. But it is absolutely wonderful how our appreciation and enjoyment of nature is heightened and refined by the study of the great landscape painters, of a Claude, a Gaspar Poussin, a Ruysdael, and a Hobbins: the two first of these masters contribute more especially to the cultivation of our sense for the beauty of such lines as those of which the neighbourhood of Rome, Olevano, and Naples afford so many examples. From Ruysdael and Hobbins, on the other hand, we first learn to feel thoroughly the peculiar impressions of nature in that homely dress which she assumes in the Netherlands, England, and Northern Germany. Sometimes we behold the solitude of a forest with noble trees finished in

all their minuter details; sometimes open prospects over wide plains where the gleams of sunshine, alternating with the shadows of clouds, produce the most delightful effects of light and shade, sometimes peaceful villages interspersed with wood, or, lastly, that picture of restless motion, fresh gurgling waterfalls. Who that is well acquainted with the pictures of Wilham Vanderveelde, of Backhuysen, and many, indeed, of Cuyt, but must have experienced a similar refinement of his taste for the numerous picturesque effects of the sea under its ever-varying circumstances, and of the vessels that enliven its surface; and can any one doubt that he who regards fruits and flowers with the eyes of a De Heen, or a Van Hynsun, men who made the beauties of these objects the study of a life, will derive from them an incomparably more refined enjoyment than others?

Thus we see that the Arts of Painting and Sculpture embrace within their sphere the most manifold relationships in the world of spirits, the most various phenomena in the world of reality; and for those who know how to drink worthily at their source they are an ever-flowing fountain of instruction, of moral education, and of the purest and noblest pleasures of which human nature is capable.

BERLIN, January, 1850.

THE NATIONAL EXPOSITION OF 1851.

In our recent number we endeavoured to trace the progress of manufacturing industry, from a period commencing with the reign of George the Third; to show the rapid growth and extension of certain branches, the increase of capital, of employment, the development and application of intellectual power. The more general application of science to the Industrial Arts, which had marked this epoch, made it an important chapter in the "Annals of British Commerce," and through the more immediate intercourse of nations by the agency of Steam, of the highest interest in the "History of Civilisation." For in the moral government of the world, interests which appear to be exclusively selfish, are made conducive to good ends. No man is permitted to prosper for himself alone. The genius which exalts or gives eternal fame to one, becomes the source of happiness to thousands. Even as light extends in rays, which fill the earth with circling glory, so does knowledge in her expansive progress awaken the faculties of man, direct them to nobler ends, and provide a wider horizon for their exertion. By the advance, the success, and the reward of this, all even the poorest are benefited. It is as the genial rain which sweeps across the grateful surface of a widespread plain, blessing the land with fertility, bearing the wealth of its produce unto the hearths of all. We shall in a future number continue the subject, but confine ourselves in the present to some remarks upon the Commission recently issued, for the due execution of the design so honourable to the prince, so becoming the people;—the "Promotion of Arts, Manufactures and Commerce." The interest we feel in its success, the attention due to manufacturers, and to all whom it is the special object of this Journal to assist, render it absolutely requisite that we should watch with earnest attention every detail, and, free from party zeal, independent of any local or associate influence, offer such comments as may appear most conducive to the successful realisation of the design. The Commission, which is dated January 3, 1850, is thus composed.—H. R. H. the Prince Albert, the Duke of Buccleuch, the Earl of Rosse, Earl John Russell, Sir Robert Peel, Henry Labouchere, W. E. Gladstone, the Chairman of the East India Company, Sir Richard Westmacott, Sir Charles Lyell, Thomas Baring, Charles Barry, Thomas Bazely, Richard Cobden, William Cubitt, C. L. Eastlake, T. F. Gibson, John Gott, Samuel Jones Loyd, Philip Pusey, and William Thomson. We shall pass over the second part of this instrument commencing with the name of "Our right trusty and entirely beloved cousin, Spencer Joshua Alwyne, Marquess of Northampton, to that of

our trusty and well beloved Thomas Winkworth;"—as matter merely relating to Treasurers and Trustees; to those of the gentlemen who constitute the "Executive;" viz. Henry Cole, Charles Wentworth Dilke, junior, George Drew, Francis Fuller, and Robert Stephenson;—with Matthew Digby Wyatt as the Secretary. Then follows a paragraph of great importance as we hope to show, giving fuller power to the Commission to appoint "such several persons of ability as you may think fit to be Local Commissioners in such parts of our kingdom and in foreign parts, to aid you in the premises," concluding with the names of John Scott Russell, and Stafford Henry Northcote, as Secretaries to the Commission.

Now, to these names—as respects the Commission—we apprehend no reasonable objection can be urged. Agriculture, Science, Trade, the Premiers of past and present governments, Colonial interests, Art, the Raw Produce of the Empire, Commerce, Manufacturing and local interests are alike represented. There is not a name, unconnected with great personal worth, whilst the majority enjoy a European reputation. The objections urged, are chiefly on the ground of great omission. Why, it is said, were not the names of De la Beche, Brande, Faraday, and Wyo, each so eminent for his special branch of Art, &c., included? Why not add those of the ambassadors of foreign states, as "ex-officio" guardians of the interests of the people they represent, and who are invited to compete? Against the first objection many well-founded arguments may be adduced. We must never lose sight of the means to the end. A large commission is fatal to all practical results. There is a tendency in all public boards for every member to indulge his own particular theory. The active seek to impress their predominance upon the rest, and the inexperienced in details are generally found to be the most original in conception. Hence, plot and counterplot, debate and division, which retard progress, chill zeal, and weary down the patience of others, who having pursuits or pleasures to lure them from attendance at the council, which it is ever of the highest importance to render "frequent and full," gradually vacate their duties to the less occupied, the more interested and enduring. The number, therefore, sufficient to secure an adequate representation of all interests, and to prevent the government falling into the power of a few, is the best; and this, we think, the appointment of the Commission will effect. Let it be remembered also, that there are men to be selected as Judges, whom, for that reason, it would be impolitic to appoint on a Commission; that no time is to be lost; and if such a system of election is to be adopted—for which some contend—until all men are satisfied, the year 1851 will find the Commission in the situation of the rustic, who waited on the bank of the river until its waters should glide away. To the second objection, the appointment "ex-officio" of the foreign ambassadors, we have heard no sufficient reply. We urge this for adoption, for the following reasons:—The scheme of the Exhibition proposed by H. R. H. Prince Albert, differs from those hitherto adopted by any other nation; and heretofore never contemplated by this. It is nobler in its aim, unlimited in its sphere, unshackled in its action; emphatically an appeal to the world to compete with the English Artist, Manufacturer, and Artisan. Thus, from its origin, this Exhibition bears a strictly national character. Now, politically all nations living in amity together, demand efficient guarantees for the protection of their several subjects. The mutual interests flowing from such intercourse are thus alone secured. For this, as a settled principle equally cogent in all cases of greater or lesser import, comprised within its category, we urge the nomination of the representatives of each state accredited at the English Court. From many, much might be learnt; it would strengthen well-founded confidence, possess a useful moral influence, secure to the competitor of every land the counsellor and protector he sought, and exhibit on the part of his English rival

that love of a "fair field, and no suspicion or exercise of favour," which is so much with him a characteristic, as to have become to him a proverb. The future of such a policy, will never be so useful as the present. Men are generally content in success, unwilling then to be suspicious or critical as to its cause. It is in the origin of designs when results are uncertain, that the neglected and suspicion, the timid clog the hold, the indifferent chill the fervent. There is a wisdom which complains that it is never justified until justified by results. Successful, it appears as the "Reward," and reminds you of its prophetic glance at the future; in the hour of failure, however, it assumes another aspect, and rises the "Remorse" which cries "I warned you," when the deed is done. Therefore it is, that in the commencement of great designs men do well to take hostages of Fortune, to adopt such rules of action, as create confidence in the minds of the earnest and strongminded. Of such rules, we hold the immediate appointment of the ambassadors to be one.

We pass now to the appointment of the Executive. To the limitation of this to the names selected, objection has been taken, not without reason. We pass, as unworthy of notice, all personal criticism; personal motives, as George Canning truly and wittily said, "are motives fit only for the Devil, with whom, as with the Pope, Her Britannic Majesty's Government are forbidden to hold intercourse." We take advantage (now *in part* revealed) of the statute. That the Executive however should be made to bear a closer relation to the Commission, must be conceded. Observe the facts. The Exhibition is no longer that of GREAT BRITAIN, promoted by the SOCIETY OF ARTS, which has transferred it from three rooms and a staircase, the company of their own members with conversation and coffee which makes the politician wise, to Hyde Park. No; the Society of Arts, most honourably, as most wisely, with one voice approved the noble design of His Royal Highness their President, and whilst seeking to rival the Exhibition of French Industry, proposed at once to enter into competition and to provide on English ground for the competition of the INDUSTRIAL ARTS OF ALL NATIONS. From that hour it became a NATIONAL concern; from that time no matter who formed the machinery, the design could only be conducted by the Government in a strictly national manner, with little or no departure from the usual constitutional forms. It seems therefore clear, the same rule applicable to the formation of the Commission, holds with respect to the Executive. You cannot make the names in the first all "Prizes" and leave the rest all "Blanks." If position, public office, eminent talents, are the selection in one case, something like this, or at least more like this, is a consequent in the second. It is idle to say—"Oh, but the Executive means nothing! It is merely the machinery, the working power!" The Executive rightly constituted must mean and effect much. That it will be greatly governed by the legislative power, receive at least an impress from it, we admit; but what Executive with a consciousness of the ability, the knowledge, the power of conducting details to a successful issue, does not react, does not seek to control the opinion of the Legislature, and make this the expression of its will. Who are hrougnt so immediately in connection with the Executive? Who are supposed to be more thoroughly acquainted with their immediate interests, their special pursuits? It appears, therefore, of the highest consequence the gentlemen selected should be of great scientific attainments, men practically acquainted with industrial details, combined with others whose industry, zeal, and leisure may enable them to give that continuous attention, that ready decision to all points submitted to their judgment, for which an Executive is constituted. The want of this combination we regret. To no public body could the conduct of this design be more justly committed than the Society of Arts. When, however, the acts cease to be the mere fulfilment of its own "Prospectus," when it comes forth clothed with national pomp, with the national standard flaunting in the van,

it should appear heralded and arrayed with something more of national power. No officer, at least, should be appointed for a special case,—to act as the providence of contingencies. Thus, for instance, in the case of Mr. Fuller and Mr. Drew, however their appointment was justified by the necessity of raising funds, however influential the first was in this respect (and we know his zeal has been untiring), however honourable the conduct of the Messrs Munday, and becoming the appointment of Mr. Drew as the representative of those gentlemen who so liberally and unselfishly placed so much at stake, the entire argument on their behalf breaks down;—by the cancelling of the contract into which the Society of Arts had entered, and in relation to which they were appointed. This was decided at the first meeting of the Royal Commission held on the 11th inst, when "in concordance (consequence)" with what appeared to be the wishes of the public, the Commission decided to give notice of its termination and to place the whole undertaking upon the basis of a general subscription,"—that is, to carry the EXHIBITION OF THE INDUSTRIAL ARTS OF ALL NATIONS into effect, in a National manner upon NATIONAL FUNDS. We again repeat, the Executive should be formed in analogy to this design. "Confidence is of slow growth," said Lord Calthorpe, "in aged hosoms; it is of still slower in the minds of public constituencies, and amid the leaders of great interests." Yet confidence is above all to be inspired in transactions of this nature, and this cannot be won by any charm, but that of sound principles, a due caution in adapting the means to the end, and the utmost frankness. Already at a meeting held at Manchester, January 12th, the report says "Only one opinion was expressed at the meeting in reference to the contract entered into, and that was in reprobation of the haste with which it had been made, and of the principle of a *private contract* in a GREAT NATIONAL UNDERTAKING, designed to bring forth the Art and Industry of the entire kingdom," to which should have been added, in competition with the Art and Industry of the world. It is evident this meeting felt;—No national undertaking of this nature can be satisfactorily conducted by an EXECUTIVE, which resembles a Firm.

All objections, however, to the Executive would be, we think, removed, and public confidence established, if two members were added to it—such two to be appointed by the Commission.

It should be enlarged, its importance increased; which importance, made to assume a national character, can only be effected by the combination of eminent talent, with an active, intelligent working power. It is idle, we repeat, to suppose an Executive a mere piece of machinery, to be only set in motion by the Commission as a driving power, whilst from the offices of that Executive Committee, documents are issued, of such importance as that relating to the Local Commissioners, to which we shall presently refer. If the Council of the Society of Arts want power to effect this, they should appeal to the public body; but it is dangerous to the best interests of their design to give cause for excuse to the lukewarm, of despondency to the zealous and suspicion to the sceptical. "From first to last," says the *Times*, "the Exhibition of the Industry of all Nations must be free from the imputation of being merely a job in the interest of a few individuals." The realisation of its aim depends upon the integrity of its plan, and public confidence in this integrity. It is for this reason the proprietors of this Journal have ever avoided connection with the practical working of such a scheme. Not that connection with the press is to be the rule of exclusion from all offices of trust, of enterprise, and honour. This would be an intolerable condemnation of an honourable pursuit, to which no man of intellect, possessed of a right-minded sense of the respect due to it, would submit. It would be an usurpation over private worth in the name of public interest. In most cases, especially such as the one under consideration, conductors of journals devoted to Literature and Art, are for that very cause oftentimes the most efficient agents in their promotion. But when public feel-

ing is liable to be disturbed in its healthy exercise by the influence of zealous partisans, party spirit, and personal interests ever likely to seek to tempt justice from its course, we think then the press is the more respected the less it is immediately connected with the competitors. The press has power only as opinion has power. The press is the living spirit which bears to all the impulse of the individual;—Ideas become a moral power by expression. As the sound falls on each man's mind, associate tones awaken, the chord of thought and feeling is struck, and produces, by the circling strength of its wave, that deep reverberation in which a Nation's Will is echoed. But it should be as the impassive immutable voice uttered from the far depths of Reason and Truth; the reflex action of the Thought which has its origin in Eternity.

We now come to the question of the Local Commissioners. It is to this we would earnestly direct the attention of the manufacturers. Most urgently we would advise them in every town or district, or union of townships, to elect their own representatives, to confer with the Local Commissioners, or to claim his appointment. Their special duty would be to collect evidence to report on the various subjects affecting their interests and the Exhibition, either referred to them by the Commissioners, or which they should represent to the Commission, as suggestions upon matters of local or general import. These Local Commissioners should be men willing to give personal attendance on the Commission or Executive Committee. A division of labour in this respect is of the highest importance, the most competent man in each department of industrial or scientific pursuit should be elected; and no man simply for position, or the mere accident of office for the time being. Such an organisation would lead to the practical establishment of a public body hearing the same relation to the Commission as the House of Commons to the House of Lords; aiding, controlling, and giving power to the Executive. Finally, we trust that the utmost energy will now be displayed by all. There must be no vacillation or uncertainty, no letting "we cannot wait upon we would;" hesitation, irresolution now, compromise the scheme at home,—ruin it abroad. Already in Paris preparations are making for the General Exposition in London, and the Government of France has been memorialised to aid to the utmost the desire of the Continent to enter the lists. A year is much in the life of individuals, it is nothing for the preparation of measures to meet the interests we have evoked. We may expect competition from the raw products of the most opposing regions. From the ice-bound harrier, where eternal winter reigns over thrilling regions of thick ribbed ice; the wealthy plains of the exhaustless East, hands still redolent of the wealth of Ormus and of Ind, or others such as Italy, over which the foot of man has for centuries trodden down what heaven has done for that classic soil of ancient greatness, but to which the genius of the poet and the artist has imparted an undying interest, an immortality both of memory and thought. From China, an empire still fettered by the laws of an imperfect civilisation,—Russia, off whose gigantic frame these very fetters are falling;—from the North whose spirit it has been the policy of every government, especially in relation to Arts and Manufactures, to evoke;—from France where from the days of the Eleventh Louis to the last of her kings, these Arts and Manufactures have ever been royally encouraged, or placed under the safeguard of the nation; we have called forth a competition, which it would be shameful to misconduct. On the highest and the lowest, we would impress the necessity of earnest and well combined exertion. We are not working for a trifling cause, or a selfish end. Let it be remembered no man can advance Art, Science or Literature without at the same time promoting the social and the moral good of the entire human race. For ART, SCIENCE, and MANUFACTURES are as the winged messengers of heaven which sit before the Mercy Seat, and bear unto all nations, the least blessed, or the most refined, that doctrine—sacred in its origin, eternal in its duty—of Peace on Earth, Good Will towards Man.

LINEAR PERSPECTIVE.

NO. III.

IN the brief reply which has been most kindly allowed me, with respect to the three articles disputing the truth of the curved theory of Perspective, as laid down in the theorems in my first essay, I cannot possibly enter fully into the various objections and sophistries therein contained; and must, therefore, select a few important points which I shall be able to clear of the confusion that has been attempted to cast around it.

First, it is contended that right-lined perspective is true?—and are its theorems offered to us as the unquestionable laws of nature?—because if they be, it will be impossible they can produce error; and if error can positively be demonstrated to result from them, then we are all afloat, for the science of vision or perspective must be perfect, whatever it be: its laws must be in harmony with itself, producing always that which is consonant with reason and common sense. Herein is the first great difficulty, because right-lined perspective can be demonstrated by figure to be false,—to contradict its own requirements. I am of opinion that Fig. 2, in the second essay, will be sufficient for every unprejudiced mind. The system which requires the contraction of lines to a definite point at one side of the eye, and the indefinite expansion of the same lines at the other, cannot be true. I am ready with other figures still more absurd, which demonstrate by irrefragable evidence the utter inconsistency and absolute falsehood of right-lined perspective; and that, not by extending the view beyond the limits of 60°, which the advocates of the old system take shelter under, but by single figures.

Besides these errors, demonstrable by figure, frequent reflection, when sketching from nature, led me to consider that the distortions of right-lined perspective, beyond the angle of 60°, lay in some fundamental error in the science. It was observed that nature did not look in any way distorted beyond that angle, and I could not see why a picture should; and the idea arose that the cause lay in our not disposing our lines as nature did; and that by disposing them as they are exhibited to the eye, we should reap no longer distortion by extending the field of view. This is found to be the case far beyond my most sanguine expectations. The freedom, truth, and extent that may now be obtained, are revealing themselves in every additional study.

The spectator can now approach nearer the plane of the picture; he can look either way as in nature. Pictures can be drawn, (I am engaged on one now,) in which the planes parallel to the picture, are intersecting the plane of the picture; it gives both the frontal view and the angular view at once, which the eye sees in turning either way to look at objects, and that by a single diagram, easily understood, and which produces the vanishing points also. Such is the reward of freeing the science from the imperfections and imbecilities that had been imposed upon it. It was from individuals, not artists, I expected that flood of opposition I have been assailed with; who, not being acquainted with the difficulties with which we have had to contend, and who, dwelling always upon the tangible, confound these with the visible, and these again with our representation of it. They overlook this great and important truth, that perspective is in the eye; it is not what nature is, but what the retina makes of it. An examination of the lens of vision, (the crystalline) will convince any one, that from its convex form it is impossible our vision of nature can be any other than what is laid down in the theorems in the first essay. Recent experiments show these to be so accurate, that the view being taken from an elevation, the line of the eye rose with it, forming a surreptitious horizontal line; the real horizontal line became concave, and vertical lines began of curving towards their line of the eye downwards.

It is impossible I can go through the Theorems in this brief notice. Mr. Heald might prefer such a theorem worked one way, and some one else would have preferred it another. Theorem third will be alone considered, for on this hangs the whole fabric of the system. It must be granted at once that a horizontal plane passing through the eye, ceases to be seen as a plane and becomes a line, and that this line is the vanishing line of horizontal planes parallel to it; right-lined perspective is involved in this, or we should have no declination of lines whatever. Then if a parallel plane (any roof under which we stand is a portion of such plane), be declining on all sides, every way to its vanishing plane in the eye, such parallel plane must be convex in appearance; and, as the distance

of these parallel planes increases, having still to vanish in the plane or line of the eye, their convexity must increase also; and as stated in the comment to this theorem, any line that can be drawn in any of these planes will partake of the exact convexity of the plane it is in; and herein is my system fully and firmly established. Beware of what right-lined perspective will make of these parallel planes; it makes them into a cone, which is an error, seeing that they are perfectly flat in reality, and appear so over the head, which is their centre. Mr. Heald may not agree with this, but there is no necessity to mystify ourselves by wandering amongst the Spheres, the Greeks, or the Antipodes; it is all resolved into this plain question,—A plane, being a right line when passing the eye, what is the nature of a parallel plane according to vision?

It will now be shown how little the generality of minds comprehend that vision of objects with which artists have to do, and what egregious errors are in consequence perpetuated.

It is stated by Mr. Heald that the curvature of lines, two miles in length, parallel to the picture, would not be distinguished by the microscope. This is a mere assertion without any data, and shows want of observation. The degree of curvature of any horizontal line, depends upon its height from the line of the eye, and can be obtained with perfect accuracy, by receding from any line above the eye you lower its position and decrease its curve, by approaching it you raise it and increase it. Knowing from long and careful practice how much curvature nature produces, I selected a frontal facade of about seventy yards, and a height of twenty-five feet, and placing the eye in the centre at a distance from it of ninety feet, the curvature as traced, showed by measurement a height in proportion to two in the centre to one and three-eighths at each extreme.

Mr. Heald's error consists in overlooking the statement at the commencement of the theorems, that we were declaring the laws of appearances. We know that parallel planes can never meet, but they meet to vision. We know that vertical lines may be of immeasurable extent, and may penetrate all space, but they all rise perpendicular to the plane of the earth's surface and terminate at the zenith to vision. We know that planes may be of infinite extent also, but we have no recognition by sight of their being so. It is immaterial from what undefined region a geometrical line comes, we have no recognition of it or its properties, till it comes into that hemisphere of which the eye is in the centre, when it immediately becomes subservient to the laws of that organ, and liable to representation. Now it is these laws and this representation that are the objects of my inquiry, disengaged from those truths of comprehension with which we have nothing to do in Art, and with which geometry is alone absorbed.

Mr. Heald confutes himself at once, and supports my position by his closing acknowledgment, that "errors of perspective views of architecture had been pointed out to him with a view to remedy." What remedy? If perspective was true it would not have produced error, or required a remedy. It is possible this remedy may be found in the theorems he denounces.

With respect to the rays of the sun, which we must nevertheless number amongst the "playful lines" of earth, they being subject to the laws of perspective, and of representation as other natural effects, the writers are judiciously silent, save some doubts of a dubious and cautious character.

It will be evident to every capacity that two lines proceeding from a point (the sun), and gradually expanding to 90° from it, and gradually contracting to 90° further, cannot be straight the whole way, they only appear straight when viewed in small portions, which is their general appearance; to see rays from the sun contracting to their vanishing point 180° from it, could only be seen at its rise or setting—almost daily observation for about six years has only afforded me two opportunities of seeing the diminishing rays of the sun, which were exactly as I have described.

With the letter of Mr. Huggins, which by the by is written in a calm and temperate manner, I have little to do but answer two points, brought also forward by other correspondents.

It is contended that the right lines of nature cannot or ought not to be drawn as they are seen, except on a sphere, in which the eye is placed opposite a point determined. The brief space I am restricted to will not allow me to enter fully into this part of the subject, any further than to state, that the theorems I have propounded will produce the nearest approximation to the concavity and curvature of nature which science has yet produced. This system will produce the spherical appearance on a flat surface. The camera gives

this curvature on a flat surface, which puts an end to the objection.

It is also contended by this and the other writers that as the eye curves the lines of nature in obedience to the laws of its construction, it will curve the lines of a picture also, and that therefore they should be made straight. I have just hinted at this in my second essay in answer to a correspondent. I will now add further, that the diminution of curve which the eye would make of the lines of a picture would amount to nothing more than the size of the picture, which would be inappreciable.

For instance, the view of Roslyn Chapel in the second essay contains the curvature of the original to the eye, reduced in proportion to the reduction of the drawing; which is truth;—were this drawn straight, no curvature would take place, not if it were ten times the size.

In order to show how fallacious the argument is, I must mention, that its advocates entirely overlook the important principle of relative proportion. A picture thirty-six inches long may represent an object that size, when its lines would appear perfectly straight, and would be truly represented so; it may represent a building or groups of considerable size and extent, or it may include an immense lateral extent of space and objects, when it ought to represent truly the various curves that will be drawn straight, the curve that the eye will make will be the same for all proportions, for the object first named as for the most extensive building or view, and will be just as much as though you took the picture away and left a stick a yard long in its place, which will be nothing. What I contend for is, that as the visual rays from the extremes of a building are contracting in proportion to their distance from the eye; its representation shall be a section of these rays producing proportionate contractions; which will be truth, and which will lead to results as advantageous to Art, as beautiful in appearance, and of which the artistic world has as yet no comprehension.

I now come to Mr. Doeg's theory of vertical lines, which are asserted to be straight lines, the Aurora Borealis included. It will be shown how inutile is a knowledge of the geometry of visibles when pressed to what ought to be its sequence—the science of representation. Let us see what this theory will do for us. It is worse for the artist than any theory yet laid down, inasmuch as it destroys all vertical lines whatever, reducing them to the condition of a pile of arms, seeing that they all terminate at the zenith of the spectator. Vertical lines rise perpendicular to the plane of the earth's surface, and gradually converge to the zenith. This is the theory I have laid down—what I have seen of Daguerrotype views show this disposition of them, which is conclusive.

I will now put the theory to practical test as regards representation. The rays of the Aurora are stated to be straight lines between the horizon and the zenith; therefore if we select a given extent for representation, to give their acknowledged convergency, the angle of their origin from the horizon will continue to decrease, as in the annexed figure, which is not truth, because they

all rise perpendicular to the horizon. Again, if they are to be straight lines rising perpendicular to the horizon, their disposition will be so, without

any convergency to the zenith, which is not true. It is thus conclusive that neither of these will do for representation. Adopt the theory I have laid down, and we shall have the nearest approximation

to truth of fact and representation that can be given. Here everything is in harmony; each rises

perpendicular to the horizon—each converges to the zenith; they will appear to traverse the concavity of the heavens on each side, and give the nearest approach to a drawing on a sphere which art can produce.

Mr. Doeg asserts that cloud-lines parallel to the horizon are straight also. As they approach and meet together at their vanishing points, how are their various elevations and convergencies to be represented by parallel straight lines?—This system would at once destroy all perspective, for it is the seen departs from their parallelism that is the foundation of right-lined perspective. If Mr. Doeg will take a dozen hoops (one coloured) and unting them on a common diameter, their axis; let the coloured one be placed horizontally, and the others at various distances apart, to one vertically; their convex convergency to their respective poles (the two vanishing points) the eye being supposed in the centre, will then be seen exactly as in nature. As the eye moves round (continuing in the centre) the disposition of the various elevations and vanishing points will remain the same; and it will be seen that two lines only will be seen and can be represented straight—namely the horizontal hoop, and the vertical one, when the eye is opposite either pole. Introduce other diameters, and other vanishing points will be generated, having their parallels converging to them; and the whole system of convex perspective will be seen at a glance, and clearly comprehended.

To conclude; my object in introducing the subject before the world was to set the artist free from the trammels that had been imposed upon him; sanctioned, it is true, by the devotions of respected men, but nevertheless erroneous—to enable him to assert his independence, and to show him how to use much power and truth he was losing by following in the wake of the past, however mighty and venerable. Though assailed, the theories I have propounded will be found to be the truths on which alone we must repose for future time, for our exposition of the visible in creation, and the regulation of its representation in Art.

WILLIAM GAWIN HERDMAN.

[We have received a paper from Mr. Heald, of Carlisle, apparently sent with the twofold purpose of honouring and conceding to Mr. Herdman the truth of his system, and of expounding a system of his own, termed "Cylindrical Perspective," and of which we can do no more than give the following brief abstract.

Whilst regretting that Mr. Herdman had not as yet given the precision of mathematical theory to his views, "I am conceded from the further explanations Mr. Herdman has given, that there is truth in the system," though linear perspective is capable of being defended from the attacks made upon it.

Mr. Heald's system consists in substituting a vertical cylinder instead of the transparent plane of glass, and placing the eye in the centre, and at some defined point of the axis, draw on the cylinder, the form of what you see around you. Having drawn to any extent desirable, cut the portion of the cylinder drawn upon, flatten it and hang it against the wall, when there will be given "a correct representation of the aspect of nature around," "having some affinity to linear perspective, and some to orthographic projection; yet differing from each in the singular fact, that while in both the first mentioned modes of representation, straight lines in nature are straight lines in the picture, yet in this developed cylinder, all straight lines in nature are curves in the representation with only two exceptions, which are vertical lines and the horizontal line at the level of the eye. In the twofold proportion of deviation from the vertical and elevation, or depression from the horizontal line does the curvature increase; the greatest amount of curvature is seen in the highest and lowest horizontal lines, precisely as in Mr. Herdman's system."

In this cylindrical picture there will be attained "the almost impossible condition mentioned by Mr. Huggins of placing the point of sight opposite every part of the picture." A dozen spectators of a picture will each view the part correctly opposite his eye; whereas in linear perspective one point only is correct, which is rarely discovered by the spectator.

The laws discovered are stated closely to resemble Mr. Herdman's, and the principal are as follows:—1st, Every straight line has two vanishing points, which measure on the generating cylinder 180° apart; but the absolute length of the lines connecting these points varies from the semi-circumference of the cylinders (which is the length for horizontal lines) up to infinity, which is the distance for vertical lines, and which is one reason for vertical lines being straight.

"2nd, The nature of the curves into which the lines are projected (except vertical lines and the horizon) is a wave, the curvature changing at the vanishing point into the contrary direction; therefore just as the vanishing point the line is perfectly straight; from thence its curvature increases till you get to the centre, which is the point of quickest curvature."

From the concluding paragraph we ascertain, that should a bird's-eye view be taken, the horizontal line itself will become curved, and vertical lines converge as they descend.

The applicability of the system by artists and draughtsmen, is stated to be "readier than linear perspective," all the vanishing points will either lay within the picture, or not be further from it than will be convenient; and that we shall get quit of the nuisance of inaccessible vanishing points, and have instead to arrange the curves.

Mr. Heald, whilst hinting that it is possible the two systems may be identical, wishes to guard himself from the presumption of saying that what he now puts forth is Mr. Herdman's system.]

FÊTE ARTISTIQUE AT BRUSSELS.

MONSIEUR LÉON GAUCIEZ, the editor of the *Revue de Belgique*, conceived the idea some weeks since of giving a ball, the proceeds of which might be distributed to alleviate the sufferings of a numerous race of young and promising artists, occasioned principally by the political occurrences of the Continent. The sentiment was eagerly responded to by the leading men of rank and talent in Belgium, and the result has surpassed the most sanguine expectations. The ball took place on January 5, at the principal Theatre of the City of Brussels, situated in the Place de la Monnaie. The price of admission was fixed at twenty francs each person; and for each ticket the purchaser was entitled to a chance in a lottery for works of Art. Subscriptions were likewise received, also entitled to proportionate chances in the lottery of one for every ten francs. The principal artists of celebrity have so bountifully contributed their works, that about 800 pictures, drawings, sculptures, &c., have been collected. Among these are fine specimens from the pencils of Massé, Hamman, Leys, Robert, Stevens, Verboeckhoven, Robbe, T'Sebagony, Willems, Wauters, Dillens, Eekhout, Cluys, Huard, Kindermans, Portaels, Fokhmois, &c. M. Louis Gallait, the distinguished painter of the "Last Moments of Count Egmont," has presented a picture, entitled "The Broken Bow." A wandering minstrel constitutes the subject, who regards with hopeless dismay the instrument which arrests his execution on the violin, indicating a sudden privation of the means of existence. M. Fraikin, the sculptor, sent a model of Cupid emerging from a shell, which he offers to execute in marble for the fortunate holder of the number that may be entitled to this prize. The most singular and original feature among the artistic contributions are some prepared canvases. The winners of these will be entitled to have their portraits painted on them. One is the gift of the Baron Gustaf Wappers, President of the Academy of Antwerp; another that of M. Navez, President of the Academy of Brussels; and a third is from M. Laurent Mathieu. The estimated value of the whole of the objects obtained for this lottery is 200,000 francs.

The Ball was brilliantly attended. Their Majesties and the young Princess, attended by the officers of the Court, honoured it with their presence. They arrived about 9 o'clock, and were received with the most joyous and loyal bursts of applause. The ministers, burgomaster, and other dignitaries were also present. The crowd was so compact that but little dancing could take place until late in the evening. The theatre was entirely transformed by the new decorations, which were of gold of various hues at the end of the stage, an allegorical picture of the Chariot of the Sun was painted, from the design of M. Portaels, and the ceiling was filled by a subject similar in idea to M. Delaroché's famous hemicycle, portraying the apotheosis of great men in Art and learning, from the design of M. Gallait.

The drawing of the lottery will take place in the month of February at the Hôtel de Ville, in presence of the Burgomaster and the municipal authorities. Tickets for it are to be issued until that period, and from the amount now in hand, the projectors of this truly philanthropic fête expect to be enabled to distribute among the humbler and suffering class of meritorious artists or aspirants, no less a sum than 100,000 francs (4,000*l.*)

THE VERNON GALLERY.

THE AGE OF INNOCENCE.

Sir J. Reynolds, P.R.A., Painter. F. Joubert, Engraver.
Size of the Picture, 2 ft. 5 in. by 2 ft. 1 in.

WITH the exception of two portraits—of one himself, and the other of the late Sir A. Hume, this is the only example of Sir Joshua's pencil contained in the Vernon collection; it is one, however, worthy of his high fame, though, as may be presumed, simply the portrait of a little child. It is here indeed that the works of Reynolds exhibit his powers of fascination; for it has been justly observed, that "his fame must rest on his numerous superlative portraits, and his enchanting representations of the innocence, simplicity, and natural habits of unsophisticated children; in these he stands alone." "I should grieve to see Reynolds," says Dr. Johnson, "transfer to heroes and to goddesses, to empty splendour and to airy fiction, that art which is now employed in diffusing friendship, in renewing tenderness, in quickening the affections of the absent, and continuing the presence of the dead." The great charm of Reynolds's portraits of children, is the remarkably intellectual expression imparted to them; they are not mere chubby, rosy-cheeked, inert masses of flesh and blood, but beings endowed with mental faculties—blossoms whose fullness and beauty must ripen into wholesome fruit; it is impossible not to see this in the sweet face of the subject so appropriately termed "The Age of Innocence."

This picture has always borne a high character among Sir Joshua's works; it was in the gallery of the late Mr. Harman, and was purchased at the sale of that gentleman's collection by Mr. Vernon, for 1450 guineas. It is fortunately in excellent condition, and constitutes a gem of no ordinary value among our national pictures.

SIR FRANCIS CHANTREY, R.A.*

It is assuredly true that we read with interest and curiosity all anecdotes of our distinguished contemporaries, while we esteem all stories of the celebrities of the past only in stories of their point. When the sayings of an artist are found worthy of communication to the world which lies beyond the circle of his profession, they must savour strongly of the sagacity of that outside world; and this qualification it is that characterises the "Opinions" of Chantrey. A great part of the life of this celebrated artist was passed in daily intercourse with some or other of the most eminent personages of his time. Therefore of such a man there is much to be said, and much that he has said of others is worthy of record. Like all men who apprentice themselves early to Art, one of the most severe of mistresses, Chantrey enjoyed few of the advantages of education; but he nevertheless adapted himself to the highest class of society, with a tact rarely discoverable in more carefully educated men. The acumen and accurate conclusion displayed by him in speaking of works of art, leads us to regret that he has not committed to paper his thoughts of the works of his contemporaries. He saw much of Canova and his works, and the simple purity of his taste was shocked by the little tricks by which the otherwise great Italian sculptor diminished the merit of his design. He knew Thorvaldsen, and he looked into the Dane undazzled by the halo which surrounded him; and we should have been the better for knowing what he saw, but he has left no record. In reading these recollections, and having seen some of Chantrey's sketches, we are disposed to believe that he would have acquired if not as great a fortune—at least an equal—perhaps a more genuine—reputation, as a landscape painter, than as a sculptor; and it would seem that he hesitated some time between painting and sculpture. Inasmuch as portrait painting is a profession distinct and apart from imaginative art, so is the profession of portrait sculpture very different

John Chantrey

from that of poetic sculptural design; and if the mind of the artist teem with imaginative subject matter, no earthly consideration can hinder him to bust or portrait. The following passage is in accordance with what may be conceived of Chantrey from his works: "At an early period, when he was inclined to follow painting as a profession, he displayed a similar disposition for the unornamented style; and his works at that period, though few, indicate a masterly mind and noble conception of light and shadow which he studied particularly. He always professed that every good statue should produce a chiaroscuro that would be perfect in painting, and that the one art might be considered a good rule for the other in this respect." This feeling for simplicity and breadth characterised everything which he did, and gave infinite value to the vitality which he inspired the features of his heads, and this same love of simplicity which is ever the last affection arrived at by ordinary minds, seems in him to have set aside, from an early period, every vulgar tendency. Constable in a letter to a friend, describing the varnishing day at the Royal Academy, says, "Chantrey loves painting, and is always upstairs; he works now and then on my pictures; yesterday he joined our group, and after exhausting his jokes on my landscape, he took up a dirty palette, threw it at me, and was off." Whether Chantrey and Constable were, or were not, what we may term sworn brothers in Art, we know not, but they might have been, for the idiosyncrasy of each was identical. The breadth and simplicity professed by each were elements of the same unaffected grandeur which both acknowledged with ardent devotion. We find Chantrey touching upon Constable's pictures, and at the same time saying that he would allow the painter to work upon his busts. Constable was intensely sensitive of the many-luad and ever-varying phases of nature; and we learn from his works that the emotions of Chantrey were the same in contemplation of the like theme, but neither were, in the strict sense of the word, poets, that is, creators; had they been so, the works of both had necessarily been different as to subject, though they might have been endowed with equally estimable qualities.

The constancy with which, in the early and obscure parts of his career, the sculptor pursued his profession, is a mark of a mind of no common stamp. In 1808 he received a commission to execute four colossal busts for Greenwich Hospital:—those of Duncan, Howe, St. Vincent, and Nelson, and from this time his prosperity may be dated. During the eight previous years he declared that he had not gained five pounds by his labours as a modeller; and until he executed the bust of Horne Tooke, in clay, in 1811, he was himself diffident of success. He was, however, entrusted with commissions to the amount of 12,000. His prices at this time were eighty or a hundred guineas for a bust, and he continued to work at this rate for three years, after which he raised his terms to a hundred and twenty, and a hundred and fifty guineas, and continued these prices until the year 1822, when he again raised the terms to two hundred guineas; and when he modelled the bust of George IV., the King wished him to increase the price, and insisted that the bust of himself should not return to the artist a less sum than three hundred guineas.

He never gained five pounds by modelling during eight years.—Such a period of drudgery at the chisel had disgusted and discouraged any other than a man stimulated by the purest love of his Art. But Chantrey has not been alone in his drudgery, yet he hid his time, and at length the honours were dealt to him, and he played them to advantage. We have seen others, the pet-children of their mother, the Muse of their art, by whose threadbare livery they were ever to be distinguished, and who had some influence once in Hellas, but in these iron-days she is herself almost a beggar—we have seen, we say, men whose every thought was purely Homeric, whose every conception was an emanation of the most refined sentiment, these we have seen mere heavers of stone during the best period of their lives, because there was no resplendent chord in persons miscalled patrons of Art. Flaxman, for example, lived more than two thousand years too late. He was born in England under Aquarius—he should have been born at Athens under Pericles.

Chantrey's criticisms on painting, from his natural inclination for that art, were not less judicious than his observations on works in his own department of art. All his remarks bore immediately on the main purport of the work, and his first inquiry was relative to the value of the sentiment expressed, never suffering himself to be misled by finish or manner. He looked for the best and most careful execution in the heads and hands, as therein are read the emotions of the mind. To him the value of a picture existed in expression; sans the *mens divinator*, all was to him worthless.

The character given to his friend by Mr. Jones is honourable to the latter, and increases our respect for the memory of the former. In addition to his eminent talent, his heart was the seat of virtues which endear men to their fellows by bonds that can never be knit by the merely cold exercise of social duty. He was generous, humane, and charitable; and of his liberality Mr. Jones gives many interesting examples. He lived upon the most friendly terms with all his brother Academicians, and was respected in those circles to which, by his position, he was entitled to admission. "His busts," says Mr. Jones, "were dignified by his knowledge and admiration of the antique; and the fleshy pulpy appearance he gave to the marble seems almost miraculous, when the heads of his busts were raised with dignity, the throats large and well turned, the shoulders ample, or made to appear so; likeness was preserved and natural defect obliterated. George IV., the Duke of Sussex, Lord Castlereagh and others, were so struck with Chantrey's power of appreciating every advantage of form, that they bared their chests and shoulders that the sculptor might have every opportunity that well-formed nature could present."

The distinction he enjoyed in his profession gained him the consideration of the most exalted personages of the kingdom. "From three sovereigns he received great attention. George IV. evinced an affability towards him which he often mentioned with pleasure. In conversing with Sir Henry Russell, he remarked that the King was a great master of that first proof of good-breeding, which consists in putting every one at their ease; for from the throne each word and gesture has its effect. The first day the King said, 'Now, Mr. Chantrey, I insist upon your laying aside everything like restraint, both for your own sake and for mine; do here, if you please, just as you would if you were at home.' When he was preparing the clay, the King, who continued standing near him, suddenly took off his wig, and holding it out at arm's length said, 'Now, Mr. Chantrey, which way shall it be? With the wig or without it?' As he did not say what answer he had given, Sir H. Russell asked him—'Oh, with the wig, if you please, Sir.'"

The book abounds with agreeable anecdotes, in all of which the sculptor is an actor. On the varnishing days, at the Royal Academy, he was very fond of joking with Turner and Constable, carrying his jokes even to an extent which might have ruffled the temper of some men. Mr. Jones relates many instances of his liberality, one of which is in reference to the monument to Northcote:—"On the sculptor being asked what it was to be, he replied, 'It is left entirely to me. I may make merely a tablet if I choose. The money is too much for a bust, and not enough for a statue; but I love to be treated with confidence, and I shall make a statue, and do my best.' And probably Chantrey never executed anything more characteristic or more like than the face and figure of Northcote, for every one to whom the painter was known started at the resemblance; and the work only wanted colour to make the spectator believe that he saw the veteran artist in his studio."

This is but one of many instances of goodness of heart narrated by Mr. Jones, who, in every respect, does justice to the memory of his friend; thus may we recommend the book equally to those who knew Chantrey and those who knew him not, since those who knew him must desire to know more of him, and those who knew him not, must be gratified in reading of one who, to his eminent talent, added so many virtues.

WORDSWORTH.

Richard Redgrave

AUTOBIOGRAPHY OF
RICHARD REDGRAVE, A.R.A.

DEAR SIR,—You request some particulars of my life for your Art-Journal, and I should have much pleasure in complying, did I not fear they would have little to interest your readers. The life of the artist, as distinguished from that of others, may or may not be remarkable for variety of incident, or from his struggles in the path of excellence and independence; but its true interest would be in a revelation of the inner life—the peculiar temperament, the nervous sensibility, the more refined feelings, that raise him to excellence, and fit him for his high vocation. The very possession, however, of these qualities prevents the revelation of them, and restrains the confession of feelings and thoughts which influence him so deeply; but which he fears would hardly be appreciated by those whose natures qualify them for the more stirring duties of active life. So far as the outward particulars of my progress go, they are here at your service.

I was born in the year 1804, during the hard times of the great war, and may say "I am a citizen of no mean city," seeing that I am a Londoner. My early life was passed in the counting-house of my father, who was a manufacturer, at that time employing many workmen, and where my duty principally consisted in making the designs and working drawings for the men, and journeying into the country to measure and direct the works in progress. This latter office was my chief recreation, since, my business gone through, I used to linger with an intense pleasure—a pleasure that I now find only in these memories—on the heaths and commons which surround London, making such rude attempts at sketching as a little landscape-painting learned at school would suffice for, and searching out the plants and wild flowers that grow so plentifully on these open wastes, thus perhaps laying the foundation for a love of the wild growths of plants and for landscape-painting, which are among my greatest sources of present pleasure.

In these rambles which, for my own gratifi-

cation, I always made on foot, I became intimately acquainted with all the highways and byways of the southern and western sides of the great metropolis, and would often linger so long on some spot of wild beauty that I had to make a forced march as I got nearer home. As I advanced in life, however, I began to perceive that ours was a falling business; my dear mother died while we were yet young, and left a large family of brothers and sisters pressing upon my father's means; there was, therefore, little prospect for the future. It soon became evident that the useful education I had hitherto received was to be my sole resource; moreover, my secret wishes had been for the Arts, while for some portions of my then occupation I had a most invincible and painful dislike. At this time, when I was between nineteen and twenty years of age, an early friend and schoolfellow, with whom I had lately been very intimate, broke away from a business to which he had been unwillingly apprenticed, and commenced the career of art, against the wishes of his few friends, for he was an orphan. His defection determined mine, and we both resolutely set to work to study from the Elgin and Townly marbles at the British Museum; for which purpose I obtained my father's permission to avail myself of the two days when students only are admitted, and on those days the clock rarely struck nine, summer or winter, that I was not found waiting at the glass-door for admission. After a time, I think it was early in 1826, I obtained admission as a student in the Royal Academy, and then it would have seemed that my path was at least straight before me; but soon my troubles began. I could not remain a burthen at home, so I determined to leave, and rest on my own unassisted resources. My friend had done so, and was at least able to keep his head above water, although his sole wealth at commencing was about three pounds which he had saved; he had everything to learn, whilst I, in one direction at least, had some professional knowledge. At that time there was little to help the young beginner; wood-engraving, compared with its present extension, was in its infancy; lithography was unknown; Art-Unions to assist the young artist

were yet unthought of; exhibitions were few and very exclusive; and all the means and appliances required by the artist were fewer and more difficult to obtain. As I before remarked, I had some knowledge of landscape painting, and I commenced teaching; although I must confess that learning would have been more requisite for me. These were the years of labour, and I may add, of sorrow also—efforts made in vain, hopes frustrated, expectations raised but to be disappointed—the slavery of the profession with scarcely any of its rewards. I may safely say that during the greatest part of this period I laboured thirteen and fourteen hours per diem, teaching and preparing for teaching during the day, but always nightly at my post as a student in the schools, rarely losing an evening, and determined to conquer if perseverance would do it.

But the very increase of my professional emoluments seemed but to rivet tighter my chains, and it was hard to keep a single day of the week apart for painting, Sunday having been ever, as I trust it always will be, a sacred day to me. Moreover, it seemed as if I had mistaken my powers. I made efforts for the Academy gold medal, and my old friend was my successful competitor. Again I tried, and MacIisle most fairly carried off the prize. I got pictures hung on the line, and our excellent Keeper, the late William Hilton, R.A., comforted me with praise, of which he was usually most chary, and told me that the like efforts on his own part had had the like want of success. The truth was, I had not been able to bestow enough either of time or expense upon my pictures, but my increased means now enabled me to devote more time, and to make more use of nature in my works.

About this period I exhibited a picture at the British Institution, "Gulliver on the Farmer's Table," which was bought for the purpose of engraving. It was my first success. It is true the price was a small one, but it led me to hope for better times. The work is now in the possession of my friend, Mr. Sheepbanks, of Rutland Gate. I renewed my efforts, but not with the like success; my picture was even rejected from the walls, and though it is not in my nature to despair, I was, indeed, much cast down. But how little do we know what is best for us! That which I lamented as a great evil was, indeed, my best good. I was unable to finish a picture, which I was then labouring upon, in time for the Academy, and I sent the one the Institution had rejected. The subject, at least, was a good one; it was from Crabbe's poem of "Ellen Orford," the point taken when the poor deserted creature sees from the window her lover going to church with another. The Academy thought better of it than the directors of the Institution (in my early days I, at least, found the members of that body liberal and kind to my efforts); it was hung, and well hung; it was *on the line*, and, ere the opening, was purchased by its present possessor, Mr. Cartwright, while many kind words from members of the Academy were a source of energy to me for new efforts. The following year (1839), I was enabled to complete two pictures for the Exhibition, "Olivia's Return to her Parents," and "Quintin Matsys showing his first Picture, to win thereby the Painter's Daughter." These were well hung, and were respectively purchased by the late Mr. Vernon and Mr. D. Salomons. And now I truly began to have my own way in Art; the greater portion of my teaching was given up; I had pleasure in my work; some of my early liabilities and difficulties were cleared away, and my progress seemed most hopeful.

I may here mention that my poor friend, whose struggles had been far harder than mine, succeeded, after obtaining the gold medal, in being sent as the travelling student to Rome; but the efforts he had to make had proved too much for him. Myself and my brother had nursed him through a sad attack of inflammation of the lungs, which, although cured for the time, left behind a weakness that even Italia's sun could not remove. He returned home with a broken constitution, only to renewed struggles, and to die of a ruptured vessel in the lungs;—to die, poor fellow! just before the commencement of that new period for which he was so well

fitted—the competition called for by the Royal Commission of Fine Arts for decorating the New Houses of Parliament.

My trials were now nearly over. I painted for the exhibition at the Royal Academy in 1840, two pictures, "The Reduced Gentleman's Daughter," and "Paracelsus administering his elixir to the Dying Man, invites him to Dinner;" the first was purchased by Mr. Hippley, of Shoobrooke Park, the second by the late Mr. Wells, of Redleaf. These pictures obtained for me my election as an Associate of the Royal Academy, in November of the same year; and commissions followed from both of the above gentlemen, as well as from that true friend of artists, Mr. Sheepshanks, at whose hands I have to acknowledge much and continued kindness: since that time my labours have been rewarded with almost undeserved success. I married, in 1843, my dear wife. Her tastes and feelings for Art are most congenial to my own, and by God's blessing I can now look back without regret to former struggles, and forward with hope, if it be His will, for continued efforts in a profession which, with all its disappointments, has been to me a continual source of happiness. It is one of my most gratifying feelings, that many of my best efforts in art have aimed at calling attention to the trials and struggles of the poor and the oppressed. In the "Reduced Gentleman's Daughter," "The Poor Teacher," "The Seamstress," "Fashion's Slaves," and other works, I have had in view the "helping them to right that suffer wrong" at the hands of their fellow-men. If this has been done feebly, it has at least been done from the heart, and I trust when I shall have finished my labours, I shall never have occasion to regret that I have debased the art I love, by making it subservient to any unworthy end.

I remain, dear Sir,
Yours faithfully,

RICHARD REDGRAVE.

[The observations with which Mr. Redgrave concludes the interesting sketch of his life are just what might have been expected by those who know his disposition. He could not urge his claim on the best feelings of his fellow-man by enlarging upon the good he has effected through the medium of his art; but we can with propriety do so for him; and it is our firm conviction that the artist's pencil has done more to create sympathy and consideration for those whose misfortunes and sufferings have been its theme, than a host of pamphleteers could have worked. Mr. Redgrave has employed a noble art in the spirit of a true philanthropist, and even now "he hath his reward." It is our business, however, to look at his pictures not only as moral teachers, but as works of Art; and here we may give them unqualified praise. His descriptive scenes show much careful study, abundance of imagination, judicious treatment, and an excellent feeling for colour; there is evidently much time and labour bestowed upon them, but neither has been thrown away by redundancy of subject or over-elaboration. His landscapes are capital bits of nature—veritable copies of the willow brook and the sedgy pool.]

THE PHANTASCOPE.

PROFESSOR LOCKE, of the National Observatory, Washington, has invented an instrument to which he has given the above name, which illustrates very prettily and with simplicity many of the phenomena of binocular vision. It consists of a flat board base, about nine by eleven inches, with two upright rods, one at each end, a horizontal strip connecting the upper ends of the uprights, and a screen or diaphragm, nearly as large as the base, interposed between the top strip and the tabular base, this screen being adjustable to any intermediate height. The top strip has a slit one-fourth of an inch wide, and about three inches long from left to right. The observer places his eyes over this slit, looking downward. The moveable screen has also a slit of the same length, but about an inch wide.

A few experiments, which we will describe, will illustrate its use.

First. Let there be two identical pictures of the same flower, say a rose, about one inch in diameter, placed the one to the left and the other to the right

of the centre of the tabular base, or board, forming the support, and about two and a half or three inches apart from centre to centre. A flower-pot or vase is painted on the upper screen, at the centre

of it as regards right and left, and with its top even with the lower edge of the open slit.

Experiment 1. Look downward through the upper slit, and direct both eyes steadily to a mark, a quasi stem, in the flower-pot or vase; instantly a flower similar to one of those on the lower screen, but of half the size, will appear growing out of the vase, and in the open slit of the moveable screen. On directing the attention through the upper screen to the base, this phantom flower disappears, and only the two pictures on each side of the place of the phantom remain. The phantom itself consists of the two images painted on the base, optically super-imposed on each other. If one of these images be red and the other blue, the phantom will be purple. It is not infrequently that people see single objects double; but it is only since the establishment of temperance institutions that it has been discovered that two objects can be seen as one, which is the fact in the phantoscope.

Experiment 2. Let part of a flower be painted at the left, and the supplementary part to the right, on the lower screen; then proceed as in experiment first, and a whole flower will appear as a phantom.

Experiment 3. Let a horizontal line be marked on one side of the lower screen, and a horizontal one on the other; then proceeding as in experiment first, a cross will appear in the opening of the upper screen as the phantom. This might be called the "experimentum crucis."

Experiment 4. If two identical figures of persons be placed at the proper positions on the lower screen, and the upper screen be gradually slid up from its lowest point, the eye being directed to the index, each image will at first be doubled, and will gradually recede, there being of course four in view until the two contiguous ones coincide, when three only are seen. This is the proper point where the middle or doubled image is the phantom seen in the air. If the screen be raised higher, then the middle images pass by each other, and again four are seen receding more and more as the screen is raised.

As all this is the effect of crossing the axes of the eyes, it follows that a person with only one perfect eye cannot make the experiments. They depend on binocular vision.

All these effects depend on the principle that one of the two primitive pictures is seen by one eye, and the other by the other eye, and that the axes are so converged by looking at the index or mark on the upper screen that those separate images fall on the points in the eye which produce single vision. To a person who has perfect voluntary control over the axes of his eyes, the upper screen and index are unnecessary. Such an observer can at any time look two contiguous persons into one, or superimpose the image of one upon the image of the other.

This apparatus will illustrate many important points in optics, and especially the physiological point of "single vision by two eyes." It shows also that we do not see an object in itself, but the mind contemplates an image on the retina, and always associates an object of such a figure, altitude, distance, and colour, as will produce that image by rectilinear pencils of light. If this image on the retina can be produced without the object, as in the Phantoscope, then there is a perfect optical illusion, and an object is seen where it is not. Nay, more, the mind does not contemplate a mere luminous image, but that image produces an unknown physiological impression on the brain.

A similar and superior instrument to this has been long known to the public and artists—the Stereoscope of Professor Wheatstone. But so many beautiful experiments may be made with this simple contrivance of Professor Locke's, that we are certain this description will be acceptable to our readers.

MEMORIAL OF MARY, QUEEN OF SCOTS.

THE Messrs. Falcke, have lately submitted to Her Majesty and H.R.H. Prince Albert, a carved ivory horn of singular and national interest. It is no less than an object of luxury, by no means of an unusual class in the sixteenth century, executed to commemorate the marriage of François II. and Mary Queen of Scots. The date upon it is 1558, and every portion of the work is crowded with a profusion of detail in the taste of the period. In the upper part are arabesque ornaments surrounding portraits of the august couple, interspersed with fleur-de-lys, lions, heads, thistles, &c. Beneath occurs a raised posy or distich, composed with the quaint conceit which was the fashion of the day, and tinged even the verses of the unhappy queen herself. It alludes to the union of the thistle of Scotland with the fleur-de-lys of France. Next follow hunting subjects between four pilasters, which in this part render the horn octagonal, and are decorated in relief with various hedges and monograms. Upon one side the arms of Paris are discernible, on another those of the Dauphin. The appearance of a globe in the centre of another compartment does not at first sight seem easy of explanation, unless it were the private badge of some important personage connected with the ceremony. To our minds the most graceful section of the entire subject is that which remains to be described. Nearer the mouthpiece is a sufficiently large surface covered with raised grotesque ornaments, which completely encircle it; combined with the foliage are crowned dolphins, in allusion to the young prince's title, a crowned F, and a series of fleur-de-lys. The grotesque animals and Italian ornaments which accompany the emblems are designed and executed in the best style of Renaissance taste, undulating and entwining themselves in every conceivable variety of form, now enriched with conventional flowers, and now branching off into luxuriant tendrils. Masks, Roman shields, and similar accessories fill up the perpendicular portions. France, during the middle of the sixteenth century, was in her decorative productions remarkable for a combination often more luxurious than beautiful, of the arabesque, which derived its origin from Italy, with the strap-work style, which in England we generally characterise as Elizabethan. In the work before us the freedom from this strap and the purity of the grotesque reliefs would seem to intimate that the design had been furnished by an Italian artist, if even the execution could not also be identified as possessing more Italian than French features. The only occurrences of strap-work details upon the horn are at each end; at the top, where it is introduced, something in the manner of the capital of a column, and at the bottom, where it is used to connect the arabesque, last described, with the mouthpiece. It is necessary for us to observe that the entire horn is carved out of a single piece of ivory of the finest quality, with the exception of the mouthpiece, which is composed of a boar's head, and the flat strap-work just mentioned. This is a separate piece attached, the colour and texture of the ivory being different, and the work upon it far less vigorous and effective than that upon the upper part of the horn. Indeed, as this mouthpiece is much more nearly allied than the rest of the horn to the ordinary performances of France in the sixteenth century; and in the absence of any documentary evidence with reference to this interesting relic, we venture to suggest that the horn itself was the work of an Italian, but that some alteration or reparation being requisite shortly afterwards, the present mouthpiece was added by the hand of a native artist.

The decision of Her Majesty has not yet transpired respecting the horn, but in the event of its being declined for the Royal Collection or for Holyrood Palace, where so many other memorials of the unfortunate Queen are preserved, we will express a hope that the country will be sufficiently alive to its value and importance to secure it for the British Museum.

Fortunately much attention is now directed to our national monuments from an extension of the taste for Archaeology, by the zeal of private individuals and the establishment of branch societies, and in addition to this, the Trustees of the British Museum have at length been alive to the necessity of a collection of Medieval Art. In such a collection, the horn before us would find a worthy place, as a relic of high historical interest, full of romantic associations, and, to us particularly, as a most perfect example of the high decorative Art of the period at which it was executed.

ORIGINAL DESIGNS
FOR MANUFACTURERS.

DESIGN FOR A WIRE-BLIND. By J. STRUDWICK (14, New Bond Street). The substitution of wire-blinds for the dwarf Venetian, so long in

use, has of late years been very general, and a vast improvement they are upon the old system, which tended to exclude light, and thus far to banish cheerfulness from a dwelling-room. The close and

compact surface of the wire-blind admits of ornament with the colour brush, which is intended to be used for working out the subjoined design: this consists chiefly of a wreath of ivy leaves carried round and inside the frame. The scroll-work stretching along the top should be of carved mahogany: it forms an excellent finish to the whole.

DESIGN FOR A PICKLE-FORK. By W. HARRY ROGERS (10, Carlisle Street, Soho). Though the primary object of the artist here was to have his design executed entirely of silver, the handle of

the fork would look exceedingly well if carved in ivory or pearl. It is of a circular form, and is ornamented with the leaves and tendrils of the vine. The prongs and the intermediate portion

between them and the handle are quite novel in form, and are very well proportioned. The article could be made at comparatively little cost, and would well repay the manufacturer.

DESIGN FOR A CHILD'S CUP. By H. FITZCOOK, (13, New Ormond Street). It is an old truism, that whatever is put into the hands of a child, should besomething that will instruct or afford rational enjoyment; even the objects that come into its daily necessary use may serve one or other of these purposes. The ornament here engraved is intended to decorate a child's mug; and a pretty tale might be told from each device—a tale that would constantly recur to the young mind when-

ever the object met the sight. In the first subject a youthful shepherd, with a lamb at its side, is intently watching a butterfly upspringing from a rose-tree; the distant rays of the sun mark the time of day—morning; the whole may typify the dawn of life, and happiness. The other is of a contrary character, and indicates death and sorrow; the child is weeping over its dead favourite, which a snake has killed; the butterfly is also at rest. The central ornament is encircled by the passion-

flower, and the festoon of flowers forming the design for the top and base of the mug is composed of a variety of floral decorations. Simple as the idea is, it is likewise poetical, and one that inculcates a wholesome lesson. Books are not the only teachers, nor is it necessary that instruction should be delayed till the child knows its letters; a mug if inscribed with something beyond "A present for George," or "A gift from Grandmama," may take the place of a volume, in its proper season.

DESIGN FOR A CARD RACK. By J. STRUDWICK. The leaves, stems, and berries of the ivy plant form the component parts of this design, in which it will readily be understood that the cards would be placed behind the leaves. These ornaments, which used, not very many years ago, to grace our mantel-pieces, are now almost out of fashion; we still, however, find them occasionally made in papier-mâché, which would, of course, be the material used for this.

DESIGN FOR A WORK TABLE. By H. FITZ-COOK. In form and character, this design may justly lay claim to originality. The table is supported by three demi-figures, terminating in scroll-work for the legs; the part immediately under the flat is ornamented with groups of figures, which, if the material be papier-mâché, may be painted, or, if of wood, carved, the depending bag is very elegant in shape, though we apprehend there would be some difficulty in keeping it to this form, if made of silk only.

DESIGN FOR IRON BALUSTRADE. By T. R. MACQUOID, (3, Stanley Place, Chelsea). The great desideratum to be attained in all designs for iron-work adapted for the above purpose is to combine strength and elegance with lightness of appearance: this is often extremely difficult, especially in cast metal, which in our day has almost superseded wrought iron. The design introduced below does, we think, unite these qualities, inasmuch as the weaker lines are so arranged as to find support in the heavier masses: the whole is well

DESIGN FOR A CANDLESTICK. By R. P. CUFFY (7, Owen's Row, Goswell Road). This elegant design exhibits much elaborate ornament. It should be executed in silver, and chased.

DESIGN FOR AN EGG-CUP. By J. STRUDWICK. The ivy plant is again brought into requisition here; its various features are put together with taste and judgment; the stem, as being the strongest part, constituting that which serves for the handle.

put together. It is one of the most marked features of the age that these balustrades, instead of being stiff, formal, and ungainly,

are made to derive grace and elegance from Art. We are, however, in this article far behind the manufacturer of France; among the most elegant and beautiful of the ornaments seen in the streets of Paris are these decorations, which, wherever they are introduced into domestic architecture, form a feature of greater importance than might be at first supposed, and often show much talent in the designer.

A DICTIONARY OF TERMS IN ART.

ALMUCE, AMESS, AUMUCE, (ALMUTIUM, Lat.) A furred hood, worn round the neck, having long ends, hanging down the front of the dress, something like the stole, and which was worn by the clergy from the thirteenth to the fifteenth centuries, for warmth, when officiating in the church during inclement weather. Its usual colour was grey; sometimes white and spotted.* It could be thrown over the head when circumstances required it.

ALTAR, in Christian Art, is employed as an attribute. Thus St. Stephen (Pope), and St. Thomas à Becket are represented as immolated before an altar; St. Canute as lying; St. Charles Borromeo as kneeling; and St. Gregory (Pope) offering a holy sacrifice, before an altar. An altar overthrown, is an attribute of St. Victor.

ALTO-RILIEVO (Ital., HIGH RELIEF). Sculptured works in *rilievo* are divided into *bas-rilievo*, or low relief, *mezzo-rilievo*, medium relief, and *alto-rilievo*, high relief, according to the degree of projection in which the figures stand *relieved* from the flat surface of the block from which they are cut. In each of these the degree varies, but not so much as to trench upon the others; the figures are most commonly left adherent to the background; but in some fine *alto-rilievos*, so-called, the figures are entirely cut away from the surface of the block, and are, in fact, *Bosses*. The finest *alto-rilievos* extant are the fifteen *Metopes* in the collection of the Elgin marbles in the British Museum. In their original situation they ornamented the frieze of the entablature which surrounded the exterior colonnade of the Parthenon, giving relief, by the boldness of their projection, to the dull uniformity of a large plain surface, and the most legitimate use of *alto-rilievo* is where it is so introduced in alternate or occasional compartments with triglyphs, &c.

cut represents the predominating forms of early altars, whether circular or square, and are copied from Roman originals.

ALTAR, in Christian Art. The altars of Christian churches bear no resemblance to those of the heathens, because the sacrifice to which the former are appropriated, the Lord's Supper, was instituted by the Saviour, and therefore the type of their form is a table, and their covering was intended to represent a table-cloth; but it resembles the ancient altars in the diversified forms of the base. It is frequently in the form of a sarcophagus, because the early Christians assembled in the catacombs, offered the holy sacrament on the tombs of martyrs, whence also was derived the custom of placing upon the altar the relics of saints.

In the primitive church, the altars were constructed simply of wood, subsequently of stone, marble, and bronze, adorned with rich architectural ornaments, sculptures, and paintings, and the altar-piece was generally raised on a screen above them, while the altar-plate was in the shape of a sarcophagus. Upon the decline of the Byzantine style of architecture and the introduction of the Gothic, altar-architecture acquired through this new style a new and exalted character. The Gothic architecture pointed heavenwards: delicate in single parts, it was magnificent as a whole, and full of meaning. Symbolic Art was greatly enriched. To the art of painting we owe the altar-piece, with its side wings (*TRIPTYCH*),

* It is very clearly shown in the above cut from Waller's excellent work on sepulchral brasses.

on which were represented the histories of the saints and martyrs to whom the altar was dedicated. The altars of the English churches are, for the most part, utterly tasteless, consisting generally of an oaken table or stone slab, covered with a white cloth. The Reformed church does not allow of altars proper. The desire of showing respect to the Christian altars by splendour and richness of decoration has not been attended with success. The most ancient altars in the Basilica at Rome have a *CROMIUM*, but this was afterwards supplanted by the richly ornamented *BALDACHIN*, which, however, was scarcely ever used for any but detached altars, those which stood apart having screens ornamented with columns, paintings, and bas-reliefs. The altars standing in the choir had both these appurtenances, and we see by them how the spirit of invention exhausted itself in ambitious combinations.

ALTAR, in Christian Art, is employed as an attribute. Thus St. Stephen (Pope), and St. Thomas à Becket are represented as immolated before an altar; St. Canute as lying; St. Charles Borromeo as kneeling; and St. Gregory (Pope) offering a holy sacrifice, before an altar. An altar overthrown, is an attribute of St. Victor.

ALTO-RILIEVO (Ital., HIGH RELIEF). Sculptured works in *rilievo* are divided into *bas-rilievo*, or low relief, *mezzo-rilievo*, medium relief, and *alto-rilievo*, high relief, according to the degree of projection in which the figures stand *relieved* from the flat surface of the block from which they are cut. In each of these the degree varies, but not so much as to trench upon the others; the figures are most commonly left adherent to the background; but in some fine *alto-rilievos*, so-called, the figures are entirely cut away from the surface of the block, and are, in fact, *Bosses*. The finest *alto-rilievos* extant are the fifteen *Metopes* in the collection of the Elgin marbles in the British Museum. In their original situation they ornamented the frieze of the entablature which surrounded the exterior colonnade of the Parthenon, giving relief, by the boldness of their projection, to the dull uniformity of a large plain surface, and the most legitimate use of *alto-rilievo* is where it is so introduced in alternate or occasional compartments with triglyphs, &c.

ALUM (ALUN, Fr., ALAUM, Germ.) This well known substance performs an important part in many processes of the arts. In combination with animal glue (*chondrine*) and with white of egg (*albumen*), it forms an insoluble substance resembling horn; advantage is taken of this property to produce the so-called *KALOMINE TEMPERA*.* Similar to this, is the familiar process of rendering unsized paper (such as engravings are printed on) suitable for the application of water-colour pigments. One of the most important uses of alum is as a mordant in dyeing; another, is in the preparation of *LAKES*, and of *CAJUMINE* from cochineal. The common alum of commerce is a double sulphate of alumina and potash. Other kinds are known to the chemist in which the potash is replaced by soda or ammonia. *Roche Alum* (or *Roach Alum*), *Roman Alum*, and *Turkey Alum*, are varieties of the same substance (potash alum) in different degrees of purity, described by medieval writers as *ALUMENS*.

ALUMEN (Lat.) The name *Alumen* of the Romans, and *Sypteria* of the Greeks, was doubtless applied to several salts of the nature of vitriols, and among them to the natural sulphate of iron (*COPPERAS* or *GREEN VITRIOL* of commerce). *Alumen* was the name formerly given to all the *sulphates*, but the vitriols have either copper, iron, or zinc, as a base. *Alum* has for a base the earth alumina; hence arises some confusion in the works of the medieval writers on Art. Thus *Alumen glarum*, *A. glacie*, *A. jamenti*, *Alum de glace*, were probably only different names for *ROCHE ALUM*, which was also called *Alun de Roche*; *Alume di Tocco*. *Alume cativo* was carbonate of soda; *Alume di faccia*, bitartrate of potash or cream of tartar. *Alume di piume*, *Alun de plume*, *Alume Scissile*, is a natural alum, fibrous, and fringed or bearded like feathers, sometimes miscalled *Any-anthus*.

AMASSETTE (Fr.) An instrument of horn with which the colours are collected and scraped together on the stone during the process of grinding.

AMATEUR (Fr.) AMATORE (Ital.) One who has a taste for, a skill in, and an enlightened admiration of the Fine Arts, but who does not engage in them professionally. Such are honorary members of academies of painting, &c.

* Many ancient works executed in *Tempera* are found incapable of being removed by water. Since both animal glue and alum were known and used from the earliest times, it is not improbable that the paintings executed with pigments mixed with glue and alum were washed after they were finished with a solution of alum.

AMATITO (Ital.) LAPIS AMATTIA. *Amatito* is the soft red hematite, and is called also *matia*, *matia rossa*. *Lapis amattia* is the compact red hematite, and is also called in Italy *mineral cinabro*, and in Spain, *abim*. When this word occurs in the works of the early writers on Art it probably indicates red ochre, the red hematite of mineralogists.

AMAZONS. A fabulous race of female warriors; the legend of their existence was founded on the worship paid to the moon by priestesses and eunuchs in the countries lying on the eastern coasts of the Black Sea. As the eunuchs represented the female sex in the male form, so the amazons were the male sex in the female form. Poetical sagas speak of them as a strong brave nation of females, and place them beside their historical heroes; but these sagas evidently point to the symbolic religious customs of a warlike people in the Caucasus, who represented the goddess of the moon as armed, and paid her honour by war-dances, thus explaining the warlike appearance of the Amazons. The Greeks believed these people to exist near the present city of Trebizond, dwelling on the banks of the river Thermodon. The Amazons fought on horseback, carrying small crescent-shaped shields, a bow, quiver, spear, and battle-axe. Grecian Art has touched the myth of the Amazons in its most heroic sense; representations of Amazonian battles are to be found on bas-reliefs, vases, and in wall-paintings, where we find these warriors with their crescent shields and military girdles, sometimes clothed in the Asiatic costume, (particularly on vases), at others in the simple Doric, and sometimes even their dress is a union of these two. Our engraving represents a statue in the Vatican, of an Amazon probably the work of Phidias. An Amazon on horseback, found at Herculaneum, is preserved in the Museo Borbonico, at Naples. In the Gregorian Museum is the renowned "Amazonian Vase."

AMBER. A fossil product, usually washed up by the sea in various parts of the world, especially in the Baltic. It is probably the resin of some coniferous tree, as such wood is found in a fossil state. It is most used in commerce in irregular-shaped pieces, of a yellowish resinous appearance, translucent, brittle, and devoid of taste and smell. It is not acted upon by water or alcohol, but is soluble in warm rectified spirits of turpentine, but more readily in its vapour, balsam of copaiba, and in hot linseed oil, forming a valuable varnish, which has been used from a very early period in Art, both as a vehicle and as a protection to the surface of pictures. It is harder than copal, and if carefully prepared, as pale in colour. Great difference of opinion exists as to the expediency of using it as a picture varnish, but we can see no valid objection to it. Much of the brilliancy and crispness in the works of the early Flemish painters is undoubtedly due to the employment of this varnish as a vehicle, and it is now employed by many eminent English artists. In the works of the earlier continental writers on Art, Amber is described under the various names of *Carabe*, *Glas*, *Glossa*, *Glossum*; and is sometimes confounded with oriental copal, and with the resin of the black poplar. For an examination of the evidence of the use of Amber varnish, see Mrs. MERRIFIELD'S "Ancient Practice of Oil Painting," and Eastlake's "Materials for the History of Oil Painting."

AMBER VARNISH. A modern writer (J. Wilson Neil), gives the following recipe for making pale Amber Varnish. Fuse six pounds of fusc-piecked, very pale, transparent Amber, and pour over it two gallons of hot linseed oil; boil it until it strings very strongly; mix with four gallons of turpentine. This will be as fine as body-copal, will work very freely, and flow well upon any work it is applied to; it becomes very hard, and is the most durable of all varnishes. Amber varnish requires a long time to fit it for polishing.†

AMBER YELLOW is an ochre of rich Amber colour in its raw state; when burnt it yields a fine brown-red. It is better known in Germany than in other countries.

* Baldinucci, *Vocabolario in Trece Dialecti*.

† Transactions of the Society of Arts, vol. XIII.

AMBROSE, St. The patron saint of Milan: but few works of Art exist, in which he is so represented. The finest is the painting that adorns his chapel in the Frari at Venice, painted by Vivarini, towards the end of the fifteenth century, a work of the highest excellence. St. Ambrose is usually represented in the costume of a bishop. His attributes are, 1. A *bee-hive*, in allusion to the legend told of him, as well as of some others distinguished for their eloquence, that when an infant, a swarm of bees settled on his mouth without doing him any injury. 2. A *scourge* (as an emblem of the castigation of sin), in token of the expulsion of the Arians from Italy, or of the penance he inflicted on the Emperor Theodosius. This latter event has been finely represented by Rubens; the picture is at Vienna, but a very beautiful copy by Vandyck is in the National Gallery at London (No. 50). The same incident is illustrated by Falconet, in a statue now in the Hotel des Invalides at Paris.

AMENTUM, ANSA (Lat.) 1. The strap or thong by which the various kinds of shoes, worn by the ancients, were fastened on the foot, passing through the loops affixed to the soles. (Fig. 1.) 2. A strap or thong of leather fastened to the handle of a spear at the centre of gravity, in order to admit of its being thrown with greater force, (Fig. 2.) In the Pompeian Mosaic of the battle of Issus, a broken spear is depicted, with an *Amentum* attached.

Fig. 1.

The ANSA was probably identical with the *Amentum*, and was so called, as being the part which the soldier laid hold of in hurrying the spear. Our illustration is derived from Sir William Hamilton's Etruscan vases, and it shows it affixed above the middle of the spear. The shoe is copied from a Roman statue.

AMETHYST. A rock crystal of a purple colour. Many ancient vases and cups are composed of this mineral, and the finer varieties are still much in request for cutting into seals and brooches.

AMICE. An oblong piece of linen with an *APPAREL* sewed on to one of its edges, worn by all the clergy above the four minor orders. It had two strings attached to the apperelled side, by which it was fastened behind the back and tied on the breast. It then covered the neck, and might be drawn up over the head like a hood. It was gradually introduced during the seventh and eighth centuries, and was considered to symbolise the helmet of salvation, and from its surrounding the throat, the restraint of speech. It is frequently met with on monumental brasses.*

AMICTUS (Lat.) Under this general term was expressed the various articles of outer clothing used by the Romans, such as the *ABOLLA*, *PALLIUM*, *PAUDAMENTUM*, *SAGUM*, *TOGA*, &c. It did not apply to the articles of inner clothing, or those which were drawn on.

AMICULUM, diminutive of *AMICULUS*; this term included all the finer and smaller outside garments worn by both males and females in the manner explained, in the previous article, such as the *CHLANTIS*, *SAGULUM*, &c.

AMPELITIS (Gr.) A black or coal-brown pigment used by the ancients. It derived its name from *Ampelos*, a vine, either from the black pigment prepared by the ancients from the burnt branches of that plant, or because *Ampelitis* was used to cure the diseases to which the vine is subject. Pliny speaks of *Ampelitis* as resembling *ASPHALTUM*, and says it ought to dissolve like wax when mixed with oil, and yield when burnt a black colour; it readily softens and dissolves, and for this reason was added to medicaments, and used also for dyeing the hair. It is considered by chemists to be a manganeseous and ferruginous coal. In some of the Continental countries *Ampelithis* is a name given to black chalk.

* Our illustration is copied from Pugin's *Glossary of Ecclesiastical Costume*.

AMPHORA (Gr.) A term in Grecian and Roman archaeology, signifying a vessel, pointed at the base, so that it could be stuck in the ground, with a handle on each side the neck, which was narrow. Amphoræ were used for keeping wine, oil, honey, and other liquids in, and sometimes as coffins, in which case they were divided down the middle to receive the corpse, and the two parts afterwards rejoined. The usual material of which Amphoræ were composed was clay of various kinds; sometimes they are found made of glass, and mention is made by Nepos, as one of great rarity being made of *onyx* (*Stalactite alabaster*). The name of the maker, and of the place of manufacture was frequently stamped upon them, as may be seen on those preserved in the British Museum.

AMPUL (Lat.) A small vessel, vial, or cruet, used for containing consecrated oil, or wine and water for the Eucharistic service. The engraving exhibits an enamelled ampul of the fourteenth century, preserved in the Bibliothèque du Roi, at Paris. It is six inches in height, and is elegantly decorated with representations of angels in coloured medallions, and scroll ornaments of a fanciful kind distributed over its surface.

AMPULLA (Lat.) A bottle. A vessel made of clay, glass, or metal, and sometimes of these materials covered with leather, of various shapes, but always with a long neck, so that oil or any other liquid could be dropped from it. It was used by the Romans, and specimens abound in most collections of antiquities. The *ampulla olearia*, an oil flask, (lentil-shaped), was used in the baths for pouring oil over the *STRIGIL*, to prevent it abrading the skin, and for other purposes; it was flattened at the sides, and with a somewhat shorter neck than the other ampulle. The engraving represents both kinds from Roman originals.

AMPYX (Gr.), FRONTALE (Rom.) A broad band or plate of metal, worn upon the forehead as a part of the head-dress of Greek ladies of rank. It is often seen in ancient works of Art, as an attribute of female divinities. Artemis wears a frontal of gold. The *Ampyx* was sometimes enriched with precious stones. It was also worn by horses and elephants. The cut is a copy of a Roman lady wearing the *Ampyx*, as given by Montfaucon.

AMULET. Any object worn suspended from the neck, or attached to any part of the body, supposed to have the effect of warding off evils, and of securing good fortune. They consisted of

various substances, such as stones, roots, plants, and scraps of writing. Amulets are frequently found preserved in museums, in the shape of beetles, quadrupeds, members of the human body, &c., cut out of amber, cornelian, agate, &c.*

ANACHRONISM. A disturbance or inversion of the order of time, by which events are represented, or objects introduced, which could not have happened or existed; such as the introduction of guns or cannon in historical pictures representing events which occurred before the invention of gunpowder; the representation of events belonging to ancient history in which the figures are clothed in modern costume. Anachronisms occur very frequently in the works of the old masters.

ANADEM. A Greek term for a band or fillet worn on the head by women and young men; it

must be distinguished from the *DIADEM* and other head-bands, which were honorary distinctions, or the insignia of royalty, or of religious offices. Those worn by male and female are shown in the annexed cut, copied from Greek vases.

ANAGLYPHA, ANAGLYPTA, ANAGLYPHIC (Gr.) Vessels of bronze or of the precious metals chased or embossed, which derived their name from the work on them being in relief and not engraved, the relief being produced by hammering; hence the term *anaglyphic*, to denote the art of executing such figures. The name was also applied to cameos and sculptured gems. When the figure is indented or sunk, it is an *INTAGLIO*, or *DIAGLYPHIC*.

ANAGLYPTOGRAPHY (Gr.) Anaglyptographic engraving, is that process of machine ruling on an etching ground which gives to a subject the appearance of being raised from the surface of the paper as if it were embossed, and is frequently employed in the representation of coins, medals, bas-reliefs, &c. It is the invention of M. Achille Collas, who has published a large work engraved on this plan.†

ANAGRAM. Changing the place of the letters of one or more words so as to give a different meaning to the word or to the sentence; also to read the words backwards. As examples of the former kind of anagram, are *EROS, ROSE; A VOX, ROMAN; ALQUINUS, CALVINUS*. Several artists have used the anagram of their names as a *MONOGRAM*.

ANALOGY. The agreement of two things in their known qualities and relations; in the Fine Arts, the unity and conformity of the representation.

ANALYSIS. To separate a thing or an idea into its component parts; in the philosophy of Art, to arrive at principles by examining characteristics.

ANASTASIA, St., is represented with the attributes, a stake and faggots; and with the palm as a symbol of her martyrdom.

ANASTATIC. A word derived from the Greek, signifying "reviving." A recently invented process, by which any number of copies of a printed page of any size, a woodcut, or a line-engraving, can be obtained. The process is based upon the law of "the repulsion of dissimilar, and the mutual attraction of similar particles," and is exhibited by oil, water, and gum arabic. The printed matter to be copied is first submitted to the action of diluted nitric acid, and, while retaining a portion of the moisture, is pressed upon a sheet of polished zinc, which is immediately attacked by the acid in

* Amulets, from their nature, everywhere transgress the limits of Art, nay, are even in direct contradiction to artistic taste. The dressed *scapula*, according to the belief of antiquity, was with so much the greater certainty warded off the more repulsive, nay, disgusting the object held before one; and the numerous *Phallic* bronzes, although originally symbols of life-creating nature, had afterwards, however, only this meaning and aim. The eye, the foot, the hand variously applied, are to be met with in symbolical and superstitious significance. See in our *Symbolical and Superstitious Significance*.—See in the above cut represent Egyptian necklaces of sacred symbols, the earliest form of Amulets. The eye of Osiris; the head of the cat sacred to Isis, and figures of gods compose them. Figures 3 and 4 are Roman; one representing the head of Hercules enveloped in the lion's skin; the other a hollow golden bulla, in which the charm was enclosed.

† Examples of this kind of engraving have been given in the *Art-Journal*: in the number for June, 1846, are specimens from Mr. Freebairn's engraving of Flaxman's shield of Achilles; and in April, 1849, specimens of Mr. Hornig's restoration of the bas-reliefs of the Parthenon, in the British Museum.

every part except that covered by the printing-ink, a thin film of which is left on the zinc; it is then washed with a weak solution of gum arabic; an inked-roller being now passed over the zinc-plate, the ink adheres only to that portion which was inked in the original; the impressions are then taken from the zinc-plate, in the same manner as in lithographic printing.

ANATHEMATATA (Gr.) DONARIA (Lat.) By these names the ancients designated presents or offerings made to the gods. In the early ages these consisted of garlands, locks of hair, &c., but when the Arts flourished in Greece, the anathematata were tripods, candelabra, cups, vases, statues, &c., of the most exquisite workmanship in bronze and the precious metals. The number of Anathematata must have been immense; many are still extant, showing by their inscriptions that they were dedicated to the gods as tokens of gratitude. Another class of Anathematata, consisting of tablets to commemorate recovery from sickness, will be described under **VOTIVE TABLETS**.

ANATOMY. The science of the structure of living creatures; that branch which relates to man is called **ANTHROPOLOGY**, and that to animals **ZOOLOGY**; * the former is the knowledge of the

interior and exterior parts of the human frame, and its changes according to its position, emotions, and movements; it is particularly necessary to the artist, as there is no true beauty in his representations, unless there be truth also. The study of the bones (**OSTEOLOGY**) and that of the muscles (**MYOLOGY**) is also of the highest importance, for upon these depend the proper balancing, motion, and expression; and it is not always that genius, taste, and readiness in seizing nature, will suffice without actual study. The Anatomy of the artist is not that of the physician, for the former only studies the bones and muscles so far as they influence the external form; in the blood-vessels, for instance, he merely requires to know those which appear in representing passion. The physician studies in the corpse the muscles and their mechanical functions; the artist, on the contrary, examines their play, their life, regarding them as the type of physical strength, of the state of mind, as a mirror of that which agitates the soul,—a reflex of the spiritual life. Anatomy in a medical point of view, is a purely material study, useful to the artist in his representations of dead bodies; in an artistic sense, it is an abstruse physiological science. Skeletons and anatomical drawings are not enough for the artist; he must penetrate into the mysterious region where the soul moves the springs of the body, speaking in a language which will be intelligible as long as man exists. To this language descriptive anatomy is only the dictionary; living, acting, sentient man must form the study, for where passions are struggling—where grief, joy, and love, are acting—there must the artist learn the idiom. Thus did Michael Angelo, Jacques Callot, and Hogarth, study life, and thus did the Dutch conceive their faithful representations of human nature; the great painters of the sixteenth century, Da Vinci, Raffaello, Titian, and Michael Angelo, employed much time in anatomical drawings, but few of which are preserved to us. Such drawings, or anatomical tablets as they were called, were first engraved in wood, and then in metal, and latterly in lithography, so that the anatomical wants of the artist are well supplied.†

* The accompanying woodcut represents the anatomy of a Winged Victory slaying a Bull (the original of which is in the British Museum), and is copied from the frontispiece to a Discourse "On the Nature of Limbs," by Richard Owen, F.R.S. London, 1849.

† The best treatise on the Anatomy of the External Forms

ANCHOR, in Christian Art, is the symbol of hope, firmness, tranquillity, patience and faith. Among those saints, of whom the anchor is an attribute, are Clement of Rome and Nicolas of Bari. Pope Clement, who suffered martyrdom in the year 80, also received the Anchor as an attribute, either because he was bound to one when thrown into the sea, or, because in a pretended letter from the Apostle Peter, he was commissioned to steer the Church safe into the haven. Nicolas of Bari, whose martyrdom took place in the year 209, received the Anchor as patron saint of sailors, to whose prayers he answered by appearing to

them, guiding them safely into harbour. The Anchor also symbolises commerce and navigation. The cut represents the earlier forms of the Anchor; the first being Roman, the second Medieval (twelfth century).

ANGEL. The sacred shield carried in Rome by the Sali at the festival of Mars. It was on both sides *ancusum, incisum, and recisum*; being neither round nor oval, but the two sides receding inwards, making it broader at the ends than in the middle. It was sent from heaven to Numa, who was told by the nymph Egeria and the Muses, that the safety of Rome depended on its preservation. The king ordered Mamurius Veturius to make eleven others exactly like it, and hid the real one among these, so that it might not be recognised and stolen. They were all hung in the temple of Mars, on the Palatine Hill, and were carried once a year through the city by the Sali.

There is a representation of Ancilla upon a gem in the Florentine collection, in which are two servants of the Sali with coloured togas, carrying a rod on which are hanging six shields, every two fastened together with a strap. The inscription shows that they are ANCILLA.*

ANDREW, Sr. The patron saint of Scotland; also of the renowned order of the Golden Fleece of Burgundy, and of the order of the Cross of St. Andrew of Russia. The principal events in the life of this apostle chosen for representation by the Christian artists are, his Flagellation, the Adoration of the Cross, and his Martyrdom. He is usually depicted as an old man, with long white hair and beard, holding the Gospel in his right hand, and leaning upon a transverse cross, formed sometimes of planks; at others, of the rough branches of trees. This form of cross is peculiar to this saint, and hence it is termed St. Andrew's Cross.

His Flagellation, and the Adoration of the Cross, form the subjects of two fine frescoes in the Chapel of S. Andrea, in the Church of San Gregorio, at Rome. The Flagellation is the work of Domenico, the Adoration that of Guido. This latter subject has also been well depicted by Andrea Sacchi, in the Vatican at Rome. This martyrdom forms the subject of an admirable picture by Murillo, the original study of which is in the Dulwich Gallery.

ANDROSPHINXES. In Egyptian Art, are lions with human heads. One of enormous size is at Ghizeh, which is hewn out of the solid rock, in the exception of the fore-paws, between which stood a small temple. It is considered (on the authority of Pliny), that the Sphinx represented the Nile in a state of flood, which event regularly occurred under the signs Leo and Virgo.

for the use of artists, is that by DR. FAU, translated by DR. KNOX. London, 1840. H. B. S. S.

* They are also represented on the reverse of a coin of Antoninus Pius, which is engraved above. The lines ending in circles, which appear above and below each shield, is a rude way of delineating glory emanating from them.

ANELACE, ANLACE, ANLAS. A short weapon, between a sword and a dagger, the blade tapering to a very fine point, commonly worn by civilians until the end of the fifteenth century. It is always represented as hanging from a belt or strap, apparently attached to the upper end of the sheath. It frequently occurs in monumental brasses. Our cut is copied from a brass of the time of Edward III.

ANGELS, in Christian Art, are very frequently represented both in sculpture and in painting. By the devout artists of the fourteenth, fifteenth, and sixteenth centuries, angels are depicted of human form, and masculine; as young, to show their continued strength; winged,* as messengers of grace and good tidings, and to show their unweariedness; barefooted and girt to show their readiness, and that they did not belong to this earth; they were clothed in robes of white, to show their purity, or in cloth of gold to show their sanctity and glory; the cloth of gold diapered with orphreys of jewels and precious stones; with emerald (*unfading youth*); crystal (*purity*); sapphire (*celestial contemplation*); and ruby (*divine love*). At this period of the history of Art, angels were often represented as clothed in the ecclesiastical vestments, copes, chasubles, dalmatics, and tunicles, but in the works of an earlier period they are usually figured in albes, white, with golden wings.† Sometimes angels were drawn as feathered all over like birds, as is frequently seen in the carving and stained glass of the fifteenth century, but the idea is not warranted by the tradition of Christian antiquity, and the effect, bordering on the ludicrous, is far from good. In Christian design, in sculpture, and in painting, angels are frequently introduced, as corbels, bearing the stanchions of roofs; as bosses, or in pannels and spandrels, bearing labels with scriptures, or emblems of sacred things, or shields of arms; on shafts and beams; holding candelsticks; as supporting the head of the ludicrous effigy; in adoration round the sacred symbols, or persons; winged with the hands extended, and standing on wheels. Of good Angels there are nine degrees, which are divided into three categories. The first consists of **CHEERUBIMS, SERAPHIMS, and THRONES**; the second of **DOMINIONS, POWERS, and PRINCIPALITIES**; the third of **ANGELS, ANCHANGELS, and VIRTUES**. Their attributes are—1. Trumpets (*the voice of God*), 2. Flaming swords (*the wrath of God*), 3. Sceptres (*the power of God*), 4. Thuribles or censers, incense (*the prayers of saints they offer*), 5. Musical instruments, such as harps, trumpets, and organs, to express their *felicity*. The nine orders of angels are frequently introduced in the magnificent rose-windows of the Continental churches, diverging from the centre in nine circumferences of rich tracery.

ANIMALS, HYBRID. This name is given to pictured animals composed of two different species, they abound in ancient and mediæval works of art; in the former, combinations of the human

with the animal form; are more frequent than combinations of different animals; thus, we find Centaurs, Satyrs, Tritons, and Winged-figures, in these the human form ever appears the nobler, but rather more human. Among the Egyptians,

with the animal form; are more frequent than combinations of different animals; thus, we find Centaurs, Satyrs, Tritons, and Winged-figures, in these the human form ever appears the nobler, but rather more human. Among the Egyptians,

* ANGELE is the name, not of an order of beings, but of an office, and means messenger, therefore they are represented with wings.

† On the revival of Pagan design in the sixteenth century, the edifying and traditional representations of angelic spirits were abandoned, and in lieu of the albe of purity and golden vests of glory the artists indulged in pretty cupids sporting in clouds, or half-naked youths twisting like posture masters, to display their limbs without reserve, dignity, or even decency of apparel."

Our cut represents a Nereid riding on the back of a monster which combines the forms of beast and serpent, with fanciful adjuncts. It is copied from a Grecian painting on the walls at Pompeii.

the animal form was conceived with more depth and liveliness than that of man; from the first the Egyptians were impelled to an admiring observation of the former, by a natural tendency, as their religion proves; their combination, too, of various animal figures are often very bappy, but often indeed in the highest degree fantastical and bizarre. They produced Sphinxes, (lions with human heads) lion-hawks, serpent-vultures, serpents with human legs, which are all symbolical. While the Greeks for the most part retained the human head in such compositions, the Egyptians sacrificed it first. By extension of the term, HYBRID ANIMALS is applied to the fantastic animals so common in architectural buildings of the middle ages, especially in the twelfth century. Sometimes we see the human head upon the body of a bird, of a quadruped, or a dragon; the head of a goat upon the body of a horse; doves, of which the body terminates in the tail of a serpent; eagles with the tails of dragons. We must not look for a symbolical meaning in all these figures, although it is difficult not to recognise a hidden meaning in most of them; they appear to embody the popular faith of the time as EMBLEMS, frequently they were but the freaks of fancy of the sculptor-masons of those times. When we meet the same figures in different countries, they appear to be copied from each other.

ANIMAL PAINTING. Some artists have so excelled in the representations of animals, that their pictures form a distinct class. These are usually of large dimensions, and the subjects are principally those of the chase; thus, we have Bear-hunts, Lion-hunts, Deer-hunts, usually painted with the view of adorning hunting-seats, baronial halls, &c. The animals are exhibited in all the wild energies of life, or dead, as trophies. The greatest masters in this class of painting are the friend of Rabens, P. Snyders, J. Weenix, M. Hindkoeter, C. Rutharts, P. Caultz, J. E. Rüdinger, and Lilienberg. Another set of painters who have delighted to depict animals as they appear in the stables or the kitchen, are in fact, *meat-painters*; surrounded with the utensils of the kitchen and other consonant paraphernalia, they exhibit great pains-taking in their execution, but their excellence is chiefly mechanical. Among great painters of this class it is sufficient to name Lanssech. Of painters of fish the most famous are Gills and Adrienuscn. "The mastery of the ancients in the representation of the nobler animals arose from their live sense of characteristic forms. The horse was immediately connected with the human form in Greek statues of Victors, and Roman equestrian statues; there are animals of this description (dogs) of distinguished beauty; as well as bulls, wolves, rams, boars, lions, and panthers, in which sometimes the forms of these animals are as greatly developed as the human forms in gods and horses. To represent powerfully-designed wild animals, especially fighting with one another, was one of the first efforts of early Greek Art."—*Muller's Ancient Art and its Remains.*

ANIMAL SYMBOLS. Both in ancient and in mediæval Art animals have been extensively employed as SYMBOLS, in which certain peculiarities of the animals depicted are taken as a means of embodying moral sentiments, religious ideas, &c. Not only the animal, in its simple, perfect state was so employed, but combinations of various animals in one, HYBRID ANIMALS, and of the human form with the animal, abounded from the earliest times. They are made familiar to us in the remains of Egyptian Art, in the recently discovered sculptures at Nineveh, and in the more perfect productions of Greek Art. In mediæval Art, the Animal Symbols are drawn from the imagery of scripture, and they are chiefly employed as types of the virtues and vices. The prudence of the ant and the bee, the submission of the camel, the fidelity of the dog, the vigilance of the cock, furnished perpetual sources of meditation and reflection to the minds of the devout. The viler and unclean animals were also taken as a means of exhibiting the vices. The ox typified pride; the fox, fraud and cunning; the wolf, cruelty; and the leopard, constancy in evil. The hog was regarded as the emblem of impurity, and is the animal form generally assumed by demons. Animals were employed as symbols of the EVANGELISTS, in every age of Christian Art, under a great variety of place and circumstance; sometimes the Lord himself is typified by the four beasts; his manhood, by the face as of a man; his almighty power, by the lion; his sacrifice, by the calf; and his resurrection and ascension, by the eagle.*

* Under their respective places in this Dictionary, the

ANIMATION, ANIMATED. A term applied to a figure in sculpture or painting, when it exhibits a sort of momentary activity in its motions; it is also used figuratively, when a statue or painting is executed with such vigour and truth that it appears full of life, or *animated*.

ANIME, GUM. Gum anime is a resin imported from South America, of a pale-brown yellow colour, transparent and brittle, somewhat resembling copal, with which it is mixed in making copal varnish to cause it to dry quicker and firmer, and enable it to take the polish much sooner. It is soluble in hot oil, and forms, in alcohol, a bulky, tenacious, elastic mass. It is extensively employed in the manufacture of Coachmaker's varnishes.

ANKLET. An ornament of gold, or other metal, worn by the women of the Eastern nations, the Egyptians, Greeks and Romans, on the legs,

above the ankle, in the same manner as the bracelet adorns the arm. They are very frequently depicted in works of Art. The first example in our cut is copied from an Egyptian, the second from a Greek, painting; another specimen occurs in the preceding page, as worn by the Nereid, who rides the Hybrid Animal.

ANNEALING. Glass, when suddenly cooled after melting, and some metals, after long hammering, become extremely brittle. This brittleness is removed by leaving the glass in an oven, after the fire is withdrawn, and by heating the metals again, after the hammering, by which they become annealed.

ANNUNCIATION. (ANNUNZIATA, Ital.) This religious mystery is one of the most beautiful, as well as important in the whole range of Christian Art; from the earliest period it has been chosen as a most frequent subject. In the "Manuel d'Iconographie Chrétienne," by M. Dillron, the mode of treatment adopted by the early Greek and Byzantine artists is as follows: the scene is a house, or a porch, the Holy Virgin kneeling before a chair, her head slightly inclined, holding in her left hand a spindle, while she extends the other to the Archangel Gabriel, who salutes her with his right hand, and holds in his left a lance. Above the house, in the sky, is seen the Holy Ghost descending as a ray of light upon the head of the Virgin. At a subsequent period in the history of Art, the treatment varied from this Greek formula: the Virgin is represented seated on a throne, the Archangel Gabriel bears a sceptre, which at a later period was exchanged for the lily-branch, and this in its turn was by some artists superseded by an olive-branch; and the Archangel was also crowned with olive, but the lily is the most frequent as well as most significant. Gabriel is also frequently represented as an ambassador bearing his credentials, with attendant angels. By the early German artists he is represented as habited in the richly embroidered vestments of the priesthood.

ANTEPEDA. This term was applied by the Romans to various ornaments in TERRA-COTTA, which were used to decorate several parts of an edifice, to give an ornamental finish, or to conceal unsightly junctures in the masonry. They appear on the top of tabulars, above the upper member of the cornice, where they served the purpose of concealing the ends of the ridge-tiles, and the juncture of the flat ones.* They also were affixed to

the cornice of an entablature, for the purpose of giving a vent to the rain-water from the roof similar to the GURGOYLES of Gothic architecture. Antefixe, in the form of long flat slabs of terra-

symbolical signification of animals and monsters will be described.

* Our cut exhibits an antefix of this kind in terra-cotta, discovered at Chester.

cotta impressed with designs in relief, were nailed along the whole surface of a FAÇADE, for ornamental effect, resembling the sculptured METOPES of the Greeks in their application, but antefixe were not employed in decoration by them. Some good specimens of antefixe are in the British Museum; they exhibit great variety and beauty of workmanship.

ANTHONY, St. The events in the life of this saint form a very important class of subjects in Christian Art. Among the most frequent are his Temptation, and his Meeting with Saint Paul. St. Anthony has several distinctive attributes by which he is easily recognised; as the founder of monachism he is depicted in a monk's habit and cowl, bearing a crutch in the shape of a T, called a *tace*,* as a token of his age and feebleness, with a bell suspended to it, or in his hand, to scare away the evil spirits by which he was persecuted; a firebrand in his hand, with flames at his feet, a black hog, representing the demons Gluttony and Sensuality, under his feet; sometimes a devil is substituted for the hog. The subject of the Temptation of St. Anthony is treated by Annibale Carracci in a picture in the National Gallery of London (No. 198). The Meeting of St. Paul and Anthony has been well treated by Guido, Velasquez, and Pintaricchio.

ANTHROPOMORPHISM. (Gr.) HUMANISATION. A compound Greek word, signifying the representation of the human form; but it is employed to signify the representation of divinity under the human form. In the portrayal of the Divinity, Art can convey the idea only by Humanisation, or *Anthropomorphism*; hence the beautiful statues of their gods produced by the ancients. Among the Greeks popular opinion never separated the idea of superior powers from the representation of them under a human form; hence, in their Mythology and in their Arts, each deity had his peculiar and distinguishing attributes, and a characteristic human shape. Combinations of the human form with those of animals, HYBRID ANIMALS, are found in Egyptian remains, as well as in those recently brought to light at Nineveh; these combinations are symbolical. By the Egyptians the animal form was conceived with more depth and liveliness than that of man; their combinations of various animal figures are often very happy, and also frequently in the highest degree fantastical and bizarre.

ANTICAGLIA. An Italian word signifying the remains of antiquity, particularly fragments of ancient architecture and the plastic Arts. At the present time this term is usually applied to the less important specimens, for instance, utensils, weapons, ornaments, &c.

ANTICO-MODERNO. QUATTRO-CENTO (Ital.) That transition style between the comparatively meagre productions of the most eminent early masters, and the fully developed form and character of the works of Raphael and his great contemporaries. It arose soon after the time of Massaccio, and characterised the whole of the fifteenth century, until the appearance of the works of Da Vinci and Fra Bartolomeo. It is exhibited in its most perfect condition in the works of Francia.

ANTIMONY. The oxide of this metal enters into the composition of some of the pigments used in painting, as Naples Yellow, which is a compound of the oxides of lead and antimony. A mineral yellow is compounded of the oxides of antimony and bismuth. Guimet's yellow is the deutoxide of lead and antimony. These pigments are useful in enamel or porcelain painting, but by no means eligible in oil or water-colours. Most of the Naples Yellow now sold by artists' colourmen is prepared from white lead mixed with a small proportion of cadmium yellow. Glass is coloured yellow by antimony; the women of the East use the native sulphure of antimony to blacken their eyebrows and eyelids.

ANTIQUARIAN. Drawing-paper is cut into sheets of various dimensions, that called Antiquarian usually measures fifty-three inches by thirty-one.

ANTIQUÉ, ANTIQUES, a term derived from the Latin *antiquus*, ancient. By "antique" is understood pre-eminently those peculiarities of

* The badge of the knightly order of St. Anthony exhibits this attribute of the saint, and is represented in the annexed cut from Stothard's engraving of the effigy of Sir Roger De Bois, in Ingham Church, Norfolk. The word *Anthony* occurs above the *tace* in metal letters.

genius, invention, and art, which are preserved in the remains of cultivated nations of antiquity, and which must always excite our admiration, and influence our studies, as the most important and enduring relics of ancient times. With the idea of the antique is united the CLASSICAL, by which we generally understand those writings and works of art which are perfect in conception and execution, and therefore worthy of being our patterns. The term is used only for those creations which are left us of the Greeks and Romans, which among all early nations we call *par excellence* "the Ancients," because they were superior to all others in mind and manners, and because they impressed more or less the stamp of their cultivation on the greater part of the ancient world. In Art we regard the Greeks as the true classical ancients, being incontestably superior to the Romans, who were only an imitative nation, formed on the Greeks themselves. Of all nations, the Greek alone is that in which internal and external sentiment and mental life existed in its most beautiful proportions; therefore they appear from the beginning to have been peculiarly destined for independent cultivation of the forms of art, although a long development and many favourable circumstances were required before the genius which early appeared in mythology and poetry could be transferred to plastic Art. In that perfection of external form by which the Greek artist was surrounded he formed his IDEAL, in which lies the great truth of the so-called antique forms; in them the ideal is the comprehension of nature, whose prevailing character is the embodiment of the *spiritual*. By ANTIQUES we understand those works which have become as it were the types of human form, the representations of life in all its variety, which belong to true plastic art, such as the works of the chisel, the mould—statues, has-reliefs, and mosaics. In a wider sense we use the word ANTIQUES to express all the productions in the various plastic arts of the Greeks and Romans, as distinguished from the art of the remaining ancient and unclassical nations—Egyptians, Indians, &c., and also from all later and modern Art.

ANTIQUITY—ANTIQUITIES. In an artistic sense, the Old as opposed to the New times. It is supposed to extend from the earliest historical knowledge to the irruption of the barbarians upon the Roman empire, which event, in connection with the diffusion of Christianity, produced the great turning-point in the history of the civilisation of mankind. We also use the word in a limited sense to denote the early ages of every nation, but particularly with reference to the two great nations of ancient times, the Greeks and Romans, whom we call pre-eminently "the Ancients." By ANTIQUITIES we understand those monuments of all kinds which were produced in antiquity, in whatever sense this word may be used.*

ANTONINE COLUMN. In the middle of one of the principal squares of the city of Rome stands a lofty pillar, erected by the Senate in honour of the Emperor Marcus Aurelius Antoninus, and to commemorate his victory over the Marcomanni and other Germanic tribes. Around the exterior of the shaft is placed a continuous series of bas-reliefs, reaching from the base to the summit in a spiral line, representing the victories of Marcus Aurelius. It is evidently an imitation of the column of Trajan, but both in style and execution these sculptures of the Antonine Column are very inferior.

* According to Miller, the treatment of Ancient Art since the love for classical antiquity was re-awakened, may be divided into three periods—First, The *Artistic*, extending from about 1450 to 1600, and the time of collections and renovations. Secondly, The *Antiquarian*, from 1600 to 1700, when learned examinations and elucidations having no reference to Art took place. Lastly, The *Scientific* period, from 1750, in which a new opening was given to the study of Archeology.

THE BIRMINGHAM EXPOSITION.

THE close of this Exposition, to which we have devoted much space—feeling the importance of the movement, and looking forward to the result with much interest—enables us now to say a few words on its general bearing, and the influence for good which we from the outset predicted would issue from it. No collection of the products of our manufactures has heretofore met with the same amount of patronage and support; during the last week the admissions averaged 2700 daily; altogether, in round numbers, the visits may be taken at 100,000, including 1535 season tickets; these and the admissions, with the sale of catalogues, of which 8000 were disposed of, produced a sum equal to 3,076 1/2 l. It will be seen by the above statement that the success of the Exposition throws into shade that of the Society of Arts, with all its adventitious aids of metropolitan situation and patronage of the most exalted kind. We learn from the report of the Society, that their *first* Exposition, in 1847, was visited by about 20,000; their second, in 1848, by 70,000; their third, in 1849, was still more numerously attended, although the number is not stated. It must be observed that all the visitors to the Birmingham Exposition did not pay for admission; tickets were freely distributed to the workmen in the various manufacturing, to the School of Design, the children of the Blue School, and various public and private seminaries; a more triumphant demonstration of the progress of Art in connection with Manufactures—of temperance and sobriety—of regularity and order, it has not been our duty to record; and who shall henceforth say that even the humblest of our artisans may not be trusted with the examination of what is valuable? of all the numerous and costly articles exhibited, but two are missing, and they are of trifling value. This speaks volumes in favour of the moral discipline which characterised the visitors, and we may add to this, the cheering fact that of the large number of workmen who attended for instruction as well as amusement, only four seemed under the influence of drink. The desire for places of intellectual resort among the people in the evening is proved by the fact that the largest number of admissions were between the hours of six and eight o'clock. Altogether, we consider the whole to result as another powerful proof in favour of a National Exposition. We should have no difficulty in pointing out manufacturers of plated wares, of papier mâché goods; of glass, brass-founders, and engineers, all of whom, to our knowledge, have secured good orders through this exhibition of their works. We are sure that although such Exhibitions show our weakness, they are, nevertheless, the beginning of our strength; he who knows his weakness and defects is already far on the path that leads to improvement. Manufacturers must never forget that if they would advance the Arts of Design as applicable to their wants and labours, they must supply suitable stimulants both to the workman and the public, and that they are the persons from whom the first movement must come; in their hands is their own future success. They are to educate and supply both these classes; first, by directing public taste by the production of first rate works, which rarely if ever fail of being properly appreciated; and next, by placing before the eye of the artisan that which will be suggestive of the beautiful. Originality of design, thus, has its foundation in the appreciation of what is excellent. This appreciation can only be acquired by inspection of what is best in ancient or modern art; no town in the empire can boast of fewer adjuncts of this kind, than Birmingham; in none is there a greater necessity for what is becoming daily more called for—the Art-educated workman. We do most earnestly hope that a surplus which must arise from this Exhibition, will form the nucleus of something permanent; a respectable, in truth, which will contain a history of ornament, of Art applied to manufactures, where the WORKING MAN may retire, in the evening, from the bustle and turmoil of business, to store up in his mind that which will aid him for the coming day.

With much that was defective in the specimens submitted for examination at the Exhibition, there was abundant evidence of power, will, and a desire to excel, which but require encouragement and education to produce the most successful results. Art-education is the work of centuries. Greece acquired not the proud pre-eminence she held in high art, without due preparation and long years of careful study; neither will England arrive at the position she would occupy, without the same; there is no royal road to excellence: let us then be up and doing, already are our

mechanical inventions limited, and increased production is rapidly receding from us; it is time then to gird ourselves for the conflict, for it has been said by one who is no dreamer, that if we continue deficient in education, every railway and steamboat will aid in transferring the demand from us to others, better fitted by previous training to supply the demand. We do most earnestly hope that in a few months the foundation will be laid of a permanent museum, which cannot fail to enhance the value of Birmingham manufactures a hundred fold.

We congratulate the exhibitors generally, and all who have been concerned in the carrying out of this really important exhibition; the manufacturers of Birmingham have shown both zeal and ability in the matter, and we do not fear a lack of encouragement for our native manufactures both at home and abroad, when such laudable exertions as these are made. Let but the same spirit characterise the exertions of all connected with the Exposition of 1851, and the result cannot but be highly favourable to the country.

THE GREEK SLAVE.

FROM THE STATUE IN MARBLE BY HIRAM POWERS.

IN the summer of 1845 there was exhibited at the rooms of Messrs. Graves, in Pall Mall, a statue in marble by Hiram Powers, an American sculptor. It was called "The Greek Slave," and attracted a large number of visitors by the fame of its excellence. The idea of the work was suggested by the practice of exposing female slaves for sale in the bazaar of Turkey. The figure is upright, and rests the right hand upon a support, over which is thrown a modern Greek drape, both hands being confined by a chain.

There is much in this work to remind the learned in sculpture of the best productions of the antique; in the simple severity of its outline, and in the intellectual expression which dwells on that sorrowful face, it bears a close affinity to the Greek school. Appealing to the sympathies and sensibilities of our nature, rather than to those feelings which call forth words of delight, we are yet won to admiration by its touching beauty and its unexaggerated idealty. The sculptor has aimed high in his purpose of uniting modesty with scorn, and shame with rebuke, but he has undoubtedly carried out his intent, holdly and successfully. It was no easy task to place a young and high-minded female in such a position without a chance of offending delicacy; but the great charm of Mr. Powers' work is, that it repels the very thoughts which would be likely to arise under such circumstances, and produces others totally at variance with them—sympathy and compassion for the captive; execration for those who could make merchandise of the beauty and the innocence of the fairest of God's creatures;—

"As if their value could be justly told
By pearls, and gems, and heaps of shining gold."

While admitting the truth that genius exclusively belongs not to age nor race, and that its elements are as likely to dwell in the minds of the untutored savage as in the more favoured inhabitant of a civilised state, the first sight of this statue—coming from the hand of a sculptor whose country has hitherto made comparatively little progress in this, the highest department of Art—afforded us no little surprise, but it also gave us infinite pleasure. We had not even heard of the name of Hiram Powers, and were consequently astonished to find so fine a work from one whose fame had not already reached the shores of England. But we subsequently learned that Mr. Powers had been studying for a considerable time in Florence. In his studio here, Captain Grant saw a small model of the "Greek Slave," in plaster, and was so struck with the beauty of the subject, that he immediately gave a commission to the sculptor to execute it in marble. It is still in the possession of that gentleman, who congratulates himself, and not without reason, upon having one of the most chaste and classical compositions of modern sculpture. Certainly his taste and judgment in thus bringing to light, and securing, a noble production of Art, cannot be too highly commended.

THE UNIVERSITY OF CHICAGO PRESS
IN CHICAGO ILLINOIS

The first part of the history is devoted to a description of the country and its inhabitants. The author describes the various tribes and their customs, and the different parts of the country. He also mentions the various rivers and lakes, and the different kinds of animals and plants which are found there.

The second part of the history is devoted to a description of the various wars and battles which have taken place in the country. The author describes the different battles and the various strategies which were used by the different tribes. He also mentions the different names of the battles and the names of the various warriors.

The third part of the history is devoted to a description of the various customs and traditions of the different tribes. The author describes the different kinds of dances and songs which are performed, and the different kinds of games which are played. He also mentions the different kinds of food and drink which are eaten, and the different kinds of clothing which is worn.

The fourth part of the history is devoted to a description of the various legends and myths which are told in the country. The author describes the different kinds of stories which are told, and the different kinds of characters which appear in them. He also mentions the different kinds of beliefs and superstitions which are held by the different tribes.

THE MONUMENT OF WREN.

ARE old London! It would be difficult for us to describe the affection we entertain for this noble city—venerable for its antiquity, and revered for its associations with our greatest men—although it combines so much that occasions us distress of mind with so much that is dear and honoured to our every feeling of existence. We should never have loved it so well if we had not become acquainted with the histories of some of its public buildings, its houses, its holy temples, one by one, almost stone by stone; and yet how little we know of what we might know, and of what we hope yet to learn. We marvel more and more how we could ever have passed a peculiar-looking house without inquiring, 'Who lived there?' Certainly, we move through life very listlessly; we go along its highways and into its by-lanes without being stirred by the immortality around us; we close our eyes against the evidences of change which are the accompaniments of life; and we plod on, of the earth—earthly, with little more than a fluttering effort to raise our minds by the contemplation of the acts of those glorious spirits who elevated England to the rank she holds among nations.

We had been wandering through the human labyrinths of London—contigating, rather than observing—musing, instead of rousing ourselves to enter into the feelings and occupations of those with whom we live, when suddenly we stood opposite the gate of the Church of St. Bride, Fleet Street. We never can pass any one of Sir Christopher Wren's churches without endeavouring to obtain a sight of the beautiful spire by which he loved to decorate his sacred buildings; accordingly, we stepped down the paved court, and strained back the head to gratify desire. As we turned the corner to go on, St. Paul's, looming through the atmosphere of mingled smoke and fog, again recalled to mind the character of its mighty architect—that polished, high-minded, true-hearted, modest man, who loved his art with a depth and purity unknown in our times, and with the steady enthusiasm of his noble nature, not for the gold it brought, but because of its own high merits, and the power it gave him to elevate his country in the eyes of the whole world.

Born in 1632, Christopher Wren was nurtured in the highest principles of the Reformed Church; his father, at whose rectory he drew breath, at East Knoyle, in Wiltshire, was also Dean of Windsor; and his uncle, successively Bishop of Hereford, Norwich, and Ely, is celebrated in the Ecclesiastical history of England as having devoted himself to the royal cause, and remaining so firmly attached to the fortunes of the deposed King as to endure an imprisonment of nearly twenty years without being brought to trial. During a portion of this dismal time for all who held the true royalist faith, Mr. Christopher Wren, even then distinguished as a youth of equal modesty and talent, was a frequent visitor at Mrs. Claypole's, who was sure to distinguish and promote excellence. Here he occasionally met the stern Protector, who called to him one day, in his usually abrupt and determined manner, to go immediately and 'tell his uncle that he might come out of the Tower if he liked.' The youth bowed his thanks. Knowing the equally determined nature of his uncle's spirit, he proceeded with an anxious heart to the Tower. The shadows of the massive building lay heavily upon the waters, and, as the heavier gates ground beneath the creaking chains and rusty bolts, he hoped that one he loved so well would come forth to the light and liberty so very, very dear to a young aspiring

mind. So strongly did the value of this inestimable blessing seem to him, as he entered the dark and narrow room appropriated to his relative, that he could hardly forbear throwing himself upon his neck, and wishing him joy of the liberty he at first doubted whether he would or would not accept. The stern contempt which the prelate at once expressed towards the Protector's message—the air of offended dignity with which he regarded his nephew for being its bearer—the exalted nature that breathed in every word he uttered, proving his sincerity, and his determination to accept no favour from those he despised—were never forgotten by the future architect; and unable to repress or direct the feelings he had roused, he listened with silent respect to his high-souled relative. 'Go back!' he exclaimed, 'to the man who holds the power of England within his blood-stained palm, and tell him that I will none of his permission to depart, but will tarry the Lord's leisure, and owe my deliverance to Him alone!'

This noble disregard of things temporal, when contrasted with things eternal, was strongly characteristic of both the uncle and the nephew. Many of our paltry piles of brick and mortar—builders of mere paper-houses—creatures with not half as much architectural knowledge as the bee or the beaver—would think themselves insulted if required to superintend a square or a street in the suburbs of London at the remunerating rate that was paid the mighty architect of Saint Paul's. But long before he was distinguished as an architect, or thought of architecture, perhaps, but as a branch of the sciences to which his young mind rendered such ready homage, every man of knowledge in England considered the youth a prodigy. Like his remarkable contemporary, Pascal, his genius displayed itself at a very early age. At thirteen he dedicated the invention of an astronomical instrument to his father in a Latin ode; and, though labouring under extreme delicacy of health, he was able to enter Wadham College, Oxford, at the age of fourteen; here he secured the friendship of Bishop Wilkins, who introduced him to Prince Charles, the Elector Palatine, as a prodigy; and Oughtred, in his preface to his 'Clavis Mathematica,' mentions his extraordinary promise as a youth of sixteen.

About this time, Doctor Willis, an eminent mathematician, collected together a knot of scientific men, chiefly from Gresham College, who gave the idea after the lapse of a few years of the formation of the Royal Society; and Doctor Willis was another of his friends. Wren devoted much attention to the microscope, which caused both him and his cousin to be sneered at by the author of the 'Oceanus,' as those 'who had an excellent faculty for magnifying an atom, and diminishing a commonwealth.' He then turned his attention to some astronomical theories, and many claim for him the invention of the barometer, though there exists little doubt that the discovery belonged to Torricelli. The expatiate Evelyn, so associated with all that is honourable to England, so dear to all who love the registers of old times, makes frequent mention of Wren, designating him as 'that rare and early prodigy of science,' 'that miracle of youth,' 'that prodigious young scholar.' Well, indeed, did he deserve this praise. At fifteen, Sir Charles Scarborough, an eminent physician of his time, employed him as a demonstrating assistant; and it was the future architect of St. Paul's who first injected several liquids into the veins of living animals. But, turn where we will to the records of this great man's life, we find all illumined by his fame. Having abandoned his classic retirement, he filled the chair of astronomy at Gresham

College,* and the next year solved Pascal's celebrated problem, that was issued in all magnificence as a challenge to the learned of England, and then posed the mathematicians of France by one that was never answered. So he continued his course, mingling the mild lustre of the morning and evening star with the splendour of the comet; the perfection of human talent and human virtue; alienating himself from the party quarrels of the day, yet feeding the sacred flame of loyalty within his heart.

After a period of much turmoil, during the most interesting epoch of England's history, Charles II. was received back into the bosoms of his loving subjects, and Wren was chosen to fill the highest chair (the Savilian) at Oxford. Then the Royal Society, aided by the learning of England, was established firmly, Doctor Wren being one of its most efficient members, and yet we find him toying with all sciences—observing Saturn—mapping the Pleiades—calculating eclipses—writing on the longitude—most probably inventing mezzotinto engraving, and permitting the credit thereof (for which he never cared, except for truth's sake) to rest with his friend Prince Rupert. He also sacrificed, occasionally, to the Muses, but this most likely was in his love-making hours: that the wisest men must go through despite all other sciences.

But this human weakness was no stain upon his stainless career—as completely *sans reproche* as that of Bayard himself. At length, he went to Paris to study architecture and the mechanical inventions, and there saw the Louvre in progress. Soon after the Restoration, our Charles, whose foreign sojourn had given him some taste in architecture, took it into his head to contem-

COURT YARD OF GRESHAM COLLEGE.

plate repairing St. Paul's, which was absolutely necessary from the dilapidations it had suffered during the Commonwealth, when Cromwell converted the Choir into a horse barnack.

Wren was named in the royal commission to superintend the repairs, but it was decreed by a greater power that no one desecrated stone should remain above another. The mighty fire came in its terror upon the city, sweeping it away like chaff before the wind, and rendering

* Gresham College, as its name implies, is a foundation which owes its origin to the builder of the Royal Exchange; and in his will he bequeathed all his interest in that building, and also his dwelling-house, to the Corporation of London and the Mercers' Company, on condition that they provided seven professors to lecture publicly and gratuitously on the seven liberal sciences. At the death of his wife the professors entered on their duties, and had apartments assigned them in Sir Thomas's house, which was situated in Bishopsgate Street (upon the site of the present Excise Office), and which was in consequence now termed Gresham College. It numbered many eminent men among its professors, and flourished until the commencement of the civil wars, when it was occupied as a military garrison, and all the professors, save one, compelled to leave it. The restoration revived it, and the foundation connected itself with the newly-formed Royal Society. In the early part of the eighteenth century, discussions arose between the professors and trustees, and the building was deserted and allowed to go to decay, until an act was obtained for its sale and the ground on which it stood. There is a curious bird's-eye view of the building in 1710, and that portion of it which shows the inner quadrangle has been delineated above.

old St. Paul's* a tottering ruin; and there, amid the destruction, upon the burning cinders, fearless, amid the embers that crumbled about him—calm, amid the desolation that surrounded him on every side—heedless of the smoke and debris

of what should be seen no more, was the fearless architect, concentrating a mind of inconceivable strength, knowledge, solidity, purity, vastness, and vigour, upon one point—the restoration of London! Up to this period he had been one

OLD ST. PAUL'S CATHEDRAL.

of whom no evil was ever whispered, but at once the undercurrent of self-interest, that muddy, babbling, polluted stream, was let loose upon him; yet he stood between the glory of London and the mean and paltry economy that would have neglected the clearance made by the fire, and patched and cramped St. Paul's, emancipated from its disjointed thralldom by what to individuals was a great calamity. If the plans of this astonishing projector had been worked out altogether, as he intended, we should have had a city as remarkable for the dignity of uniformity as for extent.† He proposed a street ninety feet wide to proceed from St. Dunstan's Church to Tower Hill, there to terminate in a piazza; this, besides its magnificence, would have ensured a world of air and health to the citizens; he intended this to open into a circular piazza on its way, the centre of eight streets, leaving Ludgate prison on the left side, where, instead of the gate, he designed a triumphal arch to the renovator of London, Charles II.

The street was then to divide into two other streets as large, and before they, spreading at acute angles, could have been clear, one of the other, he intended them to form a triangular piazza, the

basis of which would be filled by the Cathedral Church of St. Paul's. How glorious this picture! The magnificent structure would not have been cribbed up by those close-fitting gaudy shops; and the proposed piazza would have given a majesty to the immediate neighbourhood in keeping with the cathedral; though piazzas can never be generally adopted in England with advantage. If they shelter from rain they darken the houses; and an Englishman connects some Italian idea with them; something of 'lurking' and hiding, and 'secret stabbing'; and indeed the more broad and wide and expanded streets are the better: still there they would have formed a noble base to the mighty pyramid. It was a fine idea of his also to make his highway to the Tower, adorned with parochial churches; setting before the people continually their Christian temples in the best situations, thus reminding them of their highest duties.

We can, without difficulty, imagine the magnificent appearance of our river, if he had been permitted to carry his quay along the whole bank of the Thames, from Blackfriars to the Tower, a canal being cut at Bridewell, with sluices at Holborn Bridge and at the mouth, and stores for coal at either side. What metropolitan magnificence would have arisen, had he erected twelve halls for the twelve chief companies, united into a regular square, annexed to Guildhall? He desired to banish trades that use great fires and create noisome smells, and all burying-grounds, out of the city. Our cemeteries are but the working out of one of his projects! Yet, necessary and useful as they are, we should be sorry to be buried in one of those dead highways; we would rather repose quietly in a sheltered nook of an old churchyard, where the shadow of the trees we saw planted should fall

WREN'S PLAN FOR RE-BUILDING LONDON.

* Old St. Paul's was the idol of the Londoners. They seem to have looked upon it as the very perfection of its species, and were redolent of its praises. One of its great holds in popular affection consisted in the belief of its legendary history. It was supposed to stand on the site of the Roman temple to Diana, and believed to be the spot where Christianity first found a home amongst us. All the older antiquaries fall in with this popular belief; and the legends they tell may be complemented by a reference to the pages of Camden. Its great antiquity and its constant connection with the historic and ecclesiastical history of our country, gave it however a strong interest. Its interior was enriched with the tombs of the great and the learned, some few relics of which are still preserved in the crypts of the present building. The long-drawn aisle, which in the sixteenth century used as the meeting-place and lounge of the citizens. So began desecration, and the cathedral became a place for idlers and a noisy rendezvous not always respectable. In a short time dilapidation and decay began to appear, and during the reign of James I. strong measures were necessary to be adopted to preserve the building at all. Our cut shows its palmy state when the steeple was entire. It was destroyed by fire in 1561, some say by lightning, others by the neglect of plumbers, who left their fires burning in their absence. It was new roofed after this; but was neglected until the reign of Charles I., who did that which had been urged during his father's reign unfruitfully, and set the example of restoration by building at his own expense a noble portico. Others followed the royal example and subscribed towards the work nobly,

and in 1643 the renovation was completed at a cost of about one hundred thousand pounds. The Civil War came, and with it a desecration worse than any previous one to which the noble building had been subjected. Houses were stabled within its walls, and it received so much injury, that on the restoration of Charles, that of the cathedral became again necessary. It was slowly proceeded with when the Great Fire left it a mere mass of ruins, to be succeeded by Wren's grander and more uniform conception.

† Wren's mode of operation is detailed by his son in his 'Parentalia.' He says, that after his appointment as surveyor-general and principal architect for rebuilding the city, he immediately 'took an exact survey of the whole area and confines of the burning, having traced over with great trouble and hazard the great plain of ashes and ruins; and designed a plan or model of a new city, in which the deformity and inconveniences of the old town were remedied, by the enlarging the streets and lanes, and carrying them as near parallel to one another as might be; avoiding if compatible with greater conveniences, all acute angles; by seating all the parochial churches conspicuous and insular; by forming the most public places into large piazzas, the centre of six or eight ways; by uniting the halls of the twelve chief companies into one regular square annexed to Guildhall, by making a quay on the whole bank of the river from Blackfriars to the Tower.' In his clear sighted plans and useful improvements he designed 'the streets to be of three magnitudes; the three principal leading straight through the City and one or two cross streets to be at least ninety feet

wide; others sixty feet; and lanes about thirty feet, excluding all narrow dark alleys without thoroughfares or courts.' An examination of his plan engraved above, will make these improvements apparent, and show how much London has lost by not adopting Wren's views; they were opposed by the vested interests of the citizens, which then, as now, deprecated all changes even for evident advantages. They had insurmountable prejudices in favour of rebuilding in old localities and in old styles, and hence he lost the opportunity of his wish to render London 'the most magnificent as well as commodious city for health and trade of any upon earth.' A glance at his plan will show how well he had laid out main streets, and studied the proper position of public buildings, with an eye as well to utility as to architectural effect. A shows the position of St. Paul's, which would have been the first grand object that claimed attention when the western side of the city was covered; at B is Doctors' Commons, in close and proper proximity. The letters C refer to the piazzas with which Wren intended to ornament London, where the principal streets meet. At D we have the principal buildings sacred to trade and commerce; E is the Post Office; F, the Exchequer Office; G, Insurance Office; H, the Mint; while at I are the Goldsmiths shops. K shows the position of Guildhall; L that of the Custom House. At M are the public markets; N, the Strand entrance to the City; O, is Southwark; P, the Temple; Q, a Quay along the entire bank of the Thames; R, is the detachment of the Fleet river at Bridewell; S, Queenhithe; T, Dowgate; U, London Bridge; and V, Billingsgate. W, shows the position of the Tower; X, that of

upon our green-grass grave, while the voices of those we have loved, and who have loved us, echo above it.

It is evident to all who contemplate the plan of Sir Christopher Wren's renovation of St. Paul's that the sun of his system; he would have ranged his planets and their satellites around it. His mind was as harmonious as the movements of the heavenly bodies; and the more we thought upon the more we felt the sublimity of his conceptions. It is with a feeling of extreme diffidence that we object to his fondness for arcades, which, except as a sort of amphitheatre for St. Paul's church-yard, are, for the reasons we have mentioned, unsuited to our climate. But we cannot feel the objection which some have stated to his plan, on the ground of sameness and uniformity.

Darmstadt, Carlsruhe, and Manheim, those uniform Continental cities, are dull enough, not from their uniformity, but from the absence of that moving world which is the variety of London.

Sir Richard Steele justly observed with reference both to Wren and the great fire, that 'That which produced so much individual misery afforded the greatest occasion that ever builder had to render his name immortal and his person venerable.' But though nothing could exceed the fortitude displayed by those who had seen their city swept, first by the plague, and then by fire; and though 'the people' would have embraced his plans, yet the selfishness of some individuals, the conflicting interests of others, the intrigues of certain parties in both court and

parliament on the completion of that admirable building.

He was not suffered to continue uninterruptedly at his St. Paul's. Papers of the Privy Council speak of his being hurried to Knightsbridge to decide if the site of a projected reprobic building was far enough from town; then to report concerning buildings to be made in the rear of St. Giles's Church. Nobody could be found to make arrangements for the accommodation of the Lord Mayor and Aldermen and their officers, and also the livery of the twelve companies, in Bow Church! He was appointed jointly with Evelyn to conduct the sale of Chelsea College to Government; upon him devolved the task of detecting and abating all nuisances, irregular buildings, defects in drainage that might prove prejudicial to public health or the beauty of the Court end of the town. These and all other tasks concerning the laying out of roads imposed upon him too much personal exertion and extensive and intricate calculations.

He laboured diligently; the Monument, Temple Bar, Chelsea Hospital, many of the balls of the great companies, seventeen churches of the largest parishes in London, and thirty-four out of the remaining parishes on a large scale, were rebuilt under the direction and from the designs of Wren, during the time that he was engaged upon St. Paul's. And when Queen Anne passed an act of Parliament for the erection of fifty additional churches in London and Westminster, the omnipotent Wren was appointed one of the commissioners.

What other man has left such records of a life behind him? Michael Angelo, so gloriously associated with St. Peter's, had as strong a struggle against prejudice and meanness as our 'Hero Architect,' and their characters were cast in the same mould, alike high-souled—alike poor in this world's riches—loving Art for its own sake—sacrificing their time, their knowledge, and themselves for their city's glory; but Angelo's hot southern nature lacked the fine tempering of Wren's, for he earnestly, at the expiration of seventeen years, implored Cardinal Carpi 'to liberate him from his vexatious employment.' Wren completed his task in thirty-five years, but St. Peter's occupied a space of 145 years, during the pontificate of nineteen Popes.

His name has filled our imagination with images of his works. They rise before us, distracting our mind with their magnitude and number. Recollections of his life, too, crowd upon us, and we see him in a hundred situations of his varied career. With an effort we banish these visions, for we have a Pilgrimage to make.

BOYER HOUSE.

At Camberwell there is a quaint old house called Boyer House or Manor House; and Evelyn records a visit to Sir Edmund Boyer at his 'melancholic house at Camberwell. He has,' he

WREN'S ORIGINAL DESIGN FOR ST. PAUL'S.

state, dispersed the architect's noble efforts as regarded the city; and when he was, after innumerable vexations and provocations from the prejudiced and the ignorant, really permitted to set about his great work of St. Paul's, he did so with superhuman patience and perseverance.

Nurtured in the purest Protestantism, his first plan of the cathedral did not include the length of the aisle necessary for the processions and pageantry of the Roman Catholic worship, but unnecessary in our Reformed cathedral service. The Duke of York, afterwards the tyrannical and bigoted James, insisted on the lengthened aisles and the addition of side oratories, thus preparing the cathedral for a religion, the subsequent attempt to re-establish which cost him his crown. This infringement on Wren's plans and princi-

ples caused him to shed bitter tears; but his Royal Highness, who would have hardly ventured to interfere with the design of a sculptor, altered the plan of the architect; and Wren began his work of immortality—laying the first stone of London's landmark on the 21st of June, 1675. And in the year 1710 the good old man, having attained the seventy-eighth year of his age, having spent thirty-five years of his life in the actual and daily labour of this erection, having seen the terminations of three reigns, having experienced a revolution which drove the Stuarts from the throne, and witnessed the going out of the Orange dynasty and the coming in of the Hanoverian, saw his son lay the highest stone of the lantern on the cupola. The toils, and taunts, and vexations he had endured were forgotten at this triumphant moment. The shouts of a grateful people rent the air; he was surrounded still by long-tryed friends, and his character was as stainless as when he took his first lesson in the dignity of a fixed purpose from his uncle within the Tower walls.

And what now, gentle friends, suppose you was the sun allotted to Sir Christopher Wren for building your St. Paul's—our St. Paul's!—what to remunerate him for the learning, the labour, the untiring attention he brought to his work of love? *Two hundred pounds a year!* And the commissioners had the pettiness to stop a portion of this until the work was completed; nor could he obtain his money without an application to Parliament. Well might that splendid vixen Sarah, Duchess of Marlborough, remonstrate with her architect, when, as she said herself, 'It is well known that Sir Christopher Wren was content to be dragged up in a basket three or four times a-week to the top of St. Paul's, and at a great hazard, for 200*l.* a-year.' Poor Sarah! she took little into consideration his mind or talent, but thought mightily of his swinging in a basket for such a paltry sum!

His payment, as architect of the City churches, was hardly better, being no more than 100*l.* a-year; though the parish of St. Stephen, Walbrook, voted his lady a present of twenty Moorfields; and Y, the circuit of the City Walls. The small black blocks, which are isolated, represent churches which he had intended to place in prominent positions in the main thoroughfares, but always free of the houses. It is only necessary further to remark, that that portion of our plan which is covered by lines of tint, represents that part of London which was destroyed by the great fire. The dome of St. Paul rises above his grave, a noble monument; but there ought to be another. There has been published a tribute to his memory—a pictured representation of the workings of his mind, beautifully grasped, by Mr. Cockerell. This fine representation of British architecture sets forth no less than sixty-two of Sir Christopher's buildings, the principal number being churches. The unfortunate circumstance of the Duke of York's tendency to the Roman Catholic faith deprived England of possessing the only Protestant cathedral in the world. Wren's notions of church-building for the reformed faith were well expressed in his report to the King, where he declares that our own ritual and its form should guide the architect solely in his designs for the buildings sacredly devoted to such service. 'The Romanists,' he says, 'indeed, may build larger churches; it is enough if they hear the murmur of the mass, and see the elevation of the host; but ours are to be fitted for auditories.' Impressed with this view, he omitted the long aisles and side chapels necessary to the Romish ritual and its processions, and made the body of the building a compact centre as a grand substructure to the dome, and forming an enormous receptacle for a large auditory. But the Duke, who had, no doubt, long cherished the idea of restoring Popery, insisted on the long aisles and side chapels being inserted. Wren was therefore obliged to alter his design entirely to our less original and beautiful, but to gratify the wish of one who sat upon our throne but two short years and was banished for ever.

says, 'a pretty grove of oaks, and hedges of yew in his garden, and a tall row of elms before the door.' This house is still standing in the London Road; and in that house, not 'melancholie' to our thinking, Sir Christopher Wren resided during a great portion of the time occupied in building St. Paul's. Most likely Wren rented the house from Sir Edmund. And, as Evelyn is believed to have introduced cedars into England, who knows but Sir Christopher obtained the very tree which we regret to see looking so really 'melancholie,' from the sweet author of the 'Sylva!' The house, as you may see, has a very different appearance from any other in this particular neighbourhood; and the wide-spreading branches of the cedar, now the wreck of what it was, invite attention. Tradition calls it 'Queen Elizabeth's tree;' but there is a certainty that her Majesty never saw it. The house has a sufficient claim to our attention without this distinction—Evelyn entered the gateway, Sir Christopher Wren resided within those walls!

There are no people in the world more misunderstood than the English. Our 'shyness' is termed 'coldness,' our 'timidity and reserve' 'heartlessness,' no one ever knocked at the proper door of an English heart without having it opened. Here were we personal strangers to the lady who resides in this venerable mansion; and yet a mere expression of a desire to see Wren's house, sufficed not only to secure us admission, but such kind attention as we can never forget. The steps ascended, the hall is entered by a glass door, and you immediately find yourself where taste and judgment have presided, and where care is still taken of the work of their hands. From the gloomy aspect without you are astonished at the cheerfulness within, for the hall is spacious and lightsome; and, though it has been deprived of many of its ancient honours, still the plainness of its paneling is in keeping with the character of the building, and though it has lost much—for its present occupant informed us that when she took it the owner of the mansion removed the 'carved imageries of fruit and flowers,' and various other beauties, that decorated an exquisitely perfumed room, still called the 'cedar parlour'—though much has unhappily been removed from this house of noble memories, nothing has been introduced in violation of the pure taste that presided over its adornment. The 'cedar parlour' is of a mellow and yet delicate colour, panelled with that expensive wood from the floor to the lofty ceiling. The adjoining room is finely proportioned; but the room on the opposite side of the building is the one that particularly attracted the attention of our artist friend. The chimney-piece still boasts some undisturbed carving, and there is a door remarkable for its simplicity.

DOOR AT DOVER HOUSE.

This probably was the architect's study; his own proper room. We would give much to know whose bust originally occupied the position which its present possessor has assigned to Sir Walter Scott. Perhaps Inigo Jones or Michael Angelo. And the window, which now only looks forth towards a chapel, then opened

upon a trim parterre, guarded from all harsh winds by the 'hedges of yew,' and enjoying a sight of the 'pretty grove of oaks' that commanded even Evelyn's commendation, despite the 'melancholie' of 'Canerwell.' Here the most wonderful of men reposed from his fatigues, and, relying with the high faith of a Christian spirit upon the God who works all things together for good to them that trust in Him, was never bowed down, never shaken, never turned from his loyalty to his maker, to his ruler, to his art. Well might Steele aver that 'his personal modesty overthrew all his public actions; the modest man built the city, and the modest man's skill was unknown!'

Here, perhaps, originated the meeting which Herder asserts was the origin of the Freemasonry of St. John. Here, with a few friends, to save his journey home to dinner, he arranged to dine somewhere in the neighbourhood of St. Paul's; and a club was thus formed, which by degrees introduced a formula of initiation and rules for the conduct of the members expressed by symbolic language, derived from the masonic profession. Knight thinks it rather corroborative of Wren's assertion, that, while the biographers of Wren mention the attendance of the lodge of Freemasons, of which he was the master, at the ceremony of placing the highest stone of the lantern, no mention is made of their attendance at laying the foundation stone; and every lodge in Great Britain is an offshoot from the lodge of antiquity of which Sir Christopher was master! We can fancy these walls covered with his plans, and, as the twilight gathered round us, might almost hear the music of his clear, sweet, demonstrative voice replying kindly to those who questioned upon all points, by short but satisfactory answers. Perhaps when at breakfast in this very room, when told that the frightful hurricane of the previous night had damaged all the steeples in London, he observed, with his quiet, faithful smile, 'Not St. Dunstan's, I am sure.'

The admirable order of his mind gave him time for all things. He never abandoned his scientific pursuits; and here were written many of his interesting letters to the Royal Society. One in particular partakes so much of the simplicity of the man and dignity of the philosopher, that it occurred to us while gazing on the beautiful proportions of the door.

'It is,' he said, 'upon billiard and tennis balls, upon the *parling* of sticks and tops, upon a vial of water, a wedge of glass, that the great Des Cartes has built the most refined and accurate theories that human wit ever reached to; and certainly nature, in the best of her works, is apparent enough in obvious things, *were they but curiously observed*; and the key that opens treasures is often plain and rusty.' 'But,' he adds, with the pen of experience and prophecy, '*unless it be gilt, it makes no show at court.*'

As we walked round what is but a remnant of the garden that belonged to the house, and learned that it is now occupied as a school for the education of young ladies, we could not but think of the fine associations (those creators of noble thoughts) the young could not fail to imbibe in such a residence. We are sure the lady, who felt so thoroughly the purity, even more than the vastness, of Wren's character, will not fail to impress upon their minds the great lesson taught by his life; how much can be done by the right employment and division of time, and how surely a noble object, when persevered in, will be, *must* be, accomplished. When we entered, we did envy her that house,

* The St. Dunstan's alluded to is the Church in Tower Street, London, known as St. Dunstan's in the East. There is a tradition that the plan of this elegant tower and spire was furnished to Wren by his daughter, Jane Wren, who had seen and admired the famous one of St. Nicholas, at Newcastle. She died in 1702, aged twenty-six, and was buried under the choir of St. Paul's Cathedral. The storm which occasioned Wren's remark, raged in London through the night of the 20th of November, 1703, and some of the steeples and pinnacles in the city suffered serious injury.

but when we left it, we thought it could not, in the present day, be more worthily occupied.

We have deferred as long as we could the last public act of England towards Sir Christopher Wren, because we are ashamed to record it. His talents, his uprightness, his exertions, his deeds, were forgotten; and almost beneath the very shadow of London's chief glory, when his head was crowned with those snows of age which kings might envy, in the eighty-sixth year of his earthly pilgrimage—when he had been half a century architect to the crown, George I., whose mind was just sufficiently large to contain corruption and intrigue, dismissed him! For once Horace Walpole forgot that the disclaimer was a king, and the dismissed a subject. He speaks of Wren as 'having enriched the reign of several princes, and *disgraced the last of them.*' God bless his honesty! We say this heartily, for he seldom affords us so great a luxury.

The retirement of this great man was as glorious as his career—the sunset of a long summer-day of untiring, untired life, which he laid down, not as a burden, but a duty. We may surely accept his character as a man of science upon the testimony of Newton, who in his 'Principia' joins his name with those of Wallis and Huygens, whom he styles *hujus ætatis geometrarum facile principes*.

Raking from the immediate neighbourhood of London to Hampton Court, he spent the remaining five years of his life chiefly in the study of the Scriptures. Time, which had enfeebled his limbs, left his faculties unclouded nearly to the last day of his existence. His chief delight up to the very close of life was to be carried once a year to visit his great work; and we once met a lady who had heard her grandfather describe having seen him assisted by two friends up the steps of the cathedral. He was a little child then, but he never forgot following the architect into the holy building, and wondered, when he heard the people, who uncovered as he passed, say, that that old man, whose every smile was a blessing, had built the great St. Paul's. After one of those visits, he rested at his lodging in St. James's Street, after his dinner, on the 25th of February, 1723. His servant, thinking he closed longer than usual in his chair, found, to use the euphatic words of Scripture, 'that he had fallen asleep.'

TOMB OF WREN.

Of course, he had a splendid funeral. His remains were deposited in the crypt under the south side of the choir of the cathedral.*

* Wren's tomb, a simple ponderous slab, bears the following inscription:—'Here lieth Christopher Wren, Kn't, who dyed, in the year of our Lord, MDCCLXXIII., and of his Age xli.' At the head of the tomb, on the wall above, is a more ambitious Latin epitaph, enclosed in an ornamental border after the fashion of a Roman tablet. It runs thus:—'Subtus conditur hujus Ecclesie et urbis conditor Christophorus Wren, qui vixit Annos ultra nonaginta non sibi sed hono publico: Lector si monumentum requirās circumspice. Obiit xxv. Feb. Ætatis xli. Anno MDCCLXXIII.' On the opposite wall, at the foot of the tomb, is the monument of Dean Holder, who married Wren's sister; and on the massive pillars is that of Jane Wren, his daughter, who officiated as organist in the Cathedral, and is here represented playing on her favourite instrument to listening angels.

GOVERNMENT SCHOOL OF DESIGN—
SOMERSET HOUSE.

The annual meeting for the distribution of prizes, to the students of this Institution, and to receive the report for the past year, took place on the 10th of January; the Right Hon. Henry Labouchere, M.P., President of the Board of Trade, presided on the occasion, and was supported by Earl Granville, Vice-President of the Board, as well as by several gentlemen interested in the progress of our manufacturing and industrial arts. The report of the head masters, Mr. Herbert, R.A., Mr. Redgrave, A.R.A., and Mr. Townsend, was read by the Secretary, Mr. Deverell. It stated that the average number of students, male and female, in each month in 1848-9 was 383; while for the last nine months of the current financial year, to the 31st of December 1849, the average had amounted to 423, being an increase of 40 in each month. A corresponding increase of fees had also occurred to the amount of 41l. on the preceding year. With regard to the great National Exposition in 1851, the report expressed the earnest hopes of the masters that the Board of Trade would extend its utmost assistance to further the studies of the pupils during the present year. If it should be determined that the School of Design should contribute to that Exposition the *élite* of their productions, it was desirable that early information of that determination should be communicated to the school; and it was hoped that the Board of Trade would extend with no sparing hand such pecuniary aid as might be thought adequate to the execution of designs, which would be otherwise too costly for individual means.

Mr. LABOUCHERE, after the report had been read, signified his great satisfaction at the account which it gave of the position and prospects of the school. He had himself, from the very earliest, watched its progress with great interest, and he earnestly hoped that more and more attention would be paid to the arts of design in this country, the stability of whose manufacturing prosperity must, in many branches, mainly depend upon the successful cultivation of those arts. At present, though we excelled other nations in mechanical contrivances, we were behind some of them in those arts to which the principles of taste applied, and if we wished to hold our place among the nations of the earth, every encouragement must be afforded to the arts of design. He had heard with great pleasure the report which had been read by the Secretary. He had seen evidences of progress every year, but during the last year the improvement had been more decided and marked. It would be invidious to institute any comparison between the progress made in different branches of study, but he could not help saying that he had observed with feelings of no ordinary gratification, the beautiful drawings and designs exhibited by the female class of students. He trusted that this institution had now taken so firm a root in the country, that nothing could prevent its final success; and he hoped that the students would exert themselves, and exhibit such specimens of their skill at the great National Exposition of 1851 as would do credit to the school.

After the distribution of the prizes to which we shall refer presently,

Mr. REDGRAVE, A.R.A., stated that the President and Vice-President of the Board of Trade had kindly given the sum of 300l. to be distributed as rewards among those sections which were not sufficiently provided for in the list of prizes. Having been requested by the Board of Trade to visit Paris, for the purpose of inspecting the Art-manufactures of the French, he felt bound to say, that although our French neighbours excelled us at present in the department of Ornamental Art, they were not so immeasurably our superiors in that respect that we might not hope to equal them. There was much that was meretricious, and there was a great redundancy of ornament among the French designers. But in one respect they were greatly our superiors. The Art-workman was much better educated in France than the English Art-workman, and consequently the execution of their designs was carried out with greater fidelity.

Mr. LABOUCHERE said he had listened with much satisfaction to the remarks made by Mr. Redgrave. He believed that some gentlemen and many ladies thought it impossible for an English-

man to compete with a Frenchman in the art of design, but he hoped that the students of the school would show that such an opinion was ill-founded. The present superiority of the French was attributable to the long continued establishment of similar schools, which were founded by Louis XIV. at the instance of that eminent statesman, M. Colbert. A few words from Earl GRANVILLE closed the meeting; he said he had just come over from Paris, and that he found the French much excited at the prospect of the great exhibition of 1851. The manufacturers of France felt confident of success so far as the art of design would ensure it, though they acknowledged the superiority of our own countrymen in superiority of workmanship and in its durability.

Through some inadvertence our tickets of admission to the meeting did not reach us in time to permit our attendance at it; but on the following day we passed some time in reviewing the numerous models, drawings and designs which filled to overflowing three rooms of no limited dimensions; there were upwards of 1,200 of various descriptions, showing at least the industry of the pupils of the school; the majority of these designs are for textile fabrics and paper-hangings, though there was no lack of other subjects. We had not, at our visit, heard the names of the successful candidates for the prizes, but we especially noticed as highly meritorious, designs for paper and china, by Miss Alice West; a pair of oil paintings of fruit and flowers, by Miss Eliza Mills; fruit and flowers in *tempera*, by Miss H. McInnes; a design for a table-cover by Miss Charity Palmer; two large water-colour drawings of fruit and flowers by the same young lady; fruit and flowers in *tempera*, by Miss Alice West; designs for muslin dresses, by Miss L. Gann, Miss E. Mills, Miss S. J. Edgley; a design for a salt-cellar, by Miss A. West; a design for an inkstand, by Miss L. Gann. Among the contributions by the male students, we were much pleased with a set of anatomical drawings in chalk, by J. S. Porteb; a small model of a Bull attacked by a Lion and Lioness, by C. J. Hill; drawings in chalk from the antique, by T. S. Bell; a large vase in plaster, by W. J. Wills; two clever bas-reliefs in plaster, by F. Wills; a design for an Etruscan vase, by T. Brown; designs for a breakfast service, by T. S. Bell. There were many more by both classes of pupils worthy of special mention, did our space admit. The principal prizes were awarded as follows.

