OLDEST BEE PAPER
IN AMERICA

ESTABLISHED
IN 1861

THE AMERICAN

BEE JOURNAL

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN
1861.

Chicago, Ill., January 2, 1884.

VOLUME XX.
No. 1.

THE WEEKLY EDITION

OF

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

The *Monthly Bee Journal* and any of the above, \$1 less than the figures in the last column.

Look at Your Wrapper-Label.

X SUBSCRIBERS whose papers reach them with this paragraph marked with a *blue* pencil, will please take notice that their *subscriptions will expire at the end of the present month.* Such are marked thus on the label, "Jan. 84." We do not want to lose any of our subscribers, and give this notice so that all may get every number of the BEE JOURNAL without any break, and no papers will be missed. When the money for renewal is received at this office, the date on the label is changed to correspond, and this change is your receipt. If there is any mistake made, notify us at once.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

DADANT'S HONEY CROP!

Our crop being very large, we offer **THIRTY THOUSAND POUNDS** of extracted Honey

FOR SALE

at REASONABLE PRICES. We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15c. for our 24-page Pamphlet on Harvesting, Handling and Marketing extracted honey.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

1876. CROWN 1882.

The best arranged HIVE for all purposes in existence. Took first premium at St. Louis Fair in 1882 and 1883 over all competitors. Descriptive Circular sent free to all on application.

Address, **ELVIN A. HENNING,** Prop'r. of the Crown Bee Hive Factory and Apiary, **JERSEYVILLE, ILL.**

DADANT'S FOUNDATION

From **JAMES HEDDON**, July 27th, 1883.—Your Foundation is certainly the nicest and best handled of any I have seen on the market. It is the only foundation true to sample I have ever received.

From **JAMES HEDDON**, Aug. 10th, 1883.—I will contract for 2,000 pounds of foundation for next season on the terms of your letter.

From **A. H. NEWMAN**, Aug. 24th, 1883.—Book my order for 5,000 pounds for spring delivery.

From **C. F. MUTH**, Dec. 12, 1883.—Book my order for 2,000 lbs. of heavy; 1,000 lbs. of thin, and 500 lbs. of extra thin.

Dealers, send in your orders for next spring while wax is cheaper, and save trouble and money.

CHAS. DADANT & SON,

5AB1y Hamilton, Hancock co., Ill.

MANUFACTORY FOR HIVES, SECTIONS, &c.

I am now prepared to supply dealers and consumers with

Hives, Sections, Broad Frames, Shipping Crates, etc.,

all kinds. I make a specialty of LANGSTROTH AND MOORE'S HIVES. Correspondence with supply dealers solicited. My Sections are all made from Poplar. Address,

GEORGE TAYLOR,

49A4t & 1C1f 12Btf DUNDEE, Kane Co., ILL.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee-culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon, who probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2."

Queen-Rearing, by Henry Atley.—A full and detailed account of TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully up with the times on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foams, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c. a per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advance views on this important subject, with suggestions what to plant, and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interest, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every mechanic, Farmer, and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Minors, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind.

The work contains 106 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 33 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable home information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey-Bee.—This is a standard scientific work. Price, 32c.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Der Tlichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königin—Füttern—Schwärmen—Ableger—Versehen—Ftalien siren—Züfeger von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare Darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formküchlehen, Puddings, Schaumkonfekt, Weine, u. s. f. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Continenten bestimmt, und sollte vieltaufendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., JANUARY 2, 1884.

No. 1.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The Opening Year—1884.

Twenty-four years ago to-day, our worthy predecessor, Mr. Samuel Wagner, launched the first number of the BEE JOURNAL upon the sea of the journalism of the World. Up to that time, no periodical devoted exclusively to bee-culture had been published in America, and the pursuit was indeed in its infancy. Now, seven Monthlies and one Weekly are being regularly published in the United States, numbering their subscribers in all, from 40 to 50 thousand! Truly this shows progress in a quarter of a century! what the next 25 years may reveal in this direction, it is difficult to conjecture.

These facts give a comprehensive view of the mission before us, as well as the exalted possibilities which should inspire us to fresh zeal and grander achievement. Behold, how invention and improvement have followed our pursuit—elevating it, in fact, to the position it now occupies!

Now, in order that we may realize the great possibilities before us, five things are, above all others, essential:

1. We should encourage planting bee-pasturage, that there may be, every season, a crop of honey to gather, in order to make apiculture a certain occupation.

2. Foster district and local societies to afford mutual instruction, and strengthen fraternization.

3. Institute large and attractive honey and apiarian exhibits at all Fairs, to educate the community to the desirableness of a superior product.

4. Cultivate a discriminating domestic market, to encourage superiority and excellence.

5. Sell at all times, and in all places, an honest article under an honest name.

The object of the existence of bee papers is not only to record the news of matters and things transpiring in the apicultural world, but to discuss the newest ideas and inventions as they develop. While giving the strongest arguments, therefore, all should be careful not to use words that may wound the feelings of those whose views may differ with their own. Aye, we should all endeavor to "spread liberally the cement of brotherly-love and affection—that cement which unites us into a society of friends and brothers"—having but one object, and that, the furtherance of the science and art of progressive bee-culture.

We hope our correspondents will endeavor to be guided by the sentiment just expressed, and thus help to bring about a reform in the manner of discussing questions as they develop.

By the following notice in the Cedar Rapids, Iowa, *Times*, we learn that Mr. Quinlan, of that enterprising city, is making an aggressive war on adulterated table syrups. He has "hit upon" just the right thing to "tell" on the denizens of that "burg." His notice reads thus:

"Just the thing to eat on your buckwheat cakes—some of Quinlan's extracted honey."

He solicits orders by postal card, and offers to deliver it to any part of the city. That is the way to increase the consumption of pure honey in place of the vile table syrups which entail both disease and death to the users. Honey, that life-preserving and health-giving sweet should take its place on the tables of all, no matter whether rich or poor. It is cheaper, sweeter, and better in every way.

The BEE JOURNAL is printed on new type, which makes it very readable, and its mechanical execution is something we feel proud of.

Planning for Next Season's Work.

Brains tell everywhere, but nowhere do they play a more important part than in bee-keeping. It is said that some one asked Opie by what wonderful process he mixed his magnificent colors. He replied, "I mix them with my brains, sir." Every one who would excel in any undertaking must use his brains; and by thought, planning, contriving and inventing, overcome the difficulties that stand in the way, and thus develop the needed improvement.

If "necessity is the mother of invention," we may well claim that a Yankee is its father—for Americans are proverbially inventors. The best labor-saving machinery in the world emanate from the American continent, and it has revolutionized the labor of the civilized world. As examples note the magnificent farm machinery and the mammoth printing presses.

Many complaints were made last season because bee-keepers could not get their supplies when they wanted them. This was the result of not ordering them in time to have them on hand when wanted. No thoughtful bee-keeper should wait until he wants implements or supplies before ordering. Think ahead—plan for the campaign, get what will be needed, and—be happy.

Do not put off necessary work in the apiary, but do it when it should be done—never putting off until tomorrow what should be done to-day. Sufficient for the day is the work thereof.

We might enlarge upon the details, but each can think them out for themselves.

The new Catalogue of D. S. Given & Co., Hoopston, Ills., is on our desk. It is nicely gotten up, and has quite an array of certificates from those who are using the Given foundation press.

Wide Frames for Holding Sections.

In *Gleanings* for Dec. 15 we notice the following comments on our article on "Nomenclature of Bee Keeping," published on pages 603 and 604 of the BEE JOURNAL for 1883:

The A. B. J. for Nov. has an excellent article on calling things by their right names, and gives a list of the terms ordinarily used in bee culture. I would suggest one change, however, and that is, on a frame for holding sections they call it "broad frame" which was the name I originally gave when we first commenced making them; but finding it so often confounded with "brood frame," we changed it to "wide frame," and now invariably say "wide frame" in our price list. You will notice that a single letter would have to be depended on to distinguish between "broad frame" and "brood frame;" and an *a* is so often made like an *o*, there is much danger of confusion. For instance, a customer orders "100 broad frames," and his *a* might be either a *o*. After studying over it, we do the best we can, and send them along; and it soon transpires that he is in a great strait for lack of something that he has not got, and has a lot of frames he did not want. Now, you see if we name them "brood frames" and "wide frames," both short names, too, there is not much danger of confusion.

We are glad at all times with criticisms in a friendly way, and will here publicly thank Mr. Root for his re-

marks. But had he read a little farther on in the same page, he would have seen that we gave the preference to wide frames in the following language:

"Wide Frames.—Frames two-inches wide to hold sections at the side of the brood-chamber, or in the second story."

We are well aware that the glossary there given is neither complete nor perfect, and hence we are glad to have criticisms. One correspondent says in a private letter: "I would like to criticise your glossary, but as I am not well-acquainted with you, I will forbear." That is where he errs. We think that our friends will give us credit for good-nature, and we quite enjoy criticisms, if they are made in a friendly way. Our article was only intended to introduce the subject, and we hope all will be free to suggest amendments, and thereby settle upon correct phrases for our pursuit. One sentence in Mr. Root's criticism is consoling. It is this: "We now invariably say Wide Frames in our price lists." That is right, and we hope that all who will soon be publishing price lists for 1884 will make a thorough revision and "call things by their right names." That will be a good step in the right direction; for in the price lists of last year there were much confounding of terms. Will they please take the hint, and compare their "copy" before giving it to the printer with our article on pages 603 and 604 of the Weekly, or page 356 to 358 of the Monthly BEE JOURNAL for last year. Some further criticisms will be found in this and succeeding issues of the BEE JOURNAL, as fast as we can find room for them.

☞ The *American Agriculturist* is one of our most valued exchanges. It has just entered upon the 43d year of its existence, with varied improvements, and more reading matter and engravings. It is invaluable to those engaged in farming pursuits. We will send the *American Agriculturist* and the BEE JOURNAL for one year to any address, on receipt of Three Dollars.

THE SURGEON'S DAUGHTER.—T. B. Peterson & Brothers, Philadelphia, publish this day, "The Surgeon's Daughter," being the *Sixth Volume* of their new and cheap edition of "The Waverly Novels," by Sir Walter Scott, which will be completed in Twenty-six Weekly Volumes, each volume being a novel complete in itself, and one volume will be issued every Saturday until the whole are published.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., Dec. 30, 1883.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no excitement in the honey market. The demand for extracted honey is improving, but supplies being large, prices keep down. It brings 7@10c. on arrival. Arrivals of comb honey and demand for it, are in fair proportion. A choice article in $\frac{1}{2}$ lb. sections brings 20c. per lb. from store, and 16@18c. on arrival.

BEESWAX—Scarce; brings 28@32c. on arrival.
CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17@22c. Dark and second quality, 14@15c.; extracted white clover in kegs and barrels, 9@10c.; dark, 8@9c.

BEESWAX—Prime yellow, 27@29 c.
H. K. & F. B. THURBER & CO.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; $\frac{1}{2}$ lb. sections, 14@15c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@35c., according to color and cleanliness.
R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—No change to note since last report. Prices and demand well sustained, and receipts about equal to shipments. White comb, 1 and 2 lb. sections, 17@18c. Extracted, 8@10c.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—There is a limited demand for comb of superior quality, but all other descriptions are slow of sale, and the market for the same, weak. Sales of candied at 5@c., and very good quality, uncandied, at 6c. White to extra white comb, 15@20c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7@c.; dark and candied, 5c.—

BEESWAX—Wholesale, 27@c. 30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb 13@18c. per lb. Strained and extracted 7@8c.; choice in cans more.

BEESWAX—Firm, at 30@31c.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—Honey continues in excellent demand, as reported last; every lot of choice white comb is taken up as fast as it comes at 18c. in quantity for 1 lb. sections, and an occasional sale at 19c. in a very few instances only. 20c. has been reached. Broken lots and second quality is very slow sale. For extracted there is no demand.

BEESWAX—Is eagerly inquired for at 28@30c., but none to supply the demand.
A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Our market is very quiet on honey. We quote 16@18c. for best 2 lb. sections—18@20c. for best white 1 lb., and 10c. for extracted.

BEESWAX—We have none to quote.
BLAKE & RIPLEY, 57 Chatham Street.

VICK'S FLORAL GUIDE.—Here it is again, brighter and better than ever; the cover alone, with its delicate tinted background and its dish of gracefully arranged flowers, would entitle it to a permanent place in every home. The book contains three beautiful colored plates, is full of illustrations, printed on the best of paper, and is filled with just such information as is required by the gardner, the farmer, those growing plants, and every one needing seeds or plants. The price, only ten cents, can be deducted from the first order sent for goods. All parties any way interested in this subject, should send at once to James Vick, Rochester, N. Y., for the Floral Guide.

Bee - Idyl.

MEDORA CLARK.

He lies in his hammock under the trees.

In the bush of summer hours,
And he hears the voice of plundering bees,
Down there on the bed of flowers.

The restful, murmuring music of bees
In their buzzing, monotonous note,
On memory's board of ivory keys,
Has 'wakened a muffled note.

And he tries to drown, in an idle dream,
To-day with its living prose,
And glide to that past, which will always seem
A poem of gold and rose.

Though hours be as sweet as an angel's thought,
And skies wear a tender hue—
We yet dream of days whose heavens were wrought
From a turquoise of finer blue.

An hour flies by, on the pinions of time—
He's resting, "Ah, bless those bees!"
He rests and dreams to their rhythm and rhyme,
And the stir of the summer breeze.

New his slippers feet on the turf are hung;
He yawns and essays to rise.
A smothered oath—a crushed white flower—"I'm
stung!"
Confound those bees!" he cries.

Bee-Keeping in France.

ARTHUR TODD.

Some years ago, I made the acquaintance of Monsieur Georges De Layens, of Paris, who then was earnestly advocating the merits of the movable comb hive, and had put before the French bee keepers a book replete with scientific, practical knowledge. Many pleasant and profitable hours have I spent in his company, and worked in his apiary, which is some 40 miles from Paris. My coming to this country; for some time put an end to the discussion of our favorite topic, but, appreciating his love of knowing all going on in bee culture of a progressive nature, I sent him at various times, journals, catalogues, etc., which contained illustrations of bee appliances of a novel character.

Finding my location, he has lately sent me a copy of his new book on bee keeping entitled "Letters to a Friend" and a photograph of his apiary. Thinking it may interest some to see it, I send it to the BEE JOURNAL as the surest means for one and all to have a peep. On the occasion of my first visit to this apiary, Mr. Layens was not able to accompany me. Armed with his introduction, I started at 5 a. m. on a Sunday morning from Paris, visiting the historic town of Dreux on my way. Arriving at the station, I found I had a country walk of some 2 miles before me, but this I soon covered, and presented myself tired, and weary at the hour

of high 12 at the door of Monsieur le Cure—who was temporarily caring for Mr. Layens' bees.

My mission explained, the good Cure welcomed me in the most hospitable manner; the best in his house was set before me, and bee talk ran riot. Great was the surprise to see me come armed with a smoker, bee veil, thermometer, etc., and each article was carefully examined by the visitors, for one by one the whole village seemed to learn that an English bee keeper had arrived, and (accidentally of course) they called in to see the Cure, and found me and my interesting exhibit. At 2 p. m. the good Cure, myself, and a few others went to the apiary. It was then as now seen in the illustration.

We opened hive after hive, taking out frames (large and deep) loaded with honey. There, just behind that hive where stands Monsieur de Layens did the dear good Cure, exhausted by excitement and physical weakness sink prone on the grass. We revived him, and when rested we returned to the village. Those among us who were of the old-school, having completely changed their minds, after the

dire Franco-German war, and affording all the material aid he could, to the wounded and the last sad offices of religion to the dying. Alas! this noble man, whom to know was but to love and honor, had lost his health and strength in trying to serve his brethren. This noble brother bee keeper had in him that day, the consuming fire of "consumption." As he told me of his weakness I thought of the packet of quinine in my pocket, and begging him to use it, and cure himself. I parted from one of nature's noble men. He died in the arms of my friend Mr. Layens, and dying his thoughts went back to the Sunday in the apiary, the quinine, etc., and he charged Mr. Layens to present me with his love, and good wishes. Good and true men are few, but in the ranks of bee culture they are to be found.

Mr. Layens being of independent means has been able to give his scientific researches full scope, without being hampered by any thoughts of the having to make his apiary pay a profit on the capital invested. He has taken up at times certain special points in apiculture, and at great

ocular demonstration afforded them of the facility with which the honey might be taken, and no bee lose its life.

The Cure sung vespers while I rested myself, and then the old horse and chariot was brought out. Seated in it, I found the Cure wished to speed me on my return journey all he could, and at the same time show me a sight never to be forgotten. He drove me through a forest where the heather was in full bloom, and, in a secluded hidden spot, he showed me some half dozen large straw hives (certainly the largest I have ever seen.) They were crammed full of bees and honey. Thousands of bees, idle for want of room, and around me such a mass of floral wealth as I think I have never seen equalled. Those only who have seen the heather in full bloom, in all its glory, can appreciate the reasons for the annual migrations of bees and hives that take place in France and Germany.

There, seated on a rock, the Cure told how he had helped like a true man, to do his duty to his country, by following the French army in that

personal cost and labor, set himself the task of unfolding its hidden mysteries. On one occasion he established apiaries at certain points on one of the Swiss Alps. Each apiary being at a higher level than the one immediately beneath it. The deviation of honey yield in each zone was carefully noted, and by chemical analysis the constituents of the honey from each zone were looked into. The moment of the departure of the first bee at the beginning of each day's toil at each successive altitude was taken, and an inspection of the note book recording the results of these "before breakfast studies" showed me the intense love of the science of bee keeping that animates Mr. Layens.

The relation between the number of bees fanning at the door and the necessity for a greater or less evaporation of moisture was another of his studies. Foul brood has per force been of late one of his studies, and I propose to translate, and in a later number of the BEE JOURNAL give in his own words his own method of treating this dreadful disease.

In a recent letter he says: "My apiary has given me much work for the last two years, although I have but few colonies, the terrible disease of foul brood reigning all over the country—each spring, for two years past, my apiary has been attacked. This spring I only had 18 colonies, but of these 7 were attacked. I am now up again to 23 colonies; apparently the disease is cured. I believe I have solved the question of curing foul brood, but the great difficulty consists in preserving the apiary in the future where one finds himself in the midst of an infected region."

Mr. Layens is deeply interested in the botanical questions affecting bee keeping, and asks me for the names of the plants, and the date of flowering, that yield the greatest amount of honey in the various sections of this vast republic. Any brother bee keeper that can favor me with such a list especially noting the botanical features of his locality, will have my best thanks, and be carefully mailed to Mr. Layens.

Some of his botanical remarks in recent letters to me may be interesting and I will quote: "I see by your letter to the *Bulletin de la Somme* that the Americans gather prodigious quantities of honey, and that these large yields are due to the united influence of climate, flora, and soil. (still new) of the United States, and that it would be impossible to us here in France to obtain such splendid results. In America much is written about the linden or basswood tree as being very mellifluous. Alas! close to my apiary are 500 linden trees, and never once in 7 years have my colonies increased in weight at the time of their flowering. Again, there are certain plants that yield honey well in certain kinds of ground, and none at all in others. I had some 19 acres planted with buckwheat all around me, and the bees hardly touched a plant—yet in Brittany it is accounted a good honey plant. One of my relatives, a first rate botanist, having observed in Norway some plants accounted very mellifluous, brought some seeds to our domain, and planted them. Not one of my bees gets honey therefrom. If I only had lists of the honey-bearing plants in the various sections of the country I could very quickly make a comparison with the honey-bearing plants I know. It would be very interesting to see what are the plants giving so much honey in your country, and to compare the honey-bearing power of certain of those plants which doubtless are found here in France."

Thanks to the unselfish exertions of such men as these I speak of. The bar frame hive is making headway in France, and now comb foundation is purchased, not as it was from me 5 years ago as a curiosity, but as a necessary adjunct to modern bee keeping.

Well do I remember filling orders for foundation by the *half pound* per mail, and the amazement of myself and family to get an order from a very venturesome Frenchman for 30 lbs. I never saw that man, but in long let-

ters I minutely taught him how to fix foundation in his frames, and how to use it successfully. To-day he has a Root 12-inch machine, and is doing the largest trade in the article. There is one other machine in France, a Dunham, I think, but I have no particulars of sales.

If time permits, I will offer some further remarks on bee keeping in France in a future number of the BEE JOURNAL.

Philadelphia, Pa.

For the American Bee Journal.

Winter Repository For Bees.

A. C. BALCH.

If I could choose my place, I should choose one where a natural spring of water flowed from the ground, from a side hill, and then dig into the hill and make the cellar over it, allowing it to run out of the cellar constantly, all open in the cellar.

The next best place would be, a cellar large enough to have a good cistern of water in it. Both tending to keep the air moist. I have every reason to believe that there are more bees killed by having them kept too dry than of having them too damp.

For facts. I, one fall, built a bee house with a cellar under it, in which to keep my bees through the winter. I got it completed in November, and put 60 or 70 colonies in it in less than 10 days from the time the house was built. The cellar was made of stone below the ground, and brick above, laid in lime mortar, so damp that I was afraid I should lose them all. I gave them no ventilation outside, but a small wooden one up through the floor to the room above, through that into a space under the roof, and then stopped. After a few days I looked in; the cellar was about 10 by 16 ft. inside, and the hives were put in on two sides and back end; three hives high.

Now for the condition. The cellar walls, the joists and floor over head all hung with water in drops; in fact some of it had dropped off on to the hives and ground. I closed the doors, one opening outside and one inside, lit a lamp and examined them. They were so quiet that at first I thought they were all dead, but the cold air let in by opening the doors, and the light, soon animated them and they began to show themselves at the entrance as lively as I could wish. I was satisfied that they were all right, put out the light, closed them up, and left them until the next April, when I took them out on a good, sunshiny day, in the presence of Mr. Heddon, and to his great surprise all were right and strong, as he had lost all of his that winter.

My hives had no ventilation, except the entrance contacted to $\frac{3}{8}$ of one inch by 4 inches; top closed tight, and sealed by the bees as tight as wood and propolis could make it.

Some of the outside combs were moldy and moist; all of the combs were more or less moldy at the bottoms; but there were very few dead

bees; the live ones were bright and lively, not a queen missing and the air was soon full of bees, but diarrhoea and brood were both lacking.

Mr. Cornell thinks they would have died if left any longer. Perhaps they would, but they had been in from November to April and showed no signs of disease, and could he have seen them fly that day he would not have called them very sick.

The 150 I lost since, I left out doors without any protection.

I will remember the conversation Mr. Heddon and I had that day. He took out the frames of the first hive I took out, while I was getting the second; he held up a frame and said: "Mr. Balch your comb is all moldy. I looked at it and said that it did not matter, as the bees would clean them all up in short order; but, he said, they are all damp and moldy. Well, I said, yours are all dry and the bees dead. He has acknowledged since in one of our conventions that I had the best of that argument. The first and only time I have ever heard him do so, to myself or any other person. How is that Mr. H.? Is it true?"

Kalamazoo, Mich., Dec. 17, 1883.

For the American Bee Journal.

Italian and German Bees.

W. Z. HUTCHINSON.

On page 655 of the JOURNAL for 1883 Mr. Demaree gives 13 points in favor of the Italians, and 4 in favor of the Germans, and then attempts to explain away the good points of the German, but neglects to do as much for the Italians. The most of the points given by him in favor of the Italians he would probably have found as difficult to explain away as he did those in favor of the Germans; while, with a few of them, he might have succeeded even better.

He says: "The Italians adhere with more tenacity to, and spread more evenly over the combs when manipulating them."

This spreading evenly over the combs, and remaining quiet while being handled, is an advantage, but the tenacity with which they cling to the combs is a disadvantage.

"The Italians build their combs more compact and squarely in the brood nest." If true, this would be no advantage in these days of comb foundation.

"Italians adhere better to location when moved a short distance." If true, this might be an advantage to the queen breeder, but to the practical honey producer is scarcely worth counting.

"The Italians are constitutionally a stronger race." Important if true.

Mr. Demaree admits that "the peddling little black imps 'pile on' an excess of wax in the process of capping, and thereby impart to their combs a dead, chalky appearance decidedly inferior, in his judgment, to the delicate cream-tinted combs so deftly finished by the Italians." Whether the "dead chalky whiteness," as Mr. Demaree is pleased to

call it, is caused by the "peddling little imps" "piling on mere wax," or by a space left unfilled with honey just beneath the capping, we will not here discuss, but we would remark that it may be well enough for Mr. Demaree to talk about "the peddling little black imps," and the "dead chalky appearance," and the "delicate cream-tinted comb so deftly filled by the Italians," but all this rubbish is swept away when the "dead chalk" comes into competition with the "cream-tinted." It might be mentioned that the truest, whitest combs always carry off the prizes at the fairs, but this is not so important as the difference in price when the honey is marketed. Just turn to some of the market reports, and such expressions as these will be found: "New crop, prime one pound sections (pure white) have sold for 20 cts., when in fancy cases." "1 lb sections, well filled, 18 cts. None but white being taken." When in Chicago last October, I visited the commission merchants who handled honey, and was shown honey of different grades. The very whitest, "dead chalky," honey was selling for 20 cts.; honey just as good, but having the "cream-tint," brought only 18 cts. Now why try to "slide" over this point by using such expressions as: "Peddling little black imps," "dead chalky appearance" and "delicate cream-tinted combs so deftly finished"? Why not come out, like a man, and say: "Yes, it is true that the German bees furnish the whitest combs, and though my taste is in favor of the 'cream colored,' yet the public is in favor of the 'dead chalky' at the rate of 2 cents a pound." I believe that no one has asserted that the superior whiteness of the combs adds to the good qualities of the honey *itself*, but appearance always has had, and always *will* have, a market value; why ignore it?

That the Germans are *not* better comb builders than the Italians, Mr. Demaree brings forward no proof except his own experience; but, although, he does not forget to inform us that that experience has been drawn out to a great length,—nearly 40 years—yet he forgets entirely to mention its *breadth*. A man may be doctor, editor, lawyer, clergyman, professor, or merchant for 40 long years, and all this time may be "dabbling" with a few colonies of bees; another man drops everything for bee-keeping, devotes his whole time, talent and energies to the business, thinks of little else during his waking hours, and even dreams of bees. He reads almost everything written upon the subject, visits bee-keepers and attends conventions, and conducts experiments upon such a comprehensive scale as to give weight to the conclusions drawn therefrom. He continues this course for 8 or 10 years, and becomes, every inch, a thorough going, well-informed, first-class bee-keeper; but let him attempt to express his views, and ten to one if some "professional dabbler" does not exclaim: "Oh you have had no experience young man, while I have been in the

business 40 years." Now, which one knows the most of what he is talking about? I do not wish Mr. Demaree to think that in writing thus I intend to be personal, nothing of the kind. I merely wish to show that, to have value, experience must have breadth and quality as well as length.

Mr. Demaree has seen it mentioned in print, that "the Germans are better comb builders"; he has seen it so often that he does not know how many times he *has* seen it, yet it counts for nothing against his "long" experience.

That "the Germaus build less, or more, drone comb" is immaterial now that we have comb foundation.

That the German bees do *not* enter the surplus receptacles more readily, Mr. Demaree attempts to prove by again putting his "long" experience "against the world." Oh yes, and he also mentions that there has always been complaints because they did not enter the boxes. Of course there has always been such complaints, and there always will be, because many bee-keepers do not understand the principles of comb-honey production, but among well-informed, experienced, comb-honey producers, these complaints have been neither long nor loud.

That German bees produce whiter combs, are better comb builders, enter the surplus boxes more readily, are less liable to upset the apiarist's plans by their swarming propensities, than the Italians, has been so generally admitted, that, to me, it seems like a waste of time to attempt to prove the contrary.

I believe that we "hybrid" bee-keepers admit, (I know that I do) that, upon actual count, there are more points in favor of the Italians than there are in favor of any other pure variety, and that for the production of extracted honey they are unexcelled; and, of course, the "pure Italian" bee-keepers find no fault with this admission, but the moment that we reach out for the good qualities of the German race, and say that, in the production of comb honey, we cannot afford to ignore the few good qualities that they possess; when we try, by crossing the two varieties, to obtain a strain of bees possessing the good qualities of *both* varieties; then, as the "old school" physicians condemn the Eclectics because they are progressive enough to use remedies that they find good, even if not mentioned in the books, so would *some* of the old school bee-keepers condemn us.

I have no desire to build up nor to pull down the reputation of any variety or strain of bees, my only desire is to arrive at the truth; and, if there is a better bee for the production of comb honey than a cross between the dark leather-colored Italian and the large brown German—not the "little fidgety black imps"—no one would be more pleased to know it than myself.

Rogersville, Mich., Dec. 20, 1883.

For the American Bee Journal.

Section Rack Comment.

T. E. TURNER.

The comment of Mr. Hedden, on page 558, of the BEE JOURNAL for 1883, on my article on Section Racks, deserves a little notice, "ere some of the less experienced be led, what seems to me, astray;" and what I have to say may serve, in part, as an answer to J. C. Thom, on page 548.

I do not claim to have tried as many devices for holding sections on the top and sides of hives, as Mr. Hedden, but I claim to have thoroughly tested the rack he uses, except the $\frac{3}{8}$ inch space between tiers, and I find it much more impracticable than the portable-sided rack, in all the respects indicated in my former article. I fail to see wherein the movable-sided rack is "weak and incapable of enduring some of the most important manipulations," from anything that has been said against it by Mr. H., and I think I have handled quite a few bees.

With respect to the variations in the shrinking and swelling of wood in sections, in the use of the movable-sided rack, I have not experienced the slightest inconvenience, from their use for 4 years, and, perhaps, that is a little longer experience than he has had with them.

It may be that glass is objectionable to bees, but with all my observations, I do say that bees do not "sorely neglect those combs that are next to them." Bees do not always work as quickly on the outside sections as they do the centre ones, in any kind of a rack, but that those without glass, are perceptibly more acceptable to the bees than those with them, may be considered an open question. The glass admits of the same examination between the ranges of combs that others do, and then one can see with them, with sufficient accuracy for practical purposes, when the sections are full, without disturbing the bees by taking off the honey-board, for generally bees commence work in the centre, and when the outside combs are capped, all are ready to remove.

If glass is so objectionable to bees, those who think so can have racks without it, for, like separators, they are no part of a movable-sided rack. I have never tried separators on one side of sections and glass on the other, but from my use of separators, I would lay the blame on them, rather than the glass. Though I regard glass as a very convenient arrangement, yet the views and taste of the individual must regulate that matter. The expense of movable-sided racks is but a trifle more than those with stationery sides, especially if the views are left off.

I did speak of the risk of breaking the cappings in shoving one section past another, for that is the danger with his rack in removing single sections. Full sets, or even rows, cannot always be removed, for the bees will not always fill a set full, and it may be desirable to leave those partially full on the hive, and take full ones off, putting new ones in their

place. If one or two sections alone are to be removed, and empty ones put in their place, the movable-side need not be taken out, but only the keys loosened, and there is then no re-adjusting except tightening the keys by pushing them down with the hand; and only when a full set are to be removed, are the sides taken off.

Nothing was said about the speed of taking out one section at a time, but the safety of the comb in the movable-sided rack is the point of preference, but the speed, as well as the safety, I think, would be in favor of the movable-sided rack.

I make no pretensions to being a large honey-producer, but on looking over the report of the Northwestern Convention, I find I am more than an average in the amount of surplus honey and the number of colonies, and could report more than Mr. Heddon of an average per colony of surplus honey and increase, and I claim the right to think that the time I gave to my bees had to be used as actively as his.

Some who reported at that convention are far ahead of him in the average per colony, and have a goodly number of colonies too, that are using the movable-sided racks, and would have nothing else now, having thoroughly tested the stationary sided racks, and discarded them.

If one finds a few bees in the way, let him put the edge of the rack on the back edge of the one already on, and shove it gently from him until it is in place on the other, without hurting any bees. A $\frac{3}{8}$ inch space between the honey-board and sections allows the bees to gum the sections on the bottom and top too, in tiering up, and this they invariably do, more or less, for experience has proved it.

I tried 10 racks in 1882 without any honey-board, and with a $\frac{3}{8}$ inch space over the brood-combs under the sections, and the sections in these racks were so gummed up that they had to be cleaned off before they were fit to case, while those on a honey-board were clean. My experience with them was such that I decided never to use any more racks without honey-boards with slats on which to rest the sections, to keep the bees from spoiling them with wax.

The assertion that bees "will squirt in between sections set on top of each other more glue than they will put on those with $\frac{3}{8}$ inch space from any other surface," needs some proof when the experience of many is the opposite. True, they would do that if much space was left, but with the sections we use, and such as are properly made, there is very little if any space between the bottom and top of sections tiered up. With regard to the spaces interfering with the work in the surplus receptacles, I refer Mr. Heddon and others to my former article on that point, which, seems to me, remains unanswered. I, too, "am willing to leave the matter to the coming practice of honey producers," and willing or unwilling, there is where it must be left.

Sussex, Wis., Nov. 17, 1883.

For the American Bee Journal.

Cause of Moisture in Hives.

S. CORNELL.

Although in Mr. Heddon's article, page 590 of the BEE JOURNAL for 1883, there are points on which much might be said in reply, it is perhaps better not to have too much of one subject, so I shall not at present say a word more about pollen, humidity or dysentery. But another question is raised on which we differ, and as it relates to a matter which has come under the notice of most bee-keepers, I feel reluctant to let it go by default, without submitting it for their decision. I shall give Mr. Heddon's statement of the case in his own words. The italics are mine.

On page 269 of the BEE JOURNAL for 1881, he says: "In nearly every repository, or out-of-doors, *as soon as a colony is dead, dampness accumulates in the hive, an effect, not a cause of the death of the bees.*"

On page 392 of the BEE JOURNAL for 1882, he says: "I have found that *the honey soon gets thin after the warmth of living bees is exchanged for the damp carcasses of dead ones.*"

In his late article, page 590 of the BEE JOURNAL for 1883, he says: "In regard to the excessive dampness found in colonies having died of dysentery, it will be found upon close examination, together with more extended observation, that *the wet moldy condition is the effect of the death, and not the cause.*"

That is, the water which we find condensed on the sealed honey and on the inside of the walls of the hive, and sometimes running out of the flyhole, comes from dead bees.

On the contrary, I hold that this water is produced by living bees, and that when they die, its production ceases, and I think it is not difficult to understand how it is that a colony whose numbers are daily decreasing, should, in their efforts to make up for the loss of heat by the reduction of their numbers, consume more fuel, thus producing an increased quantity of vapor which, if it be produced faster than it escapes from the hive, soon accumulates, and is condensed, causing the appearance of matters as we often find them after the bees have died.

In support of the opinion that the inside of the hive is often dripping with moisture while the bees are still alive, I do not see how I can do better than to give the observations of Mr. Heddon as stated by himself.

On page 392 of the BEE JOURNAL for 1882, he says: "I saw Mr. Balch's bees come from a close unventilated room, *dripping with water and combs all moldy*, in excellent condition. I have seen the same on other occasions."

And on page 464 of the current volume, we find him saying: "I am somewhat at a loss to know why he (Dr. Tinker) so carelessly passed by the fact, that so many instances are recorded, where bees came out of special repositories *perfectly drenched with dampness, and the combs covered*

with blue mold, but with the bees perfectly healthy."

I ask those who have had experience to decide whether the moisture found when we came to examine colonies which have died, emanated from the bees while alive, or from "the damp carcasses of dead ones."

Lindsay, Ont., Dec. 11, 1883.

For the American Bee Journal.

Will all Pure Honey Granulate?

J. W. MARGRAVE.

In Mr. Dadant's book on "Extracted Honey," etc., he takes the position that pure honey will *always* granulate in his latitude, and, of course, the converse of this, *i. e.*, that honey that does not granulate in cold weather is impure, not ripened, or else adulterated. The Toronto Convention came very near taking the same ground.

I have great respect for Mr. Dadant, as also for the Toronto Convention, and do not doubt the ability or candor of either, yet I cannot indorse the position. I have handled honey in a limited way for the past 10 years, and have not had a single pound of candied honey of my own, nor have I seen a specimen of it in this country since I have been here—some 20 years. I do not know why it is; neither do I know why honey does, or does not granulate, and I do not want to be placed under the ban of suspicion, either.

I as cordially despise the adulteration of honey by glucose, or anything else, as any one, and I have been in full sympathy with all that I have seen written against the adulteration of all foods. I think the man who is guilty of doing so for gain, is guilty of a heinous crime, and should suffer the full penalty of a stringent law; but, as my honey thus far stubbornly refuses to granulate, I must demur to being classed with adulterators.

It may be said that my "honey is not well ripened." Well, I think that honey that weighs 12 lbs. to the gallon, is not very unripe; as I understand it, honey that is not ripe is in danger of souring; my honey is so thick that in cold weather I can hold 2 or 3 lbs. on a common case knife. It is so thick that it will not run out of a 2 inch molasses gate in cold weather. Our honey resources are almost identically the same as those Mr. Dadant mentions; heartsease largely predominating.

Please do not put me on the list of adulterators, nor call my honey glucose; I cannot stand that.

Iliawatha, Kans., Dec. 17, 1883.

[The rule is that pure honey will granulate in cool weather, but there are exceptions; and Mr. Margrave's is one case of exception, evidently.—Ed.]

Essentials of the Coming Steam-Engine.

WM. MUTHI-RASMUSSEN.

I have felt a lively interest in the improvement of steam-engines ever since I have handled them, which I began about 20 years ago. There are many natural laws, that have an important bearing on steam-engine construction, but inventors are apt to give undue prominence to one or more points, which are made much of, to the neglect of others which are, perhaps, of equal or even greater importance. Nearly all who have written on "the coming engine," "a standard engine," etc., seem to take it for granted that some one of the engines or boilers now in common use should be adopted as such. I think that advanced engineers in the latter part of the 19th century should do better than that; and look for an engine constructed on a new and scientific plan, and a new system of manipulation and management, that by its adaptation to the natural properties of steam and the requirements of engineers, shall commend itself to enlightened minds, and not need the formal endorsement of conventions and societies. Those who do not appreciate applied science will, of course, be free to use steam on Watt's, Corliss, or any other plan they may choose. Of the improvements of the past, sliding valves must be retained, but of an entirely different construction from those now in common use; and should be fixed, and reversible as well as movable. Steam-power has become a staple necessity, and its production must be provided for.

Self-oilers are so convenient and popular, that the best possible system of using them should be adopted; and be of a sufficient number of different sizes to meet the requirements of all—for home use and market—which should be of such proportionate dimensions as to be usable on the same engine without change or alteration of engines.

The exhaust-steam is too valuable to be neglected, and intermixed with cold water, to be re-injected into the boiler, is too useful to be rejected until something better is provided.

Cushions or packing of wool, hair, wood or other non-conductors of heat, or confined air, may be used to economize fuel in cold seasons and climates, and occupy space on top and on all sides of the boiler, frequently used for surplus storage of dust and all kinds of trash, except when the inspector comes round, or gained by reducing the pressure of steam to correspond to the diminished amount of work to be done at certain times of the year.

I will here summarize some of the essential points as follows: It must be perfectly adapted to either high or low pressure, at all seasons and in all climates. To secure this the boiler must be deep and capable of any required amount of contraction or expansion, on all sides alike, by making it of India-rubber or some similar

material. It must supply abundant room for surplus-steam as closely as possible to the cylinder, with free continuous passages. It must be equally adapted to a vertical or horizontal position, using either position as may be required, without change or alteration of parts. It must be easy to manipulate for all purposes, with the least possible danger of hurting the engineer or making him mad. It must be of simple construction, rejecting all unnecessary parts and complications, such as throttle-valve, piston-rod, cross-head, governor, crank, balance-wheel, etc. There are several minor points that I will not stop to enumerate, but all are in harmony with the above.

I am looking for the "coming steam engine," and shall continue to do so until it appears. To show that looking with me is not idle watching and waiting to see what others are doing, I may be allowed to state that I have at several times devised, constructed and tested steam-engines that embodied my best ideas at the time, and now have engines in use, that seem to be right in the plan, and only require to be perfected in details, so that any blind, deaf and dumb idiot can run a steam-engine the first time he lays his hand on it.

By comparing the above with the article "Essentials of the Coming Hive," on page 575 of the BEE JOURNAL, it will be seen that the writer and I agree perfectly in the desired requirements of our "coming hobby horses."

Independence, Cal., Nov. 22, 1883.

For the American Bee Journal.

Correct Use of Apicultural Terms.

WM. F. CLARKE.

It was a good beginning in a needed line of improvement that was made by the editorial of BEE JOURNAL, No. 48, entitled "Call Things by Their Right Names." Critics and reformers, however, become shining marks, and are very apt to have the proverb "Physician heal thyself" shot at them. The editor of the BEE JOURNAL is one of the most genial of mortals, always bubbling over with good-nature, so I am certain he will take no offence at the tables being turned upon himself a little—which is the object of the present article.

The vocabulary or encyclopædia of bee-keeping words and phrases, is for the most part excellent, but is, I think blemished by a few inaccuracies, which it will be well to correct in a future edition. For I do not doubt that this beginning will some day grow to a size and importance that will justify its publication in the form of a pamphlet or hand-book. Let every bee-keeper think the matter over, and should any addition or correction suggest itself, it will be well to "make a note on't," and forward it to the JOURNAL. Thus, in time, we may hope to have a complete and correct nomenclature of bee-keeping.

I subjoin a few criticisms which have occurred to my mind in conning

over the article now under notice. "Apiarist.—An expert bee-keeper." Is not "expert" redundant and incorrect? Would not "A bee-keeper" be an all-sufficient definition or synonym for "apiarist"? If apiarist means "an expert bee-keeper," then it will be hardly modest for any one but such as Langstroth, Jones, Heddon, Doolittle, Root, Dadant, etc., to say "I am an apiarist." May not an apiarist be either inexperienced or expert? I will say here that I like bee-keeper, better than apiarist, though the latter term sometimes comes handy to avoid repetition. Of two words meaning the same, commend me to the simpler one.

"Apiary.—A place where bees are kept." Now is that so? Is not an apiary the whole establishment, bees, hives, extractor, smoker, veil, etc. "Place" is rather the spot or locality where all this is gathered. It may be a lawn, grove, building or as with Bro. Muth, the roof of a store. But I think apiary is, strictly speaking, the entire institution over which the "apiarist" presides.

"Bee Moth.—A miller which preys upon the combs." I am not enough of an entomologist to know if "miller" is a scientifically correct word. I know it is a common one, but "insect" would be a more exact definition in this case.

"Cluster of Bees.—A festoon of bees clinging to one another." It appears to me that there is a difference between a "cluster" and a "festoon." A cluster is a close, compact body. A festoon is open and in ring-form, usually oval rather than circular. A festoon is a cluster, I suppose, but is a cluster necessarily a festoon? I think not. "A number of bees clinging to one another," would be, to my mind, a more accurate definition.

"House—Apiary.—A building having double-walls, in which to keep several colonies of bees." Must such a building necessarily have double walls?

"Manipulation.—The handling of bees." Manipulation is operating with the hands. This word by itself is not suggestive of bees at all. Handling a shovel, or a horse is manipulation. "Bee-manipulation" is handling bees, and it is better to say so in plain terms, instead of lugging in a word of five syllables which without an accompanying adjective or other explanatory terms has no special reference to bees.

A similar criticism applies to the word "robbing" which does not by itself express the idea of robbery by bees. There has been a great deal of robbing done round apiaries by thieves destitute of wings, and not in a fair way to get any, however sweetly they may sing, "I want to be an angel."

"Spring Dwindling.—Decimation of a colony of bees in spring." Decimation is literally the destruction of a tenth part, but unfortunately spring dwindling does not stop at this. Decrease or diminution would be a better word.

Is "pollen" always "the farina of flowers?" In spring, it is frequently

the farina of rye or other meal. Would it not be better to define "queen," as "the mother bee," instead of "the mother of the colony," a phrase not applicable to a queen just fertilized or newly-introduced. "Wedding-flight" is not merely "an excursion of a virgin queen to meet a drone." Vain will be the meeting, unless there be a mating.

There are a number of other words that might properly be included in the list under notice: e. g. "Bee-eater.—A bird that devours bees." "Bee-line.—The shortest line from one place to another." "Bee-veil.—A protection for the face and head, condemned by thick-skinned bee-keepers, but valued by the sensitive, and those liable to swell."

"Bee-journal.—A periodical indispensable to successful bee-keeping."

But a vocabulary of this kind is a work of time. It is not by jotting down the few words that occur to one's recollection on the spur of the moment, but by recording them from time to time in a memorandum-book, that a considerable collection can be made. If bee-keepers will be at the pains and trouble to pursue this course, and send their lists, when as complete as they can make them, to the editor of the JOURNAL, we shall by and by have a reference-book which will be very valuable and useful to bee-keepers generally.

Guelph, Ontario, Dec. 1, 1883.

For the American Bee Journal.

The Cause of Bee Diarrhœa.

H. V. TRAIN.

There may be many first causes operating to produce the final cause, but I believe the final cause always to be sour honey. And I do not believe that pollen ever has anything to do with it, *pro* or *con*. Sugar syrup is safe winter food if made thick, because it is not easily soured. Clover honey is safe, because it is always gathered early in the season, and gets well ripened, and hence does not sour easily.

But what causes honey to sour? That is the question; and when we have solved that, in my opinion, the whole problem of wintering is solved. For I never yet knew of a case of the disease, where I could not find sour honey in the hive; and I never found sour honey in a hive in the spring, where there was no disease in that colony.

A. R. Kohnke, on page 639 of the BEE JOURNAL for 1883, says: "Now I wish Mr. D., and such other bee-keepers as are interested in it, to experiment as to how to produce the disease at will, whenever they wish," etc.

I do not wish, but I can produce the disease in any colony he may have, if he wishes; or I can tell him how to do it. Let him put his bees into a cellar without much circulation of air; keep the top of the hives tight, with a small entrance, and keep the temperature of his cellar below 40°, and a part of the time down to 30°, and he

will have his wish sure. The reason is, if I am right, the breath of the bees will condense on the honey outside of the cluster; there is not sufficient circulation of air to dry it off; the cappings crack, more or less; the honey and water getting mixed will sour; and, fermentation once commenced, penetrates the whole mass; and when the bees eat the soured honey in confinement, they are effected.

But if the bees have well-ripened stores; a brisk circulation of air through the cellar; a large entrance to the hives; a Hill's device over the frames; with only a burlap over the device and the cover on that (I use straw matting obtained from tea chests); and then keep the temperature of the cellar from 45° to 50°, he will have neither sour honey or its effects.

This, at last, is my settled conviction, after 20 years of experimenting and close observation. I do not feel so sure as to all the conditions which causes honey to sour out-of-doors, but I do feel sure as to the conditions which causes it to sour in cellars or bee houses.

Let the above conditions be met, and I would like to insure all the bees in the United States against dysentery for 10 cents a colony. And there is another consideration: it does not cost half as much to prepare bees for the cellar, put them in and take them out, as it does to make them half as safe on the summer stands. And it does not take more than half as much honey to winter them in the cellar, under these conditions, as it does to winter them out-of-doors. A word to the wise is sufficient.

Mauston, Wis., Dec. 17, 1883.

Convention Notices.

☞ The Southeastern Michigan Bee-Keepers' Convention will be held at Adrian, Mich., in the Plymouth Church Chapel, Jan. 23, 1884; morning, afternoon and evening session.

H. D. CUTTING, *Pres.*
H. C. MARKHAM, *Sec.*

☞ The Eastern New York Bee-Keepers Union, will hold an annual Convention in the Agricultural Hall at Albany, N. Y., on Tuesday, Wednesday and Thursday, Jan. 8, 9 and 10, 1884. We invite exhibition of hives, extractors, implements for the apiary, and all apiarian supplies. Time will be given for exhibition and examination, and testimonials awarded. There will be speeches and essays on important topics from prominent apiarists, and questions on interesting subjects will be discussed. A general invitation is extended to all interested in apiculture. S. VROOMAN, *Pres.*

☞ The Marshall County Bee-Keepers' Association, will meet at the Court House, in Marshalltown, Iowa, on Saturday, Jan. 5, 1884. Subject for discussion: "Promotion of Bee-Keeping." All are invited.

J. W. SANDERS, *Sec.*
Le Grand, Iowa.

The 15th annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 22, 23 and 24 days of January 1884.

This will be the largest and most interesting convention of bee-keepers ever held in America. Many of the most scientific apiarists in the country will take part in the discussions. The programme is completed, and comprises all the interesting topics of the day. The question box will be opened each day, and the questions answered. All are invited to send in questions.

Implements and other articles of interest for exhibition will be received and properly arranged. It will pay any bee-keeper to go a thousand miles to listen to the discussions. By hearing and seeing, you will obtain much more knowledge than by reading. Five hundred bee-keepers will be in attendance. Reduced rates of board at hotels have been secured. All are invited.

GEO. W. HOUSE, *Sec.*
W. E. CLARK, *Pres.*

☞ A meeting of bee-keepers will be held at the residence of W. Cossens, Monee, Will Co., Ills., on Monday, Jan. 28, 1884. All friends of improved management of the apiary, are invited to attend.

A. WICHERTS, }
W. COSENS, } *Committee.*
B. HEYEN, }

☞ The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association, will hold its annual meeting in Temperance Hall, Freeport, Ill., on Jan. 15 and 16, 1884.

J. STEWART, *Sec.*
Rock City, Ill., Nov. 30, 1883.

☞ The 5th annual Convention of the Northeastern Ohio and Northwestern Pennsylvania Bee-Keepers' Association, will be held at Jefferson, Ohio, Jan. 16 and 17, 1884. All are cordially invited.

C. H. COON, *Sec.*
New Lyme, O., Nov. 26, 1883.

☞ Owing to the death of our Secretary, Mr. T. Brookins, please announce in the BEE JOURNAL that the annual meeting of the Champlain Valley Bee-Keepers' Association, will meet in the parlors of the Addison House, Middleburg, Vt., the second Thursday in January, 1884.

J. E. CRANE, *Pres.*

☞ The Bee-Keepers' Association of Central Illinois, will meet in Bloomington, on Jan. 9, 1884. All are cordially invited to attend.

JAS. POINDEXTER, *Sec.*

☞ A meeting of the bee-keepers of Des Moines Co., Iowa, will be held on the second Tuesday in January, at 10 a. m., for the purpose of organizing a county bee-keepers' association, at Middleton, Iowa, in R. C. Crawford's Hall. JOHN NAU, FRANK MELCHER, A. M. BALDWIN, W. R. GLANDON, *Committee.*

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Best Hive for Comb Honey.

Will Mr. Heddon please answer this? Which is the best hive for comb honey, 8 or 10 frame Langstroth hives? If 8 frames is best, how wide in the clear should the hive be?

H. M. CATES.

Shidler, Ind., Dec. 11, 1883.

Having tested both, I much prefer and use the 8-frame hive. I use 11½ inches in the clear, to 8 frames.

Transferring, etc.

This is my first summer with bees. My first swarm I hived myself, and, having no hive, I put them in a box, with two pieces of lath across the inside, and they have done nicely. Please to tell me how and when to get them into a hive. I am using the common two-story hive, having frames below and four square boxes in the top. What is the proper name for it? What book is best for a beginner to have?

F. H. GLEASON.

Mankato, Minn., Nov. 29, 1883.

"Modern transferring," which will be found on page 367 of the BEE JOURNAL for 1883, gives my ideas of the best method and time for transferring bees.

There are a good many kinds of 2-story hives, with frames below, and various numbers of boxes on top, and it would be difficult to give any name for a tenth part of them.

The works of Langstroth, Quinby, Cook and Newman, are worth many times their cost to the beginner.

Rack for Sections.

Please give a description of Heddon's rack in the BEE JOURNAL, to hold sections without glass. If it has been described in the JOURNAL, it is in a volume that I have not got. I think it would oblige many others as well as myself.

S. L. VAIL.

Coal Creek, Iowa.

If the case or snper we use for storing honey is meant, I will say that a description will occupy too much room for this department, but in response to Miss Vail and many others, I will describe it in the columns of the BEE JOURNAL, as soon as I can get to it.

Did the Sugar kill the Bees?

I send you a package containing some sugar and dead bees. The bees have been fed upon the sugar all the fall, as they had no natural stores. My attention was attracted by a number of dead bees about the entrance

of the hives. I examined the hives, but could find nothing that would solve the mystery. The combs and hives were dry and bright. The inside of the hives were not spotted, neither was the outside; the bees had evidently fallen from the combs upon the bottom of the hive, and had been dragged out of the hives by their comrades. I saw the bees bringing dead ones out, but saw none coming out as is the case where they are affected by dysentery. The sugar was sold to me for pure sugar, and I send it to you to examine it, for I fear it is glucose. I also send the bees, as I thought they would help solve the mystery.

Salem, Mo. JAMES F. JOHNSON.

I infer from your statements that there are no more bees dying in your hive, than is usual at this time of the year. If there are, I can account for it in no way unless they may be starving. Are you sure there is plenty of sugar syrup in the hives, not crystallized, but in proper condition for food? The bees show no signs of disease. The sugar, if mixed at all with grape, the mixture is too slight to injure the bees, and had they been fed entirely with grape sugar, there would be no such symptoms, especially at this time of the year, in such a winter as we have had, I do not think, though I would not advise the use of grape sugar, in whole or any part, in connection with bees, for I should expect it to give them dysentery, if fed pure, for them to subsist upon during cold and long confinement.

SELECTIONS FROM OUR LETTER BOX

Well Done.

My report for 1883 is as follows: I commenced the season with 44 colonies; increased to 105, and obtained 2,000 lbs. of comb honey, and 2,000 lbs. of extracted, mostly white clover.

WM. HEALD.

Mt. Sterling, Iowa, Dec. 20, 1883.

Excellent Report.

I started with 3 colonies of bees last spring; increased to 13, and lost 2. They gave me 150 lbs. of extracted honey, and 250 lbs. of nice comb honey. Did I do well or not?

P. E. V.

Jerseyville, Ill., Dec. 22, 1883.

[You did exceedingly well.—ED.]

Good Yield of Honey.

I had a good yield of honey during the past season, and the bees are now in splendid condition for winter.

W. W. HIPOLITE.

DeValls' Bluff, Ark., Dec. 19, 1883.

An Amateur's Report.

My report for 1883 is as follows, viz.: Spring count 2, increased by swarming to 7, found 7 bee trees and bought 5 colonies, making in all 19, which I reduced to 8 good strong colonies by uniting. I have them in the cellar, in simplicity hives. If I succeed in safely wintering them, I intend to Cyprianize by introducing Cyprian queens. I am an amateur at the business; but like it well, and if I can make it a success, I intend to build up a respectable apiary. I handle my bees without smoke or gloves. I read the BEE JOURNAL with great interest. Why do not the seedsmen or nurserymen not offer bee-keepers collections, consisting of flower seeds, which are frequented by bees, and also shrubbery, that, in ornamenting our yards and gardens with flowers, are useful as well as ornamental? I shall want something of that sort this coming spring, and if they would advertise in the BEE JOURNAL, it would no doubt pay them.

DAVID R. PHILLIPS.

Fulton, Mo.

Hives in Use in the West.

What style of hive is now mostly in use west of, say Cleveland? Has the new Langstroth hive with movable side, such as Mr. Newman had a model of in Europe in 1879, been a success? Please answer in the BEE JOURNAL.

Philadelphia, Pa.

A. TODD.

[Langstroth hives are mostly in use in the West, and some thousands with the movable side, as mentioned above, are also used.—ED.]

Black Bees as Honey-Gatherers.

I began, in the spring, with 30 colonies of bees; 5 were very weak, and 25 fair colonies. I got 4,500 pounds of honey; 1,400 pounds in the comb, and 3,100 pounds of extracted honey; 3,900 pounds of it was basswood honey, and 600 pounds was white clover. This was the best year I ever saw for basswood honey. My bees are all blacks; they averaged 150 lbs. of honey per hive, spring count. I think they have done well for poor despised blacks. I have now 72 colonies of bees.

WM. COLEMAN.

Devizes, Ont., Dec. 18, 1883.

Wintered in a Warm Cellar.

