The intention of giving the Text of a DESCRIPTIVE CATALOGUE OF SHELLS, by JOHN EDWARD GRAY, Esq. F.R.S. &c., in company with these CONCHOLOGICAL ILLUSTRATIONS, having been abandoned, the names of the species figured in each part will now be given with it, and, as complete a Catalogue as can be made will be added in the course of publishing each genus. Such Catalogue will consist of the names of all the species that can be ascertained, together with the localities and a reference to a figure where any is known: and where there is no good previous figure known, one will be given. A reference to the Author whose name is adopted will be added, together with concise descriptions of the new species. The CONCHOLOGICAL ILLUSTRATIONS will thus form a very complete addition to WOOD'S CATALOGUE OF SHELLS.

DESCRIPTIVE CATALOGUE  
OF  
BRITISH CHITONES,

By G. B. SOWERBY, JUN.

---

While engaged in preparing a Catalogue of the genus *Chiton* for publication, with these illustrations, my attention has been directed to the confusion, prevailing among authors and collectors, respecting the British species. It having consequently occurred to me that effectual service would be rendered to science by determining the nomenclature and synonymes of this section, I have procured specimens from the principal cabinets, through the kindness of their possessors, and compared them carefully with the published figures and descriptions. The following result is presented in a separate form, for the convenience of those collectors whose attention is confined to species found on our own coasts.

Sp. 1. *Ch. FASCICULARIS.*

*Descr.* Shell elongated, depressed; valves sub-triangular, coarsely granulated at the sides; with

a dorsal striated band; margin rough, hairy, with bunches of bristles on both sides; inserted laminæ of the valves narrow; colour brown, slightly varied, with one black, and two white, dorsal bands.

*C. fascicularis*, Linn. Syst. Nat. p. 1106.

Chemn. Conch. 10. t. 173. f. 1688.

Sow. Jun. Conch. Illustr. f. 87. 87 a.

*Obs.* This species is much more depressed than the following; the valves are closer at the sides, and the granulations coarser. As Linnæus appears not to have recognized two fasciculated species, it cannot be known which he intended to describe; but there can be no doubt of the present species being identical with that figured in Chemnitz.

Sp. 2. *C. CRINITUS*.

*Descr.* Shell oblong; strongly keeled by a dorsal striated rib; valves beaked, reniform, finely granulated at the sides, disunited at the extremities; margin smooth, hairy, fasciculated; inserted laminæ broad; colour various.

*Ch. crinitus*, Pennant, Brit. Zool.

*Ch. discrepans*, Brown.

*Ch. fascicularis*, Sow. Gen. of Sh. Wood's Gen. Conch. pl. 2. f. 6.

*Ch. crinitus*, Sow. Jun. Conch. Illustr. f. 88, 93.

*Obs.* This being the most common of the two fasciculated species, has been most frequently figured under the original name; which, however, it seems to me

most correct to retain for the shell of Chemnitz, his figure being the oldest, and universally quoted. The general appearance and the strong central band of striæ in Pennant's figure, leave no doubt on my mind that he intended to represent the shell to which we have fixed the name proposed by him.

Sp. 3. *C. MARGINATUS.*

*Descr.* Shell oval, carinated. elevated, posteriorly widened, minutely granulated; margin also minutely granulated; colour various.

*Ch. marginatus*, Pennant, Brit. Zool. Wood. Gen. Conch. f. 4.

*Ch. cinereus*, Zool. Jour. v. 5. p. 99. Wood Gen. Conch. f. 5. Chemn. Conch. 96. f. 818?

Red var. *C. ruber?* Chemn. Conch. t. 96. f. 813.

Black var. *C. Asellus*, Chemn. Conch. t. 96. f. 816.

Banded var. *C. minimus*, Chemn. Conch. t. 96. f. 814

*C. marginatus* and varieties, Sow. Jun. Conch. Illustr. f. 106 to 112.

*Obs.* This common species, including many varieties in colour, is more clearly referrible to *C. Marginatus*, of Pennant, than to *C. cinereus*, of authors; and without presuming to decide whether the description of Linnæus and the figure of Chemnitz were taken from ash coloured varieties of this or of the following species, I prefer applying the respective names as used by collectors at present. *C. marginatus* is more angular than the next species, and the granulations on the dorsal areas are not arranged in longitudinal lines.

*C. minimus* and *C. asellus*, of Chemnitz, may be black and banded varieties of this or of the next.

Sp. 4. *C. CINEREUS*.

*Descr.* Shell depressed, sub-carinated, minutely granulated; granulations on the central areas arranged in lines; margin minutely grained; colour various.

*Ch. cinereus*, Linn. Syst. Nat. p. 1106?

White var. *C. albus*, Auct?

Striped, *C. cimex*, Chemn. Conch. t. 96. 815.

Black, *C. Asellus*, Zool. Journ. vol. 5. pl. 5. f. 4.

Banded. *C. minimus*, Chemn. Conch? *Asellus*. (Young) Zool. Journ. v. 5. pl. 5. f. 3.

*Ch. cinereus* and varieties, Sow. Jun. Conch Illustr. Chiton, f. 94 to 98.

\* *Obs.* The comparative roundness and flatness of the shell, and the linear arrangement of the dorsal granules in this species distinguish it from the preceding. The white variety may have been the *C. albus*, of authors, but there is no proof of it, and having little else than colour to guide us, in reference to the ancient figures, it cannot be determined whether *C. Asellus*, of Chemn. is my black variety of *C. marginatus*, or Mr. Lowe's black var. of this species. The same difficulty occurs with respect to all the varieties.