A prize of 2l. to Miss Alice West, for a design for a chintz; 2l. to Miss Louisa Gann for a design for a hearth-rug; 2l. 10s. to Miss Alice West, for a design for a salt-cellar; 2l. 10s. to Miss Louisa Gann, for a design for an inkstand; 2l. to Miss Alice West, for flowers and fruit in *tempera*; 2l. to Miss Charity Palmer, for ditto in water-colours; 2l. to Miss Eliza Mills, for ditto in oil; 2l. to Miss Alice West, for a design for paper hangings; and 2l. to the same lady for a design for a muslin dress. The value of the prizes distributed among the female class of students amounted in the whole to 57l. 5s. Among the prizes given in the elementary school were 2l. to Mr. Johnson, for a set of the five orders, tinted; 2l. to Mr. Dutler, for a drawing of Gothic Architecture; 2l. to Mr. Porteb, for an original set of anatomical drawings of the human figure; 2l. to Mr. Griesbach, for a copy of a painting containing a group of fruit and flowers; and 3l. to Mr. Moyo, for studies from fruits, &c., from nature, in oil. Mr. Brown, sen., obtained a prize of 2l. 10s. for a design for a vase, ornamented in two colours; Mr. Bell received a prize of the same value for design for a breakfast service; Mr. Slocomb was awarded 3l. for a design for a stained glass window; and a prize of the same value was given to Mr. Hodder for ditto and a panel. Mr. Slocomb also carried off a prize of 5l. for a design for the painted decorations of a ceiling, and another of 3l. for designs for silk hangings. Mr. J. George obtained a prize of 1l. 10s. for a design for a printed druggist; and Mr. J. B. George one of 2l. for a design for a carpet and hearth-rug. Other prizes were distributed among the male students, amounting in the whole to 209l.

It would seem almost invidious, amid so much that was excellent, to single out any for particular notice, but it would be unjust to Miss Alice West not to direct attention to her four prizes; and to Miss L. Gann for her two.

Our remarks on the exhibition as a whole must necessarily be brief; but we are bound to

say that we were more than pleased with it; the productions of the pupils surpassed our most sanguine expectations, though we had heard most encouraging accounts of their progress during the past year. The female classes have certainly performed wonders under the judicious and clever management of Mrs. McIn, who shows herself here as excellent an instructress as she is an accomplished artist; and sure we are that Mr. Herbert, with the other masters at the head of this school, will most cordially assent to the justice of our remarks. We desire not, however, to disparage the efforts of the male pupils, which are, generally, highly creditable to all parties; and in some cases of a very superior order. Still we could not but notice the scarcity of designs for such objects as are adapted to the requirements of numerous classes of our manufacturers, workers in metals, pottery, wood, papier mâché, bookbinding &c.; matters which belong rather to the stronger sex as subjects of study. In going through the rooms our thoughts naturally reverted to the great National Exposition in prospect, and we felt assured that if our manufacturers of paper-hangings, carpets, and textile fabrics, were to make selection from some of the designs here exhibited, they would do well, for there is much most worthy of their attention, both for home consumption and for public competition. The increased assistance which the school will most probably receive from the Government, during the present year, will give a fresh impulse to the energies of the young artists that must tell on their future exertions. There is evidence of abundant talent ready to be called into the field of action, if free scope be given for its display—talent that will reflect lustre on individuals and on the country; let it be generously and liberally dealt with by those who desire to see the Art-manufactures of Great Britain flourish, whether directly or indirectly interested in their success, and there can be no doubt of a proportionate reward. The recent exhibition at Somerset House inspires us with fresh hopes for our country in the impending struggle for pre-eminence in the Industrial Arts.

THE ROYAL ACADEMY
AND ITS CALUMNIATORS.

For some weeks past, communications signed "William Coningham" have been published in the *Times* newspaper, the object of which—as far as it can be made out—is to excite public indignation against the Royal Academy; with a view to the cjection of that body from the apartments they occupy in Trafalgar Square. The charges advanced by Mr. Coningham are so utterly groundless, so entirely opposed to facts, that one might be almost justified in supposing him rather the cunning advocate than the uncompromising enemy of that Institution; for the unquestionable effect of his writings will be to withdraw attention from those points in which it is assailable, and direct assaults upon those which are easily defended. According to Mr. Coningham, the only boon conferred upon the country by the Academy in return for a host of benefits is, that "it professes to support a School of Design, notoriously mismanaged." Now, it has been affirmed over and over again, that the Academy is hostile to the School of Design, but it was for Mr. Coningham to discover its "professions of support."

This is a sample of the whole "rignmole;" about equally true with the broad-faced assertion that the Academy "exact" from a candidate for admission to membership "an amount of servile solicitation, to which high-spirited men, conscious of their own superiority, must naturally be unwilling to submit." It is by no means likely that Mr. Coningham is personally acquainted with many members of the Royal Academy; he may have, therefore, yet to learn that not only is "servile solicitation" never "exact," but that it would go far to insure the failure of any candidate. To our own knowledge, a large majority of the recent elections, have been of artists totally unknown to more than four

members out of the forty—except by their works. Mr. MacDowell, when elected an associate, had never been introduced to, and had consequently never exchanged a word with, a single member; we believe the same, or nearly the same, may be said of Mr. Foley. Both these gentlemen are Irishmen; without position—except that which they obtain from their profession; without patronage; in short, without one of the extrinsic advantages by which it is insinuated their elevation was obtained. The members of the Academy knew their works, but knew nothing more of them until they took seats by their sides. We might, indeed, go through the list of all those recently elected. Was it by "servile solicitation" that Mr. Poole, Mr. Pickersgill, Mr. Ward, Mr. Frith, Mr. Egg, Mr. Sidney Suirke, Mr. Frost, Mr. Elmore, obtained admission? or is it by "servile solicitation" that Mr. Pugin expects election (and will no doubt be elected), at the next vacancy?

We have quoted the names of the younger members, merely because it has been our privilege to know them, from the commencement of their career in Art, to the event of their election; but surely Mr. Coningham will scarcely venture, except in this general way, to dare the assertion that such men as Mr. Barry, Mr. Cockrill, Sir Robert Smirke, Mr. Webster, Mr. Dyce, Mr. Cope, Mr. Wyon, Mr. Stanfield, Mr. Leslie (indeed, we might quote the whole list but with two or three exceptions), are less high-spirited and upright, less truckling to obtain "Academic honours," which (according to Mr. Coningham), "impose only on the ignorant," than Mr. Coningham himself; or than that ally—a bad painter and a worse critic—whom Mr. Coningham continually quotes, and who, in his estimation, would no doubt make a far better keeper of the gallery and cleaner of its contents than either Mr. Eastlake, or his successor, Mr. Uwins.

There is no body in the kingdom, perhaps none in the world, less subject to reproach than the Royal Academy, as regards the election of members. The best artists among the candidates are almost invariably elected; they are chosen in such a manner as to avoid,—as far as human power can avoid it—the danger of private motives in selection; if the members had no higher principle to guide them, it is obviously their interest to strengthen the body by obtaining the co-operation of able men. They thus invigorate their own society, and weaken societies that might become rivals; but, above all, there is a responsibility from which no assemblage of men dare shrink—public opinion cannot be outraged with impunity.

It would be an insult to Mr. Eastlake to say a word in his defence against the vituperation and apparent animosity of Mr. Coningham. As a gentleman, an artist, and a man of letters, he is placed far beyond the reach of his accuser, who very nearly reiterates charges confuted long ago by a solemn decision of a committee of inquiry, such decision being based upon the combined testimony of the best authorities upon Art in the kingdom.* It is, however, with the gross injustice of the attacks on the Royal Academy that we have now to do. Mr. Coningham aims his blows so recklessly—with blundering passion—that not one of them hits the mark. We are by no means the unreflecting defenders of the Academy. For a very long period we have laboured to show that reforms have become necessary to this Institution—for its own welfare and that of Art—and that such reforms are practicable and easy. A few concessions to the

* The strength of Mr. Eastlake's case consists in the judgment given by our most eminent artists. What is to be said in answer to the opinions of Mr. Mulready, Mr. Ety, Mr. Lavender, Mr. Uwins, and Mr. Stanfield? These gentlemen all agree in praising what has been done, and although artists are not always the best judges of a picture, and sometimes lay too much stress on technical excellence, yet it is obvious that if any men are qualified to judge on what is dirt and what is glazing, or are competent to express an opinion on the colour and surface of painting, it must be such artists as those we have mentioned. We think our readers will agree with us in the opinion that the Trustees could not have done otherwise than resolve as they did (Lord Ellesmere being present, and the Earl of Aberdeen in the chair): "That, in the opinion of the Trustees, the Report, as made by Mr. Eastlake, is entirely satisfactory, and justifies the confidence which they repose in his judgment in respect to the pictures in the National Gallery."—*Edinburgh Review*.

liberal spirit of the age, a few abrogations of old laws, to which the Society adheres with lamentable pertinacity, and we verily believe that no society in the world would be more free of matter for reproach—more honourable or more useful. But it is notorious that its schools are admirably arranged and conducted; that nearly all our best artists have issued from them; that the student there acquires knowledge entirely free of charge; that the most accomplished painters and sculptors there give lessons for sums the most insignificant—such sums, insignificant though they be, coming out of their own funds; that to its library every qualified student is admitted; that its charities are large, not alone to the widows and children of deceased members, but to decayed artists and their families, who have no claims other than those of want. The Academy does this, and much more, without the smallest aid from the national purse; for it is beyond dispute that the poor apartments they occupy are theirs by inalienable right; and we say unhesitatingly, that if deprived of them, a Court of Equity would substantiate their just claim for compensation. When they were removed from Somerset House, and the Royal Society and the Society of Antiquaries retained their rooms in that building, it was for the public benefit, more than for their own, that such removal took place. To cast the Academy adrift, would be to inflict an injury upon British Art, for which half a century of national fosterage could not atone. We trust that some means will be found, and that soon, to remedy two crying evils; to find fitting room for the national collection, and space sufficient for an exhibition of contemporary Art; and we hope this will be done by giving up to the Royal Academy the whole of the building in Trafalgar Square, and providing for the National pictures a structure worthy of the Nation.

ART IN THE PROVINCES.

MANCHESTER.—THE UNION CLUB HOUSE.—Whatever objections may be urged against club-houses, as interfering with the family gathering round the domestic fireside, it would seem, from their increasing number and the amount of support they receive, that they are considered as essential to the wants and requirements of the age. Certain it is, that every pains is taken, and money is abundantly expended, to make such places of resort elegant, commodious, and inviting. We see conclusive evidence of this in the streets of our metropolis, nor are some of the most important cities and towns in the provinces far behind us in these matters. The Union Club of Manchester, one of the oldest in the county, and of much influence in the locality, from the position of the great body of its members, has recently re-opened its "Coffee-room," or rather "Saloon," after extensive alterations have been effected therein. The dimensions of the room are fifty feet by twenty-five feet. It is a well-proportioned apartment, in height, as in length and width, and is lighted solely from a large lantern in the roof. The ceiling at each end of the room is in flat panels; from these springs a coving, out of which rises the large square lantern in the centre. The walls are divided vertically by pilasters into a series of panels; and horizontally, by a projecting cornice forming a subbase. The prevailing colour of the walls is a sort of salmon colour, the pilasters are a sea-green, while the ceiling and the higher parts of the lantern are of light hues; so that a regular gradation in colours, from dark to light, is found to be observed throughout, as the eye glances from the floor,—(covered by a dark rich carpet, made to correspond in style and character with the decoration)—and the lower part of the walls, to the ceiling and lantern. The style of the decorations of this room is arabesque. The cornice is divided by rich bands into sixteen compartments, the centres of which are filled with allegorical paintings and imitations of sculpture. The subjects in the angles represent the cardinal virtues, Justice, Fortitude, Prudence, and Temperance. The centre compartments on three sides contain Architecture, Painting, and Sculpture. The others are filled with the Muses, the daughters of Jupiter and Mnemosyne. The arabesques on the principal pilasters are divided into sections, enclosing various allegorical representations of the Hours of the day, the Months of the year, and the Zodiacal

signs. Over the entrance for the members is a bold alto-relievo, representing Anacreon imbibing the spirit of poetry administered to him by the Muses, and over that, at the other end of the room, a similar alto-relievo, representing Bacchus in his cups. These alto-relievs, we may state, in explanation of the term, are done on white with black shadows, to imitate statuary, the background being crimson, in order to harmonise with the rest of the room. All the figure painting has been done by Mr. Horner, of London; the ornamental designs were furnished by Mr. George Jackson, and the projective ornaments, in *carton pierre*, were from his establishment in Brumenshoe Street; while the decorative painting, harmony of colour, and general arrangement, have been executed under the superintendence of Mr. Froggatt, and by workmen in his employ. The room is in all respects worthy of the leading manufacturing town of British Industry.

YORK.—The seventh annual meeting of the friends and subscribers to the Government School of Design in this ancient city was held on the seventh of last month; it was attended by a numerous and highly respectable assembly. J. G. Smith, Esq., M.P. for the city, presided on the occasion. From the report of the Committee, it appears that the average number of pupils who have attended during the past year has been upwards of eighty, many of whom removed to London and other places to seek employment in their professions. The report then alludes to the great loss the school has sustained by the death of its founder, Mr. Ety, R.A., who, both personally and indirectly, took a warm interest in its welfare, and greatly aided its success. The lectures lately delivered by Mr. R. N. Wornum are also adverted to as tending much to the benefit and instruction of the pupils. It seems, however, that there is in this place, as elsewhere, an obstacle to the free growth and rapid progress of the institution, in the shape of a debt of £201, incurred chiefly by its removal to the present enlarged building; but surely this modicum of money might easily be raised in such a city as York, if the real value of the school were appreciated by the citizens; it is a stigma upon them to allow it to stand unaided. Prizes were distributed at the meeting to several of the pupils both male and female.

STOKE-UPON-TRENT.—The Athenæum Institution in this town has recently been opened for the purpose of exhibiting an extensive and valuable collection of Art-manufactures, contributed by many of the most distinguished establishments, not only in that district, but in others also—chiefly, however, the productions of Birmingham. Among the principal objects which attracted attention, were various kinds of pottery, contributed by Mr. Alderman Copeland, especially a number of his beautiful statuettes, now so widely circulated; vases, elaborately ornamented, chiefly in the style of Sévres, busts and statuettes in Parian marble, by H. Minton & Co.; classical productions by Wedgwood & Co.; statuettes by Keys & Mountford; a variety of objects in pottery forwarded by Mrs. Burslem, Messrs. F. & H. Pratt, Dimmock & Co. Boston; besides some exquisite antique vases, pitchers, &c., lent by Mr. S. Childers, of Rowall Hall, and Mr. Bateman of Knypersley. In glass-ware, the specimens sent by Messrs. Davenport and the Stourbridge Glass Company were conspicuous; and some gilt brackets, mirrors, &c., from the establishment of Mr. Harrison, of Newcastle, are worthy of especial notice. Mr. Potts, of Birmingham, contributed a number of the best of his very beautiful manufacture, embodying a combination of glass and porcelain statuary with metal. The union is extremely felicitous—the golden texture of the metallurgical enrichments effectively enhance the purity of the porcelain, and realise an ensemble of chastened elegance. Amongst the articles was a splendid candle-labrum, of exquisite workmanship, extremely graceful in proportion, and the details most admirably worked out. Our space will not permit a reference to the many valuable works which Mr. Potts furnished, but we may allude to a triple card-stand. The tazza of ruby glass with gold enrichments, supported by three kneeling female figures in porcelain statuary, upon an ornamental metal base, is of great beauty. To this article the Society of Arts awarded its last Isis medal. Several branch-lights and flower-holders possessed rare merit. The modelling of some animals in connection with the bases of some of these, particularly a sea-horse and a stork, is of the very highest order. Indeed, the manipulative processes, both of modelling and manufacture, struck us as generally superior to those of any works of the class that have come under our observation. It would be difficult to excel the crispness and brilliancy with which the metallic details are produced. The paper-

mâché works of Messrs. Jennens & Bettridge have now obtained a European celebrity; and judging from the specimens alone included in this exhibition, it has been most justly awarded. Messrs. Jennens & Bettridge were the first to place in immediate alliance with Art a branch of manufacture which, till then, had been beyond its pale, and it is gratifying to witness the complete success of their zealous and praiseworthy efforts. The only possible objection that the most refined and restrictive taste could raise, in its severest criticism, is the redundancy of ornament to which the peculiarity of the material, and its capabilities of embellishment, render it liable; still the works are of a class in which this excess may not only be tolerated, but where its admission may be deemed a part of its legitimate character. The specimens exhibited realise all that could be imagined of gorgeous and dazzling richness, and embrace a variety of useful as well as ornamental elegancies, viz., chess and "occasional" tables, work-boxes, chairs (two after the design of Julienne), a splendid cabinet, similar to one executed by Jenny Lind, several inlaid stands, the Bedstead, the Jenny Lind, several flower-stands, &c. The "gen-enamelling" displayed in some of their productions, is a process which originated with Messrs. Jennens & Bettridge, and is alike important for its extreme gorgeousness as for its novelty.

LIVERPOOL ART-UNION.—The annual meeting of this society, for the purpose of receiving the report, and for the distribution of prizes, was held during the past month, the Earl of Sefton, President of the Society, being in the chair. Mr. J. R. Isaac, the secretary, read the report, the principal feature of which was, as a matter of course, the amount of the subscriptions; this was stated to be 630*l.*—more than double the amount of the two preceding years, and there was every reason to believe that even this would have been still greater had the committee been able to deliver the promised engraving at the time of subscribing, but which from some delay on the part of the printer, they could not accomplish. Such a disappointment is not likely to occur in future, as the engraving for 1850 will be printed and ready for delivery ere it is announced for distribution. It also appears that the plan (which we believe to be a wise one) of giving each subscriber a season-ticket of admission to the exhibition of the Liverpool Academy, has not operated to the disadvantage of the latter society, which has indeed profited by its liberality, as the receipts for season-tickets exceed those of the past year. Out of the 630*l.* subscribed, the sum of 315*l.* one-half, was set apart for the prizes, and divided as follows:—One of 50*l.*, one of 30*l.*, two of 25*l.*, two of 20*l.*, three of 15*l.*, eight of 10*l.*, and four of 5*l.*; the remainder going for the payment of the engravings, and the necessary expenses incidental to carrying on the business of the society. The report concludes with the well-grounded hope that as the Fine Arts generally are becoming every year better appreciated, and understood, and sought after, and as the commercial prosperity of the country has lately received a stimulus, so a corresponding success may attend the labours of those who are interested in promoting their welfare.

OPENING ADDRESS AT THE CORK SCHOOL OF DESIGN.—Mr. Willis, the principal of the School of Design at Cork, delivered at its opening, on the 7th of last January, a very able address; in which, after congratulating his hearers on the good effects of such institutions, he pointed out the fact of their having occupied the attention of practical men in that city long before. "The establishment of Schools of Design in our city," remarked Mr. Willis, "although an apparent novelty to many who hear me, they will be surprised to learn, is, in reality, a very old idea but recently revived. They will find, in Smith's 'History of Cork,' written a century back, that their advantages were then placed before the public, on the same national grounds as they are urged at present. At that remote period, attention was called to their obvious importance and necessity, from their striking influence on the productions, at that time manufactured, by our Continental rivals. When Smith wrote, they had then been in operation in France and elsewhere, since the year 1692, so that we may be said to have lost 193 years, in the consideration of the subject."

MANCHESTER SCHOOL OF DESIGN.—On the evening of the 29th of December, the students of this Institution gave a *soirée* in their school-room. The idea originated entirely with them, and the whole of the arrangements, which were highly creditable, were conducted by them; the members of the council, and the masters, Messrs. Hammersley, Kydd, and Dodd, being among the invited guests. The room in which the company assembled was hung with paintings and drawings by many of our leading artists, by the masters of the school, and their pupils.

THE VERNON GALLERY.

THE WOODLAND GATE.

W. Collins, R.A., Painter. C. Cousen, Engraver. Size of the Picture, 2 R. 14 in. by 2 ft. 23 in.

If this engraving had no painter's name attached to it, there would still be little difficulty in determining the artist by all acquainted with the various examples of our native school. It is a subject which would scarcely have suggested itself to any other mind than that of Collins, who loved to study nature, animate and inanimate, in her most agreeable and unpretending moods: his pictures imbibe that atmosphere of pure rational enjoyment which seems to be the birthright only of those who dwell by the broad sea or amid pleasant pastures. It was among such that the painter studied, and from them he chose his models; the frequenters of cottage doorways, the young lovers about green lanes and hedges, the fishermen about green lanes and hedges, the young lovers about cottage doorways, the ruddy half-clad amphibious urchins who pass the livelong day in gathering their "pearls" by the sea-side, are the beings with whom his pencil chiefly held communion. And much of happiness does the contemplation of his pictures bring with it to all—but especially to those whose occupations keep them in pent-up cities or overgrown towns, and whose knowledge of rustic life, albeit we live in an age of easy and rapid transit, is gleaned from books, and pictures like that before us. We reverence the painter who brings nature in her beauty and her majesty to our own doors, and proffers to the imagination flowers which our feet cannot press.

The "Woodland Gate" was exhibited at the Royal Academy in 1836; Collins painted another picture of the same subject, but with some slight variations, and both works bore the title of "Happy as a King"; the latter picture has been engraved on rather a larger scale than our own, and in order that neither the engravings, nor the paintings from which they are taken, should be confounded with each other, we have thought fit to change the title of our own print. The youngster who rides so fearlessly and joyously on the top bar of the gate is a capital specimen of juvenile daring; he "sits right royally," and is the object of admiration and envy to his less venturesome companions; in the plenitude of his power he feels his independence, and laughs merrily at the greatness he has attained. The other characters in the composition are equally well rendered, particularly the young girl by his side, whose countenance is eminently sweet and expressive. The child sprawling on the ground forms a sad contrast to the others, and may inculcate a lesson of that "vaulting ambition which o'erleaps itself."

The landscape portion of the work is a beautiful bit of pastoral scenery; the farther gate opens into one of those richly wooded drives frequently to be met with in the south of England. Every part of the picture is most carefully and solidly painted, in a tone which we think will, for a long period, defy the hand of time. Mr. Cousen has made of it a charming transcript.

CORRESPONDENCE.

COPYRIGHT IN DESIGNS.

SIR, I hail with pleasure an article in your Journal of this month on the above topic, from the effect it will have in keeping prominent the necessity of a change in the laws relating to it, which, as a producer of many new designs in metal work, I feel require revision, and may be made highly stimulative of improvement. I need not dwell long on the necessity there exists for exciting our manufacturers to equal the generally very superior designs and execution of the French, that is conceded even by our manufacturers; the government has long evinced its anxiety in the matter by supporting Schools of Design out of the public exchequer, and the gratifying interest taken in the subject by Prince Albert (which has produced a deep sense of grateful respect in the manufacturing classes), testifies not a little to its importance. It therefore remains to be determined how the Laws can be best framed to that end; their efforts will depend greatly on the question of Costs, which will be viewed relatively to the length of time they exclusively benefit the originator; for the amount of registration fees, and the duration of the exclusive right to the use of designs, are, I conceive, the points mainly requiring change in the laws affecting the hardware department of pro-

ductions; nay, in my view, no other features are of prominent interest, as the (conjectured) existence of a tribunal to criticise designs, and decide on their claims to a greater or lesser period of protection, would be most injudicious, and likely to give much dissatisfaction to producers, who might often have reason to question the judgment on a topic truly resting much on personal opinions or predilections, and in some departments of Art more or less influenced even by the fashion of the time. I would inquire, why interfere with the subjects any originator chooses to wish registered? He is the only party risking either money or ability. The shopkeeper, merchant, and the public are all free-agents—at liberty to support, or not, the manufacturer,—and to put their own estimate on the value of his works, which will be kept within the means of consumers, at the instigation of the producer's interest. Nor can I see why legislators should let the fear of foreign competition deter them from extending the period of Copyright, as our laws only operate within the limits of our own shores, and the power to produce as cheaply as other nations would not be affected by the question of protection. I think, too, that the fear should operate "as a temptation to piracy, which could only be checked by expensive litigation," is groundless; but supposing it had that effect, the existing law expressly provides a punishment, which has hitherto been promptly administered by our local magistracy, a mode of obtaining redress, neither expensive nor tedious. I retain the opinion expressed in my former letter, that the fee might be safely reduced from three guineas to one guinea on *all* new subjects of design, as a safe reliance might be felt in the increased number compensating for the reduction in price, and the design should be shielded from piracy until its claim to originality was disproved.

Finally, let it be remembered, the existing inadequate laws were meant to induce improvement by guarding the property of artists and manufacturers in designs; and if the present greatly advanced state of French ornamental manufactures can be traced to their protective system, its adoption here may be judicious, if not necessary; though to produce novelties at the expense of the Government, as alluded to in a late number of the *Builder*, will not, I believe, be desired by our manufacturers, who would, I consider, rather rely on their native energy and perseverance, at once the brightest and most valuable features of the national character—while the countrymen of Shakespeare, Milton, and Byron, will surely not lack imaginative power.

I remain, Sir,
Very respectfully yours,
ORNAMENTOR.

BIRMINGHAM, January 7, 1850.

TRANSITIONS OF STYLE.

To the Editor of the *Art-Journal*.

SIR,—Under the head of "Transitions of Style" in your last number, Mr. W. H. Rogers claims the credit of a new adaptation of geometric principle to foliated design, and accompanies his arguments by a series of nine circular panels, founded, as he says, upon diagrams of old tracery. This claim so directly infringes upon my recently produced work on Design,* that I must request you to give me a hearing.

For years my pursuits have been directed to the object of proving that the medieval architects, both in general features and in matters of detail, designed upon geometric principles. The great majority of architects now admit that the works I have published are sufficiently conclusive as to these principles of working. Having accomplished this, my recent work, the result of long study, proves incontrovertibly that by following the steps of the ancients (i. e. by forming designs upon geometric principles), we have an unlimited field of new combinations before us, and I produced as evidence of this one hundred circular panels upon one fixed diagram; to each of these is affixed a geometric diagram, but on a smaller scale, proving that the most difficult patterns are within the creative powers of the merest child in art. Following this display came other matter in proof of universality, and then a plate of the "Branching of Tracery Skeletons" as the motive for foliated designs.

The following quotations from the description accompanying these designs, will show whether Mr. Rogers has any claim to originality in introducing the matters in question.

P. 10. "Let the workman, as in some degree

* "The Infinity of Geometric Design Exemplified," by Robert William Billings. William Blackwood & Sons, 1849.

ignorant of the first principles of Art, be instructed to preserve a specified and well defined mechanical foundation in any design he is directed to realise, a foundation which shall predominate over the minor details, and the result will be, that in ninety-nine cases out of a hundred, the scrutiniser will fail to observe the working of the details altogether. Of this position we have abundant evidence in numerous examples of old tracery, for the roughly formed mouldings, the frequent artistic execution of foliage, and of other ornaments, would utterly condemn the whole, were not the defects hidden by the masterly predominance of mind displayed in the main fragments of the structure."

Again p. 17. "To mere tracery examples, we do not intend at present calling further attention. The primary forms of these, however, open entirely new ground, as their skeletons are frequently exceedingly beautiful. Look for confirmation of this point to the plate 'Branching of Tracery Skeletons,' and the reader will possibly incline to the opinion that the flowing foundation lines of tracery are more beautiful than the results. It was within geometric skeletons as a foundation that Gothic architecture first displayed its foliated ornaments even before tracery was invented."

Finally, p. 18. "The illustrations of form delineated are the mere expositions of an individual, and it is a matter of anxiety to him that other minds should be at work upon the subject; but more especially to the department of it, that of changing forms applied to other branches of ornament. Undoubtedly there is a point where the mechanic ends and the artist begins, but no man is entitled to overlook the dry plodding, calculating labour, which must ultimately help him on the way. Let the student only follow the principles and practices of the old artists and he will attain the results they did, in the production of new and excellent designs; and assuredly he is unworthy of their spirit who remains contentedly a mere servile copyist."

So much for my book quotations.

Two years back I lectured upon this subject, first, to the School of Design at Somerset House, secondly, to the Institute of British Architects, and lastly, twelve months back, to the Philosophical Institution of Edinburgh. At each of these places I particularly urged the application of my tracery diagrams to foliated design, and my own practice has founded many successful foliated designs upon the system recommended by me to others.

If your readers will trouble themselves to refer to my work, they will find hundreds of designs, which, by simply placing leaves in the place of cups upon their branches will end in this supposed discovery of your correspondent. To their use the whole world is welcome and I threw out the principle for that purpose. If any body can claim the revival of the principle it is myself, and I now claim the right of distinctly asserting in your pages that Mr. Rogers is not only indebted to my labours for the idea of his paper, but that seven out of the nine designs produced by him are founded upon my work, and the circles he uses would alone prove the matter, for they are exactly the same size as those used by me.

It is possible that when my tracery examples were thus made use of by your contributor, he may have fancied that he was copying from old examples, but even then common courtesy should have compelled some allusion to the channel through which he had arrived at the knowledge of their existence and applicability. I am perfectly willing to allow Mr. W. H. Rogers any amount of credit for the foliated designs he affixes to my geometric branches, but, to use a common proverb, I ask that gentleman when he again "makes trousers," to at least acknowledge from whom he "took the materials."

I am, Sir, your obedient servant,
ROBERT WILLIAM BILLINGS.
LONDON, January 14, 1850.

[We have considered it due to Mr. Billings to insert his letter; next month it will be equally our duty to give Mr. Rogers a means of reply. Mr. Billings is, as a gentleman and an artist, entitled to marked consideration. His position has been, we know, obtained by industry and research, no less than by his high talents; and any statement of his cannot but claim and receive attention. We have no doubt, however, that Mr. Rogers will be able to make his case good. As an esteemed correspondent of our Journal, we are accustomed to place confidence in him; and if he has committed an error, we are sure he will readily acknowledge it and make amends.]

MINOR TOPICS OF THE MONTH.

THE EXPOSITION OF 1851.—The subscription list has been opened by Her Most Gracious Majesty and Prince Albert, the former giving 1000*l.* and the latter 500*l.* It is a fine example of liberality, which we are assured will be generally followed. We have no doubt whatever that a sum sufficient to meet all the expenses will be thus raised; London alone will aid materially; the meeting which took place in the City on the 25th, was too late in the month for us to report. Probably in our next we shall be able to supply some idea of the arrangements in contemplation for carrying out the plan. The Commission has already manifested proofs of activity, and the public will not be inert.

THE VERNON GRF.—It is known that when Mr. Vernon presented his collection of pictures to the nation he included in the gift three pictures, for which he had given commissions, but which were then upon the easels of the respective artists. The picture by Eastlake is finished. It is a repetition of the subject of the "Escape of the Carrara Family," painted for Mr. Morrison, and exhibited in the Royal Academy in 1834. The picture is what the Italians would call a *replica*, not a copy of the original. It is a work of the highest character, combining delicacy of expression, beauty of drawing, and colouring, which exhibits the true principle of Venetian Art; all these qualities make it a most valuable addition to Mr. Vernon's bequest. There is no name of the present age which will go down to posterity laden with more honour than that of Charles Lock Eastlake. As a painter he stands at the head of his profession.

As a writer on Art, no one ever exercised the pen with so much philosophy and erudition. The reports of the royal commission since separately published as *contributions to the literature of Art* will become a text book for future schools; while the *Materials for the history of oil-painting* displays an untiring search after information for which every student is most grateful. The posthumous commission to Mr. Landseer is, we believe, nearly completed. There only remains that of Mr. Mulready and then Mr. Vernon's intentions will be fulfilled.

THE BRITISH INSTITUTION.—Many works of a high degree of merit have been sent for exhibition, but by some mismanagement the joint contributions of Mr. Cooper and Mr. Lee did not arrive until a week after the days proposed for the reception of pictures. Creswick sends three; F. Goodall a composition entitled "The Post Office,"—a large proportion of landscape has as usual been contributed, among which are productions of great excellence. Some very large pictures have been rejected and we think with justice, since in such case the hanging of the pictures of one person in a limited space must operate to the exclusion of the works of many.

THE INSTITUTE.—The opinion of counsel has been taken relative to the recovery of debts due by subscribers to the Institute, whereby it is ascertained that mere absence from the establishment and the non-payment of subscriptions does not exonerate persons who have been admitted as members or subscribers from liability to pay subscriptions until they shall have declared in writing their desire to have their names erased from the books of the Society. A sight of the list of defaulters would surprise the more honourable members of the profession.

THE POOR AND THE FINE ARTS.—The recent exhibition of paintings at Post-office-place, Liverpool, afforded gratifying proof of the orderly and correct behaviour of the poorer classes, and their propriety of demeanour and carefulness in such places. During the last month it was thrown open to the working-classes at two-pence each for adults, and one penny for children; and such numbers repaired to it, that the weekly receipts were as great as when the usual price of one shilling each was demanded. The average weekly attendance during this term was about 3,250, being six times greater than the attendance at the higher charge. During the twenty-three days it was opened at reduced prices, it was calculated that 13,000 of the humbler classes availed themselves of the

opportunity of admiring the Fine Arts, yet not the slightest injury was done to a single work.

THE NEW GALLERY IN REGENT STREET.—We noticed last month the progress of the Society originally formed for the promotion of a free exhibition. The site of their new Gallery is exactly opposite the Polytechnic Institution, the rooms extending backwards on the left of Little Portland Street, and having an entrance from Regent Street. The rooms are four in number, and have been built according to a design of G. Godwin, Esq., F.R.S. The large room is seventy-five feet by twenty-five, the second fifty by twenty-three, the third is a square of twenty-eight feet, and the fourth is a small room. The works are under the immediate direction of Mr. Tyerman of Parliament Street, and it is hoped that the whole will be finished early in February, and, as soon afterwards as possible, the days will be named for the reception of pictures for the exhibition; and if in its new position, this Institution receives that support which from antecedent experience it may very justly expect, there can be no doubt of its permanent establishment.

GOVERNMENT SCHOOL OF DESIGN, SOMERSET HOUSE.—In our last we briefly noticed the delivery of a lecture on embroidery on 21st December, at the Head School of Design, Somerset House, by Mr. George Wallis, late of Manchester. This was the last of a course of three on the practical application of Art to manufactures, which the Board of Trade had engaged Mr. Wallis to deliver to the students, the others having been delivered respectively on 23rd Nov. and 7th Dec. The first, "On the conditions of design as applied to calico printing," involved the exposition of the leading features of the mechanism and chemistry of calico-printing, so far as it controls the reproduction of the design of the artist. Form and size were shown to be a condition of the mechanical means employed, whether locks, cylinders, or metal types; whilst colour, as dependent on chemistry, was illustrated by various examples of "madders" as the type of "fast" prints; "steams" being represented by *de laines*; whilst "furniture d'entrees" took the position of a mixture of the two methods. The various limitations of design in each of these primary modes of production were pointed out and explained. The second lecture was "On the conditions of design as applied to silk-weaving by the Jacquard loom." This was also illustrated by appropriate examples of manufacture, some of which were of a very high class character. The mechanism of the loom was, as far as circumstances would allow, explained and illustrated; but the relation of the design to the fabric through the medium of the rule paper and cards, and thence to the loom, was made the leading feature, and the various specimens of fabric quoted as illustrations of method, from the broad damask furniture to the ribbon, as also the application of the loom in producing copies of engravings such as the French delight to bring out as examples of their skill as artistic weavers. The third lecture "On the conditions of design as applied to embroidery by hand and by machinery," was equally interesting and effective with the others. The primitive character of this kind of textile decoration was alluded to, and the various methods adopted during the progress of this Art from an early period down to the present time, pointed out. The nature of the embroidering machine invented by M. Heilmann of Mülhausen, and so long successfully worked by the late M. Louis Selwabo of Manchester, and now by his successors, Messrs. James Houldsworth and Co., was explained, and the conditions, on which alone a successful design to be executed by this machine could be made, were illustrated. The lectures were interspersed throughout with practical hints and general comments on the successful study of Art as applied to manufactures; and its necessity as a special consideration of the student strenuously urged and enforced. Large audiences attended the lectures and strongly testified their satisfaction with this essay towards the practical. It gives us much pleasure to record the fact, that the delivery of these lectures at the head school applies additional evidence (and we imagine

was intended to do so), of the merit of Mr. Wallis as a provincial master, a position which he ought not to have quitted, and to which we hope to see him honourably restored.

HENNING'S HOMERIC TABLE.—This table, designed for the library of Lord Northwick, is now on view at Messrs. Hering and Remington, Regent Street. The surface of the table is covered by a sepia drawing, protected by plate-glass, and designed after Homer's noble description of the shield of Achilles. Flaxman has already treated this subject so finely, that Mr. Henning deserves an extra amount of praise for the boldness and success with which he has grappled with it. The centre is particularly good: Apollo in a *quadriga* boldly fronts the spectator; the Hours hover over his path, while behind are shadowed forth the principal celestial signs. This is surrounded by the series of subjects detailed by Homer; the Dance, the Marriage, the Judgment in the Forum, the Battle, the Harvest, the Vintage, and the Herdsmen attacked by the Lions. A narrow outer border is devoted to a series of Water Nymphs and Tritons sporting on marine animals; the subject varied by the introduction of the story of the Sirens, and an attack of armed soldiers. The foot and column supporting the table are exceedingly meritorious and original portions of the design; the shaft is the stem of the palm, the leaves spreading beneath and upholding the table; at the foot of the tree a warrior is reclining, listening to a female bearing a lute; a Sea Nymph is placed behind, and a Triton blowing his shell; while the triangular base upon which they are seated has at each angle small figures of Cupids riding on dolphins. The entire work reflects much honour on the artist, Mr. John Henning, Jun.; we have never seen a more classic and fitting composition for a library than this beautiful table.

THE HANGERS AT THE ROYAL ACADEMY.—We believe the hangers this year will be Messrs. Madise, Witherington, and Westmacott. As heretofore, their task will be one of thankless labour; it is one from which any artist would shrink; it must be done, however; and, as our readers are aware, the duty is imposed upon each member in turn. We do earnestly hope that the Octagon Room, and the practice of placing paintings in the Miniature Room, will be abandoned. The defence we know to be, that the mere hanging a picture on the walls of the Academy is a boon to many artists, that it tells in the circles where they are teachers; but it is notorious that little discrimination is used in selecting works for bad situations; if a little good is effected as regards some exhibitors, it is ruinous to others.

THE EXPOSITION FRANÇAISE will we believe terminate in February. It is not improbable, however, that a large proportion of the contents will remain in this country for sale; and that some portion will be returned to the dealers in London from whom they were hired for exhibition. We have reason to think the speculation has not been successful; the expenses have been large, and although during the first week or two many visitors paid shillings for admission, of late the rooms have been but thinly attended. This source of income has therefore not been productive; we understand, moreover, that purchasers have been very limited; the prices were high, in some instances we were able to compare them with those asked at the Exposition in Paris, and found that they had generally advanced from fifty to seventy per cent. There were, however, a number of objects of a "cheap" class—inferior in all respects—such as clocks, which would have been dear at any price; of these we understand many were sold, but the costlier articles remain for return. We trust that the managers of the Exposition of 1851 will learn much from this experiment; they will not of course exhibit things made only for sale, but exercise judgment in selection.

THE DIORAMA.—The new picture which is now exhibited here is entitled "The Valley of Rosenluis," a wild and romantic glen situated in the southern part of the Canton of Berne. This valley or Alpine gorge is at an elevation of 2300 feet above that of Hasli or Meyringen, enclosed between the Wetterhorn and the Schwartzhorn.

On the right of the spectator are the rocks forming a portion of the base of the Schwartzhorn, and on the left appears a path which leads across the grand Scheideck to Grindlewald; immediately in front of the spectator, and in the distance, rises the grand Eigher, which reaches an elevation of 13,086 feet above the level of the sea. The view is first seen in a subdued light, and a principal feature of the picture is the Reichenbach, the ever-toiling current of which sparkles with a reality, the closest imitation of nature that can be conceived. The sky gradually darkens and a thunder storm interrupts the everlasting monotony of the falling waters. When the storm clears off, a gleam of sunshine lights and colours the snowy peaks of the grand Eigher with a beauty and brilliancy successfully contrasted with the dark clouds of the passing storm. The other subject is the interior of the Church of Santa Croce, in Florence; which, it may be remembered, has been before exhibited. The picture, however, after a lapse of years will be regarded with fresh interest, Santa Croce being one of the most remarkable churches in Italy. This interior is seen under every effect of light, graduating from that of mid-day to midnight, when the church is artistically lighted for service. The monuments presented to the spectator are those of Michael Angelo, Petrus Antonius Michelius, and Vittorio Alfieri. Like all the similar subjects of this exhibition, the picture offers a most deceptive imitation of an actual interior.

M. CLERGET.—We have received several letters from manufacturers relative to this accomplished designer, of whose works we gave specimens in our last number. One of them says:—"I have been to Paris, and at your recommendation obtained several of M. Clerget's beautiful designs; they are indeed very choice; those I purchased from him are real gems for originality and marvellous drawing. Having many years practised from sketches of this kind I feel I can value his productions: I hope to know him better." Another manufacturer writes:—"I wrote to M. Clerget for those designs I have received, and am greatly pleased with them; and I ought to thank you for the introduction, which will be very profitable to me." Mrs. Merrifield (we presume we may mention her name) writes us:—"I have long appreciated the merit of M. Clerget, and think you have done good service by introducing him to English manufacturers; several of his designs have been useful to me."

THE NELSON MONUMENT.—There seems a fatality attached to this unfortunate structure, whose enemies are not only those who raise their voices and withhold their hands from measures tending to its completion, but actually employ the latter so as to retard its progress. A singular robbery in connection with this column was recently committed on the premises of Messrs. Wood, brass-founders, in Baldwin's Gardens, by some persons who abstracted from the workshops a considerable quantity of ornamental moulding which the firm in question were bronzing for the bas-reliefs. No clue, we believe, has hitherto been found to the thieves, whose object must have been to dispose of the material, rather than to throw any obstacle in the way of finishing the work.

MR. RAWSON WALKER'S CHARCOAL DRAWINGS.—We noticed in a former part of this Journal, (No. 110), the charcoal drawings of Mr. Rawson Walker; and as many inquiries have subsequently been made respecting them, we insert the following observations communicated by one who has tried the method, and is a highly competent judge, as the best answer we can give to these inquiries. The novelty of this method consists in reversing the usual process of drawing; the shades are first laid in on prepared paper with a tone of charcoal of the requisite depth, without regard to form. The lights are then taken out and the forms marked out with proper tools, which remove the charcoal either wholly or partially, according to the tint required. The discovery of a process which would enable artists to execute sketches and drawings in this manner, has long been a desideratum. We have inspected Mr. Walker's drawings, and we congratulate him upon having made the discovery,

and brought the process to a high degree of perfection. It appears to us that such a method of drawing is admirably adapted for ensuring breadth of effect, and for producing delicate gradations of tone, from the most tender aerial tints to the most powerful touches required for the foreground. To these advantages must be added the beautiful grey tint of the charcoal in the middle and half tints, the extreme rapidity and facility with which the drawings are executed, and the neatness of finish of which they are susceptible. The rapidity of the process recommends it strongly in sketching from nature. There is, perhaps, no method by which passing effects can be so quickly and effectively rendered. The rapid changes of the forms of the clouds, and the transient and accidental shadows which pass so rapidly over the face of the landscape, can be rendered almost instantly and with wonderful effect. With such a material, Mr. Ruskin may catch and embody the fleeting and ever-changing forms of the clouds with as much facility as he can describe them with his eloquent and flowing pen. We venture to think that if he once tried Mr. Walker's method of charcoal drawing, he would no longer advocate drawing skies with the lead pencil. For water, still or agitated, and for skies and mountain scenery, the new method is excellent. It is not, however, adapted to architectural or other drawings, which depend chiefly upon lines. The portrait-painter will derive equal advantage from adopting this method, in arresting and fixing the characteristic expression which too frequently eludes the pencil of the artist. The historical painter, also, who sometimes finds it necessary to make ten or twelve sketches before he decides on the composition of his picture, will be delighted to obtain a material which enables him to embody his conceptions with almost the quickness of thought, and to efface them or alter them at pleasure with the greatest facility. In drawing from the living model equal advantages are obtained. When the drawing is completed it must be fixed so as to secure it from being effaced, to which, from the extreme lightness with which the charcoal is applied, it is more liable than other drawings. This is effected by a very simple and ingenious process, which, if desired, can be conducted in the open air, and two minutes after the drawing may be safely deposited in the portfolio, and another commenced. We have heard of some beautiful effects being produced by tinting a charcoal drawing with coloured crayons and then fixing it. Mr. Walker has been occupied seventeen years in perfecting his process and materials. The principal difficulty lies in the preparation of the paper, which must have sufficient tooth to hold the dry charcoal, and sufficient hardness of surface to enable the artist to remove the charcoal, and to leave a perfectly clean light when necessary. This is accomplished without difficulty. We find that Mr. Walker's method has been approved by many eminent artists, and we have been informed that several of them use the materials. Mr. Walker is, indeed, supplied with abundant and ample testimony on this head.

PICTURE SALES.—The announcement of picture sales for the ensuing season shows at present a very meagre list, nor do we hear rumours of any considerable addition being made to it. Those as yet advertised are some finished pictures, studies, and sketches, left by Mr. Ety, R.A., which are ordered to be sold by his executors, and among which, we understand, are not a few excellent productions; some original works by modern artists, Ety, Chambers, Holland, Pyne, Linnell, Bonington, Boddington, Ripplingill, Bright, &c. &c.; and a number of copies from the old masters, collected by Mr. Barnard, the late keeper of the British Institution: also some pictures belonging to the late M. Du Roveray. While on this subject, we would mention a matter to which our attention has been drawn by a correspondent, who desires us to "caution buyers against a succession of auction sales, at the West end, of pictures imported from Belgium. Although the most worthless trash possible, there are names of the highest celebrity among the Belgian artists attached to them." These works are of course manufactured for the market.

REVIEWS.

ANCIENT COINS AND MEDALS. By H. N. HUMPHREYS. Published by GRANT & GRIFFITH, London.

This work, intended as a condensation of all that is known respecting the coins of ancient nations, from the origin of the art of coinage to the fall of the Roman empire, is a lucid and well-arranged narrative of monetary history. A novel and excellent mode of illustration has been adopted, that of representing the coins in exact fac-simile in gold, silver, and copper, impressed in relief, from stamps produced by casts from the originals, so that in looking upon the illustrations you appear to be examining the trays of a cabinet enriched with the rarest and most beautiful of these ancient works, many of which would be quite unattainable, and all costly. By this means we are enabled to judge of them correctly, without the intervention of any mode of drawing or engraving, which might lead to a doubt that they were improved or deteriorated by the process. The author justly observes that "no modern engraving or other imitation of some of the finest Greek coins of the best periods can adequately convey an idea of their excessive beauty, or the sculptural grandeur of their general treatment." This is perfectly true, and we may instance the noble coins of Alexander, and the exquisite medal of Syracuse; the one full of manly beauty and heroic dignity, the other redolent of female loveliness—as proofs of the fact. Nothing but embossing could give a true idea of their beauty and vigorous relief. The engravers of the antique gems, so highly valued, were the engravers of the Greek coinage; and the tasteful eye that can appreciate the one must equally value the other. The magnificent coin of Agrigentum, with the two eagles feeding on the shore, reproduced in plate 4 of this work, is as fine as any gem of the early ages (about 270 B.C.), when it is supposed to have been executed. The later coins of the same kind executed by the Romans by no means equal these charming Grecian works, but they surpass them in historic interest, inasmuch as they give a continuous history of their great events, accompanied by striking and faithful portraits of their rulers. In them we view contemporary portraits of Julius Cæsar, Brutus, Nero, and a host of other *celebrités* who are the property of history; and we also have contemporary representations of the buildings erected by them, or the public actions of their lives. It is needless, however, here to insist on the interest and historic value of the noble coinage of Greece and Rome, at once the currency and the medallic history of these countries; it is now allowed on all hands; and the increased taste for numismatology will, perhaps, even receive an additional impetus from the production of this beautiful book, in itself an argument of the increased taste for that branch of science. Should the work reach another edition, we would direct attention to a more correct reference of the coins than occasionally appears between text and specimen, and to the introduction of the coin of Varanes II., mentioned p. 92, as extremely curious, and as given in the book, but which does not appear. We do not like also to be deprived of our Roman Britannia on the coin of Antoninus Pius; and we question the coins of Carausius, being of Gaulish, and not British, manufacture, inasmuch as the coins of that sovereign found in Gaul (particularly those recently discovered at Rouen), were entirely different in style and feature from those found in this country. On the whole, we can cordially recommend this unique and beautiful volume.

THE ILLUMINATED BOOKS OF THE MIDDLE AGES. By H. NOEL HUMPHREYS. Published by LONGMAN & Co., London.

This work has already been described in our pages, and we have reported most favourably of its beauty and utility as a handbook not only to the student of Medieval Art, but also to ornamental designers of every class. The illuminated borders to ancient MSS. from the sixth to the sixteenth century contain a fund of ornament of the highest and most varied character, and thus repeated for general circulation, must be of eminent service in supplying hints to the modern artist. The present numbers, XI., XII., and XIII., complete the whole series, forming one of the most brilliant of the illustrated books which have appeared in England. The recent numbers before us comprise a splendid original title-page in gold and colours, designed by Owen Jones; the letterpress to accompany the plates in the shape of an introduction to the history of ancient illumination, and several illustrations, of which the most important are two entire pages from the celebrated Epistles of Saint Paul, by Julio Clovio, in the Soane Museum, two

pages from a gorgeous early Italian Bible, and a specimen of the work of the Cretan artist "Rhosus," of the fifteenth century. The latter example is peculiarly interesting, as it shows with what pertinacity ancient crude Byzantine forms and types were retained down to a comparatively late period. Two pages, engraved from the "Great Hours" of the Duc de Berri, will also prove eminently suggestive to the ornamentalist. They are richly decorated with family arms and badges, supported by angels, and assisted in their effect by the introduction of ribbons and delicate foliage. In the production of this charming book we must congratulate the publishers on having secured the sound knowledge and judgment of Mr. Humphreys, and the artistic talent of Mr. Owen Jones, and con- clude by recommending the work to all who can afford to indulge in a choice luxury connected with Ancient Art.

ROBERTS'S EGYPT AND NUBIA. Published by ALDERMAN MOON, London.

The end of the year has brought forth the concluding numbers of Roberts's Sketches in the Holy Land and Egypt, which, as a whole, form a work of six volumes, perhaps more generally interesting than any other that has ever arisen from individual enterprise. Alderman Moon, in a brief address to his subscribers, says—"Far from having allowed himself to slacken in his endeavours to do justice to such a work, the artist made the most beautiful. All who were engaged in its production, from the artists and the authors to the printers, have concurred to make it as honourable to themselves as to the country; and in taking leave of his subscribers, Mr. Moon gratefully acknowledges their spirited support to his undertaking, with which he is more proud to have his name associated than with any other that he has ever produced." Ten years have elapsed since we announced the first acquaintance of the late ruler of Egypt, and a series of years have gone by since we announced the first fulfilled the hope held forth by its early promise. We have closely examined it—during its yearly progress—without observing the slightest diminution of interest in the subject-matter; the last plates are as historically important as the first, and the tone and transparency of the lithographic execution mark an era in the history of drawing upon stone. And the cause is worthy the development of this excellence. In other countries such enterprises are executed only by governments; it is only among ourselves that we find individuals who project, commence, and bring to a felicitous conclusion works which are at once a monument to the memory of the man and an honour to the nation. The cost of such a work is so great as to deter even a numerous class of the most hardy speculators; and the personal peril at which the drawings have been obtained is of such a nature as few persons would readily encounter. If we consider the route taken by the artist in the Holy Land, Petra, and Syria, we find, that taking Cairo as a starting point, he crossed the desert to Suze, whence turning the extremity of the Gulf he passed to Ain Mousa and Hawara, then stretched forward to Mount Sinai, whence he travelled in the direction of the Gulf of Akaba, thence to Petra, Hebron, Gaza, Askalon, Jaffa, Jerusalem, Jericho, Nazareth, Tibrias, Mount Carmel, Tyre, Sidon, &c., &c., and the artist returned with a portfolio enriched with memoranda, which are given to the world in a form in every way worthy of the interest and importance of such subject-matter. Mr. Moon, in his valedictory address to his subscribers, says justly, that the last of these plates are equal in all the best qualities of Art to the first. One of the most striking plates of the present issue is "The Simoom in the Desert." The scene is the Desert of Gizeh, near the Great Sphinx; the blood red sun occupies the centre of the picture, and the dark pestiferous blast enters the scene on the left, and the caravan is thrown into the utmost confusion by the approach of the dreaded visitation. "The Citadel of Cairo—the Palace of the Pasha," is taken from a ruined mosque near the city walls, and looking towards the rock of the citadel, which stretches along the horizon, from where it intercepts the range of the distant Mocattam hills to the great mosque of the Sultan Hassan. The citadel itself is covered with a range of buildings that present in this view rather the appearance of barracks than the palace and mosque of the Pasha, where the court is held. In "The Interview with Mehemet Ali, in his Palace at Alexandria," the likenesses of several of the persons present are preserved with great accuracy, that is, of Abbas Pasha, Colonel Campbell, the late Lieutenant Waghorn, the Artist, &c. Other plates are—"A Scene in the Slave Market at

Cairo;" "The Nilometer;" "The Mosque of the Sultan Hassan;" "Interior of the Mosque of the Sultan El-Ghoree;" "The Gbawuzees or Dancing Girls of Cairo," &c. The number contains also title vignettes to preceding volumes; the subject of that for the third volume is a "Scene in a Street in Cairo;" others are "The Gate of Karnak;" and "The Temple of El Khasne in Petra." In taking leave of the last number of this beautiful work, it behoves us to say that never by publisher to subscriber has good faith been more religiously observed than by Alderman Moon, in the conduct, to its conclusion, after in the way of pictorial description of Egypt and the Holy Land. To be concealed in its production the public owe a debt of gratitude; first to Mr. Roberts, next (and next only) to Mr. Louis Haghe; and not a little to Dr. Croly and Mr. Brockedon, eloquent and experienced writers, who have written the accompanying letter-press.

A HISTORY OF NEW YORK; from the Beginning of the World to the End of the Dutch Dynasty. By DIDRICH KNICKERBOCKER. Published by G. P. PUTNAM, New York.

It is nearly forty years, we think, since the first edition of this work made its appearance; so long, indeed, that we were apprehensive our venerable friend Myneer Knickerbocker, like Van Winkle, must also have gone squirrel-shooting up the Catskill mountains, "and have slept the sleep which knows no waking." Whether this be the case or no appears undeterminable, but whatever his fate, he has not left the world without bequeathing it another memento of his having once existed. Now the reader will be disappointed if he expects to find here a sober history of the great American metropolis, the rise and progress of that vast commercial mart, and a statement of *when* and *how* its borders were enlarged and its opulence increased, till all trace of Aborigines and original settler was lost amid the horde of subsequent emigrants. Nothing of the kind is to be met with here; but in its place, a quaint, humorous history of the city gleaned from its earliest archives and traditions, and moulded into form with exceeding ingenuity and comicality. To use the writer's own words, "The main object of my work is to embody the traditions of our city in an amusing form; to illustrate its local humours, customs, and peculiarities; to clothe home-scenes and places and familiar names with those imaginative and whimsical associations so seldom met with in our new country, but which live like charms and spells about the cities of the old world, and kindle the heart of the native inhabitant to his home." The material for this history seems to have been ample enough, and heart-stirring enough, though the account of Peter Stuyvesant's army entering New Amsterdam (as New York was formerly called), and its accompanying illustration, suggests other ideas of the chivalry of the period than does the author's "Conquest of Granada," or his "Life of Columbus." The book, however, is altogether most pleasant one, full of humour, sarcastic, but not ill-natured, and may teach a wholesome lesson to those who would in future times establish new kingdoms and erect new dynasties. There are some very clever woodcuts in this edition, from designs by F. O. C. Darley, an American artist of whom we have spoken elsewhere in laudatory terms; he is one who may fairly take his stand by the best of those of European celebrity in his style. Mr. Washington Irving has done well to secure his services in illustrating the volume.

TALES OF A TRAVELLER. By GEOFFREY CRAYON, GENT. Published by J. MURRAY, London.

Mr. Washington Irving appears in this volume under his old cognomen, that which he assumed when he sent forth "The Sketch-book;" there is also some similarity between the two publications, not so much, however, in the matter as the manner. We miss, in his present work those descriptive scenes, narrated with so much touching eloquence and full of beautiful moral reflection which were the great charm of his earlier production, and that even now linger in our memory whenever we catch sight of the towers of Westminster Abbey, or drive through the green lanes of our rural districts. Mr. Irving has a strong claim on the esteem of every Englishman for what he has written and said about the old country, for we believe he has done much to create mutual good feeling between ourselves and his fellow-countrymen, and to imbue the minds of the latter with no small portion of the respect and reverence they now entertain for the land of their forefathers. The present volume consists of a series of tales, for the most part independent of each other, of which the scenes lie in various countries, England,

America, Italy, and Holland; they are written in a sketchy but most amusing style, and cannot fail to be appreciated by the group which, at this season of the year, are assembled round the family fireside. There are some clever illustrations, introduced, from the pencil of Mr. F. O. C. Darley.

FRUITS OF AMERICA. Drawn from Nature on Stone. Published by W. SNAPE, New York.

This work is executed by an English artist, long resident in the United States, and supplies another evidence of the desire of our Trans-Atlantic brethren to encourage the various departments of Art. Though it bears the title of "Fruits of America," it must not be presumed that all the productions here pictured are indigenous to that country; some are only cultivated there. Be this as it may, the drawings are most beautifully printed in chromo-lithography, and exhibit truthful and tempting specimens from the orchard, the garden-wall, and the hot-house. They are most delicately executed, and the colouring is so clear and brilliant as to lead us almost to infer they have been coloured by hand, rather than by the process of printing. It pleases us greatly to see such a work called for by the increasing taste of the Americans,—a work that must have cost great labour, and entailed no small expense; which could be justified only by the prospect of an extensive sale in the country where it is produced.

RIP VAN WINKLE. Designed and Etched by FELIX O. C. DARLEY, for the Members of the American Art-Union, New York.

Who does not recollect the amusing tale of Diedrich Knickerbocker, as given in Washington Irving's "Sketch-Book?" relating how Rip driven from home by his terragant wife, went squirrel-shooting up the Catskill mountains, where he fell asleep for eighteen years, and on awaking and returning to his native village found himself a grey-bearded and unknown patriarch, and instead of the subject of George III. a free citizen of the United States. This story Mr. Darley has illustrated in a series of six etchings. The conception of these subjects, though but outlines, is admirable; they are full of point and humour, with an absence of everything approaching to vulgarity; the drawing of the figures is careful and accurate, and would confer credit upon any school. While America has artists capable of what we find here, we may rest assured that Art, of the best kind too, is making rapid advances in the country.

RELIGIOUS PRINTS. Published by HERING & REMINGTON, London.

These engravings are sent forth by a Society for distribution among the middle classes, the poor, charity schools, and church missionary societies; the object being to enable the nobility, clergy, and gentry, and persons charitably disposed, to give prints of a superior character, after the best masters, to their poor tenants and parishioners at a very moderate cost, by a distribution of an annual series of engravings, illustrating the most important events in the Old and New Testament; which annual series comprises twelve original and highly finished lithographs, from original designs. The size of each print is eighteen inches by twenty-four, and the style partakes of the clear and forcible manner of the German masters, after whose designs they are executed. The names of Overbeck and Müller are a sufficient guarantee for the purity of design and elevation of feeling which should characterise such, and we cannot do less than warmly recommend so wholesome a plan of spreading good and cheap Religious Art among the humbler classes.

EPISODES IN INSECT LIFE. By ACHETA DOMESTICA, M.E.S. Published by REEVE, BENHAM & REEVE, London.

We rejoice to find that the success of the first volume of this charming mingling of fact and fancy has led to the publication of a second. We hope this insect chronicle will be continued for some time to come; the subject may be described as inexhaustible; as yet, the eloquent author has lingered on the public road, we have learned only the habits of, and the lessons given by, our old and intimate acquaintances, the Moths, the Lady-birds, the May flies, the crumpled Rose-chafers, the greedy Dragon-flies, and others; but the to us unknown insect world craves to be made known to its fellow inhabitants of the teeming earth, and who so well suited to introduce the one to the other as Acheta Domestica? This volume is richly laden with tales of exquisite imagining. "The Sylvan Morality," or "A Word to Wives," is a pleasant homily, which, with its quaint illustration, should find a place in every lady's toilet. Every page breathes of beauty and wisdom.

MANNERS AND CUSTOMS OF THE ENGLISH. By RICHARD DOYLE. Published by BRADBURY & EVANS, London.

Our witty cotemporary *Punch* never made a greater pictorial hit than when he introduced to the public these admirable designs, accompanied by the quaintly facetious "extracts from Mr. Pips his Diary," and we are glad to see them reproduced in a superior and convenient form fitted as a faithful adjunct to the drawing-room table. The abundant fancy and truth combined in Mr. Doyle's sketches, with the slight dash of caricature exhibited in their semi-antique air, render them most amusing pictures of England as it is. We know them to be highly relished by our Gallic neighbours, who have re-produced them on an enlarged scale; they fully deserve all the commendations bestowed on them, and we question whether anything more abounding in character and incident than "Epsom Downs on the Derby Day," was ever executed in the same space. "The Rush at the Opera," "The Boat-race on the Thames," "The Musical Party," exhibit various phases of character in the best possible manner; but where all is excellent, it is unnecessary to particularise.

HIGHLAND REFUGEES. Painted by FANNY M'LAN. Engraved by C. E. WAGSTAFF. Published by O. BAILEY, London.

Mrs. M'lan eminently deserves the high position awarded her in Art; she feels deeply the true and the pathetic; and, self-reliant, she expresses her thoughts with a happy combination of simplicity and eloquence. Her pictures are poems. They not only tell a tale, but they create new sympathies for it. Under the title of "Highland Refugees," she exhibits in this work the portraits of a Scottish gentleman and his wife; so at least we suppose the two, who, looking over the sea from the French coast, towards Scotland,—after the dismal struggle of '45—quote a passage from the touching ballad, and murmur "We'll maybe return to Loehaber no more." The face of the woman is hidden on the bosom of the exiled soldier—prematurely aged. The story is told most effectively; it cannot fail to excite large sympathy; the portraiture is full of pathos, the hopeless look of the wanderer is a touching story. The print cannot fail to be a favourite; it is a pure illustration of the history of that gallant struggle in which so many devoted clansmen fought and fell.

THE JUVENILE CALENDAR, OR ZODIAC OF FLOWERS. By Mrs. T. K. HERVEY. With Illustrations by RICHARD DOYLE. Published by ARTHUR HALL, VINTAGE & Co., London.

We have looked through a number of "Christmas books," intended as "gift books" for the present "festive season," which is now passing into the bustle and turmoil of life, and are grieved to record our opinion, that whether designed for old or young, they are singularly poor and paltry; it is impossible to recall any period when the literature of England was more degraded, or "Art" rendered so subservient to patry "gent"-like composition, as it has been in these books for the many. The age in which we live is unlike any epoch of past history, not only in its rapid overturning movements, but in its aiming to sneer and jest at what has been looked upon with admiration from the time we learned the importance of history, or the value of refined literature. These books compromise all dignity for the sake of a lean jest, and caricature with pen and pencil the genius which, some twenty years ago, we worshipped with beating heart and throbbing brow. We may with justice congratulate ourselves on the "progress" of railroads, the wide diffusion of education, and the increased sympathies which tend to knit the whole human race into a bond of brotherhood, equalising ranks, by addressing the beautiful command of "Friend, go up higher," to those whose modesty, or necessity, contented them with the lower seats. But while we advance in one direction we must not retrograde in another; we may, and we ought to laugh and jest, and we shall be the healthier and the happier for doing so; but we must seek legitimate objects for our mirth, we must not substitute ribaldry for wit, nor feed the hungry upon tainted meats or empty froth. If the age of poetry is passed away, let it not be succeeded by an age of vulgarity: if the keen observation, the high purpose, the rare talent of one or two remarkable men have brought out what we believed shadows until we saw their actual bodies, and found them endowed like unto ourselves,—the multitude of imitators have degraded what they had not the power to illustrate, and caricatured what they lacked the power to comprehend, much less portray. There is no end to these spurious "Jokers" who revel in slang, and mistake ribaldry for wit. Our Christmas offerings this year are only on a par with the parish beadle's yearly petition; we looked in vain for the expected "Chimes," or a genuine leaf of a "Christmas Carol;" or for something to cheer and cherish, from him whose violet blooms beneath a nettle; this year, the one was dumb, and the other perverted. And, with hardly an exception, we have had a rush of petty Christmas books only suited for the murky hauds of the mushroom "gent," who would balance a cigar on his lip in a lady's boudoir, or enter the pit of the opera in a coloured "tye" and a paletot. Let us hope for better things next season, the gifts of "Christmas time" must not be altogether shorn of the high tone and good taste, both in literature and Art, which is the best passport to the juvenile circle and the drawing-room table. Meanwhile, let our young friends repose upon this charming volume which Mrs. T. K. Hervey has had the courage to write, in these utilitarian times, and the new firm in "the Row" the good sense to publish. Although, like the "Christmas rose," the book has budded forth amid the snows of a severe winter, unlike the "Christmas rose," it will blossom all the year. It has something wise to tell, and pleasant to say of every season; it mingles, without confusion, the real and the ideal; and balances with such admirable skill, and such nice device, the created with the creation, that both reason and imagination are amply supplied. The dream-loving child will discover, *without teaching*, how beautiful is the actual world, and how good and gracious the God who gave it, us, to dwell upon and become strengthened. And the child who is too much of the "earth, earthy," cannot fail of being beguiled amid the tales and legends scattered so gracefully throughout the volume, into a lighter and a brighter mood, and become refined. Mrs. T. K. Hervey has a loving heart towards children, and has evinced much more than ordinary judgment by not crowding objects too closely together; it is quite as possible to give too much, as too little, information to a child; the mind, as well as his body, must have room to grow. We congratulate all "little people" on their "new author," and hope Mrs. Hervey will not scorn to devote the treasures of her accomplished mind and feeling heart, to the CHILDREN OF ENGLAND. Mr. Doyle has worked too harmoniously with Mrs. Hervey, not to forgive us for leaving his illustrations to be dealt with at the last. The volume is literally a calendar of the months, and Mr. Doyle has illustrated each "according to its kind;" there are consequently twelve illustrations, all calculated to induce attention and improve the taste; and it is no easy matter to forget the delight with which some of our little friends hailed "Titania and her Violets" and "The Rose Banquet," although they could not understand why we preferred the beautiful conception of "The May-thorn," and "Time and the Holly."

ILLUMINATED ALMANACK. Published by MACLURE, MACDONALD, & MACGREGOR, Bow Churchyard, London.

The year 1850 brings at its commencement the ordinary quantum of Almanacks, with some few of a new kind, and among them we may notice the elaborate and brilliant sheet Almanack issued by MacLure & Co. The composition represents a hall of the medieval age, with an armed knight, taking leave of a lady, before joining his armed retainers. Banners, armour, carved furniture, illuminated books, and the ordinary accessories of a baronial hall occupy the rest of the picture; a stained glass window, throwing its light on the embroidered hanging which occupies the centre, is devoted to the Almanack. The idea is good, but somewhat overwrought; and a serious anachronism has been committed by clothing the figures emblematic of the months in modern costume, a circumstance the more to be regretted as the effect would have been enhanced by making this appear like an antique painting where all else is medieval.

GOVERNMENT GENERAL AND ELEMENTARY PHYSICAL ATLAS. E. GOVER, Prince's Street, Bedford Row.

Eight maps, clearly and well engraved on steel, coloured in outline, and accompanied by a concise and useful description of the world in general, are here offered for 1s. 6d. It is difficult to conceive anything more useful, or cheaper, particularly as the whole are remarkably well done.

THE HEIRESS IN HER MINORITY. By the Author of "Bertha's Journal." Published by JOHN MURRAY, London.

These volumes are written with the avowed object of tracing the progress of character in a well-intentioned but self-willed young lady; and this character is developed in Ireland, where, as there is a great deal to be done, it requires no ordinary forthright and strength of purpose to do it. The plan is admirably worked out, the great purpose is never lost sight of for a moment, and yet there is an abundance of information and interest conveyed and excited, from the first page to the last. The unforced introduction of scripture readings make it peculiarly desirable for the young, as there is food for the Sabbath, as well as the other days of the week. The author also labours earnestly to interest her readers in the state and condition of Ireland, with which country she is evidently acquainted, feeling a warm interest in its improvement. Many of the scenes, however, are drawn from the poetry rather than the reality of Irish life; but her warm sympathies are enlisted in a good cause, and we should like a few such heiresses as Evelynne becomes, to be "settled" in the wilds of Conemara, as well as amid the unrivalled beauty of Kerry. It is well and wise to interest the young in national questions, and free their minds from the prejudices against sects and countries, which at the commencement of the present century were nourished in every household. In our childhood we were told "to obey our mother and hate the French," and that "if we were not good the big Irishman would eat us." It has become the business of education to eradicate false impressions, and we have never met with any publication which manages to undermine prejudice, while conveying information, so fully and ably as "The Heiress in her Minority." These two goodly volumes are a library in themselves. Our readers must bear in mind that this "progress of character" is beyond the comprehension of little children, but admirably adapted for the young, while the old may read it with pleasure and advantage; in truth, juvenile books are well calculated to instruct our granddaughters, but what makes us "wise unto salvation" will prevent our youth becoming presumptuous, for humility is twin-born with knowledge. When the volumes reach a second edition the author can easily correct a misquotation, where she attributes a stanza from the beautiful poem of "Gougann Barra," by poor Callanan, to the beaming pen of Thomas Moore. It is no small honour to the Emerald Isle—that one should be mistaken for the other. There is something more than pleasant in the substantial instructive look of these well filled volumes; to country families they are particularly suited, containing such a mass of information on important subjects, combined with such admirable lessons on the management of temper and time.

PRACTICAL HINTS ON PORTRAIT PAINTING. By JOHN BURNET, F.R.S. Published by DAVID BOGUE.

Portrait-painting is, we may say, ignorantly held to be an inferior and mechanical branch of Fine Art; but if it be so, wherefore have we not, even in a century, more than two or three artists in this department whose productions will survive as works of Art? The truth is that those qualities which give pictorial quality to a portrait are not appreciable by the many. In most cases, to use the words of Fuseli, "the aim of the artist and the sinner's wish, are confined to external likeness; that deeper, nobler aim—the personification of character—is neither required, nor, if obtained, recognised. The better artist condemned to this task can here only distinguish himself from his duller brethren by execution, by invoking the assistance of background, chiaro-scuro, and picturesque effects, and leaves us, while we lament the misapplication, with a strong impression of his power. The artist we see not; the insignificant individual that usurps the canvas we never saw—care not if we ever see, and if we do, remember not, for his head can personify nothing but his opulence or his pretence; it is furniture."

In this work, Mr. Burnet founds his remarks and precepts on the practice, especially, of Vandyke, Reynolds, Velasquez, and on the antique, at the same time illustrating his course of instruction from some of the most celebrated paintings of the Italian schools, and with plates, containing heads and features, from the works of those masters. The first of these plates consists of the mouths of children, after pictures by Reynolds, especially the daughter of Lady Gordon, in the National Gallery. This is followed by a plate containing mouths after the antique, wherein it is observed that the mouth in the antique is generally slightly

opened, the teeth being seldom seen, save in representations of fauns, satyrs, and inferior characters that bespeak an ordinary or debased nature. In the third plate, which contains features from nature, the outline of the cheek, and those of the eye and eyebrows are shown as supported by a portion of the hair. The two following plates present, each, two heads engraved from studies in the possession of the Duke of Buccleugh; the originals are sketched in burnt amber or bone brown, and appear to have been done at once. In reference to these Mr. Burnet makes the following interesting observation: "The high lights in Vandyke's portraits are generally in the forehead, cheek-bones, and above the upper lip; these points are often strengthened by the shadows of the features, or darks of the hair coming in contact with them." The sixth plate, which is placed as a frontispiece to the book, presents the well known profiles and full face of Charles I., from the original at Windsor Castle: these different sketches of the head of the king were made by Vandyke to enable Beriani the sculptor to execute a bust of Charles, which work was destroyed in the fire that occurred at Whitehall. Other plates from the works of Vandyke represent Charles I. in his robes, and the lady of the court of Charles; and three plates from Velasquez are accompanied by judicious and instructive remarks on the simple and forcible manner of that distinguished painter. Mr. Burnet has carefully studied the masters upon whose practice he founds his instruction, and by an analytical comparison of the character and quality marking the productions of each, he has deduced a course of instruction which, if attentively followed, cannot fail to impart a great amount of knowledge.

PORTRAITS OF ILLUSTRIOUS PERSONAGES. By EDMUND LODGE, Esq., F.S.A. Published by HENRY G. BOHN, London.

An edition of Lodge's Portraits, at the price of five shillings per volume, is a boon that we could scarcely hope to see even in these days of cheap literature. The first volume, however, of such an edition is now before us, containing not less than thirty portraits, with the biographical notices, commencing with that of Elizabeth of York, Queen of Henry VII., and ending with that of Cardinal Pole. When the prices at which the two preceding editions were published, the excellence of the engraving and the number of the plates, are considered, the reproduction of the work in this form will be regarded as an enterprise of extraordinary spirit. The first edition was commenced in 1811, and completed in forty parts in folio at two guineas and two guineas and a half each. Thus the price of a copy at the lower rate would be eighty guineas. In 1821 an edition in imperial 8vo. was issued in eighty parts at 7s. 6d. a part, the price of the whole being 30l., which was afterwards reduced to one-third. The whole of these portraits being engraved from known pictures, they have at all times supplied to the painter a valuable authority for costume and identical impersonation, and as all the character of the earlier plates is most perfectly preserved in these, the present inexpensive edition will be equally serviceable to the figure painter as either of those that have preceded it.

BUILDINGS AND MONUMENTS, MODERN AND MEDIEVAL. Part VI. Edited by GEORGE GODWIN, F.R.S.

This well selected series of cuts and letter-press from the pages of "The Builder," carries its course well onward; and we have in the present part many excellent engravings of interesting structures at home and abroad. The Waterman's Hall at Ghent (a fine specimen of mediæval skill) is accompanied by some remarks on a knowledge of architecture very worthy of note, particularly to continental tourists.

LITHOGRAPHS OF ROMANO-BRITISH TESSELATED PAVEMENTS DISCOVERED AT ALDBOROUGH. Published by H. E. SMITH, Parliament Street, York.

Aldbrough, in Yorkshire, the Ise-Brigantium of the Romans, is a place little visited by the antiquary; but late discoveries, personally superintended by the publisher of these plates, have laid bare the magnificent pavements they represent, as well as other mementos of the great rulers of the world. The plates are singularly faithful representations, and are richly coloured in imitation of the originals; indeed, it is not too much to say that they are perfectly equal to the far-famed works of Lysons, and not inferior, in interest or beauty, to those published by that eminent antiquary.

A COURSE OF LECTURES ON MODERN HISTORY. By FREDERICK SCHLEGEL. Published by H. G. BOHN, London.

These lectures, which have a considerable reputation in Germany, were delivered in the year 1810, at Vienna, by royal permission. They have been translated, and are now published as a volume of "Bohn's Standard Library." Besides the matter contained under the general head of Lectures, there is also "Cæsar and Alexander," an historical comparison, and a paper "On the beginning of our History and the last revolution of the Earth, as the probable effect of a Comet." These histories commence with the migrations of the nations, and terminate with reflections on "Austria, the heart of Europe," supporting, of course, her pretension to maintain the integrity of her many-kingdomed empire. But neither Schlegel nor any other writer could conceive of a fall resembling in height the precipitate decadence sustained by Austria in a few brief months. The author traces German civilisation from its birth, and necessarily considers the direct and oblique influences of other nations. The style is simple and lucid, and the name of the author is a sufficient guarantee for the excellence of the matter.

RUSTIC GROUPS IN FIGURES. By GAVARNI. Published by G. ROWNEY & Co., London.

The name of Gavarni as a facetious delineator of the manners and customs of certain classes of Parisian life, is familiar to many. For a long period he held in the French capital the same position that Cruikshank, and Doyle, and Leech, have done and are doing in our own metropolis; but he is, at present, we believe, domiciled here, and every now and then we recognise his presence in various illustrated works. This series of lithographic sketches, however, exhibits nothing of the caricaturist, they have their originals in the peasantry of our country, and the *l'artisan* of our streets, whom he has grouped, male and female, with amazing force and character; with so free a pencil are they lithographed, that they have the appearance of being done with the camel's hair brush in Indian ink. The drawing of the figures is admirable, and the variety of attitudes in which they are placed shows an intimate acquaintance with the anatomy of the human form. It is long since we have seen studies so original, both in design and execution.

ANTIQUARIAN GLEANINGS IN THE NORTH OF ENGLAND. Drawn and Etched by W. B. SCOTT. Part II. Published by BELL, London.

We are glad to welcome the second part of these "Gleanings," and to testify to an increased improvement in the series. The etchings are extremely well executed, and are delineations of objects having much intrinsic interest; the selection comprises objects of the most varied kinds, many of which are useful studies for the modern designer, particularly the carved furniture, which is very elaborate and beautiful. We would strongly advise the artist to obtain the help of some antiquarian friend in the description of his plates. The inscription on the crucifix is clearly H.H.S., X.P.S., and not as printed, and that on the Cordwainer's howl cannot be correctly given.

THE HISTORY OF ST. CUTHBERT. Published by J. BURNS, London.

This history of the "Apostle of Northumbria," has been a labour of love with a dignity of the Catholic Church (the very Rev. Monsignor C. Eyre), who exhibits considerable enthusiasm in his task, and a large amount of research. Not a hint of the movements of the Saint, or his relics after death, wherever given, seems to have escaped him; and he has personally visited the spots "made holy" in his eyes by Cuthbert's residence. We cannot go with the author in all his opinions; neither our faith nor our judgment will admit it; but we can award due praise to the enthusiasm and diligence with which he has laboured, and to the style in which he has given his labours to the public in this elegant volume.

THE WILKIE GALLERY. Part 17. Published by G. VIRTUE, London and New York.

A good number of this pleasant and popular work. It contains "Saturday Night," nicely engraved by W. Greatbach; "The Guerrilla Council of War," engraved by J. C. Arncliffe with much effect; and "The Hookah-Badar," a capital example of C. Cousen's *burin*. This publication, when complete, will be a worthy tribute to the genius of the painter, and must prove a favourite with the public.

THE ART-JOURNAL.

LONDON, MARCH 1, 1850.

ART-MANUFACTURES IN THE CLASSICAL EPOCHS.

BY DR. EMIL BRAUN.

II.—SPHYRELATA, OR HAMMERED METAL-WORK.

THE hammer and tongs, managed by a skilful hand, are the most powerful organs of Art-manufacture. We cannot imagine any branch of industry able to dispense with these means, and when we look at our establishments, where iron itself is treated

almost with the same ease, certainly with the same success, as clay by the hand of the sculptor, we find their wonderful machinery consists merely in a mechanical combination of these simple instruments used by blacksmiths; their outward form has undergone many changes, but their intention is quite the same as that of these earliest instruments which play an intermediate part between the hand of man and the otherwise unapproachable element, without the aid of which no metal can be subdued to forms suitable to the wants of human life.

No wonder, therefore, that these three ground-forms of mechanical power are mentioned in the grand description given by Greek mythology of the economy of the universe; in this oldest but most philosophical representation of the Kosmos, which Hesiod has left us in his Theogony, the plastic powers bestowed by preference upon mankind appear immediately after the great rulers of the whole metallic realm represented by electricity and galvanism. Ischys, Bie, and Mechane, that is to say, the fastening powers obtained by the tongs, the force of the hammer, and the mechanical skill of the human hand, appear as the wives of Brontes, Steropes, and Argos, the personified Thunder, Thunder-bolt, and Lightning.

If we look backwards to the most remote times of Greek industry we find that long before fire-casting became customary, almost every kind of work was carried out by these simple means. Even products of Art were created in this manner, and as statues, vases, and the like could not be put together by the process of soldering, nails were used for the purpose, as we learn not only from ancient writers, but even from monuments which have lately been discovered in Etruria, and the most important specimens of which are now possessed by the British Museum. In one of the tombs belonging to the vast necropolis of Vulci were discovered, nearly ten years ago, a great many bronzes of this very ancient workmanship; one of them represents a bust, placed on a basement covered with thin copper plates, and adorned by a row of figures, which are likewise chased; long curls fall down over the neck and shoulders, and these parts, especially, are formed in the most simple manner; one would be tempted to call it childlike, did not the whole composition show a certain character, which enables the experienced eye of the Art-philosopher to distinguish in these rude attempts at plastic metal-work the very germ of those wonderfully styled

productions of a later period. The drawing No. 1, giving a side view of this remarkable and as yet unique monument, is intended to show this arrangement of the hair, which, in spite of its simple treatment, presents as a whole some slight trace of grace and principles of fine proportions. We perceive that these curls are formed by rolling and twining together small strips of bronze plate, connected with the head

itself by the mechanical means we have alluded to: there is no trace of soldering, and we may be sure that we possess in this figure a good specimen of those hammer-wrought sculptures of old, which were spoken of by Greeks themselves as belonging to a fabulous period.

We may observe how the timid artist has, as much as possible, cautiously avoided all prominent parts presenting in this kind of workmanship, increasing difficulties. The left hand is closely attached to the chest, while the right was stretched out to hold some symbol which is now lost; a necklace hides the commissures by which head and bust are united. The ornament of which it is composed is graceful, and we see, even in this instance, that in works of a primitive period, taste and the feeling of beauty are hidden rather than absolutely wanting, and that it bursts forth like leaves in a warm spring night as soon as the facility afforded by technical conditions allows a free expression.

So we observe, also, that the compositions by which the basis of our monument is adorned show a remarkable progress in the development of the ideas artistically expressed, but it is still clear that even these designs remain far behind the description of the same subjects given by the poets of the same age. One may, however, venture to say that such undeveloped works of Art have lent inspiration to a Homer, a Hesiod, and other great bards of old, who read those symbolical characters like the written characters of a poem presenting to the unlearned eye nothing but confusion, while the man of letters finds there the highest ideas eternalised. Those who laugh at such primitive attempts ought, generally, rather to be ashamed of their own ignorance, which should impose silence upon them, as it is not allowable to throw ridicule upon what we do not understand. It is true that similar configurations of an archaic character must be considered as the germ of thoughts only to be unfolded in the course of ages. The poet, however, is able to anticipate the fruits of such an organic development, and gives full expression to what is only aspired at by the artists of those remote times.

We have thought it right to hint at the contrast between workmanship and thought which the products of primitive Art always present to us, as this circumstance must be taken into consideration in appreciating the poetical descriptions of arms, thrones, and other furnishings, which even learned men have frequently completely misunderstood. No hypothesis, for instance, can be imagined more confused and in

the wrong than that propounded by Otfried Müller in regard to the shield of Achilles: he speaks of metal silhouettes, which he supposes to have been fixed by nails and similar mechanical methods on the ground of such a defensive weapon. Without dwelling upon the impracticability of such a mode, it involves technical difficulties far greater than any which those old metal works have as yet presented. On the other hand there are such numerous examples of chasing that they allow us to conceive a tolerably clear idea of the Art-manufactures which Homer had before his eyes.

But before proceeding farther to more complicated problems, it will be not only useful but also instructive to look a little more closely at other products of similar workmanship discovered in the same tomb in which was found the bust we have just analysed; they are all embossed, and, although their ornamental part affords but a slight degree of interest, they still teach us many particulars of the highest importance to the history of Art-manufacture, enabling us better to understand many expressions of the old poets from which the reader has hitherto not been able to derive pleasure.

The drawing No. 2, represents a vase of agreeable proportions resting on a small base. This little disc forms the centre of a set of radii,

which, by dividing the conic surface into so many quarters, enliven the whole in a pleasing manner. The handle is obtained by bending a single metal strip and attaching it to the border of the rim.

The other vase, No. 3, constructed according to the same principles, affords, already, an additional monumental element. Slight and insignificant as it is, it still shows the tendency

to bestow upon every part of implements of this description a character of variety. This basin, which has a different shape, although only one member is added, is supported by a stand, lending to the whole an air of more importance.

A tall amphora, No. 4, is produced by the same method of embossing, and the handles added on both sides consist of simple pieces of bronze plate attached to the vase by nails. This mechanical procedure has afforded the motive for adorning the whole piece, similar nails being added in great numbers, not to fasten the individual parts together, but to take away from so large a surface the monotonous character which it would present in itself.

Every reader of Homer will remember the constant epithet which the father of western poetry bestows upon sceptres, thrones, and similar objects: he calls them "well-nailed," a quality which is to be referred not so much to the material workmanship and mechanical construction of such objects as to their external aspect. The points which the heads of these ornamental nails present to the eye longing for rest create a variety of fine proportions, and are to be considered as the first germs of that rich outpouring of beauty which Decorative Art

afterwards spread over every surface of which it is able to possess itself and to subject to its magic power.

A basin, of the same collection, forming a starting point for primitive Art-manufacture, displays to us, No. 5, another more striking specimen of this kind of decoration; the border

of it may be called well-nailed, for the same reason as the sceptre of Agamemnon, or the thrones of the palace of Alcinoüs.

We are prepared for the objections of many practical Art-manufacturers that it is not worth while to occupy ourselves with similar trifles, and that they can be of no use for the improvement of our industry, and it may be conceded that there are artists of high merit who never have bestowed any attention upon peculiarities of this kind. But here we must remind our readers that the question as to the progress of which Art-manufacture is capable in the present day is one of regeneration, and has, therefore, necessarily in view the restoration rather than the enlargement of the domain of Fine Art. The immediate and inconsiderate application of the products of the latter has led to so much confusion of taste in the public that it has ended in a total loss of principles, and it is even come to such a point that persons actually possessing philosophical instruction seriously pretend that it is impossible to reduce the judgment of beauty to any kind of rational principle.

One of the greatest and most fatal prejudices in matters of artistical industry is the false idea that the material of which an object is composed can contribute to the increase or diminution of its real value. By over-estimating the importance of the substance employed in Art-manufactures, Art itself has been entirely severed from them, and has at last sunk into complete degradation: it is only in the epoch of decline that we see sculpture taking possession of those colored masses of stone which present to the implements of the artist too great a resistance for a corresponding result to be obtained from their elaboration. The porphyry sarcophagus of Helen and Constantia, the wife and daughter of Constantine the Great, are, in spite of their precious material, and the enormous workmanship bestowed upon them, of no artistical value whatever when compared with monuments of the bright Hellenic epoch, although the latter present to us nothing but a heap of worthless clay.

These preliminary observations will stand excused when we direct the attention of our readers to another piece of the same collection, discovered in a sepulchre at Vulci, which is known among antiquaries under the conventional denomination of the "Egyptian

Grotto," a name derived from the circumstance of a great number of objects with Egyptian hieroglyphics being found in the same sepulchre. The monument we allude to is a tripod composed, likewise, of several pieces of embossed metal plates, and the artist has expressed his idea with the smallest expense of means that can be imagined; not only the upper part, which is richly adorned with figures and fantastically connected lines, but even the feet are obtained by that embossing process we have already described: lion's paws lend to the stand the air of a firm footing; the legs of the tripod are cannellured and bent into curves, giving a character of solidity and steadiness; the cylinder forming the mouth fitted to receive the vessel which is to be put over the fire, displays four rows of animals and arabesques, which are embossed in slight relief; near the edge is a row of simple nails, the original meaning of which has been already explained: these nails appear at the bottom, while the winged animals and the curved intersecting lines, which rest, likewise, upon nail-heads, are placed in an opposite direction. I cannot refrain from thinking that this senseless arrangement is due to a mistake in putting together the two parts, although I am not sure that it belongs to modern times. There can very little doubt that this does not represent the design as it was originally.

Tripods are, next to vases, the most ancient furniture in the world; the imagination of the ancients invested them early with fanciful forms, and we meet with designs which, although very simple, show already the power exercised by the reproductive faculties of the mind upon the objects surrounding these ancient nations. Representations of the kind were, however, exceedingly rare till the last thirty years, and it must be considered as an especial piece of good fortune that the excavations made in several parts of Etruria have afforded more than one specimen of this description. Among these discoveries of archaic monuments the large tomb, opened in 1836, at Cerveteri, occupies the first rank, and we must therefore engage our readers to examine with us the numerous monuments extracted from this sepulchral hill, which included a great many graves, also, of very remote date, but of which the two rooms where this immense store of gold ornaments was found formed the central point. The construction of these chambers was similar to that of the treasury of Atreus, which is the oldest we have any acquaintance with, the ceiling being obtained by pyramidal superposition, and not by a cuneiform connection of the stones forming the building.

To these sure indications of remote antiquity corresponds the character of the monuments which were found in this burial-ground. The bronzes forming part of this collection (called from the proprietors of the excavation the Galassi-Regulini collection, and which are now placed in the Museum Gregorianum or Etruscan Museum in the Vatican) display, almost without exception, the embossing method of working, which we have already declared to be the most ancient Art-manufacturing process known to us. The technical part of it shows indeed an astonishing perfection; and all that appears odd and awkward to us, must rather be ascribed to the want of the free development of the ideas intended to be expressed than to any defect of skill in workmanship.

As we are speaking of tripods, it may be interesting to compare with that of the Egyptian grotto of Vulci, which we have already examined, the others discovered in the Galassi-Regulini tomb of Cerveteri, the more so as the latter affords a part which is wanting in the former. Here, No. 6, we see a large vessel placed on the tripod, from the edge of which five lions' heads start forth with hideous expression. These monsters lend to the whole that fanciful aspect distinguishing objects of the archaic period. When we imagine to ourselves this kettle boiling, and these cruel animals wretched and enveloped in smoke, we can understand how the fancy of superstitious worshippers, who were wont to make use of these implements in their religious ceremonies, may have found in them an allusion to the spirits of the victims whose remains were

exposed to the destructive fire glowing underneath. To us, at least, this representation may illustrate the terrific but grand passage of Homer, where the bodies of the slaughtered sun-bills become once more instinct with life, demanding

vengeance with fearful cries: *Odyssey*, Book xii. verse 395.

"The skins began to creep and the flesh around the spits belloved,
The roasted as well as the raw. And thus grew the voice of the oxen."

The careful construction of the three-legged mechanism which lends a firm support to this fire-stand, has been restored according to the indications of some fragments found on the spot. It presents a graceful aspect, and forms in some respects a remarkable contrast to the heavy character of the vessel occupying so lofty a position, as the proportions of the legs are exceedingly slender, and the feet themselves instead of being broad and shapless, are composed of a great many fine articulations.

Belonging to ritual service, but very peculiar and unique in its kind, is a mechanism of bronze of the same collection, which seems to have been destined for burning incense. It consists of a square plate, adorned with four embossed lions, in the centre of which is a basin surmounted by an arched band, on the top of which is another concavity corresponding with the vessel below, No. 7. We can only surmise that the smaller cavity was intended to receive some description of perfumes, which was acted upon by water or some other liquid holding underneath. The whole is supported upon four wheels showing that it was intended to be moved about, which in religious ceremonies may have been a great convenience. On this occasion we must notice that oven in the Egyptian grotto of Vulci, were found several carriages of a similar character, but of less artistical merit, which are now preserved in the British Museum. As they do not present any particular ornaments, with the exception of four horses' heads placed on the corners, we withhold the drawing of them, reserving their places for other more important matter.

We proceed therefore in the analysis of the incense chariot of Cerveteri. The borders are

adorned by a row of flowershaped ornaments, the graceful forms of which will be appreciated in our side-view. It must be confessed indeed that this monument, which is marked

by the stamp of an antiquity so exceedingly remote, displays, within the limit of its archaic character, much elegance, conveying the idea of a highly refined taste suitable to a person

of dignified position, as the priest or king may be supposed to have been, to whom all this splendour and luxury belonged.

The fantastic part prevails, however, in the generality of the bronzes discovered in the tomb of the supposed lucumo or king-priest of Caere. As a striking example of these fanciful compositions, afforded by that sepulchral furniture, I may allude to another boiler, the body of which is decorated with engraved figures of winged animals, while the lions' heads attached to the border, in this instance, peep, half curious, half voracious, into the vase, the contents of which seem to excite their appetite.

One of the most interesting examples of ornamental Art belonging to those primitive times, is afforded by the bed, No. 8, on which the chief dignitary of Caere was intended to receive his overlasting rest. It is composed of bronze

strips, and may originally have been adorned with many fine ornaments now dispersed, and which can be only reconnected with it by vague conjecture. Should it be objected that such a monument was never intended for real use, we should be allowed to answer that it must certainly then be an imitation of a real bed, although it was highly probable that kings and other wealthy persons had the beds upon which they actually slept enriched by metal-work.

The manner, however, in which the bedstead is composed, affords us the explanation of an epithet which Homer constantly bestows upon the beds of his heroes, and which, as far as I know, has never been rightly understood. He calls them *wel-hotel*, and this expression has been senselessly repeated for many centuries without any scholar having inquired into the

excellence of a bed is to be well aired, and this is manifestly the reason of the holes presented by our bedstead, as well as of the Homeric epithet.

Several fragments of embossed plates, which are adorned on both sides by a rich border, are supposed to have formed a part of this bedstead, being of the same height as the feet. We have endeavoured to connect with it the characteristic ornament, No. 9, at the foot of this page, without making ourselves responsible for the truth of such a restoration, as we are entirely at a loss for analogous examples.*

Before taking leave of this precious collection of archaic Art-manufactures, which will afford us at another opportunity many interesting specimens of a different branch of industry, we must point out one of the shields, representing three wild animals placed round a sort of rosetta in very low relief obtained by embossing; and also one of the pateras, No. 10, which were used

for completing the sacrifice. The cuts given of this well adapted form lay before us the fine proportions of sacred vessels of this description, and afford us an idea of the simplicity of taste which prevailed in these times in connection with a love of what was really stirring and imposing.

The excavations of Cerveteri have, even on other occasions, afforded many monuments of a very archaic character. Among these is a kind of old-fashioned candelabra, which was discovered in 1833 in a large tomb opened in that necropolis, and which is now to be seen in the Etruscan museum in the Vatican. Two large horns connect two conic vessels, one of which forms the stand, while the other is the vase destined to receive the burning material,

whether for the purpose of giving light or for diffusing a perfume by means of the flame. The different compartments of this singular monument are divided into eleven rows, of which nine are composed of figures, while two are filled up only by an arabesque ornament, the same animals being repeated which appear elsewhere.

* Since the above lines were written, other experiments

It will be interesting to make a comparison with some other examples of these primitive forms of vases, all belonging to the embossing process, and displaying therefore a character entirely different from every kind of analogous cast-work. The Museum Etruseum of the Vatican affords a good choice of these oldest of all articles belonging to Art-Manufacture, which the antiquaries of the past century, and even during the first quarter of the present one, looked for in vain. These treasures of archaic Art have, however, as yet been but little appreciated, and even archaeologists have scarcely paid the attention to them, to which they are entitled. The passion for hunting for figured monuments has hindered these learned men, and made them forget the true starting points of Greek Art-history.

The vase of which we lay a drawing, No. 11, before our readers, is of a very singular construction. Its enlarged body enables it to receive

a considerable portion of liquid, and its comparatively high pedestal renders it easy for the bearer to lift it to his shoulders; so likewise the neck is adapted to pouring out its contents in the most secure and commodious manner. The cover prevents the water from flowing out. Long handles convey the idea of easy management. The sphere, forming the main body of the vase, is composed of two halves, put together by the means of nails, and the artist has evidently been proud of his mechanical skill, not only displaying his process, but even making a boast of it, by converting it, as we have already seen, into a graceful ornament.

In the vase, No. 12, taste begins to be observed, and the skilful management of the nail ornament lends to this vase an aspect of much elegance. The beads of the nails are edged like precious

have shown, with an almost mathematical certainty, that these fragments were connected with the bedstead in the manner we supposed. Joining the bronze ornament to the end where the head rested, we find two semi-lunar segments exactly in the place where it must have been intended to be fastened to the feet. The ornament by which this portion of the decoration is surmounted exactly covers the height to which the pillow-stand reaches. Such coincidences can scarcely be casual. They are in all probability the result of a well-intended combination. In addition to this, the rich and beautiful appearance of this ornamental composition speaks highly in favour of our hypothesis.

real meaning of it. The bronze trelliswork of our bedstead explains it at once. The greatest

stones, and the concentric circles which embrace the whole circumference are enlivened by a great number of well-distributed points, and acquire an air of pleasing variety by the lines which follow alternately different directions. Primitive as is this specimen of a workmanship belonging to a most remote period, it still proves instructive to those who inquire earnestly into the origin of the principles of beauty.

Real beauty, obtained by the same process, and with the same motives, is already to be observed in vase No. 13, which was intended to be placed on a moveable stand. Here we

admire that elegance to which the artists of former time aspired, but which has been the result of a regular development of principles of rational utility, which may be asserted to be the starting point of real refinement.

All the monuments associated together in this review of primitive Art, betray no traces either of casting or soldering. Although they have been discovered, without exception, in Etruscan tombs, they must be considered as products of Hellenic industry, the Etruscans representing but a branch of it; there being no monuments of so early a period discovered in Greece itself, these specimens of Italian workmanship are, for the history of Western Art-manufacture, of the highest value. They show us the beginning of an entirely new system of civilisation, gradually arising from the schools of oriental Art chiefly represented by Egyptians and Phœnicians, as we shall see more clearly in the further exposition of facts referring to the early history of Art. The accurate analysis of such apparently trifling monuments, leads us to an accurate knowledge and just appreciation of the organic development of those inborn faculties which raised the Greeks to such an eminence amongst all nations, I may say, of the civilised world. There is not a single step which they did not take advisedly, and to this tranquilly progressing and safe system of national self-education, is especially due that rapid progress which enabled them to give utterance to ideas never before manifested to the world. We shall endeavour to show, that by so judiciously calculated a mode of proceeding, men like Phidias found their way cleared, and a thousand well-drilled hands were ready when he required help for carrying out his gigantic projects.

In our times the case is entirely different. We suffer from too great an ease in the technical management of those materials, in which the soul of Art has to take up its residence. Redundancy of talent has driven away true genius, and of modern Art-manufacture it may be said that it has lost almost all self-government; we therefore minister rather to luxury than to real usefulness. The imagination of those who indulge in the pleasures which are granted by ornamental industry, is misled, not gratified by the exertions of our artists; we must, therefore, go to school to the Greeks, not to rob them of their refined forms and charming combinations, but to learn from them what our great statesmen have already learned in another department of mental culture: that is to think rightly and to connect our ideas logically;—the supreme law even in Art-manufacture, under the protection of which, industry, relying upon taste, can alone become and remain prosperous; and confer a moral good, instead of degrading the human mind by a frivolous flattery of the senses.

EMIL BRAUN.

THE FOUR SEASONS,

A SERIES OF STATUES DESIGNED AND EXECUTED IN MARBLE BY EMIL WOLFF.

AMONGST the favourite subjects for sculpture, that of the four great epochs of the year, which

SPRING.

SUMMER.

correspond with the different times of the day as well as with the ages into which human life is divided, has been selected more frequently

one might be tempted to suppose so commonplace a subject no longer able to afford new resources. The fact is however quite the contrary, and we see that the public is always interested anew when the subject is treated in a suitable manner and becomes the theme of a designer capable of investing it with all the charms and attractions of refined Art. No wonder, then, that the four graceful statues, which the celebrated sculptor Emil Wolff has

AUTUMN.

WINTER.

than any other argument past or present. From the time of the Romans up to the present day the idea has undergone so many changes, that

executed in marble, and which display that skill and softness of treatment distinguishing the mechanical execution of this gifted artist, should

have met with extraordinary success. It seems, therefore, proper to lay before the public at large, the motives introduced into this composition, not only to direct the attention of those to whom this branch of art gives pleasure to the originals themselves, but even to afford Art-manufacturers ideas which may in all probability inspire new combinations of pleasing conceptions.

SPRING (Drawing No. 1.) is represented as a lovely boy, who with pensive tenderness takes a flower from his basket to throw it, after the fashion of the Florentine flower-girls, to those whom he deems most worthy of the choicest gift. The gesture with which the incomparable symbol of the smiling season is put in action, is well fitted for representation; by its nature, so full of significance; and the awakening of the first germ of timid love is gracefully identified with the hopeful mirth of regenerated nature.

SUMMER (Drawing No. 2.) presents an entirely different aspect. He has already become acquainted with the more serious tendencies of life,—with hard toil and labour. He holds in his hand the sickle, with which he has gathered the fruits announced by the bright flowers borne by his brother, only as love gifts and symbols of enjoyment. The sheaf of corn placed at his side makes allusion to a rich harvest-home, but the flask which lies empty on the ground reminds us of the fatigue without which mortal men are unable to obtain the productions of nature. His thoughtfulness has a meaning entirely different from the pensive expression of his younger brother. He is resting, and looks backward, being already arrived at the summit of a hot mid-day. His features are, therefore, more distinctly marked, and ideas more defined and practical have taken the place formerly occupied by poetical enthusiasm.

AUTUMN (Drawing No. 3.) presents the reward of the labours of the whole year. Crowned with ivy, he has again filled the cup which has quenched the thirst of the poor labourers in the midst of his harvest toil. His rest is a less precarious one than that allowed to the workmen on a hot summer's day. He leans against a tree, entwined with a vine loaded with sweet grapes. His whole countenance is expressive of peace and comfort, his feet are crossed with a graceful rustic negligence, and while he offers the sweet liquid with his left hand, the right holds ready the vase, to fill the cup again as often as the cheerful hoan companion has emptied its invigorating draught.

WINTER (Drawing No. 4.) appears not only resting, but overpowered by heavy sleep. A lion's skin protects his tender limbs against the bitter cold of the dead season. The only fruit which remains in his hand is that of the pine, ever green but also for ever dry. It includes many seeds capable of future resurrection. The poor half-frozen youth leans on a heavy staff, answering, as a club, to the lion's skin thrown over his head.

It appears useless to add a single word respecting the merits, or the fine execution which distinguishes the productions of so able a sculptor as Mr. Emil Wolf is generally acknowledged to be. The sketches laid before the eyes of our readers give, besides, a sufficiently concrete idea of the charm conferred upon a subject by a well understood mode of arrangement, and of that clearness of expression, which renders the whole composition not less intelligible than agreeable.

EMIL BRAUN.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

CHEMISTRY OF ORGANIC COLOURS.

I. CARMINE AND LAKES.

The variety of beautiful colours which we see adorning the vegetable and animal kingdoms might lead a person to expect that the greater number of those which are employed in the Arts and Manufactures were derived from one or other of these sources. Such is not however the case, the colours of organised bodies seldom admitting of separation without undergoing a

destructive change in the process; and where the colouring matters are obtained they are frequently found to alter their tints so rapidly, under the influence of the atmosphere, and of sunshine, that they are seldom employed by the artist, and rarely by the manufacturer unless combined with some mineral preparation which acts the part of a mordant. The laws which determine these changes are, even now, but ill understood. From the earliest period of time, man must have noticed the bleaching of some vegetable colours, and the darkening of others. The phenomenon in either case depending upon some physical change of the organic substance, produced by the influence of Light, Heat, or Atmospheric changes; yet these derangements have never, until our own time, received the attention of scientific men.

Dr. Wollaston was led to examine the peculiarities of change in the colouring matter of Gum Guaiacum, when exposed to the action of the Solar Spectrum, and this philosopher showed that the rays at one end of the spectrum deepened the colour—changing the original pale green or blue tint of this resin, spread on paper, to one of much intensity—whereas the rays of the opposite extremity as rapidly discharged the original colour, and even this superinduced hue. Herschel has examined these phenomena with very great care, and he has shown that the deepening of the colour is due to the chemical rays, and that the bleaching is purely an operation of the Heat-rays, and that it can indeed be produced by heat alone. At the same time, it has been shown that this process of discharging colour is a mixed operation, being probably due to a peculiar class of solar rays, which act partly as calorific and partly as chemical radiations. Many of the phenomena of their action have been investigated by our talented countrywoman Mrs. Mary Somerville, but although the researches of this lady, and of Sir John Herschel, have established the fact that there does exist in one part of the solar spectrum, a class of rays of a most peculiar character, to which the name of Parathermic rays has been given, we know but little more. It is, however, probable that these solar radiations exert a more destructive action on those colours which are obtained from organic bodies than any others.

In pursuing his researches on this extremely interesting and important subject Sir John Herschel was led to the discovery of a most important fact. When any vegetable colour was destroyed by a particular ray the colour could be restored by the action of the ray, which is complementary to it. Supposing any vegetable colour has been destroyed by the continued action of the red ray, if the body was exposed to the influence of the green rays the colour would be restored. It has also been observed, in many cases, although experiments are wanting to confirm the universality of the law, that each colour is destroyed by the ray complementary to it. This fact indicates a method by which many of the more fugitive colours may probably be preserved for a long period. Presuming, for the sake of illustration, that it is desired to secure the brilliancy of a carmine or a lake; since we learn that the most destructive action is produced by those rays which affect the eye as green colour, we have only to obstruct the passage of those rays by glazing our carmine or lake with a varnish having some transparent red colouring matter in its composition. This would effectually cut off the green rays, and of course preserve such portions of our picture as were red from fading under the action of light. Notwithstanding the want of extensive experimental evidence on this point, sufficient has been done to point out to our artists, desirous of securing the permanence of their works, a line of most instructive experiments.

There is a very elaborate memoir on the effect of light, air, and moisture as discolouring agents, by M. Chevreul, in the journal of *L'Académie Royale des Sciences*, tom. xvii. As this memoir, however, treats of the undecomposed radiations from the sun, it does not, although in many respects very valuable, admit of such general application as could be desired.

Although we have some mention in Pliny and

other writers, of silks and linens dyed by vegetable juices and animal matter, yet none of the descriptions given are sufficiently accurate or important to demand our attention, if we except those which relate to the celebrated Tyrian purple. The discovery of this much valued purple was attributed to the Phœnicians, and tradition relates that it was owing to the circumstance of a dog dyeing his mouth a deep and beautiful purple by eating a kind of muscle. Along the coasts surrounding the Mediterranean are found a very numerous variety of shell-fish, the *buccinum*, which yields a red or purple colouring matter. From this and some other descriptions of shell-fish it appears this Tyrian dyo was extracted. It could not therefore have been much unlike the colouring matter which we get from the cochineal insect, but the moderns have this advantage; the colouring matter of the cochineal strikes equally well upon silks or woollen fabrics, whereas the dye from the *buccinum* could only be employed on cottons and woollens.

Leaving, therefore, the consideration of the Tyrian purple, we will proceed to the examination of the characteristics of cochineal and the preparation of carmine, which was discovered by a Franciscan monk at Pisa, and for the preparation of which Homberg published a process in 1656. Cochineal was first introduced to this country from Mexico, about the middle of the sixteenth century. It was long thought to be the seed of a plant, until Leueubock proved by microscopic examination that it was an insect, the shield-louse or *coccus*. Two kinds of cochineal are imported, one gathered wild from the woods, and the other carefully cultivated. They are known in the market by the names of silvery and purple cochineal, the former being covered with a white down. The consumption of this article is shown by the fact that in 1835 there was imported into the kingdom 411,320 lbs. Notwithstanding that madder and lac has to some extent superseded the use of cochineal, we understand that the quantity now imported is greater, and the price of the article is reduced nearly one half.

These insects inhabit the leaves of the Nopal plant, of which some interesting specimens with the *coccus* thereon may be seen at the Royal Botanic Gardens at Kew. From these plants they are collected after the ripening of the fruit, and are killed, either by momentary immersion in hot water, or by being spread out upon hot plates.

From Chevreul's examination of cochineal we gain some important information. The cochineal insects, being treated with ether to remove a peculiar waxy matter, were repeatedly digested in fresh portions of alcohol, and after thirty infusions they were found to retain still much colour. The warm alcohol solutions were red or orange, and on cooling they let fall a peculiar granular matter; by spontaneous evaporation the whole of this matter is separated of a fine red colour and somewhat of a crystalline character. This is the colouring matter of the cochineal, to which the name of *carminium* has been given, as it forms the basis of that well-known beautiful colouring matter, carmine. The preparation of carmine depends upon the affinity of alumina for the colouring matter of cochineal. Numerous processes have been employed, some much more successful than others, to produce this pigment in a state of great richness. The following methods have been severally recommended.

A pound of cochineal reduced to a coarse powder is boiled with about half an ounce of potash in from fifty to sixty pints of water, the ebullition being from time to time subdued by the addition of small quantities of cold water. The vessel in which the cochineal has been boiled is, with its liquor, placed in a convenient position when removed from the fire, for pouring off the clear liquor. An ounce of alum in powder is now added, the whole stirred together and allowed to stand until the cochineal is deposited, which will take place in about a quarter of an hour. The clear liquor containing the colouring matter and alum is now decanted into a large vessel; half an ounce of gelatine (isinglass) is added, and the whole placed on a fire. At the

approach of ebullition, a coagulum floats on the surface of the liquor, which is to be removed, and the moment the fluid begins to boil the carmine is deposited. Removing it from the fire, the quantity considerably increases, and in less than an hour all the carmine is deposited, the supernatant liquor is poured off, and the carmine collected and dried upon a filter. The fluid is still highly coloured, and is employed by the manufacturers to prepare carminated lake. To procure this colour recently precipitated alumina is added to the solution, which is gently warmed and well stirred. The alumina absorbs the colouring matter, and carries it down with it; when all is precipitated, the clear and now colourless liquor is rejected.

The carmine of Madame Cenetie of Amsterdam is prepared by adding the bitartrate of potash (salts of sorrel) to the solution of cochineal, and then adding carbonate of soda. This carmine is carefully dried in the shade at a uniform temperature; it is of great brilliancy. Other carmines are prepared by the addition of muriate of tin, but these have usually a yellowish tinge. From these modes of preparation, it will readily be inferred that carmine is a compound of a peculiar animal colouring matter and an acid.

A method of purifying or brightening carmine has been employed by those who prepare colours for miniature painters. This consists in dissolving carmine in a solution of ammonia, by allowing them to stand together in the sunshine. When the ammonia has acquired an intense blood-red colour, it is poured off, and alcohol and acetic acid are added to it. The carmine in a state of extreme brilliancy is precipitated. By this process the pure carmine is separated from the alumina, and we obtain a similar preparation to that procured by Madame Cenetie's process. A very brilliant article is also produced by the use of acetic acid and alcohol by Herschel of Halle. Considerable difference exists in the characters of this beautiful pigment; and our manufacturers have rarely been enabled to produce such richness of colour as that usually obtained by the French carmine manufacturers. The process is one which, although apparently exceedingly simple, requires the utmost attention, since every thing depends upon the addition of the alumina, &c., at certain times determined by experience, and it is most important that the heat should not be too long applied. Notwithstanding, however, that every attention has been given to these points, it is undeniable that carmine prepared on the Continent is superior to the article made in England. The cause of this was for a long time a mystery. It is, however, now explained, and curious as it may appear, it is proved to depend entirely on the circumstance that the French and Dutch manufacturers will never manufacture carmine on a dull day. Even in this country the difference between two samples of carmine, which have been prepared in precisely the same manner, except that one specimen has been precipitated on a cloudy and the other on a sunny day, is exceedingly remarkable. This peculiar influence of light on colour is not confined to carmine; we may detect, even in Prussian blue, the same difference dependent upon the character of solar radiations; and in the process of dyeing any very brilliant colours too much attention cannot be given to this fact.

Carmine are adulterated by being mixed with a large additional quantity of alumina, and sometimes with vermilion, the sulphuret of mercury.—Cochineal is adulterated by being moistened with gum-water and shaken in a box with powdered sulphate of Baryta, and bone or ivory black, by which its weight is increased about 12 or 14 per cent.

Under the name of Rouge several preparations are sold, most of them being carmine diluted with alumina, or even more frequently with chalk. The real French Rouge, which finds its way to the toilet-table for the strange purpose of "painting the lily," is prepared from the safflower (*carthamus tinctorius*) by infusing the flowers in a weak solution of soda, and precipitating the colouring matter on cotton wool, or on finely powdered tale, by crystallised lemon juice.

In the process of dyeing with cochineal, by

which a scarlet or crimson is produced, acidulous tartarate of potash and nitro-muriate of tin are added to the strong infusion of the material. The use of the first salt and of the acid of the second is to reduce the colour and precipitate it with the animal matter upon the cloth, the oxide of tin combining with it and the woolle, for which it has a peculiar affinity. Pelletier and Caveoutou remark, that, to obtain a very fine shade, the muriate of tin ought to be at the maximum of oxidisement. To obtain crimson, nothing more is required than an addition of alum to the bath. Numerous proportions have been given by chemists and dyers, in which the cochineal should be used to produce a fine scarlet, but the process of Poerner is generally preferred. Dr. Ure thus describes it:—"Bouillon, or colouring. For every pound of cloth or wool take 14 drachms of cream of tartar; when the bath is boiling and the tartar all dissolved, pour in successively 14 drachms of solution of tin, and let the whole boil together during a few minutes; now introduce the cloth and boil it for two hours and let it drain and cool."

"Rouge, or dye. For every pound of woollen stuff take 2 drachms of cream of tartar. When the bath begins to boil, add 1 ounce of cochineal reduced to fine powder, stir the mixture well with a rod of willow or any white wood, and let it boil for a few minutes. Then pour in, by successive portions, 1 ounce of solution of tin, stirring continually with the rod. Lastly, dye as quickly as possible."

A very important investigation has been made by Mr. De la Rue, on the colouring matters of cochineal, to which we refer all who are interested in the abstract chemistry of the question.—*Memoirs of the Chemical Society, Part XXII.*

The composition of carminium, as given by Pelletier, is,

Carbon	49.33
Hydrogen	6.66
Nitrogen	3.96
Oxygen	40.45

Madder, from which some of our finest lakes are prepared, and which is employed extensively in dyeing reds, is the root of the *Robin-tinctorium*, which is cultivated extensively over many parts of Europe. The importance of this substance as a colouring agent induced the Société Industrielle of Mulhausen to offer several large premiums for the best analytical investigation. In 1827 eight memoirs were sent in to the society, which, although they were not considered to have fulfilled the conditions put forth in the programme, were full of valuable matter. Kuhlmann and Robiquet, and Colin each discovered a new principle in madder, to which they gave the name of *Alizarin*. Several other chemists have examined this colouring matter, but by far the most complete investigation of the subject has been made by Dr. Schunck for the British Association. The following substances have been detected by this chemist: *Alizarin*, which appears to be the colouring principle, *Rubiadin*, which has no tinctorial property, *Alphix* and *Beta Resin*, and *Xanthin*, which not only gives no colour itself, but actually interferes with the action of the *Alizarin* of the madder on mordanted cloth. To remove this Xanthin it is usual to convert the madder into what is technically called *Garancin*, by treating it with hot sulphuric acid until it has acquired a dark brown colour, then adding water, straining and washing, until all the acid is removed. Dr. Schunck informs us that the advantages which *Garancin* has over madder are, that it dyes finer colours, that the part destined to remain white does not acquire any brown or yellow tinge, and that its tinctorial power is greater than that of the madder from which it has been prepared: he likewise attributes the superiority of *Garancin* to two causes.—The separation by the acid of the lime and magnesia combined with the colouring matter, and the decomposition and removal of the Xanthin by the oil of vitriol. Some objections have been taken to these views, and some of the most celebrated continental calico-printers affirm that the madders of Avignon, though richer in colour than those of Alsace, afford little or no *Alizarin*.

In dyeing a mordant is employed, the purpose of which is to bind by a twofold attraction the colouring matter to the textile filaments. Organic colouring matters have a very powerful attraction for some earthy and metallic salts; thus, the salts of alum, of lead, and of tin, are valuable as mordants from the circumstance that the earth and the oxides of metals adhere with great tenacity to all organic fibres, and unite with much force with all organic colouring matters. It is not our intention to describe any of the details of the various processes employed for dyeing reds with madder or any other tinctorial agents, but selecting one process, that for dyeing the *Adrianople*, or *Turkey Red*, regard it as a general representative of all.

The first step consists in cleansing and removing all greasy matters from the fabric to be dyed. This is effected by some tedious operations of the dung-bath, a process of oiling—and then washing in an alkaline bath. Then follows the galling operation, which consists in steeping the cloth in a bath of Sicilian sunnath, or of nutgalls;—next we have the mordanting, by soaking in a bath of alum to which potash and chalk are added for twelve hours, and then being well rinsed in clean water, the cloth is immersed in the madder bath and receives its dye.

Every pound of cotton or woollen cloth requires from two to three pounds of madder. The bath being made, the fabric is placed in it cold, and constantly worked about until it is thoroughly impregnated with the dye—the fire is got up under the copper—the fluid is brought to boil and ebullition is continued for two hours. Several gallons of bullock's blood is added to the cold bath, which is supposed to have some effect in improving the colour. This being accomplished the brightening of the dyed cloth follows, which is effected by raising or boiling it with soap and water, and then passing it into a bath of muriate of tin which is prepared by dissolving grain tin in nitro-muriatic acid. Other reds are produced from cochineal, which we have already mentioned;—*Kermes*, of which insects there are several varieties named from the plants upon which they feed; those of Europe being found on the prickly oak;—*Lac*, a reddish resin, produced on the branches of several plants in Siam, Assam and Bengal, by the puncture of an insect of the Coccus family;—*Archil*, the colouring matter of many lichens;—*Carthamus* or Safflower;—*Brazil-wood*;—*Logwood* and *Alkanet root*. From all these organic colouring matters lakes may be prepared.

Under the general title of lakes we include all these vegetable or animal colours, which are produced by precipitation with a white earthy base, which is ordinarily alumina. Having made an infusion of the dye stuff, a portion of the sub-sulphate of alumina is added to it; at first there is but a slight precipitate, but if a little potash is carefully added, the alumina is copiously precipitated, carrying down with it the colouring matter. *Yellow lakes* are thus prepared from an infusion of Persian or French berries, or from *Quercitron* or *Annatto*, an extract procured from a certain tree common in some parts of America, *bixa orellana*.—Carmine and carminated lakes have already been described. Lakes are also obtained from Brazil-wood, but the finest after carmine are procured from madder. The process of obtaining them is as follows, or some modification of it:—

A quantity of madder is soaked in water for a quarter of an hour and then squeezed in a press; this operation is repeated twice with the same portion. Alum is then added, and the infusion heated upon a water bath for three or four hours, water being added as it evaporates; the liquor is then carefully filtered, and the lake, aluminated alizarin, is to be precipitated by carbonate of potash. After precipitation the lakes are well washed, and then dried on blocks of chalk in a drying stove. As in the manufacture of carmine, so in the preparation of the madder lakes; attention to the most minute details of each division of the process is required. The quality of the water employed materially influences the resulting colour, and it is found that distilled water cannot be employed with advantage. We learn from inquiries at some of our largest colour manufacturers that the most brilliant lakes are made on the brightest days.

APRIL 1910

THE UNIVERSITY OF CHICAGO

The operations of light in thus determining the physical conditions necessary for obtaining the finest colours have yet to be investigated. From an extensive series of experiments, many of which are published in the "Researches on Light," we have been able to show that every chemical change is, in some measure, dependent on the influence of the solar radiations; that we always in the same time obtain a smaller quantity of a precipitate in the dark to that thrown down in daylight, and that the tone of colour of all those examined is materially influenced by the varying conditions of the sunshine. We may hope, since the whole subject of actino-chemistry, as it has been called, is now receiving much attention, that we shall rapidly advance to a more perfect knowledge of these curious truths, and that the facts made known to us by science may minister to the useful purposes of life, or enable us to increase the more refined pleasures of existence.

ROBERT HUNT.

THE VERNON GALLERY.

A SYRIAN MAID.

W. H. PICKERSGILL, R.A., Painter. S. Sangster, Engraver.
Size of the Picture, 2 ft. 11 in. by 2 ft. 3 1/2 in.

MR. PICKERSGILL is among the oldest members of the Royal Academy, having been elected to the full honours of that institution in the year 1825; it must, indeed, be nearly forty years since his pictures first appeared on its walls, during which time he has been as fully occupied in portrait painting as any contemporary artist; and among the many who have sat to him he can reckon some of the most distinguished characters of the period, eminent by birth, by literary and scientific attainments, warriors, and statesmen, the noble of both sexes. His style is eminently attractive; he has the power of catching and placing on his canvas the most intelligent expression of his model, producing an unquestionable likeness, without the affectation of prettiness or the seduction of flattery; his colouring is vivid yet not overdone, and there is a firmness and a force in it too frequently neglected by many portrait-painters. Though he is now verging towards threescore years and ten the pencil of Mr. Pickersgill has lost none of its power and of its brilliancy, neither has it declined in activity, for we remember in the last year's exhibition some five or six pictures by him, neither unimportant in subject nor size.

The picture here entitled "A Syrian Maid" is evidently the portrait of a Jewess. In the southern parts of Syria, about Jerusalem, Hebron, and what are termed the other holy cities, this ancient people are to be found in great numbers; the majority of them are poor, but there are also many who live in opulence, surrounded by the delicacies and luxuries of the highest orders of society. In these families the females attire themselves magnificently, and are adorned with a profusion of costly jewels. It must be to such a class that our "Syrian Maid" belongs, for there is an elegance about the whole subject, features, dress, and attitude, which bespeaks elevated position. Following the custom of eastern ladies, she is studying the "language of flowers" in the *bonquet* which she holds in her hand. This manner of giving historical interest to portraiture has been frequently practised by the artist, and always with success.

ART IN CONTINENTAL STATES.

THE ARTISTS IN ROME.

ALTHOUGH I have not yet found time to take a complete view of what is going on in the ateliers of our artists, who, in the midst of the disturbances of Rome, have been fully employed, I will endeavour to give you a preliminary account of the most striking productions of higher Art I have so far met with.

Let us begin with Mr. Wyatt, who has just finished the model of a group of touching character. We see a shepherd boy, who, in company with a young girl, is surprised by a hurricane, and makes a last endeavour to shelter his lovely companion with his own body; but while he is looking round for help, the pitiless storm threatens to snatch away his cap, which he holds up by a convulsive effort of the hand. The subject is exceedingly well expressed, and the skillful sculptor has found

here an opportunity for the display of many graceful emotions of the human mind, and the most striking contrasts in the impression made by the violence of the tempest, as modified by difference of sex, on the minds of the generous youth and the sensitive maiden.

I found Mr. Gibson occupied in making a design for some projected monument for the House of Lords, which affords high promise of beauty, and is most rich in poetical allusions. It consists of the statue of Her Majesty, supported by two figures, one representing Wisdom, the other Victory, who makes Queen Victoria's name speak, really, the truth, when we look to the events which render her reign glorious. On the pedestal are three bas-reliefs representing Commerce, Science, and Agriculture, the triple root of Britannia's unrivalled grandeur.

Tenebris is engaged in finishing the statue of the Grand Duchess Olga of Russia, which promises to become a masterpiece of fine execution in marble, as well as a specimen of grand conception and judicious arrangement as a whole. This renowned sculptor is so exceedingly occupied, that he has now for several years been unable to accept new commissions. Amongst the other excellent busts in his studio is to be seen that of the unhappy Count Rossi, whose likeness he has taken with that extraordinary skill which distinguishes all portraits coming from his hand. Rossi being his countryman, and also intimately acquainted with him, had a particular claim upon his power of plastic reproduction, and he has well fulfilled his vocation of immortalising the great statesman on whose shoulders rested the last hopes of Pius IX. for the regeneration of Italy.

M. Fogelberg, a Swedish sculptor, who excels in statues of a colossal size, is occupied in the restoration of his plaster model of Gustavus Adolphus, the bronze cast of which has had an unsuccessful result. This beautiful figure, intended as the monument of the hero of the thirty years' war, to be erected in Gothenburg, is full of life and historical truth. The valiant monarch of the North stands before us as though he were living, and in act to challenge his enemies. The costume of the time is managed with astonishing tact, and the whole design tells us the story of that grand epoch which decided the fate of the spiritual interests of the civilised world. Noble and dignified is the appearance of the hero of northern Protestantism, who triumphed by his firm faith over the blind superstition of southern Popery. The same artist is at work upon a colossal equestrian statue of Bernadotte, the late King of Sweden, which, to judge from the small-sized model giving the complete design, promises to become a masterpiece worthy to take its place among the few, really great works, of the kind.

M. Henschel, from Cassel, has finished a large number of fine statues, partly consisting of groups, partly of a series of figures, which are exquisite from their careful treatment and the profound knowledge which they evince of the laws governing the highest order of sculpture. He is occupied at this moment with a bas-relief representing the child Jesus riding on the lion of the tribe of Judah, which is just crossing the cliffs of a precipice where the dragon of the darkness is lurking. The style employed in this fine composition is peculiar to our artist, which may be defined as that of Albert Dürer, ennobled by elevated taste and the sentiment of refined beauty.

Galli, amongst the Italians, the favourite pupil of Thorwaldsen, was formerly occupied almost exclusively for Prince Torlonia, whom he has presented with a large number of compositions, the offspring of his fertile imagination and classical learning. We saw a beautiful series of mythological representations by him, and several fine compositions of Greek and Roman history, all placed in Prince Torlonia's nearly erected villa.

M. Kümmel, an Hanoverian sculptor, has treated a *genre* subject with great success. One of the women who in the summer months are wont to descend from the mountains to take part in the harvest labour of the Roman campaign, folds her child in her apron while her shoulders are loaded with a wheat-sheaf. This group is exceedingly well composed, and is at once graceful and dignified.

Rome is at this moment filled with the renown of a picture executed by Karelowsky for the King of Prussia. It represents the judgment of Daniel in favour of the chaste Susanna, and the condemnation of the two sinful elders. The composition is a large one, and is rich in well-imagined motives.

M. Wittmer, a Bavarian painter, has executed a large plafond design for a church newly erected in honour of Santa Rosa, at Viterbo. It represents the Madonna glorified and receiving the homage of San Francisco, the first Italian poet, who praised her in suitable and fervent terms, and of the Holy

Virgin Santa Rosa, who, as a girl of eighteen, once struck terror into the Emperor Frederic Barbarossa himself. She here appears looking out from the picture, to see whether the nuns in the choir beneath are keeping watch. The same artist has taken on the spot many interesting incidents of the siege of Rome, which give us a correct idea of the romantic character distinguishing the career of Garibaldi. These designs are of the highest interest, even in an historical point of view, and I should wish to see them inserted in your Journal, as words alone cannot satisfactorily pourtray the events which took place before the eyes of our artist.

Consoni, the most eminent amongst the Italian purists, a man imbued with the spirit of beauty and the unrivalled charm of Raphael, is occupied with a large series of drawings representing memorable events of the Old Testament. They are indeed sublime, and we shall endeavour hereafter to give a regular account of the most conspicuous amongst them.

Before concluding the report, allow me to say a few words on the subject of some water-colour paintings by M. Werner, which are to be seen in the permanent exhibition in the Casino of the German artist at Rome. One of these pourtrays to us the decayed splendour of an Italian palace, where a man, poor in the things of this world, but transported by the aid of his imagination to centuries of past glory, spends his days happily in the cheerful society of a young and lovely girl. She is occupied with her spinning-wheel, whilst he himself is perusing the large volume of an old chronicle. Another picture introduces us into a modern drawing-room, where a knight of the order of the Golden Fleece has taken his seat close beside his treasure-box, on the top of which a frightful ape bears him company. A table placed near him is loaded with bottles of costly wines and other objects ministering to gastronomic pleasures, evidently the source of much evil to the unhappy miser, whose features betray an expression of despair and a thorough disgust of life.

This will suffice for the present to convey to you some idea of what is going on in this distracted country. As soon as I have more leisure, I will endeavour to satisfy your curiosity more regularly, and will add some details which may contribute to the amusement and instruction of your readers.

E. B.

GERMANY.—It is a remarkable, but very consolatory fact, that our great artists, instead of being discouraged by the political disturbances of the Continent, have derived from them rather new strength and a more powerful impulse. Not only Cornelius, who is occupied in the execution of cartoons for the frescoes intended to decorate the Royal Camposanto of Berlin, enjoys the full vigour of his early youth, and performs wonders of artistic skill and knowledge, but even Overbeck, who has been surrounded by the disorders of the Roman revolution and by the misery which always attends similar catastrophes, unfolds a productive power which is truly astonishing. While engaged in the execution of the large altar-picture for the Cathedral of Cologne (the beautiful cartoon of which has been an object of general admiration), and even before having completed the incomparable series of drawings intended to illustrate the New Testament (engraved and published at Düsseldorf by Schulgen); he has laid hand to an entirely new work, not less distinguished by the originality of the leading ideas than by the richness of the composition and the peculiar grace of the design. The Argument, selected by a man whose profound theological learning surprises even great Biblical scholars, is that of the Seven Sacraments, illustrated by facts from Scripture, surrounded by a frame-work, formed of episcopal representations taken from the Old and New Testament, which throw light upon the symbolical meaning of the main subject. As it is our intention to give a regular account of these remarkable productions of lofty genius, when the whole series is completed, we must content ourselves with indicating the three compositions already fully outlined. The first is the Supper, depicted in a highly dramatic and novel manner; the second represents the moment when Christ re-appears to the Apostles, glowing upon them the Holy Spirit, and exhorting them to do penance; and the third represents to us the Apostles Peter and John administering the Sacrament of the Confirmation. These brilliant compositions are intended to be executed as coloured drawings, and perhaps they may one day be worked in tapestries, like the Arazzi, of which the Vatican possesses so large a store. The revival of this branch of industry by the invention of designs worthy to be reproduced in so expensive a manner, would be of the highest interest to all friends of Art.

E. B.

PARIS.—One of the least contested appointments made by the Provisional Government during the first effervescence of the February Revolution, was that of M. Jeannon to the directorship of the Louvre and all the other National Museums. It is with great regret we learn that this gentleman has just been dispossessed of his functions. He began his labours at a very critical period, when all public collections, being confounded by the vulgar with royal property, were for a time in danger of utter destruction; and it is well known in Paris that, but for his presence of mind and indomitable energy, the magnificent establishment confided to his charge would have been invaded and probably laid waste. On more than one occasion and with only the assistance afforded by the passers by, he succeeded, partly by force and partly by persuasion, in driving back whole bands of assailants, and contrived, in the midst of the riotous occupation of the Tuileries by the populace, to save and to transport to the Louvre numerous works of Art and objects of value. The more immediate duties of his office he discharged with universal satisfaction, and during his brief career contrived to effect some most important ameliorations. The new classification of all the objects of Art which he adopted won the approval not only of the public but of the whole body of artists; and in fact, the praises bestowed upon him in society and by the press on all sides were so warm and hearty, that it could not be supposed that any government would incur the responsibility of removing him. It appears, however, that for some time his place had been ardently desired by a Monsieur de Nicuwerkerke, little known in the artistic world, but intimately connected by the tender ties of friendship with the family of the President of the Republic. Intrigues of all kinds were set on foot to procure the substitution, but they failed at first, because no possible reason could be found for displacing M. Jeannon. Probably it was hoped that he might be kind enough at length to supply a fair pretext for his dismissal; but as he still continued obstinately to do his duty, and to devote his whole energies to the improvement of the establishment under his care, it was found necessary to dispense with a reason, and appeal to the law of the strongest. M. de Nicuwerkerke was therefore suddenly appointed, and M. Jeannon received notice to quit instantaneously. We regret the circumstance more for the sake of the Louvre than for M. Jeannon himself, for he only loses a very laborious though congenial occupation, whilst the Louvre loses incomparably the best director it ever possessed. M. Louis Napoleon has greatly injured himself in public opinion by this exercise of authority. The artistic world condemns it with one voice. No one in society would venture to undertake the task of defending it, and among other significant circumstances, the town of Lille has just sent up to M. Jeannon a very remarkable address expressive of sympathy and regret.

THE EXHIBITION OF WORKS OF INDUSTRY: 1851.

The first list of subscribers has been published, and will probably be advertised in our Journal. A sum of nearly 20,000*l.* has been already furnished towards the expenses of carrying out this vast National undertaking; but this amount has been supplied by London alone; from the other leading cities of England subscriptions as large, by comparison, will ere long arrive; and there can be, we think, little doubt that ultimately 100,000*l.* will be realised before the work of erecting the building has been commenced. This sum will, we apprehend, justify proceedings on a scale of sufficient magnitude.

What arrangements will be subsequently made, in reference to charges for space, and for admissions, at present no one can say; we imagine, however, there will be no per-centage on orders taken; that manufacturers and other exhibitors will be lightly taxed, and that the public will be admitted at a comparatively low charge; that, in fact, there will be a careful and considerable study to render widely available the means of instruction which it is the great purpose of the exhibition to produce.

It cannot be necessary for us to urge upon provincial manufacturers, and all classes interested in manufactures, from the highest to the lowest, the vast importance of this National movement for the promotion of British Industry; and the consequent duty which devolves

upon all—from the wealthy capitalist to the humblest artisan—to aid as liberally as circumstances justify.

The City of London has given an example of liberality which will certainly be followed by Manchester, Liverpool, Birmingham, York, Glasgow, and the other "Cities of Manufacture;" but all the towns—even the smallest—throughout England and Scotland, will contribute to the fund; and so, the 100,000*l.* will be collected.

Meanwhile preparations for the competition are in active progress, not only at home but abroad: not only in our colonies but in foreign states. Our British manufacturers are fully aware of the stern necessity which impels them to activity; their capital, energy, and enterprise, they believe will do much to enable them to compete with their rivals of the Continent: they enter upon the contest not without confidence, but yet not without some apprehension, for they know they have to compete, at comparatively short notice, with fabricants who are aged in the ways of Art, who have accomplished artists at their side, and all the 'appliances and means' which arise out of long experience. That which, in short, is ready to the hand of the manufacturer of Germany or France, the English manufacturer has to look for; we do not fear his finding what he wants. There is, in truth, nothing to discourage England in this contest: that in some articles (these being of minor importance) we shall be far surpassed, we cannot doubt; but that in others our supremacy will be manifested by this exhibition is equally sure. Those, who like ourselves, have visited the Expositions of Paris and Belgium, will be at no loss to furnish a long list of objects in the productions of which rivalry is to be courted and not shunned: and if during the next ten or twelve months competent artist-assistants he sought for and found, there need be no apprehension whatsoever that our rivals will carry off the laurels which England is preparing for the victors, in the arena to which the champions of all the nations of the world are to be admitted without let or hindrance.

We trust, however, the Commission will bear in mind that works produced out of National Funds are not to be suffered in competition with the productions of private enterprise: for example, the porcelain of Sèvres, the Carpets of the Gobelins, and the creations of Art paid for by many of the states or sovereigns of Germany—formed without regard to cost—must not be accepted on the terms offered to individuals who incur all the risks incident to costly undertakings. These and all other matters will no doubt receive the weight to which they are entitled; and while the very basis of the plan is that of entire freedom, due care will be taken to protect the interests of Great Britain in the contest.

In our next, we shall perhaps be able to report that in most of the principal cities and towns of the kingdom auxiliary committees have been formed. Upon them the issue must in a great degree depend; if they discharge their duty zealously the result is certain and safe.

We take leave to warn manufacturers against suspicions which cannot be otherwise than prejudicial: we cannot be ignorant of the fact (we have received too many letters on the subject to leave us in any doubt on the matter) that some fears are felt in reference to those gentlemen who are generally supposed to hold in a high degree the results in their hands. No apprehension in reference to them need be entertained; the Executive Committee will merely obey the orders of the Commission; the Commission will be, and desire to be, held responsible for every arrangement made, and every act that is done; nay, we may almost go so far as to say that the illustrious Prince who is at the head of the Commission offers himself as a pledge for the justice, equity, and impartiality of the transaction throughout. Week after week, his name appears on the list of those Commissioners who attend the meetings at "the new Palace of Westminster."

We have reason to know that every, even the smallest, transaction connected with the plan receives his personal scrutiny, and that he will make himself so fully acquainted with all its

minor details that nothing can "go wrong" without his sanction; a security which no man can for a moment hesitate to accept as all-sufficient.*

THE VERNON GALLERY.

THE LAST IN.

W. Mulready, R.A., Painter. J. T. Smyth, Engraver.
Size of the Picture, 2 ft. 6 in. by 2 ft. 6 in.

SINCE this picture was painted, in 1835, we have had other examples of Mr. Mulready's pencil exhibiting more delicacy of finish, and greater brilliancy of colouring, but certainly none that transcend it in all the sterling qualities of Art, composition, truth, and drawing.

From a less skilful hand than his the subject is one that could not fail to arrest attention; school-days, though not perhaps exactly as here set forth, are familiar reminiscences with most of us, and greatly as we then feared the "fusses" of hirc and the fowle wielded with despotic power by the master spirit presiding over the youthful assembly, we can recur to them as pleasant times, and feel interested in whatever brings them back again to memory. It may fairly be doubted whether any enjoyment in after-life is so much relished—as is so free from the least particle of alloy, as was the rush to the play-ground when the clock spoke the hour of deliverance from bondage, on some bright summer afternoon's holiday: we can revel in the thought of it even now, though "long years have rolled between," and the world has girded us with its harsh iron chain, and its stern realities have taken the place of the dreams we cherished as if we could command their constant abiding with us. Yet our experience testified that it was not all sunshine, especially to "The Last In" when the same tongue, then an unwelcome one, recalled us to our daily labours.

The occupants of the school-room in Mr. Mulready's picture are a mixed assembly of boys and girls—a common feature in a village school, where the duties of imparting knowledge are jointly shared by the master and his dame: such appears to be the case in the work before us. The interest of the picture centres in the person of the former and the idler who has just entered: the master, with indifferently mock ceremony, makes his obsequiousness to the "last in," whose look of embarrassment indicates his guilt; behind him, in the entrance to the doorway, are two other figures, possibly his companions in playing truant, who appear anxiously watching what kind of reception he is likely to meet. To the left of the master's rostrum is a group of girls apparently engaged in the same way, and two of the urchins in the foreground seize the opportunity to "make a sketch" with a piece of chalk on the book-cover, while the vigilant eye of the pedagogue is otherwise occupied; the youngster seated on the low stool in front is undergoing punishment for some misdeed, as he has a large log fastened to his foot—*primâ facie* evidence of delinquency in one shape or another; the birchen rod lies before him, ready for use when occasion requires. The introduction of the two females with the infant, seen in the distance to the right of the picture, is not we think sufficiently obvious as to its meaning in a scene like this.

The picture is altogether a most excellent example of the painter; there is a grace about the whole composition rarely manifested in works of this kind, while every figure has been carefully studied and finished with the utmost elaborateness; the face of the tallest of the group of girls is exceedingly beautiful in the original, so fine indeed as almost to defy the power of any engraver to render it as we see it there; the head of the master is likewise a most clever study. In colour this work assimilates closely to that of the Dutch school, as it does also in the best acquisitions of Art. The *chiaroscuro* is admirably managed, the light falling on the principal figures from a window not placed in the picture, while it is again repeated in the pretty bit of landscape seen through the opening in the rear. Few artists would have dared to venture upon such a treatment as this, where the lights that fall internally are stronger than that which appears without any intervening medium.

The difficulty of engraving a work so treated, independent of its other characteristics, must have been very great, yet Mr. Smyth has accomplished his object with perfect success; as a whole it is capital, while there are portions, as for instance the three boys to the right, which, for the combination of delicacy with solidity, we have seldom or never seen excelled.

* The "latest intelligence" on this subject will be found in another page of the *Art-Journal*.

THE UNIVERSITY OF CHICAGO PRESS

THE HISTORY

The history of the world is a vast and complex subject, encompassing the lives and actions of countless individuals and the events that have shaped our planet. From the dawn of civilization to the present day, the human story is one of constant change and evolution. The early years of our species are marked by a struggle for survival, as our ancestors sought to adapt to their environments and develop the tools and skills necessary for a more secure existence. Over time, these early struggles gave way to the rise of great empires and the birth of new cultures, each with its own unique contributions to the human legacy. The Middle Ages saw the emergence of powerful monarchies and the spread of Christianity, which would profoundly influence the course of Western history. The Renaissance brought a renewed interest in art, science, and humanism, paving the way for the modern world. The 17th and 18th centuries were characterized by the Enlightenment, a period of intellectual and scientific discovery that challenged traditional beliefs and laid the foundation for modern democracy and human rights. The 19th century was a time of rapid industrialization and global expansion, as the world became more interconnected through trade and travel. The 20th century has been a period of unprecedented change, marked by the rise of totalitarianism, the devastation of two world wars, and the dawn of the nuclear age. Today, we stand at the threshold of a new era, one in which the challenges of climate change, global inequality, and technological advancement are shaping the future of our species. The history of the world is not just a record of events, but a testament to the resilience and ingenuity of the human spirit.

W. HUGHES DEL. & ENGRAVED BY J. H. BURNETT

THE HOUSE OF REFUGE

PLATE I

easy to trace its gradual decay during the invasion of barbarism, but traces are found of it in the later times of the Greek empire. While Classic Art was forgotten, the Arabesque style was perfected by the Arabians and the Germanic nation. But as the Arabesque arose when Classical Art was declining, so the latter rose again in the blooming period of Modern Art, and was awakened from her sleep by the greatest of her masters. From the discovery of the paintings in the baths of Titus may be dated a new epoch in the history of Ornamental Art, when Raffaele gave a new and loftier direction to taste; and Arabesque won its highest triumph in the Loggia of the Vatican, a portion of which is given in our cut. This Art owes its great success to Raffaele's idea of introducing Allegory in the composition; thus, giving poetical language to that which was before only a pleasure to the eyes, his genius produced an ensemble which surpassed everything ever beheld in splendour and in beauty. After his time the Arabesque degenerated both in invention and composition. In Ornamental Art, Arabesque deserves the most extensive cultivation, but it draws upon higher resources than are possessed by the majority of modern artists; the only man who, to our knowledge, has succeeded, is the German artist, Eugene Neureuther, whose Arabesques in the Glyptothek at Munich are worthy of any age. For the Moorish Arabesques, the student should consult *The Alhambra*, by OWEN JONES; for the Ancient, ZAHN'S *Ornamente aller Classischen Kunstepochen*, and *Ornamente und Merkwürdigen Gemälden von Pompeii, Herculaneum und Stabia*; and for the Modern, GUTENBERG'S *Frescoes and Stuccoes of the Churches and Palaces of Italy*.

ARCHAEOLOGY, in general, means the knowledge of antiquity, but in a narrower sense, the science which enquires into and discovers the mental life of ancient nations from their monuments, whether literary, artistical, or mechanical. Artistic Archaeology treats of remains as works of the fine Arts, in those two nations which were models in Art, the Greeks and Romans; besides these the artistic productions of the Indians, Egyptians, Babylonians, and Persians, take an honourable place in the Archaeology of Art. According to Grüber, artistic Archaeology may be divided as follows: 1. *Historico-literary* examinations of the works still existing in museums, galleries, and private collections; the analytical method gives in this the best guide. 2. *The Technology* of the antique regarded as Art-history, and explaining style, method, and the treatment of works of Art according to the different epochs. 3. *The Criticism* of Art, which teaches the principles by which the antique is to be tried or decided as belonging to a certain period of Art. 4. *The Interpretation* of Art, which explains the symbolical part of ancient Art and artist's fables, the manner of treating the meaning of ancient works of Art, and the necessary aids, mythology, history, antiquities. 5. *The Aesthetics* of the antique, which make us comprehend the spirit of antiques (deciding their disposition, action, and expression); and showing us pure beauty, awakens and animates the feeling of it. The aesthetics of the antique show us the circle of the gods and heroes as the types of humanity, souls made visible in bodies, according to various ideals of sex and age, from the exalted divinity of a Jupiter to a satyr, where human nature is lost in that of the animal. While aesthetics are essential to Archaeology, in pointing out the pure taste, the noble simplicity, and the perfect appropriateness of these creations of Art, they are also employed in a higher kind of criticism. See MULLER'S *Ancient Art and its Remains*, translated by Leitz, WINCKELMAN'S *History of Ancient Art*, PANOFKA'S *Manners and Customs of the Greeks*, the works of Gell, Stuart, Revett, Taylor Combe, Millengen, and others.

ARCHANGELS. Under the head of ANGELS it was stated that the heavenly host is divided into three hierarchies. Archangels belong to the third; they are the seven angels who stand in the presence of God; they are his extraordinary ambassadors; they are adorers, ministers, protectors, avengers, remunerators: in all these functions they are

generally nimbed, and have their feet naked, as the Apostles and divine persons; their ensign is a banner on a cross, as representing Victory; they are usually depicted clothed as princes and warriors, with breastplates of gold, coronets and crosses on their foreheads, to show that they warred against the devil and his angels, and armed with a sword or dart in one hand. The names of the seven Archangels are Michael (*Who is like unto God*), Gabriel (*God is my Strength*), Raphael (*the Medicine of God*), Uriel (*the Light of God*), Chamuel, Zophiel, and Zacheiel; only the first four are individualised in the Scriptures. Their attributes are,—St. Michael, sometimes in complete armour, bears a sword and a pair of scales, as the Angel of Judgment; also a rod, with a cross *flory* at the upper end; St. Raphael bears a fish, and, as a traveller, carries a pilgrim's staff and a gourd; St. Gabriel bears a lily; Uriel carries a parchment roll and a hook, as the interpreter of prophecies; Chamuel bears a cup and a staff; Zophiel, a flaming sword; and Zacheiel, the sacrificial knife which he took from Abraham. The seven Archangels are introduced in some of the most beautiful works of Christian Art, such as "The Last Judgment," the "Crucifixion," and in the "Ficta," bearing the instruments of the Passion; they appear individually in other works, as in the "Expulsion," "The Sacrifice of Abraham," "The Annunciation," &c.

ARCHITECTURAL PAINTING. The principal kind of painting of inanimate objects, representing the creation of man, surrounded by nature, or independent of her. This branch of Art gives us great or small buildings, either single or grouped together, their exteriors or interiors, their details, proportions, and characteristics, according to the rules of perspective. Architectural painting has done much for the Aesthetics of Art, and also for its History, in perpetuating the features of architectural monuments which may disappear under the touch of time. It is therefore important to the future historian of Art; and many an architectural painting has thus become useful to us at the present day. With the addition of natural features appropriately and tastefully introduced, such paintings are useful as Views. Among those artists who have devoted themselves particularly to Architectural Painting, the most eminent are Gentile Bellini and V. Carpaccio. Later, but much inferior in truthfulness, are Canaletti and Claude. Among our contemporaries who have practised successfully this branch of painting, we may mention Turner, Roberts, Prout, Stanfield, Cattermole, Harding, Nash, and Haighe. Architectural Painting has recently made great progress in Germany, through the works of A. von Behr, W. Gail, D. Quaglio, M. Neuber, E. Weizmann, H. Kintze, K. F. W. Kloss, E. Dietrich, G. Pulian, Dyck, and A. Hermann.

ARK. In Medieval Art, a symbol of the body of the Virgin Mary.

ARMENIUM (LAPIS ARMENIUS). A pigment of the ancients, produced by grinding the Armenian stone, found in Armenia, which country also produced the *CRYSOCCOLA*, or green Verditer. According to Wallerius, the Armenian Stone was blue carbonate of copper, combined with lime, while others maintain that it was the same substance combined with quartz, some mica, and pyrites; it was also regarded as ultramarine, but the description of Armenium given by Pliny agrees in no respect with the peculiar qualities of ultramarine; nor has the latter ever been found in Armenia, although there are districts in that country in which carbonate of copper exists. It, however, is not improbable that the ancients prepared a pigment from Lapis Lazuli, to which they gave the name of Armenium.

ARMET. A helmet much in use during the

Fig. 1.

Fig. 2.

sixteenth century, and which may be worn with or without the beaver.*

* Our woodcut is copied from Skelton's Engravings of the Goodrich Court Armoury, and which is so described:—Fig. 1. The Armet *grand et petit*, so called from being capable of assuming either character seen in profile. The wire which appears above the umbril is to hold the triple barbed beaver. Fig. 2. The same viewed in front with the oreilletes closed, but the beaver removed so as to render it an Armet petit.

ARMILAUZA (*Lat.*) A garment, similar to the surcoat in use by the Saxons and Normans. It was worn by knights over armour. It originated with the classic nations, and sometimes assumed the form of the paludamentum, varying in shape, but retaining the name, because it was an external covering.

ARMILLA (ARMLET). The Roman term for the ornaments of the hand and arm. The former were generally called by the Greeks *Pseillon*, the latter *Peribrachionion*; and both kinds *Ophis* (serpent, *i. e.*, serpent-bands), when they were shaped like serpents, or were fastened by the heads of those animals. The term *Ophis* completely describes the Armlets of the Bacchantes, which consisted of serpents exactly resembling those in Nature.† The custom of wearing Armilla as an ornament is of the highest antiquity; they were worn by both males and females, and were given as rewards for military bravery. In the collections of antiquities in the British Museum are contained great quantities of Armilla, of infinite variety of form, in gold, silver, and bronze.

ARMING POINTS. The ties holding together the various parts of Armour.

ARMINS. Coverings of cloth or velvet, for the handle of a Pike, to give the heated hand a more secure hold.

ARMOUR. Defences worn on the body against the blows of weapons, &c. They were formed of various materials, such as leather, skins of animals, and sometimes of cloth. Frequently the armour

covered the whole body, but parts only were sometimes protected. Among the Greeks the armour consisted of helmet, cuirass, greaves, shield, and

the arms wear a sword and a spear. The first woodcut exhibits them all in the figure of a great

* Our engraving is copied from Strutt, who obtained it from an illumination in Royal MS., 20 A. 2, a work of the fourteenth century.