As my last report in the JOURNAL, on June 3, predicted that swarming was near at hand, so it proved, for swarming commenced on that day, and from June 3 to June 28, 156 swarms issued from 150 colonies, all there was in the yard. Will any man say that they were not well wintered? and yet hundreds of bee-keepers will raise their hands in horror when told that this lot of bees were wintered in a temperature from 65° to 90° of heat! Bees in my other yard, wintered on the same plan, commenced swarming on June 5, and were equally as good as the one that I worked. The whole amount of comb honey was 22,000 lbs. (not extracted). I wish to say that I

do not agree with Mr. Heddon in regard to pollen and dysentery. Keep the bees warm, and they can eat all the pollen they care to, and unless some of them get to breeding, you will see no signs of dysentery, and then it will be on the outside of the hive, and does no harm. It appears strange to me that a man like Mr. Heddon will still persist in wintering bees in a cool atmosphere. When I was wintering in a cool room, I was having the same trouble that so many are having now, and that was before Mr. Heddon and scores of writers ever owned a bee. Bees will winter on syrup made of coffee A sugar, in a very cool room, with no signs of dysentery, if kept in for 6 months; but I was never able to find any brood in a colony that had nothing but coffee A sugar syrup to live on; and, as there were no young bees to stir up the cluster, all were quiet. If any one has failed to have their bees winter well in a warm cellar, I have yet to hear from him. I find that bees will stand a high temperature in winter quarters and not scatter and run, providing they do not get a sniff of fresh air from the outside, either hot or cold. I have sold all my bees but the apiary that I work, 225 colonies, and they are in a cellar 17x19 feet. I expect some failures, as all were carried in that contained bees, and some of them were queenless, on the last of September, when cells were given them, and no further notice taken of them.

IRA BARBER.

De Kalb Junc., N. Y., Dec. 21, 1883.

My Season's Work With Bees.

After losing some and selling more than I really wanted to, I commenced with 6 strong and 10 very weak colonies, making 16, such as they were; they increased to 51, which went into winter quarters, strong in bees and the most of them with a surplus of honey; 5 or 6 will have to be fed; this I shall do in January. I took 1,200 lbs. of comb honey in 2 lb. sections and 2,400 lbs. of extracted; no fall honey.

W. H. BALCH.

Oran, N. Y., Dec. 20, 1883.

Report of a Beginner.

I send you my first report as a bee-keeper. I commenced the spring of 1883 with 15 colonies of black bees, in fair condition. I sold 3 black colonies and bought 3 of Italians. By the process of grafting the queen-cells, I now have 16 Italian and 14 black colonies. I had about two weeks' good flow of honey from white clover, and very little from buckwheat or fall flowers. I have taken 1,000 lbs. of white clover honey, almost all in boxes, and sold it all at 15 cents per pound, and could not nearly supply the demand.

S. H. WAGGONER.

Godfrey, Ill., Dec. 18, 1883.

The Cold Wet Season.

I commenced the season with 36 colonies, increased to 75; and obtained of comb honey 500 lbs.; and extracted 600 lbs.

JOHN HERNST.

Reese, Mich., Dec. 19, 1883.

My Report for 1883.

From the 43 colonies put up the previous fall, 37 survived. The weather was wet and cold during the entire season; even in July, when bees were working on basswood, they would fall by the thousands within a few rods of their hives, until the trees and fences were covered with bees, still they worked through the rain, for it rained incessantly every day but two, during the 16 days that basswood was in bloom. After basswood ceased, there was no more honey gathered. The 37 colonies increased to 60, and I took 700 lbs. of comb honey and 600 lbs. of extracted honey. I sold 3 colonies and 5 queens. This is the poorest honey season I have witnessed since I have kept bees, which is for 4 years.

C. E. MILLER.

Justus, Pa., Dec. 17, 1883.

Button-Bush Honey.

I have had a little experience during the past season with button-bush honey, and I do not want it repeated next August. Why did not some of our knowing ones tell us that the button-bush honey was far inferior to buckwheat honey? It is very thick, black, and stringy, and has a very sickening taste. It began to bloom immediately after basswood. I got from 10 to 30 pounds per colony from it. Two swarms that issued on July 25, nearly filled their hives from it in 2 weeks. As we cannot sell this dark comb honey, those of us who have more dark honey than we need for wintering, will have to extract the dark and sell it at 6 or 7 cents per lb., or put it away in combs for feeding in spring. As the season was so very cold, we did not get over 10 lbs. of golden-rod honey. I got from 50 to 75 pounds per colony of early honey, in combs.

R. S. BECKETT.

Three Oaks, Mich., Dec. 19, 1883.

Honey Crop and Fertile Workers.

I commenced the season with 39 colonies; increased 15 by dividing; 33 colonies swarmed 114 times, but as I had all my queen's wings clipped, every swarm was returned. I realized from 40 colonies 1,131 lbs. of extracted honey, and 2,171 lbs. of comb honey, in 2 lb. sections. I have 25 lbs. of wax. I have sold 2,400 lbs. of honey at 15 cts. per lb., and have 902 lbs. on hand. My honey is all first-class. The past season was a strange one; there was bloom plenty, but not rich with nectar. On Nov. 7, I weighed my bees and prepared them for the coming winter on their summer stands. Each hive contains 20 to 42 lbs. net, of ripe capped honey; the 54 colonies has 1,796 lbs.; 40 colonies averaged 82½ lbs. each. Hive No. 22 has a black queen, 3 years old; I kept her drone brood out last year, and, strange to say, she had no drones this year. I took 117 lbs. of honey from her this year. No. 23 is a pure Italian; I divided her brood 3 times this year, and she gave 116 lbs. of honey, and No. 37 is a pure Syrian; I divided her brood 3 times, and she gave 108 lbs. of honey. No. 13 is a pure Syrian-

Italian; I divided her brood 4 times, and she gave 104 lbs. of honey. We have had but very little cold weather here yet; on Nov. 4 it was 6° above zero, the coldest day yet. Last night it was freezing—to-day, clear and beautiful. Much has been said about fertile workers, and I find by experience, that the so-called fertile is not only a pest in queenless hives, but are just as apt to be in a hive where there is a splendid queen, as in one that is queenless, and I believe that many choice strains of bees are run down to worthless trash, by allowing the working bees to rear drones of their own weak and unnatural method. I have experimented in regard to these pests, the so-called fertile workers. I will give my experience with them soon. I have moved into the city of Kane, 5 miles southwest of my apiary. I have my apiary in the care of S. P. Ranney, the tenant on the farm. I go and visit my apiary every 3 weeks, and I believe that all my bees know me. I find a home market for all my honey; just this moment had an order for 210 lbs. I will not have honey enough to run till May; I asked myself in September, what I would do with all my honey, for some was reporting such large crops. I wish an endless life to the BEE JOURNAL, and may the time come when bee men will all be blessed with a land "flowing with milk and honey," and hot biscuit and butter.

R. M. OSBORN.

Kane, Ill., Dec. 15, 1883.

Prophecy About the Weather.

I take great pleasure in reading about the new things relating to bee-keeping, in the BEE JOURNAL; we find many through the course of a year. It takes too long to learn the many things pertaining to bee-culture with one's self, hence we must read. There is a gleam of satisfaction in all our hearts up in this country, about the past honey season. We all have some honey—it might have been worse. The summer of 1883, here, will not be remembered as a great honey season, but almost the reverse. Early frost discontinued the gathering of honey till 1884, and I am afraid a great many colonies will suspend, ere the beautiful flowers, casting their fragrance around, can invite the honey bees to come and sip the nectar sweet, from early morn till the close of day. Early in November we noticed that the thermometer indicated zero, or thereabouts, for a whole week through, and that the wind was up in proportion. Since that time we have had, generally, very fine weather, with remarkably red mornings and rosy evenings. To-day, the 15th of December, is very clear without any wind to speak of, yet the thermometer registers zero at noon. Most every one predicts that it will be a very mild winter; just what they base their notions upon, I am unable to tell. Some of these prophets also claim that we are to have an early spring. Others say "no snow this winter," yet snow fell to the depth of 3 inches last night; it may be they meant that it would not be 16 feet deep.

JOHN MORRIS.

Mauston, Wis., Dec. 18, 1883.

The Ohio bee-keepers will hold their annual convention in the parlors of the Farmers' Hotel, at Columbus, O., Jan. 14, 15 and 16, 1884. All interested in bee-culture are invited. The following subjects will be discussed: "How to winter bees successfully." "Are the new races of bees a success?" "What can we do to prevent adulteration of honey?" "How to create a home market for honey." "How many colonies can be kept in one locality?" "Can we do without separators?" "Which are best, deep or shallow frames?" "What shall we do with second swarms?" "How many brood frames are necessary in a hive?" "Which is the most salable section, one-half, one or two pounds?" "Is it advisable for all bee-keepers to adopt a standard size of frame?" "What is the most desirable width of sections?"

The above questions will be discussed by eminent men, such as Rev. L. L. Langstroth, Dr. Besse, S. D. Riegel, C. F. Muth, A. I. Root, of Medina, and others, and in addition to the above, Prof. Lizenby, of the Ohio University, will deliver a lecture on "Honey-producing plants;" also Mrs. Jennie Culp will read an essay.

C. M. KINGSBURY, Sec.

Notice is hereby given that the Nebraska State Bee-Keepers' Association will meet in annual session at Lincoln, Neb., Wednesday, Jan. 9, 1884, at 2 p.m., in the Y.M.C.A. rooms on Tenth street, between O. and P., just east of the Government Square.

We have the promise of some eminent apiarists from other States to be with us, and also expect to have one of the largest displays of apiarian supplies ever gathered together in the State. Each person attending, is requested to bring something to exhibit or show, to the edification of bee-keepers and others. Past members are earnestly requested to renew their membership, and all others are cordially invited to come in with us.

The ladies having been well represented at our past meetings, we certainly expect a larger attendance this session than ever before. All those not attending will surely miss a good time, for we expect the largest gathering, and also the most enthusiastic meeting of practical bee-keepers ever held west of the Mississippi river.

We have succeeded in making very satisfactory hotel arrangements. Two dollar hotels have offered \$1 rates. All bee-keepers desiring to attend can obtain certificates entitling them to excursion rates over the B. & M. and U. P. railroads by applying at any time previous to Jan. 6, to M. L. Trester, Secretary of Nebraska Bee-keepers' Association, Greenwood. Please apply immediately.

M. L. TRESTER, Sec.

T. L. VAN DORN, Pres.

The annual meeting of the Indiana bee-keepers will be held at Indianapolis, Jan. 15 and 16, in the Agricultural rooms corner of Tennessee and market streets. A cordial invitation is extended to all.

F. L. DOUGHERTY, Sec.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

How to Create a Market for Honey.

We have now published another edition of the pamphlet on "Honey as Food and Medicine," with more *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit. Try it, and you will be surprised.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Our New List of Premiums.

Getting up Clubs for 1884.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar *they send direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

Do not let your numbers of the BEE JOURNAL for 1883 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers we reply, yes; any book or binder we keep for sale, may be selected by those who get up clubs.

"HER SECOND LOVE," Ashford Owen's latest novel, just published by T. B. Peterson & Brothers, Philadelphia, Pa., should take the reading public by storm, for a better or more interesting love story is not to be found in print. It handles a delicate subject in a masterly manner, and lays bare the inmost workings of a young girl's heart with a minuteness absolutely unparalleled. Its perusal will not hurt any one, old or young, and its capacity to do good is simply enormous. It is published in a large square duodecimo volume, in uniform style with Mrs. Burnett's works, price 50 cents in paper cover, or bound in morocco cloth, price One Dollar.

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or in cloth for \$3.00.

Advertisers' Opinion.

The queen business is *rushing*, and we think the BEE JOURNAL deserves much credit as an advertising medium.
E. A. THOMAS & CO.
Coleraine, Mass., July 18, 1883.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

THE AMERICAN POPULAR DICTIONARY.

CONTAINING EVERY USEFUL WORD IN THE ENGLISH LANGUAGE,

With Its Correct Spelling, Proper Pronunciation, and True Meaning.

ALSO, A VAST AMOUNT OF ABSOLUTELY NECESSARY INFORMATION UPON

Sciences, Mythology, Biography, American History, Constitutions, Laws, Growth of Cities, Colleges, Army and Navy, Rate of Mortality, Land Titles, Insolvent and Assignment Laws, Debts, Rates of Interest, and other Useful Knowledge,

Sweet Clover

Prices:—25 cents per lb., \$3.25 per peck, (15 lbs.) and \$12.00 per bushel, (60 lbs.) When ordered by mail, add 18 cents per lb. for postage.

Having purchased a large quantity of Sweet Clover Seed, I will make a

Special Discount of 20 per cent.

from the above prices, on all orders received during the month of

JANUARY.

Now is an excellent time to make your purchases to advantage.

Sow it in the FALL, WINTER or SPRING—a great many sow it broadcast on the snow—alone, or with field grain or grass; six pounds to the acre. It will do well in field or lane, on hillside or in valley, on uplands or soil subject to overflow. It is perfectly hardy, standing drouth admirably, and flourishing well during rainy seasons. The honey is the best. As it does not bloom till the second season, it will do no harm if grazed by cattle the first season. It is excellent for waste places and commons.

THE BEST BEE PAPER IN AMERICA

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861 Chicago, Ill., January 9, 1884. VOL. XX. No. 2.

THE WEEKLY EDITION OF

THOMAS G. NEWMAN,
 EDITOR AND PROPRIETOR.
 925 WEST MADISON ST., CHICAGO, ILL.
 Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one new subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
 To Australia—Weekly, \$1; Monthly, 24 cents.
 George Nelghbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,
 For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is NOW published SEMI-MONTHLY, at Seven Shillings, per annum, and contains the best practical information for the time being, showing what to do, and when and how to do it. Rev. H. R. PEEL, Editor.

We send the Weekly AMERICAN BEE JOURNAL and the British Bee Journal, both for \$3.00 a year.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Advertisements.

DADANT'S
HONEY CROP!

Our crop being very large, we offer **THIRTY THOUSAND POUNDS** of extracted Honey

FOR SALE

at REASONABLE PRICES. We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15c. for our 24-page Pamphlet on Harvesting, Handling and Marketing extracted honey.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

1876. CROWN 1882.

The best arranged HIVE for all purposes in existence. Took first premium at St. Louis Fair in 1882 and 1883 over all competitors. Descriptive Circular sent free to all on application.

Address, **ELVIN ARMSTRONG**, Prop'r. of the Crown Bee Hive Factory and Apiary, JERSEYVILLE, ILL.

DADANT'S FOUNDATION

From JAMES HEDDON, July 27th, 1883.—Your Foundation is certainly the nicest and best handled of any I have seen on the market. It is the only foundation true to sample I have ever received.

From JAMES HEDDON, Aug. 10th, 1883.—I will contract for 2,000 pounds of foundation for next season on the terms of your letter.

From A. H. NEWMAN, Aug. 24th, 1883.—Book my order for 5,000 pounds for spring delivery.

From C. F. MUTH, Dec. 12, 1883.—Book my order for 2,000 lbs. of heavy; 1,000 lbs. of thin, and 500 lbs. of extra thin.

Dealers, send in your orders for next spring while wax is cheaper, and save trouble and money.

CHAS. DADANT & SON,

5ABly Hamilton, Hancock co., Ill.

A POCKET DICTIONARY

Containing 320 pages, and over

25,000 Words, Rightly and Plainly Defined

To make the pronunciation easily understood every word is phonetically re-spelled, and the syllables and accents made perfectly plain, so that no one who consults this book can miss the proper word to use, and giving it proper pronunciation.

This Dictionary is our Premium for a Club of 3 subscribers to the Weekly (or its equivalent to the Monthly), in addition to other Books selected from our Catalogue to the amount of \$1.00; all by mail, postpaid.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutterd, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is new of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For rest and ease, it is the best book for the bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully up with the times on every subject of bee-culture. It is not only instructive, but is intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 164 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as Food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration! What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and headings, by taking water, rest, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 100,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Pinnerers, Gun and Shot-makers, Brokers, Glaziers, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger one can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher,
Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände — Der Licht keit des Bienenstandes — Honig pflanzen — Erziehung der Königin — Füttern — Schwärmen — Ableger — Versehen — Italiensiren — Zücker von Königinnen — Ausziehen — Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thos. G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigkuchen, Formkuchchen, Puddings, Schaumconfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

Harmless Adulteration.

A correspondent has sent us the following from the *Toledo Blade* of Dec. 27, 1883:

A writer in the *Scientific American* demonstrates that while glucose is found in almost all sugars and syrups, no matter how pure they are declared to be, the adulteration is yet a perfectly harmless one. People may partake of it all their lives and yet live to a good old age. It is a pity that the same could not be said of all adulterations.

We saw the article in question in the *Scientific American*; but we concluded it was too *absurd* to merit any notice; being evidently written in the interest of that fraud—glucose—by some ignoramus.

The *Canner and Grocer* gives our views on the subject exactly, in the following language: "Adulteration is the thief of trade. More tempting than Delilah, for it woos with promises of golden gains; it finds numberless lovers among those who deal in the staple-food articles of commerce, and lures them on from bad to worse, until finally they become hopelessly entangled in a net-work of dishonest practices. Under our at present imperfect laws for protection against the sale of spurious goods, with but slight danger of detection, and with a certainty of large profit, many a dealer, finding his keener sense of honor dulled by money greed, begins to adulterate the commodities he keeps for sale, and thus enters into a career that is more villainous and more dangerous to the community than that of the old-time highwayman; for through it the public are robbed not only of their coin, but of their health as well. This infamous system has been growing of

late with frightful rapidity until one is in almost perpetual fear lest he be eating or drinking some poisonous compound instead of the healthful article which it counterfeits."

An exchange aptly remarks that it "would be better, for instance, that the courts should punish burglars even to the verge of inquisitorial persecution, and at the same time allow sneak thieves to go unprosecuted, than that they should, for the sake of ill-named justice, allow both of these rascally classes to go unscathed. Every case of adulteration punished is a victory gained for honest trade in general, no matter from what branch of business the offenders may have been selected." Adulteration of all kinds should be always strongly condemned by every honest person.

Those who have become acquainted with our youngest daughter, (known to many as "Little Sunshine") will be interested in the following, from the *Chicago Inter-Ocean* of Sunday, Dec. 30, 1883:

Wednesday evening at the residence of Mr. and Mrs. T. G. Newman, No. 147 Western Avenue, a very pleasant affair occurred, the occasion being the marriage of their daughter, Matie, to Fred H. Chenoweth, the Rev. Luther Pardee officiating. None but relatives were present. After receiving congratulations the bride and groom led the way to the dining-room where a bountiful repast was spread. The house was tastefully decorated with evergreens, smilax, and flowers. The bride was attired in cream-white gros-grain silk, with Spanish lace overdress, the bridal veil being held in place by natural flowers. The presents were both numerous and elegant. Amid the good wishes of all present Mr. and Mrs. Chenoweth left for a two weeks' trip south, and upon their return will be at home to their friends at No. 147 Western Avenue.

The Bee-Keepers' Magazine, published by King & Aspinwall, at 14 Park Place, New York, has been reduced in price to \$1 a year, and is printed with new type, on nice paper, with a new cover. The Poultry de-

partment has been dropped, and it now confines its attention to the interests of honey producers. They will send a sample free to any address.

The *Sun*, of Alfred Centre, N. Y., says that Mr. Clark Rogers has, "from 90 colonies, spring count, crated and sent off this season, 4,895 pounds of honey, and has sold and on hand for home market, 1,100 pounds, 400 pounds of which was extracted to give the queens room. He has now 159 colonies in winter quarters." Mr. Rogers is a progressive and successful apiarist, and one of the oldest subscribers to the *BEE JOURNAL*, and, of course, was successful, even in a poor season, as was the one just passed.

The *Dairy and Farm Journal* of West Liberty, Iowa, remarks as follows concerning the value of literature to honey-producers:

The *BEE JOURNAL* is almost indispensable to the successful manipulation of the industrious and persevering little insects. It is true we have often seen honey produced under the management of parties who knew apparently little more on the subject than that the bees gathered the honey and deposit it in the hive; but we have never seen any sort of farm stock managed extensively and in any sense successfully, where the manager did not avail himself of all the information, pertaining to his specialty, that he could readily obtain; and the *BEE JOURNAL* is worth many times the subscription price to every person owning an apiary, who reads it carefully.

Up to Dec. 15 the weather was beautiful and mild, then it became cold and snow appeared—but since the new year dawned, the mercury has been dancing about between 20° and 40° below zero. It will be difficult to find the men now who have, during the fall, been prophesying that the winter would be "open, mild and snowless." The predictions were based upon the antics of the festive wood chuck and the odorous musk rats. It is cold enough now to satisfy a Greenlander.

Preparing Bees for Winter.

Mrs. L. Harrison thus describes the preparation of her bees for winter, in the *Prairie Farmer*:

We have heretofore wintered our bees in the open air, but this fall we thought we would try a part in the cellar. With this end in view the cellar was renovated and white-washed, and a partition put across one end, making a nice apartment for bees. Sub-earth ventilation was furnished by means of six-inch tile, and upward ventilation through a window hung on hinges, to be opened and closed at pleasure. Many persons were prophesying a mild winter, and we began to think that we should have no use for our bee-cellar, for when we contemplated storing them, the weather would change mild and they would be on the wing. They flew on the 8th of December, and one-half of them were put in the cellar the 15th. It was then snowing and has continued at intervals since; and this morning (17th) the thermometer was in the neighborhood of zero out of doors, and 40 in the bees' apartment.

When the bees were removed from the summer stands to the cellar the entrances to the hives were closed by stuffing in cotton rags. These were left in the first night, and the cellar window open, so that it would be cold, causing them to cluster, when the entrances were opened; then the window was closed and darkened. We shall aim to keep the temperature not lower than 40, nor higher than 45°, as

this is what is recommended by those who have wintered their bees in cellars many consecutive winters.

The bees in the cellar have Hill's devices upon the frames, and then covered with unbleached muslin. To prevent the bees coming up under the muslin, a hot flat-iron was run around the top of the hive to melt the propolis and stick it fast. When the bees were put in the cellar little comforts made of thin muslin and new wadding were spread upon the muslin, and the hives were piled one upon another, with sticks at each end for the hive to rest upon, so as not to crush down the devices. The upper tiers of hives have on chaff cushions. The bees that are wintering upon their summer stands have on Hill's devices and muslin, like those in the cellar, and chaff cushions in the caps and the entrances open; upward ventilation is given above the cushions to keep them dry.

MRS. L. HARRISON.

Convention Notices.

The Southeastern Michigan Bee-Keepers' Convention will be held at Adrian, Mich., in the Plymouth Church Chapel, Jan. 23, 1884; morning, afternoon and evening session.

H. D. CUTTING, Pres.

H. C. MARKHAM, Sec.

The annual meeting of the Indiana bee-keepers will be held at Indianapolis, Jan. 15 and 16, in the Agricultural rooms corner of Tennessee and market streets. A cordial invitation is extended to all.

F. L. DOUGHERTY, Sec.

The 15th annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 22, 23 and 24 days of January 1884.

This will be the largest and most interesting convention of bee-keepers ever held in America. Many of the most scientific apiarists in the country will take part in the discussions. The programme is completed, and comprises all the interesting topics of the day. The question box will be opened each day, and the questions answered. All are invited to send in questions.

Implements and other articles of interest for exhibition will be received and properly arranged. It will pay any bee-keeper to go a thousand miles to listen to the discussions. By hearing and seeing, you will obtain much more knowledge than by reading. Five hundred bee-keepers will be in attendance. Reduced rates of board at hotels have been secured. All are invited.

GEO. W. HOUSE, Sec.

W. E. CLARK, Pres.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association, will hold its annual meeting in Temperance Hall, Freeport, Ill., on Jan. 15 and 16, 1884.

J. STEWART, Sec.

Rock City, Ill., Nov. 30, 1883.

The Mahoning Valley Bee-Keepers' Association, will be held in the Town Hall at Newton Falls, on Thursday, Jan. 24, 1884. As this is the meeting to elect officers, every member and all interested in the production and sale of honey, are requested to be present. E. W. TURNER, Sec.

A meeting of bee-keepers will be held at the residence of W. Cossens, Monee, Will Co., Ills., on Monday, Jan. 28, 1884. All friends of improved management of the apiary, are invited to attend.

A. WICHERTS,
W. COSENSS,
B. HEYEN, } Committee.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., Jan. 7, 1884.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no excitement in the honey market. The demand for extracted honey is improving, but supplies being large, prices keep down. It brings 7@10c. on arrival. Arrivals of comb honey and demand for it, are in fair proportion. A choice article in ½ lb. sections brings 20c. per lb. from store, and 16@18c. on arrival.

BEE-SWAX—Scarce; brings 28@32c. on arrival.
CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17@22c. Dark and second quality, 14@15c.; extracted white clover in kegs and barrels, 9@14c.; dark, 8@9c.

BEE-SWAX—Prime yellow, 27@29c.
H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; ¼@2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEE-SWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—No change to note since last report. Prices and demand well sustained, and receipts about equal to shipments. White comb, 1 and 2 lb. sections, 17@18c. Extracted, 8@10c.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Offerings are mostly extracted, for which the market is dull and weak. Choice comb is in very light supply. White to extra white comb, 15@20c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@.

BEE-SWAX—Wholesale, 27½@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, 13@18c.; strained and extracted, 7@8c.

BEE-SWAX—Finner, at 30@31c.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—Honey continues in excellent demand, as reported last; every lot of choice white comb is taken up as fast as it comes at 18c. in quantity for 1 lb. sections, and an occasional sale at 19; in a very few instances only, 20c. has been reached. Broken lots and second quality is very slow sale. For extracted there is no demand.

BEE-SWAX—Is eagerly inquired for at 28@30c., but none to supply the demand.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Our market is rather dull, and supply more than exceeds the demand; would not advise shipments to this market. 2 lb. comb, 16@18c.; 1 lb. comb, 18@20c.; extracted, 8@10c.

BEE-SWAX—32@35c.
BLAKE & RIPLEY, 57 Chatham Street.

For the American Bee Journal.

Prevention of Swarming.

JAMES HEDDON.

After 15 years' experience as a specialist in bee-keeping, I need not tell you that I have tried very many methods to prevent swarming; among them, various methods of artificial increase.

I have become satisfied that no method of artificial increase, is productive of as good result, as is natural swarming, all things considered. Bearing me out in this conclusion, is the practice of Messrs. Oatman, Hutchinson, Miller and numerous other large and practical honey producers.

I may also cite you to the fact that we have no practically successful method for the prevention of swarming, as no such method is in use among our leading producers. Nor do I wish to prevent natural swarming, but I would like to control it, there being one condition of our affairs, and perhaps only this one, wherein the benefits would more than counter-balance the expense and trouble arising from the use of the necessary fixtures. The one referred to, is where one has too few bees in a given locality, to afford to keep a hand to watch them continually through the swarming period.

Having begun bee keeping in connection with a careful perusal of Father Langstroth's invaluable work, (for which I am to-day very glad) my attention was early called to the idea of compelling bees to act differently from their wont, by virtue of the difference in size of the three genders inhabiting the hive. The book told us of contracted passages, that would exclude the queen and drones, while the workers would pass through. My experiments upon the principle, disappointed me from the fact that any passage-way contracted sufficiently to prevent the egress of the queen, acted as a hindrance to the ingress of heavily laden workers. More especially was this a fact with workers laden with both honey and pollen, and often loads of pollen would be detached from the legs of the bees, in their passage through the contracted spaces. Now I have seen this pollen dislodgment take place in spaces that did pass some of the smaller specimens of unfecundated queens, and I once purchased of Mr. Oatman one of the most valuable fertile queens I ever owned in my life; valuable because she produced a goodly number of most excellent working bees, of above average size, though she herself was black and so small that she passed the spaces mentioned above. Another objection to these spaces, or bee guards, as they are sometimes called, is, that they seriously interfere with the ventilation of the hive, and gen-

eral satisfaction of the workers, keeping up confusion among the thirsty perishing drones, clogging up and buzzing at the entrance for escape.

Since the advent of comb foundation and consequent control of drone production, this evil is almost entirely removed, with all our colonies except such as we use to rear the drones of our choice.

Such guards are often advocated for their usefulness in prohibiting the flight of drones, from box or other recently purchased hives. I have what I think a better method of disposing of this difficulty. I transfer such hives before time for the mating of queens, shaking their bees (all except the queens and a few workers) into a box whose end is made of perforated tin, with round holes large enough to pass the workers freely, but keep back the drones. The workers quickly return to their queen, while the deserted imprisoned drones are easily destroyed.

I will now endeavor to describe an arrangement I invented some 10 or 12 years ago, and laid aside as impracticable. Why impracticable? Mainly because of the trouble with the drones above mentioned, especially in hives where they were more numerous.

Another point; as I had but one apiary at the time, (making bee keeping a specialty) and had not the where-with to establish another, the need of such an attachment was not felt by me then.

Heddon's Non-Swarming Attachment.

In viewing the above cut, imagine yourself looking at a tin box, 14x6x4, with both sides open. (In the cut, one side is up, and the other down.) You see an angling partition A passing from one corner of the tin box to within two inches of the other. This closes the opening through the box, except the space 2x4. This space is closed by a piece of tin 2x3 $\frac{3}{8}$, and the remaining opening, 2x3 $\frac{3}{8}$ has a flat tube T of the same dimensions and about 2 $\frac{1}{2}$ inches long, open at each end. The partition A, and all of that part of the box above the partition, and on the side towards you, is perforated with round holes made with a punch, with the bur projecting on the outside. The holes are made just large enough to freely pass a worker bee when empty, and as there is no necessity for laden bees to pass these holes, they can be somewhat smaller than the ordinary contracted passages, and too small to admit of the passage of one unfertile queen out of one thousand. This attachment I made when I used the 10-frame Standard Langstroth hive with portico. To adapt it to my present hive whose in-

side dimensions across the frames is 11 $\frac{1}{2}$ inches, let us imagine it 12 inches long, instead of 14 inches, and the left end (as you face it) also perforated.* To adjust it to the hive we lay the side C on the alighting board, shove it up tightly to the hive, pushing the tube T into the entrance and under the bottom bar of the side frame.

The perforations are thickly located; in fact "the tin is most all holes." Now let us describe the actions of the bees, as we have watched them many an hour. A worker starts out to the field, he rushes to the entrance, looks at the new obstacle, accepts the invitation given him by the division A to pass to the right, goes down near the corner, slips easily through the hole, takes a look at the new order of things, sees that he is in the right church, that the *peew* is only newly ornamented, and strikes out for the field. Another, and another, and another, follow in rapid succession, all passing out near the corner, induced by the position of the angling partition A. The inner end of the tube T, being within the hive and quite dark comparatively, only about one worker in one hundred, passes out through it; besides it is constantly in use, by those passing in.

By this time the "nectar-laden bees" begin to return. Of course they propose to enter at the point of exit. They look at the holes. Sometimes stick their heads into one. The "grain" of this hole, you remember runs the wrong way, besides it is so small as to be poorly adapted to the tired and swollen bodied laden worker, even if passed the other way.†

Once again the angling partition invites the little visitor to the right, which invitation he immediately accepts and passes through the tube T. You will readily conceive that this tube is large enough to admit of the passage of the working force of the strongest colony, because the current flows all one way. (I think we used a tapering tube, it being only about 1 $\frac{1}{2}$ or 1 $\frac{1}{4}$ inches wide at the inner end.) In two or three hours, the bees seem to have perfectly learned the attachment, and accept it cheerfully, almost the entire force passing out and in at the respective places designed for egress and ingress.

I had 40 pounds of surplus comb honey stored through this attachment, and could discover no retarding influence connected with it. It was laid aside as mentioned above, because of the drone difficulty, making it necessary to remove the dead drones every few days, before they might decompose. But it is my opinion that with this difficulty mainly removed, this attachment may become practical. I am quite certain that it stands

* Of course there is no necessity for that part of the attachment, outside of the angling partition, A. It serves as a small portico, when the attachment is in use.

† When the bees swarmed through the attachment, there was a tugging and squeezing of those fullest of honey, and many of this class failed to pass through—even their thorax seemed to be distended, when they were heavily loaded. The queen jumps and buzzes about in the attachment, till she gets disgusted, and returns to the brood. If a piece of tin be slipped between the attachment and hive, the former may then be removed with the queen.

to-day as the most perfect non-swarming attachment yet known to the public. You will notice how I combined the close passage principle, with the principle utilized by the use of Mr. Langstroth's entrance blocks, better regulators than which never have been, and probably never will be devised.

I consider the inventions of this great man, inventions of over 20 years standing, yet ahead of the age, or of bee-keepers in general.

Dowagiac, Mich., Dec. 24, 1883.

Fixed Frames.

J. E. POND, JR.

In the BEE JOURNAL for Nov. 14, 1883, page 575, in an article by A. Webster, I find this sentence. "Of the improvements of the past, movable comb frames must be retained, but of an entirely different construction from those now in common use; and should be *fixed*, and reversible, as well as movable." I do not know Mr. W. nor the amount of experience in manipulation he has had during the 25 years he has kept bees, but I do certainly make issue with him on the question of construction of frames, and particularly in the matter of so constructing them as to make them *fixed*. The only frame that can be of any real value to the apiarist, is a sectional, hanging, movable frame, that is so far from being *fixed*, that, notwithstanding the inequalities of surface in the face of the combs, either in waviness or thickness, that it may at any and all times be interchangeable with any other, and in every hive in the apiary. By this plan alone can we be able to perform our labors speedily, and without injury to our bees. One of the principle points in favor of the Langstroth frames, (and by this I do not mean the standard Langstroth particularly, but any form of Langstroth frame) is that they are interchangeable; so much so, that no matter what their position in the hive relative to each other, they can be replaced after being removed without regard to the position they originally occupied. To be enabled to do this must be recognized as an immense advantage, and must allow the operator to perform much more work, and in equally as effective form, than he could possibly do were he obliged to carefully replace each frame in the particular position from which he removed it. Again in order to have fixed frames, one of two things must happen: either the frames must be close fitting at tops or ends, or else some arrangement must be made by which the frames can be held in one particular position only. Either of these plans it seems to me would cause far more labor than is needed with unfixed frames to say nothing of the liability of killing bees with close topped or close ended frames, and the liability or having the bees make them fixtures in reality by a free use of propolis. I have used the American frame, and the first objection I found

with it was the close fitting top. This renders a side opening hive necessary, and I must be able to remove any frame at pleasure, without being obliged to remove some or all of the others first. In order to have a set of frames fixed it becomes necessary to have them spaced evenly, and all apiarists of experience know that while this idea may be beautiful in theory, it is absolutely impossible in practice, without making a large amount of labor necessary, at a time when it can ill be afforded. The nearer we come to nature the nearer we are to the right. Now I claim that frames are not natural, and are a disadvantage rather than an advantage to the bees; we use them as an improvement for ourselves, and in using them we should follow nature as closely as possible. Now to follow nature closely, we must make our frames of such form that the bees can perambulate over, under, and around them, and this we cannot do if we have them fixed, without a loss to ourselves in some other important particular. But I need not follow out this idea further. I have not written as I have in a fault-finding or captious spirit, but simply for the purpose of drawing out from Mr. W. the whys and the wherefores of his fixed frame idea. He may give reasons that will commend themselves to us all, but till he does so, I shall claim that fixed frames are a positive disadvantage. Foxboro, Mass., Dec. 23, 1883.

Come Over to Macedonia and Help Us.

J. HASBROUCK.

DEAR JOURNAL.—You recommended to us a short time ago some missionary work in a dark corner of our state and while I have been planning how to undertake it, I have accidentally found demand for all my efforts nearer home. It happened on this wise. You must know that I have found out that it is best, in the home market, to select with care the grocers whom you allow to handle your honey. Well, in hunting for an additional man of the right kind the other day at our country town, I went to see a grocer who had been recommended to me as having a large trade in honey. I found that he had a stock, of which he handed me down some to look at, remarking that one lot granulated in jelly-cups, although labelled "honey," with the name of an enterprising bee-keeper of this county, was some "stuff" fed to bees and then "slung" out by a "patent machine."

I concluded my opportunity for mission work had come and so I told him, that we, who write for the bee papers, had said over and over again that the granulating was the best test of purity. The heathen told me, "that shows you don't know anything about it."

I told him that Mr. L. C. Root, who had made a book about bees and honey, had just been saying that there wasn't anything—not even glucose—which could be fed to bees with any profit. I told him I was at a loss

to see the use of the bees in the operation—that I thought he or some other man who didn't keep bees could put the "stuff" directly into the jelly-cups, if there was any money in the business, and that the bee-keeper who had to support the bees and do all the useless labor of first giving the "stuff" to them and then taking it away again could not compete with him.

He then handed down some liquid honey and said that was the genuine article that all his customers would rather give 20c for, than 10c for the other. It bore the label of a gentleman near the village containing a "notice" to this effect: "The producer wants it distinctly understood that this is *drained* honey and not extracted. Extracted honey is a cheap article fed to bees in patent combs, and afterward slung out by a patent machine, when it soon becomes sour and unfit for use." Isn't that depravity for you? Well as soon as I recovered my equanimity, I labored long and patiently with that man to convince him that extracted honey was a much cleaner, and if properly ripened, nicer article than drained honey, but all to no effect. He insisted that extracted honey and any honey that would granulate would not sell. He had tried it many times and always with the same result. I'm discouraged. Send me Dandant or some of your pamphlets—honey as food and medicine.

On the "hint" of Mr. Shankland, I will amend the report of the N. J. and E. B. K. A., by adding that the meeting was held in New Jersey—New Jersey you know is only the garden patch to the great city, and that the president is G. W. Thompson, of Stelton, N. J., and a great bee-man he is too, I tell you. When I visited him last, about two years ago, he had 70 colonies—not a hybrid colony among them—in the finest looking apiary I ever saw, which is managed entirely I believe by his accomplished daughter, who beats us all in charming those new races, and making them roll in the honey. Mr. Thompson is a man, whose acquaintance, if once enjoyed, no bee-keeper, at this time, especially if he is young and stirring and good looking, can afford to neglect. Bound Brook, N. J., Dec. 20, 1883.

Translated by Arthur Todd.

A Method to Cure Foul Brood.

GEORGES DE LAYENS.

In the spring of the year 1883, I inspected several of the hives surrounding my apiary, in order to be thoroughly aware of the state my neighboring colonies were in.

In an apiary of 5 colonies, all in frame hives, one had foul brood very badly; I transferred the bees into a new hive without any combs, and fed them with a syrup mixed with acid, and the colony appears to have been perfectly cured.

In another apiary of 20 colonies all in common straw skeps, 4 died this spring of the disease.

A third apiary of 25 colonies was also attacked: of which 4 were so bad

that I advised the proprietor to utterly destroy bees, combs and hives. Last autumn my apiary appeared to be in good condition, after the destruction in the spring time of several colonies, and the complete cure of two others to which I applied the above mentioned method of treatment. This spring, these two colonies appeared to be in good order, but 6 other colonies were attacked. It is very difficult to fix on the moment when a colony is actually attacked with the disease, and when the apiary is located in a country where foul brood is raging, it seems hardly possible to me to preserve it.

If it becomes necessary after a complete cure to commence again each year and feed every colony with an acidified syrup, either in spring or autumn, this would be impracticable, for, if we provoke egg laying too early or too late in the season, it offers many inconveniences and may even be dangerous to the welfare of the colonies.

We have then to seek for other methods to prevent the disease, or to stop it as soon as there are any signs of germs having been introduced into the hives.

We have then to set ourselves this problem: "To find a method at once rapid and economical, by the aid of which the bees may introduce into the nourishment of the larvæ, a minute quantity of acid in order to constantly neutralize the germs of the disease, without however in any way disturbing the natural order or their daily labors."

The experiences of this year seem conclusive, and make me hope for a complete success in the future. To obtain this result I have kept the water reservoir where my bees go to get their supply, charged with water mixed with salicylic acid. I dissolved 50 grammes of salicylic acid in 400 grammes of alcohol, and for each liter of water I added 10 grammes of the above solution. This dose is about double that generally recommended to be used in syrup. The consumption of water has been, on the average, 3 to 4 liters. On certain days in cold weather, it seemed to me that the water had a gelatinous appearance, but the bees sucked up the moisture from the cloth covering the tank, and all seemed to go well. This treatment lasted for 7 weeks, but in reality the *greatest honey flow* will prevent the bees going to the reservoir for at least 10 days, and they return to it only when the flow of honey slackens.

I had in the spring 6 colonies more or less affected. Three of these I treated by the first described method. I left the other 3 for experiment's sake in the condition they were in.

After 7 weeks of this general "water cure" I examined the 6 colonies very minutely, every frame of brood being carried into a warm room, in the order that they held in the hives.

The other colonies in the apiary were all examined frame by frame, and none appeared attacked, the disease having probably been killed everywhere, immediately it showed itself.

Egg laying in spring is always very regular because the queen finds plenty of room free of honey; one can then easily follow its progress at this period.

In examining the combs of brood of the 3 colonies to which I had given no special treatment, I remarked at first a large quantity of brood, on the first frame, diseased. This comb was the one on which the queen commenced her spring laying. The two other combs, to the right and left of this one, were also sadly diseased; the 4th and 5th commence to be much less so; in their centers many bees had come out of the cells, but there were still a certain number of cells isolated that were diseased. In the circle of brood (sealed) surrounding the portion empty of brood, I met with very little of the disease, and at last the combs, farthest out from the frame on which the queen commenced her spring laying, did not appear to contain a single diseased cell.

The disease instead of going on increasing, as is usual, had diminished progressively. I took away all infected combs from these 3 hives, and commenced feeding them with acidulated syrup. The three other colonies transferred to new hives appeared in good condition. At moment of writing, my apiary appears cured just by this retrograde action of the disease, and I have every hope that it will continue the same until autumn. I will continue the "water cure" right up to the end of the season, and propose to continue this treatment in the surrounding country, until the disease has disappeared from my neighborhood.

For the American Bee Journal.

Cyprian and Hybrid Bees.

P. ROLLINGER.

As I have found both pleasure and profit from the weekly visits of your valuable JOURNAL, during the past two years, I am anxious still to have its company for another year. Its timely hints and well written articles on the many topics of practical and theoretical apiculture, coming weekly and thus in season, more than pays its price above a monthly journal of equal merit in other respects. The old adage "a stitch in time saves nine," may be true, and a little knowledge in time may save its thousands—of bees, most surely. Perhaps a few thoughts of my own experience in bee-keeping may interest some of your many readers.

Most of my bees are Cyprians, or a cross between the three races. I have a few Italian queens which I received last year from W. Z. Hutchinson, Rogerville, Mich. Two years ago I purchased two Cyprian queens of E. M. Hayhurst, Kansas City, Mo. Nearly all my bees at this time were the German bees except one or two hybrid colonies with black queens mated with drones, the progeny of an Italian fertile or laying worker.

In the summer of 1882 I reared queens from my best Cyprian colony

and superseded many of my old brown queens. So by Cyprianizing and hybridizing it is hard to tell just what strain of bees I have. But I think I can tell a grand difference in the amount of honey I get. I work almost entirely for extracted honey.

In June, the creek near my apiary overflowed and all my bees were afloat; some 5 colonies washed away, and all were damaged. This occurred Friday night June 25, as near as I remember; and by having plenty of help at hand, we placed 30 colonies above the flood, wherever we could find a convenient place to put them. Next day I put them on stands above high water mark, and well, for on Sunday morning the creek overflowed her banks again. Previous to this summer this stream had overflowed its banks here but once in 26 years. On Monday, June 27, we had 30 colonies, many of them very weak, by drowning. There was no honey in the flowers till about Aug. 1. I had to feed them till near the last of July. In August the honey harvest began from heartsease and continued till frost, the 1st of October. We extracted 2,500 lbs. of honey and increased to 57 colonies. I will need to feed most of my late swarms to get them through the winter.

To give you an idea of the rapidity with which the Cyprian bees increase, I will relate what Mr. Wm. L. Clark, of Vesta, Neb., has done from one colony which I sold him last spring.

Mr. Clark divided this colony in July and then let them increase by natural swarming. In the spring, when I let him have the bees, he said he aimed to run for increase, and I think he has succeeded. I told him the Cyprians were the bees, if he desired increase. He increased to 13 colonies from 1, and says they are in good condition for winter, and he also got 200 lbs. of surplus honey. He says he knows that two swarms at least absconded.

This may be questioned by some, but I am well acquainted with Mr. Clark and saw his apiary the other day; they are placed close together and protected from the north-west wind. I did not examine them, but propose visiting him in the spring and make a careful examination of his bees. He has promised me the old queen back again, and if she has not layed her queenship out, I aim to begin early and feed if necessary and see just what can be done in one season. I may have many queens just as profitable but this one is "a tested queen."

Adams, Neb., Dec. 28, 1883.

For the American Bee Journal.

Diphtheria—Death—Hygiene.

ALLEN PRINGLE.

This is a strange medley of subjects for a single article, and I make use of it to attract the reader's attention, for I want every reader of the AMERICAN BEE JOURNAL to read this, especially those who have children whom they are liable to lose forever by that dread, fatal disease, diphtheria.

I am pained at reading on page 619, No. 49 of the JOURNAL, Mr. Fredenburg's touching letter about the death of his two dear little boys from diphtheria; and the thought at once forces itself upon me, as it has many times before, is this fearful mortality from this dread disease *necessary*? Is it inevitable? I think not. Indeed, I know it is not. Of course I know it is inevitable under the fatal circumstances, but the circumstances can be changed, and hence the fatal results changed from death to recovery. I unhesitatingly affirm (and I know whereof I affirm) that nineteen out of every twenty of those children who die of diphtheria could be saved by simple, common-sense, home treatment without a doctor at all. The Allopathic or drug treatment of this disease is nearly always fatal. I am not a physician by profession, but I have studied the whole of the popular (and unpopular) medical systems and understand the principles upon which they are based, especially the popular Drug system and the, as yet, unpopular Hygienic system. I have no axes to grind one way or another. I have no interest in any of them except to know the truth. I studied them and studied the science of health, as embraced in physiology and hygiene, for my own physical preservation and the physical good of those over whom I might have influence and those dependent upon me. The consequence is that for 25 years I have not taken a particle of medicine of any kind; and have been quite free from sickness. And this uniformly good health and exemption from sickness has not been due to an unusually strong and vigorous constitution, which, unfortunately I never possessed. Indeed it was just the reverse of this in youth, coupled with certain predispositions to disease, that impelled me to look into and study the subject of health and master the conditions upon which it depends. No medicines—patent or professional, quack or regular—are used in our family; no doctors are employed to medicate with drugs. Our habits are simple and natural and we reap the reward in good health. Physically speaking, the *real*, natural needs of human beings are few and simple; the artificial and imaginary ones are many and complicated. Children are not reared according to nature, but according to the false and unnatural conventionalities of society; and the consequence of this is physical infirmities and moral obliquities. Our only child—now about 10 years of age—has never tasted a single drop of medicine of any kind—not even the simple remedies in common domestic use; and has always been free from sickness with, of course, the exception of the contagious diseases incident to childhood and youth, such as whooping cough, mumps, etc.

The reader will, I am sure, pardon me for so much personal allusion when he considers that I am writing this with a motive to possibly benefit some who may need instruction and admonition of this kind. It is a well known fact in human nature that to some minds personal facts and experience

on any subject are all-convincing; while to others the principles upon which the experience and practice are predicated must be presented and established. The latter class of thinkers look below the surface at the foundations and fundamentals; while the former are content with superficial appearances and *prima facie* evidence. The safe way, then, in all matters not palpable or axiomatic, is, that while mere *experience* may be adduced as an auxiliary for the purpose named, to put forward or postulate nothing that will not bear the scrutiny of science and reason. To illustrate this point: The man who has used tobacco for 50 years and is now 70 or 80 adduces his age and experience to prove that tobacco is wholesome. The man who has used whisky-and-water half a century as a beverage and is now an octogenarian cites his age and experience to prove that whisky is wholesome; while another octogenarian who has used pure water his whole life without the whisky cites his age and experience to prove that water alone is the most wholesome beverage. But does the fact that the one has used tobacco 50 years and is still alive, and the other whisky 50 years and is still alive, prove that tobacco is wholesome or that whisky is wholesome? If it proves anything in the eye of the physiologist, it proves that humanity is tough, and that some constitutions can stand a great deal of abuse. On the other hand does the fact that the other octogenarian who used *only* water prove that water is wholesome. No, it does not, for we must be fair on both sides. It will thus be seen that *experience* alone without a rational or scientific interpretation is by no means a sure guide. When the tippler lives to be 80 and avers that whisky is wholesome, and the teetotaler lives to be 80 and avers that only water is wholesome, science must step in and decide the matter between them, by inquiring what is whisky and what are its relations to the living body of man; and what is water and what are its relations to the living system?

When, therefore, I affirm the following propositions (which I do most emphatically) I affirm what is supported not merely by experience and *prima facie* evidence, but what will stand the scrutiny of the highest intelligence and most advanced science of to-day. The propositions are these:

First, All sickness, disease and premature death, as well as all conditions of health, are purely natural sequences mostly within man's cognition and control, instead of being either arbitrary "dispensations" or in any manner fortuitous.

Second, As a natural corollary of this, human beings have, barring unavoidable accidents and hereditary diseases,—their life and health in their own hands.

Third, Following also from the above, nearly all the sickness, misery and premature death with which the world is filled is caused by ignorance and could be avoided by knowledge.

Fourth, As the preservation of health and life is or ought to be the

highest concern of life, our highest and greatest duty is to study and make ourselves acquainted with the natural conditions upon which health and life depend, so that we may preserve our own health and instruct our children in this knowledge and save them from premature death.

The masses, however, do not do this. The most deplorable ignorance on these subjects prevails, not only among the lower classes, but among the upper and so-called educated classes. I say "so called" because no man or woman is educated who does not know how to take care of his or her body or save their little ones from premature death from diseases which could either have been avoided altogether or cured under proper hygienic treatment. Through unphysiological living,—the breathing of foul air and poisonous miasms, bad eating and drinking, uncleanness, etc.—sickness invades the household. Wholly ignorant of the causes, the victims are equally ignorant of the remedies. The doctor is sent for. He gives his poisons. Some, with good vitality, recover in spite of them; others die.

With reference to the disease called diphtheria, as already asserted, 19 out of every 20 of those who die might be saved were the parents properly enlightened on those subjects; and the simple, natural treatment applied. I have never seen a single case prove fatal under hygienic treatment; but have seen at least five-sixths die under the regular drug treatment.

In order to make this letter practically useful, and in the hope of saving some of the little ones from premature and unnecessary death, I will give here some instructions as to the treatment of diphtheria, which I have done before and which has not been without good results.

Of course it is impossible to give a detailed treatment to apply in all cases, as the *diathesis* varies so much; but a general plan may be indicated. Cold applications to the throat, abstinence for a time from food, *enemas* to free the bowels, cooling drinks of pure soft water, tepid bathing, and thorough ventilation and cleanliness is the simple hygienic treatment of this disease and will save every child and adult to whom it is applied in time, except, perhaps, those with very frail or scrofulous constitutions, whom no treatment could save. A small piece of ice taken into the patient's mouth and swallowed, or allowed to melt in the mouth, and then replaced by another, and so on, has been effectual, with good nursing, in many cases, without any other special treatment. The *rationale* of this treatment is simply this: The cold applications to the mouth and throat, by reducing the violent heat and inflammation, arrest the *fibrinous exudation*, thus preventing the formation of the false membrane, which so often chokes the patient to death. It is very important that the feet be kept warm, and the excess of blood diverted from the head to the extremities. Indeed, a primary indication in all diseases is to restore the *balance* of the circulation; and this can be done in a simple,

common-sense way by the application of water, heat, etc., to the different parts instead of restoring to the barbarous, Allopathic practice of bleeding.

Let all parents, as a conscientious duty, study the laws and conditions of health, so that they may not only preserve their own health but that of their children and save them from premature and unnecessary death. This is by far the most important of all knowledge inasmuch as not only our own highest welfare is involved, but the future prospects of the human race.

Selby, Ontario.

The Coming Bee—Pure Mating—etc.

SAMUEL SIMMINS.

The past season has been better than that of 1882, but under the average. We have had, for two summers, cold winds and hazy skies, which made it very unsuitable for the distillation of honey. Probably this has been the result of the very mild winters we have recently experienced—even up to now we have had little frost, and there is at present no sign of any. The bees exhaust themselves flying many days during the winter, and when spring arrives it is a difficult matter to get them strong by the time our first honey crop should be gathered, which occurs the second week in May, sometimes earlier. Thus we get too much of a good thing, in the way of "winter flights."

How far will queens fly to meet a drone?

I have always had a great interest in this matter, but I consider that G. M. Doolittle has rather stretched the point. I have no doubt that his black queens did mate with drones having yellow blood. But this admixture may have traveled by successive stages from one apiary to another, until it was in the apiary nearest him. Because his black queens began to produce workers with yellow bands, that does not *prove* that they were mated *directly* to those drones of the pure Ligurians, five miles off; though I admit that once in a while such a case will occur.

I can also give a few facts on the subject. For three years I have kept a number of pure Ligurians at this place. Each autumn I "drive" the bees for the cottagers all round. The country is devoid of trees, and the results are as follows: A village one mile from my Ligurians has *never* yet shown a sign of yellow blood. At 2 other homesteads $1\frac{1}{4}$ miles, no case of crossing was found until this year, and then with only 2 colonies. Another place, *less* than a mile from here, has not the least sign of yellow bands. And at places beyond, that are from 2 to $2\frac{1}{2}$ miles, I have yet to see the first cross.

With an apiary of Ligurians, *two* miles from all other bees, I should, (considering these facts) expect to mate 99 per cent. pure. And if only 1 mile, clear, good results would be

obtained. Probably Mr. Alley has very few (if any) pure black bees around him, or he would not have considered only one-half mile sufficient.

As I have blacks in my apiary, and close around, no statement can be made regarding the "natural" mating of Italians. The results from the black queens should be conclusive, as I have always found the latter stronger on the wing. They will fly and get mated, while Ligurian queens fail time after time. This is an important matter. Wherever I am rearing queens from black mothers, I am generally certain they will be mated in good time. *Pure* Italians, as honey-gatherers, are certainly superior to *pure* blacks, and it would be well if those comparing the two, would consider well that the bees they have are really pure, which often is not the case. I find however that nothing equals the manner in which blacks *cap* their honey, and I am certain that the bee of the future will have to be bred in a *direct line* from the black side. I find hybrids from queens of the black race, not only gather honey (in this country) when the *pure* Ligurians are storing nothing, but it is a positive fact that a certain number of such hybrids will do more work than *three times* their number of any other race or hybrids, and this is what is wanted—the *largest amount of work from the least number of workers*; the laborers also producing their work in the best shape.

In conclusion, I will repeat that any attempt made to produce the "coming bee," while ignoring the most desirable qualities of the black race, will prove a complete failure.

Rottingdean, Eng., Dec. 21, 1883.

For the American Bee Journal.

Union Convention of Western Iowa.

A meeting was held in the normal school building, Dexter, Iowa, for the organization of a bee-keepers' society, on Dec. 29, 1883. Mr. J. E. Pryor, of Arbor-hill was called to the chair. A constitution was presented and adopted after some discussion. The following officers were then elected: Pres., W. B. Kenyon; Vice Pres., J. H. Brainard; Sec'y, M. E. Darby; Treas., Silas Lightner. Article 4 of the constitution was amended and the fee reduced from 50 cts. to 25 cts.

The roll was then called and members responded, stating the number of colonies kept and the hive used. 255 colonies were represented; 128 in Simplicity hives; 121 in Langstroth, and 6 in Vance hives. Every member reported some Langstroth hives in use, only 6 deep frame hives. (Our members lost but few bees during the severe winter of 1880-1.—Secretary).

The relative merits of comb and extracted honey were then discussed. The president favored comb honey, as requiring the least work per colony. Mr. Humphrey thought the production of extracted honey more profitable. Mr. Rose works for comb honey in sections. Dr. Vance for comb in full sized frames. The president and Mr. Andrews thought that success in

the apiary required the use of an extractor.

Question. "How can we get rid of laying workers?"

Mr. Humphrey sprays with sweetened scented water, and drops a laying queen in on the brood frames. Says a laying worker may be detected by her retinue, the same as a queen. The secretary dissented from this view. The advisability of using porticos was discussed. Portico had no friends.

How shall we prevent bees laying out? All said extract closely.