Sp. 5. *C. CANCELLATUS*. Leach?

*Descr.* Shell elevated, narrow, with granulated striæ on the dorsal and lateral areas; margin minutely granular.

*C. cancellatus*, Sow. Jun. Conch. Illustr. f. 104. 104.  
a. b. 105.

*Obs.* This minute species is narrower, more elevated, and more distinctly striated, than the preceding.

Sp. 6. *C. ALBUS*.

*Descr.* Shell oval, depressed, sub-carinated, lightly and minutely granulated; margin scaly.

*C. albus*, Linn. Syst. Nat. ? Mont. test. Brit.

Brown, var. *C. Aselloides*, Lowe, Zool. Journ. v. pl. v. f. 5.

*C. albus* and var. Sow. Jun. Conch. Illustr. Chiton 99. 99. a. 100.

*Obs.* Mr. Lowe, in a subsequent communication, states that his *C. Aselloides* is a variety of the *C. albus*, of Montagu. The latter may or may not be the *C. albus*, of Linnæus. It differs from the preceding in the arrangement of the granules, not being linear, and from *C. marginatus* in the large size, and regular arrangement of the granules, or rather scales of the marginal integument.

Sp. 7. *C. LÆVIS*.

*Descr.* Shell apparently smooth, but finely granulated, narrow, carinated: margin broad, velvety to the eye, but finely reticulated.

*C. lævis*, Pennant, Brit. Zool. 4. t. 36. f. 3? Lowe, Zool. Journ. vol. 5. p. 98. pl. 5. f. 1.

*C. marginatus*, Linn. Trans. viii. pl. 1. f. 2.

*C. lævis* and var. Sow. Jun. Conch. Illustr. Chiton  
f. 101. 101. a. b. 102.

Sp. 8. *C. RUBER.*

*Descr.* Shell smooth, shining; valves beaked; margin minutely granular.

*C. ruber*, Linn. Syst. Nat.? Lowe, Zool. Journ. vol. 5. p. 101. pl. 5. f. 2. Sow. Jun. Conch. Illustr. Chiton, 103, 104.

*Obs.* Care must be taken to distinguish this from the red variety of *C. marginatus*, which it resembles in appearance, and to the unassisted eye seems almost equally smooth.

Sp. 9. *C. LATUS.*

*Descr.* Shell broad, smooth, sub-carinated, margin smooth; colour white and red, variegated.

*C. latus*, Lowe, Zool. Journ. vol. 5. pl. 5. f. 6, 7. Sow. Jun. Conch. Illustr. Chiton, f. 113, 113. a.

A CATALOGUE  
OF THE  
RECENT SPECIES OF CANCELLARIÆ.

---

THE scientific Public and Conchologists are already aware that it is intended to introduce in this work figures and descriptions of all the new species which have been collected by Mr. H. CUMING. They will be brought in under the various Genera to which they belong; and several have already appeared among the Cypræadæ. I take this opportunity of drawing the attention of Naturalists to this subject, in this place, because it will be seen that half the number of species of the beautiful Genus Cancellaria at present known have been discovered and first brought to England by that Gentleman, to whose indefatigable industry we are indebted for the knowledge of at least 500 species of various Genera, among which are several *new* Genera and a great variety of the most interesting and remarkable species. The care and precision with which Mr. CUMING has preserved all the particulars relative to localities and habitations of the various subjects collected by him, entitle him to our warmest admiration and praise, and I shall gladly avail myself of the advantages afforded to me by this circumstance, not only in stating the localities and habitats of such Shells as have been first discovered by Mr. CUMING, but of such others as we were previously acquainted with, though we knew not those particulars. The descriptions of all the species discovered

by Mr. CUMING either have appeared or will appear in the "Proceedings of the Committee of Science of the Zoological Society," to which we shall refer, by the initials Z. P.

The list here given of the species of the Genus *Cancellaria* will be found to be much more copious than that in *Lam. Hist. nat. des Anim. sans vert.* where only nine species that really belong to the Genus are given,\* eight of these are in this list, and to these I have added one in my work on the Genera of Recent and Fossil Shells, two in the Catalogue of the Tankerville Collection, and sixteen in the present Conchological Illustrations: the remaining twenty-one have been discovered by Mr. CUMING, and are figured from his collection.

#### Genus CANCELLARIA.

Shell pear-shaped, fulvous, dotted with brown; beneath and border lighter, with darker and larger dots; margin of the outer lip thickened; aperture rather wide, without teeth; anterior extremity of the columella curved downwards, without any folds; spire distinct, flat; posterior extremity rather produced: length 0.9, breadth 0.6.

*Obs.* This, according to Mr. Gray, is a variety of his *Luponia Algoensis*, "with the teeth more or less obliterated:" but there never have been the slightest vestige of teeth in any of the specimens we have seen,

nor are there any irregular ridges crossing the front edge of the columella, which form the distinguishing mark of his genus *Luponia*. It is an extremely rare and very distinct species from Southern Africa.

Shell reddish brown, with a light-coloured dorsal groove, and a dark streak along each side of it; ribs prominent, wide apart, tuberculated at their dorsal extremities, mouth rather narrow, teeth of the outer lip more numerous than in *C. radians*: margin generally broad: length 0·7, breadth 0·55. Pacific Ocean.

*Obs.* This species is very much like *radians*, indeed it is impossible to know which of the two, this or the one we commonly call by that name, is the *radians* of Lam. The principal difference is in the number of teeth on the inner edge of the outer lip.