† Our specimen is obtained from a statue in the Vatican.

warrior attired for battle. It is copied from a figure given in Hope's *Costume of the Ancients*. The armour of the Roman soldiers corresponded in all essential parts with that of the Greeks, except that the former wore a dagger on his right side instead of a sword on his left. Our next engraving represents these peculiarities, and is copied from the figure of a Roman Legionary on the Column of Trajan, at Rome. The soft or flexible parts of heavy armour were made of leather or cloth, strengthened with bronze and iron; gold and silver were employed to adorn and enrich the armour. The armour of modern times has assumed an infinite variety of forms. That of the Anglo-Saxons consisted at first of a tunic covered with iron-rings, afterwards of overlapping flaps of leather; these, with slight variations, such as lozenge-shaped pieces of steel, in place of the rings on the tunic, prevailed until the end of the twelfth century. In the thirteenth, chain mail was introduced from Asia; plate-armour came into use in the fourteenth century. The figure of Edward the Black Prince, in Canterbury Cathedral, is engraved as one of our finest existing examples of this period. The subsequent variations were chiefly ornamental; the period of greatest richness and splendour being the reigns of Edward V. and Richard III.*

ARKANGEMENT. In the plastic Arts, and in painting, Invention and Arrangement are the groundwork of every composition. ARRANGEMENT is the placing together of parts in a manner conformable to the character and aim of the work; it relates entirely to the form, in which the subject must be worked out so as to produce an intuitive perception of its individuality. Artistic Arrangement belongs not only to the object as a whole, but to each part specially, to groups as well as to single figures, and to the position and contrast of their limbs. In painting it refers to the distribution of colours, and the disposition of light and shade, all of which require a peculiar artistic arrangement; light, shade, and colouring, being the soul of all painting.†

The characteristic of ARRANGEMENT must be unity in manifoldness, but there is here a threefold relation, either cause to effect, argument to conclusion, means to an end, or as part to part or to the whole. The laws of arrangement are therefore the laws of causality, referring to the purpose and proportion; every beautiful work of Art must contain a prevailing thought, a principal idea, to which all else is subject. In this subordination, the law of causality is acknowledged, and thus, to ARRANGE means in Art to plan, so that one part appears to follow from another. Time and space are also to be regarded, and in this respect the objects are not joined simply by argument and conclusion, or cause and effect, but also appear close to one another, following one another, or being in relation to the whole. Therefore a work of Art is subject to the laws of "quantitative and qualitative" proportion. Lastly, the production of a general meaning must be considered; for this especial disposition is necessary, which is a plan (*motif*) in the highest sense of the word, aiming at subduing all to the development of the artist's aim.

ARRICCIAATE, ARRICCIARE (*Ital.*) In fresco-painting, according to Alberti, the mortar with which the *intonachi* are made is laid on in three coats: the first is called *rincoffato* (rough cast); its use is to hold very firmly the other two coats which are laid upon it. The middle coat of the *intonachi* is called ARRICCIATE; its use is to obviate any defects both in the first and in the last coats. The use of the last *intonaco* is to receive the polish and the colours. According to Pozzo, the ARRICCIATE is the first coat of mortar which

Monumental brasses furnish excellent authorities for the study of the Arms and Armour worn in England during the time it continued in use. They are depicted with great care and accuracy in Mr. WALLER'S *Monumental Brasses*. See also MERRICK'S *Critical Enquiry into Ancient Armour*, and the same Author's *Description of Ancient Arms and Armour in the Collection at Goodrich Court*.

† Titian recommended the study of a bunch of grapes, as the simplest example of a beautiful natural arrangement, and it always comes in use. The genius of an artist, to be able to reduce what is rich and proud to a simple and comprehensive illustration, and yet let it be visible in his works.

is laid on the wall or place which it is required to paint.*

ARROWS—in Christian Art are the emblems of pestilence, death, and destruction, and are sometimes introduced as marks of martyrdom, as the attributes of St. Sebastian, St. Christina, and St. Ursula. The ARROW is occasionally employed as a rebus on the name of FLETCHER, being the name by which the makers of ARROWS were formerly known.

ARSENIC, ARSENICON. This metal, in combination with other substances, enters into the composition of certain pigments. With sulphur it forms two compounds, realgar and orpiment; the first of them contains the smallest proportion of sulphur, and is red; the latter is yellow, and is also known by the name of *King's yellow*. Arsenite of potash, mixed with sulphate of copper, yields the pigment known as SCHEEL'S GREEN, an Arsenite of Copper. ARSENICON was the Greek term for the yellow sulphuret of arsenic, ORPIMENT; it was called by the Romans AURIPIGMENTUM. The SANDARACH of the ancients is supposed to be the red sulphuret of arsenic; a false kind of Sandarach, mentioned by Pliny, is the red oxide of lead; a mixture of it with ochre was discovered among the pigments used in the baths of Titus. Arsenikon is sometimes written *Arsicon* and *Arsicon*.

ARTICULATION. Painters and Sculptors, as well as Anatomists, employ this term to express junction of the bones: when the passing of one member of the body into another is well marked, and correctly drawn, they are said to be "strongly articulated," or "well articulated." This part of artistic anatomy is termed ANTHROPOLOGY, and is divided by Anatomists into the *moveable* (diarthrodial), having contiguous surfaces; and the *immovable* (synarthrodial), having contiguous surfaces and symphyses, which are partly contiguous, partly continuous. The student will find this important subject treated at length in Dr. FAU'S *Anatomy of the External Forms for the use of Artists*. Translated by DR. KNOX.

ARTIST, ARTISAN. (*Fr.* ARTISTE.) One who exercises the Fine Arts, meaning thereby the Plastic Arts especially. This term is, by some writers, made to include the musician, and by others, even the poet; but it is properly limited to the sculptor, painter, and architect. Artisan is applied to one who exercises the mechanical arts, and is subordinate to the artist.

ARTISTICALLY—with Art, taken in the sense of particular ability, address, intelligence, of the artist or artisan.

ARTOPHORUM, CIRONIUM. The ancient name for the box containing the Host. In early Christian times Church vessels were richly ornamented, and many are preserved, formed of ivory, with bas-reliefs illustrating various events in Scripture history.

ART-UNIONS are societies formed for the encouragement of the Fine Arts by the purchase of paintings, sculptures, &c. out of a common fund raised in small shares or subscriptions; such works of art, or the right of selecting them, being distributed by lot among the subscribers or members. They appear to owe their origin to M. Hennin, a distinguished amateur of Paris, who about forty years ago organised a little society for the purpose of bringing together the unsold works of artists, exhibiting them, and with the exhibition money, and other subscriptions, purchasing a selection from among them, which was afterwards distributed by lot to the subscribers. In 1816 this company merged into the "Société des Amis des Arts." Art-Unions have been extensively organised in most of the German states. The Art-Union of Berlin was established in 1825. The pictures are selected by a committee, and in addition an engraving is distributed to each subscriber. The Art-Union of the Rhine-Provinces and Westphalia, among other objects, purchase pictures for public purposes, such as altar-pieces. The leading features of these German societies are—the purchase of works of Art either by commission or selection, to be appropriated by lot amongst the members; the production of an engraving for distribution annually among the members, and the creation of a reserve fund for the encouragement of historical and religious Art, by the commission or purchase of pictures for public purposes. The first Art-Union formed in Great Britain was in Scotland, in the year 1831. The Art-Union of London was established in 1837, and since that period similar societies have been established in Ireland, and in many of the principal towns in England. It is a mooted question whether the establishment of these societies in England has done much to elevate the standard of taste in Art. The works of the greatest painters are but seldom

* Vide *The Art of Fresco Painting* by Mrs. MERRIFIELD. London, 1846.

within the reach of an Art-Union prize holder, and even if they were, it is more than likely they would not be selected. There can be no doubt, however, that whatever may be the defects of their early existence, they will ultimately help to inform and instruct the public mind, and by the time that English artists are educated in their art to the point attained by their German brethren, the public will be prepared to appreciate their works. One of the chief means of instruction for the public, the engravings, has signally failed in the hands of the Art-Union of London; there is not one among them worth a title of the price any of the prints published by the Art-Unions of the small German States would command. The American Art-Union of New York has exhibited the most remarkable instance of rapid growth and prosperity of any similar societies. It was founded in 1839, and at the close of 1849 the number of members was 18,960, to whom was distributed as prizes, 460 paintings selected by a committee, 20 statuettes, 30 books of outlines by Darley, illustrating Washington Irving's "Legend of Sleepy Hollow," 250 "Trumbull" medals, 150 "Stuart" medals, and 100 "Allston" medals.

ARUNDEL MARBLES. A collection of ancient sculptured marbles collected by Mr. Petty in the early part of the seventeenth century for Thomas Howard, Earl of Arundel, part of which were presented by his grandson, Mr. Henry Howard (afterwards the Duke of Norfolk), to the University of Oxford in the year 1667. The collection, when entire, consisted of 37 statues, 128 busts, and 250 inscribed marbles, and the invaluable cameos and intaglios which now form the "Marlborough Gems." The Arundel, together with the Portland Marbles, are preserved at Oxford, and that which the University places at the head of its collection is the Greek inscription known as the Parian Chronicle, from its having been kept in the island of Paros. It is a chronological account of the principal events in Grecian, particularly Athenian history, from the reign of Cecrops, B.C. 1450, to the Archonship of Diognetus, B.C. 264.

ARUNDEL SOCIETY. A society established in London in 1848 for the purpose of facilitating the study of Art by the publication of rare historical and practical works, and of engravings from the more important examples of architecture, sculpture, painting, and ornamental design. Among the works promised are a new translation of Vasari's "Life of Fra Angelico," illustrated with outlines of his principal works, and an engraving after one of the same artist's frescoes in the chapel of Nicholas V. in the Vatican.

ARZICA. There are two pigments known by this name to medieval writers on Art. According to Cennini, it was an artificial pigment of a yellow colour, much used at Florence for miniature painting. The Bolognese MS. of the same period shows that it was a yellow lake made from the herb *gualda*, which is the Spanish and Provençal name for the *Reseda luteola*, which plant has been used as a yellow dye throughout Europe, from a very early period. This yellow lake was known to the Spanish painters under the name of *ancora* or *encora*. The other kind of ARZICA is stated to be a yellow earth for painting, of which the moulds for casting brass are formed; it yields an ochreous pigment of a pale yellow colour, which, when burnt, changes to an orange colour.*

ARZICON, ARSICON. A contraction or corruption of the word ARSENICON, the Greek name for Orpiment (*auripigmentum*). The word ARZICON must not be confounded with AZARCON, the Spanish name for red lead.

ASILLA (*Gr.*) A wooden pole, or yoke, sometimes resting on both shoulders (as in that in common use at the present day), or more frequently on one-shoulder only, and used for carrying burdens; it occurs very frequently on ancient works of Art, especially the Grecian; it is also very frequently depicted on Egyptian sculptures, and from one of which our engraving is copied.

* Vide Mrs. MERRIFIELD'S *Ancient Practice of Oil-Painting*. London, 1849.

ASP. In sculptured representations of Christ, and also of the symbolical representation of Christian Faith, the asp is often seen placed under their feet to denote the victory over Malice. Different forms are given to the Asp; sometimes it is a short reptile, approaching in form to the lizard, with a large head, without feet; at others, it is a quadruped with short feet, its body terminating in the tail of a serpent. Our engraving is copied from the effigy of a bishop in the Temple Church, London.

ASPERGES. The rod used for sprinkling the holy water in the services of the Church.

ASPHALTUM, BITUMEN, MUMMY. (*Lat. NERO DI SPALTO.*) A brown carbonaceous pigment used in painting. It is found in various parts of the world, in Egypt, China, Naples, France, Neufchatel, and Trinidad; that found in a lake in Judea is termed Jew's pitch, and this name has also been given to all the varieties of asphaltum. The best is the Egyptian; it is glossy and heavy, emitting a very strong disagreeable smell like that of garlic or asafetida, and breaks with a shining fracture; except in colour, it agrees in outward appearance with gamboge. It is not soluble either in water, turpentine, or oil, until fused. As it is not very cheap, it is often adulterated.* Much skill and care is required in preparing this pigment for artists' use, and very little that is sold can be depended on. When improperly prepared, it flies off in oil-painting, and loses its pleasant brown tone and becomes a dirty grey, which change is owing to its containing an empyreumatic oil, which being extracted, the asphaltum becomes durable. It would be greatly improved if dissolved in amber varnish. When judiciously employed it is a most valuable pigment for backgrounds, drapery, and heads in shadow, and for warming or blending other pigments, when used either alone or mixed with blue; for this purpose no other pigment can adequately supply its place. The American artist, Washington Allston used it very much, and his example was followed by the Germans and Italians, who, not having his thorough knowledge of colour, only dirtied their pictures with it. It was used by Titian as a glazing pigment, and by Tintoretto, Andrea Schiavone and others. Asphaltum is an ingredient in the compound used for FENCING-GROUNDS, in the preparation of BRUNSWICK BLACK, and, mixed with black lac, it forms a japan varnish for boxes and wood-work. French or German Prussian blue when burned produces a pigment which is considered a valuable and eligible substitute for Asphaltum. The Prussian blue manufactured in England produces an orange-coloured pigment when burned. **BITUMEN**—the pigment sold under this name differs very much in quality; some appears to be genuine ASPHALTUM, diluted and ground up with drying oil or varnish. Asphaltum greatly retards the drying of oil, but by itself it dries quickly; therefore the selection of either of these pigments will depend in a great measure upon the choice between a quick or slow-drying pigment. In using Bitumen the artist must be prepared for disappointment, for there is a substance sold as Bitumen which will not dry at all; it is probably a factitious compound, greatly resembling coal-tar in appearance and qualities. **MUMMY**—A substance is sold under this name, which differs very much in quality, according to the manner in which it is prepared. It appears in commerce as a brown dirty compound, consisting of decayed animal and vegetable matters, mixed with small pieces of Asphaltum, which is the only portion of any value to the artist. Some ignorant colourmen merely sift out the vegetable fibre, and grind up all the earthy matter together with the uncertain quantity of Asphaltum; this is literally MUMMY, but the product is a compound of a dirty olive-brown, worse than useless; the skilful manufacturer, on the contrary, carefully picks out the only portion of value to the painter—the Asphaltum (Egyptian), and after proper mani-

plation, grinds it with drying oil or with amber varnish, and therewith produces a pigment of inestimable value for artists' use.

ASPIC (Fr.). SPIKE. Essence d'Aspic, or oil of spike, is prepared from the wildlavender (*lavendula major or latifolia*). It is used in wax-painting.

ASS. This animal is employed in Christian Art as the symbol of Sobriety; in figures on some Christian monuments, as the emblem of the Jewish nation; it also seems to exhibit the Synagogue personified, carrying by the saddle the heads of many swine.

ASSUMPTION. The assumption of the Blessed Virgin Mary is a subject that has called forth the highest resources of Christian Art. Among the most famous is the picture by Titian, at Venice. Granacci has also treated this subject with great skill and feeling in a picture contained in the Florentine Gallery. The usual mode of depicting this subject is—a scene exhibiting a tomb open and empty, the Apostles around in astonishment. St. Thomas in the midst of them showing the girdle of the Virgin which he holds in his hand. Above, seated among the clouds with the crescent moon at her feet, is the Virgin Mary.

ASTRALAGUS (Gr.). A huckle-bone. From the earliest times the huckle-bones of sheep and goats have been used by women and children to play at a game which consisted in throwing these bones into the air and catching them on the

back of the hand.* Where these bones were without any artificial marks the game was entirely one of skill; when the sides of the bones were marked like dice it became a game of chance. This subject is frequently represented in ancient Art. In the British Museum is a marble group, in which a boy is hitting the arm of his playfellow.

ATELIER. A term derived from the French, and applied specially to the work-room of sculptors and painters, which are also called Studios. The Dutch and Flemish painters have delighted to portray their Ateliers. Many of the ATELIERERS of the old masters, Titian, Raffaele, Michael Angelo and others were the resort of princes, nobles, men of letters, and kindred artists; they also served as SCHOOLS of Art, after the manner of Academies, but much more efficiently, for the purposes of instruction; this custom has been adopted in modern times by Overbeck, Paul de la Roche, Couture and others.

A TEMPERA. Artists are undecided as to the nature of painting in tempera. The opinion that it was a kind of water-painting, in which white of egg (*albumen*) was used as a vehicle, is inadmissible, since investigation has proved the existence in old paintings of oily substances mixed with resin, but all have a ground of gypsum, or chalk, tempered with milk, animal glue, or white of egg. The pigments are laid on very thinly upon a glazed white ground; they are durable, and may be cleaned with water without injury, possessing all the properties of oil colours, except that they do not grow darker; nevertheless, they are covered over with a sort of PATINA. Later investigations lead to the suggestion that essential oils and wax were ingredients of the vehicle, or may have been used in some manner as a varnish. Though the laying on of the pigments appears transparent, we may conclude, from a certain stiffness, hardness, and meagreness of these old pictures, that the technical part of this kind of painting was not favourable to a free and ingenious mode of treatment. This might be remedied by the modern style of painting, and the restoration of TEMPERA-PAINTING would cause a new epoch in Art, because of the durability of its colours. It may be remarked, historically, that tempera-painting was brought from Constantinople (Byzantium) to Rome, and flourished for three hundred years, until the introduction of oil painting.

ATHLETE. Wrestlers and pugilists, who made trial of their bodily strength in gymnastic games, striving to gain the victory over their

rivals, and to obtain the prize of success. The *Gymnastic* art was that which strengthened and fortified the body, according to rules and principles; the *Agonistic*, that which exercised and preserved that strength by means of games; the *Athletic*, that which became, particularly in later times, a separate trade, striving and attaining, by the aid of science, the highest degree of bodily strength. In ancient times *Athlete* had the same meaning as *Agoniste*. Gymnastics are that part of Grecian manners, which, from a natural alliance with plastic Art, has been the best represented by Art, and although the greater part of ancient

works are lost to us, we have many representations of ATHLETE left in marble copies, reliefs, paintings on vases, and on gems. Short curling hair, strong limbs, a vigorous development of form, and proportionally small heads, characterise these figures; the crushed ears, and prominent muscles mark especially the pugilistic and Pancrastic. The representation of individual form and of characteristic movements in combat were the principal requisites in ancient Art, and these are often exemplified with perfect truthfulness by the statues in honour of the victors. The ATHLETES are also frequently represented in a simple quiet posture, and in actions common to all Gymnastic combatants, such as anointing the body with oil, (performed in the Gymnasia by the *Aliptra*), preparing for victory, and encircling the head with the victorious wreath.*

ATLANTICS, TELAMONES, PERCEES, GIGANTES, are the athletic male statues which we find as supports of parts of ancient buildings; female figures for the same purpose were called CARYATIDES; they are not exact imitations of nature, but their use is sufficiently justified by the antique.

They were only employed when pillars were too insignificant for the erections; they are suitable to a rich style, to small screens, fountains, for supporting a gallery, and for the upper rows of pillars: these should not appear so heavy as to excite compassion, but the expression should be one of graceful freedom.

ATRAMENTUM. A black pigment. Pliny used this term for all carbonised organic materials of a black colour, used in painting; but two other substances bear this name. Under ATRAMENTUM are comprised—1. Black coal and peat. 2. Lamp-black, which the ancients obtained by burning pitch and resinous woods in close reservoirs built for the purpose; 3. Stone black, prepared by carbonising the seeds of the grape, and used by Polygnotus and Myron; 4. The black produced by carbonising the dregs of wine; 5. That produced by grinding charred wood; 6. Burnt ivory, or ATRAMENTUM ELEPHANTINUM, which Apelles discovered and first used in painting; 7. That obtained from mummies, (Asphaltum); Pliny censures the use of this "carbon from graves." The term Atramentum is also used for other substances, such as writing ink, sepia, and the colouring material mixed with lime, (lamp-black) used for colouring walls.

* The statue recently discovered at Rome is supposed to be an Athlete scraping the perspiration from his body with a Strigil, and is engraved above.

* MERRIFIELD'S *Ancient Practice of Oil-Painting*, vol. i., p. cxx. et seq.

* Our engraving is copied from a Greek painting discovered at Resina.

PILGRIMAGES TO ENGLISH SHRINES.

WITH NOTES AND ILLUSTRATIONS BY
F. W. FAIRHOLT, F.S.A.

THE GRAVE OF WILLIAM PENN.

DISTINGUISHED American observed to us, not long ago, that 'of all lawgivers there are none whose names shine so brightly on the page of history as do those of GEORGE WASHINGTON and WILLIAM PENN,' both of whom he claimed for his country. The former was, indeed, truly

a great man; perhaps of all Patriots who ever lived he is the one most 'without spot or blemish'—pure, faithful, unselfish, devoted: yet, all things considered, it may be that William Penn is entitled to even higher admiration: the one nurtured in liberty became its high priest; the other cradled in luxury, lived to endure a long and fierce struggle with oppression; and yet, amid sore temptations and seductive flatteries, he passed, with the innate consciousness of genius, and a human desire of approbation, conquering not only others but himself, and finally doing justice among the 'Red men' of a new country whom all his predecessors had sought to pillage and destroy. The sense of right must indeed have been of surpassing strength in the nature of William Penn. In an age fertile of slander against every act of virtue, and of calumny as regarded all good men, the marvel is how his reputation has descended to us so unscathed; living, as he did, with those who make us blush for England, and often in contact with the low-minded and the false who were ever on the watch to do him wrong, still the evil imputed to him is little, if it be any, more than tradition; while his goodness is to this day as a beacon, casting its clear light over the waves of the Atlantic, and his name a watchword of honour and a synonyme for prophy and philanthropy.

It is a joy and a comfort to turn over the pages of this great man's life; to view him as a statesman, acting upon Christian principles in direct opposition to the ordinary policy of the world; and it was to us a source of high enjoyment, to reflect upon his eventful career, while spending, during the past summer, some sunny days wandering amid scenes in Buckinghamshire,—in places which bear his honoured name. In Penn Wood there are trees yet in all the vigour of a green old age, beneath the shadow of which the peaceful lawgiver of Pennsylvania might have pondered on the true and rational liberty he would have gladly died to establish.*

There is one spot—the most hallowed of them all—of which we shall write presently: a simple, quiet, resting-place, for those who have gone to sleep in peace; but, ere we pause at this Shrine, we must recall the lawgiver, amid the billows of life, buffeting the waves which in the end floated him into a haven of rest.

The family of William Penn were of Buckinghamshire, and from them sprang the Penns of Penn's Lodge, on the edge of Bradon Forest; from the Penns of Penn's Lodge our William Penn came in direct descent. His father was, by profession, far other than a man of peace. He was one of England's rough bulwarks, bearing

'The battle and the breeze';

obtained professional distinction while almost a boy; commanded (in 1665) the fleet which Cromwell sent against Hispaniola; and, after the Restoration, behaved so gallantly in a sea-fight against the Dutch, that he was knighted, and was 'received,' runs the chronicle, 'with all the marks of privato friendship at court.'

* Further traces of this family are to be found in Pennlands, Penn Street, Penhouse, all in the same county. The name given in after years to the American colony—Pennsylvania—is but a remembrance of the locality.

Charles II.'s 'privato' friendship could have been of small value to Admiral Penn; indeed, he seemed to have cared little which was in the ascendant—King or Commonwealth; but his sailor-nature *did* care for the glory of England, and he improved her navy in several important departments. Admiral Sir William Penn married Margaret, the daughter of John Jasper, of Rotterdam, and in due time the fair Dutch-woman's son became the 'PROPRIETOR' of Pennsylvania.† William was born in the parish of St. Catherine's, Tower Hill, on the 14th day of October, 1644;† doubtless his mother left her home at Wanstead in Essex to be confined in London, although the neighbourhood of the

Tower could not have been a very quiet retreat. The beat of the drum and the blast of the trumpet must have often disturbed the couch of the young mother. The fashionable world of those days knew nothing of the 'west end,' except from the salubrity of its fields and mulberry gardens, and the locality of Tower Hill was well adapted to suit the taste and calling of the Admiral, who had there chosen his 'town house.'

In due time the mother and child returned to Wanstead; and the Archbishop of York having a little time previously founded a grammar school at Chigwell,* the embryo lawgiver was sent there at a very early age, where he was

WANSTEAD, IN ESSEX.

sufficiently near the family residence to give his mother the opportunity of frequently seeing her beloved son.

The localities thus connected with the early life of Penn are on the borders of Epping Forest, and although but a few miles from London, lie in a district but little visited. Wanstead is a picturesque spot, and the village green with its thickly planted over-arching trees, and large red-brick houses, give it still an air of old-fashioned dignity. We were pleased with the aspect of the place, and left it with regret to

journey on to Chigwell. The latter is an old and silent village; the church, with its row of arching yews; the large inn opposite, with its deep gables and bowed windows, and the entire character of the village carried the mind insensibly back. The school is an ivy-covered building; and the room in which the after-governor of Pennsylvania was educated bears traces of considerable antiquity.

The temperament of William Penn was sensitive and enthusiastic; and must have caused his parents much anxiety. It is certain, that while

EXTERIOR OF CHIGWELL SCHOOL.

at Chigwell, his mind became seriously impressed on the great subject of religion. The Admiral, we may suppose, if he knew of this impression, would not have regarded it favourably; and if it were

known to him, it made him hasten his son's departure from Chigwell, for the following year we find him at school near his birthplace on Tower Hill, and most likely at a *day* school, for his father to augment his scholarship kept a

* This phrase is copied from the tomb of one of his grandsons, in the Church of the Village of Penn.

† This district has entirely changed its aspect; twenty years ago it was densely and not very reputationally populated. The Collegiate Church and Abbot's Houses stood in the midst of dirty streets, down which few strangers ventured: the Hospital of St. Catherine was removed to the Regent's Park; and the parish cleared away to an enormous extent to form on its site the Docks which bear the same name.

* The free schools at Chigwell were founded in the year 1629, by Archbishop Harsnet; one for teaching children reading, writing, and arithmetic, the other for their instruction in the Greek and Latin tongues. There is a fine brass to the founder in the church here; he commenced life as master of the grammar school in his native town of Colchester, and became successively Bishop of Chichester and Norwich, and ultimately Archbishop of York. He died in 1631.

private tutor for him at his own home. Sir William had high hopes for this darling child. His talents were of a lofty order, his accomplishments were many, and he won all hearts by his captivating manners. When fifteen, he entered Christ Church, Oxford, as a gentleman commoner. There, without neglecting his studies, he took great delight in manly sports and in the society of his companions, numbering among his friends Robert Spencer and John Locke; but

schools; and what was far more dear to the Admiral, the sword—then the hedge and hirthright of the English gentleman.

Even in this more tolerant age, when no sorrow or misfortune visits our country without testing and proving the social value of the Quakers, as most faithful labourers in the cause of charity and most loyal and peaceful subjects—even we can fancy the rage of some old Admiral—the very Hotspur of the ocean—if his son were

INTERIOR OF CHISWELL SCHOOL.

though the seed may remain long in the earth and give no sign of life, if the soil be but favourable, it will spring up as surely as it has been sown—to "bring forth fruit in due season."

About this time a certain Thomas Loe was drawn into what his college considered the heresy of Quakerism, and, like all sincere men who believe they have discovered truth, he sought to win others over to his new faith, or rather to a purifying of the old. Accordingly, the meetings and devotional exercises of him and his friends gave offence to the heads of the college, who fined all of them for nonconformity. This opposition strengthened their determination to persevere; and those who had been simply devotional, rushed into fanaticism. While these youths were fusing in the fire of increased zeal, a command from Charles II. to Oxford, directed that the surplice should be worn according to the custom of ancient times. His Majesty loved to see religion in full dress—outward pomp seemed to him a good excuse for absence of the vital principle—but William Penn, his friend Robert Spencer, and others who believed that the robe would impair the spirituality, fell upon the students who appeared *ex robe* and tore the dresses to pieces—for which they were all expelled. There was much more of the father's spirit, than of the mother's gentleness, in this outbreak; but his father was not moved to approbation thereby; on the contrary, he was sorely grieved; the Admiral was terror-stricken at his son's becoming 'religious;' he knew that Quakers were men who professed to hold all worldly distinctions in contempt—whose political principles were hardly defined, but who refused to remain uncovered in the presence even of Royalty—whose plain speech, and uncompromising faith, left no loop-holes for 'excuses' or 'expedients'—whose nay was nay—whose yea was yea—without 'compromise;' and, above all, who were men of peace. It was not to be expected that a hero such as Admiral Penn, could have endured the idea of his son—endowed with all the accomplishments that charm society, and the high qualities which engrave their possessor's name on the page of history—subsiding into Quakerism in the days of his youth; hiding his fortunes beneath a broad-brimmed hat; and abandoning for ever the graces of society—the established learning of the

the son, who was again sheltered beneath his roof; but not long destined to remain there.

The unenviable distinction which France enjoys of being the country where no serious thought can arrive at maturity, tempted Sir William to send his son to Paris. Foreign travel was then considered indispensable to the gentleman, and he, doubtless, thought that the gaieties of Paris would do more towards emancipating young Penn from the thralldom of sectarianism than the reproof of the college, or his repented of severity. It is believed that for a time his father's wishes were gratified; but only one anecdote is preserved of his conduct there, and that tells greatly to his honour. He was attacked one night by a person who drew his sword upon him in consequence of a supposed affront. A conflict ensued, proving that the youth had not in all things conformed to the habit of those whose influence was so dreaded by his father. William disarmed his antagonist, but spared his life, when, according to the record of all those who relate the fact, he could have taken it; thus exhibiting, says Gerard Crossa, a testimony not only of his courage but of his forbearance.

But if touched by the dissipations of Paris, he was not tainted by them.* In 1662 and 1663, we find him residing with a Protestant minister of Calvinistic faith, the very learned M. Amyraut of Saumur, whose character and works recommended him to the notice of Cardinal Richelieu, who imparted to him his design of uniting the two churches.

The privilege of receiving instruction from such a man was appreciated as it deserved by William Penn; the teaching of the schools is widely different from the knowledge communi-

* It has been said, indeed, that at this period of his life he dabbled with the enervating pleasures of the time; we have not only no evidence of this, but the supposition is inconsistent with his indignant exclamation, when before the Lieutenant of the Tower, Sir John Robinson, who charged him with having 'been as bad as other folks,' 'abroad, and at home too,' which elicited from William Penn the following:—'I make this bold challenge to all men, women, and children, upon earth, justly to accuse me with ever having seen me drunk, heard me swear, utter a curse, or speak one obscene word (much less that I ever made it my practice); I speak this to God's Glory, that has ever preserved me from the power of those pollutions, and that from a child, begot an hatred in me towards them;† combating his outbreak thus—'Thy words shall be thy burden, and I trample thy slander as dirt under my feet.'

ated by the wise and true to a docile and eager pupil, in the comparative silence and solitude of a private family. At Saumur, Penn pondered over 'the Fathers,' became more deeply interested in theology, and laboured diligently to acquire a perfect knowledge of the French language; from thence he proceeded to Turin, where he received a letter from his father informing him of his taking sea against the Dutch, and commanding his immediate return to England. The Admiral was perhaps too hushed to enquire much as to the state of his son's mind;—satisfied, as many are, with the ease and grace to which foreign travel seldom fails to mould the young, he commended his improvement, and Lincoln's Inn had the honour of receiving William Penn as a student for a year, when the 'great plague' set him free from the dry, but—as regarded his future—useful, study of the law.

The sacred fire kindled in his bosom, though it smouldered for a time, was never extinguished. The awful visitation that had driven him from Lincoln's Inn was well calculated to revive his more serious thoughts and lead them from the present to the future. The fatal pestilence had not subdued the restless spirit of religious controversy; men cried more loudly than ever 'I am of Paul,' 'and I of Apollos.' But, for a time, he spoke less and completed more; he had completed his twenty-first year, and with his manly robe, assumed a grave and manly bearing. His father returned from the expedition flushed with glory and triumph; but his proud plumes heat less quickly when he noted the gravity of his son, and his evident leaning towards serious matters. Again he determined to change the scene, and draughted him to the viceregal court of Ireland, then glowing with the brightness and animation of the accomplished Duke of Ormond. The means were too violent for the end: the young man grew disgusted with the court and courtly doings. The Admiral, fertile in expedients, then turned over to him the management of his Irish estates in the county of Cork.†

The task was after his son's own heart, and he performed it to admiration; this occupation most likely sowed the seed of his wisdom in territorial management, and, as there were no gaieties to amuse or perplex him, he might have continued long to delight his father in this capacity, but for the accident of his hearing WILLIAM LOE, the layman of Oxford, preach at a Quaker's meeting in Cork from the text,—'There is a faith which overcomes the world, and there is a faith which is overcome by the world.' This convinced him of the necessity for religious vitality; and at length he was, according to the custom of those 'rare old times,' apprehended at a Quaker's meeting in Cork, and thereupon committed to prison; but thanks to Lord Orrery, his term in 'the dark prison-house' was not long. His nature was strengthened in his new faith, as all noble natures are, by the invigorating power of persecution; for

— who would force the soul, tilts with a straw
Against a champion cased in adamant.*

From this time all wavering and indecision passed away, and he was considered a confirmed Quaker. Sir William, refusing to believe that every means he had taken to dispel, had but established, his son's faith, commanded his return; it would seem that at first William Penn desired to meet his father's wishes, were it possible to do so. His adherence to what was called the ceremony of the 'hat,' and his communion only with those of the same faith, convinced the Admiral that he embraced the 'heresy' more fondly than ever. The stormy and sorely-tried father used every means in his power to get his son even to appear to the world what he was not. The great point of dispute, the wearing or not wearing the hat in the presence of Royalty, may seem to us a light matter; but it was not so to 'the Friends,' and it is not so to this day.‡ And so the father again

* He had large estates in Ireland, one of which, comprehending Shanagarry Castle, lay in the barony of Imokelly, and the others in the baronies of Dhanee and Barryroe, all of them in the county of Cork. — Clarkson.

† Clarkson has very clearly summed up the reasons of the early Quakers for discarding *hat-worship* as they termed it. Taking it for granted that the ceremonious

turned the son from beneath the shelter of his roof, a houseless and moneyless wanderer; his situation would have been most pitiable, but for his mother's watchful tenderness and affection.

The young Quaker now put forth his faith in printed books, and was not slow in disputation; evincing, occasionally, rather more of the fiery zeal of Peter than the discretion of Paul; combating the attacks of certain Presbyterians with marvellous intrepidity, and attacking in his turn, which attacks ended in his being committed to the Tower. His imprisonment was rigid, but he wrote continuously; and in one tract, "Innocency with her open Face," explained away the anti-Christian charges made against his faith. After seven months incarceration he was liberated; it is believed, by the intercession of the Duke of York, to whom, from this or some other cause, he was personally attached. Certainly, in nothing did his purpose waver, for he left the gloom of the prison to attend the death-bed of Thomas Loe, his friend and guide. And then the heart of his father yearned towards him; the Admiral could not but respect his son's earnestness and consistency of purpose; the chords of both were the same, but they were tuned in different keys, and for different ends. He relented gradually, giving permission to the mother again to receive her son, and sanctioning his resuming the management of his Irish property.

He performed to admiration the duties with which he was entrusted; and on his return to

ing session, and then had the good fortune to be tried by one of the most steadfast and honest juries ever impanelled even in England.* The indignities endured both by prisoners and jury can hardly be credited; but ultimately the Quakers were liberated upon the payment of a fine, which was privately discharged by Sir William Penn.

When William Penn was freed from the Tower, it may be remembered that he passed from its walls to the deathbed of his spiritual father, William Loe, and he hastened from the loathsome cells of Newgate to the deathbed of his earthly father, whose career was terminating at an age when men calculate on length of days to enjoy the repose which is so needful as the evening of life approaches. At the age of forty-nine, his warlike but chastened spirit passed to the God who gave both peace and Christian wisdom to his latter days. It throws, however, a good deal of light on the 'king-loving' habit which was made a cruel reproach to William Penn's after course, by those who could not separate the *man* from the monarch—to remember, that in his last illness, indeed, towards its termination, Admiral Penn, foreseeing that while the existing laws of the country remained, his son would have many trials and much suffering to undergo, sent one of his friends to the Duke of York to entreat him, as a deathbed request, that he would endeavour to protect his son as far as he consistently could, and to ask the king to do the same in case of future persecution. The answer was such as the Admiral deserved, and for once the Stuart promise was faithfully kept; be it also remembered, the Duke of York had previously befriended the young Quaker, who was personally attached to him; and all know that every member of the house of Stuart possessed an extraordinary power of attaching to them those they desired to bring under their influence.

Now that he was his own master, with a fortune of fifteen hundred pounds a year, it would be impossible, within our limits, to trace his career abroad and at home, remarkable as it was for spiritual zeal, activity of body and mind, close penmanship in his closet, and so many perils and imprisonments, that he might compete with holy Paul in the eloquent list of perils and trials. At one time he publishes 'The People's Ancient and Just Liberties Asserted'; then he disputes with Jeremy Ives touching Baptist matters, at Wycomb; then he lets fly a barbed arrow against Popery: is again taken up and sent first to the Tower, and then to Newgate, for preaching; yet imprisonment no way damped his zeal, but seemed only to

for persons of distinction even before the Tower. It was a most miserable dungeon, originally termed Chamberlain's Gate; and when re-constructed by Whittington was called New Gate, it being then one of the gates of the City. It was destroyed in the Great Fire.

* The trial of Penn is an extraordinary picture of the legal tyranny of the times. It took place at the Old Bailey in September, 1670. The indictment was for preaching in Gracechurch Street; Penn's conduct was most heroic. He argued manfully and well against the persecution to which he and others were subjected, and appealed to the jury so powerfully, exhorting them to preserve their integrity of action uninfluenced by the lawyers, that they would only bring in their verdict: 'Guilty of speaking in Gracechurch Street.' And, although sent back to re-consider this verdict frequently, 'until, as the Recorder told them, they brought such one as the court would accept, they continued firm for two days and nights. The court indulged in brutal language toward them, and the infamous Recorder lamented the want of the Inquisition in England, declaring England 'would have been something equal to 'policy and prudence' to it was established. When finally pressed to deliver a verdict,—guilty, or not guilty—they, to a man, returned an answer in the negative; for which they were each fined forty marks and sent to Newgate, as also were Penn and Mead for refusing to pay the fines.

give him time for letters, essays, pamphlets, addresses.* He was never more fluent—never more industrious than when in bonds; his spirit of endurance, his hope, his enterprise, were astonishing. He no sooner quitted Newgate than he travelled into Germany and Holland, seeking and making converts. Returning, when in the twenty-eighth year of his age, he sought and found a loving

THE MONUMENT TO ADMIRAL PENN.†

and lovely wife, Gulielma Maria Springett, daughter of Sir William Springett, of Darling, in Sussex. For a brief time he enjoyed the quiet of domestic happiness at Rickmansworth, in Hertfordshire, but he would not, perhaps, could not, give up for domestic tranquillity, the life of excitement, wherein he had cast his lot; and in those days there was always something fresh to stir up the spirit of an independent mind. Charles II. had issued a declaration of indulgence to tender consciences in matters of religion, in consequence of which five hundred Quakers were released from prison; but William Penn again went forth on a self-imposed mission, accompanied by his lovely wife, and behold, amid the rait and turmoil of Bristol fair, they encountered George Fox, the great fountain of Quakerism, who had just then landed in Bristol, after a sojourn in America. Though subsequently much engaged in very stormy controversy, there can be little doubt that this meeting determined William Penn to investigate human nature in the New World. We may diverge a little from our subject to introduce two engravings, interesting as associated with this period of the history of William Penn. With Fox he travelled much; and in the Journal of that celebrated man he is frequently referred to. They visited each other's houses; and while we know that Fox resided at Wornoughurst, we have the traditional certainty of his visiting Fox, at his house, Swarthmoor Hall, on the borders of Lancashire. This mansion was his by marriage with the widow of Judge Fell; and in the memoirs of Margaret Fox, she records his first visit there in her husband's lifetime, in 1652, who, from being opposed to Quakerism, became a convert on hearing Fox, and she says:—'He let us have a meeting in his house the next first day after, which was the first public meeting that was at Swarthmoor, our meetings being kept at Swarthmoor about thirty-eight

* In a catalogue of 'Friends' Books' (J. Soule, 1709) we find a list of his written productions from 1668 to 1700, in number no fewer than one hundred and nine.

† The father of Penn was buried in Redcliffe Church, Bristol, and a monument was erected there to his memory by his wife, which, narrating his early promotions in the Navy until the time when he withdrew and made for his end; and with a gentle and even gale, in much peace arrived and anchored in his last and best port at Winstead in the County of Essex, the 15th of September, 1670; being then but forty-nine years and four months old."

OLD NEWGATE PRISON.

England was received with open arms by a father no longer stern or unforgiving; his mother had the joy of seeing them once more united. Nor does it appear that his son's after disputations, or preachings, or imprisonments, caused any new breach between them, though we find the young 'friend' preaching in Gracechurch Street, and expressing his opinions so freely upon various matters—especially the famous Conventicle Act passed in 1670, prohibiting dissenters from worshipping God in their own way—that he was, with another of the society, one William Mead, seized upon by constables, conveyed at once to Newgate,* where they were left until the follow-

removal of the hat was intended to be indicative of honour, respect, submission, or some similar feeling of the mind, they contended, that, used as it then was, it was no more a criterion of these than mourning garments were criterions of sorrow; hence, they argued, the falsity of the custom. If used as indicative of respect, they contended, that it was more generally applied to the purposes of flattery, and equally objectionable. But the strongest reason of the three, was that which declared, that the removal of the hat in the worship of God precluded the possibility of giving any of his creatures an equal amount of honour.

* Newgate had been a prison since 1218, and was used

years, until a new Meeting-house was built by George Fox's order and cost, near Swarthmoor Hall.*

SWARTHMOOR HALL.

In 1676 Penn became 'manager of Property concerns' in New Jersey; invited settlers, sent them out in three vessels, and occupied himself in the formation of a constitution, consisting of terms of agreement and concession. Perfect religious liberty was of course established, and William Penn left on record that 'he hoped he had laid the foundation for those in after ages of their liberty both as men and Christians, and by an adherence to which they could never be brought into bondage but by their own consent.'

How evident it is that such-like exercises qualified him for his after-charge of 'his property' of Pennsylvania! In these days it is little more than a pleasure trip, to those who like, or do not absolutely dislike, the sea, to cross the Atlantic; but in the time of William Penn it was a serious undertaking; yet nothing obstructed his progress; when once he fixed within his mind, that it was *right* to act, the act was

SWARTHMOOR MEETING-HOUSE.

'a foot.' It would be the PILGRIMAGE of a life to follow his steps; we have taken but a condensed view of his movements, yet what space it has occupied; and still his journeyings are only commenced! What meetings and preachings in Holland and Germany—what disputations abroad and in England—what petitions on behalf of the peaceful, but most persecuted Quakers—what answers to libels, and what loving epistles to God's people! Stimulated by the hot blood of his father, which at times boiled within his veins, he for a time forgot his consistency and made common cause with Algernon Sidney in his contested election at Guildford; but his 'plainness' did not move the people 'more than eloquence,' for Sidney lost his election, and Penn was forced from the hustings. And all this time his mighty hand was projecting, and his mighty heart heating with plans for the good of New Jersey: mingling

the divine and secular in a way which cannot be comprehended by those who have not known what it is to contend with the restlessness and

suggestions of an enterprising and fervent spirit. His heart was rent asunder by the persecutions endured by his people—especially in the 'rough' city of Bristol—and anxious as he then was for the grants, which he in after-time obtained, the fear of 'great ones' never prevented his rising hand and voice against tyranny.

At length one of his great objects was attained; the Charter, granting him the tract of land which he himself had marked out, bears date the 4th of March, 1681. Let none suppose this was a free gift from the Majesty of England to the Quaker,—not at all;—he had petitioned for land in 'the far West,' where brethren might dwell together in unity, in love, and in security, chiefly as the liquidation of a debt which the government owed his father.* And when his petition was granted, then commenced the career by which his name is chiefly known and honoured; his sayings and doings, his writings, his wearings and journeyings, are only parts of the political and religious contention which disjoined England in those days, and show forth the restless and truth-seeking spirit of one whose aim was to keep alive the purer and simpler forms of religion, while contending manfully for its liberty. Happily, the spirit of persecution—at least of legalised persecution—has been extinguished in our age; and now, instead of sitting in terror under our own 'vine and fig tree'—

'We rather think, with grateful mind sedate,
How Providence ordaineth, from the spring
Of lawless will, unlooked for streams of good,
Which neither force shall check, nor time abate.'

But the grand feature, the climax—the crowning of the capital—is PENN at PENNSYLVANIA; the just man, rising above all temptations. Let quibbles he raised, and old rumours revived,—the facts of Penn's legislation prove the greatness of his mind and the purity of his intentions. He had the strong feelings, passions, and thoughts inseparable from a large brain; and the wonder of all who look upon him dispassionately, must be, not that some evil has been asserted of one who accomplished what he desired, and commanded the respect of the voluptuous, as well as the affection of

the good, but that so little has been found or written to his discredit.

Gathering 'a favoured people' together from wherever he had preached 'the word,' we find that, at a very early period, he freighted two ships with Irish Quakers.

Mercurial as the Irish are, there is no country where Quakers are more beloved and trusted to this day, than in Ireland; and well they may be so! At all times the Quakers stand forth between 'the people' and destruction; no matter whether the peasantry are assailed by pestilence or by famine, the firm, calm, unpressuring, but steadfast Quaker,† comes forward with his store

* His father had advanced large sums of money from time to time for the good of the Naval service, and his pay had been also in arrears. For these two claims, including the interest upon the money due, government were in debt to him no less a sum than 16,000*l.*—*Clarkson.*

† It is worthy of record, that during the rebellion of 1798, there was but one instance of a Quaker being put to

death, and energy, and industry, and charity (pure charity in its most comprehensive sense), and *mind*, ready to save, and employ, and instruct; we have met with some who remember having heard from their parents, that their grandfathers remembered the wailing of the poor when the 'great law-maker,' William Penn, indeed so many of the 'neighbors' to go to the New World. The 'conditions,' as it pleased him to call his code of laws,—laws made as much for the advantage of a people given carelessly into his hand by a power which evidently thought little of the 'Peltries,' or 'bunting ground,' of the Red-men—as for the good of those who sought a home in an unknown land, in full reliance upon their leader,—the 'conditions' are all stated in Clarkson's life of Penn.*

The closeness and simplicity and wisdom of his legislation are admirable commentaries on the multitude and mystery of involvements which sepulchre our laws. It is evident that in all he did he sought not only that his own people should be well treated, but that they should treat others well. He put far away all attempts at religious persecution; and strove rather to make men upright and just in their old faith, than to tempt them into a new one.

The emarkation of this Quaker colony must, if we recal it by help of imagination, have formed a strange contrast to the going out of an 'emigrant ship' in our own day. The well-clad, well-organised, steadfast, earnest, subdued, yet hopeful people, taking leave of those whom they loved, yet left, subduing, as is their custom, all outward indications of anguish, and seeming ashamed of the emotion which sent tears to their eyes and tremors to their lips! Two of the good ships—well ordered, well appointed, well provisioned—sailed from London; another from Bristol. How different from those wretched hulks which are now sent staggering across the seas, to convey a diseased, half-naked, and enfeebled multitude to the promised land!

Penn's letter to the Indians, transmitted by one of the earliest ships, is a master-piece of what worldlings call policy, but which is simply, justice and right feeling. This letter preceded his visit, and was well calculated to excite the confidence and curiosity of the Red-men, who must have felt deeply anxious to see the 'Pale face' who addressed them, and was disposed to treat them, as brethren.

The death of his mother at this time spread a gloom over his loving spirit, and delayed his departure; but the interests of the New World summoned him from the Old. His letter to his wife and children, written on their separation, is such a record of pure love and true wisdom, that we should like to see it published as a tract, to find place among the treasures of every young married woman, and be unto her and her children a guide through life. He dates this letter from Worminghurst, where his family resided some considerable time.

He at length sailed for the new colony, in the ship 'Welcome,' and was there greeted by his future subjects, consisting of English, Irish, Dutch, and Swedes, then in number about 3000. He had people of many creeds and many lands to deal with, as well as an unseen and almost unknown nation, but he commenced with so noble an act of justice, in *paying* the Indians for the lands already *given* him in *payment* by the king of England, that 'Pale-faces' and 'Red-skins' were alike convinced of his certain honesty of purpose. There are few persons whose pulsations are so numbed that they will not beat the quicker when they hear of a generous action; the soul is revived, even in a worldly bosom, by the throbs of immortality which tell us there are great and righteous deeds prompted by God himself. With what an upright gait and open brow must William Penn have met the tribes at COAQUANOC—the Indian name for the place where Philadelphia now stands—foremost of a

death by the rebels; and that act was perpetrated in ignorance of the calling of the victim.

* Philadelphia, the name which Penn gave to his new city, is a compound from the Greek, signifying brotherly love. The 'conditions' were also published in French, German, and Dutch, in 1682, and were extensively circulated over the Continent, inviting adventurers of all nations, creeds, and tongues, to join him in his enterprise at the city of 'Brotherly Love.'

handful of Quakers, without weapon, undefended, except by that sure protector which the Almighty has stamped on every honest brow.

Here the peace-loving law-maker awaited the pouring out of the dusky tribes.

Amid the woods, as far as eye could reach, dark masses of wild uncouth creatures, some with paint and feathers, and rude, but deadly weapons, advanced slowly and in good order; grave, stern chiefs, and strong-armed 'braves' gathering to meet a few unarmed strangers, their future FRIENDS, NOT MASTERS! There was neither spear nor pistol, sword nor rifle, scourge nor fetter, open or concealed, among these white men; the trysting-place was an elm-tree of prodigious growth at Shackamaxon, the present Kensington of Philadelphia.* Towards

this tree the leaders of both tribes drew near, approaching each other under its widely spreading branches; front to front, eye to eye, neither having a dishonest or dishonourable thought towards his fellow-man—comprehending each other by means of that great interpreter—Truth! How vexatious, that history should be so mute as to this most glorious meeting, and that there is little but tradition,—that faintest echo of the mighty past,—to tell of the speeches made by the Indians, and replied to by William Penn after his first address had been delivered. The Quaker used no subterfuge, employed no stratagem to draw them into confidence; imposed not upon their senses by a display of crown, sceptre, mace, sword, halbert, or any of the visible signs of stately dominion or warlike power, to

But much as the lawgiver* eulogised the 'quiet' of his new colony, he was not content to remain there. His mind was anxious; his affections were divided between the two hemispheres; his ardent, restless nature longed to act wherever action was needed. If the English government had hoped to get rid of him when they sold him the land for an inheritance, they were mistaken; several of those he loved were in sorrow and imprisonment; the Stuarts gave liberty of conscience one day and withdrew it the next; he therefore returned to England. Charles II. was trembling on the verge of the grave, which soon closed over him, leaving nothing for immortality but the fame of weakness even in vice. William Penn records James telling him, soon after his accession, that now he meant to 'go to mass above board'; upon which the Quaker replied quietly and promptly, 'that he hoped his Majesty would grant to others the liberty he so loved himself, and let all go where they pleased.' His renewed intimacy with James strengthened the old reproach of 'time-serving,' and 'trimming,' and William Penn was frequently called Jesuitical. Those who so reproached him had forgotten the long friendship which had subsisted between the King and himself, and the fact that never had his influence in high places been used except for right and righteous purposes. Whatever was said against him either then or now lacks proof, and is no more history than the bubble on the surface of the stream is the stream itself. He resided then in a house at Charing Cross, most probably one ready furnished, as it has not been pointed at as a residence. His journeyings to and fro were resumed, and as he was known to be affectionately attached to James, (who certainly showed him great favour), when William came to the throne he was persecuted nearly as much as in the old times. Pennsylvania, too, became disturbed, not by the discontent of the Red-men, but by discontent with another governor. The wife of his bosom died in her fiftieth year, and soon after his son, in the prime of youth and hope, was taken from him. He married, however, again, feeling it hard to superintend a household without the overlooking care of a steadfast woman. From those of his own people who could not comprehend his liberal views he experienced great opposition and reproof, some of them thinking he enticed too much into the world of politics.

*Time and the hour run through the longest day;

Penn outlived evil report and persecution.

which, like all wild men, they were inclined to render homage;—and this is a thing to look at with pride and thankfulness, when man in a righteous purpose, and with simplicity, and steadfast intent, becomes so completely one of Heaven's delegates, that he is looked up to, and respected by his fellow mortals, who are not so richly endowed by God. It must have been a sight of exceeding glory when Penn, whose only personal distinction was a netted sash of sky-blue silk, cast his eyes over the mighty and strange multitude, who observed him with an undefined interest, while his followers displayed to the tribes various articles of merchandise, and he advanced, steadily, towards the great *Sachem*, chief of them all, who, as Penn drew near, placed a horned chaplet on his head, which gave his people intimation that the sacredness of peace was over all. With one consent the tribes threw down their bows and arrows, crouched around their chiefs, forming a huge half-moon on the ground, while their great chief told William Penn, by his interpreter, that the 'nations were ready to hear him,†

This scene has never been either recorded or painted as it might be. The great fact that he there spoke fearlessly and honestly, what they heard and believed—pledging themselves, when he had concluded, according to their country's

manner, to live in love with William Penn and his children as long as the sun and moon should endure—is more suggestive than any record in modern history.

After arranging all matters as to the future city, well might William Penn write home—'In fine, here is what Abraham, Isaac, and Jacob would be well contented with, and service enough for God, for the fields are here white with harvest. Oh, how sweet is the quiet of these parts! freed from the anxious and

* Penn, in his letter to the Earl of Sunderland, thus describes the great event which gives this spot celebrity: he says—'In settling me this land they thus ordered themselves: the old in a balcony, upon the ground; the middle-aged in a like figure at a little distance behind them; and the young fry in the same manner behind them.' 'We have thus,' says Watson, in his *Annals of Philadelphia*, 'a graphic picture of Penn's treaty, as painted by himself; and to my mind the sloping green bank presented a ready amphitheatre for the display of the successive semi-circles of Indians.' The large elm under which Penn concluded his treaty is seen to the right in the foreground of the above cut; it was blown down on the 2nd of March, 1810. In its form it was remarkably wide-spread, but not lofty; its main-branch inclining towards the river measured 150 feet in length; its girth around the trunk was twenty-four feet; and its age, as it was counted by the inspection of its circles of annual growth, was 283 years; it stood on the edge of the bank, which sloped to the river. The avenue of trees seen in the view, and Fairman Maurian opposite, was constructed in 1702. Penn greatly desired to purchase it as a country residence for himself, but failed to do so.

† Watson, in his *Annals of Philadelphia*, tells us—

'After the death of the great law-giver of Pennsylvania, his family appear to have much degenerated. One member became remarkable for dissolute and ungovernable habits, and ultimately the property passed into other hands. The settlers, however, still retained a sense of respect for the descendants, and upon a visit of one of them in the early part of the eighteenth century, who had been a shopkeeper; they received him with so much general rejoicing and public honours, that the poor man, totally unused to it, was frightened out of all propriety.

After a lapse of seventeen years he again sailed with his family to Pennsylvania; again was received by 'white and red' as their father and their friend; dispelled many differences,

* Slate-roof House, the city residence of William Penn and family while in Philadelphia, on his second visit in 1700, is remarkable as the birthplace of the only one of the race of Penn born in the country. Here John Penn, 'the American,' was born one month after the arrival of the family. After Penn's decease, the house was retained as the governor's residence; and John Adams, and other members of the Congress had their lodgings in the Slate House.

PENN'S TREATY GROUND.

SLATE-ROOF HOUSE PHILADELPHIA.

troublesome solicitations, burries, and perplexities of woeful Europe!

healed many sores, saw the city he had planned, rising rapidly on every side. These seventeen years seemed to have done the work of seventy, and the prosperity of Pennsylvania was secured. He had shown the possibility of a nation maintaining its own internal policy amid a mixture of different nations and opposite civil and religious opinions, and of maintaining its foreign relations also, without the aid of a soldier or a man-at-arms. The CONSTABLE'S STAFF was the only symbol of authority in Pennsylvania for the greater part of a century!

He had still abundant vexations to endure.

His circumstances had become embarrassed. He returned with his family to England an aged man, though more aged by the unceasing anxiety and activity of his life, than by years.

There are traditions of his dwelling at Kensington and Knightsbridge; but it is known that he possessed himself of a handsome mansion at Ruscombe, near Twyford, in Berkshire,* here a stroke of apoplexy numbed his active brain, and rendered him unfit for business; that such 'strokes' were repeated, until he finally sank beneath them, is also certain; but those who visited him between the periods of their

among friends. The Meeting-house is, of course, perfectly unadorned—plain benches, and a plain table, such as you sometimes see in 'furniture-prints' of Queen Anne's time. This table the little maid placed outside, to enable Mr. Fairbolt to sketch the grave-yard, and that we might write our names in a book, where a few English and a number of Americans had written before us,—it would be defamation to call it 'an album,'—it contained simply, as it ought, the names of those, who, like ourselves, wished to be instructed and elevated by a sight of the grave of William Penn.

The burying-ground might be termed a little meadow, for the long green grass waved over, while it in a great degree concealed, the several undulations which showed where many sleep; but when observed more closely, chequered though it was by increasing shadows, the very undulations gave an appearance of green waves to the verdure as it swept above the slightly raised mounds; there was something to us sacred beyond all telling in this green place of nameless graves, as if having done with the world, the world had nothing more to do with those whose stations were filled up, whose names were forgotten! it was more solemn, told more truly of actual death, than the monuments beneath the fretted roofs of Westminster or St. Paul's, labouring, often unworthily, 'to point a moral or adorn a tale,' to keep a memory green, which else had mouldered!

The young girl knew the 'law-giver's' grave amongst the many, as well as if it had been crushed by a tower of monumental marble.

She pointed it out, between the graves of his two wives; some pilgrim to the shrine had planted a little branch, a more twig, which had sprouted and sent forth leaves, just at the head of the mound of earth,—an effort at distinction that seemed somewhat to displease the old woman, who had come forth looking well satisfied at what she called the 'quiet place' being so noticed. 'All who came,' she said, 'knew the grave of William Penn; there was no need of any distinction; there it was, every one knew it; yes, many came,—especially Americans. Ladies now and then plucked a little root of the grass, and took it away as a treasure; and no wonder, every one said he was a man of peace,—a GOOD MAN!

We walked along the road that leads to the upland, and leaning against a stile, saw the shadows of the tall trees grow longer and longer, as if drawing themselves closer to the hallowed earth. The Meeting-house had a solemn aspect; so lonely, so embowered, so closed up,—as if it would rather keep within itself, and to itself, than be a part of the busy world of busy men.

How still and beautiful a scene! How grand in its simplicity; how unostentatiously religious,—those green mounds, upon which the setting sun was now casting its good-night in golden benisons, seemed to us more spirit-moving than all the vaulted monuments of antiquity we had ever seen. How we wished that all law-givers had been like him, who rested within the sanctuary of that green grass grave. We thought how he had the success of a conqueror in establishing and defending his colony; without ever, as was said of him, drawing a sword; the goodness of the most benevolent ruler in treating his subjects like his own children; the tenderness of an universal Father, who opened his arms, without distinction of sect or party, to the worthy of all mankind;—the man who really wishes to establish a mission of peace, and love, and justice to the ends of the earth, should first pray beside the grave of William Penn.

stances of Penn's death and funeral with touching simplicity.—'On the 31st of fifth month, 1718, I received a letter from Hannah Penn, of the decease of her husband, our ancient and honourable friend, William Penn, who departed this life on the 30th, between two and three in the morning, of a short sickness.' He then notes his visit on the 1st of the succeeding month to Ruscombe, where 'I staid till the 5th (of August), and that day accompanied the corpse to the grave, at Jordans meeting-place, in the County of Bucks, where we had a large Meeting of Friends and others from many places; and as the Lord had made choice of him in the days of his youth for great and good services, and had been with him in many dangers and difficulties of various kinds, so he did not leave him in his last moments, but honoured the occasion with his blessed presence, and gave a happy season of his goodness to the general satisfaction of all, the Meeting being well spoken of by strangers afterwards.'

RUSCOMBE.

infliction, bore testimony to his faith, and hope, and trust in the Lord, and of his unfeeling loving-kindness and gentleness to those around him. Thus, through much faintness and weakness, he had but little actual suffering, though there was a gradual pacing towards eternity, during six years, and on the 30th day of July, 1718, in the seventy-fourth year of his age, he put off the mortal coil which he had worn, even to the wearing out, and joined in Heaven those he had loved on

earth. There was an immediate and mighty gathering of his friends and admirers, who attended his remains to the burying-ground of Jordans. It must have been a thrilling sight; the silent and solemn people wending their way through the embowered lanes leading from Ruscombe into Buckinghamshire, that hallowed land of Hampden, consecrated by so many memories, of which Penn, if not chiefest, is now among the chief! The dense unweeping sorrow

THE GRAVE OF WILLIAM PENN.

of a Quaker funeral once witnessed can never be forgotten.†

The sun had begun to make long shadows on
* Ruscombe is a quiet little village on the borders of Berkshire: it lies in a valley, and the gently rising hills afar off add to the placid beauty of the scene. Some very old cottages and farms constitute the homes of its inhabitants, which remain much as they must have been when Penn was here resident. The house in which he died was destroyed nearly twenty years ago; and an old countryman, who noticed our scrutiny of the village and entered freely into the interest of our visit, described it as a large and quaint old mansion, which stood opposite the church, and commanded the view exhibited in our woodcut; a view entirely unaltered by modernisation, and upon which the eye of Penn must often have rested.

the grass, and the bright stems of the birch threw up, as it were, the foliage of heavier trees, before we came in sight of the quaint solitary place of silence and of graves. The narrow road leading to the Quakers' Meeting-house was not often disturbed by the echo of carriage-wheels, and before we alighted an aged woman had looked out with a perplexed yet kindly countenance, and then gave back and sent forth her little grand-daughter who met us with a self-possessed and quiet air, which showed that if not 'a friend,' she had dwelt

† In Thomas Story's Journal, he narrates the circum-

ORIGINAL DESIGNS
FOR MANUFACTURERS.

We remember a debate that took place some few years back in the House of Commons on the subject of Schools of Design, in which Mr. W. Williams, then member for Coventry, himself an extensive manufacturer, stated, that "he believed there was as much talent for design in this country as in any other, but unfortunately no pains had been taken to cultivate it. The feeling which existed among the higher classes here, that there was a want of taste in our manufactures, had been very detrimental to them." He related a circumstance in confirmation of the fact:—"An English manufacturer had introduced a pattern that turned out so unsuccessful that he was compelled to dispose of the greater portion of the goods at a loss. A French house got possession of a piece, and two years afterwards introduced the same pattern as the 'newest French style,' and it realised forty per cent. more than the original price." We have our doubts whether the same *russe* would succeed now.

It can scarcely be denied that England is

and enterprise, qualities whereof the world has long since been fully cognisant, but also her taste, skill, and ingenuity. To arrive at the perfection of any art, it is not enough to have acquired the mere mechanical process of composition and construction, however successfully these may be applied; such are only the foundations whereon the superstructure, enriched and beautified by the operations of the mind rather than of the hand, is to be laid. There is no beauty, either in Nature or Art, without refinement, nor can this quality be produced without a thorough knowledge of what is essential to its creation. To attain this knowledge is not an easy task, nor one to be rapidly acquired; but we believe that the majority of our manufacturers have heartily set themselves to the work, that they have already gained no inconsiderable proficiency in it, and that its actual accomplishment will ere long be fully and satisfactorily developed. We already have a School of Fine Arts unsurpassed, collectively, by any one throughout the universe; what is there to hinder our reaching the same high position in our Industrial Arts? The elements of each are identical; it is their appropriation alone which constitutes the difference.

Raffaello painted the "Transfiguration," but he also decorated the walls of churches and chapels with floriated designs; our own Flaxman sculptured the "Archangel Michael contending with Satan," yet he could furnish designs for the potter's clay and the worker in metal.

It is the purity and elegance of design to which attention is now chiefly directed by those connected with our manufacturing interests, for herein, hitherto, has our weakness been manifest; yet from it we have been gradually rising into such a measure of strength as will presently leave us little to be desired; we think it may be added without presumption, that the columns of the *Art-Journal* have been in no slight degree instrumental to this end, no less by the "Original Designs" it has furnished, than by the arguments continually enforced by us on all whom the matter especially concerns.

The first design on the present page is for a LAMP, by H. FITZ-COOK (13, New Ormond Street). It is intended either for the table, or to be placed in a niche in a hall, and is not inappropriately termed a Promethean lamp, being suggested by the fable of Prometheus, who climbed the heavens by Minerva's assistance, and stole from the chariot of the sun, and brought again to earth, the fire which Jupiter had stolen from it. The idea is a good one for such a purpose, and is well carried out in the appended design. A snake is twined round the shaft of the pillar, which serves to enrich it, while the upper part of the pedestal is ornamented with a profusion of acanthus leaves.

The other large design is for a FINGER-PLATE, by W. HARRY ROGERS (10, Carlisle Street, Soho). It consists simply of

floriated ornaments arranged, in a kind of scroll-work, with considerable taste, and connected by bands of alternating light and dark colours.

DESIGN FOR A DOOR-SCRAPER. By W. HARRY ROGERS. The ornament of this common object

is good; there is nothing in it cumbersome, or extraneous to its purpose, and we should think it

might be easily cast, so as to offer a suitable and not inelegant appendage to the doorway of a first-class mansion in the best part of our metropolis.

entering upon a new era in Manufacturing Art. Old things are passing away, to give place, we hope and trust, to what will not only display her power

DESIGN FOR A PARASOL HANDLE. By J. STRUDWICK, (14, New Bond Street). If any thing were necessary to show the incapacity of the mind for originating any form which is intended to please the eye, it is the fact that something pre-existent always is selected for its model, either wholly or in part. It matters little how noble or how insignificant is the object to be constructed and decorated, nature has already given the designer examples which will better answer his purpose than any thing he can conceive; and although these examples may be modified and turned into an infinitude of shapes, the eye accustomed to probe and anatomise, as it were, will detect the suggestive idea amid the variety of forms it may assume. The originality of a design consists then, not in creating something new, but in giving a new direction to what has before existed. In the parasol handle engraved below, we recognise a branch of ivy with its leaves and berries twisted into an elegant and novel form.

DESIGN FOR A SILVER MILK JUG. By F. D. TRAES, (1, Hornton Terrace, Kensington). The truth of our former observations with reference to the application of natural forms in the hands of the designer, cannot be more abundantly evidenced than in this object. One (Mr. Redgrave, A.R.A., of the School of Design, at Somerset House,) who from his practical acquaintance with the subject must be regarded as an authority on the matter says:—"He who would be great as a designer of ornament, must be in the hedge-rows and fields at all times, sketching with patient diligence the forms and curvatures of leaves, fruit, and flowers, their groupings and foreshortenings, studying them as a whole, and in their minutest details; not to repeat as a mere imitator, but to display them as ornament, to

dispose them geometrically, and to arrange them to suit the various fabrics in manufactures which he may be called on to design." Mr. Traes seems to have attended to the advice here given, for we find on the upper portion of the jug Burdock leaves, the Forget-me-not, and the climbing Woodbine—all emblematical of the meadow pasturage where the kine feed; at the base of the cup is twined a wreath of wild roses, which, by the way, we should think had better have been omitted, inasmuch as they add no real ornament, and seem altogether in the way as regards the utility of the object.

DESIGNS FOR PICKLE FORKS. By J. H. DELL, (5, Manor Terrace, Walsworth). It would only have occupied space unnecessarily to have engraved these forks of their entire length, we therefore introduce such portions alone as would be required by the manufacturer. The richness of ornament

in these designs is not more apparent than the taste and elegance which are displayed in them. We would especially direct attention to the clever arrangement of lines in the prongs of the upper fork, as well as to the curves in the handles. The

lower one is more massive yet equally good. The use of these forks need not to be confined to that by which they are here designated; they would be equally serviceable as oyster-forks, or for the ordinary purpose of toasting, if made of common metal.

THE BRITISH INSTITUTION.

EXHIBITION—1850.

The Exhibition consists of 500 Works of Art. Of these we shall have little to say in the way of introduction. The Collection cannot be described as other than mediocre; it is, however, superior to either of those of the last three years; and there appears a better and more judicious arrangement in "hanging" than heretofore. In several cases there is satisfactory evidence of improvement, while many artists of established repute seem to have "done their best" to sustain the position for which they are mainly indebted to this Institution. We look here for the early productions of painters who are destined to achieve fame; this year such indications are few: considering this branch of our subject, we may, we fear, confine ourselves to two—that of Mr. A. C. HAYTER, Jun., and Mr. W. UNDERHILL, whose contributions, the latter especially, are of very high merit, and give promise upon which we may depend.

We proceed to notice the leading works; and, as usual, we shall have to express our regret that our space renders our review limited.

No. 1. 'A Group on a Common,' T. SIDNEY COOPER, A.R.A. The group consists of a donkey and three sheep—a reminiscence of days gone by, when this artist painted Canterbury donkeys with equal truth but less of finish—a quality which here reminds us much of the pictures of Verbockhoven. This, although small, is the best of the works lately exhibited by its author.

No. 2. 'Melora,' W. FISHER. A charming composition, full of feeling, and coloured with much judgment and skill.

No. 3. 'A Farm Yard,' J. F. HERRING. The animals are equal to anything of the kind ever exhibited; they are two horses and two shelties, a grey and a blaek, with pigs, &c. To the straw, and the exaggerated verdure of the foliage which creeps up the farm buildings, we must demur. Every individual straw is discernible, inasmuch that they may be counted; this part of the picture does not seem to have been painted by the same hand as the horses.

No. 6. 'A View of Pesth in Hungary,' G. JONES, R.A. A small picture presenting a locality of much interest at this time. It is executed with the same excellence recognisable in similar subjects exhibited years ago by this painter.

No. 16. 'Oliver Cromwell, Lord Protector of England, dictating to John Milton, his Latin Secretary, the celebrated Dispatch in favour of the persecuted Protestants of the valleys of Piedmont,' F. NEWENHAM. The figures in this picture are above the ordinary life standard; Cromwell stands facing the spectator and Milton is seated on his left. The energetic action and expression of the former are well calculated to accompany the pointed and decisive terms of the Dictator. This is an admirable subject, and the execution does it ample justice.

No. 18. 'The Miller's Home,' T. CRESWICK, A.R.A. The materials are a rude bridge over a scanty brook,—a droughty region of mimnows, titbitles, and millers' thumbs—the mill on the other side of the foreground bridge, and a screen of trees vaulting the luxuriance of their summertime leafage. The time is afternoon, and the sentiment that of the most perfect tranquillity; the mill is at rest, and in the water there is neither voice nor movement, the only impression of life is left by the wing of a king-fisher that has just flown under the arch. The subject is homely, but those are the singing trees of the Arabian tale, and those the vocal stones of the Swan of Avon.

No. 21. 'Rich and Ripe,' G. LANCE. Two small pictures, each a bachelor's dessert, and yet no mortal bachelor ever saw such fruit. A few grapes, a couple of peaches, some filberts gathered at the heel of the year, and half a fig; this it seems here is the forbidden fruit. We would ask where the painter got his fruit, but we see it inscribed—"The Hesperides" to exalted Genius." Therefore the question only remains how does he paint it? We see nature daily outdone, but rarely in this way.

No. 30. 'Astronomy,' J. SART. The composi-

tion and treatment of this picture are admirable. It presents the head and bust of a female figure—a living woman resting on a globe. A bright and broad light is thrown on the person and the accompaniments, which are brought forward with great force in opposition to a dark sky. She holds a pair of compasses and contemplates the stars. This is a work of a very high degree of excellence, and the best the artist has exhibited.

No. 40. 'The Regretted Companion,' R. ANSDALL. The subject is an old man lamenting the death of his ass. He is an itinerant vendor of toys, and he and the poor beast have worked together for years, the one for his bread and the other for his straw or chaff. The old man kneels over the ass, and his dog shares his grief. The passage is brought forward in the vein of the epigrammatic but fluty-hearted Laurence Sterne, and is assuredly among the best of the artist's productions.

No. 43. 'A Welsh Cottage—Afternoon,' A. W. WILLIAMS. These materials and the manner of their composition are highly picturesque. In the near plane of the picture are seen the cottage with an accompaniment of trees and other auxiliary matter. The scene is enclosed by mountains, and the whole is rendered with so much felicity, as to suggest at once a studious observation of nature.

No. 44. 'An Italian Peasant,' C. ROLT. A study of a female figure in Italian costume—it is well relieved, and painted in a manner extremely clean, and with much exactness of touch.

No. 45. 'Dutch Pilots warping their craft out of harbour in rough weather,' E. W. COOKE. It is high water and the wind blows dead into the harbour-mouth of some one of those Dutch towns, *que exeat in "dam."* If we read aright the legend on her stern the craft is the good sea boat, the Eduard Van Kook, and she is being towed by her crew to the jettty head, where she may at once fall away upon a tack to the galliot in the offing. This is a picture of much excellence, but we observe in the late works of this artist that matters of detail are worked out with much hardness—in smaller works this is lost, and all is exquisite sweetness.

No. 51. 'Fishing Boats off the coast of Holland,' T. GUDIN. The description of a stiff breeze and a feeble watery sunshine is given here with much truth. The water is injured with respect to breadth by the blackness of the shadows, but otherwise the proposed theme is made out with perfect success.

No. 52. 'The Post-office,' F. GOODALL. In this composition are described the various emotions called forth by the arrival of the Indian Mail at a country Post-office. The scene has the appearance rather of an inn yard, than that of an open street; be that as it may, the manner of circumstancing the figures is most perfectly adapted to give full importance to each individual of the different groups. Of the principal knot, which is upon the left, the barber is the cynosure. He reads a detailed account of some Indian victory, in the columns of the *Times*, to an audience composed of the neighbouring eobbler, the boots, post-boy, and others. On the extreme right is an old Chelsea pensioner, listening as well as he can to a woman, who is reading a letter to him; and near these is a woman struck down by grief at the news of the death of her husband. This beautiful and valuable picture exhibits a style differing in a very marked manner from that of works by which it has been almost immediately preceded. The finish is more crisp and sharper than that of other pictures, and the colour in many degrees more subdued. These facts attest a yet anxious study of those highest qualities of Art with which such subjects may be invested, and have been treated by acknowledged authorities. Nothing is more easy than a vulgar and licentious use of colour, few things more difficult than oven discretion in its use. As to character, each figure is a living impersonation, at once announcing its position and relations, and supporting its part to the life.

No. 54. 'The Salmon Trap at Lynmouth, North Devon,' J. UWINS. This subject has been chosen with much judgment, and in execution exhibits an advance upon preceding works of the artist.

No. 57. 'Evening—Coming to the Farm,' H. JURSUM. The material here is of an ordinary kind, a farm, a house with trees, and a view opening over the adjacent country. In such subjects the artist excels, and passages of this work are of rare excellence.

No. 64. 'The Plays of Shakspeare,' J. GILBERT. This is a large composition, wherein are assembled the principal characters of the plays of Shakspeare. It is a production of great power, and every impersonation is amply pronounced.

No. 66. 'The Interior of the Chapel of St. Erasmus, Westminster Abbey,' Mrs. P. PHILLIPS. The chapel is accurately represented, having been carefully studied from the place itself.

No. 70. 'Scene near Cuckfield, Sussex,' COPLEY FIELDING. This consists of a foreground shaded by trees, with a glimpse of light and airy distance, a favourite combination in the works of this artist. In execution and pictorial quality, the picture is far beyond others painted by him.

No. 71. 'Noon—the Stream in the Valley,' T. CRESWICK, A.R.A. One of these close rocky scenes which this artist paints with such unsurpassable truth. An idle fellow who aspires to the character of a disciple of Old Isaac is lounging over a book of love posies, while a fish struggles at the end of his line. There is more light than we usually see in those pictures; had this been less freely conceded, we humbly submit that the effect had been more forcible.

No. 76. 'Periwinkle Gatherers and Shirrimpers,' J. MOGFORD. A small sea-side view with characteristic figures. It appears to be carefully painted, especially the distance.

No. 78. 'Girl with Water-Cresses,' E. M. EDDIS. The head of this figure is a highly successful study in colour and expression.

No. 79. 'In the Norfolk Marshes,' T. C. DUBBIN. The principal object is a windmill, presented under a moonlight effect, that is much aided by a storm-cloud on the right of the picture. It is clean in execution, and judicious in its disposition.

No. 82. 'Moorland Scenery,' T. J. SOFER. A small picture, remarkable for judicious light and shade and a decisive and substantial touch. The foreground is too pinky.

No. 83. 'A Scene from the Bathing-Cove—Torquay,' W. WILLIAMS. A small bright picture of great sweetness and harmony of colour.

No. 88. 'A Group in the Meadows,' T. S. COOPER, A.R.A. The group consists of three cows, which together with the open pasture in which they are grazing, are coloured with all the unaffected brilliancy of early works.

No. 89. 'Glory,' J. W. GLASS. The subject of this composition is an aggroupment of a cavalier and his horse, both lying dead. The time is sunset, and hence is derived a deep and moving sentiment. The man and horse are well drawn and firmly painted, and the proposed result is successfully realised.

No. 92. 'The Covenant of Judas,' J. FRANKLIN. This is a large composition of half-length figures, presenting on the left Judas receiving the thirty pieces of silver, and in the background on the right, the Saviour and his disciples. The picture has many agreeable passages.

No. 96. 'The Watchful Shepherd,' R. REDGRAVE, A.R.A. The centre of the picture is occupied by a green hill side, beyond which on the left is a glimpse of airy distance. The immediate right is screened and shaded by trees. This picture bears the closest inspection, as being full of detail laid in with the most effective breadth.

No. 97. 'Harvest Time,' F. TAYLER. A small figure,—a girl carrying home her gleanings on her head. The picture is worked out without much colour, but it is touched with masterly feeling.

No. 98. 'Painting,' C. H. STANLEY, Jun. A small study—a lady copying the "Cyp" of the last exhibition of the Old Masters. It is executed in good taste.

No. 100. 'Sancho's surpriso on seeing the Squire of the Wood's Nose,' G. CRUIKSHANK. This is very sketchy; if it were less so we should deem the artist serious in his eccentricity. There is originality in the more sober parts of the sketch; indeed, his greatest originality is found in his approach to grave subject matter.

No. 102. 'The Jewels and the Gem,' G. LANCE. The "Gem" is, we presume, a beautiful miniature of an infant, which has been so well copied here as to be pronounced at once the work of Sir William Buss. The "Jewels" consist of a profusion of valuable bijouterie lying round the caskets from which they have been taken, and apparently upon a piece of work on which is embroidered a croucet. These objects, with some fruit, form a charming composition, to which the artist has done ample justice. The work is, indeed, altogether one of rare merit—a most perfect copy of Nature and of Art; it may surely vie with the best efforts of the old Dutch school.

No. 107. 'The Pilgrim,' H. W. PHILLIPS. This is the Helena of "All's Well that Ends Well." The figure is simply dressed in the weeds of a pilgrim; the face is in shade, and the whole is treated in a manner very retiring, but it is nevertheless a striking picture.

No. 108. 'The Road round the Park,' E. J. COBBETT. The subject is a portion of a road shaded by beech trees, which rise and retire on the right. The instant impression of the spectator on looking at the picture is that it has been sedulously studied from Nature. The description of light seen through the foliage is made out in a manner most happily to distinguish light from colour; indeed, in the whole, the picture is most felicitous.

No. 110. 'A Shady Corner,' C. R. SPANLEY. A glimpse of park scenery, in which foreground trees, with their accompanying shade, are opposed to a lighter distance with a very natural effect.

No. 111. 'Part of Derby—from St. Mary's Bridge,' A. O. DEACON. The houses, church, and bridge form an agreeable group, which is brought forward with much good taste.

No. 114. 'Waterfall—Norway,' W. WEST. In this picture is presented a mountain stream, the waters of which are wildly precipitated from shelf to shelf of their rocky bed. The subject has been judiciously chosen, and is carefully painted.

No. 118. 'Focamp—Coast of Normandy,' J. D. HARDING. The subject of this picture is literally *nil*; but the chiaroscuro treatment of these slight materials proclaims at once the hand of a master. It is a flat coast view, deriving irresistible force and ineffable sweetness from the disposition of the shade in the middle of the composition. On the right a boat; on the left a crazy craft, unworthy of water salt or fresh; in the foreground a knot of straggling children grouping with rocks and stones. These, with a glimpse of the sea, and the tale; but in the colour and effect there resides a charm beyond description.

No. 120. 'Gipsy Trampers,' F. TAYLER. Let the spectator who may be attracted to this group follow our example and throw something in the shape of coin into the hat here held out to him. The beggar is a gipsy, the principal of a group, of which a donkey and her foal are important items. The scene is open and the remainder of the camp are behind. This is the first oil picture we have seen by this artist; it is eminently original and powerfully natural.

No. 121. 'Hungarian Insurgent,' J. ZETTER. The figure is attired in the picturesque costume of which the works of this painter afford so many examples.

No. 122. 'The Village Green,' G. A. WILLIAMS. This is a careful study from a veritable locality; the time is evening, and the near objective is opposed in shade to the sky and the light of the departing sun,—an effect which this artist treats with much felicity.

No. 123. 'Southdowns,' T. CRESWICK, A.R.A. and R. ANSDALL. This is assuredly one of the most beautiful and valuable animal pictures we have of late years seen. The landscape part is a mere piece of bald upland pasture, such as no other painter ventures to treat so openly as the former of the two painters above named. The sheep are thrown up on an immediate ridge and thus opposed to sky and airy distance. The animals are painted with surpassing truth and great originality, something to say in these days of everlasting *clique*.

No. 129. 'Sympathy,' F. STONE. This picture presents two maidens, of whom one is suffering

affliction which the other seeks to alleviate by consolation. The composition is extremely simple, as little is seen in the way of necessary. The whole is painted with a care which would even be enhanced by a little freedom here and there. The work is, however, one of high merit, and certainly equal to the best productions of the painter—productions which have secured to him large and extended fame.

No. 133. 'Opening the Gate,' J. LINNELL. The material is so simple that it might be derived from any lane in the neighbourhood of Hampstead,—the Arcadia of London painters. It would appear that the artist has proposed to himself the most rugged problem in the entire cycle of nature; a subject so forbidding in its material as to be selected only as a kind of *pons asinorum*. The virtue of the work lies in its touches of light and shade, and these are so perfect as to set aside the feeling of colour.

No. 137. 'A Welsh Mill,' H. J. BODDINGTON. The objective of the picture combines in a manner extremely picturesque, consisting of the mill overhung by trees, the rapid stream, a section of rock, and minor incident, all painted with a fine feeling for truth.

No. 138. 'The Novice,' ALEX. JOHNSTON. She is seated, and apparently engaged in divesting herself of her worldly attire. The treatment is extremely simple; the colour is remarkable for its unassuming propriety, and the clean working and neat touch afford a rare example of masterly execution.

No. 140. 'Dover,' J. HOLLAND. This view is taken from the cliff on the Dead side of the Castle. A prominent point in the view is Shakespeare's Cliff; beyond which the setting sun sheds a capricious light upon the near cliff and other parts of the composition, but leaves of course the town in shade. The effect is powerfully wrought out in the best manner of the artist.

No. 141. 'Eel Fishery on the Thames,' J. SPARK. The trees in this picture are pollards, and they are painted with much more of natural freshness than we have seen in some late pictures by this artist. This is in short equal to his best productions.

No. 142. 'A Troop of Dragoons,' J. GILBERT. They are on the march in rainy weather; there is more of unaffected truth in the sketch than is to be seen in the more imposing efforts by the same hand.

No. 143. 'Musidora,' W. E. FROST, A.R.A. One of these charming little figures which this artist paints from time to time. It is most accurately drawn, and coloured with infinite delicacy.

No. 144. 'The Knitter,' J. H. S. MANN. A study of an old woman employed according to the title. The figure is carefully drawn, well coloured, and touched with much judgment.

No. 147. 'The Gleaner's Child,' Mrs. CARPENTER. This is a small bead and bust, most agreeably coloured, and painted in the usual firm manner of this lady.

No. 148. 'A View of Angers,' E. A. GOODALL. This picture presents a highly picturesque combination of objective. The view is taken from the right bank of the river, which is here crossed by the ancient wall of the town pierced with arches. On the left rises the cathedral, and on the immediate right is seen an ancient round tower. The nearest portion of the composition shows the river craft, the lighter portions of which are painted with incomparable sweetness. Every part of this picture is finished in a manner to do ample justice to such a subject.

No. 155. 'Bo-Peep,' H. K. BROWNE. An open scene, in which are presented a mother and two children, the latter amusing themselves according to the title. The subject is very simple, but it is treated with a feeling in which there is much to praise.

THE MIDDLE ROOM.

No. 153. 'The Lovers,' C. DUKES. A rustic pair, fully bearing out the pithy title in their reciprocal relation. The figures are carefully drawn, and painted with a solidity which distinguishes the works of this artist.

No. 160. 'The Castle of Weilburg,' C. R. SPANLEY. This is a large picture, in which the edifice whence it derives its title is situated on

the right. The spectator is placed upon an eminence, whence he looks down upon a river which leads the eye to a charmingly painted distance. The subject is attractive, and is hereby dealt with.

No. 162. 'Terrace of the Capuchin's Convent, Sorrento,' W. WILD. A work of much merit, highly characteristic of the scene and its accessories.

No. 178. 'San Lorenzo—Coast of Genoa,' T. S. ROBINS. A large picture, affording a view of a portion of one of the most picturesque districts of the Italian coasts. The immediate foreground is the sand, and on the right rise the heights of the Genoese land extending to distance. The composition derives life from figures with a cart, boats, &c. A little more light in the foreground had added much to the value of the near objective.

No. 179. 'A Dutch Madonna,' C. BROCKY. This "Madonna" is a lady wearing a red *cotehardie*, and she looks very much as if she had stepped out of a Metz or a Terburg. We have seen but few pictures in oil by this artist; this, however, is spirited and brilliant. We cannot expect the same degree of striking originality which characterises his chalk heads; very few men are equally original in two very distinct genres.

No. 180. 'The Greenwood Glade,' J. MIDDLETON. This is simply a road overshadowed by trees, by the foliage of which the whole of the upper plane of the canvas is filled. The trees are admirably described, but the scene had been improved by a figure or two.

No. 181. 'The Little Brother,' A. J. WOOLMER. There is more of nature in this picture than we usually find in the works of this painter, and with a little abatement of unaccountable colour, the picture were far beyond anything he has lately exhibited.

No. 182. 'Ruins of the Library in Hadrian's Villa,' W. LINTON. A small picture in what we may term the new style of this artist. The general tone of the picture is low, but it is nevertheless forcible, and the whole of the objective is brought forward with much firmness.

No. 184. 'A View of Buda and Ofen, from Pesth,' G. JONES, R.A. A small picture, in which the spectator is placed at the end of the bridge which crosses the Daube, whence he sees Buda extended before him. The picture is painted with breadth, and is marked by spirited execution.

No. 191. 'A Good Place for Trout,' T. DANBY. A feature of Welsh scenery, and it may be a good place for trout, but it has little to recommend it as a subject for a picture; the study is, however, closely imitative of nature.

No. 192. 'The Portico of the National Gallery,' A. C. HAYTER, Junior. We should never have expected to see this delineated otherwise than as an architectural elevation; it is, however, here invested with much pictorial interest, supported by very able execution. The episodes are skillfully introduced; the treatment, as well as the idea, is original; if we look upon the production as one of promise, we augur fame hereafter for its producer.

No. 193. 'Le Petit Savetier,' E. A. GOODALL. A small picture of a cobbler, the very gem of the craft, framed in a frail tenement of a stall, a sort of cupboard of multifarious curiosities. The character of this charming little picture is that of a low-toned brilliancy combined with exquisite finish. It is one of the best pictures we have ever seen by this artist, as combining at once the best qualities of the Dutch and the English schools.

No. 196. 'Blenheim,' G. HENNING. A view of the palace from the opposite side of the lake. This is a highly successful study, in which absolute colour is treated with a masterly feeling. The material is peculiarly English, and it seems to be brought forward with unflinching truth.

No. 197. 'The Return of a Prodigal Son,' Miss J. M'LEON. This is a very ambitious picture—the faces are generally well painted and there are other portions highly praiseworthy.

No. 198. 'A Golden Moment,' F. DANBY, A.R.A. A large picture—one of those gorgeous sunsets which this painter generally describes

with so much truth. The picture we say is large—but the components are large masses and reducible to very few—hence there is a want of that space without which there is necessarily an impression of limitation, besides a deficiency of gradation and opposition of that kind which contributes to the proposed effect. The effective mass is a dense screen of trees on the left, the centre of which is penetrated by the rays of the setting sun. These trees cut the sky, and below, throw the water into shade; and we humbly submit that portions of the mass, especially those that approach the light, would be improved by being rendered less positive. Again there is a redundancy of unmitigated red, which is not light but colour to a certain extent; the proposition of green in the sky is admissible, but we think that here it is too prevalent. Thus for a scene of this nature the parts of the picture are too few, and that which is proposed as light, is colour. With more air to the trees the composition would tell well in black and white; it abounds with charming sentiment, and is inferior to none of the artist's works in careful elaboration.

No. 208. 'Aladdin's Present to the Sultan,' J. GILBERT. A study of a negro head drawn in profile: it is effective and original.

No. 205. 'Lancee Reproving his Dog,' J. CALCOOT HORSELEY. This picture was left unfinished by the late Sir Augustus Wall Callcott, and has been completed by the artist whose name is given above. The Lancee here approaches the character in the "Two Gentlemen of Verona," but the dog is not the Crab for which Lancee stood in the pillory when his dog had stolen the geese. The dog, however, listens significantly, and Lancee is very earnest in his deprecation. The picture is unaffectedly painted, and very properly centres its interest in its character.

No. 206. 'An Old Well on the Apennin Way, Campagna of Rome,' J. URRIS. The well itself is a square elevation, with a pulley and rope for drawing water; the colour is brilliant, and the aspect of the whole is eminently Roman.

No. 209. 'A Happy Lowly Shepherd Boy,' J. J. HILL. A small study of a boy standing leaning on a shepherd's crook; the figure is well painted, and prominently relieved against the sky.

No. 211. 'Piazzetta di San Marco,' J. HOLLAND. This view presents the quay of the Grand Canal, at Venice, having the palace on the left. The composition derives life from numerous figures of senators and citizens, in the costume of the palmy days of the City of the Sea. This is the class of subject in which the artist excels, and we find this qualified by his most felicitous manner.

No. 212. 'The Purchased Flock,' J. LINNELL. This is an incomparably better picture than that already noticed by this artist in all those qualities for which his productions are distinguished.

No. 221. 'The Disputed Point,' R. BRANDARD. This picture presents a group of figures assembled in a village alehouse, engaged in argument, according to the title. It is full of carefully studied material, but falls short of the "Blacksmith's Shop," by the same hand.

No. 227. 'An Irish Cabin,' The late J. BATEMAN. This picture is full of melancholy truth, and, more than that, it is a word of appeal from those left to lament the premature decease of an industrious and deserving artist.

No. 222. 'Luna,' J. G. NAISH. A small group of sea-nymphs sporting on the sea, half of the moon's orb being seen behind them. It is a picture of rare excellence, but there is no authority for thus circumstancing Diana, if she be intended for the principal figure of the group.

No. 233. 'The Boulogne Fisher's Wife,' EYRE CROWE. She appears on the sea-shore, accompanied by a child. The execution is somewhat hard—a little mitigation would render it an agreeable picture.

No. 239. 'The Glen, Cludleigh, Devon,' G. A. FERREIRA. This is a picturesque association, a small stream overhung by trees. There is much merit in the execution, but it is painted in a key too light for good effect.

No. 244. 'Naughty Pussy! she has killed poor Robin,' T. A. WOOLNOUTH. A small picture of the head of a child well drawn and delicately coloured.

No. 245. 'The Frozen Lock,' C. BRANWHITE. One of those frost pictures in which this artist is inimitable.

No. 248. 'Interior—Royal Chapel—Hampton Court,' J. D. WINGFIELD. In this class of subject the artist is unrivalled. This beautiful interior with all its ornamentation is represented with masterly skill.

No. 249. —, E. DUBUFFE. This is a three-quarter life-sized figure, evidently a portrait, but by no means approaching the excellence of the picture exhibited last season by this artist.

No. 256. 'Morning—the Stream from the Hills,' T. CRESWICK, A.R.A. An interesting and romantic subject, but there is an unusual absence of the gradations which give effect to the works of this painter.

No. 258. 'Detaining a Customer,' R. M'INNES. The "Customer," a simple maiden, is detained while a cobbler, to whom she has given her shoe to mend, tries upon his violin some favourite air. The picture has all the minute finish which distinguishes the works exhibited under this name; it is in many respects a valuable production.

No. 259. —, W. GALE. The subject is the oft-repeated one of the Jewish captives "by the rivers of Babylon." The picture is low in tone; it contains passages of good drawing and execution, but the grouping is objectionable.

No. 269. 'The Greta in Linsdale,' J. C. BENTLEY. The course of the river runs into the picture, and materially assists in describing distance. The gradations of the work are admirably made out.

No. 278. 'Jeanie Deans and the Laird of Dumbiedikes,' ALEX. FRASER. The picture tells at once its own story. It is more carefully and effectively executed than any the painter has of late exhibited.

No. 279. 'Lady Macbeth,' J. F. DICKSEE. She apostrophises her hands, "What, will these hands ne'er be clean;" and the accompanying expression of the features is highly successful, though extremely repulsive.

No. 282. 'The Rival's Wedding,' H. M. ANTHONY. The scene is a village churchyard, which with its aged tree and venerable tower were a sufficient picture. A marriage procession is issuing from the church, attended as upon all similar occasions by a crowd of curious gossips; and this assemblage is painted with all the spirit and exquisite colour which the artist usually throws into compositions of this kind. Every part of the work bears evidence of the most anxious study.

No. 285. 'View of the Black Forest near Baden Baden,' Capt. J. D. KING. A small picture presenting a subject of much romantic interest, which is treated in a manner highly appropriate.

No. 290. 'Our Saviour after the Temptation,' Sir G. HAYTER, M.A.S.L. This composition describes the ministering of the angels to the Saviour immediately after the Temptation on the Mount. The picture is large, and contains much that is beautiful in execution and expression.

No. 298. 'A Watermill,' J. WILSON, JUN. This is a small picture, in which are embodied all the best qualities of preceding works of the artist, together with a much greater degree of freshness than he has before shown. It is a charming little picture.

No. 305. 'Mouth of the Conwy—N. Wales,' A. CLINE. This picture is made out of little material, but it is nevertheless agreeable from its dispositions of light and shade. It is more sober in tone than are generally the works seen under this name.

No. 311. 'Myrrha,' H. O'NEIL. She is reclining upon cushions, having the head relieved against the sky. The picture is finished with the most elaborate nicety; the shot silk would delight a mercer's shopman—it vulgarises the picture however, and it would be much improved by any other kind of accessory drapery.

SOUTH ROOM.

No. 314. 'A Westmoreland Trout Stream,' H. JUTSUM. This is unquestionably the best picture ever painted by the artist; the subject is highly attractive, and it is treated with the most perfect success.

No. 316. 'View on the Grand Canal, Venice,' C. BURLISON. This view has been often painted, but rarely with a juster apprehension of the effect best suited to it than we find here. The picture is sparkling and characteristic. There are works under this name in the gallery which evidence a mind of high order.

No. 317. 'Departure of the Chevalier Bayard from Brescia,' J. C. HOOK. This is a sequel to the picture exhibited last season—the Chevalier is now convalescent, and a groom is buckling on his spurs, while he receives from the two kind damsels a purse and a bracelet, as mementos. It is a charming picture; the incident is impressively told. The colouring is vigorous, and the treatment altogether fine. The work should have had a leading place in the principal room.

No. 318. 'Flowers,' Mrs. HARRISON. A small vase of roses, principally painted with much sweetness and truth.

No. 322. 'Russian Pilgrims Resting,' D. W. DEANE. This small picture, though far from the eye, nevertheless shows skillful execution and good colour and effect.

No. 334. 'Distant View of Rye from Romney Marsh,' E. DUNCAN. The entire breadth of this view is occupied by the plain of the marsh, which retires to a distance. There is a charm in the colour, and a delicacy of treatment in this little picture which is rarely equalled.

No. 349. 'Market morning,' E. T. PARVIS. A small composition, the subject of which is the preparation made by a rustic family for going to market. Another small picture by the same hand, is entitled "Kathleen," showing a girl about to fill her pitecher with water; both are painted with much harmony of colour.

No. 358. 'Stepping Stones, North Wales,' Miss E. GOODALL. A small figure carrying a child, and circumscribed amid wild and mountainous scenery; the little work is remarkable for its brilliancy of tints.

No. 360. 'The Hour Glass,' H. LE JEUNE. Two children watching, with intense interest, the running sands of the hour-glass; the subject has a strong point, and the heads are treated with a daring amount of colour, but nevertheless they do not look forced in this particular.

No. 362. 'Fishing Boats off Flamborough Head,' J. W. CARMICHAEL. An assemblage of craft of various sizes fishing off the Head, which, with the lighthouse, is seen in the distance. The boats and the water are described with the accustomed tact of the artist.

No. 370. 'Going to Meet Father,' E. HOPLBY. The head of the little girl in this picture is highly successful.

No. 375. 'A Street in Bologna looking towards the Grand Square,' W. CALLOW. The oil pictures of this artist are few, but they are equal in power to his water colour views.

No. 380. 'Valentine's day,' R. FARRER. This picture is large and painted with greater nicety than late works of the artist.

No. 382. 'Hawkers of Relics exhibiting them to the Sick Daughter of a Peasant,' J. GODWIN. This is rather a large picture, the composition presenting numerous figures which are judiciously disposed, forcibly characterised, and carefully drawn. The subject has the merit of originality, and in execution it is treated with a becomingly generous breadth.

No. 387. 'Rain clearing off—a Study at Woolmer, Bucks,' J. NIEMANN. Although in parts flat in colour, the picture is signified by the usual firm execution of the artist.

No. 388. 'The First Impression,' H. C. SELWIS. The subject is Guttenberg showing to his wife the result of the first experiment with moveable types. In colour, drawing, and character, the picture is masterly, but portions of the figures want solidity, from a deficiency of depth and shade, a defect arising, perhaps, from a habit of working upon large surfaces, where air is the great desideratum. It is a picture of great excellence, but the days of Guttenberg were not those of *gutta percha* inkstands and books in the bindings of the present century. These are trifes, and may at once be corrected or painted out.

No. 401. 'The Evening Sun upon a Mountain called Tryfan in N. Wales,' T. DANBY. This is a large picture, too large in proportion to the

interest of the subject. The mountains are carefully painted, even to the destruction of the breadth necessary to the effect.

No. 407. 'Poachers,' W. UNDERHILL. We believe this artist is very young: yet the qualities of this work are those at which men arrive after long and successful study. It is strikingly original and powerful. The style is singularly vigorous; it seems to have been touched by a firm hand, and dictated by a hearty spirit. The artist will be sure, ere long, to take his proper place among his contemporaries: he will soon issue from the dark corner of a back room in the gallery.

No. 413. 'Venus dissuading Adonis from the Chase,' W. SALTER, M.A.F. The two figures are standing; they are remarkable for brilliant colour. The subject has been so often painted that it is very difficult to bring it forward with any degree of originality.

No. 425. 'The Interview between James IV. and the celebrated Outlaw Murray, on Permsmore on the banks of the Yarrow,' T. M. JOY. The subject is well chosen for display of chivalrous and rugged character. The picture is large, showing on the left the king and his nobles and on the right the party of the outlaw, who himself is the prominent figure, and addresses the king in vindication of his right to retain the lauds of Ettrick. There is every where evidence of much careful study in the work.

No. 428. 'On the Flemish Coast,' J. WILSON. A small picture containing but little of objective, but agreeable in effect.

No. 432. 'A Lane near Ripley—Surrey,' F. W. HULME. The lane is overshadowed with a dense canopy of foliage, which is here and there penetrated by lights that fall with brilliant effect upon the road. The trees are painted with a full and rich touch, a marked improvement upon preceding pictures.

No. 434. 'A Highland Shepherd and his Maiden,' ALEX. JOHNSTON. The subject is described in a quotation from an old Scottish song. There are two figures, a Highland shepherd and maiden, circumscribed as at the moment of the momentous proposal. The figures are drawn and coloured with the usual firm touch of the artist, and many passages exhibit extraordinary power.

No. 435. 'Smuggler's halt in the Sierra Morena—Spain,' W. WYLD. The figures and the scene in which they appear seem well suited to each other. The picture declares a just apprehension of telling character.

No. 442. 'Fishing Boats off the Coast of Holland,' J. WILSON, Jun. This is a picture of a high degree of merit. It is painted with an unbroken breadth of light, which is so well managed that the water and sky are bright, breezy, and purely characteristic of the North sea—after all, the real prairie hunting-ground of the marine painter.

No. 445. 'Disturbing the Congregation,' G. CRUIKSHANK. The scene is a country church, the congregation of which is disturbed by the fall of a charity boy's peg-top. The sermon is interrupted—all eyes are turned upon the delinquent and his top. In this department of art the painter of this composition is as original as in the other which he has so long and so successfully professed.

No. 451. 'Farm House and Mill at Isques near Boulogne,' G. STANFIELD. The approach to this farm house is by a paved road, which is so well painted that every stone in it is faithfully portrayed. It returns too, admirably, and the other items of the picture are painted with the same truth; the whole presenting to appearance the most accurate description of locality that can well be conceived.

No. 455. 'A Study from Nature,' G. LANDSEER. This study represents as its subject two donkeys, which are much better drawn and painted than the passage of landscape by which they are accompanied.

No. 456. 'Varney's Reception at Cumnor Place with Commands from Kenilworth,' A. T. DERRY. The Amy Robsart and Janet of this picture, as figures, are well drawn and painted, but the former fails in some degree as an identity.

No. 460. 'A Sunny Day,' A. W. WILLIAMS. A small but charming picture, having for its subject a passage of riverside scenery.

No. 464. 'The Review,' T. JONES BARKER.

The review is supplementary, the subject being a group of two figures, a lady and gentleman mounted. The figures and horses are painted with much spirit.

No. 476. 'Death of Sapphira,' J. W. WALTON. The subject is a good one, and there is every evidence of the composition having been anxiously studied.

No. 479. 'A Lane near Chiddingstone, Kent,' S. R. PERCY. Mr. Percy is an artist who always selects his subjects with judgment, and looks at nature through a right medium. This is a charming little bit of rural scenery, painted with much delicacy of execution, especially the masses of foliage on the right of the picture, which would not discredit the pencil of Ruysdael.

No. 487. 'Whiteboyism—Lying in wait for a Victim,' M. CROGAN, F.R.H.A. A band of miscreants about to commit one of those foul and cowardly murders which stain with blood the annals of the Sister Isle. The figures are highly characteristic, and there is in the whole scene a painful truth which every observer must acknowledge.

The sculptural works are thirteen in number, of which but a few are in marble. 'Sabrina' is a chaste and elegant marble bust by W. CALDER MARSHALL, A.R.A.; and a 'Bast of the Duke of Wellington,' by H. WEIGALL, presents him much younger than he now is, but still like what he has been. 'A Sketch for a Group of Charity,' by E. B. STEPHENS, has much merit; and 'La Penserosa,' by J. DURHAM, is invested with a fine poetical sentiment.

THE VERNON GALLERY.

VENICE.—THE GRAND CANAL.

J. M. W. Turner, R.A., Painter. T. S. Prior, Engraver. Size of the Picture, 2 ft. 8 in. by 1 ft. 8 in.

This picture forms a companion work to that which was engraved and introduced into our August number last year. The view here is taken from the other side of the range of buildings that terminate with the Dogana, which forms so prominent a feature in the former engraving, and the scene if not so elegant and characteristic, if the term may be thus applied, is eminently beautiful and very animated; perhaps one of the most picturesque and interesting throughout Venice.

The left of the picture is occupied by the long range of houses already referred to; they possess little architectural beauty, yet as relieved by the mass of craft at their side, and being in shadow, they compose a most effective foreground, balanced on the right by a darkly coloured gondola. The eye is carried along this line to the point where it is terminated by the tower and the portico of the Dogana, or Exchange, at the base of which numerous vessels are at anchor; it then traverses the horizontal line in front, commencing at what is called the quarter of St. Mark's. The lesser square of St. Mark is here seen, with its one side open to the sea; the two splendid pillars of granite brought from Greece in the twelfth century, are also distinctly visible; one surmounted by a winged lion of brass, the ancient emblem of the Republic of Venice, and known as the Lion of St. Mark; and the other by a statue of St. Theodore, a patron saint of the city. Behind these rises the lofty Campanile, three hundred and twenty feet in height; and the domes of the church of San Giorgio Maggiore are just seen above the Ducal Palace.

In the foreground of the subject, under the shadow of the buildings, may be discerned a figure standing before an easel, on which rests an unfinished picture; by his side are materials for the artist's work. This figure is intended for Canaletti, the great painter of Venetian scenery, who resided for some time in England about the middle of the last century, and whose works are held here in high estimation.

The material for this picture differs so much from its companion, that we cannot expect to find the same practical treatment in both; there is less opportunity here for the exhibition of that exquisite aerial perspective in which Turner so greatly excels: yet it is a charming work, beautiful and rich in colour, and sufficiently detailed to render every object discernible. The varied tints of the distant buildings are repeated in their shadows on the transparent Adriatic, while the deep blue sky over the head of the spectator, becomes still deeper when reflected on the near waters. There is a firmness and a texture in the manipulation of the picture, that will doubtless impart to it durability.

CORRESPONDENCE.

THE NATIONAL PICTURES.

To the Editor of the Art-Journal.

SIR,—I would ask Mr. Coningham whether it is as an advocate of truth and justice, or as a rancorous personal antagonist, that he again comes forward and identifies himself with assertions, that have not only been again and again refuted, but which he himself has declared were prompted by no better motive than the private animosity of their originator.

Unfortunately for those who have to do with them, there exists a class of persons whom no reasoning will convince, no proof, however irrefragable, will silence. We may "destroy their web of sophistry in vain;" still the baseless argument, the exploded fallacy, the oft-refuted fabrications, are repeated with a pertinacity which completely tires our patience, while it makes not the slightest impression on our judgment.

Should there, notwithstanding the clear proof that has been brought forward to the contrary, yet exist any persons who, from not having paid attention to the argument, are still inclined to think that there may be some small grain of truth in the statements put forth by Messrs. Coningham and Morris Moore, respecting the alleged injuries to the "Peace and War" by Rubens, I would refer them to the following portion of a letter written by the late Mr. Andrew Wilson, in 1848:—

"I believe I may say I was the first artist who saw it, and was consulted by my friend, Mr. Buchanan, the importer. The picture was in that state in which pictures are so often found in the galleries of Genoa, and required careful cleaning, and, in some places, mending, especially in the back of the little boy, in which there were some holes. Our first operation was to remove the Italian lining, and to line the picture, and in so doing we found the well-known mark on the back of the painting, which proved it to have been the property of Charles I., as historically affirmed. The picture was properly lined by Mr. Dickson, who had the reputation of being the best liner in London. I then applied to Mr. Ferrier, a Swiss artist, to undertake the cleaning and repairs, which were effected in a most satisfactory manner; and I may here mention that the retouches, which were rendered necessary by injuries, were all mended by colour mixed with inspissated oil; and I remarked in this picture, and in another which I repaired in the same manner, a most satisfactory testimony to the value of that vehicle. The picture was put in order very carefully, but with satisfactory expedition; for, to the best of my recollection, it was sold about a fortnight after its arrival, its merits being at once recognised by those judges to whom it was shown.

"Having thus a very intimate knowledge of the 'Peace and War,' I cannot refrain from taking this opportunity of offering you a few remarks upon its present state; I now do so from a wish, as far as lies in my power, to bear testimony in favour of the judicious steps taken for its preservation, which have excited so much hostile comment.

"I examined the Rubens very carefully, and have no hesitation in bearing testimony to its very favourable condition; and that it has been very carefully cleaned, is proved by the fact, that I found all the retouches with which it was repaired under my inspection, existing still upon the picture. It is perfectly evident that any violent process calculated to injure the picture would have swept them away at once. The picture now resembles precisely that state in which it was when sold to the Marquis of Stafford.

"I was, I may say, equally intimate with the Titian, and I am decidedly of opinion that it has been judiciously cleaned; the patina is safe, and is in a fine state.

"(Signed) ANDREW WILSON."

I would ask, can any thing be more decisive than this? Does there exist any person pretending to the smallest exercise of rational powers whom this letter will not convince? It is here proved beyond question, not only that the picture was injured before it was imported to this country, but that the recent cleaning operations, so far from having gone too deep, have not even gone deep enough to interfere with previous reparations; and it should be borne in mind, that in cleaning a picture, the old reparations are sure to be removed before the operations are continued to a depth likely to affect the original painting. Whether it is in consequence of the use of a different vehicle, or of the greater age of the original paint, it never combines with what may be added by the restorer afterwards, whose work may easily be removed by a turpentine or any other weak solvent, while the paint beneath is of such a stone-like hardness, that

VENICE. THE GRAND CANAL. FROM THE WATER.

in the works of some masters it will actually polish under a file. I did not call particular attention to the consequence of this, but have on a former occasion alluded to the injured state of several of the finest pictures in the National Collection, injuries sustained long before they became the nation's property. The "Venus, Mercury, and Cupid," by Correggio, is covered with restorations so badly executed, that the most casual and uninformed observer will have no difficulty in detecting them. The small "Holy Family," by the same master, though one of the best preserved pictures in the Collection, is not wholly pure; in fact, it would be difficult to point out a picture of that age, that is; while with respect to the Sebastian del Piombo, whether, as many persons well worthy of credence assert, Benjamin West repainted the Lazarus or not, it is certain that the right leg is the work of a restorer, and by no means very well executed. Since I wrote on this subject before, my friend Mr. Joseph Hume (not the hon. member for Montrose, but) a gentleman with a real knowledge of Art, assures me that he saw the picture when some of the reparations had been removed, and that, while in this state, he was commissioned by the late Mr. Beckford to negotiate with the late Mr. Angerstein for the purchase of it, with the small Carracci and the six Hogarts, for the sum of 16,000*l.*, although both he and Mr. Beckford had seen holes in it of a size that, to use his own expression, his two hands would not cover. Now, in cleaning such a picture as this, what would be the result? That which, though covered with badly executed reparations, yet under a mass of discoloured varnish, and the various accumulations resulting from long exposure to the atmosphere of London, appeared to the casual observer in a moderately good condition, would on cleaning present the appearance of a mere ruin; and though a high class picture in this state, on account of its susceptibility of restoration, is scarcely of less value to the artist or the collector than when in a perfect condition, yet it is not difficult to perceive how a person in the responsible position which Mr. Eastlake some time since filled, might, in having to superintend the cleaning of such a picture as this, be exposed to the attacks of the ignorant or the malicious.

As I stated above, there will always exist a class of persons whom no reason will convince, no proof however irrefragable will silence; it is not to such that I now address myself; but I will ask any one capable of reasoning honestly, to read the following extract from a Report of Mr. Eastlake to the Trustees of the National Gallery, dated January 28, 1847:—"In the autumn of 1844, being duly authorised, I called in the assistance of Mr. Borden Brown, an experienced picture-cleaner, Mr. Seguyer having been on former occasions alone employed. I had every reason to be satisfied with the skill and care evinced by both those gentlemen, and intended in the autumn of 1845 again to invite the assistance of Mr. Brown. I should have requested him to undertake the cleaning of the picture by Rubens called the "Allegory of Peace," and I even stated to the First Lord of the Treasury that I wished to employ Mr. Brown on that work. On attentively examining the picture, however, I found it extremely difficult, in consequence of the thick coats of darkened varnish with which it was covered, to say whether it might have been repaired or not at a former period; I therefore thought it my duty, in what appeared a difficult case, to postpone the cleaning of that picture till Mr. Seguyer, who was then much occupied, would have time to undertake it. In so altering my intention I was only desirous, while the difficulties of the work were, as I conceived, uncertain, to entrust the picture to the care of the same person who had before, and more than once, cleaned pictures in the National Gallery, and on whose experience the Trustees as a body were accustomed to rely. A question having now arisen whether the picture referred to has been properly cleaned or not, I have reason to be satisfied that I took this course."

Not having any personal acquaintance with Mr. Eastlake, I am unable to say whether he is of a cautious temperament or the opposite, but I would appeal to any one who will bring an average amount of impartiality and honesty to the discussion, whether anything can be conceived as more satisfactorily evidencing the possession of that caution, that circumspection, that we would wish to find in a person to whom a critical operation is intrusted, than this letter does?

When a person obtrudes himself before the public with an accusation of the character that has been brought against the late Keeper of the National Pictures, it is not too much to expect that his sincerity should be above suspicion, that his motives shall bear the strictest scrutiny; we

may lament while we make allowance for his mistakes, but the moment he gives us reason to suspect his sincerity, he forfeits all claim to our consideration. I will not now enter upon all the repulsive details of a letter that Mr. Coningham wrote to Mr. W. Pickering, in the year 1847, on the occasion of a difference between himself and Mr. Moore; it will be sufficient to say, that after a very laconic detail of certain benefits conferred by himself on the last named gentleman, and the ingratitude he had met with in return, he concludes with the following remark: "The real cause of this writer's" (Mr. M. Moore) "bitterness against the Trustees is evident, he is one of the rejected candidates for the office of Keeper."

I now repeat to Mr. Coningham the question with which I commenced this letter, and I call upon him to explain why he now adopts a charge against Mr. Eastlake, which he himself had before denounced, in terms that admit of no misconstruction, as prompted by the personal animosity of the author. Was he wrong then? or is he wrong now? Did he slander Mr. Moore in 1847, or Mr. Eastlake in 1850? I make no charge against Mr. Coningham; I merely call upon him for that explanation, which I should hope a regard for his own fair fame will prompt him to lose no time in making, and which I can assure him is due to Mr. Eastlake (although, I dare say, that gentleman cares nothing about the matter), is due to the public, and, above all, is eminently due to himself, as, till he makes it, all his protestations of "truth and justice" will appear contemptible, all his professions of "love of Art" stale and ridiculous. Your obedient servant,

THOMAS HEAPHY.

THE GREAT EXPOSITION OF 1851.

THERE has been some progress made in reference to the Exhibition during the past month. First, the Society of Arts have had a meeting, the object of which was to "ascertain and consider the position of the Society with respect to the Industrial Exposition;" but the real purpose of which was to induce the Executive to give some account of their proceedings. A somewhat stormy discussion ensued; the result of which is that the Society has been "thrown overboard;" the Executive floats into harbour without them; and in the Adelphi, as heretofore, miniature gatherings of manufactured works are hereafter to take place. This course appears scarcely generous, to say the least; the Council is naturally wrath at being made to dwindle into nothing. We have no desire to enter into the quarrel; but it may not be forgotten that the public will, under any and all circumstances, owe much of the ultimate issue to the Society of Arts.

A change has been made in the constitution of the Executive. Robert Stephenson, Esq., has been appointed one of the Commissioners, and his place in the Executive will be worthily filled by Lieut.-Col. William Reid, of the Engineers, who is the Chairman of the Committee. This is a most salutary arrangement, and one that will go far to establish that public confidence in the Committee, which up to the present time it certainly has not obtained. We still hope that the number may be augmented from five to seven. The Royal Commission cannot but know that much suspicion exists in reference to this Committee; but as we have elsewhere stated, they will in reality have only to execute the orders they receive; and, we repeat, that on this ground no alarm need be entertained. It is stated in the *Athenaeum* that "the registered names of the promoters of the undertaking already amount to 6000; including upwards of 50 noblemen and 150 members of Parliament."

A proposal made in the Common Council of the City of London to subscribe 1000*l.* has been postponed; no doubt, however, the grant will be made when further information has been obtained. We have reason to believe the sum would have been at once voted if the appointment of Col. Reid, as Chairman of the Executive, had been announced at the meeting.

Mr. Alderman Copeland has announced his intention to distribute among the operatives he employs any money-prize he may obtain in the competition. Further, we understand he intends to place upon the several objects he exhibits the name of the designer, or that of such person to whom the credit of the production really belongs. This is an example highly creditable, which we hope to see very generally followed.

Committees have been formed in most of the leading manufacturing cities and towns, and arrangements made for obtaining subscriptions. We understand that several small amounts have been

already sent in by operatives and artisans. But it is well known that in many influential places—Manchester, for example—the subscriptions are kept back until the "information" asked has been given; we are bound to add, until certain "doubts" have been removed.

Statements from America assure us that active exertions are already a-foot there; and that some extraordinary productions of Art-manufacture may be expected from our brethren on the other side of the Atlantic.

In France, as we have already made our readers aware, there is an absolute *furore* among the fabricants; they see no chance of trade reviving in their own country, and are eagerly striving to establish it in this. There can be no doubt of their making our manufacturers "look about them;" but it is equally certain that the result will be ultimately beneficial to us.

Mr. Sheriff Nicoll has offered a prize of 500*l.* for the best manufactured cloth of a peculiar description; for which see advertisement.

A meeting of the City of London Committee has been held. Several gentlemen addressed the meeting, and spoke in the most enthusiastic terms of the object, applauding the generosity of the idea of extending the class of exhibitors to all the world. Many questions were asked as to the nature of the articles to be exhibited—whether they were all to be manufactured, or whether raw products and natural productions, articles of elegance and luxury, or articles only of utility—whether our manufacturers or wholesale houses were to be each class exhibitors, or whether manufacturers alone were to have the privilege—whether the building to be erected would be sufficiently capacious for home and colonial and foreign exhibitors. Most of these questions were satisfactorily answered by Sir James Duke and Mr. F. M. Forster, and by the honorary secretaries, the Rev. S. E. Cattle and Mr. D. W. Wire, after which two resolutions were adopted, appointing persons to canvas, and authorising the sub-committee to apply from time to time to the Royal Commissioners for information as to plans determined upon, so that the public may be fully instructed upon all the points necessary for the guidance of the exhibitors.

A ground plan and Isometric view of a building for the Exposition of 1851, by an anonymous hand, has been sent to us; it is of circular construction, with a central hall 130 feet in diameter, from which 8 corridors radiate, and join the outer gallery. The central hall is domed, and is to be 60 feet in height, and here are to be deposited such models, &c., as require height; the clerestory windows above it are to be filled with stained glass. The corridors are to be devoted to the exhibition of the more delicate articles, and are to be lighted from the roof in order to secure plenty of wall-room; the open spaces between the corridors, to iron, marble, and other coarser works. The design is capable of extension, and it is proposed to be constructed entirely of iron.

The two Secretaries of the Commission, J. Scott Russell and Stafford H. Northcote, Esqs., have issued a preliminary advertisement (which will be found in our advertising columns); it will, no doubt, ere long be followed by another giving the several details of the project; but these cannot be given without great care and consideration. For these time will be necessary, and our provincial friends must not be impatient. It is far better to wait to have the plan properly matured than to be compelled to subject it to after alterations.

A meeting, at the "West End," took place at Willis's Rooms, on the 21st of February, with a view to forward the subscription: the High Bailiff of Westminster in the chair. We are unable, at so advanced a period of the month, to give the details; the general results were entirely satisfactory. Very full reports appeared in all the public journals, and they have been, no doubt, generally read. The assemblage was remarkably brilliant; the effect and value of the meeting being greatly enhanced by the presence of the several foreign ambassadors. A large subscription was made in the room, and arrangements were entered into for its increase.

Among other "news" connected with this subject, we may mention that the artisans of Manchester (and no doubt those of other places also) are already "making purses" in order to have funds wherewith to meet the expenses of a visit to the metropolis to view and study the Exhibition. It is said "indeed" that "half Manchester will spend a week in London." It is intimated by the railway companies—of Leeds as well as Manchester—that they mean to issue return tickets for 1*l.* each, available for a week; and, further, it is in contemplation by the Manchester Committee to take several furnished houses in London, for a period, in order to accommodate safely and comfortably the visitors from their town.

FOREIGN COPYRIGHT.

[We extract the following from "the Critic." We avail ourselves of the occasion to recommend to our readers this periodical work—published every fortnight at the price of 3d. It is conducted with considerable ability; the reviews of new books (its leading feature) are skillfully condensed, the extracts being invariably selected with sound judgment; and they are wisely arranged under the several heads of Science, Fiction, Travels, Education, &c. &c. Information, abundant, varied, and useful, is given upon nearly all subjects connected with literature, art, and the progress of the age; and over the whole of the arrangements there is evident a generous superintendence.]

"A discussion in the columns of the *Times*, between a foreign bookseller, a Custom-house officer, and Mr. Bentley, the publisher, has directed public attention to a question of very great importance to the public, as well as to the booksellers. It involves, also, a considerable amount of alleged copyright at present existing, and it must have a material influence upon the book trade generally, hastening the adoption by the Americans of an International Copyright, so long demanded of them in vain by the authors of Great Britain, upon whom piracy is systematically practised on the other side of the Atlantic.

"The question is, whether an American author can, by any contrivance, obtain a copyright in this country. If he cannot do so, neither can he convey a copyright to an English publisher. The consequence of this is, that all works, written by foreigners resident abroad, may be reprinted here by any person; or, if printed abroad, they might be imported here as foreign books, subject only to the duties imposed upon foreign books.

"The law upon this point was wavering and unsettled, until the Court of Exchequer, in *Trinity Term last*, in the case of *Boosey v. Purday* (13 *Law Times*, 529), pronounced an emphatic opinion, that a foreign author or composer resident abroad cannot acquire a copyright in England, even by first publishing his work in this country. The decision is in strict accordance with justice. The purpose of copyright is to encourage the intellect of a country, by insuring to its productions a just reward. We have not imposed the charge of a higher price for books upon the people of England, for the benefit of Americans, Germans, and Frenchmen, nor for the advantage of publishers either abroad or at home. For the common benefit of art and literature, we have by an act of parliament, empowered the government to enter into treaties with other countries, for the mutual protection and advantage of their authors and artists, each country giving a copyright to the other. But this is a privilege only to be accorded where it is to be entirely reciprocal, and as the United States have not chosen to avail themselves of it, its authors do not come within the protection of that statute.

"On the authority, then, of *Boosey v. Purday*, it must be deemed to be the law that a foreign author or artist residing abroad cannot have a copyright in Great Britain.

"Having none, he can transfer none.

"The consequence of this is, that every work, whether of literature, art, or music, the production of a foreigner residing abroad, may be reproduced, reprinted and republished here, by any British subject, and that all contracts for the purchase of such copyrights are absolutely void.

"It follows, also, that all such works may be imported as 'foreign books,' and any custom-house officer detaining or destroying them is liable to a summary punishment, or to an action, or to both.

"But it must be observed that, although there is little doubt that a decision of a court comprising so much learning as the Court of Exchequer is not likely to be reversed, still, it is but the opinion of one court, and that it may be reviewed in error, or ultimately, in the House of Lords."

"In the case of *Boosey v. Purday*, the judgment of the court declares that—"the object of the Legislature clearly is not to encourage the importation of foreign books, and their first publication in England, as a benefit to this country, but to promote the cultivation of the intellect of its own subjects; and as the act of Anne expressly states—to 'encourage learned men to compose and write useful books,' by giving them as a reward, the monopoly of their works for a certain period, from their first publication. We therefore hold that a foreigner, by sending to, and first publishing his works in Great Britain, acquires no copyright. A British subject who purchases from him such a right as he had in his own country, which could not extend beyond it, cannot be in a better condition here than the foreigner."

OBITUARY.

BENJAMIN RAWLINSON FAULKNER.

It is our painful duty to announce the decease on the 29th of October last of Mr. Benjamin Rawlinson Faulkner, late of Newman Street, whose portraits for many years added interest to the walls of the Royal Academy Exhibition. The illness which terminated the life of this much admired artist originated in a severe cold taken in a journey from the north of England in an inclement season, and was attended with much suffering, which he bore with truly Christian patience and resignation during the space of nine months. We do not wish to extend unnecessarily our observations on the events of a life which perhaps afforded few incidents that could be publicly interesting, but we feel it a duty as well as a pleasure to testify our opinion that no man in any sphere of life has more honourably and conscientiously fulfilled his relative duties as a member of society and as a sincere Christian. Like many of our artists whose talent and productions have given lustre to British Art, he commenced his studies of the art of painting only when he had attained to his twenty-fifth year; previous to that he had been engaged in a mercantile house in the foreign trade, of whose large establishment at Gibraltar, for several years, he had the sole management; but when the plague invaded that city and garrison, committing great ravages, his health suffered so grievously that he was obliged to return to England almost in a helpless condition, about the year 1813. It was during the season of his convalescence in the following year that he accidentally discovered a latent talent for painting, and under the direction of a kind brother who was himself an artist, he devoted himself two years entirely to drawing in chalk from the antique, and in studying assiduously the first principles of the Art. He was imbued with a mind of exquisite sensibility, and the remarkable diffidence of his character led him to seek knowledge rather in the tranquil recesses of his painting-room than in the excitement of an academy.

Mr. Faulkner was a native of Manchester,* where he was born in 1787. To the close of his valuable life he was held in high estimation by his fellow-townsmen, and in that city and its neighbourhood are many of his finest works in portraiture. That he was never so fully employed in London as his eminent talents deserved, must be entirely attributed to his retiring disposition—he needed to be called forth, in no instance did he obtrude himself on public attention, save by the display of the beautiful productions of his pencil, and even these were not of a character to catch the common eye in a public exhibition; they were the offspring of refined taste and feeling, and possessing nothing meretricious, were too often passed over by the mere "exhibition goer," while they afforded a rich treat to the man of taste. His "Portrait of a Lady" in the Royal Academy Exhibition of 1845 was almost universally admired, and one, a half-length of a Lady,† exhibited in 1838, is a creation of such exquisite feminine beauty and sensibility, that we say it advisedly, we know of no living artist who could equal it. We name these two only, not because it would be difficult to swell the list, but because our space is limited.

Like our admired Romney, Mr. F. had exquisite musical taste, and his performances on the piano-forte, as well as his singing, would have done honour to a professor. Nature had endowed him with a richly melodious voice, (barytone) and in his leisure hours he devoted himself so assiduously to its cultivation, that at the time when his mind first received its bias for painting, he found his inclination for music so strong that his choice of the sister arts being suspended in the balance. Having in this dilemma consulted the great oracle of the day, Mr. Thomas Welch, that gentleman declared that although Mr. F.'s vocal talents were such as to ensure him the highest rank as an orchestra singer, he had not sufficient physical power for the stage, which latter alone, in his estimation, could afford satisfactory remuneration. After this advice there was no longer room for hesitation, and Mr. F. devoted all his energies to the study and practice of the creative Art—an Art he loved, and the profession of which he adorned by his eminent ability and the blameless simplicity of his life. "And to add greater honours to his age than man could give him, he died fearing God."

* It is worthy of remark that at one time there resided in this great manufacturing city, no less than five artists who all subsequently achieved a metropolitan reputation, viz., the subject of our notice—Bradley, Hillidge, Liverseege, and Stone—most of whom were more or less indebted to Mr. F. for professional advice, which he was ever so ready to impart.

† Now in the possession of his widow.

MINOR TOPICS OF THE MONTH.

EXHIBITION OF WORKS OF ANCIENT AND MEDIEVAL ART.—In furtherance of the views of the projectors of the Exposition of 1851, the Society of Arts have formed a committee for the purpose of organising an exhibition of works of ancient Art, to be selected with reference to their beauty, and the practical illustration which they are likely to afford of the processes of manufacture; and they have considered that such an exhibition is not only likely to be interesting to the public, but useful to manufacturers; for which reason they hope not merely for varieties and curiosities, but for the contribution of such articles as may revive lost arts, or exhibitions of the modes of workmanship which made ancient Art famous. The Society have agreed to adopt the Exhibition as part of that annually made by the Society, thereby taking all the expenses connected with it upon themselves; and it is proposed to open it to the public early in March. We should have been glad to have seen upon the committee such gentlemen as Mr. Bernal, Mr. Auljo, and others, whose collections are so valuable, and selected with so much taste; and we consider that it is on the co-operation of collectors like these that the success of the exhibition mainly depends. It would not be difficult to add a dozen such names to the printed list—names which should have appeared there.

THE OLD SOCIETY OF WATER-COLOUR PAINTERS have recently added three members to their list of associates; Miss Rayner, Paul Naftel, a native of Gnarusey, and Karl Haghe, a Prussian. In a communication addressed to our contemporary, the *Athenæum*, Mr. Niemann, an artist of considerable ability, offers some objections to the choice of the two last-named candidates, principally on the ground of their being foreigners; and, so far, we think Mr. Niemann is right. This society is to all intents and purposes a "close borough," an exclusive society, admitting no contributions from any but its own members; and while English artists are to be found whose talents entitle them to a place in the exhibition-room, undoubtedly they should be preferred to strangers. If the exhibition of this society were an open one, as in the case of the Royal Academy and of the British Institution, where the foreigner, equally with the native artist, has the chance of submitting his works to the public, the matter would bear a different aspect; both are here placed on the same footing, and their pictures might happen to hang side by side. But the decision here in favour of the foreigner puts the other entirely out of court; he is rejected, although, it may be, not inferior in merit; and even if it were so, we still think our own countrymen should be first cared for. There is a prestige in ranking with this society which many an excellent artist among us would be proud to share, and he ought to be permitted to do so. The Royal Academy entirely repudiates the doctrine of foreign-fellowship, and, we believe, would not now elect as a member even an English artist who is not resident here. Of the qualifications of the gentlemen who have been chosen we know nothing, they are doubtless men of talent or they would not have been thus honoured, our remarks must not therefore be considered personal to them; but the principle for which we contend is simply this—that our first duty is to our neighbour, our second to the stranger that is within our gate." We are strenuous advocates for entire liberality in all matters of Art; but there are limits which it is neither generous nor just to pass.

THE ROYAL ACADEMY.—There are at present three vacant appointments to this Institution; one, consequent on the death of Mr. Etty, to full membership, which cannot be filled up till next February, it being necessary that three clear months notice should be given prior to the election of a successor, and such election can only be made in the month of February, the 10th inst. we believe.—Mr. Etty died on the 13th of November. The other two vacancies are among the Associates, occasioned by the death of Mr. W. Westall, and by the election of one of the present body in the room of Mr.

Etty; the nominations to this rank must be deferred till November, according to the regulations of the Academy.

A LOST ART IN PORCELAIN.—Chinese Porcelain has always been highly appreciated for its clearness and beauty, and the rarer kinds much valued by collectors; there is one kind termed *Kiasing*, or "azure-pressed," which is understood to possess an extraordinary value among the Chinese themselves, inasmuch as the secret of its manufacture has been lost, and although that patient and persevering people have endeavoured to recover the exact method, and discover a clue to the materials originally used, their efforts have been hitherto unavailing. The art was that of tracing figures on the china, which are invisible until the vessel is filled with liquid. The porcelain is of the very thinnest description—almost as thin as an egg-shell. It is said that the application in tracing these figures is by internal, and not by external painting, as in ordinary manufacture; and that after such tracing was made, a covering or coating was laid over it of the same paste of which the vessel had been formed, and thus the painting lay between two coatings of china-ware. When the internal coating became sufficiently dry they oiled it over, and shortly after, placed it in a mould and scraped the interior of the vessel as thin as possible without penetrating to the painting, and then baked it in the oven. The patience and care requisite for this seem to be peculiarly suitable to Chinese dexterity; the specimens preserved are considered of inestimable value, but the secret of their fabrication may yet be recovered by our own or other manufacturers, who have the aids of science to a greater degree than we imagine the Chinese have at their command.

THE STATUE OF THE DANCING GIRL REPOSING, executed by Calder Marshall for the Art-Union of London, has been produced in stannary porcelain by Mr. Copeland. It is in height about eighteen inches, and is intended for distribution as one of the prizes of the Society. The copy is admirably true, indeed taken altogether it is perhaps the most satisfactory work that has been yet produced in this interesting Art of the manufacturer; it exhibits too, improvement in the material, and we understand not without reason, for the excellent artist who superintends the establishment of Mr. Copeland has been unremitting in his efforts to render this now popular medium as perfect as possible. That he has succeeded there will be no doubt among those who will compare the earlier with the later productions of the works at Stoke.

THE ART UNION OF LONDON.—The etchings from MacIise's beautiful designs of the "Seven Ages" are nearly ready. These, in addition to the pair of engravings from Webster's characteristic pictures of "The Smile" and "The Frown," are due to the subscribers of the present year. Frost's "Sabrina" is still being delivered to those of the past year, who are also entitled to an engraving from Hancock's prize bas-relief of "The entry into Jerusalem."

THE DEATH OF WILLIAM WESTALL, Esq., the senior Associate of the Royal Academy, makes another vacancy in that body. We are not able this month to furnish such a memoir of this excellent man and accomplished artist as would be worthy of his memory; consequently, we postpone to our next this task, at once painful and pleasing.

THE NEW HOUSES OF PARLIAMENT.—It appears by a statement made in the House of Commons, that "if a sufficient vote is taken shortly," the New Houses, including the refreshment rooms and other apartments, will "be ready for use by the commencement of the next session of Parliament."

BREES' PANORAMA OF NEW ZEALAND.—Emigration has so intimately connected this country with our own, and progressive civilisation has given it so many home features, that its interest has increased greatly in the progress of modern years; and we are therefore indebted to Mr. Brees for making us so familiar with its peculiar features. He adds with much ability, to the charms of accurate delineation of scenery, so much of descriptive narrative, as to give great completeness to this interesting exhibition.

THE POLYTECHNIC.—This popular and attractive exhibition has added to its many useful and instructive features a series of lectures on Music, by Sir Henry L. Bishop, in which that popular and experienced composer deduces from his Art an instructive and delightful hour's intellectual gratification. We are glad to see so spirited an arrangement made for the benefit of visitors to one of the most varied and instructive places of intellectual resort, and we have no doubt it will be as properly appreciated and patronised as it deserves to be.

REPRODUCTION OF WORKS OF ART.—A professional lithographer of Paris has been reported to have discovered a method of reproducing, by mechanical means, aquarelles or designs, with the greatest exactitude, and with the preservation of the colours in all the freshness of the original. It is stated that the copies are not easily distinguished from the originals. The expense of the new invention is not great, and by it the production of aquarelles, &c., will become as easy as that of engravings or lithographs. This wonder if really available may subvert the taste for Art in a remarkable degree.

HORACE VERNET.—This accomplished artist is reported in the Paris papers to have visited Rome, for the purpose of making the necessary sketches for a finished picture of the siege of that city; which picture it is stated to be his intention to execute on so stupendous a scale, that the largest of his previous paintings will shrink by its side.

THE VENERABLE SCHADOW is dead. He died at Berlin—where he was born—at the age of 86. We shall probably give a detailed memoir of his active life.

SILEXALATED MARBLE.—This new production by Messrs. Shore is an imitation of marble, the principal component being glass. It is manufactured in slabs of various colours, and has an exceedingly rich and beautiful appearance; the glass is thin, for the purpose of exhibiting the colour to the greatest advantage, but when backed with cement, and used for the panelling of walls, &c., it is stated to be capable of bearing the blows of a hammer. We have seen it used for the top of a table, in the same manner as coloured marbles are, and with the best effect.

THE COLLOSSEUM.—This elegant place of instructive amusement has added to its other attractions three new views painted by the Messrs. Dawson. The Polar Regions, which at present excite so much interest in connexion with the fate of Sir John Franklin, forms the subject of one; Netley Abbey, near Southampton, long celebrated as one of the most picturesque ruins in England, another; and the third is a view of the Golden Island in the Yangtse-Kiang or Golden River of China, which view embraces the river life of that curious people; many of the various grades in full costume occupy the foreground. A model of a Silver Mine in operation is also added, as well as considerable musical attractions.

BURFORD'S PANORAMA OF THE POLAR REGIONS.—The materials for this new and peculiarly interesting panorama have been furnished by Lieut. Browne, of H.M.S. *Enterprise*, fitted up for Capt. Ross's expedition; and we have never witnessed more interesting pictures than the present, or any possessing greater novelties in effect. The views exhibit the Polar Regions in summer and winter, as seen during the expedition of our gallant countrymen. The extraordinary and fantastic forms assumed by the icebergs, and the peculiar greenish tints of their shadowed sides are very striking; the delicate tints of the aurora borealis tinge the snow with beautiful effect. But in no portion of the picture has the artist been more successful than in the representation of the dark half-congealed water, in which the shadows of the icebergs dimly gleam, with so perfectly natural an effect, that we are at first inclined to doubt that we look only on painted canvas. The winter scene is equally striking; the peculiar lazy light of the moon presents one of those remarkable phenomena frequently seen in these regions, which contrasts singularly with the pale blue twilight which is seen on the opposite side of the picture; the faint gleams of the aurora being the only extra

light, and the entire dark effect of a winter's day being given with wondrous fidelity. Altogether, we do not remember a more peculiarly truthful and artistically beautiful production exhibited by the talented proprietor.

TRACING PAPER.—We would direct the attention of such of our readers as require to use this material, to the tracing paper of M. Leon, of Paris, for which Messrs. Waterlov & Sons are the agents in London. From specimens submitted to us we can confidently recommend it to artists, architects, and draughtsmen of all kinds, for its firmness of texture and superior transparency.

BANVARD'S PANORAMA OF THE OHIO.—Another of the mighty rivers of America has been delineated by the indefatigable Banvard, and made to roll daily before the sight-seers who frequent the Egyptian Hall. The views embrace a portion of the Mississippi, from New Orleans to the mouth of the Ohio; and thence we pass, on both sides that river, to the large and flourishing town of Cincinnati. Banvard has been very successful in his effects; and we may notice his brilliant sunsets, dense fogs, and wood on fire, as very able illusions.

CRAYON PORTRAITS.—At the bazaar in Baker Street, there has been recently exhibited a collection of portraits in crayons or pastilles, the works of a French artist named Isidore Magues. They are remarkably in advance of ordinary works of this class, inasmuch as there is a brilliancy and depth of effect in them not usually seen. It is not usual in our country to adopt this style of Art in portraiture, but its peculiar softness and richness of tone, will be appreciated by all who inspect these specimens, which do much credit to the taste and ability of M. Magues.

MR. LESLIE, R.A., commenced his series of lectures on painting on the 14th ult. at the Royal Academy, and will continue them on the succeeding Thursday evenings. It is unnecessary to say, that Mr. Leslie's views on the subject are imbued with the highest independence and originality of thought, admirably adapted to the illustration of the artistic qualities of our native school.

THE PARIS EXHIBITION.—The exhibition of works by modern French painters usually exhibited at the Louvre, is this season to take place in the Palais Royal. It has long been a matter of regret that the national series of works by the old masters have been annually hidden, for some months, by placing those of the modern painters over them, and thus preventing foreigners, connoisseurs, and students, from studying them; we are therefore inclined to hail the change with satisfaction.

THE PANOPTICON.—Under this not very euphonious name it is intended to open a new scientific institution, which is to combine the advantages of a public exhibition, with the membership allowed by a private society. It is to be constructed in the neighbourhood of Exeter Hall, with fronts in the Strand, Southampton, Tavistock, and Exeter Streets. It is intended to exhibit the principal manufactures of the country in all their varied processes; to embrace specimens of machinery; construct an effective laboratory; to give lectures in arts and science, and to combine within itself a museum of practical science; and to lend on hire to other associations, on the most moderate terms, scientific apparatus of the best kind. The central situation of this building will be one eminent advantage. We shall probably give further details of this project next month.

MESSRS. COLLIS' GALLERY OF MODERN ART.—In justice to these gentlemen we must here correct an error (made by themselves however), in the copy of an advertisement in the first page of our February number, and which stated that no painting was sold by them with a guarantee, whereas they intended the public to understand that no painting would be sold without a guarantee. We may rightly add that Mr. Collis is excelled by no one as a judge of the value of a picture of modern Art; that he has established a high reputation for integrity and fair-dealing; and that the good faith of his transactions may be fully relied upon.

REVIEWS.

THE DECORATIVE ARTS OF THE MIDDLE AGES. Part I. By HENRY SHAW, F.S.A. Published by PICKERING, London.

Mr. Shaw has here commenced another of those serials, which he has so ably conducted, on Decorative Art, and this first part is equal in interest to any of his preceding works. He proposes to exhibit, by means of a series of carefully executed engravings from the best original authorities, the peculiar features and general characteristics of Decorative Art from the Byzantine, or early Christian period, to the decline of that called the Renaissance. The gem of the present number is the cup designed by Hans Holbein for Jane Seymour, Queen of Henry VIII., which is as remarkable for the beauty of its general effect as for the taste of its varied detail; the stained glass from Chartres can only be considered as an ugly curiosity; the embroidery from a picture of Queen Mary, in the Society of Arts, is useful and good, and is a fair example of Mr. Shaw's ingenious tact in thus making use of a portion of a picture. The iron-work from the tomb of Eleanor of Castile, once lost, and now restored to Westminster Abbey, is a remarkable and elegant specimen of the wrought iron-work of the thirteenth century. Altogether the work promises well, and the field is so large that we cannot but hope the best from Mr. Shaw's selection.

CHOICE EXAMPLES OF ART WORKMANSHIP, MEDIEVAL AND MODERN. Part I. Published by BOGUE & CUNDALL, London.

The great attention which is now given by all classes of the community to the subject of Decorative Art, may be regarded as one of the "signs of the times." Not many years since great jealousy would have been excited at the idea of ornamental designers being classed as artists, and great astonishment produced by the fact of men of ability and intellect devoting their study either to the history of design, or to the works of the manufacturer, and the embellishment of the every-day appurtenances of our households. But how different is the case at present, when Royal Academicians "stoop" from their exclusive altitude to co-operate with the manufacturer for the production of works of utility whose merits become severely tested and criticised, and when book after book issues from the press purporting to give instruction to the patron and suggestions to the workman. And if this be a sign of the times, we will venture to add, that it is a healthful and encouraging sign. Every published volume of "Examples" becomes a practical hint both to artist and fabricator, and a further step towards a state of things under which ugliness in any shape shall be regarded as intolerable, and beauty be received and cherished as the common heritage of all, from the prince to the peasant. Our observations arise from a glance at the "Choice Examples of Art Workmanship," of which the first part is now before us. The intention of this work, of which it is supposed that a part should appear occasionally, is to get together and engrave as many fine examples of Decorative Art as possible, selecting the beautiful rather than the quaint or curious, that lovers of Art may be gratified by witnessing the elegance of form and aptitude for decoration for which so many of the old masters were distinguished; that artist-designers may derive benefit from seeing fine specimens, and that manufacturers in metals, pottery, glass, and wood, may be thankful for the suggestions offered them by the contemplation of the best examples of their various arts which the last four centuries have produced. The four engravings contained in the part before us are executed with considerable taste upon tinted paper, and are accompanied with short but appropriate notices. The "getting up" of the work before us is most excellent, and we trust that future numbers may equal it in execution, interest, and utility.

AN ARTIST'S RAMBLE IN THE NORTH OF SCOTLAND. By MICHEL BOUQUET. THREE PLATES OF FIGURES BY GAVARNI. Published by ACKERMANN & Co., London.

In turning over the folio pages of a volume like this, it is impossible to avoid drawing a comparison unfavourable to it, when we bear in mind what our own countrymen, Roberts, Stanfield, Harding, Hill, and Leitch have done in the same land. Judging from the series of lithographic views before us, we are much inclined to doubt M. Bouquet's capabilities to appreciate the truly picturesque; otherwise, from a country abounding with such magnificent scenery as the north of Scotland, its

vast wild moorlands, lofty mountains, rugged fastnesses, its woods, and lakes, he might certainly have selected less common-place subjects than we find in his work. Neither does his treatment of those he has chosen make amends for the poverty of the material; his pencil, though free, is coarse, and his management of light and shade imperfect and ineffective. The only plates to which these objections do not, perhaps, refer, are "Highlanders' Huts," "Cattle on the Banks of the Don," and "The Cathedral of St. Machar, Old Aberdeen." These are well chosen subjects, and are carefully lithographed. The three plates of "Figures" by Gavarni, are full of character; their titles are "Putting the Stone," a popular Highland game; "Girls washing Clothes," a domestic duty generally performed, in the Highlands, with the naked feet in the mountain streams; and a "Highland Piper;" this last is a truly fine composition, most boldly and powerfully executed. We presume M. Bouquet to be a foreigner, and as such it would have gratified us to speak in more complimentary terms of the results of his "Ramble."

ELEMENTARY INSTRUCTION IN THE ART OF ILLUMINATION. By D. DE LARA. Published by ACKERMANN & Co., London.

Until we read the dedication of this little hand-book we were not aware that the Art was taught in the present day; and that some fair ladies had become proficient in it. We are also told that Messrs. Ackermann have prepared a Chromographic colour box for the use of illuminators on vellum, so that taste and study only are required to rival the beauties of this preliminary lecture on the style of composition, the colouring and gilding necessary for due effect in such productions; and all the hints and directions seem to be dictated with so much clearness and precision that we are sure it will be eminently useful to all who practise it, or who wish to do so. A few plates are appended as elementary lessons to the learner.

THE COLLEGIATE CHURCH OF ALL SAINTS, MAIDSTONE; Restored to the date of its completion, A. D. 1400. Published by WICKHAM & Co., Maidstone.

The beauties of this structure have been dwelt on by many; but they have been so much hidden by the introduction of pews and other encumbrances, that the eye of the educated Ecclesiologist could only appreciate the merits of the primitive design. The drawing by J. Whichcord, F.S.A., in which this engraving has been executed, is a restoration of the building to its original glories, and its painted rood screen and decorated chancel, and is an admirable representation of its kind, useful alike to the Ecclesiologist and the antiquary, and possessing attractions also to the mere print-collector.

THE GERM: Thoughts towards Nature, in Poetry, Literature, and Art. Published by AYLOTT & SOYNS, London.

We understand that this little Periodical is to be devoted to the "incubations of various of our younger artists, who are monthly to contribute their quantum of poetry, pictures, and prose. It is well to find "thoughts towards Nature," in the minds of our younger professionals, with whom the Poetry of the Mind in these utilitarian days, must be pretty much confined; it is theirs to give a more wholesome bias to the thoughts of such whom Providence has placed in more prosaic employments; they are high priests or guardians of the sacred fire, and they should feel their noble responsibility. There is much of true thinking and right feeling in the various articles in this little journal; and we wish so well to its projectors that we will gladly doff the critic, cheering them on their path, and begging their readers to encourage right aspirations by paroling little errors, lest "The Germ" should not flourish. The effort ought to be supported; it is highly to the credit of young artists that they strive to encourage thought; there is here much evidence of talent; the accompanying etchings are very satisfactory. Altogether, as a work of promise, it claims a compliment to its conductors.

DESCRIPTION OF A ROMAN BUILDING, AND OTHER REMAINS, RECENTLY DISCOVERED AT CARLEON. By J. E. LEE. Published by J. R. SMITH, London.

Of the firm-seated Roman occupancy of Britain the active investigations of modern times give convincing and curious proof. Scarcely a corner exists without the debris of Roman Art. Carleion, for a long series of years a station of a Roman

legion, and subsequently one of the border fortresses of Wales, has produced its full quota of remarkable remains. It is now an unfrequented village, but so full of relics of these great conquerors, that, a few years ago, some parts of the town, which are common property, were found to be so full of Roman foundations, that the labour of digging the whole of them over was more than repaid by the value of the stone. The present work is devoted to a description of a Roman building only recently excavated, and which is remarkably interesting from the clear idea it gives of the in-door life of this remarkable people. The many fragments of pottery, glass, ivory carvings, and articles of personal ornament, all exhibit the taste and refinement of the inhabitants when living, and are well delineated in the plates to this little volume, and the letter-press of which is a clear, sensible, and well-duced history of them and their excavation. There are eighteen of these plates for five shillings; the profits from the sale is to be devoted to the funds of the Museum of Antiquities at Carleion; the zeal and energy with which Mr. Lee has worked in aid of a good cause deserve all commendation.

FRUIT. Painted by G. LANCE. Engraved by W. O. GELLER.

This is not the first opportunity we have had of commending Mr. Geller's excellent transcripts into black and white of Mr. Lance's beautiful pictures; but we are certainly surprised that the engraver finds it answer his purpose to expend his time upon subjects which, we are persuaded, the public cannot appreciate. The value of such works must depend upon colour, inasmuch as there is neither story, nor incident, nor scenery, to attract interest even subordinatedly; and the blossom of the peach, the mellowness of the ripe fig, and the transparency of the grape, lose much of their beauty and fragrance when cultivated only in the printing-room and the engraver's studio, how ably soever, as in the present instance, their growth may have been attended. From the old Dutch engravers prints of fruits and flowers frequently emanated; but this is accounted for by the enthusiasm which all Dutchmen feel for these productions of nature; hence, they who could not afford to buy pictures, put up with prints rather than have sought to remind them of their gardens during the dreary winter months; but it is not so here. Nothing can be better in its way than the engraving before us; it may justly take its place by the side of the best of those we have referred to; we may express our hope that the public will appreciate it beyond our expectations.