A few other topics were discussed. Adjourned to meet in Dexter, on the last Saturday in March, 1884.

W. B. KENYON, Pres.

M. E. DARBY, Sec'y.

Getting Straight Combs.

J. V. CALDWELL.

In a late article Mr. Doolittle claims that good worker combs can be had as cheaply without the use of comb *foundation* as with it; in fact cheaper, as Mr. D. does not use the article in question. To say that I was surprised does not express my feelings; I was simply astonished. The use of *foundation* in getting combs nice and smooth, and all worker, I had supposed to be an established fact among bee-men. But here Mr. Doolittle tells us virtually that the discovery of comb foundation is not only useless, but a real damage to bee-keepers, as they are spending their hard-earned dollars for a worse than useless purpose. Mr. D. wishes us to try the experiment with two good natural swarms, one having full sheets of comb foundation; the other only a wax guide on the frame to start them. In reply I would say that I could never get swarms, before using foundation, to fill 8 frames, 8x19 in. solid, with comb and honey in less than from 10 days to 2 weeks. But to favor Mr. D. as much as I can, I will say 10 days. Now I have had swarms in the last two or three seasons fill the same number of frames in just 3 days, and they were ready to work in the boxes. Mr. D. knows about what the foundation would be worth, but we will say at the highest figure about 75c. Now the time of a good swarm for 7 days in the honey season is worth, according to Mr. Doolittle's own figures, about \$8. Give the comb foundation credit with \$7.75 on this deal.

Cambridge, Ill.

Are 6 Frames Enough in Summer?

In the BEE JOURNAL, page 626, Mr. Doolittle says that during the past season he worked some of his hives with only 6 Gallup frames. Will Mr. D. please tell us whether he used more than 6 frames before the honey harvest; or in other words, can he get a colony strong enough with 6 frames?

D. G. PARKER.

St. Joseph, Mo., Dec. 22, 1883.

SELECTIONS FROM OUR LETTER BOX

Cold in New York.

Yesterday morning at 7 o'clock the mercury stood at 20° below zero. This morning at 30° above at 7 o'clock, making a change of 50° in 24 hours. We had the most severe gale from the south from 9 to 12 last night that we ever experienced. Haystacks were untopped, windows blown in, etc. The snow was driven into every crevice possible. Some of the covers to my bee hives were blown off and the hives filled with snow and hail which accompanied the wind. Upon getting out the snow the bees were found lively and in good condition.

G. M. DOOLITTLE.

Borodino, N. Y., Dec. 24, 1883.

My Season's Work.

I started the last spring with 4 colonies (1 very weak); increased to 7 by natural swarming; and 3 went to the woods. They gave 250 lbs. of honey, mostly in 1-pound sections. I bought 6 colonies, making 13 in all now, in good condition.

E. C. FARQUHAR.

Carlos City, Ind., Dec. 25, 1883.

Wintering on the Summer Stands.

The spring of 1883 found me with 13 colonies of bees; some of them were very weak. They increased to 85 this season. I obtained 1,400 lbs. of honey, mostly extracted. I sold all my honey at home, at 15 cents per pound for extracted, and 20c for comb. My best colony gave 250 lbs. of extracted honey and increased to 5; it had a queen that I received from Mr. Alley, the season before. My bees are mostly Italians. I always winter my bees on the summer stands, with plenty of good sealed honey. I have always been more successful that way, than in the cellar.

JOHN BAXTER.

Pickering, Ont.

Clipping Queen's Wings, etc.

My bees went into quarters for winter in good condition, to all appearance; 257 in all; 20 in 5 frame hives; the balance in 9 and 10 frame hives. They are packed in 4 cellars, made for their use, and, up to date, are wintering finely. I see some object to the practice of clipping queen's wings. I have practiced the above-named plan for the last 3 years; the result is that I have not lost one swarm during that time, by their flying away to "parts unknown," and only lost two queens by clipping their wings. Last spring, having a very choice queen and wishing to encourage her, that I might get early drones, I placed a card of nice new drone comb in the center of the brood nest, and fed often; in fact did everything I could to stimulate them. About the 15th or 20th of June, out came the old lady with a large swarm but no drones. On examining the combs I could not find any drone

larva, or eggs either, in the drone comb, but there was plenty of worker brood. She was three years old; and was good the balance of the season, when I killed her, as I do all old queens at the close of their third season's work. I think it would be still better to kill all queens after their second year's laying, as it is very easy to get plenty of fine, well-developed young queens in swarming time, which are worth more than old queens.

WM. LOSSING.

Hokah, Minn., Dec. 29, 1883.

Bees Quiet and in Good Condition.

My bees are all quiet along the line, with the thermometer down to 22° below zero this morning. They are packed in hay and chaff in Langstroth hives on the summer stands. They came out nicely last winter in that way, and if they could stand that, I think they will stand any other winter that will be likely to occur.

D. K. BOUTELLE.

Lake City, Minn., Dec. 19, 1883.

The Old and New Way.

I am now in my 74th year, but I like to work among the bees. I started in the spring with 9 colonies and have now 30 in good condition. I took 280 pounds of comb honey in sections, and 700 pounds of extracted. My neighbors work principally on the old plan, but one of them had, this fall, 69 colonies; another 32, and another 34 colonies; 135 colonies in all. I have taken more honey than all three of them.

WM. C. WOLCOTT.

Eldorado Mills, Wis., Dec. 26, 1883.

Bee-Keeping in Wyoming Territory.

I am the first and only man who ever tried the honey bee in Wyoming. I have had them two seasons on my ranche, and had surplus honey each year. I have demonstrated the fact that they can be wintered here as easily as in any of the northern states, and that they can store up beautiful white honey from nothing but the wild flowers of these mountains and prairies.

G. G. MEAD.

Rawlins, Wyo., Dec. 25, 1883.

Rigging up Saws for Making Hives.

I wish to rig a saw or saws to run by horse power, to cut my hive lumber, and also to cut section boxes and frames. I have a threshing machine horse power and I want to use it to run my saws, and would like to have some information in regard to attaching them to it. The necessary speed of saws and how to arrange wheels and pulleys and size of same to secure the necessary speed.

As I have never seen anything in the BEE JOURNAL in regard to setting up and running circular saws for hive making, I thought, inasmuch as the time was close at hand when many would want to be doing such work, it would not be amiss to have some general information on the subject. Who now will make the contribution?

How about that egg worker of Prof. Phin's? It expresses to my mind an idea that to me seems incredible, to wit: The egg does not produce the worker but that the worker is actually, and the drone also, made of the egg or out of the material which composes the egg, upon the same principle that we would make an ax handle of oak or hickory! He also says: "By the way, who ever heard of rooster eggs?" I wonder if the Prof. ever saw an egg rooster? I have seen tin roosters, and they were tin themselves, not produced by tin. Just so would it be with the egg drone and egg bee.

F. M. REEDS.

Hindsboro, Ill., Dec. 19, 1883.

Lost None in Winter.

I commenced the last season with 24 colonies of bees; increased to 91, and took 1,400 pounds of comb honey. I winter them in the cellar, where I have always wintered my bees heretofore, and never lost a colony. My bees are a very satisfactory investment.

PETER P. HARTL.

Beaver Dam, Wis., Dec. 22, 1883.

Bees Moved in Winter.

In December 1882 I bought 2 colonies of Italian bees, at a public sale, for \$2 each, and moved them about 16 miles; with one colony I had before, these made three to winter. I wintered them out doors with chaff cushions in the upper story, and corn fodder around the outside. One that I bought at the sale starved; the others came through alive but I had to feed them. The spring was cold, and I was compelled to keep on feeding until about the middle of May. They increased by natural swarming to 8 colonies, having plenty of stores for the winter. Of honey I only got about 15 lbs., in one-pound sections. Basswood was our best honey source, and at that time my bees had the swarming fever, so for that reason I did not get much honey, but I am well satisfied with the increase. This winter I have my bees in a shed packed in straw.

J. J. THIEROFF.

Defiance, O., Dec. 26, 1883.

Bees Packed on the Summer Stands.

I had in the fall of 1882, 17 colonies; I lost 4 in winter. In the spring of 1883 I bought 2 colonies, making 15 to start with. They increased by natural swarming to 50 colonies, and I took about 900 lbs. of comb honey in one-pound sections, all white. I had no fall honey. I doubled up a few and have now packed on the summer stands 47 colonies in fair condition.

W. H. MILLER.

Berrien Springs, Mich., Dec. 31, 1883.

Two per cent. of Loss in Winter.

In the fall of 1882, I had 47 colonies; 46 survived the winter, but one was queenless; increased to 96, and gave 1,900 lbs. of comb honey, or about 41 lbs. to the colony, spring count. We had no fall honey. Bees are wintering finely now.

D. RAWHOUSER.

Columbus City, Iowa, Jan. 4, 1884.

Cow Pea for Bee Pasturage.

Will some southern bee-keepers please give their experience with the cow pea as pasture for bees? Such information as I have been able to obtain concerning its value, is conflicting. It is said that, during the season, two crops of peas can be raised in this latitude. If so, and if the bloom furnishes any considerable quantity of honey, it seems to me that the cow pea might be made very useful to the bee-keeper here in tiding over the July dearth of flowers, to which we are subject.

W. C. PRESTON.

Rome, Georgia, Dec. 26, 1883.

Packed in Forest Leaves.

I have 44 colonies in winter quarters; 12 in the cellar and the others on the summer stands, packed in forest leaves; all doing well.

JACOB BISHOP.

Greenwood, Ind., Dec. 27, 1883.

Three Years of Bee-Keeping.

I began bee-keeping in 1881 with 2 colonies, one German and one pure Italian; they increased to 4; from 4 to 11 in 1882; from 11, with one Alley queen, to 40 in 1883. They are packed on the summer stands, with one foot of fine hay and a shock of corn fodder over this. They were all alive on Dec. 24. Some of my Syrian and Italian crosses were flying on the 23d. We had 2 nights of cold; 25 and 24° below zero. My pure Italians were from Herman Bros.; their's from Doolittle.

A. M. FIRMAN.

Quasqueton, Iowa, Dec. 27, 1883.

Ancient Bee Lore.

Can any of the botanical readers inform me whether or not the term *wolf's bladder* is another name for the puff-ball? Old Gervase Markham in his "Countrie Farm," now before me, gives directions for taking honey from the hives or as he calls it "gelding the combs." He advises us to use the "smoake of Neat's dung; or of a wolfe's bladder, or galbanum, or wild mallones. and with the juice of this herb must be annointed which shall gather the honey, to keep him that he be not stung." And then he goes on to describe a very good bee dress. Markham's work was published in 1610, just 134 years before the "Female Monarchy" of Rev. John Thorley; 116 years before Warder's book "The True Amazons," and 24 years before the famous work of Butler, in his "Hive and Honey-Bee." Mr. Langstroth, probably following Bagster, tells us at page 210 that Thorley first suggested the use of the puff-ball, but if, as I suspect, wolf's bladder was at that time the common name of the puff-ball, then the first notice of it belongs to Markham, unless he took it from some still earlier writer. Many of my old books on bees escaped the destruction of my library by fire in 1881, and it is very curious to see how the old bee-masters worked. Markham tells us not to kill the drones because they "hatch the

small bees," an idea which has been held by modern writers ever since the most important function of the drone hive has been fully discovered. He also directs us to hang hives in the woods, and tells us how to "order" them—a device which under the name of decoy hives has been attributed to modern bee-keepers. My suspicion that wolf's bladder is another name for the puff-ball is supported by the etymology of the scientific name of the plant *lycopodium*. The first part is Greek for *wolf*; the second is not translatable to ears polite.

JOHN PHIN.

Cedar Brae, Paterson, N. J., Dec. 25, 1883.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Obstructed Entrances.

Some bee-keepers say their colonies covered with a snow drift, come through the winter better than those not so covered. What is your opinion? Should the snow be swept off the alighting board and dug from the entrance as often as it gathers? This is what I do, but it seems to disturb the bees, as they know instantly when the hive is touched.

F. H. DOW.

Corning, N. Y.

We know of numerous instances where bees have wintered splendidly when entirely buried in snow, most of the winter; again, of cases where they have nearly, or quite, all died with dysentery, while so buried. My opinion is, that the main cause of our winter losses, is not to be found in snow drifts, nor the want of them. I do think, however, that the disturbance caused by even the most careful methods of clearing away the snow, often result in damage, by aggravating the difficulty. A portion of my hives set very near the ground. I have leaned a board up over the entrances, which leaves a vacuum when the snow covers them over.

Heddon's Section Case.

Wishing to have some comb honey this season, I had two cases and honey boards made according to the plan given in the BEE JOURNAL, and placed them on two of my strongest colonies, at the time Mr. H. recommended. When they began to build comb between the frames and honey board, I filled the sections with foundation and they never entered them for work. I kept them on the hives, one for 2 weeks and the other for 4 weeks, while other colonies used for extracting were giving me 12 to 15 lbs. of extracted honey per week. In the colonies having the cases I found every crack and crevice filled with bits of comb, and the brood chamber filled

with honey, and only two frames with brood. One of my friends who had one of Mr. Heddon's queens for business did not succeed much better than I did, while with extracted honey he was quite successful. What is the matter? Is it the bees or the cases?

DeWitt, Neb.

W. F. WARE.

I was not aware that specifications for the construction of my case, and honey-board, sufficient to work by, had ever been given in the JOURNAL. I am anxious to have these improvements enjoyed by bee-keepers, and for that reason I have declined publishing manufacturing descriptions, feeling confident that a large majority who might thus be led to make them without a sample to work from, would make a failure, and thus condemn mine, because they failed with their own.

In reply to the question "What is the matter," I must say I cannot tell. If Mr. Ware, having made cases and honey-boards like my own, in principle, and his friend having my strain of bees, have both failed in the production of comb-honey, surrounded by the same conditions with which I best succeed, I am *forced* to the conclusion that the difference is in the management.

Glassing Honey in Sections.

I am in a quandary and look to the "What and How" department for light. My honey the past season (6,000 lbs.) was in 2 lb. sections, unglassed. I had some difficulty in finding a home market, because of that shipped in from other points—honey in glass at less cost than my price for the same quality. I do not wish to order sections until I know what the prevailing demand is. Please answer the following questions:

1. Is it the prevailing practice, and does the market demand that honey in 2 lb. packages be glassed?
2. In honey quotations, is reference made to honey glassed or unglassed?
3. To secure honey for glassing, what width of section is best?
4. Do parties who succeed without the use of separators, secure honey in condition to be glassed?
5. In marketing, what difference in price, if any, is made between honey glassed and unglassed?

E. W. THOMPSON.

Hinesdale, N. Y.

1. Eastern bee-keepers and eastern salesmen, tell us, that there is quite a demand for glassed sections, especially for the larger sizes, like yours.

2. Where the matter is not specified, I take it that the quotations mean either way. Some Chicago dealers tell us that their retailing customers ask them for glassed sections, during warm weather, in time of flies.

3. I would not alter my preferred width of sections, if I choose to glass them. If the glass goes *within* the wide pieces (resting on the narrow), separators would be used while storing, and I would use $1\frac{3}{4}$ in. scant, sections. If I glassed on the outside of the wide pieces of the sections (using paste-board cap, top and bottom, *a la Moore*) no separators would be needed, and I now think I would use $1\frac{1}{2}$ in. sections, though those would be rather thin, for so much glass. I much prefer 1 lb. sections without separators, and without glass.

4. Answered above.

5. In some markets none. In others, more is paid for those unglazed.

Regarding the *future* practice of producers, ask yourself which you would buy. You are wiser than the consumer. Something of what you know, he has yet to learn.

"For truth shall conquer at the last,
As round and round we run;
And the right shall ever come uppermost,
And justice shall be done."

Preparing Bees for Shipment.

Will Mr. J. Heddon in the "What and How" column, please give explicit directions for preparing bees for shipment, when sold by the pound, in lots varying from 5 to 100 pounds? How to make the shipping cages, how much room to give them, kind of feed, etc.

Clifton, Tenn.

C. WEEKS.

For a cage for shipping bees by the pound, I use my shipping crate. The same which was described three or four weeks ago, in this paper, by W. Z. Hutchinson. The crate is $12\frac{1}{2}$ in. long, $8\frac{1}{2}$ wide, and $4\frac{3}{8}$ high, with 2x9 glass at the ends. Instead of the glass, we put in wire cloth. For a cover we use the same, and for the whole, we use one continuous strip. We use a proper sized wood pocket, on each inner side of the crate, in the one we put wet rags, containing all the water they will hold and not drip. In the other, what is known, as the Viallon or Good candy. We open one end of the case, insert a large tin funnel "*a la Root*," and shake the bees from the combs into this funnel, when they slip into the cage to stay. Now tack fast the end, and set the crate down flat. I forgot to mention a wood bail which we make of thin flat barrel hoops, which is tacked permanently to the sides of the crate, which serves as a handle, and prevents the top being covered. A more lengthy account of all the detail, would take too much room here. I have tried to give an outline of the principle I use and con-

sider cheapest and best. This crate has a capacity well equal to 2 lbs. of bees. We use it for 1 lb. also. For 100 lbs. we should prefer the use of 50 of them, to any thing larger.

Metal Rabbets for Frames to Rest On.

Will Mr. Heddon kindly give, through "What and How" his objection to metal rabbets for frames to rest on, provided the frames are *metal cornered*?

1. When all-wood frames are used, I can readily understand from my own short experience, why metal rabbets are worse than useless, as the bees will glue the top bars to them, rendering it necessary to pry them loose *sideways*, and unless very carefully done, irritating the bees; but would not all trouble be avoided by the use of metal corners, (tops at least) and would not the advantage of being so readily moved, more than counter-balance the additional cost?

2. Would there be any advantage or disadvantage in adding salicylic acid to the syrup, when feeding, as a *preventive* of foul brood?

3. At the proper time, will he please give the details of his method of wintering bees without pollen?

J. W. RASIN.

Jenkingtown, Pa.

I. For three years I used 25 hives with metal rabbets, and metal cornered frames. In 1871 I first used metal rabbets with all wood top-bars, and have used them ever since in extracting supers. At the date mentioned, I used them in brood chambers. In either place, I prefer all wood top-bars with metal rabbets, to the use of metal corners with metal rabbets. My objections to metal corners are, they are disagreeable to handle. When a heavy comb is gripped sufficiently firm to shake off the bees, they bend in the fingers, and sometimes their cutting tendency hurts the fingers. If you read my late article on readily movable hives, you will see how one working under our system, would be annoyed by metal cornered frames sliding about. In our brood chambers we want neither metal corners nor metal rabbets. In extracting supers we want metal rabbets, but no metal corners any where. A wood top-bar resting upon a tin rabet does away with more than $\frac{3}{4}$ of the ordinary gluing-fast of the frames. The bees cannot glue the top bars to them but very little, and this little we desire; and in the brood-chamber we desire still more gluing, in fact all that we find between our wood top-bars and wood rabbets.

With the almost immovable chaff hive, metal rabbets are more consistent; we fold no tin in constructing

metal rabbets. We rabet down $\frac{3}{8}$ below the desired point, and then tack a $\frac{3}{4}$ strip of tin flatly to the inside of the end piece of the hive, $\frac{3}{8}$ being above, and $\frac{3}{8}$ below the rabet shoulder.

2. I wouldn't advise drugging the food given to bees with as powerful an antiseptic as salicylic acid merely as a preventive of foul brood, unless it had been in my apiary. The best and surest preventive is in using great caution in the purchase of bees, queens, etc.

3. The proper time to give details of the method of wintering bees without pollen will be when we know to a certainty that it is the cause of dysentery. At present we only believe it so, and hope to know soon.

The 5th annual Convention of the Northeastern Ohio and Northwestern Pennsylvania Bee-Keepers' Association, will be held at Jefferson, Ohio, Jan. 16 and 17, 1884. All are cordially invited.

C. H. COON, Sec.

New Lyme, O., Nov. 26, 1883.

The Ohio bee-keepers will hold their annual convention in the parlors of the Farmers' Hotel, at Columbus, O., Jan. 14, 15 and 16, 1884. All interested in bee-culture are invited. The following subjects will be discussed: "How to winter bees successfully." "Are the new races of bees a success?" "What can we do to prevent adulteration of honey?" "How to create a home market for honey." "How many colonies can be kept in one locality?" "Can we do without separators?" "Which are best, deep or shallow frames?" "What shall we do with second swarms?" "How many brood frames are necessary in a hive?" "Which is the most salable section, one-half, one or two pounds?" "Is it advisable for all bee-keepers to adopt a standard size of frame?" "What is the most desirable width of sections?"

The above questions will be discussed by eminent men, such as Rev. L. L. Langstroth, Dr. Besse, S. D. Riegel, C. F. Muth, A. I. Root, of Medina, and others, and in addition to the above, Prof. Lizenby, of the Ohio University, will deliver a lecture on "Honey-producing plants;" also Mrs. Jennie Culp will read an essay.

C. M. KINGSBURY, Sec.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Our New List of Premiums.

Getting up Clubs for 1884.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send *direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

☞ Do not let your numbers of the BEE JOURNAL for 1883 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or in cloth for \$3.00.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

We have received the Price List for 1884 of Mr. G. B. Lewis, of Watertown, Wis.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers we reply, yes; any book or binder we keep for sale, may be selected by those who get up clubs.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Letters for publication must be written on a separate piece of paper from items of business.

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

The 25th annual fair of the Linn County Agricultural and Mechanical Society will be held on the fair grounds at Cedar Rapids, Ia., Sept. 9th, 10th, 11th and 12th, 1884.

C. G. GREENE, Sec'y.

Advertisers' Opinion.

The queen business is *rushing*, and we think the BEE JOURNAL deserves much credit as an advertising medium.
E. A. THOMAS & Co.
Coleraine, Mass., July 18, 1883.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

A NEW HIVE.

Arranged for continuous combs and continuous passage-ways. Will be found a pleasure to work with, and can be easily and rapidly managed. For comb honey it is without a rival, and as an invention, is second only to that of movable brood frames.

Guaranteed to Give Satisfaction.

SEND FOR PRICE LIST AND CIRCULAR.

It will Save Doctor Bills!

Price only 25 Cents. Sent by Mail, post-paid, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

KEGS AND PAILS

FOR EXTRACTED HONEY.

These KEGS are designed to answer the popular demand for honey in small packages, and when compared with large barrels holding from 500 to 500 lbs. each, they are fully as cheap and often cheaper. They need no waxing, but should simply be thoroughly scalded with boiling water before used. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using this size of packages. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these Kegs can be handled and shipped, with an actual saving in original cost, it is apparent to all that they are the best. Prices:

| | |
|--|-----|
| 5 gallon Kegs, holding a trifle over 50 lbs. | 40c |
| 10 " " " " " " " " " " | 60c |
| 18 " " " " " " " " " " | 80c |

When 25 or more kegs are ordered at one time, a discount of 10 per cent. given on the above prices.

These new kegs are designed and manufactured with special reference to my experience and suggestions from those who have used the fish, lard and syrup kegs of last season. The staves are Norway Pine; the heads are Oak; and the hoops are Hickory, and, as will be noticed by the accompanying illustrations, they are well bound. If the heads are painted, I will guarantee these kegs not to leak. It is not essential to paint them, but I believe it will pay to do so.

These PAILS have a full cover and are excellent for selling honey in a home market, and after the honey is candied, they can be shipped anywhere. All sizes, except the smallest, have a bail or handle, and when emptied by the consumer will be found useful in every household.

Assorted samples of the four sizes put inside of one another as a nest, price, 50 cts. by express. The following are the prices in quanti less:

| Gallon, holdi | g | Per doz. | Per 100. |
|---------------|-------|----------|----------|
| 11 1/2 Gal | 5 | \$1.80 | \$12.00 |
| Quart. | 2 1/2 | 1.50 | 9.00 |
| Pint. | 1 1/4 | 1.20 | 7.00 |
| | | .75 | 4.00 |

Sprout Brook, Mont. Co., N. Y.

THIS PAPER may be found on file at Geo. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it in NEW YORK.

Sweet Clover

Prices:—25 cents per lb., \$3.25 per peck, (15 lbs.) and \$12.00 per bushel, (60 lbs.) When ordered, by mail, add 18 cents per lb. for postage.

Having purchased a large quantity of Sweet Clover Seed, I will make a

Special Discount of 20 per cent.

from the above prices, on all orders received during the month of

JANUARY.

Now is an excellent time to make your purchases to advantage.

Sow it in the FALL, WINTER or SPRING—a great many sow it broadcast on the snow—alone, or with field grain or grass; six pounds to the acre. It will do well in field or lane, on hill-side or in valley, on uplands or soil subject to overflow. It is perfectly hardy, standing drouth admirably, and flourishing well during rainy seasons. The honey is the best. As it does not bloom till the second season, it will do no harm if grazed by cattle the first season. It is excellent for waste places and commons.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 350 colonies of bees, of our new strain, and of pure Italian blood. As most of you are aware, for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do well to correspond with me.

Among the goods we have to offer are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Veils, Sample Shipping Crates, Comb Foundations, and many more. We also have our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN.

Editor of the *Weekly Bee Journal.*

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiculturist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—*American Agriculturist*, N. Y.

Its chapter on marketing honey is worth many times its cost.—*Citizen*, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—*Eagle*, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—*News*, Keittsburg, Ill.

Valuable for all who are interested in the care and management of bees.—*Dcm.*, Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—*Farmer*, Cleveland, O.

Carefully prepared for beginners.—*Farmers' Cabinet*, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—*News*, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—*Journal*, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—*Indianian*, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—*Democrat*, Salem, Ind.

Much practical useful information, in a cheap form.—*Daily Standard*, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—*Anti-Monopolist*, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—*Plain Dealer*, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—*Farmers' Journal*, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—*Daily Republican*, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—*Col. Valley and Farm*.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—*Sentinel*, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—*Farm and Fireside*, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—*Farm*, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—*Chicago Herald*.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—*Daily Times*, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—*Signal*, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—*Farmer*, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861

Chicago, Ill., January 16, 1884.

VOL. XX. No. 3.

THE WEEKLY EDITION

OF

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR,

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one new subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is NOW published SEMI-MONTHLY, at Seven Shillings, per annum, and contains the best practical information for the time being, showing what to do, and when and how to do it. Rev. H. R. PEEL, Editor.

We send the Weekly AMERICAN BEE JOURNAL and the British Bee Journal, both for \$3.00 a year.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Advertisements.

DADANT'S HONEY CROP!

Our crop being very large, we offer **THIRTY THOUSAND POUNDS** of extracted Honey **FOR SALE**

at REASONABLE PRICES. We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15c. for our 24-page Pamphlet on Harvesting, Handling and Marketing extracted honey.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

1876. CROWN 1882.

The best arranged HIVE for all purposes in existence. Took first premium at St. Louis Fair in 1882 and 1883 over all competitors. Descriptive Circular sent free to all on application.
Address, **ELVIN A. HENNING**, Prop'r. of the Crown Bee Hive Factory and Apiary, **JERSEYVILLE, ILL.**

DADANT'S FOUNDATION

From JAMES HEDDON, July 27th, 1883.—Your Foundation is certainly the nicest and best handled of any I have seen on the market. It is the only foundation true to sample I have ever received.

From JAMES HEDDON, Aug. 10th, 1883.—I will contract for 2,000 pounds of foundation for next season on the terms of your letter.

From A. H. NEWMAN, Aug. 24th, 1883.—Book my order for 5,000 pounds for spring delivery.

From C. F. MUTH, Dec. 12, 1883.—Book my order for 2,000 lbs. of heavy; 1,000 lbs. of thin, and 500 lbs. of extra thin.

Dealers, send in your orders for next spring while wax is cheaper, and save trouble and money.

CHAS. DADANT & SON,

5ABly Hamilton, Hancock co., Ill.

A POCKET DICTIONARY

Containing 320 pages, and over

25,000 Words, Rightly and Plainly Defined

To make the pronunciation easily understood every word is phonetically re-spelled, and the syllables and accents made perfectly plain, so that no one who consults this book can miss the proper word to use, and giving it proper pronunciation.

This Dictionary is our Premium for a Club of 3 subscribers to the Weekly (or its equivalent to the Monthly), in addition to other Books selected from our Catalogue to the amount of \$1.00; all by mail, postpaid.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, Editor of the "British Bee Journal." Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apilary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey as Food and Medicine, by Thomas G. Newman. This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c. per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and Instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with Instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration! What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages. 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurements of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for costing up grain, produce, hay; cost of pork, lard, etc.; wages tables, rod measures, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 20,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of useful knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Qtnby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey-Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Font Brood; its origin, development and cure. By Albert H. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Velehrungen ueber folgende Gegenstände—
—Vertlichkeit des Bienenstandes—
—Honig pflanzen—Erziehung der Königin—
—Zütern—Schwärmen—Ableger—
—Verfegen—Zaleniieren—Züfeker von Königinnen—Ausziehen—Bienen behandeln und beruthigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigkuchen, Formkügeln, Puddings, Schaumconfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Recepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von W. J. Kenball, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN.

925 West Madison St., CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., JANUARY 16, 1884.

No. 3.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Mr. A. H. Holcomb, of Winnebago, has sold his apiary, as advertised in BEE JOURNAL, to Mr. C. M. Hollingsworth, of Iowa City, Iowa.

We have received Vennor's Almanac for 1884, published by the American News Company of New York. Vennor is sadly "out" on his guesses about the weather for January, so far. He talks of "brightness and balminess," when the mercury is dancing around the thirties below zero.

Just as last week's BEE JOURNAL was ready for the press we received by mail a fine Christmas bouquet from Mr. J. D. Enas, of Napa, California, which he cut on Christmas day out of doors. It was a pleasant contemplation when we were enjoying (?) the winter weather at 25° below zero, that in California—the flowers were blooming out of doors, spreading their fragrance all around. Mr. Enas has our thanks for the fine bouquet.

It is now quite time to be making arrangements for all the hives, sections, foundation, and other articles needed in the apiary which require time to make and get in readiness for the coming honey harvest. If you fail to send your orders to some responsible dealer in proper time, you must not complain if these necessary articles are not on hand in time to aid in augmenting your receipts of 1884. The reason for trying to impress this upon the minds of all, is the fact that, last year, there were many complaints because orders could not be filled as soon as received by the dealers all over the country.

Mr. O. O. Poppleton, of Williamstown, Iowa, has sent us the following extract from the *New Hampton Courier*, on the subject of bee pasturage:

Look out for the spread of alsike or melilot clover in the grain fields. British millers say its seed come to them in California wheat; they are highly objectionable from the odor, and it is hard to separate them from the wheat. We notice that this clover is becoming a positive nuisance along the roadsides in some portions of northern Illinois. We drove along roads this fall where the alsike was so abundant and so tall, that it was with difficulty two teams could pass each other. It hid the fences as effectually as snowbanks ever did in winter, and extended completely out to the line of travel. The law about noxious weeds along the roadsides, should be enforced against this pest.—*Prairie Farmer*.

The above extract from the editorial columns of the *Prairie Farmer*, is about as stupid a blunder as is possible to make. It speaks of alsike clover (*Trifolium hybridum*) as being identical with melilot clover (*Melilotus alba*), while in fact, the two plants bear no more resemblance to each other, than does common clover and milkweed. Alsike clover very much resembles common red clover, and on some soils makes more valuable forage than red clover. Its seed is also very valuable, bringing from \$8 to \$12 per bushel in the wholesale markets. It is utterly impossible for it to become a roadside nuisance, as it rarely grows over 2 feet high.

Melilot or sweet clover is, of course, the plant referred to by the editor. It grows to the height of 4 to 6 feet, and is valuable for the large amount of fine flavored honey which it yields. Some of our best bee-keepers are growing it on their farms quite largely, and the editor of the *Prairie Farmer* could do me no greater service than by teaching me how I can induce this "nuisance" to grow on my farm as thriftily as he says it does in Northern Illinois. I am afraid he thought more of the little trouble it happened to make him personally, than of its

real value in furnishing such a bountiful yield of one of our sweetest and purest productions of nature.

The idea that its seeds are objectionable to millers is a new one, and I am very much inclined to think that it is another blunder, the seeds of another kind of clover being referred to. I judge this is so, from the fact that the seeds of both, the Alsike and melilot clover, are so small as to be quite readily separated from wheat.

O. O. POPPLETON.

The Price List for 1884 of Henry Alley, Wenham, Mass., is received. Mr. Alley has inserted the following offer, which our new subscribers may desire to take advantage of:

THE AMERICAN BEE JOURNAL (Weekly) is published by Thomas G. Newman, Chicago, Ills., at \$2.00 per annum. To all new subscribers to the above, we will send one of our best queens on receipt of \$1.00.

Mr. J. M. Hicks, in the *Grange Bulletin*, gives the following opinions about good tested queens and laying workers:

A good prolific queen will always lay her eggs in close, concentric circles, and but one egg in a cell. You will also find both sides of the combs filled with eggs and brood alike, which is sure evidence of a fertile queen, which has mated with a drone. Never buy cheap queens, believing them to be as good as the high-priced queens, as there is as great a difference in the real value of queens as in any other stock.

One of the most troublesome things for the apiarist to contend with, is the pest, called a fertile worker, which is frequently very annoying to queen-breeders, as well as to some who only keep a few colonies of bees. You can always know when a hive is possessed with a fertile worker, by the appearance of the brood in the combs, which is always drone-brood, and very uneven, with many of the cells containing from two to six eggs in each, as well as several cells having none.

We now club the *British Bee Journal* and our *Weekly* for \$3.50. See change in prices on first page.

Test for Purity in Honey.

Mr. W. K. Williams, Buffalo, N. Y., asks us to give in the BEE JOURNAL a test for pure honey. We have several times given tests, but it is well to repeat them. The following is the test in common use in chemical laboratories for detecting glucose in honey, as given by Prof. W. C. Preston, of the State University, Iowa City, Iowa, who remarks as follows:

Having noticed in your excellent BEE JOURNAL an inquiry for some simple method of detecting glucose, allow me to give your readers the test in common use in chemical laboratories.

The test is sufficiently simple, and at the same time very delicate—and may, I think, be stated so plainly that the non-professional reader will find no difficulty in its practical application. It is based on the fact that if to a boiling alkaline solution of blue vitriol, a solution containing glucose be added, a red precipitate of cuprous oxide be immediately thrown down; while cane sugar will give the red precipitate only after protracted boiling. It will be necessary to prepare the following solutions, which may be bottled up and kept for use as required:

1. One-half ounce blue vitriol dissolved in one pint of rain water.
2. Three ounces caustic potassa dissolved in one pint of rain water.

Also procure a test tube about 6 inches long, such as may be found at almost any drug store. Pour into this tube about a tablespoonful of the blue vitriol solution, and add about an equal amount of the solution of potassa—a light blue precipitate will be formed—now add a small quantity of the sweet substance to be tested (it is better to be in solution), and heat to boiling. If even a trace of glucose is present, it will be revealed by the reddish tint immediately imparted to the liquor, best seen by looking down through the tube lengthwise. If there is much glucose, a red precipitate will sink to the bottom of the tube.

It may be well to add that this test does not enable us to detect the adulteration of honey by manufactured glucose, inasmuch as all honey contains a large percentage of the same saccharine substance—but pure, as formed in Nature's laboratory—the nectaries of flowers.

We have received "Landreth's Companion for the Garden and Farm," which is the Seed Catalogue of D. Landreth & Sons, Philadelphia, for the one-hundredth year. It is splendidly illustrated and handsomely printed. Price 10 cents.

"One Thousand and One Riddles," by Nellie Greenway, is on our desk. It is published by J. S. Ogilvie & Co., 31 Rose Street, New York. Price 15 cents.

Some Conundrums.

A correspondent sends us these conundrums for bee-keepers. They "will pass in a crowd, if the crowd is large enough," as is sometimes said of ordinary jokes:

Why is a colony of bees like the Bible? Because there is so much in it that we should practice before we preach.

Why are bee-keepers' reports like a load of potatoes, hauled over a rough road? Because only the large ones work to the top.

Why is a bee-keeper like a congressman? Because he gets his pay by his colonies' labor.

How Far will Bees Go for Honey?

The London *Journal of Horticulture* answers the question thus:

This is a question that has been addressed to us by a gardener, who states that bees find their way into his peach house every year, and he knows of no hives nearer than one and a half mile. On this subject Mr. Pettigrew has a short chapter in his "Handy Book of Bees," which we cite: "This question we cannot answer with accuracy. Our experience in this matter goes dead against the wonderful stories that are told in some books. We read of bees flying 4, 7 and 12 miles for food! Our bees will perish and die for want of food within three miles of good pasture. Our bees here never find the hundreds of acres of Heather which cover Carrington Moss within three miles of them. In fine sunny weather bees go farther from home than they do in dark cloudy weather. But even in the best and brightest of weather in June and July, very few, if any, find their way home to their old stand if removed three miles off. Moreover, the return of some bees does not prove that they travel three miles in search of food. It proves that some of them go a little more than one mile and a half from home, and finding themselves on known pastures within one mile and a half of the old place, they return thither, forgetting, as it were, where they last came from. I am, therefore, of opinion that very few bees go more than two miles for food. It is very desirable to have bees near the pasture on which they work. Short journeys are not only a saving of labor to bees, but also a protection of their lives. When compelled to fly far for honey they are often caught by showers and destroyed. In warm genial weather, with a superabundance of honey in flowers, bees will have it. They go beyond the bounds of safety for it. Gentle showers do not stop out-door laborers. Black clouds often send them hurriedly home; but they are frequently caught, and die on the altar of their industry. Hives containing 8 pounds and 10 pounds of bees have lost two-thirds of their ranks by sudden showers in warm honey weather. Bees driven to the

earth by showers do not die at once. If the following day be warm and fair the rays of the sun sometimes reanimate these storm-beaten creatures, and enable them to return to their hives."

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., Jan. 14, 1884.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no excitement in the honey market. The demand for extracted honey is improving, but supplies being large, prices keep down. It brings 7@10c. on arrival. Arrivals of comb honey and demand for it, are in fair proportion. A choice article in $\frac{1}{2}$ lb. sections brings 20c. per lb. from store, and 16@18c. on arrival.
BEESWAX—Scarce; brings 28@32c. on arrival.
CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17@22c. Dark and second quality, 14@15c.; extracted white clover in kegs and barrels, 9@ $\frac{1}{2}$ 10c.; dark, 8@9c.
BEESWAX—Prime yellow, 27@29 c.
H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect, sales are made of 1 lb. sections at 15@20c.; 1 $\frac{1}{2}$ @2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.
BEESWAX—Scarce, at 28@35c., according to color and cleanliness.
R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—The extreme cold weather of the past week has put a check on the movements of honey, both in and out, and some slight concessions made in prices. Extra choice, 1 and 2 lb. sections, 17@18c.; dark and irregular, 15@16c. Sales for the week about 2,000 lbs; receipts 3,000. Extracted slow; sales about 2,500 lbs., at 8@8 $\frac{1}{2}$ c; receipts light.
JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Fancy comb is scarce, and prices for the same are firm, but offerings of other descriptions receive little or no attention. White to extra white comb, 15@20c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7 $\frac{1}{2}$ c.; dark and candied, 5@—
BEESWAX—Wholesale, 27@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, 13@18c.; strained and extracted, 7@8c.
BEESWAX—Firm, at 30@31c.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—Honey continues in excellent demand, as reported last; every lot of choice white comb is taken up as fast as it comes at 18c. in quantity for 1 lb. sections, and an occasional sale at 19c. in broken lots and second quality is very slow sale. For extracted there is no demand.
BEESWAX—Is eagerly inquired for at 28@30c., but none to supply the demand.
A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Our market is rather dull, and supply more than exceeds the demand; would not advise shipments to this market. 2 lb. comb, 16@18c.; 1 lb. comb, 18@20c.; extracted, 8@10c.
BEESWAX—32@35c.
BLAKE & RIPLEY, 57 Chatham Street.

A meeting of bee-keepers will be held at the residence of W. Cossens, Monee, Will Co., Ills., on Monday, Jan. 28, 1884. All friends of improved management of the apiary, are invited to attend.

Cause of Moisture in Hives, etc.

JAMES HEDDON.

Although I have enough writing on apiculture without opening any controversy, yet when such is opened by others, and by misunderstanding or intent I am misunderstood or misrepresented, not to have an uncontrollable desire to reply would be something more than human.

Allow me to call attention to Mr. Corneil's quotations from my articles. After reading them can you see why Mr. Corneil should suppose that I thought that the dampness in hives was mainly due to an accumulation of moisture caused by the absence of heat after the death of the bees? It seems to me that I have said enough in past articles, to give any reader who reads my articles as closely as Mr. Corneil must have done, to understand that I was aware that respiration and transpiration were the main causes of dampness in bee hives.

In examining my colonies in the spring, when a portion were dead and a portion alive, on several occasions I found much more dampness in the dead colonies than in the live ones, when all were treated precisely alike. Many colonies had a lesser and some a greater portion of their numbers dead, and in almost exact proportion to the numbers of living and dead so I found the moisture. This might lead some, and undoubtedly would lead Mr. Corneil to pronounce moisture the cause of the mortality, but I pronounced it the effect, and will present to you, what are to me, valid reasons for such a decision. First, if moisture is the cause of dysentery, why does not the moisture folks account for numerous such instances as given by Mr. Balch on page 6, current volume? Secondly, there is a law by which it is an effect in such cases as I have mentioned. During such temperature as we have at the season of the year mentioned, moisture seeks the colder substances and places, upon the same principle that the pitcher of ice water placed upon the summer dinner table gathers moisture upon its outer surface.

Upon this principle you see, as long as there were live bees enough in a hive to keep the temperature above that surrounding it, no excess of moisture would take place. As soon as no life was left in the hive, and a rise in temperature left the combs, honey, etc., colder than the outside air, condensation would take place in the hive on the same principle that our cellars are damper in summer than in winter. Said dampness does not come from the earth, but from the warmer atmosphere outside, governed by the law above mentioned. That the bodies of the dead bees may contribute to this accumulation of

moisture, I have reason to believe. Let it be remembered that I am all along referring to times when the temperature is above the freezing point—such times as we are examining our colonies.

Mr. Balch has given us facts regarding the condition of his bees when taken from the damp repository, facts to which I was an eye witness, as I have been to others similar. We want to believe and know the truth, whatever it may be, and we appreciate learned theorizing, especially if correct, but it cannot force itself upon us as such while running contrary to such facts as given by Mr. Balch. To reply to Mr. Balch's last question in his valuable article, I will say, that before I kept bees I learned from observing others, that the best way to gain self-respect, as well as the respect of others, was to frankly own right up when knowingly beaten in discussion. That open confession was not only good for the soul, but wholesome for the opinions of others. In recalling to memory all that I can of my controversies with Mr. Balch, I call to mind no other occasion for such concession. If I remember correctly, this occurred in the second year of my bee-keeping, and upon that ground I ask Mr. Balch to excuse my weakness in supposing that his bright, healthy bees ought to have been all dead coming from such a damp, moldy pit—more especially when this dampness was a common dread, and even yet our scientific friend across the line believes it to be the Gorgon of our honeyed hopes.

Let me say to Mr. Turner that my case without the divisions (which he did not use) is not my case at all, nor is it worth the tenth part as much as the one I use, in my estimation. With our leading honey-producers, the tide has been steadily moving away from the use of glass in surplus-storing supers or cases, and when with this class of bee-keepers the tide turns back upon itself, will be time enough for me to begin to think of going back over the old, old ground. Mr. Turner cites to my average yield of honey. No greater mistake has ever been made than that of attaching importance to the arguments of him whose name appears under "a big report, simply because of such report. First, is the report true? Secondly, if so, are the conditions causing it necessarily coupled with great wisdom? Here, we have not had much over half a crop of nectar secreted by the flora since I first saw the name of Mr. Turner, and, perhaps, since Mr. Turner first saw mine. I am not old enough to yet have reached my first year of dotage.

I believe I knew less about bee-keeping, in all its branches, ten years ago than at present. At that time I scored pro rata yields far in advance of that reported by Mr. Turner, and I think equal to any thing I have seen reported this side of the Rocky Mountains. If I should get another such yield the coming season, shall I rewrite my article against the use of movable-sided cases? Mr. Balch's article, seems to me, to be a concise

answer to one in the same issue by Mr. H. V. Train.

The report of Ira Barber, on page 12, deserves more than a passing thought. A young man reported similarly upon the same subject about 12 years ago at our Kalamazoo Convention. If bees kept in so high a temperature can crawl outside and void and go back with safety, as inferred by Mr. Barber, most assuredly they can breed, and use all the pollen they desire. But it seems from this extensive experience that even in so high a temperature, as a rule, there is no breeding (see fourth line on page 12), and if such be the case, I should not expect any consumption of pollen, as a free and unrestricted choice of food is left to the bees in such temperature. This is the fourth or fifth time that my attention has been called to this principle, and though it has worked considerably upon my mind each time, never more strongly than now, for Mr. Barber is known to us as a practical man of integrity and ability, and his report is upon a scale sufficiently large to make it more valuable. While this high temperature may save the bees, again the low tempered cellar is not a cause of the disease, because many are the apiaries that come out of such cellars in excellent condition.

I wish Mr. Barber would tell us more about it. Tell us how long he has wintered in this high temperature. All about his successes and failures, and conditions accompanying them. Where is Dr. Southard upon this wintering question? Come out Doctor and give us your experience, observations and conclusions. No matter with whom they may run crosswise, we cannot afford to do without them.

For the American Bee Journal.

"Button Bush Honey" Again.

REV. M. MAHIN, D. D.

In the BEE JOURNAL of Jan. 2, 1884, R. S. Beckett writes about button bush honey, and says that it is far inferior to buckwheat honey, that it has a very sickening taste, and that it is black and stinky. I am very certain that he is mistaken in supposing that the honey he describes was gathered from button bush, and that while his bees were working on that shrub they were getting large quantities of honey from some other and unobserved source.

Button bush (*cephalanthus occidentalis*) used to abound in this section, until the ponds were drained and cleared up; and in the earlier days of my bee-keeping my bees gathered a good deal of honey from it.

I am sure that Mr. Beckett is mistaken, because while button bush abounded in the locality of my apiary I have never seen any such honey as he describes, and his must have been gathered from some plant that does not grow in this vicinity. I have had abundant opportunity to determine the quality of button bush honey, having repeatedly removed it with the

extractor almost as soon as it was gathered. In color it is as light and clear as white clover honey or any other I have ever seen. Its flavor is mild and pleasant. But it has one disagreeable quality—it will begin to granulate almost as soon as it is stored. I have found little round pellets of sugar to abound in it, when extracting it in the month of August. But notwithstanding its propensity to granulate, I will take all the button bush honey I can get.

New Castle, Ind., Jan. 2, 1884.

For the American Bee Journal.

The New Races of Bees.

FRANK BENTON.

Coming from a man whom I have been accustomed to regard as pretty generally correct in his conclusions in regard to bee matters, and honest in the statement of the same, the views of Mr. G. M. Doolittle, as expressed on page 500 of the BEE JOURNAL for Oct. 10, surprised me exceedingly. All my experience in bee-keeping has tended to make me value prolificness in a queen above all other qualities—to regard it, in fact, as the basis of all success in honey-production. If we have the workers in a hive when the harvest opens, we are sure of honey. This Mr. Doolittle will not deny, nor can he say that the individual workers of the Eastern races are not the best of honey-gatherers. But he admits, yes, even claims it as a *fault*, that the queens of the "Holy Land" bees, as he calls them, are extra prolific. Where, then, lies the fault? What is the reason Mr. Doolittle finds these bees "practically good for nothing for his locality?" He says: "These bees seem to think that a large flow of honey should mean lots of brood, so at brood-rearing they go." (That is just what I want them to do whenever the weather will permit.) Then follows the statement that, "when fall arrives, we have a hive overflowing with bees." (That is what I want and can have, not in the fall alone, but from spring until fall with these bees.)

Further on he says: "All are aware of my views regarding the secret of honey-producing being to get the bees just in the right time for the honey harvest (neither too early nor too late), that being of more moment than any one other thing pertaining to honey-producing. Admitted. But he gets his bees "when fall arrives!" Oh, well, the next sentence sets that all right (?) "That the Syrian bees cannot be thus managed in this locality is the reason of my saying they are practically good for nothing." Passing by, for the moment, the fact that Mr. Doolittle starts out with "Holy Land" bees and concludes with a very different race, the *Syrian* bee, I would point out here that Mr. Doolittle, after having admitted that these Eastern bees are especially inclined to rear brood whenever food is coming in, then says he fails to get his hive filled with bees until fall, and follows by saying that he cannot

manage these bees so as to get the workers ready for the harvest. And this is a simple confession on the part of Mr. Doolittle that he cannot accomplish what, to use his own words, "is of more moment than any one other thing pertaining to honey-producing." How does this agree with his reported success in raising comb honey! Why, if I should take an apprentice in bee-culture, this would be one of the first things I would teach him! and with no bees could it be more easily accomplished than with Eastern bees?

Mr. Doolittle further says: "They have another exceedingly bad feature, which is, that before the young queens are fertilized in the parent hive which has cast a swarm, fertile workers spring up, and the result is a queenless colony." Not at all. If left to themselves the young queens of Eastern races are just as sure as those of any other race to become fertile and commence laying, and if fertile workers have commenced laying in the hives, they will almost invariably disappear without occasioning the least trouble. Eastern bees are more liable than other races to have fertile workers. Palestine (Holy Land) bees more so than Syrians. But this "bad feature" is by no means such a difficult thing to cure with them as with other bees. I usually give little heed to it; introduce queens, even virgin queens, put in queen-cells, or give them brood and let them rear a queen. This they rarely fail to do, but carries with it the objectionable feature of allowing the fertile workers time to get nice worker-combs filled with drone brood, and to waste honey in rearing these useless fellows. These are, in my opinion, by far the worst features of the fertile worker tendencies of the "new races."

In his closing paragraph, Mr. Doolittle gets back to the race of bees with which he originally stated, the "Holy Lands." He says: "However, as in all respects, unless it is in wintering, they are inferior to the Italians. I felt warranted in doing away with them entirely, and, to-day, finds my yard without a Holy Land bee in it." Now, if Mr. Doolittle really means "Holy Land" bees, that is, bees from Palestine proper, and not from Syria, and will throw in the "wintering" and leave out most of the "respects," I will agree that the statement is correct. In other words, the bees that come from south of the mountain-range that extends from the Sea of Galilee to the Mediterranean, terminating in Mt. Carmel, the true "Holy Land" or Palestine bees stand in my list of good bees, fifth, or after Cyprian, Syrian, Carniolan and Italian bees. They are inferior to Italians in temper, in not clinging to the combs, in wintering qualities, and in that they are more easily pestered with fertile workers, and, though superior to Italians in beauty, in prolificness, in defending their hives, in strength and rapidity of flight, and in diligence in collecting stores, still on account of the grave faults just mentioned, I put them, all in all, after

Italians. They are the smallest bees of the species *Apis-melifica* that I have ever seen. Their pointed abdomens usually show three lemon-yellow bands, but all are not equally well marked, the variation in the same hive often being quite striking. Their bodies show a remarkable elongation when filled, and such workers, if well marked, are very handsome. The thorax, the edge of each abdominal ring, and the tip of the abdomen are covered with very dense gray fuzz giving them the appearance of having been dusted with flour. The drones, especially, have a very thick coat of iron-gray fuzz on both thorax and abdomen. The queens have rather elongated bodies, often a beautiful yellow in color, though many of them are leather-colored. Palestine bees are very liable to fly into a passion upon slight provocation, and when once aroused, are not easily subdued in any way. I have noticed a remarkable variation in the disposition of different colonies of these bees. This, with their irregular markings, is a proof that the race is not well established, that is, it leans first toward one type, then toward another.

In general, these bees are difficult to manage. They crawl from the frames upon one's hands, and quite impudently creep under sleeves and cuffs, biting the flesh, and then often curving their bodies and stinging. They crawl on the combs and drop off much like black bees. In a cold climate they die off in winter and spring, somewhat as did the Egyptian bees when brought to Europe and America; in fact, after four years' experience with the bees of Palestine, I regard them as constituting an inconstant race, forming a connecting link between the Syrian and the Egyptian bees, resembling more nearly the Egyptians than any other race, yet to be preferred rather than the latter, although not equal to the Syrians. Such is the true "Holy Land" bee.

Going northward on the mainland lying adjacent to the Mediterranean we find, after passing the mountain range above mentioned, a very different bee—the race of Syria proper. These bees are larger and more golden yellow than those of Palestine, very uniform in general color and markings. The queens are generally larger, a greater number are yellow rather than leather-colored, and they are even more prolific than the queens of Palestine. The drones, instead of being such a complete gray in color, are more or less mottled with yellow. The workers do not run on the combs, nor do they drop off at all. They can be handled much more easily than the bees of Palestine, and, even if aroused are less vindictive. They are beautiful bees. The fuzz on their bodies is brown, with just a tinge of gray, and the three golden-yellow bands are distinct and never lacking. The type is well fixed, and in all parts of the Lebanon only a distinctly golden yellow, active, strong-winged race is to be found, which distinguishes itself for its prolificness and its good honey-

gathering qualities. In short, we see here a race far more closely related to the Cyprians than to the Palestines, and, like the Cyprians, they winter better than do Italian bees; while, with care, they can be manipulated more rapidly than Italians. Such is the Syrian race of bees, which, if introduced into America in its purity, cannot fail to find favor with the mass of intelligent apiarists.

I never recommended the "Holy Land" bee further than the above recommends it, and, though I have better facilities for procuring these bees than the Syrians, and can get them at a somewhat less cost, yet I must state my conviction that, of the two races, the Syrian is decidedly the preferable one. I have addressed many queens of each race to Europe and America, and have never failed to mark plainly on each box the name of the locality from which its contents came, so that if, in the face of my remonstrances, some have persisted in mixing them together and calling them all "Holy Land" queens, I am not to be blamed for the present jumbled up state of public opinion regarding Eastern bees. Nor should the good bees of Syria forever bear a bad name because somebody chose to make them associate with bad company. For my part I have always called, and shall continue to call, the bees from north of the mountain range mentioned Syrian bees, and to restrict the term Palestine bees to those from the south of that range, leaving the name "Holy Land" as applied to bees for such as have a mortal dread of being too exact in their work and modes of expression.

Munich, Germany, Nov. 3, 1883.

[Mr. Benton makes a fine distinction between Syrian and Palestine bees. A glance at the map of Asia will show that Palestine is a portion of Syria bounded on the North by Lebanon, and on the South by the Desert of Arabia. Syria comprises this whole land, but runs North to Asia Minor, and East to Persia. It might be said with as much propriety that natives of the United States, Canada, Mexico, or any other Province or Country in America, were not Americans! There may possibly be a difference in the bees of Northern Syria or Palestine, but the bees of Palestine, or the "Holy Land" (as some call them), are as properly named Syrian, as the inhabitants of Mexico are called American, or the people of Scotland called British.—Ed.]

The Mahoning Valley Bee-Keepers' Association, will be held in the Town Hall at Newton Falls, on Thursday, Jan. 24, 1884. As this is the meeting to elect officers, every member and all interested in the production and sale of honey, are requested to be present.

E. W. TURNER, Sec.

For the American Bee Journal.

Premium List for Bees and Honey.

W. Z. HUTCHINSON.

I see by page 643 of the BEE JOURNAL for 1883 that I am called upon for an article upon the above subject, and that Mr. Clute also desires criticisms upon the list that he has offered. Before reading Mr. Clute's list, I had prepared one which I intended offering to the committee on the revision of the apiarist department of our state fair premium list, but after reading Mr. Clute's list I feel like making a few slight changes. The premiums offered in the poultry department of our state fair premium list amount to over \$300, and, like Mr. Clute, I had placed the amount of premiums in the bee-keeping department at about \$300.

In regard to offering premiums upon the different varieties of bees, I think the amount offered should be the same upon each variety. As to which is the best variety, opinions differ; and it does not seem right that the one who prepares the premium list should decide which is the best variety, and then put the highest premiums upon the kind that he considers best, and more upon the one that he considers the least desirable. Upon each breed of hives the premium is the same, and the same is true of different breeds of cattle and sheep, why should the bees be made an exception?

If we can have suitable buildings, I too, should be in favor of public manipulations with bees, but I am decidedly opposed to allowing bees their liberty on the fair grounds, at the same time that visitors are present; I have seen too much trouble from this source. Just as soon as our bees become a nuisance at fairs, and annoy the public, just so soon will we be obliged to "fold up our tents and steal silently away."