PORTRAITS OF LEADING REFORMERS. Published by OLIVER & BOYD, Edinburgh.

Let not our readers imagine from an ill-chosen title that they are called to look upon the likenesses of Hume, Cobden, and other modern political reformers; a mistake which more than one of our friends have been guilty of. The work has to do with the great religious reformers of past ages, and consists of portraits from cotemporary pictures of Wickliff, Huss, Melancthon, Luther, Knox, and other great men who have shaken the Papacy, accompanied by an essay on the subject by G. Hume. They are well executed in a painter-like and effective style, and the volume winds up with the best representation extant of the house of John Knox in High Street, Edinburgh. The work possesses great attractions to all, and is very original and unique in its character. It is impossible to look upon the features of these earnest truth-loving men, without deep feeling of interest; an interest which varies with each face: the hard marked features of Melancthon and Erasmus, the kindly look of George Buchanan, and the youthful beauty of the famous Scottish martyr, George Wishart, contrast forcibly with each other; but the placid determination of truthful minds appears pictured in each face.

BATH FROM SHAM CASTLE. Published by EVERITT, Pulteney Street, Bath.

We have here a new view of the ancient city "Bathonia, nestled in the lap of circumjacent hills," and we have hitherto seen none which gives a better notion of the beautiful site it occupies. The entire city is well seen, the railroad and the Abbey Church being conspicuous to the left; and Lansdown Hill surmounted by the Beckford monument, to the right of the spectator, while behind, appears a succession of gently swelling hills, completing the panorama. To Messrs. Everitt we are indebted for numerous views of Bath, of all sizes and prices; but this is perhaps the worthiest which they have hitherto issued.

THE ART-JOURNAL.

LONDON, APRIL 1, 1850.

THOUGHTS AND SUGGESTIONS ON THE EXPOSITION OF 1851.

AFTER years of ardent and unwearied advocacy, during which the *Art-Journal* unceasingly enforced the policy and necessity of a National Industrial Exposition on a comprehensive scale, it was with feelings of pride and gratification we learned, that

such a plan, and of a scope more extensively inclusive in its range than we, upon its first promulgation, could have ventured to propose, had engaged the favourable and earnest consideration of His Royal Highness Prince Albert, and that he had determined to test the feeling of the country as to its immediate adoption. We extract from an article upon this subject, published in the *Art-Journal*, January, 1848, the following paragraphs as worthy of note at the present time:—“From Government nothing need be required but first its sanction—direct and emphatic; next, the allotment of ground in one of the Parks upon which to erect a temporary building; and next, the award of honorary medals in gold and silver to those manufacturers who exhibited greatest enterprise and ability, or both combined, or whose productions were calculated to be practically useful to their country.” Again: “We believe a proposal for such an Exposition would be well received in the highest quarters. Prince Albert is known to take a deep personal interest in all matters that relate to the Industrial Arts of England, and to cherish an earnest desire for their advancement. We cannot doubt his willingness to place himself at the head of a duly authorised, and properly arranged, committee of management.”

We now see fulfilled, not only the project for which we had so long been deeply solicitous, but also through the precise instrumentality we had trustfully predicted.

Our readers will bear in mind that these sentiments are but repetitions of those we had expressed in the years 1844, 45, 46 and 47, and that in January 1848 the plan now in operation had not been promulgated. So far back as September, 1844, indeed, we thus expressed ourselves:—“A National Exposition appears to us almost the only means by which taste can be brought to act upon the various branches of Industry,” and we “desired a National Exposition as an essential part of a judicious system of National Education.”

Peculiarly anxious under these considerations that the onward current of the tide should not be either impeded or divided, by any misgivings or objections on our part as to the initiatory steps, we have despite the repeated statements and remonstrances that have been forwarded to us, commencing on the impolicy of the selection of certain parties as agents in the advancement of the scheme,—a selection in itself presenting very serious hindrances to the faith and unanimity of feeling so essential to its success—determined during its primary stages to take no step that either by misconception or misconception should induce a doubt of our best wishes and most earnest sympathy being heartily enlisted in its favour. Once firmly

* We have on a former occasion explained that in the year 1847 we had the honour to correspond on this subject with two members of Her Majesty's Government—the Earl of Carlisle and the Right Hon. Thomas Wyse—and were of opinion that although such an Exposition was highly desirable, the time for it had not then arrived.

based, the project itself is too worthy to fear honest and fair criticism as to details; and we shall therefore, as occasion may arise, best serve its true interests by questioning those points whose expediency or propriety we have reason to doubt, and also assist its progress by such suggestions as we may deem worthy of consideration. The merits and demerits of the members selected to carry it into effect have been so much canvassed, and the objections to some so justly and warmly sustained (though others present themselves to our consideration of a more serious aspect), that we will not enlarge upon this topic (unless future necessities force it upon us) as we fear it is useless to expect amendment. A false step has been taken, and will doubtless be persisted in; but time is too valuable now to be wasted upon the further exposure of an error that is sufficiently palpable to those that will see. In position the members of the Executive Committee should each have stood perfectly and entirely free from any connection or interest that might even to a prejudiced eye have cast the shadow of a doubt upon disinterested action. The selection in some instances precludes a possibility of this—and a lamentable want of confidence has resulted, in part remedied, it is true, by the appointment of a Chairman above suspicion. It now only becomes the more imperative to be vigilant as to future movements. And vigilant we shall be—the welfare of British manufacturers and the honour of the British character are involved in the issue, and no consideration of false or mistaken delicacy shall blind us to the inference of any act, or deter us from its exposure, which in the slightest degree threatens to militate against either; nor need we hesitate to declare it—the unity of purpose which actuates His Royal Highness in the honourable task he has imposed upon himself, viz., the improvement and development of the national resources of Industrial production, warrants and confirms the belief that all suggestions having for their object the general interests of the project, will be duly and fairly weighed.

We proceed then to comment upon its present aspect and progress; and we may anticipate that such will be our duty from month to month for many months to come. It is hardly necessary to add that during the last six or seven years we have been labouring incessantly to prepare the manufacturers on the one hand and the public on the other, for a struggle and, we trust, a triumph, which now awaits both. Four or five years ago the experiment about to be tried could not have been contemplated with any prospect of success. When we recommended it, and endeavoured to promote it, it was only with reference to a period that has at length arrived.

The appeal made by His Royal Highness Prince Albert for aid and co-operation in raising the necessary funds, has been, as might have been expected, to a considerable extent nobly and generously responded to; still it cannot be concealed that the donations already raised are the contributions of royalty, the nobility, gentry, and merchants; those of the classes most interested in the success of the project are still in abeyance; these, taking a practical view of the subject, and foreseeing the difficulties and hazards that await the progress and issue of the venture, naturally enough desire to know something definite of a plan so pregnant with serious consequences to themselves, before they finally stand committed to its adoption.

At the important meeting in Westminster, for example, who constituted almost exclusively the advocates and supporters of the scheme?—Earls, Lords, Bishops, and Ambassadors—all eminent—all actuated by the best and most exalted purpose, the desire to further, and assist in, the achievement of a general good. In the view of many of the noble speakers the subject glowed with the finer and more exalted impulses of our better nature, till warmed by the fervour of their sympathies and the vivacity and ardour of a susceptible imagination, it became a theme upon which was expended in brilliant succession a series of enlightened and hopeful theories.

Again, at the meeting in the Egyptian Hall, Mansion House, the speakers comprised Statesmen, Bankers, and Merchants, and were restricted to those classes. Now we are sensitively alive to the importance of, and absolute necessity for, the prestige which the adhesion of rank and wealth insures, and lacking which, vain would be the expectancy of labour imposed or outlay incurred, and profitless the results if undertaken—still we must not under-

* There were a few persons in trade moving and seconding resolutions, but they were not, we believe, manufacturers; at least they do not stand before the world in that position, although men of eminence and men of taste.

value or neglect the positive requirement of responsive feeling from those upon whose operations the realisation of these bright and sanguine hopes depend. It is very evident that much doubt and indecision exist amongst manufacturers and producers, and it is vitally imperative that these be at once allayed and removed.

The strictures which we have occasionally found it necessary to make upon the frequent deficiencies of manufacturers themselves, will absolve us from the charge of undue partiality or bias in their favour. It has always been with regret we have felt bound to enforce them, but the same feeling which has urged their declaration, emanating from a sincere desire for an unclouded and extended productive intelligence, now impels us to advocate their claims to consideration.

The state of feeling in the principal manufacturing towns does not evince that enthusiasm in the movement, which would have resulted had there been a more explicit and satisfactory understanding upon the subject.

At the Manchester meeting but from thirty to forty gentlemen were present, although upwards of six hundred circulars were issued. Now Manchester is not deficient in either spirit, skill, or capital, when the object for which advocacy and support is claimed warrants their enlistment, and it is alone the ambiguity and doubt in which the plan is at present shrouded that chills the energies and retards the action of those who, under a plain and explicit declaration of judicious and honest details, would have zealously abetted its fulfilment. Up to the time of writing, Birmingham, a most important locality, and one capable of maintaining a permanent and honourable position in the struggle, “makes no sign.” Here, again, this cannot arise from want of energy, or incompetency. In those manufacturing towns where subscriptions have commenced they are trifling alike in their separate items and in their aggregate sums, and until some matured and digested scheme of operation is decided, it is in vain to expect that amounts of funds, and that extent of faith in their application, which are essential to a successful result. Blank cheques have been forwarded to parties who gave their signatures as acquiescing in the general proposition, accompanied with a request that they be filled up for the amount of the intended donation for immediate payment. Now this course, and we speak from extensive personal knowledge and inquiry, has been in a great many instances considered premature, and will end in much disappointment. The objection comes from sincere well-wishers to the movement, who hesitate thus blindly to part with their money, resigning all future control or influence over its disbursement, without some understanding as to the mode of its proposed application.

Admitting the “preliminary step” of sending the deputation round the country, to feel the manufacturing pulse upon the general question, to have been well advised, the next movement should certainly have been to draw up such leading outlines of the proposed details as could have been submitted to the opinions of the local commissioners of the different extensive seats of manufacture, for advice upon those points which immediately affected their interests and requirements. In many respects as regards manufacturing data and experimental knowledge, the most valuable must be gained from provincial sources; and should any advisable suggestions have emanated from them, their adoption should have been consequent. The plan thus matured, and due deliberation had upon its several bearings—then,

* Since the above was in type a meeting has been held in Birmingham, at which the question of “money prizes” was brought prominently under discussion, and met with strong and determined opposition. We are gratified to note this, as we have ever held them to be not only positively and directly injurious, in their immediate effect, to the more elevated bearing of the industrial contest, but also a certain source of future dissatisfaction and reproach. At the meeting alluded to, a resolution was carried to the effect:—“That it was not desirable to award money prizes to successful competitors, the meeting being of opinion that honorary distinction and commercial reputation are the most sure and honourable awards, and will prove the more generally satisfactory to the manufacturers of this district.” A most just and honourable conclusion—alike creditable in feeling and expression. A resolution was also passed in favour of a subscription to aid the funds necessary for the purposes of the Exposition, but reserving powers to the Committee in the event of “large money prizes” being given, “to award only such a moiety of the subscriptions as the Local Committee may deem advisable.”

Here is confirmatory evidence of the truth of the position we have elsewhere enforced of the absolute necessity for a cordial and explicit understanding upon the details of the plan; without this, it is vain to expect either unanimity or fervour in the cause. In the case of this important town, it is impossible, under present circumstances, that the subscriptions can realise the amount which they might otherwise have done—a matter for regret, which might have been foreseen and avoided.

and not till then, should the demand for subscriptions have been made—and they would have been promptly forthcoming. Secure on the judicious arrangement and honest working of the scheme, no doubt could have been entertained that ample and more than ample funds would have been easily raised, and those too from "cheerful givers." Up to the present time the faith, reliance, and support which has been rendered, has been wholly through the influence of His Royal Highness's immediate connection, the time has now arrived when its own merits should relieve the Prince of this temporary responsibility. The success of this "preliminary step," as it was called, may be over-estimated, but a limited reliance should be placed upon a verdict given before the particulars of the cause to which it related were examined into. A ready assent was yielded to the *general object* submitted to the various provincial meetings, of an Exposition upon an enlarged and comprehensive scale, including within its range of competition the products of all nations.

So far the motive of the plan was approved, but there was an implied reservation in the minds of all who thought upon the subject, that the definite modes of procedure in carrying it to completion were such as they could cordially support; at these meetings the name of the Prince was made to supply the place of all explanation, and the respect which so justly attaches to his general character, added to the gratitude felt, particularly by the manufacturing classes, to him for the personal interest he so kindly took in a proposition he believed conducive to their welfare, closed the lips of many who would otherwise have sought further elucidation into the merits of a scheme for which they were solicited to stand pledged.

It is now primarily essential that the proposed executive arrangements, specifying the works in the different branches of art and manufacture which may be considered *competitive*, with the regulations and restrictions affecting their competitive qualities, be published as early as possible, for the time allowed for subsequent action is too short to allow any to lapse in protracted or dilatory preliminaries. The paramount and indispensable necessity to the successful working of the whole (in a National point of view) is an undoubting

* As additional proof of the necessity of the course we have recommended with regard to the immediate necessity of an explicit and satisfactory statement of the proposed details of the scheme, and of the doubts and misgivings which naturally arise from its being withheld, we may quote from the *Times* part of a correspondence that has taken place between the London Committee and the secretaries of the Commission. The questions and comments of the former are as follow:—

"*King's Head,oultry, Office of the London Committee,*

"*March 11th.*

"Gentlemen.—We are requested by the City of London Committee for promoting the Exhibition of Industry of all Nations to beg the earliest attention of the Royal Commissioners to some points of a practical nature, which materially affect, and indeed impede, the progress of the subscriptions now being raised for this important undertaking. We have the honour to acknowledge the receipts of the various instructions already set forth under the authority of the Royal Commissioners, but we find that minor details in the making out of the arrangements of the Royal Commission are of more vital importance in the appreciation of those gentlemen who intend to offer objects for exhibition. Subscriptions have been withheld in consequence of an impression that four secretaries attached to the Executive Committee, or acting under the Royal Commissioners, are each in the receipt of 800*l.* a-year. Erroneous as such impressions may be, it must be obvious to the Royal Commissioners that the opportunity of correcting such a statement would be advantageous to the influence and operations of this Committee."

"The Committee further recommend that the duties and offices of the committees of sections should be properly defined, and that the members of such sections should give their opinions as to the adjudication upon the merits of articles to be exhibited, and upon the prizes; they also request to be informed on the following points:—
1. In whose name articles were to be exhibited; 2. whether one or more names should be attached to each article; 3. if the members of the committees of sections, as manufacturers, were to be allowed to be competitors for prizes, or judges of articles exhibited, and as to matters of detail.

The following are the answers of the Secretaries:—
"1. Juries will be selected to award prizes; but no competitor for a prize in any section will be allowed to act upon a jury to award the prizes in that section.

"2. It is not intended to require of exhibitors that they should necessarily be subscribers.
"3. It is not intended to exclude any person, whether he be the manufacturer, designer, inventor, or proprietor of any article, from exhibiting it, whatever may be the regulations under which he may hereafter be required to do so."

A fourth answer states, that no sales of articles will be permitted at the Exhibition; but we presume there will be no restriction as to taking "orders" for such articles.

No reply is given to the inquiry concerning the payment of the "four secretaries attached to the Executive Committee;" and we understand the question is to be again put.

reliance upon the judgment and good faith with which these are drawn up. Till the determined prizes are announced, it is impossible that specific works in competition can be commenced. We would not imply encouragement of, nor would we pander to the mercenary spirit, that would grasp solely at the money value which the rewards may bring; these golden baits have already been put too prominently forward, and in them lie a fertile source of mischief. To the system of money prizes we hold *positive and strong objections*, which but increase with the increasing amount of the award, and this feeling is shared by the great majority of the most intelligent and influential of our manufacturers. Independent of the utter impossibility of regulating their relative amount consistently with the direct or indirect value of the successful objects in their separate classes, there is the added difficulty of so graduating their scale, that they may fairly indicate the respective general commercial importance and mercantile value of the works to which they are awarded. That class of production which may be justly deemed most worthy of extraordinary commendation and reward, including in its possessive merits, improved qualities of execution, taste, and ingenuity, so judiciously applied, as to enlarge the means, while it extends the facilities of general adoption, is from these very causes the most certain to insure its own remuneration, by the mere force of public acknowledgment influencing public patronage—thus rendering large money prizes wholly unnecessary and inexpedient. Their expediency could only have been tolerated by the fact that manufacturers required such a stimulus to rouse them to exertion, and even in this view their admission would have been a very questionable policy, as ministering to a low standard of motive influence, but we are proud to say that on this ground they are generally repudiated. Manufacturers not only disavow their necessity but deny their expediency altogether. Honorary distinction is in every sense a preferable mode of approving recognition. Would it not have been reward enough to any patriotic spirit to have found his victory in the field of science, art, or manufacture, acknowledged by the verdict of his country—that public confirmation ratified by his Queen, the fountain of all honour—although attested but by an olive wreath, the Hellenic type and meed of victory.

This in the estimation of that mighty intellect which has left its marvellous stamp on all within its range, was deemed ample confirmation of triumph far greater than we can possibly hope to realise; and if this spirit breathe not, at least to some extent, within the breasts of the aspiring competitors, the elevating impulse to lofty and intellectual working is wanting, and in vain may we expect its operating value.

We are not Quixotic enough to despise, or slight, the necessary advantages of positive and certain remuneration, to secure and reward mercantile enterprise, in this utilitarian age too oft the sole mainspring of all progressive action. This, however, would be amply secured to the successful candidate by the after-impetus to his manufacture which the award of victory must necessarily involve. Triumph in an arena stored with the products of a competitive world—the record of that triumph a "universal fact"—is of itself sufficient honour, and must realise sufficient recompense, to satisfy the most inordinate ambition.

The name to become a "household word"—its stamp to give a determined value to the products which bear its impress—is a sequence as proudly honourable as it will be certainly and extensively remunerative.

Still, it having been decided that money prizes are desirable—and such having been definitely proposed—and the Royal Commissioners, it is understood, feeling themselves in some degree pledged to their retention, they become most important matters for consideration and determination. While agreeing cordially in the proposal to admit universal competition for a share of the prizes to be offered, yet we most strenuously urge that a *class of awards or honorary distinctions should be expressly allotted for native competition only*. Let us be just to ourselves, if not before, at least while we are, generous to others. This fact should stand in prominent relief, that our home productions in Art and manufacture will be the results of *individual enterprise*, effected at *individual cost*, the private pocket supplying the necessary outlay, not as in the case of our more favoured continental rivals, the public purse contributing its quota of the amount.

Into the question of the policy of government grants for the advancement of Art-manufactures, we are not now about to enter, though the ready commendation which such a course receives from many, evidences a narrow and short sighted estimate of the importance of the subject. A public

grant judiciously made, may by its influence upon that branch to which it is applied, exercise such a stimulative and expansive power, and cause such an extension of trade, as in its general spread, to repay the friendly help with usurious interest. Be this as it may, it will not be doubted, that to government aid, is mainly to be attributed the advanced position of the Art-products of the continent, and in the awards which foreign competitors will bear from us, we shall nationally approve in others the result of the very policy of government encouragement, which as a nation we have repudiated and rejected in our own case. Is not the superiority of France in Art-decoration consequent upon the enlightened patronage and judicious instruction, which her government has ever extended to her Art-workmen?—Is it not the result of discipline and study undertaken because its means and appliances were readily available, and because success would ensure appreciation and remunerative employ? What in our perverted views has been a questionable and neglected accessory—with them was held a primary and indispensable necessity.—Successful as these results now are, they have but been progressive—their first efforts were as feeble and uncertain as our own, these have been guided and fostered by paternal care; salutary training and constant sustenance have developed after years of successive growth, the strength and vigour of advanced maturity; and now in the very zenith of this power, in the admitted superiority of its resources, we boldly challenge the products of its rival, against the weakly offspring of our neglect and indifference. This assuredly argues more for our timidity than our sagacity.

The confirmed errors and mistaken course of a life cannot be retrieved and corrected in a few months. Were the amount of loss entailed by failure, bounded only by the intrinsic value of the prize itself, this would be of but trifling consideration, but it is the loss of status as a manufacturing community which this infers that makes the decision vitally important. The estimation of British production in the foreign markets will to a very considerable extent be influenced by the verdicts of 1851, and this should not be lightly trifled with. We would not seek a partial success at the expense of justice, but the concession we advocate is one that justice itself demands. We repeat—there should be a class of awards and honorary distinctions expressly allotted for native competition only."

Upon the same grounds we contend that *no works which are the production of manufactories supported by government grants—the so-called Royal manufactories—shall be eligible to compete for prizes*. It is manifestly unfair to allow works, which in many instances have been the labour of years, and which have been produced irrespective of all consideration of cost, the expense of which has been defrayed by public grant, to enter the lists against the unaided results of individual manufacturers wholly dependent on their own resources. Gladly would we hail their advent as works for exhibition, frankly would we acknowledge their merit and yield all honour and praise to the executors, but further than this we cannot concede, nor can they desire; it would indeed be but little credit to win in a contest where the odds are so unequal. The necessity for increased exertion which will be felt to conviction by their contemplation, and the earnestness with which our future efforts will be directed to emulate their perfection, will soon have positive evidence; and in a future struggle, and that at no distant period, we will willingly throw down all restrictive barriers and let the competition be as universal as the works themselves.

Tardy though it has been, and inadequate as its results at present are, it cannot be denied that a steady and regular improvement in manufactures, we are sanguine that the campaign which the advent of 1851 promises, is pregnant with well grounded hopes of a still increased advancement, and a more uninterrupted and definitive progress.

Mr. Redgrave, A.R.A., at the meeting for the distribution of prizes at the Government School of Design, Somerset House, a few weeks ago, said—"The real difficulty in the superiority in France of the Art-workmen? The truth of this remark, as far as it applies, no one will question; but more extended experience in the manufacturing world will prove to that gentleman that there are other "real difficulties" besides the one he has revealed. It is not in the "workmen" alone that France has the vantage ground—it extends to those who call that labour into action—the *manager* as well as the *employee* brings to the task the requisite intelligence and ability—a more generally diffused taste pervades their purchasers; in fact, a more elevated standard of appreciatory

knowledge in Art-requirements is nationally cultivated. It is futile to blame one class alone; the secret, if it be such, of the insufficiency of the Art-status in England, is the depressed condition of taste in general; and the sooner this is acknowledged the more prompt and decisive will be the means taken to remedy the grievance.

It would be difficult to exaggerate the repulsive quality of a great bulk of English decorative manufactures; with the mass of producers Art is altogether a dead letter—a thing intangible—without form and void. Like nature to Fusch—"it puts them out." Could their eyes but happily be opened to the abortions upon which they employ the time of those under their control—could their enmity but become palpably evident—operations must altogether cease or be at once amended.

The improving efforts of the "judicious few" are fatally hindered by the misguided number; and it will be a hopeful feature in the forthcoming Exposition, to mark in most decisive terms, its repulsion of those productions which tend so seriously to mislead and debase the public taste. Works of questionable and objectionable direction should not be admitted; it should not be left to the caprice of the ill-judging in the crowd to admire what should be condemned, and thus fortify and confirm their own misguided and perverted notions. The eye unaccustomed to the investigation of the principles of elegance and constructive beauty, oblivious to the requirements which constitute grace and originality, distinguishing and separating them from affectation and servile imitation, is readily led captive by the crude and startling effects, which appeal only to its external sense. This risk should not be incurred. Admission to the advantages of the publicity offered by the Exposition, should of itself be so judiciously regulated and restricted, as to be to some extent a warrant for the creditability and merit of the work received; and in this alone, irrespective of the collateral benefits it insures, its influence will be of vast and salutary import. We would enforce particular attention to this, as it has been stated that *all* works sent for exhibition will be admitted; for in a country like our own where Art-education has been the one thing not needful, the very rules which regulate and curb the fancy, otherwise apt to run riot, are written in a soiled book.

The more general diffusion of artistic feeling and knowledge by the promulgation of the laws of harmony, analogy, and beauty, which is thus within the compass and capabilities of the Exposition, is a marked and cheering feature of its corrective influence.

As a general truth, it is rare that the object which at first sight excites astonishment, possesses those qualities which, upon mature and critical reflection, command our sympathies and elicit our admiration. The one absolute necessity to all inherent beauty, simplicity, is never attained but through the medium of severe and studious research. However elaborated the details, however extensive the development or intricate the components embodying the design, still to constitute a really perfect work, its plan and details must be drawn and based upon simplicity.

The beautifully simple outlines of the funeral pottery of Greece are but the result of this feeling thoroughly understood; its principles are alike evident in the natural grace of the Apollo, in the wondrous marbles of the Parthenon, as in the humble utensils of domestic requirement; and it is the want of this feeling which is the marked and leading characteristic of British Art-manufactures. They lack the education which should guide, influence and restrain the innate faculties, so as to render their efforts amenable to such control as tends to give them value and utility. The unbridled impulse hurries on in feats of wanton vagaries, which, at the best, but startle and surprise if they escape our positive condemnation.

The scheme for regulating the admission of exhibitive works should be so drawn up that no inducement be held out to the commission of these ridiculous freaks or vulgar whim. Encouragement only should be extended to those works which minister to direct purposes of utility and elegance (which is a refined and necessary utility in advanced civilisation), and let the object be as mean in its material, as humble in its purpose, still it should be the condition of its reception, that in its execution merit be expressed, and visible. In this respect the Exposition can work a great Art-moral lesson; indeed, its most directly useful attribute is summed in this requirement.

Miles and miles of promenade, as we are promised, will be but weary treading if the objects which bound their length and breadth, present in the aggregate but questionable value, or positive worthlessness.

Better far as many yards of such selected materials as may by study and investigation excite our emulation, and teach the valuable lessons of improved perception and extended capability.

The classified list of objects to be received is to say the least of it in many respects comprehensive enough, but it is marked by a singular and startling omission—*no reference whatever is made to the acceptance of drawings of original designs for manufacturing purposes.* Now, the admission of these we conceive a fertile source, not only of useful and vigorous action, as calling forth the exercise of powers in the very direction where our weakness has been most apparent and regretted, but also one so largely inclusive in its adoption as to be more extensively and available productive than any other. Numbers may have the talent and facilities for suggestive studies upon paper, to whom the practical execution of those designs in any manufacturing process may be an utter impossibility from want of proximity to the locality of their operations, or the expenses involved in their production. The influence of the Schools of Design might in this feature have been brought prominently and efficiently into play, and a powerful stimulant applied to their efforts, but singularly enough, these have been altogether overlooked or but lightly estimated. The admission of the designs should of course have been dependent upon their intrinsic merit and constructive or applicative capability. We must strenuously advise the consideration of this subject. The omission becomes the more remarkable and almost sinister in appearance, when we observe that works of sculpture are admitted. For the latter productions the various Art-exhibitions, both in London and the provinces are always available, and therefore offer a constant and legitimate medium for their submission to the public notice.

Surely the reception of "designs," the emanation of creative intelligence developed by educational resources, is more consonant with the interest and purpose of an Industrial Exposition, and more reasonably suggestive of a beneficially productive tendency, than the inclusion in their "raw state" of mineral and vegetable substances—such as "calomel, corrosive sublimate, sodium, soapers' waste, gas lime, arsenic, kaolin, quartz, granites, sand-stones, green-stones, resins, balsams," &c. &c.

These are, however, elaborately detailed in the list of admitted objects, with we think questionable judgment—they will be both uninteresting to and unnoticed by the million, and those alone who feel an interest in their examination would prefer their study in the more congenial and secluded sphere of a museum, than in a public and crowded exhibition.

The list, however, contains no allusion to those objects which are proposed to be competitive.*

In conclusion we would briefly, for the present, (as we shall continue our comments in future numbers) urge on British manufacturers, artists and artisans, to be "UP AND DOING." Indifference and apathy at the present crisis are fatal to your future progress. Wisely or rashly, heed it not to consider now—you are committed to a severe trial which cannot be deferred; ball is given for your appearance at the bar of public opinion—fail not your sureties; that it has been sought with a sure conviction of its eventual beneficial influence upon yourselves, and advocated as the necessary advent of increased exertion, cannot admit of doubt, and it is suicidal to your position to remain inert or antagonistic.

Vain the solace that dislike to general arrangements or objection to specific details caused your place in the industrial ranks of the modern "British Volunteers" to be vacant. "Lay not that flattering unctious" to your souls. This will be known only to yourselves, and probably the narrow circle of your own neighbourhood, but the world-wide fact will record the names of those alone who did contest and won honourable mention. You may avoid competition, but you cannot avoid the reflection and injury which your pusillanimity will inflict upon you.

Now is the time for discussion and suggestion; speak out your wishes, and let them but evidence sincerity of purpose and just requirement, and doubt not that they will have all due consideration.

* This very important document forms, as it were, the key by which the doors of the Exhibition are to be opened; our readers will therefore expect that it undergoes some scrutiny at our hands; not only with regard to the "Objects Admissible," but to the "Committees" to whom will be confided the onerous duty of deciding what shall be admitted and what rejected. As respects the latter, the selection are unquestionably liable to some objection. The "Objects Admissible" demands much consideration; and we have devoted this month so much space to the Exposition, that we cannot now pass this document under review. We must for the present content ourselves with observing that we find in it some very unaccountable errors, and some omissions of a very serious character.

There is no reason why eventually you ought not to be able as successfully to compete with any nation, let its position and qualification be what it may, in works which involve the exercise of taste, as in those of scientific requirements, provided you embrace the means to become so. Resolve then to begin this course at once and in earnest; no more promising era for the dawn of enlightened and amended action will arise than the present.

Shrink not from your responsibility! By omission or commission—directly or indirectly—the status of England's Industrial Art is in your hands. If indifferent and resigned to indifference—or incompetent, and you will not struggle for efficiency—depend on this—a lesson of severe, but wholesome and deserved humiliation, awaits you!

B.

[Our readers will find an authorised list of the objects admissible to the exhibition attached in at the end of the present number, to which we would refer them. We are thus spared the necessity of transferring the document to our columns.]

SKETCHES BY E. LANDESEER.*

It is scarcely necessary, we should think, to remind the readers of our Journal that its pages rarely censure—where attempts, however feeble they may be, are made to aid the progress of Art. It is far more consonant with our feelings and wishes to cheer on, than to urge back; yet there are occurrences which sometimes compel us to depart from our usual course, and which leave us no alternative but to record entire disapprobation. The appearance of the two prints under the titles quoted respectively, is an incident which we cannot overlook. The drawings from which they are taken were, we believe, made by Mr. Landseer for the late Countess of Blessington's portfolio of "scraps." They are nothing more than mere sketches in India-ink; clever, as all must be, which comes from the hand of this distinguished artist; but they were never intended for the engraver; and it is an act of gross injustice to Mr. Landseer to reproduce them as we find them here.

It is clear not only that the painter never intended these light things to be engraved, but that he would have prohibited their engraving if he had had the power. They are calculated not to serve, but to injure, his reputation; for they are really nothing more nor less than scraps scarcely worthy even as gifts of friendship. The first-named is a little bit either borrowed from, or suggestive of, the large and fine print which bears the same title; the second is a mere sketch in outline. But now comes what seems to us as great an inconsistency, as their publication under any circumstances is unjust to the artist: the prints are respectively announced for sale at the following charges—"Huntsman and Hounds," artists' proofs, *two guineas*; fac-similes, in tints, *one guinea*; prints, *half-a-guinea*; "Coming Events," artists' proofs, *two guineas*; proofs before letters, *one guinea*; prints, *half-a-guinea*. Now, we utterly repudiate the doctrine—

"That the value of a thing,
Is just the money it will bring;"—

the value of that whereon *mind* and time are employed should be determined by the amount of both expended upon it. In the case of these two engravings, a few minutes' thought probably engaged the artist's attention, and a few minutes of time sufficed to put his ideas on paper, while scarcely a greater number of hours enabled the engraver to transfer the subjects to the steel or copper; and yet half-a-guinea is charged for an ordinary print. The whole thing is an absurdity, and if the publisher finds his speculation a profitable one, we shall consider the public more readily duped than at present we believe them to be. But there is yet another medium by which the value of a work of Art should be tested, that is, by comparison; there would be little difficulty in adducing numerous examples of engravings, published either separately or serially at the present time, from which to draw our inference, to show that the charge for these meagre sketches is to the last degree ridiculous. Mr. Grundy, we believe, has but recently established himself in London as a publisher, and it is not because we desire to offer an obstacle to his success that we make these remarks, but to warn him of the error into which he has fallen, lest a repetition of it may do him irreparable injury. We trust this hint, which we offer in good part, will not be lost, and that he will not again be misled into a wrong act by the popularity of a name.

* "Coming Events." "The Huntsman and Hounds." Engraved by H. T. Ryall, from Drawings by E. Landseer, R.A. Published by J. L. Grundy, London.

OBITUARY.

SIR WILLIAM ALLAN, R.A.,
PRESIDENT OF THE ROYAL SCOTTISH ACADEMY.

Among of the chieftains of British Art is gone from another us. For some time past accounts had reached us of the precarious state of Sir William's health, and latterly these accounts have been of so unfavourable a nature that we were not surprised to hear of his decease, the ultimate cause of which was an attack of bronchitis. He died at his residence in Edinburgh, on the 23rd of February, in his sixty-ninth year.

In the *Art-Journal* for April 1849, we introduced a portrait of this eminent Scottish painter, with a somewhat lengthened notice of his professional life, the early part of which was so full of instructive and entertaining incident, when, with the enthusiasm of one devoted to his art, he journeyed through Turkey and the rudest parts of half-civilised Russia to collect materials for his future labours. The use he subsequently made of what he gathered in his travels, and a list of his pictures of every kind, were also brought forward in our remarks, so that now little remains for us to do beyond the sad task of announcing his death, whereby the Scottish school especially has lost its greatest ornament in historical painting; nor will it be much less felt among ourselves of the south.

In our former biographical sketch it was said—
"The patriotic President of the Scottish Academy is now engaged with his wonted vigour in painting the 'Battle of Bannockburn' on the same extensive scale as his latter picture of the 'Battle of Waterloo.' May success and reward attend his noble effort." This picture was fast advancing to a state of finish, and as it was intended for the next exhibition of our Royal Academy, Sir William was working at it with as much diligence as his enfeebled condition would permit; in fact, with more than he should have been allowed to do; for the *Athenæum* states that "he had his bed removed into his painting-room that he might sleep near his work. When the pencil fell at length from his hand he was too far gone in illness to be removed, and he died in his painting-room, in front of his latest picture."

Men are accustomed to honour those who, with their good swords in hand, fall with their faces to the foe, whatever be the cause that brings them to the battle field; it takes no glory due to the veteran whom death overtakes while engaged in perpetuating the victories of his country, and in adding to its renown in the arts of peace?

Much interest will be excited in reference to Sir William Allan's successor to the Presidency of the Scottish Academy.

JOHN PETER DEERING, R.A.

To the above announcement, we have also to add the death, on the 2nd of March, of Mr. John Peter Deering, R.A., a name as connected with art, known but to few of late years, unless they may have chanced to see it among the list of members of the Royal Academy, as printed in their annual catalogue; and they who have done so would most probably marvel how it ever came there.

Mr. J. P. Deering, who was known as Mr. J. P. Gandy in earlier life, was an architect, and we believe a younger brother of Mr. Joseph Gandy, also an architect and an associate of the Academy. According to the *Athenæum*, Mr. Deering began life under the patronage of the Dilettanti Society, and by that Society undertook a professional mission to Greece. With the exception of Exeter Hall in the Strand, we are not aware of any important edifice designed and erected by him, yet in 1827 he was elected an Associate of the Academy, having in that year succeeded to considerable landed property in Buckinghamshire. In 1838 he was chosen Academician, though for the five preceding years he had not exhibited a drawing in their exhibitions, nor has there been one since a period of seventeen years. Mr. Deering sat in the first reformed parliament for the borough of Aylesbury. Our contemporary to whom we have before alluded, says—
"He was fond of his art, and if he had been a poorer man would have become distinguished in it."

The election of Mr. Deering into full membership with the academic body, is one of the "mistakes" which the Royal Academy has sometimes made; the retention of its honours by this gentleman, seventeen years after he had *de facto* quitted his profession, was neither creditable to him, nor should it have been permitted by the Society. There is another member of the Academy of whom the world knows nothing as an artist, whether he be painter, sculptor, or architect. We have before us at this moment the catalogues of the Academy for the last quarter of a century and cannot

find, during the whole of this period, his name as a contributor. Now, this ought not to be; some plan should be devised to remedy the evil, for it is a glaring one: so long as the number of Academicians is limited to forty, they should all be on the "effective strength" of the Institution. If age, or infirmity, or the increase of wealth incapacitate or keep back a member from adding his annual contributions to the exhibition for three or four successive years, he might be "superannuated" as an honorary member, and another elected in his room. There would be no difficulty in procuring the Royal assent to some such plan as this, which should be tried. For the present we merely throw out the suggestion; we have no space this month to enter at large upon the subject; it is important, and one we shall hereafter find occasion to recur to.

JAMES CHRISTOPHER TIMBRELL.

We regret to announce the decease of this painter at Portsmouth, on the 5th of January, after a painful illness, aged thirty-nine years. He was brother to Mr. H. Timbrell, the sculptor, whose death at Rome we noticed some months back; and his works have at various times been before the public.

THE BRITISH INSTITUTION.

To judge from the list of pictures which have already been sold from the gallery of this Society, now open, we anticipate a most prosperous season for our artists. There are 487 pictures exhibited, and of this number, up to the 20th ultimo, seventy have been sold, or about one-seventh of the whole. This is highly encouraging, inasmuch as we may expect a considerable increase from the purchases made by the subscribers to the Art-Union, as well as from other sources, during the next month or two. We annex a list of the above sales, with the prices realised, so far as we could ascertain them; some few of the pictures having been bought from the painters' easels, before being exhibited to the public.

(bought by G. W. Yates, Esq.); No. 479. 'A Lane near Chiddingstone—Kent,' S. R. Percy, 10s.; No. 481. 'The Woods in Autumn,' J. Middleton, 50 gs.

ART IN THE PROVINCES.

EXPOSITION OF 1851.

BIRMINGHAM.—An important public meeting has been held in the Town Hall, the principal feature of which consisted in an animated discussion on the third resolution, to the effect—"That it is the opinion of this meeting that it is not desirable to award money prizes to the successful competitors in the intended Exhibition, they being of opinion that honorary distinction and commercial reputation are the most sure and honourable reward, and will prove the most generally satisfactory to the manufacturers of this district;" an opinion which seemed to meet universal approval. The subscription commenced in the room amounted to 200l., a pitiful sum in comparison with that obtained in other places.

LEEDS.—A meeting at the Court House has been held (the Mayor presiding), to aid the general Congress of Industrial Art in 1851, and the amount of subscriptions announced at the meeting was nearly 1100l.

BRADFORD.—Workmen's Clubs have been formed in this town, and will no doubt be followed by others, by which they will be enabled, by the payment of small weekly subscriptions, to visit the Metropolis when the National Exposition opens. This is "a good sign," and we augur the best results from a proper enthusiasm among the workmen which this movement leads us assuredly to expect.

GLASGOW.—A meeting of the principal merchants, manufacturers, and other leading men of the City and its vicinity, met by invitation of the Lord Provost, in the Council Chamber, to consider the best mode of obtaining an effective working committee.

HUDDERSFIELD.—A meeting has been held in the Guildhall of this town, to insure the industry of that locality an appropriate and honourable representation at the Great Exposition, and upwards of 200l. subscribed.

MANCHESTER.—The leading commercial men of this town held a meeting in the Town Hall; when resolutions approving of the Exhibition of 1851 were moved, and subscriptions commenced, which were announced to have reached 3000l.

LIVERPOOL ART-UNION.—This Association has given instructions to Messrs. Copeland to prepare Statuettes in Porcelain, from the figure of Lady Godiva unrobing, from Alfred Tennyson's poem; it is the work of the sculptor Macbride, of Liverpool. We are glad to announce the spread of a taste for these beautiful productions of the plastic arts.

THE BIRMINGHAM EXPOSITION OF 1849.—The final statement of the expenditure and receipts for the fifteen weeks during which this Exposition was open to the public, has been supplied to us; and we lay it at once before our readers, inasmuch as it is a curious and instructive paper, particularly when considered in reference to the projected Exposition of 1851.

	£	s.	d.
Money realised by Season Tickets, Single admissions, and sale of Catalogues	3,076	14	0
Cost of Building and Fitting up	1,258	19	8
Gas consumed and Gas Fittings	231	13	11
Fire Insurance on £23,000 for 6 months	128	14	8
Printing, Advertising, and Catalogues	493	19	7
Carriage of Goods from Distant Contributions	45	0	0
Attendances, &c.	482	13	5
Incidental Expenses, Superintendent's Salary, &c.	325	11	8
Balance	110	3	1

The balance, £110 3s. 1d., to be devoted to the purchase of casts, models, and books, to be presented to the Birmingham School of Design. This, we think, will be the best commemoration which could be desired to keep alive a remembrance of by far the most successful Exhibition of Industrial Art, which has yet been achieved in this country. A large sum was subscribed by manufacturers previous to the opening, to meet the expenses; this, we apprehend, has been returned to them.

ROYAL SCOTTISH ACADEMY.

The twenty-fourth exhibition of this important and advancing body, is as remarkable for its general merit as for those proofs of rising genius which adorn its walls, and testify to the enduring excellence of native art. We are justified in congratulating our northern brethren on these cheering facts; believing as we do that it is in their power to hold a high position among similar bodies, while they thus preserve a vitality in their younger members who may succeed, and by honourable study, excel, the older ones as they decline. We have never seen a less objectionable exhibition than that which this year asks the attention of the Scottish capital—an attention which its merit demands, and which no one need shrink from giving. It is quite clear that the Scottish School need not fear any comparison with that of London.

No. 9. 'Highland Girls Winnowing Corn,' R. R. M'IAN. We have here a genuine Scottish picture to begin with, painted with all that truthfulness which an intimate acquaintance with northern manners and scenery has given this artist. There is a clearness and decision in this picture which ranks it with the best of his productions.

No. 10. 'On the Coast of France near Havre,' JOHN WILSON, JUN. A simple scene, evincing a true knowledge of nature; the colouring clear and good.

No. 26. 'Skye and Gregor,' JOHN GLASS, A. A black and white horse painted in a good broad style, which must ultimately reach excellence.

No. 27. 'Too Late,' JOHN D. MARSHALL. A boy has just entered a village school. He is received by the Dominie with suppressed anger. He pulls forth his watch, and enforces on his timid the fact, to be more deeply felt when the half-hidden cane falls on his shoulders. The schoolfellows are engaged in speculation as to the event, but some eagerly snatch the moment for other pleasures; and a scene of uproar seems likely to ensue on all hands. There is boldness in taking a subject which has been so well and so often done before by some of our best artists; it has many good points in it, and displays much knowledge and ability.

No. 34. 'Head of Ullswater—Cumberland,' MISS FRANCES STODDART. One of the best landscapes in the room. The water and distant hills are in a flood of light, which gleams through the dark tints of a green line in the foreground with the happiest effect. It is altogether a charming transcript of a lovely scene.

No. 43. 'Lime-kiln in the Highlands,' HORATIO MACCULLOCH, R.S.A. A really noble landscape, painted with great depth and brilliancy. The clearness of the distant tints upon the mountains, the broad waste in the middle distance, and the masterly manner in which the rocks and heath in the foreground, are rendered by the painter, are well worthy the attention of the younger members of the academy who also "woo nature."

No. 48. 'An Italian Shepherd,' THOMAS SMITH. A fine study of a picturesque figure, good in colour and execution.

No. 50. 'The Cap found in Benjamin's Sack,' SIR W. ALLAN, P.R.S.A. We have already had the opportunity of seeing this picture in London. It is a subject well chosen, and the contrast between the richly and quaintly habited Egyptians and the simple Jewish brethren, is striking and good. A study of some portions of this picture is however more satisfactory than looking at it as an entire work.

No. 51. 'Portrait of Mrs. James Merry,' J. G. GILBERT, R.S.A. An excellent picture with good flesh tints; and a dignity of treatment which elevates it above portraiture in general.

No. 54. 'Scene in the Forest of Arden,' J. A. HOUTSON, R.S.A. "Still green nooks, woods old and hoary," are here depicted on "a day in June after rain," and worthily have they been displayed, with an intimate knowledge of nature and strength of touch. We hope for much at the hands of this artist, and augur well for his future success. Such transcripts of nature are especially covetable by all "in populous city pent," and these are by no means bad patrons of the landscape painter.

No. 61. 'Leaving the Glen,' M. BARTON, A. A Highland family mournfully visiting for the last time the graves of their people; an aged widow is aroused from her reverie of grief by a little child directing her attention to the wagoner who summons their departure. Her son, with his wife and elder child, stands beside her; the haze over the hills and gathering storm add to the gloom of a scene well conceived, and wrought out with much ability.

No. 77. 'Portrait of a Lady,' D. MACNEE, R.S.A. A really noble half-length, full of intelligence and power, the colouring rich and masterly.

No. 80. 'The Knife-Grinder,' W. DOUGLAS. An extremely good genre picture; the figures are all full of truth, and that of the girl who stands with her back to the spectator in deep abstraction at the grinder's wheel, is an excellent example of the success that may attend a proper study of character, which may pervade attitude and dress as thoroughly as it does feature, and in pictures of this class be quite as useful to the artist.

No. 89. 'River Scene and Shipping—Holland,' E. T. CRAWFORD, R.S.A. A good clear style pervades this picture; the brilliancy of the foreground and quietude of the distance are both equally well executed.

No. 95. 'The Highlands in 1746,' J. A. HOUTSON, R.S.A. A Highlander among his native mountains is looking over a crag, with gun in hand, preparing for the foe beneath; his hard features speak rigid determination, and his whole aspect is characteristic of unconquerable freedom. There is a story in this simple picture well and truly told; and it is painted with much vigour and richness of colour.

No. 96. 'What's your Will?' GORBLAY STEELE, R.S.A. The scene from "Old Mortality," in which Henry Morton asks his way of the peasant child. This picture is too much in the "pretty" style to be satisfactory; both horse and man are over well dressed; and the child is idealised until we think rather of a waxen doll than a Daughter of the Mist. We are daily more convinced of the folly of the Scrap-book school of elegance.

No. 98. 'The Convalescent,' W. STEWART. This we also look on as another mistake. A sick woman, possessing no beauty, seated at a window in languid helplessness, can surely be no pleasant thing to look upon; it is a picture few would covet, however well painted.

No. 100. 'Horses Drinking,' W. HUGGINS. A richly coloured and spirited duo, one of them "an old stager, once the property of Madame Ducrow," and as attractive in canvas as he must have been in the theatre.

No. 101. 'A Lady Drawing,' J. G. GILBERT, R.S.A. A well studied picture, in deep shadow, with a side light; reminding us of the excellency of the old masters.

No. 104. 'Boyhood,' JOHN FAED, A. By no means an agreeable or poetic transcript of this phase of life. Two rough boys are quarrelling, and an old man, parting them. One of the boys is crying heartily, having been severely punished by the other, whose face betrays the worst passions, and whose end may be prophesied if there be truth in the old adage. The man who parts them is by no means benevolent-looking either, and calls to mind Dickens's Quip. With so much of power, as is exhibited in this picture, how deeply we regret that it is lavished on such a subject. The utmost amount of ability cannot make these beings other than repulsive; while the crying boy is a most disagreeable caricature. It gives us much pain to say this, inasmuch as Mr. Faed has great ability; why should he thus cast his talents away when they might be so well employed?

No. 115. 'Little Jack Horner,' JAMES EDGAR. A pleasant, well painted study of a gleeful child, after the old nursery rhyme.

No. 116. 'River Scene on the Cannick, Inverness-shire,' ARTHUR PERIGAL, A. There is a brilliancy of colour and a vividness in the works of this artist, which is much marred by his hardness of treatment; the hazy tints pervading Scottish landscape would be well and profitably studied by one who, with that aid, might rank high as a landscape painter.

No. 117. 'Portrait of Mrs. Miller,' DANIEL MACNEE, R.S.A. A full length figure in a dark dress, standing on a terrace. The soberness and breadth, which are the characteristics of this picture, give it a high rank among the portraits in the present exhibition.

No. 132. 'Christ Walking on the Sea,' R. S. LAUDER, R.S.A. The solitary figure of the Saviour, upon whose head a flood of glory falls from above, lighting his path over the dark waters, is conceived in a spirit of the highest poetry; the simple grandeur of the figure, the gloom which spreads around, and the red sunset in the extreme distance, give an air of awe and mystery to the scene, which is much enhanced by the sober tints that clothe the entire painting.

No. 135. 'A Lonely Shore—Summer Afternoon,' D. O. HILL, R.S.A. A striking instance of how much an artist may make of a trifle; a simple bay with a solitary tower is all that it comprises; but by aid of atmospheric effect, we have, out of such unpromising material, a little picture, that may be studied with earnest pleasure.

No. 137. 'Dutch River Craft,' G. SIMSON, R.S.A. A good bit of rich colouring.

No. 144. 'A Quiet River,' HORATIO MACCULLOCH, R.S.A. A scene in which Isaac Walton might revel. The river winds through level plains, here and there garnished with trees; there is enough of nature to win the enthusiast, and sufficient hint of human vicinage to make it agreeable. It is broad and clear in effect, with much brilliancy of touch.

No. 151. 'The Quarrel of Oberon and Titania,' J. N. PATON, R.S.A. This picture, "a companion" to that painted by this artist in 1848—"The Reconciliation"—can be considered as a companion only in subject, inasmuch as the artist has greatly improved in his colour and general treatment. The present work is certainly the great original feature of the Exhibition of this year. It is an extraordinary production, whether we consider the fertility of imagination it displays, the vast amount of labour it involves, or the abundance of suggestive passages with which it abounds. It is not too much to say that it contains within itself materials for a dozen paintings. The numberless episodes which surround the principal action are all alike original and ably pictured forth. The Gnome, who peers forth with yellow care-worn face, holding in his hand the proceeds of his gold-finding; and whose repulsive features are worshipped and smiled on by the little beings near, is again typified by the spider above his head, whose fearful web is thickly studded with the bodies and wings of entrapped insects. The slimy snails who crawl into the dismal cave are also typical of those who cringe and crawl after mammon. Some relief is found from this in another scene, where Beauty is wooed by Riches; but is won by Poesy, who rivets her attention and secures her pure heart. In a similar manner we might enlarge on the various parts of this picture, but enough has been said to show the quantity of thought it exhibits. We should perhaps say a few words on the care with which it has been studied in all its accessories; every blade of grass, or bit of moss, is true to nature, and would satisfy a botanist. We by no means insist that this carefulness is absolutely necessary in such pictures; but we point to the present one as a proof that it is possible to do this without injury to the general breadth and artistic treatment of a subject. Altogether the picture is an extraordinary advance upon the former works of this artist, and an evidence of deep thought and study, which must lead to greatness. Mr. Paton is certain to obtain the very highest rank in Art.

No. 160. 'The Penance of Jane Shore,' R. S. LAUDER, R.S.A. The unfortunate mistress of a weak king leans against the cross in an attitude of deep sorrow and humiliation, with an air of womanly shame, which is as beautifully conceived as it is exquisitely rendered. The varied expressions upon the faces of those who gaze upon her degradation, are well shadowed forth; some in pity, some in doubt, some in anger, look upon her; but "the observed of all observers," with downcast eyes and heavy heart, irresistibly draws all our attention and pity. This is in itself a proof of the great ability Mr. Lauder has exercised upon his subject, which absorbs attention entirely on the principal figure.

No. 179. 'Highland Cottage—Evening,' A. PERIGAL, A. The sun is setting in a mountain district, and tips the hills with his last rays. The picture is deep in tone towards the foreground, and dark shadows, with glints of light, rest on a little patch of water in the foreground. A sky, less hard than the painter has adopted, is all that is wanted to make this an excellent picture.

No. 185. 'Burns and Captain Grose,' R. S. LAUDER, R.S.A. Our readers are already familiar with the composition of this picture from the woodcut which has appeared in our Journal. It is rich and colour and excellently handled; our only objection being to the worthy antiquary, who is on too small a scale for *vraisemblance*.

No. 191. 'Castle of Bishopstein on the Moselle,' T. M. RICHARDSON. Broad and excellent in its handling and rich in tone.

No. 199. 'Portrait of Very Rev. John Lee, D.D., Principal of the University of Edinburgh,' J. W. GONDON, R.S.A., A.R.A. The great charm of Sir Joshua Reynolds's portraits was the fact that they were always beautiful pictures upon which the eye might rest with pleasure, even though the claim of personal interest was not felt toward the subject represented. This portrait is one of that kind; and although it gives with apparent truth a speaking likeness of an excellent man, it is so pleasing as a picture and so fine as a work of art, that a stranger might covet it to look upon. The flesh is exquisitely painted, and the sentiment and colour which pervade the entire picture is conceived and wrought out in the best possible taste. It is a

picture of which painter and possessor may be alike proud.

No. 204. 'The Young Virtuoso,' CHARLES LEES, R.S.A. A youth in his study looking on a drawing. The side light thrown upon him is exceedingly well worked out, and there is a breadth and clearness throughout which merit praise.

No. 205. 'Cottage Piety,' THOMAS FAED, A. A group round a table listening to the head of the family engaged in devotion. There is an extreme delicacy of colour and touch in the faces of each figure, and great ability in the treatment of this very agreeable and meritorious picture.

No. 215. 'The Departure for Battle,' WILLIAM DOUGLAS. A group of armoured soldiers of the olden time are bidding their adieux preparatory to the battle-field. A compact mass of half-length figures fill the foreground, while behind appear troops leaving an old tower. Above is a murky sky, fitted for the gloomy scene. A sombre hue pervades the entire picture, which is extremely well conceived.

No. 232. 'Fun,' JOHN FAED, A. A capital picture. A labouring man, whose face is redolent of "fun," is engaged in dancing his child on his knee. The kittens playing with their mother's tail beneath are also equally gleeful; the whole scene is full of life and humour, and is so well studied, that the very shoe-nails of the man's upturned foot tell a story. In vigour of conception and power of execution, this picture ranks foremost in works of its class.

No. 266. 'A Border Raid,' J. A. HOUSTON, R.S.A. A lonely Peel-tower has been attacked in the night, and the inmates have vigorously defended it. The beacon blazes from the battlements, and the first streak of morning's light shows the approach of mountain friends, who hasten over the lone country which surrounds it. The besiegers, a little worsted by the fire from the castle, are now about to escape on despoiling the rescue. The whole scene is powerfully and naturally told.

No. 291. 'The Widow,' JAMES DRUMMOND, A. A lonely woman hushing her child in a wild landscape on a stormy day. There is fine feeling in this little picture, and a rich and deep colouring.

No. 292. 'The Valley of the Nith,' D. O. HILL, R.S.A. The painter of this noble landscape has honourably distinguished himself by his great national work illustrative of "the Land of Burns," and here he has given us the poet's farm-house at Ellisland, and the walk near it where he composed "Tam o' Shanter." The mansion of Dalswinton, with the little loch beside it, is also classic ground; for here, in 1788, the first steam-vessel was tried, bearing in it Miller, the proprietor of the house, Taylor, the engineer, Burns, Brougham, and Nasmyth, the father of Scottish landscape-painting. The distance embraces the Cumberland mountains, the Solway, Lochar Moss, Dumfries, &c., and combines to form a magnificent landscape, rich in historic and poetic interest, and one to which the artist has rendered ample justice. It is a national picture that deserves to be national property.

No. 310. 'The Commencement of Portrait-painting,' A. CHRISTIE, A. Dante is sitting for his portrait to Giotto. The subject is treated in mediæval, or modern German, taste; it is simple, clear, and good.

No. 321. 'Furness Abbey,' MISS J. NASMYTH. An agreeable copy of a beautiful scene; the group of old towers in the foreground is very well rendered.

No. 328. 'The Improvisatrice of Ischia,' W. M. CRAWFORD. An admirable picture, rich in tone and colour, and with 'The Moorish Girl,' No. 7, by the same artist, deserves to be ranked among the best pictures in the rooms.

No. 340. 'The First Pair of Trews,' ROBERT MINNES. A Highland boy is measured by a tailor for this hitherto superfluous article of attire, and the action is concluded by a libation of mountain dew. It is a humorous scene, naturally and capably told.

No. 352. 'The Hope of the Borders,' JAMES DRUMMOND, A. A young border chieftain is rallying forth in the evening among armed retainers who watch his management of the war-steed with pride and deep interest. The costume and all the accessories of this picture are well studied, and the colour and treatment are very grand. The grey heap of clouds which gather above, is admirably artistic and greatly aids the composition.

No. 351. 'Yorick and the Grisette,' J. E. LAUDER, R.S.A. Admirable in expression and sentiment.

No. 397. 'The Last Scene of Scapin,' EUGENE DEVEREAUX. French art is seen to most advantage in scenes like these; and this is an excellent sample of the school.

No. 400-411. 'A series of admirable Portraits,' by G. LEES, R.S.A., remarkable for a truthfulness the most apparent, and a broad artistic treatment of the best kind.

No. 415. 'Sketch of an old Pensioner,' GOURLAY STEELE, A. An excellent sketch of an old dog, painted with much power and truth.

No. 417. 'Rose Bradwardine,' THOMAS FAED, A. An admirable little study, full of the best principles of colour and effect.

No. 450. 'Highland Herd Boy,' KENNETH MACLEAY, R.S.A. An excellent little picture; we have seldom seen a sweeter head than this boy's, or one more beautifully painted.

Among the water-colour paintings and miniatures we may particularly mention No. 486, 'A Mountain Torrent in Argyleshire,' by G. SIMS, R.S.A.; and No. 610, 'A Mill Stream,' by the same artist; No. 592, 'Craig-na-Cohlig,' by J. FERRIER, which appears to be very good, but is badly hung; No. 520, 'New Abbey—Kirkcudbrightshire,' by DAVID SIMSON; No. 549, 'A Scene in the West Highlands,' and No. 623, 'A Sketch for a Picture,' by HOUSTON; No. 559, 'Melrose Abbey,' by JOHN LESSELLS; No. 636, 'Lantallan Castle,' and No. 656, 'A Highland Landscape,' by E. T. CRAWFORD. Of the Miniatures, those by KENNETH MACLEAY support the position he holds in his art, and are exquisite productions. Those by JOHN FAED are all extremely good, as are those by MRS. DEWAR and MISS MARY ANN NICHOLLS. There is also a pencil drawing of an elaborate and beautiful kind by PAUL DELAROCHE, 'A Portrait of S. G. Hall, Esq.,' drawn we believe in the year 1846, and a worthy study for the students in this class of art. There are a large number of Sketches in this room by NOEL PATON, evincing a most fertile imagination and power of drawing. We were especially pleased with his 'Vision of Life,' and the series illustrative of the Mission of the Saviour, which are singularly original and beautiful.

Sculpture is confined to some twenty specimens. BRODIE'S group, 'Little Neil and her Grandfather,' is pleasing; 'TUTCHIE'S bust of 'W. B. Scott,' and BOODIE'S bust of 'Professor Simpson,' are both good; but the palm of high excellence must be awarded to PATRIC PARK; there is life, intelligence, and dignity, of the most refined and elevated kind in his busts; and when we look upon the expressive head of 'Lord Jeffrey,' we cannot but hope that it should find a resting-place on his monument. But the finest thing in the Exhibition, and one that most enchain our attention, was his grand colossal head of 'Oliver Cromwell,' modelled from the mask taken after death by order of the Grand Duke of Tuscany, compared with other authorities. This noble bust, free of either flattery or vulgarity, restores to us the sturdy features of the old Protector, with his deep-seated determination and look of power. If a place be awarded to one of England's greatest rulers in Westminster Parliament House, this grand work should be the one destined for the place of honour. It is as powerful in execution as conception, and admirable in both.

THE VERNON GALLERY.

COTTAGE CHILDREN.

T. Gainsborough, R. A. Painter. G. B. Shaw, Engraver. Size of the Picture 1 ft. 6 in., by 1 ft. 2½ in.

WHILE admitting Gainsborough's undoubted claim to great originality as a painter of portraits and figures, we must yet express our preference for his landscapes. That same truthfulness which distinguishes all his works and constitutes the chief beauty of the latter class, makes the former less inviting to us; there is nature in them, but it is nature in her rudest phases,—sometimes coarse,—rarely set forth in that exterior adorning with which she frequently clothes even her humblest children. The cottage as well as the mansion furnishes us with many examples of those who in their outward appearance are stamped with the nobility of humanity;—jewels unpolished, and in no costly setting nor gilded casket, but withal beautiful.

The small picture from which the engraving is taken forms no exception to these general remarks, but rather, we think, confirms the truth of them; for the heads of the figures would have borne more refinement without detracting from their individuality; nor is it necessary in portraying a group of "Cottage Children" to exhibit them in tattered garments—the outward signs of neglect, poverty, and wretchedness. After all, perhaps, these are mere questions of taste that do not really affect the value of a work of Art in public opinion. For composition, execution, and colour, this picture is an excellent example of the painter, though time and a London atmosphere have somewhat added to the heaviness which distinguishes Gainsborough's second manner.

EXPOSITION OF ANCIENT AND MEDIÆVAL ART—SOCIETY OF ARTS.

EVERY season shows in a stronger light that the long years of inactivity indulged in by the Society of Arts, and broken in upon now four summers ago, have given place to energy alike honourable to the Institution and valuable to the public at large. The principal efforts of this revival have been directed to the improvement of the arts of design and decoration in this country. We have seen annual exhibitions of industry formed, premiums offered for designs and models for manufactures—more or less successful results attending each project; nor must we overlook the active position in which the Society of Arts has placed itself with reference to the Great Exposition of 1851. We have now to record the adoption by the same body of another scheme, not only calculated to be of peculiar interest, but also of considerable practical utility. This scheme consists of the formation of a temporary Museum of objects of Ancient and Mediæval Art, and to this Museum the large room of the Society has been devoted. The various objects have been collected by a committee of gentlemen appointed for the purpose, with Prince Albert at their head; and comprise, for the most part, gold and silver plate, enamelled work, carvings in wood and ivory, stoneware, Venetian and German glass, and ecclesiastical appointments of various materials. Her Majesty has shown her sense of the value of the Exhibition by contributing to it some ancient plate from Windsor Castle, and particularly the large and important shield by Benvenuto Cellini. Cups from the halls of our City Companies and other communities appear in abundance, and it is especially creditable to such exclusive bodies as University Colleges that they have come forward to assist the committee with the aid of their valuable plate, for the most part of early date and interesting features. Several of the important private collections of objects of virtue have also been placed at the disposal of the Society, and by this means many treasures of Ancient Art, always before inaccessible to the public, stand open to general investigation. There seems scarcely to be any one of the Arts of Antiquity which has not been classified and arranged with judgment and ability, if we consider the difficulties that must ever arise in such matters with regard to Chronology, and also the various opinions necessary to be conciliated with respect both to the history and process of many objects.

We heartily congratulate the Society of Arts on the important step it has taken in thus setting before the manufacturer specimens of the Art-manufactures of our ancestors, giving him an opportunity of imitating their excellencies and avoiding their excesses, besides placing before his eyes many works of Art, the results of processes now no longer employed, but which it will be his business to consider the propriety of reviving.

In the department of enamel, for instance, we may safely say that nearly every different mode of applying the material to metal, practised by the ancients, is illustrated by examples in this collection, which readily explain at a glance the means by which the greatest brilliancy of colour can be secured, the enamel made most translucent, or the effects of light and shade he most easily and forcibly rendered. Here are some of the choicest specimens of "incrusted" or "champlevé" enamel executed during the twelfth and thirteenth centuries, at Limoges, and contributed to the exhibition by the Earl of Shrewsbury, Mr. Magniac, Dr. Rock, Mr. George Isaacs, Mr. Webb, and others. In these instances the enamel was inserted into the recesses of the metal previously sculpted according to the required designs, a plan which has we believe been adopted with considerable success by Mr. Skidmore, of Coventry, for church plate, &c., but which might be even further extended. The other positive and transitional processes of enamelling are almost unknown to the moderns, but while they cannot be difficult of attainment, they would no doubt if employed soon become a favourite mode of superficial decoration.

The Venetian and German glass vessels which were carried to such perfection during the sixteenth and seventeenth centuries, are here in considerable numbers, and present a gorgeous display of fine and varied forms, quaint arrangements, and beautiful colours. Here the manufacturer may glean all that is necessary to render the exquisite crystal of the present day, far surpassing as it does in clearness and purity the best efforts of former times, a luxury wanting in none of the requisites of real art. In many of the Venetian glasses,

THE FINEST OF THE FINEST

silver, vases, &c., the shapes are of the highest beauty and originality, and in some instances the application of colour is very peculiar. In addition to the spiral reeds and threads of various tints which were formerly so universal and have recently been revived abroad, some examples present mottled or marbled surfaces, which assume another appearance upon being placed against the light; and two drinking-vessels are internally enriched by regular lines of powdered gold, introduced by a process of which we are now totally ignorant. The best contributions to the glass cabinet in this exhibition are the property of the Duke of Buccleuch, Mr. Slade, and Mr. Farrer.

Of the dazzling assemblage of gold and silver plate, goldsmiths' work, and metal work in general, our limits will not allow us to say much. It is however a duty and pleasure to state, that Her Majesty has forwarded, besides the shield to which we have already alluded, an Italian bronze group of Theseus and Antiope, of the highest artistic merit, and some costly cups of crystal and the precious metals, studded with gems. The Baron Lionel de Rothschild, Dr. Magniac, Mr. Swaly, and many other gentlemen, the Marchioness of Beresford, several Colleges of Oxford and Cambridge, and the City Companies, particularly that of the Barber-Surgeons, have also assisted in rendering this one of the most interesting and practically valuable features of the exhibition. Some of the state cups and other pieces of plate thus accumulated add to pleasing associations, the most elegant outlines and masterly workmanship, and unfortunately contrast too strongly with the unsatisfactory productions which are manufactured as presentation plate in the nineteenth century.

"Niello" or "Nigellum," a combination of metals blackened by sulphur and inserted in the channels of an engraved plate, is represented by a magnificent work of the twelfth century, the property of Dr. Roek, consisting of a superlative or portable altar of Italian workmanship, enriched with jasper surrounded by a border of niello in four patterns, and having in compartments the four elements, and in other places the Holy Dove and the Agnus Dei. This remarkable object is fully worthy the attention alike of the manufacturer and the student of design, and is in the eye of the antiquary an inestimable treasure.

As might have been expected, many beautiful works in wood and ivory are congregated. Mr. Field, Mr. Pugin, and Mr. W. G. Rogers, have sent a goodly number of small and delicate carved works, of the rarest and best class. Mr. Pugin's contributions are, of course, in the Gothic style, and consist principally of images of saints, or groups forming sacred subjects. Mr. Rogers forwards, among some choice works of a later period, some studies of exquisite finish, in boxwood, by an Italian hand of the 16th century; and Mr. Field, whose fondness for this department of art is equalled by his good taste, contributes a small "Renaissance" frame, in boxwood, said to be the finest in the world; some carefully executed Flemish statuettes, of the seventeenth century, and some Gothic ivory bas-reliefs, brought from the De Brage Dunes collection, for their elaboration truly marvellous. Other gentlemen have supplied ivory diptychs, of the fourteenth and fifteenth centuries, besides two trinket boxes, carved in the same material, with romantic subjects upon every side.

The glazed and enamelled earthenware of the sixteenth and seventeenth centuries, of French and Italian creation, and the stoneware of Flanders and Germany, are ranged with much effect on either side of the Venetian glass, at the extreme end of the room. Here is an unrivalled vase in relief, enamelled in brilliant colours by the famous but unfortunate Bernard Palissy, the property of Mr. Hope; and a considerable number of the stoneware jugs, or "Bellarmines" of sterner forms, some of them in their original silver or pewter mountings, contributed by various collectors. A great novelty in this ware is, a Gothic pilgrim's bottle, of earlier date than any before met with, elegantly ornamented with foliage, fleur-de-lis, and busts of saints, and bearing an inscription recording its fabrication at Aix-la-Chapelle. It was lately brought from Paris by Mr. George Isaacs. With respect to Majolica, or Raffaele ware, of which numerous pieces have been assembled, no example seems to present itself of the early school, attributed to Spain, and which is wanting to complete the history of this ware. Of the sixteenth century, however, there are a few choice specimens, some covered with a prismatic glaze, and others in simple colours, painted with figures and arabesques. Mr. T. M. Whitehead has added a vessel in white glazed pottery, in the shape of a satyr's head, the mouth and horns forming the spout and handle. This is remarkable, as being of a kind mentioned in the autobiography of Benvenuto Cellini.

In the angles of the room, and in some other situations, are suits of armour, and various implements of offence and defence, principally removed from the Royal Armoury at Windsor Castle, and from the Board of Ordnance.

As a matter of course, the next step on the part of the Society of Arts, after obtaining consent of possessors of medieval remains to place their property in the collection, was to prepare a catalogue. The plan suggested by him, with regard to the catalogue, and adopted by the Society, was to divide the entire collection of works exhibited into classes, chiefly according to material and character of manufacture, and these again into sections, according to country, origin, &c.

Great credit is due to Mr. A. W. Franks, the Hon. Secretary, as regards the exhibition, as also to Mr. Hawkins and other gentlemen of the committee, who have devoted much of their valuable time towards properly carrying out an object calculated to be of so much benefit to the arts and manufacturing interests of this country.

Of all, in conclusion, that may be learned from an examination of the various objects of mediæval art at the Society's rooms, nothing stands forward in a clearer light than the fact that our ancestors were not, as we are, tied down in matters of art by a consideration of expense; and this is particularly obvious with respect to those ecclesiastical apartments which form so important a part of the collection, and which in the ages of faith were executed less with a view to emolument than to the honour of religion.

This exposition, moreover, offers another grand elucidation of the principle, that the merit of every manufacture depends mainly upon the first design. Every object exhibited impresses this fact more strongly on the mind. Here are some relics of Mediæval or Renaissance Art, fascinating from their beauty, and attracting attention even in the midst of the other interesting articles which surround them, and yet how much of their beauty do they derive from their execution?—execution at which the commonest workman would blush at the present day. The stones are unevenly cut; the joints are ill-concealed; the very chasing is carelessly irregular; but the work stands before us full of beauty, which is owing to no fine chiselling or exact workmanship, but which depends solely on the fact, that the man who devised it was an artist who perfectly understood the principles of form and harmonious combination in design.

These are the lessons which will, we hope, be learned from the present Exhibition. It will be a disgrace to our manufacturers if they do not take every advantage of the privilege now offered to them of comparing their own productions with those of more than a thousand similar productions centuries ago; and they do not endeavour in all earnestness to bring into the great Exposition of 1851, works which would scarcely have shamed the best periods of the "olden time," when Art was less an "effort" than a "habit."

THE NATIONAL GALLERY AND THE ROYAL ACADEMY.

In answer to a question put to him in the House of Commons, Lord John Russell stated that—

"No arrangement had been finally made with respect to the National Gallery, but the question was under the consideration of the Government whether, in some way, they might not provide greater room for the pictures recently given by individuals to the Gallery, particularly the Vernon pictures. It was not in contemplation to remove the pictures of the Royal Academicians from the place in which they were now situated."

On this subject a "leader" appeared in the *Times* of the 15th, very strongly protesting against "daubs of contemporary mediocrity flaring upon walls that should be graced by standards of ancient perfection." It is to be deplored that so powerful an organ of public opinion should have been guilty of palpable injustice: the very pictures for which room is required, and demanded, are the "daubs" which in the VERNON GALLERY are examples of "contemporary mediocrity;" remove the works of the English School from the National Gallery, and the space will be

ample for all the "standards of ancient perfection" which the Nation possesses. It is precisely for the works of "Redgrave, Macleise, and Uwins," and some forty other British artists, that additional accommodation is required. The "steeklers" for ancient Art seem to consider the National Gallery only as a place for teaching drawing and painting; it is a teacher of a far loftier kind—a teacher of history, manners, morals, virtue, and religion: it is the property of THE PEOPLE who are there taught; and who will say that the lessons best to be acquired are not better learned from the works of contemporary painters, than from those great works of the great masters which rarely touch the heart. It would be a disgrace to the country to sacrifice either the National Gallery or the Royal Academy; but we do not hesitate to say that to ruin the latter would be a greater public calamity than to destroy the former: and that the protection of British Art is far more the duty of the State than even the safety of its costly collection of old paintings. It is the curse of the Royal Academy that it considers it can prosper without public opinion; which upon all occasions it seems not alone to scorn but to defy; a more unpopular body perhaps never flourished; it will make no move to meet the advanced spirit of the time: as it was in the comparatively dark ages of Art in England, it is now, when liberal principles and enlightened legislation have made their way into every institution of a public character; but the services rendered to British Art by the Academy are numerous and unquestionable: its faults are few, its advantages many: the right to its rooms which the *Times* repudiates, is based not alone upon a solemn national contract, it is founded upon benefits conferred upon Art and upon the country—the cheapest ever obtained by the one or purchased by the other. The rooms in Trafalgar Square are indeed but a paltry payment for the work it does for the professors of Art, the students of Art, and the lovers of Art. We hope to see the Academy in quiet possession of the whole of the ugly and inconvenient building of which it is now but the tenant, and the Nation possessed of a structure in all respects adequate to its wants.

The "leader" of the 15th was followed by another on the 20th: the *Times* with its vast power—for good or ill—in assisting the Royal Academy loses sight of that prudence and stern love of justice for which it has ever been famous, and which are the sources of its mighty strength. We have said, again and again, that no public institution requires re-modelling more than the Royal Academy, and we warned its members long ago that if reformation did not come from themselves it would be forced upon them. From the spirit in which these articles are written we fear the issue will be even more perilous than we had predicted; yet they are easily answered upon nearly all points: the Academy have, we know, a good case: and it will become their duty as well as their interest, to state it fully and fairly. Such sweeping assertions as that "the society has failed to serve one useful purpose"—that "it has not elevated the Arts, but has simply produced a personal benefit to artists"—carry with them their own refutations: indeed, they are refuted by other passages in the very articles in which they appear; for the *Times* admits that "the Academy has raised the artist in the social scale of his own country," and in the following gives to the Academy so large a share of praise that its acrimonious censure appears unaccountable:—

"The Institution was ostensibly designed for the noble purpose of raising the standard of British Art; but it seems to have been directed chiefly to educating the artist in his profession and to teaching the public duty to appreciate it; to fixing pictorial skill in a high social position; and to maintaining it there by the distribution of honours and the support of royalty. That these results have in a great measure been attained, and that the Academy has so far answered the end of its foundation, cannot, we think, be denied."

In this paragraph, we think, the *Times* has supplied the best answer to its own question—somewhat uncourtously put—"What is the Royal Academy—and what does it in the National Gallery?"

MEMOIR OF

WILLIAM WESTALL, A.R.A.

THE following memoir of this accomplished artist has been drawn up at our request, by his son, Mr. Robert Westall, who is himself a student in the Arts.

William Westall, A.R.A., was born at Hertford, October 12th, 1781, and died in London, January 22nd, 1850, in the sixty-ninth year of his age. His parents were of Norwich families, but after residing in that city for several years, they removed for some time to Hertford, and finally came to London and its vicinity, Sydenham and Hampstead, where his earlier years were passed.

Like most of those who have attained to professional honours, he displayed a great passion for drawing when very young, having frequently related that he used to run away from school for the purpose of making sketches from nature. His early studies were pursued under the care of his elder brother, the late Richard Westall, R.A., then at the height of his fame.

Mr. W. Westall's professional engagements commenced early in life, and under the following circumstances.—The late William Daniel, R.A., who had previously been in India, received the appointment of landscape draughtsman, on a voyage of discovery then about to proceed to Australia in 1801, under Captain Flinders. In H.M.S. *Investigator*. From this appointment Mr. Daniel eventually withdrew, in consequence of an engagement with Mr. Westall's eldest sister, whom he afterwards married. On receiving an intimation of his withdrawal, the Government applied to the President of the Royal Academy to recommend one of their students. Westall had entered as a probationer in the schools of the Royal Academy, but had not become a qualified student. He was, however, proposed to the Government by the President (West), who had noticed his remarkable talent and aptitude for the appointment, which he at once received, though not nineteen years of age.

After the expedition had been arduously employed for nearly two years, the *Investigator* was condemned as not sea-worthy, and was left at Port Jackson, while Mr. Westall and most of his fellow-voyagers were shipped on board H.M.S. *Porpoise*, under the command of their late First Lieutenant, Fowler, for the purpose of returning to England. While making their way towards Torres' Straits, accompanied by two Indians, they had the misfortune to be shipwrecked on a coral reef, considerably to the eastward of the great barrier reef, on the north-eastern coast of Australia, which catastrophe was also shared by their companion, the *Cato*. Happily the ships' companies were saved, and also the provisions and stores of the *Porpoise*, with most of Mr. Westall's valuable collection of sketches and drawings. After a residence of eight weeks upon a small coral bank, having been deserted and left to their fate without any offers of assistance by the commander of the accompanying vessel, the *Bridge-water*, they were taken off by some vessels sent from Port Jackson, Captain Flinders having courageously returned to the colony in an open boat, a distance of two hundred and fifty leagues.

The vessel which rescued a part of the shipwrecked crew from their dreary situation, was the *Cumberland* schooner, of twenty-nine tons burden. There was also another schooner at the service of any of the party who wished to return to Port Jackson. The ship *Rolla*, bound to China, took the rest of the party off the reef.

Mr. Westall went in the *Rolla* to China, and enriched his portfolio with many sketches of that interesting country. While there he fortunately obtained permission to go up the river, above Canton, with an expedition of scientific gentlemen. On one occasion, whilst sketching in an island garden, a mandarin's barge landed a number of ladies and gentlemen of rank; they went to an open summer-house, and learning that a foreigner was in the grounds, desired Mr. Westall to be sent for. When introduced to the party he was looked upon with great curiosity; the ladies, in particular, minutely examining his

attire, and laughing heartily at its novelty. Although, at the time, he felt abashed at being thus "exhibited," yet the scene made a lasting impression on his mind; and, on retiring, while the party recreated themselves with music and singing, he made a sketch of the subject before him. The extreme beauty and delicacy of the females, and the richness of their costumes, combined with a charming peep of the Canton river, the magnificent exotic trees and plants of the garden—conspicuous amongst them the feathery bamboo and the lofty palm, garlanded with a wild underwood of the richest fruits and flowers—formed a composition which could scarcely be exceeded in loveliness.

Of this incident he afterwards painted a large picture, which was exhibited at the Royal Academy in 1814, and within the last few years was hung in the Exhibition Rooms of the Pantheon. A smaller duplicate picture was in the possession of the late Mr. Loddiges, of Hackney.

After a residence of some months in Canton, Mr. Westall secured a passage to India in one of the China fleet, and witnessed the renowned action in the Straits of Malacca, where Admiral Linois and the whole of his force was beaten off by a fleet of British merchantmen, commanded by Sir Nathaniel Dance. Mr. Westall's love of variety determined him, on his arrival at Bombay, to undertake a journey into the neighbouring mountains of the Mahratta country, for which purpose he obtained a passport from Sir Arthur Wellesley (now the Duke of Wellington), Commander of the Indian Forces at that time. While among the magnificent mountains of the Boja Ghaut, he met the Indian army, soon after the Battle of Assaye, and received a kind invitation from Sir Arthur to accompany the army to Seringapatam, which advantageous offer he declined, to his deep regret in after life; feeling, at the time, a great anxiety to return to his native land, more especially as a report had been spread in India by the captain of the *Bridge-water* that the whole of the ships' companies of the *Porpoise* and *Cato* were lost. Mr. Westall was the first person who contradicted the report at Bombay. During his expedition into the interior, he witnessed the most frightful ravages caused by a famine and drought; he was always much affected when alluding, in after-life, to the horrors he here beheld. The perishing natives poured from the upper country towards the metropolis, and lay along the roads by thousands; the living dying, and the dead intermingled in awful companionship. On more than one occasion when the gasping sufferers held out their trembling hands for a draught of water to assuage their agony, they grasped the proffered cup with dying avidity, and draining it to the last drop, instantly expired, their famine-struck features brightening with a gleam of delight. When in the mountains, he came upon a family of natives, reduced to the last stage of destitution, consisting of a man, his wife, and only remaining son, several other children having perished. With the hopes of saving their own and their son's life, they offered him to Mr. Westall's chief servant, and an agreement was ratified, the principal articles of the bargain consisting of the rare happiness of a substantial meal and a few pounds of rice.

On their return to the coast, opposite Bombay Island, the baggage and servants were sent on board a vessel to be taken to the town, Mr. Westall and the new slave alone remaining ashore. Before stepping into the boat, he put a previously formed project into effect—he drew some money from his pocket, and putting it into the young man's hand, pointed to his native mountains. The language of nature was sufficient, with tears of joy and a look of astonishment and deep gratitude, the youth threw himself on the ground and kissed his benefactor's feet; then, with the swiftness of a deer, darted towards his home and was out of sight in a few minutes. In the meantime his purchaser, standing on the deck of the vessel, looked at the scene with dismay, unable to interfere; contemplating the serious loss he had sustained of a fine young fellow, whose value would have been fully appreciated in the slave market; but he soon consoled himself with the prospect of making up the

deficiency by the more ordinary mode of fleecing his master.*

After visiting and making elaborate drawings of the wonderful excavated temples of Karles and Elephanta, and of other interesting objects, he returned to England, having been absent from his native land about four years.

During his residence in India, he received the greatest attention from Sir James Mackintosh, then Recorder of Bombay. Mr. Westall, in return for the judge's kindness, gave lessons in drawing to his daughters. He has often said that it was the custom of Sir James—who always considered his position in India a banishment—to muster his family after dinner, and walk to an elevated point in his grounds which overlooked the sea, saying—"Come, girls, let us go and look at the road to England."

Soon after his return, finding that his services were not immediately required in the publication of the late voyage, he revisited Madeira, at which island the *Investigator* had made a stay of three days on the outward voyage. On the latter occasion the scientific gentlemen made an expedition into the interior, and young Westall, by the most indefatigable exertions, produced a number of sketches of the enchanting scenery; but on their leaving the island, the native boat they had hired to take them to the vessel was upset in the surf (as they always suspected, purposely) by the boatman, and in consequence their collections and sketches were all lost, and Westall was nearly drowned.

The fatigue and exposure of the journey, combined with the effects of the accident and his distress and anxiety at losing the fruits of so much toil, brought on a *coup de soleil*, which nearly terminated his existence. But the picturesque beauty of the island had so enchanted him, that he resolved his first days of independence should be spent there; and in accordance with this determination, he obtained a passage to Madeira in the summer of 1805, and carried his early resolution into effect.

He was treated with great kindness by the residents, particularly Mr. Pringle, the Consul, Mr. and Mrs. Lynch, Lady Georgiana and Mr. Eliot, afterwards Earl St. Germain, and their families. While making those selections of the scenery which he especially loved, he executed, in the way of business and profit, drawings and paintings of the *quintas* (villas), of the planters and merchants; and with the money so obtained, he went, after a year's sojourn, to the West India Islands.

He always spoke of his residence in Madeira as one of the most delightful periods of his life.

During a stay of a few months in Jamaica, Mr. Westall added innumerable drawings of this interesting island to his large collection of sketches of foreign scenery. After his return to England, he painted various pictures of foreign scenery; and in 1808, having accumulated a considerable number of water colour drawings of views in China, India, and Madeira, he opened an Exhibition in Brook Street, but it did not realise his expectations.

In 1810, Captain Flinders arrived in England, having been released from his long and cruel confinement in the Isle of Mauritius, where he was detained, on his putting into Port Louis in his little vessel, on his way home from Wreck Reef. The publication of his voyage, necessarily delayed until this period, was now proceeded with, and Mr. Westall was for a considerable time engaged in preparing his sketches and drawings for engravings; and also in painting pictures, by command of the Lords Commissioners of the Admiralty, of the most important discoveries and incidents connected with the voyage. These were views of King George's Sound, Port Lincoln, Port Jackson, Port Bowen, on the north-eastern coast, two views in the Gulf of Carpentaria; a scene in Kangaroo Island, and the view from the summit of Mount Westall.

The views of Port Bowen and Seaforth's Isles, in the Gulf of Carpentaria, were exhibited in 1812 at the Royal Academy, and attracted great attention from their novelty. They were

* In the years 1817 and 1824 he exhibited two pictures, Views in the Mahratta mountains, with the Indian army winding down the extraordinary passes.

Mr. Westall.

all views of places, for the most part the first time visited by Europeans. In the foregrounds were displayed the magnificent and gorgeous foliage and flora of this country, painted with great attention to their botanical character.

On his final settlement in England he was employed by many publishers in illustrating various works, amongst the rest by Ackerman, in 1813, who was getting up an embellished edition of the History of the Two Universities, and other public schools. In this commission, he was united with Messrs. Uwins, F. Mackenzie, F. Nash, and Augustus Pugin.

In 1811 Mr. Westall paid his first visit to the Lake country, and stopped on his way to make a sketch of Sedburgh for Professor Inman, whom he knew at Port Jackson, and with whom he was fellow passenger in the *Holla* to China. Professor Inman had gone out as astronomer to Flinders' expedition, but only arrived at Port Jackson just before the voyage was abandoned. From him Mr. Westall received a letter of introduction to the Rev. William Stevens, Master of the Grammar School at Sedburgh, with whom and his family he was afterwards united in the closest friendship.

Mr. Westall was so much charmed with the beauty of the northern scenery that he resided at Keswick or its neighbourhood, during part of every winter, until 1820, when he married; he afterwards frequently visited the Lake country.

While at Keswick he first became acquainted with Southey and Wordsworth, which ended in an enduring friendship.

An accidental circumstance first introduced Mr. Westall to the late Sir George and Lady Beaumont; the latter, when going to replenish her stock of pencils at Mr. Airey's of Keswick, happened to see an unfinished picture of Indian scenery, and on inquiring the name of the artist, who lodged at the house, immediately sent Mr. Westall an invitation to dinner. Sir George Beaumont's well known love of landscape-painting led him to cultivate an intimacy, which resulted in Mr. Westall's spending the greater part of two winters (1813-14) at his seat, Coleorton, in Leicestershire.

In 1812 Mr. Westall was elected an Associate

of the Royal Academy, having long previously been a member of the Water-Colour Society.

After having resided for some years at Dulwich, he paid a visit, in 1815, to Mr. Stevens, at Sedburgh, where he became acquainted with Mr. Stevens' beloved and venerable friend, the Rev. Richard Sedgwick, whose youngest daughter became the wife of Mr. Westall in 1820.

In 1816 he engraved, in aquatint, a work of the noted caves in Chaple le Dale, near Ingleborough; Yordas Cave, and Cordale Scar, near Malham, in Yorkshire. The following year, in company with Mr. Mackenzie, he made a series of views of Rivaux, Byland, and various other abbeys and celebrated edifices in the north of England, some of which were introduced by Dr. Whitaker in his History of Yorkshire. About this time he put a long-formed project into effect, of engraving in aquatint a series of panoramic and other views of the Lake country, which he continued to increase in number for many years.

In 1832, when on a visit to his brother-in-law, the Rev. James Sedgwick, at the Isle of Wight, he commenced his work of that island.

The number of views and works he had undertaken occupied so much time, that from this period he had little leisure for contributing to the exhibition of the Royal Academy. During several years the only picture he exhibited was a view of Norwich, painted in 1840, for another brother-in-law, the Rev. Professor Sedgwick.

His publications were afterwards increased by the addition of several works; Ragland Castle, in Monmouthshire; Kirkstall Abbey, near Leeds; and Fountains Abbey, Studley Park, &c.

It is singular that Mr. Westall, although so great a traveller, should never have landed on the Continent of Europe until the spring of 1847, when he took a trip to Paris, with which city and its environs he was, as may well be imagined, much delighted.

A few years after his marriage he purchased a house in St. John's Wood, where he resided until his death, with an intermission of seven years; during that time he lived in Surrey, having removed there for the convenience of a son, who was a pupil with Sir John and Mr.

George Rennie, the celebrated engineers; he had only returned to his favourite home about a year and a half. Although blessed in early youth with a strong constitution, a premature old age was brought on by his exposure and sufferings when abroad.

In the autumn of 1847 Mr. Westall met with a very severe accident, not only breaking his left arm, but receiving serious internal injuries. From the effects of this he never recovered; and during the last winter, a succession of severe colds terminated in a bronchial attack, accompanied by dropsy, which carried him off after a few weeks of suffering. Besides the pictures already mentioned, Mr. Westall painted few others of any consequence; for finding that his efforts were not appreciated by the public, he sacrificed his name and fame to the duty of providing for the welfare of his family. Therefore, as he has often been heard to say, "he was reduced to the necessity of giving up his early hopes of fame, for a trade," as he termed his engravings and publications.

The principal works exhibited at the Royal Academy were the following—

1813. "A View of St. Paul's from Bankside," also a "Sunrise," with Bambro' Castle.

1814. "Richmond—Yorkshire," with the view in the Mandarin's garden.

1815. Several views of Cambridge.

1826. "A view of Cape Wilberforce," in the Cnlf of Carpentaria, with that singular phenomenon, a waterspout.

1827. "A view in the valley of St. Vincent—Madeira;" also several water-colour drawings of views in India, for Captain Grindley; and also, the following year, several drawings of the Temple of Elephanta.

In 1832 were exhibited the drawings for Sharpe's "Residences of the Poets." In succeeding years he exhibited a few water-colour drawings, views in Jamaica (for the late Lord Sligo), China, and India. In 1848, he exhibited his last great painting, "The Commencement of the Deluge."

His last illness intercepted the progress of a painting of "Wreck-reef a few days after the loss of the *Porpoise and Cato*," which he commenced a short time previously.

The following sketch of his character, as a painter, has been kindly furnished by Mr. John Landseer, the engraver, A.R.A. —

"The integrity and moral character of William Westall are unblemished; his manners were mild and unassuming, or, as Goldsmith has it—

—gentle, complying, and bland;"

and his style as an artist partook of these elements, being chiefly remarkable for a combination of fidelity with amenity, and an entire absence of everything ostentatious, or too ambitious for the occasion. While his trees were characteristically varied (and his Australian and other exotic trees with a certain portion of botanical discrimination); and while his rocks and castles, and sacred caverns, were solemn and grand; his cottages were places of sheltered pastoral comfort. His colouring was chaste, and his chiaroscuro harmonious—never flashing, or forced, or meretricious. The attainment of fleeting popularity was quite out of his way: the artist was never obtruded before the demands of the subject; and hence Westall's forte was rather landscape portraiture, than the treatment of ideal subjects; hence too, and from a corresponding want of critical discrimination on the part of the public, he was not, as a landscape painter—one, too, who had seen much more of the world than his academical brethren—duly appreciated, although justly valued by the judicious few. As instances, may be mentioned, the apparent neglect of his Brook Street Exhibition, and the real neglect of rather a large picture from his hand, a grand mountain scene with a lofty waterfall; a "View among the Ghauts of Hindostan," a picture possessing much of the charming grey aerial tone and just degradation on which the early fame of Turner was founded: this picture long hung with far too little notice, against the walls of the Pantheon exhibition room."

A bust of the late Mr. Westall is now being executed by Mr. E. J. Physick.

THOMSON.

Frederick Pickersgill

EVERY lover of Art, and all who feel proud of its success as an element of national greatness, must find satisfaction in reflecting that as yet no symptoms of premature decay are manifest in the artistic body. True it is that year after year branches wither, and young and apparently vigorous shoots drop away; the former having yielded rich and glorious fruits, and leaving behind them precious seed,—and the latter after producing buds of promise that bid fair to reach maturity; but there is a vitality in its constitution, at present, which seems to defy the hand of time, and disposes us to regard the future with increased hopes of its bringing with it a still more abundant harvest. We lament those who are gone

“With all their blushing honours thick upon them;”—

Reynolds and Barry, Opie and Northcote, Hilton, Wilkie, Etty, and a host of others; and it may be we are too sanguine respecting the future: yet we see around us those who, if their lives are prolonged, will not be unworthy to wear the mantle of their predecessors, if they do not impart to it a higher dignity. It will be the fault of such should our expectations not be realised; all who came before flourished in a comparatively ungenial soil, unbroken and uncultivated, with little sympathy to urge them onward, and still less of that watchful control and careful superintendence so necessary to ensure perfection. It is far otherwise now—there is the excitement of previous examples to stimulate,—their works to study and to teach,—their errors to serve as a warning,—the experience of the old and the wise, still left, to direct,—and, above all, a public capable of appreciating excellence, with the desire to search it out, and the will to reward it. With such advantages we again say that our “young” school ought not to be satisfied with doing simply as others have done, they must go beyond them, or be content to suffer reproach where failure scarcely admits of excuse. It is no very difficult task to point out many who have already earned for themselves an honourable name, and who, at an earlier age, have yet produced works surpassing those of their predecessors; these are the men to whom we are looking to sustain and to advance the Arts of the country. There are others, indeed,

of whom we encouraged similar hopes, but who, having reached a certain point of excellence, seem satisfied therewith and afford no further promise;—travellers weary of the journey up the rough mountain-path, pleased to see the woodlands and pastures smiling a little below their feet, but unambitious of gaining a loftier ascent where the eye takes in a world of creative Art;—flowerers by the way, more intent upon gathering than earning an immortality of greatness;—thoughtless spendthrifts of that time which they cannot recall, and unmindful of the sun which hastens to its setting, ere what should be the labour of their life is half accomplished.

Mr. F. R. Pickersgill, A.R.A., is a young artist who has arrived at Academical honours at an unusually early age, but not before he had justly earned them. He was born in London in 1820, and it may be as well to remark here that he is in no way related to the venerable Academician of the same name. After receiving the usual school education, his uncle, Mr. Witherington, R.A., discovering in the youth a taste for the Arts, undertook to superintend his studies, and accordingly some time was passed, under the guidance of his relative, in drawing the figure from plaster casts.

In 1839 Mr. Pickersgill exhibited at the Royal Academy a drawing in water-colours of “The Brazen Age,” from Hesiod; and at the end of the same year he became a student of that Institution; but it is somewhat remarkable in one who has since done so well that he never succeeded in the competitions for the prizes. This fact should prove a consolation to others who are striving after honours which yet elude their grasp, and should stimulate them to perseverance, while they must bear in mind that “the appended is not always to the *swift*.” In 1840 he appended his first oil-picture, “Hercules fighting Achelous under the form of a Bull;” in 1841, “Amoret delivered from the Enchanter;” in 1842, “Edipus cursing Polyneices;” and in 1843, “Florinel in the Cottage of the Witch,” and “Dante’s Dream.” In our remarks on the Academy Exhibition of this year we briefly alluded to the latter picture, observing that “the artist promises well, and possesses much ability.”

In the same year was opened to the public

the first exhibition—that of cartoons—in Westminster Hall; Mr. Pickersgill contributed to it “The Death of Lear,” to which one of the ten prizes of 100*l.* each was awarded, his name standing third on the list. In 1844 his academy picture was “The Brothers driving out Comus,” and during the same year he painted a fresco for the Westminster Hall Exhibition, which he himself confessed to have proved a failure, so far at least as the manipulation was concerned; this was very likely to have been the case—it was so with many others—the process being entirely new to our artists generally; the work, however, was the first and last attempt of Mr. Pickersgill in that style. The following year (1845) he prepared two pictures for the Royal Academy, “Amoret,” “Emilia,” and “Prince Arthur, in the Cottage of Selander,” purchased by the late Mr. Vernon, and now in the Vernon Gallery; and “The Four Ages,” selected by Mr. Longman. Both of these works obtained honourable mention from us when they were exhibited. The proposed gathering of pictures, &c. within the walls of “Old Westminster,” began now to put our artists on their mettle; and among those who girded on their armour for the coming contest in this peaceful warfare was the subject of this notice; he commenced “The Burial of Harold.” But the campaign was delayed for a year, the troops went into quarters, (to continue our figurative language) the palette and pencils were laid aside by some, and devoted to other purposes by others. Mr. Pickersgill employed a portion of the intervening time in working for the Academy, to which he sent four pictures, the most important being an incident in the history of Venice, connected with the civil discords that disturbed the peace of that Republic during the tenth century; the subject was “The Flight of Stephano Colloprini;” we remember the picture as displaying talent of no common order. At length the doors of Westminster Hall were thrown open, and the public admitted to the feast which the “younger” hands of the profession had prepared for its gratification; for it will be remembered that scarcely one of our elder artists contributed to this exhibition. Mr. Pickersgill’s picture obtained the first prize of 500*l.*, a glorious and well merited reward for its rare excellence of execution: it was purchased by the Commissioners for another 500*l.* In this year he sent to the Royal Academy “The Christian Church during its Persecutions by the Roman Emperors;” and in the November following was elected an “Associate” of that Institution, being then only twenty-seven years of age, an unusually early period of life for one to be chosen for academical honours. In the following year his contributions to the Academy were a picture entitled “Idleness;” and a subject from the “Faire Queene”—the “Contest of Beauty for the Girdle of Florinel;” and in the past year (1849) a subject from “Comus,” and another from the “Orlando Furioso.”

We have thus, briefly, sketched out Mr. Pickersgill’s career, and given a list of the principal works he has painted; it will be seen that, from the first, he has made choice of a high range of art, and that his success has kept pace with his aim. The Greek lyric and tragic poets, Spenser, Shakspeare, and Milton, are the fountains from which he has drawn his inspirations; and to what more noble sources can a young and aspiring mind go for purity and elevation of thought? But he who frequents them must not expect those springs of wisdom and knowledge to open up to him spontaneously, they must be sought after diligently and laboriously, yet when found, they amply reward the seeker; they are pleasant to the eye and sweet to the taste.

Mr. Pickersgill’s pictures are distinguished by careful and accurate drawing, (we should think he had studied Plaxman with some attention) and by judicious colouring, although in a few of his works this latter quality would be improved by more power. He has within him every material to constitute a first-rate artist; time, and application, and a reliance on his own innate capacity will, or we are greatly mistaken, ultimately elevate him to a very high rank in his profession.

A DICTIONARY OF TERMS IN ART.

ART. This term employed in a collective sense comprehends all the products of the Plastic and Graphic Arts; it is also extended to the Orchestric, Rhythmic, and Mimic Arts, but in the present instance we limit ourselves to the consideration of the former—the Arts of Design.*

"Art," says Müller, "is a representation, that is, an activity, by means of which something internal or spiritual is revealed to sense. Its only object is to represent, and it is distinguished by its being satisfied therewith, apart from all practical activities which are directed to some particular purpose of external life. The more immediate determination in Art depends especially on the kind of connection between the internal and the external, the representing and the represented. This connection must absolutely be one imparted of necessity in the nature of man, not assumed from arbitrary regulation. It is not a subject of acquisition, although it may exercise greater or less influence on different natures and different stages of civilisation. At the same time, this correspondence in Art is so close and intimate that the internal or spiritual momentum immediately impels to the external representation, and is only completely developed in the mind by the representation. Hence the artistic activity in the soul is from the very beginning directed to the external manifestation; and Art is universally regarded as a making, a creating. The external or representing in Art is a sensible form; now, the sensible form which is capable of expressing an internal life can be created by the fancy, or present itself to the external senses in the world of reality. But as even ordinary vision, and much more every artistic exercise of the sight, is at the same time an activity of the fancy, the form-creating fancy in general must be designated as the chief faculty of representation in Art. The creative fanciful conception of the artistic form is accompanied by a subordinate but closely allied activity—the representation or embodiment of the form in the materials—which we call EXECUTION. To the internal or represented in Art—the spiritual life, whose corresponding and satisfying expression is the artistic form—we apply the term *Artistic Idea*, understanding thereby, in quite a general way, the mood and activity of the mind from which proceeds the conception of the particular form. The *Artistic Idea* is never an idea in the ordinary sense; as it can never be rendered in an entirely satisfactory manner by language, it can have no expression but the work of Art itself. It lies in the notion of a work of Art as an intimate combination of an Artistic Idea with external forms, that it must have a unity to which everything in the work may be referred, and by which the different parts, whether simultaneously or successively existing, may be so held together that the one, as it were, demands the other, and makes it necessary. The work must be one and a whole.†

* These arts are distinguished from each other in this, that the one, Sculpture, or the Plastic Art, places bodily before us the organic forms themselves, and that the other, Design, or the Graphic Art, merely produces by means of light and shade the appearance of bodies on a surface, inasmuch as the eye only perceives corporeal forms by means of light and shade. The relation of Sculpture and Painting, as regards their capabilities and destination, is already hereby defined in its main features—the Plastic Art represents the organic form in highest perfection, and justly holds by its apex, the human form. It must always represent completely and roundly, and leave nothing undetected; a certain restrictiveness in its subjects, but on the other hand great clearness belongs to its character. Painting, which immediately represents light (in whose wonders it truly shows its greatness), and in exchange is satisfied with the appearance thereby produced in the corporeal form, is capable of drawing much more into its sphere and making all nature a representation of ideas. The Plastic Art is in its nature more directed to the quiescent, the fixed—painting more to the transient, the laterative, than the former; and, in fact, and near, admit of more movement than the former; Sculpture is therefore better adapted for the representation of character, Painting for expression. Sculpture is always bound to a strict regularity, to a simple line of beauty; Painting may venture on a greater apparent disturbance in detail, because it has richer means of again neutralising it in the whole.—MÜLLER, *Ancient Art and its Remains*.

† Deep feeling is the only true source of lofty Art. It is a feeling which rises and corrects its own intentions, and gives that indefinable charm, never to be conveyed in words, but which the hand of the painter, guided by the poet's soul alone can diffuse throughout all his works. From religious feeling, love, and devotion, arises the silent inward inspiration of the old masters; few, indeed, now seek their hallowed inspiration or tread the paths by which alone they could attain it, or emulate that earnest endeavour to work in the principle of serious and noble philosophy, which is discoverable in the works of Dürer and Leonardo.—SCHÖNBERG'S *Æsthetic Works*. London, 1849, H. G. Bohn.

ATTITUDE. The position of the whole body in a state of immobility, either instantaneous or continued. In this respect ATTITUDE differs from Gesture and Action, the term is more particularly employed in speaking of portraits, in which case it conveys the idea of a certain preparation on the part of the painter to give a good *pose* to his sitter.

ATTRIBUTES. By attributes we understand subordinate natural beings, or products of human workmanship, which serve to denote the character and action of the principal figures. These things are not so closely connected with spiritual life and character as the human body; they must therefore be founded on faith, custom, and the positive laws of Art. And here the inborn sense of the Greeks for noble and simple form, and their great simplicity of life, came to the aid of Art. Every employment, situation and effort of life found in certain objects borrowed from nature, or created by the hand of man, a characteristic and easily recognised sign. Also in the creation of SYMBOLS, to which belonged animals, vessels, and arms dedicated to the gods, there was revealed, besides a religious fancy and a childlike naïveté of thought (to which much bolder combinations are as deficient as in reflection), a growing sense of appropriateness, and in a certain sense of artistic forms. In ancient Art the figures were principally distinguished by their often redundant attributes, but attributes in a period of improved Art became very desirable additions, and clearer developments of the idea expressed by the human form in general and allegorical painting thus found in them many welcome expressions for abstract ideas. With attributes was often united a reference to a definite action borrowed from religion and life; and in this Greek Art had the skill of saying much with a few touches, the language of ancient Art thence arising requires much study, since it cannot be divined by the natural feeling in the same way as the purely human language of gesture. The interpretation is often rendered more difficult by the principle which belonged to Greek Art, of treating in a subordinate manner, diminishing in size, and making less careful in execution, everything that did not belong to the principal figure. This negligence of the accessories was carried so far, that in figures of fighting gods and heroes, their adversaries, whether monsters or human figures, were frequently diminished, contrary to every requirement of modern Art, which demands more real imitation and illusion—because the noble form of the god or hero is of itself capable of expressing everything by attitude and action.* ATTRIBUTES in Christian Art when employed for the clearer designation of the personages of the old and new Testament are highly poetical. Ancient Christian Art preferred attributive action to dry attribute. Thus we see an old man with children on his knee symbolising Abraham, who may also be recognised by the knife in his hand. When Christ appears over the couch of his mother with a child on her arm, the Virgin Mary is symbolised. In the carvings of an old Christian sarcophagi, Chr. has a staff; in old pictures, a globe. The ladder of heaven is a striking attribute for the patriarch Jacob, and the harp for King David. The Virgin on the half-moon represents the Conception of Mary; her girdle in a man's hand is a sign of the Apostle Thomas. The pen-case and writing materials betoken the Evangelists and Fathers of the Church, but especially St. John. Books or rolls of manuscript symbolise the gospel, and with *Alpha* and *Omega* upon them, Christ, or the Evangelists, or the Apostles. A crutch in the hand is the attribute of the Egyptian Anthony, the staff (tace) formed like a T which he sometimes bears, is only an idealisation of the crutch. St. Ambrose is represented with a rod, because he defended the church against the entrance of the Emperor Theodosius. A model of a church held in the hand (the special attribute of St. Barbara), betokens the titular saint of the church, and sometimes its founder or benefactor.

AU PREMIER COUP. (Fr.) ALLA PRIMA. (Ital.) PRIMA PAINTING. This method of oil-painting has been revived to a considerable extent during the few past years, and in the hands of painters possessing true genius for their Art, with remarkable success. Among the French painters who have taught and practised this method with singular ability, we may specially instance Couture, whose magnificent picture of the *Decadence of the Roman Empire*, in the gallery of the Luxembourg, may be justly pronounced one of the noblest productions of modern Art. PRIMA PAINTING, or painting *au premier coup*,

* Vide MÜLLER'S *Ancient Art and its Remains*.

† One of the imperial Diadems among the treasures of St. Peter's at Rome, on the great Mosaic in the Cathedral of Torcello, and elsewhere.

as its name implies, consists in painting in at once, at one touch, contrary to the practice usually recommended of "dead colouring," "first stage," "second stage," "finishing," &c. "Whoever wishes to learn Prima Painting must form a strong resolution never to try to finish his work by over-painting." The practice of Prima Painting is fully detailed in a work recently published,* which is worthy the most attentive and repeated perusal of the artist. Prima-painting is based upon a thorough knowledge of the relative qualities and properties of colours, and of the peculiar effects of under and over painting with *opposite* colours.

AUREOLA GLORY, NIMBUS. From a very early period in the history of Christian Art, it has been customary to depict that "halo of light and glory," that luminous nebula supposed to emanate from and surround divine persons. When it is limited to the head only, it is termed NIMBUS; when it envelops the whole body, it is the AUREOLA. These attributes are very characteristic in Iconography, and it is important to the artist to study their varieties, else he may be led to commit the greatest errors; confounding, perhaps, the creator with the created, the living with the dead, in his works. The Nimbus is of Pagan origin, and was with much opposition admitted into Christian Art. It was probably derived from the Romans, who ornamented the statues of their divinities and emperors with radiated crowns. The colossal statue of Nero wore a circle of rays, imitating the glory of the sun; and similar insignias are seen on medals, round the heads on the coins of the consuls of the later empire. This custom was discontinued in the middle ages, and after the eleventh century; the Nimbus was exclusively employed to distinguish sacred personages, as the Saviour, the Virgin Mary, Angels, Apostles, Saints, and Martyrs. NIMBUS are properly depicted of gold; but sometimes in stained windows they appear of various colours.† They are of various forms, the most frequent is that of a circular halo, within which are various enrichments, distinctive of the persons represented. In that of Christ it contains a cross more or less enriched; in subjects representing events before the Resurrection, the cross is of a simpler form than in his glorified state. The Nimbus most appropriate to the Virgin Mary consists of a circlet of small stars; Angels wear a circle of small rays, surrounded by another circle of quatre-foils, like roses, interspersed with pearls. Those for Saints and Martyrs were similarly adorned; but in the fifteenth century it was

customary to inscribe the name of the peculiar saint, especially the Apostles, round the circumference. A Nimbus of rays diverging in a triangular direction, which occurs but seldom before the fourteenth century, is attached to representations of the Eternal Father; and his symbol, the Hand in the act of Benediction, was generally encompassed by a Nimbus. When the Nimbus is depicted of a square form, it indicates that the person was living when delineated, and is affixed

* The Art of Painting restored to its simplest and surest principles. Translated from the German of Liberat Hundt, published in London, 1849, D. Hogue.

† "I believe these coloured glories to be symbolical, but am not sure of the application of the colours. Among the miniatures of the *Horas Deliciorum*, painted in 1150, is a representation of the celestial paradise, in which the Virgins, the Apostles, the Martyrs, and Confessors wear the golden nimbus; the Prophets and the Patriarchs, the white or silver nimbus; the Saints who strove with temptation, the red nimbus; those who were married have the nimbus green; while the beatified penitents have theirs of yellowish white, somewhat shaded."—DUBOS, *Iconographie Chrétienne*, p. 168.

as a mark of honour and respect. From the fifth to the twelfth centuries, the Nimbus assumed the form of a disc or plate over the head. Thence to the fifteenth century it appears as a broad golden band behind the head, composed of concentric circles, frequently enriched with precious stones. From the fifteenth century it became a bright fillet over the head, (and this is the mode of representation most frequently adopted in the present day); in the seventeenth century it disappeared altogether, to be revived again in the nineteenth. As an attribute of power, the Nimbus is often seen attached to the heads of evil spirits. In many of the illuminated books of the ninth and following centuries Satan wears a Glory. It is also seen in a representation of the Beast of the Apocalypse, six heads of which have the Nimbus; the seventh, wounded and drooping, is without that sign of power.

GLORY. As stated above, the Aureola is the Nimbus of the whole body, as the Nimbus is the Aureola of the head; the word is derived from the Latin *Aura*, a gentle wind, zephyr, exhalation. The Aureola and the Nimbus are of a similar nature—"a solid light, a transparent cloud," but they are often confounded. The Aureola is as a mantle of light, which envelops the body from head to foot; its use is much more limited than the Nimbus, being confined to the persons of the Almighty, Jesus, and the Virgin Mary. Sometimes, however, it is seen enveloping the souls of the Saints, (never the bodies), and of Lazarus. The variations in the form of the Aureola, depend upon the position of the person represented; if erect, the Aureola is oval, elliptical, or almond-shaped; if seated, it becomes nearly or quite circular; sometimes the oval is placed within a circle; at others, the Aureola forms four lobes, each encompassing a salient portion of the body, one comprising the head, one the feet, the others the arms. The Aureola is frequently intersected by a Rainbow, upon which is seated Jesus or the Virgin Mary. The AUREOLA is rarely depicted in pagan Iconography, and is much more restricted in its use than the NIMBUS. We have shown that the Nimbus of the head, and the Aureola of the body, differ notably, yet both are composed of the same elements, are sometimes figured in the same manner, and convey to many the same idea: glorification, apotheosis, divinity. It is necessary, therefore, that a single word should comprehend the combination of these two attributes, and he the generic term of both kinds of Nimbus; therefore we call **GLORY** the union of NIMBUS and AUREOLA, the Nimbus being peculiar to the head, the Aureola to the body, and the term **GLORY** is extended to the former and the latter united.*

AURIPETRUM, AURIPETRUM. An economical substitute for gold used in mural painting in the middle ages; it consisted of leaves of tin foil varnished, the gold colour being imparted to it by the addition of saffron. Another substitute was called **PORPORINO**, a composition of mercury, tin, and sulphur, similar to the gold powder used in chromo-lithography and woodcut printing.

AURIPETRUM, AURIPETRUM. The name given by the Romans to ORPIMENT, or the yellow sulphuret of arsenic.

AVANTAIL (AVANT TAILLE, Fr.) The movable front of the helmet, which covered the whole face, and through which the air was breathed. In many instances the sight could only be obtained by a space left for the eyes between the lacing of the helmet and avant-tail. This under various names was soon superseded by a more convenient and airy face-guard,

* The Nimbus is an insignia which may sometimes appear telescopic in its dimensions, but it is always great in importance. A sculptor who makes or reproduces a Gothic statue, a painter who restores an ancient fresco or painting on glass, should pay the most scrupulous attention to this character encircling the head in certain

such as the visor. The Normans called *nasals*, *cheek-pieces*, and all other protections for the face, *nasals* or *aventailles*.*

AVENTURINE. A brownish coloured glass interspersed with spangles, which give it a peculiar shining appearance; it was formerly manufactured at Venice, and employed for many ornamental purposes. Its manufacture was kept secret, but it is known that its peculiar brilliancy was due to the presence of copper filings. French chemists have succeeded in preparing this glass by fusing together for twelve hours a mixture of 300 parts of powdered glass, 40 parts of copper scales, and 80 parts of iron scales, and afterwards cooling the mixture slowly.

AXE. In Christian Art the axe is the attribute of the Apostles Matthew and Matthias. Thomas à Becket has sometimes the Axe as an attribute, but this is an error, it should be a Sword.

AZURE. Many blue pigments are described by medieval writers under the general term AZURE, which differ materially in their composition. The German Azure was the native blue carbonate of copper, which yielded as fine a colour as ultramarine, although it is not so permanent, at least in northern climates. The Egyptians used a similar blue pigment, which has retained its brilliancy nearly unimpaired during three thousand years. The German *leuzstein* yielded a pigment which was called *asurblau*. Ultramarine was sometimes called *Azure*; but the various substances known to the early Italian painters as *Azzurro della Magna*, *Azzurro de Lombardia*, *Azzurro Todesco*, *Azzurro Spagnuolo*, *Azzurro de Anglia*, were only the blue carbonate of the oxide of copper. Azure is a name given also to **CORALL**.

AZURE (Fr. AZUR, Blue.) A light or sky-coloured blue. Azure, in herald-painting, means the blues in the Arms of persons whose rank is below that of a baron. In engraving, this colour is always represented by regular horizontal lines.

AZZURRO DI BIADETTO (Ital.) The artificial carbonate of copper. The *Biadetto* now sold in Italy is the artificial pigment which is imported from England. It is identical with **BICE** or **Cendres blue** (Smauder's Blue).

AZZURRO DI POZZUOLI differed from the above, it was the *Testorian azure* described by Vitruvius; a kind of glass composed of sand, nitre, and copper filings (AVENTURINE) used, when ground, chiefly in fresco-painting. It is sometimes called **SMALTRO**.

BACCHANTES. The persons who took part in the festivals of Bacchus. At first only women were allowed to do this, but Pœnula Mitia at Rome obliged young men to appear, and consequently the feasts became scenes of riot and debauchery. The Bacchæ mentioned in ancient myths were the female attendants upon the god, during his journey to India. They were also called **MEXADES**, **Thyades**, **Leones**, **Bassarides**, and **Mimallides**. They wore vine leaves in their hair, the skin of a tiger or roe over their shoulders, and carried the **THYRSUS**, or staff entwined with vine-leaves. When inspired by Bacchus they performed miracles, such as wreathing serpents in their hair, taming wild beasts with the hand; and whenever they touched the earth with the Thyrsus, honey

figures, else he incurs the danger of reducing a saint to the condition of a man, or of transforming a simple mortal into a god. This error is frequently committed by modern artists in the representation of religious subjects; hence the Nimbus in Iconography, is what the fingers and mammae are in zoology, characters very small to the eye, but very important to the sense.

Ample details of all the various forms and applications of the **GLORY** are given in Dupon's *Manuel d'Iconographie Chrétienne*. Our cut exhibits an Avantail of the time of Edward III., as worn by a figure of St. George at Dijon.

and milk streamed forth. The Bacchantes are represented on ancient vases and reliefs as very beautiful, their extravagance being expressed by the thrown-back head and dishevelled hair; they carry Thyrsi, swords, serpents, a torn skin of a kid, and timbrels. Their garments are generally flowing, but in more recent antiquities they are transparent; the figures never wear a girdle; they are occasionally naked. Sometimes we see the **MENADES** (i. e. the mad Bacchantes), exhausted with frenzy and sunk in slumber, with serpents coiled round them. The Bacchic Nymphs are more spiritual Bacchantes, with a less excited demeanour; these were also occasionally female satyrs. The wife of Bacchus is the true ideal of a Bacchantess. The blooming graceful Ariadne (who must never be confounded with the nymph Cora), is the acmé of Bacchic female beauty. The female Satyrs and Fauns belong to the Bacchic nymphs; they have short noses and laughing faces; they hold a flute and the **PURFURS**, and are playing with a Satyr child. Many Gems have beautiful Bacchic heads; and in reliefs, vases, sarcophagi, urns, and in the pictures at Herculaneum are found the figures of half-naked dances. On many Gems is seen depicted a naïve wandering herself in Bacchic frenzy, or half-naked, kneeling in ecstasy before an altar, and holding a female image playing on a flute; there are great Bacchantes carrying the same idol. The other representations of these Bacchantes are—Menades on a panther, with Bacchus on an ass, led by Silenus; they are sometimes riding upon the Bacchic Bull, which is swimming across the sea; or they are reclining against a sea-horse; a Bacchantess (a beautiful figure, resembling Venus), playing the lyre, and singing in praise of the god; another rescuing the carcass of a young Faun; a third on the back of a Centaur, whom she overcomes by seizing his ear with her right hand, while she guides him with an inverted Thyrsus, and supporting herself by her right knee, she thrusts her left leg against his back. Thalia, Irene, Galene, Opora (carrying fruits), and Comedy, are found among the Bacchic women; on the latter, Bacchus is fastening a mask, and a Satyr the buskin.

BACKGROUND in painting is the space behind a portrait or group of figures. The distance in a picture is usually divided into the foreground, middle-distance, and background. In portrait-painting, the nature and treatment of backgrounds has varied in the hands of almost every master, yet there are certain recognised methods which are more worthy of imitation and study than others. In most of the portraits of Titian, Vandyke, and Rembrandt, the backgrounds represent only *space*, indicated by a warm brown gray tone, and this treatment is the most effective; the spectator's eye is at once attracted to the face, from which the attraction is not distracted by frivolous accessories, but the tone of colour in backgrounds must depend upon the tone of the carnations in the flesh. Asphaltum, Bitumen, and other warm transparent browns deepened with blue, appear to have been most frequently employed by the above named painters.

BACULUS, BACULUM, BACILLUS, BACILLUM (Lat.) In works of ancient Art, personages are frequently represented bearing or supported by long sticks or staves.

These may be divided into two kinds: the **BACULUS**, borne by kings and others in authority, and by divinities, as a mark of distinction, or as a defence; sometimes gilt and ornamented. It was the original of the more modern sceptre. Another, of smaller size, was commonly borne by shepherds, herdsmen, rustics, and travellers, as seen in our engraving. The **BACILLUM** was simply a walking-stick.

BADGE or **COGNIZANCE** (in heraldry). During the middle ages, when great heraldic displays were universal, the badge was adopted as a mark of distinction; it was somewhat similar to a Cross, but not worn upon the helmet, and occasionally embroidered upon the sleeves of servants and followers, on the caparisons of horses, and on robes of state; they were also introduced on Seals and in the details of Gothic edifices, as well as for the signs of Inns. The Cross of St. George has from the time of Edward III. been the badge both of

our kings and the nation. Its use was for a while nearly superseded during the wars of the Roses, when this flower, red or white, became the badge of the rival houses. The Thistle is the Badge of Scotland, and the Harp of Ireland. For a long period badges were of considerable importance, and the legislature frequently interfered to prevent their being worn by any but the personal retainers and servants of the nobility, but they have gradually fallen into disuse, and are now nearly forgotten.*

BADGERS (BLAIEAUX, Fr.) Brushes made of the hair of the Badger are used in oil-painting as *softeners*, for blending or melting the pigments, as it were, into each other, and imparting a smoothness to the surface. They differ in form from the brushes with which the pigments are applied, being open and spreading at the end, like a dusting-brush. The use of these brushes is much to be deprecated; it belongs to the degenerate method of painting; "they are the veritable form-destroyers."

BAINBERGS (BEIN-BERGEN, German.) Shin guards. The term for the graves or jambs first used by the military as an additional protection, less vulnerable than the chain-mail with which the body was protected. They first appear upon the monumental effigies of the thirteenth century, and led to the entire adoption of plate-armour. Our illustration is obtained from the brass of Sir John De Croke, in Westley Waterless Church, Cambridgeshire. It is of the age of Edward III., and very clearly exhibits the mixture of chain-mail with plate, which was then usual in the knightly carapison.

BALDACHIN, BALDACHINO (Ital.) A tent-like covering or canopy of wood stone or metal, on the exterior as well as interior of buildings, over portals and altars, thrones, beds, &c., either supported on columns, suspended from the roof, or projecting from a wall. The Italian word corresponds to our *CANOPY*, signifying a piece of furniture carried or fixed over sacred things, or the seats of kings and persons of distinction; but the term has a more extended sense in other countries. They were formerly common over fire-places, and many still exist in this country. Those of the Eastern fireplaces in the Gürzenich hall at Cologne are remarkable; they are pyramidal in form, and of perforated work, similar to those in the Cathedral at Regensburg, placed over the altar; the font has a similar Baldachin. The Baldachin in St. Peter's at Rome, placed over the bodies of St. Peter and St. Paul, the work of Bernini, is among the most celebrated; it is the largest work of the kind in bronze, "an enormous *concelto* of architecture," but it is not destitute of ingenuity, brilliancy, and grandeur. Over the marriage-gate of the Upper Church of St. Mary at Bamberg, is a splendid specimen of an ancient German Baldachin, projecting from the wall, it is supported by two slender pillars, and is remarkable for elegance of form. These structures afforded opportunities for a rich development of ancient German Art. The form of the Baldachin, for the most part, is square, but there still remain many of hexagonal shape, executed towards the latter end of the fifteenth century, having metal ornaments. Statues were placed under small Baldachins in the churches and houses of the old German style; for example, the

statues of Agrippa and Marsilius on the façade of the Gürzenich at Cologne, and on the above mentioned altar at Regensburg;

the statues stand under small Baldachins, pyramidal, perforated, and terminating in flowers. Portable Baldachins were chiefly used at the coronation of Emperors and Kings, under which the newly crowned sovereign walked, clad in ermine and purple. Baldachins over beds were customary among the ancients, whence we have the word *tester-bed*, the roof being like a canopy, and representing an artificial sky. Portable Baldachins are used in the East as the necessary appendages of dignity. And we also find them carried at solemn catholic processions over the Pope, and sometimes at the celebration of the oath of allegiance. See *CIBORIUM*.

BALDRIC, BAUDRIK (BAUDRIER, Fr.) A plain or ornamental band, belt, or sash, worn pendant from the shoulder diagonally across the body, to the waist, and employed to suspend a sword, dagger, or horn, much used by warriors in ancient and feudal times. It frequently encircled the waist, and as an ornamental appendage served to denote the rank of the wearer.*

BALSAM, is the product of a fir-tree, *abies balsamifer*, which grows abundantly in Canada. It has the consistence of honey when fresh, is of a very pale yellow colour, and of an agreeable odour. When genuine, it should be completely soluble in pure turpentine, forming with it a beautiful glassy colourless varnish, called *crystal varnish*, and much used for varnishing maps, prints, drawings. It is often called *Balm of Gilead*.

BALSAM OF COPAIBA or COPAIVA, CAPIVI. An Oleo-Resin usually obtained from S. America, by making deep incisions in the trunks of trees; it is liquid, of an oily consistence, transparent, of a strong odour, nauseous acid taste, and of a pale straw-colour; soluble in alcohol, ether, and oils, but insoluble in water. It possesses the property of *drying*, and has been recommended and used as a vehicle in oil-painting, as a varnish, and as a substitute for linseed-oil in printer's ink.

BALTEUS (Lat.) The ancient Baldric used to suspend the sword, dagger, or quiver; usually made of leather, and frequently richly ornamented. It was worn over the right shoulder when used to sustain the sword, and over the left to support the dagger when worn on the right side.

BAMBOCCIATA (BAMBOCIATA, Ital. BAMBOCHADE, Fr.) Rustic. This term is applied to a class of compositions which represent nature in an every-day rustic

* A curious specimen of an ornamental Baldric, decorated with bells, is given above, from an illumination in Royal MS. 45 D. 3, executed toward the end of the fourteenth century.

and homely manner embracing the most ordinary actions of life, such as fairs, festivals, &c., and unlike the elevated style of painting, does not abstract from natural accidents and deformities without seeking to exaggerate the whims of nature—but on the contrary applies itself to represent her *natively*, and herein the **BAMBOCCIATA** ranks higher than compositions of **GROTESQUE** figures with which it must not be confounded. This particular style of **GENRE** painting was practised by Teniers, Van Ostade and Brower, but Peter Van Laar first introduced it into Rome about the year 1626; he, on account of his deformity, was called **IL BAMBOCCIO**, or the *Cripple*, and fixed his unfortunate *soubriquet* to the style in which he excelled. Painting can only admit of Bambocciata in the same way it does the Grotesque—employing in it only figures of small size. Sculpture absolutely rejects both.

BANDEROLLE, BANNEROLLE. A Banner or Flag, usually about a yard square, several of which were carried at the funerals of the great. They generally display the Arms of the matches of the deceased's ancestors, especially of those which brought honours or estates into the family: these Arms fill the entire flag, which is on some occasions fringed with the principal metal and colour of the arms of the deceased.*

BANNER (BANNIERE, Fr.) This general term are included all those indications of authority, command, rank, or dignity used in civil, military, or religious affairs, which are known as Standards, Ensigns, Flags, Colours, Pennons, Pendants, Gonfannons, &c.; they usually consist of a piece of velvet, silk (taffeta), or other textile material, either of one uniform colour, or parti-coloured, fastened to the upper part of a staff or pole, generally hanging loose, but sometimes fastened to a kind of wooden framework; they are of various forms and sizes, and frequently richly ornamented with tassels and fringe. In Catholic countries, Banners form an important feature in religious services, processions, &c., to which they impart great splendour; before the Reformation, all the monasteries in England had Banners preserved in their wardrobes, from which they were brought on anniversaries, festivals and other important occasions, and sometimes displayed on the battle field; these religious Banners contained a representation of some particular saint or symbol, such as the Cross, or the picture of Jesus Christ.† The military Banner, or **STANDARD** constituted the rallying point of the forces under one general commander; besides this, in feudal times, the King's own Banner, the Banners contributed by the religious societies, the Banners of the nobles and other leaders were brought into the field as well as into tournaments and other pageants, such as coronations, funerals, &c., where their profusion and variety must have imparted great splendour and picturesque effect to the scene. It does not appear that military Banners were used by the ancients, the Standards seen on monumental remains appear to be entirely earrings in wood and metal. In

* Vide *A Glossary of Terms used in British Heraldry*, Oxford, 1817. The engraving represents the Bannerolle which was placed at the head of Cromwell at his magnificent funeral, and exhibits his arms—*sable*, a lion rampant, *argent*; impaling Stuart, *or*, on a fess chequy, *argent and azure*, an escutcheon *argent*, debased with a *head fretty, or*.

† When used in processions, such as coronations, they are proportioned according to the rank of the bearer, and vary in size from six feet square to three feet.

‡ The national standard of England is a religious Banner, being composed of the crosses of St. George, St. Andrew, and St. Patrick. The banner of St. George, in its simple originality as the flag of England, is depicted in our engraving.

* It is lamented by a writer in the *Retrospective Review* (N. S. vol. I.), "that so beautiful an appendage of rank to fortune should not be more general; the general adoption of ennobled badges would give employment to a much greater number of industrious people, than might at first be imagined, and hence, at the same time that they increased the splendour of their equipage, they would do infinite good to a large portion of the most useful class of the community." Our cut exhibits a Medieval badge of bronze, the shield beautifully enamelled, and is one of the kind anciently worn by retainers in royal and noble families.

† Vide *The Art of Printing Restored to its Staple and Surest Principles*. By L. II. X. B. 1793. London, 1810.

former times Corporations had their Banners, and the several trading companies, which still retain them, as for instance the Livery Companies of London.*

BARBARA (St.) The patron Saint of those who might otherwise die impenitent. Her attributes are, 1. The Cup, given her as a sign that those who honoured her could not die without the sacrament; 2. A Tower, her father having shut her up in one when a child; 3. The Sword by which she was beheaded; 4. A Crown, which she wears as a symbol of victory and reward. St. Barbara, who was the patron saint of Mantua, was a favorite subject with the artists of the middle ages. Raffaello introduces her in the *Madonna del Sisto*, kneeling by the side of Mary. The St. Barbara painted by Beltrario is particularly magnificent. One of the most beautiful representations of this Saint is a figure carved in oak depicted in Heidehoff's *Ornamentik des Mittelalters*. The expression of the features is pure and beautiful, and the waving hair exquisitely carved.

BARBITON. The name given to the Lyre of Apollo.

BARNABAS (St.) Representations of this saint are seldom to be met with, except in the works of the Venetian artists. He is usually depicted as a venerable man, of majestic mien, holding the Gospel of St. Matthew in his hand. The subjects are chiefly taken from the Acts of the Apostles, and from the life of St. Paul.

BARTHOLOMEW (St.) The Apostle, generally depicted with a knife, and his skin in his hand. The horrible scene of his being flayed alive, by order of the chief magistrate of Albanopolis, who condemned him also to be crucified, has been painted by some artists. In these pictures, St. Bartholomew is represented as standing headless, and holding his skin with the head attached to it in his hand. Sometimes he carries an axe or a lance, but in St. Schall's Church at Nuremberg, he is drawn holding a curved knife in the left hand, the position of which is very striking, while in the right he holds his garment. In the Last Judgment by Michael Angelo, in the Sistine Chapel, Bartholomew is represented with the skin in one hand, while the other exhibits the martyrdom.

BARYTES, or BARYTA. An alkaline earth, the oxide of the metal Barium, commonly found combined with sulphuric acid (*sulphate of Barytes*) in ponderous spar, and, united with carbonic acid, (*carbonate of Barytes*) in the mineral *W.therie*. The sulphate of Barytes is extensively employed to adulterate WHITE LEAD. It is also used in water-colour painting, and is known as CONSTANT WHITE, and HUME'S PERMANENT WHITE. Although very ponderable, yet it does not possess sufficient body to work well, being scarcely visible when first laid on; its use is limited to miniature-painting, for representations of lace, &c. The pigment known as Lemon Yellow, is erroneously stated to be the *chromate of Barytes*, but this salt is decomposed by the sun's rays. Lemon yellow is most probably *chromate of strontian*.

BASALT. Common basalt is a stone bearing much resemblance to the lava of Vesuvius, in fact it may be considered as a solid coloured lava, which it most frequently is. There are two kinds of Basalt, the black and the green, the latter being of various shades. The Egyptian and Grecian statues have worked in both kinds; in the former they have carved animals. Only the best artists worked in Basalt. In front of the Balustrade on the northern ascent to the Capitol are two lions casting forth water, and splendidly carved in black Basalt; they are of ancient Egyptian workmanship. In the Florentine Gallery is a remarkable Torso of green Basalt; it is that of a youthful figure, naked, powerful and finely formed, apparently that of an athlete, and the work is minutely delicate, even to the hair. Considering the almost unconquerable hardness of the material, the delicacy with which these and other works are finished is wonderful.†

BASIL (St.) Representations of this saint, who was Bishop of Cesarea, are very rare. He is represented in Greek pontificals bareheaded, with an emaciated appearance. One of the mosaics of St. Peter's at Rome, designed by Subleyras, represents the Emperor Valens fainting in the presence of St. Basil. This work is highly extolled by Lanzi.

* The study of this subject is of the greatest importance to the Historical Painter, but few sources of information are available. We must refer him to MEYER'S *Critical Enquiry into Ancient Armour*, &c., to the *Retrospective Review*, vols. i. and ii. (N.S.) and to the *Penny Cyclopaedia*, from which our information on this subject is chiefly derived.

† If space allowed the attempt, we might give a comprehensive list of works executed in this material, but we must content ourselves with referring to the works executed in Basalt in the collection of Egyptian antiquities in the British Museum.

BASCINET, BASINET, or BASNET. A bascinet-shaped helmet of various shapes, globular or conical, plain or fluted, worn during the reigns of Edward II. and III., and Richard II. At the apex which is more or less pointed, we frequently find an arrangement for attaching the scarf or crest; sometimes a wreath of velvet, silk, or cloth, enriched with jewels and goldsmith's work was worn over the Bascinet. In actual combat the tilting helm was worn over the Bascinet. See MEYER'S "Illustrations of Ancient Arms and Armour."

BASILISK. A fabulous animal said to have come from an egg laid by a hen thirty years old, and hatched by a toad in the water. This animal grew to an enormous size, having the body of a cock, the beak and claws of polished brass, and a long tail, which resembled three serpents, and had three points. The glance of the basilisk caused death, therefore being itself invulnerable, it could only be conquered by holding a mirror before it, when it burst, frightened at its own image. In Christian Art, the Basilisk is the emblem of the Spirit of Evil. St. Basil regards it as the type of a depraved woman.

BASKET. A basket containing fruit and flowers is the peculiar attribute of St. Dorothea.

BASONS. These vessels were used in churches for various purposes, such as collecting alms and oblations; for washing the hands of bishops during the celebration of the sacred rites; to hold the cruets

containing the wine and water—suspended with pickets to hold burning tapers before altars and shrines. They were made indifferently of silver, parcel or whole gilt, copper gilt, brass, either quite round or sex-foil, with enrichments of chasing, engraving, and enamelling.*

BAS-RELIEF (BASSO-RELIEVO, Ital.) Figures which have a very slight projection from the ground, are said to be in BAS-RELIEF (low relief), in contradistinction to those which are in MEZZO-RELIEVO, or in ALTO-RELIEVO. The sort of composition proper to bas-reliefs resembles that which is suitable for a picture, in the great number of characters which it admits, and in the mode in which they are disposed upon one, two, and three planes, profiling them one before the other, and realising as painting does, the appearance of the effects of linear perspective; on this account Bas-relief has been called sculptured painting.

BASTERNA. A kind of litter or palanquin,

in which women were carried in the time of the Roman Emperors; it resembled the *LECTICA*, but differed in being a close carriage; it was borne by two mules, and similar vehicles are still in use on the continent. During the middle ages they were commonly used by the noble and wealthy, and our cut represents a Royal litter, from a MS. of the fourteenth century, in the British Museum, Royal Lib. 16. G. 6.

* Prome's *Glossary of Ecclesiastical Ornament and Costume*. The most interesting and beautiful enamelled basons of the thirteenth century are figured in WHELAN'S *Monuments Français Inédites*, vol. i. Our engraving exhibits one of a similar date, prepared by the Society of Antiquaries, and containing a series of beautifully enamelled subjects connected with hunting and hawking.

BAT, RERE-MOUSE. This creature, between a bird and a beast, was frequently introduced in ancient sculptures, especially under stalls.

BATTLE-AXE. From the earliest times the Axe has been used as a military weapon. It is frequently seen depicted on ancient monuments, sometimes with but one head, at others, as in the Amazonian Axe, with two heads or edges, (*BIPENNIS*). It appears to have been regarded as peculiar to barbaric nations, and was not used by the Romans. The date of its introduction into this

country is uncertain, but fragments of battle-axes have been found among Druidical remains. The pole-axe differed from the battle-axe, in having an edge on one side and a sharp point on the other; it is considered to have been introduced by the Normans.*

BATTLE-PIECE. The representation of battles has been made a special class of painting. The numerous figures, persons, and incidents, the crowd, the confusion, the number, and sometimes the revolting character of the details, do not allow of this style being treated with anything but small figures; and by the term Battle-piece we usually call those pictures which are treated in this manner. When the figures are of life-size, they come under the historical class. Raffaello's *Battles of Constantine*, and the *Battles of Alexander* by Le Brun, are not called Battle-pieces, far less can those great artists be designated painters of Battles, which term can only be applied to him who chiefly occupies himself in painting in the manner first mentioned. One of the most splendid specimens of a Battle-piece is the Pompeian Mosaic of the Battle of Issus, discovered in 1831. The composition is of the highest order, and it exhibits a thorough knowledge of perspective and foreshortening.

BAYEUX TAPESTRY. This singular monument of the Middle Ages consists of a web or roll of linen cloth or canvas, upon which a continuous representation of the events connected with the conquest of England by the Normans is worked in woollen thread of different colours, in the manner of a sampler. Its length is 214 feet and twenty inches in width, being divided into seventy-two compartments, each bearing a superscription in the Latin language indicating either the subject or the person or persons represented. It is edged on both the upper and lower parts by a border representing birds, quadrupeds, sphinxes, and other similar subjects. It is traditionally said to be the work of Matilda, Queen of William the Conqueror, and presented by her to the Cathedral of

Bayeux, of which Odo, the Conqueror's half-brother, was bishop. This work possesses much historical interest and value, since it represents the minutest manners and customs of the earliest Norman times in England, and embraces several events of which no other record now exists. It was accurately copied by Mr. Charles Stothard, and engraved one-fourth of the size of the original in the fourth volume of the *Vestula Monumenta*, in sixteen plates. A portion is engraved above.

* See MEYER'S *Illustrations of Ancient Armour*. Our cut gives examples of the Axe of the time of Elizabeth, and the Scottish Pole-Axe, of a later date.

SIDEBOARD PLATES
WITH PLASTIC ORNAMENTS.

In the bright epoch of the cinque-cento, when every branch of Art lent its aid to heighten the sensitive pleasures of life in all their various aspects, and to throw a graceful veil of poetry even over the splendour of the rich and great, goldsmiths' work, among the rest, displayed a peculiar stylo of delicate ornament often affording a refined detail worthy of the overflowing luxuriance of a higher domain of Art. We must not, as is usually done, look to the works of Benvenuto Cellini, who had, really, no share in guiding the development of so naïve and refined an expression of artistic feeling. He was accustomed to treat such works rather in a spirit belonging only to pretensions of the highest order, and, in his own compositions, we find nothing of that innocent, almost child-like simplicity, which characterises, at the epoch we have named, this branch of Art-manufacture.

In illustration of our meaning, a plate, the design (No. 2) of which we lay before our readers, may afford a good and striking example. The large surface of this dish (the destination of which was, rather to increase the splendour of a side-board, than to serve any purpose of immediate utility) is divided by successive circles into compartments of very graceful proportions. A general view conveys only the idea of a mass of arabesques which make an agreeable impression upon the eye even without regard to the inward meaning of this fantastic composition. Looking however a little more closely at the objects which seem to be concealed, rather than distinctly brought forward, by the peculiar mode of arrangement, we perceive indications of that spirit of poetical treatment to which we have alluded. If we examine, in fact, the figures composing the frieze which surrounds the whole, we presently discover that the parable of the Prodigal Son is here represented with the same charming simplicity of style which we find only in the popular stories and ballads of the olden time. The character of the figures themselves is very peculiar, but wonderfully adapted to the language in which the story is originally related. The revelry of luxurious banquet contrasts forcibly with the patriarchal simplicity of the feast given by the happy father, who once more presses his beloved son to his paternal bosom—but above all with the touching scene representing the unfortunate youth kneeling before the swine-trough.

The moral signification of this scriptural story is alluded to by the figure placed in the centre, personifying Temperance, who sits enthroned between the symbols of rural industry, but who holds in her hand a cup of wine to cheer and refresh the wearied labourer when the hours of daily toil are over.

The space between the moral inculcated by the central group and the illustration of it by the story surrounding the plate, is filled up by two successive circles composed of a rich network of lines, enclosing figures, masks, stags, and fruit, forming a fine arabesque pattern.

Formerly works of this description were enjoyed only by the favoured few, whose wealth enabled them to appropriate such rare and precious specimens of artistical skill. The process of electrotyping has now, by its power of infinite multiplication, brought them within reach of the many, who with moderate, even limited, means, may thus surround themselves with the choicest productions of genius.

Mr. Elkington who has received a finely chased model of this plate from Rome, has multiplied it by the above process, and thus offers to the public the opportunity of becoming possessors of this beautiful specimen of medieval workmanship.

Nearly to the same epoch belongs a sacramental plate, (No. 5) which, in a style modified by its sacred destination, represents angels holding the instruments of the Passion, surrounded by arabesques, which enclose them in maudlin-shaped figures. In the centre appears the Resurrection, offering a striking yet consolatory contrast to those symbols of death and martyrdom.

The beautiful disposition of the decoration of this plate has inspired the Duke de Luynes with the idea of a composition conceived in an analogous spirit (No. 1.) It represents the six days of the week, with Sunday in the centre. The latter is indicated by the quadriga of the Sun-god, while the former appear as the gods from whom the days of the week have received their names.

An arabesque plant, taken from the sylphium on the beautiful coins of Cyrene, forms the connecting link between the discs surrounding the six gods. Two griffins are placed upon the convolutions which spring from each side of the plant, and each rests its paw upon the medallions enclosing the figures of the gods. The whole composition is in that pure Greek style, a more extensive acquaintance with which we have lately learned to appreciate from vase-pictures, and in which the learned Duke is a most profound connoisseur.

This is intended for a dessert-plate, and it is, indeed, a graceful idea to present fruit or sweetmeats upon a ground decorated with the symbol of a day of rest and enjoyment, and surrounded by those of six preceding days of labour.

The series of the latter does not present a simple succession, but rather an antithropic opposition, a mode of representation adopted even by Raphael in his wonderful mosaics of the Capella Chigi, engraved lately in a pure and conscientious style by Mr. Gruner. Luna, riding on horseshoe, and covered with a dark veil, represents Monday, and may be considered as withdrawing herself from the Sun-god who, with rises from the ocean goddess of the Moon see Mars (Mardi), who is preparatory to entering To him corresponds the diagonal direction, mands of Jupiter, who him, in the centre, as it (Jeudi—Giovedì). His awful majesty is tempered by the appearance of Venus (Vendredi); and the whole is concluded by Saturn, who, devouring his own children, brings the series to an end. Every figure may easily be recognised by its peculiar character, as well as by the symbols which distinguish the different gods; and a very slight degree of classical knowledge is sufficient to enable one to understand and enjoy the poetical language in which those graceful ideas

are expressed. The execution of this design displays a refinement which has hitherto only been effected by carefully engraved dies. Electrotyping is, however, the only process by which a perfect fac-simile of so large a surface can be reproduced without deteriorating from the original sharpness of execution. This also is now to be obtained at a trifling expense compared with the enormous sums paid in former times by princes and noblemen for high finish in works of this description.

A plate, intended for fruit, presents the mask of a little Bacchus ornamented by a crown of vine-leaves, which form a basket ready to receive the bounteous gifts of that god by whom every tree and every product of the garden was protected (Nos. 3 and 4). The idea is a pleasing

one, that from underneath a mass of heaped-up fruits, gradually appears, uncovered, the smiling face of a deity to whom mankind owe the choicest treasures of the garden and the orchard. Used as a sideboard decoration this plate would have an effect no less brilliant than agreeable, in combination with the other (described above), according to the fashion of former days. In order to render it available for a table, a stand has been added in an appropriate style, composed of the twining roots and branches of trees upon which the plate rests, like a sun-flower on its stem, clasped round with ivy and embellished with shells and flowers.

The so-called Lazzaroni plate presents a rich Alhambra-like pattern, which fills up the interstices between the wires of a light basket-work, forming the motive of the whole basin (No. 6). The interior is composed of a net-work of lines of the same character laid upon a dead background. This portion contrasts by its flatness with the richness of the border and that of the inner circle, in the centre of which appears an Italian Lazzaroni, bearing on his arm baskets loaded with fruit from the lovely shores of Sorrento. Those who have inhaled the balmy air of those charming regions will be able to appreciate the merit of this design, in which, under the squalid wretchedness of the Italian beggar, the practised eye can yet discover, and render available for the purposes of Art, traces of that inborn nobility and grace which characterise the present race of this country.

We conclude with a general remark respecting the manufacture of similar objects, which hitherto have only been found in the dining room and on the buffets of princes and the high aristocracy, their reproduction being not less expensive than the number of them was limited by the character of the workmanship itself. There existed in those times only two processes by which such works could be multiplied, neither of which afforded the certainty and facility requisite for manufacturing purposes. We allude to the arts of embossing, chasing, and fire-casting. The latter encounters extraordinary difficulties in the management of large surfaces, and even if the results were less coarse, much inconvenience arises from the great bulk of metal necessarily employed in this process. Both modes of treatment, however, require the aid of handicraft, which entirely excludes the mechanical means requisite for the re-production of refinements, after all, not to be obtained by other methods.

Electrotyping, on the contrary, preserves the slightest and finest details of beauty in the original work, and affords to sculpture the same advantages which the arts of design have for many centuries enjoyed by means of copper, steel, and wood engraving, including the use of woodcuts. Neither are the advantages which this mode of re-production offers, in any way diminished by want of solidity in the material employed. To artists of fertile invention this discovery presents a wide field for the exercise and display of their powers before the eyes of a public eagerly desirous of participating in the more refined enjoyments of Art, and affords to the public itself the means of fully gratifying this newly-awakened taste for a higher and better expression of artistic feeling.*

EMIL BRAUN.

* These beautiful specimens of galvano-plastic workmanship are to be found in the elegantly fitted up showroom of Messrs. Elkington. These gentlemen, with the most praiseworthy skill and perseverance, are now exerting themselves for the re-production and multiplication of the finest specimens of ancient and modern art-manufactures, adapted to the wants of the present day. The models are for the most part furnished by the galvano-plastic works established in Rome by Dr. Emil Braun, Secretary to the Archaeological Institute in that city. Dr. Braun's learning and refined taste in Art eminently qualify him for the direction of such works, which are executed by skillful artists regularly trained for the purpose; electrotyping requires a totally different method from the old process of chasing and fire-casting, by which, more especially from the latter, more slovenly copies were generally produced, instead of the genuine fac-similes produced by the electrotype.—Ed. BRITISH BALLADS.*

It is now several years since the earlier portions of these beautifully illustrated volumes were first presented to the public, and, inasmuch as they were published serially, a considerable time elapsed ere they were completed; but even this is so far back, that comparatively few of the present readers of the *Art-Journal*, can be aware of the existence of the work from the specimens of the engravings which we introduced when the publication was brought to a close in 1844. The recent demand for a re-issue, in its completed form, would of itself be sufficient justification for a notice at this time; but putting aside any personal feeling we may have in the success of a work which, during its progress, was truly a labour of love, and for which, therefore, it is unnecessary to apologise; sure we are that most of our readers will thank us for placing before them, on the two preceding pages, examples of the exquisite wood-cuts that adorn the volumes, and which it is not too much to say, are among the finest that modern Art has produced.

The primary object of the editor of the "Book of British Ballads" was to show that English artists were as capable of excelling in this branch of Art as those of Germany and France, although it had long been the fashion with critics to extol the one and to deride the other; the encomiums bestowed on the work as its successive numbers appeared, were sufficient to prove that he had judged rightly. In selecting our native "ballads" as the arena for the display of native "Art," he had a twofold object: to offer to the public a collection of the best of these quaint but heart-stirring songs, culled from the masses of inferior or objectionable compositions by which previous compilers had too frequently surrounded them; and to give the artists every variety of subject for the exercise of their respective pencils. To accomplish the first of these purposes the collections of Percy, Evans, Ritson, Pinkerton, Scott, Motherwell, Jamieson, Buchan, Herd, and many others less widely-known, were laid under contribution; while in carrying out the second he secured the services of Messrs. Herbert, R.A., Creswick, A.R.A., Resigrove, A.R.A., E. M. Ward, A.R.A., F. W. Pickersgill, A.R.A., W. P. Frith, A.R.A., Tenniel, E. Corbould, J. N. Paton, R.S.A., Townsend, Fairholt, Franklin, Selous, J. Gilbert, H. Warren, and numerous other artists of established reputation. The engravings were entrusted to Messrs. Orrin Smith, Linton, Williams, Dalziel, Nicholls, Walsley, Bastin, Armstrong, Landells, Vizetelly, Green, &c., &c. Among both these classes of artists are some who may date back their professional success to the time when their names first appeared in connection with the "Book of British Ballads."

The two volumes contain fifty-two poems, many of them being of considerable length; each ballad is prefaced by two pages, with decorative borders of introductory matter, giving its history and supplying such information concerning the subject as it was possible to obtain; then follows the ballad itself, each with a head-piece and tail-piece, of the size and character shown in the annexed specimens. The intervening pages occupied by the successive stanzas are embellished with woodcuts, also descriptive of the text, so that there is not a single page without its appropriate illustration.

"The Bonnie Bairns" is taken from Allan Cunningham's "Songs of Scotland;" it begins thus:—

"The lady she walk'd in yon wild wood
Amidst the holly-trees,
And she was awar o' two bonnie bairns
Were ramming at her knee."

"The Beggar's Daughter of Bednall Green" is a well known old ballad, the original of which is preserved in the British Museum. "The Eve of St. John" is from the pen of Sir Walter Scott, and describes a tragic occurrence which tradition assigns to a particular locality in Roxburghshire. Tickell, the friend of Addison, was the author of "Colin and Lucy;" it is an exquisite example of the comparatively modern ballad, touching, pathetic, and true to nature; it refers to an incident in Irish life, which is supposed to have passed under the observation of the poet.

The specimens of the engravings here given, and these few lines of explanatory remarks serve to show the nature and the plan of the work. Of the admirable style in which the illustrations are executed, we may speak without being deemed egotistical; they have seldom or never been surpassed; the only merit claimed by the editor is that of having placed in the hands of the artists, materials which they have so well applied to his purpose and their own reputation.