I also object to the putting of comb honey on a par with extracted honey. To bring comb honey to a fair, that is, enough to make a creditable display, is a risky undertaking, much more than the bringing of extracted; and the man who takes the risk should be suitably rewarded.

The classification of honey into "white clover," "linden," and "fall honey," may be well enough in the west, but I think it unnecessary here in Michigan, as we seldom fail of having some of all three kinds.

The offering of separate premiums upon honey-producing plants pressed and mounted, and those in bloom, seems to me undesirable, for the reason that, at the time that fairs are held, only fall-blooming plants could be exhibited in bloom, while flowers can be pressed and mounted so nicely, as to be almost nicer than when in bloom.

Neither do I like the plan of offering premiums upon so many different points in bee hives, I would offer a premium for the best hive, all things considered.

There is just one more thing that I would "tear to pieces," and that is the offering of a premium, for the largest

yield of honey from one colony and its increase; not but what kee-keepers would honestly report, but some one who failed to get the premiums might think differently, and there might be hard feelings, criminations and re-criminations. Let no premiums be offered upon anything that cannot be shown and proved by the exhibit. There are some things that Mr. Clute has not mentioned upon which I would offer a premium, but the list that I append will show what they are.

I am thankful, indeed, that Mr. Clute has "stirred up" this matter, and that too, in just the "nick o' time."

| | First Prem. | Second Prem. |
|--|-------------|--------------|
| Best colony Italian bees in observatory hives..... | \$10 00 | 5 00 |
| Best colony Syrian bees in observatory hives..... | 10 00 | 5 00 |
| Best colony black bees in observatory hives..... | 10 00 | 5 00 |
| Note—The observatory hives must have at least two sides of glass. In awarding premiums purity of race and numerical strength must be considered. Bees must not be allowed to fly while visitors are present. | | |
| Best and largest display of full colonies of different races of bees..... | \$10 00 | 5 00 |
| Largest collection of queen bees, alive..... | 8 00 | 5 00 |
| Largest display of bees under glass, so arranged as to be handled by visitors..... | 10 00 | 5 00 |
| Largest and best display of comb honey..... | 20 00 | 10 00 |
| Largest and best display of extracted honey..... | 15 00 | 8 00 |
| Best specimen of comb honey, not less than ten pounds, quality and manner of putting up for market to be considered..... | 10 00 | 5 00 |
| Best specimen extracted honey, not less than ten pounds, quality and manner of putting up for the market to be considered..... | 8 00 | 4 00 |
| Best 10 pound beeswax..... | 5 00 | 3 00 |
| Largest and best collection of honey producing plants, pressed and mounted, or in bloom..... | 10 00 | 5 00 |
| Largest and best collection of apicultural literature..... | 10 00 | 5 00 |
| Best bee hive, all things considered..... | 10 00 | 5 00 |
| Best honey extractor..... | 8 00 | 4 00 |
| Best comb foundation machine..... | 10 00 | 5 00 |
| Best specimen comb foundation..... | 3 00 | 2 00 |
| Best bee smoker..... | 3 00 | 2 00 |
| Best honey knife for uncapping..... | 2 00 | 1 00 |
| Best wax extractor..... | 3 00 | 2 00 |
| Best section honey box..... | 2 00 | 1 00 |
| Largest and best collection of apiarist implements..... | 10 00 | 5 00 |
| Largest, best, and most interesting and instructive exhibit, all things considered..... | 10 00 | 5 00 |

Then, friends, as Mr. Clute says, "I am quite willing that this list of mine shall be knocked into splinters, if from its ruins can be evolved the perfect list;" but you must be lively about it, for the time when these lists must be used is close at hand.

Rogersville, Mich.

For the American Bee Journal.

Essentials in Comb-Honey Racks.

GEO. F. WILLIAMS.

As bee-keepers are waiting for the coming of spring in order to begin active operations among the bees, it seems to me that this is the very best time for a discussion of section racks. I think that a friendly discussion of those racks in use, with suggestions as to their improvement, founded both on fact and reason, will ultimately lead to the adoption of the best. Some racks are adapted to individual hives only, but to be the acme of perfection they should be suitable for any hive, no matter how made, and to a frame of any size.

The following are the principle features which I think must be combined in a perfect rack:

1. It should be made solid, having no movable sides.
2. There should be no partitions.
3. It should be so made and arranged that the bees have direct or continuous passage ways from the brood chamber into the sections; there should be neither honey-board or bee-space between the brood chamber and sections, nor should there be a bee-space between the different tiers of sections.

4. It should be reversible.
5. It should be so made as to serve as a half-story on a single-walled hive, without an extra covering.

6. It should be so arranged as to permit the bees to ascend from the outside of outside combs directly into the outside of the side sections.

As to the first, durability, if nothing more, would be a sufficient argument in its favor; but there are others,—convenience in handling, no falling apart, always in shape and ready for use.

Never in my experience as a bee-keeper, could I conceive why any one wanted partitions in a section rack; it not only costs time and money to put them in, but, when they are in, they occupy space that ought to be filled with sections.

On page 637 of BEE JOURNAL Mr. Heddon quotes more than a column from the specifications of the Langstroth patent, in order to demonstrate his 4th principle upon which all hives should be constructed, viz.: That "the sections should never rest on each other or on the brood frames."

At the bottom of the middle column on the above page we find this: "This shallow chamber, while it greatly facilitates the storage of honey in large receptacles, is especially adapted to securing it in small ones, which usually meet with the readiest sale."

After-experience changed Mr. Langstroth's views, which, had Mr. H. known, he probably would not have quoted quite so much; for on the very next page he (Mr. L.) says: "I see no reason why sections for comb honey may not be set, to the best advantage, directly on these sheets. Before giving up my apiary, I found that small boxes were much more readily filled by Italian bees, when put directly on top of the frames; and that, however admirably the shallow chamber answered for black bees, the Italians plainly wanted nothing to do with it."

The advantage of setting the rack directly on the frames are:

1. The bees will not fasten it so tightly as where the bee-space and honey-board are used. Every bee-keeper knows what an amount of comb is generally built in the bee-space and consequently of the effort required to remove the rack.
2. The building of these pieces of comb requires time and material, hence we arrive at our second reason, viz.: Less work for the bees and no waste of wax.

3. The bees will go into the sections much sooner.

4. More comb honey.
5. Easy and quick manipulation.

By the use of a reversible rack we get our combs built solidly against both the top and bottom of the sections, which adds very much to the appearance of our honey as well as to its stability, which advantage can not be over-rated when it is to be handled much, or shipped to a distant market.

I remember, when at the Cincinnati convention, over a year ago, D. A. Jones held up a section of honey and told in his forcible manner, how to get comb honey that would take the premium every time. It was simply to reverse the sections when partly filled.

As racks are generally made, the bees can not pass directly up from the outside of the side comb into the sections, but they must go in toward the center of the hive until they come to the passage between the first and second rows of sections, before ascending. That this is a disadvantage any one can well see; for we wish to give our bees every advantage possible, because upon so doing we add just so much to our profits, be it ever so little.

If this improvement was made to all racks, I think there would be less complaint that the side sections were the last to be filled. It may be that we are laying the blame of half-finished side sections on the glass sides of some crates, while the want of a direct passage way is just as much to blame.

New Philadelphia, O.

For the American Bee Journal.

Dysentery without Pollen.

WM. F. KANZLER.

We, the readers of the BEE JOURNAL, are under very high obligations to Mr. W. Z. Hutchinson, for he brought before us Dr. Donhoff, a very competent witness in our pollen controversy, in Vol. XIX, page 641. Dr. Donhoff was a great chemist, and a close observer, and settled, microscope in hand, many disputed questions in bee-life. Please allow me to add some more facts brought out by Dr. Donhoff.

1. Cold is the cause of dysentery. Dr. Donhoff brought well-filled bees, in two small boxes, and put one of these boxes under his shirt on his breast for 24 hours, where the thermometer showed 72½°; the other box he placed in a room where the temperature was 50° to 59°. In opening the boxes, after 24 hours, he found the first box as clean as before, but the second box, kept in the colder room, soiled with discharges. After repeating this experiment several times, and giving the same results, he concluded that bees, if they live in a temperature of from 50° to 59°, will contract dysentery—(Appendix to F. Huber's work, Vol. II, page 244, by G. Kleine.)

Any one who will repeat this experiment can get well-filled bees, if he follows the advice of Mr. Doolittle—whose writings are an honor to our valuable JOURNAL—and disturb a colony of bees, then they will rush head foremost into cells and fill them-

selves, and in so doing each one can be secured by their wings.

2. Dr. Donhoff dissected bees in November, and did not find a particle of pollen in their stomach, but found pollen in their intestines in February by bees which had brood, and by those which had no brood (II, 274).

3. Prof. Leuckart, another great chemist, found by dissecting in November no pollen, but in the middle of December; and was able, out of the excrement of the plants, to tell wherefrom the pollen was gathered (II, 241).

4. In the stomach of the queen and drones no pollen has been found (II, 242).

Thus, it is proved that bees eat pollen, but it is not proved that out of the eating dysentery will follow, for, in the experiment at No. 1, we find dysentery without pollen.

Spencer Co., Ind., Jan. 1, 1884.

For the American Bee Journal.

Stings and Their Poison.

R. J. KENDALL.

I was much interested in reading the report of the second day's Michigan state convention, and especially that portion devoted to "Is Bee Keeping Healthful?" The title struck me as being novel for I thought the healthfulness of bee keeping was one of the settled things of life, and that the thing had definitely advanced from theory to fact. But from the expressions given at the convention, my ideas on this score are shown to be mistaken utterly.

When bee keepers like James Heddon, Dr. Mason, Mr. Millard and possibly hundreds of others, whose experience I do not know, state that bee sting poison renders them nearly "helpless," it is indeed a revelation to one like me who had got it firmly fixed in mind that the poison from stings merely had ill effects at the start. In fact I had begun to believe that stings were like tobacco,—only made one sick for the first, but afterward became more desirable than otherwise.

In a late JOURNAL I read an article that tended to prove that the acid bee poison was really of great benefit to the human system. This illusion is dispelled.

My own experience has been of such a nature as to render me a little skeptical of the beneficial and delightful results from bee stings. But in spite of this experience when I read what Root, Quinly, Newman, Cook, and in fact nearly all the writers say about it, I thought I must be mistaken, and that I was not hurt at all, in spite of the convincing nature of a bee sting, in popular imagination.

I began keeping bees by getting one colony said to be Italians, in the fall of 1882. I got them in October and they had plenty of winter stores. During the few days of autumn and the fine days of early winter, I used to open the hive, take out the frames and look them over (to learn something.) I took off the roof and put my face close to them. I had no cover

on my face or hands, and used very little smoke indeed. I never received a sting. By May 1883, my brother had divided this colony, getting stung a few times. In May I got three more full colonies of "Italian" bees, said to be very gentle, and when the apirist from whom I bought the three looked at my others, he pronounced them Cyprians, and told me I would have trouble in handling them.

When I had got them all together and looked at them evenings, I began with bare hands, arms and face. The bees soon taught me, if I wanted to be presentable during the day at the office, I must wear a veil over my face any way. My hands got stung all the same and all the bees seemed alike. There was not a pin to choose between them. Those stings felt like the prick of a pin and came usually so unexpectedly that I had proven myself not to be the "captain of the Pinafore" before I could recollect that I had sworn off swearing.

The stings were followed by swelling, but the pain was no more than that caused by a pin's smart. The swollen parts felt water-soaked like dropsy, and at first a slight dull ache was felt if I pressed them and they then subsided with itching.

So things went on, the bees getting worse instead of better. I might be as gentle as a mother with her new born babe and speak as kindly to them as my tongue could frame words, but it was of no use, they got to hate the very sight of me, apparently, as much as a debtor does a dun, and would have no truce at all.

In the latter part of July, or early in August, I was handling them one day and got two or three stings, one near the heel. These stings instead of going on painlessly swelling, rankled, and hurt keenly for some half an hour, but they did not swell at all. I could not understand this. It was new to me. During the latter part of the summer, and through the autumn the bees kept on being savage, and I took to wearing gloves. Then I could handle them.

On Christmas day, 1883, I opened my hives and looked them over and got one sting that neither hurt nor swelled beyond the preliminary prick. Here was another phase of the matter.

Perhaps it should be stated that the year 1883 has been a failure, so far as a honey crop is concerned, and I have not taken a pound of honey from the bees, but on the contrary had to feed them. There my first year of experience with bee stings ends.

I have learned this, that the effects of the sting vary on my own person. Is this caused by change in myself, or by the temper the bees happen to be in? And, again, does the temper of the bees result or be affected by the honey flow?

I think if this question of stings and results were investigated a little more, it might have much result in the number of bee keeping beginners, and might reduce the "Blasted Hopes" list to a minimum. Many inquirers into the mysteries of keeping bees, might possibly deem the game not worth the candle, if they have to ex-

pect ill effects from bee stings permanently, and think that to be helpless almost, is paying a little too dear for keeping bees; and surely no one will contend that it is not better to give such clear warning rather than let them buy their experience by being stung—and then getting so disgusted as to throw it up.

Again to professional bee keepers, being stung is no luxury; and if stinging could be controlled it would be to them a boon. Smoke will not always control bees, neither will offering them sweets. They would rather sting than eat, sometimes. As to embrocations; well, so far as I am concerned, they seem to do as much good as if I spat on my fingers and snapped them, and no more. What can be done then? I do not know; but I do think, if we could have a few experiences that we would arrive at so much of a solution as to get a pretty good line towards it. In this hope I have ventured to trouble you with mine. Austin, Texas.

For the American Bee Journal.

Experience with Cellar Wintering.

HENRIETTA F. BULLER.

I have just been reading Mr. Balch's account of his success in wintering bees in a cellar dripping with moisture, and his hives all sealed up tight on top. He ought also to have told the temperature of his cellar. Perhaps he will do so at some future time.

Mr. Ira Barber advocates a very high temperature, and says: "Keep the bees warm, and they can eat all the pollen they care to; and, unless some of them get to breeding, you will see no sign of dysentery." How does he keep them from breeding in such a high temperature?

In 1881 I put 3 colonies in frame hives and one in a box hive into a newly built bee-house, which was quite damp, and the temperature was never above 38°, and often down to 34°. The frame hives had cushions filled with sawdust over the frames, and bees were strong in the spring, when I took them out; the combs were dry and the bees healthy, no spring dwindling. The box hive with a small hole in the top, got very damp, and the bees all died before the winter was half over.

In 1882 I put 8 colonies in frame hives and one into a box hive into the same house, which was then dry. They were provided with cushions as before; the temperature about the same, and the results the same. The bees in frame hives all did well; those in the box hive died. Before I put my bees away I was advised to leave the waxed quilts I used in summer over them, and put chaff cushions on, but I said, "no, thank you." The person who gave me the advice put 60 colonies away in a cellar under a barn; I presume, though I am not sure, with the waxed quilts over them, and all but 12 of the 60 were dead in the spring, and they even were very weak. He says the honey was sour, but, no

doubt, it was sweet enough when the bees stored it.

Mr. Balch thinks more bees are killed by having the repositories too dry than too damp, but, judging from the amount of frost that accumulates in the ventilating pipe in cold weather, I should say the breath of the bees, or the evaporation from them must keep the air moist enough.

In 1880 I began with 1 colony of bees in a box hive, which I transferred to a frame hive. The next year I Italianized them, and this fall I had increased my stock to 29 colonies, and had a surplus of 350 pounds of comb honey and 800 pounds of extracted, this last summer.

Campbellford, Ont., Jan. 5, 1884.

Local Convention Directory.

1884. Time and place of Meeting.
- Jan. 22-24.—Northeastern, at Syracuse, N. Y.
Geo. W. House, Sec., Fayetteville, N. Y.
- Jan 22.—S. E. Mich., at Adrian, Mich.
H. C. Markham, Sec.
- Jan. 24.—Mahoning Valley, at Newton Falls, E. W. Turner, Sec.
- Jan. 28.—Bee-Keepers' meeting at Monee, Ills.
A. Wicherts, W. Cossens, B. Heyen, Com.
- March 5.—N. E. Michigan, at Laneer, Mich.
W. Z. Hutchinson, Sec., Rogersville, Mich.
- Mar. 29.—Union Association, at Dexter, Iowa.
M. E. Darby, Sec., Dexter, Iowa.
- April 18.—Iowa Central, at Winterset, Iowa.
J. E. Pryor, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

Convention Notices.

The Southeastern Michigan Bee-Keepers' Convention will be held at Adrian, Mich., in the Plymouth Church Chapel, Jan. 23, 1884; morning, afternoon and evening session.

H. D. CUTTING, Pres.

H. C. MARKHAM, Sec.

The 15th annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 22, 23 and 24 days of January 1884.

This will be the largest and most interesting convention of bee-keepers ever held in America. Many of the most scientific apirists in the country will take part in the discussions. The programme is completed, and comprises all the interesting topics of the day. The question box will be opened each day, and the questions answered. All are invited to send in questions.

Implements and other articles of interest for exhibition will be received and properly arranged. It will pay any bee-keeper to go a thousand miles to listen to the discussions. By hearing and seeing, you will obtain much more knowledge than by reading. Five hundred bee-keepers will be in attendance. Reduced rates of board at hotels have been secured. All are invited.

GEO. W. HOUSE, Sec.

W. E. CLARK, Pres.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Sections, Brood Frames, etc.

Please answer the questions, as below, in the BEE JOURNAL:

1. Which way should the sections stand on the hives? As the frames run, or across the frames?

2. Should the frames come flush with the top of the hive, or should there be a quarter of an inch space between the top of frames and the bottom of the sections or rack?

3. How wide should the tops of the brood frames be? I have used an inch, and placed the frames one-half inch apart, but I see Mr. Cook says, $\frac{1}{4}$ inch apart.

4. What space should there be between the floor board and the frames, and between the sides of the frames and the hive?

5. Are reversible frames any good?

6. Do any of the bee supply men put wired foundations into frames?

New Jersey, Jan. 2, 1884. H.

ANSWERS.—1. I much prefer to have the sections run parallel with the brood frames for too many reasons to enumerate here, while I know of no advantage of their running crosswise.

2. By all means allow a space above the brood-frames of 5-16.

3. After considerable experiment in using different width top-bars to brood-frames, I prefer a bar $\frac{7}{8}$ wide, and place them about $1\frac{3}{8}$ apart, from centre to centre, using 8 frames in a hive, whose inside dimension, crosswise, is $11\frac{1}{2}$ inches; thus we have 9 spaces between frames and sides of the hive, each one being very nearly $\frac{1}{2}$ inch.

I hardly think Prof. Cook means to allow only $\frac{1}{4}$ inch space between frames—perhaps it is a misprint.

4. Between bottoms of frames and bottom boards we allow $\frac{5}{8}$ of an inch, calculating the day will come when shrinkage will make it about $\frac{1}{2}$ inch. If there was no objection we would use a space of one inch between the sides of the frame or ends of the frame (I suppose you mean) and hive. But there is an objection; the bees will build comb in so large a space. We can use a space as large as $\frac{3}{8}$ of an inch, provided the end-bars are $\frac{1}{2}$ inch thick by $\frac{7}{8}$ inches wide, without any danger from comb-building there. The larger the space the greater speed gained in handling combs.

5. I have never used reversible frames. A few have told us they

were the "coming frame," and then it was all still again, and we hear not the foot-steps of their "coming." Upon reading the claims of their advocates, I made up my mind that any advantages in them would be more than counter-balanced by disadvantages.

6. I think very few use wired foundation; nearly all now wire their frames and then press the foundation on to the wires by hand, or with a press.

Wintering Bees in Canada.

Will Mr. Heddon please answer in the Weekly BEE JOURNAL?

1. Would you advise wintering out doors in Prince Edward County, Ont., which, I think, is about 29° north of Cass County, Mich.?

2. What kind of a cover would you advise for a two-story hive, which appears to be the best for all purposes after a good trial.

CLOWES NOXON.

Northport, Ont.

ANSWERS.—1. As both in-door and out-door wintering, each in turn, prove the best in both northern and southern latitudes, and as the true cause of loss in winter is not yet understood, I do not feel justified at present in saying other than try both ways, and hold fast to that which proves best. I have wintered both ways nearly every winter, for 15 years, and have found out-doors, with proper protection, to give me the best results.

2. We use a $\frac{5}{8}$ board cover cleated on either side, or more properly on each end, painted both sides, and I prefer it to any other tried; this is for summer. For winter, we cover with burlap and shavings, leaves or chaff, and this cover over all. I agree with you in decidedly favoring two-story hives.

Foundation, Winter Flights, etc.

1. Is foundation that has been made more than a year, drawn out as readily by the bees as that fresh made?

2. Would it be advisable to place screens over the entrance of hives in the cellar, to prevent the bees from flying out?

3. Is it absolutely necessary to give bees a flight in this northern climate?

M. B. HOLMES.

Delta, Ont., Dec. 29, 1883.

1. While it is quite true that other influences often have more to do with the readiness with which bees draw out comb foundation than does its age, yet I am well satisfied that freshly-made foundation is the best.

2. No; if the bees find they are imprisoned, they become excited, and

this excitement will aggravate dysentery if it is present at the time. A wire cloth box adjusted over the entrance, would confine the bees to the hive and the box, and do no harm, and perhaps accomplish your purpose, but would make quite a bill of expense, if used upon many hives.

3. It is not. Often bees pass long steady confinement from fall till spring, and come through in splendid condition, though frequent flights will often prevent dysentery, when it otherwise would have destroyed the bees. If however, the disease reaches a certain point in its development, a flight sometimes proves immediately destructive to the bees.

SELECTIONS FROM OUR LETTER BOX

Wintering in the Cellar.

My honey crop amounted to about 1,000 lbs. of comb honey, of very fine quality. There was no fall honey, and some colonies are rather light. I have 50 colonies in the cellar.

I. W. ROLLINS.

Elgin, Minn., Jan. 3, 1884.

Packed in Clover, Chaff and Leaves.

I started in the spring of 1883 with 23 colonies, having lost 3 in the previous winter. They increased to 59. I sold 13 colonies and had 6 taken away that I had on shares, leaving me at present 41 colonies, that are all packed in clover chaff and leaves, on the summer stands. I received 733 lbs. of comb honey in sections, nearly all basswood. I use the "Mitchell (square frame) hive," and have added a $\frac{1}{2}$ story for surplus honey. My bees are all Italians or hybrids of blacks and Italians.

H. F. SAGER.

North Bristol, O., Jan. 3, 1884.

Six Years' Experience.

In 1878 I procured 15 Langstroth hives in the flat. After making and painting them, I traded one for 2 colonies of black bees from a neighbor, in the month of May. In September I took 25 pounds of surplus comb honey. The season of 1879 being a dry one, I got no surplus; I bought another colony and 3 Italian queens. In 1880 they increased to 7 colonies, and I extracted to 250 pounds of white clover and basswood honey. On account of a hard winter, my inexperience in wintering, and a two-legged depreddator, I had to begin the season of 1881 with only 3 weak colonies: these increased to 5, and gave me a small surplus. In 1882, my bees gave me 2 swarms, and 400 pounds of extracted honey. An incident that transpired in 1882, is worthy of mention. As I was expecting to remove

some 20 miles, which I did, and needing money, as I thought, about the end of the honey season, I offered to sell 3 colonies for \$30, but found no one who would give that price. On opening those 3 hives a short time afterward, to my amazement, I found them full of honey (about 150 pounds), which I sold for 15 and 20 cents per pound, realizing more money than I had asked for the "blessed bees" one month before. In 1883 I began with 7 colonies; increased to 14; took 1,300 pounds of white clover honey; and bought 6 colonies; so I now have 20 colonies tucked up nicely on their summer stands, where I have always kept them. GEO. W. MORRIS.
Salvisa, Ky., Jan. 1, 1884.

The Cause of Dysentery.

I am pleased to see that the "pollen question" has so much space given to it in the BEE JOURNAL. I have been a firm believer that pollen was the chief cause of dysentery, for the last 8 years. When we assort the combs, putting those having considerable pollen all together, with plenty of honey, the bees have dysentery; while those not having pollen in the hive are free, every time, from it. I expect to be in Chicago at the October Convention, and will try and tell the Convention something about bees.

W. A. CARMACK.

Marengo, Ill., Jan. 7, 1884.

Nomenclature of Bee-Keeping.

MR. EDITOR:—In your "Nomenclature of Bee-Keeping," on pages 603 and 604, you say a "Bee-moth is a miller which preys upon the combs;" and Mr. W. F. Clarke says about the same, in his criticism. I always supposed it was the larvæ instead of the moth or miller that actually ate the combs. O. O. POPPLETON.

Williamstown, Iowa, Jan. 2, 1884.

[The point is well taken. Such criticisms are just what is wanted. Of course it was an oversight in writing.—ED.]

Experience with Syrian Bees.

Last spring found me with 10 colonies, two of which I divided into nuclei for queen rearing; leaving 8, which I ran for comb honey. I received 425 pounds in one and two-pound sections, and increased to 31 colonies; all but 2 or 3 of which are in fine condition, and packed with sawdust on the summer stands. My best colony was a Syrian, which, with increase, gave over 100 pounds and increased to 5 good colonies. The first swarm gave 40 pounds, and then threw out a very large swarm, leaving behind them 46 queen-cells (45 of which I destroyed); and gave 12 lbs. of surplus. I find them as gentle as my Italians, but making a very different class of movements; requiring some knowledge of the race in order to manipulate them with the best results. I am much pleased with them, and shall stock my apiary principally with them. My report might have

been much better, had I not sustained a great loss both of honey and patience, by delay of supplies ordered from a prominent dealer, it being two months from time of ordering until I received them. I wish to give my method of disposing of after-swarms. Instead of living them in the usual way, I shake them into 3 or 4 empty hives, and, of course, all will soon return to the parent colony, except the division where the queen happens to be; here I give them a frame of unsealed brood, and let them remain until the queen is laying, then I use her when needed. This is often easier than finding a virgin queen. A happy New Year to the JOURNAL and its Editor. W. C. STEDDOM.

Oregonia, O., Jan. 1, 1884.

[You will probably order earlier in future and save a rupture of patience, and increase your honey crop.—ED.]

Warm Cellars.

Allow me to ask Mr. Ira Barber, of De Kalb, N. Y., through the BEE JOURNAL, how he manages to keep his bees at such a high temperature as 65° to 90° through the winter?

MARTIN EMIGH.

Holbrook, Ont., Jan. 5, 1884.

A Critic Criticised.

In Mr. Clarke's letter (page 9) he asks: "Is 'pollen' always 'the farina of flowers'?" and suggests that the farina of rye or other meal may be pollen. The use of pollen as signifying meal is now obsolete, according to the best lexicographers; its use is now confined solely to the fecundating powder found on the anthers of flowers. If bees feed on pollen—say pollen; if on meal, say meal. Since my note appeared in the BEE JOURNAL, I have received several letters urging me to publish my vocabulary, and I will probably do so as soon as I have time to revise it. It will contain nearly 400 vocables, all relating strictly to bee-keeping. JOHN PHIN.

Cedar Brae, Paterson, N. J.

My Report for 1883.

I commenced the spring with 28 colonies in fair condition; increased them to 62 colonies by natural swarming, and harvested 3,100 pounds of honey (2,100 pounds extracted and 1,000 pounds in one and two-pound sections). The largest amount taken from any one hive was 330 pounds of extracted honey; the largest amount of comb honey was 84 pounds from one hive. I have sold 7 colonies at \$6 each, and have sold about all of my honey at home at an average of 15 cents per pound. I packed 55 colonies in sawdust on the summer stands on Nov. 1, in fair condition, and they are doing well, notwithstanding the thermometer indicated 24° below zero on Jan. 5. I use the standard Langstroth 10-frame hive, and obtain increase by natural swarming. Give me the Italians and hybrids for general purposes, and the BEE JOURNAL as my guide. J. W. SEARS.

Harrodsburg, Ind., Jan. 9, 1884.

Prospects in California.

Who would or can keep bees in this age without one or more bee publications? My choice is the Weekly BEE JOURNAL. I have a copy of every number which has been published; and for nine years I have been its constant reader, and from it I have derived both pleasure and profit. Long may it continue on its useful mission. The rainfall here of this winter, up to date, has been about 5 inches. As far as I can ascertain, bees are in good condition, and the pulse of their keepers beats higher than it has for many years, at this season.

J. E. PLEASANTS.

Los Angeles, Cal., Jan. 1, 1884.

Home Market for Honey.

I commenced last spring with 28 colonies, and got 1,300 lbs. of honey, mostly extracted. It was all sold in my home market at 9 and 10 cts. per lb. for extracted, and 18 cts. per lb. for comb honey. I have 62 colonies in winter quarters; all are in the cellar except 5 double-walled hives, on the summer stands. Each have from 25 to 35 lbs. of good honey. My cellar is very dry, with temperature from 35° to 45°. They are very quiet, so far.

S. J. CHURCH.

Cedar Rapids, Iowa, Jan. 8, 1884.

Cold in Nebraska.

Even since Dec. 27, the thermometer has been below zero during the nights, and once it was 19° below. There is plenty of snow, and it is continually cloudy. WM. STOLLEY.

Grand Island, Neb., Jan. 8, 1884.

[In Chicago the thermometer has been as low as 27° below zero, during the weeks' blizzard.—ED.]

Pasturage for Bees Over-stocked.

I have kept bees for over 25 years, and have experienced its various ups and downs, but as a general thing more of the latter than the former, still I enjoy, as well as ever, to care for and study their industries and wonderful habits. I have 50 colonies, apparently wintering well. Within a radius of 3 miles there are about 250 colonies. The past season has been a good one for honey, but not in this immediate vicinity, on account, in my opinion, of its being over-stocked, and of one side of our pasturage being cut off by the St. Lawrence river (1½ miles wide). My product was only about 800 pounds of comb honey from 30 colonies. ROBT. HENDERSON.

Ogdensburg, N. Y., Jan. 7, 1884.

Bees Buried Under the Snow.

Since the second day of the new year, we are wrapped in a severe snow storm. The mercury has been playing around zero all the time. To-day the snow fell to the depth of about 10 inches on a level, and at this writing (9 o'clock p. m.) it is coming down as fast as ever. Bees are buried in "clump snow." WM. BOLLING.

Dunkirk, N. Y., Jan. 8, 1884.

No Honey from Buckwheat.

I started, last spring, with 21 colonies, all in fair condition; increased to 31; took 4,000 pounds of surplus honey, all extracted except 100 pounds. The first part of the honey season was good, but after the basswood bloom, my bees stored scarcely no surplus. There were acres of buckwheat within a radius of 2 miles, yet I extracted only 1½ pounds of buckwheat honey. Bees are now in good condition. I have wintered in a cellar for four successive winters without the loss of a single colony.

I. J. WHEELER.

Monona, Iowa, Jan. 9, 1884.

Prefers the Cellar for Wintering.

We are having some very cold weather here this winter. The thermometer ranges from 20° to 25° below zero. I am wintering 15 colonies of Italian bees in the cellar, all in good condition. As yet, I think the cellar wintering preferable, as it took only from 5 to 8 lbs. of honey to a colony, last winter, to get through.

R. C. CRESSY.

Battleboro, Vt., Jan. 7, 1884.

Producing Dysentery.

To produce dysentery, feed the bees with honey that has been exposed in the cold from 10° to 20° below zero, when they cannot fly freely afterwards, and dysentery will follow every time; at least it has with me, pollen or no pollen. I think frozen honey will produce it. My cellar is kept from 45° to 50° all the time.

Mattison, Ills. A. WICHERTS.

My Report for the Season.

I commenced the season with 23 colonies; increased to 41. It being a busy season with me, I lost 6 swarms that went to the woods. My yield is 600 pounds of extracted and 1,830 pounds of comb in two-pound sections. I sold my honey at 18 and 20 cents for comb, and 12½ cents for extracted.

J. I. LUCAS.

Stanton, Mich., Jan. 8, 1884.

Is Comb Foundation Valuable?

On page 671 of Vol. 19, Mr. Doolittle says the use of foundation for brood-chambers is an unnecessary expense, or words to that effect. From actual experience I beg leave to differ with him on that point. Although I have not been in the business as many years as Mr. D., I have given thorough experiments, and have proven it to be of untold value. I am inclined to believe that if a little foundation or wax guide is good, that more is better, whether it be in the brood-chamber or surplus boxes. One of my experiments, last summer, consisted of living 3 swarms of equal size and value at the same time on the following plan: No. 1 was placed in a hive without any foundation; No. 2 I gave starters 3 inches wide, and No. 3 was lived on full sheets of foundation. Now, for the results: At the close of the honey season I had taken 7 pounds of honey from No. 1; from No. 2 I had

taken 60 pounds, and from No. 3 I received 168 pounds, which puts me on the list of those who would not do without foundation in the brood-chamber. This is not the only experiment I have tried, but many others that gave as good results. I use the Langstroth frame, and use three wires the long way of the frame, and the eggs never fail to hatch on the wires, and my combs are always straight. So, before any one discards the use of foundation for the brood-chamber, try it yourself, and see if I am not right.

Macomb, Ill. J. G. NORTON.

Out-door Cellar for Wintering Bees.

In 1880 I had 75 colonies of bees, of which I was proud. In the spring of 1881 I had only one left, but I have again increased to 22, this summer. I have an out-door cellar in which they did well last winter. Mr. Sargent, who has helped me along considerably, has 35 colonies in my cellar this winter. My neighbors all winter their bees out-doors, unprotected, and are careless about them.

JACOB C. WHITING.

Twin Lakes, Mich.

Bees Packed on the Summer Stands.

I have all my bees in the cellar; they are as quiet as they can be, after this cold weather, 30° below zero. We had hundreds of dead bees on the bottom boards; two days before the cold you could not see a single bee. I have them packed thus: I lay three sticks across the frames; then lay a cloth over them, put on the second story and fill it full of chaff. I have sweet clover growing all around. It will be in blossom next summer. I had about ½ acre of Alsike last season; that is a great honey plant, but it is no field crop. I hope there will be an early spring, as some of my colonies have only about 10 pounds of honey (all they gathered all summer, as they were weak in the spring). I suppose they used it to rear brood.

HUGH WILLIAMS.

Racine, Wis., Jan. 9, 1884.

Beginning with Frame Hives.

I commenced the spring of 1883 with 7 colonies of bees, mostly blacks, and some hybrids, in box hives. I transferred most of them to frame hives, and also transferred some for my neighbors, and they all have done well. I received 155 lbs. of honey from one of them, and they have 40 pounds left to winter on, but they never swarmed. I have kept bees for over 5 years, and like to work with them, and have never been run off by any bees I ever saw. I have never seen any Syrian or Cyprian bees in this part of the country. I never used a smoker until this season, and I found it a great help to me. I bought 5 colonies this fall, in box hives, which I will transfer in the spring, making 18 strong colonies, 3 weak ones and one nuclei (22 colonies), from 7. spring count; besides 200 pounds of extracted and 425 pounds of comb honey, which was all sold at home at an

average of 12½ cts. per pound. I winter my bees on the summer stands, in the same way as Mr. Dadant, of Hamilton, Ill. They are all right so far; the weather has run below zero for a week, and was 31° below zero on Jan. 5, 1884. I have been reading the BEE JOURNAL for a year, and lay the most of my success with my bees to it.

HENRY ERBRODT.

La Harpe, Ills., Jan. 7, 1884.

Bees Banked up with Snow.

I came here on March 7, 1883, and brought 8 colonies of bees from Iowa County, Ind. Of course the bees were short of honey, on account of being moved. The spring was wet and cold, but fruit bloom gave the bees a start; clover was simply immense, but the honey from it was thin; there was not much linden honey, but the proceeds from the bees was \$6 per colony, spring count, and they increased to 24 colonies. They are on the summer stands, and have plenty of honey and bees. They are now banked up with snow.

WM. S. BUCHANAN.

Elizaville, Ind.

Premiums at the Iowa State Fair.

In reference to the Premium List presented by O. Clute, allow me as an Iowa bee-keeper to say that I think Cyprian and Syrian bees should have the same premiums as Italians. All races should have an equal chance for the same premium.

WM. MALONE.

Oakley, Iowa, Dec. 29, 1883.

The Season's Work.

The past season was rather a poor one for bee-keepers; part of the time it was too wet, and the latter part of the summer and early fall were dry; and besides that we had a very hard frost on Sept. 10, which killed most of the fall flowers. Last fall I had 8 colonies of bees, in pretty good condition for winter, but I did not get them packed in time, so I lost all but one colony. I got no increase, but I had 80 pounds of honey from it, from June 8 to Sept. 10. On June 15 I purchased 6 three-frame nuclei, and put them into Langstroth hives, and gave them frames of comb that I saved from bees that died the winter previous. One of them swarmed on July 20; this one also swarmed twice afterward, on July 20 and Aug. 10; the last one "left for parts unknown" the next day after being hived. I returned this also several times, but on Sept. 4 it came out, and I did not see them until they were ready to leave. I think this rather late swarming for this section of country. I have a colony in a chaff Electric hive, which I think is the best chaff hive I have seen, or seen described.

J. S. BARB.

Bristolville, O., Dec. 6, 1883.

Satisfactory Results.

In the spring of 1883 I had 11 colonies of bees; in the fall they had increased to 27 colonies. I obtained from them 1,600 lbs. of honey.

C. W. JOHNSON.

Norwood, Mich., Jan. 8, 1884.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Our New List of Premiums.

Getting up Clubs for 1884.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

☞ Do not let your numbers of the BEE JOURNAL for 1883 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or in cloth for \$3.00.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers we reply, yes; any book or binder we keep for sale, may be selected by those who get up clubs.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Letters for publication must be written on a separate piece of paper from items of business.

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

THIS PAPER may be found on file at Geo. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for this **NEW YORK**.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

A NEW HIVE.

Arranged for continuous combs and continuous passage-ways. Will be found a pleasure to work with, and can be easily and rapidly managed. For comb honey it is without a rival, and as an invention, is second only to that of movable brood frames.

Guaranteed to Give Satisfaction.

Sweet Clover

Prices:—25 cents per lb., \$3.25 per peck, (15 lbs.) and \$12.00 per bushel, (60 lbs.) When ordered by mail, add 18 cents per lb. for postage.

Having purchased a large quantity of Sweet Clover Seed, I will make a **Special Discount of 20 per cent.**

from the above prices, on all orders received during the month of

JANUARY.

Now is an excellent time to make your purchases to advantage.

Sow it in the **FALL, WINTER or SPRING**—a great many sow it broadcast on the snow—alone, or with field grain or grass; six pounds to the acre. It will do well in field or lane, on hillside or in valley, on uplands or soil subject to overflow. It is perfectly hardy, standing drouth admirably, and flourishing well during rainy seasons. The honey is the best. As it does not bloom till the second season, it will do no harm if grazed by cattle the first season. It is excellent for waste places and commons.

HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 350 colonies of bees, of our new strain, and of pure Italian blood. As most of you are aware for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do so by writing to me.

Among the goods we have to offer, are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Vests, Sample Shipping Crates, Comb Foundation Fasteners, Surplus Honey Registers, our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

BEEES and HONEY,

OR THE Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keitsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

THOMAS G. NEWMAN,

925 W. Madison St., Chicago, Ill.

A Liberal Discount to Dealers by the Dozen or Hundred.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861

Chicago, Ill., January 23, 1884.

VOL. XX. No. 4.

THE WEEKLY EDITION

OF

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THE BRITISH BEE JOURNAL

AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is NOW published SEMI-MONTHLY, at Seven Shillings, per annum, and contains the best practical information for the time being, showing what to do, and when and how to do it. **Rev. H. R. PEEL, Editor.**

We send the Weekly AMERICAN BEE JOURNAL and the *British Bee Journal*, both for \$3.50 a year.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Advertisements.

DADANT'S HONEY CROP!

Our crop being very large, we offer **THIRTY THOUSAND POUNDS** of extracted Honey

FOR SALE

at REASONABLE PRICES. We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15c. for our 24-page Pamphlet on Harvesting, Handling and Marketing extracted honey.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

1876. CROWN 1882.

The best arranged HIVE for all purposes in existence. Took first premium at St. Louis Fair in 1882 and 1883 over all competitors. Descriptive Circular sent free to all on application.

Address, **ELVIN ARMSTRONG**, Prop'r. of the Crown Bee Hive Factory and Apiary, JERSEYVILLE, ILL.

DADANT'S FOUNDATION

From JAMES HEDDON, July 27th, 1883.—Your Foundation is certainly the nicest and best handled of any I have seen on the market. It is the only foundation true to sample I have ever received.

From JAMES HEDDON, Aug. 10th, 1883.—I will contract for 2,000 pounds of foundation for next season on the terms of your letter.

From A. H. NEWMAN, Aug. 24th, 1883.—Book my order for 5,000 pounds for spring delivery.

From C. F. MUTH, Dec. 12, 1883.—Book my order for 2,000 lbs. of heavy; 1,000 lbs. of this, and 500 lbs. of extra thin.

Dealers, send in your orders for next spring while wax is cheaper, and save trouble and money.

CHAS. DADANT & SON,

5AB1y Hamilton, Hancock co., Ill.

A POCKET DICTIONARY

Containing 820 pages, and over

25,000 Words, Rightly and Plainly Defined

To make the pronunciation easily understood every word is phonetically re-spelled, and the syllables and accents made perfectly plain, so that no one who consults this book can miss the proper word to use, and giving it proper pronunciation.

This Dictionary is our Premium for a Club of 3 subscribers to the Weekly (or its equivalent to the Monthly), in addition to other Books selected from our Catalogue to the amount of \$1.00; all by mail, postpaid.

BOOKS!

Sent by mail, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2."

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide for Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c.; postpaid.

Honey as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicines, with many useful Recipes. It is intended for consumers, and should be scattered by those who are creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 6c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving a series of hints on this important subject, with suggestions what to plant and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations of our food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay, cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc. of vast utility to every Mechanic, Farmer and Business Man. Gives 2,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Braziers, Gilders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$3.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use.—Being a description of the hive used by G. M. Doolittle. Price, 6c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert K. Kobke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Chas. C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory; presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—**Derthlichkeit des Bienenstandes**—**Honig pflanzen**—**Erziehung der Königin**—**Füttern**—**Schwärmen**—**Ableger**—**Versezen**—**Italienisiren**—**Züfzer von Königinnen**—**Ausziehen**—**Bienen behandeln und beruhigen**; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare Darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigtuchen, Formkucheln, Puddings, Schaumfocet, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankeiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,

925 West Madison St. CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., JANUARY 23, 1884.

No. 4.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

☞ We have received a copy of the report of the Kansas State Board of Agriculture for the quarter ending Dec. 31, 1883. In it we find a Table showing the honey and wax product, and the number of colonies of bees in the State in 1882. The totals are as follows: Colonies of bees, 19,752. Honey product, 312,421 lbs. Wax, 4,475 pounds.

☞ We have a few photographs (cabinet size) just taken, of the Rev. L. L. Langstroth, which we can send to those desiring them for 50 cts. each, postage prepaid.

☞ Mr. W. F. Clarke has removed from Guelph to Speedside, Ontario, Canada. His correspondents will please take due notice.

☞ The *Apiculturist* for January is received; it contains a full-page likeness of Mr. Langstroth.

Ellwanger & Barry, of Rochester, N. Y., have sent us their Price List of American Seedling Roses for the season of 1883-4.

Price Lists for 1884.—The following are on our desk:

M. Richardson, Port Colborne, Ont., 16 pages—hives and apianian supplies.

J. C. Mishler, Ligonier, Ind., 1 page—Italian bees and queens.

J. T. Wilson, Mortonsville, Ky., 1 page—Italian queens.

A. H. Newman, Chicago, Ills., 36 pages—bee-keepers' supplies.

I. R. Good, Tullahoma, Tenn., 1 page—Syrian and Italian bees and queens.

Jas. H. French, Elizabethtown, Ky., 1 page—Combination bee hive.

Toronto Convention Report.

It will be remembered that we sent a representative to the Toronto Convention, and that a Report of the Convention, written by Mr. W. F. Clarke, was published in the Weekly BEE JOURNAL for Sept. 26, the very next week after the Convention, and in the following number for Oct. 3, we published the Reports of Vice-Presidents, President's address, and the essay of Mr. Clarke. Now, in the light of these facts, it is refreshing to read the following letter:

By the way, Mr. Newman, why have you never given us a full report of the Toronto Convention? A motion was offered by Dr. Brown, and supported by Judge Andrews, of Texas, to have the minutes published in pamphlet form and distributed to the members; the motion carried, but the report does not come, for some reason or other. From hints received at Flint, there is a nigger in the fence somewhere.

WM. MORHOUS.

Dearborn, Mich., Jan. 5, 1884.

Of course the resolution to have "the minutes published in pamphlet form" has nothing to do with us, or the BEE JOURNAL. Why it has not been done, we know not. Perhaps the Secretary can explain it satisfactorily to our correspondent.

The mystery under cover of "hints received at Flint," is rather interesting. If any one has anything to say, it is more dignified and honest to speak it right out, than to hint and insinuate about "an African in the wood pile." Will you please speak out, Mr. Morhous—

"Speaking may relieve you!"

Who hinted? To whom did the hints refer? What were they hinting about?

☞ The pamphlet on "Wintering Bees," containing the "Prize Essays" on that subject read at the Centennial Bee-Keepers' Association, is now "out of print." The edition is exhausted, and it will not be reprinted.

The Old Virginian and Glucose.

Mr. E. E. Jordan, of White Sulphur Springs, Va., has sent us the following with this introduction: "I have just clipped this from one of our best and most popular papers, and hope you will think it worth a place in the BEE JOURNAL:"

THE OLD VIRGINIAN.—And with all this material progress let us put it on record that the Virginian is still the old Virginian; and let us be thankful for that. He, with his solid notions of honor, truth, piety, purity, and hospitality, is a good anchor to the Nation. This old Virginian, under whose solid mahogany I have had my legs, is building a barn. Every timber of this barn I have had to approve and praise for its solidity and permanence. His head is blossoming near the seventies, but he stumps and thumps every thing with his big oak stick to see that it is "solid! solid! solid! sah!" He is building a stone wall about his thousands of mountain acres, and, although he well knows he will never live to see it completed, he lays the foundation deep in the earth—solid! solid! solid! And his character, as well as those of his neighbors, seems to be quite as substantial. At breakfast one morning a bottle of honey, so called, was brought upon the table to be spread upon the crisp and smoking corn cakes. Well, this "honey" proved to be glucose. This glucose had been poured in upon a "honey-comb" which some Yankee had made by machinery. The good and gray old man had just finished saying grace. But he got up. He struck his fist in the air, and I tell you he fairly turned the atmosphere blue. "In France, sah, that grocer's store would be shut up, confiscated in ten minutes, sah. He would be tried for adultery, sah. It means that you shall not adulterate sugar, or tea, or coffee, or honey, or any of God's gifts to man, sah! Honey! Honey! That's not the work of bees, sah. Its glucose, sticky, stinking glucose, sah!"

The above is copied from the Winchester, Va., *Times*, and shows the growth of popular indignation at the nefarious work of adulterators. It also shows how that "scientific pleasantry" (lie) of Prof. Wiley, is deceiving conscientious men in every portion of the country.

That Glucose Fraud, Again.

Mr. Henry Jones has sent us the Detroit *Free Press* of Jan. 14, with the following paragraph marked:

WASHINGTON, Jan. 12.—The National Academy of Sciences, through President O. C. Marsh, to-day made a report on glucose to the Commissioner of Internal Revenue. After stating what starch sugar is, how manufactured, and chiefly used, the report says: The starch sugar industry in the United States gives employment to 29 factories, having an estimated capital of \$5,000,000, consuming 40,000 bushels of corn per day, and producing grape sugar and glucose of the annual value of nearly \$10,000,000. In Germany in 1881-82 there were 39 factories of this sort, consuming 70,000 tons of starch, producing 40,000 tons of starch sugar.

A thorough investigation of the whole subject was made by members of the academy, and as a result the following facts appear: That the manufacture of sugar from starch is a long-established industry, scientifically valuable and commercially important; that the processes it employs at the present time are unobjectionable in character, and leave the product uncontaminated; that starch sugar thus made and sent into commerce, is exceptional in purity and uniformity of composition, and contains no injurious substance, and that, though having at best only about two-thirds of the sweetening power of cane sugar, yet starch sugar is in no way inferior to cane sugar in regard to healthfulness, there being no evidence before the committee that maize starch sugar, either in its normal condition or fermented, has any deleterious effect upon the system, even when taken in large quantities.

We are well aware that glucose can be made without leaving sulphuric acid and other poisons in it, but it is done only in the laboratories of chemists, where absolutely pure materials are used, and the greatest of care exercised in its manufacture. But when made in quantities in the glucose factories, of materials which would have been rejected by chemists, glucose is just what we find it in the adulterated articles of commerce. The glucose in common use and the glucose of the laboratory are very far from being identical, in so far as purity is concerned.

To use the samples made in the laboratory, to aid in the sale and use of the impure glucose of the factories is but adding another fraud to the list! When made of pure materials, and with great care, it cannot be profitably used for the purposes of adulteration, and if not so used, it is of no value.

Analyses of glucose and glucose syrup have been made by Prof. Charles

R. Fletcher, lecturer of chemistry in Boston University and State Assayer of Massachusetts; by Prof. R. C. Kedzie, of the Agricultural College of Michigan, and more recently by Prof. Geo. A. Mariner and Dr. T. D. Williams, of Chicago, as well as by hundreds of other highly competent and credible analysis throughout the country.

Prof. Fletcher, in a letter to Mr. G. T. Angell, the distinguished humanitarian and reformer, of Boston, says: "I have recently made three analyses of glucose and two of glucose syrup, and have found quantities of the free sulphuric acid in every case."

Prof. Mariner, in a letter to the same gentleman, says: "I have examined several syrups made essentially and entirely of glucose, and found in them chlorides of tin, calcium, iron and magnesia, and in quantities which made very poisonous."

A family by the name of Doty, living at Hudson, Mich., recently purchased some syrup of a grocer in that village. The members of the family ate freely of the syrup, and were all made very sick by its use. They became alarmed and sent a can of the syrup to the Michigan Agricultural College for analysis, supposing it to contain poison. The result of the analysis of this syrup induced Prof. Kedzie, of the University, to examine a number of table syrups purchased promiscuously from the grocery shops, in all of which he found poison.

Dr. Williams has made a careful analysis for use of a number of samples of glucose syrup and of sugars adulterated with glucose, in every case finding free sulphuric acid.

The presence of all the impurities found by the chemists whom we have quoted are readily accounted for. If iron pipes are used for conveying the steam for heating the contents of the vat, the sulphuric acid will attack and dissolve some of the iron, and thus sulphate of iron (copperas) will appear. If too little chalk is used free sulphuric acid will remain in the syrup. The chalk being carbonate of lime, its use will explain why lime is sometimes found in the syrup in large quantities.

The extent to which this spurious sweet-glucose—enters into the preparation and manufacture of articles of food, is quite alarming, and demands stringent laws against its encroachments upon the health of the general public.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., Jan. 21, 1894.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no particular change to note in demand or price of extracted honey. Demand seems gradually improving, but the market being well supplied, and almost daily arrivals, keeps prices down. It brings 7@10c. The market of comb honey is as last reported. Choice in small sections brings 16@20c. from store.

In my last market report you make me say: "A choice article of comb honey in ½ lb. sections brings," etc. I wish to have it stated that I have sold a good deal of comb honey in 1 and 2 lb. sections during this winter, and that I had not a single call for ½ lb. sections. No doubt I should have sold them if I had some, but I am certain that they would have brought no better price than 1 lb. sections, nor would they have sold faster. I doubt whether they would have sold as well. I have, therefore, no particular use for ½ lb. sections of comb honey. I do not object to them, if the honey is choice; this is the best I can say of them. One time this winter we had 600 barrels or more of extracted honey on hand. We have now more than 400 barrels on hand yet. Margins and demand have, so far, been very unsatisfactory. Reason: "Slow business among manufacturers." But I have not been lazy, working up the sales for honey, and if I do not report a very large demand for extracted honey in the very near future, then I have made a mistake.

BEESWAX—Scarce; brings 28@32c. on arrival.
CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17@22c. Dark and second quality, 14@15c.; extracted white clover in kegs and barrels, 9@10c.; dark, 8@9c.

BEESWAX—Prime yellow, 27@29 c.
H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 16@20c.; 1½ lb. sections, 14@15c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—The extreme cold weather of the past week has put a check on the movements of honey, both in and out, and some slight concessions made in prices. Extra choice, 1 and 2 lb. sections, 17@18c.; dark and irregular, 15@16c. Sales for the week about 2,000 lbs.; receipts 3,000. Extracted slow; sales about 2,500 lbs., at 6@8½c.; receipts light.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Fancy comb scarce, and prices for the same are firm, but offerings of other descriptions receive little or no attention. White to extra white comb, 15@20c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@6c.

BEESWAX—Wholesale, 27½@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, 13@18c.; strained and extracted, 7@8c.

BEESWAX—Finner, at 30@31c.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—Honey continues in excellent demand, as reported last; every lot of choice white comb is taken up as fast as it comes at 18c. In quantity for 1 lb. sections, and an occasional sale at 19; in a very few instances only, 20c. has been reached. Broken lots and second quality is very slow sale. For extracted there is no demand.

BEESWAX—Is eagerly inquired for at 28@30c., but none to supply the demand.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Our market is rather dull, and supply more than exceeds the demand; would not advise shipments to this market. 2 lb. comb, 16@18c.; 1 lb. comb, 13@20c.; extracted, 8@10c.

BEESWAX—32@35c.

BLAKE & RIPLEY, 57 Chatham Street.

CORRESPONDENCE

For the American Bee Journal.

Nebraska State Convention.

The Nebraska State Bee-Keepers' Association met at Lincoln, Neb., Jan. 9, 1884, and was called to order by President Von Dorn at 2:30 p. m.; upon roll call more old members were found present than ever before during the history of the association.

The minutes of the last annual meeting were read and approved. The Treasurer's report was read and referred to a committee on finance, consisting of Messrs. Hawley, Rose, and Muir; the committee reported favorably, and it was approved. The President's address was then made special order of business for 10 a. m., Jan. 10.

The election of officers was made a special order of business for 2:30 p. m., Jan. 10, in order that all might be present.

It was stated that foul brood had made its appearance in our State, and a resolution was unanimously adopted to appoint a committee to thoroughly investigate the statement and report to the association with such resolutions and recommendations as to them may seem proper. Messrs. Hawley, Muir and Culbertson were appointed as such committee.

No other business being especially in order, the association discussed the following: "What size of hive is the best to extract from?"

Prof. H. Culbertson, of the State Agricultural College, Lincoln, took the ground that an 8-frame Langstroth was too small, even if two-story, but preferred a large one-story hive, and was of the opinion that where more than one-story was used, that, during the honey flow, entrances in the upper story was beneficial, from the fact that bees always used any crack or opening that existed in the upper story.

G. M. Hawley, of Lincoln, was of the opinion that by using a perforated honey board 8-frame Langstroth hives could be tiered up and extracted from, with the best results. The board preventing the combs, in different stories, from being bridged together.

R. V. Muir, of Brownville, uses 10-frame Langstroths and thinks them as good as any; tiers up by raising the full top and putting an empty one in between. Out of 30 colonies, only one queen went up to the second story; he thinks it an easy matter to put in empty combs and keep her down.

The Secretary: At present I run for extracted honey, and use an 8-frame Langstroth, but believe that a large one-story hive is the best for extracted honey, from the fact that I believe that the bees will store their load in the empty cell that is the most convenient, and such room can be furnished convenient to the entrance in a large hive. I would not recommend any one to make such a large

hive, from the fact that the market is liable to change, and in that case we might want to change from extracted to comb honey, and I do not think a large one-story hive as suitable for comb honey as a small two-story one. I believe in having a hive that is the most suitable for either kind of honey, and I am of the opinion that the 8-frame Langstroth comes nearest to filling the bill. I use a perforated honey board to keep from the bridging, Mr. Hawley speaks of, but do not think a queen-excluder can be made to work satisfactorily in all cases. During the past two years, if I had used an excluder to keep the queen from the second-story, she would have been kept from laying almost entirely, for want of space, because the lower story was kept so full that the queen had scarcely any place to lay, unless she went above. Of course I thought the bees moved the honey above, in the night, but then the lower story was filled again before noon, and the consequence was that I found nearly as many queens above as below. The greatest objection to two-story extracting hives is lifting a heavy second story off and on, to get to ripe honey in the lower story. When extracting, I always leave some of the oldest honey for winter.