ON MURAL PAINTING.*

BY MRS. MERRIFIELD.

I MENTIONED in a preceding number of this Journal, that several kinds of mural painting were practised in Italy, with some of which we are well acquainted, while others are, as yet, only partially known and described. I proceed now to offer some further observations on the present state of some of the mural paintings of northern Italy, in order to assist those interested in the subject, and who may not have the opportunity of making personal observations, in determining what situations should be chosen, what processes should be adopted, and what colours should be used, so as to ensure the beauty and durability of mural paintings.

It is easy to perceive that the worst enemies with which this kind of painting has to contend, are damp, and the careless preparation of the wall. The action of damp on mural paintings is insidious; it frequently operates unseen, until the injury has gone too far to be arrested by the skill of man, and perhaps the first indication of its existence is the commencement of decay in the picture. A knowledge of the way in which damp operates on buildings, and of the means of preventing injuries to paintings from this cause, involves a practical acquaintance with architecture, and especially with the chemistry of architecture—for this science, like painting and agriculture, has also its chemistry. I shall not venture to make any remarks on this subject; I will merely observe, that among those to whom, in all questions connected with Art, we always look for examples, the old Italian painters, the Arts of painting and architecture were frequently united in the same person; and indeed, when these artists were so generally called upon to decorate churches and other public buildings, a knowledge of architecture was essential to the production of a harmonious effect. It would be easy to multiply instances of painters who were celebrated for their skill in architecture, but it will be sufficient to refer to Giotto among the earlier masters, and to Michael Angelo and Raffaello among the cinquecentisti. Among the architects who were also painters may be mentioned Leon Batista Alberti, Bramante, and Sansovino.

The visible effects of damp on pictures are, however, sometimes so obvious, that many useful lessons may be learned from studying the present appearance of mural paintings, without possessing a deep knowledge of the primary causes of their decay. I will mention a few observations which occurred to me on this subject, first premising that in some cases damp causes the plastering to fall off, while in others it destroys the colours. Generally speaking, the intonaco adheres firmly to the walls, in the frescoes at Milan, Novara, Bergamo, and Brescia, but the damp, ascending from the earth, and beginning at the lower part of the pictures sometimes consumes the colour. The frescoes on ceilings are frequently in a better state of preservation than those on the external walls of buildings. In ceiling-frescoes those parts always fade first, where the roof joins the side walls, and although the progress of damp may be prevented by the application of some hydrofuge, it would be a safe plan not to begin a fresco-painting within four or five feet from the place where the walls unite, and along which the pipes for carrying off the rain-water are carried. The interval might be filled with arabesques or *grisaille*† to suit the general design, and as these arabesques would be independent of the picture, they might be executed in temper, or encaustic, and any damage they might receive from damp or other causes, could be repaired without touching the fresco-painting. The frescoes by Bagnadore and Rossi, in the ceiling and upper part of the semi-cupola of Sta. Afra, at Brescia, are in good preservation, while those on the lower part of the cupola and on the walls have suffered from damp. The same may be observed of the frescoes by Calisto da Lodi, Il Moretto, the Campi, Appiani, and others, on the walls of the Church of Sta. Maria

presso S. Celso at Milan, which are nearly obliterated by damp; while those on the cupola painted by Appiani in 1795 are as fresh as if just painted. It is reported that this artist had a secret process for painting both in oil and in fresco, but the preservation of the paintings in this cupola is undoubtedly to be ascribed to the precautions taken by him to secure his work against damp, by covering the inside of the dome with a hydrofuge consisting of pitch and sand, to which the intonaco afterwards applied, adhered firmly. In some cases, as I have before observed, the intonaco and plaster bulges, and scales from the walls. This will probably be the fate of a fine fresco, now preserved under a glass case, in the Church of S. Lorenzo at Milan; a portion of the plaster in the centre of the picture has bulged, and a crack has formed along the middle of it; unless this can be laid flat and again attached to the wall, the destruction of a considerable and important part of the painting will be the result. The successful operation of repairing the frescoes by the Carracci in the Farnese Gallery and others by Raffaello by means of metal clamps or nails, may perhaps be repeated in the case of this picture with advantage. It is certain that the application of any cement which retains moisture, will add to the danger; even plastering the wall behind a fresco at Milan which showed symptoms of decay from damp, accelerated the evil it was intended to guard against, and the moisture from the fresh mortar, penetrating through the walls to the picture, destroyed it. This is not a solitary instance; Mr. Wilson mentions in his report on fresco-painting, a similar case of the destruction of a fresco, solely from plastering the back of the brick wall on which it was painted. In some cases the decay of frescoes may be attributed to the presence of salts in the colours. We are told by Vasari that this happened to certain pictures by Buffalmacco, who, in order to paint the flesh with greater facility, was accustomed to spread over the whole surface a coat of "morello di sale" which caused the formation of salts that consumed the white and other colours. The use of a pigment of this nature, may have occasioned the partial destruction of one of the paintings in the Monastero Maggiore before-mentioned. The picture is situated in a corner of the building, and while the draperies and accessories are perfect, the flesh-colour has completely disappeared, leaving the bare mortar visible on the spaces formerly covered by the flesh, the form only of which remains. Had damp alone been the cause of this injury, its effects would have been more equally distributed, instead of being confined to the flesh. The appearance of the picture in the state described was singular, and it is the only instance of the kind which met my observation. It will convey a useful lesson as to the extreme importance of attending to the purification of the colours.

Vasari informs us, that in his time precautions were sometimes taken to secure the walls on which frescoes were intended to be painted, from the effects of damp; had this been always the case, we should not now have to regret the loss of so many valuable pictures. The firmness with which early mural paintings adhere to the wall cannot escape observation; it is a most satisfactory evidence of the goodness and durability of the old technical processes. The instances are, of course, rare that enable one to learn much respecting the intonaco on which mural pictures are executed, from a mere inspection of the surface; such opportunities do, however, occasionally occur, and the first remark which suggests itself on such occasions is the difference in the thickness of the intonaco in early pictures as compared with those of a later date. In the former the intonaco is frequently extremely thin. There is a picture in the Cathedral of Chambéry which bears the date "September, 1190," in Lombard characters. It is painted on a very thin intonaco or ground spread upon the stone wall, which is visible in a few places where the ground has scaled off. The wall has been marked with the chisel to give the intonaco a proper hold. The extreme rapidity with which this ground must have dried, as well as the colours used in the painting, apparently

* (Continued from page 38.)

† That is, in black and white. Sometimes browns of different shades were used instead of black.

precludes the supposition of its having been painted *entirely* in fresco. The painting is older in style than might be anticipated from the date, and is a proof that there was, at the period when this picture was painted, little communication between the schools of painting in the mountainous districts of Savoy, and the Milanese school over which Leonardo da Vinci was then presiding. The background of the picture had probably been blue, but is now a blackish green. The head-dress of the Virgin is vermilion, and around the picture is an arabesque border also of vermilion, shaded with the usual dark-red colour. The former colour, as well as the white, is very bright, the paint is laid on in such body as to show the marks of the brush, and the shadows are softened, not hatched. The picture has a polished or glazed surface, and as the marks of the brush are visible, this polish must have been produced by the application of some substance of an unctuous nature on the surface, and not by friction. The purity and brightness of the white paint preclude the idea of an oleo-resinous varnish having been used.

Another example of a thin intonaco may be seen on one of the mural paintings of a later date, in the Church of Sta. Maria delle Grazie, at Milan. The intonaco, and indeed the colours also in this picture are so thin, that the shape and colour of the bricks are seen through them.

It was frequently the custom of the earlier painters to execute in relief certain parts of the picture, such as the glories of saints, crowns, and similar ornaments, in metal. Montorfano has done this in the large fresco before-mentioned in the Refectory of the Convent of Sta. Maria delle Grazie. These ornaments in relief, which were frequently gilded, were adopted occasionally even so late as the time of Gaudenzio Ferrari, by whom they were occasionally used. An example of these reliefs occurs in one of the frescoes by this artist in the Gallery of Brera.

A close examination of the mural paintings of different periods in Upper Italy, makes us aware that a material change took place, probably towards the latter part of the XVIIth century, not only as regards the state of the surface, but the handling also. In early mural paintings, such as those by Giovonone, Ambrogio Borgognone, Avanzi, and others, the shades are softened, and the hatchings are not so apparent as in those by later masters. In the frescoes of Luini and Gaudenzio Ferrari, the flesh-colour has been first painted, and then the dark shades have, moreover, a smooth and shining surface; in some of the modern Italian frescoes, on the contrary, the shadows are painted first, and the flesh-colour hatched above them; the surface of these pictures is rough and granular, and does not shine. The hatchings in the frescoes by the Carracci in the Palazzo Fava at Bologna, although at least twelve feet from the ground, are distinctly visible, and from this cause the paintings appear unfinished and sketchy.

We grave inhabitants of the cold North can scarcely realise the effect of the façades of houses in a whole street being adorned with frescoes glowing with the liveliest colours; yet we know that this was not unusual in Italy, and the remains, among many others, of the paintings by the Campi in one of the streets of Cremona, and those by Lattanzio Gambara on the façades of many houses in Brescia, still exist, and bear witness of the fact. These touching mementos of former prosperity, dear to the moralist as the painter, recall to the mind the palmy days of Italy, when her merchants were princes, and the streets of her cities were thronged with gay cavaliers and noble ladies clad in the rich and picturesque costume of the cinque-cento.

Of the numerous frescoes painted at different periods in Italy on walls exposed to the air, the greater part are in a ruinous condition; some are entirely obliterated, while of others there remain only a few patches of colour, which appear bright and lively when compared with the bare walls which surround them. These colours are chiefly of the warm kind, yellows and reds; the cooler colours, such as blue and green, having frequently disappeared; occasionally, however, even the blues and greens also are preserved, but the design is often so nearly

effaced as to be scarcely distinguishable. This is the case with many of the external frescoes by Lattanzio Gambara at Brescia: some however are nearly perfect. The prevailing colours are warm yellows and reds, with little blue, the last named colour is in one instance well preserved. The surface of these frescoes is uneven, and the dust, lodging on them, conceals great part from sight. Injudicious attempts have been made to clean and restore some of these paintings, and the consequence is, that they are in a worse state than before; the restorations have, therefore, been discontinued.

On the south wall of the town of Basano, not far from the yard of the Albergo della Luna, and on the south side of the wall (which is built of brick) are the remains of two external paintings in fresco. The figures are not quite so large as life; the one on the right hand, the whole of the head and face of which has been destroyed by violence, appears, from the drapery and accessories, to represent a bishop. The intonaco, which is very thin, is damaged on the lower parts of the pictures, but the part left adheres firmly to the wall. The surface of the fresco is smooth and shining like glass, and as far as my recollection serves me, the colours are blended without hatchings. The colours—a fine red earth, a copper-green, and a mixed colour formed by the addition of yellow to the green—are extremely bright and vivid; and as these colours must have been exposed to the noon-day sun for a very long period, it is a sufficient proof that they do not fade by exposure to light, and that if the intonaco can be made durable, the picture will last. It appears to be established beyond a doubt, that the fading of the colours in fresco-painting, where the proper colours are used, is to be attributed entirely to the action of damp and defective intonachi.

Compared with Verona and other cities of the north of Italy, frescoes enjoy but a brief existence at Venice. The external frescoes, by Tintoretto, on the façade of the Casa Marcello a San Trovaso, mentioned by Boschini, are nearly obliterated; the figure of Cybele, and the wheels of her chariot, are just visible. Casa Marcello is now called "Ca Tofete." The side of this palazzo is distant about twenty feet from that of the Palazzo Roini, and on the side of the latter, facing the Ca Tofete, and about ten or twelve feet (as it appears to me) from the ground, is an architectural painting in the manner of Paolo Veronese; I mean as to the style of the architecture. This fresco is quite fresh and perfect, but the blue of the sky is rather heavy, and the painting is quite different in character from those on the Ca Tofete, and yet tradition ascribes this also to Tintoretto: it is supposed, however, by those who are better informed, to have been painted about the end of the seventeenth or the beginning of the eighteenth century. Had it existed in Boschini's time (1674) he would undoubtedly have mentioned it as well as the other frescoes at Venice.

On the exterior of a palace near the Ca d'Oro, (so called from the gilding with which it was formerly decorated, which is still visible in parts) on the Canal Grande, in the same city, are the remains of a fresco by Visentini, which must have faced nearly west; the colours which are chiefly red, yellow, and green, are extremely vivid, but the surface of the fresco is so much injured that it is difficult to trace with the eye the forms of the figures; a female figure is still, however, tolerably perfect.

Some few external frescoes are at the present time in such a perfect state as to make one desire to penetrate the secret of their preservation: some of the best preserved of these paintings are sheltered either by a loggia or by a projecting roof; but this is not always the case, and the frescoes by Campagnola, over the principal door of the Church of S. Antonio, and elsewhere at Padua, are instances of frescoes having received no injury from long exposure to the air without any protection of this kind. The great technical defect of these pictures by Campagnola is that the blues have acquired a heavy indigo colour, but this defect is by no means peculiar to paintings in the open air.

Generally speaking, external frescoes at Bologna, when protected by a portico or loggia,

are well preserved; blue is, as usual, the colour least durable, although, in many cases, this stands well. I thought I could distinguish by the difference in the colour, that in some frescoes smaltino had been used instead of the usual blue; the former has always somewhat of a red tint; the latter is of a purer blue, or inclines slightly to green; but in the frescoes under the arcades of S. Francisco (now the post-office), painted by the scholars of the Carracci, the usual blue pigment has been used, and the deepest shades of blue are not darker than sky blue, or the pigment called "Biadetto," or "Turchino," except in one instance, namely, the sash of the mad woman, who is springing over a chair placed upon a table (an exquisite picture, full of life and nature), where the colour is deeper and brighter, and resembles ultramarine. In one of these frescoes is a boy in a recumbent posture dressed entirely in blue; in this instance the colour has remained, but the shades have fled, and the blue is of one uniform tint.

These frescoes are by various masters, and the different styles of painting are distinguishable as you walk along under them, as well in the design as in the costume and colouring; the figures in many of the paintings are as large as life; in others they are small, a variation in size which does not add to the effect, the eye being unprepared for the change. The tone of colouring is light and aerial, and harmonises with the blue (of the same depth as Turchino in the darkest parts), the pure colours being used as darks, and relief being produced by the addition of white, not of dark pigments, and thus is secured that lightness of effect which characterises the best frescoes. Generally speaking, the intonaco is even, but in some of these paintings the surface is undulating, and on these the dust has lodged so as greatly to obscure the picture. The outline of all has been marked out on the wet intonaco (as we see by the smooth line) with a large nail or other tool, and in many cases this has been done with so heavy a hand that the dust has lodged in the deep indentation, and the figures appear to be outlined with white chalk. This defect is particularly apparent in the figure of a man in the foreground of one fresco, where the strongly developed muscles have a hard white outline. The colours used, appear to have been earths, except the blue, and one yellow drapery, which is extremely vivid and out of harmony with the rest, and which is too bright to have been ochre.

These frescoes are painted on the upper part of the arcades, so that it is impossible for the rain to touch them. Their present appearance, and that of the other frescoes to which I have alluded, are a confirmation of what I have before remarked, namely, that there is no doubt of the permanence of the early colours in fresco; the difficulty consists in preparing an intonaco which shall be proof against the injuries arising from damp.*

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

CHEMISTRY OF ORGANIC COLOURS.

II. INDIGO, &c.

INDIGO is perhaps the most important of all the colours produced by the vegetable kingdom. The plants which yield this valuable substance are few in number; they belong to the genera *Indigofera*, *Isatis* and *Nerium*, but nearly all the Indigo of commerce is produced from the first of these. The *Indigofera* are leguminous plants which are indigenous to the equatorial climates. The *Indigofera anil*, a native of tropical America, is cultivated in that region extensively, while in the East and West Indies, the *Indigofera tinctoria* is the plant which claims the most attention. This genus *Indigofera* includes a great many productive species, all of which are natives of the warmer regions of the earth; but some of the plants which produce Indigo, as the *Isatis tinctoria*, or Woad, and the *Polygonum tinctorium*, are found in the more temperate climates, the former growing in many parts of England and

* To be continued.

Ireland, and being cultivated in large quantities in Belgium and France. At present the largest quantities of Indigo are produced in Bengal, where it forms a leading branch of the East India Company's trade, and in Guatemala; but the political state of Mexico and the Texas has much interfered with the Indigo trade of central America.

The Indigo is secreted in the cellular tissue of the leaf, and it remains colourless so long as the tissue is perfect.—When the leaves wither, oxygen is absorbed—a process of slow combustion indeed takes place—they become covered with many small blue points, which are indications that the coloured Indigo has begun to form, and that the season for collecting them has arrived.

Dioscorides mentions *Indicon*, and Pliny describes *Indicum* as a blue pigment believed to have been brought from India, and used in painting and dyeing; there is not much doubt but these authors describe substances of the same kind as our Indigo. Dioscorides says the *Indicon* was scraped from the sides of the pans in which the infusion of the leaves producing the colour was placed; and Pliny speaks of two kinds, one of which adheres to reeds in the form of scum and slime, and the other obtained as a crust upon the sides of the vessel in which it is produced. The *Indicon*, Pliny says, belongs to the astrigent medicines, and was employed to cleanse and heal wounds.

A very careful examination into the history of Indigo has been made by Beckmann, and published in his "History of Inventions and Discoveries," to which we are principally indebted for the following interesting facts. Beckmann appears to think that the ancient authors comprehended many very different productions under the name of *Indicon*, and that the *Nigrum Indicum* of Arrian, Galen, Pausanias, and others, was merely some Indian substance of a carbonaceous character. At the same time from his examination of the works of Avicenna and the other Arabian Physicians, he believes them to have been perfectly acquainted with the Indigo or Indian wood from a very early period. In 1193, *indigum* is named as one of the articles which paid duty at Bologna.

Marco Polo, who wrote his travels in the thirteenth century, states that he saw the Indigo plant in China, and he describes the mode of preparing the dye from it in that country. Nicolas Conti, in the year 1444, mentions *endigo* among the articles of merchandise from Candiar. The native wood appears to have been long used for dyeing blues and purples by the Italians and other European nations, as well as by our Anglo-Saxon fathers. The Italians were the first people who employed the Indigo of the East instead of the wood, and arrived at any degree of perfection in their process of dyeing with it. Its use rapidly extended over Europe; Vasco de Gama probably introduced Indigo into Portugal on the return of that navigator from the East Indies; and in 1516 he found Barbosa, a Portuguese, who accompanied Magellan, has given the value of good Indigo at Calcutt.

There appears to have been a great struggle between those who employed the indigenous wood, and those by whom Indigo was gradually introduced into Europe. We find even sovereigns forbidding by edict the introduction of Indigo, and the people of the Netherlands are particularly censured for the part which they took in its importation. Indigo was represented as being a most destructive article, and went by the name of the *devil's dye*. Even in England the use of Indigo was long kept back, from an absurd impression that it injured the wool, and that it was a fugitive colour. We find in the statutes of Elizabeth that searchers were employed to seek for Indigo and Logwood, and burn them wherever they were discovered. But this dyestuff was afterwards legalised by the act of the same Sovereign, no woollen goods being to be dyed black with the gallant, madder, or other materials that had not been rendered blue by the use of wood or Indigo, or by a mixture of these substances.

Indigo is prepared from both the fresh and the dried leaves. When those recently gathered are employed, they are thrown into a large vat

or cistern of water, and being kept pressed tightly together by beams of wood placed across the surface, the whole is allowed to ferment. The process of fermentation occupies from fourteen to eighteen hours, during which time bubbles appear upon the surface, at first colourless, but gradually changing to a blue or purple. When this is the case, the liquor is drawn off into another cistern (it is of a yellow colour), and either by hand or by some mechanical means it is kept in a state of agitation for some time; at length, under the process of heating, the Indigo gathers into flocks and precipitates. The object of the disturbance by heating—so necessary to the formation of Indigo—is to liberate a large quantity of carbonic acid, and to admit to the newly-developed colouring matter the quantity of oxygen which it requires.

When the dried leaves are employed, they are infused with six times their bulk of water, and allowed to macerate for two or three hours, with almost constant stirring for that period. The fluid is then drawn off into the *water vat*, and being subjected to the operation already described, the Indigo is precipitated.

The blue Indigo thus obtained is still a mixture, being combined with *Indigo-red*, or red resin of Indigo, *Indigo-brown*, and *Indigo-gluten*. These substances are separated by acids, alkalies, and alcohol, and the Indigo-blue left behind combined with some earthy matters. To procure Indigo-blue in its utmost purity, the blue must be acted upon by deoxidising agents, such as the protoxide of tin or iron, or sulphurous acid, when it is converted into *white Indigo*, which is insoluble in water, but soluble in alkaline solutions. The solution of white Indigo in lime water is exposed to the action of the air; the Indigo again absorbs oxygen, and is precipitated of a fine blue, when by digestion with dilute muriatic acid the foreign earthy matters are removed, and we obtain, by these means, *absolute Indigo*. This, in the mass, has a fine cast of a purple red, and it gives, when rubbed, the characteristic copper lustre, but in powder it is a fine blue. It is a property of pure Indigo that it volatilises at a temperature of 554° Fahr., subliming in a purple vapour, which condenses into shining slender needle-like crystals.

From the very accurate chemical investigation of Mr. Crum, we learn that Indigo is a compound of—

Carbon	73.22
Oxygen	12.69
Nitrogen	11.26
Hydrogen	2.82

Pure Indigo being treated with concentrated sulphuric acid is completely dissolved, and very curious compound chemical bodies are obtained. We first have the blue sulphate of Indigo, which constitutes the *Saxon blue*, or *Chemic blue* of the dyers; secondly the hyposulphite of Indigo is formed; and we have, lastly, the formation of *Phenicine* or Indigo purple.

To separate these from the dark-blue solution in which they are combined, the acid liquor is diluted with a very large quantity of water, and perfectly clean wool or flannel is immersed in the filtered liquor. The blue acids combine with the animal matter, leaving the other substances free. The wool is then scoured with water containing a small portion of alkali, which produces a blue compound of the two Indigos which is to be evaporated to dryness. Alcohol being poured on the residuum dissolves the blue hyposulphite, but leaves the blue sulphate undissolved. By means of acetate of lead and sulphuretted hydrogen, either of the two acids can be obtained. Indigo-blue sulphate of potash, or as it is sometimes designated in conformity with the nomenclature of Mr. Crum, who terms the blue sulphate—*ceruline*, the *ceruleo sulphate of potash*, is much employed to give starch a blue colour, and when made into balls or cakes with starch it forms the *thumb* and *cake-blue* of washerwomen. This is prepared by extracting the blue colour from the wool by water and carbonate of potash, evaporating to nearly dryness, and treating the residuum with alcohol and acetic acid. This pigment is known among artists as *precipitated Indigo*, *soluble Indigo*, and *blue carmine*.

The colours of the salts of ceruline are of

great brilliancy and beauty, but it unfortunately happens that they all change by sunshine, becoming grey, or greenish grey, with great rapidity. This change is thought to arise from the separation of a small quantity of combined water from the ceruleo-sulphate.

Since Indigo is insoluble, and that it is necessary that it should be in solution to penetrate the woollens, cottons, or silks which are to be dyed blue by its use, it is required that it should be rendered soluble, by some process, for this purpose. We have shown that by certain processes blue Indigo can be converted into white Indigo, which is soluble in very weak alkaline solutions, and that blue Indigo is itself soluble in acids. According to the character of the dye required, one process or the other is therefore adopted, and, since the processes are in many respects curious, and involve many remarkable chemical changes, we shall proceed to a succinct description of those which are most commonly employed.

The *Indigo Vat*, as it is technically called, requires woad dried Indigo ground to fine powder, madder, potash and lime, and common bran. The vat is filled in the first place with water—the softer the better—since many of the salts found in hard waters act chemically to the injury of the colour—the fire is kindled and the ingredients are introduced. The temperature is not allowed to rise above 160° Fahr., and it is maintained at this point until the deoxidation or discoloration of the Indigo commences. According to the condition of the ingredients employed, this may take place in from ten to twelve hours, or it may be retarded for several days.

After a longer or shorter period, however, blue bubbles appear on the surface of the fluid in the vat; ammoniacal gases escape abundantly from the solution, and the liquor becomes of a pale wine-yellow. It is now in a fit state for the dyer, and by attending to certain phenomena, with which practice alone familiarises the operator, the bath can be kept in a proper condition for some months. Bran and madder with Indigo and potash have to be added occasionally to supply the material agents in producing the colour required.

The theory of the *Indigo Vat* is, notwithstanding the advanced state of chemistry, but ill understood. It is evident that during the process of fermentation, the carbon of the saccharine and glutinous matter of the bran, madder, and woad, takes oxygen from the Indigo to form carbonic acid, which escapes, leaving a deoxidised Indigo soluble in the alkaline solution behind; but we have in the process the formation of acetic acid and ammonia, which appears to prove that at the same time some water is decomposed. May we not from this infer that white and blue Indigo differ from each other in this—that the blue contains the elements of water which, escaping, leaves it white?

However this may be, the permanence of the Indigo blues depends upon these very peculiar changes which we have endeavoured briefly to describe. The yellow liquor of the vat penetrates the fibre of the woollen, cotton, or silk, and by exposure to the action of oxygen the Indigo is again formed in close combination with the organic fibre, as a fine blue. The woven fabric, after having been subjected to the action of the dyeing liquor, is well cleaned at the fulling-mill, and prepared for the market.

The *Cold*, or *Coppered Vat*, as it is called, differs from the former in the employments of the protoxide of iron (the sulphate of the protoxide), as the reducing agent. It is well known that any solution of the sulphate of iron (common copperas) exposed to the air, is rapidly covered with a film of the peroxide (red-rust) of iron.

It has absorbed an additional quantity of oxygen from the atmosphere, and this is the result. Now, when this salt is mixed with blue Indigo it obtains its oxygen, by which it is converted into a peroxide from that substance, and the deoxidised white Indigo remains. If therefore a little lime or potash is in the mixture, a yellow solution of a similar character to that already described is obtained, and the results in dyeing are nearly the same, the rationale of the operations differing in no material features.

Other modes are sometimes employed, but the principle is in all cases the same—the Indigo is to be rendered soluble that the fibre may absorb it, and it is reconverted into coloured Indigo in the closest possible combination with the cotton or other fibre.

Barth, of Grossenhayn, in Saxony, discovered in 1740 the process of dissolving Indigo in sulphuric acid, and from this circumstance the blue produced by this means has been called the *Saxon blue*. Smoking sulphuric acid is employed, four parts of which will dissolve one part of Indigo. The acid being poured into a proper vessel, the Indigo in fine powder is added to it, and the whole is kept cool by being placed in another vessel of water. If the mixture becomes heated, some of the Indigo is decomposed, and an injury is produced to the colour, and a loss sustained on the colouring material. After all the Indigo is dissolved, and the solution has returned to its normal temperature, it is diluted with twice its weight of soft water.

We have already stated that wool possesses the very peculiar property of separating the Indigo blues from the acid, and availing himself of this the dyer used the sulphuric acid as his solvent. The *soluble blue*, or, as it is sometimes called *distilled blue*, is produced by placing wool which has absorbed the blue of the acid vat in a solution of carbonate of potash and boiling them together. The blue forsakes the wool, leaving it of a dirty yellow, and the fluid assumes the peculiar blue colour. When wool is to be permanently dyed with this sulphate of Indigo, it must be first boiled in alum, (sulphate of alumina) then treated with the hoiled liquor, and these processes must be several times repeated in order to obtain the required uniformity of colour. With sulphate of Indigo almost every shade of blue is dyed, and also greens, olives, and greys, and it is employed to give character and permanence to some other vegetable colours, particularly those obtained from logwood.

China or Indian Ink, Bistre, &c. A great many blacks and browns are preparations of carbon. The more important of these are lamp-black and ivory black. The former is prepared by burning oil, highly carbonised spirits, or tar, in such a manner that the carbon of their smoky flames is all condensed upon a cold surface fitted for receiving it. A very great difference exists between the blacks thus prepared; and for the finer purposes of the artist very great care is required in the operation. Ivory-black is prepared by calcining ivory dust in close vessels, after which it is levigated and mixed with oil or gum accordingly as it is to be employed as an oil or water colour. China or Indian ink has been long celebrated, and much mystery has been thrown around its mode of preparation. It is evidently nothing more than a very carefully prepared lamp-black, said to be formed by collecting the smoke from the oil of sesame, combined with a peculiar gum which in many respects resembles the gum formed from starch by the action of sulphuric acid. Many varieties of charcoal are employed by artists, but although they vary in their density and darkness they all originate in the calcination of vegetable or animal matter of a selected character, and the process requires no description.

The brown colour called *Bistre* is prepared from the soot of burnt beech. A large quantity of beech-wood being set on fire, it is allowed to burn freely, the heat being so regulated that combustion should not be too energetic, the smoke from the burning material being collected in chimneys properly formed. The more compact portions of the soot are collected and passed through silk sieves. This fine powder is infused in water and frequently stirred with a glass rod. The coarser parts being allowed to settle, the supernatant liquor is drawn off into another vessel. The finer portion then settles—the water is drawn off—more water is added and the mass is subjected three or four times to this process, by which an impalpable powder is eventually obtained. This is mixed with gun-water made into cakes and dried. *Bistre* is seldom employed as an oil colour, the mineral kingdom furnishing browns which are in every respect superior to it for all the purposes of the artist.

ROBERT HUNT.

DAVID SCOTT R.S.A.*

BIOGRAPHIES of artists are now so numerous, and are constantly appearing in such thick ranks, that one is disposed to hail the advent of such works with somewhat of indifference; the generality are the same incidentless compilations, or else are so much alike in their incidents that unless one has known personally the subject of the memoir, they contain little to keep up the interest of the reader. Poor and helpless childhood, buoyed up by inexhaustible hope; obscure drudgery and sober sadness at thirty; and at last death, or a cheering ray of prosperity, at forty. Such is an outline of the careers of the great majority of our successful and unsuccessful artists.

The career of David Scott is of the unhappy category—the ray came, but it was only to cast illumination upon the end. In the details of the life of this painter, however, there is much that is not ordinary, and the manner in which it has been pictured by the brother, William Scott, is still less ordinary. It is in the shape of letters to a friend, and as far as the mere biography goes, a few words will suffice to explain its scheme. Some opening preliminary observations are followed by pedigree and parentage; anecdotes of early boyhood; early youth at St. Leonard's; the painter's beginnings; Journal; letters from abroad; residence in Rome; first successes; changes; writings on Art; thoughts and speculations; notes on pictures, &c.; poetry; way of life at the end; closed by Death, on the 5th of March, 1849, aged forty-two.

For details of the life, we must refer the reader to the book itself, though it is rather a psychological essay than a biography, and David Scott's career is but the particular thesis of illustration; and, in our opinion, it is a good one, and one that offers a useful lesson to many a poet and painter who is even now stemming the wave that overwhelmed Scott. His bark was ambition, and praise or acknowledgment, as he termed it, his haven. His ambition seems to have been equalled only by his impatience for fame. With all his labour, and it was great and constant, his habitual solitude seems to have debilitated him into the idea that others went by the royal road to eminence, and that he alone had his own path to cut. He seems to have been ignorant that other men had toiled as much, and perhaps even more, than he, for that little need of praise which the world and he himself had charily awarded them. This is one of the great sins of disappointed men; they are constantly quarrelling with the world for not doing by them what they themselves habitually neglect to do by others, yet are so engrossed with self and the fortunes of self that they are actually unaware of their inconsistency. This is the way with many men who have passed away without even making their misfortunes known.

The same was, in a great measure, the case with David Scott, not particularly so, but the fact is evident; and his biographer, his brother, has not attempted to disguise this fault, but with a candour which characterises the volume throughout has openly reproved it, and well too.

In reference to his brother's notes of thoughts, hopes, and memories in his Journal, in which disappointment is paramount, the author observes:—"May we not properly inquire here how far the mental state indicated by these notes is a true state or a good? In relation to itself and to self-culture it is of course alone to be considered. As related to family and the world it is irreconcilable. It assists and participates in the pains, pleasures, and struggles of none other about it; it scarcely acknowledges any identity but its own; the insatiable *me* sees nothing but obstacles in the *not me*. Moreover, how could he reasonably have been successful, suddenly during the greatest difficulties of Art. Boyhood, even that of an intellectual giant, must wait the endowment of experience; nothing but experience can give just originality or afford wisdom—could we at once achieve, what would become of after-life?"

There is truth, and valuable truth, in all this. The artist, from the necessarily solitary character of his labours, is too apt to magnify his difficulties; from his dwelling long on one idea, it acquires an importance with him which does not belong to it, and which he never can get the world to recognise; hence disappointment, eventually magnified into injury, and that morbid sensitiveness which ultimately involves the incapacity of its subject.

The book contains many extracts from the painter's Journal in Italy. The professional remarks are brief and chiefly technical; but his

* Memoir of David Scott, R.S.A., containing his Journal in Italy, Notes on Art, and other Papers. With Seven Illustrations. By William B. Scott. Adam and Charles Black, Edinburgh, 1850.

observations which have no reference to himself or his anticipated position, are often characterised by sound judgment and vigorous and acute thought. Speaking of the school of Florence, he says:—"The Florentines—the coverers of large canvasses—after the time of Michel Angelo, are degraders of Art. They paint interminably; and what do you see? Ever the same. There is no expression, no history. The older masters are venerable, stern, and true: from them Michel Angelo arose, having, as is the case with the great masters of all the schools, received materials of Art at their hands; he gives them harmony and ease. Add the individual characteristics, more or less powerful, and there is the Michel Angelo, the Raphael, and the Titian." Again, of Rome—"The modern Romans have many things to master them: they are domineered over by former greatness. A slave to ideal superiority is in the heaviest bondage. All attempt at the repetition of former greatness, by the institution of universities, academies, rewards, is putting a pair of bellows into the nose-hole of a skull, with the hope of making it breathe again. Of something nearer home, he well observes:—

"At this moment, there are some who would again reduce the wide field of Art to the narrowest limits. There are some who look upon themselves as the truly enlightened, and who take an important standing on this ground. The kind of Art we speak of may be an off-shoot from a wider movement, and in a measure connects itself with a momentary false activity in theological matters. It is a compound of antiquarianism and of gentle religious sentiment, not without sanctimoniousness and superciliousness in the mixture, although this is exhibited in a form resuscitated from a time so long past, that we view it as poetic. The endeavour is not to enter into the spirit of Christianity, but to enter into its *forms of thought*, as expressed by men some centuries ago; things that to a British mind cannot, or ought not, to have even vitality.

"This novelty in the treatment of painting is remarkable in this country, inasmuch as it is completely at variance with the current of English Art hitherto, and also with that of Germany, in which it has already spread to a large extent over all the different departments of painting, and where indeed it originated.

"There is something like exhaustion or senility," he continues, "in this recurrence to past standards. It is like the mistaken efforts of an individual, and never will or can become more than a sectional and limited movement; for it is evident that it is not an accession of wisdom, and that it is obviously supported by party feeling singularly at variance with the general tendency of thought in the present day."

The work is illustrated by seven etchings by the author; one of them is an expressive head of the subject of the memoir from a painting by himself; another is a very spirited and faithful etching of David Scott's great work, "Vasco de Gama encountering the Spirit of the Cape." The phantom is grandly introduced; the whole composition is full of life and incident, and the picture is one of the greatest and most successful efforts of the British school; it is a subject for which the vigorous style of the painter is peculiarly adapted.

We are glad to find that this picture is public property, and has found a very suitable resting-place in the painter's native land. It was purchased by subscription, and is now placed in the Hall of the Trinity House at Leith, there to remain a monument of the maritime enterprise of the past, and a stirring incentive to bold spirits of the future.

This biography is a generous tribute of fraternal affection; it must have been a work of much labour, literary and artistic, but the judgment of the biographer has not been absorbed in the partiality of the brother; the author has been spared the delicate task of speaking of some of his brother's principal pictures, by quoting the remarks of a friendly pen in the *North British Review*; and he has candidly reprehended his brother's perpetual and mistaken interpositions. As already observed, the psychological character of this memoir gives it a freshness not at all ungrateful in this class of book, which is too often a mere repetition of circumstances told over and over again, the subject only being different. The perusal of the book may do good service to many an aspiring painter who may be hastening himself into a similar dependent ecstasy to that which seems to have made up the greater portion of the life of this gifted, but by far too sensitive, artist. Let the young artist beware how he gives way to a morbid sense of justice because the world does not view his efforts with his eyes; let him estimate them rather by the measure with which he metes out his commendation to others, and he will find that he has no cause either to depend on or to complain.

W.

THE CARPET MANUFACTURE

OF MESSRS. REQUILLARD, ROUSSEL, AND CHOQUEIL.

THE pages of the *Art-Journal* are, like the Exposition of 1851, open to the Industry of all Nations. The only requisite claims for introduction here are those of Art. Wherever excellence is to be met with, it is our duty and privilege to record it, for the double purpose of showing patrons that which is most worthy of their encouragement, and of inciting British manufacturers to the continued struggle after perfection: a struggle which is now happily the aim of the entire manufacturing world. A faithful account of what has been done, and of what is being done, was never so necessary as it is at the present time. No circumstance in detail in the Industrial Arts is so trivial as to be neglected now, since every manufacturing contributor to the Great Exposition of next year, is, properly speaking, unarmed for competition unless fully aware, each in his own department, of the productions of other nations and individuals, which it must be his endeavour to equal or to surpass. This fact scarcely can be too much insisted upon, because if overlooked, it will materially tend to place the industrial efforts of Great Britain in a less honourable position than they ought to occupy by the side of those of the Continent.

While preparing to lay before our readers an account of the contents of the French National Exposition of last year, we felt that one of the distinguishing features of the collection was the excellence of the carpets and furniture tapestries there brought together; we were compelled to regard them as very far superior to any performances of our own country in the same branch; and from that moment determined to devote to the subject a more extended space than could be allowed in our general notice of the Exhibition; we therefore, with this object in view, paid a visit to the establishment of Messieurs Requillard, Roussel, & Choqueil, at Paris, in the Rue Vivienne (No. 20), a firm which has perhaps surpassed all others in the excellence and variety of its carpets and moquettes; and we now, after having taken sufficient time to enable us to illustrate our observations by engravings, fulfil our promise of drawing public attention to the subject of French carpet manufacture.

The French have always been prominent in the eyes of Europe for the perfection they have attained in the fabrication of carpets, tapestries, wall-hangings, and all articles of a similar nature; but it must be remembered that they were the first in the field, and that the patronage of a luxurious monarchy, in the midst of aristocratic imitators, had a favourable influence on this interesting and necessary branch before the Revolution, while since then a similar result has been attained by opposite means. An improved feeling for design, a progressive study of chemistry, and the necessity for economy, have been the agents in furthering the manufacture of such works as are being constantly produced at the present day, and which, in many respects, rival the best performances of the period of Louis Quatorze; the latter had also the disadvantage of being made for a narrow and exclusive class, while the manufactures of our own age constitute one of the necessities of the people, and are executed so cheaply as to come generally within their reach.

This manufactory, the products of which we now attempt to describe, exists at Tourcoing, in the department Du Nord, and some stress, whether on a real or imaginary foundation,

has been laid on the purity of the water in this district as being favourable for preserving the brilliancy of the colours employed. The establishment occupies regularly the labours of 2,500 workmen, and its monthly receipts for carpets and moquettes amount to 250,000 francs. By the word "moquettes" we must be understood to mean the stuffs manufactured so largely by the French, and so fashionable at the present day, made of the same material as the carpets, though of a finer quality, and intended for the coverings of furniture, as, for instance, the backs and seats of chairs, sofas, door-hangings, table-covers, curtains, &c.; and these, as they do not receive the same amount of tribulation as the carpets themselves, will last, at the least, for ten years scarcely impaired.

The establishment under consideration is represented in London by that of M. De Labroue, Regent Street, where many choice examples of the manufacture may always be seen, both of carpets and moquettes.

The peculiarities of French carpet-work refer to texture, colour, and design. In point of texture it presents a beautifully soft and velvet-like surface, the principles of which ought to be well investigated by the English manufacturer.

The colours employed are of the utmost depth and brilliancy, aided alike by the natural gloss of the material, and by the taste for arrangement which seems so innate with the French, that a Parisian lady will intuitively dispose a bouquet of flowers with such elegance as to make it a fit subject for the hand of a painter. Nor must it here be forgotten that the science of chemistry is more deeply inculcated and more ardently studied abroad than it is in our own country; a fact truly remarkable, when we consider how eminently we are a scientific people, while for the most part the reputation of the French rests upon opposite grounds.

The third peculiarity we have noticed is respecting the art of design. We have heard, and are willing to believe, that the firm in question has paid premiums to the first artists of the country for furnishing designs. How happy would it be if the same enterprise were exhibited by our own capitalists instead of the plan which is too often adopted of leaving design to chance, to a mere workman, or sign, consisting simply of a series of bouquets strung together with ribands; this

of carelessly copying a pattern of Continental origin! It is true that in this respect much has been done recently by Messrs. Whytock of Eden and Messrs. Templeton of Glasgow, but these gentlemen have not yet overcome all the difficulties which energy, rightly directed and tempered by care, may eventually surmount. We earnestly hope that the manufacturers of Kidderminster will in the Exposition of next year prove themselves alive to the importance of the subject on which we are now insisting.

The first of the six subjects we engrave from the works of Messrs. Requillard, Rousset, and Choqueil, is the pattern of a magnificent carpet on a dark ground richly covered with roses, which contrast agreeably with smaller flowers, and these again with masses of naturally coloured foliage. A bunch of lilac in this pattern is executed with an effect worthy of all praise.

On the present page we offer three patterns of moquettes, the first of which is perhaps the most chaste in design

would be particularly elegant for a set of chairs in a room having all its decorations "en suite." In the other examples a more conventional style of orna-

mentation has been adopted, but they are notwithstanding very suitable for positions in which mere copies from nature would almost be inadmissible.

The carpets and moquettes of Messrs. Requillard, Rousset, and Cloquet, are, as may be readily imagined, manufactured on a large scale for exportation to every part of the globe. It is said, that owing entirely to the publicity given to these works by the French Exposition of 1849, 10,000,000 worth have been disposed of to Russia alone; a sum large enough to secure a considerable number of the best productions of this firm, but which would be very insufficient in purchasing many fine specimens of the works of Beauvais or the Gobelins.

The first subject on the present page is similar to the example which heads this notice, excepting that the colours of the design differ exceedingly. The grouping of the flowers, their selection so as to secure variety of form and harmony of colours, and the tasteful introduction occasionally of large masses of leafage, render this moquette one of the most elegant of the establishment; while its dark shades of red and black are happily suitable for the velvet-like texture of the material itself.

These moquettes may be applied to a hundred different purposes. For wall-hangings, chair-backs, sofas, and other pieces of furniture, perhaps no material is so gracefully appropriate, as being soft

and pleasing to the touch, and eminently durable. Its necessarily high price of course prevents its universal adoption, but in the drawing-rooms of the wealthy it is certain to find a place, while the carpets will make their way into the apartments of the middle classes.

The last subject we engrave is a portière or door-hanging, of magnificent design and workmanship, richly ornamented with flowers, scroll work, and the imperial arms of Russia. Of course, for the last, any other armorial bearings might be readily substituted.

With this example we take leave of the establishment of Messrs. Requillard & Co., earnestly recommending to the manufacturers of our own country, on the one hand, an adoption of the principle employed by the French in the selection of the best artists for furnishing designs, and, on the other, a more devoted study of chemistry for the purpose

of securing a greater brilliancy of colours than has hitherto been attained in England.

There can be no doubt that attention to these matters would be eminently crowned with success, and eventually throw out of the field the claims of foreign carpet manufacturers to the palm of excellence. At a time when every branch of manufacture is receiving improvements which are loudly called for by the public, and its increased education in Art, and at a time moreover when British industry has to compete with the entire world—objects of such universal adoption as carpets, ought not to be overlooked or neglected, but should be represented by examples, which, when placed in the general Exposition of 1851, may fairly rival the best exertions of foreign hands. Carpets have long since ceased to be mere luxuries; they are now among the necessities of life, and all classes are interested in their improvement.

PILGRIMAGES TO ENGLISH SHRINES.

BY MRS. S. C. HALL.

WITH NOTES AND ILLUSTRATIONS BY
F. W. FAIRHOLT, F.S.A.

SHRINES IN BUCKINGHAMSHIRE.

WE have made frequent pilgrimages to shrines that enrich Buckinghamshire. It is one of the most interesting—if not the most interesting—of our English counties; and once, thanks to the kindness of the late Sir John, and Lady Frankland, Russell, we spent a day at Chequers Court,* interested not only by the tell-tale dwelling—its long galleries, its Cromwellian portraits,† its stores of gems, its varied trophies of the past and beauties of the present time—but by the memory of those sorrows which enshrine the name of Lady Mary Grey, whose sufferings excite sympathy, and who would have slept for ever in a forgotten grave, but for the cruelty

tude even in his day to have supplied the monarch shade and shelter. It is banded with iron, and conjectured to have been at least

KING STEPHEN'S TREE.

coeval with the foundation of the house. It is only to be regretted that it could not have been the old Haw-tree of primeval celebrity, from which the family, who during many years inhab-

CHEQUERS COURT.

practised towards her by Elizabeth. Her room, at Chequers Court, is a small dark chamber, looking over the roofs and walls of a house that was her prison. We shall presently make some notes concerning the melancholy course of her young life.

The mansion—successively the residence of the Hawtreys and Russells—is situated in a little valley, surrounded by irregular eminences, clothed to their summits with beech trees, interspersed with box, larch, and holly, in a very picturesque manner. The house is said to have been originally built about 1326, re-erected about 1566, and modernised, with great taste, by the late Sir Robert Greenhill Russell, Bart., and still more recently improved by its last possessor, Sir Robert Frankland Russell, Bart. It stands on a small but very elegant parterre, ornamented with beds of shrubs and flowers, and enclosed by a light iron fence.

The grounds are full of valuable records—associations with the past—near the south-west angle of the building are the remains of an elm known for centuries as King Stephen's tree, and said to have been one of sufficient magni-

* Chequers takes its name from the King's Exchequer, he having palaces here and at Hinton.

† On the death of Sir F. Russell, in 1654, who had been governor of Ely and Lichfield, and one of the Parliamentary Assessors in the time of the Civil Wars, as also one of Oliver Cromwell's lords, Sir John Russell, of Chippenham, having succeeded to the title, married Frances, youngest daughter of the Lord Protector Cromwell, relict of Robert Rich, son of Lord Rich, and grandson of Robert, Earl of Warwick, by which means so many relics of the Cromwells came into the possession of the family. Among the portraits are those of Cromwell when a child, and at mature age; his mother; his wife; his son Richard, afterwards Protector; and Henry, Lord Deputy of Ireland; his eldest daughter, Bridget; Elizabeth, wife of Mr. Claypole; his third daughter, Mary, wife of Thomas Falconberg; his youngest daughter, Frances, above named, who became possessed of Chequers. There are other memorials of the period preserved within these walls, in portraits of Thurloe, Lambert, Cornet Joyce, &c., as well as Cromwell's swords and slippers.

ited the mansion, might he conjectured to have derived their name.

Yes, many happy, thoughtful, and, at least to ourselves, profitable, days, have we spent in that birth-county of liberty—Buckinghamshire; but that of last autumn—when our visit was to the grave of William Penn—was especially delightful, not only because of the beauty of the places we examined, but because of the companionship of those who accompanied us on our way.

The country was reposing in all the self-satisfied luxury of an abundant harvest. The tangled hedges, rich in their winter store of 'blaes' and berries, were of every variety of tint; the partridge whirred over the stubble; and but few birds chanted the vespers of summertime.

The foliage of the trees was hardly changed, and as we drove towards Beaconsfield, we passed some timber that might be called unrivalled. The tomb of Ebatump BRAGE, who is buried in the village church, and who died in the house not far off, is worthy of a pilgrimage; and to this Shrine—honourable alike to Ireland and to England—our earliest visit must be made; but the neglected churchyard of Beaconsfield—where the dock and the nettle triumph over the graves, and pigs are permitted to go and come without hindrance—is sadly at war with the reverential feeling which the memory of an eloquent and able statesman—one upon whose words the senate hung, and whose eloquence told as much in the closet as in the

crowded hall where his country's laws were made and defended—naturally summoned up. It was well to have looked upon his monument, and entered the pew where he had worshipped in earnestness and truth, and prayed for consolation during his time of trial. Our own memories and musings were, perhaps, a thought too much tinged with pride, because that he was a native of our own island—never more beloved than when most miserable; and the galaxy of glorious names which have illuminated the whole world by their radiance, will always serve to show what its people might have been, but for the neglect and misconception of one party, and the unwise agitation of the other.

In this churchyard is the grave of another great man—that of Edmund Waller; but the name of the poet is far less truly famous than that of the orator and statesman.

Hall Barn, the ancient mansion of the Wallers, was a large quadrangular edifice, now destroyed; Gregories, another portion of the estate, was situated close to Beaconsfield Church, and here the poet resided in 1686, and his widow, after his death. Waller's tomb is one of the most conspicuous in the churchyard, and is of quaint and peculiar design, as will be seen from our faithful delineation of its aspect; the pyramid which surmounts the tomb is supported by skulls, to which bat's wings are appended, a ghastly memento of the last end of man.

Edmund Waller, the son of Robert Waller, Esq., of Armondsbarn, Bucks, and the descendant of an ancient and honourable family, was born at Galeshill, Herts, on the 3rd of March, 1605. His mother, to whom he was indebted for the early direction of his mind, was the sister of the patriot John Hampden. He was twice married; between the death of the first, and his union with the second wife, the more valuable productions of his muse were given to the world. He had become the suitor of the Lady Dorothea Sidney, daughter of the Earl of Leicester, whom he immortalised as Saacharissa, a name 'formed, as he used to say, pleasantly, from *saccharum*, sugar. Yet he describes her as haughty and scornful, and places the passion with which she inspired him in contrast with his love for the more gentle Amoret. Although unsuccessful with both, his fate sat lightly on him.*

As a politician, he was unworthy his mother's blood; fickle and unsteady—shifting like a

* Saacharissa and her lover met long after the spring of life had passed, and on her asking him 'when he would write such fine verses upon her again,' the poet somewhat ungraciously replied, 'O, madam when you are as young again!'

THE TOMB OF EDMUND WALLER.

weathercock—from the Commonwealth to the King, from the King to the Commonwealth, and then to the King again. Measly securing his own safety, by appearing as a witness against his associates, in a conspiracy to overthrow the Commons when arrayed against the Crown, and whining out a pitiful moan for pardon at the bar of the House, in which he had previously held the language and maintained the bearing of a man, he succeeded in purchasing his life at the expense of honour, and was for many years an exile in France. Through his various changes of fortune he was followed by his yielding and convenient muse. The most vigorous of all his poems is a 'Panegyric to my Lord Protector,' whom he praises in the extreme of poetic extravagance; but—the Second Charles ascends the throne, and the zealous royalist is ready with his greeting to the monarch 'upon his happy return.' The political poet, however, seems to have been estimated at his full value, and was left with no other recompense than his laurels.

He died in London, in the autumn of 1688, disappointed in his wish to have relinquished life on the spot that gave him birth, 'to die like the stag where he was roams.' He is described as possessing rare personal advantages, exceedingly eloquent, and as one of the most gallant and witty men of his time; so much so, that, according to Clarendon, 'his company was acceptable where his spirit was odious.'

Waller obtained a reputation greater than his deserts. He has been absurdly styled the father of English verse—lauded as 'finding English poetry like the ore in the mine, some sparkling bits here and there, and leaving it refined and polished;' and, 'as understanding our tongue the best of any man in England.' Even Dryden says, 'The excellence and dignity of rhyme were never fully known till Mr. Waller taught;' and one of his biographers, after quoting the panegyrics of some of his contemporaries, adds, with stranger simplicity, 'we must confess there is something more great and noble in Milton.' As a lyrical poet, however, his claims upon our admiration are by no means inconsiderable. 'Waller's smoothness' was the theme of Pope; but this is his chief merit. To compare him with Shakespeare and Ben Jonson, his predecessors, or with Milton and Cowley, his contemporaries, even in smoothness, that secondary quality of the poet, is absurd.

His mind was undoubtedly a narrow one. In his conceptions there was nothing grand nor lofty; in all he produced there is not the slightest token that any topic of his muse had ever touched his heart. He was a flatterer—and a servile one. His devotion to women was mere gallantry—a fashion of the age in which he lived. Of tenderness, pathos, or that true love which breathes from the soul as well as the lips, he knew nothing.

How opposite in all things great and good was he to that far greater Poet whose home we visited next.

As the day advanced, we found ourselves in the primitive village of Chalfont, where Milton resided when, terror-stricken, he fled from the great plague of London, sheltering within a ragged vine-covered cottage, not far from that of his friend Elwood the Quaker; this house, at the extremity of the village, is supposed to have been built by some of the Fleetwood family, whose arms are over the door. Elwood's acquaintance with the poet resulted from Jeremy Pennington, son of the Mayor of London who was executed as a regicide in the days of Charles II., and he had an intimate acquaintance with Dr. Paget, a physician of note in London, and he with John Milton, a gentleman of great note for learning throughout the learned world, for the accurate pieces he had written on various subjects and occasions; this person having filled a public station in the former times, lived now a private and retired life in London, and having wholly lost his sight, kept always a man to read to him, which usually was the son of some gentleman of his acquaintance whom in kindness he took to improve his learning. For the advantage of thus reading with Milton Elwood took a lodging in Jewin Street. When the plague came, Milton desired him to take a house

in the neighbourhood where he resided. He says, 'I took a pretty box for him in St. Giles's Chalfont, a mile from me, of which I gave him notice.' Elwood was imprisoned, but on his release he made a visit of welcome to him, and proposed 'Paradise Found' as a theme for the poet, and a pendant to his greater work. Milton made no answer, but on his return to London wrote 'Paradise Regained,' and in a pleasant tone said to me, 'This is owing to you, for you put it into my head by the question you put to me at Chalfont, which before I had not thought of.'

We stood beneath the over-hanging beams, where a tall man could not more than stand erect. We noted the thick walls, the deep embrasure of the quaint windows, the ochrey hue of the cracked tiles, the ambitious roses, blushing beneath the broad vine-leaves, and vying in beauty with the purpling grapes; the housewife's pride, sweet rosemary, which only flourishes where woman loves to labour; the antique lavender knotted and knarled to the root, but sending forth such spikes of fragrance,

MILTON'S HOUSE AT CHALFONT.

that the very earth was grey from its sweet blossoms; the sheds around, such as an artist loves, their patched, worn eaten roofs, mosaic'd by all hues and growths of mosses: the shining path-stones that marked the way from the low unprotecting gate to the house-door might have been hallowed by the poet's tread, and the huge trees on the other side of the road, screened him from the hot sun during his hours of meditation, or while listening for the horses' tramp, that told of news from the plague-stricken city. What a day of interest and emotions—of mysterious combinations between the present and the past—did we spend amid these scenes! how all the movement of our own actual times seemed low, and speculative, and void of high ambition. But that feeling did not often jar upon our senses: there was so much to see beyond the beauty of the full, rich, ripe, glowing scenery of the hills and valleys, so much that made the heart beat and the eyelids moist, so much to make us proud that England reared such men; for we had recognised the outline of those well-known hills—the Chilterns—where HAMDEN drank in the pure air of liberty; and we had sheltered beneath the roof that sheltered MILTON, and we had knelt beside the tomb of BURKE, and then forward! to seek the grave of PENN, in the lonely burying-ground of Jordans!

But we have lost sight of the sad story of the Lady Mary Grey, and its associations with the ancient and venerable Mansion of Chequers Court; we must therefore intreat the reader to accompany us thither once again.

While we think over the sad destinies of many noble houses, some claim more than others the sympathy it is impossible not to bestow, in different degrees, upon all. More of this has been given to the lovely Queen of Scotland than perhaps to any other woman, and to the end of time her history will suggest themes for poetry and painting; but the unoffending daughters of the house of Grey command, in addition to our sympathy, feelings of reverence

and respect which cannot be yielded to Mary Stuart. The deplorable destiny of Lady Jane Grey, eldest born of Henry, Duke of Suffolk, by the imperious daughter of Henry VII., is recorded in one of the darkest pages of English history. The fate of Jane's sister Catherine was almost as unhappy—in punishment for contracting a marriage with the Earl of Hertford without previously obtaining the Queen's consent, she was doomed to the Tower, where she passed the remainder of her days, and was only liberated by God's mercy, in 1567, from the vile prison-house of earthly bondage, in which her youth and loveliness withered like a sickly plant deprived of light and air. One of the Harleian MSS. contains a most affecting paper entitled 'The manner of her departing,' which no eye can linger over without being dimmed by tears. But there was yet another sister—from what can be gathered, not over wise, or witty, or even blessed with comeliness—appointed, in the spirit of concentrated cruelty, by the Queen, as one of her Maids of Honour; described by Cecil as the most diminutive lady at Court, and by Sandford as slightly deformed. It has been argued, that with the example of the fate of her two sisters before her, this little creature should never have thought of matrimony! Those who so said, knew little of the deep-seated yearning in every woman's heart for affection; yet, in bestowing her affections upon the giant like Sergeant-Porter—Mr. Thomas Keys—she doubtless considered he was far too humble to be suspected of any treason; and fancied that

with her lowly choice she might have been permitted to pass into the disgrace and obscurity, which would have been clysmus compared to her position about the Royal person. But no. All the riffs at court stood upright at the outrage perpetrated against propriety by the Lady Mary Grey. Sir William Cecil noted it in a letter to Sir Thomas Smith, saying, 'The Sergeant-Porter, being the biggest gentleman in all this Court, had married secretly the Lady Mary Grey, the *test* (i.e., smallest) in all the Court. They are committed to several prisons; and again, '*the offence is very great.*'

It was evident that her Royal Mistress lay in wait for an opportunity to destroy the last of these ill-starred sisters. The insignificance of the 'great giant Porter,' the weakness and simplicity of his lady-wife; their utter incapacity to injure or even offend, might have protected them against any tyrant in the world—even in those days—except Elizabeth Tudor; but the indignation of the sycophant court rose in arms against the sister of Lady Jane Grey! And in the State Paper Office are some documents, a portion in the handwriting of Sir William Cecil, entitled 'Articles for the Examination of the Lady Mary Grey.' The marriage was performed, it appears, by a somewhat unsightly priest—'old, fat, and of low stature'—in the 'Sergeant Porter's Chamber, by the Water Gate, at Westminster;' and the questions asked at that examination were no less frivolous than impertinent; the little gifts she confesses to—the 'love-tokens'—are touching from their simplicity. The 'giant-lover' had given her first 'two little' rings; next 'a ring with four rubies and a diamond;' 'a chain,' and 'a little hauging hottle of mother-of-pearl.' The honeymoon was certainly passed in separate prisons; two days after the marriage it was known to the Queen; the husband was committed to the Fleet; and a letter was dispatched to the keeper, stating that 'her Majesty had taken his *offence much to heart.*' The words in italics are underlined in the original.

The poor lady's immediate fate is more obscure; but at last it was determined by the PRIVY COUNCIL that she should be sent to the country,

* Life of Elwood, by Himself

and given in charge to a certain Mr. Hawtrey, of 'Chequers,' in Buckinghamshire; there to remain 'without conference with any, suffering only one waiting-woman to attend upon her, without liberty of going abroad, for whose charges the Queen's Majesty will see him the said Mr. Hawtrey, in reason, satisfied;' subsequently, however, the Lady Mary was allowed a groom as well as a gentlewoman, and the clause concerning her 'going abroad' was in a degree modified.

Any one not sleeping under the nightmare of Elizabeth, and whose dreams were not disturbed by memories of the absent, must have enjoyed Chequers Court, even as a prison! It is a place to linger in and love, a delicious vision of beauty and romance, one of the 'places'—see one ever so many—that can never be forgotten.

Whether the poor prisoner was permitted to wander over 'velvet lawn,' or visit the 'silver spring,' or enjoy the refreshment of the 'happy valley,' we cannot now ascertain; the persecutor and the persecuted have long since gone to 'their account'; and the dark waters of oblivion have passed over the sufferings of the young bride. Perhaps she never lost herself or her sorrows in the labyrinths of the hill, she could not even see from the widow of her attic. We must not look upon those abundant beauties, and conjure her fairy-like form as adding to their interest.

It seems that Lady Mary was removed from Chequers Court after an imprisonment of two years, and delivered to the care of her maternal step-mother, the Dowager Duchess of Suffolk, who lived—in the Minories! but the Minories then and now were very different. Still the change must have been great from Chequers, to a neighbourhood so unhealthy. Her step-mother had small 'pleasuring' to store her rooms, and even entreats the Queen to lend her 'some old silver pots to fetch her drink in.' 'A basin and an ewer,' she adds in a housewifely letter extant, 'I fear were too much; but what it shall please her Majesty to appoint for her (i. e., the Lady Mary), shall be always ready to be delivered againe whosoever it shall please her Majesty to call for it.'

The Queen seems to have had pleasure in moving her victim from place to place, for we next find her under the roof of Sir Thomas Gresham, who sorely felt the heavy weight of the charge; frequently, during a period of three years, praying she should be removed from him. Toward the latter end of this time poor Keys died, most likely in prison. Sir Thomas writes that she (Lady Mary) hath grievously taken his death, and that she desires the Queen's leave to keep and bring up his children. The entire kindness and lovingness of her nature is greatly shown in this simple and beautiful request; moreover, during his lifetime, though she had always signed herself 'Mary Grey,' doubtless to pleasure Elizabeth, after his death her womanly sense of right conquered every other feeling, and in her heart's first grief she signed herself 'Mary Keys.'

In process of time her liberty was restored, and it may be she was restored also to what the world would call 'favour'; for on the first of January, 1577-8, she presented the Queen at Hampton Court with 'two pair of swete gloves, with foure doozen buttones of golde, in every one a side perle, and received in return a cup with a cover weighing eighteen ounces.'

Soon after this she died—on the 20th of April, 1578—in the parish of St. Botolph Without, Aldersgate.

Truly the memory of this simple-minded and most unfortunate lady, was more with us at Chequers Court than was perhaps consistent with more striking and important associations. The sombre air of several of the rooms, the stillness and loneliness of the scene, the deep shadows that came and went, seemed to belong especially to this youngest of three most unfortunate sisters. And yet, but for the persecution and persevering cruelty of Queen Elizabeth, we should not have given a sign to the memory of that sister of 'Lady Jane Grey,' who could so far forget herself as to marry the Sergeant-Porter of the palace which some might have held to be her birthright! Such will be the invariable result of persecution.

THE NELSON COLUMN.

TRAFALGAR SQUARE.

WILLIAM RAILTON, ARCHITECT.

WHETHER as an isolated episode to our series of sculptural subjects to which it bears in its details some analogy, or as the precursor of other illustrations of distinguished architectural productions, we feel sure that our selection for the third embellishment of the present number will be deemed of general interest; and, as a love for his theme is the first essential of a biographer, so we are determined to give to this work, in spite of our innate partiality for painting and sculpture, at least a plain and fair review.

Ten years have elapsed since the Nelson column was begun, and the successful debut of Architecture, in the business of commemoration and biography, startled the world of Art. Public (or at least party) feeling ran high against it, and a select Committee of the Commons, in reporting to the House, put forward a number of statements and preconceptions which the result has proved to be perfectly chimerical; but the check given to the subscription list was positive and irremediable. Of the professional artists whose opinions were obtained, no one was more opposed to the erection of a column than Sir Francis Chantrey; no one was more likely to be heard with deference; and when raising his voice against an architectural design, none seemed to recollect that he was a sculptor, and that in his own words, "the tanner is always for leather."

The main points of apprehension entertained by the Committee were, that in the view from Whitehall, the portico and cupola of the National Gallery would be concealed, and the general effect of the edifice injured. Secondly, that the site was unfavourable for the column itself; and further, that as the funds fell so far short of the estimated cost, the design could be but imperfectly carried out.

We will consider these points *seriatim*, and, approaching the Square from Westminster and Whitehall, we hold ourselves free to select just points of view for each object of interest as it successively attracts contemplation; and to vary our point of sight as we change our purpose, from viewing a group of edifices *ensemble*, to that of contemplating singly each component of the mass. We come in connection with our immediate subject, and the general view of Trafalgar Square, to the point adopted for the engraving; and we think the able artist, whose highly-successful work we copy, has shown equal judgment in the choice of his position and in the treatment of the scene. This view then most completely negatives the first assertion; but the station is yet too remote for the direct observation of the National Gallery, which, indeed, would nowhere be more advantageously seen than from the platform about the column, unfortunately, in this respect not accessible. Nothing could, indeed, be more desirable for a building like this gallery, whose main defect is a want of boldness, than mask it by the preponderating consequence of some other object till the spectator has made a near approximation. Bald, indeed, would this grand area appear, unless studded with objects and features of interest; and, "if," said Professor Donaldson, "any other ornamental erections are to be placed in Trafalgar Square, and restricted to being subordinate in scale to the National Gallery, the area will consist of a vast space occupied by insignificant objects." The only way to restore to it that importance which it deserves, and which it has lost through the National Gallery, is to place within it a lofty towering edifice, to which all the buildings around will be subordinate and form the background.

On the second point the opinion given in the report seems diametrically opposed to the evidence taken, *ex gr.*, Mr. Blomfield, no hesitation in stating the position to be peculiarly favourable for a lofty object, such as a column or obelisk; Mr. Decimus Burton thought the position very favourable; Sir Francis Chantrey deemed it the most favourable to be found or imagined; Professor Donaldson pronounced it one of the finest in the world; Mr. Hardwick thought it altogether an eligible site; Mr. Sidney Smirke and Sir Richard Westmacott both viewed the position as most favourable.

Mr. Joseph Gwilt, on the other hand, held the position to be unfavourable from want of a background of sky and foliage; and Professor Cockerell preferred two columns; "such a column," says he, "on a pedestal 43 feet high, the whole being 170 feet high, will have no ill effect on the National Gallery and the surrounding buildings, on the score of its scale and dimensions viewed from the north, west, and east sides of the square, because I

believe that the juxtaposition of colossal and ordinary proportions has been practised in all times and in all styles of architecture with success, especially by the ancients, who observed this principle more strictly than the moderns. Witness the column of Trajan in an area of 82 feet by 62 feet; that of Antonine in a square not much larger; the ivory and gold colossal statues of Jupiter and of Minerva, which occupied the entire nave of their temples. Again, the Tower of St. Mark, at Venice, 42 feet wide at the base, and 316 feet high, in a square 562 by 232; the Column of London and that of the Duke of York, none of which can be said to deteriorate from the architecture in connexion with which they are seen. The placing such colossal objects in extensive areas, as in the front of St. Peter's at Rome, Place Louis XV. at Paris, at St. Petersburg, and other places, is wholly a modern practice and a departure from the principle of effect on which they were originally founded by the ancients. My conclusion, therefore, is not that the proposed column is too large for the site, but that the site is too large for the full effect of the proposed column."

The opinion of Mr. Deering, R.A., may be given *in extenso*.

"I think the proposed Nelson Monument presents that precise character of altitude most to be desired at the particular site intended, where a great and wide street of entrance necessarily branches off right and left into a principal artery of the metropolis, and where the idea of termination is the impression most essential to be avoided; for we must recollect that the object is not to arrive at Trafalgar Square or the National Gallery—it is to convey to the mind of the stranger the true and peculiar character of our capital—its endless continuation.

"If this view be correct, the worst object would be a plain unbroken mass, which, like the County Fire Office, to its site (grasped by the eye at once) conveys the idea of obstruction, and limits consideration to its own pretensions alone, as the sole object of the whole arrangement. The broken line of architecture in the National Gallery obliges the eye to travel along its length, but the proposed form completely gets over the difficulty, presenting a magnificent object in the vista of approach while it leaves the idea of space beyond, and suggests the idea of divergence without obstruction where that idea is most essential.

"I cannot suppose the effect would be unfavourable upon the National Gallery, for although that building could be no longer seen in its whole extent from any point more distant than the column, I doubt whether its broken character of outline and laboured details, as well as smallness of parts, do not require that it should not be seen as a whole, beyond the distance whence those features could be visible at the same time, and so form as it were a part of the design. But on the whole I think it equally certain, that in its magnitude this monument in reducing to comparative insignificance not only the Gallery but St. Martin's Church, (its pedestal being nearly as large as the portico and the whole nearly as high as the spire of that building), will also be a monument equally unfavourable to the memory of those who spoil the National Gallery inside and outside, for the assumed sake of a building, of which the importance would be thus placed in its true light.

"But notwithstanding, we must not forget that the great end should be to adorn the metropolis, and not to persuade the unwilling of the architectural beauty of Trafalgar Square or any particular building around its circuit."

On the third point it appeared, that to meet Mr. Railton's estimate of 25,000*l.* there was a subscribed fund of not more than 18,000*l.*, which, after payment of the first contract for the column proper, left about three thousand only, applicable to all the ornaments and accessories; but Mr. C. D. Scott, the energetic secretary of the memorial to Nelson, (at whose feet his father had fallen mortally wounded a short time previous to the hero's own death), showed that of the 18,000*l.*, two-thirds had been subscribed within a couple of years, and expressed his conviction that abundant contributions for completing the undertaking as designed would be readily obtained when the public were satisfied that it would be carried out.

The strong and unswerving rebuke by Mr. Railton upon the violation of all good faith that must ensue upon the revocation of the grant of the site made by the Government, and the representation that assuming the subscription to have reached its maximum, it would cost the country as much to undo what had already been effected as to complete the monument, were however of chief efficacy in subverting the effort to quash the erection of his work.

This effort, though not successful, in fact was sufficient to subject the work and its author to

FRONT VIEW.

WINDMILL STREET, LONDON.

great unpopularity; and although the grant of the site was not rescinded, the public desire had been effectually estranged, and the government have been slow to award funds for its completion; but that a reaction is now setting in, the most ample evidence may be gleaned from the constant attention given to the subject by the press.

This reverting current of feeling has no doubt been fostered by the appearance of one of the long-looked-for bas-reliefs, and the assurance that the others are in a state of great forwardness. The commemorative subjects comprised in Mr. Railton's design are, St. Vincent, Copenhagen, Nile, and Trafalgar, respectively entrusted for execution to Messrs. Watson, Ternouth, Woodington, and Carew, and who have been left entirely unfettered in the treatment of their work, except on some governing principles requisite to insure uniformity and agreement.

An impression has been promulgated that the colossal lions at the angles of the podium are to be abandoned, but we regard it as entirely unfounded, or we should indeed say with the *Athenæum* that Mr. Railton has been most unfortunate as regards this omission, because not only does his name attach in spite of himself to the disarranged proportions, and fame report him falsely to half the artist world of Europe through the incompleteness of his work, but even the hope of an ultimate consummation would be denied him if the lions, which were to give a breadth to the base and a meaning to the whole, were to be given up. "Their necessity," says the *Naval and Military Gazette*, "for giving to the work not only a general completeness, but that nationality of character to which it has so admitted, and so just, a pretension must strike all who take the trouble to form an opinion on the point;" and the *Observer* writes forcibly, "It is hoped, it is entreated of the Government, that they will without any longer delay give orders for the completion of this monument, which, as it now stands, is a satire upon the sea service and a memento of national ingratitude to departed heroism rather than a symbol of naval glory!"

We confess, that regarding Mr. Railton as the representative organ of the Column, we have deemed his unbroken silence somewhat apathetic, but are relieved by hearing that he has addressed a memorial to the Government, from which some fruit may be reaped in the current session of Parliament; and we have most unalloyed pleasure in finding that in expressing his views on the general completion of Trafalgar Square, for which he was at one time consulted, he has put forward a suggestion for occupying the vacant pedestal at the north-west angle of the square, by an equestrian statue of Her Majesty.

All this is, indeed, devoutly to be wished, and we trust the day is not distant when Mr. Railton will see his designs matured, and the Nelson Column appreciated as one of the celebrities of modern achievement.

THE COLLECTION OF COUNT PEPOLI.

THE important collection of pictures possessed by Count Carlo Pepoli demand more notice at our hands than we usually give to private collections, inasmuch as they comprise pictures of a high class which may be depended upon as genuine, and not the mere marketable fabrications of the dealers. All who are acquainted with European history, or who have read Sismondi's work on the Italian Republics, will know that the Pepolis were Lords of Bologna, and of several other cities, as far back as 1334, when the Palazzo Pepoli was first built. They struck their own money and medals, and formed the Gallery now under consideration, which came from the Palace at Bologna, just named. The fondness for the Arts, which is recorded by Lanzi and others, as shown by early members of the family, and the extensive patronage they bestowed on the most famous men of the day, enabled them to adorn their walls with frescoes and pictures, and to make their home a shrine of Art known and appreciated by all elevated minds. The Count Carlo Pepoli, the present possessor, is about to dispose of the whole collection; and the cause of the immediate sale is his departure from England. He is well known in Italy as an amateur, and a writer on Art, and personally as an honourable descendant of a noble house. Almost all these pictures are in their original carved frames, and have the attestation of the magistrates of Bologna that they were sent from the Pepoli Palace.

Among the pictures forming this important collection is a "Madonna and Child," by Correggio, which has always been prized by the Pepoli family as one of its most valuable heir-looms. It is a work of much sweetness and beauty, and was always greatly admired by the late Sir David

Wilkie. "A Madonna with a Crown of Thorns" is another sublime conception by the same master, abounding in expression. There are four very important pictures by Guido, which were painted by that great artist for the Pepoli family; they are a "Madonna and Child," the "Virgin and Mary Magdalen," a picture combining great beauty, with strong expression of passion; "St. Francis in Prayer;" and "Medea." A fine Ludovico Carracci, the "Madonna with a Book," a beautiful picture, which has always been highly esteemed. There is also a very lovely "Holy Family," by A. Carracci, a cabinet picture, especially rich in its colour; and a very fine "Altar-Piece," by Paul Veronese; an exquisite "Barocchia;" and a "St. Peter in Prison," by Salvator Rosa.

Among the pictures of lesser note, in many instances fine, and by artists whose works are of rare occurrence in England, we may note those by Liocella Spada, Simone da Pesaro, Orazio Sammachini, Bartolomeo Passarotti (one of whose pictures passed in his own day for the work of Michael Angelo); Michele Desubleo, the pupil of Guido; Pietro Faccini, the pupil and afterwards the rival of Carracci; a fine "Madonna in the Clouds," by Benvenuti L'Ortolano di Ferrara; and a "Flagellation," of wonderful power, by Dosso Dossi di Ferrara. These last named artists and their works are almost unknown in England, though highly esteemed in Italy.

Among the landscapes are two very fine and powerful pictures by Iriarte, a Spanish painter, whose works remind us of Rembrandt; and among the portraits, two by Juan de Juanés, the chief painter of the school of Valencia, whose pictures are rarely to be seen out of Spain. They are portraits of the Prince and Princess Gonzaga of Mantua.

The collection comprises examples of the various great Continental schools, and contains many real gems of art; the history of which is as satisfactory as their execution is great; and it must be evident that this adds greatly to the interest with which such a collection can be studied, when it is felt that we see the genuine and undoubted work of the masters whose labours comprise it.

SCENERY OF THE STAGE.

MR. LUNLEY has auspiciously taken the initiative of the lyric drama for the season with entirely new decorations of both opera and ballet. The mythical tale of Medea is recorded of such remote antiquity that no vestiges of Art-conception exist, offering any contemporaneous type or character; the painter called on to illustrate this story is consequently compelled to fall back upon the most rude elements of architectural construction, with no other data than vaguely transmitted poetical traditions, and to depend on the primitive simplicity of principles, however ill adapted for the magnificence demanded in theatrical representation. This difficulty has been ably overcome by Mr. Charles Marshall, in his adoption of the utmost purity of lines, and the absence of those ulterior refinements of ornament which attested the perfection of Hellenic architecture; in massive forms, indicating the dawn of Greek thought, and yet, not free from the germ of Egyptian grandeur; skillfully but sparingly decorated with polychromatic hues, and conceived in a vivid sunshine with a masterly distribution of light and shadow; the eyes of the audience were charmed, and the cultivated mind relieved from any pain of palpable anachronism, or the senseless jumble of discordant varieties. The first and the last scenes given to the "Medea" are cognisants of pure taste, strictly appropriate, and of high artistic excellence.

In a ballet all that is light, and gay, and fantastic in decoration responds to the poetry of motion which constitutes the essence of its pleasure. The artist-painter, here, has boundless play for the most romantic fancy—for structural combinations of gold, and jewels, and crystal, while the floral region, in its profusion of brilliant tints, becomes a despicuous necessity. In the final scene of the new ballet, entitled "Les Métamorphoses," all these absolute requirements were united. An arched pavilion is supported by slender porcelain columns grouped together and entwined by roses. It opens on the distant view of an ancient Château, environed by formal parterres and quaintly trimmed arborescent arcades. The gay scene of a "Bal Masqué" is given beneath this gorgeous pavilion, rendered dazzling to bewilderment by a vast corona of gas suspended over the bustling dance, and linked to the sides by waving garlands of flowers, most singularly intermingled with real blazing jets of the same light. The ensemble offered a brilliant conclusion to an elegant and splendid entertainment.

ART IN CONTINENTAL STATES.

FRANCE.—The *Moniteur*, of March 1, contains a report addressed to the President of the Republic by M. DRMAS, the Minister of Commerce and Agriculture, relative to the co-operation of France in doing honour to the invitation from England to transmit specimens of its best productions for the Exhibition of 1851. It expresses the natural ambition of the manufacturers to maintain their well-earned reputation for taste and power of production, and urges them to redoubled efforts on this occasion. The duties of the committee are proposed to be—1. Affording information to the French manufacturers as to the conditions upon which their productions will be admitted. 2. Centralising information as to the transmission of these productions. 3. Concerning with the Royal Commission in London all the necessary measures for the transport, the reception, and the final placing of these productions. At the same time the Minister reserves to himself the nomination of one or more commissioners who shall make a report upon the exhibition, and which will eventually be published. For this purpose a selection has been made of the most distinguished men representing the various sciences, arts, and manufactures of France, and who, by their talents, their experience, their patriotic devotion, and their independence of character, have been deemed most worthy to assist in establishing more intimate mercantile connexions between two countries so evidently designed to co-operate for the benefit of mankind; and it is fervently to be hoped that this mission to London may be an earnest proof of the desire of closer union, and of that noble emulation in the arts of peace, which are the best evidence of advance in order, labour, and the general progress of nations towards happiness and prosperity. The following list of the committee contains the names of many men well known in the scientific and manufacturing world; among them M. Charles Dupin, whose works on Great Britain created so much sensation:—Messrs. Payen and Balard, chymists, M. Fontaine, the architect; M. Sallandrouze de Lamornaix, the celebrated manufacturer of Aubusson carpets and tapestry; Messrs. Morin, Châtellier, and Combes, engineers, and others, whose names are found in the general list which is given as being approved by the President of the Republic. It is to be hoped that the co-operation and the experience of this commission will tend to fix the decision of our Royal Commissioners on many points on which for want of previous training, they are necessarily as yet only scantily informed. The members of the Royal Commission are, MM. Charles Dupin, member of the Academy of Sciences, Representative of the People, President of the Central Jury of the National Exhibition of 1849, President; Tourret, late Minister of Commerce, Vice-President of the Central Jury; Payen, member of the Academy of Sciences, Professor of Commercial Chymistry of the Conservatory of Arts and Manufactures, Secretary of the Central Jury; De Kergoly, member of the Central Society of Agriculture, Secretary of the Central Jury; Le Châtellier, Engineer of Mines, Secretary of the Central Jury; A. Munciel, Representative of the People, President of the Committee of Woven Stuffs; Michel Chevalier, Professor of Political Economy at the College of France, Vice-President of the Committee of Metals; Combes, Member of the Academy of Sciences, President of the Committee of Machinery; Pouillet, member of the Academy of Sciences, President of the Committee of Instruments; Balard, Professor of Chymistry at the Academy of Sciences, Vice-President of the Committee of Sciences and Chymistry applied to the Arts; Fontaine, member of the Academy of Sciences, President of Fine Arts; Ebelmen, Director of the National Manufactory of China at Sèvres, Vice-President of the Committee of Pottery and the plastic Arts; L. de Laborde, member of the Academy of the Fine Arts, President of the Committee of Arts; Heucart de Thury, member of the Academy of Sciences, President of the Committee of Agriculture and Horticulture; Legenlie, President of the Chamber of Commerce at Paris, late President of the Central Jury; Sallandrouze de Lamornaix, late Deputy of the department of La Creuse, member of the General Council of Manufacturers, member of the Committees of Woven Stuffs and of the Fine Arts; A. Morrin, member of the Academy of Sciences, Director of the Conservatory of Arts and Manufactures, member of the Committee of Machinery; A. Barbet, late Peer of France, late Mayor of Rouen, manufacturer of floor and other painted cloths, member of the Committee of Woven Stuffs. Such an array of names as this actively co-operating with our own Committee, must tend to advance the great object in view.

THE VERNON GALLERY.

YOUTH AND PLEASURE.

W. Etty, R.A., Painter. C. W. Sharpe, Engraver.
Size of the Picture 5 ft. 2 in. by 3 ft. 10 in.

This is a strictly allegorical work; it was exhibited at the Royal Academy, in 1832, without a title, but in its stead was the following quotation from the Poet Gray:

"Fair laughs the morn, and soft the zephyr blows,
While proudly riding o'er the azure realm,
In gallant trim the gilded vessel goes,
Youth at the prow, and Pleasure at the helm,
Unmindful of the sweeping whirlwind's sway,
That, hush'd in grim repose, expects his evening prey."

Mr. Etty's ideas on the subject he has illustrated are best stated in his own words, which have been communicated to us:—"The view I took of it is a general allegory of Human Life, morally, where what we see here portrayed in its fabulous sense, is often real. How like the joys, the hopes, the buoyancy of youth, when all above is sunshine, and all beneath is flowers. They snatch at the bubbles of pleasure, of amusement, and of promised happiness; delighted with the chase and pursuit, till the roar of the whirlwind of distress, and misery, and death, awakens them from their pleasant dreams and sweeps them to the general doom—the Valley of the Shadow of Death."

The composition of this magnificent work exhibits a poetical mind of the highest order, wherein every figure furnishes an idea. The centre one of the group appears most eager in the pursuit of enjoyment; she is striving to catch a bubble that a boy behind has just launched into the air. "Youth" and "Pleasure," ostensibly the pilots of the bark, but occupied with other matters, and heedless of the course they pursue, allow it to drive at will; the figures sporting in the stream or following in the wake of the vessel, would fain participate in the enjoyments of the crew even at a distance; one especially appears to be supplicating for admission to the already overladen bark, allured by the magic of its beauty, and the merry voices of its occupants. Perched on one end of the spar to which the sail is fixed are two doves, emblems of the simplicity and innocence so strikingly contrasted below. In the dark mass of clouds portending the coming storm, is the shapeless winged figure—the "Whirlwind"—ominous of evil.

This picture will ever be regarded as one of the glories of Etty's pencil. In the brilliancy and harmony of colouring, transparency, and delicacy of touch, it is equal to his best efforts. One such work as this is sufficient to immortalise an artist.

CORRESPONDENCE.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.

DEAR SIR,—On Tuesday, 15th January, the Council held their usual half-yearly meeting, for the reception of the Treasurer's Report, and also for the relief of applicants; when thirty-five cases were presented, of which thirty-three were relieved by donations, amounting to 301*l.*, being the whole disposable balance of the half-year's account in the treasurer's hands. There are two features connected with this statement to which I beg to solicit your attention, and entreat your assistance.—The first is, that of these thirty-five applicants for relief, there was only one who at any time had assisted the funds of the Institution; while from the specimens of talent on the Council table, it was evident that many of the applicants, or the husbands and fathers of others, had attained to that high standing in their profession which would have enabled them either personally, or relatively by their influence over their patrons, to have benefited the funds of the Institution. This fact should suggest to other artists the importance of their assisting in the support of an institution to which it is possible that either themselves or their relatives and dependants may have recourse in the time of their distress. If they cannot support by pecuniary assistance, they can recommend it to their patrons, or assist by becoming stewards at the anniversary festival, to which the Institution stands so much indebted for its means of usefulness. Again, Sir, when I contemplate 301*l.* divided among thirty-three cases, how small a pittance can be assigned to each, where talent, former station in life and character, should have commanded much more. If British benevolence with a noble generosity can raise, as it has and is doing, 14,000*l.* in a few weeks, for the destitute daughters of suffering humanity, surely as large or even a larger amount

might with equal ease be obtained for the relief of those to whom the country is so much indebted, not only for gratification and enjoyment, but for the cultivation and improvement of our taste and influence; to say nothing of the importance of the Fine Arts in the advancement of the interests of the country as a manufacturing nation.

So much do I feel the weight of these obligations in soliciting increased support for deserving and distressed artists and their widows and orphans, that I venture to ask it, not more as a sacrifice at the shrine of benevolence than as an offering upon the altar of justice.

I remain, Dear Sir, &c.,

J. H. MANN.

Chairman of the Council.

[What can we add in favour of the appeal so urgently set forth in the above communication? Year by year, since the existence of our Journal, have we advocated the undoubted claims of this Society to a large and liberal share of public patronage, and have endeavoured to make the artist, able to contribute to its support, feel the importance of so doing; yet we find that little or no progress has been made to increase its funds, and enlarge its sphere of practical usefulness. We are perfectly aware how varied and numerous are the calls on charitable benevolence, yet it appears to us that those societies, whose object it is to assist destitute artists, receive less attention than many others, although the pleasure and profit derived by thousands from the works of their hands is surely not exceeded by the labours of any other class. There is scarcely a trade or handicraft carried on in our huge metropolis which has not its endowed almshouse for decayed members, independent of considerable funds for the sick and the destitute, and yet about 600*l.* or 700*l.* is all that can be collected annually, on an average, for those who administer so largely in their days of health and vigour, to the enjoyment of almost the entire community. We will hope the appeal once more put forward will not be made in vain; there is a "luxury in doing good," and a reward promised to the doer of it—"he hath dispersed abroad, he hath given to the poor, his righteousness remaineth for ever."—*Ed. A. J.*]

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—The days for the reception of the pictures for the exhibition are the 8th and 9th of April, and the exhibition will open as usual early in May. It has been reported that the Academy contemplates affording their non-academical contributors "a varnishing day," this would be an inestimable advantage to many, who might materially improve their works on seeing them contrasted with those of others.

THE ROYAL ACADEMY.—Our "Obituary" this month contains the names of two members of the Royal Academy—one who has long been a valuable contributor to its exhibitions, and has done some service towards upholding the character of our School; the other, almost a stranger to the Institution, as we have stated in our biographical notice. Thus there are at the present time seven vacancies in the two constituent parts of this body—three as Academicians, and four as Associates—none of which can be filled up for many months, in consequence of the absurd laws regulating the elections, which, in justice to the whole body of artists who are not members, should at once be repealed, and which would not be tolerated for a day in any other corporate body. There are some twenty or thirty candidates for the rank of Associate kept in suspense for nine months—a suspense altogether unnecessary—while those who may happen to be elected are deprived of the prospective honours for a whole season, a period of no little importance to them if the position be worth anything. It is still worse with the three vacancies among the Academicians—these must remain so for nearly an entire year. We showed last month that because Mr. Etty chanced to die on the 13th of November, instead of the 10th, his successor could not be appointed till February 1851; but had he died three days earlier, the vacancy would have been filled up in the February of the present year. Such arrangements as these are downright puerilities, and cannot be defended on any tenable ground whatever; they argue a determination in adhering to the "good old paths," that is truly ridiculous.

We are no advocates for unseemly haste in burying the dead out of our sight and memory, nor would we assist those who seek indecorously (if such there be), to pass over their graves to prevent the election seats; but what is there to prevent the vacant taking place at the expiration of a month, or six weeks at farthest, after the decease of a member? How much anxiety would then be spared—and consequently how much sweeter would be the reward to the recipient. *Bis dat qui cito dat* is a motto that appears not to enter the minds of the Royal Academy; strange it is that this Institution should remain stationary in its laws and regulations, where reform is so loudly called for, and while all else are moving onwards.

THE OLD WATER-COLOUR SOCIETY.—The gallery of this society will open as usual about one week before the Royal Academy. The number of this Society is not full, at least one vacancy is generally reserved.

THE NEW WATER-COLOUR SOCIETY.—The works intended for exhibition in the gallery of this society will be received on the 8th of April; the figure compositions that we have had an opportunity of seeing are productions of high character. There have been no recent elections to this body.

ART UNION OF LONDON.—The subscription list of this Society closes, according to custom, at the end of March, but the last day of the month being Sunday, we understand that subscriptions will be received on Monday; there will thus be still time for those of our readers to enter their names who may have forgotten to do so.

THE SOCIETY OF BRITISH ARTISTS.—The gallery of this Society was opened on the 25th of March, with a collection of works of a character much higher than any that has for some years appeared upon these walls. Among the members who especially distinguish themselves are Anthony, Herring, Pyne, Hurlstone, the younger Wilson, Montague, and some others, whose works will be noticed at length in our next number.

THE NATIONAL INSTITUTION.—This is the name by which, in future, the growing nucleus of the proposed "free" exhibition will be known. The establishment of a free exhibition is a project worthy of an advanced intelligence; and had an institution been formed on such a basis in this country, with all the onus of rent and taxes, the triumph had been greater than the vaunted maintenance of open institutions in those countries where the means are supplied by the respective governments. The first and principal item, however, of several hundreds of pounds, would crush the immaturity of any such project, and hence the necessary recourse to a charge for admission in aid of the funds. Since the experiment, with its disadvantageous site at Hyde Park Corner has really justified (in the main a desideratum) the acquisition of other premises with extended views, it may be assumed that the permanent success of the institution is no longer problematical. The situation, as we have already stated of the new premises is Regent Street, directly opposite the Polytechnic Institution; the rooms are finished, and the exhibition will be forthwith opened. The time of opening is, we believe, later than last year, but it must be remembered that much has been done in a brief space. This society proposes the addition of a new feature—THE EXHIBITION OF THE WORKS OF FOREIGN ARTISTS. After all, the great lesson is learned from immediate comparison; we should rejoice to see side by side with the productions of British painters, those of some of the continental schools; and we believe that foreign artists would find it advantageous to send good pictures here for exhibition; none but really good works would serve either the painters or the purposes of the institution. There exists, we know, a strong desire on the part of continental painters to make their works known in this country, and it cannot be doubted that many of them will avail themselves of such an opportunity, if the invitation be freely given. It will however, be understood, that such an arrangement could only be effected for the next and succeeding seasons. Under all circumstances, the "National Institution" opens with accessions of reputation, and highly favourable prospects, which will be infinitely more available in Regent

THE ART OF THE

THE ART OF THE

THE ART OF THE

Street than they possibly could have been at Hyde Park Corner.

THE VERNON COLLECTION.—There is reason to believe that the Vernon Collection of British Pictures will be removed from the cellar in Trafalgar Square to the spacious rooms at Marlborough House, the residence of the late Queen Adelaide. This will be on all accounts most desirable: at present they are in great danger of injury daily: it is, indeed, somewhat surprising, and much to the honour of "the people," that as yet no accident has occurred; it is also to the credit of the officers employed to protect them. At Marlborough House they will be seen to great advantage, and be placed in safety. They will probably remain there until a National Gallery is built by the Nation; and it is by no means unlikely that such National Gallery will be erected on this site.

FOLDING DRAWING MODELS.—There are few engaged in teaching the rudiments of drawing insensible to the advantages which their pupils derive by working from models, especially of such objects as would hereafter enable them to sketch from nature. The mere copying of geometrical forms is very well for a beginning, but they do not sufficiently indicate, to the inexperienced eye of a young learner, the application to which such forms have ultimate reference. Moreover, the models that are now commonly used are cumbersome and otherwise objectionable in many respects; to obviate these objections, Messrs. J. Pater and B. R. Green, members of the New Society of Painters in Water-Colours, and artists of long experience, have for a considerable time been engaged in designing and executing a series of *card-board* models, which we desire strongly to recommend to every teacher of drawing. These models consist of buildings, and portions of buildings of various kinds, one side of each showing the simple outlines of the various parts; and the other side coloured to imitate the natural object. They can easily be folded together so as to occupy but a small space in a table-drawer; in brief, we regard them as ingenious, as they are practically useful.

SUBURBAN SCHOOL OF DESIGN.—An example has been set which we hope to see extensively followed: arrangements are in progress for establishing a School of Design in the populous district of St. Pancras; the object being to give the means of agreeable and profitable occupation to workmen, and by improving their tastes under judicious culture, to aid the great movement which is everywhere influencing British Manufactured Art. A public meeting is about to be held to forward this very laudable project, and in our next we shall probably be in a condition to furnish all the necessary details; for the present it will suffice to say, that the committee contains the names of many gentlemen of high repute; and that the "masters" who have tendered their services are among the very best which the metropolis could supply.

ROYAL ASYLUM OF ST. ANN'S SOCIETY.—The Anniversary Festival of this most excellent Institution will take place early in June. We shall be glad to hear of a large attendance of friends and patrons on the occasion.

THE DIORAMA.—The two pictures now exhibited here are, "The Shrine of the Nativity," and "The Castle of Stolzenfels." The former was exhibited some years ago, but the latter is a new picture, painted by Nicholas Meisler, of Cologne. The Castle of Stolzenfels is presented under two effects with intermediate gradations, being seen first under an aspect of stormy sunset, the tower of the castle and portions of the distant landscape being lighted up by the rays of the sun, which are brought forward with much brilliancy by the contrast of strong masses of shade. The light gradually fades, night comes on, and the thunder-storm bursts over the castle with a singularly rare accompaniment of rain and thunder. The Castle of Stolzenfels is near Coblenz, and immediately overhangs the Rhine at its junction with the river Lahn. The scenery in this district is equal in picturesque and romantic interest to any which the Rhine-land affords. "The Shrine of the Nativity" is an old favourite with the public, and has not lost any of its attractions.

THE PANORAMA OF THE NILE.—A new picture has been added to this attractive exhibition; it is a representation of the interior of the temple of Abou Simbel, which is introduced after the view of the second cataract. It is shown under an effect of torch light, which breaks with great force upon the enormous statues of Rhameses the Great, and shows the figures and sculptures almost as sharp and clear as they were three thousand years ago.

ORIGINAL DESIGNS.—We are desirous of correcting an error which appeared in our last number, under this head. The design for a finger-plate was inadvertently assigned to Mr. W. H. Rogers; it is the work of Mr. H. Fitzcock.

LINEAR PERSPECTIVE.—Mr. Herdman, of Liverpool, has requested us to insert the following communication, in answer to a number of inquiries as to when and where illustrations of his new system, as propounded in the columns of our Journal, may be seen:—"A series of drawings and paintings are in preparation which it is deemed advisable to exhibit first in Liverpool, in order that the views selected may be tested by examination. For the like purpose, views in London will be selected for exhibition there; but as it is absolutely necessary these views should be placed on the line to examine the accuracy of their principles, and as a certainty of their being placed on the line could not be depended upon in the metropolitan exhibitions, arrangements will have to be made to exhibit them alone, and of which due notice by advertisement will be given."

EXPOSITION OF 1851. LONDON MOVEMENTS.—A ladies' committee has been formed at the Duchess of Sutherland's mansion. A vestry-meeting at Marylebone is about to co-operate with other parishes in aiding the general result. A grant of 1000*l.* was moved for in the Court of Common Council, but was substituted by one for 500*l.*, which was granted. We are glad to see that workmen are on the alert to aid in their bumble bees, in the employ of Messrs. De la Rue, of Bunnhill Row, have forwarded five guineas; and those of Mr. Thomas Cubitt, 147, &c. *fid.* to the commissioners. Kensington has very nobly set an example to the suburban districts, which we wish to see extensively followed.

IN THE HOUSE OF LORDS, on the 19th of March, Lord Brougham put a question to the Earl of Carlisle respecting the erection of a building in Hyde Park for the Great Exhibition in 1851. He trusted that no such erection would be allowed in what had been called "the lungs of London," and suggested the Victoria Park as a fitter locality! The Earl of Carlisle replied that an application from the Commission to erect such a building had been made to the Government, who, as they knew that the projected exhibition was sanctioned by the Sovereign, did not feel themselves justified in throwing any obstacles in its way. Besides, he did not see why their Lordships should be more tender of the aristocratic lungs of one portion of the metropolis than to those of the densely-peopled district around the Victoria Park; his Lordship added that the building would be "temporary," to last "a year or so;" upon which Lord Brougham said, "then this will be a very expensive sort of thing. I warn you that the west end of London will become uninhabitable during the month, the philosophic month, of this exhibition."

MONUMENT TO LORD JEFFREY.—The recent death of this eminent critic has aroused his Northern friends to meet for the purpose of obtaining a suitable monument to his memory. It was proposed and carried, that an architectural erection of that kind should be constructed in Edinburgh, and committees have been appointed in Edinburgh and London to carry out such intention.

PEN AND INK DRAWING.—There is at present on view at Messrs. Colnaghi's, in Pall Mall, a portrait of the late Right Hon. Thomas Grenville, drawn by Mr. Minasi, in that peculiarly beautiful style we have heretofore commended. The drawing is for sale, and it will rejoice us much to hear that the venerable artist has found a purchaser for his really clever work.

BANQUET AT THE MANSION HOUSE.—We regret that the close of the month prevents our noticing so fully as we could wish, the banquet given on Thursday, March 21, to the friends and promoters of the great exhibition of 1851. The Prince Albert honoured the Lord Mayor with his presence on the occasion; and the interest felt by provincial towns was shown by the attendance of no fewer than one hundred and twenty three mayors and other representatives of corporate bodies in England, ten provosts of Scottish towns, and four mayors of Ireland. The Archbishop of Canterbury, the Bishop of London, the Marquis of Lansdowne, and a large body of distinguished persons were also present; the principal foreign ministers and representatives; the Commissioners for the Exposition; a large number of Aldermen; Masters of City Companies and the Chairmen of Committees of Common Council; the Vice-Chancellors of Oxford and Cambridge; the Governor and Deputy-Governor of the Bank of England; the Deputy-Chairman of the East India Company, and other influential City men. The speech of his Royal Highness was characterised by all that warmth of feeling, and soundness of judgment, which he has so eminently displayed hitherto; the speeches of Lord John Russell, Lord Stanley, and Sir Robert Peel, were also in the best possible taste, as also was the toast proposed by the Earl of Carlisle—"The Working Men of the United Kingdom"—who received that amount of consideration respect which ought to be gratefully felt by that important body. The noble response which such a meeting as this must be to His Royal Highness's views, cannot but be grateful to him, and augurs favourably to the ultimate triumphant success of a great national movement.

THE ANNIVERSARY DINNER of the Artists' Benevolent Fund took place on the 23rd, too late in the month for us to do more than notice the fact.

UNIVERSAL BROOCH PROTECTOR.—Under this appropriate title, Mr. Tucker, of Exeter, has invented a security for brooches of a valuable description, which is effected by this means with no more trouble than is necessary with the ordinary kinds. Its freedom from all complication, and its applicability to every description of brooch, at a trifling expense, will, we have no doubt, recommend it to general adoption.

JOHN KNOX'S HOUSE, EDINBURGH.—This interesting relic which has so narrowly escaped destruction, is now in course of repair and restoration, and will, when completed, resist the ravages of time probably for as long a period as has elapsed between the Reformer's era and our own. The front of the house, toward the High Street, has been restored to its original condition; and the removal of the comparatively modern bow-windows, revealed the original framework of ornamental stone ones beneath, composed of pilasters, cornices, and vases, in the style of the Renaissance, and which give entirely new features to the building, that had been hidden for a long series of years. The lower story has its doors and windows of stone restored to their pristine sharpness, and the old *fores-tair* is reconstructed after the old model, so that the entire effect of the building is now similar to what it must have been when the fiery reformer inhabited it.

DIORAMA OF HER MAJESTY'S VISIT TO IRELAND.—A moving diorama, by Mr. P. Phillips, has been opened at the Chinese Gallery, Hyde Park Corner, which embraces the principal points of the Queen's memorable visit to Ireland; commencing with her landing at the harbour of Cove. It comprises views of Killarney, and the entire of that picturesque neighbourhood, Bantry Bay, the river Lee, Dundalk, Armagh, Belfast, &c., concluding with Her Majesty's departure. The whole series of views are admirably painted, and give a perfect idea of the many beauties which the admirer of picturesque scenery will find in the Sister Island. The atmospheric effects are exquisitely managed, and the entire panorama is one of the best of its class. Every scene is a picture, as well conceived and painted as if for the adornment of a gallery, and reflects the highest credit on the taste and ability of the artist.

THE FEMALE SCHOOL OF DESIGN.—In our notice of the recent exhibition of drawings and models by the students of this Institution, we directed the attention of manufacturers to the unusual display of excellence manifested in most of these designs, and at the same time suggested to them the advantages that might be derived by appropriating some of the drawings, &c., to a practical purpose. The hint thrown out has been taken, for we understand that the following have been selected by different manufacturers:—a model for a salt-cellar by Miss Burrows; a design for a table-cover by Miss C. Palmer; design for chintz by Miss A. West; six designs for muslin by Miss Edgeley; a design for a table-cover by Miss A. Carey; also a design for paper-hanging by the same young lady. Commissions have likewise been given to Miss Gann for a mosaic-table and a Brussels carpet; to Miss Palmer for a panel-paper; and to Miss Edgeley for print dresses. All this, though little by comparison, is encouraging, as it may be the means hereafter of increased business between the manufacturer and the designer; the former having found a market where he may make his purchases advantageously will doubtless resort to it for the future. We hope to find this the case, and that we shall have to record many more transactions of a similar nature.

THE DEPARTURE OF THE ROYAL SQUADRON FROM KINGSTOWN.—This forms the subject of a picture which is now being exhibited in the rooms of Messrs. Lloyd, on Ludgate Hill, before passing into the hands of the engraver. The artist is Mr. Kendrick, R.H.A., and of his work it is but little to say, that of all the works illustrating incidents in regal Progresses that have come under our notice, this picture is incomparably the best. The moment chosen is that when the *Victoria* and *Albert* is about to pass the lighthouse on the eastern pier of Kingstown Harbour, followed by the *Fairy*, the *Vivid*, and the *Stromboli*. The Queen, Prince Albert, and the royal children appear on the paddle-box, responding to the farewell of the crowds that throng all the available space commanding a good view of the royal yacht. The materials are highly picturesque, the whole of the near parts of the composition presenting very properly a scene of much animation. The artist has disposed most skillfully of the difficulties which necessarily present themselves in a picture like this, which, we rejoice to hear, has been purchased by the Queen.

ALLEGED "SKETCH BY MICHAEL ANGELO."—An article has appeared in the *Times*, and been copied thence into several journals, to the effect that the original sketch which the famous artist arranged previous to painting the fresco in the Sistine Chapel, has been "discovered;" and being discovered, is, of course, brought to England, where Italian picture-dealers have always believed there is more money than wit. There can be little doubt that the *Times* has been grossly deceived in this matter; it leaves, indeed, the question whether the drawing is an original, a copy, or a forgery, to be determined "by connoisseurs." But any article in that mighty journal has a character of authority; and, in this instance, danger may arise to some unfortunate nobleman or gentleman who will be solicited to "buy." There is not only a total absence of even a shade of evidence to support the idea that the sketch referred to is an original sketch, but there is convincing proof to the contrary,—such proof being mainly supplied by the wretched character of the work itself, upon which no "connoisseur" can look and for a moment hesitate under which class to place it,—originals, copies, or forgeries. The readers of this Journal need not, we think, be told to "open their eyes" to the perpetual frauds that are practised upon the ignorant, or the heedless, in the matter of "manufactured old masters." We have laboured in vain if we have left them any excuse in the event of their becoming victims.

THE KING OF HOLLAND'S PICTURES.—The famed collection of Dutch pictures formed by William III. of Holland is to be disposed of by his executors, and the Emperor of Russia has empowered agents to secure them for himself.

ROYAL SCOTTISH ACADEMY.—Mr. John Watson Gordon, A.R.A., has been unanimously elected President, in the place of Sir Wm. Allan, deceased.

DRAWINGS IN CRETA LEVIS.—A large number of drawings, figures and landscapes, have been forwarded for our inspection, produced with the *creta levis*, or permanent drawing-chalks, manufactured by Messrs. Wolf & Sons. They are by Mr. Kearney, a member of the New Society of Water Colour Painters, and are very beautifully executed. But our object now is chiefly to direct the attention of the amateur and the young artist to the material, so well adapted for sketching from nature, as a substitute for water-colours, from which it is scarcely distinguishable. Chalks of every shade and colour are manufactured, so as to enable the artist to complete his subject, however diversified, without any other medium; they have truth, depth, and brilliancy, and blend harmoniously together,—moreover, they cannot be obliterated, unless severe means are used for that purpose. The *creta levis* may be had either in cedar, like ordinary pencils, or without, as the common chalk; the former are far preferable as more conveniently handled. It may be used upon any paper, though the tinted paper manufactured by Messrs. Wolf, for this especial purpose, is what we would recommend. On looking over these drawings one can scarcely avoid contrasting the means and appliances for the practice of Art now with those of former years, and the advantages in our favour are nowhere more noticeable than in what may be termed "dry materials." We used to have only the lead pencil, black, red, and white chalks, and these in their *roide* state. Now we get every colour, manufactured in a neat, portable, and cleanly form, so that an artist departing on a sketching tour finds he has nothing else to do but pack up a few dozens of these, with a roll of paper in his knapsack, and he is equipped for his expedition in every artistic requisite.

THE BRITANNIA TUBULAR BRIDGE.—A series of views, or rather scenes, is now exhibiting in Regent Street, near the Polytechnic Institution, representing the most interesting objects on the railway route leading to this colossal wonder. Although ostensibly said to be painted by, and under the direction of Mr. J. W. Allen, the well-known landscape-painter, yet the greater portion of its meritorious execution is due to one of our most eminent stage decorators. The various views are highly diversified, and would be rendered additionally instructive to juvenile visitors, if the lecturer were a little more clear in his explanation of the principal antiquarian, manufacturing, and agricultural features on the line.

PICTURE COPYING EXTRAORDINARY.—Mr. Sant's picture of a half-length figure resting on a globe, personifying Astronomy, is one of the most attractive works now exhibiting at the British Institution, Pall Mall. Although only a month had elapsed from the first opening of this gallery, yet a spurious copy of it in oil has already appeared; and was offered for public sale at an auction room near Leicester Square. Is there no way of putting a stop to so disgraceful a procedure? Cannot the copyist be detected? We imagine, in this instance, the copy was made up from a published wood-cut.

IMPORTED PICTURES.—We are enabled to publish the following statement of the number of pictures imported into the United Kingdom in the year 1849.

From Prussia	34
" Germany	1,066
" Holland	1,946
" Belgium	2,430
" France	3,498
" Spain and Portugal	326
" Italy	1,723
" Other Countries	1,678
	Total 12,631

AN EXTENSIVE DEALER in old pictures, old prints, old coins, and—whether good or bad—anything old, having collected together a mass of rubbish of the Florentine School, refurbishing up the same, and giving it the benefit of fine frames, has been offering his gatherings to the government for the very pitiful sum of twenty thousand pounds!—the original cost of the collection being possibly as many shillings, but the veritable

value of which, for any useful purpose, is about as many pence. Fortunately, for Art and the country, Lord John Russell has been sufficiently well informed upon the subject, and declines the bargain; the inference of course is, as usual, that "a glorious opportunity has been lost," &c., and that "Art in England is ruined!"

THE EXPOSITION OF FRENCH INDUSTRY.—This bazaar has reopened with a new selection of objects for sale; but it is not now pretended that it has any relation whatever to the great Industrial Exposition of Paris. As a trading speculation it may be a fair and a just one. As we have heretofore said, the prices of the objects are very far higher than those asked for them in France; but this is the business of the buyer. We must protest against the collection being regarded in any other light than that of a shop, in which goods of foreign manufacture are sold and bought.

THE RENAISSANCE.—Mr. R. Wornum has been recently lecturing at the Government School of Design, Somerset House, "On the Origin and Peculiarities of the Renaissance Period of Decorative Art;" in which he ably traced the history of the style from its origin to its close, pointing out its peculiarities, and concluding by recommending the *method* rather than the *design* of the old artists in this style to the student. The lecture was chiefly remarkable for the clearness with which the lecturer dissected the style and descanted on its history.

FOLLY'S GROUP OF INO AND BACCHUS.—This elegant composition has been reduced by Cheverton's process, in metal, for Alderman Copeland, who intends to produce it in statuary porcelain for the approaching great Industrial Exhibition. The reduced copy is about two feet in length, and was on view for a few days at the establishment in New Bond Street, previously to preparing the mould for casting the copies. We have no doubt that these porcelain copies will be among the most attractive works in the Exposition of 1851.

MR. LESLIE'S FIFTH LECTURE ON PAINTING, was honoured by the attendance of ladies,—a first step in reformation which augurs well for the future. It is needless to say that the number of amateurs and patrons was proportionably large, and the attendance of students, exhibitors, and visitors, was very numerous; they completely filled those seats which heretofore have been but sparingly occupied. The surprise was so great at seeing a column of ladies advance into the room, that the most cheering and deafening applause ensued for several minutes. The walls on this occasion were adorned with many of the choicest pictures by Constable and R. Wilson, lent by their possessors to gratify and instruct the audience. Mr. Leslie's lecture displayed the highest order of thought and reasoning on the subject he selected, which was landscape-painting. It may perhaps not be out of place here to say, that much additional gratification would be afforded, if the ante-room, where the presentation pictures of the members of the Royal Academy are hung, were to be indulged with sufficient lights to enable them to be seen. The collection is of high interest, and on the lecture nights numerous persons are always groping about, close to the canvases, in faint hopes of being able to get a glimpse of their artistic excellence.

THE FLORENTINE PARASOL.—The Messrs. Morland, of Eusestap, have fabricated a novelty in these useful articles, which forms an elegant and pleasing variation from the long worn Clremont. Our readers will remember a suggestion made some time back in the *Art Journal*, by a lady-correspondent, who pointed out the applicability of the forms of flowers to the uses of the parasol. The hint has been adopted and carried out by the Messrs. Morland with good effect; and the result is an elegant and graceful novelty which cannot fail to be popular among persons of taste.

ART IN SOUTHAMPTON.—A public meeting has been held recently in this important town to form an association for the promotion of Art, and provide a studio for the use of its members. From the manner in which the proposition has been received, we may argue the success of the movement.

REVIEWS.

THE HIGHLAND FERRY BOAT. Engraved by J. T. WILLMORE, A.R.A., from the Picture by JACOB THOMSON. Published by LEGGATT & Co., London.

There is a class of pictures of which, notwithstanding their frequent appearance amongst us, the eye never seems to be weary, nor from which the thoughts turn as from objects that neither interest nor profit. And the reason why we always give such works a hearty welcome is obvious; there is so large a mass of material, and of so diversified a character, from which a painter may make his selection of subject, that with apparent sameness in all, we still find something "ever new." Mr. Thomson's picture of "The Highland Ferry Boat" is of this class; we have seen a multitude of scenes in the Highlands during the last twenty years, yet we are not tired of them, for the hand of the artist must indeed be unskilful, and his mental vision very circumscribed, who cannot extract beauty from a land so peculiarly rich in the picturesque.

This picture was exhibited in Westminster Hall, in 1847, under the auspices of the Royal Commission; it then received from us as large a portion of commendatory notices as we could find space for; we spoke of it as "an interesting, original, and valuable work, truthful and effective in composition, and painted with very considerable ability." None of these excellent qualities are lost in the transference of the subject; in fact, we think the composition tells with even more spirit in the engraving than in the painting. The scene lies near the head of a loch, from whose shores rises a range of bold and wild mountains; the time is evening, for the long deepening shadows of one high mass of rock are stretched half over the opposite pile, the central and more distant hills being steeped in sunshine. The "Ferry Boat" occupies the entire breadth of the picture in the foreground; it is laden with a varied, but highly characteristic group, of which the centre is a grey pony, across whose back is slung a fine stag, the result of the day's "stalking"; standing in the rear of these are two sportsmen, one of whom resembles Prince Albert, accompanied by their dogs. The remainder of the passengers consists of a bagpiper, men, women, and children, homeward-bound after the labours of the day, all sufficiently expressing how each has been employed; these, with the two rowers, complete the entire freight of the boat. The scene is altogether one of great interest, and although belonging to a school of which Landseer stands unequivocally at the head, Mr. Thomson shows he is not a plagiarist; however strongly we are reminded of him who has hitherto almost monopolised the "Highlands" to himself, Mr. Willmore has had his work to do in executing so large an engraving, where every square inch is well covered with subject, but he has done it faithfully and effectively, uniting delicacy with breadth in a manner we have rarely seen surpassed, even from his own *barin*. We understand that the publishers have received the special permission of the Highland Society of London, of which Prince Albert is President, to dedicate this print to them.

ANTONINA, OR THE FALL OF ROME: A Romance of the Fifth Century. In Three Volumes. By WILLIAM WILKIE COLLINS. Published by R. BENTLEY, London.

The last time we met Mr. Collins, it was as his father's earnest and eloquent historian, rendering facts simply and naturally—without ostentation, and yet with a manly and honest pride in the memory of a beloved and deservedly honoured parent. The great English landscape-painter's monument was raised long before his death; but the chapter, woven by his son, and laid as an offering upon his tomb, added to its interest, and made the world better acquainted with a man so thoroughly devoted to Art. In "Antonina" Mr. Collins has holdily rushed, not only into fiction, but fiction of the highest kind, enlisting our feelings in the events of the FIFTH CENTURY—by no means an easy task—and stimulating the imagination by the most vivid scene and actual portraiture of the eventful and mighty past. His subject was gigantic, yet not beyond his grasp, enshrined as it is in gloomy grandeur; the pulses of life beat strongly and naturally in the heart of the Goth, and beneath the toga of the Roman; the plot or plan has been laid with much care, the circumstances are well placed, the characters formed by the times in which they lived stand firmly and boldly out from the canvas of this remarkable picture; in painter's phrase, the "effects" are well "massed," the "lights and shadows" harmoniously "balanced," or if, at times, the peal of the organ, the tolling of the deep-mouthed bell, overpower

the soft breathings of the flute, or the gentle music of Antonina's cherished and stricken lute, there is no jar, nothing unactable in the solemn strain. The style is throughout, with very few exceptions, exceedingly graceful and impressive, frequently rising into language so nervous, so eloquent, and at times so epigrammatic, that it is hard to believe this, that doubtful thing, "a young author's first book of fiction." The character of our Journal precludes our giving much space to any publication unconnected with the Fine or Industrial Arts; but we assure our readers that there is matter in these volumes from which both the painter and the dramatist may draw inspiration; they are crowded with pictures, and full of the most dramatic "situations" and "effects." The author's descriptions are indeed all pictures, and if his "dialogues" be comparatively feeble portions of the romance, the characters are suggestive of the richest poetry. It may be, there are expressions we would wish omitted, and one or two scenes too passionate for a work that anticipates a large drawing-room circulation; but they are evidently introduced to preserve the *keeping* of the whole; they are *statuesque* but by no means judicious: still we would there should be no stain on such a noble fiction, and a little careful reading for a second edition would sweep away every chance of the author's being misunderstood by any portion of the reading public.

Mr. Collins is the most honest writer of romance we have met with for years; yet the foot-notes show, to our thinking, too much of the *lay-figure*, which he knows so well how to drape; if he must quote "Gibbon" for the satisfaction of his conscience, we wish he would place these notes in the appendix; they disturb the rich current of the story. We like to abandon ourselves to perfect belief in such a romance, to feel the dark and powerful influence of Goisvintha, to render homage to the mighty Alaric, to honour the gloomy, yet earnest worshipping Christian, Numerian, to spurn the vacillating Hermanric, who, however Mr. Collins may think, we deem unworthy of the affection he inspired. We do not like to be told by a foot-note that we are revelling in a dream, and that we must be awakened to look into "Gibbon's Decline and Fall;"—the great skill of the mechanist consists in producing the effect without displaying the cause. But the author of "Antonina" has produced a high toned and most remarkable book.

THE ORIGIN OF THE STOCKING-LOOM. Engraved by F. HOLL, from the picture by A. ELMORE, A.R.A. Published by LLOYD, BROTHERS & Co., London.

Perhaps nothing manifests the entire change which of late years has passed over the tastes and feelings of the English nation more than its estimation of the various classes of Art. The relish for battles and sieges, and the multifarious scenes which follow in the train of war, has passed away; even historic events, unless of peculiarly interesting nature, have little attraction for the multitude; yet if referring to some matter which connects, even through the lapse of many years, the present time with the past, or if the narrative records some scene of a domestic nature, however remote, the picture will assuredly find a host of admirers. Accordingly the publishers of engravings, having ascertained this fact, are meeting the demands of the public by the issue of subjects like the one before us, and others of an analogous character, which, if not works of high historical Art, fall little short of it, and in most instances possess far more interest. Mr. Elmore's picture will be remembered by many who visited the exhibition at the Royal Academy in 1847: the story of the subject is briefly that of a member of the University of Cambridge, who in the year 1689 was expelled his college for marrying contrary to the statutes. Having no fortune, his wife was compelled to contribute to their support by knitting, and the husband while watching the motion of her fingers, conceived the idea of imitating those movements by a machine. The incident is touchingly told, almost painfully so, for it is painful to witness noble features blending thought with sadness, as in the husband, and beauty overshadowed by sorrow, as in the young mother; both outwardly manifesting how weary a thing is poverty. The "inventor" of the loom has been reading, but the book is held half closed in his hand, while with great earnestness he marks the movement of the knitting needle. The engraving, which is in the mixed style of line and stipple, is upon the whole good, especially the figures; but there are portions that would have borne a little more strength without disturbing the harmony of the picture. The publishers we understand, have other works in the hands of engravers, of a character that cannot fail to be popular.

HAGHE'S PORTFOLIO OF SKETCHES: Belgium, Germany. Published by T. McLEAN, London.

To every lover of the picturesque in architecture, and especially to an artist of Mr. Haghe's endowments, with the eye to select and the hand to delineate whatever is most beautiful, a sketching tour through Belgium, Germany, or Flanders, must be a source of infinite pleasure. In each of these countries there is gathered together so rich an assemblage of quaint old edifices, ecclesiastical, civic, and domestic, most of them connected with important historical associations, that the traveller, wherever he roams, has always some object of more than ordinary interest presented before him. We "moderns" may boast as we please of our wealth, and our progress in the refining arts of civilisation, but we shall never make the former subscribe the purposes of the latter to the same extent of grandeur and magnificence as did our forefathers. Noble were the structures they reared, and destined to last for centuries of years, yet are they venerable now; and when time shall have laid their glories in the dust, as he will certainly do with some of them ere many more generations shall have passed away, there appears little likelihood of others, equal in costliness and beauty, rising up in their room. The age in which we live is in most matters too selfish; we build for ourselves—and for our children—perhaps; but their posterity will have to be their own architects. Here and there an edifice is erected which may survive a few centennial cycles, but in most cases the sand-brick, and the plaster, and the painted pine, will be found sorry substitutes for the marble, and the stone, and the knotted oak which our predecessors used. The modern "lamps of architecture" are, we fear, not intended for a lasting display. We sometimes wonder where the future artist who, like Mr. Haghe, would seek subjects for his pencil amid the picturesque of by-gone ages, will find them to any extent when those that now exist are swept away; few records will there be of our doings, and fewer still, worthy of being so perpetuated: yet let it not be understood that we are here casting even a shadow of blame on the architects of our time—they could build as did others, with the same means at their command; it is their misfortune to live at a period niggard in its high patronage of their profession.

We have before journeyed with Mr. Haghe in the countries whither he now leads us, and a pleasant pilgrimage he has always made it; yet have we never so much enjoyed his company as in the beautiful volume whose pages we have just turned over; for he carries us not only to the places here delineated, but he contrives to add to the interest of each respectively, by associating the scene with some historical incident worthy of commemoration; so that the work is not only a series of admirable architectural sketches, but also a series of historical pictures. Moreover, these groups of figures are introduced with a spirit and effect that, in our judgment, almost surpass the treatment of the structural portion of the work. There are altogether twenty-seven views, each printed in three different tints, which has enabled the artist to give his "sketches" (as he modestly, yet not quite appropriately, calls them,) the appearance of tinted drawings, allowing for the absence of positive colour: this novel method of producing lithographic prints gives to the work an advantage over all which have gone before it, since drawing on stone was first practised. To do full justice to the entire publication we should go through the whole number of subjects *seriatim*, and discuss the merits of each; this, however, our space forbids us to do, and we can only point attention to a few of the more striking scenes. No. 2, "A Confessional in the Church of St. Paul, at Antwerp," is a richly carved modern structure, the principal features of which are four life-sized statues also carved in wood. In No. 4, which shows the exquisitely carved "Stalls of the Church of St. Gertrude at Louvain," the artist has introduced a group of warlike figures who have obtained entrance into the church, and are attacking the monks while engaged in their religious services. No. 8, is a costly "Altar-tomb of Lalain, in the Church of Hoogstraeten;" No. 9, "The Interior of a Domestic House at Antwerp" is treated with a beautiful effect of *chiar-oscuro*. The magnificent example of wood-carving by H. Verbruggen in the "Pulpit at St. Gudule, Brussels" is seen in plate 12, most admirably brought forward; No. 13 is the "Rood-screen and Chandelier in the Church of Aerschot;" the chandelier is the work of Quentin Matsys, whose skill as a blacksmith appears also in the iron-work represented in the following plate. No. 16 is a fine specimen of monumental sculpture. "The Tomb of the De Merode Family, at Ghel." The rich Gothic architecture of the seventeenth century is seen in the nearest portion of the "Town Hall of

Ghent" No. 16; and in the "Town Hall of Oudenarde," No. 18. No. 19 is a beautiful "Altarpiece in the Cathedral of Ratisbon," recently restored by the late King of Bavaria. No. 22, "The Entrance to the Church of St. Sebald, Nuremberg," forms a capital picture, mainly attributable to the introduction of some cleverly drawn figures. The same may be said of No. 24, a judicial scene in the "Town Hall of Antwerp." No. 27 represents a hawking party at the entrance of the "Castle of Heidelberg," treated with exceeding spirit. We can only add in conclusion that a more elegant publication of its kind never issued from the press; the drawings have been most carefully and artistically printed by Messrs. Day and Co.

"AND YE SHALL WALK IN SILK ATTIRE."
Engraved by S. BELLIN, from a Drawing by MISS S. SETCHELL. Published by LLOYD, BROTHERS, & Co., London.

The burden of this favourite old Scotch ballad is well suited to the pencil of Miss Setchell, whose beautiful drawing of "The Momecutous Question" gained so many admirers two or three years back. She has been scarcely less fortunate in her treatment of the present work, where the avaricious old mother is endeavouring to win the "pair broken heart" of her daughter from its "Donauld," by the display of a "silk gown," the gift of a rich suitor. "Tis a vain effort; neither the silk nor 'siller" can entice the young heart from its affections, nor corrupt it with the splendid bribe. The figure of the girl is a charming personation, that well bears out the character. The print altogether is worthy to be ranked with the best of its class—a class that sometimes teaches a more wholesome lesson than works of a higher standard in Art.

THE ART OF LANDSCAPE PAINTING IN WATER COLOURS. By THOMAS ROWBOTHAM, Professor of Drawing to the Royal Naval School, and THOMAS L. ROWBOTHAM, JUN., Member of the New Society of Painters in Water Colours. Published by WINSOR & NEWTON, London.

Books containing instructions for Water-colour Art are now very numerous, but, in many of them, the principles which they advocate are frequently set forth in a manner so obscure and prolix, as to embarrass rather than enlighten the student. Every English painter of eminence has been his own master, has achieved for himself that distinction of style on which his celebrity rests; but yet there are initiatory lessons to be learnt, and it is our desire and our duty to speak favourably of those which are best fitted to convey those lessons. The little book before us recommends the student to attach himself to no particular style, but to follow nature as closely as possible in application of the general rules of Art, with a view to the formation of a style, which he may call, and feel to be, his "own." This brief and pithy treatise, laying open all the manipulative cunning, and mechanical execution of modern Water-colour Art, will be eminently useful to all who strive in the dark for those enchanting effects which, after all, are to be learnt only as the leger-de-main of the Art. At the commencement of the book, the qualities of papers and the properties of colours are described in a manner which conveys much useful information to the beginner; and then the delicate process of effacing, scraping, correcting flaws and accidents, are treated of to show the various methods of producing some of the most striking effects in nature. The names of the authors sufficiently guarantee the character of the work; few artists have enjoyed a higher reputation than the elder Mr. Rowbotham, and few of the rising school promise to win a more honourable distinction than the younger.

MODERN TOMBS, OR GLEANINGS FROM THE PUBLIC CEMETERIES. By A. W. HAKEWELL. Published by LONGMAN & Co.; London.

This is a laudable attempt on the part of Mr. Hakewell to draw attention to that which is good in composition, in our public cemeteries, and to show the necessity for employing talent of a higher kind than that of the mere mason or mechanic in the construction of monumental memorials. The publication will consist of at least fifty designs, selected with reference to taste in composition, and represented geometrically to an uniform scale. The idea is good, and the selection made by Mr. Hakewell in this first part of his work shows much judgment, and cannot fail to make the work an useful reference-book for all who need it.

KING RENÉE'S DAUGHTER. Translated by THEODORE MARTIN, Esq.

It is most unnecessary, as far as the author and translator of this most exquisite of modern dramas are concerned, to add our praise to the abundance they have already received; but we should not be at peace with ourselves did we not express our gratification that what is so pure and holy, and withal so simple, has met in its varied dresses, the homage of all circles. Mr. Theodore Martin is known to many as a poet, and to others as a well-practised lawyer; this union of poesy and law is by no means uncommon; but it is rare to find a man so successful in both. Mr. Martin has, in this instance, carefully unlocked one of the richest caskets of northern literature, and the chrysolite repays the trouble a thousand fold. This particular translation was done for Miss Helen Faucit, a lady whose long absence from the London boards is a subject of regret and surprise; but we believe she rendered ample justice to the poet's delicate creation in Scotland, where the poem is greatly admired. We hold it as a proof of the return to a purer and better taste, that this play, with Mrs. Stirling as the blind Princess, was so wonderfully popular at a minor theatre; it is suggestive of beautiful subjects to the painter, and well worthy of taking its place as one of the *classics of the studio*, from which the highest in Art may receive inspiration.

VESTIGES OF OLD LONDON. By J. WYKEHAM ARCHER. Published by D. BOGUE, Fleet Street.

We are lovers of London, and hence inclined to look favourably on all that pays deference and honour to that "chamber of lanes." The industrious and pains-taking artist who has devoted himself to the task of delineating the Vestiges before us, is well known for his enthusiasm and knowledge of his subject. He proposes to engrave and describe all such places and things as are worthy of record, either on account of their intrinsic merit as specimens of ancient Art, their beauty as picturesque objects, their peculiarity of character, or association with remarkable events. As a specimen of the variety afforded by this plan, the contents of the first part may be noted. It consists of views of the last of the Old Bulk Shops, at Temple Bar; Dryden's house, in Fetter Lane; Milborn's Almshouses, Crutched Friars; Kingsland Chapel; and two plates of Roman Antiquities—the *zephyr* of the conquerors of the world. The engravings are capitally done; Dryden's house is admirable; the letterpress is characterised by research and ability, and the work altogether is highly creditable to Mr. Archer.

TEN COLOURED VIEWS TAKEN DURING THE ARCTIC EXPEDITION. By W. H. BROWNE, Esq., R.N. Published by ACKERMANN & Co., London.

The "regions of thick-ribbed ice" are here faithfully delineated by one of Sir James Ross's lieutenants, who has shown much power and truth in his views of this inhospitable land. There is a *verisemblance* about them all which is pleasant to see; a compliment which we cannot pay to the places they represent. The cheerless glaciers, murky skies, and snow-capped peaks, make us involuntarily pray for the safe return of such hardy men as have ventured thus far for geographical knowledge. There is a savage grandeur and a sublimity about some of these scenes, of a very striking kind; and we may instance the Bivouac at Cape Seppings, "the castled crags" near Whaler Point, Port Leopold; Noon in Midwinter, and the views exhibiting atmospheric effects generally, are particularly well rendered. The work is a valuable addition to our knowledge of the Arctic regions.

REMARKS ON THE ARTICLES WHICH HAVE RECENTLY APPEARED IN THE "RAMBLER," RELATIVE TO ECCLESIASTICAL ARCHITECTURE AND DECORATION. By A. W. PUGIN. Published by DOLMAN, London.

This is a remarkable pamphlet, and one which deserves careful reading and reflection. The opinions here promulgated and enforced are those formed upon the experience of a life of thought and practice in architecture, and go towards exalting and defending the true principles of pointed architecture. While eulogistic in its praise, Mr. Pugin has honestly shown its failures, even in his own hands; but he has boldly traced them to their proper sources; that meddling interference and meanness which cramp and destroy so many fine architectural imaginings. This pamphlet may almost be considered as an autobiography of the writer, inasmuch as he has dwelt upon his own personal history and experience so largely, and so spoken

so truly on all points. Whatever views he puts forth, and however much they may clash with those of many who read them, they are evidently the result of deep conviction, and there is an earnestness about them which enforces attention and respect. He is as strong in pointing out the instances of crippled design and bad proportions in his own buildings, as in those of other men; attributing all to inadequate funds, or injudicious interference; so that he declares he has passed a life "in thinking of fine things, studying fine things, designing fine things, and realising very poor ones;" a conclusion, however, which we cannot allow. With regard to the decoration of churches, he instances some unfortunate daubings which some of his own have undergone, and concludes that painted windows are of more vital importance, as to fitness and beauty, than painted walls. He draws a sensible contrast between the devotion of the old artists and the new, and he points to inmates of monasteries, like Angelico and Fra Bartolomeo, who might devote their talents and lives to church decoration; "but, in these days, painters (and devout painters, too), fall in love, marry, have large families, and require to be well paid for what they do. Indeed, a painter, by his position, is entitled to large remuneration. In most professions a man can gain by the labour of others; but a painter is alone. But a few years of a short life are open to him to obtain a competence for his declining years; he has not only to look to the present, but the future; and, by an illness or an accident, he may be disabled for life. *Painting that is worth having can never be cheap.*" Mr. Pugin has placed these last words in italics, and they are worthy of note; so, also, is his testimony in favour of native ability; he says:—"Some visionary people imagine, that German artists can be procured for almost nothing; but let those who labour under this delusion try the scheme in practice, and they will soon discover their mistake. I, to my cost, have endeavoured to import foreign painters, and the result was, my paying a good sum to get rid of my engagement." England is considered as an *El Dorado*, and what was ample at home is dissatisfying here. There is much else in these two dozen pages worth knowing and reflecting on, and we recommend their perusal strongly.

ARCHITECTURAL PUBLICATION SOCIETY. Part III. of Vol. for 1849-50.

The onward progress of this Society seems evident from the spirit with which its publications are carried out. A series of excellent illustrations of Architecture has already appeared, and we have here a quantity of text, very good of its kind, and abounding with extracts and reprints of the works of the fathers of the Art, as well as some of more modern time, a plan which gives the subscribers a body of literature of a rare and valuable kind, now scattered over the field of letters. At the end of this part we perceive a list of terms proposed to be inserted in a Cyclopaedia of Architecture, to which contributions of drawings and notes are solicited from all quarters, in order that a perfect work of the kind may be obtained by general co-operation.

THE HISTORY OF ANCIENT ART AMONG THE GREEKS. Translated from the German of JOHN WINCKELMANN, by G. N. LODGE. Published by J. CHAPMAN, London.

The celebrated work, a portion of which forms this volume, has long since passed the ordeal of criticism, and been established as a classic work of reference in every well-selected library. Perhaps no man ever lived better qualified than Winckelmann for the task he has chosen, and his history of Ancient Art is as remarkable for its purity of taste and knowledge of the subject as it is for its Historic and Antiquarian information. Not contented with presenting to view the most beautiful monuments of human genius, he investigates and exhibits the sources of their beauty, the characteristics of their style, and the reasons why they still command the admiration of the world. His opening chapter is a very remarkable one, devoted as it is to a philosophical consideration of the grounds and causes of the progress and superiority of Greek Art beyond that of any other nation, and he traces it upwards from the innate love of personal beauty so remarkably developed among this early people; increasing and ramifying on all sides until ugliness of any kind became as intolerable an offence to the eye, as evil manners or personal vices would be to civilised nations of the present time. Every facility was offered for the proper cultivation of taste; it was publicly encouraged and rewarded, while the Arts were in every way fostered. It is impossible for any artist or lover of Art to rise unimproved from the perusal of this volume, the result of the experience of so learned and tasteful a mind.

THE ART-JOURNAL.

LONDON, MAY 1, 1850.

ROMANISM AND PROTESTANTISM
IN THEIR RELATION TO PAINTING.

It is often asked, is not Romanism more favourable to the development of high Art than Protestantism? Have not all the great monumental works of painting been produced by Roman Catholics? Have the Protestants produced a single great painter who has devoted his labours to the Church? These, and similar, are questions that occur more frequently than many of us would suppose, not in England so much as in other European countries; but even in this country the idea of an antagonism in Protestantism unfavourable to the development of what is termed historical painting does exist.—Romanism being assumed to be decidedly favourable, and Protestantism as decidedly unfavourable to it. We use the term Romanism without the slightest irreverential allusion; we merely wish to speak of these two different forms of Christianity, so far as they have been represented to be antagonistic as relates to the development of the art of painting; and as the impression of the inferiority of Protestantism is more than generally spread, its truth is a legitimate question of criticism for the consideration of this Journal; and the object of these remarks is to show that the assumed advantages of Romanism are founded on a few special circumstances which have no bearing on the abstract question itself, but are wholly derived from *ex parte* evidence, such as the destruction of works of Art by the iconoclasts of the sixteenth century, and a few other examples of local fanaticism. All reactions are violent at starting, but reaction is an abnormal state, especially in religious matters where the feelings are too often allowed to get the better of the judgment; and in the case of these iconoclasts, the supposed faults of a system were indiscriminately visited upon everything that proceeded from it. This was solely the result of party animosity; what one upheld, the other destroyed, and what brought this extraordinary vengeance more particularly upon the works of Art was, that the great mass of these works was in honour of individual saints, and not of the Church or the progress of Christianity itself. The very cessation of the iconoclasts is a virtual disclaimer of the principles which instigated them. There is nothing whatever antagonistic to the highest development of Art in Protestantism itself, whatever may be the feelings of some individual Protestants; Protestantism has no affinity whatever in this respect with Judaism and Mahometanism, which, on the contrary, are essentially antagonistic to imitative Art.

We were once told by an Italian gentleman in Florence,—“You English will never be painters, you believe nothing.” It would certainly be very difficult to produce a picture of anything, where there is no faith in anything. Again by a learned German in Munich and an Art-critic too, it was asked,—“How is it that the English have never produced a single great painter; West was an American!”—of course implying a limitation of the designation *great*

painter, to History and Religion, as understood; and it is a limitation which courtesy may perhaps grant, on an occasion.

Here are certainly two hard positions, anything but flattering to the Englishman; we need not delay to examine whether they are true or not, but let us rather investigate how such opinions came to be entertained; there is nothing without its cause; the *never will* of the Italian seems to be borne out by the *never have* of the German; and although the admission about West may perplex the solution, it is evident that both impressions have proceeded from the same idea, that Protestantism is essentially antagonistic to the development of high religious Art, which is on the other hand signally fostered by Romanism.

Now, this is the question: is it so? Is the Romanist a better judge of the work of the Protestant, than the Protestant of his own work, or that of the Romanist? Assuredly not. It requires a long time to recover the effects of such excitement as is indicated in the ruthless iconoclasts both of England and Holland in the sixteenth century. All this long period was time lost to the Protestant; the period has scarcely yet expired. The Romanist, however, was still progressing on his course, his advantage, therefore, is incalculable; there can, indeed, as regards the past, be no comparison; the suggestion of the German, therefore, must accept, in this its answer; for it was, of course, relative as to what had been done elsewhere. We must then test the proposed question by the inherent qualities of the two elements themselves, or rather by the examples of the one that has produced so much, and ascertain what is peculiar to it, and what it has in common with the other. There are thousands of pictures in Italy and other Roman Catholic countries, which are decidedly opposed to the spirit of Protestantism; these, therefore, are peculiar to Romanism. But there are, again, thousands of a more universal character which Protestantism might unconditionally recognise; and these cannot be claimed by Romanism, because it is not to any peculiar virtue of Romanism that they owe their existence. Any English painter, notwithstanding his Protestantism, might and would be proud to own them; and, in this fact, is disproved the postulate of the Italian, regarding the Englishman's scepticism. On the contrary, one might safely affirm that there is little in any one of the greatest monumental works of the Italian schools of painting, which the Englishman might not cordially assent to; and, therefore, as far as his mere belief, or Protestantism, is concerned, might not cumulate. The idea that Romanism itself confers a talent upon its professor for anything extrinsic and independent of it, is too fanciful to merit the slightest consideration.

The question now very much resolves itself into an investigation of the peculiar and common grounds of these two great Art-provinces; and we will endeavour to show that their greatness is in the common, while the *peculiar* is without general interest, and however dear to local partialities, has never conferred the slightest dignity on Art. Art was forbidden the Jews because they imitated the idolatries of the Egyptians; but in every part of the Scriptures it is *idolatry*, and not Art that is deprecated. This is the spirit of the second commandment; we start, therefore, with the assumption that there is nothing inherently offensive in Art itself, in the imitation, or in the work of imitation, but simply in its abuse when made. The position or estimation of Art, accordingly, and its powers for good or for evil, depend upon the state of the human mind acted upon by it; for evil, where superstition and ignorance prevail,—for good, where wisdom and intelligence prevail; and this more or less according to the various degrees of superstition or intelligence.

With the early Christians, as in immediate antagonism with the Pagans of Greece and Rome, one of whose greatest characteristics was the love of images, images were magnified into a source of evils, and being viewed only in this light, were visited with the most inveterate anathemas, a crusade against them being inculcated as a Christian duty.

This was a period in which Art was avoided

as sinful, because imagined to be destructive to religion; and this opinion was maintained with all possible vigour, as long as any traces of Art-fostering Paganism remained in the civilised world. But no sooner had the Art-prohibiting religion attained the complete ascendancy, than the persecution ceased; and it was immediately discovered that Art, in itself, was so far from being inimical to religion, that it might be safely had recourse to to propagate that very faith, the zealous advocates of which, for three hundred years, had employed their greatest energies in sweeping it from the earth; not only visiting their vengeance on the work of Art itself, but on the artist also, who could not be baptised until he had forsworn his idolatrous profession, and who, if he recurred to it, was excommunicated. The celebrated Gnostic and philosopher, Hermogenes, against whom Tertullian wrote one of his treatises, was a painter; and this appears to have been as great an offence in the opinion of Tertullian, as his profession of what are termed Gnostic principles. The Gnostics of Africa were the only Christian sect of this period who did not follow the example of the Roman Church and wholly repudiate Art.

This Christian persecution of, or crusade against, Art, was at its height in the time of Tertullian, who lived in the second century; and it continued with some rigour until the close of the third; but in the course of the third, pictorial and plastic representations were mixed up with the early Christian symbolism, and were tolerated by the Church with certain limitations. The great limitation was that what was *adored*, was never to be represented. This was decided by the celebrated canon of the council of Iliberis, in Spain, in the beginning of the fourth century. This canon, however, literally prohibited pictures from the churches altogether, “*lest what was worshipped and adored should be painted on the walls.*” This was, however, a very important qualification of this picture prohibition, for the exclusion was the most limited possible; there was prodigious scope left for the development of Art, provided the spirit only of the canon were observed, and this is, in fact, all that was observed; saints were not adored, and accordingly their images were not excluded, and thus, in the Martyrology, a vast and exciting field was opened to the dawning Art. Some of the great prelates and writers of the fourth century point emphatically to Art as a means for the spreading of the Christian Church, as Gregory of Nyssa, and Gregory of Nazianzus; and Basilus of Cesarea even exhorts the painters of his time to perpetuate with their colours the martyrdoms of the saints. This was the great resource of the early Church paintings and mosaics; and this Christian Martyrology has ever been the most universal and distinctive theme of Art under the influence of Romanism; quite irrespective of the peculiar spirit of the several ages through which it has lived, down even to the Classic *cinque-cents* period, when the antagonistic spirit of Protestantism commenced anew against her Art the persecution which Rome itself had twelve hundred years before exhausted on that of ancient Greece, after a perseverance of about three centuries. The Protestant crusade against Romanist Art was, however, after the first outburst at the end of the first half century, more of a passive than an active character, rather *unproductive* than *destructive*, and so it is now. Protestantism has been unfavourable to Art not by what it has done, but simply by what it has left undone; inherent mischief, therefore, cannot be predicated of it, because it has not yet been tried; it has, like the Romanism of the first three centuries, only just outlived its blind animosity against that which its antagonist loved, for no other reason than that it was the delight of its antagonist.

About three hundred years after the promulgation of Christianity, the Romanist prelates at Iliberis formally excluded pictures from their churches; about three hundred years after the Protestant schism, Protestant prelates in London likewise formally excluded pictures from their churches; but as the Romanist exclusion appears to have been very shortly followed by a general admission of pictures into the churches,

we may hope that the Protestant prohibition will not prove more efficacious or lasting, although still vigilant even at this day, as a recent instance proves. It is a fact that we have still, in the middle of the nineteenth century, our Terricks, who will "not open their doors to Popery," in the shape of a pictorial illustration of scripture. But how difficult it would be to show wherein is the "Popery" in hanging over our altars, or on the walls of our churches, pictures of such incidents as "Christ blessing little Children," "Christ's Sermon on the Mount," "Christ weeping over Jerusalem," "The Feeding of the Five Thousand," "The Healing of the Sick," and endless others, expounding the religion of love, proclaiming and honouring its founder, in a manner at once intelligible and impressive, to the most simple capacities. These things are read and recorded in our churches, each picturing as he listens, according to his capacity; and faint and inadequate indeed must be the pictures of many, even of those who hear and understand the words of Holy Writ; but what idea must those form who imperfectly hear, and less perfectly understand! The miracles themselves were acted pictures for the multitude with whom preaching would not avail; what they saw indelibly impressed their minds; the eye in the humbler classes is always better educated than the ear; nearly all their notions sufficiently distinct to be practically available must be derived from what they see. This has been well understood for ages by those in authority, both in early and modern times; children will derive ideas with pleasure from prints when they will neither listen nor read, and many a child will read a story simply to gratify the curiosity raised by an impression received from a print. But to go to greater examples, Quintilian (*Inst. Orat.*, vi. 1, 32) gives an instance of the extraordinary power attributed to painting by the ancients. When a man was accused of some atrocious act, to secure an adequate punishment if guilty, his case did not rest upon the persuasive eloquence of the advocate, but a picture of the act was exhibited in court. Quintilian disapproves of this, and it was, in fact, greedy to the disadvantage of the accused, for the judge might be too much shocked by the contemplation of the act itself to impartially weigh the evidence: the means resorted to to make an impression were too strong; no eloquence on the part of the advocate for the prosecution could be considered an undue advantage, but an exhibition of the act itself took the mind by storm.

A modification of this principle was carried out in the middle ages; it was common in the courts of justice of the Low Countries to hang up pictures of remarkable judgments which had been made in the course of the world's history, those in which justice had prevailed to the exclusion of all other considerations. The pictures of the "Golden" Judgment of the Emperor Otho III., by Stuerbont—now two of the brightest ornaments of the gallery of the King of Holland, at the Hague—were only lately removed from the Justice Hall of Louvain, for which they were originally painted. A more appropriate example here, one, indeed, which perfectly illustrates the position, is that of Paulinus, Bishop of Nola, in the close of the fourth century: he decorated two churches, which he had recently built in his diocese, with pictures, and the Bishop himself gives an account (*NATALIS—Münter, Simbilder, de. Einleitung.*) of his motive for so doing, as it was such a rare thing to decorate a church with paintings in Italy. The Bishop's explanation is notable: it appears that drunkenness was then, as now, a very common vice, and the celebration of the festivals of the saints, by bringing large concourses of people together, afforded unusual temptations, and thus became incentives to drunkenness and other debaucheries.

Paulinus, therefore, in hopes to correct these abuses, as the people were unable to read, and, perhaps, indisposed to, or incapable of listening, imagined that his moral lessons might be most efficiently conveyed by graphic representations. He accordingly selected prominent passages of Bible history, and the Christian Martyrology; which by their novelty, their stirring incidents,

and attractive form would be sure, he thought, to promote reflexion and enquiry that would lead ultimately to the most beneficial results. The scheme was a noble one; there was nothing of Idolatry in these works, the most narrow-minded bigot could not distort their influence to any such tendency, they were destined to lift up the mind out of its sensual debasement, where nothing else would avail, to the elevated contemplation of noble deeds, and to the earnest imitation of worthy examples; that Paulinus met with some success there can be no doubt, though probably it was by no means commensurate with his intentions. His example was soon followed by other prelates and the subsequent misunderstanding of the objects of such works, is not to be attributed to any inherent inpropriety in the works themselves but to the low debasement of the human mind, and the fault was, as the canons of several councils show, not in the people but in the priests, who gave an undue weight and influence to the works and the images of the saints, which on several occasions were decreed veneration, with the formal honours of salutation, the kiss, genuflection, and burning of lights: by Gregory II., in 730, and by Adrian I. in 787, at the second council of Nice, and lastly at the celebrated Council of Trent, in 1563.

This was the pure act of Romanism, and in opposition to the Eastern Church. That the real spirit of these decrees was not thoroughly understood by the populace is not remarkable. The grosser form of Christian idolatry commenced only with the priestly sanction of the veneration of images; of course not in themselves adorable, as Gregory himself explains in his epistle to Leo III., but as memorials of those whom they represented. Still this fine distinction in the face of injunctions for acts of adoration was not to be made by an uneducated populace, who knew only the images, and obsessed by a superstition commensurate with their ignorance, it was next to impossible for them to appreciate exactly the nature and purport of these memorials which their bishops had set up; and instead of examples of fortitude, and incentives to higher or nobler aspirations, they were looked upon themselves as sacred images and mediators, and from mere moral records or spiritual symbols, they were converted into material saints and became the objects of real worship. The veneration was transferred from wood and stone to canvas; and all religious works were vested with a species of sanctity, and till the period of the *cinque-cento*, Art itself became almost monopolised by monastic asceticism and the martyrology—a consummation, not a greater violation of common sense than it was of the antecedent practice of religious Art.

This was the state of Art during Roman supremacy, after the decay of the Eastern Church and empire; the Greek Church, however, was the mistress of the Latin in all the great Art-cycles of the Christian Church, and their subjects were of a far more Catholic character before the Roman supremacy, and the prevailing subjects such as perhaps even the most scrupulous Protestants could not object to the tendency of on the most simple minds. Many are pure religious dramas or epics in the most impressive and instructive form, for the inculcating or spreading the leading principles of Christian morality, as well as affording the best exposition of many of the doctrines of the Church.

These cycles were visible embodiments of the prophecies, indirectly pointing to Christ's second Advent, or the perfect Church; historical lonely in semblance.

The great features of these cycles are:—From the Old Testament—the Fall; Noah in the Ark; the Sacrifice of Abraham; Moses taking off his Sandals; the Destruction of Pharaoh's Host; the Battles of Moses and Joshua; Job in sackcloth and ashes; the Ark of the Covenant; Sampson carrying away the Gates of Gaza; David and Goliath; Samuel anointing David; the Ascension of Elijah; Daniel in the Lion's den; Jonah and the Whale; Jonah in the Shade of the Gourd awaiting the destruction of Nineveh; Nebuchadnezzar's Image; and the Three young Men in the fiery Furnace.

From the New Testament:—the Visitation of the Virgin Mary to Elizabeth; Joseph's Dream, and

the Journey into Bethlehem; the Nativity; the Adoration of the Three Kings; Christ disputing in the Temple; Christ baptised in the Jordan; Christ with the Apostles; the Marriage at Cana; and the Conversion of Water into Wine, Christ's first Miracle; Christ and the Woman of Samaria; Christ and the Canaanite Woman; the Feeding of the Five Thousand; the Healing of the lame Man; the Resurrection of Lazarus; Christ walking on the Waters; Christ's entrance into Jerusalem; Peter's denial; Christ before Pilate; the Crucifixion; the Entombment; and the Resurrection of Christ.

Later, a special cycle, relating to the Virgin, became very general, known as the "Joys and Sorrows of the Virgin," which comprised several of the New Testament series but differently treated; the joys and sorrows were each seven:—Of the Joys,—the Annunciation and the Coronation of the Virgin are the first and last, and the most frequent of the Joys occurring as single subjects; here her part is principal, in the others only secondary, as in the Visitation of Elizabeth, and in the Adoration of the Kings.* These cycles were, of course, gradually extended; the apostles, but especially St. Peter and St. Paul, became prominent, and many special cycles were developed, which occur constantly in the manuscripts, and in stained glass windows.

Now all these subjects are of a Catholic character, and not Romanist or Greek than Protestant in sentiment; they cannot, therefore, be claimed as Romanist developments, but belong to Christian Art in its widest sense. These cycles, however, do not comprise one-tenth of the popular subjects of representation which from time to time have engrossed the attention of the Christian artist, and these again are not one-tenth of the general subjects of interest which a single gospel even might suggest, without having recourse to either legend of saint or martyr, or any mere ecclesiastical institution, which might excite sectarian difference.

All that is ecclesiastical is not gospel; but it is in the ecclesiastical where differences arise, and if we divide Christian Art into these two provinces, the general and the special, we shall discover that all our differences are in the special province; while the general, whatever it may be in practice, is in principle common to both. It cannot be denied that there is a common ground, or that these two provinces are distinct, and that the special is all that is proper to a Church.

If the admission of these general or gospel subjects into our churches, is opening the doors to what it is pleased to call "Popery," then can there be no discussion as long as "Popery" is inadmissible. But it must require the idiosyncrasy of a Terrick, to discover Popery in such works as the cartoons of Raphael, or in the pictorial representation of any passage from the Life of the founder of the Christian religion, or in a practical illustration of any of the cardinal virtues of Christian morality. Dr. Terrick's prohibition of itself is perhaps not a matter of serious regret; such works as the English school produced some seventy years ago, allowing those of West and Angelica Knuffmann to stand as fair specimens, are not such as are best fitted to decorate a church, or do credit to a national school of Art; it will require something in every respect more substantial, and more circumstantial, to produce those impressions on the senses calculated to excite reflexions and resolutions in the spirit of the great truths and doctrines of Christianity, and the infinite powers of love. The work has been happily reserved for an allier school and a more tolerant public; for though we still have our Terricks, the days of their influence are numbered, and our cold grey walls will yet be clothed with glowing tints, and change their chilling mildew and whitewash, suggestive only of rheumatism and age, for the vivid scenes of the human soul in its progressive stages, aggregate and individual, from the patriarchs and prophets of old, to the humblest recipient of the divine image and grace in the ordinary daily offices of love and charity, in our own day; engendering associations of Christian realities, elevating the thoughts from

* On these cycles, see an interesting note by Mr. Eastlake in the translation of Kugler's "Handbook of Painting,"—Italian Schools.

the fetters of this life's worldly cares, to a clear and palpable notion of a substantial existence and a substantial future; bringing the mind at once into the best state to listen and reflect on the importance of a religious faith, and all this without for one instant suggesting the notion of idolatry. Yet these are the engines of perversion, and it is better, we are told, to be frigidly devout in a charnel-house, reeking with the vapours of dead men's bones, than to be glad in the midst of storied walls telling of Christ and his apostles, of redemption and salvation charming the present and brightening the future—this is materialism, sensualism, in a word "Popery."

Strange to say, widely different from the early Christians, it is with us colour not form which engenders Paganism or Popery; the early Christians, with all their jealous exclusion of images or anything very approximate to the human form, never deprecate colour. We deprecate colour only, for a single glance at the interior of St. Paul's or Westminster Abbey, will discover not only a tolerance of human images, but an absolute partiality for the figure in Pagan costume; but who has surmised danger to the Church on this account; yet artistically considered, it is neither more nor less than a masquerade. Colour seems to be the great stumbling block to the adequate decoration of our churches. Colours, like—

"Clintzes are gaudy, and engage our eyes
Too much about the particoloured dyes."—SWIFT.

So with pictures, statues not having this chintz defect which offended the old weavers, are perfectly orthodox.

Such being the Art-condition involved by the two Churches or sects of a Church, are they the necessary consequences or proper exponents of these two forms of religion? The Romanist result seems by the experience of fifteen hundred years to be inevitable; the existing Christian Art *par excellence*, is a Romanist development, that especially of the *Renaissance*; the *cinq-ue-cents* does not come under the category. But the cases very different with the Protestant development, which is yet in embryo.

The present Protestant exclusiveness is no more a fair exponent of the capabilities of Protestantism in relation to Art, than was the early Christian deprecation of all species of image, a fair exponent of what Romanism is capable.

Of Romanism, we have positive results; of Protestantism, as yet, only negative. The idea of Protestantism being more spiritual in its essence than Romanism is pure arrogance; if there is a difference in this respect, it is that in Protestantism we have a spirit without a body, while in Romanism we have both spirit and substantial body too. Exactly what we wish to see is Protestantism in its substantial body, not only in our churches, but everywhere. How do dark vaults and cells, or bleak stone walls, harmonise with the gladness of righteousness? are they not rather the fitting types of that outer darkness where there is weeping and gnashing of teeth? It is not ordained that we should always worship in sackcloth and ashes.

However the principle of religious decoration is fully admitted in the introduction of stained glass figure windows; and its limitation there is only an imperfect carrying out of a principle, and the designedly imperfect carrying out of any principle is simply folly. We should never pretend to argue with any who maintain that a man who cannot satisfy himself with an abstract idea is necessarily material and sensual. Every worthy idea may be worthily embodied, and if an idea will not bear the test of embodiment then it is worthless, for the mind itself naturally embodies every idea that passes through it: a vague image is a proof of a vague idea. If the image of the mind is not vague, then the realisation of this image cannot impair the mental image, but on the contrary will supply a reality to those who unaided had but the vaguest notions.

If a religion is incapable of being substantially realised in its operations in Art, then it is clearly impossible to conceive a definite idea of what its operations are. This is not the case with Protestantism, its capabilities are infinite; and as it is not a religion remarkable for its ceremonial, its tendencies are of a more general

character than those of Romanism, which, dwelling much on its peculiar ceremonies, appeals rather to habit or education than to the more universal impulses of the heart; of all its peculiarities, however, it has hitherto dwelt most on penance, on mortification: Spanish Art is little more than one great exponent of Romanist asceticism; this is far not love, and under no condition can it be grateful to the human heart, except in that morbid state, exhibited in highest perfection, by the Indian Yogi.

Faith, Hope, and Charity, are all capable of being represented in Art; not in an abstract manner only, but on the contrary, far better in the form of practical examples, or by their works. Romanist Art exhibits many grand specimens, and these constitute one great class of general subjects which do not belong peculiarly to Romanism, but to Christianity itself; and every good example, might, without scruple, be adopted by Protestantism. Every virtue belongs to this category, and as an example of how a Protestant can treat such matters we may refer to Elty's great pictures lately exhibited at the Society of Arts, which are, and were expressly designed to be by the painter, illustrations of the practical operation of the several virtues represented; and how infinitely superior to cold abstract impersonations: the drama against allegory. There is scarcely a chapter in the sacred scriptures, which does not offer matter for a thousand of such pictures, each conveying an impressive and instructive lesson, without the aid of either peculiar dogma or prejudice. Profane history is almost equally rich without recourse to fiction, or those well-worn mines—*Don Quixote*, the *Merry Wives of Windsor*, and the *Vicar of Wakefield*; worthies it is to be hoped, who will be soon allowed some respite from the stage, as well as the clever handiwork of Charles II.'s laundresses. It is not one of the least of Elty's merits that he never did anything of this kind.

As a grand example of Faith, on this general practical system, and it is the only one worthy of a great painter, we may instance Raphael's picture of the "Transfiguration;" the woman's faith that the Apostles could cure her child. "Christ in the Garden," frequently represented by Romanist painters is another; as is also the woman anointing the feet of Christ with the spikenard that "might have been sold for three hundred pence and given to the poor," as suggested by Judas Iscariot, and this is Faith and Hypocrisy at once. Such subjects are clearly general, and belong no more to Romanism than to Protestantism. Such of the martyrdoms likewise as are not mere legends are the common property of every division of the Christian Church, more especially those which belong to the history of its early establishment; there might be a difference of method and accessory, but the subject itself, *ceteris paribus*, would be equally well treated by the Protestant as by the Romanist artist. And it is incontestable that all the greatest works of the Italian schools, and those of the widest reputation, are such, by reason of their *Catholic*,—of their general character,—and not their Romanist or special features; as for example, every work of Michelangelo, and nearly every work of Raphael's, if not by its subject, at least by its treatment.

There is nothing whatever peculiarly Romanist in the ceiling of the Sistine Chapel, or in Michelangelo's "Last Judgment;" they are equally approved by Protestant and Romanist critics, or rather, have met with more commendation from the Protestant than the Romanist. The case is identical with the cartoons at Hampton Court, the triumphs of Raphael's pencil; it is the Protestant critic that has accumulated glory on these works, because of their Catholic character. And it is from such works as these that Protestantism will take its cue, when once clear of its barren prejudices and antipathies. Their day has not gone by, it is only now coming on; Raphael was before his time, his best works, indeed, are so essentially human, so universal, that they are appropriate to the good of all times and countries, and to the English pre-eminently, unless we have attained that anticipated consummation when every sentiment must have reference either to cotton or to iron.

But perhaps a cotton cloth on an iron stretcher may satisfy the exigency, and Art escape.

In the whole Art of Venice too, the general prevails far over the special; there is little in the gallery of the Academy at Venice that the most fastidious Protestantism could take offence at. The same, indeed, may be said of the whole Art of the "cinq-ue-cents" schools, in which sense and sentiment are not only equally balanced, but everything is subordinate to Art. It was then only that Art was really perfected; it was freed from the trammels of Romanism, and this is what the Romanist critics have termed the profanation of Art. It has been declared that the "Dispute on the Sacrament," or the great fresco of the Theology, in the Vatican Stanza, was Raphael's last great work,—his subsequent productions are profane,—the School of Athens, the Heliodorus, the Attila, the Borgo, the Cartoons, the Transfiguration,—all!

Then to recapitulate, there is a general and a special character in Romanist Art which is derived from the combination of two distinct qualities, the Catholic or Christian, in its wider sense, and the Romanist or Sectarian, in its peculiar character, and all that is great in Art belongs to the former, and *ceteris paribus* again, might as naturally proceed from a Protestant school as a Romanist; that it has not done so yet is simply because that school is yet incipient. If, however, we inopportune Romanism of so much, what is left to it? Its ecclesiastical legends, its martyrdoms, its mortifications, its votive offerings, its conciliations, atonements, commemorations, and sacrifices; its ceremonies, its pomp, its seclusion, its monastic severity, and asceticism. These subjects make up the great numerical strength of Romanist Art, and these would be lost to a new school except as supplying occasional historical materials; but what would Art itself lose by surrendering these themes; or what the Roman Catholic churches by giving up the innumerable votive pictures with which they are disfigured; or what even would the great galleries suffer by losing their St. Jeromes, St. Antonies, St. Francis, St. Brunos, and a host of others, such as may be specially treated, if their places were supplied by pictures of a universal character of sentiment, such as some instance above. The churches would be infinite gainers, and the great galleries would convey a far more agreeable impression, and allow their visitors to pass out glad in their hearts rather than in a gloomy reverie on the miseries of humanity, wondering why such things are, and whether their day will ever pass away. Who can enter the very fine gallery of Bologna, as regards the display of technical skill, without being impressed with the unhappiness of life in general, and of the Bolognese in particular. The pictures are almost exclusively Bolognese, and they are almost exclusively of a miserable tendency—their very tone is that of gloom and despondency; all is mortification, conciliation, sacrifice. One would think that these painters or their employers thought, that to be glad or to rejoice was wicked, so sedulously have they excluded joy or love from their works; they are the offspring of a religion of fear—not of love. And it is for such works as these that Art is especially indebted to Romanism, and it is in this province only that Protestantism will be found deficient in its capabilities with reference to Art. Assuming this peculiar development to be highly objectionable, and even injurious to the human mind and to progress, we must maintain that the capabilities of Protestantism are infinitely superior to those of Romanism as hitherto experienced. It is owing to these peculiar Romanist expressions that there has as yet been no great Protestant school of Art; Art has not yet surmounted the great barrier of prejudices which these very works engendered against itself.

As to the want of ceremonies in the Protestant churches, this is but a slight drawback to the development of Protestant Art; that is but the shell of Art which depends upon mere outward form or costume, and all ceremony and all costume, of whatever faith or people, is common property in historical matters. Protestant Art is therefore not deprived of this

interesting source of the picturesque, though it is really a very secondary matter. As Church ceremonies are not such subjects as Protestantism can dwell on, it is less likely to waste its energies on anything so hollow, but will reserve them for more real and more natural states, in which the far more picturesque and more varied civil costume will be ever at its service.

The above is a mere sketch of a very interesting and, to Art, important subject; we leave others to prosecute the enquiry further. Of course, we do not anticipate the conversion of those who assume that the Protestant Church is of that inherent spiritual character that it can and will dispense with all forms and ceremonies whatever, whether in worship or in Art; or that no illustration of the practical operation of any love, or grade of charity, can be in the least degree enlightened or strengthened by the Art of the painter. Assuredly no labour is thrown away, and least of all, the labour of that beautiful Art, which cannot appeal in vain even to the infant; and with this we leave the subject, exhorting artists to dwell in the spirit of their religion, and not in the revival of a dead ceremonial, or the affected resuscitation of the old *quattrocento* form of Art, a shell, of which the kernel has been consumed these four hundred years past.

R. N. WORNUM.

THE VERNON GALLERY.

SIR THOMAS MORE AND HIS DAUGHTER.

J. R. HERBERT R.A. Painter. J. OUTRIN, Engraver.
Size of the Picture, 3 ft. 7½ in. by 2 ft. 9 in.

In this picture Mr. Herbert has selected a subject which, as a passage of history, possesses little material for the powers of an historical painter; yet, from its very simplicity, and from its exhibition of elevated character it is one of great interest.

In the year 1534, Sir Thomas More, who succeeded Wolsey as Lord Chancellor, which office he held till his resignation in 1532, was committed to the Tower by Henry VIII. partly to punish him for refusing to assist that monarch in his marriage with Anne Boleyn, but particularly because he declined to acknowledge the king's ecclesiastical supremacy as head of the Reformed Church—More himself being a zealous Roman Catholic. Here he remained till he was brought to trial, condemned, and executed in the following year. "During his imprisonment," says his son-in-law and biographer, Roper, who married his favourite daughter Margaret—"one day looking from his window, he saw four monks (who also had refused the oath of supremacy) going to their execution, and regretting that he could not bear them company, said, 'Looke, Mezge, dost thou not see that these blessed fathers be now going as cheerfully to their deaths, as bridegrooms to their marriage? By which thou may'st see (myne own good daughter), what a great difference there is between such as have spent all their days in a religious, hard, and penitential life, and such as have (as thy poore father here hath done) consumed all their tyme in pleasure and ease:—' and so he proceeded to enlarge on their merits and martyrdom. "By which most humble and heavenly meditation," writes another of his biographers, his great grandson, Cressame More—"we may easily guess what a spirit of charity he had gotten by often meditations, that every sight brought him new matter to practise most heroicall resolutions."

As we have said, there is little here to draw forth great expression of character, and yet what more noble expression can the human features take than that which shows them serene and resigned under injustice and the prospect of an untimely death? Erasmus, his friend, says—"With More you might imagine yourself in the company of Plato;" but the unaffected piety of the former was based on safer and more solid grounds than the philosophy of the Greek, and sustained him under trials to which the latter was not subjected. A calm submission to his fate, whether of life or death, is what we should look for from the character of More, in the circumstances wherein he now stands; so that the melancholy procession to which his eyes are directed is not trouble to him, though foreshadowing, as he believes, his own doom, while to his daughter it is too painful to be looked on. Mr. Herbert has made these feelings abundantly manifest in his work, which is altogether an excellent example of one of our best historical painters; it is dignified and eloquent.

SOCIETY OF BRITISH ARTISTS.

TWENTY-SEVENTH EXHIBITION,—1850.

The twenty-seventh Exhibition of the Society of British Artists consists of 735 works, including miniatures and sculpture: the collection, as heretofore, taken as a whole, is by no means a satisfactory proof of the progress of the British School; but among the paintings here gathered there are many which possess high merit, and confer honour upon the respective artists: we have, indeed, but little evidence of advance, nor will it be expected in this Society, inasmuch as while every now and then one of its most effective members drops off from the body, there seems to be no indication that we are to be compensated for such defections by an augmented accession of strength from without. With the Royal Academy on the one side, and the National Institution on the other, we fear we must consider the Society in Suffolk Street to have seen its best days: that it has been useful no one will deny; but that it has been usually subjected to ill management is quite as certain: the acquisition of a charter appears to have conferred upon it no great benefit; its schools are, we understand, deserted if not abandoned, and we may deplore as a calamity to Art, that decadence, which timely care, consideration, and liberality might have prevented.

The few "good men and true" who cleave to the society will not be sufficient to sustain it, unless some steps are taken to obtain the co-operation of others as strong in power and popularity.

The Exhibition this year if equal, is certainly not superior, to the exhibitions we have witnessed in Suffolk Street during the last four or five years.

No. 9. 'On the French Coast—Fishing Boats coming In,' J. WILSON, Jun. This artist now professes himself a painter of marine subjects, and those which he exhibits in this department possess even a higher power than he has shown in landscape. The sea in this picture is on the right; the left of the canvas is occupied by houses and harbour scenery. The water and sky are charmingly painted; we see the movement in both, and feel the breeze by which it is excited. The light on the landscape is too sparingly dealt with: the effect would be much enhanced by its passing over the quay.

No. 12. 'Portrait of George Clint, Esq.,' C. BAXTER. A striking resemblance, and full of animated intelligence.

No. 19. 'Interior of a Stable,' J. F. HERRING. The principal tenant of the stable is a well-conditioned grey horse; the subordinates are a dog, a goat, a cat, and a varied "assortment" of ducks. In the painting of the horse's coat the good old classic rule about the concealment of the art is successfully carried out; no artist ever painted straw, ducks, tares, and a stable-lantern with so much truth as this painter.

No. 20. 'Sunset Scene in Holland,' A. MONTAGUE. The old Dutch painters did not know the wealth they possessed in the dirty, picturesque houses that overhang their muddy waters. A block of these occupies the right of the composition, and a boat, with a crew of women, is pulling in. The colour here is much richer than the proper local colour, a circumstance pronouncing favourably for the skillful treatment of the material.

No. 23. 'The Folly of Extravagance,' E. PRENTIS. We are here shown how a gentleman, having wasted his patrimony, is compelled with his wife and child to quit the halls of his fathers. The scene is the entrance hall of a mansion; and, as usual in the works of the painter, we find every item of the composition painted with the most scrupulous nicety. The subject is however by no means agreeable; and the subject is not told with truth.

No. 31. 'Ehrenbreitstein,' J. B. PYNE. The view presents the fortress from the opposite side of the river, under an aspect of sunset. The sky is warm and clear, and the castellated height is coloured by the red rays of the departing sun. The picture is, as usual, painted in a very high key, and is remarkable for brilliant

colour. The artist contributes also 'Thames Recollections,' 'The Wreck Ashore,' &c.

No. 38. 'Portrait of the son of Edward Hopwood, Esq.,' F. G. HURLSTONE. This is a boy carrying a pup, the mother of which, a fine hound, is looking anxiously after her offspring. The youthful figure shows a more careful manner than has been seen in the works of the painter of late. The dog is admirably painted by Ansdell. Mr. Hurlstone exhibits, in all thirteen pictures, every one of which is more carefully painted than others he has recently executed.

No. 42. 'The Minstrel,' A. J. WOOLMER. Two figures, a lady and the minstrel—the former a repetition from a picture of last year. There is often much in the works of this painter that approximates very closely to great excellence, and again much that is unintelligible. Parts of this picture are in every thing unexceptionable.

No. 54. 'Study at Trefriw—North Wales,' A. CLINT. This is a captivating passage of river scenery—a wild nook luxuriant with trees and effective herbage, and abounding with stones that encumber the water course. It is a subject of a class different from that to which this artist has hitherto devoted himself, and it seems to have been painted on the spot. It is highly successful in its close imitation of nature. Five other works are exhibited by the artist, some of which are close river scenes.

No. 50. 'The Usurer,' D. W. DEANE. A small study of an old man, beautiful in colour, and distinguished by a very skilful disposition of chiaroscuro.

No. 60. 'Railway—by Moonlight,' J. TENNANT. There is little of pictorial sympathy between the two propositions of the title. The moonlight effect is rendered with much truth and fine feeling, the light being repeated in the water of a stream, which occupies the near breadth of the canvas, and on the right bank of which is seen the train, an association that vitiates the sentiment of the principal effect. The works of this painter are more substantially natural than perhaps at any preceding time. His 'View near Chiswick,' cannot be surpassed in the qualities of light, lustre, and tranquillity.

No. 70. 'The Pilot Boat,' J. WILSON. An unhandy looking craft, but probably a good sea-boat. She seems to have just dropped astern of the ship with which she may have left the harbour. This is a large picture, sharing largely in the spirit, accurate balance, and other good qualities, which distinguish the works of its author, to all of which double value had been given by a more careful finish. There is much truth in the water, and probably no artist ever arrived at a similarly happy result with apparently so little labour; it is this easy felicity in the water which demands for the sky, the distance, and the objective, a greater amount of care. This artist contributes many pictures, some of which remind us of early works.

No. 75. 'Poulterer and Dealer in Game,' J. F. HERRING. Mr. Herring presents himself here as, in legal phrase, the "licensed vendor;" but his fowls have generally gone off so well in their feathers, that we had thought it altogether unnecessary to offer them plucked. We humbly submit that these rows of plucked fowls detract from the value of the composition, the execution of which is equal to the very best works of the golden period of the Dutch school.

No. 85. 'On the Greta—Coast of Cornwall,' S. R. PERCY. We transcribe the title as we find it, not without a misgiving that some printer's Pack has been amusing himself by confounding the geography of the catalogue. The Greta that we wot of is a Yorkshire stream, so jealously beloved by the neighbouring trees, that they annually enshrine her in a temple of verdure. The subject is a passage of close river scenery, painted with an earnestness of tone perhaps a trifle too grave. The truth, substance, and power of the work would have been displayed to greater advantage by a little more light.

No. 86. 'The Deserted,' J. H. J. MANN. A study of a female figure accurately drawn, and painted in a manner careful and substantial.

No. 87. 'A Bacchanalian Dance,' W. SAITZ. In this *xopos* of nymphs, the artist surpasses everything of the same class which he has yet

exhibited. The figures are numerous, variously disposed, and display brilliancy and life-like warmth in flesh painting. The draperies, which are worked up to the highest key in colour, display in arrangement of line, and association and opposition of tone, much successful study. This name is appended to other works of much merit.

No. 90. 'Derwentwater—Cumberland,' J. A. HAMMERSLEY. A passage of scenery selected with a fine feeling for the picturesque, and treated with a becoming sentiment. It exhibits in colour, in comparison with preceding works, that improvement consequent upon greater harmony and maturity of tint.

No. 94. 'At Lily's, the Painter's, and see the Portrait of the Duchess of York. I hence to my House, where I took great Pride to lead her through the Court by the Hand, she being very fine, and her Page carrying up her Train,' J. NOBLE PEPPYS is here presented to us *en bourgeois gentilhomme*. He is attired in a black coat, with nether ceremonials, also sable. His pride and pleasure are shown in the manner in which he conducts Mrs. Peppys through the court. She is, as he observes, "very fine," being dressed in white satin. There are other figures in the composition which contrast unfavourably with Peppys and his wife, inasmuch that they were better absent. The principal figures are much in the spirit of the text.

No. 97. 'Summons to Milking,' A. R. C. CONNOLD. One of the most forcible animal pictures we have for some time noticed. It contains two cows, simply accompanied by some willow pollards, and a few items, such as might be seen from a farm paddock. The cows are finely painted, and the effect and execution are striking and masterly.

No. 100. 'Waterfall near Haeg, between Christiana and Bergen—Norway,' W. WEST. The features of this composition are essentially different from those of the scenery of our own country, and of that which we are accustomed to see as the subject-matter of the majority of our landscape essayists. It represents a waterfall brought forward under a breath of light, inasmuch as to show the minute and careful drawing and painting of the prominent portion of the picture—that is, a ledge of the rock, over which the water is precipitated—and this is rendered with a truth that the most fastidious geologist cannot challenge.

No. 101. 'Portrait of his Grace the Duke of Manchester,' T. H. HILDGE. The figure is presented as the size of life, the pose is erect and easy, and the general treatment unaffected, a rare merit in these days.

No. 107. 'Portrait,' J. BARCLAY. This appears to be a portrait of a veteran member of this society, a marine painter, the petrel of the North Sea. The head is carefully painted, and the resemblance sufficiently striking.

No. 115. 'The Shower,' E. J. COBBETT. The title is admirably supported by the treatment of the picture, which, like all those of its author, bears the freshest impress of nature.

No. 117. 'Hazy Morning on the Thames, near Medenhall,' H. J. BODDINGTON. The works of this painter usually present, as a rule, an aspect of subdued light, but here we have—maugre the filmy haze—an uncompromised breadth of daylight. The picture is large, and so luminous, that we feel the sun to be somewhere near, and look for him with shaded eyes through the mist. The near sedges, water docks, and shaded pool, are painted with fine feeling, as is the meadow on the left bank.

No. 118. 'A Portrait,' H. MOSELEY. That of a lady, a life-sized figure, standing in a pose easy and graceful; the features, which bespeak the inward intelligence, are painted with much life-like freshness.

No. 121. 'Winter,' A. MONTAGUE. Certainly in effect the best production of the artist. The materials consist only of a few ragged old houses, a figure or two, which, by the way, should have been in motion, for it is very cold there—and a few patches of snow, with some inconsiderable items. It may be said to be easy to paint frost pictures, yet if it were so we should see more than we do, of commendable quality.

No. 124. 'The Village Pastor relieving the

Poor,' J. GODWIN. The prominent impersonation in this composition, is that favourite character of Goldsmith, the country clergyman. The immediate text is from the *Deserted Village*—

"His house was known to all the vagrant train,
He chid their wanderings but relieved their pain;"

and hence we find him busily ministering to the necessities of every variety of vagrant. He has all the benevolence of Goldie himself, and his guests are in everything up to the utmost latitude of the reality.

No. 125. 'A Recollection of the Alps,' J. N. DE FLEURY. The scene is a wild mountain pass, which rises from the foreground to a rocky ridge closing the view. It abounds with passages of fine colour, and the definitions show the earnestness with which it has been studied.

No. 144. 'Windings of the Wye and its Junction with the Severn as seen from Windelyfe,' H. M. ANTHONY. We cannot concur in the epithet "eccentric" in application to this picture; we see nothing in it but a singularly enthusiastic interpretation of nature which has led to results that it is most probable will never again be seen in the works of this artist. The *last glace* has rendered the shades so impudently as to force them perhaps too much, but when the eye is relieved of them, nothing can be more beautifully true than the description of the Severn, which traverses the canvas into distance; portions also of the Wye and the country beyond are charmingly painted. The subject is one of high and honourable ambition, it is rendered in a manner purely original and independent of all antecedent examples of art, and the errors of the work are those of an intelligence of no ordinary power.

No. 150. 'In the Park of St. Cloud,' J. D. WINGFIELD. A small picture with figures in picturesque costume, characterised and grouped with much taste.

No. 161. 'Putting on the Headdress (Panno),' F. W. HURSTON. This is a life-sized figure, representing an Italian woman putting on the well-known head-gear of the peasants of Italy. There is in the study, animation, movement and character, inasmuch as to constitute it the best of this class of work lately exhibited by the artist, and forcibly reminding the spectator of those which years ago were exhibited under this name.

No. 177. 'Lanc Scene,' E. WILLIAMS. The subject is extremely simple, but it is rendered in a manner perfectly natural, and distinguished by the neat execution which prevails in the works of this painter.

No. 187. 'An Interior,' J. C. GOODEN. Small and very sketchy, but admirable in colour and effect.

No. 191. 'A Winter Night in the Highlands,' F. K. FAIRLESS. This is an interior with two figures seen by the light of a fire; the manner is free, but the effect is full of truth.

No. 196. 'Cooper's Hill with Windsor Castle in the Distance,' J. W. ALLEN. This is a large picture in which is represented a great extent of the fertile and beautiful country in the neighbourhood of Windsor. In the left distance appears the castle and on the right is seen the Thames, the line of which is screened from the eye by intervening objective towards the centre composition. The sky presents two aspects; on the left it is clear and tranquil, on the right a rain cloud breaks over the middle distance. The subject has been carefully studied, and the veritable face of the country is faithfully described.

No. 200. 'Gustavus Smith, Esq., Salcombe Mount, Devon,' T. W. MACKAY. A portrait of no ordinary merit; the head is most accurately drawn, and brought forward in a manner at once forcible and unaffected.

No. 231. 'An Italian Mother and Child,' A. JENOME. These two figures are well drawn and firmly painted, but the poses and general treatment are too apparently like those of the *Madonna della Seggiola*.

SOUTH-EAST ROOM,

No. 209. 'The Fisherman's Home,' T. CLATER. An interior, with the fisherman and his wife, both figures lighted by a bright fire; the effect is faithfully rendered.

No. 232. 'Il Reposo,' A. J. WOOLMER. A small round composition with two figures, Mary and Joseph, with the Infant Jesus. The sketch contains quality which would be charming if accompanied by careful study.

No. 236. 'Portrait of Isabella Stewart,' C. BAXTER. This is a head, a production exquisite in every quality valuable in portrait-painting. It is beautiful in colour, animated in expression, and truly simple and natural in general treatment; so much simplicity and sweetness are rarely seen.

No. 241. 'Winter,' E. HASSELL. The foreground of this composition seems to be an orchard or paddock, a little beyond which is a mill and a farm-yard. The ground is covered with snow, and many aged trees are dispersed in their nakedness on the left of the composition; these with their trunks and branches are painted with infinite dexterity.

No. 245. 'Hungarian Peasant Girl,' J. ZETTER. She leans against a bank, waiting till her water pitcher be full. With a little more care, and less of the cold and grey tones with which the artist works, this sketch would be much improved.

No. 246. 'Crossing the Stream,' J. J. HILL. A study of a country girl, barefoot and bare-headed, carrying a child under her arm across a rivulet. The movement of the figure is free and natural; it is accurately drawn and harmoniously coloured.

No. 252. 'Pastoral Repose,' H. M. ANTHONY. This is a study possessing qualities of a very high order; the immediate foreground consists of grass and aquatic herbage growing on the bank of a river or stream, beyond which rises a screen of trees, which closes the view, with the exception of a glimpse here and there between the masses of foliage. These principal elements, the trees, water, and strip of foreground, combine in a beautiful passage of the most perfect unity. When we say that the truth of this picture resembles very much a Talbotype, its character will be at once understood.

No. 256. 'Study of a Head,' W. GALE. Small and very carefully finished, elegantly dramatic in taste, and studiously refined in sentiment.

No. 257. 'Evening—a Woodland Dell,' E. HASSELL. A small picture, the subject of which is a close wooded scene presented under an evening aspect. It is agreeably painted.

No. 261. 'The Cottage Door—Winter,' J. WILSON, Jun. Simply the gable end of a farm house, with trees and accidental objective brought forward under an aspect of frost and snow. This is a companion to another picture showing the same house surrounded by the luxuriance of summer. These pictures are perhaps the best of the *terra firma* subjects the artist has painted.

No. 268. 'On the Leder—North Wales,' W. WEST. The stream winds over a rocky bed which is shut in by hills, the circumstances constituting a composition of much pictorial interest. The limpid current, and the stones and rocks are rendered with infinite truth.

No. 274. 'River Scene—Moonlight,' E. WILLIAMS. A small picture, in which the artist displays great power in dealing with this effect.

No. 306. 'Robin Hood's Bay—Yorkshire,' J. DANBY. Seen under an effect of sunset which appears to have been studied immediately from nature. The manner is free, but somewhat too crisp.

No. 307. 'Evening on the Thames, near Medenhall,' J. D. WINGFIELD. This in effect is certainly the best production we have ever seen exhibited under this name. A gaily ornamented barge is moored at the river-side, where has landed a picnic party wearing the costume of the last century, some walking, others yet seated on the green sward. The picture has been everywhere very carefully studied.

No. 322. 'Landscape and Cattle,' E. J. COBBETT. This picture being small is too high for inspection; the cattle appear to be on the bank of a stream, on which is also a group of trees. The rays of the afternoon sun enter the picture on the left, shedding a mellow light over the whole; this aspect is admirably sustained throughout.

No. 332. 'Thames Barges and Shipping beating

to Windward,' R. H. NIBBS. We are here in some reach below Gravesend with a barge carrying a tanned lug-sail directly a-head, and a schooner, a bark, and other craft at no great distance. The barge is the principal object, it is carefully drawn, and the whole is characteristic of the river.

No. 334. 'Fresh from the Lake,' H. L. ROLFE. A dish of fish, composed of trout, perch, and small ebb, painted with more of the freshness of actual life than we have ever seen in this department of Art; nothing can exceed the success with which the colour and brilliant scaling of the fish are imitated.

We regret that want of space compels us to close our notice of this Exhibition with the titles only of other works possessing various degrees of merit, as 349, 'Fruit Piece,' by W. DUFFIELD; 366, 'Too Late,' J. W. GLASS; 375, 'Glen Massan, Argyleshire,' 397, 'Tower looking towards Denzy, near Cologne on the Rhine,' J. V. DE FLEURY; 498, 'Gillie and Pony,' T. J. BARRETT; 420, 'A Study,' J. HARRISON; 460, 'Milton and his Daughters,' A. J. WOOLMER; 529, 'Boats in Leigh Bay,' J. C. GOODEN.

In the Water-Colour Room may be instanced—551. 'The New River at Cauobury,' W. W. FENN; —. 'Hollybocks,' V. BARTHOLOMEW (an exquisite group of flowers); 567. 'Interior,' G. POPKIN; 583. 'Interior of a Welsh Cottage,' S. READ; 600. 'Sketch of Mrs. Mowatt, the American Actress,' Miss Fox; 611. 'Brooch Miniatures,' Mrs. V. BARTHOLOMEW; 620. 'Cleopatra,' Miss C. E. F. KETTLE (a miniature historical composition of great merit); 679. 'The Great Staircase, Aston Hall,' A. E. EVERITT.

The Sculpture is limited to six productions, contributed by F. PEYFFERS, D. HEWLETT, and C. FOX.

THE NATIONAL INSTITUTION FOR THE EXHIBITION OF MODERN ART.

This institution—in its obtrusive static called the "Free"—has grown into importance as rapidly as any other of its class, even under circumstances peculiarly favourable. This will assuredly be deemed the *annus mirabilis* of its minority; with its new name and new locality it assumes a sudden power which astonishes its creators not less than its long-standing friends. The private view was afforded on the 12th of April, with arrangements for the comfort of visitors which cannot be surpassed. The number of works of Art is three hundred and seventy-three; it may be said that the list is not long—it will also be said that there are no really objectionable pictures, and certainly not an inch of "screaming" canvas on the walls. On the other hand, there are pictures that would confer honour on any school—on any period—works distinguished by qualities that reach the high-water mark of the best times of painting. With unity and liberality in its councils this institution must flourish; but if it become a hermetically sealed society, with intestine divisions, melancholy experience warrants the assumption that it will decline in popularity and respectability; and then no human effort can save it. The youth of the National Institution is healthy and promising; we sincerely pray that its maturity and age may be honourable. We shall endeavour to do as much justice to the collection as our limited space will permit.

No. 2. 'A Highland Ford—Lochaber,' R. R. M'LAN. The scene, and the figures from which it derives life have been carefully studied from nature. A company of Highland wayfarers, apparently returning from hunting, are about to ford a stream, which lies in their homeward passage to the neighbouring chacean. The gillies, dogs, and the landscape in which they are circumscribed are all purely characteristic.

No. 7. 'Portrait of Mrs. Hoole and Children,' J. G. MIDDLETON. The lady and the elder of the children are agreeably grouped. The heads of both have been profitably studied—that of the latter is eminently successful.

No. 8. 'Mill at Nafford—Worcestershire,' W. E. DIGHTON. The material of this picture is of the simplest kind, and the feeling with which it is brought forward is an honest and unaffected desire to realise a veritably natural aspect. The near section is occupied by the waters of a mill pool; the mill itself is on the left, and beyond this and the water rises a screen of trees. The movement, depth, and lustrous surface of the water are rarely seen so felicitously combined as in this work.

No. 19. 'Dressed for Conquest,' M. WOOD. A small figure—an ultra-fashionable lady of the last century, whose taste, like that of the actor in the epigram, is to "rustle in French silks." She is giving the last adjustment to her touzour before the glass. The figure perfectly sustains the spirit of the title.

No. 22. 'Don Quixote entertained at an Inn, which he believed to be a Castle,' R. W. BUSS. The burlesque is well met in the composition; in the full enjoyment of the error which he has committed, we find the Don seated, still wearing his casaca, and drinking from the long tube which the landlord has inserted into his mouth. All the figures contribute to the prevalent vein, and the minor objective is appropriate.

No. 27. 'Thought is free—Caliban, Ariel, and his Fellows,' A. FUSSELL. The subject of this picture is derived from Caliban's description to Stephano—

—"The isle is full of noises,
Sounds and sweet airs, that give delight and hurt not;
Sometimes a thousand twangling instruments will hum
About mine ears," &c.

We find accordingly the gentle monster asleep, and the spiritings of which he speaks are realised by Ariel and an atmosphere of shapes that descend upon, and hover over him. The picture evidences an excursive and fertile imagination, but it seems to have been worked out under certain misconceptions, which injure its composition and effect.

No. 29. 'Wood Scenery,' P. W. ELEN. The subject is simply a road shaded by trees, the substance and masses of which are judiciously relieved by the alternations of light and shade. This is the best picture we have seen exhibited under this name.

No. 30. 'Fruit Piece,' W. DUFFIELD. Consisting of a pine, some red grapes, plums, &c., all painted with the most perfect truth.

No. 31. 'The Graces,' W. BARRAUD. These are the heads of three fox-hounds grouped in good taste, well drawn, and full of animation.

No. 34. 'On the Banks of the Thames, near Hurley,' A. GILBERT. A passage of river-side scenery, in which is conspicuous a row of pollards, a favourite feature in the works of this artist; the foreground is a most successful transcript from nature.

No. 35. 'Fishermen's Children on the French Coast,' E. J. CORBETT. The composition to which they give life is a coast view, affording as a foreground, a portion of a green bank descending to the shore, which throws off into distance a continuation of the same sea-bank. The little figures are painted with a brilliancy and firmness which contrast favourably with the airy sweetness of the distance; it is the best picture of its class that has ever been exhibited under this name.

No. 39. 'An Old Mill,' F. W. HULME. An ancient and dilapidated structure, flanked on the left by a dense group of trees; the ragged little building is made out with infinite care, and coloured with much sweetness.

No. 41. 'Noon,' A. W. WILLIAMS. This is the most important composition that has yet been essayed by this artist. The title is accompanied by a quotation from Thomson's Seasons, but the picture is not, we believe, in anywise imaginative, being entirely wrought after studies of Welsh scenery. It is professedly a warm landscape, its aspect proclaims the maturity of the year and the prevalence of the yellow, but not the serene light. The foreground is a piece of rough herbage forming the bank of a river which traverses the composition and beyond which are a group of trees telling in relief against the neighbouring mountains, one of which lies in shade on the right. The triumph of the picture consists in its colour and play of light, the sun

is clouded, but here and there, now on the trees, now against the hill side, the fitting rays shoot down with enchanting effect; this work in short is transcendently rich in colour, masterly in execution, and wrought out in right earnest research of a solution of some of the most difficult of nature's problems.

No. 42. 'View near Huddersfield,' J. PEEL. The right half of this picture is closed by trees, the left is open to distance. The foliage tints are mellowed; in comparison with those of preceding works, the touch is peculiarly crisp.

No. 45. 'Gallioti shoving to Louis XI. the first Specimen of Printing,' R. S. LAUDER, R.S.A. The subject, it will be remembered, is from Quentin Durward—Gallioti startsles this French Tiberius by foretelling to him the future influences of the new invention, but the latter is consoled by the persuasion that the mighty revisions will not take place in his time. The king is seated, he wears a buff tunic over a mailed jerkin, and points at the characters on a scroll held before him by Gallioti, who offers a striking contrast to the successfully sinister description of Lonis. The philosopher is a fine commanding impersonation, attired in a black robe, and remarkable for his firm and upright bearing—a qualification which has the effect of enhancing the demerits of the villainous compound which the painter so forcibly presents to the spectator. The head of the king is an admirable study, and the canvas otherwise is most worthily devoted, as everywhere entertaining the eye with picturesque and appropriate material.

No. 50. 'Outskirts of an English Village,' J. C. BENTLEY. The prominent object is a wooden bridge, beyond which is seen a village church with other objects combining in agreeable composition. The picture is rather large; it is painted with much firmness, and evinces a close observation of nature.

No. 55. 'Here's his Health in Water,' R. R. Mc. LAN. This is an incident of the '15, one of the years of the last century held memorable in the Highlands. The scene is the interior of the prison in the Castle of Carlisle, where we see a Highland gentleman in chains whom his family has been permitted to visit. He drinks the health of James the Third, in which his son joins him; the lesson will remind the spectator of that given by Hamular to Hannibal. The wife, with a younger child, sits weeping by the side of the prisoner; and an elderly lady, his mother, stands on the left. The story is emphatically told, the point touchingly dwelt upon, and in power the picture far exceeds all that have preceded it by the same hand.

No. 57. 'Samson, a Study,' E. ARMITAGE. "Aud Samson caught an hundred foxes, and tying firebrands to their tails turned them loose among the Philistines' corn." The passage is read simply and literally; Samson, a figure of heroic size, stoops to seize the foxes; he looks round with an expression rather of apprehension than of malignant triumph. The style of this figure is that of the French school; it is impossible too highly to appreciate the nerve and firmness which it derives from its vigorous and beautiful drawing. The head is a masterly study, but it wants the reflection of hatred of the Philistines. This admirable figure seems to constitute a part of some larger composition.

No. 58. 'On the Thames, looking towards Priney,' E. WILLIAMS, Sen. This is a moonlight view, a phase in which this artist eminently excels; the success of the vapoury atmosphere and clouded sky in this picture is perfect, and not less true is the manner in which the light is broken on the trees, water, and near objects. The painter is, we believe, among the patriarchs of the profession, but he never could have painted more effectively.

Nos. 61 & 62. 'Cupid and Psyche,' DESANGES. Two small compositions, showing the two figures in different relations; both sketches are powerful in colour and charming in effect.

No. 65. 'Medueham Abbey—Evening,' G. A. WILLIAMS. The Abbey is seen from the opposite side of the Thames, and a very forcible effect is realised by the contrast between the deeply toned buildings and trees, and the bright evening sky. The treatment of the water and near

objective contributes to the intensity of the focus of light and colour.

No. 72. 'Landscape,' NIEMANN. The works of this artist present a marked difference from those of antecedent periods, inasmuch as they are characterised by a much greater sobriety of tone and colour. This is a large picture, and it appears to be a composition, but extremely simple, as consisting of only two principal parts, the left section closed by trees, and the right opening into distance; the forms are few, but they are effectively employed, and nowhere invalidated by any minute manipulation destructive of breadth. It is a solitude; there is no trace of life—a denegation which, together with its profound gravity of subject, contributes to a sentiment more profound than its author has reached in any former production.

No. 75. 'The Nest of Birds,' E. J. COBBETT. Two youthful figures circumscribed in a very sweetly coloured piece of landscape.

No. 76. 'The Highland Coronach,' R. R. M'LAN. This is unquestionably, hitherto, the best production of its author; it describes the lament over the body of Niel Macdonald, son of the Laird of Achtreachtan, "indweller of Glenoco," who was "shot unto death" on the hills between Glenoco and Fasnacloich. The scene seems to be the summit of the hill where, it may be, he met his death; the body lies upon a portion of rock, and a brother or clansman, the prominent figure, kissing, apparently, his *alene Glas*, vows to avenge the death of his kinsman. The action of this figure is most energetic, and the dire oath even reaches the ear of the spectator. The assemblage of mourners is numerous, and the voice and gesture of each impersonation contribute effectively to the narrative; the figures have been all most carefully studied, and the mountain scenery, especially the nearest rocks and ground, cannot be surpassed in truth.

No. 82. 'Portrait,' A. CORNOULD. A small three-quarter length portrait of an artist, in oil; it is very forcibly painted, and infallibly striking in resemblance.

No. 86. 'Fishermen on the English Coast,' E. C. WILLIAMS. A large picture presenting every characteristic of coast scenery. The right of the picture is occupied by boats, cottages, figures, and appropriate material, and the left opens to the sea, over which the sky is left with a coming storm; the whole is painted with firmness, and the colour is agreeably harmonious.

No. 87. 'New Forest, near Lyndhurst,' Mrs. OLIVER. A small picture in which the eye is carried into distance from an eminence whence a road descends into a valley; trees occur in the near and remote parts of the view; the distances are well defined, and the execution evinces much improvement.

No. 89. 'The River Side,' F. W. HELME. A small picture, simple in component, but exhibiting increasing decision of manner.

No. 93. 'The Castle of Indolence,' D. V. DEANE.

"—Where sooth to say,
No living might could work us cared even for play!"
The distribution of figures occurs here in a scene partially open, those grouped on the left are accompanied by luxurious accessories and do ample justice to their "pleasing land of drowsyhead." On the right there is a passage of much sweetness formed of a group of those engaged in the serious occupation of *far niente* within the contiguous shade cast by a sculpture of the loving twain, Cupid and Psyche. The colour and execution of the picture are of great excellence.

No. 94. 'A Hunting Morning,' W. & H. BARRAUD. A large picture wherein is shown a grey hunter, the rider of which is being equipped with his spurs. The work shows an advance upon those that have preceded it.

No. 98. 'Fruit Piece,' W. DUFFIELD. Painted with imitable freshness and colour. This artist represents half an orange with a juicy delicacy that excites the thirst of the spectator.

No. 100. 'The Homestead—Scene in Kent,' R. BRANDARD. A farm-yard with house and outbuildings, drawn with elaborate accuracy and coloured with a harmonious variety of tint. The subject is extremely simple but is rendered highly attractive by its colour and chiaroscuro.

No. 102. 'A Canal View—Yorkshire,' J. PHEL. A composition simply according to the title; the picture is large and contains on the left a broad study of trees, the foliage of which is painted in a manner approaching perhaps an undue degree of crispness. The glimpses of distance are judiciously disposed.

No. 106. 'Marie Antoinette with her Children escaping by the Secret Door from her Apartment in Versailles when the Palace was attacked by the Mob,' M. CLAXTON. The subject is from a remote source, but it is nevertheless the best production we have of late years seen exhibited under this name. It is large, the resemblance to Marie Antoinette is at once determinable, and the narrative is sufficiently perspicuous.

No. 107. 'The Beau,' J. D. WINGFIELD. Three figures appear in this work, two ladies and a gentleman, the latter saluting the former as "the beau," according to Goldsmith's description in the *Citizen of the World*. The scene is a garden terrace, which with all its relations is brought forward with the usual good taste of the artist. The costume of the figures is in the piquant fashion of the last century.

No. 108. 'Lowering Weather on the Thames,' G. A. WILLIAMS. A small picture in which the threatening sky is happily responded to by the tone and feeling prevalent in the lower part of the subject; which, although simple, is highly attractive from the manner of its treatment.

No. 111. 'Aqueduct crossing the River Aire at Shipley, Yorkshire,' J. CLAYTON BENTLEY. The subject is judiciously selected for picturesque association—the river expands and occupies the lower breadth of the canvas. The lustrous reflection of the sky has been successfully imitated in the water, and everywhere the eye is gratified by brilliant and harmonious tones.

No. 116. 'A Study,' L. W. DESANGES. This is a female head wearing a coronal of vine leaves and grapes; it is charming in colour and strikingly original in style.

No. 119. 'At Rowe—North Wales,' Mrs. OLIVER. This picture exhibits, especially in colour, a marked improvement upon preceding works.

No. 142. 'A Study on the Gliderfaw—North Wales,' W. E. DIGHTON. This, like all the works of the artist, appears to have been painted on the spot; he is happy in his selections of passages of living nature, which are ever ennobled by his firm masculine style of working.

No. 143. '*** W. DEVERELL. The subject of this picture, to which no title has been given, is found in the fourth scene of the second act of "Twelfth Night, or What You Will." The particular incident being the Clown singing to the Duke:—

"Come away, come away, Death,
And in sad yew-tree let me be laid," &c.

The Duke is seated listening to the Clown, in a pose which, we humbly submit, detracts from the dignity and gentlemanly bearing of the character. The singer is on the left of the Duke, and near them are Viola and Curio, and on the outside (for the scene seems to be, not a room of the Duke's house, but a gallery open to the garden), are musicians in oriental costume. The manner of the picture is that of the first epoch of the Florentine school, and it supports the opinion of Taddeo Gaddi, that even at this time "*Art was declining every day*." The artist goes back to those who went before Masaccio, for after him the Florentine school acquired generous breadth and force. The costume is a modification of that worn towards the middle of the fifteenth century. As a whole the work is successful in its imitation of the post-Giottoesque epoch.

No. 148. 'A Welsh Farm,' S. R. PERCY. This picture is beautiful in colour, and remarkable for the careful manner in which the forms are made out. The foreground, with its vegetable wealth, is in itself a picture.

No. 154. 'Norman Staircase at the Old Mint, Canterbury,' NIEMANN. The subject is marked by a highly picturesque character, and the artist has given to it a becomingly ragged and venerable texture, emphatically descriptive of its ancient date and present neglected condition. This is among the most successful of his works.

No. 159. 'The Excommunication of Robert, King of France, and his Queen, Bertha,' L. W. DESANGES. This picture illustrates an event in the life of Robert the Pious, King of France, who reigned in the earlier part of the eleventh century. His marriage with Bertha, a cousin of the fourth degree, being forbidden by the canons of the Church, he was excommunicated by decree of Pope Gregory; and the moment of the pronouncement of the anathema is the passage here dwelt upon. The king is seated in state, and his queen kneels in terror at his feet; on the right stands the dignitary who delivers the execration of the Church upon the devoted heads of the king, queen, and the three bishops who had sanctioned the marriage. It is a large picture, thronged with figures of great variety of character, all powerfully expressive, and many energetic in action. Every impersonation is endowed with impressive language, and everywhere the eye is gratified by striking and ingenious effect. The artist dignifies the king, but he was a weak and irresolute monarch. The military costume is advanced beyond its time, being of a better manufacture than, though of the same fashion as, we see it in the Bayeux tapestry.

No. 161. 'Scene in Sussex—Showery Afternoon, Autumn,' A. GILBERT. The material of this picture is of ordinary character, but it is brought forward under an effect of much poetic grandeur. A section of foreground is backed by a screen of trees, dominated by a sky of great power, contrasting a dark and dense rain-cloud with a light volume of extraordinary brilliancy. The foreground is a study of rare excellence, and the whole forms perhaps the very best work of the artist.

No. 166. 'Maitre Pierre—Quentin Durward and Jacqueline,' R. S. LAUDER, R.S.A. The Maitre Pierre of this picture is the most successful of the profane impersonations ever realised by this artist. We see him in profile, he is seated leaning his head on his hand like an impassive Mephistopheles, whose freeing contemplation almost stultifies poor Jacqueline, and even the stalwart Quentin. Jacqueline is eminently graceful, her features are distinguished by a great measure of feminine beauty; the relation between herself, Quentin, and the king, is most distinctly established. But the emphasis of the work is the head of the last-mentioned figure—in the eye of which is reflected all the dark and cold malignity of the character. This picture is not so full of accessory, as to deprive the figures of their due importance.

No. 169. 'Snowdon—North Wales,' T. S. SOPER. A small round picture, perhaps a trifle cold in colour, but distinguished by a firm and clean execution.

No. 174. 'Scene from Henry IV.,' C. DUKES. This is the scene at the Boar's Head immediately after Pistol had been "quitted" down stairs because he persisted in "doing nothing but saying nothing." Falstaff is red with the exertion of driving him out; he has invited Doll to sit upon his knee, and she on the one side consoles him with equivocal compliment, while on the other Bardolph offers a sedative in the shape of a cup of sack. Mistress Quickly is busied in re-adjusting the furniture which had been displaced in the fray. Falstaff is the most unapproachable realisation in the entire cycle of Shakesperian character. So difficult is it to work up to the stream of everlasting wit, to catch the *geist* of his brief and epigrammatic posies—for poetry there is under that boundless doublet—so difficult is this that it has never yet been done. The composition of the picture is remarkably spirited, it is brilliant in colour, and the subject at once declares itself.

No. 188. 'Spring Tides—Folkestone—Shakespere's Cliff in the Distance,' T. C. DIBDIN. The jetty-head and the small portion of the little harbour is at once recognisable. A stiff breeze rolls a heavy volume of water on to the beach—a description which perfectly supports the title.

No. 189. 'A Roman Youth,' J. S. BRONIE. A successful and characteristic study of the head of an Italian boy.

No. 201. 'Œdipus and Antigone,' E. ARMSTRONG. This is a small picture, wherein the subject is treated with admirable taste and feeling.

Having discovered the enormities of which he has been guilty, *Edipus* has deprived himself of sight, and having quitted *Boetia*, has arrived near *Colonus*, conducted by his daughter *Antigone*. We find him here seated by an altar, on which *Antigone* leans speaking to him. The head is a purely classic deduction, from the head of *Homer* it may be; the hands also are distinguished by that squareness of formation which is only obtained from the study of the antique. No. 205, entitled, 'Combining Physical with Moral Consolation,' is by the same artist, and represents a monk with a lighted cigar in his hand, exhorting a peasant woman. Both figures are strikingly truthful.

No. 207, 'A Woodland River,' S. R. PERCY. A large picture, combining the highest qualities of landscape Art. It is a foreground, enclosed by trees, and accompanied by a sky of transcendent grandeur. The trees cannot be too highly praised, and the lower composition presents a study of water, herbage, and aquatic plants that has never been surpassed; indeed, every part of this valuable picture is truly masterly.

No. 208, 'A Study in Fontainebleau Forest,' W. E. DIGNON. One of those sketches evidently painted by its author on the spot, with a vigorous hand and enthusiastic earnestness. The aspect of nature is here secured, and united to a profoundly poetic sentiment.

No. 225, 'Ecce Ancilla Domini,' D. G. ROBERT. This is a small picture, the subject of which is the salutation of *Mary* by the Angel *Gabriel*. It is painted in the manner of the Florentine school, before the advent of *Masaccio*, every portion being stippled with the utmost nicety. The Angel, to whom is given a straight hanging white drapery, stands with his back to the spectator, and offers to the *Virgin* a white lily—the latter also wearing white. The background is white; indeed, so generally white is the picture, that it is only here and there broken by colour—a treatment allusive to the purity of the *Virgin*. The work is perfectly successful in its imitation of the school which it follows.

No. 227, 'A Storm clearing off Dolwyddelan Valley—North Wales,' ALFRED W. WILLIAMS. This is a large picture, forcibly descriptive of the aspect proposed, and possessing all the good qualities which we have already observed in the works of the artist.

No. 244, 'Captivity and Liberty,' Mrs. McLAN. To say that this is the best picture which this accomplished lady artist has yet exhibited, is not enough; it is a work possessing qualities which would do honour to eminent professors of the Art. The subject is ideal, and it is worked out with a touching sentiment. Two women are imprisoned; one nurses a child at her breast, and looks up, contemplating the movements of two swallows that, having formed their nest in the upper corner of the prison window, are busied in tending their young, and flying in and out of the prison at will; so lucid is the narrative, that the emotions are at once touched. The figures are admirably drawn, brilliantly coloured, and firmly painted; and not only are these of great excellence, but the background, in its broad and free treatment and in colour, is a masterly passage of art.

No. 247, 'A Merry Time—Scene in Kent,' G. A. WILLIAMS. The subject of this work, which is large and full of stirring incident, is a country fair. On the left—the end of the village it would appear—there are some quaint old houses shaded by lofty trees, and hence the lines are carried into the picture, which even to distance is thronged with innumerable figures, all pointedly characterised. It is everywhere distinguished by the most careful execution.

No. 250, 'Knowle Park,' E. J. CORRETT. A study of trees, carefully and successfully rendered immediately from nature.

No. 251, 'A Jealous Man, disguised as a Priest, bears the Confession of his Wife,' D. W. DEANE. These two figures are admirably painted, the man especially, seated in the confessional, is remarkable for beautiful chiaroscuro.

No. 254, 'Portrait,' BILL SMITH. This is a small full length portrait of a lady; she is attired in white, and relieved by a foliage background with a glimpse of distance. The pose is easy

and graceful, and the features are drawn and painted with a finish extremely careful, but still with the preservation of breadth. It is one of the most agreeable works of its class we have seen.

No. 260, 'Mal-Apropos; or One too Many,' J. E. LAUDER, R.S.A. A large picture containing two life-sized figures—ladies—one of whom is cognizant of the presence of a visitor, a portion only of whose head appears at the window, and who cannot enter because there is "One too many." The figures are skillfully drawn and painted, and the incident circumstantially described.

No. 277, 'Welsh Mountains,' S. R. PERCY. The treatment of this subject is perhaps as masterly as it could have been in the hands of any professor of landscape art.

No. 280, 'Christ appearing to two of his Disciples on the Way to Emmaus,' R. S. LAUDER, R.S.A. We cannot speak more highly of this picture than to say that it is of a quality which reaches the sublimity of the works of the masters of the art. "It is toward evening and the day is far spent." This is profoundly felt, the sky is darkening and the remnant of light is sparingly broken on the figures. The comparison between the two states is strikingly presented; the Saviour is eminently divine, the disciples are impressively human. Their expression is not that of recognition but of admiration of Christ's exposition of the scriptures. This is a picture that would do honour to any period—any school.

No. 291, ' * * *,' J. CLAYTON BENTLEY. A small picture wherein the prominent object is a windmill, beyond which is an extensive open view. The subject is unpretending, but it is treated in a manner extremely agreeable and interesting.

No. 293, ' * * *,' F. W. HULME. A view of a village church from beneath some near trees, which cast a shade on the foreground. The effect is that of evening, and it is rendered with a happy tranquillity which communicates an inexpressible charm to the little picture.

No. 298, 'Border Tower on the Yarrow,' H. McCULLOCH. From an admirably broken foreground the eye is led to the Peel house, which occupies an eminence on the left, the right opens into distance. The picture is harmoniously coloured, and firmly painted.

The Water-Colour Room contains works of great excellence; they are in the whole not numerous, but even those that we might signalise are more than we have space even to mention. There are some highly finished portraits by BILL SMITH, especially a miniature group of exquisite finish and truth. The drawings by NIEMANN are of great power; and those by R. R. McLAN are closely imitative of nature. GAVARNI, the French artist, exhibits a drawing entitled 'Le Carnaval à Paris.' W. H. COPE contributes some forcible drawings; and other works of merit are by OAKLEY, MISS M. A. NICHOLS, J. L. BRODIE, &c.

ON MURAL PAINTING. *

BY MRS. MERRIFIELD.

It is rare at the present time to meet with perfect external frescoes which have withstood the vicissitudes of the seasons for two or three hundred years; this is by no means the case with regard to mural paintings in interiors, many of which are still as perfect as when first painted. As examples we may refer to the works of *Bernardino Luini* and *Gaudenzio Ferrari*, the best frescos of the Milanese school. The oil-paintings of *Luini* are so beautiful and so fully imbued with the spirit of *Lionardo da Vinci*, that some of them have been mistaken for the genuine works of that artist. But the frescoes of *Luini* are considered to be superior to his oil-paintings; the latter are known and appreciated in this country, but his mural paintings are necessarily confined to Italy. The beauty and grace of the female figures in his pictures are remarkable. The sweet but melancholy expression which prevails in his oil-paintings is quite *Lionardesque*, but there is a variety in the character of the heads in his frescoes

which is truly charming; I know no artist who would have been more capable of delineating the beautiful and truly feminine characters of *Shakespeare* than *Bernardino Luini*. A *Miranda*, a *Desdemona*, or a *Cordelia*, by the hand of *Luini* would be invaluable. The exquisitely beautiful fresco, representing *Angels* bearing the *Body of St. Catherine* to *Mount Sinai*, will not be soon forgotten by those who have had the good fortune to see it. The state of preservation of his pictures generally is no less remarkable than the excellence of the painting, and the force and harmony of the colours.

Gaudenzio Ferrari enjoyed a high reputation in his native country in the time of *Lomazzo*, who never loses an opportunity of extolling his merits. Like *Luini*, his frescoes are superior to his oil-paintings. He was of the old Milanese school—a pupil of *Giovenone*; and although he possessed great originality, the influence of *Lionardo* may be traced in his earlier paintings, and that of *Raffaello* (with whom he worked at *Rome*), in those of a later period.

The interior of the Church of *St. Maurizio* (called also the *Monastero Maggiore*), at *Milan* is entirely filled with mural paintings by *Luini* and *Gaudenzio*, which must have been exquisite when fresh; even now they are extremely beautiful, and the general effect from the whole of the interior, the galleries, and the roof being covered with frescoes, is magnificent. The church is built of brick, the surface of many of the frescoes is not flat, but undulating, and the dust lodges on the top. The lower parts of all frescoes are the parts most frequently spoiled by damp. The intonaco adheres closely to the wall. The outlines of *Luini's* frescoes are indented with the style. The greens are generally well preserved; they appear to have been prepared from copper. There are some soft and beautiful greys, for they can scarcely be called blues, in the lower pictures by *Luini*; but the blue in the paintings over the arches in the gallery, each consisting of a three-quarter figure of a female saint with a blue background is of a fine colour. The latter were situated so high, that it was impossible to distinguish whether these blues were in fresco or secco. Some colours had the appearance of lake, others seemed to be shaded with the last mentioned colour; the darkest shades had evidently been retouched in secco. In the painting of the *Assumption*, by *Gaudenzio Ferrari*, the parts painted blue are still of a very fine colour, and the whole picture is in excellent preservation.

Many of the frescoes painted by these two distinguished artists in other localities have been sawn from the wall or transferred to canvas or panel, and are now preserved in the gallery of *Brena* at *Milan*, where they are favourably placed for observation.

Luini's frescoes are generally outlined with the style, the indentations of which are visible. This artist appears to have employed a colour which resembled lake in fresco, for on looking along the face of the picture (the picture being placed between the eye and the light) the surface of the fresco appears unbroken both on lights and shades. *Luini* introduces draperies of a fine yellow colour which is still perfect; the lights are of the colour of *Naples-yellow*, either alone or mixed with white, and occasionally gold is employed on his mural pictures. Besides *terra-verde*, he appears to have used a green pigment prepared from copper. Both this painter and *Gaudenzio Ferrari* seem to have been so well aware of the difficulties attending the use of this colour that they rarely introduced it. The small quantity of blue found on the pictures of *Luini* is of a greyish but inclining rather to red than black. The glassy surface is visible on the lighter parts, but the darkest shades look dull, as if they had been applied in distemper. Some of the draperies are of a fine deep red colour, which appears to be painted entirely in fresco. *Luini's* colours are in general very bright and perfect, the darkest shades being produced by the pure colour, and the gradations made by adding white to the local colours.

Among the principal frescoes by *Gaudenzio Ferrari*, now in the gallery of *Brena*, are the "Adoration of the Magi," and the "History of *Joachim* and *Anna*," two large pictures, divided,

* (Continued from page 118.)

each of them, into three compartments; and a third picture representing some passages in the life of the Virgin. These pictures being characteristic specimens of Gaudenzio's style of colouring, I procured some engravings of them in outline, and coloured them from the original pictures, imitating as nearly as possible the present state of the colouring. The effect of the pictures is warm and rich; red and yellow are the prevailing colours. Many of the draperies are changeable, or as we should call them, "shot;" these changeable draperies, in which the lights and shades are of different colours, give great variety and richness to the picture. There are white draperies shaded with yellow; light yellow shaded with dark yellow, or with green; darker yellows shaded with red; and red draperies with the folds of a darker tint of the same colour. Many of the figures have pink draperies, which I could not imitate without using lake, and this was the more singular, inasmuch as I found that the lake on my white palette, when placed close to and compared with the original, did not in the least resemble it; but, on the contrary, a mixed tint of light red and Indian red, and in some cases, of Indian red alone, when on the palette, exactly matched the lake colour of the original. I mention this fact without being able to account for it, unless it is to be attributed to the effects of contrast with other colours, or to the mixture of lime with the red, for we know that vermilion mixed with white in oil-painting takes a pink tint. The lake colour, whatever it was, was probably applied before the picture was dry, for it had the same polished surface as the rest of the picture, and as the eye glanced along the face of it, no re-touchings in secco were visible except in the case of the blue pigment, to which I shall again refer. Continuing then to compare the colours on the palette with those on the picture, I found that the darkest lake colours exactly matched Indian red; the colour resembling vermilion corresponded precisely with the vermilion on the palette; and as this colour is by some authors enumerated among the pigments used in fresco-painting, we may conclude that it was actually employed in these pictures where it appears to be so. The deep reds appeared to be painted with red ochre, Indian red being used for the shadows, and a few bright lights were apparently touched with vermilion. The earthy red colours, although perhaps not particularly bright in themselves, gained brilliancy and value by their judicious opposition with cool green, which is freely introduced in these old frescoes. A great deal of terra verde is used, with a more vivid green prepared from copper on the brightest parts. The tones of the flesh are warm, and the hair of many of the figures brown or chestnut. To balance the warm colours, the painter has introduced some white draperies with grey shades, some green draperies, grass beneath the feet of the figures, green trees, and green trappings to a horse. In the two large pictures, Gaudenzio appears to have endeavoured to avoid the use of blue, which is limited to the sandals of a figure in the foreground of each painting; and this blue, which appears to have been a preparation of copper, was certainly laid on in distemper. In another picture, the blue lights on a red drapery, and in a third, the scarf of one figure, and a ribbon round the hair of the Virgin, are the only blue touches introduced by the painter. It may be observed that there are no marks of the style in these, or any other pictures that I have seen by Gaudenzio Ferrari, who appears to have outlined his frescoes with a red earth.

Luni and Gaudenzio Ferrari flourished in the early part of the sixteenth century; I shall now mention the works of an artist who lived about a century later, and who enjoys a great reputation as a fresco-painter.

The mural-paintings by Bartolommeo Cesi (the master of the Carracci) in the chapel of the Archiginnasio at Bologna are, at least as regards the execution, perfect specimens of mural painting. They are extremely well preserved, the only part injured being a portion of the picture in the centre of the ceiling, which appears to have suffered slightly from damp. They are

not executed entirely in buon fresco. The outline is indented with the style. The joinings of the Tareas (days' work) are visible, or at least conspicuous, in a few places only where they sometimes cross a large piece of drapery or the ground of the picture. The fact of these joinings being discernible, is a proof that some parts of the pictures were painted in fresco. The surface of the paintings does not shine like those of Luni and others of the Lombard School. The colours consist of 1. A fine scarlet ochre with which lake was imitated; the full colour being used for the shades of draperies, and white being mixed with all the other tints. There is no colour on the walls which can be mistaken for lake, but on the ceiling there is a drapery which may have been painted with this colour. 2. Light and dark ochres, shaded with burnt sienna, with or without umber; the darkest shades are painted with burnt umber, the lights with white. 3. A cool green, which gives intensity to the reds. 4. The shades of white draperies are of a bluish grey, sometimes formed of blue and white with a little black, and sometimes of black and white upon which blue of the usual tint has been hatched. 5. Blue draperies are sparingly introduced, and they appear to have been painted in the following manner. The lights are of pure white, the pigment being mixed stiff enough to keep its place; the intonaco of the colour of sand-stone is visible between the lights and the blue, and sometimes through the thin blue, and serves for the half-lights. This it will be observed is a variation from the practice of the old masters, who always covered the intonaco entirely with colour. The blue, which is of the colour of turclino and no darker, is hatched on the shades, to which sufficient depth is given by repeating the hatchings. This colour is as perfect as any part of the painting. With the exception of the blue and the white draperies, the high lights of the coloured draperies are in no instance of pure white. The various tints appear to have been laid in flat or softened and united with nearly as much facility as in water-colours. Where hatching is introduced, the gradation of the tints is so well observed that the hatching does not by its harshness offend the eye, as in many frescoes which I have seen, particularly in those by the Carracci in the Palazzo Fava. The shadows have the true character of shade, neutrality, and transparency. The flesh is painted with the impasto of oil, and the hatching is not very perceptible.

The subjects of the large paintings around the Chapel are from the history of the Virgin. The figures on the ceiling are smaller than those on the wall, and this, with the lightness of the colours in the former, gives an effect of distance. The painter has introduced into the background pleasing landscapes, which are very retiring, and has diffused over the whole that impression of daylight which prevails in all the best frescoes. I cannot omit to mention a kneeling female figure in one of the angles of the ceiling; she is covered with a white veil, which suffers her features to be seen through it, and which is beautifully painted. It appears to me that the difficulty of painting a transparent drapery of this kind in fresco, without disturbing the colours on the damp wall beneath must have been very great; but if we suppose that the veil was added in distemper when the surface was dry, the difficulty would be in a great measure removed, although, even in that case, one cannot help being surprised at the perfect state of preservation in which we find this figure after a lapse of at least two hundred years.

The mention of the landscape backgrounds in these compositions by Cesi, reminds me of a remark of some writer, the truth of which I have frequently proved, and which is applicable not only to fresco painting, but to all other pictures whatsoever. I allude to the situation of the horizontal line, which, in historical or other subjects, where the figures are the principal object, is, by all the best masters invariably placed very high in the picture, frequently above the heads of the figures. This rule, founded on the first principles of perspective, is so generally observed by them, that it would, I believe, be scarcely possible to find a deviation from it in any old Italian picture. Where a practice

is so universal, it is almost unnecessary to refer to examples; I will, however, direct the attention of the reader to the "Raising of Lazarus," by Sebastian del Piombo, and the "St. Catherine" of Raffaele, in the National Gallery, and also to the Cartoons at Hampton Court, copies of which are in every one's hands. In all these compositions the horizontal blue is placed very high, and the landscape backgrounds are very retiring. With precept and example before them, it is astonishing that so many painters of our own era should so frequently have violated this fundamental rule. It is undoubtedly much easier, and a great saving of time, to paint a background of clouds, or even a level expanse of blue sky, with a little bit of distance, not reaching up to the knees of the figures, than it is to fill the backgrounds with a landscape varied with hill, and valley, and river, and diversified with trees, animals, and figures, the whole receding gradually from the eye according to the laws of aerial perspective; but the practice first alluded to is inexecutable, and as a painter cannot, or ought not, to plead ignorance of the laws of perspective, the non-observance of them can only be attributed to the idleness of the artist, or the presumed ignorance of the spectator. The study of perspective is now so generally diffused, that it appears almost superfluous to observe that there cannot be two horizontal lines in the same picture. The eye of the spectator cannot dwell at the same time upon the countenances of the figures, in which the sentiment of the picture resides; and upon the horizontal line of a landscape background which does not reach to the knees of the figures. I will refer, by way of illustration, to the otherwise fine picture by Müller, entitled "Prayer in the Desert," which is known to the readers of this Journal by the engraving in the number for September, 1847. The scene represents a level country, terminated by a range of distant mountains; several figures in the Egyptian costume are arranged in different attitudes on a prayer-carpet near the foreground; these figures are of such dimensions that the low and distant horizon appears just above their knees. Now, supposing the horizon to represent the height of a person of ordinary stature either sitting or standing, and about four or five feet from the ground, the figures must have been giants, not quite so large, it is true, as the celebrated "Pair" which Müller has represented in another and most effective picture, but at least from sixteen to twenty feet in height. If, on the contrary, the figures are supposed to be of the natural size, and to be standing on level ground, it is quite impossible that the horizon could have appeared, unless to a person whose eye is near the ground, so low as it is represented in the picture. In either case, it appears to me, that figures placed so near the foreground, and yet so high above the eye of the spectator (as represented by a point on the horizon of the picture), should be somewhat foreshortened. Other instances of a similar deviation from the laws of perspective might be mentioned, but my object is to point out the error, and to recommend the example of the great Italians in this respect, and not to criticise modern painters.

Let us now recapitulate. We find that the chief sources of injury to mural paintings are damp arising from the earth, or from the infiltration of water, and the imperfect preparation of the wall; and that when due precautions are observed in both these particulars, there is no reason to fear any injury to mural paintings from exposure to the rain and other vicissitudes of the seasons.

With regard to the colours used on mural paintings, we find that the most durable are reds and yellows. On these neither the light of the sun nor exposure to the weather appears to have any effect, and after a lapse of between three or four hundred years, these colours are as bright as when they were first laid on the wall by the painter. The cooler colours, such as blues and greens, are not equally durable, although we have seen that in some few instances green has been found permanent even on pictures exposed to the weather.*

ART-MANUFACTURES IN THE CLASSICAL EPOCHS.

BY DR. EMIL BRAUN.

III.—BRONZES OF PERUGIA.

The embossing process recommended itself to the earliest art-manufacturers not only by its simplicity and ease, but even by its economy. Metal being in those remote times much more scarce and precious than at present, it was an object to save it as much as possible. Casting requires much bulk of metal, and the fire-process, however improved it may be, can never obtain such a diminution of material as is insured by hammering and chasing. This, which at first sight appears a trifling circumstance, may explain to us the reason of the enormous efforts made by the oldest art-manufacturers to prepare the metal in such a manner as to become manageable for embossing. Handicraft, in those primitive times was very cheap, whilst the material was perhaps not to be afforded in sufficient quantity at any price.

But a far higher consideration, for practical purposes, is the diminution of weight, in articles not intended to be fixed in a permanent situation, but to be subservient to the hand of man. A shield, for instance, must be as light as a lady's dressing-box. Cast bronze would be inapplicable to either object. On the other hand, no material in the world could present the same advantages as are afforded by metal. Necessity was, therefore, the teacher of one of the most wonderful of human inventions; that is to say, the conversion of the rough ore into a thin sheet, which, by its uniformity, rivals the productions of organic nature, not only the papyrus, but even the skin itself with which nature has carefully protected the animal body. We see it assume the form even of the free moving limbs of man, and shelter and adorn alike the hardy warrior and the maiden delighting in glittering ornaments.

The most useful inventions are generally soonest forgotten. As they become, necessarily, a common good, they are treated as a commonplace improvement, and no one thinks of the difficulties which are overcome in order to arrive at them. As our cylinders furnish us every day with many thousand yards of rolled metal-sheets of every degree of thinness required, we scarcely recollect that there has been a time not very distant from the present, when the same advantages could only be obtained by severe exertion and expensive labour. It supposes a very skilful hand, indeed, to be capable of managing the hammer with the same ease as we see it used in the Art-manufactures of those times which are generally spoken of as belonging to a period of childhood in art, whilst in truth they were possessed of secrets, afterwards entirely lost.

This seems to have been actually the case with this invention, as we may infer from a remarkable circumstance. It is known that the whole of the state archives of the Romans were written on bronze tables, from which they derive the denomination of *tabularium*, identical with that of *tabularium*. But is it not very striking to find that all these tables were of cast metal? Would it not have saved many hundred thousand pounds weight, had hammered metal been made use of? Greater solidity cannot have been the reason for deserting the old custom, which has been adhered to in inscriptions on gold, as hammered metal presents at least the same advantages. We must therefore conclude, that in later times bronze metal had become cheaper than the handicraft required to hammer out such thin sheets as are of frequent occurrence in the earlier ages.

Such changes of method often occur in different branches of industry, and we may venture to say that there is not any improvement which does not act at the same time as a drawback. An instance chosen from among the things passing before our own eyes, may prove the truth of an assertion appearing at first sight, paradoxical. Our century, while it prides itself on the development of a mechanical power formerly neither known nor supposed to be

attainable by man, and while it is able to obtain, by means of machinery, results which no handicraft whatever would be able to produce, has lost, on the other hand, much of that careful skill and amazing precision displayed in the products of hand-workmanship belonging to an epoch anterior to that of progress in the construction of machinery. In common life we do not so easily perceive such a striking difference, but those who are obliged to rely upon the refined exactness of philosophical instruments, complain greatly of the change which has taken place in this high department of machine manufacture. The fact is, that whilst in former times no observatory could dispense with English telescopes, now, that of Greenwich itself, not only receives its higher instruments from the Continent, but has been obliged to send them back thither to be repaired; and I have been told by an astronomer of the first rank, that it was his conviction that, ere long, not a single mechanic would be found in England able to handle a file properly. Such a fact is related not for the purpose of imparting blame, but to show by a striking example how, even in this sphere of human knowledge, advantages are counterbalanced by the loss of hereditary or traditional faculties.

But we must turn back to our monuments of primitive epochs, not to leave imperfect the catalogue of the few which have come down to our own times. The first collection of similar remains of which we have notice, was discovered in 1812 at Perugia, and is now preserved, partly in the museum of that town, partly in the Royal Glyptotheca at Munich, for which they were purchased from an Englishman who has rendered the greatest services to the history of ancient art.—I mean Dodwell, who by his highly cultivated taste and real knowledge of monumental antiquity, has done much for the propagation of these refined but most ungrateful studies. He had plaster moulds made from

freedom of ideas, enabling the hand to execute every thing that is required in art. In this respect the bronzes of Perugia are of the highest importance, and we feel ourselves therefore allowed to lay these poor fragments of ruined splendour before the eyes of a public accustomed to hold converse with an entirely different kind of art, and to take delight in works of genius of the highest order. Sometimes, however, it may be useful to learn from childhood, and so, in questions concerning Art-industry, contrast often teaches more than is to be learnt by a profuse display of objects of dazzling beauty.

The embossed bronze fragments we are speaking of, are supposed to belong to the lid on ornaments of a chariot, but we know nothing either of the form of the latter, nor of the manner in which the parts were originally adapted. All that we can learn from it is, that it has been the intention to fill up every compartment of this object with figures suited to the peculiar form of the spaces which it presents. There is no doubt that these designs have some meaning even of a symbolical character, but we are entirely at a loss for a key to enable us to enter into ideas of so intricate and mysterious a nature. Could we arrive at a clearer understanding of the language expressed by these signs, we should perhaps admire the vigour of a mode of expression which the human mind attained even in the midst of the difficulties offered by a first beginning. I feel quite sure, that the works of art which inspired Homer to write the description of the shield of Achilles, have not been very different in execution from these specimens, and that the hieroglyphs which he had before his eyes, were in all probability even more condensed in character.

We begin by examining a portion of the composition filling up the swelling lines of a border which forms the edge or moulding of a large metal strip, being the upper portion of the

then, and casts which were sent abroad showed for the first time to those really interested in the history of antiquity, the striking character of primitive Etruscan art, which is identical with that of the oldest Greek workmanship. These monuments, also, were soon afterwards, I will not say forgotten, but at any rate neglected, no writer having taken the trouble to give an exact definition of their real character; and whilst volumes have been filled with empty words and wild conjectures respecting monuments of which we possess nothing but the descriptions of poets or the dry indications given by Pausanias, no one has cared to investigate the actual reality presented to us by their technical workmanship. I honestly confess that it is no easy task to make an exact report of the degree of artistic progress of which these miserable bronze fragments allow us to take cognisance, but without a careful analysis of their peculiar character we cannot hope to attain any clear idea of the history of ancient Art-manufacture. Without knowing the difficulties gradually overcome by exertions of the human mind, we cannot well appreciate, or thoroughly understand, the great merit of later times. It is therefore highly interesting to see how these gifted nations, whom we afterwards see cutting into a race of mutual rivalry, have been obliged to begin by creeping like children before they could attain, by slow degrees, a

chariot in our first cut. Beneath it is placed an ornament composed of simple but tastefully arranged canellures. The design presents the favourite subject of a boar-hunt, which occurs very frequently in monuments of so ancient a date. The wild animal attacked by two dogs, who are eagerly biting him, is placed within the space left by the curling line of a volute, from the height of which it descends as if a sloping hill were indicated by it. A hero is piercing the creature with his sturdy spear, while another follows him with a dog led by a cord. This part of the composition is quite intelligible, but now begins the difficulty. The monster placed behind the dog belongs to the class of those imaginary beings, which, although they are themselves out of nature, allude symbolically to an imaginary sphere of existence, of which they convey a brief but characteristic notion. Here we see a horse's head combined with the tail of a fish distinguished by those fins which nature has conferred on the inhabitants of the deep, enabling them to move with a velocity equaling that of the feathered tribe. It is clear that the inward meaning of this figure can only be symbolical. In this connection of ideas it may be intended to bring before our eyes the locality where this event takes place, and we shall not err greatly if we imagine that it represents the marshes frequented by animals whose charac-

teristic mode of living and moving about, is here indicated by a compound of organs sometimes combined by nature herself in certain beings, forming in an analogous manner the transition from one class of the animal kingdom to the other.

Were the other half of this remarkable composition better preserved, we should not only obtain a clearer idea of the shape of the object to which it was adapted, but we should even be enabled to confirm or modify our ideas concerning the original meaning of this accessory figure, as the continuation of this design represents another hunting scene, which we can infer from the appearance of an archer following a person who seems likewise to be provided with some implement of the chase. Now the subject of this heroic adventure will most probably have determined the artist to adapt to it the other accessory figure, which, this time, displays human features, but is characterised by the fins suited to its body as inhabiting the liquid element. I suppose it to be intended to represent a local deity, who cries for mercy on seeing one of his favourite children mortally assailed. A fragment of a Centaur of the oldest formation, which seems to have occupied this place, is still existing, and is introduced in the restoration which we have made of the chariot.

At first sight such a conventional composition strikes us by its childish character, but looking at the skillful manner in which this design is adapted to the somewhat awkward form of the surface allotted to the artist for the display of his ideas, we are surprised rather than disappointed. We must even confess that there is a certain talent shown in arranging the figures in such a manner that their outlines never interfere with the limits of the whole compartment, more especially if we are acquainted with those laws sanctioned by Greek art, though appearing to us great licences. We mean the change of size of the different figures, which at first sight seems to be arbitrary, but in reality depends upon a rational distinction. The protagonists appear constantly of larger proportions, whilst all secondary figures may be freely adapted to the peculiarities of the composition, and the convenience afforded by the space accorded to the artistic development of an idea. This custom prevails not only on vase-paintings, but even on Athenian bas-reliefs of the most advanced period, and has its analogy also in Greek poetry, above all in tragedy. It is therefore not allowable to smile at the appearance of a figure, belonging to an entirely different system of proportions, which we meet with on the opposite side of the spiral line dividing the two parts of the composition. The aspect it presents is that of a person belonging to the rear of an expedition of warlike character, who is employed on the look-out.

Another fragment of the same ancient monument presents to us a subject occurring very frequently on ancient monuments as well of Greek as of Etruscan origin, without becoming more intelligible by its repetition. The principal motive of all these representations is a monstrous being, which afterwards assumes the aspect of a deity, grasping with both hands the strongest and most cruel animals in the universe. Here this powerful demon is placed by the artist in a sitting position, so as to increase the effect of the enormous exertions made by him in order to keep aloof the assailing animals. His features are what we see afterwards almost exclusively reserved for heads of Medusa, but which are also lent to other frightful mythological conceptions, as for instance to the personification of Terror and Fear ruling the Homeric battles. The mouth is armed with dreadful teeth, and the voracious longing by which this demon is animated, is indicated by the blood-thirsty tongue issuing from the jaws. His power is irresistible even to lions, whose throats he strangles with an iron grasp; but if we examine closely the intention of the design, it appears that the lions are rather intended to assist each other than the figure itself, by which their power is at once paralysed. We are therefore inclined to suppose that it represents one of those great beings which the ancients personified in various ways as the rulers of living nature. But be this as it may, the composition itself

must be considered as perfect from its highly developed architectonic character, a merit always depending on the skillful management of a well balanced symmetry. It is seen in our back view of the chariot in its restored state.

In this compartment, also, every small corner is turned to account, and we meet again with one of those marine horses the symbolic character of which we have already determined, in the space left open by the bulging out of the winding border-line that confines the whole ground of this portion of the composition. In the place corresponding to that occupied in the former cut by a soldier on the watch, we find a long-legged bird stretching out its slender neck with a similar gesture. What may be the particular meaning of it we cannot even guess, as every ground of conjecture is wanting, by the loss of the rest of the design. We can only admire the characteristic mode of expression which already at this epoch manifests itself in the artistic imitation of different forms of animal being. The arrangement is in many respects perfect, and although it might not be advisable to take it as a model for imitation, we can certainly learn much from the laws of style so severely observed in it.

These two pieces of hammered bronze work were discovered together with a great number of other fragments, which are commonly assigned to the chariot, in the Perugian excavation of 1812. A slight inspection of them, however, shows that all do not belong to the same monument, may, that there is amongst them a great variety of style and workmanship. Archaeologists seldom take the trouble to enter into questions of criticism, but are accustomed thoughtlessly to repeat the notices suggested by excavators, dealers, and artists, rather than to take upon themselves the responsibility of bestowing due consideration upon the subject; and while they are puzzling their heads about the chest of Cypselus, the throne of Amyclae, and such like vain problems, these remarkable remains have now been lying neglected for nearly forty years without having been the object of more than a mere stupid curiosity. No wonder, therefore, that the branch of historical science which is represented by Archaeology should be so little honoured, sometimes even so profoundly despised even by learned men, whilst the public itself testifies a great indifference towards the progress of antiquarian knowledge, because it feels by a sort of instinct that real interest for it is wanting even in those who make pretensions to authority. Is it not striking, that amongst all the learned men who have treated of these bronzes in one way or another, not a single one has taken the trouble of endeavouring to adapt the principal relics to some rational system of decoration? All speak of chariots in general, or quote the biga of the Etruscan Museum at the Vatican, without giving the slightest hint* that the shape of the chariot, to which our bronzes have belonged, must have been essentially different. For the plane surfaces of the plates we have just examined, can never have been intended to cover the convex outside of a biga; and if we are called upon to find out a mode of construction suitable for a chariot, we must look out for a totally different species of carriage.

* The only man who has hinted at the square form of the supposed chariot, has been the late L. Schorn in his excellent catalogue of the R. Glyptothek at Munich.

It is true, that the restoration of a similar monument becomes extremely difficult, when the parts belonging to it have not been examined on the spot by intelligent persons, and in our case the difficulties are increased by their remains having been immediately dispersed, and being now placed in several different collections. This makes it almost impossible to conduct these researches with that exactness and method which alone can insure good results. We might therefore stand excused were we to dispense ourselves from the attempt to discover the real use of these remarkable remains; but we think it still better to endeavour, at least, to enter into the intention of the artist whose ideas were adapted to so peculiar a form, and to show by this experiment that there really does exist some ground motive, forming, as it were, the crystallising point of the whole.

The first rule in similar reconstructive labours is to avoid, as much as possible, minute questions and to be satisfied with great results. There are problems of a secondary order which must rather be avoided than touched upon, and sometimes it is enough to gain a starting point. Now, if we look at the character of the size and of the peculiarities of the form, which the two pieces as yet examined present to us, we soon perceive that they are linked closely together by a certain relationship. Both are of the same height and surrounded by the same border, which is disposed in an analogous manner.

We should certainly be very much at a loss, did we not derive help from the discovery of some ancient monuments of a similar construction; since mere speculation, supported even by the utmost sagacity and shrewdness, would be of little avail in questions of the kind, requiring a solution based upon tangible probability. In this case we are fortunate enough to obtain such a comparative light from an Etruscan bas-relief published by Micali, 2nd edition, tab. lvii. 1., which presents but little interest in itself but which is of the highest importance for our question. A single glance bestowed upon these trifling outlines, representing, as it seems, a funeral procession, shows us the mode of putting our bronzes together, which, as we learn from this drawing, must have been intended for a carriage of the same description, as will be made evident by the restoration which we have made on this account. We lay it before our readers, leaving it to them to decide whether the analogy pointed out by us between the two monuments, the represented one and the remains of the real one, actually exists.

This once granted, very little is required to unite the other smaller piece with the figure strangling the lions. It must have been employed for adorning the back of our supposed carriage, as we have endeavoured to show by the drawing made of this part of the reconstruction, which seems not to leave any considerable doubt, as the combination of the general forms is almost spontaneous. We have, therefore, only to give account of the reasons which have induced us to reconstruct some other fragments of bronze-work, securing indubitably to have belonged to this sacred implement.

If we look for any other ornamental parts among the bronzes of Perugia, which might be adapted to the chariot, the reconstruction of which we have undertaken, there is one fragment of embossed bas-relief, only nondescriptly belonging to the same monument as the two preceding compositions. Not only is the style quite identical, but it also presents the very same border-ornament, consisting of a row of cannellures. We think it therefore right to adorn the lower part of the chariot-seat with it, as this vehicle, in the representation of the bas-relief taken from Micali, displays a similar construction. Although a small portion only of the animals belonging to it are preserved, we may

infer from such examples that the continuation did not afford any great variety, as it is a merely accessory ornament. It is also probable that it was repeated on the back, under the combat with the lions, and we have therefore preferred to abstain from introducing any other elements largely afforded by the rest of the bronze fragments; as it seems safer to err in doing too little than to fall into mistakes arising from a sagacity supported by mere arbitrary reasoning.

The lions' heads placed on the centre of the wheels have been introduced there, because amongst the Perugian bronzes there is a mask of this animal, not of hammered bronze-work, but of a very remote date. It was found together with the nail which was intended to fasten the wheel to the axle-tree, and we suppose that this circumstance, more than any other, has caused the idea that by far the greater part of these bronzes belong to a chariot, whilst it can be asserted with certainty only of a few fragments, the adaptation of the remainder being a very doubtful matter. Have we not reason to be satisfied for the present? Is it not better to wait for a moment of more matured consideration, before daring to go further on in researches of so perplexed a character?

It will be scarcely necessary to remind our readers that all these bronze plates have been intended to cover the outside of the supposed chariot, the substance of which it was constructed having been of wood, as many analogies prove to us, and which is rendered probable by the character of the workmanship. The question of the use to which such a chariot may have been destined, is a totally different one. The subject to which the chariot belongs, appearing in Micali's bas-relief, seems to be of a decidedly funeral character, and we should not wonder, were some one to declare our chariot to be of the same class. We are even inclined to think that it may be a *tensa* constructed for the purpose of carrying round either sacrificial utensils or images of the divinities in sacred procession, as was practised in later times even by the Romans, particularly in those rites adopted from the Etruscans. Not only does Micali's bas-relief make upon me the impression of a funeral chariot intended to be filled up with such idols, but we find not unfrequently similar constructions of a reduced size, though of analogous construction, in Etruscan tombs. In the Egyptian grotto of Vulci were found several, and if we have formerly denied a place to drawings taken from them, it may be useful to add one here, (fig. 4.)

in order to give an idea of the custom which prevailed in Etruria, and which has left traces even in those tables of black earthenware so frequently found at Chiusi, filled up with a great variety of vases and surrounded by a high border cut away in the front to show the contents of this species of portable altar.

This is shown by cut 5, taken from Micali, 2nd Ed., tab. xxvii. 1, 2, while cut 6 gives us an idea of the ornaments on the back of it, which may teach us caution in the reconstruction

tion of similar objects, without the support of strict and clear analogies. Nobody certainly who had never before seen such a monument, would have been able to put the fragments together in the manner in which they appear here.

To a similar or analogous object may also belong a small disc with a hole in the centre (fig. 7.) for the use of which I cannot find any

other probable conjecture than that afforded by the wheeled perfume-burner of the Galassi-Regulini tomb at Cervetri, and of which we have given a drawing in a former article. The bas-reliefs by which it is adorned represent amongst other quadrupeds a griffin and a sea-horse, while a human being terminating in the tail of a fish seems to be the guardian of this wild flock, like Proteus, who rules the inhabi-

tants of the deep, and has perhaps some analogy with the man furnished with fins who interferes in the Centaur-battle of our chariot bas-reliefs.

Another hypothesis illustrating this curious piece of bronze-work may be afforded by the pedestal of a candelabra, which having been found together with it, shows Etruscan Art to be already considerably advanced. The character of the figures represented on it is strongly pronounced, and we must here for the first time admire not only the technical workmanship, but even the artistical feeling perceptible in the whole design, as well as in the refined treatment of the details. It is hammered out from a very fine sheet of bronze plate, and closed upon three lions' feet, which are of cast-work. The parts are united by fine nail-work, and there are traces of an ancient restoration, proving to us the high value attached to it by the ancients

themselves, who saw it already in a state of decay, caused, perhaps, by its remote antiquity. The care bestowed upon it has, however, not enabled it to escape its destiny. Even now the different parts are separated from one another, and while two façades of this triangular pedestal are preserved in the Royal Glyptothek of Munich, the third lies neglected in a corner of the Museum at Florence or Perugia. The drawings of it already published are not at all satisfactory, and only give a general and vague idea of this remarkable monument, where the embossing work attains for the first time a character of bold and effective high-relief.

The first side (cut 8), represents Hercules without beard, and covered with the lion's skin, holding in his right hand a piece of his bow, whilst the left seems to conceal the apples gathered from the Hesperide tree. The expres-

sion of the features is full of character, and the drawing of the extremities shows already an eager desire to enter into rivalry with the forms created by nature. On the knees the hero who has gone through so many struggles. The forms driven out by the punches have received their last finishing and refinement by delicate chasing. In short, we here, perhaps, for the first time, meet with a real work of Art belonging to this early period.

The second side represents a female deity covered by the skin of a goat, in the same manner as Hercules by that of a lion, as seen in the annexed cut. She is armed with a Boeotian shield, and is generally thought to represent

Juno, who appeared in Lanuvium in a similar dress. The composition is, with reference to a work of so early a date, pure and rich, and the undraped parts as well as the drapery itself, including the animal's skin, are treated with refined taste, and show an artistic feeling of an elevated character.

The same must be said of the female figure, on the third side, which we also engrave, veiled and adorned by a rich garment. She holds up in one hand a symbol, which seems to be rather a fruit than a flower. As she lifts her drapery with the other hand, these figures have gene-

rally been supposed to be images of Spes or Hope, whilst they are really nothing more than representations of Venus characterised by the bursting flower-hud. Many are the names conferred upon our figure, but for our purpose it matters less to give her a definite name than to decide whether the supposed Juno with the goat's skin is not rather a Minerva with an old-fashioned ægis. At any rate the one is probably the protecting deity of our hero, while the other presents to him the reward of fatigues gloriously endured.

Although the use of this precious monument is in itself clear, it may still be desirable to acquire a concrete and well-founded idea of the ornamental system to which it more particularly belongs. This can only be obtained by comparing it with some other monument of analogous character and construction. We therefore introduce here a candelabra in the Etruscan Museum of the Vatican, supported by a trian-

gular basis, which, however, presents flat and naked side-views. I do not know whether it would be advisable to attempt a restoration of our monument, its early character making it highly probable that great originalities must have prevailed in those portions of it which are for ever lost.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

- I. THE PHOTOGRAPHIC CAMERA.
- II. THE TRINOPTIC MAGIC LANTERN.

As the prospect of fine weather and bright skies increases with the advance of the spring, we find many of our readers becoming desirous to avail themselves of the advantages promised by the processes of Photography. To copy nature by the agency of a subtle principle which comes to us in mysterious connection with the light and warmth of the sunbeam—to transfer to our portfolios faithful transcripts of the external world pencilled by so delicate an agent as that solar ray which illuminates it, is certainly one of the most interesting applications of abstract truths with which modern science has made us familiar. In some previous articles in this Journal* the details of the most important

* See *Art-Journal* 1848, p. 433; 1849, p. 96, 354, 358; and 1850, p. 29. Those who desire a more intimate acquaintance with the peculiar phenomena of the chemical changes which take place under the influence of sunshine, would do us to study the "Researches on Light," by the Author of this paper.

processes have been already given; our object, therefore, will now be, in accordance with the wishes of many of our esteemed correspondents, to describe the construction of the Photographic Camera, and such particulars of the use of this instrument as will enable such as are at a distance from other sources of information to construct Cameras for themselves, if they choose to do so; to guide them in their choice, if they adopt the wiser course of purchasing from a respectable philosophical instrument-maker; and to enable them to use with facility and certainty the Camera obscura for procuring Photographic drawings of scenes, buildings, &c.

A mistake is too commonly made by those who are ignorant of Photographic manipulation in conceiving that no difficulties stand in the way of their success, that they have only to buy or prepare paper, and place it in the Camera, when sunshine does all the rest for them; the result being, as they hope, a very perfect picture of the object they desire to copy. It cannot be too often, nor too strongly stated, that to ensure success in any of the Photographic processes demands a very large amount of care on the part of the operator in every stage of the process, and that, even when every precaution has been taken, numerous and often annoying failures will occur. It may be as well to state succinctly the points demanding attention in the preliminary stages.

1st. In the selection of the paper the utmost care must be used to procure such as is free from specks or spots of any kind, and it should be of equal texture throughout, and as far as possible uniformly absorbent.* The longer the paper has been made, provided it is not coloured by keeping, the better it will prove. As the pictures procured in the Camera are negative (see the *Art-Journal*, May, 1848,) and positive copies are to be obtained from these the paper should be as transparent as possible, but it should, at the same time, be quite free from small holes, which will be detected by looking through the paper at a bright point of light.

2nd. The chemicals with which the paper is to be rendered sensitive, must be absolutely pure, and every different solution must be uniformly applied; and for every preparation a different brush employed. Extreme cleanliness is necessary to insure success, and in the application of the last and most sensitive coatings, the process must be carried on either in the dark, or under such conditions as will ensure an entire absence of the chemically active rays. Where it is not convenient to exclude the light from an apartment, the use of a curtain of yellow long cloth will answer the purpose of excluding such rays as are injurious in this stage of the process.

3rd. The last sensitive coating should be applied but a little time before the paper is to be used, as it rapidly loses that extreme delicacy which is required for obtaining the best effects. It need scarcely be stated that the sensitive paper must be carefully excluded from every trace of light, until the moment when the radiations from the object we desire to copy are allowed to fall upon it.

A mode of manipulating with the iodide of

* The imperfections of the best varieties of paper is a source of common complaint, and even that which is prepared for receiving impressions of our finest engravings is found to lose colour and become spotty, often to the destruction of the print. This in most cases arises from the circumstance that the paper manufacturer bleaches his paper with sulphites; these by exposure to the atmosphere decompose, and yellow or brown spots of sulphurets are formed.

silver has been lately introduced with much advantage. It is as follows: Iodide of silver, which has been precipitated from the nitrate of silver by the use of the iodide of potassium, is re-dissolved in a strong solution of the iodide of potassium. This mixture is to be applied over one side of the paper, which is then to be immersed in a shallow vessel of clean water. The water removes the iodide of potassium, and a very pure and uniform coating of the iodide of silver is left upon the paper; in this condition it may be preserved to receive eventually its sensitive coating of the gallo-nitrate or any other exciting solution of silver.

The Camera-obscura is essentially, although a very curious, a very simple optical instrument. The primary form of the dark chamber of Baptista Porta involves the whole of the phenomena. Close the shutters of an apartment on a bright day, and make a small hole in them with a gimlet; the radiations from any external objects pass through this hole, and their spectral images are seen upon the opposite wall or on any screen conveniently placed to receive the picture. If upon the hole a small lens is placed and the screen adjusted to the correct focus, the picture acquires additional brightness and beauty. The main features of construction in the Camera required for photographic purposes, will be immediately understood by reference to the following woodcut:—

A is the external object, a statue, a house, or a tree, of which we may desire to obtain a copy; the rays from it fall upon the lens placed at one end of a blackened box, B; they are refracted by the glass, and they fall, giving a miniature representation, on the screen c. The object of constructing one part of the box to slide within the other, is to admit of an adjustment of the focal distance. Some such arrangement is necessary, since the distance of objects from the lens must of necessity be continually altered within extensive limits, the distance from the lens to the screen must vary accordingly. These adjustments are susceptible of almost mathematical accuracy, and indeed, a well-taken photographic picture may serve as a faithful measure of the height of the buildings which have impressed their images upon it. By the rule of proportion, this is readily obtained, the required data being given.

A column for instance is one hundred feet from the lens of the Camera, and a picture has been obtained two inches in height with a focal distance of twelve inches. Now if twelve inches give two inches, what will one hundred feet give, soon answers the question.

For the purpose of showing how simply and easily a Camera-obscura for ordinary purposes may be constructed, we have inserted the following two woodcuts:—

The first being an oblong box, into which is fitted two pieces of brass tubing made to move one within the other like the parts of a telescope, the movement being produced by a rack

worked by a thumb-screw, the lens being fitted into the movable tube. In the other arrangement the parts of the box slide, and the single tube holding the lens does not move. It is not

possible, however, by this arrangement to adjust the focus with such nicety as by the former method, but it is more economical. The mode in which the box may be constructed is a very secondary matter in comparison with the character of the lens employed.

In selecting a lens the glass should be as free as possible of striae, as these tend to distort many of the fine lines of objects. It is essential that the lens should be achromatic, as it is most important that each coloured radiation should be united into one focus. It is, of course, generally understood that the angle of refraction differs for every coloured ray, and that consequently the images of a yellow and of a blue object do not appear with equal distinctness on the same plane—if an ordinary lens is employed—and that the object of the double or achromatic arrangement of lenses is, by combining two kinds of glass, the refractive powers of which are different, and of which the difference is known, to correct this evil. Having, however, corrected for chromatic aberration, we have to obviate the distortions which arise from the spherical shape of the lens. It will be obvious to any one examining a convex lens that the radiations passing—being refracted—through it, must be of unequal focal lengths; and hence the necessity for using concave tables in the large Camera-obscuras upon which the images are received. For the photographic Camera it is not practical to employ any other than a plane surface, and consequently we are compelled to meet the difficulty by modifying the shape of the lens we employ. The best form to insure a flat figure is a *meniscus*, having the radii of its curves in the proportion of two to one. An achromatic meniscus lens is required to meet the conditions, and since the edges of all lenses are their most defective parts, it is always advisable to have the lens of greater diameter than is really necessary for the size of the pictures we desire to obtain, and then by means of a diaphragm, or by opaque colour laid around the outer circle of the glass, to cut off all but the central portions. The great attention that has been paid by Mr. Ross of Featherstone Buildings to the manufacture of lenses for photographic purposes, has resulted in the production of lenses for landscape and portraiture which are equal to any of those for which some towns on the Continent have long been celebrated, and they may be procured at a comparatively low price.

There is one point in connection with the use of the Camera, which is of great importance in practice. It is that the visual focus and the chemical focus of the instrument do not correspond, that is to say, when we procure upon the ground glass which is placed at the end of the Camera, where the arrow, in the first cut, marks the position of the lenticular image, and the picture appears most perfect—we have not obtained that focus which will produce the best chemical effect. The chemical rays have not so great a focal length as the luminous rays, and consequently, after having carefully adjusted the Camera to the best luminous focus, it should be shifted so as to shorten slightly the distance between the lens and the screen. All things being thus arranged, we have only to place the prepared paper in the Camera. The most convenient mode of adjustment is to place, when the glass is ready for use, a sheet in a frame having a shutter front, before which slides easily a shutter of wood to exclude all light. Several such frames should be filled with paper and constructed to fit into the

Camera-obscura, to enable any one to take several sheets of prepared paper into the country. This frame is let down into the place previously occupied by the ground glass, and then the shutter is to be carefully drawn up, and the lenticular image allowed to impress itself on the paper.

The period of exposure to solar influence varies most importantly. Much, of course, depends on the sensibility of the paper, which can only be determined by trial. It, however, often happens that a longer time is required to produce a good picture under the influence of the bright days of summer, than even in the more subdued light of the spring. It has been proved that, relatively to each other, the proportions of light and Actinism, the agent producing chemical change, are continually varying. The causes of these variations are unknown; it appears probable that there is a uniform rate of change between Light, Heat, and Actinism, as united in the sunbeam; but it is also certain

that changes in the condition of the atmosphere materially influence the Photographic action. Under these circumstances it will be clear that experience alone can determine the length of time during which a prepared paper or plate is to remain in the Camera to receive a good impression. The impressed image, whether the Calotype, the Ferrotype, or as it was first called the Euergetype, be employed, or whether we use a silver plate iodised—the Daguerreotype—is at first invisible; it has therefore to be brought out by one of the methods described in the papers already referred to. The most simple process, and, if carefully practised, the most sensitive and effective, is the Ferrotype, which differs from the Calotype in the use of a simple solution of sulphate of iron, instead of the compound of gallic acid and nitrate of silver.* On this process Mr. Talbot remarks:—“The same iodised paper as was used in the calotype process, gave the best results. With this and sulphate of iron, he had obtained portraits in one or two seconds.”†

Armed with an inexpensive Camera-obscura, and with a few sheets of prepared paper, any one may now visit any locality, and procure for himself faithful transcripts of the scenery and

points of interest around it. The landscape painter already avails himself of this most charming art to catch those fleeting charms of light and shadow which lend so much loveliness to nature; and many of those who aim at the highest walks of Art, employ the Camera in their studies of the living model. With each improvement of the Photographic processes, new beauties develop themselves, and we have pictures possessing all the charms of aerial distance, the natural gradations from the highest lights to the deepest shadows, each middle tint being beautifully preserved, and a wonderful minuteness of detail united to a fine breadth of effect. Every picture taken with a good Camera, becomes a study, and although it wants the charm of colour, it possesses almost every other element of beauty. In the consciousness that, at the same time as entertainment will be afforded to every one who watches the marvellous process of sun-painting, much instruction of a high order will be furnished, and the taste of all corrected; and we have penned the brief directions contained in this article.

NO. II. BEECHEY'S PATENT TRINOPTRIC LANTERN.

The amount of amusement which is afforded by these optical arrangements, which pass by the names of the Magic Lantern and Phantasmagoria is so great, that we are certain we shall interest our readers by some description of an instrument which possesses many advantages over any which has yet been introduced to public attention. This instrument, the invention of the Rev. H. Vincent Beechey, the son of Sir William Beechey, the well known Royal Academician, is correctly described as possessing, within less compass than a single lantern of the ordinary description, all the powers of two or three lanterns, with only one small lamp of intense brightness, free from the objectionable smell and heat of ordinary lamps, whereby a disc of twenty-five feet for each tube may be obtained;

each disc is capable of being darkened to any required extent, without the least shadow on any particular portion of the picture. As these three discs may be thrown either altogether on one circle, or two or three together at various distances in length upon the screen, the number of effects which may be produced may be easily imagined; they present, first, a succession of dissolving views, so accurately and gradually dissolving, that the most experienced eye cannot perceive the process going on. Second, various diorama effects, as rain, snow, thunder and lightning; succeeded by sunshine and the rainbow; waterfalls with running water; volcanos in eruption, without the necessity for darkening any part of the picture to admit the revolving portion, &c. Third, the introduction of moving figures—boats, steam-boats, with revolving paddles, &c. Fourth, long continuous pictures, thirty feet in length. Fifth, double or treble discs, as the two hemispheres of the globe on the screen at once, full size; or three separate

* This process is described in the Report of the British Association for the Advancement of Science for 1844. Under the title of “On the Ferrotype, and the property of Sulphate of Iron in developing Photographic Images.”

† British Association, Report for 1844, page 105 of Transactions of Sections.

portions of one diagram of extended length, without crowding, as at present, all the objects into one disc; or two or three moving pantomimic figures acting independently of each other, &c. Lastly, combinations of three moving or revolving slides on one circle, as all the planetary system in motion round a very bright sun, and within a large fixed zodiac, whilst comets perform their eccentric orbits at the same time; or all the vagaries of two or three Chromatropes taken in combination, and permutations of one, two, or three together.

This lantern consists essentially of a square metal-box, into three sides of which are fixed the tubes containing the lenses; and, as will be seen by examining the woodcut illustration, to the two side tubes are affixed mirrors, which are capable of adjustment to any angle. It will be easily understood that by these means we may have either three distinct pictures on the screen at one and the same time, or that they may be easily made to blend, or pass one into the other, thus affording means by which a series of "dissolving views" may be produced, without any of the annoyances which arise from the use of two or more lanterns.

The imperfection in the Trinoptic Lantern as above described lay in the use of reflectors, from which there was considerable loss of light in the side tubes; and although with the oxygen and lime light invented by Mr. Beechey (to be presently described) the pictures were clear and good in a twenty feet disc, yet it was advisable to choose the lightest pictures for the sides, reserving the darker ones for the front. The double surface of glass mirrors also prevented that sharpness and clearness of detail which it is desirable to preserve. The use of prisms instead of mirrors was suggested, but the narrow limits under which the reflection from prisms is confined, rendered it very difficult to get even two perfect discs to be coincident with any high power. This will be apparent when the conditions of perfect reflection from prisms is considered. The reflection obtained at the correct angle is the most perfect possible, but it is only when the incident ray is less than $41^{\circ} 50'$ that reflection is perfect; at any greater angle the light passes through. If therefore the back of a reflecting prism be inclined at the angle of 45° or 46° , which was necessary in the old Trinoptic in order to obtain coincidence, it will be evident that part of the disc will be imperfect. Suppose $a b c$ to be the back of a right-angled

employed are very narrow. The front and back of a circular box being firmly fixed to the top and bottom, but having the sides on which the other tubes are fastened moveable by a circular groove and tongue in the top and bottom, so that the two side tubes may be inclined to the front tube at any angle from 65° to 100° , between the sides, and the front, and back, there are diaphragms of black leather, bent like the bellows of an accordion, to allow of the angular movement, and yet prevent any light from escaping.

The front slides are put in from above, which is found to be even more convenient than in the former arrangement. The front lever, which opens and closes the slinters, is bent to allow of this, and is moveable about a ring round the chimney, whilst a semicircular space in the top above the centre tube allows of the motion of the cranks of revolving slides. Now the lights being placed in the centre of such a box, it is clear that it will, at whatever angle the tubes are inclined, prove true with respect to the light. When the side tubes are placed in such a manner that they form with it an angle of 65° or even less, this will allow of the back of the prism being inclined so much less that the angle of incidence shall be sufficiently small, and a perfect disc obtained of 7 feet diameter at 12 feet distance with a plain right-angled prism;

and if a lenticular right-angled prism be employed of about 30 inches focal length, the diameter of the disc will be increased to 9 or 10 feet. This is sufficient for every ordinary purpose, giving a 20 feet disc at 24 feet distance, perfectly bright and only a very slight imperfection at the side furthest from the centre, owing to the lenticular side sloping a little from the direct axis of light.

In order, however, to remove this last imperfection, Mr. Beechey has had constructed a prism which he believes will be found of the most perfect form. D E F is a lenticular prism of about 24 inches focal length; the sides D E, E F, are of equal length, viz. $2\frac{1}{2}$ inches. The back D F, forms with them angles of 50° . The angle D E F being 80° , from a slight inspection of the angles as they are marked in the diagram, it will be seen that without any inclination of the prism, the ray $c a a$ will make with the back an angle of 49° , thus making the angle of incidence $= 41^{\circ}$, which is an \angle of perfect reflection. The centre ray $c c$

enters at right-angles to the surface D E, and leaves the side E F also at right-angles, consequently undergoing no refraction whatever. It makes with the direct axis $c c$ (or the parallel line $e c$) only an angle of 100° , so that an inclination of 10° in the side tube will bring it perpendicular to the screen and produce coincidence; this is 12° less than would bring it to the front. There is a further advantage in this lenticular prism, for if it be so set that it can revolve upon the pivot G, the plain side may be turned to the lantern, and the lenticular side will come where E F now is; the consequence will be the immediate obtaining of a lower power.

Thus constituted the Prismatic Trinoptic Lantern becomes a very perfect instrument for lectures and exhibitions. The pictures produced

by the sides are equal to those of the front. Three perfect lanterns are in the hands of the operator at once, which can all be made to bear upon one point, producing the most beautiful dioramic effects. A single light, whether the oxygen and lime lamp, or a small camphine, or good solar lamp, according as the exhibition is large or small, is all that is required, though the oxygen and lime light is greatly to be preferred, as free from heat or smell, and so very superior in intensity.

It is unnecessary to mention the numerous effects of which such a lantern is capable; whoever has been in the habit of using the large and cumbersome machinery of two lanterns and lamps, or two Drummond lime lights with their great consumption of oxygen and hydrogen, will readily believe that to possess all the power, not of two but of three such lanterns, in one mahogany box, eleven inches in diameter, must powerfully recommend itself to the lecturer and open an entirely new field in the use of the lantern.

The oxygen lime lamp is an exceedingly neat and ingenious contrivance, and from its simplicity and perfection adds much to the value of the instrument.

The lamp is a small fountain lamp, with a circular wick, which is easily fitted to the holder, like an argand burner; it is preferable to use a fresh wick on each occasion. The wick should not be raised too high; but just to produce as much smoke as will be entirely absorbed by the gas.

In the exact centre of the wick, and precisely level with the top of it when raised, is a small tube for supplying oxygen. A little oxidation will occasionally be found on the top of this tube, which should be removed with a wire. At the bottom of the oxygen tube is a cup to receive any overflow of oil, screwed on with a connecting joint, at which an India-rubber tube is united, the other end of which is attached to a gas bag, filled with oxygen gas. Apply a

pressure of about twenty pounds, which is effected by placing a weight on the top of the bag, and turn on sufficient gas only by the small stop-cock to produce perfect brightness. This should be particularly attended to,—if too much gas is turned on, the lime ball is cooled and gas wasted. Exactly over the centre of the wick and oxygen tube, at about three eighths of an inch above the latter, a small lime ball is suspended by platinum wire, which greatly increases the brightness. The lime balls should be kept in a stoppered bottle, and in a dry place; the oil used should be best olive. The lamp consumes about an ounce and a half of oil, and a cubic foot of oxygen, per hour. The oil cistern should always be filled—and the wick carefully trimmed so that the surface is perfectly even.

The common mode of preparing oxygen gas from the black manganese is a very troublesome and often an exceedingly tedious process. The following process is therefore given as the most efficient in every respect. Having an iron bottle to which a tube is attached, place in it a mixture of the chlorate of potash and oxide of manganese in the following proportions:—chlorate of potash, eleven ounces; oxide of manganese, two ounces. Screw or lute on your tube, and connecting it with your receiver, place the iron bottle on the fire. If it is tolerably bright, in about ten minutes three cubic feet of gas will be produced.

The bag in which the gas is collected is united to the lamp, and when the wick is ignited a proper proportion of the gas is allowed to quicken the combustion, and by acting on the lime ball to produce the brilliant star of light, which is but slightly inferior to the Drummond light, and far less troublesome.

ROBERT HUNT.

prism opposite the tube $a c r$, $A D B$ to be the diameter of the condenser (say $3\frac{1}{4}$ inches); then if the centre of the object lens c be six inches from the condenser, the rays $a c c$, $b c b$, will be found to subtend an angle of about 28° ; therefore the angle $A c c = 14^{\circ}$ and the angle $A a a$, will be found to be 62° the half of which being the angle of incidence will be 31° , which being less than the least angle of perfect reflection by more than 10° , a large portion of the left-hand side of the disc will be imperfect. And if, in order to remedy this, the back of the prism be inclined much further back, the disc will never agree with that from the front tube and there is, moreover, danger of some of the rays of the pencil $b c b$, missing the back altogether and so spoiling the other side of the disc. Thus the limits within which such a prism can be

PILGRIMAGES TO ENGLISH SHRINES.

BY MRS. S. C. HALL.

WITH NOTES AND ILLUSTRATIONS BY
F. W. FAIRBOLT, F.S.A.

THE GARDEN OF SIR THOMAS MORE.

WHILE living in the neighbourhood of Chelsea, we determined to look upon the few broken walls that once enclosed the residence of Sir Thomas More—a man, who, despite the bitterness in-

separable from a persecuting age, was of most wonderful goodness as well as intellectual power. We first read over the memories of him preserved by Erasmus, Hoddosdon, Roper, Aubrey, his own namesake, and others. It is pleasant to muse over the past,—pleasant to know that much of malice and bigotry has departed, to return no more,—that the prevalence of a spirit which could render even Sir Thomas More unjust, and, to seeming, cruel, is passing away. Though we do implicitly believe there would be no lack of great hearts, and brave hearts, at the present day, if it were necessary to bring them to the test—still, there have been few men like unto him. It is a pleasant, and a profitable task, so to sift through past ages, as to separate the wheat from the chaff,—to see, when the feelings of party and prejudice sink to their proper insignificance, how the morally great stands forth in its own dignity, bright, glorious, and everlasting. St. Evremont sets forth the firmness and constancy of Petronius Arbitrator in his last moments, and imagines he discovers in them a softer nobility of mind and resolution, than in the deaths of Seneca, Cato, or Socrates himself; but Addison says, and we cannot but think truly, 'that if he was so well pleased with gaiety of humour in a dying man, he might have found a much more noble instance of it in Sir Thomas More, who died upon a point of religion, and is respected as a martyr by that side for which he suffered.' What was pious philosophy in this extraordinary man, might seem profane in anyone who does not resemble him as well in the cheerfulness of his temper as in the sanctity of his life and manners.

Oh, that some such man as he were to sit upon our woollack now; what would the world think, if when the mighty oracle commanded the next cause to come on, the reply should be, 'Please your good lordship, there is no other!' Well might the smart epigrammatist write:—

When More's some time had Chaucer been,
No more seats did remain;
The same shall never more be seen,
Till More be there again!

We mused over the history of his time until we slept—and dreamed: and first in our dream we saw a fair meadow, and it was sprinkled over with white daisies, and a hull was feeding therein; and as we looked upon him he grew fatter and fatter, and roared in the wantonness of power and strength, so that the earth trembled; and he plucked the branches off the trees, and trampled on the ancient enclosures of the meadow, and as he stormed, and bellowed and destroyed, the daisies became human heads, and the creature flung them about and warmed his hoofs in the hot blood that flowed from them; and we grew sick and sorry at heart, and thought, is there no one to slay the destroyer? And when we looked again the Eighth Harry was alone in the meadow; and, while many heads were lying upon the grass, some kept perpetually bowing before him, while others sang his praises as wise, just, and merciful. Then we heard a trumpet ringing its scarlet music through the air, and we stood in the old tilt-yard at Whitehall, and the pompous Wolsey, the blotted King, the still living Holbein, the picturesque Surrey, the Aragonian

Catharine, the gentle Jane, the hutterly Anne Bullen, the coarse-seeming but wise-thinking Ann of Cleves, the precise Catherine Howard, and the stout-hearted Catherine Parr, passed us so closely by, that we could have touched their garments—then a howling troop of Court gallants came on—others whose names and actions you may read of in history—and then the hero of our thoughts, Sir Thomas More—well dressed, for it was a time of pageants—was talking somewhat apart to his pale-faced friend Erasmus, while 'Son Roper,' as the Chancellor loved to call his son-in-law, stood watchfully and respectfully a little on one side. Even if we had never seen the pictures Holbein painted of his first patron, we should have known him by the bright benevolence of his aspect, the singular purity of his complexion, his penetrating yet gentle eyes, and the incomparable grandeur with which virtue and independence dignified even an indifferent figure. His smile was so catching that the most broken-hearted were won by it to forget their sorrows; and his voice, low and sweet though it was, was so distinct, that we heard it above all the coarse jests, loud music, and trumpet calls of the vain and idle crowd. And while we listened, we awoke; resolved next day to make our Pilgrimage, perfectly satisfied at the outset, that though no fewer than four houses in Chelsea contend for the honour of his residence, Doctor King's arguments in favour of the site being the saunas that of Beaufort House—upon the greater part of which now stands Beaufort-row—are the most conclusive; those who are curious in the matter can go and see his manuscripts in the British Museum. Passing Beaufort-row, we proceeded straight on to the turn leading to the Chelsea Clock-house.

CLOCK HOUSE.

It is an old, patched-up, rickety dwelling, containing perhaps but few of the original stones, yet interesting as being the lodge-entrance to the offices of Beaufort House; remarkable, also, as the dwelling of a family of the name of Howard, who have occupied it for more than a hundred years, the first possessor being gardener to Sir Hans Sloane, into whose possession, after a lapse of years, and many changes, a portion of Sir Thomas More's property had passed. This Howard had skill in the distilling of herbs and perfumes, which his descendant carries on to this day. We lifted the heavy brass knocker, and were admitted into the 'old clock-house.' The interior shows evident marks of extreme age, the flooring being ridgy and seamed, hearing their marks with discontented creaking—like the secret murmurs of a faded beauty against her wrinkles! On the counter stood a few frost-bitten geraniums; and drawers, containing various roots and seeds, were ranged round the walls, while above them were placed good stout quart and pint bottles of distilled waters. The man would have it that the 'clock-house' was the 'real original' lodge-entrance to Beaufort House; and so we agreed it might have been, but not, 'perhaps,' built during Sir Thomas More's lifetime. To this insinuation he turned a deaf ear, assuring us that his family, having lived there so long, must know all about it, and that the brother of Sir Hans Sloane's gardener had made the great clock in old Chelsea Church, as the church books could

prove. 'You can, if you please,' he said, 'go under the archway at the side of this house, leading into the Moravian chapel and burying-ground, where the notice, that "within are the Park-chapel Schools," is put up.' And that is quite true; the Moravians now only use the chapel which was erected in their burying-ground to perform an occasional funeral service in, and so they 'let it' to the infant school. The burying-ground is very pretty in the summer time. Its space occupies only a small portion of the Chancellor's garden; part of the walls are very old, and the south one certainly belonged to Beaufort House. There have been some who trace out a Tudor arch and one or two Gothic windows as having been filled up with more modern mason-work; but that may be fancy. There seems no doubt that the Moravian chapel stands on the site of the old stables.

'Then,' we said, 'the clock-house could only have been at the entrance to the offices.' The man looked for a moment a little hurt at this observation, as derogatory to the dignity of his dwelling, but he smiled, and said 'Perhaps so;' and very good-naturedly showed us the cemetery of this interesting people. Indeed, their original settlement in Chelsea is quite a romance. The chapel stands to the left of the burying-ground, which is entered by a primitive wicket-gate; it forms a square of thick grass, crossed by broad gravel walks, kept with the greatest neatness. The tomb-stones are all flat, and the graves not raised above the level of the sward. They are of two sizes only: the larger for grown persons, the smaller for children. The inscriptions on the grave-stones, in general, seldom record more than the names and ages of the persons interred. The men are buried in one division, the women

in another. We read one or two of the names, and they were quaint and strange; 'Anne Hyphoria Hulloch'; 'Anna Benigna La Froch'; and one was especially interesting, James Gilray, forty years sexton to this simple cemetery, and father of Gilray, the H.B. of the past century. One thing pleased us mightily—the extreme old age to which all the dwellers in this house seemed to have attained.

A line of ancient trees runs along the back of the narrow gardens of Millman's-row,—which is parallel with, but farther from town than, Beaufort-row,—and affords a grateful shade in the summer time. We resolved to walk quietly round, and then enter the chapel. How strange the changes of the world! The graves of a simple, peace-loving, unambitious people were lying around us, and yet it was the place which Erasmus describes as 'Sir Thomas More's estate, purchased at Chelsey,' and where 'he built him a house, neither mean nor subject to envy, yet magnificent and commodious enough.' How dearly he loved this place, and how much care he bestowed upon it, can be gathered from the various documents still extant.* The herbery

* After the death of More this favourite home of his, where he had so frequently gathered a choice company of men distinguished by their genius and learning, passed into the rapacious hands of his bad Sovereign, and by him was presented to Sir William Pawlet, ultimately Lord High Treasurer and Marquis of Winchester; from his hands it passed into Lord Dacre's, to whom succeeded Lord Burghley; then followed his son, the Earl of Salisbury, as his master; from him it passed successively to the Earl of Lincoln, Sir Arthur Gorges, the Earl of Middlesex, Villiers, Duke of Buckingham, Sir Bulstrode Whitelock, the second Duke of Buckingham, the Earl of Bristol, the Duke of Beaufort, and ultimately to Sir Hans Sloane, who obtained it in 1738, and after keeping it but two years razed it to the ground; an unhappy want of reverence on the part of the great materialist for the home of so many great men. There is a print of it by J. Kay, in 1839, which is copied above; it shows some old features, but it had then been enlarged and altered. Erasmus has well described it as it was in More's lifetime. It had a chapel, a library, and a gallery, called the New Buildings, a good distance from his main-house, wherein his custom was to busy himself in

with which, soon after he was elected a Burgess to Parliament, he opposed a subsidy demanded by Henry the Seventh, with so much power that he won the Parliament to his opinion, and incensed the King so greatly, that out of revenge he committed the young barrister's father to the

Tower, and fined him in the fine of a hundred pounds! That bravery remained with him to the last, and with it was mingled the simplicity which so frequently and so beautifully blends with the intellectuality that seems to belong to a higher world than this. When he 'took

count his office dishonoured.' Another reply to the same abject noble, is well given on our memory. He expostulated with him, like many of his other friends, for braving the King's displeasure. 'By the mass, Master More,' he said, 'it is perilous striving with princes; therefore I wish you somewhat to incline to the King's pleasure, for "*indignatio Principis mors est.*"' 'And is that all, my lord?' replied this man, so much above all paltry considerations; 'then in good faith the difference between your Grace and me is but this—that I may die to-day, and you to-morrow.'

He took great delight in beautifying Chelsea Church, although he had a private chapel of his own; and when last there they told us the painted window had been his gift. It must have been a rare sight to see the Chancellor of England sitting with the quire; and yet there was a fair share of pomp in the manner of his servitor bowing at his lady's pew, when the service of the mass was ended, and saying, 'My lord is gone before.' But the day after he resigned the great seal of England (of which his wife knew nothing) Sir Thomas presented himself at the pew-door, and, after the fashion of his servitor, quaintly said, 'Madam, my lord is gone.' The vain woman could not comprehend his meaning, which, when, during their short walk home, he fully explained, she was greatly pained thereby, lamenting it with exceeding bitterness of spirit.

We fancied we could trace a gothic door or window in the wall; but our great desire would have been to discover the water-gate from which he took his departure the morning he was summoned to Lambeth to take the oath of supremacy. True to what he believed right, he offered up his prayers and confessions in Chelsea Church, and then returning to his own house, took an affectionate farewell of his wife and children, forbidding them to accompany him to the water-gate, as was their custom, fearing, doubtless, that his mighty heart could not sustain a prolonged interview. Who could paint the silent parting between him and all he loved so well—the boat waiting at the foot of the stairs—the rowers in their rich liveries, while their hearts, heavy with apprehension for the fate of him they served, still trusted that nothing could be found to harm so good a master—the pale and earnest countenance of 'son Roper,' wondering at the calmness, at such a time, which more than all other things bespeaks the master mind. For a moment his hand lingered on the gate, and in fastening the simple latch his fingers trembled, and then he took his seat by his son's side; and in another moment the boat was flying through the waters. For some time he spoke no word, but communed with and strengthened his great heart by holy thoughts; then looking straight

into his son Roper's eyes, while his own frightened with a glorious triumph, he exclaimed in the fulness of his rich-toned voice, 'I thank our Lord, the field is won.' It was no wonder that, overwhelmed with apprehension, his son-in-law could not apprehend his meaning then, but afterwards bethought him that he signified how he had conquered the world.

The Abbot of Westminster took him that same day into custody, on his refusal to 'take the King as head of his Church,' and upon his repeating this refusal

four days afterwards, he was committed to the Tower. Then, indeed, these heretofore bowers of bliss echoed to the weak and wavering complaints of his proud wife, who disturbed him also in his prison by her desires, so vain and so worldly, when compared with the elevated feelings of his dear daughter Margaret.

How did the fond foolish woman seek to shake his purpose? 'Seeing,' she said, 'you have a

MORE'S HOUSE.

to marrying; he fancied the second daughter of a Mr. Colt, a gentleman of Essex; yet when he considered the pain it must give the eldest to see her sister preferred before her, he gave up his first love, and framed his fancy to the elder. This lady died, after having brought him four children; but his second choice, Dame Alice, has always seemed to us a punishment and a sore trial. And yet how beautifully does Erasmus describe his mode of living in this very place—'Ho converseth with his wife, his son, his daughter-in-law, his three daughters and their husbands, with eleven grandchildren. There is not a man living so affectionate to his children as he. He loveth his old wife as if she were a young maid; he persuadeth her to play on the lute, and so with the like gentleness he ordereth his family. Such is the excellence of his temper, that whatsoever happeneth that could not be helped, he loveth, as if nothing could have happened more happily. You would say there was in that place Plato's academy; but I do his house an injury in comparing it to Plato's academy, where there were only disputations of numbers and geometrical figures, and sometimes of moral virtues. I should rather call his house a school, or university of Christian religion; for though there is none therein but readeth and studyeth the liberal sciences, their special care is piety and virtue.'

The King was used to visit his 'beloved Chancellor' here for days together to admire his ter-

prayer and meditation, whensoever he was at leisure. Heywood, in his *Utopia* (Florence, 1556), describes 'the garden as wonderfully charming, both from the advantages of its site, for from one part almost the whole of the noble city of London was visible; and from the other, the beautiful Thames, with green meadows by woody eminences all around; and also for its own beauty, for it was crowned with an almost perpetual verdure.' At one side was a small green eminence to command the prospect.

The conduct of this great man's house was a model to all, and as near an approach to his own Utopia as might well be. Erasmus says, 'I should rather call his house a school or university of Christian religion, for though there is none therein but readeth and studyeth the liberal sciences; their special care is piety and virtue; there is no quarrelling or intemperate words heard; none seen idle; which household discipline that worthy gentleman doth not govern, but with all kind and courteous benevolence.' The servant-men abode on one side of the house, the women on another, and met at prayer-time, or on church festivals, when More would read and expound to them. He suffered no cards or dice, but gave each one his garden-plot for relaxation, or set them to sing, or play music! He had an affection for all who truly served him, and his daughters' nurse is as affectionately remembered in his letters when from home as are they themselves.

Thomas More someth greeting to his most dear daughters Margaret, Elizabeth, and Cecily; and to Margaret Giggis, as dear to him as if she were his own, are his words in one letter; and his valued and trust-worthy domestics appear in the family pictures of the family by Holbein. They requited his attachment by truest fidelity and love; and his daughter, Margaret, in her last passionate interview with her father on his way to the Tower, was succeeded by Margaret Giggis and a maid-servant, who embraced and kissed their condemned master, of whom he said after, it was homely but very lovingly done. Of these and other of his servants, Erasmus remarks, 'after Sir Thomas More's death, none ever was touched with the least suspicion of any evil fame.'

race overhauling the Thames, to row in his state barge, to ask opinions upon divers matters, and it is said that the royal answer to Luther was composed under the Chancellor's revising eye. Still, the penetrating vision of Sir Thomas was in no degree obscured by this glitter. One day, the King came unexpectedly to Chelsea, and, having dined, walked with Sir Thomas for the space of an hour in the garden, having his arm about his neck. We pleased ourselves with the notion that they walked where then we stood! Well might such condescension cause his son Roper—for whom he entertained so warm an affection—to congratulate his father upon such condescension, and to remind him that he had never seen his Majesty approach such familiarity with any one, save once, when he was seen to walk arm in arm with Cardinal Wolsey. 'I thank our Lord,' answered Sir Thomas, 'I find his Grace my very good Lord, indeed; and I do believe, he doth as singularly love me as any subject within the realm; however, son Roper, I may tell thee I have no cause to be proud thereof, for if my head should win him a castle in France, it should not fail to go off.'

With the exception of his own family (and his wife formed an exception here), there are few indeed of his cotemporaries, notwithstanding the eulogiums they are prone to heap upon him, who understood the elevated and unworldly character of this extraordinary man.

CHELSEA CHURCH.

The Duke of Norfolk, coming one day to die with him, found him in Chelsea Church, singing in the choir, with his surplice on. 'What! what!' exclaimed the Duke, 'What, what, my Lord Chancellor a parish clerk!—a parish clerk! you dishonour the King and his office.' And how exquisite his reply, 'Nay, you may not think your master and mine will be offended with me for serving God his master, or thereby

house at Chelsea, a right fair house, your library, your gallery, your garden, your orchard, and all other necessities so handsome about you, where you might, in company with me your wife, your children, and household, be merry, I marvel that you, who have been always taken for so wise a man, can be content thus to be shut up among mice and rats, and, too, when you might be abroad at your liberty, and with the favour and good will both of the King and his council, if you would but do as all the bishops and best learned men of the realm have done.

And then not even angered by her folly, seeing how little was given her to understand, he asked her if the house in Chelsea was any nearer Heaven than the gloomy one he then occupied! ending his pleasant yet wise parleying with a simple question:—

'Tell me,' he said, 'good Mistress Alice, how long do you think might we live and enjoy that same house?'

She answered, 'Some twenty years.'

'Truly,' he replied, 'if you had said some thousand years, it might have been somewhat; and yet he were a very bad merchant who would put himself in danger to lose eternity for a thousand years. How much the rather if we are not sure to enjoy it one day to an end!'

It is for the glory of women, that his daughter Margaret, while she loved and honoured him past all telling, strengthened his noble nature; for, writing him during his fifteen months' imprisonment in the Tower, she asks, in words not to be forgotten, 'What do you think, most dear father, doth comfort us at Chelsey in this your absence? Surely the remembrance of your manner of life passed amongst us—your holy conversation—your wholesome counsels—your examples of virtue, of which there is hope that they do not only persevere with you, but that they are by God's grace much more increased.'

After the endurance of fifteen months' imprisonment, he was arraigned, tried, and found guilty of denying the King's supremacy. Alack! is there no painter of English history bold enough to immortalise himself by painting this trial? Sir Thomas More was beheaded on Tower Hill, in the bright sunshine of the month of July, on its fifth day, 1535, the King remitting the disgusting quartering of the quivering flesh, because of his 'high office.' When told of the King's 'mercy,' 'Now, God forbid,' he said, 'the King should use any more such to any of my friends; and God bless all my posterity from such pardons.'

One man of all the crowd who wept at his death, reproached him with a decision he had given in Chancery. More, nothing discomposed, replied, that if it were still to do, he would give the same decision. This happened twelve months before. And, while the last scene was enacting on Tower Hill, the King, who had walked in this very garden with his arm round the neck which by his command the axe had severed, was playing at Tables in Whitehall, Queen Anne Bullen looking on; and when told that Sir Thomas More was dead, casting his eyes upon the pretty girl that had glittered in his pageants, he said, 'Thou art the cause of this man's death.'—'The coward! to seek to turn upon a thing so weak as that, the heavy sin which clung to his own soul!'

Some say the body lies in Chelsea Church, beneath the tomb we have sketched—the epitaph having been written by himself before he anticipated the manner of his death.* It is too long to insert; but the lines at the conclusion are very like the man. The epitaph and poetry are in Latin: we give the translation:—

"For Alice and for Thomas More's remains
Prepared, this tomb Johanna's form contains.
Owe, married young; with mutual ardour blest,
A boy and three fair girls our joy confest.
The other (no small praise), of these appear'd
As food as if by her own pains entair'd.
One lived with me, one lives, in such sweet strife,
Slight preference could I give to either wife.

* Wood and Weaver both affirm that the body of More was first deposited in the Tower Chapel, but was subsequently obtained by his devoted and accomplished daughter Margaret Roper, and re-interred in Chelsea Church, in the tomb he had finished in 1532, the year in which he had surrendered the Chancellorship, and resolved to abide the issue of his conscientious opposition to the King's wishes, as if he felt that the tomb should then be prepared.

Oh! had it met Heaven's sanction and decree,
One hallow'd bond might have united three;
Yet still be ours one grave, one lot on high!
'Tis death, what life denied us, shall supply.'

Others tell that his remains were interred in

TOMB.

the Tower,* and some record that the head was sought and preserved by that same daughter

ROPER'S HOUSE.

Margaret, who caused it to be buried in the family vault of the Ropers, in St. Dunstan's Church, Canterbury;† and they add a pretty legend how that, when his head was upon London-bridge, Margaret would be rowed beneath it, and, nothing horrified at the sight, say aloud, 'That head has layde many a time in my lappe; would to God, would to God, it would fall into my lappe as I passe under now, and the head did so fall, and she carried it in her 'lappe' until she placed it in her husband's, 'son Roper's' vault, at Canterbury.

* Faulkner, in his history of Chelsea, adheres to this opinion, and says that the tomb in that church is but 'an empty cenotaph.' His grandson, in his Life, says, 'his body was hurried in the Chapel of St. Peter, in the Tower, in the belfry, or, as some say, as one entered into the vestry;' and he does not notice the story of his daughter's re-interment of it elsewhere.

† The Ropers lived at Canterbury, in St. Dunstan's Street. The house is destroyed, and a brewery occupies its site; but the picturesque old gateway, of red brick, still remains, and is engraved above. Margaret Roper, the noble-hearted, learned, and favourite daughter of More,

The King took possession of these fair grounds at Chelsea, and all the Chancellor's other property, namely, Dunkington, Trenkford, and Benley Park, in Oxfordshire, allowing the widow he had made, twenty potts per year for her life, and indulging his petty tyranny still more by imprisoning Sir Thomas's daughter Margaret, both because she kept her father's head for a relic, and that she meant to set her father's works in print.

We were calling to mind more minute particulars of the charities and good deeds of this great man, when, standing at the moment opposite a grave where some loving hand had planted two standard rose-trees, we suddenly heard a chant of children's voices, the infant scholars singing their little hymn—the tune, too, was a well-known and popular melody, and very sweet, yet sad of sound—it was just such music as, for its simplicity, would have been welcome to the mighty dead; and, as we entered among the little songsters, the past faded away, and we found ourselves speculating on the hopeful present.

THE VERNON GALLERY.

READING THE NEWS.

Sir D. Wilkie, R.A., Painter. W. Taylor, Engraver.
Size of the Picture, 10. 4 in. by 11. 14 in.

This small picture painted in 1821, passed into the Vernon Collection from the hands of General Plipps; it was purchased after the death of Wilkie, but before the news of his decease had reached England.

When the painter was in the height of his fame England had long been engaged in hostilities with France; the great events consequent on this protracted warfare, which followed each other with such rapidity towards its close, kept the public mind, even of the humblest classes, in a state of eager excitement, and news from the continent was sought after with the utmost avidity by all of every rank and degree. It was this circumstance, no doubt, that suggested to Wilkie the idea of his well-known picture of "Chelsea Pensioners reading the Gazette of the Battle of Waterloo," finished in 1822, for the Duke of Wellington, "Reading the News," a kind of "lateral" to the larger and more important work, being exhibited at the Royal Academy in the preceding year, prepared the public for what was to follow.

The knot of news-mongers in our engraving is not, however, composed of the veterans who, for the edification of embryo warriors,

"Shoulder their crutch and show how fields are won;"

but idlers, of whom the major part are neglecting their business to hear, it may be, news of the success of our victorious armies: it is certainly something of marvellous interest, as indicated in their countenances.

We cannot regard this picture as one of Wilkie's happiest efforts, either in composition or colour; the figures of the baker, and the pair conning over the newspaper are in his best manner; with the others he has not been so successful; they are formal in the drawing, and their attitudes are forced. The work has a strong daylight effect, but it is subdued in tone and shows very little positive colour.

resided here with her husband until her death, in 1644, nine years after the execution of her father, when she was buried in the family vault at St. Dunstan's, where she had reverently placed the head of her father. The story of her piety is thus told by Cresacre More, in his Life of his grandfather, Sir Thomas:—'His head having remained about a month upon London Bridge, and being to be cast into the Thames, because room should be made for divers others, who in plentiful sort suffered martyrdom for the same supremacy, shortly after, it was bought by his daughter Margaret, lest, as she stoutly affirmed before the council, being called before them after for the matter, it should be food for fishes; which she buried, where she thought fittest.' Anthony-a-Wood says that she preserved it in a leaden box, and placed it in her tomb 'with great devotion;' and in 1715 Dr. Russell told Hearne, the antiquary, that he had seen it there 'enclosed in an iron-grate.' This was fully confirmed in 1835, when the chance of the church being repaired, the Roper vault was opened, and several persons descended into it, and saw the skull in a leaden box, something like a bee-hive, open in the front, and which was placed in a square recess in the wall, with an iron-grating before it. A drawing was made, which was engraved in the *Gentleman's Magazine* of May, 1837, which we have copied in our initial letter; Sumner, in his Handbook to Canterbury, says—'in the print there, however, the opening in the leaden box enclosing the head is not shown, and it should be in the form of a triangle!' We have therefore so corrected our copy.

THE DECORATIONS OF VERSAILLES.

HAVING recently received from Paris a considerable number of woodcuts from M. Gavard's voluminous and truly beautiful work, "Versailles, Galeries Historiques," we consider this a suitable opportunity of introducing a few of them into our journal. Most of our readers will remember that

we have on former occasions brought this valuable publication to their notice; it will well bear further extract, and the present time, when the public atten-

tion is prominently directed to designs of every kind, is especially appropriate to our purpose.

The decorations of the palace of Versailles may not inaptly be termed an illustrated history of France for many centuries past, inasmuch as it contains some pictorial record of almost every event of national importance, with busts or portraits of the greater number of distinguished characters who have flourished since the reigns of Clovis and Charlemagne. It is, perhaps, the noblest monument that has ever been raised to the civil and military genius of a mighty empire. The study of this vast museum is a study of the history of the country where the men and their deeds are seen by the light which the greatest artists of France have shed upon them. It will not be denied that French ideas of luxury and magnificence have been of the most extravagant kind, yet the taste and judgment exhibited in whatever is undertaken, from the design of a metal ornament to the decoration of a *salon*, are unsurpassed by any nation of modern times; and the display of these qualities,—the combination of taste with splendour,—is nowhere more distinctly visible than in this *quondam* palace of the monarchs of the country, perhaps destined never again to receive a crowned head under its gorgeous roofs. Amid the frenzy of political convulsions, the people have never entirely lost sight of the glories which this edifice sets forth, so that the storms of revolution have not only passed it unscathed, but it owes no small amount of its present wealth and beauty,—in its galleries of pictures, and in its renovated splendour,—to those whom revolution afforded the opportunity of adding to its riches—Napoleon and Louis Philippe. How much longer its honours may be sustained, is not for us to predict, seeing we live in strange and uncertain times; this much, however, we dare

affirm,—it will be a dark day for France when she sees the hand of the spoiler busy among the wrecks of so noble a monument of her monarchical power;

for to Louis Quatorze as the founder, and to Louis Philippe as the restorer of this edifice, the glories of it are principally due.

Two centuries have nearly elapsed since the former monarch transformed the comparatively humble hunting chateau of his predecessor into the present noble pile of buildings—noble, not as regards its architectural magnificence, but in its costly decorations and in the art-treasures it contains. And during these two centuries of its existence what scenes of gay festivity and of terrible sadness has not it witnessed; the magnificent fêtes to which Louis XIV. invited all in his kingdom eminent by rank, beauty, wealth, or attainments—the great of every department in the social scale. It was at Versailles that Louis XVI. and Marie Antoinette took refuge when the fury of a Parisian mob drove them from the capital, a fury which followed them to their sanctuary, and forced them back to a sanguinary and ignominious death. During the intervening time, and under the iron sceptre of Napoleon, Versailles was the constant rendezvous of the illustrious of every degree; so that a history of the edifice—not of its pictorial contents—would be a history of the French Court from the period of its foundation till it became no longer a royal residence. Though now silent and deserted, as a place of revelry and of political intrigue, it is a source of constant attraction to the Parisians and to strangers who visit their capital.

The decorations on the walls and ceilings from which the majority of the appended illustrations are taken, are the works of the principal artists of France engaged by Louis Quatorze, and are of the style of ornament which now bears the name of the monarch. Our first engraving is from an ornament in the *CHATEL*. It exhibits at the extremities a combination of warlike parapher-

nal, and in the centre a medallion of a sacred subject, supported by a pair of winged demi-figures. The chandelier hangs in the *CABINET OF LOUIS XVI.*

The sacred subject of the following cut is one of the numerous designs to be found in the elevated parts of the interior of the CHAPEL, wherein the religious Art of the French nation is exhibited in all its perfection.

The next design is simply the regal crown between two branches of laurel; it frequently appears in the salons appropriated to the portraits of several royal sovereigns, whether as monarchs of France or as reigning Dukes.

The five medallions extending across the page are from the "MEUBLE DE CHARLES X.," in the Gallery of Statues; they are portraits of the later French monarchs, and the series is terminated at

The cornice introduced below is copied from the | containing, as its name implies, portraits of the | country to the present time. Many of these portraits
SALLE DES MARÉCHAUX, a noble apartment, | Marshals of France from the earliest annals of the | are by the first artists of the respective periods.

each end by a winged figure with its torch reversed. The CHAPEL again supplies us with two subjects

of winged figures of very graceful design from the ceiling, and slight as they appear, they show the correctness of form and beauty of outline for which

the artists of France have long been pre-eminent. The pose of these figures is remarkably easy.

The ornaments which occupy the first column of this page are taken from the BOSQUET DES

DAMES, they are all of the implements of warfare, some of them being interspersed with leaves, and

and tied with bands of ribbon. The grouping of these several objects is admirably managed: the various

galleries which are devoted to the illustration of the military and naval glories of the country are

filled with an infinite number of similar designs, yet differing in their component parts.

The beautiful heraldic device heading this column appears in M. Gavard's work, on the page that describes the "Institution of the Military Order of St. Louis." The centre, containing the *Fleur-de-lys* of France, has for supporters two *Cornucopie* filled with flowers, the horns themselves being almost

concealed by floriated ornament, the whole is surmounted by the royal crown. The engraving which follows is from that division of the volumes entitled *AILE DU NORD*, and we should suppose (for there is no explanation of it) that it represents a "dog" attached to the fire-place in one of the apartments, it is

exceedingly rich and beautiful. The last ornament is also from the *AILE DU NORD*, and from that portion of it which contains the portraits of the great artists of France: the figures supporting the

shield are in perfect harmony with the appropriation of the gallery, while the base of the device is composed, with much elegance, of scroll work mingled with acanthus leaves.

The first and last designs placed across this page are taken from the CHAPEL, one of the "lions" of Versailles, so profusely and richly is it decorated; we could fill an entire number with the *moreaux*

M. Gavard has collected together in his costly publication from this portion of the edifice alone. The two central ornaments are from the CABINET DES BAINS; the composition of these groups completely

identifies them with the use of the apartments; we recognise in them the various articles indispensable to the enjoyment of the luxurious and healthful bath: reeds and bulrushes typical of the fresh and purifying stream, small vases for holding water, combs, brushes, sponge, bottles of *cosmétiques*, curling

irous, &c. The three smaller cuts are also, we believe, copied from the same source, but the text in M. Gavard's work only incidentally alludes to it, yet as they are composed of objects having reference to water—dolphins, shells, aqueous plants, &c., we presume our conjecture is not far from the truth.

We shall find occasion in future numbers to present our readers with further specimens of the "Decorations of Versailles" as extracted from M. Gavard's volumes. In dismissing the subject

for the present, we would commend them to universal notice; artist, designer, and amateur, will find in them abundant material for study and consideration. The palace both externally and internally, is a grand museum of Art which is an honour to even that great nation. Will the day ever arrive when England shall be found following so bright an example of munificence to her artists? or are we ever to hear the reproaches of foreigners who smile at British patronage of Art, and in their hearts despise our parsimony and niggardly doing

out of grants for national purposes? We complain of our legislators, but the fault rests not solely with them; it rather rests with the great body of those who send men to parliament, whom a little of the pressure from without, as it is termed, would stimulate to a wiser and more liberal course of action. It is not vast armies and numerous fleets that make a nation great; they give her power—power which, properly directed, enables her to

achieve greatness in Art, in science, in literature, and to promote her own happiness, and that of the world at large.

A DICTIONARY OF TERMS IN ART.

BEAMS, or RAYS of GLORY, are frequently depicted round Saints, and proceeding from the nebule or clouds. Under Angels—they should always be blazoned on, on an azure field.

BEARD. An attribute of the Prophets, Apostles, Evangelists (with the exception of St. John), Fathers of the Church, and Hermits. The long beard is also worn by two female Saints, viz., Paula, Dardana, in the fourth century, who, in order to escape the addresses of a youth, obtained a beard by means of prayer; and St. Galla at Rome, who procured one by the same method, in order to avoid a second marriage. In Ancient Art, the beard is an appendage of Jupiter, Serapis, Neptune, of the full-grown Hercules, the aged Æsculapius, the double-headed Janus, Triptolemus, &c. The Asiatic Bacchus was also bearded, and in contradistinction to the youthful god of their own country and of Greece. His companions the FAUNS (Satyrs), and Silenus are generally bearded, and even bristly, as are also the Pans, the latter having a Goat's beard, which in Pan corresponds with the feet. The very beautiful head of the statue of Neptune, taken to Florence from the Villa Medici at Rome, is only to be distinguished from the heads of Jupiter by the beard; the latter is straight, as if wet, nor longer than that of Jupiter, but it is crispier, and the moustache is thicker.

BEAUTY, BEAUTIFUL. The consideration of this subject, so important in the philosophy of Art, involves so many investigations of a purely metaphysical character, that it would scarcely be possible to treat it satisfactorily within the narrow limits at our disposal, and it does not lie within the nature of the subject to admit of a concise definition, we must therefore refer the reader to those works in which the subject is treated with the greatest ability.*

BEES, as an attribute, in Christian Art. Saint Ambrose is often represented with a bee-hive near him, in allusion to the legend, that when an infant swarm of bees settled upon his mouth without doing him injury; but this fable implied only his eloquence, and is told of others distinguished for that quality.

BELL. In Christian Art, a Bell is one of the attributes of St. Anthony.

BELLOWS. In Christian Art, a pair of Bellows in the hands of a demon, is the attribute of St. Genevieve, by which is typified the light of Faith (figured by a burning taper), extinguished by Sin.

BEMA. The term applied by the Athenians to the platform from which the orators spoke. In the early Christian churches it was the part corresponding to our pulpit, and was surrounded with lattice work.