E. A. Butterfield, of York, made seven fly holes in the second story, and only four of them were used.

The President and F. E. Colwell liked fly holes. Mr. Colwell's bees, in a honey flow, flew directly in the hole.

W. F. Tucker's bees did the same.

Mr. Hunt's bees used the fly hole when they wanted to get out and sting him.

N. Pursen, of Florence: The instinct of bees we believe naturally inclines them to use but one entrance, and I think that is sufficient. I think that young bees receive the honey from the field bees and store it in the cell. In the latter part of the day, I have seen brood covered with honey, and in the morning uncovered; I think a bee two days old will carry honey, and do not change much in appearance until they go to the field.

The President had seen bees come from the field and go directly and stick their head in a cell apparently unloading. It was a very easy matter to watch a bee by dusting it with flour.

C. B. Darrow, of Geneva, inquired if it would not be advisable to use the lower story entirely for extracting, and keep the queen above, as the indications are that the bees store the most readily below.

Mr. Pursen said that the instinct of the bee is against Mr. Darrow's question. He thought they stored over the brood-nest to encourage heat for curing the honey. In 1882 his honey was not good for table use for four or five days after extracting, but in 1883 it was good at once as soon as extracted. Bees enlarge the brood nest equally in all directions, and put the pollen in the lower story.

W. F. Tucker inquired if we could not cure honey as well after extracting as before.

L. B. Boggs, of Tilly, had hived a strong swarm on foundation, and in ten days it was filled; he took out two uncapped combs of very green honey, and in ten days it was ripe and good.

The Secretary being called for, believed that in the hive was the proper place to cure honey, from the fact that it was in bodies of very small quantities, also the heat of the bees was present, and the dampness in the honey had to rise but a short distance to come to the surface and be carried off and evaporated. Honey was an absorbent of dampness, if exposed to damp air. He had noticed honey, exposed to damp air in wet weather become thin and watery on top, while deeper down in the honey it was thick. Honey put in damp cellars should always be put in air-tight vessels as it will gather dampness and sour; and then, of course, the bee-keeper was to blame, and really I do not know but what he is, for not educating his customers better, with labels, etc. I use oak barrels, which I cannot keep from leaking even with paraffine, and when I returned from Chicago, last fall, it was uncommonly wet and rainy, and the floor of my honey room being partly covered with honey, which leaked from the barrels, it had absorbed the dampness until it was almost as thin as water, and made an excellent skating rink. My honey is all from heart's-ease.

Mr. Hunt uses basswood barrels, and a few years ago extracted basswood honey one day and shipped the next, and the barrels were not uncorked for three months, when the honey was found to be all right.

President Von Dorn then announced that out of 30 reports gathered during fall, showing 918 in the spring and 1,432 in the fall, 49,996 pounds of honey was taken.

Adjourned until 7 p. m.

The meeting was called to order, and an address of welcome delivered by H. W. Hardy, of Lincoln, and replied to by T. L. Whitbeck, of Wahoo. These were excellent, but time and space compel us to leave them out. Next in order was the reading of an essay written by T. L. Von Dorn, on the old, old subject of wintering, dysentery, etc., and the entire evening was taken up in discussing it—each one having his own style and theory, about as is usual when discussing any subject.

Jan. 10.—Met at 10 a. m., and the President addressed the Convention as follows:

At the close of the 5th year of our Association, I congratulate you on the advancement we have made, both in point of numbers and ability. From the small beginning made at Omaha, our numbers have steadily increased until our membership is scattered over quite an extent of the State, and embraces some of the very best of practical and successful apiarists. The proceedings of our sessions have been of great interest to those bee-keepers who have been unable to attend them, as well as to those who were present, and I would recommend that a more full and careful report be furnished for publication.

In accordance with my own views, and with the concurrence of the other members of the executive committee, I have assumed the responsibility of calling the annual meeting on the second Wednesday instead of the second Thursday, as provided in the constitution governing us. The chief reason for such action being the increased time, it would allow members to return to their homes, liable as we are to delaying storms at this time of the year. I hope the action will meet with your approval, and that the change will be made permanent by suitable action of this body.

The exhibition at the State Fair was by far the best ever had, both in bees and honey; and it now seems desirable that provision be made for increased space for a proper display of our products. Objection was made last year to allowing us the space already granted, and as, so far as I know, there is no other suitable place upon the grounds, it seems probable that unless additional room is made, we will be without a location in which to make an exhibit. I would advise that the matter be given careful consideration. In this connection, I would suggest that our exhibition be made of a more instructive character, and that, to that end, there be a daily manipulation of one or more colonies, demonstrating practical apiculture. I would also suggest a consideration of the rules to govern such exhibits.

The exhibitors and bee-keepers at large are under many obligations to the Hon. B. E. B. Kennedy, Superintendent of Class 7, Bees and Honey, for the very able and courteous manner in which he supervised our exhibit. His zeal in our chosen pursuit, his courtesy and kindness to all, and his earnest effort in our behalf, merit our warmest thanks. The various officials of the State Fair have also shown their usual courtesy, leaving nothing to be desired, except a suitable place to exhibit.

Next to the production, one of the most important subjects is the marketing of honey, and I am convinced that but few understand it well. I would suggest that the subject be made a special order early in our session.

Our Association was represented at the Northwestern Bee-Keepers' annual meeting, at Chicago, Ill., by our Secretary and President, and quite full notes were taken of the proceedings, which will be valuable for reference in our debates. I would suggest that two of our number be delegated to attend these annual meetings, that we may have the full benefit to be derived therefrom. The railroads of our State, always ready to advance the general good, again laid us under obligations, the B. & M. furnishing transportation for your representative upon this occasion.

I would call your attention to the fact that we are liable, unless great care is taken, to have foul brood introduced into our State, which would be a deplorable calamity. As we are every year buying more or less largely of bees and queens from points east of here, and as it was openly stated at

the Chicago Convention, mentioned above, that unscrupulous parties were disposing of bees known to be infected. I feel that our Association should take prompt action in the premises, and mature, if possible, some plan by which, if introduced, it may be at once stamped out, and its further spread prevented.

This address closes the third year during which I have been honored by being your presiding officer. I would suggest the propriety of electing another, as there may be a commendable desire in others for the honors, and in those who could add new vigor to our Association. We should not let any felling actuate us, but that of a generous rivalry in advancing our mutual good. While fully appreciating your good wishes, and bearing most cheerful testimony to the many kindnesses shown me, I am sincere in the opinion that a change may be of advantage to us all.

T. L. VONDORN.

The above address was referred to a committee consisting of J. R. Ballard, Chas. R. Thompson and Jas. W. Bishop, who, after a short absence, made the following report:

"In regard to the President assuming the responsibility of calling the annual meeting one day earlier than is fixed by the constitution, we heartily approve of, and recommend that the second Wednesday in January be permanently fixed as the time for the annual meeting, instead of the second Thursday. We would further recommend that a committee be appointed to confer with the State Board of Agriculture, and do all in their power to secure ample room for the exhibition of our apianian products. Your committee would still further approve of our President's suggestion that a delegation of two or more of our members be elected to attend the Northwestern Bee-Keepers' Association at Chicago during the fall of 1884."

The report was adopted and the committee discharged.

The committee on Treasurer's and Secretary's report, said they had examined them and found them correct.

The report adopted and bill of \$11.50 for stationery ordered paid.

The hour having arrived for the election of officers, the following were unanimously elected: T. L. Von Dorn President; S. L. Thomas Vice-President; R. V. Muir Treasurer, and M. L. Trestler Secretary.

The President and Secretary were then elected as delegates to the Northwestern Bee-Keepers' Society.

The foul brood question was then taken up and discussed at great length; it being ascertained that the disease existed at two points in the State—one of them having been certainly brought from Illinois, and the other appeared in bees brought from Illinois, but it is not known whether the disease was brought or not in the last case, but from the circumstances surrounding them, it is reasonable to believe that they were diseased when received.

Prof. Culbertson then offered the following remarks on fungus growth, which he stated was a vegetable

growth, consisting of spores or particles so small and light that they would float in the air, and that each kind of fungus growth had its own food to live and prey upon, and did no harm in any other place. For instance, foul brood was a fungus growth, and lived upon the larvæ of bees, and from what he had read, did not affect the old bees or the eggs. Diphtheria was the result of fungus growth, and found the place for it to take root and grow in the throat and vicinity of the human family, the condition of children's throats being more adapted to its taking root and growing than in the throats of adults. The smut of corn is a fungus growth, also the rust on wheat; that Prof. Burrill had shown that the pear blight was a fungus growth, that we were indebted to the German scientists for these facts, as there was but few magnifying glasses in the United States powerful enough to be used satisfactorily in their researches; that one spore or seed of fungus growth, when coming in contact with its natural food, would in a short time produce millions and millions of spores or seeds, which would, in many cases, float in all directions, making destruction in its course.

The committee on foul brood made their report, which was referred back, and the committee directed to consult with the Governor and Attorney-General of the State, and recommend such action as to them seems proper.

The Committee elected to confer with the State Board of Agriculture were T. L. Von Dorn, G. M. Hawley, and E. Shugart, Beatrice.

Bee pasturage being brought up, Mr. Ballard spoke very highly of dandelion and alsike clover, stating that he had seen 4 or 5 bees on one blossom of dandelion, and recommends alsike clover, as it will take root on the prairie.

G. M. Cooper, Beatrice, gave it as his opinion that white clover did not secrete any honey last spring, on account of the cool weather.

P. M. Aldrich said that his bees worked on rape long after frost. No one present had ever seen rape fall.

Mr. Colwell sowed the roadside twice last year, and had a continuous bloom all summer and late in the fall; puts about one peck to the acre on the roadside.

Mr. Hawley sows about 6 lbs. of rape seed per acre.

Mr. Colwell's bees have a great feast on box elder sap, early in spring.

Mr. Hawley had sown rape several times, but the bees only gathered fast enough to build up; he can tell when his bees are gathering rape honey by the odor.

C. C. Turney, Ceresco, had seen bees work very extensively on the blackberry, both blossom and fruit, and also on parsley.

Wm. Sutton, Elk Creek, saw his bees on raspberry and alsike clover; they did a great deal to stimulate his bees, although the quantity is limited in his locality; they bloom about the middle of June.

"Races of bees" being taken up, several speakers thought that hybrids

had many qualities superior to Italians, inasmuch as they were excellent comb builders, and easy to induce into the sections; some claiming that the Italians came out too early in the spring, and thereby dwindled.

Mr. Hawley had over 100 colonies of Italians and 2 or 3 Cyprians. Cyprians were so cross that he tried to Italianize them, but they would not receive the queen, and persecuted her, in one case, until she flew away. He was not at all pleased with them.

Mr. Sutton said his Italians had worked on red clover a great deal during the last season.

Mr. Butterfield had watched his bees very closely, and found that last fall the red clover revived after frost, and the Italian bees stored surplus honey from it, which he believed was the finest honey he ever tasted.

Mr. Darrow had 20 acres of red clover in 1883, and bees would not touch it; while in 1882, they left early-sown buckwheat at 9 a. m., and went to the clover; the honey they gathered from it was excellent.

Mr. — said he had 13 acres of red and white clover, which he used as a pasture, and his children, while going for the cows, would often count the bees on the clover, one counting white clover workers, and the other red clover workers, coming out with various results. He does not think they ever mix the load with two kinds of honey.

G. M. Cooper, Beatrice, and others, came to the conclusion from the discussions on bee pasturage, that it was only necessary to plant or sow in Nebraska for the purpose of stimulation or increase.

Mr. Muir was of the opinion that the disposition of a colony of bees depended, to a very great extent, on its strength, strong colonies generally being more cross than weak ones.

At this stage of the meeting, the foul brood question was again sprung, and a motion made to appoint Prof. Culbertson as State Inspector of that disease. Also another motion was carried, for the President to appoint a committee of three to consult with the regents of the State University, and urge upon them the importance to the State of their directing Prof. Culbertson to carry out the wishes of our Association. The committee consisted of Messrs. Hawley, Trester and Bishop.

An expression was then taken by the Association, showing a preference for Lincoln as the place for holding the next annual meeting.

Mr. Muir then asked the question: "Will it pay to keep 80 acres of land on which there are about 1,600 basswood trees, 9 and 10 inches in diameter, exclusively for a bee pasture?"

After quite a general expression of opinion, the Association seemed to come to the conclusion that the owner of such a piece of land, could figure with considerable certainty on \$1,000 worth of honey from it annually.

The committee on resolutions, consisting of N. Pursen, P. C. Backus, Omaha, and C. S. Avery, Omaha, reported as follows:

Resolved, That the thanks of this Association are hereby tendered to

the bee-keepers and citizens of Lincoln, for kind and generous treatment received from them.

Resolved, That we tender a vote of thanks to the U. P., and B. & M. railroads, for reduced rates of transportation furnished to members of this Association while attending this meeting.

Resolved, That we tender Mr. B. E. B. Kennedy a vote of thanks for his aid in the apiarian department at the last State fair, also to the Y. M. C. A. of Lincoln, for the use of room for this meeting.

A vote of thanks was also tendered the Secretary, for work done in the interests of the Association.

M. L. TRESTER, Sec.

For the American Bee Journal.

Buckwheat for Honey.

ALLEN PRINGLE.

In sowing buckwheat for honey, I have found (unusual as it may appear) that the best time is about the first of August; that is, when there is but the one seeding during the season. Of course if you have plenty of land to devote to buckwheat, and sow several times during the summer, you can commence in May and sow every two weeks until the first of August. But my experience is that bees will not gather from buckwheat early in the season, even when it is yielding honey freely, unless they cannot get it anywhere else. Buckwheat sown the first of August will bloom during the first half of the month of September, when honey from other sources is scarce, and the bees will then gather from it freely. This, of course, pre-supposes the absence of frost during that time. Last fall my bees had nicely commenced the first week in September to work on the first-of-August-sown buckwheat, when the frost came and promptly stopped the industrious ingathering. But that frost last September was exceptionally early in this latitude. The fall before (in 1882) there was no frost during September, as is usually the case here, and the bees reaped an abundant fall harvest.

To make the most of buckwheat for honey, the best policy the bee-keeper can pursue, who has land to spare for two seedings during the season, is this: Sow the first lot about two weeks previous to the ordinary time your neighbors sow for a crop; and then sow again about the first of August as already stated. You will then have a pretty continuous bloom (frosts excepted) for over two months; for the farmers in almost any given locality vary from ten to twenty days in their time of sowing buckwheat for a crop—some sowing as early as the first week in June, while others sow the last of June and the first of July. By supplying your neighbors with the seed *gratis*, they will generally sow at the time you may direct—that is, within the bounds of a reasonable seeding time, so as to raise a crop.

Thus you can give seed to a neighbor on one side of you instructing

him to sow it a certain time, say two weeks after you have sowed your own first lot. Then to another you can give seed enjoining him to sow it, say a week or ten days after the first. Then if you can get somebody else to sow a week after that, or even four or five days, give him the seed and you will lose nothing by it. Finally, you can draw up with your own last sowing about the first of August, and then your buckwheat "low" will not only have "two strings," but about half a dozen.

A few years ago I hit upon a plan by means of which I can have a given field of buckwheat blooming continuously for three or four weeks. I fancy I now see some *old fogies* and *young wise-acres* smiling incredulously at this. Well, it is a fact nevertheless; and as I have never thought of taking out a patent on the *secret*, I will tell all and sundry how the thing is done. I do not say it can be done on all kinds of soil, but it certainly can on light soils, sandy or gravelly.

After first plowing and harrowing the field to be sown, in order to get the land well pulverized, I plow again in deep and shallow furrows alternately. The plow must be so adjusted that it will be thrown well "to land," so that the earth turned up from every furrow will fall just short of the next one to it, and *not fall into it*. Having got your plow so arranged that it will run just far enough "to land" to accomplish this without any extra exertion in holding it, you can plow every alternate furrow shallow by properly bearing upon the handles. This will leave the land in alternate deep and shallow furrows with cones, more or less regular, between them. Now sow your land thus prepared (lengthwise of the furrows for ease in walking), and harrow thoroughly *across* the furrows, and your work is done.

This process leaves the grain in the soil at different depths from a half inch to seven or eight inches, that near the surface coming up first and the rest following at different times. You will thus have a continuous and protracted bloom for two or three weeks or more. On heavy clay the plan would probably not work; I have not tried it on such, but on light soils it is an almost invariable success as I have proved.

Selby, Ont.

For the American Bee Journal.

Can Fertilization and Swarming be Controlled?

HENRY ALLEY.

We have many and perhaps nearly all the useful and valuable implements for managing the apiary, that the bee-keeper demands. A device for controlling fertilization and swarming has been about the only article not supplied. We now have that, and I will give a brief description of one that I have been at work upon for a long time.

The first year I began bee-keeping, I saw the need of some kind of an arrangement for destroying drones. I

then devised one, the principle features of which I have used during my experience with bees. It was simply a box, 6 or 8 inches square, with a piece of tin one inch wide, having a perfectly straight edge, nailed across the top of one end. A square of glass was then used to cover the box, and to let the light in, as the drones would not enter the trap unless the light attracted them there. The glass was set within 3-16 of an inch of the tin, or just room enough was left between the edges of the glass and tin for a worker bee to pass, while the drones could not. A wire-cloth tube was used to connect the box and hive, for the bees and drones to pass through from the brood nest. When the drones and queen had once entered the trap, they could not return or escape, and hence were entrapped. Now, while this contrivance answered every purpose for my own use, I never thought I could so describe it that one could be made without a model to work from, neither could I say that the traps, as I have made and used them, were as perfect as they should be; in fact, I could not perfect them for want of proper material. But since the introduction of perforated zinc, I have completed the apparatus, and can now pronounce it a success.

I will give a few of its most valuable features: It is a drone-excluder, drone and queen trap combined. It is merely a box 6 inches deep, 10 inches long, and 2½ inches wide. (They can be made much larger if desirable). The drone-trap proper is about 4 inches deep. The bees enter and leave the hive through the bottom slide, which is of perforated zinc (shown in the cut partially drawn out). The apartment in which the drones and queens are entrapped, is above this. The drones, when they attempt to fly, cannot pass through the zinc, and are compelled to go up through the wire-tubes into the trap above, while the workers pass out freely through the perforations. Now, if it is intended to destroy the drones, they can remain in the trap, or, if to be preserved, but not permitted to fly for 2 or 3 days, towards night the slides can be drawn, when they will take an airing and enter the hive again.

By the use of these traps, queens can be mated with the drones from any colony in the yard, as no drones can take wing from any hive where the trap is placed.

But the most important feature about the trap is in connection with swarming. It will be found by a brief trial that swarming is completely within the control of the

bee-master. When a colony has swarmed, and while the bees are in the air, the queen will be found in the trap, which can be placed near the bees on the ground, or a bench, or near the hive they are to occupy. The bees, if they have settled, discovering their queenless condition, commence to leave the cluster in search of her. They soon find her in the trap and at once settle there. Before all the bees have clustered on the trap, the top slide should be opened to release the queen, when the bees will enter their new home, and having them is completed. The trap then can be placed in front of the new hive, and the swarm cannot decamp to the woods, as is the case sometimes.

There is another advantage in using a trap: The bee-keeper is not obliged to run and hive his bees the moment the swarm has come off, as there is not the least danger of their going away without the queen; neither is there any danger of his bees swarming while he is away from home—gone to church, for instance, or away for any purpose. Then again, not every bee-keeper cares to climb from 10 to 30 feet into a tree for a swarm of bees, especially if the thermometer indicates 90° or 100° in the shade.

Such things will be known only as in the past, and will be classed with the old way of killing bees, to secure their honey. With the use of the trap, the work of managing and caring for the apiary will be greatly lessened, and the profits therefrom much larger. A queen-and-drone trap should be classed with foundation machines, honey extractor and movable frames, in point of utility and worth.

Since the above was written, I have read with some interest Mr. Heddon's description of his trap. Mine, it will be seen, is unlike his, in all respects.

Wenham, Mass.

For the American Bee Journal.

Is Dampness the Cause of Diarrhœa?

O. O. POPPLETON.

In an article on out-door wintering, I once made the statement: "Show me a practical method of keeping the entire inside of my hives perfectly free from dampness, and I have no further fears of unsuccessful wintering." Of course, holding that opinion, which time and a farther comparison of the experiences of others has only served to strengthen, I cannot help being very much interested in trying to learn what are the causes of dampness in hives, and how to prevent it.

I have had very little experience with anything except out-door wintering, but so far as that is concerned, have no doubt but dampness is the cause of disease, instead of disease being the cause of dampness. Reasons for this opinion are: that I frequently find hives in the early spring that are quite damp inside, chaff, cushions, etc., as well as the refuse or excreta that is always found on the bottom-board at that season of the year, such hives almost invariably containing

bees that are more or less diseased, but very frequently not having any more dead bees on the bottom-board than do those hives in which the bees have wintered in perfect health. Of course, in these cases, it is not at all probable the dampness could have been caused by the few dead bees that were present.

Again, bees sometimes die from starvation; in which case, so far as my observation goes, both the hives and their contents, including the bees themselves, remain as bright, clean and dry as it is possible for hives and bees to be; thus showing conclusively that bees, even in large numbers, do not always cause dampness.

There are a number of well authenticated instances where bees have wintered in perfect health, in very damp cellars, notably the one mentioned by Mr. Balch on page 6 of the BEE JOURNAL. Again, several instances are reported where bees have wintered perfectly in cellars having spring water running through them, in which cases the air was probably quite moist all the time. Such facts as these have caused some writers to jump to the conclusion that dampness in no case causes disease.

I have had occasion a number of times during the past few years to test the temperature of water from drive wells; the water from these kind of wells being probably nearer like spring water than from any other kind of wells. I found the temperature of water very constant during the entire year, usually being about 1° warmer in January than in June, and in no instance did I find it lower than 45° or higher than 48°. Again, I now have a bored well, curbed with 12-inch patent stone curbing. The water in this well having so little exposure to the outside air, remains at about the temperature as was that from drive wells (47° at present). We have just been having a week of extreme cold weather, the thermometer not being above 10° below zero any morning of the week, and below 30° three of those mornings; and yet, frost has penetrated only about 2 feet on the inside of the stone curbing, and below that the entire inner surface of the stone curbing is kept free from frost by the warmth of the water below. Now, is not this exactly what a stream of running spring water through a cellar does, viz.: keeps the air in the cellar at an even degree of temperature, about the same as is the water; that is, not far from 45°, which seems to be about the nearest right temperature to secure safe wintering of bees. Not only this, but the same aperture out of which the water runs to the open air must allow of a return draft of pure air, this air being itself tempered by its contact with the water to about the desired temperature. Probably a large body of water in a cellar acts somewhat similar to what spring water does, only not so effectually.

My opinions or theories, whichever they may be called, on this subject, can be briefly summarized as follows:

1. If dampness is not a cause of disease, it is almost always (always in

my experience) present with disease.

2. Colonies that have died from other causes than diarrhoea, are usually in a dry condition.

3. Those causes which produce dampness, whatever they are, are undoubtedly the ones that cause disease, if dampness itself is not the prime cause.

4. Bees seldom become damp or diseased in the winter, unless they are exposed to long confinement in a temperature lower than 45° or 50° above zero, or are exposed in the open air to a much lower temperature than freezing.

5. A running stream of spring water through a cellar is probably the best known means of securing an even proper temperature for a long period of time, as well as proper ventilation.

6. Bees seem to possess the power to keep themselves dry in a very damp atmosphere, provided the room in which they are kept is properly ventilated and kept at a steady medium temperature.

Prevention of Swarming.

CHAS. DADANT.

As the question on the possibility of preventing natural swarming is discussed in the bee papers, I desire to have my say about it.

I am satisfied; nay, our practice of about 15 years, has proved to us that natural swarming is always caused by a suffering, or by a need that bees are unable to satisfy, or, at least, by an abnormal condition of the colony which swarms.

The first main cause of natural swarming is the lack of room.

The second main cause is the rearing of queens during the honey season.

There are several other causes which force the bees to swarm out of the regular season, but these desertions *en masse* are not what is called natural swarming. We can control the first cause by giving our bees large hives and large combs, if we take care to enlarge the room before the harvest time, not by giving empty space only, but by giving empty combs or comb foundation.

We use large hives containing 10 or 11 Quinby frames, 18x11 $\frac{1}{4}$ inches; on these hives we place, before the honey season, a tier of 10 half combs. As soon as these surplus combs are about half full, we put between them and the hive, a second tier, furnished also with combs, or comb foundation, and sometimes a third tier, and even a fourth, if necessary.

The result is that our prevention of swarming succeeds so well that, in one of our large apiaries, numbering, last year, 62 colonies, which gave 15,000 pounds of honey, we did not get a single natural swarm. The same apiary, this year, increased to 87 by artificial swarming, gave 12,000 pounds of honey, and only two natural swarms.

Of course all our apiaries did not succeed so well, especially our home

apiary, on account of our sale of queens; these queens being taken from full colonies. During the summer their colonies were placed under the second cause, that I have assigned to natural swarming, and they, or at least part of them, swarmed.

When a colony becomes queenless, it raises several queens. As soon as the first is hatched she tries to kill her sisters in their cells; but if it is summer, and if the honey harvest is good, the bees oppose this killing, and the young queen departs with a swarm.

It is, in part, on account of the annoyance of watching for the swarms, and of hiving them, that we have concluded to stop the rearing of any more queens for sale.

From our experience, in an apiary exclusively intended to raise honey, if the hives are large, giving to the queens ample room to lay three or four thousand eggs per day, if the bee-keeper has the care to provide his bees in time with plenty of surplus combs, or comb foundation, the number of natural swarms will rarely exceed 2 or 3 per cent. annually. This percentage would be reduced to naught but for the natural death of queens. So small a number of natural swarms dispenses with the watching of the bees; for, in supposing that every swarm is lost, by this lack of watching, the loss is small in proportion with the value of the time expended in watching the apiary for weeks, and even months.

As to the means proposed to prevent natural swarming by retaining the queens in the hives by perforated tin or zinc, let me give my experience in that direction.

About 12 or 14 years ago, our lamented friend Quinby had contrived a yard furnished with tin all around, and fixed in front of the hives, to prevent the queens from following their swarms. The bees would fly from the yard, but the queens, who had one of their wings clipped, were unable to climb under the slippery tin, and compelled to remain in the yard and to return in the hives.

I had fixed 14 of these yards in front of as many hives, containing my best queens. When the first swarm went out, I watched the queen. I saw her make several unsuccessful attempts to climb out the yard; but I noticed also that the workers, who had not followed the swarm, were very angry against her, and treated her as they used to drones, when they want to get rid of them.

Of course the swarm came back in the hive.

On the next day the same colony attempted to swarm again, with the same ill-treatment of the queen; with this difference that two, or even three workers instead of one, were after her.

Two others of my colonies with yards, tried to swarm also on the same day, and both ill-used their queens, as the first one had done.

The three colonies tried again to swarm on the following day, and with the same increased anger against their queens.

At last, on the evening of that day, I found the dead body of the queen who had tried three times to follow her swarm; it had been dragged in the yard by the bees, after she had succumbed, killed or exhausted by the ill-treatment of her bees.

Of course I hastened to swarm both the other colonies, and to take out all the yards.

Now, it is certain that the ill-treatment of the queen by the bees, ill-treatment that I was able to see since it had begun in the open air, it is certain that the same ill-treatment will take place in the hives, where the queen will be prevented from following the swarms, whatever be the means used by the bee-keeper. Quinby yards or perforated tin will produce the same results.

Let me now advise my readers, if they want to prevent swarming, to resort to our large hives, and I dare to predict them good returns for the investment; for not only natural swarming teases the bee-keeper, but the colony before swarming lose time in remaining idle, and both the swarm and the colony do not give as much profit as a colony of the same population which have not swarmed.

Working in Supers—Obstinate Bees.

WM. H. BALCH.

After reading of Mr. Ware's trouble mentioned on page 27 of the present volume, in trying to get his bees to work in supers, I was reminded of the trouble I formerly had with a colony of my best workers. There seems to be now and then a colony of bees that are so opposed to the wishes of the apiarist, that unless he puts them in the right position (or, in other words, hold some inducement out), they soon determine to crowd the brood out of the hive, when plenty of surplus receptacles are on, in readiness to receive the surplus of the honey harvest. The best remedy that I ever found, is the extractor. I never have found a case but what I cured, by extracting about one-half of the honey; if the colony is very strong, extract a little more. Place the empty frames in the center of the hive; the queen will fill them, and they having plenty of brood to care for, seem to think that a surplus of honey is needed. I have often had such colonies make up what they had lost, providing they were not neglected too long.

Oran, N. Y.

For the American Bee Journal.

Lucas Co., Iowa, Convention.

A meeting of the bee-keepers of Lucas county was held at the Court House in Chariton, Iowa, on Dec. 29, at 2 p. m., for the purpose of organizing a Bee-Keepers' Association. The meeting was called to order by Mr. Wm. Malone, who stated the purpose of the meeting. Mr. J. H. Sydebotham was called to the chair.

Mr. Wm. Malone made a motion to call the association "The Lucas County Bee-Keepers' Association," which, being adopted, they proceeded to elect their officers, which resulted as follows: J. H. Sydebotham, President; W. P. Davis, Vice-President; W. L. Miller, Treasurer; A. Reusch, Secretary. The meeting then proceeded to adopt a constitution and by-laws, which was signed by the following: J. H. Sydebotham, W. L. Miller, A. Reusch, Wm. Malone, E. Sater, A. W. Troutman, W. P. Davis, D. C. Rook, Isaiah Robinson, W. O. Parmenter, J. G. Stafford, J. O. Voris, Mrs. Wm. Kent, Milton Good, Geo. R. Riker and Evan Morgan.

Messrs. W. O. Parmenter, Wm. Malone, and Geo. W. Riker made some remarks about wintering bees.

All interested in bee-keeping are cordially invited to attend our next meeting on the first Saturday in March, at the Court House in Chariton, at 1 p. m. A. REUSCH, Sec.

For the American Bee Journal.

Des Moines Co., Iowa, Convention.

The bee-keepers of Des Moines County, Iowa, met according to the notice of the committee, and formed an organization by appointing John Nau as President *pro tem*, and Elijah Beans as Secretary *pro tem*, and then adjourned to 1 p. m. In the afternoon the first thing in order was to ballot for officers for the ensuing year, which resulted in the election of Geo. Bischoff, for President; W. R. Glandon, for Vice-President; John Nau, for Secretary, and A. M. Baldwin for Treasurer. A regular printed bee-keepers' constitution and by-laws was laid before the meeting, which was amended by changing the membership fee to 25 cents, and then adopted.

There was some interesting discussions which lasted about two hours, and then a committee, which consisted of John Nau, Samuel Catlin and H. W. Cartwright were appointed to meet the officers of the Agricultural Society and insist on them in giving liberal premiums on our industry, at the next annual fair in Des Moines county.

It was agreed to meet in regular session on the fourth Tuesday in April, 1884, at 10 a. m., in R. C. Crawford's hall, in Middletown, Iowa. The society is to be known as the Des Moines County Bee-Keepers' Association. The number of colonies represented was 217. JOHN NAU, Sec. Middletown, Iowa, Jan. 8, 1884.

A meeting of bee-keepers will be held at the residence of W. Cossens, Monee, Will Co., Ills., on Monday, Jan. 28, 1884. All friends of improved management of the apiary, are invited to attend.

A. WICHERTS,
W. COSENS,
B. HEYEN, } Committee.

Letters for publication must be written on a separate piece of paper from items of business.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Diseased Bees.

In looking over my bees to-day, I found them all right, except two colonies which stood side by side; they were dead. I found some decayed brood in a few cells which emitted a strong odor on opening the hive. Do you think there is any danger of it being foul brood? and would you advise destroying hives, combs, etc.? If you think it foul brood, please tell me how to prevent it from spreading. I forgot to say there was both honey and pollen in the hive.

J. D. CUNNINGHAM, JR.
Orchard Hill, Ga., Jan. 9, 1884.

I have had no experience with foul brood whatever, but from studying it I am rather of the opinion that you have it in those two colonies. Were it my case, and I considered it foul brood, I should burn the both hives complete at once. It is, however, more than likely that the seeds of the disease are at present in other colonies, which will develop into the same condition as the two mentioned, this coming spring. By that time these will have infected others, and soon it is liable to go on all through your apiary. Prevention is the vital point to study.

Sundry Questions.

1. Do you consider extra prolificness of queens a valuable characteristic?

2. Of what value is the bee space above brood frames?

3. Do you think that cold alone would produce dysentery?

4. What is your opinion of the effects of being stung by bees for many years? B. F.

1. Several times during the past 10 years I have stated through the JOURNAL, that I did not consider prolificness in the queen, beyond normality, of any special value, because with it is apt to go qualities of inferiority, and because so small a part of the capital invested rests with the queen.

2. In my judgment, there is no claim in the Langstroth patent (now expired) of as great value. Mr. Langstroth's late statement that the Italian bee seemed to object to the space, must have arisen from the fact, that when he used the space, he used an objectionable and improperly constructed honey board, which they objected to, rather than the space. Right here and now I wish to state and have it remembered in the future, that I

believe he who advocates doing away with this space, thus allowing receptacles of the upper and lower story to rest upon each other, retards progress in apiculture, in just so far as his influence goes. I think it the duty of the JOURNAL to call forth the expression of our well-known leading practical producers upon this subject, that beginners may know how to decide.

3. I cannot believe that cold alone can produce dysentery. It may cause bees to gorge themselves with honey or pollen, said honey or pollen producing dysentery, but so general an effect must have one general cause, and that surely is not cold, for bees often die with dysentery in its worst form in cellars whose temperature is never below 40°.

4. There is no doubt many persons who may receive into their blood the virus of bee stings, and into their lungs breathe the same poison, and continually throw it off as fast as received; but there are many who will become chronic sufferers from the effects of this poison, and it is my opinion that the number will astonish us that will be reported, after the business has undergone a score of years more of development in this country.

SELECTIONS FROM OUR LETTER BOX

Packed in Clover Chaff.

I commenced the honey season of 1883 with 2 colonies in Langstroth hives. On May 23 I bought 2 more. I have 13 colonies wintering well. I run one for comb honey, and got from it 60 lbs. in one-pound sections; and 2 for extracted honey. My young colonies gathered enough to winter on. I received in all 500 lbs. I pack in clover chaff, and rear my own queens.

JOHN H. SHELTON.
Napoleon, O., Jan. 14, 1884.

Hill's Method of Wintering Bees.

I can safely say that all would be much interested in reading a detailed account of the method of wintering, practiced by Mr. J. S. Hill, of Mount Healthy, O., as recommended by Mr. Langstroth. I, therefore, respectfully suggest that Mr. Hill's plan be fully described in an early issue of the Weekly BEE JOURNAL, either by Mr. Langstroth or Mr. Hill himself. While on this subject allow me to ask some experienced bee-keeper whether paper has ever been thoroughly tested as an absorbent over the bees in winter? I should hardly think it suitable to place directly next to the bees, but a

few thicknesses over a light woolen blanket ought to confine much of the heat. Newspaper, for instance, is an excellent non-conductor, as any one can easily demonstrate by placing some between blankets of the bed during a cold night, or using as an extra wrap under the overcoat in very cold weather. It would not surprise me, if weight for weight, newspapers are amongst the best non-conductors. Now, the question is, will they absorb moisture well enough to use as a covering.

W. J. RASIN.

Jenkintown, Pa., Jan. 7, 1884.

Poor Season.

Las spring I had 3 colonies of bees. They swarmed ten times, of which I saved nine; one flew away, I being away from home. In June, they were gathering honey rapidly, and there seemed to be a large supply. I anticipated a large amount of surplus honey in the fall, but the season changed (in July, I think), and became unfavorable, and but little honey was gathered afterwards. From my best colony (the first or second swarm) I took 28 two-pound boxes. This was nearly one-half of the whole amount taken off.

WM. BRUNDAGE.

Lodi, N. Y., Jan. 7, 1884.

Our Nebraska State Convention.

We certainly had an excellent meeting. I have attended one North American and two Northwestern meetings, and am pleased to say there was more ladies present at our late meeting than I ever saw present at a bee meeting before. Having been present at meetings East, I think I am qualified to say that, although Nebraska is one among the baby states, she is taking long strides close behind, if not "neck and neck" with her old sisters, in the apicultural pursuit. We enrolled 51 members, but could not find time to take a statistical report. You will also see that foul brood, that terrible destroyer, has encroached upon our territory, and that we are making an attempt to stamp it out with the power of a united effort.

M. L. TRESTER.

Lincoln, Neb., Jan. 14, 1884.

Home Market for Honey.

I have 184 colonies in the cellar, all in fine condition at the present. Have wintered the bees in the cellar for several years, and have never lost a colony that had stores enough to last the winter through. My cellar is quite dry; keep the temperature as near 40° as possible. I can thus winter on about 10 lbs. of honey per colony from Nov. 1, to May 1, after which date stores are consumed quite rapidly, thus requiring not less than 30 lbs. of honey to carry a colony from autumn frost to clover bloom. I use the long shallow frame and work for comb honey, which sells readily at 18 cts. per lb. I can now sell 100 lbs. as readily as I could 10 lbs. 5 years ago, when I first offered honey for sale about here; and this is the result of working up a home market with a good article. I find the 1 lb. sections

sell the best, also small cans of extracted honey. My advice to all is, attend to the home market first, if you have one; if not, make one. Although I have over 100 acres of good land, I can make the bees pay a much larger per cent. than land or domestic animals. The year 1883 was the poorest season for bees and honey I ever saw. My cure for dyspepsia is simply this: as you finish each meal take a teaspoonful of extracted honey, as you leave the table. Try it; I know it is a cure. For years I could not eat warm biscuit, fat meat, nor vegetables, pastries, cooked fruit, nor any thing good or rich, but now this misery has given place to a good digestion by the use of honey as above stated.

C. H. CHAPMAN.

Cohoctah, Mich., Jan. 15, 1884.

Extremely Cold.

We have had unprecedented weather for several days. Saturday, Jan. 5, was the coldest day we have had for several years; it moderated some on the 10th, but turned cold on the 11th, and it still holds. I fear our pets will suffer. On the 10th some dew out, but soon dropped on the snow to rise no more.

G. W. ASHBY.

Valley Station, Ky., Jan. 12, 1884.

The "Cold Snap" in Kentucky.

The morning of Jan. 4 was the coldest weather we have had for 20 years. The thermometer was 20° below zero at 8 a. m.; and 12° below at 8 a. m. on Jan. 5. The weather has moderated, and a big snow of 8 to 12 inches fell yesterday; then a heavy wind from the south, and the snow melted rapidly. Some few bees were out; all my bees answered to roll call; they are on the summer stands snug and dry, with quilt and leaves in the upper story, and each hive has a sheet of tin on the corner, painted, and they are water proof. Peaches are all killed in the bud; and I fear much danger is done by the low temperature to small fruits. Prospects for clover are very fine, and that is our main crop for honey.

N. P. ALLEN.

Smith's Grove, Ky., Jan. 11, 1884.

My Report for 1883.

Commencing with 12 colonies in the spring, I increased to 21, and 2 went away; I received 20 queens and had 750 pounds of honey (500 lbs. in comb, and 250 lbs. of extracted). I winter on the summer stands, mostly in chaff hives, with brood chamber full of honey. I sell my honey at home for 20 cts. per lb.

JOHN WIRSCHY.

Morrill, Kans., Jan. 14, 1884.

Splendid Winter for Bees.

I took my 60 colonies of bees out of the cellar about April 15. I have called the roll, and they all answered but 4 colonies; they had gone to their happy hunting ground. Forty of the rest were strong, and 16 weak. I sold the 40 strong ones for \$10 each; kept the 16 weak ones to commence the season's work. They built up nicely. I had the first natural swarm on May

20; they increased by natural swarming to 37, and I got 1,000 pounds of comb and extracted honey. We have had a splendid fall and winter, so far. It has been very cold for a few days, and a little snow on the ground. My bees are all in the cellar, dreaming of what a happy time they are going to have in "the sweet by-and-by."

G. W. STARK.

Holmesville, Neb., Jan. 9, 1884.

From the Buckhorn Apiary.

My bees are doing well—all are quiet. Thermometer stands at 85°. From my own experience I feel satisfied that I have discovered the cause and a cure for dysentery. I send you a New Year's present of a pail honey, gathered by what some call "the little black imps." What was this honey gathered from? I have had 4,000 lbs. of the same during the past season. I put my bees in the cellar at different times.

F. A. GIBSON.

Racine, Wis., Jan. 12, 1884.

[Thanks for the honey; it has some basswood in it, but it is mixed with other bloom; it is very nice and palatable.—ED.]

Bees Buried in a Clamp.

On April 19, 1883, I moved from Arcadia to Columbus, Wis., 85 colonies of bees; a distance of 200 miles; sold 11, and started with 74; increased to 99; took off 5,500 lbs. of comb honey finished, all white clover; 450 lbs. half finished; 150 lbs. of open combs, and 500 lbs. of extracted, making a total of 6,600 lbs. Thirteen colonies weighing less than required on Nov. 1 were killed and their combs stored away. I sold 2; put 84 into a clamp and buried them. They are wintering finely. I have sold one-half of my honey at an average price of 18 cents. I have the balance on hand. I use the Muth sections, 5¼x5½ square, 1½ inches thick, weight 1¼ lbs., which gives larger surface face than ordinary sections, and are more enticing to customers.

E. A. MORGAN.

Arcadia, Wis., Jan. 14, 1884.

Report of a Beginner.

Last April I bought one colony of bees for Italians, but I soon found them to be hybrids. My brother gave me two colonies of brown bees; we transferred them to frames in May. In June I sent to two different places for Italian queens; I got half a pound of bees with the one from Kansas City, and let her build up, which she did in the best of order. I did what I could for them, when cold or rainy, by feeding them good sugar syrup. Early in August we moved them from the 5 frame hive to 9 frames. As a piece of comb was built to the side of the hive, in which was eggs and small larva, and so many bees wanted to stay, we left them; they built 8 queen cells from which we saved 3 queens, divided the bees with them and let them do the best they could, after giving them some frames of sealed honey. I did not get the queen from Georgia until

the 12th day after she was started, being delayed on account of the flood. On July 4, I put her with a few black bees; it did not seem much over a month until the hive was full of beautiful Italians, and there were no blacks to be seen. I love my bees, although they sting me some. I obtained 77 lbs. of honey in 1 lb. sections. I was late starting with the bees, and there was no fall honey. I have 13 colonies, and I think they are well provided with good honey. I left them on the summer stands, protected with straw and chaff cushions. To-day the bees are out; some dropped on the snow, but rose again, as there is no wind. This is the first flight they have had since Dec. 21. MRS. KATE FISHER.

Stewartville, Mo., Jan. 12, 1884.

Foundation with Natural Cells.

My 44 colonies are all alive to-day, taking a flight in the open air, having a good time. I used 75 pounds of flat-bottom foundation, last year, and if there was an old comb in the hive, the queen would lay in the old comb and not touch the foundation, unless forced to use it. It appears that there is no place for the eggs. I found the eggs at one side of the cell, not in the centre; in concave-bottom, the egg would be in the centre of the cell, showing me it was not natural, and the queens did not like it.

H. RICHEY.

Sing Sing, N. Y., Jan. 14, 1884.

Diphtheria—Death—Hygiene.

It was with no little pleasure that I read Mr. Pringle's letter under the above caption on page 23 of the BEE JOURNAL. Mr. Pringle stands square on his feet, and on solid ground, as I well know by experience in my own family. As many enquiring ones do not know where to look for aid in their extremity, I would suggest that Mr. P. make a list of books that he would recommend, and that our worthy editor keep these books for sale to those who may need them.

E. M. HAYHURST.

Kansas City, Mo., Jan. 14, 1884.

[We will do so, with pleasure.—Ed.]

The Season in Arkansas.

The season of 1883 I will call an ordinary good one. Colonies in two-story twenty-frame Langstroth hives have given from 75 to 100 lbs. of extracted honey; those in box hives 25 to 30 lbs. The fall of 1883 was fair. We only had cold snaps on Nov. 17 and 18, but on Jan. 2 it turned cold, and on the 6th and 7th we had snow for three days; at daybreak the thermometer was at zero. To-day, at daybreak, it was 12°; at noon, 45°, with a few bees flying. My bees are in one and two-story hives, and in good condition. Those having upward ventilation are very quiet and dry; those having no upward ventilation are a little frosty. The honey market is poor; business dull; no trade; cause, the failure of the cotton crop and drought. FRANK THIAVILLE.

Forrest City, Ark., Jan. 10, 1884.

Pollen and Brood Rearing.

In an article by G. M. Doolittle (page 606 of the BEE JOURNAL for 1883), it would appear that old bees will not eat pollen when not rearing brood. I think my experience proves the opposite. One colony starved this winter which I neglected to give provision enough in the fall. The bees appeared to be in good condition otherwise, but not a particle of honey or pollen could I find in the hive. I found one cell in the centre of a comb which was capped, this being the only sign of brood. There were no pains taken to exclude pollen from this hive in the fall. I like to read the BEE JOURNAL very much, and cannot do without it. W. FISHER.

Hamler, O., Jan. 16, 1884.

A Real Winter.

I put 17 colonies in winter quarters on Nov. 1, on summer stands, *a la* Heddon. They had a flight on Nov. 24; since that time we have had a winter. On Jan. 5 and 6 it was 20° below zero; to-day my bees are flying some; it is 45°. I looked at some colonies, and they are all right yet. The last two weeks have been the coldest that I ever knew, in the last 20 years, in this section of the State.

J. W. STURWOLD.

Haymond, Ind., Jan. 14, 1884.

Bees Alive and Well.

I am alive and well, and so are my 70 colonies of bees; they passed through the blizzard all right, without loss. They had a grand flight on Sunday, Jan. 13. JAMES RONIAN.

Villisca, Iowa, Jan. 15, 1884.

No Winter Loss or Spring Dwindling

Bees are wintering well; mine took the first flight of 1884 yesterday, and all look bright and in the best condition. They are left out-of-doors, packed in chaff. I have packed them this way for four winters without the loss of a single colony, and they never spring dwindle. J. G. NORTON.

Macomb, Ill., Jan. 14, 1884.

Bees Packed in Leaves.

We have just survived a very cold spell of weather, 30° to 37° below zero; but, to-day, was quite mild, so much so that the most of my bees were flying some, and but few were left on the snow. My bees are packed in leaves on the summer stands, and really look comfortable. The honey flow stopped, last season, about the last week in July. I started with 105 colonies in the spring; increased to 133, and got about 300 gallons of extracted and 3,000 lbs. of comb honey, and 100 lbs. of wax for my season's crop. Not so bad for a side show. I have not had time to attend to the selling of honey, as I have wished. I have now sold some over \$300 worth, principally in the stores in wholesale lots, but have to sell from 12½ to 15 cents per pound. I would promise you great results in bee-keeping only for two obstacles in the way, these are, successful winter-

ing and the disposing of honey at fair prices. It seems that extracted honey finds but little demand, this season. I cannot see why honey is so little used as food when it can be bought at 12½ to 20 cents per pound, when butter brings from 25 to 35 cents per pound, and adulterated syrups 85 cents per gallon. Considering the advantages of honey for food and medicine, it is by far the cheapest sweet now sold in the market. H. S. HACKMAN.

Peru, Ill., Jan. 13, 1884.

A "Bee Story."

A neighbor of mine, in the fall of 1882, put a colony of bees in his kitchen chamber, to winter them, the boards of the floor are loosely laid, and consequently a high temperature was maintained where the bees were. A considerable quantity of maple sugar was stored in the chamber. The bees worked on the sugar most of the winter, increased very fast, and on Feb. 22, a fine swarm came out which was hived, and when the bees were moved to the summer stand, in April, the old colony was very strong, the swarm had built a large quantity of comb, and had about 15 lbs. of honey. How is that for "winter dairying?"

H. H. MCNETT.

Carpenter, Pa., Jan. 14, 1884.

The Dowagiac, Mich., *Times*, of Jan. 9, contains this report of Mr. Shirley's apiary:

W. H. Shirley, the Glenwood apiarist, has put into winter quarters 167 colonies of bees, all of which he thinks are in safe condition for wintering successfully. His honey crop last year was a good one, as he has already sold 1,800 pounds of extracted honey, and his comb honey aggregated 5,000 lbs. Mr. Shirley is a close student of Mr. Heddon's system of bee-keeping, and his business ability and industry enables him to carry it out successfully. He is a gentleman with whom it is a pleasure to deal; and he is destined to take a front rank with the honey producers of the State.

Local Convention Directory.

1884. *Time and place of Meeting.*
- Jan. 28.—Bee-Keepers' meeting at Monee, Ills.
A. Wicherts, W. Cossens, B. Heyen, Com.
- March 5.—N. E. Michigan, at Lapeer, Mich.
W. Z. Hutchinson, Sec., Rogersville, Mich.
- Mar. 29.—Union Association, at Dexter, Iowa.
M. E. Darby, Sec., Dexter, Iowa.
- April 18.—Iowa Central, at Winterset, Iowa.
J. E. Pryor, Sec.
- April 22.—Des Moines Co., at Middleton, Iowa.
John Nau, Sec.
- Oct. 11, 12.—Northern Mich., at Alma, Mich.
F. A. Palmer, Sec., McBride, Mich.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

☞ We now club the *British Bee Journal* and our *Weekly* for \$3.50. See change in prices on first page.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Our New List of Premiums.

Getting up Clubs for 1884.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar *they send direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

☞ Do not let your numbers of the BEE JOURNAL for 1883 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or in cloth for \$3.00.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers; we reply, yes, any book or binder we keep for sale may be selected by those who get up clubs.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

THIS PAPER may be found on file at Geo. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it. **NEW YORK.**

ELECTROTYPES

Engravings used in the Bee Journal for sale at 25 cents per square inch—no single cut sold for less than 50c. **THOMAS G. NEWMAN,** 925 West Madison Street Chicago, Ill.

Sweet Clover

Prices:—25 cents per lb., \$3.25 per peck, (15 lbs.) and \$12.00 per bushel, (60 lbs.) When ordered by mail, add 18 cents per lb. for postage.

Having purchased a large quantity of Sweet Clover Seed, I will make a

Special Discount of 20 per cent.

from the above prices, on all orders received during the month of

JANUARY.

Now is an excellent time to make your purchases to advantage.

Sow it in the FALL, WINTER or SPRING—a great many sow it broadcast on the snow—alone, or with field grain or grass; six pounds to the acre. It will do well in field or lane, on hillside or in valley, on uplands or soil subject to overflow. It is perfectly hardy, standing drouth admirably, and flourishing well during rainy seasons. The honey is the best. As it does not bloom till the second season, it will do no harm if grazed by cattle the first season. It is excellent for waste places and commons.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 350 colonies of bees, of our new strain, and of pure Italian blood. As most of you are aware, for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do well to correspond with me.

Among the goods we have to offer, are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Vells, Sample Shipping Crates, Comb Foundation Fasteners, Surplus Honey Registers, our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced in this subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Roma, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OLDEST BEE PAPER
IN AMERICA

ESTABLISHED
IN 1861

THE AMERICAN

BEE JOURNAL

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN
1861.

Chicago, Ill., January 30, 1884.

VOL. XX. No. 5.

THE WEEKLY EDITION

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

✂ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

✂ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

✂ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,
For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THE BRITISH BEE JOURNAL

AND BEE-KEEPER'S ADVISER.

THE BRITISH BEE JOURNAL is NOW published SEMI-MONTHLY, at Seven Shillings, per annum, and contains the best practical information for the time being, showing what to do, and when and how to do it. **Rev. H. R. PEEL, Editor.**

We send the Weekly AMERICAN BEE JOURNAL and the *British Bee Journal*, both for \$3.50 a year.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

✂ Letters for publication must be written on a separate piece of paper from items of business.

Advertisements.

DADANT'S HONEY CROP!

Our crop being very large, we offer **THIRTY THOUSAND POUNDS** of extracted Honey

FOR SALE

at **REASONABLE PRICES.** We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send **15c.** for our 24-page Pamphlet on Harvesting, Handling and Marketing extracted honey.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

1876. CROWN 1882.

The best arranged **HIVE** for all purposes in existence. Took first premium at St. Louis Fair in 1882 and 1883 over all competitors. Descriptive Circular sent free to all on application.

Address, **ELVIN ARMSTRONG,**
Prop'r. of the Crown Bee Hive Factory and Apiary,
JERSEYVILLE, ILL.

DADANT'S FOUNDATION

From **JAMES HEDDON,** July 27th, 1883.—Your Foundation is certainly the nicest and best banded of any I have seen on the market. It is the only foundation true to sample I have ever received.

From **JAMES HEDDON,** Aug. 10th, 1883.—I will contract for 2,000 pounds of foundation for next season on the terms of your letter.

From **A. H. NEWMAN,** Aug. 24th, 1883.—Book my order for 5,000 pounds for spring delivery.

From **C. F. MUTH,** Dec. 12, 1883.—Book my order for 2,000 lbs. of heavy; 1,000 lbs. of thin, and 500 lbs. of extra thin.

Dealers, send in your orders for next spring while wax is cheaper, and save trouble and money.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock co., Ill.

A POCKET DICTIONARY

Containing 320 pages, and over 25,000 Words, Rightly and Plainly Defined

To make the pronunciation easily understood every word is phonetically re-spelled, and the syllables and accents made perfectly plain, so that no one who consults this book can miss the proper word to use, and giving it proper pronunciation.

This Dictionary is our Premium for a Club of 3 subscribers to the Weekly (or its equivalent to the Monthly), in addition to other Books selected from our Catalogue to the amount of \$1.00; all by mail, postpaid.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by E. Dieck and S. Stuttered, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Atley.—A full and detailed account of TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apicary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that every bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be secured by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advice on this point, and the subject, with suggestions what to plant, and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee-Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages. 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form, full of useful tables for estimating up grain, produce, hay; cost of pork, interest, wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use.—Belog a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, 35c.

Hesed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cura. By Albert H. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—**Der Tlichkeit des Bienenstandes—Honigpflanzen—Erziehung der Königinnen—Füttern—Schwärmen—Ableger—Verzeten—Italienisieren—Züfzer von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.**

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigtuchen, Formkücheln, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Recepten. Es ist für den Conumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., JANUARY 30, 1884.

No. 5.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Nomenclature of Bee-Keeping.

A correspondent propounds the following questions, based upon our late article on the subject of "Calling things by their right Names." The queries are as follows:

1. John Phin says if bees feed on meal, say meal. Why not call it artificial bee-bread?

2. Does not a swarm mean simply the bees, while a colony means bees, hives, combs, etc.?

3. Does a stock mean a colony, or a whole apiary?

4. Are workers erroneously called neuters; if so, is there a gender other than the two?

5. Is the white stick candy we get at the store, equally as good as that we make of sugar to give to bees?

S. Sutton, N.H. F. M. CHENEY.

In replying, we will do so by numbers, in the order the questions are propounded to us.

1. The word "artificial" is defined to mean something *unnatural*, fraudulent, or an imitation. We do decidedly object to the calling of *meal* artificial bee bread. There is nothing artificial about it.

When "comb foundation" was first made, some one called it "artificial comb," and that erroneous name would, we verily believe, have been what it would have been known by today, but for the vigorous protest we gave in the BEE JOURNAL some 5 or 6 years ago.

We have no use for the term *artificial* in all the vocabulary of bee-keeping.

2. No, sir; a "swarm of bees" can only be so called when in the act of leaving the parent colony for the purpose of increase. When organized and devoted to their work, they form a "colony." To call such bees a "swarm" is, at best, a misnomer.

3. A "colony" should never be called a "stock"; that term should only be used to designate the quantity comprising one or more apiaries; or, in a more general sense, the insects themselves—such as "improving the stock," meaning the *race*. It has come down to us, by a corruption of the German word, "Bienenstocke," meaning a straw bee hive in which bees were formerly kept—almost universally, and even now, are quite generally so kept in Europe.