BENZOIN. A solid balsam, yielded from incisions made in a tree which grows in Sumatra, called the Styrax Benzoin. It is hard, friable, with an agreeable fragrant odour, soluble in alcohol, ether, and oil of turpentine. It has been employed as an ingredient in spirit varnishes by the Italians and Spaniards, but does not appear to have been an ingredient in oil varnishes.

BIACCA (Ital.) White carbonate of lead used by the Italians in oil and distemper painting, but not in fresco.

BIADETTO. This term, very frequently met with in writers on painting, is synonymous with BICE, being the native or artificial carbonate of copper, known by various names, such as *Cendres Bleues* (corrected in *Scavola's Blue*), *Bleu Bice*, *Azzurro di Biadetto*. According to Mr. Eastlake, this term is derived from *Bladetus de Inde*.

BIANCO SECCO. A white used in Fresco-painting, consisting of lime macerated in water until its causticity is removed, to which pulverised marble is added.

BIBIANA, St. In the Church at Rome dedicated to this Saint is a statue by Bernini, representing St. Bibiana. It stands upon the altar, leaning against a pillar, and is considered the simplest, most graceful, and best work of this artist, and one of the most pleasing productions of modern Art. There is a series of frescoes representing scenes from the life of this Saint, executed by Pietro da Cortona.

BICE (Beis, Germ., BIADETTO, Ital.) There are two pigments known by this name, both native

* *The Philosophical and Ethical Letters and Essays of Schiller.* Translated by J. WEISS. London, 1845.—*The Philosophy of the Beautiful.* By VICTOR COUSIN. Translated from the French, by J. C. DARTER. London, 1848.—*The Æsthetic and Miscellaneous Works of F. SCHLEGEL.* London, 1849.—*Modern Painters.* by a Graduate of the University of Oxford. London, 1849.

carbonates of copper, one of which is blue, the other green. BLUE BICE has been known to artists from the earliest times, under various names, such as MOUNTAIN BLUE, AZZURRO DI TERRA, CENDRES BLEUES (*Scavola's Blue*), ONGARO, &c. BICE is sometimes artificially prepared, but is less durable than the native, still it has been extensively employed in the various branches of painting. The artificial pigment always turns green when ground in oil, but mixed with glue, as in Distemper, and with lime in Fresco-painting, or for colouring the walls of rooms, it is of sufficient durability. The artificial BICE, prepared according to various formulae, is known in commerce as MOUNTAIN BLUE, Mineral-Lime-Copper-English—and Hambro' Blues. GREEN BICE, known as MALACHITE GREEN and MOUNTAIN GREEN, is also a carbonate of copper, mixed with a small proportion of the oxide of iron. It is obtained from the Tyrol, and Hungary. It was known to the early painters as CHRYSOCOLLA, VERDETTO, HUNGARIAN GREEN, VERDE DE MONTENA, VERDE DI SPAGNA, CENERE VERDE. The native carbonate of copper is a valuable pigment, and of great durability, as may be seen in the most ancient miniatures: it has of late fallen into disuse, though undeservedly. Most of the MOUNTAIN GREEN now obtained in commerce is an artificial product, of a pale greyish-green tint, opaque, and much less brilliant than the native. MALACHITE is often found native in the shape of a fine powder, ready for the artist's use. EMERALD GREEN and PAUL VERONESE GREEN, are vivid green pigments, prepared artificially, by mixing carbonate of copper and whitening, to which sometimes ochres are added.

BIDENT (Lat.) An instrument or weapon with two prongs; sometimes erroneously given to repre-

sentations of Pluto, instead of a sceptre, his proper attribute.

BIGA, BIGE. The term applied by the ancients to those vehicles drawn by two animals.* Harnessing abreast is the oldest manner found among the classic nations; in the *Iliad*, it is the customary

method, but besides the two horses in the yoke, there are sometimes others added on either side. Hector drives a four-horsed chariot, called by the Romans QUADRIGA. BIGA generally means the Roman chariot used in the circus or in processions. It is a Roman term, as the Greeks called this method of harnessing, *Synoris*. The form of the chariot resembled that of the great HARMA, or DIPYROS, a short body, resting on two wheels, closed in front, but open behind, where it was entered, and the charioteer drove standing. These are what are seen on ancient monuments.

BIPENNIS. An axe with two blades or heads,

one on each side of the handle. It is the weapon usually seen depicted in the hands of the Amazons.

BIRD'S-EYE VIEW, in Perspective, is a view taken from a great elevation, in which the point of sight is at a very considerable distance above the objects viewed and delineated. This mode of drawing is very useful in representing extensive districts of country, battle-fields, panoramic views, &c. For many purposes it has been superseded by ISOMETRIC PERSPECTIVE.

* Our illustration is copied from a painting on the walls of the Pantheon at Pompeii.

BIREMIS. A ship with two banks of rowers,

frequently depicted on ancient bas-reliefs. This name was also given to a small boat managed by two oars only.

BIRRUS (Lat.) A woollen cape or hood, worn over the shoulder, or over the head as a cowl. Our engraving represents one worn by a shepherd, from a MS. of the eleventh century, engraved by Strutt.

BIRRUS, or BUR-REAU. According to Strutt, these were the names given to coarse woollen cloths used for the garments of the lower orders during the thirteenth century.

BISCUIT. A kind of white unglazed, baked porcelain-clay, much employed in the manufacture of statuettes, &c., but for this purpose, a much finer and more suitable material is the so-called PARIAN. Biscuit is the term generally applied to articles of clay, which have gone through only one "baking" or "firing" in the oven, and which have not received the glaze. In this state it is porous, and is used for wine-coolers, and other purposes.*

BISELLIUM (Lat.) A seat of honour granted to distinguished persons upon public occasions. It was large enough to contain two persons, hence its

name, but it does not appear to have been occupied by more than one. The cut represents a Bisellium inscribed "to Caius Calventius Quietus, Augustal. To him, in reward of his munificence, the honour of the Bisellium was granted by the decree of the Decurians, and with the consent of the people."

BISHOP'S LENGTH. Canvas of this size measures fifty-eight inches by ninety-four. The *Half-Bishop* measures forty-five by fifty-six.

BISMUTH. The substrate of this metal forms the Pearl-white, used as a cosmetic and as a pigment, but its use is in every respect to be avoided, as it is readily acted upon by sulphurous vapours, which blacken it.

BISTRE. This pigment is of a warm brown colour of different tints, principally yellowish and transparent. It is prepared from the soot of wood, that of the heech being the most esteemed, which is finely pulverised, the salts washed away by water. The Roman Bistre is esteemed the best, but the quality of that met with in commerce depends chiefly on the kind of wood used in the burning. Bistre is not used in oil-painting, but is valuable in water-colours, yielding fine transparent tints in washing, and is much employed for sketches in the manner of those made in Indian ink and Sepia. By mediæval writers Bistre was termed FULIGO and FULIGINE.

BIRING-IN. A term used in engraving to describe the action of the Aquafortis upon the copper or steel, on those parts from which the etching ground is removed by the graver and other tools.

BITUME GIUDAICO, JEWS' PITCH. A name given to Asphaltum or Bitumen.

BLACK is the extinction of colour, produced by the combination of the three primary colours, Blue, Red, and Yellow, when mixed in equal strength and proportion. The combination of the three primary colours in unequal strength and proportion produces the infinite variety of Brown and Grey tones, according to the predominance of

* See *Art-Journal* 1849.

one or other of the Primaries. Two Primary, or two Secondary colours, cannot produce Black, because the Primary colours meet in them in unequal proportions; but a Primary and a Secondary colour of equal power effects the union of the three Primaries, and hence the result of the mixture is black.* When compared with the type of pure colours found in the prismatic spectrum, the rainbow, every pigment, except Ultramarine, is found impure; the Blues are all alloyed with Blue or Yellow, the Greens with Red or Yellow, the YELLOWS, with Blue or Red. Now, it is easy to perceive that when such pigments are mixed at random, an undue and unnecessary quantity of Black is produced, by which their purity and brilliancy is impaired, and it is to this, and not to the "lost medium" of the old masters, that the attention of the artist should be directed.†

BLACK, in Ancient and Medieval Art, COLOURS had a Symbolical meaning, an acquaintance with which formed part of the artist's studies. In later times this knowledge has been suffered to fall into almost total neglect, but with the recent revival of a feeling for, and an imitation of, the works of the past, the Symbolism of Colours has come in for a share of that attention its importance demands. In this Dictionary we can do little more than direct the attention of the artist to the subject, and exhibit in a slight degree the character and application of its language.‡ BLACK, considered as the negation of colours, represents darkness, and is symbolical of Evil, Falsehood, and Error.§ BLACK, as a mortuary colour, and worn as mourning, is authorised by the most ancient traditions. VIOLET was thought so nearly allied to BLACK, that the Roman Church used them indiscriminately for one and the same in days of mourning and fasting.¶ The ancients were fond of dark purple, and at funerals they wore Black, or nearly Black. Among the Moors, Black designates Grief, Despair, Obscurity, and Constancy. In BLAZONRY, Black, named Sable, signifies Prudence, Wisdom, and Constancy in Adversity and Love. Engravers usually represent it by a series of horizontal and perpendicular lines crossing each other. Black with Red produces Tan colour; with White, Grey.

BLACK CHALK. An indurated black clay, used as crayons in drawing, but the artificial crayons prepared in France and Italy are used in preference. In France, Black Chalk is known by the names *Schiste à dessiner*, *Amphète graphique*.

BLACK-LEAD, PLUMBAGO, GRAPHITE. The substance known by this name is a peculiar form of carbon, but there is no lead in its composition, as its name implies. It is the material used for making drawing-pencils, and is chiefly obtained from Borrowdale, in Cumberland. It is also found of inferior quality, in various parts of the world—in Scotland, Norway, Spain, Ceylon, United States, and Mexico. Analysis of certain specimens show that it consists of—

Carbon	88 parts
Oxide of Iron	12 parts
	100

with small quantities of silica and alumina.¶ In oil-painting, Black-lead gives very pure tones of grey, which were much used by Van Dyke in his draperies, &c.

BLACK PIGMENTS. Those used in painting are chiefly derived from the animal and vegetable kingdoms; they are very numerous, of different degrees of transparency, and of various hues, in which either red or blue predominates, producing brown-black, or blue-blacks. The most important

* The painter should consult the chapter on "The Life and Death of Colours," in *The Art of Painting Restored*, by L. HENRIERREUX, unquestionably the most valuable contribution ever made to the literature of the Art of Painting.

† A brilliant picture can never be produced from a fond palette, yet a cursory glance at the *working* of the majority of artists would lead us to suppose that they preferred painting with mud, to using the pigments in their natural purity, or in well-judged mixtures. Want of space forbids our entering further into this important subject, but this is the least to be regretted, since the work of Hundertpfund, quoted above, enters fully into the principles and practice of Colouring.

‡ This subject is ably treated by F. PORTAL, in his work entitled *Des Couleurs Symboliques dans l'Antiquité, le moyen âge et les temps modernes*, Svo. Paris, 1837. A translation of this work, by Mr. Inman, appeared in WALLIS'S *Quarterly Papers on Architecture*, vol. vi.

§ The illuminations of the middle ages represent Jesus Christ in black drapery when wrestling against the Spirit of Evil; and the Virgin Mary often has a black complexion in paintings of the thirteenth century, which pertains to Byzantine Art.

¶ Black vestments were not commonly used for the office for the dead in antiquity; they are seldom figured in the earlier illuminations, even in miniatures of the sixteenth century. The chariot of a funeral is often represented in a coloured cope or vestment.—FROST.

* See the *Art-Journal* for September, 1848.

black pigments are—Beech-black, or Vegetable Blue-black, prepared by burning beechwood in closed vessels; Bone-black or Paris-black, called also Ivory-black; Cassel or Cologne-black; Cork-black; Franckfort-black; Ivory-black; and Lamp-black. German or French *Prussian-blue*, when burned, yields a fine-toned brownish-black pigment, which is often used as a substitute for ASPHALTUM. Black pigments are slow driers; mixed with white they yield greys of various hues; they ought never to be used to represent *shadowe* in painting; transparent brown pigments, such as Asphaltum, deepened with Prussian-blue, are best suited for that purpose.* In fresco-painting the carbonaceous pigments are not admissible; only native earths, such as Black-chalk, possess sufficient durability.

BLAZONRY is the art of delineating the figures

and devices of a coat of arms in their proper colours, ornaments, armorial shields, &c. In order to do this, a knowledge of the points of the shield is essential.† In Engraving, the term *Blazonry* is also employed to express the hatching of the same by the engraver, so as to designate the different colours or metals. As for instance, Shakspeare's Coat of Arms, here engraved, and which is selected as a familiar illustration, would be thus described: "Or, on a bend *sable*, a spear of the first, the point steeled, *argent*."

BLENDING. A process by which the *fusion* or *melting* of the pigments is effected by means of a soft brush of *Fitch* or *Badger's* hair, called a Blender or Softener, which is passed over the little ridges with a light feathery touch. It requires much skill and dexterity to accomplish this operation successfully; in the hands of the unskilful it generally destroys all force and strength of touch, and leads to a muddiness, in which all purity of colour is lost. It may be justly considered that BLENDING is the resource chiefly of incapacity and mediocrity, and that if the painter resorts not to it in the first instance, he will always be able to do without it.

BLOOMING. A clouded appearance which varnish sometimes assumes upon the surface of a picture; so called, because it somewhat resembles the bloom on the surface of certain kinds of fruit, such as plums, grapes, &c. It is most probably caused by the presence of moisture either on the surface of the picture or in the varnish, and is best prevented by making the varnish hot, and the picture thoroughly dry, before applying it. Blooming is fatal to the clearness and transparency so essential to the proper effect of a picture, and no pains should be spared to remove it. This is best accomplished by rubbing the surface of the picture with a piece of soft sponge, moistened with well rectified oil of turpentine (Camphine), and smoothing it with a large soft brush, then placing the picture in a clear sunshine.

BLUE. One of the three primary colours, and the only one that can be adequately represented by a material pigment. Ultramarine approaches the purity of the Blue in the prismatic spectrum so nearly, that it may be justly regarded as a pure Blue. The properties of Blue are negative and cold; when united with the other primary colours it produces certain Secondary colours; with Yellow it yields various shades of GREEN; with Red, numerous PURPLE or VIOLET hues. BLUE is the complementary colour to ORANGE.

BLUE, in Medieval Art, BLUE, in Symbolism, was of three kinds—one, which emanates from Red, another from White, and a third allied to Black; they are sometimes represented by one colour only, but frequently are distinguished by different hues of Blue. AZURE (*Light Blue*), was the symbol of divine eternity, of human immortality, and by a natural sequence, became a mortuary colour.‡ As an Angel's garment it signifies Faith and Fidelity; as the dress worn by the

* The method of producing neutral shadows, practised by many German artists, seems to consist in mixing the three primary-coloured pigments over each other, whereby the greatest depth and transparency is obtained.

† See *Glossary of Heraldry*, Oxford, 1847.

‡ As we see in the custom of covering the coffins of young persons with *Blue* cloth. The sabbath Breviary contains several miniatures, in which appear Biers covered with a Blue Mortuary cloth. On others, but more seldom, the Pall is Red; finally, on one only is the Pall Red, and the Baldachin which covers the Catafalque Blue. This, the two colours, one over the other, indicates Divine Love raising the soul to immortality. The Baldachin or Canopy is the emblem of heaven. Ceilings of churches were generally painted blue, and powdered with stars to represent the canopy of heaven over the faithful.

Virgin Mary, Modesty.* When it is one of the colours worn during the celebration of the Mass (varying with the seasons of the church), it signifies Humility and Satisfaction. In the Symbolism of compound colours, BLUE, when allied (in Green) (in Purple or Violet), or with YELLOW (in Green), imparts a portion of its own symbolical meaning; thus Purple (compounded of Blue and Red, the latter predominating), indicates the *Love of Truth*; Hyacinth, in which Blue predominates, signifies the *Truth of Love*. When the two colours are equally blended, as in Violet,† the signification is derived from the animal kingdom, and the *Love of Truth*. In BLAZONRY, Blue signifies Chastity, Loyalty, Fidelity, and good reputation. Engravers represent it by horizontal lines.

BLUE BLACK, CHARCOAL-BLACK. This pigment is prepared by calcining vine-twigs in close vessels. Mixed with WHITE LEAD it yields very fine silver GULETS, and may be considered in all respects an eligible pigment.

BLUE PIGMENTS. Those employed in oil and water-colour painting are obtained from the three kingdoms of nature. Those derived from the mineral kingdom are ULTRAMARINE, COBALT, BLUE VERDITER (*Bice*, or *Mountain Blue*). Of Vegetable Blues, the only one of any value is INDIGO. PRUSSIAN BLUE may be said to be derived from the animal kingdom, as it is prepared from a mixture of *prussiate of potash* (obtained from the decomposition of blood, hoofs, &c.) and an oxide of iron. The qualities and uses of these Blue Pigments will be described under the respective places in this Dictionary.

BOAR. In Medieval Art this animal is emblematical of ferocity and sensuality.

BODKIN (*Acus, Lat.*) In the figures of maidens in highest antique style, we see the hair either bound together at the top of the head, or fastened in a knot behind, with a Bodkin. The female characters in the Greek tragedies, and the priests of Cybele, wore this simple head-dress.‡ At the present day, the peasant-girls of Naples wear silver Bodkins. The *Acus discriminatis* was used for dividing the hair into curls.

BODY, BODY COLOURS. This term is applied in Oil Painting to pigments or to their vehicles, and expresses their degree of consistence, substance, and fixing power. It implies, in some degree, *Opacity*, although there are many pigments possessing *body* which are also transparent, as in the case of Indian Yellow and Prussian Blue. In Water-colour painting, works are said to be executed in *body colours* when, in contradistinction to the early mode of proceeding in tints and washes, the pigments are laid on thickly and mixed with white as in oil painting, from which style of painting only differs in certain relations, by the employment of water as a vehicle for the pigments instead of oil.

BOLDNESS. That quality which distinguishes the artist who, educated in the soundest principles of Art, designs and executes with fearlessness and decision. When under proper control, it imparts to all his productions a vigour that is sure to charm. It is exhibited in the highest degree in the works of Rubens.

BONE BLACK (PARIS BLACK). A pigment of an intense Black colour, slightly tinged with Red, prepared from the bones of various animals burned in close vessels free from the contact of air. It is transparent, and very deep in tone, when mixed with White, it yields beautiful pearly Greys. It is the pigment usually sold for IVORY-BLACK, from which it differs very little; genuine Ivory-Black is met with in commerce under the names of COLOGNE and CASSEL BLACK.

BOOK. In Medieval Art a book is the universal Attribute of the Fathers of the Church, Bishops,

* The Virgin Mary has always been traditionally represented in a Blue mantle, on account of the mystic signification of this colour.

† VIOLET was considered so nearly allied to the colour Black, that the Roman Church used them indiscriminately for one and the same on the days of mourning and fasting.—FROST.

‡ Of how many examples are still preserved, which show how far the ancients carried their love of the beautiful even in trifles, Winckelmann describes four large silver Bodkins found in the tomb of a young girl, about eight inches long, having at the end a Corinthian Capital, upon which stands Venus, dressing her hair with both hands, while Cupid holds a circular mirror before her. Upon another stand Cupid and Psyche, embracing; another has two busts; and upon the fourth and smallest is Venus leaning upon a Cippus of Priapus. Our engraving is copied from Montfaucon, and exhibits the ordinary mode of wearing these bodkins by the Roman ladies.

and Abbots, as an emblem of their learning. In the hands of the Evangelists and Apostles it represents the Gospel. St. Boniface carries a book pierced with a sword. St. Stephen carries a book, which represents the Old Testament: in the hands of St. Catherine it indicates her learning, and the same when in the hands of St. Bonaventura and St. Thomas Aquinas.

BORAX. A mixture of a solution of this substance with gum tragacanth, has been recommended as a vehicle in miniature painting, but with doubtful propriety; as, upon the evaporation of the water holding the borax in solution, crystals of borax must be left on the surface of the ivory; these are slightly alkaline, and would change many vegetable pigments. Perhaps a better vehicle would be found in white lac dissolved in a hot solution of borax.

BORDER (BORDURE, Fr.) That which limits or ornaments the extremities of a thing. **FRAME,** in a picture, is a border of carved wood, sometimes painted or gilt, and of copper-gilt, on which the picture is placed. The frame is not only a luxurious ornament, but it is necessary to circumscribe the composition, and to figure the opening through which the spectator perceives the painted objects, which an illusion of perspective leads him to think are beyond the wall on which the picture is placed. **TAPESTRIES,** in imitation of Paintings, have also **BORDERS,** worked in the Tapestry: as these must be proportionate to the size of the picture, which in Tapestry are usually very large, they may be ornamented with Arabesques, Masks, Cameos, &c. The greatest painters have not disdained this style of composition; the borders of many of the tapestries in the Vatican were executed after designs by Raffaele.

BOSS (RONDE BOSSE, Fr.) This term describes sculptured objects in their full forms in contradistinction to those which are in **RELIEF,** or attached more or less to a plane or ground.

BOSSIES are projecting ornaments used in architecture in various situations, such as ceilings, to cover the points of intersection of the ribs, &c. They consist variously of foliage, heads, armorial

shields, &c., and embrace a great variety of fanciful shapes. Our engraving represents a very beautiful one in the Chapter House of Oxford Cathedral, executed about 1250.*

BOW (ARCUS, Lat.) A weapon of defence, used from the most ancient times, chiefly by the

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Asiatic nations, but also by Europeans. Among the former the Scythians and Parthians were most skilled in the use of this implement of war; as

* Bosses of Bronze and other metals were used to adorn the sword-hilts of antiquity. The heads of nails were also ornamented with sculptured Bosses, as is seen on the doors of the Pantheon at Rome.

were the Cretans among the Greeks. The form of the Bow varied considerably. The earliest representations occur upon Egyptian sculptures, one of which is copied in fig. 1; that of the Scythians and Parthians was nearly crescent-shaped (fig. 4); that of the Greeks is more nearly the type of the Bow of modern times (fig. 2). The Roman Bow is seen in fig. 3. Connected with the Bow, we have the Quiver which held the Arrows, and the Bow-case, which contained both the Bow and the Arrows. They are frequently met with on ancient bas-reliefs. The Bow is an attribute of Apollo, Cupid, Diana, Hercules, and the Centaurs.

BRACÆE, BRACÆE (ANANYRIDES, Gr.) The term applied by the Romans to the Trowsers worn by the Asiatics, Decians, and Teutones, but unknown to the two classic nations even in later times. They were sometimes wide, sometimes narrow, the latter being peculiar to warlike people such as the Persians, and generally of leather. The Amazons also wore them, the Medes, Lydians, Phrygians, and Decians, wore wide Trowsers tied under the foot.* Later, the Persians wore many-coloured trowsers, generally scarlet. Towards the end of the second century after Christ, the Roman Emperors appear to have worn them as a mark of distinction. The custom of wearing trowsers, though imitated by many, was never general among the Romans; by Hortensius they were forbidden to be worn in the town. We have no evidence that they were ever

worn by the Greeks.

BRACELETS. Bracelets were with the Ancients, and are still with the Moderns, the symbol of marriage. They were generally in the form of a serpent, and some were round bands fastened by two serpent's heads like the girdle of warriors. The number of golden and bronze bracelets found at Herculaneum and Pompeii, show that these ornaments, particularly those in the form of serpents, were articles of luxury among the females of ancient times. Antique bracelets are

of two kinds, armlets and true bracelets, the one worn on the upper arm and the other on the wrist or lower arm. Smaller bracelets, generally of gold, beautifully worked, and sometimes set with jewels were worn on the wrist. Bracelets have also been found like twisted bands. The Bacchantes wore real serpents instead of serpent-like bracelets. These ornaments were not worn exclusively by women, for we find that the Roman Consuls wore bracelets in triumphal processions; they were presented by emperors to soldiers who distinguished themselves (ANVILLE). The ankles had similar ornaments, thence called ANKLETS.†

* See PIRANESI, *Col. Trojana*, tav. 1-2. For the Asiatic, see the representations of Paris, *Mus. Flo. Clem.* II. 37. MILLINGEN, *Insed. Memm.*, and numerous other authorities. Our engraving represents a fine antique statuette of a Gaulish Captive, formerly in the Villa Borghese at Rome.

† The cut represents an Egyptian bracelet in the form

BRACHIALE. In ancient armour, a defence for the upper part of the arm. Some specimens have been found at Pompeii, which are beautifully ornamented,* and one of which we here engrave.

BRASS (LAITON, Fr., MESSING, Ger.) is an alloy of copper and zinc, in various proportions, but usually consisting of two-thirds copper, and one-third zinc. According to the variety in these proportions, there are produced the compounds known as mosaic gold, pinchebeck, prince's metal, &c. Brass, as well as Bronze, has been extensively applied to various useful and ornamental purposes from the remotest antiquity.† **LATEN** is a name formerly applied to thin sheets of rolled Brass, extensively employed for monumental BRASSES. Brass beaten into very thin leaves is called **DUTCH GOLD,** or **DUTCH METAL.**

BRASSARTS. In Plato-armour, are the pieces which protect the upper part of the arms, connecting the shoulder-pieces with the elbows. Demi-brassarts covered the front of the arm only, as the Greaves protected the front of the legs. The covering of the lower arms, from the elbow to the wrist, was variously termed *avant bras*, *vant*—or *vam braces*. The ancient term for this portion

of armour was **BRACHIALE.**

BRASSES. Monumental Brasses form one of the three classes of sepulchral effigies extant in this country; they consist of engraved or incised metal plates; Brass, or a similar compound called **LATEN**, (from the French *Laiton*, brass,) being the metal used for the purpose. These metal plates were inlaid or embedded in stone slabs, which formed part of the pavement of the church, or were elevated on altar-tombs, or affixed to the wall.

The incised lines depicted the person of the deceased in appropriate costume—religious, military, and civilian; or in lieu of this, Crosses ornamented or foliated, with sacred emblems or devices, accompanied in either case with armorial bearings and quaint inscriptions, characteristic of the simple and earnest piety of our ancestors. They were used by all ranks of society, and consequently depict a corresponding variety of costume. Brasses were probably introduced into this country from Flanders, and many now remaining are known to be the work of Flemish artists; they were probably adopted with a view of economising the space in the area of churches, which the too great use of altar-tombs and sculptured monuments encumbered. Examples exist dating from the year 1277 to 1631. Very many were destroyed during the Civil Wars, including perhaps some of earlier date. The use of Brasses has lately been revived with great success, and it is to be hoped that this elegant and appropriate form of memorial may again come into general use. Our absurd modern costume, however, will greatly militate against their excellence in an artistic point of view. The grace and beauty frequently expressed by a few simple lines in old Brasses may be well illustrated in our engraving of one in Wimlish Church, Essex, executed about 1350.

of a serpent, from Wilkinson; and a Roman bracelet of a simple kind.

* We find this term only in Ma. Riou's *Companion to the Latin Dictionary and Greek Lexicon* (London, 1849); a work to which we have been indebted in some of our articles on Classical Antiquities; and we gladly bear testimony to the minute and ample detail, and painstaking accuracy, with which that work is executed. As an authority in all matters relating to Ancient Art it is invaluable to the artist.

† See MULLER'S *Ancient Art and its Remains*.

THOUGHTS AND SUGGESTIONS ON THE EXPOSITION OF 1851.

It is with much regret we remark that the present aspect of the subject under review, is in no degree improved since our last notice of its position. The retrospect of the close of the last month, only confirms and realises the fears we expressed at its commencement, and to which we should have given earlier and more forcible expression, but for the anxiety we felt lest, even by misconception, we might be instrumental in strengthening any doubt, by which the progress of the plan might have been checked or its advisability questioned; trusting that the objections we forecast—many of which were palpably evident—might have been in good time acknowledged and removed. This, however, has not been the case to the extent we advocate and deem essentially necessary; and we are therefore bound again to remark on those points by which the chances of success are not only considerably weakened but positively endangered. It will be indeed an ungrateful return for the personal interest and unwearied attention which our illustrious Prince has devoted to this attempt to advance the welfare of British manufacturers, if through lack of judicious guidance the attempt fails of its purposed object; and there is strong evidence to fear this; dissent becomes more marked, want of faith more confirmed, and suspicion of probable injury to native commercial interests strengthened, by the evident want of practical judgment and decision in the few leading outlines of the scheme which have as yet appeared.

The great manufacturing districts, the localities upon whose efforts the onus of the struggle must depend, upon the shoulders of whose artisans must rest the burden of the task, remain still involved in uncertainty, and consequently in comparative inactivity as to preparatory action.

In the leading Journals of Birmingham and Manchester have appeared strictures upon the unsatisfactory position in which the matter at present stands, which are not only justly conceived, but conclusively expressed; and we should but have stultified the conviction which a long experience had forced upon us, had we not been prepared for a result which the indecision and mystery that still shroud the project must have engendered.

The hesitation and reluctance to commit themselves to an uncertain and unexplained course, prove to demonstration, that a much clearer understanding of the necessary requirements exists on the part of the intended exhibitors and the public generally, than on that of the selected few, whose province it should have been to have taken the initiative in all matters of preliminary arrangement and subsequent detail.*

The executive appointments should have been consequent upon the possession of the necessary capabilities for carrying the scheme into operation; but the selections in many instances seem to have been in this respect most unfortunate, for the only positive and specific engagements which they had made have been altogether abandoned—and most wisely so; yet this fact testifies very conclusively to the more than questionable fitness of the parties for the post they occupy.

We are gratified to observe that the offer of large money prizes, as originally made, to the amount of 20,000*l.*, has shared the fate of the Munday contract, and is altogether abandoned; we ever reprobated its policy, and gladly note its repudiation; in this decision we think the commissioners have acted most judiciously, and have avoided what must have proved a very serious and certain cause of future difficulty; still the positive assurance made that they would be given, and their subsequent total withdrawal, has been to some extent detrimental; particularly as the promised awards of gold and silver medals are also to be transmuted into bronze.

This course, in the estimation of many with whose opinions we have been favoured, appears to be an extreme, as poor and inadequate as the primary golden baits were lavish and impolitic—in avoiding Scylla we have fallen into Charybdis. Holding as we do the position, that the successful competitor will find his surest and most valuable recompense in the increased value which

* A feather may show how the wind blows. We cannot pass over a very unpardonable error which occurs in the "classified list," viz., naming the Earl of Aberdeen, head of the section Sculpture, &c., as President of the Society of Antiquaries. The Earl of Aberdeen ceased to be President of that Society in 1847; his successor in the chair is Lord Mahon. The error is not in itself of much consequence, but it is a rather alarming proof of either ignorance or carelessness on the part of those employed to draw up and publish a solemn document. There occur in this document errors of a more important character, to which we may hereafter refer, inasmuch as they unquestionably ought to be removed.

the award will stamp, in both an honorary and a pecuniary sense, upon his present and future efforts, and the impulse which it will create in favour of his productions, we esteem the material of the object attesting this triumph, as of comparative insignificance—but we certainly demur to there being but *one uniform class of medals or distinctions*. The progressive merits of the successful works, varying as they will in requirements involving the exercise of taste and judgment—of scientific research—and manipulative dexterity, should, by the relative value or distinction of the prize, to some extent at least, be consistently acknowledged. This levelling system of uniformity of award, however it may satisfy the ambition of mediocrity, will be rejected by the more advanced and gifted intelligence among the exhibitors.

This decision is the result, we presume, of a recommendation from the committee of the Section of Manufacturers which was to the following effect: "The committee have felt that it would be most acceptable to exhibitors in the section of manufactures, that medals should be awarded as far as practicable, rather as testimonials of the co-operation on the part of manufacturers towards the Exhibition and of success or general excellence of manufacture, than of marking an individual superiority, which might chance to be in some degree accidental and misleading to the public; they therefore recommend that the medals should be of equal value in classes, and that each medal in each class be of equal value."

It is not stated upon what grounds the belief that this course would be "most acceptable" to manufacturers is based. We very much misunderstand the feeling of that class, at least of its most influential and leading members, if such be their views or wishes on the subject, and even had such appeared to be the case, it is a course in which their wishes should not have been acceded to, as it is one that must necessarily tend to retard their progress, and check the spirit of emulative action, which should be the marked feature of the scheme. Sure are we, that there is no manufacturer of eminence, who has really earned his position, deserves an honourable rank, and is prepared to maintain and improve it at the coming crisis; but will denounce the recommendation of the Sectional Committee *in toto*.

We feel strongly on this matter, being confident that an equality of prizes will tend to an equality in the competitive works, and that uniformity of acknowledgment will induce an uniformity of claim. To the bulk of mediocrity it will offer a grateful and flattering recognition, to the "individual superiority" but a chilling and nugatory approval. Emulation will find no response; extraordinary and average merits will, according to the old saw, "share and share alike," and the highest aim of the exposition be missed. We must enter into a further analysis of this "recommendation," as there are other points quite as objectionable as that already referred to. The medals are, it is proposed, to be awarded "rather as testimonials of co-operation, &c., than as marking an individual superiority, which might chance in some degree to be accidental, and to mislead the public." When private interest has its own ends to serve, so surely does it seek to hide the shuffle of the cards by diverting attention to a feigned solicitude for the security of the public. Are the embryo judges to be so hoodwinked and incompetent, that they will not be able to distinguish between "superiority which may chance to be accidental," and the purposed and matured excellence, the long toiled for, long sought result, of mental and physical exertion? If this be the opinion of the Sectional Committee of Manufacturers, as to the fitness of those upon whose verdict the issues must devolve, we beg distinctly to deny the inference—an inference that would be fatal to the whole plan. We are sure that judges may and will be found, capable of distinguishing excellencies far more subtle than those this committee fears are so "accidental and misleading." It may eventually be necessary to enquire how that committee was organised, and by whom its members were selected, that we may know what degree of weight to attach to its deliberations. Are the manufacturing districts generally represented in its councils, and were they consulted in the choice of delegates to represent them? In both respects, the reply must be in the negative. Few manufacturing interests are represented at all, and in the matter of representation those interests have had no voice whatever.

We are fully alive to the difficulty of framing the necessary rules for the conduct of an experiment so vast and novel; but happily it is difficult is not an impossibility, and it would not have proved so in the present instance, if but ordinary practical experience and tact had been brought to the task. The neglect with which the Provincial Local Com-

mittees have been treated, as regards consultation on the various subjects influencing and regulating the operations of the plan, has been most remarkable; these Committees appear to be expected to do no more than collect the necessary amount of funds, without being provided with the requisite instruction as to their application to enable them to do so agreeably and satisfactorily.

Now as we before stated, the most valuable information as regards practical bearing was only to be obtained from the great seats of manufacture. The Local Committees of the different districts should have been consulted, but these have been altogether overlooked; and this is the more remarkable, as the necessity for such assistance is made so palpably evident by the incompetency of those who have usurped their duties.

The appointment and composition of the Sectional Committee of Manufacturers, to act in lieu of the Local Committees in matters of arraignment, &c., are most injudicious, as the numerous jealous and severe animadversions, as the numerous complaints we have had on this topic fully confirm. We may at a future time, should its operations continue, enter more fully into a review of its constitution.

We again refer to the decisions of the Royal Commissioners, and extract the paragraph referring to the mode of awarding prizes. "With regard to the mode in which the prizes are to be awarded, the Commissioners think it inexpedient to establish beforehand, rules so precise as to fetter the discretion of the juries upon which the task will ultimately devolve. It will be sufficient for the present to indicate the general principles to which it will probably be advisable to conform, in the award of prizes for successful competition in the several departments of the exhibition."

This certainly is very vague and unsatisfactory, and we beg to demur to the inexpediency of establishing rules beforehand; we contend that precise rules should have been drawn up, and that to the general details of a well digested plan the discretion of the juries should have been fettered; at the same time, we would have left ample room for the acknowledgment of deserving merit, which had not been foreseen or provided for in the prescribed regulation. In most branches of science, art, and manufacture, there are particular chemical and mechanical "desiderata" essential to their interests and improvement; these might have been ascertained by reference to those practically acquainted with the subjects; and these "desiderata" should have formed the prominent objects of reward and distinction. They should have been *specifically particularised and named, as selected for competitive honours*, and thus general attention would have been attracted to their requirement, and the necessary efforts secured to achieve their realisation. Even the "general principles" so loosely indicated in the paragraph are only referred to as those "it will probably be advisable to conform to," thus leaving the whole for after revision and consideration. We repeat, that great injury must result from this indecision, and the seeming inadequacy to meet the demands of the emergency which such a document presents; an injury that will not only seriously militate against the success of the Exposition of 1851, but be a fatal hindrance to the probability of its repetition at a future time. Again, we consider a sad mistake has been made in the following declaration, which appears in the same official document to which we have just referred to:—"A question having been put to the Commissioners as to the parties who will be allowed to exhibit, and who will be entitled to prizes, they avail themselves of this opportunity to state that all persons, whether being the designers or inventors, the manufacturers or the proprietors of any articles, will be allowed to exhibit, and that it will not be essential that they should state the character in which they do so. In awarding the prizes, however, it will be for the juries to consider in each individual case how far the various elements of merit should be recognised, and to decide whether the prize should be handed to the exhibitor without previous inquiry as to the character in which he exhibits."

Now so far from its being allowed to remain a matter of choice or indifference as to the character in which the exhibitor appears in reference to the work which he exhibits, it should be the primary and conditional stipulation, on the reception of a work, that the exhibitor be bound to state the capacity in which he claims acknowledgment. Without this reservation, vain is it to expect that any degree of justice can influence or be expressed in the awards which follow. As an exhibitor merely, but little credit can attach to any work beyond that due to the exercise of taste, which may have influenced its possession in a creditable purchase. In its proper place, and at its just estimate, we

W. H. WOOD, R.S.A. 10, BROADWAY, N.Y.C.

THE HISTORY OF THE
CITY OF NEW YORK

The city of New York, situated in the north-eastern part of the island of Long Island, is one of the most important and populous cities in the United States. It was first settled by Dutch traders in 1624, and was named New Amsterdam. In 1664, the city was taken over by the British and renamed New York. The city has a long and rich history, and has played a major role in the development of the United States. It is known for its diverse culture, its financial district, and its iconic landmarks such as the Statue of Liberty and the Empire State Building.

THE UNIVERSITY OF CHICAGO
LIBRARY
540 EAST 57TH STREET
CHICAGO, ILL. 60637

would duly recognise the value of such a judgment as fostering and encouraging improved production, but it is altogether distinct and apart from the claims of the producer. If this principle be admitted, the possessor of a work may, in many instances, usurp the position and rights of its creator. The labour of long and diligent application, whose result brought to its originator but a very inadequate return, may now realise to its fortunate possessor a reward from which its producer is excluded.

This is no extreme supposition: the Exposition of 1851 offering as it does the first great opportunity of enlisting public notice, under auspices that will ensure a vast and valuable amount of appreciative and remunerative consideration, will induce all who possess works in which any improvement upon existing processes is involved, to submit them to the verdict of such a tribunal, and many such will thus secure the advantages of public commendation and deserved reward which have hitherto remained unknown and unremunerative. True, the last paragraph states that it will be for the jurists "to decide whether the prize should be handed to the exhibitor without previous inquiry as to the character in which he exhibits." But this is a very lame and impotent conclusion, the chance of the exhibitor having the prize handed to him without previous inquiry as to the character in which he exhibits, appears to us so manifestly and lamentably unfair, that it ought not to have been left to the decision of any body of jurors to have repudiated—and repudiated it must be. What is here made the exception should have formed the rule. These matters rightly considered should have been subject to preliminary discussion, ending only, at least as to general principles, in a settled, determined purpose, upon which the necessary operations should have been based—whereas nothing definite has been resolved on, or at least so expressed, and all is left for after decision, and the consequence will be, that endless disputes, disappointment, and confusion, will likely mark the closing issue.

In justice to competitors, they should know distinctly and positively, without doubt or reservation, for what they are competing, and to what they have to trust. Either abolish prizes altogether, or regulate their location so that specific works may be undertaken for their gain. In the maze of uncertainty which now prevails, no work can be undertaken with any security that a prize will be awarded to such an effort at all, however successful it may be; and unless there be immediate and comprehensive details of procedure published, the necessity for which we have before enforced, there is every reason to fear a very inefficient and unsatisfactory termination.

Retailers should be required to state the names of the manufacturers of the articles they forward for exhibition. There is a disinclination, we understand, on their part to do this, arising from the fear that by giving publicity to the name of the manufacturers, orders may be sent direct to them. We think this far altogether groundless. No respectable manufacturer would supply private parties at any other rate than the retail prices; added to which they would have to defray the cost of package, carriage, also incur risk of damage, loss, &c., which, in the comparatively small bulk that such orders contain, would be a very serious addition to the original cost. Of course, the retailer has to meet these charges, but from the increased bulk he requires, and the mutual arrangements between him and the manufacturer, they are rendered much less onerous. It will be only necessary for retailers to announce that the most approved works may be obtained at their establishments, to remove such a doubt altogether; for so far from finding their interests suffer by the Exposition in this respect, they may rely on a greatly extended demand.

The implied reservation of pecuniary grants in particular and special cases, as in the instance of workmen, &c., we cordially approve; but even this intention is left a matter of discretion and contingency, so that in this point, as in most others, the same unfortunate state of indecision and want of determination prevail.

And yet amidst all this doubt and perplexity, manufacturers and exhibitors are required, "at as early a period as possible, on or before the 10th of May, to forward a general list of the articles likely to be supplied." This, we think, there will be much difficulty in doing, as few, if any, are in such an advanced state as to form any accurate idea of the works they may have ready, or the space they may require.

Up to the present time there has been too much of the dilettanti air about the whole matter to suit the necessities of a National and International Exposition, fraught with such serious commercial responsibility.

To practical, earnest observers, it resembles too much our youthful game of "make belief" without its hilarity and barmlessness; and unless this be promptly remedied, we shall find in the end (at least as far as England is concerned), that, though with all gravity and solemnity, we have but been "playing at Expositions."

But the greatest of all the mistakes, has been the call upon exhibitors to send—somewhere and someone—a list of articles intended for exhibition; a thing not only most unwise to do but impossible to be done. First, who can say what objects he will be enabled to produce by the 1st of March next; and next, who will be so foolish as to inform all competitors as to the precise objects he intends to produce? We venture to assert that not one in one hundred will send in any such list.

We do earnestly hope that, all things considered, the Exposition of the Industry of All Nations will be held in London—not in 1851, but in 1852. There are abundant reasons for such a postponement; and we can see none against it. It is clear to all that the Commissioners are not prepared for it—a surety the Manufacturers are not prepared for it—and the experience of each day furnishes convincing proof that the public are not prepared for it.

We might support this opinion by much evidence since the scheme was promulgated, and as yet sufficient moneys have not been collected to justify a commencement of the building; lenders have been committed which must be remedied—and remedies can only be provided by time. Confidence has been lost, which must be restored; this cannot be done hastily or soon.

From the first, we believed the call to have been too sudden; the trumpet blast was blown before we were armed for battle. But we had hoped, at all events, that the sinews of war would not have been withheld; had they been furnished freely and abundantly, with them we might have looked for a triumph. They have not, however, been supplied; and we do humbly and respectfully entreat His Royal Highness and the Commissioners to consider the policy—if not the necessity—of POSTPONING THE EXHIBITION.

B.

ST. GEORGE.

FROM THE MEDAL BY W. WYON, R.A.

THE history of numismatics informs us, that the art of engraving dies for medals, distinct from coins or moneys, is of far more recent origin than either of the other arts to which the term "fine" may be applied. Among the Greeks, medals and medallions were very rare; the earliest information we have concerning them dating no further back than the time when Greece was under the dominion of Imperial Rome. The peculiarities of modern medals, by which is meant those that have been executed during the last five hundred years, is that they often exhibit the portraits of illustrious persons, not of royal or princely houses,—warriors, philosophers, statesmen, poets, &c. Apparently insignificant as these works of art may be, the genius and skill necessary for their perfect production are by no means of a common order; and the study of them by the historian has frequently thrown considerable light upon passages of history otherwise obscure; the information obtained is generally gathered from the inscription, legends, and dates which they supply. An art of so much national and individual importance, and one requiring artistic talent of a high degree, demands some recognition on the part of those who have Art-honours to confer; Mr. Wyon's place among the members of the Royal Academy, is a position to which he is justly entitled as the first die-engraver of our time.

His Royal Highness Prince Albert, with the desire to encourage every branch of Art among us, of which we have had, and still have, so many proofs, some time back commissioned Mr. Wyon to execute for him a medal of "St. George,"—the titular saint of his adopted country; and the artist's design of the subject is seen in the engraving which Mr. Wyon, with the Prince's permission, has kindly permitted us to make. The composition is most spirited, scarcely if at all inferior to some of Flaxman's, and the drawing of the horse and his rider is most admirable. The former was modelled from the Prince's favourite horse "Imaun," at Windsor. The inscription on this side of the medal is TAKEN FROM FISH—"Faithful and Firm;" the obverse bears a portrait of the Prince, who sat to Mr. Wyon for the purpose; with the inscription ALBERTUS PRINCEPS VICTORIE REGINE CONJUX, and the date of the year 1845. The medal is not large, about two inches in diameter, but the workmanship is exquisite.

WORKS OF THE LATE WILLIAM ETTY, R.A.

THE genius of William Etty has been fully exemplified in the late exhibition of his collective works at the Society of Arts, but his great industry, patience, and perseverance, remain to be seen in the studies, sketches, and copies he has bequeathed to the world; these are to be disposed of by Messrs. Christie and Manson on the 6th of May, and will occupy six days in the selling. Few men have left such a record to the student in Art of the necessity as well as the service of earnest application in its attainment; these studies and sketches contain the history of Etty's life; the schools and studio were the arena wherein he fought and achieved the laurels which taste accorded him. The characteristics of the mind of Etty are made fully manifest in these progresses of his thought towards subsequent perfection, and many of the sketches furnish happy illustrations of the careful study which insured success to the finished works of which they formed the prototype; a few of the studies convey the idea that the mind has been sportively playing with the subject prior to its grasping more general details, and that the conception of the painter was trying the range of his fancy before he could trust himself to the embodiment of his imaginings.

The autobiography of Etty* was penned but a few short months prior to his decease; the narrative was highly characteristic of the painter's great and noble mind—quiet, unobtrusive, and full of simplicity, yet at times bold, vigorous, and fervent—earnest in "his calling," which was of nature's own creating, born within him, and first evidencing its existence on the floor of his father's mill, and afterwards demanding exercise and tutorage amidst the arduous duties of a painter's office; then struggling with all the difficulties that Art demands, even of its most gifted children, until the world acknowledged in the "Coral Finders," and "Youth at the Prow," that one of no ordinary talent was working his quiet way onward towards the steep where Fame's proud temple stands.

The studies and sketches at Messrs. Christie and Manson's are evidences of deep study, while they take as high a position as the works of any other painter of modern days. They are a school for study, inasmuch as the sketches evidence the progress of thought and skill in Art, and the copies vie with the originals; it has even been said, that in one or two instances, the great originals have been excelled.

The late William Etty was often urged to convey his thoughts to paper for the benefit of young artists, and it is to be regretted that his well-stored mind and brilliant genius have left no record of his own thoughts and reflections on Art to guide and direct the future aspirant; but from his early letters, and from his correspondence when in Italy, much of interest may be culled identifying his classic feeling in all relating to Art with that enjoyed by the most fervent and poetic minds. Those who knew Etty will say that he lived but for "Art," not under the contracted view of painting merely, but paying it due homage when he found it in any work bearing the authentic stamp of genius, confining it to no school or period.

Among the great number of Etty's works consigned to the rooms of Messrs. Christie, there are a few paintings in style and originality equal to some of his most famed productions; these are of course but few, for the demand for his works direct from the easel had of late years greatly exceeded the supply, and at his decease there were several in due course of execution.

It is to be regretted that he had no school, no young and kindred feeling identified with his own amiable and artistic mind; none who can retrace his thought and again shadow forth the genius of the great artist. The works included in this sale are open, and very fairly open, to criticism; but they do not tend to disparage the celebrity of the artist, for the greater portion of them were not painted with any view to the public eye, being, as they are designated in the catalogue, merely "sketches and studies;" but if they be regarded as the progressive scholastic efforts of genius through a series of years, they will then become highly instructive and interesting.

Etty sleeps in his own native and much beloved city, the time honoured Ebor. A tomb marks his resting place in St. Olave Marygate Churchyard; thus York is honoured by his grave, as it was by his living residence, and his name will be revered there while Art holds rank in the land.

* In the Art-Journal of January and February, 1849.

ART IN THE PROVINCES.

BELFAST SCHOOL OF DESIGN.—During the past month this institution has been opened with an inaugural address by the President, Lord Dufferin, in which his lordship with much tact and ability pointed out many errors in public taste which manufacturers had been hitherto compelled to gratify, such as the "pine-pattern" on ladies' shawls, and the peacock in papier-mâché works; the one adopted from India, the other from Japan, and both monstrosities, like the willow pattern plate, made sacred and indispensable by long (and wrong) associations. This his lordship showed might be well removed by a more artistic education given to workmen, and a cultivated taste to consumers, both of which the establishment of such schools might effect, as well as aid home-manufacturers; and he instructed the outlay of 60,000*l.* yearly for labels to linen, which he confidently predicted might be made at home.

THE GREAT EXHIBITION OF 1851.—A meeting was held in this town (March 23,) pursuant to an invitation from the mayor, but as that functionary was absent, attending the great dinner at the Mansion-House, in London, the chair was taken by Mr. J. F. Ferguson. The Lord Bishop of Down, and other influential persons addressed the meeting. The importance of Ireland taking an active position in the movement was especially dwelt upon, "and then," to use the words of Mr. Holden, one of the speakers: "they might tell the world, that if they wanted French cambric, or fine sewed muslin, they must come to Belfast for it; that they need not go to Damascus for damask, nor to Holland to get brown holland," and thus the proceeds of Irish industry, might be known, and valued.

CARLISLE.—An exhibition of Painting and Sculpture, the works of British artists, will open at the Athenæum, Carlisle, on the 18th August, 1850, under the patronage of the Earls of Carlisle and Lonsdale, and the principal men of the county.

EXPOSITION OF ART AND MANUFACTURE AT DEVONPORT.—The Devonport Mechanics' Institution has decided on the formation of an exhibition, comprising works in the Fine Arts, models and machinery, scientific inventions, specimens of natural history and antiquities, and in fact any objects which have generally found a place in such collections. The accessible position of Devonport, situated on the borders of Devon and Cornwall, and surrounded by a large maritime, commercial, agricultural, and mining population, renders it exceedingly eligible for exhibitions of this nature. With a view therefore of affording the inhabitants of the western counties an opportunity of extending their practical acquaintance with the works of Nature and Art; and more particularly to encourage those peculiar branches of Art and Manufacture, upon the development and improvement of which our social welfare mainly depends, it has been determined to commemorate the opening of the New Hall and Subscription Rooms of the Institute, with a Grand Exposition of works of Art, Manufactures, Natural Products, &c., to be held during the month of August, 1850, when a series of Premiums, Medals, and other honorary rewards will be offered for the best productions in each department. It is also intended to offer money prizes for the best essays on the best methods of reclaiming the waste lands of Dartmoor, and profitably employing workmen; and for the best paper on the natural products of Devon and Cornwall. The utility and comprehensiveness of the scheme are apparent; and we trust that it may meet with all the success it so richly merits.

SUFFOLK FINE ARTS ASSOCIATION.—The first meeting of the Association, has been held, during the last month, in the Town Hall, Ipswich, to receive the report of the Provisional Committee, and to nominate the future executive. The establishment of an annual exhibition of works in painting, sculpture, architecture, and engraving; the formation of a collection of works of Art; and the delivery of lectures on subjects connected therewith, are the proposed objects to be carried out. Suffolk has already given to the Arts many brilliant names, and we hail with pleasure the success of the present movement.

MANCHESTER.—The Grand Exhibition of Specimens of practical science, manufactures, and Art, is opened at the Royal Manchester Institution, and comprises articles which will interest all the lovers of painting, sculpture, and the useful Arts, all of which are to be seen within the walls of the building, furnishing instructive gratification.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—A brief discussion has taken place in the House of Commons relative to the Royal Academy. In answer to a question by Mr. Ewart, Lord John Russell said:—

"It was the wish of the Government that the National Gallery should be devoted to the reception of works of Art, at present belonging to the nation, including the pictures of the late Mr. Vernon, and any others that might be given to the country. At the same time, George III., having given the Royal Academy rooms in Somerset House, and various privileges, with a view to the founding of a national school of Art in this kingdom, by means of which the Academy had been enabled to maintain schools both of sculpture and painting, it was due to the Royal Academy, as well as desirable in a national point of view, that the Academy should have it in their power to carry on their schools. The Government, therefore, did not think it right to ask the Royal Academy to give up the rooms which they possessed in the National Gallery for the reception of national works of Art without proposing that the House of Commons should grant that body a sum of money to enable them to obtain a site for a building which they might devote to the purposes to which the rooms they now occupied in the National Gallery were applied. As this arrangement could not be effected immediately, it of course implied that room could not, at once, be found for the Vernon collection in the National Gallery; but in the course of the present session the Government would introduce a bill into the house to accomplish the object at the earliest possible moment. In the meantime Marlborough House, which was recently in possession of the Queen Dowager, had been given up to the Crown, and was destined to be the residence of the Prince of Wales; but Her Majesty had been graciously pleased to declare that for the present, and for two years to come, the pictures of the late Mr. Vernon and any others that might within that period be added to the national collection, should be placed in Marlborough House for the purpose of being exhibited to the public."

The debate which ensued was chiefly remarkable for the fact, that all the speakers exhibited unmitigated hostility to the Royal Academy; and were singularly unanimous in opinion that the country owed nothing to the Royal Academy, and consequently that any grant of public money they should oppose. This feeling is to be deplored; it is irrational as well as unjust; but if the Royal Academy will do nothing to remove it, it cannot but produce a disastrous influence upon that body, and, we greatly fear, upon Art. We shall have much to say on this subject when it comes before us in a more tangible form.

MEDAL FOR MAJOR EDWARDES.—Mr. Wyon, R.A., has been commissioned by the East India Company to prepare a die for a gold medal, to be presented to Major Edwarde, in acknowledgment of the eminent services rendered by this officer during the recent war in the East. As it is intended solely for the Major, the die, we understand, will be destroyed when the medal is cast, so that no duplicate shall exist. Such a testimonial is of very rare occurrence; so rare, indeed, as to have but one precedent, as far as we can ascertain, and that was in the case of Blake, the distinguished admiral of the Commonwealth, for whom a medal was struck, from a design by Thomas Simon, the famous medallist of that period. This medal passed through a succession of owners till it was purchased by William IV.; it is now, we believe, in the possession of her Majesty.

MEDAL FOR THE ARMY OF THE PUNJAB.—We have been favoured with a sight of the model in wax, designed and executed by Mr. Wyon, R.A., for the medal about to be presented, by the East India Company, to Lord Gough and the officers and men who served in the late war in the Punjab. The obverse, as a matter of course, contains a portrait of the Queen; on the reverse, a group of Sikh chiefs dismounted, are presenting their swords to Lord Gough, in token of submission. The veteran commander of the victorious forces is mounted on a beautiful Arabian charger, which Mr. Wyon modelled from the life; in the background is seen a number of Sepoy troops, with such other objects as a field of battle at its

termination discloses; the usual accompaniments of an Indian landscape, among which is a group of noble palm-trees, complete the composition. The entire design is exceedingly beautiful, but the figure of Lord Gough on his charger is spirited to a degree; we have rarely seen a work of its class which has pleased us better.

SUBURBAN SCHOOLS OF DESIGN.—The advantages which Paris affords to the artisan in the branch schools of design scattered over the various arrondissements, and the want of which has been so much felt in London, is now about to be remedied, as we hinted last month, by the formation of one in the populous parish of St. Pancras. On Tuesday evening the 9th, a meeting was held at the National School Room of that parish to promote the formation of schools in this neighbourhood for the instruction of workmen and others in drawing and modelling. The chair was taken by Mr. S. C. Hall, F.S.A.; and on the platform were Lord Compton, Professor Donaldson, Mr. G. Godwin, Mr. Latham, Mr. Fenton, Mr. Fairholt, Mr. Seddon, the Rev. Dr. Laing, Mr. Cave Thomas, Mr. C. Lucy, Mr. J. N. Warren, &c. Before the commencement of the proceedings, upwards of six hundred persons had assembled, the majority of whom appeared to be working men and apprentices, and who manifested throughout the evening a warm interest in the object of the meeting. A prospectus of the intended "North London School of Drawing and Modelling" was circulated in the room. It fully recognised the value of the Government School of Design; but stated that the great distance of that establishment from the localities inhabited by many workmen, virtually excluded them. On these grounds it was proposed to establish, in various parts of the metropolis, local artisan schools—the neighbourhood of Camden Town being selected for the first of such establishments. A school was proposed to be opened in that district for instruction in drawing and modelling, on payment, by adults, of 1*s.* 6*d.* per month, and by lads under fifteen years of age of 1*s.* per month. The school to be open three evenings in each week. The Chairman opened the proceedings in an address, in which he forcibly urged the importance of Art-education to the several classes of operatives. The school now proposed was actually formed, a room capable of accommodating two hundred students had been engaged, and half-a-year's rent paid. Subscriptions had been raised amongst manufacturers, artists, and other gentlemen of the neighbourhood, and he hoped that subscription would be aided by the shillings of the workmen, so that the plan might be successfully carried out. Though chiefly intended for adults, the school would be open also to the young; to the sons, and he hoped even the daughters, of working men. The committee would give their best attention to its conduct and management, and he had much pleasure in stating that instruction would be given to the students by Mr. W. Cave Thomas, whose genius had been so justly rewarded in the Westminster Hall exhibition, and whose education in Germany and Italy, and more particularly his knowledge of the application of Art to manufactures, peculiarly qualified him for the task. Though at first drawing and modelling only would be taught, the establishment must, in fact, become a school of design. He hoped none of his hearers would be deterred by the idea that it was too late to learn; and to refute that notion he referred in animated terms to many of our greatest men of practical genius, who were thirty years of age, or upwards, before they adopted those pursuits, or made those great discoveries, which had rendered them famous. English workmen had the strongest capacity for any species of instruction; but in the approaching exhibition they would have to compete with those who were well trained by many years' practice and improvement in Art-manufacture; yet if such schools as that now contemplated were extensively adopted, he was confident an exhibition of 1856 would place this country far above every competitor. Lord Compton, Mr. Donaldson, Mr. Godwin, Mr. Fairholt, Mr. Seddon, and other gentlemen addressed the meeting, and much good feeling was displayed between employers and workmen. Mr. Warren, the secretary, explained that the

room which had been taken was in Mary's Terrace, High Street, Camden Town, that it would be opened on the 1st of May. Altogether we have never witnessed a more gratifying opening meeting. The large room was crowded by attentive listeners (above six hundred in number), and when we consider that the school is to be located in a neighbourhood the most remarkable in London for the number of artists who reside in it (more than a third of the members of the Royal Academy among them), we cannot but hope that the interchange of feeling between artist and manufacturer will be conducive to the best results.

THE EXHIBITION OF 1851.—At the meeting of the Royal Commission, no fewer than two hundred and twenty-nine designs were submitted to the notice of the members, for the building to be erected in Hyde Park. One hundred and twenty-eight of these designs were by London residents, fifty were sent from provincial towns in England, six came from Scotland, three from Ireland, and seven were sent anonymously. Our continental neighbours have also brought their experience to bear upon it, for, among the rest, were thirty-four designs contributed by foreigners.

EXHIBITION OF 1851.—Fifty one of the committees established for the furtherance of this national work have made a return of their first subscription lists to the Royal Commissioners. We believe the sums announced were—Bath, 89*l.*; Belfast, 315*l.*; Bingley, 82*l.*; Birmingham, 339*l.*; Blackburn, 400*l.*; Bolton, 470*l.*; Bradford, 1100*l.*; Bridgenorth, 17*l.*; Bristol, 527*l.*; Bristol (ladies), 6*l.*; Cambridge (town), 119*l.*; Cambridge University, 109*l.*; Canterbury, 23*l.*; Cardiff, 95*l.*; Derby, 259*l.*; Devonport, 62*l.*; Dover, 27*l.*; Dudley, 245*l.*; Falmouth, 20*l.*; Gloucester, 67*l.*; Guildford, 41*l.*; Halifax, 551*l.*; Hartlepool, 39*l.*; Hereford, 37*l.*; Huddersfield, 78*l.*; Lancaster, 83*l.*; Kendal, 105*l.*; Kensington, 221*l.*; Leeds, 1283*l.*; Lincoln, 120*l.*; London and Westminster, 28,360*l.*; Ladies' Committee, 975*l.*; Manchester, 3300*l.*; Newcastle, 414*l.*; Newcastle-under-Lyme, 50*l.*; Newport, Monmouth, 33*l.*; Norwich, 350*l.*; Nottingham, Oxford, Preston, 200*l.*; Raingate, 34*l.*; Sheffield, 844*l.*; Stafford, 29*l.*; Stirling, 38*l.*; Stockport, 292*l.*; Tanworth, 33*l.*; Tewkesbury, 20*l.*; Warrington, 110*l.*; Wexford, 3*l.*; Wigan, 174*l.*; Whitehaven, 65*l.*; Windsor, Eton, &c., 238*l.*; Wolverhampton, 237*l.*; York, 120*l.* In addition to these returns, it was announced that the Royal Academy had voted 500*l.*, and the Mercers' Company, 100*l.*

THE COLOSSEUM.—The Easter holidays have been the occasion of adding another to the many attractions of this, the most refined and beautiful of our places of public amusement and intellectual gratification. A view of the Tête Noir Pass and the lovely valley of Trent, embracing a torrent of real water, is the new feature to which we allude. The activity of the proprietors in thus adding to their exhibition whatever may be most conducive to public gratification from time to time is deserving of due notice and patronage.

ELKINGTON'S ART GALLERY.—The Messrs. Elkington have devoted the floor immediately over their Electro-Plate Show-room, in Regent Street, to an exhibition of Bronze Statuary, Antiquities, and Fictile Ivory; all executed by them, in a manner most satisfactory. To ensure this they have been assisted by excellent native artists; and have produced, by means of Electro-deposit, Bronze Statuary, and other first-rate works of Art, unknown in England except as matters of importation; and which, they hope to prove, may be as well effected by home manufacture. It is on the judicious patronage of the tasteful and the wealthy they must depend for the successful results of their efforts. This can best be effected by enforcing a higher standard in matters of artistic taste than has hitherto marked the progress of British manufactures. It is completely within the power of the elevated classes to compel this improvement, by resolutely withholding their approbation from all inferior works; but, at the same time, yielding a ready preference for all home-made productions which prove of equal merit with foreign as relates to artistic design and execution. The collection of Bronzes com-

prise faithful busts and basso-relievos, from the most celebrated works of Ancient and Medieval Art. Electro-deposited Shields and Dishes, some by Michael Angelo and Benvenuto Cellini; copies of the rarest vases, cups, and lamps, from Pompeii and Herculaneum, and many new and beautiful designs in Fictile Ivory, in which, at a moderate price, very excellent imitations of ivory-carving may be attained. The great care and skill which characterise the whole of these productions do the greatest credit to the manufacturer, and will well repay the visit of the tasteful lover of Art whether ancient or modern.

ILLUSTRATED LECTURES ON NORTH AMERICA.—Under this title, Mr. G. Harvey (an American artist of considerable reputation) has undertaken to illustrate the scenery, resources, and progress of America—north of Virginia, and including Canada—in a series of sixty-three views, to be brought forward in various lectures, and which show the peculiarities and social condition of the country. They are painted on glass, and exhibited by means of the lantern, but are superior to that class of painting in general; they all strike the spectator forcibly by the apparent truthfulness of each view, and embrace scenes of forest life, and the general peculiarities of the country, in a manner which cannot fail to instruct and gratify the visitor. Mr. Harvey has also a large series of drawings of English and American scenery on view in the day-time in the same gallery, situated next door to the Haymarket Theatre.

ARTISTIC PLANO.—There is a magnificent piano at present in the possession of Mr. Walesby, of Bond Street. The case is most elaborately decorated in rare woods, representing fruits, flowers, insects, and birds, with all the delicacy and truth of a painting. The instrument is a striking example of the high taste which may be exercised in this branch of manufacture.

GRADUATED PLUG FLOWER-POT.—A properly graduated supply of water to flower-pots has long been a desideratum among horticulturists, and this has now been effected by Messrs. Oliver, of Regent Street, who have constructed a sort of double pot, the inner one of porous clay, the outer provided with a double plug, which graduates the amount of water between them. The great advantages which will result from this very delicate and useful invention cannot fail to make it universally acceptable; while the tasteful ornament upon the pots renders them a fitting decoration for any apartment.

MR. F. R. PICKERSGILL, A.R.A.—Our attention has been directed to an error which appeared in our memoir of this artist. We had understood that no relationship existed between him and the Royal Academician of the same name; but we are informed that the younger member is nephew of the elder, Mr. H. W. Pickersgill.

DIORAMA OF THE OVERLAND ROUTE TO INDIA.—A moving diorama on a large scale is now exhibited in Regent Street, which illustrates the route of the overland mail to India, depicting every object worthy of notice on the journey from Southampton to Calcutta. The series comprises strikingly original representations of the many picturesque and beautiful localities which the traveller visits in his journey, and the points of view selected are interesting and novel. The journey over the desert is admirably set forth, the blank wastes of sand, the glaring smothering sunlight, and the mid night camp, are all wonderfully rendered, giving a reality to the scenes, which completely dispels the idea that we look only on a painting, and we almost feel the heat and oppression of the Desert. The scale on which these views are executed is admirably adapted to secure the most minute traits of scenery in all its peculiarity of character, and to give us the best possible notion of the entire route. Our intimate connection with the East cannot fail to make this series of views of general interest to all, while the admirable manner in which they are painted must call forth the warmest eulogium of the lover of Art.

PROUT'S PANORAMA OF AUSTRALIA.—A series of views from sketches made in Australia by Mr. Prout, is now exhibited at the Western Literary Institution, Leicester Square; they

comprise the principal points of attraction in the colony, and show the peculiar features of its landscape scenery, which in some instances is very characteristic and beautiful. The views of the penal settlements exhibit the peculiarities of convict life in all its distressing forms, and the anecdotes with which the lecturer enlivens his local information tend toward the clearer comprehension of the same phase of society. We only regret that these views are exhibited by means of the lantern, as painted glass cannot give that clearness and solidity to them which they ought to have. Dissolving views are very good things in their way; but they are not sufficiently high in character for a subject of primary importance.

THE NELSON COLUMN.—On the Royal Academy side of the monument is now placed Mr. W. F. Woodington's bronze panel, the subject of which is "The Battle of the Nile." This it will be understood is Mr. Woodington's own work—we say this—because it will be remembered that on the death of poor Watson he was charged with the finishing of the design of the latter. The incident selected by the artist is the rejection, by Nelson when wounded, of the aid of the surgeon, expressing his wish to wait his turn. The work is eminently qualified with that refined sentiment which distinguishes the productions of the artist. It has been cast in bronze by Messrs. Moore & Fressange, in whose hands are also the panels of the other sculptors, Watson and Temouhot, both of whom are dead. We may observe, that the figures in the work of Mr. Crew are not so large as those in the other three; but to what extent this discrepancy may appear on the column cannot yet be determined.

ARTISTS' BENEVOLENT FUND.—We were pleased to meet a tolerably numerous company at the anniversary dinner of this excellent Institution, at the Freemason's Tavern, on the 23rd of March; still it would have gratified us yet more to have seen the artists muster in greater strength, especially those whose rank and position carry weight with them, and whose presence at a social gathering like this shows the interest they take in the Society, and affords encouragement to the younger men of the profession who are glad of an opportunity of meeting their "elders." The chair was occupied by C. B. Wall, Esq. M.P., supported by B. B. Cabbell, Esq. M.P., R. H. Solly, Esq., Sir W. Ross, R.A., Messrs. Uwins, R.A., J. D. Harding, G. Lance, E. W. Cooke, G. Godwin, &c. &c. The evening passed off most harmoniously, while the subscriptions amounted by the secretary amounted to nearly 500*l.* including a donation of 100*g.* from Her Majesty. The operations of this Institution might be far more widely extended with increased means;—means which artists themselves ought to be the first to place at the disposal of the executive, if only for the advantage they might possibly find occasion to derive from it in the hour of need.

MOSAIC PICTURES.—Mr. Gausser of Munich, an artist of the school of Schwanthaler, and who is celebrated there for his powers of construction of mosaic pictures, which rival the famous works of antiquity, has arrived in London, where he intends to practise his Art. We have seen two table tops executed by this artist at his temporary residence in New Burlington Street; one delineating the parting of Ulysses and Penelope, the other a rich border enclosing a coat of arms. The colours and the distinctness of drawing are admirably rendered, and the true feeling of the antique mosaic preserved. This artist has sufficiently proved his ability and taste in the construction of different pavements in marble mosaic, which are placed in the Pompeian Villa of King Louis near Aschaffenburg.

THE ILLNESS OF THOMAS MOORE is drawing to a close; and probably, within a short period, he who has been, for half a century, "the poet of all circles and the idol of his own," will be immortal as his works. We should not anticipate this calamity, but that ere long some public effort may be needed in order that the poet may rest in Westminster Abbey, and not at Sloper-ton, in accordance with his own wishes; nor in one of the Irish glens made famous by him, as some of his Irish friends seem earnestly, but we think unwisely, to desire.

REVIEWS.

SPECIMENS OF ORNAMENTAL ART OF THE CLASSICAL EPOCHS. By LEWIS GRUNER. Published by T. M'LEAN, London.

A work of importance and beauty equal to this it does not often fall to our lot to notice in our pages. Whether we consider the ability with which it is executed, the judgment with which the subjects are selected, or their innate value to the student of ornamental Art, we are bound to award the highest praise. We have already found occasion to notice the singular merits of this work in our January number; it will now fall within our province to give some detail of its contents, in order that our readers may be aware of the mine of ornamental wealth therein contained, and which ranges from the Greek and Roman period until the seventeenth century, embracing the finest examples of enriched ornament in the abstract. They are not confined to designs of each period, but comprise such articles as cups, armour, book-binding, &c., in which florid design is visible. It will thus be seen that the work is by no means limited to the architect or house-decorator, but has claims on the consideration, and is for the use of, all. Dr. Braun, in his preface, remarks very truly, that a work like that before us, presents immense advantages to those who are desirous of acquiring a more profound knowledge of the first principles of beauty. The examples it contains are, perhaps, not so much adapted for being carried literally into application, as for showing in how masterly a manner difficult problems have been solved by the greatest artists of different epochs, under the most varied circumstances and conditions. It is only in this sense that such a collection can afford the means of improvement to be derived from a well-directed study of the works of Art already existing. We must proceed in our analysis by the method which the practical chemist adopts to enable him to arrive at a knowledge, not only of useful substances, but even of the very elements of which they are composed. Such an intimate and reciprocal connection between Art and common life is distinctly shown in the examples in the work before us. We see how mere dead walls become instinct with life under the hand of the skilful artist. The vigour and beauty of the paintings of Pompeii attest the power possessed by its early decorators; and which certainly originated in the mind of Raphael a similar mode of rendering walls exponents of Art. Considering these in all their fanciful arrangements of form and colour, they have merited and received the homage of all lovers of the beautiful; but M. Gruner has shown in his plates of ornamental borders of flowers and fruits, arranged from nature, how extremely simple such things may be, and yet how lovely. The plate of the hawthorn is especially good, inasmuch as it clearly shows the wondrous applicability of nature; in one instance the rich clusters of red and white flowers contrast beautifully with the fresh green leaves; in the other we have the bunches of scarlet fruit, and the scree and yellow leaf of autumn. The contrast is very forcible; so much so as to give a totally different character to the design. The prevailing tints of these beautiful plates also display the truest principle of the arrangement of colour, and again prove how well a study of nature can bring in constant use the highest principles of Art. The plates of the French bean and convolvulus are also lessons of the same useful kind; and the many plates of antique foliage which are given in this work from marbles and terra-cottas, show how the truest and most pleasing of decorations in all ages have resulted from a due study of nature. The plates of mural paintings in the Casa de Bronzi, at Pompeii, as well as the Medeval examples of decoration given in this work, exhibit an archaic treatment of natural forms which is of a totally distinct order, but which is abundantly available to the decorator. Indeed, we may conclude by observing, that so varied and useful are the contents of this sumptuous volume, that we shall not fail to benefit artists and manufacturers of all kinds by recommending it warmly to their notice and use.

AN INQUIRY INTO THE SUCCESSION OF STYLES IN RENAISSANCE AND POINTED ARCHITECTURE IN FRANCE. By THOMAS INSKERSLEY. Published by J. MURRAY, London.

This is no mere compilation or review of French architecture got up at home by aid of a comparison of published works and opinions, but the result of five years travel and study in France of the principal ecclesiastical edifices it contains. What the author has to say is said briefly and clearly; and his notes on buildings are all lucid and useful, detailing the chief points worthy of observation. The French antiquaries of the last century were

chiefly distinguished by their love for ante-dating their ecclesiastical edifices, and this they did to an unreasonable extent: it has fallen to the lot of modern investigation to set them right on this point; and foremost in the field have been our own countrymen. The author of the present work has brought curious and conclusive evidence from ancient chartered documents to prove the period when the principal edifices were erected, which is exceedingly valuable. He believes that no absolute reliance can be placed upon any date more remote than the commencement of the eleventh century for any one; and that the church of Roncey in the City of Angers, founded by Poulques Earl of Anjou, and dedicated to the Virgin in the year 1208, is one of the earliest. He deduces from the fact of the wars and plagues which ravaged France from the accession of Philip de Valois in 1328, until more than a century afterwards, the paucity of architectural examples of a decorated style, embracing new tastes. The work is carefully and thoughtfully compiled, and will be a useful text-book of dates for the architectural student; we cannot, however, but regret the want of plates, which would have rendered it of much greater value, and which we shall hope to see in a new edition whenever that is required.

AUTHENTICATED TARTANS OF THE CLANS AND FAMILIES OF SCOTLAND. W. & A. SMITH, Mauchline, Ayrshire, Scotland.

This is a book possessing peculiarities of a remarkable order. It is not the production of a bookseller, but of a firm which have rendered themselves famous by the manufacture of snuff-boxes and other objects of a minor character into which the tartan is introduced; and the manufacturers have devoted much careful thought, much profitable labour, much genuine enthusiasm in the production of this really national book. We have frequently had occasion to remark that undertakings which upon the Continent would require and obtain government sanction and aid, without which they would not appear, are not unfrequently produced in our own kingdoms by the result of individual labour and expense—as nobly and as effectively. The garb of the Highland Clans is here given in all its brilliancy or variety by the aid of colour-printing of a novel and peculiar kind. It is well observed by the author, that although various works have been brought out in which it has been attempted to exhibit the Clan Tartans by means of lithographic printing or colouring with the hand, it must be obvious to those familiar with the lithographic printer's art, that no good imitation of woven tartans can be produced by such means. The great difficulty of printing close parallel lines in different colours, and the impossibility of securing the beautiful secondary and tertiary tints produced by the interlacing of the different coloured threads, when transparent colours are laid one upon another, render the results of any mode of printing or print-colouring yet known but a poor and feeble imitation of the beauty of the woven fabric; but this mode of producing the intermediate tints, on which so much of the beauty of the tartan essentially depends, is produced in the most natural manner by the Manchine machine-printing, in the establishment of the authors, simply because it is a weaving with colours; for exactly as each thread of the web is successively introduced, so each line of colour in the specimens of tartans given in this work is drawn in succession, and thus produces the desired result by the same harmonious commingling of the primary colours. It is this latter arrangement which has made the tartan an object of admiration alike to natives and foreigners, and given it the approval of the highest artistic taste. West has remarked, that "great Art, that is to say, much knowledge of the principles of colouring with pleasing effect, has been displayed in the composition of the tartans of several of the clans, regarding them in general as specimens of natural taste, something analogous to the affecting but artless strains of the native music of Scotland." There are in this volume sixty-nine examples of clan and family tartans produced in the most perfect manner, thread for thread, and tint for tint, and accompanied with a concise, but useful, and satisfactory notice of the family or sept who wear them. Prefixed to the whole is a very excellent introductory essay on the Scottish Gael by a member of the Society of Antiquaries of Scotland, which is carefully and conscientiously written, and in which the peculiarities and merits of the race are fully and properly described on. There is also appended a useful map of the Highlands of Scotland, in which the territories of the various clans are carefully defined.

From what we have said, it must be apparent that this very curious volume presents attractions of no ordinary kind. To us "Southrons" it is

particularly curious and valuable, and will tend to the proper advancement of our knowledge of the habits and manners of the Highlander. It is no uncommon thing to find persons calling any piece of cloth of Scottish pattern "a plaid," forgetting that that is an article of dress, and the pattern is no plaid but a tartan. This characteristic garb had begun to be lost sight of, until the interest with which Scott and others had invested their native land and its history raised the question of old usages, and excited a new ardour for the vestiges of past times. Then it was found that in spite of the enactment of 1747, devised for the purpose of eradicating every vestige or memorial of Highland clanship, and which made the wearing of the old Scottish dress a crime, exposing all guilty of it to prison or transportation; that portions of the old tartan consecrated by many an historic event, or hard fought party-battle, had been religiously preserved by the elders of families, and were triumphantly brought to light to adorn the Court of George IV. at Holyrood; since then it has been generally manufactured in all its varieties, and extensively adopted, the practice having received the patronage of the present Majesty, who so graciously adopts whatever is useful and good in each of her kingdoms. It has been the object of the authors of the present volume to give an authentic standard for "the sets of the clans" as a guide to all manufacturers, for which purpose no expense nor trouble has been spared, and we thus have an excellent authority and a beautiful book, worthy alike of the subject and the projectors.

THE ACQUITTAL OF THE SEVEN BISHOPS. Engraved by S. W. REYNOLDS, from the Picture by J. R. HERBERT, R.A. Published by T. AGNEW, Manchester.

Had the painter of this picture searched the entire History of England for a subject calculated to excite the interest of all classes, he could not have selected one more effectual for his purpose than that he has chosen. The painter of history is a missionary for good or for evil, his teaching is often more powerful than the pen of the writer, and the eloquence of the orator, inasmuch as he enables us to see what these only offer to the imagination, which too often takes an erroneous impression; the eye is rarely deceived by false appearances of realities. The people of Rome were stirred to meeting against the tyranny of their nobles by an allegorical picture placed in the Forum, it is said, by Rienzi; and there cannot be a doubt that the first impulses to a holy and devout life may be traced in many to the contemplation of sacred art. The trial and acquittal of the seven bishops for refusing to order the clergy of their respective dioceses to read, publicly in their churches, the celebrated "Declaration for liberty of conscience" promulgated by James II., was a grand feature in the history of this country, the completion and confirmation of all that had previously been done to establish our civil and religious liberties; the resistance of these courageous and noble minded prelates to the jesuitical edict of the monarch secured to us the Protestant faith, and effectually checked any subsequent encroachment that despotism might have contemplated. Here was a grand subject for the painter's skill, and Mr. Herbert entered upon it with an adequate sense of its importance, and a determination to throw into his work every energy of his mind. The result is a picture worthy of its theme, and most honourable to the artist; it was exhibited at the Royal Academy in 1844 (with that of "Sir Thomas More and his Daughter," engraved for the present number of the *Art-Journal*), when we awarded it the highest praise as one of the most meritorious productions of the English School. There is no surer standard, nor one more severe, by which to test the composition and material of a picture, than an engraving after it, when the eye is not allured to a false estimate of its beauties by the glow of colour and the diversity of hues. We confess that our original opinion of this is in no way changed by the transformation it has undergone; the beautiful daylight effect is still retained, and the breadth of *Chiossuro* remains unbroken; the various groups which compose the scene include about one hundred and fifty figures, yet each group seems in its proper place, and all are in perfect harmony of keeping.

Mr. Agnew is entitled to all praise for his enterprise in bringing out a work of so elevated a character and of such national interest; for it ought not to be forgotten that the features of the chief actors in this great dramatic scene are, for the most part, from authenticated portraits; a value is therefore attached to the engraving over and above what would accrue to the mere ideal representation of an important event. The publisher need not fear the success of his undertaking.

THE ART-JOURNAL.

LONDON, JUNE 1, 1850.

THE ROYAL ACADEMY.
THE EIGHTY-SECOND EXHIBITION—1850.

THE Royal Academy open their Exhibition this year under peculiar circumstances. They have received notice that the rooms they occupy, and have occupied so long, to the honour of Art and to the advantage of the public, will be theirs no longer; that a local habitation they must seek elsewhere; and that although some compensation may be afforded to them by a grant of public money, the expenses incident to their schools, library, and exhibitions, must be, in future, borne by themselves. Strange to say, this measure, harsh, unnecessary, and, we think, unjust, as it is, will be received without a murmur by the public generally, and by all artists who do not directly benefit by the Institution. The unpopularity of the Royal Academy is sufficiently notorious; and, perhaps, it is the only establishment of the kind in Europe in which the people not only feel no sympathy and take no interest, but which, it is scarcely too much to say, they would see destroyed without regret. This is a deplorable evil; but it is one for which the members of the Royal Academy are alone responsible. Having persuaded themselves of their own infallibility, they have repelled all idea of change. Believing their Institution incapable of improvement, they have considered advice as insult, and have seemed to take a pride in manifesting their contempt of public opinion. Adversaries were exasperated, and friends contemned,—as if by system; and it appeared an established rule to do nothing, to take no step, to make no move, which might lead to a supposition that its members imagined any influence out of their council room could be either beneficial or prejudicial to them. No institution, public or private, could for any long period pursue such a course with impunity. The day of reckoning has come; and it is at this moment a very doubtful matter whether Parliament will sanction the grant of money for which the Prime Minister means to apply, in order to aid the Academy to erect a building suited to its purposes. During the discussion to which Lord John Russell's notice has given rise, scarcely a voice has been raised in its favour. Those who have seemed to support the proposal, have spoken in terms apologetic rather than defensive; while we believe there is hardly a public journal in the kingdom that has not in strong terms objected to the grant. We repeat, this is to be deplored as a serious evil. The Academy has been of immense value to Art; it has upheld Art as a status; in the words of its most uncompromising and most powerful opponent—

"The Institution was ostensibly designed for the noble purpose of raising the standard of British Art; but it seems to have been directed chiefly to educating the artist in his profession, and to teaching the public duly to appreciate it; to fixing pictorial skill in a high social position, and to maintaining it there by the distribution of honours and the support of royalty. That these results have in a great measure been attained, and that

the Academy has so far answered the end of its foundation cannot, we think, be denied."

Yet the evil is one which a few unimportant changes might have prevented—which a few trifling concessions might have averted; if its members, unhappily for them, and still more unhappily for Art, had not persuaded themselves that what was good in 1768 was equally good in 1850; had they, on the contrary, seen with enlightened understandings and liberal views, that a century passed over mankind had rendered changes not alone expedient but absolutely necessary in every institution formed by our great-grandfathers, they would have acted in a manner commensurate with the spirit of the age, and have done for themselves that which others will now do for them. The Academy cannot plead ignorance of the public feeling which has so long operated to their prejudice. We find it less easy to quote the opinions of others than our own; we therefore copy the following passage from the *Art-Journal* of June, 1846—

"The spirit of the age is conservative, but it is by no means opposed to wholesome and practical reforms. Of this fact every day gives us some convincing and conclusive proof; and we say, once for all, that the Royal Academy dare not much longer remain the only Institution of the kingdom that will make no move towards that renovation, the continued postponement of which must inevitably lead to ruin."

But in fact, year after year, for the last fifty years, every organ of public opinion has suggested, and as far as possible insisted, upon subjecting the Royal Academy to those constitutional remedies which could alone render it healthy and useful to the extent of its capabilities; yet until this year, not only was no notice taken of such prompters, gentle or urgent, but, as we have said, advice was invariably construed into insult.

At length, however, a voice more potential than that of the Press has been heard—the voice of Parliament!—and concessions have been commenced. The critics whose business it is to communicate between the exhibitors and the public have in 1850 been admitted, for the first time, to a private view. Twenty-three cards of invitation were issued to metropolitan journals. The consequence is even now apparent; a more generous tone pervades the criticisms; the critics have been enabled to see and to examine that which it was their duty to write about. Instead of the pushing and driving, the dust and confusion of the "opening day," they have studied the works exhibited; and while artists generally will have had better reason to be satisfied with the judgments pronounced, the public will have gained, instead of hasty conclusions, and opinions framed in anger, results arising out of cool and considerate scrutiny.

We hail this concession as the dawn of a brighter day, and heartily hope it may be followed by others. Although they would, no doubt, have come with better grace had they been made before, and not after, the hints "not-to-be-mistaken" which the Academy received from the House of Commons; at least they argue a willingness to abandon the old resolution to remain "stock-still" while the rest of the world is advancing with giant strides.

It is not unlikely that the discussion concerning the Academy will have taken place in Parliament before this number of our Journal is published; we do not therefore speculate on the result; it is understood that a grant of 40,000l. will be moved for—payable at two periods—as a set-off against the claims of the Academy to their rooms in Trafalgar Square; and in order to enable the members to erect a building in all respects suitable to their wants, and of such character as may be honourable rather than prejudicial to the Arts in Great Britain. The Academy is in possession of a large fund—it is said upwards of 80,000l.—which must be expended in addition. No doubt Mr. Barry will consider it a privilege to superintend its progress; and there can be no question that, although direct national prestige may be, in a degree, withdrawn from the Academy by its removal from the National Gallery, its annual

income will be augmented rather than diminished by the advantages that will be thus obtained for them by increased space and a more healthy tone of public opinion.

It is understood that some difference exists in the Academy, as to whether the proposed grant should be accepted or declined. It can scarcely be refused. The Academy stands upon its right: its right to compensation is unquestionable. By rejecting the proffered grant, they would, in spirit, admit that they had been for the last fifteen years usurpers of the accommodation to which they have a legitimate and perfectly correct claim.

Whether the prime minister will couple the grant with rules for the future government of the body, and stipulate for power to control its future movements, remain to be seen; while on the one hand it would be unjust to do so, on the other, such a course might be very salutary for Art in England. We leave the difficulty to be grappled with; but, of a surety, however tempting the opportunity may appear, no injustice must be done; the compensation made to the Royal Academy ought to be freed from any bargain or restriction whatever. It is due to them as a matter of equity; we believe, indeed, it is also legally theirs.

The Exhibition of 1850—the Eighty-second Exhibition of the Royal Academy—consists, including miniatures and sculpture, of 1456 works. On the whole, it is highly satisfactory. The "hanging" has been generally fair. Several artists, not members, have been accorded good places, and although the octagon room and the rooms for miniatures and architectural drawings contain many paintings that would do honour to any collection in Europe, the evil is one which we must always anticipate, and for which much allowance must be made, until proper space is found for all worthy applicants for admission. A higher and better tone seems to prevail in the selection of subjects. There are more pictures than usual to study and think about, and while our "school" has made progress in its younger branches, established favourites maintain their positions, and, perhaps, extend their repute.*

With this brief introduction we leave the subject for the present; and proceed to pass under notice the leading works contained in the Exhibition.

No. 6. 'Portrait of the Hon. Caroline Dawson, Maid of Honour to Her Majesty,' E. DUBUFE. In this portrait there are many fine points of colour and execution, yet it is by no means so brilliant as that exhibited last year under this name.

No. 8. 'The Wind on Sborc, T. CRESWICK, A. This subject will remind the spectator of a coast scene exhibited by this artist we believe last year. Like that, the view shows a bay shut in by a mountainous coast, which in the distance trends seaward. The prominent object is a schooner lying on the dry beach and under repair. It appears to be about half tide, and the breeze off the sea lifts the frothy crest from the distant surf. The sky is full of the busy scud drifting off the sea, and one solitary gleam of sunshine streaks for an instant the slung line beyond the schooner. The picture has all the high qualities which confer value on the works of the painter; in adopting a style different from that of his earlier aim, he has arrived at equal excellence.

No. 9. 'Portrait of Mrs. Broadville,' W. B. ESSEX. A work of small size. The features are remarkable for animated expression.

No. 10. 'Marlborough Forest,' J. STARK. The primary object is a group of trees in the left foreground. It is gratifying to observe how much more of freshness there is in the colour of the foliage than has been seen in preceding works. This, although the subject is commonplace, will be accounted among the best of the recent productions of its author.

No. 12. 'A Mountain Stream—Borrowdale, Cumberland,' J. BROWN. This is a small picture, exhibiting the admirable balance of the *aggr. et dolce*, which the painter knows so well how to maintain in his works. This quality of colour and unerring certainty of touch, with all the

* It is understood that 1400 works of Art were rejected "for want of room." This fact requires no comment.

accompanying semblance of luxuriant *abandon*, show a mastery over material which we rarely see.

No. 13. 'Market Day,' A. R. C. CORNOUR. The objective, manner, and feeling of this picture remind the spectator of the Dutch masters. The work is sober in tone, and has been very carefully studied.

No. 15. 'The Disarming of Cupid,' W. E. FROST, A. The subject of this picture, which has been painted for His Royal Highness Prince Albert, is derived from the Sonnets of Shakespeare:—

"The little love-god lying once asleep,
Laid by his side his heart-inflaming brand,
Whilst many nymphs that vowed chaste life to keep
Came tripping by; but in her maiden hand
The fairest votary took up that fire,
Which many legions of true hearts had warmed;
And so the general of soft desire
Was sleeping, by a virgin hand disarmed."

In this picture the painter again shows the elegance with which he draws, and the delicacy wherewith he paints, the nude and semi-nude. According to the tastes which he has already declared, the composition presents an assemblage of nymphs thronging round the God of Love, who sleeps under a dwarf honeysuckle at the foot of a tree. His bow lies by his side, and an arrow, held loosely in his hand, is about to be stealthily removed by one of the nymphs. In the principal of these figures there is all the elegant movement by which others of his preceding choirs are distinguished; there is also a degree of refined expression in the features which we are unaccustomed to see in similar works, manage the precept inculcated by the exalted materiality of the classic. It may be fairly said of the nymphs of this painter that they are not the Amarylides of the pastoral lays of the Mantuan poet, nor the fragile vessels of the Metamorphoses. They are higher in the scale; their motto is *volo amare*, and in every other respect they are creations at which the Graces have presided.

No. 16. 'Samson Betrayed,' F. R. PICKERSGILL, A. This is a large picture, following in its composition the letter of the text—"And she made him sleep upon her knees; and she called for a man, and she caused him to shave off the seven locks of his head." Samson lies with his back turned to the spectator, partly supported by Dalilah, who presents a front face. The operator is a black, who, on the left, very carefully severs the locks, while on the right two female figures express the utmost alarm lest Samson should awake; and this is a principal impression sought to be conveyed. Every figure, not only in the features, but even in the hands and otherwise, express the utmost dread of awaking the strong man. The back of Samson is an admirable study; it is realised from the antique. The female figures are also skillfully drawn, firmly painted, and judiciously distinguished by complexion. This picture is executed with infinitely greater power than the "Harold," and is everywhere enriched by higher artistic qualities.

No. 23. 'Cattle Crossing a Ford—Summer Morning,' F. R. LES, R.A., and T. S. COOPER, A. This is apparently a composition, the principal form in which is a screen of lofty trees on the left. The water-course goes into the picture from the immediate parts of the composition, which is closed, on the right, by cliffs. The cattle cross the river in a long perspective line, which is admirably drawn; indeed, the work generally is unexceptionable.

No. 24. 'A Morning Concert,' J. HOLLAND. This is a small picture in which the scene is a section of the court-yard of an ancient residence, the end of which terminates in a *tourrelle*, beautifully ornamented with Gothic fretwork. The tone and manner of this little picture are masterly.

No. 25. 'Study from Nature,' H. S. ROLFE. The subject of this study is fish—a juck, trout, chub, and perch, painted so closely imitative of nature as to afford the freshness and metallic lustre of the scales with a truth that cannot be surpassed.

No. 26. 'Old Bridge at Nuremberg,' W. CALLOW. This bridge crosses the river between two gate-towers, forming altogether a picturesque association to which a very good effect is given.

No. 28. 'Blackberry Gatherers,' H. LE JEUNE. A small picture singularly brilliant and harmonious; it shows a boy stretched upon a grassy bank, and his little sister dropping the fruit into his mouth. It is highly finished, but with a perfect taste in the work of elaboration.

No. 29. 'The Deer alive and the Deer deceased,' A. COOPER, R.A. This title is explained by a sportsman returning from the hill with the "deer deceased" borne by his pony, and encountering the "deer alive," (miserable pun), a Highland girl, who had perhaps been waiting in his homeward path.

No. 39. 'King Lear, Act IV. scene 7,' C. W. COPE, R.A. This is the scene in which Cordelia and the physician exert themselves in restoration of Lear. The king is extended on a couch, and his daughter bends over him in expression of all filial tenderness—

"Oh my dear father! Restoration hang
Thy medicine on my lips, and let this kiss
Repair those violent harms that my two sisters
Have in thy reverence made," &c.

The physician anxiously counts the pulse of his patient as waiting the result of the louder music which he has just commanded. This is essentially a dark picture, and in every way different from all that has preceded it from the same hand. The heads are painted with very great care, and the outlines are generally very decided. The head of Cordelia equals the expression of the text; the countenance of the physician declares a profound anxiety, and some of the heads of the musicians are endowed with a charming sentiment.

No. 40. 'Autumn—Scene in Wales,' H. J. BODDINGTON. This work pronounces itself at once a very careful study from nature. To the left of the composition rises a group of trees drawn with unquestionable truth, and painted with incomparable freshness. Other trees occur which are described with equal success, and not less genuine is the grass and herbage of the lower part of the work.

No. 43. 'A hollow Road through a Wood,' the figures by the late James Laurent Agassac, J. J. CHALON, R.A. This is a picturesque passage of sylvan scenery, which it would seem has been painted with a desire to render the work as much as possible like an old picture. It is generally low in tone, with an almost entire denegation of colour.

No. 52. 'The Countess Bruce,' F. GRANT. The lady is attired very simply in white, she stands in an easy pose, resting on a pedestal. The features are painted with breadth, and the entire head seems to have been executed with great facility.

No. 53. 'The Sanctuary of the Koran Mosque at Cordova,' D. ROBERTS, R.A. A small picture showing the interior of a religious edifice of Saracenic architecture. On each side is placed a row of red marble columns, and at the extremity appears the Moorish arch. The upper parts are of a uniform drab colour, and the colours generally are subdued. The place is thronged with figures wearing a variety of picturesque costumes. The picture possesses the high qualities of the painter's best works.

No. 54. 'A Study from Nature,' T. WEBSTER, R.A. The subject is that section of a cottage interior which contains the fire-place, the chimney being of that ancient kind which admits of one or two seats within it. On the left we find, accordingly, a boy busily discussing the contents of a porringer, and in the other his grandmother seated in a dozing attitude. Nothing can surpass the reality of this little picture.

No. 55. 'An Italian Cottage-Door,' P. WILLIAMS. There is in this picture less of salient colour than in those works exhibited last year under this name. The tint of this picture is almost universally grey; the composition presents a girl spinning at the door. The head of the figure evinces great finesse in execution. Altogether, it is a charming work, and sustains the high reputation of the accomplished artist.

No. 56. 'The Gross of Green Spectacles,' D. MACLEISE. If Goldie could himself see the amount of character embodied in this picture, he would most honestly confess himself outdone.

Moses has just returned, and shows the result of his venture with the colt. The gross of spectacles in their bright shagreen cases are under inspection, and Dr. Primrose pronounces the rims nothing more than copper washed with silver, at which announcement all the faces round the table are drawn out to their utmost longitude. The scene is the family room, an apartment which Mrs. Primrose, like the good housewives of a time gone by, was not ashamed to ornament with a variety of utensils of domestic economy which are now placed in the kitchen. The good vicar deprecates the bargain, but with Christian resignation; the sisters look reproachfully at Moses, but the excitement of Mrs. Primrose amounts to something more implacable. The appeal of Moses is inimitable, the expression and pose of the figure are eloquent with appropriate language. The amount of finish in this picture is wonderful, every object of the composition is brought forward with an accuracy of description that has never been surpassed.

No. 57. 'The Old Bridge, Frankfurt,' G. STANFIELD. A picture of considerable size, everywhere worked out upon the most valuable principle of study. The bridge crosses the composition, and in the middle supports a picturesque old house, baving at the extremities other edifices of like character. The work is subdued in tone, and shows a highly effective adjustment of chiaroscuro.

No. 58. 'Evening—A Scene on the Rivera di Ponente, Gulf of Genoa,' E. M. COOKE. The right of the picture describes a section of a terrace overhanging the shores of the Gulf, on which the buildings and trees are opposed to the light of the setting sun. This picture is purely in the Mediterranean style of the painter, which differs entirely in feeling from the tone of his North Sea subjects.

No. 59. 'John Baldwin Buckstone, Comedian,' J. P. KNIGHT, R.A. The head is painted in a manner extremely substantial, and the features bear a striking resemblance to the life.

No. 60. 'Portrait of Joseph Brotherton, Esq.' P. WESTCOTT (painted for the Corporation of Salford.) The subject is presented at full length seated. The head is remarkably forcible in treatment.

No. 67. 'Macbeth,' (Act I, scene 3), C. STANFIELD, R.A.

Enter MACBETH and BANQUO.
Macbeth. So foul and fair a day I have not seen.
Banquo. What are these,
So withered and so wild in their attire?

This is a large picture; not a figure composition, as might be supposed from the title, but a landscape, in which the eye is carried over a vast expanse of dreary waste on the left, the right being bounded by mountains. In the foreground are the witches, and at a little distance appear Macbeth and Banquo, surveying them with astonishment; and yet further, we observe the line of march of their armed followers. We do not find in this picture the same studious care in the realisation of minor detail which is observable in other works of its author. The tone of the subject is necessarily sombre, and it is worked out with auxiliary passages of great sublimity, from which undoubtedly a minute manipulation would sensibly derogate.

No. 69. 'Temptation,' G. SMITH. The objects of trial are some children, who are assembled round a fruit stall, presided over by a bard-featured old woman, sensible only to the touch of coined metal. She is a highly successful study. In the face there is a living truth not very often attainable.

No. 72. 'The Good Samaritan,' C. L. EASTLAKE, R.A. In this work there is at once recognisable an aspiration identical with that professed in the Vernon picture "Christ on the Mount of Olives." It does not pronounce in favour of this or that style of art, the old or the new; in short, it is not a tribute to art so much as another legend of the Parable. It will be observed of the Samaritan, that he very nearly resembles the impersonation of the Saviour in the picture already alluded to, we cannot suppose that these figures could be made thus to correspond, without a purpose. As in all the

works of this artist the picture is distinguished by the fastidious care with which it has been executed.

No. 73. 'His Grace the Duke of Devonshire,' F. GRANT, A. This is a full-length portrait of the size of life, presenting the figure in a standing attitude; the costume is plain evening dress. The resemblance to the noble subject is striking, but the work looks unfinished in parts.

No. 75. 'Portrait of Mrs. Ennis,' T. MOGFORD. The features in this work, the portrait of an elderly lady, seem to be painted under an effect of light, but the picture is hung so high that it is impossible to determine its qualities.

No. 79. 'Portrait of Robert Keate, Esq., F.R.S., Sergeant-Surgeon to the Queen, &c.' J. P. KNIGHT, R.A. A testimonial from the friends and pupils of Mr. Keate, and intended to be placed in the board-room of the hospital. The head is admirably round and substantial, and the argumentative expression at once arrests the attention.

No. 80. 'A Mountain Stream,' F. R. LEE, R.A. A favourite class of subject with this artist, but none of those which have preceded it, equal this in valuable quality. The sky is charged with towering clouds, and the lower aspect is that of the freshness after summer rain. It appears that the ordinary phenomena of water, which are generally painted with transparent material, are here laid in with opaque colour. The trees are very carefully described, and the retiring gradations judiciously managed.

No. 82. 'The Keeper's Daughter,' F. TAYLER. A small half-length figure; she is busied in hanging up the trophies of the field. It is a study of much spirit and freshness.

No. 83. 'Rydal Water—Westmoreland,' H. JUTSUM. A small picture, having for its subject one of the most romantic views in the region of the lake scenery, which derives from its treatment a charming sentiment of tranquillity. The distances are airy and finely felt, the more immediate passages are substantial and harmonious.

No. 85. 'Nourmahal—the Light of the Harem,' H. W. PICKERSHILL, R.A. A life-sized figure in Eastern costume; certainly one of the best of the Oriental essays of the painter. It is a very charming work, and sustains the high repute of the accomplished artist.

No. 91. 'Portrait of Mrs. Simpson,' Mrs. CARPENTER. The lady is simply attired in white. She is posed with ease and grace. The features are coloured with the freshness, and worked with the firmness, which always distinguish the works of this lady.

No. 92. 'The Meeting of Jacob and Rachel,' W. DYCE, R.A. The subject of this work is derived from Genesis (chap. xxix.)—"And Jacob kissed Rachel, and lifted up his voice and wept." The figures are half-length. Rachel rests the left hand on the side of the well, the other, Jacob presses to his bosom as he bends towards her. In determining the character of the heads of these figures it would appear that the result is a deduction of sedulous study; every thing approaching to effeminacy in the one, and mere pretentiousness in the other, has been carefully avoided. The drawing is vigorous, and the style of costume original. Rachel wears a blue drapery, covering the shoulders and bust, and leaving the arms nude; and Jacob is partially clad in goat-skin, which, crossing the body, is confined at the waist by a girdle. We cannot too highly praise this work; it is a most masterly production, in all respects honourable to the British School of Art.

No. 93. 'Scheveling Sands—The Tide Making,' E. W. COOKE. There is little in this composition; it is, however, a production of infinite sweetness, and curiously enough maintains one of the two styles which this artist professes. The scene is a flat shore, with a low horizon of breakers, and the only objects are two doggers seated on the sand, and waiting as patiently as King Canute, the coming of the sea. These vessels are most faithfully painted, but there is yet in their timbers and cordage a little Mediterranean hardness. The foreground and the white horses of the sea are charmingly painted.

No. 94. 'A Farm-House Kitchen,' Miss E. GOODALL. One of these unassuming interiors which this lady describes with so much taste, and a feeling for colour and spirited exertion rarely surpassed.

No. 95. 'Beatrice,' C. E. LESLIE, R.A. She is represented as looking over the balustrade of a garden-terrace. The background is a mass of foliage, and her dress is plain and subdued in colour; everything, in short, is reduced in order to enhance the brilliancy of the face, which is a conception of much graceful animation, eminently spirited and extremely lustrous in effect.

No. 96. 'Portrait of an English Officer,' S. PEARCE. A small half-length, attired in, apparently, the undress of the Guards. The features are remarkable for softness of manipulation and forcible tone.

No. 97. 'W. Cahitt, Esq., M.P.,' W. BOXALL. A small figure seated, having the head supported by the hand. In character, colour, and texture, this head has been rarely surpassed.

No. 98. 'A Cherry Seller,' T. WEBSTER, R.A. One of the smaller productions of this painter by no means high in tone, but by which nevertheless the eye is at once fascinated. The story is how an old woman who sold cherries would not give one over the precise weight, although the grey "wide-awake" of the buyer, a boy in dirty corduroys, was impatiently thrust under the scale. His expression, and that of his companion on seeing the overweight cherries withdrawn, are inimitable. In this little picture, there is nothing left to desire, there is not room for an improving touch. The works of this artist are distinguished by the inestimable quality of the best Dutch pictures; they are everywhere most carefully finished, but nowhere is the elaboration obtrusive.

No. 100. 'Haurietta, youngest daughter of the Hon. Mr. Justice Vaughan,' J. SANT. At once a portrait and a picture, representing a child seated on a bank, the head telling in opposition to a depth of shade upwards. The whole forms a study of much power and good taste.

No. 106. 'Sinclath Toruh—The Rejoicing of the Law,' S. A. HART, R.A. The subject is a festival which takes place among the Israelites at the end of the Tabernacle holidays, when the concluding part of the Pentateuch is read, and when it is also recommenced. The scene is a portion of the Synagogue at Leghorn, a section of interior well calculated for pictorial effect in association with the figures which are officiating. The impersonations are numerous and all wear ceremonial robes, which impart dignity and importance. The work is equal to any of its class of subject which the artist has painted. It is, indeed, one of very considerable power; carefully considered as to composition, skilfully grouped, and finished with much skill and judgment. The picture will greatly enhance the painter's reputation.

No. 109. 'The Fortress of Bard in the Val d'Aosta—Piedmont,' J. UWINS. The foreground of this picture is apparently a mountain gorge whence the eye passes upward to the fort, which is on an eminence at a short distance from the spectator. The picture is low in tone, the only point of light being the walls of the fort. It may be considered an advance on late works exhibited by its author.

No. 118. 'Portrait of Mrs. Wadham Locke,' T. M. JOY. The lady is seated in a pose graceful and easy, and the features are distinguished by animated intelligence.

No. 120. 'Summer,' W. F. WITHERINGTON, R.A. This is a close view, very much like a passage of sylvan scenery in the immediate neighbourhood of some well-wooded park. The trees have been carefully studied from nature, the foliage being amply detailed, and without any loss of breadth; and compared with other similar productions by the same hand, there is a devaluation of light, a most judicious step, giving great value to that which is distributed in the composition.

No. 121. 'Autumn—Wounded Woodcock,' T. WOLF. A painful subject, cleverly treated; the wing of the poor bird is broken, it has sought shelter by the side of a bank, under the protection of a spider; the proprietor of a web that extends over a good moiety of the picture.

No. 122. 'Scottish Fern-Gatherer,' F. TAYLER. A small half-length, a girl toiling homeward with her load of fern. She is fresh in colour, and amply endowed with living character and natural movement.

No. 124. 'The Approach of a Storm,' A. W.

WILLIAMS. A river-side subject almost closed by trees on the opposite bank; and although all the material in the work is exquisitely wrought, it is not this that is felt—it is the effect, which is realised with extraordinary power. The sky is obscured—blackened by a lowering thunder-cloud, that casts its ominous shade on the earth—but relieved by dropping gleams, which fall here and there with beautiful truth, giving lustre to the water and colour to the earth. The qualities of this work are of a very high order.

No. 125. 'Tom Jones showing to Sophia Western herself as her best security for his good behaviour,' C. R. LESLIE, R.A. The particular passage forming the subject of this work is found in the Eighteenth Book:—"If I am to judge," said she, "of the future by the past, my image will no more remain in your heart when I am out of your sight, than it will in this glass when I am out of the room." The composition is extremely simple. The room is plainly set forth with the furniture of the latter part of the last century, which is of a fashion belonging to no style. Jones has placed Miss Western before the glass, and points exultingly to the reflection. The impersonation of Sophia is a conception of much sweetness.

No. 126. 'Miss Grant,' F. GRANT, A. The young lady is presented in profile; the figure relieved against a fragment of a bank or rocky background. The head is a charming study; one of the best of its author.

No. 127. 'Portrait of Thomas Farmer Bailey, Esq., J. G. MIDDLETON. This is a half-length, of the size of life, everywhere brought forward with much care; the features are full of animate expression.

No. 131. 'Scene on the Maas, near Dort; Market People waiting for the Evening Tide,' C. STANFIELD, R.A. A large picture, which, though simple in the character of its subject, is distinguished by points possessing a peculiar value, equal to that of materials better adapted for grandeur of expression. The spectator looks along the shore of the river and recognises at once the old buildings which have been celebrated by Albert Cuyp. The near breadth of the composition shows a mill on the right, a favourite object with the painter,—with an assemblage of material painted with a surface which we find in the works of no other artist. The river is thronged with a distribution of those winged doggers, which are still the same as Caesar described them; some near, others farther removed from the eye, but all so admirably put in their respective berths that each skipper would at once point out his own craft. The foreground, beaten by the tiny waves, and the lustrous reflection of the water, are most effectively rendered.

No. 133. 'A Nymph,' C. BROCKY. A nude figure reclining and playing with a Cupid; the drawing is accurate, and the colour is of that agreeable mellowness we have before observed in the works of this painter.

No. 134. 'Portrait of L. Macdonald, Esq., Sculptor, Rome,' S. PEARCE. A small half-length, representing the subject in an easy pose, and holding a chisel in one hand. The resemblance is striking, the head is forcibly brought forward; it is life-like in colour, and qualified with thinking intelligence.

No. 135. 'The Gardener's Daughter,' F. STONE. A figure attired in white, she is reaching up to a bunch of roses, one of which she is plucking; at a short distance stand two youths watching her. The face is equal in finish to the most careful miniature, and every part of the composition is equally well sustained.

No. 136. 'Scene from Henry VIII.,' C. R. LESLIE, R.A. The subject is Queen Katherine's dying charge to Capucius—

"Sir, I most humbly pray you to deliver
This to my lord the King;
In which I have commended to his goodness
The model of our chaste loves, his young daughter,
Beseeching him to give her virtuous breeding," &c.

It is one of the darker pictures of its author, depending more upon depth and subdued harmonies than salient points of effect. And although properly a dramatic subject, the spectator forgets its source, and cannot help considering it a passage of veritable history. The

Queen is seated in a large chair, supported by cushions; she delivers her letter to Cupidius, who receives it with deference. The room is paneled, and set forth in a manner approaching as nearly as possible what may be conceived of such a reality. It is a picture extremely unassuming, but of much excellence.

No. 137. 'Portrait of a Lady and Child,' J. WATSON GORDON. The lady is seated, supporting the child on her left arm. The work is masterly; it is in portraying the other sex that this artist chiefly excels. He has here proved, however, that with a good subject he can attain equal excellence; that he can commemorate the beauty of woman, with as much force and truth, as he can convey to canvas the mind of man.

No. 143. 'Coniston Lake,' W. F. WITHERINGTON, R.A. The aspect of the view is bright and tranquil; it is described, with its romantic shore, in a spirit of the most conscientious fidelity. The mountains in the distance are worked out with airy hues, which with perfect truth represent the atmospheric medium.

No. 144. 'The Sunday School,' A. RANKLEY. An assemblage in a cottage interior, the left section being occupied by children in the neat but formal attire of a charity school, while on the right we find a various miscellany, the entire circle comprehending not less than twenty figures, the principal being a clergyman, who is examining the classes on the left. The effect is that of broad daylight, which is nowhere compromised; and hence it may be understood that the work had acquired force and harmony from a certain proportion of shade. The subject is one of great difficulty to treat.

No. 145. 'Meeting of Sir J. S. Swinborne's Keepers on his Moors in Northumberland,' A. COOPER, R.A. This is perhaps the best of the artist's late pictures. The scene is a wild nook shut in by hills, where the keepers have met to show the result of the day's sport. The immediate foreground with the show of grouse, blackcock, and other game, is coloured with sweetness and touched with much spirit.

No. 146. 'A Peasant's Home,' T. WESTER, R.A. The interior of a cottage, wherein the housewife sits at the window working industriously with her needle. The tone is generally subdued in order to give point to the figure, and the light which breaks upon it from without. The transparent depth of the retiring parts and the careful manipulation of those that are brought forward have each their peculiar value, and materially contribute to the importance of the principal passage.

No. 147. 'Forest Scene,' J. STARK. The principal form is an groupment of foreground trees, rendered from nature with a careful hand, yet the foliage wants breadth, and freshness in colour.

No. 148. 'Fruit,' G. LANCE. A composition of white and red grapes, a peach, plums, &c., described with the most tempting reality.

No. 149. * * * G. JONES, R.A. A small sketch from the 35th and 36th verses of the 17th Chapter of St. Luke. "Two women shall be grinding together; the one shall be taken and the other left. Two men shall be in the field; the one shall be taken and the other left." The lower part is composed literally according to the text, but the sky is darkened in a manner to produce an effect which would tell powerfully in a larger picture. Another small sketch by the same hand, No. 150, is entitled 'Sketch for a Picture—Cæsar to Cicero,' the subject being supplied by the first Act of Julius Cæsar.

No. 151. 'Psyche returning from the Infernal Regions with the Basket of Beauty,' T. URWIS, R.A. She has just stepped out of Charon's boat, and we see her leaving the Stygian shore holding before her very carefully the mysterious casket; Cupid hovers above her, but he is not observed. There is in the figure, which is presented in profile, the classic sentiment of the antique, united with the most graceful characteristics of humanity. It is a charming work, and though of little pretence, fully upholds the reputation of the painter.

No. 154. 'Kathleen,' C. BAXTER. A life-sized head and bust, in an oval frame. She is arranging her hair, with a movement which is perfectly natural. The expression is most felicitous, and

the tints of the complexion are fresh, brilliant, and life-like.

No. 160. 'The Spirit of Justice,' (Painted in fresco in the House of Lords) D. MACLISE, R.A. We are truly glad of an opportunity of examining this composition in a better light than that in which the fresco has been executed in the House of Lords. Had it been a dark fresco it would not have been seen at all, and even as it is, all the original and ingenious detail, and profound character which are displayed in this oil *replica* are not visible in the fresco. To adopt the description of its author, the figure of Justice occupies the centre of the design, and on either side are the Angels of Mercy and Retribution. Immediately in front of the Angels, and on a level with the tribunal, are seated the judges, lay and ecclesiastical. At the base, on the side of the Angel of Retribution, stand the guilty one, and the accuser who displays the evidence against him. Beneath the Angel of Mercy are the widow and orphans, protected by their armed champion. In the front a negro kneels, newly liberated from his bonds; and a free citizen, also bending before Justice, unrolls the charter of liberty. We must remember in considering this work that it has been painted for a dark nook; a subdued light may mellow the composition, but at the cost of valuable qualities with which this artist endows all his works. We have already spoken of the measure of success with which the allegorical narrative is worked out.

No. 162. 'Interior of the Church of St. Jacques at Antwerp,' D. ROBERTS, R.A. We must confess to a preference of such a religious interior as this in comparison with the Spanish subjects exhibited from time to time by the painter. This picture impresses the observer with a feeling of solemn reverence, while the excessive decoration of the Spanish cathedrals suggest the presence of scenic effect. Beautiful as the lower part of this picture is, with its varied throng of devotees and curious visitors in the costume of the seventeenth century, the eye cannot be withdrawn from the breadth, softness, and play of light, which give such a charm to the simply and uniformly coloured Gothic vaulting of the roof. The truthful reality of this production will class it among the best of the works of its author.

No. 163. 'Don't Move,' T. H. MACHURE. The words of the title are addressed to the spectator by a lady who is desirous of making a sketch of him. The expression is that of a person extremely earnest in her purpose. The reflected lights on the face are skillfully managed, but the head had been better without a cap.

No. 167. 'Portrait of his Excellency Mehemed Pacha, the Turkish Ambassador,' W. MADDOX. The figure is drawn at half length of the size of life, and represents the subject standing in an easy pose, supporting his sword on his left arm. With the exception of the fez the costume is European, being simply a frock coat. The figure is well drawn, and the whole is firm in manipulation.

No. 169. 'The Escape of Francesco Novello di Carrara, Lord of Padua, with Taddea d'Este, his Wife, from Giovanni Galeazzo Visconti, Duke of Milan,' C. L. EASTLAKE, R.A. This is a *replica* of a subject painted some years ago, and well known to the public from an engraving. The incident is found in the third chapter of Sismondi's *Historie des Republiques Italiennes du Moyen Age*, being the pursuit of the fugitives by the authorities of Ventimiglia, against whom they were compelled to defend themselves. The present picture has been executed for the Vernon Collection. It is qualified with all the sweetness of character, and elegance of design, of the best works of his author.

No. 171. 'Autumn—Timber Clearing,' H. JETSUM. A small picture, slight in composition, but beautifully mellowed by warm hues in the herbage and foliage. The point of view is an eminence, on which is a group of trees, and near these lie the trunks of others that have been felled and lopped. A road passes into the picture, which is lost in the descent, and hence the eye is led to the remote parts of the view. It is one of the best of the works that have lately been exhibited under this name.

No. 174. 'Mercury sent to admonish Æneas,' J. M. W. TURNER, R.A. We hail with inexpressible delight the return of these lustrous hues to the walls of the Academy. The late experimental productions of Mr. Turner have not been so well understood as those made out from subjects in his legitimate sphere. After a hundred years of toil in this dirty and ungrateful planet, it is more than mortifying still to be considered a veritable Sphinx by one's best friends. The subject of this dazzling picture is from Mr. Turner's unpublished poem, 'The Fallacies of Hope,' the illustrated lines being—

"Beneath the morning mist
Mercury waited to tell of his neglected fleet"

This is not exactly according to the text of Virgil, who seemed to know nothing of the mist—

"Ut primum alatis teligit magna planis,
Æneam fundantem arces ac tecta novantem
Conspicit."

That is, he found Æneas ruining himself by building, and he at once delivered the message from his anxious friends. This picture is equal to anything that the artist has done. It is of overpowering brilliancy, and full of forms and masses suggestive of the building of a city.

No. 175. 'Portrait of Daniel Vere, Esq., of Stonebyres, Sheriff of Lancashire,' J. WATSON GORDON, A. The figure is of the size of life, and the treatment of the portrait is such as to centre the interest especially upon the head, which is most successfully endowed with thought and language.

No. 182. 'Portrait of Sir James Duke, Bart., M.P., J. P. KNIGHT, R.A. An excellent portrait of the eminent gentleman whose career as chief magistrate of London was so honourable to him. The work has been painted for the Town Hall of Moutrose—probably the place of his birth.

No. 188. 'The Vicount Hardinge, G.C.B.,' F. GRANT, A. The subject is presented at half length, standing, simply attired in a plain blue frock; the resemblance is striking, but there is a deficiency of softness in the execution.

No. 189. 'A Dialogue at Waterloo,' E. LANDSEER, R.A. A large composition; we think the largest picture that has ever been exhibited by Mr. Landseer. The principal figures represent the Duke of Wellington and the Marquioness of Douro, both mounted, the former pointing out to the latter, the positions of the two armies on the field of battle. The Duke is the nearer of the two to the point of sight, he is seen in profile, while the lady is attentively listening to the explanation, having her full face turned to the spectator. The composition may be said to consist of two groupments, that of the principals, and, on the left, an assemblage of Belgian rustics. The Duke is here somewhat younger than he now is, and in person much fuller; he did not, we believe, sit for this picture, as he now declines sitting for anybody, his manner however of riding is most accurately described. We observe that, in the painting of this figure, there is even a greater breadth than has perhaps ever been seen in any finished picture by the same hand. There are no half-tones in the colouring of the coat, for instance, and, in a subdued light, these may not be necessary. On the left, are a Belgian farmer, a girl selling Waterloo aliums, and other figures all wrought with the solid handling and harmonious colour prevalent in the works of this distinguished artist. The foreground site, perhaps, is that particular spot on the right of the British position where the memorable charge was made by the Guards under the immediate order of the Duke himself. The left portion of the picture is superior to anything that the artist has before done. The Duke's horse, the legs of the animals that are in shade, and the treatment of the landscape, are all masterly passages of Art.

No. 191. 'The Mermaid,' J. G. NASH, The subject is from the poetry of Tennyson—

"At night I would roam abroad and play
With the mermaids in and out of the rocks
Chasing each other merrily."

The scene of these sports is a close submarine view, or rather a back-ground of rocks, with a medium of salt water. Many figures assist in

the composition, but they are too widely distributed; there are, however, much spirit and good colour in the picture.

No. 192. 'Æneas relating his story to Dido,' J. M. W. TURNER, R.A. This picture is also a suggestion from Mr. Turner's MS. poem, the quotation is—

"Fallacious Hope beneath the moon's pale crescent
shone,
Dido listened to Troy being lost and won."

The second line comes baling home; it is like one of those short verses that Virgil, with the best intentions in the world, never lived to fill up. But the missing feet are found in the picture, which is another of the gorgeous creations of the artist's glorious summer (will he never grow old?). It is however to be regretted that we sometimes find eccentricities in his very best works, which a vulgar mind can never forgive. We have here, in Carthage, on the left of the picture, a Ponte di Rialto—a Bridge of Sighs—and Duca Palace, something very like the tower of the Palazzo Vecchio at Florence, and something very like the Castle of St. Angelo, or one of the forts in the neighbourhood of Ostia. It had been as easy to be consistent here as otherwise; there may be in genius a sublime contempt for honest and simple probabilities, but these, nevertheless, in the absence of direct truth, constitute the only currency of legal tender in Art.

No. 197. 'Study of a Factory Child,' Miss Fox. A head, apparently painted with much delicacy, but placed so high as to preclude the possibility of examination.

No. 199. 'Edith, Daughter of the late W. A. Beechey, Esq.,' F. R. SAY. A portrait of a child, dressed in white; she holds a dog in her lap. In composition and feeling, it is a production of much excellence.

No. 200. 'Arnolfo di Lapo,' S. A. HART, R.A. This is, we presume, an ideal portrait of the architect of "the despair of Michael Angelo"—that is, the Duomo of Florence. There is a sedentary statue of him in the Piazza del Duomo; we know not whether that be founded on any portrait existing among the *Ritratti dei Pittori*, if so, this may be from the same source. He is represented as bustled with the design of the ground plan of the Cathedral.

No. 201. 'The Willow Shade,' S. B. PERCY. A river side scene, wherein the principal forms consist of willows, which, together with the thick herbage of the foreground, constitute a picture of much excellence.

No. 202. 'Interior of the Church of St. Gomar, at Lierre, in Belgium,' D. ROBERTS, R.A. Another of those beautiful religious interiors, which, from the hand of this artist, derive an interest that no other could communicate to them. The eye rests at once upon a carved oak screen, which is painted with singular nicety of touch, and which, in colour, contributes much to the general effect. The whole of the upper vaulting is broadly painted in with one prevalent gray colour, here and there broken by a charming play of light.

No. 203. 'Scene in the Campagna of Rome, looking towards the Alban Mount,' P. WILLIAMS. There is but little in this picture. In the foreground we find the family of a goatherd, and behind these figures the Campagna extends to distance, closed only by the remote Alban Hills. The picture is finely painted, but, perhaps, not so brilliant as others that have been executed by the same hand.

No. 205. 'Portrait of a Lady,' W. P. FRITH, A. A small picture, in which the subject is seen in profile. It is everywhere very carefully executed; the features especially are drawn and coloured with great delicacy.

No. 206. 'Coloured Sketch for Fresco of the Order of the Garter conferred on the Black Prince,' C. W. COPE, R.A. This sketch has a pendant, No. 222, described as a "Coloured Sketch for Fresco of Prince Henry's submission to the Law in the person of Judge Gascoigne." Both of these works are well known to the public as having been executed in the House of Lords. We humbly opine that they scarcely do justice to the frescoes, the latter being finished with so much care.

No. 215. 'Æsop,' C. LANDSEER, R.A. We find Æsop at home seated with a style in his hand, noting the inhospitable treatment of the crane by the fox, upon the occasion of the latter having invited the former to dine. There are also a peacock, a monkey, and a tortoise; and to these it appears the fabulist is more attentive than to his wife, who stands by his side. The narrative is sufficiently perspicuous; the fox and the crane, without other aid, proclaim at once the subject.

No. 218. 'The Temple of Minerva Medica—Rome,' W. LINTON. The subject has already we believe, been painted by this artist. The whole of the site, with the water by which it is partially environed, is in shade, and the ruin rises into the bright light of the declining sun. The remnant of the temple is painted with great solidity, and the whole has the appearance of a veritable locality.

No. 221. 'Hospitality—The Mote, Ightham, Kent,' J. C. HONSLY. The composition represents an aged beggar soliciting alms at the door of this ancient house. He is relieved by a child, whose face is the attractive point of the picture, as being painted with infinite delicacy.

MIDDLE ROOM.

No. 227. 'Voyagers in the cause of Humanity—Commander Collingwood and Captain M'Clure in search of Sir John Franklin,' J. W. CAMMICHAEL. These two ships hold on their course obliquely into the picture, sailing under easy canvas in each other's wake, with the wind on their quarter, and icebergs lying in their path. The painting of the water and the drawing of the vessels, manifest extensive knowledge in this department of Art.

No. 233. 'The Marquis having chosen Patient Griselda for his Wife, causes the Court Ladies to dress her in her Father's Cottage,' R. REDGRAVE, A. The subject is found in the Clerk's Tale, in Chaucer:

"And for that nothing of her olde gere
She shold bring in into his house, he bade
That wynde sholde despoilln her right there,
Of which these ladies werin nothing glade."

In this composition the figures are numerous. Griselda, is the nucleus of the assemblage; she is in profile, seated, and one of the ladies is busied in dressing her hair; some are preparing her attire, others are idly gossiping, the envied Griselda being pointedly the subject of their discourse. In the features of the principal figures there are, variously expressed, sarcasm and contempt. The humble abode of the father of Griselda contrasts strongly with the rich dresses of the ladies, although the figures are so numerous that little of the cottage is seen. The Marquis is seated just within the cottage door, a curtain separates him from the attendants, mounted and outside appear his attendants, in all its parts in waiting. This work manifests in all its parts the most studious care; the composition is, perhaps, somewhat crowded, but it is distinguished by colour, and other valuable qualities of the most estimable specimens of Art.

No. 234. 'The Cavalier's Song on the Terrace—Haddon Hall,' J. D. WINDFIELD. The spectator is here placed on the terrace, just opposite to the steps, whence he has a glimpse of the lower garden and of a portion of the hall. He finds himself in company with a limited society, of whom the lion is a somnolent cavalier, who sings to his friends verses of his own, to the melodies of the time. These picturesque figures are well drawn and carefully painted.

No. 237. 'Donkey and Foal,' J. STARK. A small picture, in which the animals are painted with much truth and good effect. The artist is, we believe, the son of the distinguished painter of the same name. The work is full of good promise.

No. 239. 'Summer Showers,' T. S. COOPER, A. The scene is an open meadow in which is a group of cows and a horse, others being distributed at short distances from the foreground. The picture is large, affording abundant space for showing the quality of finish in which the works of this artist abound. We need not speak of the manner in which the cattle are drawn and painted. The sky is not charged with dark

clouds, but the title is sustained by a rain cloud which breaks on the left of the view.

No. 244. 'The Virgin Mary and the Child Jesus,' W. C. T. DOBSON. Certainly the most successful Madonna we have seen for some time. She is seated holding the child on her lap. The subject is one of the most difficult in the cycle of art; the style is severe, and approaches sufficiently the manner of the early schools.

No. 245. 'Venus and Cupid,' G. PATTEN, A. Venus is seated on a shaded bank; she holds a dove with her left hand, which Cupid is teasing with an arrow. The manner of lighting the Venus is effective, and the general colour is mellow and harmonious.

No. 246. 'A Winter Sunset,' C. BRANWHITE. There is a great similarity in all the winter pictures of this artist, but it must also be said that by no other hand do we see this kind of subject more skilfully treated. The composition shows a frozen lock with a barge, and on the right bank a cottage with trees, and the red sun is descending, shorn of his beams by the haze of the winter afternoon. There is a singular reality in the scene, accompanied with a finish and breadth which are rarely found so happily united in this class of subject.

No. 247. 'A Norfolk Marsh Mill,' T. LOUND. A very small picture of nothing but the windmill; it is however painted with much sweetness.

No. 248. 'Interior of a Church at Florence,' S. A. HART, R.A. This, and another small picture, No. 250, 'Interior of St. Mark's, Venice,' by the same hand, form pendants. Both subjects are very interesting and are rendered with much exactitude.

No. 249. 'Arendiaus,' A. COOPER, R.A. Three nymphs, grouped in relief against a bank—a *recueil* from sketches made from the nude.

No. 252. 'Socialists,' E. ARMITAGE. A small picture, very French in style, but admirable in character and manipulation. It represents three of the Parisian *canaille*, two men and a woman. It is but a sketch, and with but little colour.

No. 257. 'Miss Virginia Pattle,' G. F. WATTS. This is a portrait, but it is executed with a degree of elevated sentiment which we rarely find in this class of Art. The lady is presented at full length and in profile; she stands upon a terrace, so as to bring the entire figure in relief against the sky. The colour is little else than grey; it would be impossible to have less variety of hue. The sentiment of the impersonation is extremely chaste. There is, in the expression, a devotedness, and in the *maintien*, a pilgrim air that at once fix the attention.

No. 258. 'The first glimpse of the Sea,' T. CHESWICK, A. In the immediate foreground of this composition, flows a tiny rill, so small as to be lost here and there behind the stones and rushes that lie in its droughty course—a most valuable association, when properly adjusted. A few spoonfuls of water thus operating upon those stones, *non vi sed sæpe fulgendo*, give them an inestimable value. The force of the picture lies in the foreground; in the right the ground rises, and we find there a mill and a cottage. The middle distance is luxuriant with foliage, and lighted by the reflection of a winding river; and in the far horizon is seen the sea, bright with the rays of the sun.

No. 262. 'Breaking up of the Clouds—Cool Morning,' C. R. STANLEY. A close scene, representing a river overhung by dense masses of the foliage of the trees on its banks. The tone is subdued; there is much reality in the manner in which the composition is made out.

No. 264. 'Pluto carrying away Proserpine, opposed by the Nymph Cyane,' F. R. PICKERSGILL, A. The text is from Ovid:—

"Nec longius illius, inquit,
Non potes iavite Cororis gener esse—roganda
Non repienda fuit."

But Pluto is of a different opinion; he has seized the lady by the waist, and removed her into his chariot, the horses of which are already put in motion by Cupid. The companions of Proserpine are, of course, in consternation, and this is sufficiently expressed by action and expression. On the right is one group of figures, and on the

left another, all the components of which are carefully drawn and firmly painted. The colour of these is of that uniformly delicate and high tone always employed by the artist; this might be varied and modified with advantage.

No. 271. 'Portrait of M. de Conny,' F. ETEX. This is a portrait by a French artist. It is deficient in point, and is scarcely a picture to have been sent to a foreign exhibition.

No. 274. 'A Greek Page,' W. UNDERHILL. A half-length figure, holding in his left hand a parrot, and in his right a bowl of fruit. It seems to be a production of considerable merit, being well drawn and firmly executed. Being hung high, the manner of its detail cannot be seen.

No. 276. 'The Toilet,' The late W. ETTY, R.A. A life-sized head and bust representing a woman dressing her hair. The left hand is out of drawing, and other parts are too free, but there are yet the colour and originality of ETTY.

No. 277. 'Remains of the Eastern Portico of the Temple of the Sun, at Baalbec—Mount Lebanon in the Distance,' D. ROBERTS, R.A. This place is well known from numerous views of it that have been published from time to time. The picture shows little beyond the portico, which rises here almost a solitary memento of the former magnificence of Heliopolis. The distance is on all sides closed by the mountains of the neighbouring district; thus, in the composition there is but little material, but that little is rendered interesting by masterly treatment.

No. 278. 'A Mountain Group—Evening,' T. S. COOPER, A. The scene is in Wales, and the group is composed of goats which graze upon a very carefully and substantially painted site telling forcibly against the opposite mountain side, the solidity of which is fused into the tenuity of vapour by the rays of the evening sun. The goats are admirably drawn, even more elaborately touched than any other of the animals by the same hand in the present exhibition.

No. 279. 'A Study from Nature,' W. WILLIAMS. A small picture, the composition of which is traversed and closed by a screen of trees; perhaps too cold in colour, but touched with freedom and decision.

No. 281. '***,' E. LANDSEER. "What man among you having an hundred sheep, if he lose one of them doth not leave the ninety and nine in the wilderness and go after that which is lost until he find it?" This passage from St. Luke stands in the place of a title to the picture, but we humbly submit that it does not apply. The scene is a hill pasture in the Highlands, and some of the flock being lost in the snow the shepherd with his three dogs is in the snow the shepherd with his three dogs is busy in searching for them. A ram, apparently all but dead, has been removed from the drift, and the fleeces of others of his companions in misfortune are visible. The dogs here are the principal *personae*, the man is somewhat loosely painted; so, indeed, is the whole of the picture, which seems to have been very carelessly wrought.

No. 282. 'Portrait of H.R.H. the Duke d'Anmale,' V. MOTTEZ. The drawing and execution of this picture are exemplary, but there is in it an affectation of *abandon* not altogether agreeable. The figure is of the size of life, and is habited in a black round jacket, blue plush or velvet waist-coat, pantalons of the same hue and material, and riding boots; the left hand is in the pocket and the right arm rests upon a pedestal. The blue of the dress is supported by a darker blue drapery behind. The likeness is striking; and beyond doubt the work is one of very considerable merit.

No. 286. 'La Siesta,' J. WOOD. A half-figure, seated in a chair, holding a fan, and attired as a Spanish lady. The picture is well drawn, and mellow in colour.

No. 287. 'Geraldine,' W. BOXALL. The figure being of the size of life is too large for the subject, but it is nevertheless a work of a high degree of merit. She is partially nude and holds before her some drapery, and has the head turned to the right. The drawing and painting are skilful, and the head is a study of much excellence.

No. 288. 'Near Foria—Island of Ischia,' C. STANFIELD, R.A. A sparkling *marceau* of Italian scenery; there is little in the subject, but that little is beautifully brought forward. Mr. Stan-

field adds grace to grace in painting these Mediterranean and Adriatic scenes, but how much sower he may love these sunny nooks, it appears to us that he is bent upon being made burgomaster of Dort. This is a charming picture, but by no means so powerful as any of his Dutch subjects.

No. 289. 'In the Forest,' T. CRESWICK, A. Trees bound the right and left of the nearest site, and the group on the right especially is painted, as to the foliage, with an inimitable lightness and feathery grace. In the centre of the composition the eye is carried far into a distance, graduated with the tenderest feeling for aerial effect. Like all similar subjects painted by the artist, the foreground is in shadow.

No. 290. 'On the Thames below Greenwich,' J. HOLLAND. This is a view looking up the river, the spectator being placed immediately below the Hospital. The effect is that of moonlight, and it is made out with great power. A close examination of the work shows a high degree of finish and great originality of execution. The sky is a passage of infinite beauty.

No. 291. 'Berry Hill, near Dorking,' H. C. SELOUS. The subject does not recommend itself by anything of picturesque character; it has, however, the impress of nature. It is generally low in tone, and is not at all comparable to the figure pictures of the artist.

No. 292. 'Peter the Great sees Catherine, his future Empress, for the first time,' A. L. EGG, A. The eye is relieved by the substantial simplicity of this picture. It has been the purpose of the artist to confide the value of his work to the character of his figures, for rarely do we see a figure composition with so little accessory. The scene is a tent before a fortified town, and Peter and a few of his officers are considering a map of the neighborhood, with a view to the operations of their troops. They are seated at a table on tressels, and on the left is Catherine, in the character of an *cantiniere*, handing to one of the officers a glass of some beverage. Peter is struck with the appearance of Catherine, and directs to her the attention of the officer opposite to him. The artist has travelled far for his subject, but nothing can be more unaffected than his manner of treating it. It is, indeed, a picture of very great merit; and fully sustains the established reputation of the painter.

No. 296. 'Scene from the Tempest—The Island before Prospero's Cell,' A. J. WOOLMER. This picture strongly reminds us of another, entitled 'The Syrens,' recently painted by this artist; indeed, the composition and feeling are nearly the same, and not sufficiently attractive for repetition.

No. 297. 'Her Grace the Duchess of Marlborough,' J. SANT. A portrait of a high degree of excellence, in colour, drawing, movement, and other qualities which give value to a work of Art. The figure is introduced at full length, attired in a crimson velvet dress, and enveloped in a flowing red drapery. The face is painted in a high tone of colour, and is full of life-like expression.

No. 298. 'The Watering Place,' F. R. LEE, R.A., and T. S. COOPER, A. A large picture, the subject of which is a passage of river scenery, closed by trees and cliffs covered with verdure. On the left, the water flows over a shallow, with a highly successful description of the current. A herd of cows are come to drink, which are all right with perfect accuracy; the group on the right is most skilfully brought forward by the shade of the opposite bank.

No. 300. 'Returning from Pasture to the Glebe Farm,' A. W. WILLIAMS. A small work, in which the lower parts lie in deep shade, and are opposed to a sky lighted as if by the rising moon. The effect is powerful.

No. 303. 'The Ruins of Rome, from the Garden of the Palace of the Caesars,' G. E. HERRING. The principal object of the composition is the Colosseum, which rises from a base of shade into the golden light of the setting sun. We generally see the Colosseum represented, as it were, in an architectural composition, but here it is qualified in a manner essentially pictorial. The near sites are subdued in tone, with here and there bright touches of light. We have never seen the Colosseum so agreeably painted.

No. 304. 'Andromeda,' W. E. FROST, A. The title is accompanied by an allusive passage from "Il Penseroso":—

"Or that started Ethiopea queen that strove
To set her beauty's praise above,
The sea nymphs, and their powers offended."

Andromeda is chained to the rock, and assembled round her are a Triton and a company of sea nymphs. All the figures are nude, and are painted with that refinement of texture and careful drawing which prevail in the works of the painter—whose female impersonations are conceived so purely in the spirit of the antique, as to offer a remarkable contrast to works in which the ordinary model is all but faithfully represented. It may be observed that the movement of Andromeda is a pose frequently seen in the works of Mr. Frost.

No. 305. 'Interior of Part of the Kitchen in Sir Thomas Gresham's Palace at Mayfield, Sussex,' S. A. HART, R.A. A small picture, simple and unaffected in execution, and having all the appearance of a veritable representation.

No. 306. 'Study of a Child's Head,' C. W. COPE, R.A. A head and bust, executed with a free touch, and successfully qualified with unusual characteristic.

No. 311. 'Portrait of the Most Noble the Marquis of Breadalbane,' J. M. BARGLEY. The figure is presented in an erect pose at full length, attired in the Highland garb; the attitude is easy and firm, the tone of the work is generally low, the drawing seems decided and accurate.

No. 312. 'Griselda,' A. ELMORE, A.
"And as she wolds over the threshold gon,
The Marks came and gan hire for to call,
And she set down hire water-pot anon,
Beside the threshold gin an ox's stall."

Such is the passage which forms the subject of the picture, and the spirit in which it has been illustrated is that of a literal interpretation. We find accordingly Griselda on the steps before the "threshold" there depositing the vase which she carried, as about to respond to the call of the Marquis, who approaches her. On the right, the father of Griselda salutes the Marquis, and supplementary figures are variously disposed in the composition. In this picture there is not so much of effort as in that of last year; it has, however, been most carefully studied in all its parts. The Marquis is a well conceived figure, cast in a mould somewhat too Herculean it may be, but well drawn and well described. The picture is everywhere studiously worked out, and it must be observed that there is less of tendency to manner than may be observed in preceding works by the same hand.

No. 313. 'Wreck on the Coast of Hampshire,' C. TAYLOR. There is some error in the title of this picture, the subject of which is a river barge under sail apparently off Sheerness. The vessel is carefully drawn and effectively supported by other parts of the composition.

No. 314. 'Lane Scene near Henley—from Nature,' P. W. EZZEN. A shady lane inclosed on both sides by trees, the foliage of which is fresh in hue, and free in touch.

No. 315. 'Dutch Fishing Craft off the Booms—Amsterdam,' E. W. COOKE. A highly picturesque association of these curious boats, with an endless show of small and distant objects, all nicely balanced in their allotted places. The artist seems to be on excellent terms with these Dutch skippers; we know not how he stands with the along-shore people of the Mediterranean, but we doubt not that these hard weather saits of the North Sea will give him their stroke or to pull.

No. 316. 'The Mountain Road,' W. F. WITHERINGTON, R.A. The subject seems to be a passage of Welsh scenery, which like most of those selected by the artist, is closely imitated from nature. The "road," which is on the ascent, is soon lost, and the eye passes to the mountains, that close the view. The foreground is extremely bright and sunny, it tells in powerful opposition against a dark mountain side on the right of the composition. The subject is picturesque and striking in effect.

No. 322. 'An Episode of the Field of Battle,' P. TCHAGGEY. This picture is hung high—all that can be seen of it are the principal forms.

In the nearest part of the composition a wounded man lies partly under his charger, which is dead; he is in danger of being trampled upon by a horse which is wildly galloping without a rider. The work is spirited, and the figure and animal seem to be well drawn.

No. 323. 'The Fisherman's Cart,' G. STUBBS. The work appears creditable in execution and colour, but it is too high for inspection.

No. 326. 'The Bay of Baie from the Capuchin Convent above Pozzuoli,' C. STANFIELD, R.A. The spectator is placed on a terrace which occupies the breadth of the canvas, and hence opens before him the most enchanting view that the shores of Italy can offer. It is sheer nonsense for Horace to profess himself the faithful servant of the Muses, and in the same breath to name Thur and Preneste with Baie—

"Vester Camonae, vester in arduis
Tollor Sabinos; seu nubi frigidum
Preneste, seu Tibur supinum
Sed liquidum placere Baie."

In this view every part of the objective is impressive, the tranquil sea, the nearer buildings, and the distant mountains; and to all these valuable points the artist has done ample justice.

No. 327. 'A Sailor's Yarn,' R. C. LESLIE, Jun. A seagoing composition, of the same character as those usually exhibited by this artist. The figures are three in number, and are characteristic and painted with solidity.

No. 328. 'A Peninsular Man,' G. B. O'NEIL. A small composition of three figures, one an old soldier describing to his friends some battle at which he has been present. The heads are carefully finished.

No. 329. 'Une More auprès de son Enfant avec Effet de Lumière,' P. VAN SCHEDEL. A small picture, composed exactly according to the title. The principal figure is effectively lighted, but the works looks the production of an artist who gainsays the merit of modern art.

No. 331. 'Mrs. Suith Child,' W. BOXALL. A small portrait of a lady, dressed in black, and relieved by a green curtain. The features are skilfully pencilled, and worked up to a high tone of colour. The pose and movement are easy and graceful.

No. 332. 'Sancho tells a tale to the Duke and Duchess to prove that Don Quixote is at the bottom of the table,' W. P. FRITH, A. The definite variety and appropriate felicity of character in this picture are evidently a result of assiduous study and research. It is extremely difficult to work up to the proniuent characters of Cervantes,—as much so as to embody those of Shakespeare. The Duchess occupies the place of honour, and the Duke is by her side, the features of both being seen in profile. In comparison with the Duke she is somewhat too youthful, but not less an impersonation of infinite grace and beauty. Sancho stands with his back to the spectator, and so tells his story. Don Quixote is seated, or rather rising from his seat, at the bottom of the table; the chaplain is placed facing the spectator, and behind the Duchess is a group of ladies in waiting. There is but little of the prevalent taste for upholstery in the work; every figure maintains its place, and the relation between all the members of the circle is well sustained. The colour and texture are of great excellence; on the whole, there are few more admirable pictures in the Exhibition.

No. 334. 'Warwick Castle,' J. F. DE FLEURY. A large picture containing apparently some good colour and execution, but deficient in breadth and harmony of parts.

No. 342. 'Scene from the Tempest,' F. STONE. The subject is Miranda's admiration of Ferdinand:

"What is't?—a spirit?
Lord, how it looks about. Believe me, sir,
It carries a brave form, but 'tis a spirit."

Ferdinand is listening in wonder to the songs of Ariel. The cave is on the left, and there appear Prospero and Miranda. The picture requires no title—its source is at once proclaimed; it is a work of much excellence.

No. 350. 'James II., in his Palace of Whitehall, receiving the News of the Landing of the Prince of Orange, in 1688,' E. M. WARD, A. The source of this composition is Sir John Dalrym-

ple's Memoirs:—"He turned pale, and remained motionless; the letter dropped from his hand; his past errors, his future dangers, rushed at once upon his thoughts; he strove to conceal his perturbation, but in doing so betrayed it; and his courtiers in affecting not to observe him betrayed that they did." The King is seated near the centre of the composition; his dress is dark—black and blue, and he tells as the principal figure, being surrounded by lighter tints. Near him, and bending forward, is the Queen; and sitting on his right, at a table, is Judge Jeffries and the Pope's Nuncio, having his back turned to the spectator. On the left of the King is the Prince of Wales (afterwards the old Pretender), with his nurse; and the other supplementary figures are courtiers and ladies of the court; among whom, behind the King, is young Churchill, afterwards Duke of Marlborough. This picture is incomparably the best of the painter's works, especially in the qualities of texture and execution. There is little or no forcible shade, no marked variety of reflected lights, but it seems to have been painted on the principle of the opposition of colour tints. The subject of the work is immediately declared. James II. is at once recognised; he is as certainly there as if he had sat for the impersonation; and the letter has announced some dread calamity, which could be nothing short of his immediate expulsion from the throne. The colour is everywhere better, particularly the flesh tints, than in antecedent works; in short, it is a picture which must enhance the already extensive reputation of its author; and may be characterised as a *chef d'œuvre* of the British school, honourable to the artist and to the Academy, of which he has been a pupil, and is a member.

No. 351. 'Portrait of Mrs. Phillips,' H. W. PHILLIPS. A work of much merit; the lady is dressed in black, and is presented in an erect pose. The treatment of the portrait is simple and forcible.

No. 360. 'A Farm House Kitchen,' T. WEBSTER, R.A. Like all the similar works of the artist this is a most faithful description of the subject, of which the brick floor is by no means the least remarkable feature.

No. 361. 'Portrait of Dr. Morgan,' J. LINNELL. A small work, in which the subject is represented sitting, and having the face turned towards the spectator. We observe that the face is not finished with a glaze so deep as usual; of whatever of the golden harmonies of the old masters this may deprive the work, it will nevertheless approach more nearly the reality, than the certainly beautiful glaze with which we see at times the portraits finished by this artist.

No. 362. 'Giorgione at his Studies,' J. REED. Giorgione is here full dressed; he is on a kind of terrace sketching a group of women in the national costume. In drawing and surface the picture and its manner are open to amendment.

No. 363. 'Ponte Atrani—Gulf of Salerno,' C. STANFIELD, R.A. The view is closed by the mountains, which rise from the shores of the gulf. The locality that gives a title to the work is upon the left of the picture, and presents an agroupment of buildings of a class which always, under judicious treatment, constitutes a striking feature. There are also figures and a boat; the sea enters the composition on the right, and the mountains terminating the perspective are painted with the usual fine feeling which the artist displays in the treatment of this element, so important in most of his Italian pictures.

No. 366. 'Portrait of Miss Talford,' T. TALFOURD. The lady is resting her right arm on a cushion; the head seems to have been drawn with care, and the colour is high in tone. The taste of the work appears to incline to that of the French school.

No. 368. 'Portraits of the Children of S. R. McClean, Esq.,' N. J. CRAWLEY. A group of youthful heads, bright in colour, and abundantly endowed with animation.

No. 369. 'Cromwell looking at the dead body of Charles the First,' P. DELAROCHE. Although this celebrated picture be surrounded with much of the high toned colour of the English school, it loses none of that substantial force for which it is so celebrated. The key of the

work is the pall, which has been thrown off the coffin and has fallen behind Cromwell; without this the whole would be comparatively feeble. We may here take occasion to observe, that M. Delaroche with admirable truth makes Cromwell's dress appear old, at least well worn; whereas when we see him among ourselves he is like the fore-ground figure in the Devil's Walk—

—"drest
In his Sunday best."

His red velvet doublet has here lost its colour, his hat is worn, and his boots do not show any taste in their fall and folds; in short, whatever credit the world might have given him for being fastidious, he was no precisian in dress. Such is Delaroche's version of his *personnel*, and he is right. We have always considered that this picture had been advantaged by a little cool colour somewhere in the background. It is a valuable contribution to our exhibition, and may prove a most beneficial lesson to many of our British painters. We have to thank the great artist of France for sending it to us. It may be a copy by a pupil, but Delaroche has undoubtedly worked upon it.

No. 370. 'Monsieur Colomb,' H. W. PICKERSGILL, R.A. A portrait of a gentleman in a suit of plate armour. He holds his helmet before him, and wears a scarf on his left arm. This is one of the best portraits we have ever seen by this painter. The head is well drawn, and finished with a very life-like expression; and the armour is a most successful study.

No. 371. 'The Wreck Ashore—Coast of Normandy,' J. WILSON, Jun. This is a coast view, seen under a peculiarly fiery effect in the sky. It is high tide; a vessel is cast upon the rocks, and the sea is breaking over her. The breakers are described with force and truth. A little of the colour of the sky, which might be repeated here, would harmonise the picture.

No. 372. 'Harwich Harbour,' W. A. KNELL. The view is from the sea, little of the town being seen. The principal form is a dogger, which is making for the harbour. It is well drawn, but rather hard in execution. The movement and depth of the water are rendered with much truth.

No. 373. 'The Visit to the Tomb,' J. M. W. TURNER, R.A. This is another subject from the "Fallacies of Hope"—

"The sun went down in wrath at such deceit;"

that is, at Dido's pretended tears in remembrance of her late husband; but Mr. Turner is rendering Virgil somewhat too freely; we are, however, in some degree reconciled on looking at the picture, although certainly we find again startling discrepancies in Carthage. Whatever may be said in the "Fallacies of Hope," about the Sun being disgusted at the infidelity of Dido, he is here as dazzling as in any other of Mr. Turner's works.

No. 374. 'T. S. Cooper, Esq., A.R.A.,' J. P. KNIGHT, R.A. A portrait of the eminent cattle painter, remarkable for fidelity of resemblance. It is highly successful in animated expression, and in execution firm and unaffected.