4. "Worker bees" are undeveloped females; queens are females, but fully developed; drones are males. A "neuter" would be neither the one nor the other—neither male nor female—and to use such a term to designate bees, would make a "gender other than the two" necessary. So when worker bees are called *neuters*, it is highly improper.

5. Having no experience in candy-making, we cannot say whether it is as good or not. Mr. Heddon replies thus: "I once worked at candy-making; in those days all our sugars were pure cane. If stick candy is used, get that which is the softest and most creamy. I think there has been a mistake made, if you find it necessary now to feed candy; you should have fed them a proper amount of pure sugar syrup in the fall."

☞ Mr. J. M. Hicks gives the following report of how the bees are wintering, in the *Grange Bulletin*: "Bees in this vicinity are wintering well so far, and yet the thermometer registered 26° below zero Jan. 4, here at Battle Ground, Ind., and at Lafayette, seven miles distant, it was 30° below zero.

☞ Mr. Henry Alley has sent to our museum one of his Drone Excluders. It is a queen and drone trap, combined, and was described on page 56 by Mr. A. It is nicely made, and recommends itself as an article, the need of which has long been felt by every bee-keeper.

Convention at Davenport, Iowa.

The coming convention at Davenport, Iowa, on Thursday, Friday and Saturday, Feb. 21, 22 and 23, promises to be a very large gathering of the bee-keepers of Eastern Iowa and Western Illinois. The Davenport *Democrat* of Jan. 22, contains the following editorial remarks on the "prospects:—"

The prospect is that the Bee-Keepers' Convention which is to be held in Davenport on the 21st, 22d and 23d days of February next, will be the largest gathering of persons interested in the producing of honey ever held in the State, if not in the West. President McCagg, of the Local Association under whose auspices the convention will be held, is in receipt of letters from Independence, Fayette, Iowa City, Des Moines, Grinnell, Muscatine, Ottumwa, Clinton, De Witt, Monticello, Wilton, Marengo, Dubuque, Marshalltown, Delhi and Waterloo, stating that there will be delegations present from Buchanan, Fayette, Polk, Muscatine, Wapello, Clinton, Iowa, Dubuque, Jones, Marshall, Delaware, Blackhawk, Poweshiek, Benton and Linn counties, in Iowa, while there will be good delegations from Rock Island, Whiteside, Henry, Carroll, Stephenson and other counties in Illinois.

It is well known that the last year was a disastrous one for bee-keepers, as only about a third of a crop of honey was produced in Iowa and Northern Illinois, and persons who intend to continue in the business do well to come together for consultation. Among the prominent men who will be present is Mr. Thos. G. Newman, editor of the AMERICAN BEE JOURNAL, of Chicago, who will spend two days in the convention, will deliver an address each day, and take part in the proceedings and discussions with the other members. The veteran Langstroth has been invited, and writes that he will be present if the weather shall prove favorable enough to allow a man of his age to travel.

We expect to be present according to the above notice, and hope to meet a large number of the bee-keepers of the surrounding country.

☞ We now club the *British Bee Journal* and our *Weekly* for \$3.50. See change in prices on first page.

Intelligence in Bees.

Mr. Geo. E. Hilton, of Fremont, Mich., has sent the following clipped from the *Golden Days*, and desires it inserted in the BEE JOURNAL:

Nowhere in the working of natural law, in the lower order, do we see more wonderful exhibitions of instinct, nearly approaching to intelligence, than in the common honey bee. This little creature is truly "fearfully and wonderfully made."

Take, for instance, the feet of the common working bee. They exhibit at one and the same time a basket, a brush and a pair of pincers. One of these articles, indeed, is a brush of extreme fineness, the hairs of which, arranged in symmetrical rows, are only to be seen with the microscope.

With this brush of fairy delicacy, the bee continually brushes its velvet robe, to remove the pollen dust, with which it becomes loaded while rifling the flowers and sucking up their nectar.

Another article, which is hollowed like a spoon, receives all the gleanings which the insect carries to the hive. It is a panier for provisions. Finally, by opening them one upon another, by means of a hinge, those two pieces become a pair of pincers, which render important service in the construction of the combs, and it is with them that the bee lays hold of semi-circles of wax below its abdomen, and carries them to his mouth.

The mechanism of the sting is no less extraordinary. This weapon consists of a sheath, inclosing two needle-shaped darts of exceeding fineness, placed side by side.

Toward the point they are armed with minute teeth like those of a saw, whence it happens that the bee is sometimes unable to withdraw this little javelin from the enemy it has pierced, for so powerful is the impetus of the sting that it will pierce even the thick human skin the twelfth of an inch deep.

When the sting makes the wound, the acrid poison is squeezed in from the bag near its base, the structure and process being nearly identical with those of the poison fangs of serpents. Only the females and the neuters of working bees have these formidable weapons, the males or drones being defenseless.

Let us glance at some of the exhibitions of wisdom shown by these little fellows which make such a buzzing through our gardens and hedges, and stand among all the insects as the nearest friends and familiars of man.

When an enemy little to be dreaded sneaks into a hive of bees, the first sentinels that see it pierce it with their stings, and in the twinkling of an eye the corpse is tossed out. The work is not interrupted for a moment.

But if the intruder is a big, strong slug or worm, all the workers are thrown into agitation. They all rally and pierce the enemy with a hundred stings. But what is to be done with such a heavy body? The little feet of

all the tribe would not suffice to stir the corpse, and the narrow door of the hive would not allow it to pass. Its putrid odors would, however, soon infect the colony, and develop the germ of some malady. How are they to escape from this danger? The little republicans take counsel, and come suddenly to just such a resolution as they would have done if they had thoroughly known one of the arts of ancient Egypt. As under the Pharaohs men embalmed the corpse of animals—either with a religious view, or to preserve themselves from decay—so all the bees now set to work to embalm the dead animal, the presence of which is a menace to them. For this purpose the workers scatter themselves about the country in order to gather the resinous matter which clings to the buds, for this is what replaces the essences and aloes used by the undertakers of the Nile. The bees closely envelop the dead body with this in the form of little fillets, and deposit all around it a thick, solid layer, which preserves it from putrefaction.

Unveiling the Fraud.

It has now come to the light. We well knew there was some reason under cover why the glucose men were working so persistently to prove that their product was an honest one. Mr. Henry Jones, of Chesaning, Mich., has sent us a copy of the *Detroit Post and Tribune*, with the following item marked:

The decision of the National Academy of Sciences that glucose, as at present made, is healthful, is likely to bear fruit in an unexpected manner. It is understood that a number of glucose and starch manufacturers will soon apply to the proper authorities to have distilleries surveyed at their factories, in order that they may go into the business of making distilled spirits from glucose. Distilleries must, however, be on premises separate from factories under the law. Some of the Western distilleries are said to have already discovered this possible opening of a new competition, and they will make an earnest fight to induce Congress to place some restriction on the manufacture of spirits from glucose. The applications of the glucose men will be made first to the internal revenue collectors of the various districts, and will then go to Commissioner Evans for final approval.

So they have discovered that they can make whisky of the diabolical stuff, and the "boom" is to accomplish that object. We shall watch developments with interest.

We have a few photographs (cabinet size) just taken, of the Rev. L. L. Langstroth, which we can send to those desiring them for 50 cts. each, postage prepaid.

Items like the following are now to be found in nearly every paper, designing, of course, to give glucose another "boost." "The National Academy of Sciences has reported to the Commissioner of Internal Revenue that starch sugar contains no injurious ingredients." The above is taken from the *Norwalk, O., Chronicle*, and was sent us by Mr. H. R. Boardman, who is firm friend of honest trade and undulterated food products.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL. }
Monday, 10 a. m., Jan. 21, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7@10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1½ lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY.—Receipts liberal, and sales satisfactory. White comb, 1 and 2 lb. sections, 17@18c. I could place several thousand pounds of dark, fall extracted honey, at 8@9c. Who has any? Do not all speak at once.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Market is quiet but steady. A shipment of 1,075 cases was made this week per sailing vessel to Liverpool. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@—

BEESWAX—Wholesale, 27½@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, 13@18c.; strained and extracted, 7@8c.

BEESWAX—Firm, at 31@32c.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—Honey continues in excellent demand, as reported last; every lot of choice white comb is taken up as fast as it comes at 18c. in quantity for 1 lb. sections, and an occasional sale at 19; in a very few instances only, 20c. has been reached. Broken lots and second quality is very slow sale. For extracted there is no demand.

BEESWAX—Is eagerly inquired for at 28@30c., but none to supply the demand.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

For the American Bee Journal.

Those Six Frame Hives.

G. M. DOOLITTLE.

On page 25 of the BEE JOURNAL, Mr. D. G. Parker asks about those 6-frame hives, I mentioned on page 626 of the BEE JOURNAL for 1883.

In order to make all plain, I will say that the hive which I use mostly is 24 inches long, 12 inches wide, and 12 inches deep. As the frames are but $11\frac{1}{4} \times 11\frac{1}{4}$ inches square, they must, of course, go the short way of the hive. Five inches from either end of the hive is placed a slotted division-board $\frac{1}{4}$ of an inch thick, the slots being so arranged as to form openings at the right place for the bees to work to the best advantage in the sections, which are to be placed in each of these 5-inch spaces, which are partitioned off for said sections. This leaves a space $12 \times 12 \times 13\frac{1}{2}$ inches for the brood-chamber, in which is placed 9 Gallup frames. The entrance to the hive is a $\frac{3}{8}$ -inch slot cut from the bottom of the hive the whole length of the brood chamber (or $13\frac{1}{2}$ inches long), and is regulated by entrance blocks. When the bees are being prepared for winter, the sections are taken out and a strip of common cotton cloth spread over the frames, and down each side over the slotted division-boards. The 5-inch spaces are now filled with chaff, and a chaff or sawdust cushion placed over the frames. Thus the bees are during the winter. (Please bear in mind that I do not manufacture hives for sale, nor keep for sale the pamphlet describing my hive.) When spring arrives the bees in these hives packed with chaff, etc., are stimulated by spreading the brood, and by other ways familiar to the apiarist, till the 9 frames are filled with brood.

As the weather is always changeable in the spring and early summer, the chaff packing is a great help to the bees, by the way of enabling them to maintain an even temperature, and thus our hives are filled with brood a little earlier in the season than they otherwise would be.

As it is still too early for swarms to issue to the best advantage for the production of honey, and desiring all the bees possible at this season of the year (these bees are in reality our crop of honey), I remove the chaff and cotton cloth from one of the 5-inch spaces, and place three frames of brood taken from the brood-chamber beyond the slotted division-board, placing empty combs in the brood-nest in place of the removed frames of brood. In a week the other end of the hive is served in the same way, which gives me, as will be seen, 15 frames in a hive, thus securing a large force of bees with no disposing to swarm thus far. As the brood in the frames which are set over in the 5-inch space, should be all sealed when

set there, it will be seen that in 12 days the brood should be all matured, and as the queen rarely goes into these spaces to deposit eggs. We have these combs empty of brood, or nearly so, when the flowers begin to secrete honey. They can now be taken out and reserved for new swarms. If any of the combs we wish to take out still have brood in them, they can be used in forming nuclei, or building up those already formed. When I have decided that it is time to put on the sections, I take out the six combs which are in the side box apartment, and set in one tier of sections next to the division-board. (The 5-inch space accommodates two tiers of sections.) I next take from the brood-chamber two frames of unsealed brood, and place behind the one tier of sections; placing two frames of the empty combs, taken out of the 5-inch spaces, in the brood-nest where the unsealed brood was taken from. I now put sections on top and close the hive.

By placing the frames of unsealed brood behind the tier of sections, I virtually have the two tier of sections in the centre of the brood-nest, in which case the bees go to work in them at once, if there is any honey to be obtained. Such a course also has a tendency to keep the bees from swarming. At the end of a week the two frames of brood are taken out from behind the sections and placed in nuclei, or where we can use them to the best advantage, and the tier of partially filled sections pushed back so as to place an empty tier between them and the brood-chamber, when we have a complete number of sections on the hive, and have done it in such a way that we have secured the greatest working force possible, and have also enticed the bees into the sections at the proper time, and that with but little disposition to swarm so far. Now, as the sections begin to get filled, and the brood-chamber remains undisturbed, a part or all of the colonies will soon swarm (I should be pleased if they would not do so).

Now to secure the most honey for the rest of the season, we proceed as follows: When a swarm issues from a hive, the old colony is moved to a new stand, and the swarm hived on the old stand, which secures us nearly all the working force from the parent colony. A part of the sections are taken from the old hive and taken to the new hive. In this new hive is placed 6 Gallup frames (in some I have used only 4, but do not like it as well as 6), and next to these frames are placed a tier of empty sections, while back of this tier is placed a tier of those partly full, taken from the parent colony. The top sections are now put on, and the swarm is hived. The work done in the sections by a swarm thus treated for the next ten days, is almost marvellous.

During the first week after moving, the old colony will do but little work, but at the end of this time they begin to be populous again, and in a few more days are in a flourishing condition. As soon as the young queen begins to lay, 3 of the 9 brood combs are taken out (thus leaving only 6), and

the sections brought up to these combs when all are in the best possible condition to give a good yield of comb honey as long as the harvest lasts. When I first started on this plan, I thought that these 6 combs would not contain honey enough at the end of the season for the colony to winter on, but I find by experience that it has a tendency to reduce the brood, and I have in September from 18 to 22 lbs. of honey in the frames with a very small colony of bees for wintering. If these small colonies of bees will only winter as well as the large ones, I shall fully accomplish my object, which is to get the largest number of bees possible in just the right time for the honey harvest, and rear as few at other times as is consistent with preparing for said harvest.

This getting the bees in the right condition for the harvest may be called my hobby. If so, " 'tis well," for I believe it one of the best hobbies ever rode upon by any one producing comb honey.

Borodino, N. Y.

For the American Bee Journal.

Some Stray Thoughts.

W. H. SHIRLEY.

While reading the excellent articles upon Theory and Practice in the back numbers of the BEE JOURNAL, we have often asked ourselves this question: "How many facts have there been proved, without theory first teaching the way?"

It looks to me as though it is proved beyond a doubt, that bees have wintered in all sorts of repositories, and put in at all times and in all conditions, and have come out in good condition in the spring.

I am not well acquainted with Mr. Humidity, neither am I with Mr. Right-Temperature, nor am I in "hand and glove" with Mr. Pollen Theory. But taking my own experience and experiments, and adding Mr. Pollen Theory to it, backed up by Mr. Granulated Sugar, and then Mr. Pollen Theory, it seems to me, has the best of the argument on wintering.

I would like to ask bee-keepers: has any one lost, or heard of any one losing a colony of bees with dysentery, that was fed on granulated sugar? Speak out, and let us see if that "fact" cannot be turned into theory!

Some time ago, the plan of giving the number of colonies kept by the writer, at his signature, was practiced by some writers, and it was favored by the late convention at Toronto. I think. I thought it was a good plan, for it helped one to estimate the "breadth" of the writer's experience. (I am like Mr. Hutchinson in that respect). But please let me add something more: Number of colonies, and then the number of years that the bee business has been made a specialty. That is what I want to know. I have not time to read long articles from some novice with 3 or 4 colonies of bees and a large apiary in his head, though his head may be ever so large.

Now, one word about bee-keeping being in the hands of specialists. How many bee-keepers are there today, who are making the production of honey their whole business, and getting rich? Now, please do not head the list with A. Grimm, but let us have another name, just once. The bee-keeper who has a farm, a hennery, a supply trade, or some "bee fixing" in connection with his bees, will in time get left behind by the specialist. It is so in all other branches of industry; why not in the bee business? I propose to have bees, hives and fixtures, etc., so fixed in the near future, to be able to sell honey to those who make the bee business a side issue.

No. of colonies, 165. The production of honey a specialty for the past 6 years. Average No. of colonies kept during that time, 100.

Glenwood, Mich., Jan. 7, 1884.

For the American Bee Journal.

Primary Conventions.

BY "THREE NOVICES."

Neighbors, I have called you, to discuss with you, the practicability of organizing ourselves as a precinct society. I am tired of studying alone. I have discovered that I can make better headway when I have somebody with whom to discuss matters. My energy is better concentrated on the subject under consideration, and, in conveying my thoughts to others, it gives force and demonstration to my own ideas.

C. Do you not know here is only us three bee-keepers in the precinct? And after the heavy winter losses we have had of late, we are not likely to be any more, very soon. What sort of a convention do you suppose we would make up?

L. A first rate one! We are all of us of an inquiring turn of mind, and take a somewhat different view of matters. We could not fail to make it interesting and profitable for all.

R. I think we had better try to organize a county association.

C. With but few exceptions I do not think the State associations have accomplished anything. We often find that the most successful bee-keepers stay at home and leave the work to the novices, who spend most of their time in the recital of matters that has nothing to do with progressive bee-culture: take it all in all, I do not think they are a success.

L. Let me tell you why I think they are not a success. It is as you say, the novices take up too much time in telling how their disorganized bees behave in one way and another. It has nothing to do with a well-organized colony. They ought to learn this at home in oft-repeated practical and theoretical lessons, such as we should endeavor to make our precinct meetings.

C. I am satisfied with the classical works handed down to us by recognized authority. I do not think we can improve upon them.

L. It is only conservative men like yourself who consider their work com-

plete. They certainly do not want it so understood themselves. They tell us here is a machine that will do the work, but we are aware that it can be improved upon, and it will be for you to do it, even if it should become necessary to alter some of its fundamental principles. When we strive to do so, and then only do we fully appreciate the value of their work, and make it possible to derive the greatest benefit from it, for ourselves and posterity.

C. That will be for the bee papers to attend to.

L. The papers are what the bee-keepers make them. They are doing excellent work, but if we can in any way aid them it will only be our duty to do so.

C. By what means shall we able to aid them?

L. They will keep a record of our works and forward copies of the same to Mr. Newman, and if he thinks them worthy a place in the BEE JOURNAL, he shall be at liberty to publish them.

C. They will only laugh at our silly proceedings.

L. They may, though I think we should be able to make them intelligent enough to merit criticism. We will lay no claim to any defined knowledge, but place ourselves before them as mere novices. There is one thing about the papers which we would try to improve upon. Often have I seen valuable hints given well calculated to elicit inquiry into matters of importance, only to be passed into oblivion without a single comment having been made upon them, probably because they were not introduced by what you would call "recognized authority." We will make a practice of scrutinizing those points whether they spring from a novice's fancy or a professor's store of knowledge. Our precinct meetings should be the primaries of conventions. Here the ground work should be done and materials gathered. Our monthly reports should be collected for the county association, who should meet twice a year to review and condense our work and forward copies to the State association, which meet once a year to discuss matters of a more general character; to see that the honey resources of our State are developed, and elect delegates to the National convention. It would be for this latter to perform work of a higher order, and see to it that our industry was placed in its proper light before the commonwealth. Thus you see, if our several conventions were characterized by their special functions, they would be more sensitive to their duty, and more likely to accomplish it.

C. Your plan for the conventions is good, I admit, but suppose there was only one man in some precincts, or some one should be found who would have nothing to do with us, he might foster foul brood in his apiary, and we would know nothing of it until the mischief was done.

R. We would appeal to the law, and go there and destroy his bees for him.

C. Now, you always take such radi-

cal views of things, what would the eccentric man be doing all this time, or what would he be likely to do afterwards?

L. We had better let the law alone. I think if he was a man of reason, he would soon concur with us; if not, we would dispatch a phrenologist to examine the case.

C. *Appropos*, foul brood. Do you think we shall ever be able to get this terrible calamity under our control?

L. Yes sir! I am sanguine enough to believe that before 2 years roll around, we shall have it so under our control as to make us laugh at the idea of having allowed ourselves to be frightened by it.

C. What do you think of the article on foul brood in the BEE JOURNAL, by Mr. De Layens. He seems to have partially succeeded in curing it.

L. There is a specimen for you. It is the best article on the subject that ever came to my notice. It knocks their contagion theory all in the dust, and it strengthens me in my belief that we shall never have a reliable cure, but what is better, a never failing preventative. He did not succeed in partially curing as much as in partially "wearing" it out, though he started on the everlasting cure, he discovers a tolerably good preventative, and I hope he is now successfully pursuing his course to the bottom of it. When we set to work on this subject, which I think we had better do the first thing, the spring is the critical time when bees begin to rear brood, then we will take this article for test, and dissect it from beginning to end. And, now, you have heard my views on precinct conventions. When you have made up your mind about it, come over and let me know. If you think favorably of it, we will put the scheme into practice.

Paradox Apiary, Jan. 15, 1884.

For the American Bee Journal.

Statistics of the Honey Crop.

C. C. MILLER, 172-251.

I do not know that any one doubts the desirability of obtaining reliable statistics of bee-keeping, but how to do so in a manner that shall inure to the benefit of bee-keepers is as yet an unsolved problem. In 1882, the North American Society appointed a committee, of which I was chairman, to collect statistics. The effort was made in what was supposed to be the best way, and I suppose few will imagine the many days' labor devoted to the matter with no reward except being accused by some of sinister motives in the matter. Possibly no fuller report was ever obtained, but for practical purposes it was so meager as to be of little if any value. The plan pursued was the very simple one of having each bee-keeper send his report to one address, so they could be all tabulated together. But the majority did not send in reports. No action was taken by the National Society at its last meeting to do any thing further in the matter; but it

certainly does seem to me a matter of so much importance that it is at least worth talking about.

Whilst there may not be a bee-keeper in the land who would doubt the desirability of obtaining accurate statistics, it may not be amiss to consider why we want them, as also what and when. Passing by all other reasons, I am free to say that as a producer of honey, my chief answer to the question why is, that I may better know how to sell my honey, my what is the amount of honey produced in the various sections of the country, and my when is in summer or fall, immediately after the crop is taken, and before I put my honey on the market. I know these that I have mentioned are not by any means all the things to be considered, but they are the ones of the greatest importance, of the greatest money value.

Like all other things, the market value of honey depends on supply and demand, and to know what price to expect for my honey, I should know something about the supply of honey in the country. If this year's crop is double that of last year, the price must be lower, and vice versa. But if we know nothing of the amount produced, both buyer and seller are in the dark, and we may sell early at a low price to find that we might have done much better later, and another year may suppose the crop light, hold our honey at a high figure and refuse a fair price early in the season only to sell for much less late in the season. A few days ago I learned from a prominent dealer that he had offered "20 cents for a lot of comb honey in December, which did not bring more than 12 cents in the latter part of February." Now, I do not believe that either producer or consumer is benefited by this state of things, but until some plan is adopted for securing information of the right kind and at the right time, this uncertain state of things is sure to continue, resulting in an annual loss of thousands of dollars.

Now the question comes, how are we to obtain this information? I do not know. I have thought much about it, and have studied various plans without being satisfied in full with any. If all interested will do a little thinking about it, and offer suggestions, we may arrive at something feasible.

Better than nothing would be to continue the plan tried already. Possibly, if all the bee papers urged it, a fuller report might be obtained next time.

Mr. O. O. Poppleton, vice-president of Iowa, suggests a plan that I think is better. He suggests that each vice-president of the National Society (I hope no Canadian friend will take umbrage at my using the short and familiar name "National" instead of "North American.") We are all one nation of bee-keepers). Mr. P. suggests that each vice-president gather statistics from his own State or territory, and forward them to the secretary to be compiled by him. This plan is good if the vice-presidents can secure the reports. I am of the opin-

ion that more would report to a man in their own State than to any outside.

Another plan. Let influential parties in the different States secure the passage of laws, such as exist in Illinois, and perhaps other States, making it the duty of some officer of the State to collect the desired statistics. Very fully reports were thus obtained in Illinois last year, but whether they were early enough to be of much service is doubtful.

The fact that so many send individual reports to the different papers each year for publication, suggests the thought that if the names were to be published in full, many more would report. This would be a matter of considerable expense, which might be kept down by limiting the reports to those who had not less than 5, 10 or 20 colonies.

Another plan would be to have each bee-keeper send with his report the trifle of 5 or 10 cents, then let all the names be printed and a copy sent to each one who sent in his pittance and report. In this case each name could be printed, if only owning a single colony, as he would bear his full share of the expense.

Now, friends, do not let us drop so important a matter as this without at least trying to get at something practical. I think I could well afford to pay \$5 or \$10 annually for a full knowledge on this subject. I feel confident of the co-operation of the bee papers, and I know that the BEE JOURNAL, which has done so much in this direction, will not go back on its record.

Who can suggest a plan that will work, or show the faults in what has been done or suggested?

Marengo, Ill.

For the American Bee Journal.

Champlain Valley Convention.

The Champlain Valley Bee-keepers' Association, met at the Addison House, Middleburg, Vt., Jan 10, 1884; called to order at 11 a. m., by President Crane.

On motion, V. V. Blackmer was made secretary *pro tem*.

The Chair appointed a committee of three on nominations. A committee was also appointed to select topics for discussion. The committee on nominations reported: for President, H. L. Leonard; Vice-President, E. P. Wolcott; Secretary and Treasurer, J. E. Crane; and they were unanimously elected.

President Leonard, on taking the chair, made a short speech, expressing his thanks for the honor, and his appreciation of the great usefulness of the Association in building up the industry of bee-keeping.

The meeting now being open for business, Mr. Isham asked, "Is it desirable to exchange queens with other bee-keepers for the benefit of their apiaries?"

President Leonard thought it not desirable.

The secretary thought it might often be of great benefit. He had much more respect for black bees, af-

ter having used them in some of his apiaries during the past season.

Question: "Will some strains of bees of the same race prove more productive than others, or will some colonies of bees with the same care, in the same condition in spring, prove more productive than others?"

Dr. Boyd thought the difference owing to good crosses or the innate good qualities of some strains of bees, and that such good qualities should be perpetuated by careful breeding.

Mr. Forbs: Some of my colonies that were in equally good condition in the spring, would vary greatly in productivity. Others spoke to the same effect.

V. V. Blackmer asked which had wintered best, the black or Italian bees? Answered by E. Smith and G. S. Brown, in favor of the black bees.

I. B. Isham gave his experience with the two races the past season. His Italian colonies had given an average of 32 lbs. more of honey, and as many swarms as his black bees, to the colony.

R. H. Holmes inquired, in what respect the black bees wintered best? Answered that the Italians died while the black bees lived. The Secretary's experience had been different; the Italian bees wintered best.

Adjourned till 1.30 p. m.

At the opening of the afternoon session, a report from those present was called for by the President, and much interesting information obtained, which is condensed in the following table:

| NAMES. | No. colonies, fall, 1882. | Colo. spring, 1883. | Colo. fall, 1883. | Lbs of comb honey in 1883. |
|-------------------|---------------------------|---------------------|-------------------|----------------------------|

| G. S. Brown.... | 65 | 37 | 65 | †† |
| V. N. Forbs.... | 29 | 19 | 38 | 1,200 |
| R. H. Holmes... | 8 | 4 | 7 | 200 |
| J. E. Crane.... | 400 | 300 | 438 | ‡‡25,500 |

* Sold to the value of \$151.00.

† Honey for family use.

‡ One colony gave 250 lbs. of honey.

‡ Best yield from one colony, 273 lbs.

† Also 126 lbs. of extracted honey.

**Honey not reported.

††Sold \$200.00 worth of honey.

‡‡Also 1,000 lbs. of extracted honey.

While the various reports were being put on paper, the President called on Mr. F. L. Ripley, of Boston, to give any information on the honey trade or marketing, that might be of use or value to honey producers.

Mr. Ripley then read a short hastily-prepared paper on the best methods of putting up honey for the Boston and other New England markets, which was listened to with great interest by all present. During the reading of the paper, he was frequently interrupted with questions, which were answered satisfactorily to all. He said he did not come to represent the firm of Blake & Ripley, of which he was a member, but rather in the interests of the honey trade. He wished to be-

comes acquainted with the honey producers of New England, and gave many interesting facts in regard to the best methods of putting up honey for market.

On motion of Dr. Bond, a hearty vote of thanks was given Mr. Ripley for his pleasant and interesting paper. He was also made an honorary member of the Association.

Voted, to give those ladies present who were interested in producing honey, the privilege of becoming members of this Association without paying the usual fee. Several ladies gave their names and became members.

The topic, "The best way to build up weak colonies," was taken up.

G. S. Brown: I have not been successful in doubling weak colonies in spring. I have found it better to take a comb of brood from a strong colony and give it to a weak one.

H. B. Isham: I prefer to let the strong ones alone and take from the weak ones.

Edson Smith: I take two medium colonies and feed them, and then take brood from these to help every weak colony. Other members seemed to prefer doubling weak colonies.

Topic: "How far apart should large apiaries be located?"

J. D. Brooks said he had lined bees for 5 miles, yet he lost many of his bees in crossing Lake Champlain; his apiary being located on the east shore, and the distance across being about $\frac{3}{4}$ of a mile.

President Leonard thought large apiaries should be located at least 4 miles apart.

Topic: "Which is best, a hive with dead-air space, or one packed with chaff?"

Various views were expressed; the President thought the chaff-packed hives best.

Topic: "What foundation machine is best for working up wax?"

H. B. Isham thought the Given press was the best; had used, the past season, foundation made on Vander-vort, Van Deusen, and Dunham mills. He governed the thickness of the foundation by dipping.

R. H. Holmes asked if the wax sheets were not thicker on one side than the other, when dipped but once?

E. L. Moody: I dip three times for heavy foundation.

Mr. Beech asked if the foundation was as good after it had been made some time?

J. I. Clarke: When honey is coming in fast, I think it makes no difference.

H. B. Isham: The age of the wax does not make as much difference as the quality.

J. H. Mead asked what conditions would injure comb foundation?

Dr. Bond thought it should be kept from the air. Others said it should be kept in a dry place.

The last topic taken up: "What advantage have the Cyprian race of bees over other races?"

Mr. Isham thought their strongest points were their stings. This seemed to be the experience of all who had had anything to do with them.

The Association then adjourned till the second Thursday in Jan., 1885.

The attendance was good, about 40 persons being present. Some fine sections of honey were on exhibition, also samples of Given foundation and some one-piece sections.

J. E. CRANE, Sec.

For the American Bee Journal.

Circular Saws for Hive Making.

W. D. WRIGHT.

In the BEE JOURNAL, page 26, No. 2, Mr. F. M. Reed, of Hinsboro, Ill., asks for information in regard to setting up and running circular saws. As I have had one in use for a number of years, with which I have cut out several hundreds of hives, clamps, etc., perhaps a description of my arrangement will be of benefit to him.

I have a one-horse railway or endless chain power, standing close alongside of my shop, outside, with the band wheel next to and parallel with the building. A $1\frac{3}{4}$ inch steel shaft 10 feet long is supported by three bearings, about one foot from the floor in shop, at right angles with, and with one end projecting through the side of the building, at a suitable distance from the horse power, with a pulley on the outer end to receive the belt from the power. On the other end of the shaft is a larger pulley from which I run the belt to the saw. I also have a 90 pound balance wheel on this shaft, which serves to partly regulate the speed.

My saw table stands near the centre of the floor that I may have plenty of room to work all around it, and cut up long stuff. The table is about 3 feet wide by 4 feet long, with the top hinged at the back, so that it can be raised or lowered with a hand screw in front, for rabbeting, etc. For cutting hand holes in hives or crates, set the saw wabbling, raise the table until the saw cuts to the proper depth, then raise and lower the table with a lever.

At the right of the saw as it runs towards you (and hinged to the side of the table), is a slitting gauge, which is set with a single thumb screw. At the left of the saw, and 5 or 6 inches from it, is a sliding parallel bar 4 or 5 inches wide, let into the table, flush with the top of the same. Firmly fastened at exact right angles to this bar, is a cross bar, against which the lumber is placed for cutting off. To prevent this cross-bar from getting racked "out of true," fasten a strip across from the back end of the parallel bar to the outer end of the cross-bar, making a figure 4. On this cross-bar I have an adjustable stop (fastened at any point by a thumb screw), which I use in cutting off short stuff. I also have another parallel bar, 8 or 10 feet long, with several spurs in the upper side, which I use in place of the above for jointing the edges of long pieces.

My mandrel cost \$7.50, but the same can now be purchased for \$5.00. It is $\frac{3}{4}$ inches in diameter, and is large enough for 6 or 8-inch saws.

Against the side of the shop, I have a cord connecting with the break on

the power, by means of which it can be quickly put on or off. With a horse that understands his business, I can saw one-half day without looking to the horse at all. I also have a break on the large pulley on the shaft, regulated by a treadle in front of the saw table, with which I control the power, when cutting off lumber, which requires much less than ripping. I can also stop the power with this break if desired.

I get my lumber dressed on both sides, the thickness that I wish, at the lumber yard. In cutting it up, to make it more convenient to handle, I cut a board in two or three pieces, of proper length to cut a certain number of short pieces. I then straighten one edge of all of these pieces, by pressing them down on the spurs in the long bar, so that the saw will just nicely trim them. Now we have a straight edge to work from, they may next be ripped to the right width, and then cut up in lengths by placing them against the stop on the cross-bar, or they may be cut up first and ripped to the proper width afterwards, which I usually do with wide stuff. In sawing stuff for brood frames, I cut it all up in lengths first, then rip up in slats.

I once tried to cut up a lot of 2-inch plank for sections, but found the power insufficient for ripping stuff of that thickness to advantage. No doubt a two-horse power would answer the purpose, but as it requires expensive machinery to manufacture the best dovetailed sections, I prefer to purchase them in the flat of some reliable dealer.

After setting up your machinery to suit you, if the saws run the wrong way, cross one of the belts, which will reverse the motion. To do good work, good sharp tools must be employed, the saws must be well filed, set and jointed. The Simons' saws are the best with which I am acquainted. I have never used the hollow ground saws for cross-cutting, but think they would be best for that purpose, as they require no set, and cut very smoothly. They also cut smoothly in ripping, but very slowly. The saw that has given me the best satisfaction for light ripping is 6 inches in diameter, No. 20 gauge, $2\frac{1}{2}$ points to the inch, and just enough "set" to run freely. However, this saw is too thin to joint the edges of boards, as it will spring if crowded much. Cross-cut saws for fine work should have 5 or 6 points to the inch, No. 17 or 18 gauge, or if beveled, No. 18 gauge at centre, and No. 15 or 16 gauge at circumference. If preferred they may be made thinner than this, but are more apt to spring if crowded.

If new leather belting is used, it should be well covered with castor oil, and allowed 24 hours before using to penetrate, else the greasiness will cause it to slip. Thus treated it will be much more efficient, last much longer, always remain flexible, and will not crack. Also if the grain side is placed to the pulley it will drive one-third more than the flesh side, because it is less porous, thus admitting less air between the surfaces.

The proper speed for circular saws is given at 6,000 to 7,000 feet at periphery per minute. Mine make about 5,000 feet per minute, with good results. The diameter of band wheel on my power is 42 inches. Pulley on outer end of shaft, 10 inches. Pulley at inner end of shaft, 16 inches, and pulley on saw mandrel, 2½ inches.

Knowersville, N. Y., Jan. 15, 1884.

For the American Bee Journal.

Calling Things by their right Names.

DR. G. L. TINKER.

On pages 603 and 604 of the BEE JOURNAL for 1883, the editor gives a valuable glossary of the modern terms used in apiculture. It seems to me that a glossary of terms should be added as an appendix to every standard work on bee-keeping. It would add much to their worth, and be a ready means of reference.

Many more terms could be added, particularly those relating to the different sizes of movable frames, as the Langstroth, Gallup, Simplicity, etc. The description should give the exact size, the length, width, and thickness of the top-bars and the originator. Then the simple mention of the Simplicity frame would mean a size 17½x9½, with a top-bar 19½ inches long, ⅜ wide, and 5-16 thick. The Langstroth frame would mean a size 17½x9½, with a top-bar 19½ inches long, 1 inch wide, and ⅜ thick. Now these are very important matters with those ordering hives from manufacturers. In other words, there seems to be a greater need of some standard in the matter of exact measurement, than there is of a standard frame. And if all movable frames were properly described in our standard works, it would save much confusion and trouble.

The difference of size between the standard Langstroth and the Simplicity frame, is not very great, it is true; but it is sufficient, in my estimation, to require a hive especially constructed for each; and hence, they differ as much in this respect as the Langstroth from the Gallup frame.

For one, I shall hope that all bee-keepers may hereafter agree to make the distinction that justice demands, by calling the size 17½x9½, only after its distinguished inventor, and every other size of frame after the originator, or after the name of the hive in which it is used.

Again, as the broad-frame system of obtaining surplus seems to be quite generally disliked by those bee-keepers who have had the most experience in its use, we may conclude that the time is not far distant when broad section frames will cease to be used by practical bee-keepers altogether.

Since there will be no occasion after a time for a variation in the original measurements given of the Langstroth frame, on account of the size of a section, would it not be advisable for all bee-keepers who like the long shallow frame, to make in the future only the standard Langstroth frame? It seems to me that all bee-keepers

will do themselves honor by commemorating in this one size of frame, the name of the Rev. L. L. Langstroth.

In regard to the use of the word "dysentery," I have always thought it to be improper. The terms "bee dysentery," would imply on inflammatory condition, of which there is no evidence. The words "bee diarrhoea" are undoubtedly the most proper, and if all bee-keepers would try to remember them, we would soon hear no more about bee "dysentery."

New Philadelphia, O.

For the American Bee Journal.

Is Bee-Culture Profitable?

JOHN NEBEL.

I have translated the following from *Welt Bote*, a German paper published in Allentown, Pa.:

This occasionally puzzles some persons who live in a favorable locality. They derive a nice profit from bees that they kept during a good season. The rumor of it is spread far and wide, and encourage many others to commence keeping bees. A few persons in this country have succeeded by their shrewdness to accumulate considerable wealth. Usually have they adopted with honey raising the breeding and selling of imported bees, and occasionally have sold a few hives and implements to bee-keepers.

Experience teaches that most of these persons engaged in the business lose time and money. The cause does not likely lay in the business itself as much as it does in the men that manage it. Some are not satisfied with a small profit; they want to accumulate wealth by it, the same as they have read that others have done. Many commencing the business without any knowledge and without learning from books or from experienced persons. They have heard that bees are intelligent and industrious insects, and presuming also that they can with surety live there alone, and gather honey and take care of themselves, trusting to the little creatures' ability and wisdom. When the weather is warm the hives are molested with moths, and during winter the cold weather seriously injure the inhabitants of those hives.

At the close of the first year they have harvested a large amount of experience, but is not salable. There are plenty of books written with sweet matter from the blessed bees, and they have done much to stimulate the desire for practical experiments. Those who want to save the costly learning of experience, will do better if they first carefully consider the advise of some practical bee-keeper, and then commence with small experiments.

High Hill, Mo., Jan. 14, 1884.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

For the American Bee Journal.

Essays at Conventions.

W. Z. HUTCHINSON.

I have been opposed to the reading of essays at conventions, and in regard to the prosy, exhaustive, half-hour-essays that are sometimes read, I am of the same opinion still; but after attending a few conventions, I do think that essays can be made beneficial.

In my opinion, their primary object should be that of introducing topics, and not that of treating subjects exhaustively; hence, they should be short, sharp, concise, right to the point, of a character that will arouse discussions, and not more than ten minutes long—five would be better.

When a subject is announced for discussion, many times no one wishes to be the first to speak, one waits for another, and the slow, spiritless manner in which the discussion starts off, throws a gloomy, depressing feeling over the whole assembly, and it is some time before the enthusiasm with which the preceding question was dropped is again revived. Before the discussion of each topic let there be read a short, crispy, sparkling, lively, spicy, pungent essay, written by some one who has made a "hobby" of the subject, and thus knows how to handle it, and before the reader has scarcely made his final bow, half a dozen or more will be on their feet exclaiming: "Mr. President," and the discussion starts off with a "boom," and with so much enthusiasm that it is sometimes difficult to stop it in time for the next topic.

I say, let us have essays at conventions, provided that we can have them pithy, pertinent and brief—especially brief.

Rogersville, Mich., Dec. 22, 1883.

[Mr. Hutchinson is quite right. Such essays as he proposes are just what are wanted, but the long ones are killing to the enthusiasm of a convention.—Ed.]

Maine Bee-Keepers' Convention.

The annual meeting of the Maine Bee-Keepers' Association will be held at Small City Hall, Lewiston, Feb. 14 and 15, 1884. The meeting will open at 1 o'clock, Thursday p. m. The afternoon will be devoted to the President's address, reports of the Secretary, Treasurer, Vice-Presidents of different counties, and all committees. A session will be held Thursday evening for essays and discussions. Friday morning election of officers. Friday afternoon essays and discussions. The Western Maine Bee-Keepers' Association will also meet at the same time and place. The Maine Central railroad will grant free return tickets to all paying full fare one way. Let there be a full attendance, and a good display of apiarian implements.

WM. HOYT, Sec.

What and How.

ANSWERS BY

Jamse Heddon, Dowagiac, Mich.

I wish to say to W. C., of N. H., that his questions regarding my hive, etc., being relative to my own private business, and not of general interest, are out of place for this department. Once more, I wish to impress it upon your minds, that the questions are to be sent to the editor, and not to me.

J. H.

Honey Granulation.

Reading an article on Granulated Honey, in the BEE JOURNAL, giving reasons why pure honey granulates, I have a question to solve. We have honey taken during the last honey season, some in barrels and some in 5 gallon kegs. The honey has all been kept in the same room; that in the barrels has granulated, and is as clear and beautiful as any I ever saw, while that in the kegs has not granulated a particle, and seems as pure as can be. Now why this difference?

MRS. J. W. KNADLER.

Valley Sta., Ky., Jan. 14, 1884.

If the honey is all from the same kind of blossoms. I can think of no reason for the different action, unless the wood of the kegs contained some powerful acids. Honey from different plants and trees differs much in its tendency to granulate.

Frost-Proof House.

1. Will a house be frost-proof that is covered inside and outside with tarred paper, and boarded over on the outside?

2. Would tarred paper have any effect on the honey? I want some place to keep honey in, that will not be too expensive.

G. DREW.

Bunker Hill, Ill., Jan., 19, 1884.

1. Certainly not, if there is no heat produced within. If the walls were 10 feet thick, and alternated with sawdust, charcoal, chaff, and dead-air space walls, and closed tight at a temperature of 100, and then the outer temperature reduced to zero, and held there, it would be only a question of time, when the temperature of the inner-room would also stand at zero. No wall can be made perfectly non-conducting, and those that are made partially so, are made to retard the radiation of some heat continually produced within. A cellar receives its heat from the warmer earth which surrounds it. It is a good place to keep honey (if clean), as long as the

temperature within is above that without; but when below, dampness will injure the honey at once.

2. No, not after it had been exposed to the air for a time.

Feeding Bees.

What is the best way to feed bees in the fall and spring, so as to avoid disturbance and drowning of bees?

JOHN TYE.

Toronto, Ont., Jan. 16, 1884.

I use three different styles of feeders, with which I feed liquid food, diluted honey or sugar syrup. One is made for feeding small quantities; another large quantities; another for feeding in cold weather when it is difficult for the bees to move about. They all work on the same principle, and are constructed so as to prevent robbing, daubing or drowning, leaking, loss of heat from the hive, or the necessity of coming in contact with the bees, when filling or re-filling the feeder.

Wax and Comb.

1. In a given number of pounds of empty comb, what amount of wax could be obtained, the comb to be free from pollen?

2. Will it pay to take straight combs which are dark and heavy and melt them to make foundation?

3. By so doing how many sheets of foundation, suitable for brood-chamber, would comb of the same length and width make?

W. FISHER.

Hamler, O., Jan. 16, 1884.

1. I could not say. I think that a comb will make wax enough to make foundation enough to a little more than equal the size of the comb. I have not experimented with this point.

2. By no means; if they are not objectionable on account of having too much drone comb.

3. Answered above.

Wires or no Wires in Foundation.

Which do you consider the most desirable way to use comb foundation, to get it wired, wire the frames or use it without wire? I have never used any wired; have always had success using it without wire, but if there is a better way, I want it. How long would it take to wire 100 frames and prepare foundation into them? How would you make the holes in the frames? What is the comparative cost of different ways?

JOHN CRAWFORD.

Pleasant, Ind.

I consider it best to wire the frame, and put the foundation on to the wires afterward. The "success" of one bee-keeper would not be considered so by another, and so the term conveys but little meaning. Many have

changed from no wires to wires. None have reported a change the other way. A girl or boy of 12 years will wire 100 frames in 3 or 4 hours. It will take a little longer and an older hand to put in the sheets of foundation by hand. We bore our frames with a special machine made for boring, and run by steam power. The wire costs about 1/2 cent per frame, and now you can estimate the whole cost—much depending upon local circumstances.

Locating an Apiary.

Will Mr. Heddon please give in the BEE JOURNAL an explanation, or something approaching one, of the paragraphs on page 177 (front page) of the Kansas Bee-keeper for December, 1883, relative to "How to locate and control an apicultural field." Thanks for reply as to Italianizing; also, some time, please make it a little more clear how you do to teach bee-keepers near you that two persons cannot successfully produce honey in the same field." I always thought this depended on the honey supply and flowers in the locality. There are a dozen in and near Austin. When I make bee-keeping my profession, and go out from political life, of course I shall move into the country.

R. J. KENDALL.

Austin, Texas Jan. 15, 1884.

This question suggests almost too long an answer for this department, but, as I think it is one of vital importance to successful producers, I will write an article on it for next week's BEE JOURNAL.

Local Convention Directory.

1884. *Time and place of Meeting.*

Jan. 28.—Bee-Keepers' meeting at Monee, Ills.
A. Wicherts, W. Cossens, B. Heyen, Com.

Feb. 2.—Marshall Co., Iowa, at Le Grand.
J. W. Sanders, Sec.

Feb. 14, 15.—Maine State, at Lewiston, Me.
Wm. Hoyt, Sec.

March 5.—N. E. Michigan, at Lapeer, Mich.
W. Z. Hutchinson, Sec., Rogersville, Mich.

Mar. 29.—Union Association, at Dexter, Iowa.
M. E. Darby, Sec., Dexter, Iowa.

April 18.—Iowa Central, at Winterset, Iowa.
J. E. Pryor, Sec.

April 22.—Des Moines Co., at Middleton, Iowa.
John Nau, Sec.

April 24, 25.—Texas State, at McKinney.
W. R. Howard, Sec.

Oct. 11, 12.—Northern Mich., at Alma, Mich.
F. A. Palmer, Sec., McBride, Mich.

Oct. 15, 16.—Northwestern, at Chicago, Ill.
W. Z. Hutchinson, Sec.

Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

SELECTIONS FROM OUR LETTER BOX

Extremely Cold in the South.

I put into winter quarters 60 colonies of bees in good condition. Since January the weather has been very cold for this latitude, in fact the coldest ever known; the thermometer reaching 30° below zero on Jan. 5, and this in "Dixie's Land." Last season the honey crop was short; the season previous, we had an immense yield. I have no trouble to dispose of my honey crop at home at 15 cents per pound for extracted.

LEE EMRICK.

Lone Tree, Mo., Jan. 18, 1884.

Honey Production in Northern Wis.

We have a splendid location for honey production—a good many unoccupied fields for the coming bee-keepers. The market is the best in this country. We have not produced honey enough to supply our local market. We are within easy shipping distance (60 miles) of St. Paul and Minneapolis, and there the great prairie wheat raising country commences, and extends throughout Minnesota and Dakota, in which bees cannot be kept profitably. This region is becoming thickly settled with many large and prosperous towns that must draw their supplies of honey from the above-named cities. What is needed is a little capital, and skilled bee-keepers to gather the tons of white clover and basswood honey that go to waste annually, with a market that will take every pound that can be produced for years to come. We are making a speciality of honey production, and are doing well. I will cheerfully answer correspondents among the readers of the BEE JOURNAL, who are in search of good locations for bee-keeping.

A. A. DECKER.

Boycerville, Wis., Jan. 17, 1884.

Feeding Bees in Winter.

We are having some cold weather, 36° below zero on Jan. 4 and 5; 26° this morning. Bees are generally boused through this section, and are all right, as far as heard from; except a few are reported light in stores. I raised the quilts and gave my colonies some sugar candy as directed in the book, "Bees and Honey." They take right hold of it, and I do not see why they will not do well on it. They all seem in prime condition, except a little light in stores. I have the brood nest contracted with division-boards, which I find a great help. The temperature of my cellar has been from 34° to 40°, but it is dry and pure from this on. I shall try and keep it from 40° to 45°. I will report how my candy feeding succeeds in the future. I find the work, "Bees and Honey," a library in itself, and very handy to every bee-keeper. J. W. SANDERS.

Le Grand, Iowa, Jan. 24, 1884.

Steady Cold Weather.

I have 3 thermometers, and all agree that the following were the degrees below zero, from Jan. 2 to 11, inclusive: 15, 22, 31, 33, 34, 15, 27, 4, 6, 26. How is that for cold?

C. W. DAYTON.

Bradford, Iowa, Jan. 15, 1884.

Sweet Home Apiary.

I commenced the season with 27 colonies; increased to 45, and 3 swarms went to the woods or somewhere else. I gave up the chase. My yield is 600 lbs. of comb honey in one and two-pound sections. I sold all my honey at 20 cents per pound. This has been a poor season here. Too much rain in the spring, and in the latter part of the summer and early fall, too cold and dry. There was no fall honey for the bee-keeper, and hardly enough for the bees to keep them until spring. I have been feeding some late swarms. I use the Langstroth hive, winter on the summer stands, and increase by natural swarming. I get my bees all ready for winter by Oct. 1, pack them over the frames with dry planer sawdust, and leave the entrances all open during the winter. This is the way I prepared them last winter, and I only lost one, and that one where the entrance was frozen shut, and the bees smothered. I now bore a ½ inch hole over the entrance, so, in case the entrance freezes up, they may get air through the ½ inch hole above.

JOHN REY.

East Saginaw, Mich., Jan. 18, 1884.

Cold in Alabama.

The weather for 8 days has been cold here. It has been 4° below zero 800 or 900 feet below our apiary. We have lost 15 colonies of bees in this cold snap. The ice has been flowing down the Tennessee river 3 or 4 days. Bees are flying now. T. S. HALL.

Kirby's Creek, Ala., Jan. 14, 1883.

Regular Blizzard.

It was 22° below zero here on the morning of the 6th, and it is 18° this morning. We have had a blizzard for a week. W. H. SHIRLEY.

Glenwood, Mich., Jan. 7, 1884.

Packing Comb Honey for Shipment.

Allow me to make another suggestion with regard to packing sections of comb honey in cases for shipment. By placing a sheet of stiff manilla paper between each row of sections, so that if any comb should break loose from the frame, it cannot fall against the next comb nor get out of place. I discovered this in overhauling cases, which, on arrival, showed some broken combs, and I found by straightening them up and placing the paper between them, I was enabled to save a great many that otherwise would have to be removed and put in pails and sold as broken honey. The adoption of this plan, and the use of the paper pan in the bottom of the case, together with the marking of the cases, "This side up with care,"

with large plain stencil, will insure almost absolute safety in shipping. My "Honey Depot" is becoming one of the institutions of this city.

JEROME TWICHELL.

Kansas City, Mo., Jan. 23, 1884.

Glucose in Honey.

Does not Prof. Preston get things a little mixed in his contribution on page 36, about detecting glucose in honey? His method is the usual one for testing glucose in cane sugar; but I agree with him exactly in his closing sentence, where he says "that this test does not enable us to detect the adulteration of honey by manufactured glucose. I would add that this last remark ought also to be applied to the tests given by Prof. Marsh on page 377 of Vol. XIX. They might answer for the glucose which he had at that time, but the glucose offered for sale in New York, as far as I can find, and largely used for adulterating honey, contains no free sulphuric acid nor calcic sulphate. The grocers in all the larger towns in this region keep the spurious honey, which the polaroscope shows to be largely "manufactured glucose," but yet they would "yield no sign" to Prof. Marsh's tests. I believe the only test available and useful to the public generally, is the "candying" test. Anything claiming to be honey, which granulates, is, without much doubt, pure; and that which will not granulate, when exposed to cold and moisture, is 99 times out of 100 adulterated.

J. HASBROUCK.

Bound Brook, N. J.

How I Prepare Bees for Winter.

I began last season with 108 colonies; increased to 198; got 4,000 lbs. of section box honey and 9,000 lbs. of extracted. So you can see I have not been idle, to say nothing of my other business. We had a splendid crop of white clover, but it was very wet and cold during the early part of the season; very little fall honey gathered. We have had very cold weather; the mercury dancing around zero, and down to 28° below; 3° below this morning. I have most of my bees stored in the bee house. I am wintering 75 colonies on the summer stands. They are in two-story hives; the upper story is full of empty combs. I took off the enameled cloth and laid several thicknesses of newspapers over the frames, then the cloth over all, pressing down the cover so as to cut off all upward ventilation. I wintered 20 colonies the same way last winter, and they came through in good condition. I think it is as good, if not better, than to fill the upper story with chaff or other packing; the moisture that will rise from the cluster will be absorbed by the paper, and if frost should accumulate on the paper at the top of the hive, it will be away from the bees. In preparing bees in this way, it is essential that the bees are clustered in the lower story, as they could not get down to the stores in cold weather. I will report the result. J. M. VALENTINE.

Carlinville, Ill., Jan. 24, 1884.

"No Loss in Wintering Bees."

Many bee-keepers report "no loss in wintering bees." On the first day of March following the winter of 1880-81, our bees flew from every hive and gathered pollen. Did we not winter our bees successfully? On the first of May we had one very large colony, and if all the remnants scattered here and there through the apiary had been put together, they would not have made another. We all are prone to report success, and dislike to report loss. It is so easy to write "wintered successfully," but hard, "lost all or nearly so during March and April." Mrs. L. HARRISON.

Peoria, Ill.

The Main Cause of Disease.

In the article of H. V. Train, page 10 of the current volume, he says: "I do not believe that pollen has any thing to do with bee dysentery *pro* or *con*," and, again, "clover honey is safe stores because it is gathered early in the season and gets well ripened." The latter may be true, but I would ask him to explain the following: In the summer of 1878 we had a flood of white clover honey, and none was taken from the brood-chambers, and that was the stock of the following winter's supply, in which we lost 56 out of 68 colonies, and nearly every one by dysentery. I would further ask Mr. Train, or any other bee-keeper who reads this, if he has ever known a case of malignant dysentery in bees where there was no pollen in the hive? I have not, and I believe it to be the main cause of the disease.

A. A. FRADENBERG.

Port Washington, O., Jan. 21, 1884.

Bees on the Summer Stands.

I have 19 colonies of Italian bees packed on the summer stands, in American and box hives of 3 different kinds. I have been looking over the various hives intending to transfer them all to one kind of hive, and have bought a lot of Dr. Tinker, which, I think, the best I have seen, both as to workmanship and ease of operation. I am always glad when Thursday comes to get my BEE JOURNAL.

CHAS. B. WILSON.

Edmore, Mich., Jan. 20, 1884.

Value of Comb Foundation.

I thought of trying to do without the JOURNAL one year, as I receive a monthly bee paper, and my labor with a correspondence for several weekly newspapers takes up so much of my time; but one week it did not come, and it was so missed that my subscription is herewith enclosed for another year. I put 60 colonies away under fodder the last week in December, and left 36 on their summer stands, in double-walled hives. On the 13th inst. they had a flight, and I was enabled to lift all hives with loose bottom-boards, and clean off the dead bees and litter. I was struck with the fact that where the entrance was underneath, and through the bottom-board there were fewer dead bees and

accumulated moisture, ice, etc., than where the entrance was in front. By setting swarms, hived on empty frames, by the side of those hived on frames partly or wholly filled with foundation, the results left no doubt in my mind as to the value of foundation; but when we have as many or more bees than we need, I am not sure but what we can utilize them in the manufacture of wax better than in any other way; at least while wax is so scarce, and getting scarcer. I shall try it the next season by putting brood chambers, containing empty frames, under each full hive before swarming time. If anything will prevent swarming, I believe this course will; and after the lower chamber is filled, or nearly so, it will be easy to divide if increase is desired; and if not, extract.

W. M. CAMM.

Murrayville, Ill., Jan. 19, 1884.

Bees Buried under the Snow.

It is lonesome work to keep bees without the old BEE JOURNAL. Please put my name on the roll again. Our honey season here was 3 weeks late; the cold rains of spring and early summer, put it back; it was good when it did come. My bees (27 colonies) are now buried in the snow. I have been successful in wintering bees this way; gradually move 5 or 6 together; cover deep with snow and ventilate with a 6-inch stove pipe.

C. SMITH, JR.

Vandalia, Mich., Jan. 21, 1884.

My Report for 1883.

My bees came from the cellar, after their winter repose, in fair condition; but a snow storm with a cold spell of 8 or 10 days weakened them badly, leaving some colonies a mere handful. The soft maples, which had just opened when the bees were first removed from the cellar, were frozen, leaving the bees nothing to do of any account until fruit bloom, which yielded but very little honey on account of the weather. The bees got very little pollen, scarcely enough to keep up brood-rearing up to nearly the time fruit bloom opened. White clover opened fairly, the weather again being unfavorable, it proved to be the source of scarcely any surplus. At this time I found that, out of 62 colonies, only 51 were fit for surplus; the remainder being weak, were used for queen-rearing and improvement of stock. Basswood yielded well, remaining in bloom for the longest space of time ever known by me; but when this closed, the honey season for 1883 was at an end—buckwheat yielding nothing. I have taken 6,200 lbs. of extracted honey, averaging about 121½ lbs. per colony, spring count. I have increased to 118 colonies, which, except 17 or 18, are all fed on sugar syrup. The honey that was extracted to give place for the syrup is not included in the above report. The cellar in which my bees are wintered is too cold, it being at present 36°; last winter it went as low as 32°, and once or twice, 30°; but they seem to winter fairly. The dead bees clogging in

the bottom of the hive when they should be on the cellar bottom. I tried the honey kegs, the past season, and I think they are what we have long needed; they are well made, do not leak, require no waxing, and are of very convenient size. Can any one tell of a pure sugar that is free from color of any kind? I have fed sugar for several years; have tried several different brands of the best granulated sugars, and have never yet found any that would not, when melted with water, produce a blue scum on top. Last fall I skimmed most of it; this fall I have not. A friend suggests confectioners' A, but this has the bluing, or at least that kept here has.

A. A. E. WILBER.

Moravia, N. Y., Jan. 13, 1884.

Extracted Honey.

My hobby has always been comb honey; but last season I thought I would see what I could do with extracted honey, and the first thing I did was to get one of Mr. Dadant's pamphlets on extracted honey. I sent for pint and quart Mason's fruit cans and filled them with white clover and basswood honey. Then I labeled them, telling people that the candying was a positive proof of its purity. Now, for the result. Up to this date, I have sold 1,800 lbs. of extracted honey, and the most of it was candied. In fact, I can now hardly sell liquid honey. I found that the pint fruit cans sold about 3 to 1 of the quart size; another proof that small packages are demanded by the people. I know some who bought the small cans just for the cans, to can fruit in them, and in that way my honey found its way where it would not, if it had been put up in packages that were of no use when the honey was used. I am looking for a large trade next season, if I have the honey. Number of colonies, 167; 6 years a specialist. W. H. SHIRLEY.

Glenwood, Mich., Jan. 14, 1884.

Some Honey Not Candied Yet.

My last communication was about the time when every prospect seemed favorable for a heavy crop of honey. These prospects were partly blasted by continued cold and wet weather during white clover and a part of blue thistle bloom. The honey obtained was of fine quality. I have a few 2 quart jars and ½ pint tumbler of extracted honey which a zero freeze has failed to granulate. I know it is pure honey. The winter here has, we think, been severe, but not so regularly cold as to prevent the bees from flying now and then. On Monday last, they had a good flight, but since then a blizzard struck us, sending the mercury 10° below zero, which is the lowest point touched this winter. I trust I shall be able to send you a good report for the coming season. So far every colony responds to the tap. They are not all packed with chaff, but have chaff cushions on top of the brood frames, with space between the cushions and the top of the frames.

J. W. CARTER.

Pleasant Dale, W. Va., Jan. 18, 1884.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Our New List of Premiums.

Getting up Clubs for 1884.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send *direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

☞ Do not let your numbers of the BEE JOURNAL for 1883 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or in cloth for \$3.00.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Price Lists for 1884.—The following are received:

Paul L. Viallon, Bayon Goula, La.—8 pages—"Aparian Implements and Italian Bees and Queens."

Emil Kratz, Hochheim-Erfurt, Germany—32 pages—"Garden and Field Seeds."

Cole & Brothers, Pella, Iowa—40 pages—"Flower and Garden Seeds."

U. E. Dodge, Fredonia, N. Y.—1 page—"Bees, Queens and Bee-Keepers' Supplies."

The Marshall County Bee-Keepers' Association will meet at the Court House in Marshalltown, Iowa, on Saturday, Feb. 2, 1884, at 10:30 a. m. Subject for discussion: "Promotion of Bee-Keeping." All are invited. Our meeting, which was to have been held on Jan. 6, owing to the cold weather, failed. It was 36° to 40° below zero, and that is a little too cold for a bee-keeper's meeting. As we aim to have a meeting once in three months, we will try it again on Feb. 2, and we hope all, who may see this notice living within our limits, will try it again, for we expect to have a good meeting.

J. W. SANDERS, Sec.

Le Grand, Iowa.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

W. M. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

NO MORE ORDERS WANTED.

I wish to give notice to all bee-keepers that I cannot accept any more orders for Sections this season, as I already have all the orders on my book that I can fill before the honey season commences. I will here say, that I am preparing to build "at once" a larger factory, in which I intend to use steam-power, and expect by another season to be able to fill all orders promptly, by the aid of more and improved machinery. I shall be able to turn off four times the amount of work I ever have before.

Respectfully, A. E. MANUM.
Bristol, Vt., Jan. 21, 1884.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Muth's Honey Extractor,

Square Glass Honey Jars, Tin Buckets, Langstroth Bee Hives, Honey Sections, etc. Apply to C. F. MUTH, 976 and 978 Central Ave., CINCINNATI, O. Send 10c. for Practical Hints to Bee-Keepers.

A NEW HIVE.

Arranged for continuous combs and continuous passage-ways. Will be found a pleasure to work with, and can be easily and rapidly managed. For comb honey it is without a rival, and as an invention, is second only to that of movable brood frames.

Guaranteed to Give Satisfaction.

SEND FOR PRICE LIST AND CIRCULAR.

Sweet Clover

Prices:—25 cents per lb., \$3.25 per peck, (15 lbs.) and \$12.00 per bushel, (60 lbs.) When ordered by mail, add 18 cents per lb. for postage.

Having purchased a large quantity of Sweet Clover Seed, I will make a

Special Discount of 20 per cent.

from the above prices, on all orders received during the month of

JANUARY.

Now is an excellent time to make your purchases to advantage.

Sow it in the **FALL, WINTER or SPRING**—a great many sow it broadcast on the snow—alone, or with field grain or grass; six pounds to the acre. It will do well in field or lane, on hill-side or in valley, on uplands or soil subject to overflow. It is perfectly hardy, standing drouth admirably, and flourishing well during rainy seasons. The honey is the best. As it does not bloom till the second season, it will do no harm if grazed by cattle the first season. It is excellent for waste places and commons.

ALFRED H. NEWMAN,

923 West Madison Street, Chicago, Ill.

AGENTS

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 350 colonies of bees, of our new strain, and of pure Italian blood. As most of you are aware, for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do well to correspond with me.

Among the goods we have to offer, are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Veils, Sample Shipping Crates, Comb Foundation Fasteners, Surplus Honey Registers, our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaaki, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-keeping.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861

Chicago, Ill., February 6, 1884.

VOL. XX. No. 6.

THE WEEKLY EDITION OF

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

✂ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

✂ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

✂ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of smoke and chips and stuff, and make lots of smoke and comfort, and have no dumpers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 will not be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Dzierzon's Rational Bee-Keeping.—A Translation of the masterpiece of the most celebrated German authority, by H. Dieck and S. Stutterd, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a mastery production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman, Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 100 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages. 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurements of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, hoard capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; weighing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Minors, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—
—Vertlichkeit des Bienenstandes—
—Honig pflanzen—Erziehung der Königin—
—Jüttern—Schwärmen—Ableger—
—Versehen—Tali en i s i r e n—Züfeker von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigtuchen, Formkügeln, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniss der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

ESTABLISHED 1862
PUBLISHED BY
THE AMERICAN BEE JOURNAL
ESTABLISHED 1862

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Report of the National Society.

In reference to the "African in the wood pile," about this Report, mentioned on page 51, the following have come to hand from Dr. Miller, the present Secretary of that Society:

FRIEND NEWMAN:—On page 51, Jan. 23, of the BEE JOURNAL, in the article on "Toronto Convention Report," you say: "Perhaps the Secretary can explain it satisfactorily to our correspondent." As stated by Mr. Morhous, the motion was passed to have the minutes published in pamphlet form, and, if I am correct, the old officers elected in 1882 were made a committee to get up the report; at any rate I know that the matter was left in such shape that the present Secretary has nothing to do with it. A stenographer was present in the employ of Mr. McPherson (a nephew of D. A. Jones), and I think he took a full account of the whole proceedings. This stenographic report was, of course, the private property of Mr. McPherson, but I think it was the expectation that it would be used in publishing the pamphlet, paying for the expense of the same or otherwise. I am much mistaken in my impression of Mr. McPherson, if he had anything but the most honorable motives in the matter.

It certainly seems to me we ought to have the report by this time, or hear why we do not have it. Here is a chance for one of those things that we all so much delight in—a personal quarrel—so I pitch into Secretary Root, with all the venom I can command, and demand "Brother Root: where's that report? Get up, quick, and explain." C. C. MILLER,
Sec'y. N. A. B. K. Society.

The following is Mr. A. I. Root's explanation of the matter:

FRIEND MILLER:—I do not know of any one in the world, that would afford me much more pleasure to have a quarrel with than yourself; but I do not believe there is a very good chance now, because, while I think of it, did

you ever hear of the woman that did not want to lend her tub? She said it was broke, leaked, and was full of water; besides all that, she hadn't any and wanted to use it herself. Now, I did not have anything to do with the report, besides I told them when they wanted to put me in as Secretary, that I wouldn't make a good one; and, since you mention it, I remember that somebody else asked about this report, and I wrote to our good friend, D. A. Jones, in regard to it, and he told me all how it was; but I sent the letter to the man who inquired, and now have forgotten his name. If I should undertake to tell it from memory, I might make so many blunders that there would be a chance for more quarrels. However, I will try: A reporter was employed, and a right smart man he was, because I sat beside him. Well, friend Jones said he took the job for so much; but after he got done, he wanted about three times as much as the agreed price before he would give it up. As the trade was a personal one between Mr. McPherson and the reporter, the former gentleman decided to let him keep the report, that he might enjoy it all alone by himself. Now, if I havn't told it right, we will let friend Jones correct it.

FRIEND NEWMAN:—You can publish any or all of the above as you see fit. I do not think there is any danger of any "bitterness" anywhere, do you? A. I. ROOT.

Certainly not. The Association did not pay for any report, and have no claim on private parties for their's. But here is another trouble, about the list of Vice-Presidents for the different States.

WHO ARE THE VICE PRESIDENTS?

Is it not about time to let us know who are the vice-presidents of the North American Bee-Keepers' Society? In the BEE JOURNAL for 1883, page 475, 2d column, 33d line from below, I read: "A list of vice-presidents for the several States and Provinces was also made up." That is all I have seen about the matter. *Gleanings* did not give the list either. Having lately had a letter calling on me in my (former) capacity as vice-president, I should like to know if I was re-elected or not, and also who the other vice-presidents are?

WM. MUTH-RASMUSSEN,
Independence, Cal., Jan. 21, 1884.

The Secretary is invited to further explain. This is no doubt a matter

which he will be able to clear up quite easily—but at any rate give us the list of Vice-Presidents.

The Conventions of New York.

We regret to learn that the two bee conventions lately held in the State of New York were not of the most pacific character.

At the Albany convention of last year Mr. Tennant led that body into egregious blunders, by his war upon the BEE JOURNAL and its editor, as was shown on page 125 of this JOURNAL for 1883. This year having failed to control the convention, he resigned his office and withdrew in high dudgeon, as will be noticed on page 85.

At Syracuse, an attack on Mr. A. I. Root and *Gleanings* was indulged in, and the daily papers, thinking it a nice bit of sensational news, "dished it up in good style." The "newsboys" caught the "cue," and we are informed that they were heard calling out, as an inducement for bee men and others to buy the papers, that it contained news about how "poor bee men were swindled out of thousands of dollars by a man in Ohio."

If these things are so, they are to be deplored; they bring discredit upon bee-keeping and injure the pursuit. How much better it would be to study to create harmony rather than discord. "Let brotherly love continue," is good advice.

☞ We have received a Catalogue of Percheron Horses, for 1884, imported and bred by M. W. Dunham, at the Oakland Farm, Wayne, Ill. It is elegantly illustrated, and contains about 140 pages. Those interested should send for it.

☞ These new Price Lists are received: Henry Cripe, North Manchester, Ind.; G. F. Williams, New Philadelphia, O.; Smith & Smith, Columbus, Wis.; Dr. G. W. Young, Lexington, Mo.; Ellwanger & Barry, (seeds) Rochester, N. Y.

CORRESPONDENCE

For the American Bee Journal.

Michigan State Fair Premium List for Bees and Honey.

W. Z. HUTCHINSON.

Jan. 14, 1884, the Executive Board of the Michigan State Agricultural Society held its annual business meeting at the Russell House in Detroit. Mr. H. D. Cutting and myself as representatives of the Michigan State Bee-Keepers' Association, put in an appearance at the same time and place. From the mass of correspondence and other premium lists in our possession, we "evolved" a list that we thought best; the aggregate amount of premiums being exactly \$300.

There appears to be a disposition upon the part of the fair managers to discontinue offering premiums upon machinery and manufactured goods. The manufacturers of this class of exhibits bringing them to the fair simply for advertising purposes, and the officers of the society consider that, if they allow space for exhibits of this character, they are sufficiently generous without offering any premiums, and it was only by placing the amounts very low upon "apiarian implements," and assuring the premium list committee that, as a general thing, the manufacturers of these implements did not exhibit them, that they were brought there by the keepers themselves for the purpose of enlightening the public in regard to the improved methods now in use in scientific bee-culture, that they were not stricken from the list.

The officers of the society were much pleased with a project proposed by Mr. Cutting, which was nothing less than the giving away to children, upon "childrens' day," of 1,000 5-cent packages of extracted honey labeled as follows: "Compliments of the Michigan State Bee-Keepers' Association." Mr. Cutting and myself devoted considerable time to the discussion of this subject, but did not arrive at any definite conclusion as to how the matter should be managed. Although we did not feel like bearing the whole expense, we were willing to pay at least \$5 each towards carrying out the programme, and we thought that, perhaps, the whole amount might be secured by voluntary contribution of either money or honey. I mention this matter more for the purpose of drawing out suggestions than for anything else. It would certainly be a good advertisement for Michigan State Fair (especially the apiarian department) of her Bee-Keepers' Association, and of her honey. It would get into the papers and go all over; other States might adopt it, and the result would be that thousands of children would in this manner receive, perhaps, their first taste of honey, and this taste would

be so glowingly described that many parents would, perhaps, buy their first package of honey. Any plan that will increase the consumption of honey should not be slighted.

Now let those who complain of the meager premiums offered in the apiarian department of their State Fair, go to work and prepare such a list as they think best, and then go in person (this important) and ask the premium list committee to adopt it. The demands, or rather the requests, should be moderate and reasonable, and, even though refused, there should be no exhibition of "temper" or even disappointment; but the next fair should witness a fine display, premiums or no premiums, and at the next meeting of the premium-list committee let the petition be again preservingly but smilingly presented. The State association of bee-keepers should send a delegate to present the matter to the premium-list committee. When a man comes as a representative of a State Association, his requests are usually treated with more consideration than were they simply private requests. But all these things require time, patience and perseverance. It has taken several years of hard work to place Michigan's bee and honey premium where it now is, and now that we have secured this liberal list, let the bee-keepers come forward and make an exhibition next fall that will eclipse all former bee and honey shows. But I have chatted long enough, and I know that you are all anxious to see the list, so here it is:

| | 1st Prem. | 2d Prem. |
|---|-----------|----------|
| Best colony Italian bees in movable comb hive..... | \$10 00 | \$ 5 00 |
| Best colony Syrian bees in movable comb hive..... | 10 00 | 5 00 |
| Best colony black bees in movable comb hive..... | 10 00 | 5 00 |
| Largest and best display of full colonies of different races of bees..... | 10 00 | 5 00 |
| NOTE.—Purity of race and numerical strength shall constitute the competing points; and colonies must be exhibited in such shape as to be readily seen on at least two sides. Bees must not be allowed to fly when visitors are present. | | |
| Largest and best collection of queen bees, alive..... | 8 00 | 5 00 |
| Largest and best display of comb honey..... | 20 00 | 10 00 |
| Largest and best display of extracted honey..... | 12 00 | 6 00 |
| Best specimen of comb honey, not less than 20 lbs., quality and manner of putting up for the market to be considered..... | 10 00 | 5 00 |
| Best specimen of extracted honey, not less than 20 lbs., quality and manner of putting up for the market to be considered..... | 8 00 | 4 00 |
| Largest and best display of samples of different kinds of honey..... | 10 00 | 5 00 |
| Best specimen of beeswax, not less than 10 lbs..... | 5 00 | 3 00 |
| Largest and best display of honey-producing plants, pressed and mounted, or in bloom..... | 10 00 | 5 00 |
| Largest and best collection of apicultural literature..... | 10 00 | 5 00 |
| Best bee for purposes..... | 5 00 | 3 00 |
| Best honey extractor..... | 5 00 | 3 00 |
| Best comb foundation machine..... | 8 00 | 4 00 |
| Best specimen of comb foundation..... | 4 00 | 2 00 |
| Best specimen of comb foundation made on the grounds..... | 5 00 | 3 00 |
| Best bee smoker..... | 2 00 | 1 00 |

Test for Purity of Beeswax.

CHAS. DADANT & SON.

FRIEND NEWMAN:—We have just hit upon a very easy plan for testing the purity of wax, and will give it to you: Dilute water and alcohol in a vial about $\frac{3}{4}$ water and $\frac{1}{4}$ alcohol. Then take a small piece of wax which you know to be pure (you or any bee-keeper can easily find such), put it in the vial and add alcohol slowly until your mixture is of the same specific weight as the wax. Then the wax will go to the bottom very slowly. Your testing apparatus is now ready. If you have wax with tallow or paraffine, and put it in the mixture, it will remain at the top, its specific gravity being less than that of the mixture. If it contains rosin, on the other hand, it will go to the bottom quickly, being heavier than the mixture.

In testing, you should take care that the sample contains no air, as this would change its specific weight. In testing foundation, therefore, the sample should be thoroughly melted before testing, so as to exclude all air from the inside of the sample.

This test is cheap and conclusive. There may be a small difference from one sample of wax to another, but it is not so as to exclude the clear discovery of paraffine or tallow, which are the worst enemies we have, for purity of wax. We have tested one or two samples which we suspected, and they floated in a manner that proved their impure origin clearly.

As this may be of use to bee-keepers at large, we authorize you to publish the above entirely in the columns of the BEE JOURNAL, and will be glad if it can be of service in preventing the sale of adulterated wax.

Hamilton, Ill.

Eastern New York Convention.

The seventh annual meeting of the Eastern New York Association met in Agricultural Hall, Albany, N. Y., on Jan. 8, 1884. Called to order at 2:30 p. m. President Vrooman, of Seward, N. Y., in the chair. John Aspinwall was elected Secretary. *pro tem.*

The President made some eulogistic remarks relative to the character of the late Secretary, Mr. Theo. Houck, and appointed a committee composed of Messrs. Tennant, Snyder and the Secretary, to prepare suitable resolutions respecting the death of Mr. Houck, to be presented to the association for approval on the afternoon of the 9th.

Twenty-six new members were taken into the association.

Treasurer's report showed \$20.98 in the treasury.

The President then read his address. The election of officers was deferred till the next day.

Mr. Tennant talked at some length on different subjects. He advised more unity in the different associations. That associations should com-

bine together more closely and endeavor to regulate the honey market to some extent, and he wanted to know whether the association thought honey should be consigned or sold "out and out"—also that our Board of Trade should be impressed with the importance of our business.

The President announced the presence of Mr. Betsinger, and he was unanimously elected as honorary member.

Mr. Pierce reported a failure, due, he thought, to wintering in Langstroth frames, out of doors, without chaff packing.

Mr. Garrett reported that his bees working in the early spring on the pine trees, had a great deal of spring dwindling, which, he thinks, was caused by the bees working on the pines.

Mr. Woodward reported, spring count, 72; 4,000 lbs. of comb honey in one-pound sections, and 1,500 lbs. of extracted. Wintered part out doors, and part in the cellar.

Mr. Wright wintered 100 colonies, and saved 75, was disabled with a sore foot. Bees swarmed when no honey was coming in. He wanted to know what good an extractor was to control swarming, when there was no honey to throw out.

The President: Spring count 66; increased to 77; 6,000 lbs. of comb honey, and several pounds of extracted honey.

Mr. Tennant did not believe in stimulative feeding, but thought if bees were wintered well, they needed no feeding. Wintered 166 in one yard, and 120 in another; both lots were wintered in-doors.

The meeting elected Mr. E. W. Philo, Assistant Secretary *pro tem*, and adjourned till 7 p. m.

Called to order by the President. The question was drawn from the "question box" as follows: "How to move bees a short distance, during the working season, with the least loss?"

Messrs. Brown, Garrett and Tennant thought they should be moved a short distance at a time, on a rainy day, and a board put over the front of the hive to cause the bees to mark their new stand.

The President would move the strong colonies and leave the weak ones to receive returning bees.

Mr. Brown would shake the bees up well and get them confused.

Next question: "What is the best time and way to unite nuclei?" The fall was the best time, and have several nuclei in a box, and remove division boards to unite them.

Next question: "What is the best comb foundation?"

The President: Prefers Van Deusen No. 3. Prefers it fresh milled.

Mr. Tennant thinks Van Deusen's flat bottom No. 3; also uses Vanderbilt, and has used the Dunham.

Mr. Brown believes the Given the best. He has used the Oatman, and several other kinds.

Mr. Green said he has used all kinds but the Given and Oatman, and found fish bone in all of them except the Van Deusen.

Mr. Brown presses his foundation in on wired frames.

Mr. Betsinger thinks it bad policy to put wire in frames and press foundation on it; he thinks wires injurious to brood. Adjourned.

SECOND DAY.

Called to order at 9:45 a. m. President Vrooman in the chair.

A letter from Mr. Geo. W. House, Secretary of the Northeastern Beekeepers' Association, was then read, condemning the discussion of adulteration, because it gave it too much publicity, and advising a consolidation of this society and the Northeastern.

A discussion followed, and it was decided that local associations were most beneficial, and the Secretary was appointed a delegate to the Northeastern Association.

Mr. Aspinwall then gave an address on the adulteration of honey.

The officers were all re-elected.

The President appointed Messrs. Pierce, Woodward and Green as a committee to report on exhibits. Adjourned for dinner.

Meeting called to order at 1 p. m.

Mr. W. W. Cary, who was present, was made an honorary member.

The question: "How to prevent adulteration," was then taken up.

Mr. Tennant said, put all in comb.

Mr. Snyder said, to put extracted into pails under your own name, and warrant it pure.

Mr. Pierce had good success in this way.

Mr. Tennant said laws were enacted, but they did no good; silver gloss syrup was 25 per cent. glucose.

Mr. Betsinger said there were laws against thieving, but little good they did, unless efforts were made to catch the thief—that we must work together to stop middlemen from tampering with honey.

Mr. Tennant believed we could not get along without middlemen.

Mr. Betsinger said no middlemen dared to adulterate his honey.

The fourth question: "What can we do to benefit our honey market?" was then taken up.

Mr. Tennant thought this a very important question, and that we should take active measures to make higher prices. He also said that he thought honey should be sold outright and not consigned, that commission men were working the price lower and lower every year; that these who bought outright, paid the best price.

Mr. Pierce believed in a home market; he got quick sales.

Mr. Lord thought supply and demand regulated prices. After further discussion it was decided to appoint a committee of three to confer with the different honey houses to try and establish some regularity of prices, and to report to the members of the association by next September.

The President said he would appoint the committee later.

The resolutions of regret at the death of the late Theo. Houck were presented by the committee and ac-

cepted by the association. They were as follows:

WHEREAS, We have lost, by death, our late brother and secretary, Theo. Houck.

Resolved, That we deeply regret this loss, and that, in his death, we lose a pleasant companion, an energetic fellow-worker, and an efficient secretary.

Resolved, That these resolutions be forwarded to the family of the deceased with the deep sympathy, and that these resolutions be sent to the several bee papers for publication. Carried.

The next question was: "Which is the most profitable section?"

After long discussion it was agreed by almost a unanimous vote that the two-pound section was the best. The meeting then adjourned for supper.

Called to order at 7:15 by the President. The question: "Which race of bees are the best?" was then taken up; this discussion was very interesting, and occupied a good deal of time. Of the several races, Carniolans, Italians, Holy Lands, hybrids and albinos, the latter were conceded to be either a sport, or simply pure Italians, but not a different race. The only one who had tried Carniolans was Mr. Aspinwall, and he thought them the best. Quite a number had tried and liked the albinos, as they were gentle and good workers. Hybrids also had been tried, and for business at both ends, were thought unexcelled. Pure Italians, which included albinos, were then noted by the association as the best, in their estimation.

The following questions were then drawn from the box and answered as follows:

1. "What degree of heat is best for cellar wintering?" Between 45° and 55°.

2. "Can straight combs be produced without separators?" No.

3. "Will it pay to make our own foundation, if we have 50 colonies?" Think not.

4. "Is it customary to put printed paper between sheets of foundation, or simply thin manilla paper?" Thin manilla paper.

Adjourned.

THIRD DAY.

Meeting called to order at 9:30; Vice-President Snyder, of Albany, in the chair, the President having been called home the night before.

As soon as the meeting opened Mr. Tennant rose and said that the market question had not been settled to his satisfaction the day before, and moved it be reconsidered. The motion was seconded, and the matter discussed.

Mr. Aspinwall said that the matter had been fully considered yesterday, when there were more members than now.

Mr. Tennant said he had talked with a number, and there was a general feeling for reconsideration, that a committee to confer with the different honey houses was not the thing, but that we should appoint the heads of the different honey houses to confer among themselves.

Mr. Betsinger said they would not agree, in committee, any better than cats and dogs.

After similar remarks by other members, the motion was put and lost, only Mr. Tennant voting in favor of reconsideration.

Mr. Tennant said that he did not believe the association was working for its own good or his, and, therefore, tendered his resignation and withdrew, bidding the members farewell.

Mr. Betsinger said he regretted that a member should withdraw from the association just because his opinion did not happen to coincide with others.

The next question was: "At what age are queens most prolific?" It was generally thought that no definite time could be given, as it depended upon the queen; but after three years, a queen had better be removed.

The committee on the best manner of obtaining statistics of the honey crop for the next year, reported as follows:

The best plan is to have the Secretary confer with each member of the association, requesting him to ascertain the crop in that vicinity, and that members inform the Secretary at their earliest convenience the result. The total should be then at once published in the several bee papers.

The question: "How shall we winter our bees successfully?" was discussed at length. It was finally decided, by a vote, that from a financial point of view, considering the honey consumption when wintered in-doors and out, that cellar wintering was the best for this latitude.

After some routine work, such as naming the second week of next January as the time for the next meeting, and the appointing of the President, Vice-President and Treasurer, as a committee to obtain exhibits for the next meeting, the convention adjourned.

The above is a condensed copy of the minutes of the seventh annual meeting of the Eastern New York Bee-Keepers' Association.

JOHN ASPINWALL, Sec.

For the American Bee Journal.

Locating and Occupying a Field.

JAMES HEDDON.

We have found by experience, and observing the actions of such apiarists as Adam Grimm, E. J. Oatman, Capt. Hetherington, Chas. Dadant & Son, and numerous other bee-keepers whose success and intelligence command our respect, that there is such a thing as over-stocking an apicultural area. By that term I mean a floral field of a diameter twice as long as the common working range of our honey gatherers. By over-stocking, I mean having more bees in one field or area than the flora of that area will support in such a manner as to give us the greatest aggregate amount of surplus honey that can be realized from the field one year with another.

When we have one field well stocked, and the business therein carried on is paying a satisfactory profit, the

law of "advantage, in specialty" imbues the mind of the apiarist with a desire to do more of the same business. His experience tells him that to do so necessitates a change of *modus operandi*. One or more "out apiaries" must be started; horse and wagon, more fences and buildings, and time spent getting from one place to another are all added, to come out of the profits of these after-apiaries.

After all of these extra expenses, these apiaries will not get the careful attention nor yield as great a profit as the "home apiary," more especially as it did when it alone claimed the master's undivided attention. Employees come next, and their main object is of necessity the wages rather than the profits from the production of the bees they attend, unless, perchance, they are working for a share of the profits; a plan I much prefer as the best for both parties. But to sum up: As it is a fact that as you enlarge this business up to the complete occupancy of one field, the profits on capital and labor increase, and after that, on further enlargement, they decrease, we see how important it is that an apiarist should alone enjoy at least one area, and the poverty or riches of the field, change not the principle. The richer the field, the greater the inducement to occupy it, and fully as great the desire will be to occupy it alone.

But how to select and then control an area. Use your best judgment in choosing a rich location; a detail description of which cannot be accurately given to be a suitable guide to bee-keepers located in so many latitudes and longitudes as this JOURNAL visits. In this selection, as in all acts, "do not to others that which you would not that they should do unto you." For the welfare of your pocket and comfort of your conscience, never locate in a field already occupied. Show your brother bee-keepers that any man that will do that is just that much nearer related to the knave or fool than you are. Let us clearly understand the term "occupied." I consider a field occupied when it has in its limits a located bee-keeper who either is or intends as fast as possible to stock it to its capacity. This, and nothing short of it.

Now let us imagine that you have located a field. Let us suppose that a member from the ranks of the mean or mistaken should begin operations in your field. Yours by priority of location. Yours alone, because there are plenty of other unoccupied areas. Now, what shall you do? Be honest, kind and charitable. "Do unto others as ye would that they should do unto you," and use all just and reasonable means to make them do likewise. You have but to tell and act the truth to accomplish your object.

You will say: "Good morning neighbor Jones, how goes the craft?"

"Good morning Mr. Kendall; oh! middling, middling."

"Mr. Jones I think you made a mistake in trying to produce honey in an already occupied field."

"Well, Mr. K. I will give you credit for thoroughly understanding this business, but I know you will forgive me if I tell you my honest opinion, which is, that you are a little selfish in this matter. You think that my few bees working in the same field with yours will cut down your private yield, somewhat; at least, that is what 'Joe,' your hired man, says."

"Well, Jones, I thank you for your frankness and compliment to my ability, and will take you at your word, at least regarding my possessing a thorough knowledge of the principles of one feature, over-stocking. Now, Jones, if I dread your 30 colonies, ought you not ought to dread my 200 to an extent that would at once cause you to move yours off to an unoccupied field, the same as I did when I came here? No, Jones, I feel as sorry on your account as on my own, for while I must "get on" a little more slowly, you must fail.

If Mr. Jones cannot see the point sufficiently clear to cease further efforts at growing into successful opposition, he must be like the young dandy who tried to get a No. 8 foot into a "large 5" boot, and need not be feared. Very soon he will propose to sell all out to you, when you can buy at a true cash value. Never pay any more; give no bonus; offer no premiums for another similar wrong. But you say, suppose Jones won't sell, what then? Then this: You know that the more colonies kept in one area the less is the *pro rata* yield. Instead of selling off or starting an out apiary (what is the use to start an out apiary and have the home field divided? This is only a gradual moving out and relinquishing the field to a usurper), start out in the spring with colonies enough to over-stock the field, and reduce the *pro rata* yield to that point that Jones' apiary will not pay. This plan does not harm you as much as Jones. Let us figure. Say you start with 100, and Jones with 30 colonies, and the *pro rata* yield is 50 pounds per colony, you have 5,000 pounds, Jones 1,500 pounds. Suppose you start with 250 colonies and Jones 30 colonies, or 280 in all, and the *pro rata* yield is 20 pounds per colony, you have the same amount of surplus as before, and Jones has only 600 pounds, or just two-fifths, and three-fifths nearly all taken from the net profits will kill any business. You furnish a little more capital and work a little harder. If this does not look on paper like a success, take my word for it that it has proven so with me, twice. I will not work against or chide a man for doing that which I will do myself. I will not do that which I will try to prevent others from doing.

Twelve years ago, when I tried to awaken some of these ideas in the minds of my brother bee-keepers, ideas that I felt sure would spring into being as soon as bee-keeping arose to the dignity of a business, a profession, I was laughed at, sneered at, and almost everything was done except to answer my arguments. At that day this article would have been a target, written under protest, forced

forward only by the inspiration of neglected truth, smothered facts. Now it comes in response to questions from men who bid fair to rank among the leaders of our business in the near future. I expect the A B C class will wonder. The old producers will generally sanction it. The froth of the profession, those whose interests lie in the sale of such wares as only the beginner can be caught with, will scream the same old scream, "Put him out." But time has added wonderfully to the ranks of the experienced. There are too many of us to "put out" now.

There may be some who are honest and sincere, who have no other interest than that of the producer to bias their judgment, who may wish to take issue with me. With them it will be a pleasure to discuss until we are put to rights, or they are, upon so important a subject; one whose importance and interests are growing so rapidly. With no other class do I care to argue. I wish it to be remembered that at the time above referred to, a time when this business was run by gas to a far greater extent than it is to-day, the BEE JOURNAL was either conservative enough, or philosophical enough, or generous enough, or more likely all combined, under the management of its present editor, to give us a hearing above the multitude; a gift that most of the other bee publications withheld. We shall be slow to forget the debt.

Dowagiac, Mich., Jan. 24, 1884.

For the American Bee Journal.

My Critics.

WM. F. CLARKE.

Early in the New Year I received the following friendly criticism, which, as it contains also a couple of items of bee news, may, perhaps, fitly find a place in the BEE JOURNAL along with an apology for not forwarding it sooner. The apology will be accepted, I know, when I state that I have been in the throes of moving and settling down in a new home, hence, a variety of matters have been either overlooked or postponed:

MR. WM. F. CLARKE:—In reading your article in the last BEE JOURNAL, it occurred to me that the definition to bee moth should be more explicit. As I understand it, the moth does not eat wax at all, but the larvæ does. The past year has been a very poor one for honey, $\frac{1}{4}$ of a crop is all. Bees are wintering well, so far.

L. C. WHITING.

East Saginaw, Mich., Jan. 3, 1884.

To the same purport as the above is Mr. Poppleton's criticism on page 43. As editorially remarked in a note at the close of Mr. P.'s communication, "the point is well taken," as to its being the larvæ and not the moth which eats wax, though this was not the "point" that caught my eye, but rather whether "miller" is a strictly and scientifically correct term to use in an apicultural vocabulary. Prof. Cook will, no doubt, be able to settle

the point I raised, and I for one shall feel obliged by his doing so.

I am not so sure about the correctness of Prof. Phin's criticisms as to "pollen" and "farina." It is not my good fortune to own Webster-on-a-bridge," as Mrs. Partington called it, but the dictionary I go by, gives the following definitions: "Pollen, the fecundating dust contained in the anthers of flowers; fine bran." "Pollenarious, consisting of meal." "Farina, the pollen or fine powder contained in the anthers of plants, and which is supposed to fall on the stigma and fructify the plant; the flour of any species of corn or starchy root, such as the potato, etc.

Let us not forget, in our aim to be critical, that it is possible to be hypercritical, which my dictionary explains to mean, "critical beyond use or reason, excessively exact."

Will my correspondents kindly notice my present residence, and address me accordingly?
Speedside, Ont.

For the American Bee Journal.

Section Racks and Bee Spaces.

M. BRAY.

On page 514 of the BEE JOURNAL for 1883, Mr. T. E. Turner says the racks should be no deeper than the sections, $\frac{1}{4}$ inches, and then one tier will set right on another, leaving no space between tiers. I have had, and used this system of no bee-space between and above the boxes. I did not like it, and will give some reasons for not liking it.

1. In tiering up, the killing of bees is unavoidable. With the rack of empty sections in place, one may pick up the rack that is to be raised (it is full of bees, and bees running thickly over the bottom), and attempt to place it on the empty rack, no matter in what way or how gently he may push, he is certain to kill a few bees. If he only catches the bee's foot and keeps pushing, that bee is gone.

2. The cover will be more or less glued to the boxes; in taking it off, we break the glue, with a jar; this excites the bees, and they will soon be running over the top of the boxes. I never could put the cover on without crushing two or three bees; these two or three bees, with a little bee glue, will raise the cover a little and the cover will warp some; this will give a half a chance to the wax moth, and this seems to be all they want.

I find it more work to clean the propolis from the boxes with no bee-space. As well have no bee-space over the brood frames as over the section boxes.

I am now using the Heddon case system, for comb honey, and get along with but little killing of bees, consequently do not get quite so many crushings; the boxes come off cleaner than from any other system that I have used.

The honey board is a necessity. Mr. Turner, on page 514 (1883), makes the depth of the Heddon honey-board bee-space $\frac{3}{8}$ inch; honey-board, $\frac{1}{2}$

inch; making the whole $\frac{3}{8}$ of an inch. The sample sent me was only $\frac{1}{4}$ of an inch. I make mine $\frac{1}{2}$ inch, $\frac{1}{4}$ bee-space; it takes off the brood frames better than one that is more stiff.

My comb honey goes on the market in retail (1 and 3 lbs.) packages. This demands the use of separators. I have made some triling changes in the Heddon section case, to adapt it to the use of separators. To my mind it is one of the best of separator-systems. I do not claim to have improved it, for Mr. Heddon or any one that can get along without separators. I have no supply business, and no axe to grind.

New Almaden, Cal., Jan. 25, 1884.

Comb Honey Reported as being Made Without Aid of the Bees.

C. R. ISHAM.

Not long since I was in the large retail grocery store of Chas. Salmon, Esq., of Rochester, N. Y., talking up the honey trade, its prospects, etc., when handing me a section with contents partly used, he inquired what kind of honey do you call that? I at once told him it was honey gathered from Alsike clover blossoms. He then remarked a lady has just returned that box claiming it was not honey, but a manufactured article. I said there was no way of manufacturing honey and putting it in the comb like that, all sealed over with beautiful white cappings; and further explained that the lady had probably purchased this section with the impression that it was either white clover or basswood honey, which would be light amber or light colored, instead of the pale wine color characteristic to Alsike, and although of excellent quality, yet these should not be classed together. He said it was pure honey, but the lady had been reading some of the newspaper articles about comb manufactured and filled with imitation honey, sealed over as though capped by the bees, and sold for a genuine article; and she had formed the impression that this was of the kind she had been reading about.

Mr. Salmon then stated that this newspaper talk about adulterated honey was seriously affecting his trade, and unless something was done to counteract its influence, the honey trade would be badly injured; that he knew they were erroneous, but that did not prevent a great many who naturally would become consumers from entirely discarding honey from their tables as a vile, unhealthy article of food. He then related the following circumstance which took place in his store shortly before this conversation:

He had received a large consignment of honey from Mr. C. J. Van Eaton, of York, part of which was piled in his show window. A gentleman of the highest integrity who represents the Kingsford Starch Co., observing the display, candidly put the interrogatory: "Is that manufactured honey, or was it made by the

bees?" Being assured that it was the work of the bees, he made the statement, that while visiting the Exposition in Chicago, this fall, he saw a large exhibit of comb honey made by Thubers, of New York, that bees had never seen or touched, the whole being manufactured without their aid or assistance. He was positive in his statement, and could not be convinced to the contrary. This gentleman, as before stated, is head agent of the Kingsford Starch Co., and resides in Detroit. His name and address can be obtained if desired.

I promised Mr. S. to write you full particulars as you resided in Chicago, and probably would be cognizant of that exhibition of honey. When persons of such standing and business capacity as is this gentleman, are so grossly deceived and induced to believe such impossible statements, and go repeating them in their travels among grocerymen all over the country, how is their influence to be counteracted and the contradiction as extensively told as the story has been circulated? While the *BEE JOURNAL* and *Bee-Keepers' Magazine* have taken firm and decided positions against food adulterations of all kinds, and especially that of honey, declaring war to the knife against glucose and grape sugar, I regret to say that one bee periodical, with a large circulation, though more passive on the subject, still recommends their use for feeding purposes; thus giving to the outside public grave cause for suspicion. Here comes the question for serious consideration: Is it advisable to buy grape sugar for feeding purposes, when a suspicious public are so closely watching the honey raisers' every movement?

After reading reports of raising (to them) of almost fabulous amounts of honey, are they not likely to have a doubt about its purity when they have seen boxes and barrels of this great adulterant of all sweets unloaded at the bee-keeper's door? Will it not be better for honey raisers to entirely discard the use of this vile adulterant that the product of their apiaries may not have even the taint of suspicion. Peoria, N. Y.

[The Detroit man had been deceived by Wiley's lie about the manufacture of comb honey—which he excused as a "scientific pleasantry," too absurd for any one to believe. There was no such exhibit at the Chicago Exposition. It is nothing but fiction, for we personally examined the exhibition, and there was no large exhibit of comb honey there.—ED.]

For the American Bee Journal.

Elgin, Ont., Bee-Keepers' Association.

The bee-keepers of Elgin met at St. Thomas on Tuesday last, when Mr. S. T. Pettit, of Belmont, was appointed President of the convention; Wm. H. Hill, of St. Thomas, Vice-President, and John Yoder, of Springfield, Secretary-Treasurer. It was resolved

that this association be known as the Elgin, Ont., Bee-Keepers' Association, after which suitable constitution and by-laws were adopted, and that this association believe that the honey interest of Ontario demands legislation to enable bee-keepers to successfully contend with foul brood, and that a director be appointed to act with the executive committee of the Ontario Bee-Keepers' Association in that behalf. Adjourned until the 29th inst.

For the American Bee Journal.

My Report for the Past Season.

S. CORNELL.

Last spring we had 64 colonies alive out of 65 put into the cellar in the fall, one having starved. For about seven or eight weeks the temperature averaged about 8° lower than usual for that season of the year. I sold four, lost several queens, and united weak colonies, so that on the 2d of July, I had only 48 good, bad, and indifferent. We ran 43 of these for extracted honey, and reserved 5 of the weakest to be used as circumstances might require. We commenced to extract on the 7th of July, and finished on the 24th of August, with a yield of 8,579 lbs., and an increase of 58 besides 154 lbs. of comb honey. We weighed the combs of each hive before and after extracting them. I have never tried to determine accurately how much the honey loses in weight by remaining in the solar evaporator a week or ten days, but I have an opinion that the loss is considerable. We have sold the last of the crop, and have realized an average price of 13 cents.

On the 10th of October we weighed our bees and found it necessary to feed 350 lbs. of loaf sugar. We weighed them again on the 12th of November. Those which had not been fed lost from 2 to 3 lbs. in that time. I sold 2 colonies, and my son purchased 11 on his own account, making in all 115. Of these 114 are stowed away in a small cellar, covered with quilts of wool, but without bottom boards, there being a clear open space of from three to four inches under the frames of each hive. We are wintering one outside in one of Jones' double-walled hives.

I have a strain of bees which I believe I might back against anything on the Continent for gathering honey, and for getting into good condition in the fall for winter. I bought a dollar-queen from Mr. H. Alley in the summer of 1880. After a few weeks I found she had either met with an accident or else she was superseded, because I found in her place a nice, yellow unclipped queen, not yet fertile. For two years in succession I found this colony was so much stronger and had so much more stores than the others, that I decided to leave it on the summer stand. In the summer of 1881, it was the best in the yard for honey gathering. In 1882 we had hardly any honey, but I divided and subdivided this one so much for

queen rearing that it was not strong in the fall. Notwithstanding this it had a queen-cell with an egg in it on the 25th of May last. We did not allow it to swarm, but changed places with a 3-frame nucleus. Six days after, the nucleus threw off a natural swarm on account of the crowd of bees obtained from the strong one. In July last the queen was superseded leaving a nice lot of queen-cells. I placed one in each eight combs, and when they were nearly ready to hatch I removed seven of these with sufficient bees to form a nucleus, to new stands. After all these drafts on the old colony, it gave us 308 lbs., of extracted honey. The largest yield from one colony was 343 lbs. It was a Syrian colony crossed with Italian blood.

I never saw the honey so thick as it was this season. I tested some taken from combs which had been emptied just 48 hours before, and found the specific gravity was 1.400, the English standard according to the *British Bee Journal* being 1.261, and in Germany from 1.414 to 1.455. Duncan, said to be the latest and best authority, gives it at 1.333, pure water at 60° being 1.

Lindsay, Ont., Dec. 17, 1883.

Experience in Wintering.

J. V. CALDWELL.

Now that our bees are in their winter quarters, is a good time to discuss the problem of the saving of our bees, until the mild and sunny days of spring and summer are with us again. We read the experience of our brethren in the business, and, turning from the fascinating pages of our favorite bee periodicals, we can repair to our winter repository, and see how our little pets are prospering in their long winter sleep.

In this business, theory as against practice makes but a poor showing. I am willing men should theorize, and am willing to read their theories; but this whole bee-business to some of us at least, is getting to be one of the most intense interest, inasmuch as we are depending upon it for our daily bread, and the support and education of our families.

But to the question in hand, Mr. Heddon takes very kindly to the pollen theory, and indeed, it may be justly called a theory, at least so far as he has not proved himself to be a successful winter bee-keeper. I am glad Mr. Heddon is making experiments in this line, as it may lead to good results. I am glad to notice that he thinks that a safe and cheap mode of wintering, will lead to placing them in good cellars. I am in favor of cellar wintering, and always have been; but granting that the cellar is the only safe way in this latitude, another important question comes up right here:

Mr. A. puts them in early in the winter, giving them plenty of both upward and downward ventilation, while Mr. B. puts them in late, and wants them thoroughly chilled, so they will not breed until set upon their summer

stands. Again, Mr. C. places his bees to the number of 200 or more colonies, in a warm cellar with a temperature at times of 65°, or warmer, with no ventilation in the cellar, and but little in the hive. One must have them perfectly dry; another must have them perfectly wet (I was going to say). My own experience has shown me that at least, they do not need to be kept dry; that is, the room need not be a dry one. My bees 4 years ago were kept in a cave in a side hill, and were put in as soon as it was finished, the bottom fresh, damp clay, and the sides were new green boards. They were in about 100 days, and came out in the best possible condition, as they did not spot their hives in the least, when taking their first flight.

The past winter of 1882-83, one of the coldest we have ever had, my bees were wintered in the same kind of a cellar, and came out in just as good condition, except the ones that were drowned, as the water got in while I was away from home, and rose to the depth of a foot or more; these dead ones had quite a large amount of brood, 7,000 to 8,000 bees in process of hatching.

I cannot see how the pollen theory can figure in such cases. It may be possible that Mr. Heddon's bees get it in such excessive amounts that makes it such a difficult job to bring his bees safely through a cold winter. But, Mr. Heddon, I cannot resist the temptation to give you a piece of friendly advice. You must not persist in wintering your bees on the old foggy plan, so much in vogue with our ancestors centuries ago.

Who are the successful winter beekeepers? They who safely winter them in both cold and warm winters. Do they let them set out-doors in snow and wind, and zero weather? Stand up, ye successful ones who do this. I have a vision, and behold, before me a great multitude of bee-keepers, as it were, in a vast level plain, and I see a hill in the midst thereof, and he it is who does this very thing, and he keeps them safely; but where are the ninety-and-nine who lose them all? But I must bring this article to a close. Thousands of the most skillful beekeepers are safely keeping their bees from year to year in warm cellars, and will I think continue to do so.

Cambridge, Ill.

For the American Bee Journal.

To Bee-Keepers of Illinois and Iowa.

The regular annual meeting of the Eastern Iowa and Western Illinois Bee-Keepers' Association will be held at Moore's Hall, No. 110 East Third street, on Thursday, Friday and Saturday, Feb. 21, 22 and 23, 1884.

Mr. T. G. Newman, of Chicago, editor of the Weekly BEE JOURNAL, will be with us, and has been engaged to give two lectures on "Bee-Keeping" on the 22d and 23d.

It is hoped that the members of the Association, and others will bring or send honey, apiarian supplies, etc. Any shipment of these, sent to Mr. Israel Hall, Treasurer of the Bee-

Keepers' Association, Davenport, will be taken from the express office, removed to the Hall and cared for.

Also be ready to report results of last season's work.

Invitation is hereby extended, not only to the members, but also to their friends.

We want you to just swarm.

J. V. McCAGG, Pres.

I. J. NAGLE, Sec.

For the American Bee Journal.

Middlesex, Ont., Honey Crop.

W. H. WESTON.

Just at this time of the year it is advisable to bring our industry as much as possible before the public, and as we have not formed a Bee-Keepers' Society for this county yet, I took it upon myself to address the Western Fair Association of this city on the advisability of increasing their prize list for this year, and as the directors have not met yet, I sent the following letter to our daily paper, thinking that if any of them should read it, perhaps it would impress them favorably.

"If full statistics could be given of the honey crop of this county, the figures would be as interesting as they would be surprising. During the last few years quite a large number of farmers and mechanics have undertaken the care and development of bees, with the result that thousands of dollars' worth of rich and useful honey has been gathered that would otherwise have dried up in the flowers under the summer sun. The smallness of the capital required is the greater temptation to those who invest in bee-keeping. As an instance both of the profitable characters of this industry and the extent to which it is being developed in this district, the case may be given of Mr. Pettit, living near Belmont. He began last season with 72 colonies, and at the end of the summer he sold \$970.53 worth of honey, and kept 225 lbs. for his own use, which would bring up the total value of his season's yield to \$1,000. Now, on a fair estimate, \$700 of that sum would be profit. There have been many others besides who have found the production of honey to be so profitable that they have made arrangements to largely increase their bee accommodations for next year. At the Western Fair, last year, there was about \$10,000 worth of honey shown, and many of the leading beekeepers were not on hand, owing to the meagreness of the prize list and lack of accommodation. There are many interesting facts in connection with bee life that may be given at another time."

London, Ont., Jan. 28, 1884.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

SELECTIONS FROM OUR LETTER BOX

Mild Winter in England.

We are experiencing a very mild winter. I have not heard of much mortality amongst bees, at present. But, of course, it is too early to congratulate ourselves on this point.

ALFRED NEIGHBOUR.

London, England, Jan. 15, 1884.

Home Market for Honey.

I commenced the season with 23 colonies, after selling some; increased them to 48, and received 1,420 lbs. of extracted honey, nearly all from Alsike clover. I raise no comb honey, for I can sell 100 lbs. of extracted honey better than I can sell 1 lb. of comb honey. I sold at home, besides my own crop, 1,500 lbs. of extracted, and 150 lbs. of comb honey. I used quite a lot of the pamphlets, "Honey as Food and Medicine," and it paid me well. I use the Langstroth hive with the Simplicity top, at the home apiary.

E. S. HILDEMAN.

Ashippun, Wis., Jan. 29, 1884.

Wintering in Three Ways.

Yesterday being a fine day, my bees took occasion to air themselves a little. I have about 20 colonies on the summer stands, without packing of any kind. Some of them show dysentery, but not bad, as yet. I have 12 packed in timothy chaff, which appear to be all right yet, with the covering all dry and in good order. All together things are in a much better shape than I expected to find them after such unusual cold weather. I have 22 in my cellar that, to all appearance, are doing well. This wintering in three ways, is just like a disciple of G. M. Doolittle, is it not?

T. N. MARQUIS.

Woodland, Ill., Jan. 31, 1884.

Dysentery.

Will any of the bee-keepers of Iowa who winter bees in cellars, please notice the first signs of dysentery, and carefully note the date and report in the BEE JOURNAL? I have 140 colonies in one cellar, and to-day, Jan. 26, I find them all well; they have been confined 41 days, temperature 38° to 40° since Jan. 1.; before, at 45°.

L. L. TRIEM.

La Porte City, Iowa, Jan. 26, 1884.

How far Bees go for Honey.

This is a question which is very unsatisfactorily answered. A number of years ago, when the Italian bees were first introduced in this part of the country, a man noticed his bees working very busily in the direction of the river; he followed them up and found them working on the river bottom, six miles from his farm; this was on fall flowers. My own bees have frequently worked on sweet

clover four miles from the apiary. In the direction they worked the clover was two miles distant, where it commenced; it was along a roadside, so they followed it up, and were storing honey quite fast. A man in this place claims that he had known bees to work on sweet clover a distance of not less than eight miles, but I cannot vouch for it. H. S. HACKMAN.

Peru, Ill., Jan. 24, 1884.

No Signs of Dysentery Yet.

I commenced last spring's work with 74 colonies, many of them very light. I got 1,000 lbs. of comb honey in 1-lb. sections, and 3,500 lbs. of extracted, nearly all white clover; no basswood. About 900 lbs. of it light fall crop, all is now sold except about 600 lbs. I have realized about \$600. I use the Golden bee hive, and think it an excellent hive for this latitude; no trouble to get bees to work in the sections with it. I put 104 in the cellar, and have 3 colonies buried in the snow. The winter has been very cold; no signs of dysentery yet.

B. F. LITTLE.

Brush Creek, Iowa, Feb. 1, 1884.

The Old Plague.

Some of our colonies begin to show signs of the old plague, dysentery or diarrhoea. We are glad that we have had winter enough to make our test of some value. We shall study closely the effects, as auxiliaries, that cold confinement, and humidity have to do in connection with the main cause, when we are sure of this cause. We have seen colonies come through in good condition, when cold had done its worst, when confinement had also, and when humidity had drenched the combs, and we cannot think any or all of these can be the main cause, because further, we have lost our colonies by the majority when none of these conditions were present. How they act as aggravations to the cause, we are carefully studying. I will report later.

JAMES HEDDON.

Dowagiac, Mich., Feb. 1, 1884.

Bees winter as Safely as Sheep.

My 300 colonies of bees are wintering all right in my bee cellar. 16x16 feet, inside measure, tiered up 4 tiers high, with no upward ventilation in the hives; the hives rest on scantling 3 inches thick; no tight bottom boards for me. I have in this way wintered my bees for the past 6 years, without any loss to speak of. I can winter bees as safely as I can sheep, with plenty of hay and oats.

A. JENNINGS.

Medusa, N. Y., Jan. 29, 1884.

Bee-Keeping in Middle Texas.

For the past year or two bee-keeping has received increased attention in the improved methods as well as enlarged apiaries and additional friends, in this part of Texas. The past season was very unfavorable for bees, in fact the most so of any in quite a number of years, and has had a tendency to discourage beginners, and, perhaps, abate the enthusiasm of

some of the more advanced keepers. Bees went into winter quarters generally with light supplies, and many colonies will require feeding to bring them out in the spring alive, and in working condition. The winter, since Christmas, has been almost continuously cold, and of more than average severity. In the end this may work in the interest of bee-culture, for it may so retard the business as to force a better understanding of it, in all its details, which is necessary to success. If discouragements in the beginning, do not drive one from an enterprise, they usually form the basis of success. Let us hope this will be the case with young bee-keepers under the unfavorable circumstances and difficulties encountered the past season in this part of Texas. With the experience thus gathered, and the hope of a better time ahead, let us use the coming year in overcoming the failures of the past, and place bee-keeping further on the road to success than it has been before.

W. P. HANCOCK.

Salado, Texas, Jan. 26, 1884.

Bees Wintering Well.

The bees are all lively up to this time. I think they well winter all right. I have my bees in a building in a side hill, with a ventilator at the top of the building. I feel disgusted at some who are so blind as not to take any bee papers. I know of some not far from me that have, this winter, lost enough to have paid for the BEE JOURNAL several years. I expect to give all my time to the care of bees after this season.

W. A. CARMACK.

Marengo, Ill., Feb. 2, 1884.

Bees doing Nicely—No Dysentery.

The snow is all gone, after a three-days' thaw, and to-day the thermometer stood at 54°; bees had a good flight, and all responded to roll call. No dysentery yet. They have plenty of stores, and had a good chance to change their position in the combs. Some of my box-hive neighbors lost some of theirs, and they want to change to frame hives in the spring, those that are left. If mine will pull through the rest of the winter and spring as well as they have done so far, I can be thankful.

J. W. STURWOLD.

Haymond, Ind., Jan. 31, 1884.

Will County, Ill., Association.