No. 375. 'Modern Fruit—Medieval Art,' G. LANCE. The fruits are hothouse grapes, plums, cherries, a pine melon, and peaches; and Medieval Art is represented by a carved basket, a cup, and cover; a costly set vase, forming, as a whole, a richer and more elegant association of fruit and still life than we have ever seen.

No. 376. 'Francesco Novello di Carrara and the Lady Taddea escape from the Emisaries of Galeazzo Visconti, who are in pursuit of them,' J. C. HOOK. The source of this subject is the Chronicle of Gataro, the immediate passage being—"A thicket afforded them shelter till their company had passed by, and Carrara then cheered the drooping spirit of his lady by assuring her that certain succour was at hand." We find Carrara, his lady, and their party hiding themselves behind a tree, and the thin foliage of other intervening trees, which scarcely realise the idea that they are in concealment from the party in search of them. The story, however, of a flight is circumstantially narrated; apprehension is expressed not only in the features of the fugitives, but also by movement, pose, and action. It is altogether a work of high merit.

No. 378. 'View—looking from under the portico of the great Temple of Edfo, Upper Egypt,' D. ROBERTS, R.A. The view is, on both sides of the picture, limited by the massive columns of the portico, beyond which the near sites are covered with remains of like character. Such a subject it is most difficult to invest with the pictorial interest which is given to the materials of this composition.

No. 388. 'M. Guizot,' F. R. SAY. The size of this portrait is kit-kat, the subject is in an erect pose, resting his left hand between the buttons of the coat. The work is eminently qualified with a refinement of character which at once impresses the spectator, and withal the resemblance is such as at once to declare whom it is intended to represent.

No. 389. 'The Messenger announcing to Job the Irruption of the Sabaeans and the Slaughter of the Servants,' P. F. POOLE, A. "And there came a messenger unto Job, and said, the oxen were ploughing and the asses were beside them; and the Sabaeans fell upon them and took them away; yea they have slain the servants with the edge of the sword; and I only am escaped alive to tell thee. While he was yet speaking there came another,—" A work of extraordinary power and striking originality, and the more remarkable as a profession of religious Art different from the current tone of conventionality. Job sits on the right, and opposite to him are his three consoling friends; but the emphatic figure of the composition is the first messenger, a semi-nude figure having his back turned to the light as he addresses Job. The treatment of this figure is admirable, the lights and reflections whereby it is made out and brought forward are incomparably fine. There are other supplementary figures male and female; one of the latter is on the extreme left, squeezing the juice of grapes into a vase, and a boy in the centre of the picture pours out wine. The former of these is classic, even Anacreontic and sculpturesque, her character places her apart from the sentiment of the others; and the latter seems to interrupt the solemn intercourse between Job and his friends. The light falls on all the figures from above in a manner to bring them forward with the most perfectly tangible reality; indeed it were impossible in Art to communicate a greater measure of force to a delineated representation. We are struck with the effect; and the eye may in some degree feel the absence of reflected lights, but it is nevertheless altogether an essay of a kind perfectly original in sacred Art. The work cannot fail to augment the high and honourably earned reputation of the painter.

No. 390. 'Madeuioiselle Rachel as Canille,' R. BUCKNER. The figure is painted at full length and of the size of life; but the work is not so felicitous as others we have seen by the same hand.

No. 394. 'Sir Thomas Aubrey, Bart.,' F. R. SAY. This portrait is painted for and by desire of the Lord Lieutenant and the Magistrates of the County of Buckingham. The subject is represented, at full length, sitting, resting the right arm on a table; the pose is easy, and the work is executed generally with much firmness.

No. 395. 'Crossing the Brook,' J. LINNELL. A subject as usual of the simplest kind,—gorgeous with colour, brilliant with light, as are the very best of the artist's productions. The scene is a country lane traversed by a shallow brook, at which a market cart has stopped to allow the horse to drink. The road is closed in by sandy banks shaded by trees, and in the centre of the view there is a glimpse of a charmingly painted distance. In manner, and in the style of his subject matter, this artist always reminds the spectator of Gainsborough; he makes abundant use of transparent colour, and seems to employ his vehicle with equal freedom. The lights and shades of this picture are admirably dispersed, and we observe here prominent instances of what may be seen in all the productions by the same hand; there is no treatment or modification of natural form.

No. 396. 'Porlock Church, Somerset—Waiting for the Return of the Bridal Party,' T. C. BURN. A slight grey picture, remarkable for facility of handling; the scene is a lane leading to the church, along which are ranged a row of numer-

ous figures, sketched in with a masterly touch and feeling.

No. 397. 'In the Royal Gardens at Florence,' G. E. HERING. This view of the Boboli Gardens seems to look towards the hill whereon stood the house in which Galileo was confined. It is an extremely graceful association of material, rendered with much fine feeling.

No. 398. 'The Cliffs near Boulogne,' G. STANFIELD. This is an elaborate study, which seems to have been either nearly finished on the spot, or painted from sketches scarcely less careful. The cliffs rise on the left, and they are made out with all that apparently insignificant, but really telling, accident and circumstance which it is impossible to improvise, and which when judiciously described, give incredible value to the surface which it accompanies.

No. 399. 'Girl in a Hogarden,' C. LANDSEER, R.A. She carries a jar and a basket, and is relieved by a background of the material of the hogarden. The subject is extremely simple, but there is a solidity and firmness in the execution which gives it value.

No. 400. 'Portrait of the Right Hon. David Boyle, Lord Justice-General of Scotland,' C. SMITH. A work of much excellence, representing the subject seated, and wearing the robes of office. In the expression of the features there are thought and agreement; the effect is forcible and the manner substantial.

No. 405. 'A Calm Morning,' F. R. LEE, R.A. A close scene, the lower breadth of which is water lying principally in the shade of the trees by which it is overhung. It is a careful study of a veritable locality, endowed with truth and freshness of nature.

No. 406. 'Dog and Fruit,' T. EARL. A singular association; the dog, a Skye-terrier, is asleep, apparently on a table, and near him is a dish of fruit; the representation of the coat of the dog is highly successful.

No. 407. 'The Exiles,' J. BOUVIER. The lines quoted as the subject of this picture are from Moore's Irish Melodies:—

"And I'll gaze on thy cold hair as graceful it wreathes,
And haug o'er thy soft heart as wildly it breathes."

There are consequently two figures seated on an isolated cliff, the upper part rising in relief against the sky. There is in these two impersonations too much of scenic prettiness to realise, in anywise, the natural rapture of the verse.

WEST ROOM.

No. 408. 'The Good Samaritan,' G. F. WATTS. This picture is "painted as an expression of the artist's admiration and respect for the noble philanthropy of Thomas Wright, of Manchester." The figures in the composition are of life size. The Samaritan supports the wounded man, conducting him towards his ass, for the purpose of conveying him home. The manner and feeling of this picture are very much like those of some of the early Italian masters. It is severe—sufficiently so; and successfully unites the drawing and knowledge of the present day with the valuable qualities of the fathers of the art.

No. 409. '***,' T. M. JOY. The subject of this picture is from Hume's "Thurlow," a passage in which Cromwell is described as anxious to secure the throne. He is accordingly represented in this composition as contemplating the crown which is placed before him. The treatment of the subject is founded upon a misapprehension of the vaguest kind. Cromwell was not the man to be caught either by himself or others in extatic contemplation of a crown; there is an innate vulgarity in the figure altogether unjustified by any recorded act of Cromwell's life.

No. 410. 'The Pastor's Visit,' T. BROOKS. The scene is the interior of a country house of the respectable class; the figures of the composition are numerous, and in dealing with these it has been the purpose of the artist to light every member of the composition as powerfully as possible, denying to the work the necessary balance of shade, and consequently that depth and gradation of tone which are truths in all similar subjects. The drawing of the figures is most careful, and throughout, the work seems to be detailed with great nicety.

No. 411. 'The Last Man,' J. MARTIN. The subject is from the lines of Campbell—

"I saw a vision in my sleep,
That gave my spirit strength to weep
Adown the gulf of Time;
I saw the last of human mould,
That shall creation's Death behold,
As Adam saw her prime."

We have been now long familiarised with the style of this artist, and when we have looked of late for his works we have looked rather for colour than narrative; but there is a signally healthy change here, for we find no tract of colour that is not a passage of appropriate language. We could have conceived that the artist would have dealt with the subject in a certain vein of grandeur, but we were scarcely prepared for the dread severity of this description. The immediate breadth of the picture is of that rocky and desolate character which constitutes so great a proportion of all the artist's works. The middle site is occupied by a vast city extending along both shores of a broad river or arm of the sea and into an obscure distance, where these palaces and citadels are lost to the eye, save when they are here and there touched by the red and almost subdued light of the sun. The death and ruin in the city are left to the imagination, which is prompted by the remains of ruins and their subjects indiscriminately mingled in the foreground.

The last man is a draped figure standing on the right contemplating the vast Golgotha which no mortal eye is left to behold but his own. This work is much more exalted in sentiment than any that have lately been exhibited by the artist; there is no yielding to any frailties of colour, the most emphatic terms are employed in the narrative without the alloy of any inappropriate element.

No. 412. 'Market Boats arriving at Angers—Maine et Loire,' E. A. GOODALL. The materials of this view are strikingly picturesque. Most of the picturesque cities of France have yielded their quota to our exhibitions, but Angers the French artists have hitherto almost exclusively kept to themselves. There is upon the left, a portion of the old wall of the city which anciently crossed the river, and beyond this, at some little distance, appear the Cathedral and the Citadel, supported by other edifices. The market boats are on the right, and are, with the figures, grouped in and painted with much sweetness. The picture is the best of the artist's productions of this class.

No. 413. 'Another Bite,' G. SMITH. A young disciple of old Izaak, in a smock frock, seated by the brink of a pond, sees his float moved; and the intense anxiety with which he hides his time draws from every sympathising spectator an expression of his best wishes for the boy's success.

No. 415. 'A Christmas Party preparing for Blind Man's Buff,' W. H. KNIGHT. This is a large picture, formed of a composition of not less than twenty figures, the principal of which is that of the father of the family, to whose lot it has fallen to be blindfolded. The description is clear and pointed; the handkerchief is tied over the old man's eyes, but several of the party observe that he can see. The picture is full of movement, and distinguished by considerable variety of character. The figures are substantially painted, and the depth of the work admits of an effective scale of tones. The light is focussed on the principal group, whence it is graduated to the depths and extremities of the picture.

No. 416. 'Fordwick Meadows—Sunset,' T. S. COOPER, A. It is in warm pictures that this artist most generally succeeds. The nearest site in the work is a knoll, on which is a group of cows, the lower animals relieved against each other, and the upper against the sky. On the left the mellow rays of the evening sun enter the picture, but the cows are not lighted up to the tones with which we have seen them in other works similar in treatment. There is not the *finesse* of elaboration we have before observed, but the work is one of great excellence.

No. 417. 'Queen Blanche of Castile liberating the Prisoners of Châtevey,' J. A. VINTER. This is a good subject, but the canvas is crowded

with figures too large. There are good drawing and good colour in the picture; but a principal figure is a semi-nude, too muscular and Herculean to represent the privations of imprisonment.

No. 418. 'Portrait of Lady Alfred Paget,' R. BUCKNER. The lady is seated, holding an infant, which plays with a gold chain. The first impression, on looking at this picture is, that of the blackness of the shadows and the hardness of the lines. There is throughout the work a want of harmony and softness.

No. 422. 'Sir Thomas Lethbridge, Bart., and his son Arthur Erin,' The Hon. H. GRAYES. This is a large composition presenting the principal figure standing; the face is extremely well coloured, and there is much firmness in the pose, but that of the younger impersonation is deficient of grace. The group is assisted by a grey pony and a black dog.

No. 424. 'Waiting at the Station,' L. J. CRANSTON. This, under any circumstances, is an ungrateful subject; to be at all interesting it should be qualified by faultless drawing, good colour, varied character, and without vulgarity.

No. 426. 'On the Riviere di Levante,' G. E. HEMING. An Italian coast view, the objective of which is strongly characteristic of these picturesque sea-board compositions, always made up of houses, boats, figures, in association with mountains rising from the water's edge. Such are the features of this work, which is highly successful in colour and effect.

No. 427. 'Old Trees,' F. CHESWICK, A. They are placed immediately in the foreground; the principal—an ancient garbled and knotted trunk—is painted with great precision, every leaf of the scanty foliage is represented, and the boughs are individually made out with extreme nicety. This and another group of two trees, constitute the telling forms of the picture. The sky is charming in colour, and the remoter parts are rendered with extraordinary delicacy.

No. 428. 'A Breton Family,' E. A. GOODALL. One of the small rustic interiors which this artist paints with so much taste. The construction of the roof and the dispositions of the other parts are such as never could be improved; the whole has been most assiduously studied from some such existing dwelling. There is, near the fireplace, a group of figures appropriately characterised, and painted with freshness and brilliancy.

No. 429. 'Portrait of a Gentleman and his Grandchild,' J. E. MILLAIS. The principal figure is dressed in black and seated in an arm-chair looking at the spectator; the child has thrown herself playfully down on his knee. The features of both are painted with the nicety of miniature, but in the face of the principal there is much that wants softening and modification. The colour is coarse, and the lower part of the face requires treatment; it may be like the sitter, but nevertheless it should not have been left thus in a portrait. The figure of the child is stiff and hard. We know the powers of the artist, but there is nothing in this work to justify the belief that he ever saw a model set.

No. 430. 'The Hayfield,' A. JOHNSTON. The subject of the composition is the passage of the old song—

"'Twas within a mile of Edinbro' town
In the rosy tints of the year,
"Bonny Jockey, blythe and gay
Kissed sweet Jenny, making hay."

It is realised in the simplest manner from the text, the persons named in the latter lines stand on the left, and others busied in the economy of the hayfield are variously disposed. The scene is entirely open, affording ample occasion for a display of that command of colour and management of light which characterise the works of the artist. A little removed from the plane of the nearest figures is a group of much excellence in colour and character, but the work is every where luminous, and remarkable for high-toned and harmonious colour.

No. 431. 'A Portrait,' A. C. HAYTER, Jun. It is that of an artist painting at his easel; the head is effective, and the entire work is earnest and unassuming.

No. 437. 'Un comptoir Juif en Algérie—vente d'une Esclave,' C. JACQUAND. The Jew is

seated at his counter, and the slave stands before him. There is a third figure, but it cannot be determined whether the Jew is the buyer or the seller of the slave. There appear to be some tolerable points in the work, but it is too high for inspection.

No. 438. 'L'Allegro,' W. D. KENNEDY.

"Straight mine eye hath caught new pleasures,
Whist the landscape round it measures;
Russet lawns and fallows grey,
Where the nipping flocks do stray;
Mountains, on whose barren breast,
The low ring clouds do often rest;
Towers and battlements it sees
Boss'd high in tufted trees."

Without seeing this picture it would be difficult to believe that the subject is met by a picnic party of English and Italian figures in modern and mediæval costume. There are beautiful passages in the work, but it is impossible to admit the truth of the scale of shade according to which the figures are painted. The effect of figures without the degrees of shade, which even the most inexperienced person knows must accompany them—the effect, we say, of figures so insubstantial, is that of perfect fitness, in opposition to a background painted in with solidity. The picture manifests everywhere great power of execution, but too much is sacrificed to this facility.

No. 439. 'A Hunter—the property of a gentleman,' A. COOPER, R.A. The horse is loose in a paddock. This is the department of art in which the knowledge and experience of this artist tell. The head of the animal is admirably drawn.

No. 440. 'Cows on a Heath,' E. WILLES. The picture is worked out simply according to the title. The cows are accurately drawn, and the colour is agreeable, but the execution is somewhat hard.

No. 441. 'Entrance to the Great Temple of Aboosinbel, in Nubia,' D. ROBERTS, R.A. Something very like this has appeared in Roberts's Egyptian Sketches. The hues of the symbols are here extremely vivid; but it is in accordance with truth, for the brilliancy of the colour in these temples has faded but very little since it was first applied.

No. 443. 'The Woodman's Home,' F. GOODALL. The subject of this picture is extremely simple, and the work has been realised upon principles different from those of the productions that have preceded it. It is generally low in tone, and those passages which admit of colour are not brought up to the degree of brilliancy which we have been accustomed to see. The figures are but three—the Woodman, who enters the cottage; the Wife, who is seated, rocking her infant, cautioning, at the same time, her husband from making a noise; and an elder Child, who runs to welcome her father. The Woodman entering the door, opposed to the exterior light, is a highly successful study. It was impossible to paint the effect with greater truth; and it derives full value, from every other part of the composition being subdued.

No. 445. 'The Shrine of St. Gomar, at Lierre, in Belgium,' D. ROBERTS, R.A. Another view of this interior is given in a picture already noticed. The general tone of the work is composed of lights and half lights, in contrast to which the shrine is made out with solidity and darker colour, but it is yet so charmingly lighted as to appear neither hard nor heavy. Many figures are distributed through the interior in a manner materially to enrich the picture.

No. 446. 'Bacchus discovering the Use of the Grape,' G. PATTEN, A. This is a large picture,—too large, we think for the subject. The discovery is made by squeezing the juice into a cup. There are spirit and good colour in the figures, but the background is inappropriate to such a subject.

No. 447. 'Windsor,' J. STARK. The view is taken from the river side, towards Clower; the Castle is therefore on the right bank of the river, according to the dispositions of the objective. The subject is at once recognisable, but it is not of the class in which this artist excels.

No. 448. 'Answering the Emigrant's Letter,' J. COLLINSON. There are numerous figures in this work, which seems to have been very carefully studied throughout. The question of

correspondence is sufficiently evident, but it is impossible to determine that the family council is held on the subject of a letter to an emigrant.

No. 449. 'The Rivals,' R. ANSDRELL. A large picture representing two stags that have gored each other to death. The story is a painful one, but it is nevertheless true; yet we think it might have been told in a manner less repugnant. The animals seem to have been dead some time; it appears that their eyes have been removed, and the body of one has become shrunken from the length of time it has been dead. The scene is extremely sombre, and is closed by a background of mountains, whence an eagle is stooping upon what is now his indisputable prey. The narrative of the picture is sufficiently forcible and circumstantial, but the theme is by no means agreeable.

No. 451. 'Alfred giving a portion of his last loaf to the Pilgrim,' W. C. THOMAS. The incident is very simply described; Alfred stands at the threshold of his door, and offers the bread to the wanderer. The figure of the former is commanding, but, we think, too much dressed; the pilgrim although nearer than Alfred, is thrown into partial shade, a proceeding for which there is no patent reason.

No. 452. 'Bowers,' G. HARVEY. Rather a large composition founded on a subject of great simplicity, and like all the works of this painter, endowed with a deep and moving sentiment. Bowling is here shown to be the summer evening amusement of a company of villagers, among whom is found the pastor, who himself is in the act of howling. The game is described with much spirit, the varied action of the figures and the distinct personal qualifications of each, are pictured in a manner extremely interesting. But the great charm of the picture is the manner in which the light is broken on the figures; each is lighted, but all keep the places assigned them in the circle.

No. 454. 'A Group on the Welsh Mountains,' T. S. COOPER, A. This work is remarkable as being somewhat colder in tone than we are accustomed to see the pictures of its author. It is however a beautiful morceau of mountain scenery, graduated into marvellous and delicate misty tones from an immediate site of rough and broken ground, whereon is distributed a flock of sheep, whose fleeces are touched in that peculiar manner which so perfectly imitates wool.

No. 455. 'May,' W. CRABB. The title of this picture is derived, we presume, from the flowering hawthorn, within the shade of which are a youth and maiden, the latter of whom, from her modest and downcast look, is considering a reply to a momentous question proposed by her companion. In this figure there is a charming simplicity of character. The work is accurate in drawing, and firm and decided in execution.

No. 456. 'Kitchen—Mayfield,' C. LANDSEER, R.A. This simple interior is rendered with exquisite truth. The door is open, and the opposition of the light thus admitted, and the general shade of the room, produce an inconceivable reality of effect. The furniture and utensils are represented with the most perfect fidelity.

No. 457. 'Izaak Walton Angling—A Summer's Day on the Banks of the Colne,' E. M. WARD, A. A small picture full of light and lustre. Old Izaak stands beneath the shade of a willow, and has taken some fish of tolerable size. There is a marked originality in the style of the work.

No. 458. 'The Vacant Chair,' JAMES BRIDGES.

"Regret not me, for thou shalt find
Just cause of sorrow none in my decease," &c.

The subject is derived from Cowper. The scene is a modestly furnished room, in a country house of the respectable class. The "Vacant Chair" is on the left of the fire-place, and on the other side is seated an aged widow. The allusion is sufficiently clear, and the material of the composition is judiciously disposed, and painted with much neatness of execution.

No. 460. 'On the River Gears—Norfolk,' H. BRIGGS. A small picture, very grey in its general tone, but distinguished by the fine feeling which qualifies all the works of its author. The objective consists of a boat, boat-house, a group of trees, and minor incidents, the whole com-

hined into a production of excellent quality, in effect and execution.

No. 461. 'Titania,' H. PICKERSGILL, Jun.

"I know a bank whereon the wild thyme blows,
Where ox-tips and the nodding violet grows;
Quite over-canopied with luscious woodbine,
With sweet musk-roses and with eglantine," &c.

Titania is here seen sleeping, and round her are dancing choirs of the lightest of her fairy subjects. She is represented as larger than the other sprites—a material distinction—which injures the poetical conception, and reduces her to the scale of humanity. The composition is full of movement; and on the left, a group of dancers, who circulate within reach of the moon-beams, is described with much fine feeling. The execution is sketchy; the figures would admit of refinement.

No. 466. 'Black Grouse, Woodcock, and Snipes,' A. HOLD. The birds are thrown down on a piece of moorland covered with herbage, wherein the form is prominent. They are well drawn, the plumage is light, and carefully elaborated from nature.

No. 470. 'From Nature—Malliam, Yorkshire,' P. W. ELEN. A small picture, the material of which is composed of a stream, a rustic bridge, and an agroupment of trees, drawn and coloured with good taste.

No. 474. 'Christ and the Woman of Samaria at Jacob's Well,' J. LINNELL. The components and dispositions of this picture, like all those of the artist, refresh us with their incomparable allusion to home scenery; there is nothing here to assist the imagination to the regions trodden by the foot of the Saviour. The immediate site is an eminence, a rough scellity shaded by trees, affording a view over the plain and the city below. At the well on the right is Christ, and on the left is the Samaritan woman, who without being made pretty, might, we humbly submit, have been rendered more presentable than we find her; the figure is uncommonly coarse and repulsive. Further on the left, are seen approaching the people from the city, they are ascending the path which leads to the well. In the working of the composition a great amount of learning and skill is everywhere conspicuous, the road continues obliquely upward from the well, and although still lying in a breadth of light and strength of colour equal to the most powerful parts of the picture, it retires with an effect perfectly successful.

No. 475. 'View on the Rhine,' H. C. SELOUS. The manner of this picture is incomparably superior to that of a landscape already noticed, by the same hand. The material is the same as we always find on most of the Continental rivers, but with the natural characteristics of the Rhine. The colour is somewhat cold, yet in execution the work possesses much excellence.

No. 476. 'A Sussex Farm,' J. S. RAVEN. A piece of rough and knotty pasture with groups of trees worked out as if on the spot, so successful is the imitation of the aspect of nature. The tone of the herbage and trees is low, and opposed to a light sky with a satisfactory effect.

No. 477. 'North Holland,' J. WILSON, Jun. These marine subjects are assuredly the forte of this painter; the material here is extremely slight, but there is a breezy freshness in the work which would give value to the canvas if it represented nothing but sea and sky. All we see, is the jettied head of some small Dutch port, out of which two doggers are sailing, and so well do they lie in the water that the illusion of movement is perfect. The water is admirable in colour, and painted with solidity and truth.

No. 478. 'The Boat Rows,' R. CATNER. A boat containing two or three figures, rising on the back of the ground swell, and bringing the men out in strong relief against the sky. The picture is small; there is originality in the idea, and it is carried out with tolerable effect.

No. 479. 'River in Lonsdale, Yorkshire,' J. C. BENTLEY. The spectator is placed somewhere in the stream, which is fortunately shallow. The water course occupies the lower breadth of the canvas, but at a little distance the banks are seen with their verdant complement of trees and herbage. The water repeats the light of

the sky with a brilliant effect, which is enhanced by the interruption of rocks and stones. The subject has much pictorial quality, and it has been realised with a successful result.

No. 480. 'His Grace the Duke of Newcastle,' H. O'NEILL. This is a small full-length portrait, in which the subject is represented sitting, and reading a letter in his library. It is everywhere finished with the utmost nicety.

No. 481. 'Jessica and Launcelot,' J. HOLLINS, A. The subject is Jessica's charge to Launcelot:—

"I am sorry thou wilt leave my father so,
Our house is hell, and thou, a merry devil,
Didst rob it of some taste of tediousness," &c.

She is in the act of presenting him with the ducal. The picture is designed upon the simplest principle of effect, that is, opposition to a broad mass, both figures being relieved by a plain and even background. There are spirit and character in the Launcelot, but the Jessica is not so successful.

No. 482. 'The Departure of the Fleet,' J. M. W. TURNER, R.A. The "Fallacies of Hope" again supplies the subject:—

"The Orient moon shone on the departing fleet,
Nemesis invoked, the priest held the poisoned cup."

This is, we presume, the departure of Æneas from the Carthaginian shore; the water is somewhat too green, but the picture is as full of light as those in which the full radiance of the sun is represented; a comparison with the other pictures will show this: the moon appears only in the poetry.

No. 484. 'Venice,' W. LINTON. This is a large picture, affording a view of one of the smaller canals, closed in with edifices of various appearances. It is a very veracious and substantive representation, but is deficient in colour and sentiment, being by no means so agreeable as the smaller pictures exhibited under this name.

No. 485. 'The Temptation in the Wilderness,' J. T. LINNELL. This is an ambitious subject, and extremely difficult of realisation. Satan is represented as an aged man, and the Saviour replicas to his temptation, pointing to the passage of scripture—"It is written again, thou shalt not tempt the Lord thy God," &c. and the Saviour is a presence of elevated dignity and firm self-possession, but the conception of the tempter has not the same depth of argument, notwithstanding the originality of the reading.

No. 486. 'Aholibah,' E. ARMITAGE. The subject is from the twenty-third chapter of Ezekiel, in which Samaria and Jerusalem are typified by the sisters Aholah and Aholibah. The description of the abominations of Jerusalem is here materialised by an impersonation contemplating the Chaldeans on the wall—"And when she saw men pourtrayed upon the wall, the images of the Chaldeans pourtrayed with vermilion, girded with girdles upon their loins, exceeding in dyed attire upon their heads, all of them princes to look to, after the manner of the Babylonians of Chaldea," &c. The subject is, under any circumstances, an unfortunate one, and the more so that the intensity of the description is aimed at. Aholibah is seated on a low couch contemplating the paintings on the wall; there is but one attendant present; the drawing of the figure is masterly, and the head is a most successful study. The work in short is distinguished by merits of the highest order.

No. 490. 'News of Battle—Edinburgh, after Flodden,' T. J. BARKER. The principal figure in this composition is a knight in plate-armor, riding slowly along one of the streets of Edinburgh, having returned from the field of Flodden. He is followed by a throng of the inhabitants of the city, imploring news of their friends, who had gone forth with the Scottish army. The picture is placed high, inasmuch that the manner of the detail is not discernible, but the proposed sentiment is attained.

No. 491. 'The Burial of the Two Sons of Edward IV in the Tower, 1483,' T. CROSS. This is a very large composition, comprehending numerous figures beyond the ordinary life stature. The persons represented are Tyrrell, his servant—the murderers, and the man to whom the custody of the Princes was committed. The bodies are lying on the floor, and on them is

thrown the principal light. The servant of Tyrrell holds up one of the large flags of the flooring, while one of the murderers digs a trench for the reception of the bodies; the second murderer kneels beside the bodies, and Tyrrell, standing beyond these, seems to enjoin silence and dispatch. The effect of the picture is carried out on a principle similar to that of the admirable work exhibited by this artist at Westminster—the "Death of Coeur de Lion;" as in that picture, the light is concentrated, but it is not perhaps so felicitously distributed, nor are the figures so substantial. The work is a production of great merit, but neither in effect nor character is it equal to the other.

No. 492. 'On the Avon—Near Stratford,' W. E. DIGHTON. A landscape of great excellence. The water, the rushes, and river-side herbage, are painted with unquestionable truth; and the action of the wind on the trees is shown in a manner so impressive as to suggest at once the natural effect. This is an extremely difficult phase to render, yet it has never been more faithfully treated.

No. 493. 'The Child's Prayer,' R. REDGRAVE, A. A group of a mother and her child, the latter placed standing with clasped hands as in the act of prayer. The expression in the infant features is very earnest, and the head of the mother is a charming study.

No. 494. 'Portrait of an Officer in Her Majesty's Service,' M. MULREADY. A small full-length, representing the subject in the uniform of the Rifle Brigade. The background is an open landscape, which throws the figure well forward. The portrait is everywhere carefully worked out and with the best result.

No. 495. 'Result of an Antwerp Marketing,' Mrs. E. M. WARD. The material of this composition consists of a well assorted variety—a pheasant, grapes, apples, a basket, and other items judiciously arranged, and painted with a clean and decided touch.

No. 496. 'Tartuffe—Laurent and Dorine,' H. M. EBLEY, Jun. This is the scene in which Tartuffe gives Dorine his handkerchief in order to cover her neck—

Tartuffe. "Que voulez vous?
Dorine. Vous dire.
Tartuffe. (Tirant un mouchoir de sa poche.) Ah mon dieu! je vous prie, avant que de parler; prenez-moi ce mouchoir.
Dorine. Comment?
Tartuffe. Couvrez ce sein que je ne saurais voir."

Tartuffe holds forth the handkerchief to Dorine who is *un peu trop décolée*, which defeats the intended point of the scene; and the neck of Dorine more covered, the hypocrisy and affectation of Tartuffe were more apparent.

No. 497. 'A Stormy Day,' F. R. LEE, R.A. A large picture, the feature of which is a swollen torrent rushing violently down its rocky bed in an almost unbroken sheet of foam, broadly painted with almost pure white, without the modification of half tones. The sky and the rainy aspect of the scene are highly successful.

No. 498. 'Gil Blas's Embassy from the Prince of Spain to Catalina,' G. P. MANLEY. The figure of Gil Blas is somewhat small here, and the figure standing with her back turned, is injurious to both the effect and the composition; but otherwise there is much of excellent originality in the treatment of the subject.

No. 499. 'Clearing the Wood—early Spring,' J. MIDDLETON. A production of a high degree of merit; the foreground is a piece of rough herbage studded with trees, which are yet leafless, their fine sprays being worked out with an extraordinary nicety of touch. The picture is hung high, but its finish and agreeable colour and effect are sufficiently obvious.

No. 501. 'A June Study,' W. E. DIGHTON. The material is simply a group of trees, overhanging something like a park fence. The style of this work is extremely original and independent, the luxuriant density of the foliage cannot be too highly praised; the sky, too, is charged with clouds, which enhance the charming effect of this veritable passage of nature.

No. 502. 'Lake Gwentin—North Wales,' J. DANBY. A passage of mountain scenery similar in character to late productions by the same hand. The effect is that of the sun briefly lighting the summits of the mountains, the lower

parts being sunk in shade; the phase is rendered with much of the truth of nature.

No. 503. 'A Dream of Venice,' J. C. HOOK. We cannot pay this artist a higher compliment than to say that he succeeds in reminding the spectator of Veronese; his colour is surpassingly brilliant and his touch is clear and sharp, like the handling in the "St. John," or a brighter picture, the "St. Catherine" at Florence. The story is of a company of Venetian gallants, who in their gondola have serenaded some ladies that are seated in a balcony, one of whom rewards a favourite serenade with a haquet. The sentiment of the work is elegant, and it will be esteemed among the best of its author.

No. 504. 'Ferdinand lured by Ariel,' J. E. MILLAIS. This is a *quattro-cento*, displaying a great amount of genius, but a greater degree of laborious assiduity, with a considerable vein of eccentricity. Ferdinand is mystified by the floating music of the elves who play the accompaniment to Ariel's sea-song—

"Full fathom five thy father lies,
Of his bones are coral made;
Those are pearls that were his eyes,
Nothing of him that doth fade," &c.

He is holding on his capote, which Ariel is striking off his head, and before him is a band of green elves—the musicians of the party—who contrary to all authority, are made to fly near the ground. Ariel, a hideous green gnome, precipitates himself against Ferdinand with an action extremely ungraceful. The impersonation of Ferdinand is thin, and he resembles, but with better drawing, some of the figures seen in the works of Giorgione; yet the emphasis of the picture is in its botany, which is made out with a microscopic elaboration, inasmuch as to seem to have been painted from a collection of grasses, since we recognise upwards of twenty varieties; there may be more; and such is the minute description of even one leaf, that the ravages of an insect are observable upon it. There is in the work great power and knowledge, but it is wrought out in a spirit which has nothing akin to the great end of art.

No. 505. 'Martha Reproved,' H. LE JEUNE. A picture remarkable for simplicity of composition and general good taste in arrangement and execution. The Saviour is seated on the left, and Mary kneels before him, while Martha stands on the threshold, holding a water vessel, as "cumbered about much serving." The tone of reproval is in the expression of Christ, and it is responded to by the features of Martha. There is not in the work the same degree of brilliancy which has hitherto distinguished the pictures of the artist, but there is more of that depth of feeling which is becoming to this class of subject. The figures are brought forward, dependent entirely upon their own merits, being unsupported by auxiliary composition.

No. 514. 'Portrait of Miss Anna Gurney,' T. MOGFORD. A small half-length, in which the lady is presented resting against a pedestal, the figure being relieved by trees, as it were in a garden scene. The features are life-like in colour, and full of sparkling animation. The work is very highly finished.

No. 516. 'A Stormy Day,' L. E. CONSTABLE. A picture grey and soberly toned, firm in touch, and everywhere maintaining the character of the subject.

No. 517. 'Milton's Dream,' C. W. COPE, R.A. The subject is found in the lines—

"Methought I saw my late espoused saint
Brought to me, like Alcides from the grave;
* * * * *
But oh! as to embrace me she inclined,
I waked—she fled, and day brought back my night."

This is a picture of great depth, broken only by lights of a low tone, in order to afford power to the eyes of a lamp which burns near the couch on which Milton is laid. The spiritual visitant is in the act of bending over the sleeper, according to the description in the latter lines. The subject is one of great difficulty, but it is here worked out with a spirit well befitting the profound sentiment of the lines.

No. 518. * * * * * J. E. MILLAIS. "And one shall say unto him, What are these wounds in thine hands? Then he shall answer, Those with

which I was wounded in the house of my friends" (Zechariah xiii., 6). It is obvious that this composition is a result of power, of a calibre which, judiciously directed, might aim at the accomplishment of works of the highest class in art. But that ability is here exerted in the production of a remarkable example of the asceticism of painting; for there was a time when Art was employed in mortification of the flesh; and of that period is this work, for few ordinary observers there are who can look on it without a shudder. Greek Art raised men to the level of the gods, but the class of which we speak is a foretaste of the grave. It is scarcely necessary to say that the same end may be arrived at by an instrumentality less repulsive. But to speak directly of this picture:—the period is that of the childhood of the Saviour. He is yet in the home of his parents, that is, of Mary and Joseph, of whom the latter is working as a carpenter. The child Jesus has wounded his hand, and in showing it to his mother she kisses him. This is a prefiguration of the Crucifixion; and John brings a vessel of water in order that the wound may be washed. This is an allusion to the future mission of St. John. Joseph is a semi-nude figure, that is, the limbs are uncovered; and in these are scrupulously imitated all the foibles of the early Italian school; in short, in colour and in the attenuation of the limbs, the impersonation of Joseph seems to have been realised from a subject after having served a course of study in a dissecting-room. There are characteristics in the other figures equally objectionable, upon which we have not space to dwell. The improprieties of the picture are manifold. Are we to accept as consecrated to severe Art the vulgar errors of men whose ignorance never raised them beyond the coarsest representation of humanity—who would wring the soul by distorting the body? How has the so-called *parism* of the German school been modified! and yet there was a time—now forty years gone by—when the expelled students of the German schools astonished the professors of St. Luke by a resuscitation of the forms of some of the worst followers of the Giotteschi. The austerity of even Overbeck himself, with his rejection of colour, never descended to a resuscitation even more revolting than that of a flayed Marsyas. If such taste were to be accepted as the purity of Art, then nothing but empiricism are the works of the so-called stary host, shedding an unfading light upon the Art-world.

No. 519. 'Portrait of Mous. A. Scheffer, the celebrated painter,' H. W. PHILLIPS. Generally very gray in tone, but a work of a high degree of merit; it presents a marked resemblance to M. Scheffer.

No. 523. 'Her Grace the Duchess of Roxburgh,' F. R. SAY. An extremely agreeable portrait; the head is graceful and expressive.

No. 524. 'Children of the Rev. G. Barnes Northcote,' Mrs. W. CARPENTER. A group of two children, a boy and a girl, the latter playing with a kitten; the features are very fresh in colour, and are painted with great firmness and decision of touch.

No. 525. 'Too Truthful,' A. SOLOMON. A composition from Cay's Fables; the story of the painter who injured his practice by painting his sitters too faithfully—

"His honest pencil touched with truth,
And marked the date of age and youth;
He lost his friends, his practice failed,
Truth should not always be revealed."

He has upon his easel the portrait of a wealthy citizen, who is retiring in disgust at the fidelity with which he has been portrayed; but the artist has committed the error of putting the sitter's bat on, while the portrait is uncovered; the resemblance, without the hat, might of course have been made much stronger. The point of the composition is sufficiently obvious, the portrait is a source of dissatisfaction.

No. 526. 'The Queen of the day—suggested from the Decameron of Boccaccio,' A. ELMORE, A. There is in this little picture more of grace and charming sentiment, than in any preceding work of the artist. The scene is a garden, that, by the way, may be on the road to Fiesole. The principal figures of the composition are two, a

youth and a damsel, who have retired from their party and are resting beneath the trees. The former, having prepared a coronal of flowers, is adjusting it on the head of the latter. In the features of these figures there is no aim at the representation of insipid beauty, we penetrate the surface, and arrive at the cinctious of the heart.

No. 527. 'San Pietro—near Verona,' J. D. HARDING. The subject has been selected with a refined taste for picturesque association, and the judicious distribution of light and shade has given importance to every available point. The river flows to the base of the composition, and the objective immediately in relation with this, consists of houses, trees, and the chapel of a convent, with a glimpse of remote mountains, described in tints of exquisite tenderness. The colour of this landscape is brilliant and harmonious, and the manipulation is decided and masterly.

No. 528. 'Hill Pastures in Swaledale—Yorkshire,' J. PHEL. A small picture, representing a passage of scenery which rises from the immediate foreground. The view is broken by trees; the whole is strongly characterised by the aspect of nature.

No. 529. 'Beech Trees—a Study from Nature,' J. WILSON, Jun. A small round picture, somewhat cold in colour, but justifying the qualification of the title in its close resemblance to a veritable locality.

No. 530. 'The Mountaineer,' E. J. COBBETT. This mountaineer is a Welsh girl carrying a basket containing fern; the landscape portion of this little picture is painted with much sweetness.

No. 533. 'Good Doggie—the property of Lady Murchison,' E. LANDSEER, R.A. The picture is small, giving only a half-length portrait of "doggie," a handsome fox-headed animal, begging with his two paws up, resting against the arm of a sofa; there is more finish in this picture than in the other smaller picture exhibited by Mr. Landseer. The head of the dog, with its open mouth and intelligent expression, is equal to the best of his canine studies.

No. 534. 'The Woods planted by Evelyn and still the property of his Descendants,' R. KENGRAVE. Like all the sylvan subjects of this artist this is strongly marked by the impress of nature; it is much larger than the jack pools he has from time to time exhibited, but not less carefully rendered.

No. 535. 'Berenaria's alarm for the safety of her husband Richard, Cœur de Lion, awakened by the sight of his Girle offered for Sale at Rome,' C. COLLINS. This is another of these works painted in imitation of the productions of the early Florentine school. It is not a subject for nude display, there is therefore nothing offensive in it.

No. 539. 'Portrait of a Lady,' W. P. SALTER. The sight of this portrait is oval; the lady is seated resting her head on her hand and having a book before her. The complexion tints are brilliant and life-like.

No. 541. 'Baptism in Scotland,' J. PHILIP. The first impression conveyed by this picture is that of the amount and quality of light, which the artist has succeeded in imparting to it. The scene is a humble interior of the cottage class; the figures are numerous, the principal impersonations being placed near the window. These are the father and mother with the infant, and on the other side the officiating minister; and from this focus the composition opens on each side into complementary groups, embracing a great variety of appropriate character; and from this point also the light is distributed and graduated with admirable feeling and effect. On this work the utmost care has been exerted with the very best results, as in execution and surface it is superior to antecedent productions. It is indeed a production which confers the highest credit on the painter, and will go far to establish his fame.

No. 542. 'The Forest Farm,' T. CRESWICK, A. There is more of a Dutch character in this work than in any other we have seen by Mr. Creswick. The subject is commonplace, but it is worked into value by judicious treatment. The view shows on the right a farm-house, which is

painted with extraordinary care; near the base of the composition, and past the house, flows a rivulet; the right of the composition is open; the shaded parts are in some degree black, and the elaboration approaches hardness; here and there, with these exceptions, the work has a great share of the beauties which distinguish the works of its author.

No. 543. 'Mr. Honeywood introduces the Bailiffs to Miss Richland as his Friends,' W. P. FERRIS. 'The subject is from the third act of Goldsmith's "Good-Natured Man" —

Honeywood. Two of my very good friends, Mr. Twitch and Mr. Flanigan, pray, gentlemen, sit without ceremony. *Miss Richland (aside).* Who can these odd-looking men be? I fear it is as I was informed. It must be so.

The point of the work is the contrast between Honeywood and his friends, who are the veriest off-scourings of the lowest spunging-house in Chancery Lane. Honeywood is a gentlemanly-looking person, and in presenting Messrs. Twitch and Flanigan, the latter makes an extremely awkward obeisance. The character of Honeywood is successful, and his position sufficiently obvious. The drawing and colouring are both masterly.

No. 552. 'A Scene during the Invasion of Italy by Charles VIII.,' F. R. PICKERSILL, A. An Italian gentleman, who sees from his window the mansion of his neighbour on fire, is arming in all haste, either to defend his own or his friend's property. He is putting on his casque, and a negro attendant is in readiness with the rest of his suit of armour; his wife, by his side, wrings her hands in an agony of terror. The story is circumstantially told, and the picture is of much excellence in colour and composition, and remarkable for expression and original feeling.

No. 553. 'A Converted British Family sheltering a Christian Missionary from the Persecution of the Druids,' W. H. HUNT. We remember the picture exhibited last year by this artist; we spoke of it in terms of admiration because it manifested judicious discrimination between the virtues and the vices of early Art. The Christian missionary, who seems exhausted and fainting, is ministered to by members of the protecting family; he does not, however, seem one who has fed upon locusts and wild honey; his person is an ample development. Others of the circle are anxiously looking forth from their habitation at a crowd who have bound another missionary, whom they seem to be conducting to execution. The drawing and manner of the figures show all the objectionable peculiarities of the infancy of Art; one figure, especially, will strike the observer; he is on the left, and is raising himself to look out of the but; this figure has been undoubtedly painted from nature, but the striking points of the study are precisely those which are rejected in that kind of Art which is properly called "fine."

* No. 564. 'Portrait of Col. the Hon. Sir Edward Cust, K.C.H.,' T. H. LINDSEY. The subject is represented of the size of life, he is in an erect attitude, wears a blue uniform, and holds a cocked hat in the left hand. The features are successfully endowed with language, and the *mien* of the figure establishes at once a relation between itself and the spectator.

No. 565. 'Beatrice Cenci seeking protection from the persecution of the Count, her father,' W. MADDOX.

Cenci. What! Beatrice here? come hither!
And thou too, loathed image of thy cursed mother
Parried with thy alphabet! taught by rote

The narrative here is sufficiently perspicuous, for the story could not be more pointedly told; the features of the Count, and also those of Beatrice, are endowed with emphatic language. The group of the two figures, the protectress and the trembling refugee, is a carefully studied and highly finished passage—charming in colour, and powerful in expression.

No. 568. 'A Lady Sketching,' Mrs. CARPENTER. She is presented in profile in an erect attitude, and resting with her back against a tree. The picture has much sweetness of colour, with a freedom of handling which reminds the spec-

tator of the more sketchy style of the English school.

No. 569. 'The Abdication,' J. SEVERNS. A large picture, founded on the passage of history which records the interview between Mary, Queen of Scots, and Lord Ruthven and Lindsay, at Lochleven. Mary is seated, and one of the Lords offers her a pen to sign her abdication. The treatment of the subject is literal, its source is at once declared. In this work there is much merit, both of conception and execution.

No. 571. 'The Parting of Charles I. with his two youngest Children, the day previous to his Execution,' G. LUCY. The incident is described in the Memoirs of Herbert, &c. "The King frequently kissed and blessed his children, then suddenly rising, called the Bishop, Juxon, to take them away; the children sobbed aloud; the King standing, leant against the window, trying to repress his tears." This is a large composition, in which the dispositions are followed out according to the letter of the quotation. The king leans "against the window," and the bishop is retiring with the children. The picture has no need of a title, and it is distinguished by valuable qualities in drawing and execution, but it is not so successful as the picture of last year by the same artist.

No. 572. 'Lady Northumberland and Lady Percy dissuading the Earl from joining the Wars against Henry IV.,' R. HANNAH. This is an essay in a class of study new to this artist; it is original and powerful in effect, but we humbly opine that his manner would tell better in something poised between the heroic and the class of ordinary incident. The drawing and execution of the work are masterly.

No. 573. 'Spring,' F. DANBY, A. A large work which, in composition and feeling, will remind the spectator of the Wood Nymph picture exhibited a year or two ago. From the centre of the composition rises a group of trees, whereof the most conspicuous is the horse-chestnut, which is in flower. On the left flows a stream, and the right is closed by cliffs; while to the whole, life is communicated by a company of nymphs, who convey a personation of Spring; another Nymph is scattering flowers. It is evening, with an aspect of sunset, but without that intense effulgence which characterises the works of this painter. The prevalent tone of the work is that of shade, broken sparingly by the admission of rays of red light, which strike upon the figures; thus the effect is comparatively subdued, but the picture, nevertheless, abounds with descriptive poetry.

OCTAGON ROOM.

No. 577. 'Portraits of Lady Alice and Lady Adelaide, Daughters of the Earl of Ellesmere,' A. DE DREUX. The ladies are mounted on horseback, being dressed in appropriate costume; the accessory and position, in which the figures and animals are brought forward, is landscape partially closed by trees. The artist is a French animal-painter of some eminence, and this production is a favourable example of his powers. It was neither generous nor just to place it in this room. Mr. De Dreux is in Paris considered the rival of Landseer; while we cannot class him so high, we must concede to him great and original power. It is much to be deplored that neither in England nor in France will painters receive courtesy, much less justice, from their rivals.

No. 581. 'Undying Laurels,' J. D. CROOME. A still-life composition, reflecting strongly on the vanity of human ambition. The components are a laurelled scull, a cast of an antique head, a guitar, &c., all of which are associated in a manner well calculated to point the moral.

No. 582. 'Fiori del Carnevale,' R. M. INNES. These flowers are a group of ladies who are seated in a balcony overlooking, we may presume, the Corso, which is, of course, supposed to be thronged with maskers. The faces are perhaps too English, but otherwise the picture possesses great merit in colour and execution. It is, however, so placed as to destroy all its beauties.

* No. 588. 'Flowers and Fruit,' J. GREENLAND. A large picture, comprehending every beauty in this class of subject. The composition is like

the outpouring of a vast cornucopia, and the finish of the flowers particularises the most minute detail. The work is equal to the best floral compositions of the Dutch masters.

No. 588. 'Repose,' T. K. FAIRLESS. A landscape composition, introducing an evening effect, in which the powerful shades of the substantive components are opposed to the light sky. The sentiment of the picture sufficiently supports the title.

No. 593. 'The Meeting of Henrietta Maria, Wife of Charles I., with her Mother, Marie de Medicis,' T. A. WOOLNORTH. The immediate source of the subject is Miss Strickland's "Lives of the Queens," in which this interview is described as having taken place in the great quadrangle of St. James's Palace. Marie de Medicis has descended from her carriage, the Queen kneels before her, and near her are the little Prince of Wales and the Duke of York. The picture is somewhat crowded, and the attention paid to draperies injures the necessary importance of the figures. It is, however, a work of very considerable merit, and ought not to have been placed where its faults are obvious, but where its advantages cannot fail to be overlooked.

No. 594. 'Touchstone and the Shepherd in the Forest of Arden,' J. GILBERT. Both of these figures are extended near the base of the picture, the right of which is closed with the foliage and ample boles of forest trees; the left being partially open. There is here much of the *abandon* and powerful originality which qualify the works of this painter, and, it would seem, with a more careful finish.

No. 611. 'Old Water Mill on the Tiber, near Perugia—Italy,' W. OLIVER. A truly picturesque subject, painted with much firmness.

No. 612. 'The Chairman of the Council of the Artists' General Benevolent Institution,' J. H. S. MANN. A small portrait, in which the head is eminently qualified with thoughtful expression; the features are well drawn and painted with effective breadth.

DRAWINGS AND MINIATURES.

No. 645. 'Coast Scene,' W. UNDERHILL. An oil picture, one of those placed round the upper part of this room. The subject is a group of two children with a dog, in an open piece of coast scenery. The painting is placed beyond the range of inspection, but it declares great power in execution, and harmony of colour.

No. 649. 'Portrait of Her Excellency the Countess of Clarendon,' N. J. CROWLEY. This is also an oil picture, a small full-length, presenting the lady in court dress; the composition is graceful, and the execution very careful.

No. 651. 'Enamel Portrait of Admiral Lord Nelson, from the original by Abbot,' W. ESSEX. This enamel is distinguished by the delicacy and brilliancy which generally characterise the works of the artist.

No. 670. 'Her late Majesty Adelaide the Queen Dowager—from the Picture by Winterhalter,' R. J. LANE, A.E. This is a lithograph distinguished by a tone, variety of texture, and finish, rarely seen in this branch of art.

No. 681. 'Portrait of a Mother and Child,' J. HAYTER. A chalk drawing of the size of life, exquisite in feeling, and of masterly execution. The works of this artist are superior this year to anything he has before produced, especially his children's heads; these are of rare excellence.

No. 685. 'Sir Archibald Keppel Macdonald, Bart.,' T. CARRICK. A miniature in which the figure is brought forward in a sedentary pose, attired in a shooting dress. The quality of breadth is instanced to an unexampled extent here, giving extraordinary force to the head. Other admirable works by the same artist are portraits of 'Mrs. H. N. Patterson,' 'Mrs. J. G. Abbot,' and 'T. Carlisle, Esq.'

No. 707. 'The late Thomas Bigge, Esq.,' E. D. SMITH. A miniature distinguished by good taste in its dispositions, life-like and harmonious in colour and vivacious expression.

No. 716. 'A. Terzaghi, Esq.,' C. COUZENS. A full-length miniature, presenting the subject standing in a reflective pose; the head is a highly successful study as to drawing and colour.

No. 728. 'A Summer's Day on the Avon,' J. GENDALL. This picture deserves a better position than that which it here occupies, for it is placed so high it is almost impossible to analyse its merits; a remark that holds good with reference to all oil-pictures hanging in this room. The artist of this work is, we believe, resident in Devonshire, amid whose beautiful and romantic scenery he finds ample scope for his pencil; the subject he has here selected is a tolerably wide stream, shaded by trees on each side, in which the play of light and the water reflections are rendered with manifest truth. The foliage, verdant with a charming summer hue, would perhaps have been improved by a little more definite marking.

No. 730. 'Drawing of Lord Ashburton,' S. LAWRENCE. A chalk portrait, in which the head is seen almost in profile; it is executed in the slight but effective manner of the artist. A pendant to this is No. 819, 'Drawing of the late Bernard Barton.'

No. 735. 'Edward Kirkpatrick, son of L. R. Hall, Esq., of Barton Hall,' MRS. W. PITT. A miniature of a child carrying grapes; he is dressed in black, which tells powerfully against a landscape background. By the same lady is exhibited a faithful miniature portrait of the 'Hon. and Rev. H. Montague Villiers.'

No. 763. 'The Marchioness of Brandebane,' SIR W. C. ROSS, R.A. The arrangement of this composition is in excellent taste. The lady is seated on one end of a *couché*; she is attired in brown velvet, which is most effectively supported by the judicious disposition of background colour. The features are exquisitely pure in tint, and the carriage of the head is natural and easy. Other miniatures by this artist are "Mrs. William Gibbs and Children," "Mrs. Oswin Cresswell and Children," &c., works all eminently beautiful in colour.

No. 767. 'J. D. Gardner, Esq., and Mrs. Gardner,' R. THORNBURN, A. This is a pictorial miniature agreement of that class in which this artist is pre-eminent. The gentleman is preparing to mount his horse, which the lady is caressing. The general tone of the picture is dark, inasmuch as to bring the heads forward with inconceivable force. The broad but minute finish peculiar to the artist's style is everywhere prevalent. Other admirable works are 'The Lady Lindsay and Miss Lindsay,' 'Miss Acland Hood,' 'Mrs. D. Coutts Marjoribanks,' &c.

No. 799. 'Brooch Miniature of Lucy, infant daughter of Jolu H. Heraud, Esq., Mrs. N. BARTHOLOMEW. A charming production of this minutest class of art, fresh in colour, and wrought with inimitable *finesse* of touch.

No. 800. 'Portraits of Walter, Katherine, and Alice, children of Robert Phillimore, Esq., D.C.L., JOHN HAYTER. Three life-sized heads in one frame. They are drawn in chalk, with a colour, texture, and living expression, that will never be excelled in this department.

No. 811. 'Miss Annie Finlaison,' Miss M. GILLIES. The lady is attired in white, the figure being brought forward against the sky. The head is a study of much elegance.

No. 832. 'Portrait of Mrs. Charles Salaman,' Miss A. COLE. A miniature, distinguished by much good taste in the simplicity of its treatment.

No. 890. 'The Hon. Constance Finch Hatton, daughter of Viscount Maidstone,' J. S. TEMPLETON. A chalk drawing, life-size, of an infant playing with a necklace; the features are successfully qualified with the blindest expression of childhood.

No. 911. 'Wood Nymphs,—imitation cameo,' W. V. PATTEN. These are heads in which the imitation is faithfully and elegantly preserved.

No. 940. 'Mrs. Jackson,' G. F. WATTS. A very slight chalk drawing, simply a head, qualified with a general refinement which is very rarely attained to. The following, No. 941, 'Adeline,' is a production of equal excellence in graceful sentiment.

No. 943. 'Portrait of Edward Plumtree Harrison, Esq., Bengal Infantry,' T. RICHMOND. The subject wears a military uniform, which tells substantially against a light and sketchy background; the head is carefully drawn, and natural in colour.

No. 947. 'Portrait of the late Laman Blan-

chard, Esq., Miss F. CORBEAUX. This head is mellow and harmonious in colour, and eminently vivacious in expression.

No. 957. 'Development,' T. UWINS, R.A. A water-colour drawing, the subject of which is the interior of a saint-manufactory at Naples; the composition is extremely various in character, and rich and harmonious in colour.

No. 991. 'Portrait of Edmund St. John Millmay, Esq.,' F. DEHAUSSEY. This head is highly meritorious in colour and drawing. Another work by the same artist in crayon, No. 1017, 'Lord Alfred Paget, M.P.,' is singularly round, substantial, and life-like.

No. 994. 'Portrait of Sir Henry Ellis, K.H.,' J. CARPENTER. This portrait declares itself at once; there is no need of a title.

No. 1023. 'Miss William Crosbie,' W. BUCKLER. A full-length portrait of a lady in a riding dress. The figure is supported by a garden composition. The features have much sweetness of expression, and the carriage of the figure is extremely natural.

No. 1040. 'Portrait of the Lady Harriet Aulton,' No. 1054. 'Portrait of the Viscountess Maidstone,' J. R. SWINSON. These are two life-sized chalk drawings, slight in manner, but eminently graceful in character.

No. 1062. 'The Mountain Stream,' J. D. HARDING. This is a large water-colour drawing, the subject of which is a highly effective association of some of the most picturesque features of nature. It is one of the best drawings we have ever seen by this artist. It is qualified by exquisite colour, and is rendered strictly according to nature.

No. 1073. 'Portrait of Mrs. Wigan,' MRS. CARPENTER. A water-colour sketch, admirable in effect, brilliant in the flesh tints, and free and firm in touch.

No. 1093. 'Comus,' R. HUSKISSON.

"Bodily assent the accomplice's hall,
Where, if he be, with dauntless hardihood
And brandished blade, rush on him, break his glass," &c.

The subject of this picture is the attack upon Comus and his hand by the brothers. It is a picture of that class of poetical composition, the beauty and originality of which have made a reputation for the artist. It is highly dramatic in feeling, and singularly powerful in colour. The figures are of every appropriate variety; and in spirit, movement, and poetry, it is beyond all praise.

We regret much that want of space compels us to omit the mention of many other meritorious works in this room.

No. 1136. 'J. Propert, Esq.,' T. W. MACKAY. This is a portrait of great excellence in drawing, colour, and effect. The treatment is simple, the interest of the work being centred in the features, which are abundantly qualified with intellectual and animated expression.

No. 1233. 'Chapel of the Holy Sacrament at St. Jacques Church, Antwerp,' S. READ. A masterly drawing, powerful in effect and faithful in representation.

No. 1244. 'Vierge, Route du Simplon,' J. D. HARDING. This is a picture that would do honour to any school. The subject is romantic, and it is painted with a fearless breadth of daylight harmonies of colour up to a high pitch of brilliancy. The composition is strongly characteristic of the district whence the view is taken, and comprehends every variety of interesting objective. The surface is everywhere worked by a firm but delicate touch; indeed, it is a work that cannot be too highly praised.

No. 1254. 'Fruit and Flowers,' J. GROENLAND. A large and gorgeous composition of fruit and flowers, very like those of the Dutch school, and equal in merit to the best of them. The delicate texture and brilliant colours of the flowers cannot be surpassed. It is one of the finest works of its class ever seen on these walls.

No. 1262. 'The Port of Marseilles,' E. W. COOKE. A large picture—one of the best of the artist's Mediterranean series. There is little seen save shipping and one of the forts at the entrance of the harbour. The vessels are painted with the usual clear finish of the artist.

There are hanging among the architectural works some of a higher quality than we have ever before seen consigned to this department of the Exhibition.

SCULPTURE.

No. 1293. 'Model of a Statue of H.R.H. Prince Alfred, executed in Marble, for Her Majesty the Queen,' Mrs. THORNEycroft. A small life-sized cast, modelled with considerable breadth. The little figure is slightly draped, and carries a bunch of grapes. The features are successful in infantine expression; and the general character of the statue is that of elegant simplicity; of this charming work an engraving has been published in the *Art-Journal*.

No. 1294. 'Marble group—A Huntress with a Leveret and a Greyhound,' R. J. WYATT. A life-sized statue, charming in feeling and finished with exquisite taste. The Leveret is held up in the left hand, and a Greyhound jumps up on the right side. The figure is of a cast so elevated that it is to be regretted it is designed as a huntress.

No. 1295. 'Group of Virginius and his Daughter,' P. MACDOWELL, R.A. This magnificent work, it will be remembered, was exhibited a year or two ago in plaster; it is now completed in marble, and is without comparison the grandest sculptural composition that has ever been seen within these walls. Historical productions on this scale are extremely rare; and if we consider the labour and cost necessary to the production of such a work, we must do ample justice to the spirit of the artist who utters upon one of so much importance. We have already described the group.—Virginius has just suffered death at the hands of her father, who supports the body with his left arm, while, with the uplifted right hand, he devotes Appius to the infernal gods. The action and expression of the principal figure constitute a coincident passage of much sublimity.

No. 1300. 'Early Affection—Marble Statue,' A. JOHNSON. A small figure of a child holding a rabbit. The idea is natural, and it is executed with pleasing simplicity, but the features are somewhat in advance of the figure as to age.

No. 1301. 'A Sleeping Girl—in Marble,' E. H. BAILY, R.A. She is extended on a couch, and holds a flower in the right hand. The head has a character of portraiture which gives the work the appearance of a monumental composition. It is endowed with a natural simplicity that is extremely captivating.

No. 1302. 'The Most Rev. William Howley, late Lord Archbishop of Canterbury—to be placed in the choir of Canterbury Cathedral,' R. WESTMACOTT, R.A. This is a monumental effigy carved in Caen stone. It has been designed in the severe manner of mediæval monumental art, in order to harmonise with the works among which it will be placed. It represents the Archbishop clasping the Scriptures to his breast.

No. 1305. 'Nymphs,' W. C. MARSHALL, A. A group of two nymphs, designed from Milton's "Ode on the Nativity." The principal figure is seated, and the nearer one, whose head is somewhat lower, rests upon her, forming a composition, the lines of which flow and harmonise most agreeably. There is much originality and poetic sentiment in the work.

No. 1306. 'A Youth returned from the Chase—to be executed in Marble,' E. H. BAILY, R.A. The figure is nude, and stands resting against the trunk of a tree. The form presents a studiously accurate description of the human form, before mature development of the muscular system.

No. 1308. 'Psyche,' P. MACDOWELL, R.A.

"Her sorrowing heart
Recalled her absent love with bitter sighs."

This charming figure is semi-draped, and disposed in a manner to describe her grief at her separation from Cupid. There is little or nothing of allusive necessity. The work is as severe in its simplicity as it is possibly can be. The head and the dependent character of the features constitute an essay in the most touching poetry of the art; and the chaste elegance of the entire composition reminds the spectator of the feeling of the worthiest romancers of Greek sculpture.

No. 1312. 'Model of Amphitrite,' J. THOMAS. She is seated on the back of a marine horse; the figure is full and round, and has much of the softness of nature.

No. 1314. 'Marble Statue of the Right Hon.

Sir Michael O'Loughlin, Bart., Master of the Rolls in Ireland, &c., C. MOORE. The subject is represented in robes, as in court; he is seated, with his head resting on his hand. The pose is easy, and the expression of the features earnest and thoughtful.

No. 1315. 'Resting after a Run—Marble Statue of the Daughter of Frederick J. Reed, Esq., H. WEEKS. The young lady has been exercising with a hoop, which now, in her attitude of repose, encircles her, raising a portion of the drapery behind. There is much of nature in the figure; the treatment has most probably been suggested by having seen such an accidental disposition.

No. 1321. 'Sketch of part of a monument recently executed in Marble and erected in Memory of the late Mrs. White, only child and heiress of Sir G. H. Smyth, Bart., J. EDWARDS. This is a small relief in fine plaster; the design is formed of a recumbent figure with two angels rising above, all of which are characterised with a charming feeling.

No. 1325. 'Contest between the Minstrel and the Nightingale,' G. G. ADAMS. The minstrel only is seen here, he is sitting, listening to the bird; the pith of the description points to the act of listening, which is represented with much natural truth.

No. 1328. 'A Marble figure of Perdita,' S. J. B. HAYDON. A small statue in which the subject is presented in a sedentary pose; the head is a most successful study, and with the rosemary and the rue in her lap the impersonation is readily determinable.

No. 1335. 'Ariel,' F. M. MILLER.

"Merrily, merrily, shall I live now,
Under the blossom that hangs on the bough."

This is a bas-relief of infinite sweetness of character; it shows Ariel, a graceful figure, swinging on the bine of the honeysuckle. The feeling of the composition accords much with that of 'Titania,' No. 1458. There is a spirit of elegant and refined poetry in these two compositions, as also in other works of this artist.

No. 1340. 'Cupid—the Birth of the Rose,' B. JENNINGS. A small figure holding a rose in the left hand; there is much spirit and classic feeling in the work which is altogether charming; it is, we believe, the production of a young sculptor who has been studying in Rome; we may safely predict his future fame.

No. 1350. ' * * * * *,' W. C. MARSHALL. A. The subject is from the "Midsummer Night's Dream"—

"A mermaid on a dolphin's back,
Uttering such dulcet and harmonious breath,
That the rude sea grew civil at her song;" &c.

The figure is grouped literally according to the description; the head is raised, and the action and expression of singing are full of truth. The figure is modelled with a nice observance of the most telling passages of the beautiful.

No. 1353. 'A Marble Bust of the Rev. T. Mathew, 1840,' J. HOGAN. This is simply a head, modelled and carved with much of the severity of the antique; the expression of the features is that of perfect benevolence.

No. 1368. 'Medallion likeness of Miss Cross,' J. EDWARDS. A profile in fine plaster, executed with much elegant taste.

No. 1370. 'Marble Bust of J. B. PYNE, Esq., T. EARLE. The manner of the hair, as flowing backwards, communicates to this head a highly picturesque character; it is modelled and carved with much nicety, and presents a striking resemblance to the subject.

No. 1372. 'Bust of a Lady,' C. ESSEX. Extremely careful in the modelling of the features, which are qualified with much life-like expression.

No. 1373. 'Bust to be executed in Marble, of Robert William Warren, Esq., E. A. FOLEY. As in all the works of this sculptor, there is, in this, powerful character and refined feeling.

No. 1376. 'Marble Bust of James Moncrieff Arnott, Esq., F.R.S., Vice President of the Royal College of Surgeons,' T. BUTLER. The character of this head accords admirably with the manner of its treatment here; it is eminently qualified

with earnest thought and penetrating intelligence.

No. 1378. 'A Colossal Bust of Felix Mendelssohn Bartholdy,' P. HOLLINS. This work is intended to be placed in the Town Hall at Birmingham. The features are refined and thoughtful, but the complex and voluminous drapery diminishes the importance of the head.

No. 1382. 'Bust of a Gentleman,' H. POWERS. There is much merit in this work, but it is injured by the heaviness of its drapery; we have never before seen a draped composition so elaborately carved and undercut as this.

No. 1383. 'Marble Bust of Mrs. Hurd,' T. BUTLER. This bust is characterised by a charming feminine sentiment; it is remarkable for finish, which is carried to a point of nicety that cannot be surpassed.

No. 1384. 'Bust of Major Herbert Edwardes, C.B., &c. &c., J. E. JONES. This gentleman is an admirable subject; the character of the features, with the beard and oriental costume, are effective either in a picture or bust. The head is commanding and *saldatesque* in character, and doubtless presents a striking resemblance to the distinguished subject.

No. 1393. 'Medallion of Robert Vernon, Esq., W. BEHNES. This is a life-sized medallion, sketchy and free in its style of modelling, but very like the late Mr. Vernon, a short period before his death.

No. 1397. 'Marble Bust of Thomas Brassy, Esq., J. E. JONES. The work is characterised by fulness of dimension and breadth of style. The sculptor has had considerable difficulty in the treatment of the work, but has succeeded in communicating to the features an agreeable expression.

No. 1404. 'Edward N. Denny, Esq., H. WEIGALL. A cast in plaster strikingly like the subject.

No. 1417. 'A Bust of a Gentleman,' J. LAWLOR. A work extremely unassuming, but distinguished by much merit. The carriage of the head is easy and natural.

No. 1421. 'Marble Bust of Charles McIvor, Esq., J. FILLANS. As well as this bust can be seen, it appears to have been worked to an extraordinary degree of softness. The expression of the features is grave and thoughtful.

No. 1429. 'Chevalier Busen,' W. BEHNES. A bust, very happy in likeness to the subject. The head is modelled in a manner truly masterly.

No. 1431. 'Marble Bust of the late W. Etty, Esq., R.A., M. NOBLE. A bust of a high degree of merit, presenting a refined, but nevertheless faithful, likeness of the distinguished painter. The expression of the features is intense and enquiring, precisely that with which he was wont to look at the shaded parts of the figure in the Academy, or the St. Martin's Lane school.

No. 1435. 'Bust in Marble of Sir John Herschel, Bart., President of the Astronomical Society,' E. M. BAILY, R.A. This bust does ample justice to the student-like character of the head. The features are successfully endowed with argument and penetration.

No. 1447. 'Bust of Lieutenant-General Sir Charles James Napier, G.C.B., Commander-in-Chief of the Armies of the East Indies,' P. PARK. This is a plaster cast, and is at once recognisable as Sir C. Napier. The earnest expression is characteristic, but we humbly submit that there is an eccentricity in the draperies which may be dispensed with.

We have thus gone through the exhibition; few, we believe, of the more meritorious works have escaped our notice; yet we must intimate the Academy, in pleading "want of room," for all upon which remarks might have been desirable.

It is impossible to examine these collected examples of our school, without feeling additional conviction that the working of the Royal Academy is highly to the advantage of British Artists and British Art.

With respect to its present position, and the suggestions that arise out of it, we shall be in a better condition to consider this institution in all its bearings, when the intentions of government in regard to it shall be made known.

THE SOCIETY OF PAINTERS IN WATER-COLOURS.

THE Gallery of this Society was opened to private view on the 27th of April, and to the public on the 29th of the same month. The number of drawings exhibited is three hundred and eighty, comprehending valuable and beautiful productions in every class of subject suitable to this department of Art. It may be observed—and we have before remarked it of the elder members of the Society—that it is refreshing to see men who have been wedded to their art for the best part of half a century, still in the path of improvement. The collection is altogether the best that has of late years appeared on these walls, and in the smaller drawings there is a greater proportion of high quality than we have ever before seen.

No. 9. 'The Terrace at Haddon,' W. C. SMITH. The terrace is on the right running into the picture, the well-known and oft-painted steps being placed at a short distance from the spectator. At the extremity appears a small section of the hall; the whole is seen under an effect of moonlight which is rendered with much truth.

No. 10. 'Palais Ducal et Petite Place sur le Molé—Venice,' S. PROUT. This drawing presents a new view of this famous locality. The point of sight being on the canal abreast of the palace, showing the Ponte di Rialto and even the Bridge of Sighs, with all the picturesque material along the quay. The whole is brought forward in the artist's known substantial and veracious manner.

No. 15. 'The Fishmarket at Rome,' CARL HAAG. One of the contributions of a new associate. The subject is a good one, but the arrangement of the figures affords specimens of *genera* which, though they may at times be in Rome, are not of Rome. The style of this artist is essentially foreign; his drawing is an accurate result of well directed study; his colour is low in tone, with the prevalent brown harmonies of the modern Italian and German schools, and his effects have in them rather the resource of art than the simplicity of nature.

No. 21. 'Moel Stabod—North Wales,' P. NAPFEL. This also is the production of a recently elected associate. The first impression on considering this drawing is that it contains in colour an overbalance of grey hues, and in effect that it has been wrought so assiduously as to have become in some degree spotty. The subject is extremely tempting and very difficult; the artist has however succeeded in realising some charming passages. The style is purely English.

No. 24. 'Summer,' D. COX. The scene is a layfield under the cloudy aspect always painted by this artist. A few figures give life to the composition, the textures of which in the lower part are vigorously appropriate, but we humbly submit that a little more care in the sky would not have diminished the power of the drawing, which is among the most charming works of its author.

No. 31. 'Highland Pastime,' F. W. TOPHAM. This is a large drawing eminently characterised by that apparent facility of composition whence the productions of the artist derive so much of their value. An aged piper is doing his worst to ensnare the twinkling feet of a Highland couple, whose animated lilt does justice to the old man's effort. A group on the left, including the piper, is strikingly natural and forcible; here indeed we think lies the charm of the picture, which, however, is everywhere finished with masterly execution and judicious care.

No. 32. 'The Nootide Rest,' JOSEPH NASH. A drawing of a class of subject different from those usually exhibited under this name. The principal object is a stately tree, apparently a cedar, which has been studied with perfect success. Beneath its spreading boughs a hunter or gamekeeper lies extended on the grass.

No. 36. 'View from Wrotham Hill—Kent,' D. COX, Jun. A drawing free in style and bearing the undoubted impress of veritable

locality. The aspect is that of a dull summer day; the right of the view opens to a distance, which, although airy and indistinct, perfectly describes the remote objective.

No. 44. 'Interior of the Hall at Spoke—Lancashire,' JOSEPH NASR. This artist is unique in his class of subject—the carvings, panelling, armour, trophies, and every passage of ornamentation, are rendered with a surpassing truth and nicety of execution.

No. 48. 'Mountain Scene, Snowdon—taken from Tremadoc,' C. BENTLEY. A highly striking opposition occurs in this drawing, the breadth of the foreground being formed of plain diversified with water, beyond which rises an amphitheatre of hills coloured with much sweetness, and lighted in a manner beautifully true.

No. 61. 'Prayer—Brittany,' JOS. J. JENKINS. This drawing contains a single figure, that of a peasant girl kneeling at a cross on the sea-shore. As in everything exhibited under this name, there is a powerful sentiment in the composition, the effect of which is made out on the principle of broad masses.

No. 66. 'View of Ben Cruachan, looking over Loch Awe, Argyllshire,' COPELY FIELDING. A large drawing, containing more of elaboration than is usually found in the works of this artist. Everything is tinted with the warm radiance of a sunny summer afternoon, the lighter tints being amply sustained by the depth of the foreground, whence the eye is led to the opposite mountains, the summits of which are mantled in clouds. The prevalence of the mellow hues necessary to the effect, is everywhere maintained in every propriety of degree with the most successful consistency.

No. 77. 'Wreck—St. Helier's Bay, Jersey, Elizabeth Castle in the Distance,' JOHN CALLOW. The principal object is the hull of a brig, which has been stranded, with the loss of every stick of rigging. It is admirably drawn, and is remarkably substantial, as opposed to the other materials of the picture.

No. 83. 'Loch Vach—Death of the Otter,' W. EVANS, of Eton. A passage of wild Highland scenery, with some kilted mountaineers resting from the fatigue of Otter-hunting. This loch is not extensive, but it looks here too small.

No. 90. 'The Irish Piper,' ALFRED FRIPP. A large drawing, extremely sketchy in manner, but full of truth in the delineation of prominent nationality. The heads and features of some of the women are animated and expressive.

No. 97. 'Near the Long Walk—Windsor,' W. C. SMITH. A small drawing of much excellence. It is extremely simple in material, but the little that it contains is most judiciously disposed of.

No. 106. 'The Trongate, the Tron Church, &c.—Glasgow,' W. CALLOW. The church is on the right of the spectator, and the point here chosen affords perhaps the best view of it. The subject is not so picturesque as those found in Continental cities, it is, however, a relief to turn to any thing at home after the everlasting street-scenery of Venice, of the Rhineland, and some of the French cities.

No. 105. 'View in the Vale of Irthing—Cumberland,' COPELY FIELDING. In this drawing Naworth Castle is seen on the left, and Lancaster Priory on the right. It is certainly the most beautiful of the late productions of its author.

No. 120. 'A Study on the Thames, near Medmenham,' GEORGE FRIPP. The subject is a small brook communicating with the river. It is shaded by trees, which, together with the still water and all its reflections, are represented with much natural truth. Portions of the drawing seem to have been worked upon the spot.

No. 125. 'Home,' F. W. TOPHAM. A humble interior, a sketch made apparently in the Highlands of Scotland; there are two figures, one, an aged woman, reads the bible, while a maiden is occupied in spinning by her side; the drawing, generally low in tone, shows a charming variety of harmonious colour.

No. 137. 'Hoop-shaving—Bridborough, Kent,' E. DUNCAN. There is very little in this drawing—a few figures and a piece of rough foreground—but in no other artist's works is there found

more success in giving an enlarged interest to a simple subject than in those exhibited under this name.

No. 146. 'A Dull Day in January,' C. BRANWHITE. A large drawing, beautifully made out in parts, especially on the right; it is a composition, and, perhaps, a little too independent of nature.

No. 147. 'The Harem,' JOHN F. LEWIS. This may be pronounced the most extraordinary production that has ever been executed in water-colour. It represents the interior of a harem in Cairo, wherein is seated in luxurious ease a young Turk, attired in the excess of Moslem fashion. Near him, and reclining upon cushions, are two Circassian women, also dressed in the extremity of Oriental taste, and on the right of these is another figure, evidently a study from an Englishwoman, an introduction which injures the uniformity of the composition.

On the right is seen a tall Nubian eunuch, who removes from the shoulders of an Egyptian slave the shawl by which she had been covered, in order to show her to the master of the harem; this figure, with her high shoulders and the characteristics of her features, is a most successful national impersonation. The Circassian women look languidly to the Egyptian with an expression of supreme contempt, which is responded to by a sneer on the face of the Nubian eunuch. At the first sight of this work it appears to want force, but it is clearly the intention of the artist to describe an excess of light, for every unimportant item is affected by numerous many-hued reflections, and the description of this is not an attempt, but a successful fulfilment. It is scarcely possible, without the aid of a glass, even to distinguish all the inimitable elaboration of this picture; it prevails in the most insignificant material—the trellis, the carving, the marble, the silk—every surface is described with a fastidiousness of imitation never before seen. There are very many passages of the work which we would describe at length had we space enough; it must, however, be observed that the subject is not worthy of the care with which it has been wrought out; yet it must be said that this work is unique in the history of water-colour Art; such a maintenance of finish has never been preserved in any similar production. We call it water-colour, though it is painted throughout with body-colour.

No. 165. 'Hare, Wood Pigeon, &c.,' W. HUNT. They are relieved by the favourite background of the artist, a piece of a mossy bank. No hare-skin has ever been painted with such nicety.

No. 173. 'Salisbury Cathedral,' FREDERICK NASR. This appears to be a view of the Cathedral from the left of the Andover road; it is impossible to mistake the edifice. There is prevalent throughout the drawing a very fine feeling.

No. 179. 'Colognyne Wallichii, a raro species of Air Plant,' V. BARTHOLOMEW. A drawing remarkable for the success with which the brilliant hues and the delicate texture of the flower are realised. Another drawing by the same artist, No. 235. 'Rhododendrons, Camillas, &c.,' is as much distinguished by the elegant taste of the composition as the other invaluable qualities already mentioned.

No. 183. 'Scene in Glencoe,' T. M. RICHARDSON. A passage of hill scenery, of a character as wild as any to be seen in the Highlands. The foreground is apparently a sporting pass above which rise, on the left, confused piles of rocks and borbage, while the right is occupied by a depth of shade, a treatment which communicates a becoming grandeur to the subject.

No. 190. 'The Angel's Whisper,' JOS. J. JENKINS. In order to conciliate the countenance of the subject, allusions to a cottage interior are preserved, but associated with sentiment truly exalted. The principal figure an angel—an admirable conception—kneels over the child in the cradle, surrounded by a halo which nearly obscures all around, and the purity of which is contrasted with the moonlight outside. This drawing is charming in feeling, and beautiful in execution.

No. 205. 'St. Paul Landing in Italy,' S. PALMER. This drawing and another by the same hand,

'Robinson Crusoe Guiding his Raft up the Creek,' are evening sun-light effects of a very powerful character.

No. 212. 'A Welsh Funeral—Betws-y-Coed, North Wales,' D. COX. It had been, perhaps, impossible to have given a more impressive character to this scene; it is a drawing which cannot be too highly praised.

No. 223. 'Italian Boy,' O. OAKLEY. A highly characteristic figure.

No. 237. 'Stow Church, Lincolnshire,' F. MACKENZIE. A work in the genuine feeling of our old masters in water-colours. Every stone in the wall which traverses the composition seems to have been individually studied.

No. 258. 'St. Valentine's Day,' O. OAKLEY. The most graceful drawing we have ever seen by this artist. It represents a young lady seated, and speculating on the valentines which she has received.

No. 259. 'Dogs and Game,' F. TAYLER. There is a higher degree of finish in this drawing than is usually seen in the productions of the artist. A white dog, in this composition, is painted to the life.

No. 285. '1. The Offence; 2. The Challenge; 3. The Sword,' G. CATHERMOLE. This artist is become a raconteur. In this and a second series, he tells of the jealousy of a youth which led to the challenge of a rival, and, it would appear, a result fatal to both. Besides these there are by the same hand three scenes from Macbeth, and other drawings, all strongly characterised by the manner of this painter, and abundantly endowed with excellence of that kind which is peculiarly his own.

No. 292. 'Sheep Feeding on the Downs—A Frosty Morning,' E. DUNCAN. In this drawing the sun is represented as penetrating the dense morning mist; and the proposition is rendered with a truth which cannot be surpassed.

No. 314. 'Evening,' G. DODGSON. A composition of infinite sweetness and fine feeling. A stream traverses the foreground, which, with a group of trees, and other simple incident, forms a drawing of a most agreeable character; another drawing No. 253. 'Spring,' instances the interest that can be given to a simple subject by masterly treatment.

The last of the drawings which we have noticed are upon the screens, where they are associated with others of very great excellence, to which we cannot afford the length of notice to which they are most justly entitled.

THE NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

THIS, the sixteenth exhibition of the New Society of Painters in Water Colours, was opened to the public on the 22nd of April. The number of drawings is three hundred and twenty-nine, among which, although there are few high class subjects, there are in landscape and figure composition, works second to none in their respective genres.

No. 11. 'Gardener's Shed,' MRS. HARRISON. A celebration of the brilliant hues and tender textures of various flowers and fruits—hollyhocks, melons, grapes, &c. It is the largest composition we remember by the hand of this lady. The fruit is described with infinite truth.

No. 12. 'Louisa,' E. H. CORBOULD. A portrait wrought out with the most surprisingly minute finish in all its parts. The lady is standing as if in a garden.

No. 22. 'The Chapel of Edward the Confessor—Westminster Abbey,' THOMAS S. BOYS. A large drawing wrought with elaborate fidelity, and apparently without any license in the actual chiroscuro of the place itself. There are the tombs of Henry V., of Queen Eleanor, and of Henry III., and the shrine whence the chapel takes its name.

No. 27. 'The Wise Men from the East on their Way,' HENRY WARREN. One of those desert scenes, in which this artist excels. The wayfarers are mounted on camels—a small caravan, each member of which in following the guiding star seems to move on individually.

The light of the setting sun is broken with much taste on the figures. There is great originality and truth in the manner of treating the subject.

No. 33. 'Thames Barges, &c., off Sheerness,' THOMAS S. ROBINS. There is much monotony in all these river craft compositions. The lion of this view is a barge, which is drawn and coloured with much substantial reality. The movement of the water has been profitably studied, and the colour is that of the waters of an estuary.

No. 34. 'Piety,' W. LEE. Two young French peasants apparently at mass. They are standing, and before them they hold an open missal, having their attention devoutly fixed upon the office. These two figures are perfect in their nationality. They are well drawn and harmoniously coloured, inasmuch as to rank this among the best works of the artist.

No. 39. 'Miseries of War,' L. HAGHE. The subject is an allusion to the capture of a town, some of the inhabitants of which are made prisoners in a portiou seemingly of the crypt of a church, which has been appropriated as a guard-room. The period is about the middle of the seventeenth century, and the locale any part of the Low Countries. The charm of this work is the unmistakable daylight which pervades it. The light, from a window on the right, breaks on the figures in a manner at once to demonstrate light and substance, and this without any effort. The shades are equally successful, every degree being accompanied by a perfect transparency, and the depths are produced without blackness.

No. 40. 'Harlech Castle—North Wales,' W. BENNETT. A distant view of this interesting ruin, showing it at the extremity of the cliff to which the eye passes from a broken and wooded foreground, the materiality of which throws off with good effect the airy tones of the distant objective. The drawing evinces great power.

No. 44. 'The Bazaar—Algiers,' C. VACHER. A large drawing, presenting the usual enclosed area, with shops and an upper gallery. The place is thronged with groups variously characterised and disposed, the whole constituting a subject of much interest to which the artist has done ample justice in his minute and particular description.

No. 47. 'The Convalescent,' MISS FANNY CORBAUX. A drawing of great merit—assuredly the best work we have ever seen exhibited by this lady. It contains two figures—one, 'The Convalescent,' is a pale girl, suffering from a yet lingering malady; the other, perhaps her sister—in the bloom of health—is tending and cheering her with expressions of affection. The figures are extremely graceful, and there is much of elegance in the entire composition, with a highly attractive association of colour and great purity of tone.

No. 50. 'A Mountain Stream,' T. L. ROWBOTHAM, Jun. This drawing and the following, 'A Bit at Bettws-y-Coed—North Wales,' exhibit a truly masterly skill in their general treatment. The airy and harmonious tints, and the decided manner of their application, are beyond all praise.

No. 52. 'A Guard Room,' L. HAGHE. The charm of this admirable drawing is again the light—the infirm and watery sunshine which enters the windows on the left—to which in strong opposition sit two of the guard in the picturesque costume of the seventeenth century. Of these sombre heroes we have one word—they are both profiles in the same pose and apparently of the same individual. Other figures sit opposite, in the light, which is distributed throughout the picture with the usual fine feeling of the artist.

No. 53. 'A Mountain Glen,' A. PENLEY. This looks very like composition; it is a wilderness of rocks and cliffs wrought into forcible effect.

No. 59. 'A Road through the Forest,' W. BENNETT. The subject is well selected for picturesque material. On the left a group of old trees occupies a site in the foreground, the remainder of which is covered with rough herbage and traversed by the "road." There is much in the feeling of this picture to remind the spectator of the fathers of the water-colour art; the artist's style is wonderfully vigorous and full of nature,

but it would be improved by a somewhat more of definition.

No. 65. 'Joan of Arc,' JOHN ABSOLON. She is in prison seated in front of a little oratory, and is divided between her devoutness and a remembrance of past glory as contemplating a suit of armour which lies near her. The countenance is endowed with language painfully eloquent; the circumstances of the subject are set forth with a penetrating intensity.

No. 75. 'Christ with his Disciples in the Cornfield,' HENRY WARREN. The subject is the Saviour's rebuke to the Pharisees when they complained that the disciples plucked and ate the corn. The principal figures are Christ and the Pharisees, the disciples being distributed in secondary groups. Between the principals a direct relation is established, and we must remark the Arab costume given to the Pharisees; this is more truly accurate than the conventional modifications of classic draperies which we continually see in sacred subjects. It is the most earnest of all the artist's late works.

No. 83. 'On the Wye at Goodrich—Rain clearing off,' D. H. MCKEWAN. The estate occupies a site in the middle of the composition, the right of which is closed by an eminence covered with trees. The right foreground is a beautifully illusive passage of art—a road solid and firm going directly into the picture.

No. 97. 'Sunset—Coast Scene,' AARON PENLEY. This appears to be a composition the effect of which is derived from the partial veiling of a sunset sky by a dense horizontal bank of clouds, and a varied, mellow, and subdued light is cast upon the whole of the objective. The long cloud looks perhaps in its uniformity somewhat artificial.

No. 104. 'Highland Emigrants—Morning of Departure,' R. CARRICK. A large composition, showing a Highland family assembled on the beach as about embarking for the Colonies. The figures are principally a stalwart herdsmen with his wife and aged mother. The narrative is forcible and perspicuous, and the colour strikingly brilliant.

No. 111. 'Blue Bell Hill and Kits Cotty House, Kent—Hop-pickers Returning,' JAMES FARREY. The features of this composition are highly picturesque without being romantic. The left is closed by a near eminence along the bottom of which runs a road, the right section being open to distance. The character of the rising ground with its coat of verdant pasture is rendered with perfect truth; indeed the drawing in all its parts has a valuable semblance of reality.

No. 119. 'The Wayfarers,' HARRISON WEIR. These are a pair of donkeys, drawn with great spirit, perhaps a trifle too rough in the coat.

No. 142. 'Mahomet Preaching in his first Mosque at Medina,' H. MAPLESTONE. Simply a sketch,—an effect,—but managed in a manner to convey an impression of grandeur.

No. 150. 'The Unexpected Return,' W. COLLINGWOOD. A cottage interior, wherein a fisherman's wife is seated near the door. The feature of the sketch is the successful treatment of the light, which is broken on the figure in a manner closely imitative of nature.

No. 179. 'Venice,' J. H. D'ECVILLE. The subject is the section of a small canal flanked by houses of ordinary class. The drawing is characteristic and spirited.

No. 185. 'Cottager,' JOHN ABSOLON. A female rustic seated. The colour of the features is rich, transparent, and beautifully mellow.

No. 190. 'Evening in the Valley,' D. H. MCKEWAN. This resembles composition—presenting a close rocky nook traversed by a stream. The whole is kept extremely low in tone, realising with much truth a broad twilight effect.

No. 193. 'Caxton reading the First Proof-Sheet from his Printing-Press, in Westminster Abbey, March, 1474,' E. H. WENHAM. The subject has received a worthy treatment at the hands of the artist; and so perspicuous is the theme that no title is necessary. The scene is such a portion of the Abbey as one of the chapels might be, without the monuments. Caxton is seated examining the proof, which is also cursorily scanned by Wynkin de Worde, Richard Pynson, and others interested in the experiment. The figures are effectively distributed, and the

attention of all points to the paper in the hands of Caxton. We humbly opine that had the light and colour been focussed and broken from the principal group, the effect had been much improved. It is, however, an admirable drawing, a valuable result of much profitable labour and study.

No. 198. 'Roses and Fruit,' MRS. MARGRETS. Roses, grapes, a melon, and other fruits. The grapes are temptingly real.

No. 202. 'Red Riding Hood,' CHARLES WELGALL. The wolf here is the *primo uomo*. The object of his bitter discouraging is clearly to show his teeth. He expresses himself with all the eloquence of his original in the story.

No. 203. 'Near the Duchess's Walk, Knowle Park,' CHARLES DAVISON. This is one of the most charming groups of trees we have ever seen in water colour. The sun is somewhere outside, but we are here in the shade with the ground *pourtré* with sunshine.

No. 207. 'Refreshment for the Traveller in North Wales,' J. H. MOLE. Two children in a piece of open composition; the elder carries fruit, the younger is seated on the ground. Like the works generally of this artist, the drawing is remarkable for sweetness of character and harmony of colour.

No. 220. 'At Lambeth—North Wales,' MRS. OLIVER. The subject is judiciously chosen for picturesque material. The drawing is highly effective.

No. 225. 'A Sebecl or Public Reservoir,' L. HAGHE. A subject entirely different from those which we are accustomed to see treated by this artist. The figures are Arab, and they are assembled round the reservoir. The impersonations have that substance and vitality which distinguish all the figures drawn by Mr. Haghe.

No. 242. 'Harlech,' D. H. MCKEWAN. From a rugged foreground the eye is led upwards to the castle which crowns an eminence at a modest distance from the point of view. The power of the drawing lies in the near passages, which, with a little more light, had been much improved.

No. 250. 'Anxious Thoughts,' WILLIAM LEE. A cottage interior, at the window of which is seated a fisherman's wife. This figure is drawn with the most perfect accuracy and lighted in a manner to render it extremely effective.

No. 253. 'Jessie and Colin,' MISS SETCHEL. The subject is a celebration of the loves of Jessie Bourn and Colin Grey, who are held up in Crabbe's Tales as a most exemplary couple. This is however the scene in which Colin's mother suggests that he should procure the licence. We see but very few of this lady's productions; those however which she does exhibit are unexceptionable. The colour of this drawing is charming, and in effect and expression it possesses extraordinary excellence.

No. 265. 'Amy Robsart's Withdrawing room at Cunnor Place,' JOHN CHASE. This drawing represents a room elaborately ornamented in the style of the sixteenth century; a successful restoration with every variety of the ornamentation of the time, but for a pictorial subject there is too much of the drawing-room formality about it.

No. 271. 'Elgiva in the hauds of the creatures of Odo, Archbishop of Canterbury,' ED. H. CORBOULD. A work distinguished by extraordinary power. Elgiva kneels in terror at the feet of an armed man, who holds her in readiness for another to brand her with a red hot horse shoe. The subject is by no means an agreeable one, but the drawing is a production of a high degree of merit.

No. 280. 'Library of Useful Knowledge,' G. H. LAPORTE. The subject of this drawing is derived from the article on the Horse in the "Library of Useful Knowledge." It describes the parting of an Arab with his horse, which he has sold to a European officer. The spirit and animated action given to the creature are points of rare excellence in animal drawing.

On the screens are hung many drawings of great merit, as 'A Straw Yard,' G. H. LAPORTE; 'Dobbs,' MISS FANNY CORBAUX; 'Lilac,' MARY HARRISON; 'Study from Nature,' MRS. HARRIS; 'Master Hernandez,' E. H. CORBOULD; 'Landscape—Summer,' T. L. ROWBOTHAM, Jun.; 'Florete de Nene,' E. H. CORBOULD, &c. &c.

J. D. Harding

THE task of writing the biography of the living is at all times one of great difficulty, but it becomes especially so when we believe there is no desire on the part of the individual who is the subject of the notice to be conspicuously brought before the public; or it may perhaps rather be said, who thinks that the public have little interest in him beyond what it sees and knows of his works. There are two extremes which in cotemporary biography it is necessary to guard against;—inordinate praise, which savours of adulation, and the withholding the truth, for fear of giving offence to the sensitive mind. In the short sketches which from time to time we have given in our Journal, our object has been to observe a just medium, speaking our own thoughts in the way we believe most congenial with the feelings of those whom our writing concerns, yet independently, and giving to the public only that in which it is most likely to be interested.

The materials for such authorship are in most cases scanty enough, unless we could take a retrospective view of the artist's studio, through his long early years of doubts, and difficulties, and hopes, and disappointments; and then onward through his after life of growing success and final triumph. Such a review would be as profitable as it is generally impracticable; but it is only an occasional glimpse we get of the chequered scenes through which he passes,—it is only now and then we hear the sigh of the sorrowful; or the less frequent accents of the voice of gladness. The true history of the artist may, after all, be better gathered from what we annually see of his works than from any other source. We have here the fruit, though we are, perhaps, ignorant by what means it has been reared and brought to maturity;—

“How begot, how nourished.”

Mr. Harding's life appears to have been spent more for the advantage of others than for his own personal fame; yet the very means he has employed for the former object have procured him the latter, to an extent which few artists of

the present day enjoy. It is our sincere opinion that no living artist has a more widely extended popularity, and a name more universally known, both at home and abroad, than he. Into whatever remote corner of the world the art of lithography has penetrated, the sketches of this accomplished draughtsman have found their way. It is quite needless for us now to expatiate on the merits of Mr. Harding's lithographic publications, but we believe that all the pictorial exhibitions in the country have done less to create a taste for Art, and a love and practical knowledge of it, than the various treatises and examples which his pencil has sent forth during the last twenty years and upwards. There are none engaged in the work of instruction (we speak of landscape drawing, which is most commonly taught), who are not deeply indebted to him for lightening their labours, and rendering their task one of comparative ease and brevity. Lithography has made rapid strides in his hands.

But we should do meagre justice to Mr. Harding if our eulogiums upon his productions extended no further than his lithographic works; they have made his name famous, but he has other claims to high consideration: as an old and valuable member of the Senior Water-Colour Society, his pictures in that department of Art have been among the most attractive of the exhibitions; while within the last few years the walls of the Royal Academy have borne many of his paintings in oil, deserving of other places than those where we have grieved to see them hanging. Even in the Exhibition just opened, there is one of the very best pictures he ever painted—one that no artist in or out of the academical body could surpass—hanging in the *architectural* room; the room which, of all others, is, as every one knows, left unnoticed by three-fourths of those who visit the Exhibition. It would be difficult to persuade us that there is nothing in this which is meant to undervalue or prejudice the painter; he can afford to overlook it, nevertheless, however galling it may be to his feelings.

The school to which Mr. Harding is mainly,

if not entirely, indebted for the position he occupies is that of nature—the only preceptress whose lessons cannot fail of success, if followed diligently, enquiringly, and in a right spirit. His father was an artist of considerable talent, in the neighbourhood of London, whose time was more employed in the instruction of others than in working for “exhibition” reputation. To this gentleman, we have heard Mr. Harding say, he owes much both for precept and example, as well as to that excellent artist and inestimable man, Mr. S. Prout, to whom he was taken, when about sixteen years of age, for some instruction. The father complained that his son wanted ideas. “Let him draw then till ideas come,” was Prout's reply; a true and valuable lesson, which was not lost upon the young artist; and well would it be for other learners would they earnestly employ their faculties in searching after these essentials to the independent practice of Art, and endeavour to bring them somewhat near maturity ere they venture into the arena of public opinion. The “*Liber Studiorum*” of Turner, R.A., is a work which Mr. Harding acknowledges to have studied with much profit, for it taught him, he says, “That if I could not bring mind as well as materials to the imitation of nature, I should do nothing;—that there was something for my philosophy to dream of, and for my eyes to see;—that there was something to be gained from nature beyond what is revealed to the sight.”

Herein lies the highest charm of this artist's style; he shows us nature in all her varied aspects as she reveals herself to the eyes of all, and not through the medium of artistic fancy; his pencil is bold, vigorous, and free, yet of exceeding delicacy; and whether it is busy among the castles and towers of feudal times, the rivers and mountains of Spain, Italy, and Germany, or the native forests, parks, and rustic cottages of our own land, it is equally felicitous in the truth and elegance of its expression. There is another feature that distinguishes his works above those of most landscape-painters, and that is, the introduction of his figures; they are always, whether of the human or the brute creation, most cleverly drawn, easy, picturesque, natural, and ever in their right places; even his solitary places are rarely deserted to the owl and the bittern, for he peoples them with the creations of his imagination, yet belonging to our waking world.

It is our conscientious belief that no living artist has done more—we would even go further, and say none has done so much—to create a taste for Art, and to disseminate a knowledge of it among the community at large as Mr. Harding, and if by this standard honours were meted out, he would have come in for a full share. There are other claims to honorary distinction in the profession than those arising from the annual exhibition of some half-dozen pictures, however excellent these may be; and we presume to say, that in no way has the Royal Academy done justice to the subject of this brief notice, by refusing him a place among them. As an artist of unquestionable merit, as a man of education, and as a gentleman, he is in all respects worthy to be included in their ranks. There have been, and still are, those within them who cannot show one half the titles to the position they hold, that we presume to say Mr. Harding has. We disclaim the purpose of dictating to the members of the Academy whom they should elect into their body; we only state our opinion whom they ought to choose; and in so doing we have no other motive than the credit of that Society, and a desire to see it render tardy justice to one who has been too long overlooked by it: we can have no personal feeling in the matter. There will shortly be four vacancies among the Associates, and if the name of Harding be not included in the list of their successors, we shall say the Academy neither studies its own interests, nor bestows its rewards where they are most due. Should they still be denied, he may nevertheless console himself with the fact, that he has already achieved a reputation which no Academical title can augment, and which cannot be impaired by the distinction being refused to him. It is simply as a recognition of his merits on the part of his brother artists that we desire such distinction for him; the public have long since borne their testimony to his worth.

James Stark

JAMES STARK was born at Norwich in 1794. His father was an eminent dyer of that place—a man distinguished for his literary and scientific acquirements.*

Mr. James Stark evinced an early fondness for drawing, which the daily visits to the house of his school-fellow and constant friend and companion, the late John Crome, Jun., tended to encourage and promote. Such, indeed, was his progress, that the elder Crome (whose works are now so eagerly sought for by the patrons of Art), induced the father to place young Stark with him in 1811, as an articled pupil for three years.

Norwich may be said at this time to have possessed a school of Art. It had its Society of Artists, the first established out of London, with an annual exhibition, entirely the production of the City and County; and the first provincial exhibition in England was upon their walls. Most of those whose works contributed so much to the interest of the exhibition are now no more; the Cromes (Senior and Junior), J. S. Cotman (whose antiquities of Normandy and other works have gained for him extended fame), Vincent, Sharpe, Ladbrooke, Dixon, and others. Much is due to the zeal and earnestness of the small body of men composing this society, for we find in a circular issued on the opening of this new exhibition-room, "that they had taken upon themselves a responsibility equal to about 200*l.* per annum for the charges incidental

* We make the following extract from the notice of his death, which appeared in the *Norwich Mercury* of February 26th, 1831:—"Died, on Wednesday last, at his house at Thorpe, Mr. Michael Stark, in the 32nd year of his age. We feel it to be our duty to record a slight sketch of the valuable life of this excellent man. Mr. Stark was a native of Scotland, a descendant of an ancient and honorable family in the county of Fife. At an early age he evinced great inclination for the pursuit of science, and showed a desire to cultivate chemistry. As the art of dyeing appeared to Mr. Stark to be that to which he could most advantageously apply his favourite science, he induced his father to place him as an apprentice to an eminent dyer in Scotland. When the term of his apprenticeship expired, he removed to London, and became acquainted with many scientific men of his day. He subsequently was induced to settle in Norwich, where he resided till he retired from business. This city is indebted to Mr. Stark for the introduction of many valuable discoveries and improvements, which have tended considerably to the success of its manufactures. He was a kind-hearted and benevolent man, a most affectionate husband and father, a warm and inflexible friend. Mr. Stark leaves this world sincerely beloved and deeply lamented by all who had the pleasure of his acquaintance."

to their exhibition, in the conviction that the taste of the County and City would not be backward to assist their efforts for the promotion of Art."

In this, however, they were doomed to be disappointed. Norwich has hitherto been without patronage, and it is with regret we see recorded in the pages of one of its local histories that "since their establishment the Norwich Society of Artists have exhibited about 4600 pictures, the productions of no fewer than 323 individuals, while scarcely a single picture has been bought in the Norwich room; and while the receipts at the door have never amounted to a sum sufficient to meet the expenses, the works of the very same artists have been readily purchased at the exhibitions of London, Edinburgh, Leeds, Liverpool, Manchester, Birmingham, &c."

We do not suppose that even a moiety of this number of pictures has been supplied by local artists, but it may reasonably be presumed that they contributed a very large number. The indifference here manifested is not a solitary instance, with shame be it said, of the truth how little a prophet is honoured in his own country; when, moreover, his reputation has been established in the first circles of Art, and his name is associated with those who have established themselves high in public opinion. We are often surprised at the apathy existing in provincial cities and towns towards those whose names have become as "household words" with thousands of their fellow-countrymen, yet are unspoken where they should be most familiar; and greatly do we wish that our observations would stir up the inert spirit that vegetates, but thrives not, in such soils, to one of active, and just, and liberal appreciation of what is due to themselves and to others. True it is, that when the hand has done its work, and mind and body have ceased from their labours, a picture is sometimes subscribed for to be placed in the Town Hall, or perhaps a tablet is reared in the parish church to commemorate the dead, in mockery of the slight bestowed upon the living,—and then men think they have paid a proper tribute to genius! Do not the histories of our great men in Art and Literature almost everywhere proclaim this to be their meagre reward from those who should have been the earliest to foster the talent that germinated among them!

We could cite a hundred instances to support the assertion, if it were not a fact already too well known, though rarely acknowledged. Unfortunately for themselves, so far as regards the honours paid by man to the great artists are not looked upon as public benefactors; their triumphs are unworthy of public ovation,—in silence and without ostentation these triumphs have been won, and as silently are they enjoyed by those who have earned them. We are no advocates for dragging artists out of their studios to make them spectacles for the multitude, and nothing, we are sure, would be more uncongenial with the feeling of the far larger majority of them; yet it would not be the less gratifying to see a desire to award them due honour by the noble and the wealthy, were it only as the outward sign of the respect to which intellectual greatness is entitled.

In about the year 1812 the younger Crome and Stark were elected members of the Norwich Society, and the monthly meeting of its members tended much to sustain the spirit which manifested itself on the annual display of their works.

Shortly after the expiration of his time with Crome, Mr. Stark was sent to London, where he assiduously applied himself to draw the human figure, and in 1817 he was admitted a student of the Royal Academy. About this period he exhibited a picture of "Boys Bathing," at the British Institution, which was purchased by the Dean of Windsor; and in the following year he exhibited at the same Institution, "Flounder Fishing" (purchased by Sir John Grey Egerton); "Penning the Flock" (bought by the Marquis of Stafford); "Lambeth—looking towards Westminster Bridge" (by the Countess de Grey); and this year also the Directors awarded to him a premium of 50*l.* In the following season a "Grove Scene" was purchased by Sir Francis Chantrey from the Exhibition at Spring Gardens, and one from the same rooms by the late T. Phillips, R.A. Commissions now flowed in upon him from Lord Northwick, Mr. Watson Taylor, Sir G. Beaumont, Sir F. Freeling, and other distinguished patrons of Art; but in the midst of this scene of hope and bright promise he was compelled to leave London and return to the care of his family at Norwich, from a severely painful affliction, which entirely prohibited the practice of his profession for three years. He remained in Norwich about twelve years, and during his stay there married. In 1827, not being sufficiently well to venture on a residence in London, he circulated proposals for publishing a large and costly work on the "Scenery of the Rivers of Norfolk." This was accomplished with some pecuniary loss, but being a book of purely local interest, much general patronage could not be expected, while his enthusiasm led on to a greater outlay than was, as a matter of speculation, prudent.

In 1830, Mr. Stark returned to London, where he remained ten years; and in 1834 he had the misfortune to lose his wife, leaving three children. A residence amidst the sylvan scenes of Windsor seemed, subsequently, more congenial to his tastes and feelings, and therefore in 1840 he took up his residence in that town, and painted many pictures from its beautiful locality; the willowed banks of the Thames, with the splendid oaks and beeches of the Forest and Park furnishing many subjects for his pencil.

For the advantages of his son's education in the Schools of Art in the metropolis Mr. Stark has lately returned to London.

It would seem almost unnecessary to dilate upon the merits of this artist, whose works, for more than thirty years, have adorned the walls of our metropolitan and provincial exhibitions. One who has had the good fortune to secure the patronage of such names as we have enumerated above must be no ordinary painter. His pictures, in subject and treatment, are purely national, hence they are sure to find favour with an English public; they have that originality which prevents invidious comparison with others, and that unaffected truth and beauty which constitute their own especial value. We trust it may be very long ere the freshness and vigour of his pencil will be lost to the lover of pure natural Art.

PASSAGES FROM THE POETS.

Drawn by Birket Foster.

Engraved by G. P. Nicholls

MORNING.

"Rous'd by the cock, the soon-clad shepherd leaves
His mossy cottage, where with peace he dwells
And from the crowded fold, in order, drives
His flock, to taste the verdure of the morn."

THOMSON'S SCOTUS

SUMMER.

THESE ENGRAVINGS form a portion of the celebrated frieze designed by the distinguished artist Bendemann, for the throne-room of the King of Saxony's palace at Dresden. The entire series illustrates the life of man, from infancy

to age, showing the various occupations in which he is chiefly engaged during the four principal periods of his life. In the above designs he is employed in agricultural operations.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

THE CURIOSITIES OF STEEL MANUFACTURE. DAMASCENING, OR DAMASC WORK, &c.

THERE is much uncertainty as to the period at which steel, or even iron, first began to be used by man. Passages occur in the Homeric poems which seem to imply that steel was known to the Trojans and the Greeks, but many learned commentators on the literature of this people are disposed to think that the term employed is only a generic name for metal in general.

Confining, however, our attention to our own island, it appears tolerably certain that the weapons of offence and defence of its early inhabitants were bronzes; and that indeed most of their handiwork tools were formed of the same material, hardened by hammering. In the article "On the Chemistry of Mixed Metal Castings," the character of those bronze swordsmen celts is alluded to,* and a very fine series of these curious relics exist among the many interesting illustrations which are to be found in the Museum of Practical Geology, shortly to be opened to the public. The earliest indications that we find in Britain of the smelting of iron occur in the Forest of Dean and in the County of Sussex; but whether forges existed in either of those places before the twelfth century, appears to be exceedingly problematical. Those heaps of scoria, which are found in many parts of the country, and are known by the names of the "Old Cinders," the "Danes' Cinders," "Jews' Works," and so on, are more probably the relics of smelting processes carried on upon copper and lead ores than upon iron. Some writers, however, contend that the Anglo-Saxons were acquainted with both iron and steel, and yet they admit that the comparatively simple art of casting iron in sand seems to have been unknown, or, at least, not practised until a very recent date. We do not intend, however, to dwell upon the history of this, the most important of the metals; suffice it, that we situate as showing the advance of our iron manufacture, the gradual increase which has taken place in our produce of this metal. The following table exhibits the number of furnaces in blast, and the number of tons of iron produced by them at different periods:—

	Tons.
In the year 1615, 300 furnaces producing 150,000 of iron.	
" 1740, 59 " "	17,000 "
" 1836, 121 " "	250,000 "
" 1857, 284 " "	630,000 "

In the year 1849 the number of furnaces in blast had arisen to 541, producing 1,750,000 tons of iron, the money value of which will be about 15,300,000*l*.

The following statement, showing the great importance of our iron manufacture, is from McCulloch:—

"Taking the annual produce of pig-iron in the United Kingdom at 1,750,000 tons, and supposing that about 34 tons of coal are required for the production of each ton of iron, the consumption of coal in this branch of iron trade will, on this hypothesis, amount to 6,125,000 tons a year; adding to this 3,000,000 tons for the coal required for conversion of pig-iron into bar-iron, it follows that a supply of no fewer than 9,125,000 tons of coal will be annually required in this single department of industry! And hence, also, the fact that the consumption of coal in the production of iron is more than three times greater than its consumption in the metropolis."

It will not be uninteresting to show the relative produce of coals in the different iron-producing countries. This was obtained with tolerable correctness in 1848, and was as follows:—

Great Britain	31,500,000 tons.
United States	4,400,000 "
Belgium	4,050,077 "
France	4,141,017 "
Prussia	3,500,000 "
Austria	700,000 "

* See *Art Union*, January 1850, page 13. In this article, by a careless oversight, an error exists. Yellow brass is said to be composed of tin and copper, instead of zinc and copper; as it is really corrected in the next paragraph, it was thought unnecessary to allude to it before, but having understood that it has been thought to be a statement made in ignorance, it becomes necessary, in now correcting it, to express a hope that there are but few schoolboys who could have been misled by the error.

Intending to confine our attention to some of the more ornamental varieties of steel manufacture and the processes of ornamentation (many of them involving nice chemical operations), which are employed, we shall omit any description of the pig, or bar iron manufacture, and proceed at once to consider the chemical nature of this very beautiful metal.

Although we now employ steel so commonly for the every-day purposes of life, and that every attention is given to its manufacture, it cannot be said that we have an accurate knowledge of its composition. It appears to be a compound of carbon and iron; but when we find that the composition of cast steel is ninety-nine parts of iron, and but one part of carbon, and that too combined with silicon, we are led to question if the combination of the carbon with the iron is actually the cause of the striking differences which exist between iron and steel.

The process adopted for the purpose of converting iron into steel is the following. Into an oven of a peculiar construction bars of iron are placed, regularly stratified with charcoal-powder, from ten to twelve tons of iron being the usual charge; the whole is then covered with a bed of sand. Heat is applied, and the iron is kept red hot for eight or ten days. If, upon withdrawing a bar, it is found sufficiently converted into steel, the whole is allowed to cool slowly. This operation is called *cementation*, and, as much of the steel thus formed is blistered,—evidently from the escape of some gas or vapour, which has not received that attention so important a process requires,—it is, therefore, called *blistered steel*. When these bars are fattened by the tilting-hammer, it is known as *tilted steel*; while *German*, or *shear steel*, is that produced by breaking and welding together the blistered bars. When cementation steel is broken up and fused in a crucible, protected from the action of the air, it becomes *cast steel*, which is much more uniform in structure than the other varieties.

It is well known that the qualities of steel are very various, and that some countries have been long famous for the character of that which they produce. In most instances these differences arise from the chemical or physical characteristics of the iron ores employed, these being the carbonate or clay-iron-stone, hematite iron ores, (being peroxides of iron,) and magnetic iron ores. The ores of Great Britain are the carbonates and peroxides; in two places only is magnetic iron ore known to exist: it is usual with our manufacturers to mix the ores of different localities together, the quality of the iron being found to vary very much, according to the proportions in which these mixtures are made.

Since it is proposed to confine attention to some interesting processes only, we shall not detain the reader by any further notice of the raw material.

Steel admits of being alloyed with other metals, and Stodart and Faraday, in a series of admirable researches on the alloys of iron and steel, appear to have proved that silver, platinum, rhodium, gold, nickel, copper, and tin would chemically combine with steel, imparting to it certain peculiar properties. The alloy of steel with silver gave such advantageous results that we transcribe the portion of the memoir which details the conclusions of the experiments undertaken by these able observers:—

"In making the silver alloy, the proportion first tried was one silver to one hundred and sixty steel; the resulting buttons were uniformly steel and silver in fibres, the silver being given out in globules during solidifying, and adhering to the surface of the fused button; some of these, when forged, gave out more globules of silver. In this state of mechanical mixture the little bars, when exposed to a moist atmosphere, evidently produced voltaic action, and to this we are disposed to attribute the rapid destruction of the metal by oxidation; no such destructive action taking place when the two metals are chemically combined. These results indicated the necessity of diminishing the quantity of silver, and one silver to two hundred steel was tried. Here, again, were fibres and globules in abundance; with one to three hundred the fibres diminished, but still were

present; they were detected even when the proportion of one to four hundred was used. The successful experiment remains to be named, when one of silver to five hundred steel were properly fused, a very perfect button was produced; no silver appeared on its surface; when forged and dissected by an acid no fibres were seen, although examined by a high magnifying power: the specimen forged remarkably well, although very hard; it had in every respect the most favourable appearance; by a delicate test every part of the bar gave steel. *This alloy is decidedly superior to the very best steel*, and this excellence is unquestionably owing to combination with a minute portion of silver. It has been repeatedly made, and always with equal success. Various cutting tools have been made from it of the best quality. This alloy is, perhaps, only inferior to that of steel with rhodium, and it may be procured at a small expense; the value of silver, where the proportion is so small, is not worth naming; it will probably be employed to many important purposes in the Arts."

It does not, however, appear that this *silver-steel*, as it was called, has been to any extent employed in manufacture; the great use of steel is for the fabrication of cutting instruments, and for this purpose it has been principally prepared from its first introduction, and great attention has been bestowed upon the processes to which it is subjected to produce the two desiderated qualities of hardness and temper.

The East has been long famous for the manufacture of sabres, the steel of which is said to surpass all other kinds. Damascus in Syria, and Ispahan in Persia, are cities celebrated for their sword manufacture. The Damascus blades have, however, been more highly extolled than those manufactured in any other part of the world, and they have been sold at exceedingly high prices. The true Damascus sabres are said to possess great keenness of edge, wonderful flexibility, a peculiar flocked grain, and a remarkable musky odour when the blade is bent or rubbed. The twisting and intertwining of the fibre of the steel of these oriental scimitars, called hence Damascus work, is the principal point which now requires attention.

The general impression is, that the old method of damasking steel was to weld together wires of iron and steel and give them twists, in different directions, during the process of welding. This is the plan now adopted to give the ornament to the twisted rifle barrels. Bars of iron and steel placed in regular alternations are welded into one bar; then this bar, or two or three of them placed together are twisted spirally, and the whole welded. Upon polishing the gun-barrel, very intricate and often elegant patterns will be apparent. It is, however, supposed by M. Bréant, that the steel of which the Damascus swords were made was of a peculiar character,—that, indeed, from the process of its manufacture, it consists of a very pure steel intimately mixed with a steel which contains an excess of carbon. This is rendered probable from the circumstance that the cakes of steel made at Golconda were of this peculiar character. It has been shown by experiment that a mixture of iron and steel filings being welded together, produces a very fine damask. In both Austria and Prussia, what are called "Damascus blades," are manufactured as follows:—

"A long flat piece of malleable steel, of about one inch and a half in breadth and one-eighth in thickness, is to be first bound with iron-wire, at intervals of one-third of an inch. The iron and steel to be then incorporated by melting—welding—and repeated additions of more iron-wire. This compound material is then to be stretched and divided into shorter lengths, to which, by the usual process of welding, grinding, and tempering, any wished for form may be given. By filing semicircular grooves in both sides of the blade, and again subjecting it to the hammer, a beautiful rosette-shaped Damascus is obtained; the material can be made to assume any other form." Among the old methods of beautifying swords, and also a variety of other articles manufactured in steel, was the inlaying of it with various other metals, as gold and silver wire; this process is also called damasking or damascening. In some cases the metal is cut

deep to represent any design, and gold or silver wire is forcibly driven into it. In others the steel is heated until it becomes of a blue or violet-colour, it is then hatched over and across with a knife; ornamental designs are then traced on the steel with a fine brass point or bodkin, and then chasing the metal, fine gold wire is sunk into it with a tool made for the purpose.

The extent to which this steel ornamentation was carried in the middle ages was very great, and artists of the first ability were employed in this work. Benvenuto Cellini informs us that he devoted much attention to the subject, and he writes as follows:—"My own performances, indeed, were much finer and more durable than the Turkish, for several reasons. One was, that I made a deeper incision in the steel than is generally practised in the Turkish works; and the other, that their foliages were nothing else but chichory leaves, with some few flowers of echites; these have, perhaps, some grace, but they do not continue to please like our foliages. In Italy there is a variety of tastes, and we cut foliages in many very different forms. The Lombards make the most beautiful wreaths, representing ivy and vine-leaves, and others of the same sort, with agreeable twinnings highly pleasing to the eye. The Romans and Tuscans have a much better notion in this respect; for they represent acanthus leaves with all their festoons and flowers winding in a variety of forms; and among these leaves they insert birds and animals of several sorts, with great ingenuity and elegance in the arrangement."

Several fine examples of the varieties of Damascus work we have been describing will be found in the Medieval Art Exhibition now open at the Rooms of the Society of Arts. The advance of chemical knowledge has enabled our manufacturers to add several methods of steel ornamentation to these we have already described, all of which, or some modifications of them, are still employed amongst us.

Ornaments are now commonly put upon steel by the chemical action of solutions of the various metals, most of them being combinations with acids. The steel being covered with some etching ground, the design is cut through to the metal, and the metallic solution being poured upon it, the metal or its oxide is precipitated, and a superficial chemical combination is thus effected. Steel may be gilded by the employment of the ethereal solution of gold. This is made by taking a neutral solution of the chloride of gold, and agitating it with some rectified ether; the gold is thus separated from the one fluid, and held in solution by the other. Upon dipping steel into this ethereal solution, an electro-chemical action appears to take place, the result of which is that a film of gold is deposited upon the metal. In this way "gold-eyed needles" receive the small coating of the precious metal; and many steel ornaments are thus fancifully decorated. The coating which the steel thus receives is exceedingly attenuated, and much friction removes it from the surface.

A very brilliant display of colours may be produced upon steel by depositing upon it films of lead by the agency of a Voltaic battery. The piece of steel to be ornamented is connected with one pole of a Voltaic battery, and upon it is placed a card-board perforated pattern of any suitable design. This is kept in close contact with the steel, and it is placed in a solution of sugar of lead. A wire from the opposite pole of the battery is now brought down upon the steel, piercing exactly through the centre of the perforated card. A beautiful series of the colours of thin films spread around this point and enlarging, gradually cover every part of the steel-plate, except those parts upon which the paper of the pattern is pressed.

A process of Etching on Steel by Electricity we have already described in this Journal (*Art-Journal*, vol. xi., p. 9). We are not aware if it has been as yet introduced by any of our manufacturers, but it appears to us that it is capable of being made available for many interesting purposes.

The only other kind of ornamentation to which we shall at present refer, are those beautiful steel-buttons and other things introduced to the Arts by John Barton, Esq., and known by the

name of *Iris Ornaments*. These are, however, now seldom seen, but there can be no doubt but in one of the capricious turns of fashion, they will again become the subjects of admiration.

The beautiful play of nebulous colours observed upon mother-of-pearl, has been found to arise from the circumstance, that the shell is crossed by an immense number of fine lines, as many as 3700 lines being contained in an inch. Upon the knowledge of this it occurred to Mr. Barton that the same effect could be produced by producing a great number of equally fine grooves upon the surface of polished steel.

By means of a delicate engine, operating by a screw of the most accurate workmanship, he succeeded in cutting grooves upon steel at the distance of from the 2000th to the 10,000th of an inch. These lines are cut with the point of a diamond; and such is their perfect parallelism and the uniformity of their distance, that while in mother-of-pearl we see only one prismatic image, we see in the grooved steel surfaces seven or eight images, all as perfect as any produced by the finest prisms. Nothing can surpass the exceeding beauty of these iridescent surfaces, which when the sun shines on them or the light of a candle, appear to scintillate with all the brilliancy of the radiations from the diamond. A very particular examination of the optical phenomena connected with these grooved surfaces has been made by Sir David Brewster, and his relation of them in his treatise on Optics is well deserving attention.

On some future occasion we shall return to this subject, particularly to that part of it which relates to the preparation of steel plates for engravers, and of the process and advantages of engraving on steel.

ROBERT HUNT.

THE VERNON GALLERY.

CLARISSA HARLOWE.

C. Landseer, R.A., Painter. G. A. Peckham, Engraver.
Size of the Picture, 1 ft. 10½ in. by 1 ft. 6½ in.

It is just about a century since Richardson sent forth to the public his voluminous, but highly entertaining and instructive novel of "Clarissa Harlowe," a work which from its healthy character would furnish wholesome reading, even in our day, when the amenities of literature are so much more insisted upon, than at the period when this book was written. Yet, who now would venture upon the task of wading through eight volumes of fiction—and that a fiction of domestic portraiture,—however interestingly the tale may be told.

Mr. Robert Chambers, in his "Encyclopædia of English Literature," says, "The character of Clarissa Harlowe is one of the noblest tributes ever paid to female virtue and honour. The moral elevation of this heroine, the saintly purity which she preserves amidst scenes of the deepest depravity and the most seductive gaiety, and the never failing sweetness and benevolence of her temper, render Clarissa one of the brightest triumphs of the whole range of imaginative literature. Perhaps the climax of her distress is too overwhelming—too oppressive to the feelings—but it is a healthy sorrow. We see the full radiance of virtue; and no reader ever rose from the perusal of those tragic scenes without feeling his moral nature renovated, and his detestation of vice increased."

This quotation will serve to give a general idea of the sentiment of the picture here engraved. The scene is a bed-chamber of humble pretensions, which bears about it unmistakable evidence of having been, at some period, tenanted by other spirits than that of her now kneeling in prayer, silent and humble; there is a rude sketch of a gibbet with a figure hanging, and there are sundry initials, scratched on the dilapidated wall, in the corners of which the spider has weaved a giant web; all signs of crime, and misery, and neglect. The time would appear to be early morning, for though the lamp still burns on the mantel-piece, the apartment is not lighted by it, but from the window through which the sunshine is breaking. Clarissa has been writing, the pen, ink, and paper are still on the table, and fragments of paper lie scattered on the floor; the Bible is open before her, whence she has gathered strength and comfort ere she kneels down to supplicate from heaven, not so much pardon for herself, as mercy for some deeply-loved yet hardened transgressor. The story is evidently one of the heart, and it is rendered with suitable feeling and pathos.

ON THE COLOURS USED IN MURAL PAINTING.

BY MRS. MERRIFIELD.

It is well known that the best frescos confined themselves, as much as possible, to the use of native pigments, which, considered individually, could not boast of great brilliancy of colour, but which derived value from their skilful arrangement and opposition, and from their great durability. This limited number of colours was not the effect of choice, but was forced upon the fresco-painter by the nature of the lime with which the colours were mixed, and which was incompatible with many of the more florid colours.

In fresco-secco a greater number of pigments were admissible, although, even in this kind of painting, the list of colours was not very extensive.

In oil-painting, where difficulties similar to those which existed in fresco-painting were not to be encountered, we find the great Venetian masters systematically employing few colours, and those chiefly earths. The limited extent, therefore, of the palette of the fresco-painter cannot altogether be considered as a disadvantage peculiar to this branch of the Art; on the contrary, it is attended with the positive advantage of showing, that beauty of colouring consists in the skilful and harmonious arrangement and opposition of colours, rather than in the brilliancy of the pigments employed.

Instances, however, are not wanting among the old masters, of the introduction of brilliant and lively colours in mural painting. The frescoes of Tiepolo of Venice and of the Campi di Cremona, leave nothing to be desired in this respect. The mural paintings by these artists are remarkable for the brightness and good preservation of the colours. Blue, which is so difficult to use, and so liable to change, remains fresh in their pictures. The greens also, and the yellows, retain their brilliancy. A green colour, evidently prepared from copper, is common in Milanese frescoes, and in all cases appears to be very permanent. On some of the frescoes in the Gallery of Brera, at Milan, those, for instance, by Luini, Gaudenzio Ferrari, and Porta, a pigment which resembles vermilion, and which retains its colour, has been used; and there is a piece of bright scarlet drapery in a fresco in the same gallery, by Vincenzo Foppa. The colours in the mural paintings by Luini, are, as I have before observed, remarkably fresh and bright; I saw one piece of drapery of a deep blue,—a rare occurrence in Luini's mural paintings—others of a full and bright red, of a brilliant yellow, and of a fine lake colour. Brilliant colours, therefore, are not incompatible with mural painting, and modern painters will, it appears to me, do right in availing themselves of all the various pigments supplied both by nature and art, provided that they are durable in themselves, that they agree chemically with each other, and with the materials with which they are used, and above all that they are perfectly well prepared for painting.

Natural pigments are universally acknowledged to be more durable than artificial. The colouring matters of the former are oxides of metals, and although they may be imitated, or even surpassed in brightness and transparency of colour by the artificial oxides, yet it is found that the pigments in their natural state contain certain ingredients, such as silice, alumina, and other substances, which contribute to their durability, and render them more eligible as pigments than the artificial oxides. Some of the ingredients referred to, may be either entirely unknown, or their nature only partially understood, as in the case of orpiment—if I may be permitted to allude to a pigment which cannot be used in mural painting, and which is of very questionable eligibility in oil. I am not aware that painters distinguish between the native and the artificial pigments of this name, but chemists know that the native specimens of orpiment are much less poisonous than the artificial. The difference indubitably arises from the mixture of some ingredients with the

The first part of the book is devoted to a general discussion of the art of writing, and the importance of style and expression. The author discusses the various elements of style, such as diction, syntax, and rhetoric, and provides numerous examples of good and bad writing to illustrate his points. He also discusses the importance of clarity and brevity in writing, and the need to avoid unnecessary ornamentation and digression.

The second part of the book is devoted to a detailed discussion of the art of writing in prose. The author discusses the various elements of prose style, such as sentence structure, paragraph construction, and the use of figurative language. He provides numerous examples of excellent prose writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of coherence and unity in prose writing, and the need to maintain a clear and consistent line of thought throughout the work.

The third part of the book is devoted to a discussion of the art of writing in verse. The author discusses the various elements of verse style, such as meter, rhyme, and imagery. He provides numerous examples of excellent verse writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of rhythm and sound in verse writing, and the need to maintain a consistent and pleasing pattern of sound throughout the work.

The fourth part of the book is devoted to a discussion of the art of writing in drama. The author discusses the various elements of drama, such as plot, character, and dialogue. He provides numerous examples of excellent drama writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of action and conflict in drama writing, and the need to maintain a clear and consistent line of thought throughout the work.

The fifth part of the book is devoted to a discussion of the art of writing in history. The author discusses the various elements of history writing, such as narrative, analysis, and argument. He provides numerous examples of excellent history writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of accuracy and objectivity in history writing, and the need to maintain a clear and consistent line of thought throughout the work.

The sixth part of the book is devoted to a discussion of the art of writing in science. The author discusses the various elements of science writing, such as description, analysis, and argument. He provides numerous examples of excellent science writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of clarity and precision in science writing, and the need to maintain a clear and consistent line of thought throughout the work.

The seventh part of the book is devoted to a discussion of the art of writing in philosophy. The author discusses the various elements of philosophy writing, such as argument, analysis, and synthesis. He provides numerous examples of excellent philosophy writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of logic and reasoning in philosophy writing, and the need to maintain a clear and consistent line of thought throughout the work.

The eighth part of the book is devoted to a discussion of the art of writing in law. The author discusses the various elements of law writing, such as argument, analysis, and synthesis. He provides numerous examples of excellent law writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of clarity and precision in law writing, and the need to maintain a clear and consistent line of thought throughout the work.

The ninth part of the book is devoted to a discussion of the art of writing in medicine. The author discusses the various elements of medicine writing, such as description, analysis, and argument. He provides numerous examples of excellent medicine writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of accuracy and objectivity in medicine writing, and the need to maintain a clear and consistent line of thought throughout the work.

The tenth part of the book is devoted to a discussion of the art of writing in general. The author discusses the various elements of general writing, such as style, expression, and argument. He provides numerous examples of excellent general writing, and discusses the techniques used by the authors to achieve their effects. He also discusses the importance of clarity and brevity in general writing, and the need to maintain a clear and consistent line of thought throughout the work.

W. G. & C. S. 1857

CHARISTA FAWCETT

former, which, without injuring its colour, render it less uxorious, and which have hitherto eluded the research, or been thought unworthy of the attention, of the chemist, who probably considered that he had done enough in ascertaining the minerals to which the pigment was indebted for its colour, without determining its exact composition. The same observation has been made with regard to mineral waters. Such is the change which has taken place in chemical science, that the analysis of waters which was deemed correct twenty years ago, is now found to be defective from the discovery of many substances, the existence of which was not at that period even suspected. Within the last ten years, no less than seven new chemical elements have been discovered; but their discovery has as yet had no effect upon science, for little is known of them besides their names. There can be no doubt, however, that the superiority of natural over artificial mineral waters is to be attributed to the admixture of the former with certain unknown ingredients. There is every probability that if chemistry continues to make the rapid strides it has done of late, the analyses of the present day will be as useless hereafter as those made twenty years since. Artificial pigments, like artificial waters, will never be as valuable as natural ones, until it can be shown that they contain exactly the same ingredients, and in the same proportion, as the native.

Cennino Cennini relates how he went one day with his father Andrea Cennini, in search of ochres, to a certain cave, the situation of which he describes so minutely, that one fancies there would be little difficulty in finding, even at this distance of time, the exact locality:—"On the confines of Casole, on the skirts of the forest of the Comune of Colle, above a village called Dometra." Here the good old man tells us with apparent delight, that he found, nearly in one spot, specimens of yellow earth, of light and dark sinopia, blue, white, and black earths; in short, a whole palette of colours. The artist who would possess a variety of ochres, cannot do better than follow Cennini's example, and collect them himself whenever he has an opportunity. The variety of the ochreous pigments is infinite; their number is legion. In the immediate neighbourhood of Brighton, and perhaps generally in those parts of Sussex where iron mines were formerly worked, many shades of ochre, varying in colour from pale yellow to bright red, may be obtained; some of the finest specimens are frequently found embedded in the heart of a lump of chalk. In Cornwall and Devon, I am informed, the varieties are still greater. Solid pieces of ochre were always preferred by the Italians to the same pigments in powder.

Au ochreous pigment called *arzen*, of a very light but not pure yellow colour, was formerly employed by the mediæval artists. It was, and still is, used in foundries for making the moulds for casting brass. When burnt, this earth assumes a subdued orange tint, which, as well as the unburnt pigment, promises to be useful not only in oil but in fresco.

Andrea Pozzo, a good fresco-painter, better known in this country as the author of the Jesuit's Perspective, mentions, in the Treatise on Fresco-Painting attached to this work, a native yellow pigment which he calls *Luteolum Napolitanum* (Naples yellow). This pigment was prepared from a mineral found near Vesuvius, and in other volcanic districts. Its nature has not been satisfactorily ascertained, but I have no doubt of its being synonymous with the *Gialloino* of Cennini.* It may be necessary to observe that the artificial pigment called Naples yellow was not known at the period when Pozzo painted and wrote, consequently it could not have been used by the old masters.

Terra-verde is a valuable pigment which has been employed from a very early period, both in oil and in fresco-painting. When burnt, it changes to a fine transparent brown colour, which was much employed by the old masters, particularly for the shadows of flesh. In this state it is now used by some of our most eminent masters, both in oil and fresco. It should be

prepared of two tints; for the first the burning should be arrested before the green tint has entirely disappeared; for the second, the heat should be continued until the terra-verde has become brown. The method of burning this pigment is described by Volpato in his small work entitled "Modo da tener nel dipenger," which has been published and translated in the "Ancient Practice of Painting."

Many colours unknown to the old masters have recently been added to the palette of the fresco-painter. Some of these which have been adopted by Professor Hess and other German artists, as well as by our most distinguished fresco-painters, are very brilliant, and are considered durable. We may enumerate antimony yellow, (the golden sulphuret), two preparations of cadmium (one yellow, the other orange), chrome green (oxide of chrome), and cobalt green.

It may be thought that the permanency of colours can only be tested by time, and that a certain period must elapse before the effects of age are visible; but such is now the extent of chemical skill, that we can anticipate the effects of time, and by concentrating the powers of those agents which, like lime, heat, damp, and sublimated hydrogen, act injuriously upon colours, modern chemistry can produce in a short space those changes which, in the natural course of time, take a century or more to accomplish. It is to be hoped that the colours recently introduced have been subjected to the most rigid tests, since whatever may be the skill of the painter, the ultimate beauty and durability of the painting depends on the goodness of the materials, and the care bestowed on the preparation of the picture.

The best painters, as well ancient as mediæval and modern, have always been careful in the selection of their pigments; and the necessity of using the best colours and materials has frequently been insisted upon by writers on Art; Cennini and Lanzi make it a point of conscience. The former holds out to the painter who employs good colours, the reward of riches and honours, and then he adds in his quaint style, "and even if you should not be repaid for it, God and our Lady will reward your soul and body for it." Lanzi, although less quaint, is equally energetic.

In former times the adoption of good colours was not left to the conscience or discretion of the painter. He was required to use those pigments which the test of long experience had proved to be best. It was usual to introduce a clause in the contracts between the Italian artists and their employers, that the former should use the best colours; and the lakes and blues were specifically mentioned in the contract. Thus, in the contract between Paolo Veronese and the Prior of the Convent of S. Giorgio Maggiore, at Venice, for the celebrated picture called "The Marriage of Cana" (which is now at Paris), it was stipulated that Paolo should use the finest ultramarine and other colours of the very best kind: "Oltremarini fuissimi, et altri colorj perfectissimi." Again, Leandro Bassano, with regard to his picture intended for the same convent, undertakes "to paint it in the most perfect manner, with good and fine colours, using Florentine lake, azures, ultramarine and other colours, according as the subject of the picture required."

The anxiety of the painters to procure the best pigments is not less than that shown by their employers to have them introduced into the pictures for which they had given commissions. The care taken in this respect by the Flemish painters is well known. On one occasion we find Michael Coxis sending to Titian at Venice for some azure of a particular kind, which was required to paint certain parts of a picture he was copying from the original by Van Eyck. On another occasion we find the great Titian himself lamenting the death of the person who used to prepare his white for him.

The permanency of colours in painting is, however, dependent on other circumstances, besides their goodness and purity. The vehicles with which they are diluted, and the materials on which they are employed, exercise considerable influence upon their durability. The causes

of the changes which take place in the colours of pictures in the course of years, are not always apparent; and it is very interesting to compare the colours of an old picture with copies made of it long ago by different artists, and at different periods.

The "Coronation of the Virgin," painted by Correggio in 1520, in the Tribune of S. Giovanni at Parma, was destroyed in 1584, in enlarging the church; but the figure of the Virgin was fortunately preserved, and is now inserted in the wall of the Ducal library at Parma. It is in perfect preservation, and is considered one of the finest works of Correggio. There are two copies of this figure at Parma, one by Aretusi, painted about 1568; the other ascribed to Annibale Carracci, now in the Pinacotheca. The Virgin wears a blue drapery, and the difference observable in the colour of this part of the three pictures affords a singular proof of the uncertainty attending the use of this colour, in oil as well as in fresco. The colour in the painting by Correggio inclines to grey, in the copy by Aretusi, it is blue but not deeper in tone; while in the picture ascribed to Annibale, it is decidedly grey, and looks very heavy when compared with the fresco. Now we cannot doubt that when these copies were painted, the colours of the latter resembled those of the original. A great change must, therefore, have taken place in one or all of them. Which of the three has varied the least from the colour as it was originally painted by Correggio, is a question which can never be satisfactorily ascertained. It is seldom, indeed, that such an opportunity occurs of contrasting the colours of an original picture with two such ancient copies by good masters.

The blue pigments have always been the stumbling-block of fresco-painting. In some pictures they have changed to a heavy leaden colour or to a black, green, or purple; in others they have come off in powder; in others, again, they are covered with a vitreous efflorescence; while some few artists have been possessed of a method of using them, whereby they have been preserved to the present time. Under these circumstances it becomes important to ascertain what blue pigments were used by the Italian fresco-painters, and the manner in which they were employed.

The blue pigments in general use, were of three kinds, namely, 1st, *Ultramarine*, which besides its high price, had the disadvantage of falling off in powder, and, according to Palomino, of being liable to fade when mixed with lime. The causes of both these defects are well described by Mr. Dyer in a very interesting paper published in the Sixth Report of the Commissioners on the Fine Arts. 2nd, *Smalino*: of this pigment there were two kinds, both of which were vitrified pigments; the one owed its colour to cobalt, the other to copper; the latter was the blue glass described by Vitruvius under the name of "Vestorian Azure." 3rd, A native and an artificial pigment prepared from copper which were known under the names of *Biadetto*, *Turchino*, *Ceudres lileus*, *Mountain lile*, &c. Judging from the colour, the latter pigments were employed most frequently on mural pictures. The blue pigments obtained from copper are deserving of the attention of the mural painter. In spite of the general want of durability of the blue colours, there is still, as I have before observed, some instances in which this colour is found to be perfectly preserved. In addition to the instances I have already mentioned, the blue backgrounds of the old pictures by Ambrugio Borgognone, in the Lunettes of the Sacristy of Sta. Maria della Passione at Milan; those of the Angels in the gallery of the Church of S. Maurizio (the Monastero Maggiore), also at Milan, and those of the Angels in the Chapel of S. Felice at Padua, are fresh and of good colour. The frequency of blue backgrounds to the figures of angels, as well as the colour, induces me to think that the pigment employed was not ultramarine, which must have been too dear and too scarce to be employed so extensively. The analyses of many early mural paintings prove that the blue pigments so frequently employed owed their colour to copper. The best pigment of this class was the *Azzuro della Magna*, a crystallised blue ore of copper, which some writers say is a

* See this more fully explained in my Treatise on Colours in the "Ancient Practice of Painting," vol. I., pp. clix-cxxiii. Murray, 1815.

carbonate of the oxide, others a simple carbonate. The directions which are contained in old manuals of colours leave no doubt of this pigment having been used in secco; there is then reason to believe that some preparation of copper may afford a good and durable pigment of a fine sky-blue colour, which may be advantageously employed in mural painting, and it would be most desirable for those interested in the subject to institute a series of experiments with a view to ascertain what preparation of copper is most eligible for this purpose. There is a modern blue pigment which is known under the names of copper, mountain, English, Hambro', lime, kassler, mineral, and Neuwieder, blue. It is prepared from carbonate of copper, and hydrated oxide of copper and lime. It is obtained (by a process, which is in part kept secret), by decomposing subchloride of copper by a solution of caustic potash, and afterwards mixing the mass with caustic lime, and exposing the mixture for some time to the air. The darker sorts contain only a small per centage of quicklime; but the lighter sorts, on the contrary, from twenty to seventy per cent. It is used as a lime colour, but chiefly for colouring rooms, on account of its unchangeability on lime grounds; sometimes as an enamel colour instead of oxide of copper.* Here then is a colour which is not only uninjured by caustic lime, but which is in part composed of this substance, which does not suffer by exposure to the air, but, on the contrary, owes the pureness of its colour to this circumstance. I am not aware that this pigment has been used in fresco painting, but it appears highly desirable to make trial of it.

I have mentioned that the carbonate of copper was called by the Italians *Turchino*. The pigment received this name from its resemblance in colour to the turquoise. The analysis of the latter may afford some useful hints as to the preparation of a pigment from copper. The turquoise is a mixture of clay or earthy phosphates, with the oxides of copper and iron; some writers have even supposed that it is produced naturally in the earth, by the impregnation of the bones of animals with copper. The analysis of the oriental turquoise is, according to Dr. John, as follows:—Alumina, 73; oxide of copper, 4.5; oxide of iron, 4; water, 13; lead and loss, 0.5. The occidental turquoise has been thus analysed by Bouillon La Grange:—Phosphate of lime, 80; carbonate of lime, 8; phosphate of iron, 2; phosphate of magnesia, 2; alumina, 1.5; water, 1.6. We have here the materials for a pigment of a sky-blue colour, which, from the nature of its composition, should be as durable as the artificial ochres—alumina, namely, coloured by the oxides of metals.

But there is another fact to be learned from the above analyses, namely, that copper is not necessary to produce a blue colour, and that iron alone is sufficient for this purpose; although, perhaps, we may not be wrong in attributing the superior colour of the oriental turquoise to the copper which it contains. The presence of iron in the turquoise, as well as in ultramarine, will not be overlooked. It is employed also in the manufacture of artificial ultramarine, and some scientific persons have gone so far as to suppose that the fine colour of the old blue glass was owing to the presence of iron. There is a natural phosphate of iron, which probably is somewhat analogous to the occidental turquoise, of which Mr. Field speaks well as a pigment, and which might probably be useful in fresco-painting, but unfortunately it is of too rare occurrence to be generally adopted, even supposing that its colour rendered it in all cases a fit substitute for other pigments of a less durable nature.

There are technical difficulties in the employment of the blue colours in fresco, which have been adverted to by all writers on fresco-painting. Some recommend their being applied in fresco, others in secco, with size and egg, or with milk. But whenever the pigment was employed in secco, and it was intended to paint a drapery of a deep blue that, it appears to have been necessary before applying it, to lay on the wall a coat of some colour which has an affinity for

lime. Theophilus directs that a coat of Veneda (black mixed with lime) should be laid under the blue; and Cennini recommends a tint composed of sinopia and black. Sometimes red alone was used, sometimes terra-verde. An instance of the brown tint formed of black and red as a preparation for blue, may be seen in the ceiling of the Sacristy belonging to Sta. Maria della Passione at Milan. It was formerly painted blue with gold stars; the blue has now almost disappeared, excepting just round the stars, the rest of the ceiling being of a dark brown. There is an old fresco in the Church of S. Antonio at Padua, in which the drapery of the Virgin is quite black. As the colours in which she is usually represented are blue and red, it is probable that the black was merely the preparation for the blue, which might have fallen off in powder, or been scraped off for the value of the ultramarine—a species of sacrifice by no means uncommon. It would have been unnecessary to advert to these particulars, except for the purpose of accounting to the non-professional reader for the appearance of these black and brown colours in situations where one expects to find blue; and it may be observed as a general rule, that where these colours are found on ceilings or on draperies, particularly on that of the Virgin, they are to be considered merely as the preparation for blue.

The use of milk as a hiding vehicle for colours, is a traditional practice derived from the ancients. Pliny states that Panous, the brother of Phidias, covered the walls of the Temple of Minerva at Elis with lime and marble, mixed with milk and saffron. The Spanish writers Quevara and Pozz state that the mixture of milk with the lime gives it greater consistency, and produces a more mellow white colour. Pacheco and Palomino recommend that blue should be mixed with milk, and we find similar directions given in the Marciana MS. on the authority of Andrea di Salerno. "When you paint with blue in fresco, that is on walls, and are desirous that it should retain its colour and not turn black, as generally happens to the blues, disemper the colour with the milk of goats, or of any other animal. *Hoc habui à Magister Andrea di Salerno.*" Andrea di Salerno (whose family name was Sabbatini) was a good fresco-painter of the school of Raffaele, and may be considered as an authority in such matters. It is so seldom that we can obtain any account of the technical practices of the old Italians, that such brief notices as that which we have just quoted are interesting and valuable. As an additional recommendation it may be mentioned, that, as a vehicle for ultramarine, milk has been tried by Mr. Dyce with satisfactory results.*

The essences of milk form with lime a cement which, once dry, is insoluble. This cement was much used by the old masters for fastening together the pieces of wood of which they formed the panels for their pictures, and we learn from the MS. of Peter de S. Andemar, that this cement was employed in a liquid state at a very early period as a vehicle for a certain vegetable colour when applied on parchment. The caseum used for these purposes was, however, obtained from cheese, and not directly from milk. Were pure caseum soluble in water without the admixture of lime, it would undoubtedly, in consequence of its freedom from salts, be a more eligible vehicle for colours than milk, which abounds in salts. Caseum dissolved by the admixture of lime would probably dry too fast to be useful.

Mr. Dyce thinks that a solution of starch might be preferable to milk as a vehicle, and although this can only be determined by experiment, it appears very probable, inasmuch as the mixture of lime-water with a solution of starch in the proportion of ninety parts of the former to one of the latter, does not occasion any precipitate. It may be observed that when blue was employed in fresco, it was sometimes diluted with lime-water, and that as there is frequently a difficulty in the case of ultramarine or smalt, to make the colour adhere, the addition of a solution of starch to the lime-water would probably effect this purpose.

Besides the difficulties arising from the nature of the pigments, and the medium with which they were applied, painters seem to have experienced another in harmonising the blue with the other colours. Some of the frescanti of the school of the Carracci have succeeded in applying the blue so that it retains its colour until the present time; but this advantage has sometimes been counterbalanced by a want of harmony. This defect is not, however, perceptible in the mural pictures of the early painters of northern Italy, or in those of the frescanti of the Milanese and Cremonese schools, and in some others. These artists, as far as my observation extends, appear to have adopted the following plan.

These masters, in their mural pictures, never used a blue tint exceeding in depth the blue of the sky. The colour may be pretty accurately described as similar to the pigments called *Biadetto* and *Turchino*. It was laid in proper gradations on the shadows and folds of the draperies; the lights were invariably white, or nearly so, and the darkest shades were sparingly touched upon the blue, so that, from the colour being limited to the shades and folds of draperies, the effect was that of a transparent lime drapery over white. By this treatment the blue harmonises with the other colours, instead of overpowering them, as it does in the frescoes of Romanelli in the Louvre, where the colour is laid on in its full strength, and the eye is irresistibly attracted by it, to the prejudice of the other colours. For examples of blue applied in the manner described, I may refer to the early pictures by Giusso in the Baptistery at Padua, and to those of a later period by the Campi di Cremona, in Sta. Maria della Passione, at Milan, by Bagagnolo and Rossi of Brescia, and by Bartolomaeo Cesi and other frescanti of Bologna. As an instance of the successful introduction of a deep blue in mural pictures, I may mention the scarf of the mad woman in one of the frescoes in the Loggia of S. Francesco at Bologna. The colour, which resembles ultramarine, is deep, and harmonises perfectly with the other parts of the picture.

Armenini speaks with great contempt of those fresco-painters who pretended to possess secret methods of using vermilion and fine lakes; and he accuses them of employing those colours solely to attract the admiration of the vulgar. The language of Vasari is not less strong; his opinion on this subject is to be collected not only from his Introduction, but from various passages in the Lives of the Painters. But these writers lived at a time when painting in buon-fresco had attained the greatest technical perfection, when it was considered derogatory to the art to finish any part in secco, and the professors of the improved, or perfect style as it was thought, looked down with contempt upon the beautiful half-tempera paintings of an early period. Making every allowance in favour of a style of painting, the claims of which to our admiration were in part founded upon its technical difficulties, it must be acknowledged that the earlier method, in which the two processes were mixed, had many admirers and followers among the best frescanti. It appears to me that, if a fresco-painting can be rendered richer and more harmonious by the skilful application of certain colours, which, from their incompatibility with lime, require to be added in secco, the use of the two methods on the same picture cannot be any disadvantage, but, on the contrary, it will be a positive improvement. In the excellent paper to which I have already referred in more than once, Mr. Dyce expresses himself as being not unfavourable to the adoption of tempera on some parts of frescoes, and the reasons he gives for the old masters having adopted the mixed method, are so satisfactory, that they cannot, as it appears to me, fail to carry conviction to the minds of all unprejudiced persons.

Lake is one of those colours which, if used at all on mural paintings, must be applied in secco. The process of applying it was simple enough: the fresco being completed to a certain point, was suffered to dry perfectly, and then a coat of size, or of "gesso da sarto," was spread over the part to be painted in secco; and on this the colour was afterwards laid. The lake in the

* "Pharmaceutical Journal," vol. vii, p. 62.

* See Observations on Fresco-Painting by Mr. Dyce, in the Sixth Report of the Commissioners on the Fine Arts.

mural pictures by Pinturicchio, at Sienna and Rome, which has retained its beauty for upwards of three hundred years,—is a sufficient evidence of the durability of this colour. And here the question arises, what kind of lakes were used by the old masters?—what was the colouring matter of those lakes which have preserved their freshness for so long a period? We have historical evidence that lakes were made from cochineal, madder, verzino, lac, and kermes, but to which of these colouring ingredients must the durable lake colour of the old pictures be attributed?

Cochineal-lake, beautiful as it is when first applied, has no pretensions to be included among the more permanent colours. Apart, however, from this consideration, there are chronological reasons why it could not have been used on some of those cinque cento pictures which still astonish us by the beauty and brightness of the colours. Cochineal could scarcely have been known in Italy previous to 1525, for it was only in 1523 that Cortes was commissioned by the Spanish government to direct his attention to the propagation of this substance, some specimens of which he had transmitted from Spain. The exact period of the introduction of cochineal-lake into Italy is not known; it must have been after 1523 and before 1547; for Matthioli, who published his translation of Dioscorides in that year, mentions it as a new kind of cremisino which was used not only in painting, but for dyeing silks.

The same chronological difficulty exists with regard to madder, which, although it was employed by the early mediæval painters of Northern Europe, does not appear to have been known to the Italians as a pigment until the time of Nerl, who gives in his *Arte Vetraria* (Florence 1612) recipes for making it.