The meeting of bee-keepers at Monee, Will Co., was not as well attended as expected, owing to the snow drifts that blocked the roads, and made it impossible for farmers in the neighborhood to attend. However, there were quite a few bee-keepers present. It was decided to organize a society to be called the Will County Bee-Keepers' Association. A. Wicherts, of Mattison, was chosen President, and P. P. Nelson, of Manteno, Secretary, to serve temporarily. There will be a meeting at Monee on Monday, May 26, to fully organize, adopt a constitution and by-laws and

transact any business that may come before the meeting. Fourteen names were enrolled as members. The following subjects were discussed in a very social, enthusiastic way: "Who should keep bees?" "Winter and spring management;" "Early stimulative feeding;" "Cellar and out-door wintering;" "The best hive to use;" "The best way of increasing;" "How to feed and what to feed." All went home feeling that they had a pleasant and profitable meeting. We wish to extend a cordial invitation to all interested in modern bee-culture to attend the meeting in May.

PHILIP P. NELSON, Sec.

Monee, Ill., Jan. 28, 1884.

Register for the Apiary.

I have received the Apiary Register, and feel well satisfied with it. I like the arrangement of the book first rate.

S. D. REIGEL.

Adelphi, O., Jan. 31, 1884.

Bees Flying.

After about seven weeks in a snow bank, and lots of cold weather, my 16 colonies of bees had a fly to-day, and seemed to enjoy it; 7 are in chaff hives, and 9 packed in a low shed with shavings all around. All are apparently doing nicely, so far.

C. W. YOUNG.

Hartford, Ont., Feb. 1, 1884.

A bee-keepers' meeting will be held at the Pember house, Janesville, Wis., on the second Tuesday in February, at 10 a. m., for the purpose of organizing a bee-keepers' association. We hope the meeting will be well attended by all that are interested in bees and honey.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

How to Wear a Bee Veil.

In response to several, I will say that I consider a black all-bobinet bee veil the best face protector we have. The meshes are round, and the shape and color is best fitted to clear vision. To make one requires a yard of goods, 20 inches wide. When sewed up, the veil will be 20 inches long, 3 feet in circumference, and one foot in diameter. The usual way of attaching this veil to the hat has been to have a cord "run" into the edge of one end and drawn up to the size of the crown of the hat. When drawn over, the veil comes out over the rim and down over the face and inside the coat, vest or shirt collar. I have found that a much better way is to procure a new white chip hat (about 15 to 20 cents is the price), and sew one end of the veil to the rim. This can be done whether the rim is just one foot in diameter or larger; for if larger it can be sewed to the rim a short distance back from its edge. The wide rim hat gives better shade. When so used, your hat and veil are always to be found at once, and the veil is practically about 6 inches longer than when used in the way first mentioned.

Thermometers, Straight Combs, etc.

1. How are thermometers tested? Mine, when tested in salt and snow, marks 8° below zero, which is, I am told, 8° wrong. Mine, in the cellar, marks 46°. Now, if as tested above, it is 8° too low, should not the real temperature in the cellar be 54°, and not 46° as it shows?

2. If bees in brood-chambers are given starters, say if an inch, will they build straight comb? or how would it do to put in 3-inch strips? I ask this as foundation seems to be so scarce and dear. JOHN YODER.

Springfield, Ont.

1. This question is somewhat out of my latitude. I have always understood that the point zero was the lowest point that could be made artificially with ice and salt. It might be best for you to compare your thermometer with others, then, even though your test be correct, your thermometer may be all right, as compared with thermometers in general, and it is from these that we have taken our cue regarding proper temperature.

2. A single inch of foundation works splendidly as a guide to straight combs. When I used such a strip, I found it best to put it the whole length of the bar, but preferred to have it in 3 pieces separated from each other, about 1-5 of an inch; this kept it from waving, which it sometimes did when in continuous strips. I would prefer this to 3-inch strips, for the one point of getting straight combs, and should choose it of the two. I believe it pays more than twice over to use full frames of foundation on wires, both for the saving to the bees, and to get rid of drone comb in colonies whose blood you do not wish to perpetuate, and excess of drone-comb everywhere, especially when brood foundation can be bought for 50 cents per pound.

Moving Bees in Winter.

On page 384 of the BEE JOURNAL for 1883, Mr. Heddon promised an article on moving bees, giving his method, but so far I have not seen it. I have 75 colonies to move 3 or 4 miles, and would like to move them now on the ice in the river. How shall I do it? D. H. LISLE.

Waldron, Ill., Jan. 27, 1884.

When promising an article on removing bees, I had reference to moving them short distances, in such manner as to prevent their returning to the old stand. In moving 3 or 4 miles no such precaution is needed. You can move them on a sleigh (use "bobbs") by filling the box with straw, or on a common wagon in the same manner. Put in twice as much straw as you think you need, and you will have none too much. If I could have but one, I would rather have straw than springs. I should not move the bees until the weather was such that they could fly immediately after reaching their new location.

Comb Foundation.

Will Mr. Heddon please answer the following:

1. How long may foundation be made before it is unfit for use?
2. Can old foundation be treated so as to make it as good as if fresh made?
3. Can foundation be pressed into wired frames by hand as good as if done by a press?
4. How would you press it in by hand? RICHARD GRINSELL.

Baden, Mo., Jan. 26, 1884.

1. I think that the fresher foundation is, the better, though I have seen that one year old well-handled by the bees, but it seemed to be with more difficulty.

2. Mr. D. A. Jones suggests dipping

the sheets in hot water (of course not leaving them there long enough to melt). This may make them appear softer; in fact, may loosen up the fiber a little, yet I think there has been an evaporation, loss, or drying-down of some of the oils that this method does not re-place.

3. It cannot be pressed on to the wires as smoothly and perfectly as if done by the press, but it can be done so well that after the bees get through manipulating it, it is in every way as perfect as if done by the machine.

4. When your frame material is out, and before nailed up, punch holes (centrally) through the top and bottom bars about 2 inches apart, and have the outside holes not further from the end bar than one-half or three-fourths of an inch. Use No. 30 tinned wire. Now sew the frame, beginning in the middle and sewing each way with each end. To fasten the ends I use a small tack, or the nails that nail the bottom-bar may be left a little out. Be careful not to draw the bottom-bar bowing by drawing the wire too tight. Diagonal wires may be put on, but I do not use them, as I find no need for them. To use them, fasten one end to the tack or nail-head, and then go down through the first hole, and through the one nearest the center of the other bar, then up through the other center hole, and fasten this end the same as the first. Now the frame is wired. Next make a lap-board larger each way than your frame is the longest way. Now cut from one-half inch lumber a board that is one-fourth inch smaller each way than the inside measure of your frame. Nail this board securely to the seven-eighths lap-board, and let the grains run cross-ways of each other. This will prevent warping. With a sponge or rag, wet the thin board or form. Have already-cut some sheets of foundation one-eighth less in size than your frame measures inside. Turn up about 3-16 of one edge, and (have the wax sheet warm) with a stiff, broad putty knife, or chisel, masb the turned-up portion to the top-bar (which should not be rough), so that the sheet will hang centrally in the frame. We have a rest fixed for the frame, on our work bench, to hold it while we do the mashing. Next lay the frame and foundation (foundation down) on the lap-board and over the form, and while the sheet is plastic, push the wires down into the base of the cells. This can be done with an eight-penny nail; some use a wheel

with points upon it. I have had success with a straight piece with about 10 points, about one-fifth of an inch apart, the points being about $\frac{1}{8}$ wide and 1-64 thick, so adjusted that they roll lengthwise of the wire, while each point runs crosswise of the wire. Of course they are not properly points. This puts the wire in quite rapidly, and is entirely satisfactory.

Profitable Increase.

Will Mr. Heddon tell us which he thinks the better plan to increase an apiary rapidly—the nucleus plan proper or the pound of bees? In the former, combs and brood are taken from strong colonies, and by the latter, bees are shaken from the combs, a queen given them, and a new hive, etc., given the miniature colony. I propose dividing my apiary, which is small, and establishing the new yard two miles away with mountain peaks and ridges intervening, and change bees from yard to yard as new colonies are formed. E. E. EWING.

Highlands, N. C., Jan. 22, 1884.

I have no choice to offer in the plans mentioned. I should never use either. I should go for honey, and take that increase came in the natural way, and when this was not fast enough for me, I should get my further increase by purchasing of some one whose troubling problem was "how to prevent further increase."

Troubled with Moths.

I am told by a man who lives in this neighborhood, how to prevent the moth troubling bees. He professes to know much about the little fellows, and says, at the season of the year when the fly comes, to build a fire in the apiary every evening at sundown, and keep it blazing until two hours after dark. He says the fly will fly into the fire and burn up. I have but little faith in it; will it do? I was troubled with moth in colonies very much last year.

J. N. SMOOT, M. D.
Fulton, Ky., Jan. 25, 1883.

The plan your neighbor offers might catch some moths, while others might not be thus caught. Such a method would be disagreeable, troublesome and dangerous in most apiaries. A better plan is to take a tin cake dish which has a "tin hole in the center," put a lighted candle in the hole and water under it in the dish; let the candle be short, to bring the blaze near the water. What is better still than this plan, is to keep your colonies normally strong compared to the combs in their possession, and have them possess a portion of Italian blood. Keep all pieces of comb out of the way of moths, giving them no

chance to breed about your premises outside of hives, and the bees will take care of the rest.

Remedy for Dysentery.

Please give the best remedy for dysentery that you know of. I have a few colonies that are affected with it; they are in the cellar, and they have no brood and the hives are dry. I have one colony that has lots of young brood, and the hives is very wet, but no signs of disease. X. Y. Z.
Monroe, Wis., Jan. 25, 1884.

I know of no successful remedy for dysentery among bees. I have tried several that I have read of as successful, and some of my own originating, but none can be relied upon. We are now working at prevention, and I believe we are going to get it in a cheap and practical manner.

The annual meeting of the Maine Bee-Keepers' Association will be held at Small City Hall, Lewiston, Feb. 14 and 15, 1884. The meeting will open at 1 o'clock, Thursday p. m. The afternoon will be devoted to the President's address, reports of the Secretary, Treasurer, Vice-Presidents of different counties, and all committees. A session will be held Thursday evening for essays and discussions. Friday morning election of officers. Friday afternoon essays and discussions. The Western Maine Bee-Keepers' Association will also meet at the same time and place. The Maine Central railroad will grant free return tickets to all paying full fare one way. Let there be a full attendance, and a good display of apianian implements.

WM. HOYT, Sec.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.
Kingston, Tex., Jan. 16, 1884.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.
Independence, Mo.

We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate. H. C. WHITE.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Feb. 4, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7@10c.
BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.
BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1½@2 lb. sections, 14@18c.; dark and mixed in color, very low, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.
BEESWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY.—Receipts liberal, and sales satisfactory. White comb, 1 and 2 lb. sections, 17@18c. I could place several thousand pounds of dark, fall extracted honey, at 8@9c. Who has any? Do not all speak at once.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Only in a small jobbing way is there any business. Prices favor buyers on all except strictly fancy qualities. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@6.

BEESWAX—Wholesale, 27½@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, 13@18c. strained and extracted, 7@8c.
BEESWAX—Firm, at 31@32c.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.
BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY.—Demand light. 1 lb. sections comb honey, 15@20c.; 2 lb. 16@18c. Extracted, 9@11c.
BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers; we reply, yes, any book or binder we keep for sale may be selected by those who get up clubs.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

Constitutions and By-Laws for Local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

The Bee Keepers' Handy Book

216 pages, bound in cloth, by mail, post-paid, for \$1.00 per copy. Send for prospectus and our special Circulars describing three new and useful articles for the apary.

NO MORE ORDERS WANTED.

I wish to give notice to all bee-keepers that I cannot accept any more orders for Sections this season, as I already have all the orders on my book that I can fill before the honey season commences. I will here say, that I am preparing to build "at once" a larger factory, in which I intend to use steam-power, and expect by another season to be able to fill all orders promptly, by the aid of more and improved machinery. I shall be able to turn off four times the amount of work I ever have before.

Respectfully, **A. E. MANUM,** Bristol, Vt., Jan. 21, 1884.

THAT STRIKES US!

—AND—
All Bee-Keepers who are in need of **SUPPLIES.**

For the benefit of those who will be disappointed by Mr. Maunum's refusal to receive any more orders this season, we wish to state that we have just completed an outfit of **Perfected Machinery**, expressly for making

White Poplar Dovetailed Sections,

The fame of which has crossed Mr. Manum to his utmost capacity. Our Factory is run by a 20-horse power engine, which enables us to supply all Orders for anything needed in a first-class Apiary. After March 1, our capacity will be 10,000 sections per day. Before making purchases, it will pay you to send two 2c. Stamps for our Circular and Samples. We guarantee good work or money refunded.

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis.
Dear Madame:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machiae for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.
Yours,
CHAS. DADANT & SON.

Hamilton, Ill., Dec. 10, 1883.

MRS. FRANCES DUNHAM, De Pere, Wis.
Dear Madame:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
Yours very truly,
D. A. JONES.

Beeton, Ont., Dec. 10, 1883.

MRS. FRANCES DUNHAM:
All your foundation I manufacture on one of your mills, to that made on any other machine. I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
Yours respectfully,
J. G. WHITTEN.

Genoa, Cayuga Co., N. Y., Dec. 12, 1883.

MRS. FRANCES DUNHAM:
After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.
Yours,
SMITH & SMITH.

Kenton, Ohio, Dec. 29, 1883.

MRS. FRANCES DUNHAM:
I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretchmer, of Coburg, Iowa, and L. C. Root & Bro., of Mobawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is me always a jewel. You are at liberty to publish this. Yours truly,
T. L. VON DORN.

Omaha, Neb., Jan. 18, 1884.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 550 colonies of bees of our new strain, and of pure Italian blood. As most of you are aware, for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do well to correspond with me.

Among the goods we have to offer, are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Veils, Sample Shipping Crates, Comb Foundation Fasteners, Surplus Honey Registers, our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Logansport, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

THE AMERICAN

BEE JOURNAL

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN }
1861.

Chicago, Ill., February 13, 1884.

VOL. XX. No. 7.

THE WEEKLY EDITION OF

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Advertisements intended for the **BEE JOURNAL** must reach this office by Saturday of the previous week.

☞ Letters for publication must be written on a separate piece of paper from items of business.

Advertisements.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made.

It is kept for sale by Messrs. A. H. NEWMAN, Chicago, Ill., C. F. MUTH, Cincinnati, O., JAMES HEDDON, Dowagiac, Mich., DOUGHERTY & McKEE, Indianapolis, Ind., CHAS. H. GREEN, Berlin, Wis., CHAS. HERTEL, Jr., Freeburg, Ill., GEO. W. HOUSE, Fayetteville, N. Y., and numbers of other dealers.

Write for SAMPLES FREE and price list of supplies, accompanied with

150 COMPLIMENTARY and UNSOLICITED TESTIMONIALS from as many bee-keepers in 1888.

We guarantee every inch of our Foundation equal to sample in every respect. CHAS. DADANT & SON, 5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but if these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

For mail rates and testimonials, send card. To sell again, send for dozen rates to BINGHAM & HETHERINGTON, AUBONIA, MICH. 6A2Btf

W.D.N. MILLS. 10 INCH \$ 15.00 W.C. PELHAM, MAYSVILLE, KY.

BOOKS!

Sent by mail, on receipt of price, by THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stuttered, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Full up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Faira," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c. per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Faira, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Faira, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Pages and Bee Hibernation, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete hook of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterna, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grn't Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous tables and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Meters, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive made by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth, 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Velehrungen über folgende Gegenstände

—Vortlichkeit des Bienenstandes—Honigpflanzen—Erziehung der Königin—Füttern—Schwärmen—Ableger—Verjagen—Italienisieren—Züfeker von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare Darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigtuchen, Formfuchelchen, Puddings, Schaumkonfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniss der verschiednen Pferdekrankeiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN. 925 West Madison St. CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., FEBRUARY 13, 1884.

No. 7.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

☞ We can supply all new subscribers and renewals with the numbers from the beginning of the year, and shall do so unless otherwise ordered—presuming that it is so desired.

☞ "How to Become a Good Mechanic." is the title of a pamphlet of 46 pages, by an "Old Apprentice," and published by the Industrial Publication Company of New York, at 15 cents. It is intended as a practical guide to self-taught men; telling what to study, what books to use, how to begin, what difficulties will be met, how to overcome them. In a word, how to carry on such a course of self-instruction as will enable the young mechanic to rise from the bench to something higher.

☞ "Dzierzon's Rational Bee-Keeping," bound in cloth, are now all gone. We have a large lot bound in paper covers, which we are sending to any one clubbed with the Weekly BEE JOURNAL for a year, for \$2.75. Any one who has paid for the BEE JOURNAL for 1884, may send 75 cents more for the book, and we will send it by return mail, postage paid. It is an imported book, printed in the English language, and the price of the book is \$1.50.

☞ Several complaints have been received about the American subscribers not getting the *British Bee Journal* for January. Evidently there has been some accident—perhaps to the steamship bringing them across the Atlantic—for our number for Jan. 1 only came to hand on Feb. 8, after the one for Jan. 15 was received. This may explain matters some.

Another Severe Attack.

The many friends of the Rev. L. L. Langstroth will be pained to learn that he is again suffering from a return of his old malady, and unable to do any mental work. The following from his daughter, dated Feb. 6, 1884, is just received:

As my father is suffering from a return of his old malady, and is unable to attend to his correspondence, I write to let you know *why* you do not hear from him. The present attack seems to be unusually severe, but I trust it may be of short duration.

Yours respectfully,

ANNA L. COWAN.

Oxford, O., Feb. 6, 1884.

Glucose.

Mr. Pringle, of Selby, Ont., writes as follows:

The following appeared editorially on Jan. 22, in the *Toronto World*. I send it to you for the columns of the BEE JOURNAL, and will be pleased to see it followed by your own comments:

"The National Academy of Scientists at Washington made a report on glucose to the commissioner of internal revenue. It shows the manner of manufacture of grape sugar and glucose, and finds that the artificial is in no way inferior to cane sugar in healthfulness, and that maize starch-sugar, either in its normal condition or fermented, has no deleterious effect upon the system even when taken in large quantities. The illustrious scientists aforesaid might have sooner reached this conclusion, which is a perfectly sound one, had they reflected that honey is sugar in the state of glucose. Honey has been considered a healthy and desirable article of food since the days of Moses, and earlier. Further, the doctors say that every grain of crystalized sugar taken into the human stomach becomes glucose in the process of digestion. If glucose or grape sugar were simply kept by itself and sold on its own merits, it might soon come into very general use."

We have already commented on this matter, on pages 19, 52 and 68. The whole thing was intended to give a "boost" to the manufactures of the fraudulent stuff; but the gauze was too thin.

Time to Think and Review.

The Indiana *Farmer* gives the following "good and timely" advice:

As the spring advances it will be well to review the past season's work, and see wherein we have failed; to try and avoid like mistakes in the future. The winter and early spring is a good time to read upon the subject in hand, then there will be less danger of failures in the time to come. Hives and fixtures necessary for the season's work should all be secured in time. Do not wait until you are in urgent need of all these things before ordering, but order early and thus avoid not only the loss of time, but bees and honey, for time with us is money, for which we work. The writer knows from experience of what he writes.

On the amount of surplus secured depends the profit of the apiary, and for this end, it should be our aim. The honey crop should consist of both comb and extracted honey. For the former, large sections are best for home consumption or for a home market, but for the general market the one-pound sections are the favorite. But let the object sought be what it may, the first and most important part of it all is to be ready in time, for in this may depend the entire success of a season's work.

☞ The following named catalogues for 1884 are received:

Smith & Smith, Kenton, O.—Supplies W. S. Cauthen, Pleasant Hill, S. C.—Bees and Queens—4 pages.

D. B. Brown, Des Moines, Iowa—Italian Bees—6 pages.

Apiarian Supply Co., Wilton Junction, Iowa—Bees and Apiarian Supplies—32 pages.

Miller Bros., Nappanee, Ind.—Hives and Supplies—8 pages.

J. W. Eckman, Richmond, Texas—Bees—1 page.

Smith & Morgan, Columbus, Wis.—Apiarian Supplies, Bees and Queens.

Hiram Sibley & Co.'s Seed Catalogue, Rochester, N. Y.—130 pages.

Cox's Seed Annual, San Francisco, Cal.—64 pages.

☞ We have so many articles for the BEE JOURNAL in waiting, that we give the preference, this week, to short articles and letters, so as to accommodate as many as possible. The others will appear as soon as we can get to them. Our correspondents will please have a little patience and "all will be well."

CORRESPONDENCE

For the American Bee Journal.

Statistics and Essays.

O. O. POPPLETON—155.

I would like to say something on these two subjects, which have been suggested by articles in the BEE JOURNAL of Jan. 30.

There is no need of my repeating any of the reasons given by Dr. Miller (page 70) why and when we want statistics of our honey crop, as he has stated them fully and correctly. What is wanted is to find the "How" to obtain them in shape and time to be of value.

Those obtained by assessors or other state officers, are undoubtedly more complete than can be obtained by any other means, but cannot possibly be obtained in time to be of value. We are, therefore, thrown on our own resources.

While we cannot get full and accurate statistics, I am satisfied from experience in trying to get them from my own State the past two seasons, that we can get them full enough to be of very great value in marketing our honey. What we want to know is, about what is the extent of the crop in different parts of the country, as regards an average crop, so we can judge about what and where the best market will be.

I have thought much on this matter, and now give suggestions of what seems to be the best plan I can think of. Let the executive committee of our North American Society decide what information is wanted, prepare a list of questions (as few as possible), then publish in each of the bee papers, at least one or two months previous to the meeting of the society, a request to all bee-keepers to send to the vice-presidents of their respective States, answers to these questions on a card, appending to this request a list of the vice-presidents and their addresses. These reports can be tabulated by the vice-presidents, and forwarded to the secretary, in time for him to prepare a tabulated report to the society. This will also have the advantage of saving some two or three hours of valuable time of the convention, now taken up in listening to individual reports from the States. This plan was tried last year, but entirely failed, because it was only published in one paper, and even that one omitted the addresses of the vice-presidents. These addresses are very important, as I doubt whether one bee-keeper in a hundred in Iowa knows where to address a card to me, if they were simply told that I was the proper person to send their reports to, and the same would be true in some of the other States.

We will probably have very little trouble so far as Iowa is concerned, as our State society is to meet at the time of the State Fair, about the close

of the honey season, and, of course, statistics can be obtained then.

ESSAYS AT CONVENTIONS.

I have attended several important conventions, the proceedings of some of them consisting almost exclusively of essay reading, while others went to the other extreme, and my opinions are exactly the same as those given by Mr. Hutchinson on page 73, but he gives no suggestions or plan how those opinions can be practically carried out, which is a very important part of the subject.

I have devoted some thought to this subject, and the best plan I can think of would be the appointment of a committee to examine all essays that may be handed in—they to select such of them for use by the convention as are on topics of general interest, and so written as to be an excellent basis for the discussion of the topics they treat of. There are one or two serious objections to this plan, but it is the only one I can think of that will prevent the reading of long prosy essays on topics not of general interest, nor valuable as a basis for discussion.

Anything that helps to make our conventions more valuable, is well worthy the careful consideration of all persons who may be charged with their conduct.

Williamstown, Iowa, Feb. 1. 1884.

[Would it not be better to select a few topics, and appoint some person to prepare a short speech or essay to introduce each subject, making suggestions, etc.?—Ed.]

For the American Bee Journal.

Ohio State Convention.

The Ohio State Bee-keepers' Convention was held in Columbus, O., Jan. 14-16. First subject: "How to create a home market for honey." Dr. Besse said that by care and careful management there is no trouble in creating a home market. When he first began, could only sell from one to two pounds where he now sells from five to ten pounds. By making a good showing at County Fairs it helps greatly to create a home market.

Mr. Benedict thinks we should impress on the minds of the people that honey is healthy as well as a luxury, and that it should be kept in every house as a medicine for coughs, colds, and, in fact, for all lung diseases.

Mr. Goodrich, of Columbus, had no trouble in selling 2,800 lbs. of extracted honey at from 18 to 20 cents per pound. He put it up in five and ten pound buckets; thinks he can sell more by using the ten pound buckets.

Mr. Cochran advises using two-pound sections for comb honey in the home market; he thinks it is just as easy to sell two pounds as one; the first thing to do is to get the confidence of the people, so that they know that they are getting pure honey. Others engaged in the discussion, but generally agreed with the above.

"What shall we do to prevent adulteration of honey?" It was generally considered that we could do nothing more than when we knew of any person so engaged, that we publish them, and if they are members of this association, that they be expelled therefrom.

"Will bees feed on glucose?" It was said by those that had tested it, that they would not, if they could get anything else to work on.

"How many colonies can be kept in one locality at a profit?" It was generally decided that by sowing pasturage on the highways, creeks, and waste ground in a neighborhood, that there could not be bees enough put in any one locality to overstock it.

Mrs. Cochran asked if it was not the duty of bee-keepers to cultivate some honey-producing plants in order to keep the bees from destroying their neighbors' grapes?

A. I. Root, of Medina, spoke of the main honey plants, also mentioned the great western fireweed in this connection. Catnip, sweet clover, borage, etc., was also added to the list.

"How to prevent second swarms?" The method thought to be the best was to look through the hive, after the first swarm had come off, cut out all queen-cells and introduce a laying queen.

A committee was appointed to wait upon the members of the Legislature to see if we could not get an appropriation to be used in securing the statistics, and to investigate the causes of diseases among bees, etc. S. D. Riegel, Dan'l Spear, Burgis Helphry, Dr. H. Besse, C. M. Kingsbury, and J. T. Martin were appointed as the committee.

A committee was appointed to confer with the Ohio State Board of Agriculture in reference to an enlarged premium list for the State Fair.

A motion was then made to change the time of holding the annual convention from fall to winter, which was adopted unanimously.

"Which are the best size of sections?" I will not occupy space to give the discussions, but will give the votes as they were taken on the different sizes. The natural law of convenience will solve this problem better than we can do at conventions.

Mrs. Cochran said that ladies preferred the one-pound sections, as they are the most convenient for table use.

One member favored half-pound; 23 favored the one-pound; 3 favored the 1½ pounds; and quite a number did not vote.

The vote in favor of the width of sections was: 17 favored 1½ inches in width; 3 favored 1¾; 1 favored 1¾, and one the 2-inch sections, and great many did not vote, as they had no preference. It was the unanimous expression of the convention to do without separators.

The subject of the size of frames for brood-chambers was next discussed. The majority favored the Langstroth; however, some favored the 10½x10½; others 12x12; and some 11x11, and all gave reasons why they should adopt their favorite sizes.

Mr. Fredenburgh says it is impor-

tant that we should look through a colony after a swarm has come out, as they will sometimes swarm when there is nothing in the hive but an egg from which to rear a queen, causing the bees to be idle from 14 to 16 days; by giving them a laying queen they will at once go to work.

Mr. Benedict: There never was a young queen hatched in an Italian colony before the old one had left.

Mr. Spear: You cannot adopt any rule on which we can always rely.

Mr. Eaton: The best way to get good queens is to give the larva plenty of food. The young bees always rear the queens, as the old ones will not care for them.

"Introducing queens in new colonies," was next discussed. Various plans was given, of which I will mention a few, that was thought to be the best.

Mr. Benedict said his plan is to conquer his bees; first he gives them a little smoke, and after the old queen is removed, he shakes the bees down in front of the hive and drops the new queen among them; he repeats this two or three times and lets them go. Another is to use a small wire cage, with corks fitting in either end loose, attached to strings, the ends of which come outside of the frames; after the bees have become quiet, draw the corks out of the cage and let the queen out; it should be done quietly. The Doolittle cage is thought to be as good as any.

Mr. Root said that foundation is now made that will take from 15 to 20 feet to a pound, and that it has been greatly improved within the last year.

J. T. Martin, of Tiffin, then delivered a lecture on "Encouraging bee-keeping among the people."

The following lectures were delivered during the convention: Mr. Benedict read an excellent paper on "The management of bees for profit;" Dr. Besse on the subject of "Spring Management;" Prof. Lazenby, of the Ohio State University, on "The nature, quality and usefulness of nectar, for the purpose of plant fertilization;" Mrs. Jennie Culp reported her management of bees during the production of over two tons of honey.

"How to keep grass and weeds down around the hives?" Sprinkle salt around them; others advised the keeping of sheep or rabbits in the Apiary.

"Which is the best and quickest way to get and keep shade over the hives?"

The President and Mr. Root preferred grape vines.

"Are the new races of bees a success?" They were not thought very favorably of by the majority of those who had kept them, on account of their being so irritable, and on account of their being too prolific in time of drouth. When bees are the main object they are very profitable, as they have been known to increase 20 colonies in a single year.

"Where a perforated honey board is used will it prevent the queen from going up into the surplus chamber?" It was generally conceded to be of no use.

A committee was appointed to examine the honey and bee supplies, and in their report Mr. Root says that he has discovered that honey may be kept two years in as good condition as that of new honey; the honey was that of Mrs. Culp.

Mr. Riegel explained a surplus honey box for containing sections of different sizes, which was considered to be quite an advantage to those that work for comb honey.

A general discussion ensued on how to winter bees successfully. Several ways were given, of which I will give two or three that was considered to be the best. One is to build a house with double walls about six inches apart, and fill between the walls with sawdust; also on the floor and ceiling about the same thickness, and at one end make an air tube from 10 to 12 inches square, allowing it to extend through the floor and within 3 feet of the ceiling; and at the other end of the building have a similar tube extending from within 3 feet of the floor, up through the roof; have a valve in the first tube, so that it can be opened and shut as the weather may change. In many instances where the cellar is well ventilated and dry, they may be wintered very successfully; the majority favored wintering on the summer stands. Care should be taken not to try to be too kind to the bees, as the entrance should be left wide open and some porous material put on top of them, and let them remain quiet all winter. The bees want more ventilation in the winter than in the summer.

Mr. Martin thinks the cause of bees dying when they have plenty of stores, is that they exhaust themselves in breathing so fast to inhale oxygen to keep up heat.

Dr. Besse's theory is that they starve to death with stores close to them, which they are unable to reach.

The committee to confer with the members of the Legislature report that they met the chairmen of the committee on agriculture in both branches of the Legislature, and they thought something ought to be done in that direction, and would give the bill a favorable consideration.

Prof. Riegel then gave a very instructive lecture on extracting honey.

Mr. Shively asked how to Italianize an apiary with one pure Italian queen. The Vice-President said the best way was to rear cells from the queen, and place them in nuclei or full hives. These young queens may, however, meet with impure drones; which must be prevented, if possible, by not allowing any black drones to be reared in the vicinity of the apiary.

Mr. Cole spoke of fertilizing queens late in the fall, when the bees had generally destroyed the drones; said he had reared queens, last fall, quite late, and feared the queens were not fertilized as they laid no eggs. The Vice-President thought that if the queens were of proper age, they would likely be fertilized, as drones would be found about the apiary.

Mr. Nutt, of Iowa, said that they have more bees die in April than any other month in the year.

Mr. Martin had an occasion to take a frame from a hive in the middle of winter, and on doing so he found web and moth worm in the middle of the frame; how did it get there, in a strong colony at that time of year?

A motion was made and carried to insert in our premium list a premium for extracting honey. By some it is thought better to go in winter quarters with old bees than young ones.

Care of Bees on Sundays.

WM. H. BALCH.

All animate creation develop, mature and decay regardless of any day, it being only a matter of time. Trees bring forth fruit, fields yield their harvest, flowers secrete nectar to be taken up by insects, or "wasted on the desert air." But man, formed in the image of his Creator, a little lower than the angels, requires more; food, raiment, and many other things; with the rest, wild and domestic animals, all more or less, in different ways, contribute to his happiness and support. With the latter there is a certain amount of care and labor to be bestowed, in order that we may reap the full benefit for them to serve the end for which they were created. Who would think of leaving the faithful horse or the patient ox after their week's toil, from Saturday night until Monday morning without food or water? What would be the result if dairymen should not milk their cows or feed them on Sunday? It seems needless to multiply words on the subject, when we consider the small amount of necessary time required for the care of our bees on Sunday, when compared to that of other domestic animals.

Oran, N. Y.

[Discussions involving religious views, of which there are all kinds among bee-men, are out of order in the BEE JOURNAL. With this, therefore, let this subject rest, for, once begun, it would be an endless dispute, and no one would be benefitted.—ED.]

For the American Bee Journal.

New Facts from Old Theories.

B. F. CARROLL.

Proposition IX. Dzierzon theory: "All eggs germinated in the ovary of the queen develop as males, unless impregnated by the male sperm while passing the mouth of the seminal sac or spermatheca, when descending the oviduct. If they be thus impregnated in their downward passage (which impregnation the queen can effect or omit at pleasure,) they develop as females."

When this theory was first promulgated by the venerable German bee-master, it seemed so ridiculous that it could not be believed; but time has shown that this great master in api-

culture was getting at the facts as they really existed. There are a few bee-keepers who yet doubt the truth of a portion of the Dzierzon theory.

I would state the proposition thus: All eggs germinated in the ovary of the queen, are coated over with a thin mucous substance, which receives the impregnating male sperm while passing the mouth of the seminal sac or spermatheca when descending the oviduct, and said male sperm can be removed by the nurse bees after the eggs are deposited in the worker cells, and the sex of the egg changed.

Holy Moses! do you intend to throw aside all well-authenticated theories, promulgated by such great lights as Huber, Rev. Dzierzon, Profs. Von Siebold and Lenckart, Baron of Berlepsch, and a host of learned bee-masters of the old and new world? No, my friends, I do not doubt one syllable of what these learned, scientific bee-masters set forth, but only wish to carry their researches a little further, if you please, making new discoveries in fields so rich with the thoughts of so many learned men.

To say that bees can change the sex of eggs at pleasure, is saying a great deal, but I think I can truthfully assert such to be true, as much so as a drone is the "son of his mamma." Understand me; a drone egg, that is, an unfertilized egg, will produce a drone always, and cannot be changed by the nurse bees, it matters not how hard the little fellows may try their mathematical skill; but, on the other hand, it is a simple operation for them to remove the male sperm from the worker egg just after the egg is laid, or just before the egg hatches.

I claim, friend bee-keepers, that if the egg is impregnated as it passes the mouth of the seminal sac when descending the oviduct, as the Rev. Father Dzierzon asserts, the male sperm is compelled to lodge in the mucus covering of the egg, and can be removed by the bees when the welfare of the colony demands it; and this seldom happens, unless a queen is suddenly killed by some mishap, and no drones left for mating with the young queen. And further, I believe the entire outer coating or covering of the egg is taken up in the development of the young larvæ; or, in other words, is a part of the milky substance seen when the egg is changed to a minute grub or larvæ.

And now for the facts in the case: I suspected this was the case in 1879, but was not positive about it until this and last year. To test the matter thoroughly, last August I took two new worker brood combs, built out on Given foundation in wired frames, and inserted them in the center of my Syrian colony containing one of D. A. Jones' best queens, and placed a Mason $\frac{1}{2}$ gallon fruit jar feeder, filled with syrup, immediately over these frames to get the bees to cluster on them. Four days after, I take them out, and find them about half filled with eggs equally, on each side. I cut a hole, about one inch in diameter, near the center of the eggs in one of the combs; in the other, near the center, I scrape the cells off to the foundation for a

space of 3 inches by one inch, and put both combs together in a strong queenless colony that had been especially prepared for this experiment, and had no laying queen for 2 weeks, having taken out a virgin queen 3 days before giving the frames with eggs; and, to be sure, I carefully examined the other frames and saw no signs of laying workers. I examined these combs every day until the brood was all capped. Around the hole 8 queen cells were drawn out, and all hatched nice queens, and near these cells a dozen or more cells were enlarged and drawn out for drones, from which I saw drones hatch, and this was the sole cause of the experiment. On comb number 2, was not a single drone cell; and on the comb containing the queen cells, the drone brood was on the same side of the comb on which were the queen cells, while the other side showed solid worker brood. I tried this experiment twice in 1882, and several times last year, and I invariably found some drone brood near queen cells.

These experiments were always in colonies where there were no drones or drone brood; and to further test the matter, I prepared a comb as above stated, and put it in a queenless colony containing drone brood and drones, without getting any drones on my prepared comb, although I got a nice lot of queen cells, which proved to my mind, that bees have the power to change the sex of eggs when the welfare of the colony demand it. It was hardly possible that the bees removed the eggs of the worker bee and deposited one in its place, for there was only 2 day's difference in the capping of the worker and drone brood.

This thing has been surmised by several of your correspondents, Mr. Editor, but I do not know how far they carried their experiments.

Now in conclusion, let me introduce three propositions, and I invite all bee-keepers to watch closely and see if I am not correct.

First proposition.—Bees change the sex of eggs (female to male only), whenever the economy of the colony require it.

2. Laying workers are found in nearly all colonies, hence a colony with a pure mismated queen may contain hybrid drones.

3. Queenless colonies containing laying workers will gladly accept a fertile queen or queen cell, if properly introduced.

Successful Out-Door Wintering.

J. E. VAN ETTEN.

On page 56 Mr. O. O. Poppleton says: "Show me a practical method of keeping the entire inside of my hives perfectly free from dampness, and I have no further fears of unsuccessful wintering."

About 2 years ago I reached the same conclusion. I observed that wasps, hornets, flies and various-winged insects invariably sought a *dry*

place in which to pass the winter, paying little or no regard to its exposure to a very low temperature. I observed flies issuing in the spring from iron door-locks, in which they had successfully passed the severest of winters.

I have also seen many "bee-trees" cut, and I observed that the bees seldom built their brood nest at the very top of the hollow, but almost always left an open space or hollow at the side or very nearly above their brood nest.

These various hints set me to thinking, and I came to the conclusion that bees could stand almost any degree of cold, if free from dampness. I made many experiments, and the more I experimented the more I became confirmed in my notion.

At last I thought I had solved or very nearly solved the problem of successful out-door wintering. Accordingly, last fall I took off the surplus sections from my bees, took out the sections and replaced the empty section boxes turned upside down, to give a dead-air space above the bees, and covered with enameled cloth and a thin woolen mat. One colony I left exposed without any case or cap surrounding or covering the frames. Over each I placed a "shock" of corn stalks, which I tied at the top.

The winter so far has been remarkably cold, the thermometer in January reaching as low as 20° below zero in this locality for several days in succession, yet my bees are all right. On the second day of February, I examined them and found them in the very best condition, and the colony without a case or cap quite as good as the rest, if not better. The bees were all bright, dry and clean, and not over a handful of dead bees could be found in any hive.

I have no further fears of successful out-door wintering. Keep away chaff and everything that will draw or hold moisture. Cover with corn stalks, set on end, tied at the top, and I will guarantee success.

Kingston, N. Y.

For the American Bee Journal.

The Winter Problem.

HENRY ALLEY.

I have read several of the articles on the above subject, that have appeared in the JOURNAL the past few months, and it strikes me that there is more or less theory in all of them. Much has been written about pollen being the cause of dysentery. Loss in wintering is not in my opinion caused by the bees eating pollen. It has not yet been made evident beyond a doubt that old bees eat it in the winter. The fact that bees will live without any pollen rather proves to me that they use but little, if any, unless breeding is going on in the hive. How is it that bees used to winter well on summer stands before patent hives and much other "scientific apparatus" were invented? Why, I know of a bee man here in Essex county (one of ye olden kind) who keeps 40 colonies, and he uses all

kinds and styles of hives extant, except the movable frame. His bees are wintered on summer stands, and no extra preparation for winter is made. I hardly think he goes near them from fall until spring. Certainly he never knew anything about bees dying from eating pollen during the winter. He seldom, if ever, loses any in wintering, and when he does it is because they starve or lose their queen—a thing he knows but little about. Well, when I want some good strong colonies of bees, in May or June, I generally go to this man and get them, and he always has first-class colonies too. I usually find his hives full of bees, and well-stocked with new honey.

Now, does any one suppose that these bees do not have plenty of pollen in their hives? Of course they have it in abundance, as every hive should if the bees are to do well the coming season. Hundreds of colonies do not get an "early start" in the spring for want of pollen, and to this fact should be attributed, to some extent, spring dwindling. I am no convert to the pollen theory. The cause of loss of bees in winter, in my opinion, is owing more to the late gathered honey than on account of pollen, or all other causes combined. If we are to succeed in all cases in wintering our bees, the fall honey must be removed, as is now being done by many bee-keepers, unless known to be of a fine quality, which is the case when the weather is warm and dry during the fall months. Apiaries that are worked for surplus honey, and more particularly for extracted, have all the best honey removed in caps, or by the extractor, and when fall comes the bees fill their combs with honey of an inferior quality. There is not generally time, or the right kind of weather to properly ripen it so late in the season. Hence, long before spring, the unripe honey will sour in the cells, run out and daub the combs and bees. Dysentery sets in, and before the weather is warm enough for the bees to fly, hundreds of colonies have perished. Bees will not do much work inside the hive unless the weather is sufficiently warm for them to fly; and for this reason the soiled combs are not cleaned, and death to all is the inevitable result.

When bees are managed on the plan which has proved so successful in the case of my friend above alluded to, there can always be found in the hive plenty of early gathered honey; hence, one of the reasons why this particular lot of bees winter as well as they do. And, again, perhaps flowers that yield honey in the fall unfit for bees to winter upon, cannot be found in that particular vicinity, and the bees are not compelled to subsist six months on a poor quality of honey.

Something new will soon be developed regarding the winter problem. I predict that in less than three years a plan will be devised for wintering bees on dry sugar candy. Of course there will have to be plenty of water at hand, as the bees would soon starve on the sugar alone.

The right kind of a feeder has been

devised, and some other things necessary to make this new idea a success have been experimented upon. When it has been demonstrated that bees will winter in a temperature of from 60° to 90° then the winter problem will have been solved. I have known for 25 years that bees can be wintered on sugar syrup without a particle of honey, but the plan I have suggested is to winter them on dry sugar, that is, candy made by boiling sugar in water until the moisture has all evaporated, when it can be run into cakes or frames to be placed in the hives. I am certain that bees can be wintered by this plan, and if I am alive another year will try the experiment. But I will not try it in a room where the temperature stands at 90°. I think 50° or 60° is as warm as will be necessary. The room should be just warm enough for the bees to work the sugar and water. If my time is not too much taken I may say more on this point by and by.

For the American Bee Journal.

Controlling the Queens.

W. R. GRAHAM.

I send a slip from the Texas *Patron*, published at Crockett, Tex., by Rev. P. W. Archer, of the Methodist Church, whose son, the Pastor of the M. E. Church, of Greenville, Tex., gave this slip to Judge Andrews and vouched for the statement, he having seen the astonishing feat performed many times by his father.

The executive committee of the Texas Bee-Keepers' Association, fully recognizing the wonderful statement, and the right of Mr. Archer to the realization of its value to our brethren, the world over, hereby extends the most cordial invitation to him to attend our next convention, when, if by gentlemanly courtesy and a fair compensation, the proprietor of this great secret can be induced to give it to the public, we expect to secure it. Here is the article:

"Probably no insects have been more carefully, intelligently and satisfactorily studied than the honey bees. Associations have been formed to discuss them, and books without number written; and it would seem that there are but few facts regarding them which are not well understood; and well have they repaid the study and toil that have been given them. A man that permits himself to become interested in this department, soon finds himself quite infatuated with the study of these truly wonderful insects. There are yet, however, many facts regarding them that have not been discovered, and some that have not been given to the public. Among them is this: It is possible to go to any thriving colony of bees, and without touching the hive, or in any way disturbing the colony by force, or the injection of any foreign substance within a few minutes, to cause the mother or queen bee to come out upon the resting-board and suffer herself to be taken up and carried away. We

repeat, for emphasis and distinctness, that this writer can locate himself beside a colony of bees, and within five minutes cause the queen bee to come out and allow herself to be captured. Others may be able to perform a similar feat, but if so, we have never read or heard of it; and certainly it is not by the plan referred to. This was an accidental discovery of the writer, and by the simplest means imaginable."

For the American Bee Journal.

Adulteration of Beeswax.

S. J. YOUNGMAN.

I see that the Michigan State Convention brought out considerable discussion on the beeswax question. I think it an important one, as wax is getting higher in price, and cannot always be readily found when wanted, causing serious loss and inconvenience to the bee-keeper at a critical time.

I think the idea of mixing paraffine or any other substance with wax for comb foundation should be discouraged, even if it should be successful. It would soon raise the hue and cry of adulterated honey; besides, it would be the means of causing serious trouble to the bee-keeper at the hands of careless and dishonest supply dealers. There is some wax that will not stand any adulteration, as it is already too soft, either of its own nature or from the effects of using paraffine or other foreign substance. As I had serious trouble the past season with foundation purchased of regular supply dealers, but I do not think for a moment that they were guilty, even if the wax was adulterated, as it would be as much as any man's reputation was worth to be proven guilty of such an imposition. The foundation in question was very nice to look at, made of the nicest light wax; not a speck visible to the eye, and ran about 6 feet to the pound. After leaving from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch space between the bottom bar and foundation, it would stretch or sag, rendering it necessary for me to cut off from $\frac{1}{2}$ to a full inch after the combs were filled with brood and honey, causing a vexation of spirit which I do not care to have repeated again, and which all bee-keepers should abstain from.

I think there will be great improvement in the production of wax in the near future, and there is certainly a great need and chance for it, as there are great quantities wasted by the bees for the want of an opportunity to store or build comb of it, especially where foundation is used. One has only to notice the wax scales at the entrance of a populous colony of bees. I have often picked them up with the point of a pin, and thus soon get a small chew of pure wax. The loss in this way, by the scales dropping off the bees during the honey season, must be enormous, and if saved there would not be such a dearth of wax as now exists. I also think that bees would often profitably build comb if allowed to do so, especially in the spring while stimulative breeding is progressing. The bees secrete wax

during a honey flow, whether they are building comb or not, and if they are not employed building comb, this wax is most certainly lost.

Although not having the experience that Mr. Doolittle has, my own agrees with his; it is an undecided question as to whether it pays at the high price of foundation, to use it exclusively. During the past season I had quite an experience in the matter of comb building—my supply of foundation running out—and as I could not get any for about two weeks, I was obliged to use frames with only very narrow strips of foundation, from $\frac{1}{2}$ to 1 inch in width, both in building up nuclei, and in full colonies. I found that nuclei could be profitably employed, and built nice straight worker combs where they would have done nothing if left to themselves.

With the full colonies comb was built very fast, but was nearly all drone comb, which I think of no value to the bee-keeper only to melt into wax. The building of an excess of drone comb seems to be the only drawback of getting nice straight combs, and I think fully as cheap as by the use of full sheets of foundation. There seems to be a large quantity of bees in the hive at all hours; would they not be building comb if comb was needed? Bees also build great quantities of comb at night; large sheets being built in a single night by new colonies. I would also like to say, while on this subject, that I think it unwise for bee-keepers to demand so fine a quality of foundation, especially for brood frames, for the dark is as good, and will be received and be built out by the bees as soon as the bleached, and is undoubtedly tougher and less apt to be adulterated, and it will be often noticed that when the bees build natural comb, it will often be far from white in color.

Cato, Mich., Jan. 4, 1884.

For the American Bee Journal.

A Queen Eleven Years Old.

S. H. HARRISON.

I am a reader of the BEE JOURNAL, and I must say that I have been many times repaid for time and money invested. I am an amateur in bee-culture, and have no lengthy theories to advance.

In the spring of 1882, I had one good colony of bees, which I had wintered in the cellar. In the fall I had 5 colonies. I put them in the cellar to winter; 1 colony proved to be without a queen, and perished soon after placing on the summer stand, leaving me 4 colonies, which were in good condition last spring. They have increased to 10, which are now in the cellar in apparently excellent condition. I got some surplus comb honey.

I purchased the first colony of J. T. Godding, now residing in Washington County, Kans., who started his apiary in Nebraska, where he purchased an imported Italian queen with both her wings clipped very short, and said to have been three

years old when he purchased her. He has now owned her eight years, and she fills her hive with young bees now just as well as she did eight years ago. He claims that there is no mistake as to her identity, for he knows her when he sees her just as certainly as he knows a horse or a cow which he has owned for that length of time. I saw him a short time ago, and he said: "The old queen went into winter quarters with as strong a colony as he had in his apiary." He claims that the queen I purchased is from the old queen; at least nine years old when she laid the egg from which my queen was reared. Is not this a little out of the regular order of theories?

Mankato, Kans.

[There surely is some mistake about it.—ED.]

For the American Bee Journal.

The Use of Comb Foundation.

F. M. TAINTOR.

On page 612 of the BEE JOURNAL for 1883, Mr. James Heddon says "that bee-keepers are now the greatest consumers of this, one of their own production, beeswax. In getting their wax to the foundation mills and back home, does it pay them to have the grocer, peddler, commission merchant and general dealer in wax, each take a margin of it? Just think the matter over and form correct conclusions." I think Mr. Heddon just right in regard to the peddler, commission merchant, etc., each taking out a margin. I believe, and would advise every one who has 20 colonies or more, to own a foundation machine, for I think that foundation fresh from the mill is worth nearly double that which is 2 or 3 months old, besides having it when you want it. I believe that everybody can afford to use foundation, even at a dollar a pound, if it could not be obtained for less.

There are several good machines made, but I prefer the Vandervort, although I think the Given press has many good points. I was as much surprised as was Mr. Caldwell to know that Mr. Doolittle did not use foundation. I guess Mr. Doolittle will think that I am extravagant, when I say that as long as I can buy beeswax for a dollar a pound or less, I shall use foundation.

Elm Grove, Mass.

For the American Bee Journal.

Rabbits for Hives, etc.

THOS. GORSUCH.

On page 28, Mr. Heddon gives J. W. R. a very good way to put in metal rabbits, or rather strips of tin. I have tried Mr. H.'s plan, and I will tell you in what way I have improved on it. In place of using a $\frac{3}{4}$ strip of tin, I use a strip $1\frac{1}{2}$ wide, and fold or turn down one edge $\frac{3}{8}$ of an inch flat; then nail it on with the folded side next to the rabbit. The advantages are, it makes the tin stronger, and

leaves no cutting edge to cut one's fingers and the chaff division-boards where used (we use no other kind), and it is much easier to put on, as the folded edge serves for a rest until it is nailed.

Is this not something unusual? On July 2, colony No. 24 swarmed out, or rather sent out a swarm, but before the bees all clustered, they commenced to go back, and soon all were home. On July 9 I found a cluster under the hive (our hives are all placed on stakes) that appeared to be working; on close examination we found three combs the size of a man's hand, and the centre one filled with eggs. This must have been the old queen, as it was the first swarm. We tried to hive them, but the bees, when we applied the smoke, went into the hive and remained there. Every bee-keeper should get an apiary register and see how easily it is to keep run of the queens, etc.

Gorsuch, Pa., Jan. 29, 1884.

To Bee-Keepers of Illinois and Iowa.

The regular annual meeting of the Eastern Iowa and Western Illinois Bee-Keepers' Association will be held at Moore's Hall, No. 110 East Third street, on Thursday, Friday and Saturday, Feb. 21, 22 and 23, 1884.

Mr. T. G. Newman, of Chicago, editor of the Weekly BEE JOURNAL, will be with us, and has been engaged to give two lectures on "Bee-Keeping" on the 22d and 23d.

It is hoped that the members of the Association, and others will bring or send honey, apianian supplies, etc. Any shipment of these, sent to Mr. Israel Hall, Treasurer of the Bee-Keepers' Association, Davenport, will be taken from the express office, removed to the Hall and cared for.

Also be ready to report results of last season's work.

Invitation is hereby extended, not only to the members, but also to their friends.

We want you to just swarm.

J. V. McCAGG, Pres.

I. J. NAGLE, Sec.

☞ Columbus Bean, of Cape Girardeau County, Mo., says about five years ago a swarm of bees took up their abode in a hollow tree that stood a short distance from his door. They have gathered honey from year to year since that time without molestation. The other day, when the snow on the ground afforded a good chance to cut the tree and save all the honey, Mr. Bean rallied a party and soon had the biggest lot of honey on hand that a bee-tree ever afforded. There was a deposit of honey for 14 feet up the hollow of the tree, the "take" amounted to about 175 pounds.—*Missouri Republican*.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Light and Heavy Foundation.

Will Mr. Heddon please answer the following questions?

1. In view of the advance in comb foundation, and scarcity of beeswax, would he have foundation, intended to be put on wired frames, heavier than 6 or 7 feet to the pound? I believe the greater weight of foundation made for brood frames was intended more to prevent sagging than to supply the necessary amount of wax to finish the cells.

2. I have, late last fall, used sheets of foundation made on the Given press, hand wired, and put in foundation running 7 feet to the pound, and believe that the bees have added no wax.

3. Would you advise the dead bees to be removed from the cellar floors, where large numbers of colonies are wintered in one cellar, say once or twice during the winter?

L. L. TRIEM.

La Porte City, Iowa.

1. We find by experiment that with Given foundation, the bees usually use to good advantage, all the wax that we give them in sheets, Langstroth size, that run about 5 sheets to the pound. The base is thin, and the side walls soft; and such a sheet will draw into comb whose cells will be brooding-depth, without any addition of wax from the bees, whatever.

2. I am not sure but what you are correct in this statement.

2. While it may not do any good, it certainly could do no harm to so remove the dead bees, provided you do it so quietly that they are not aware of your presence.

Was it Caused by Pollen?

To-day the thermometer stood at 51° above zero, in the shade. I threw the hay off the bees to let them have a fly, as there are only little patches of snow on the ground. I found them all in good condition but one colony, this one the lid had been left off last fall, the cap filled with sawdust, and some hay thrown over it, so it was not noticed: but not enough to keep the rain out. This colony had the dysentery badly, while the remaining 64 colonies showed no signs of it. Was it the dampness that caused it, or the eating of pollen?

H. CLARK.

Palmyra, Iowa, Feb. 1, 1884.

I think it was caused by an excessive accumulation of fecal matter, such as pollen, either solid, or floating in the honey. I am not aware that any such substance exists in water or dampness. Mr. Reynolds, of Cassapo-

lis, Mich., carried about 25 colonies through the winter, 3 years ago, when others about him lost heavily. Nearly or quite all of his colonies showed some signs of disease and depletion, except two that got very wet because of a leaky roof. Have you already forgotten about Mr. Balch's splendid success in the damp, moldy cellar, the same winter of our great failure in our exceedingly dry one?

Queries from a Beginner.

I am a beginner in the bee business, and would like some advice. On Oct. 2, a neighbor gave me two late swarms. I put them together in a Simplicity hive, and let them settle the queen business themselves. I suppose it was a case of the "survival of the fittest." They had no brood and no honey. I fed them nearly 25 pounds of granulated sugar syrup. They capped part of their stores. I put them in the chamber over the kitchen, where there is a coal fire night and day. I closed the hive with wire netting. I see, Mr. Heddon, you disapprove of this in cellars. Shall I open the hive? They are very uneasy in moderate weather, but are strong and healthy yet, for anything I can see. Shall I give them water? At what time shall I begin feeding to start brood rearing? Please answer in "What and How." I have some outdoors packed in dry forest leaves. They were humming a week ago. The weather is very cold.

MARTHA A. DOBBIN.

Lake, N. Y.

I am not sure that the restlessness of your colony, whether caused by high temperature or imprisonment, will injure it in the least, when their food is pure white sugar syrup. I look upon anything that excites the bees in winter, as having too deleterious effects. It will aggravate dysentery and increase consumption of food. I think there is no dysentery among your bees as you have removed the cause, and the excitement cannot aggravate what does not exist. If I desired to stop the excitement, I would put them in a cool cellar.

Moving Bees 40 Yards.

Will Mr. Heddon please answer the following question in the Weekly BEE JOURNAL?

At what time, and which would be the most successful way to move an apiary of 70 colonies about 40 yards, to keep bees from returning to the old stand and insure success?

G. W. SULLIVAN.

White Cloud, Kans.

I should prefer such time as when the bees had been confined for some time before the removal, and when they could fly immediately afterward. A good time to move them is in the

night. Clear away all land marks connected with the old yard; scatter a few heaps of some old straw or corn stalks about the yard; get up in the morning before the bees do; lean a short board about a foot wide against the hive, right in front of the entrance, so that the bees will have to fly out around it to get out. Just before they are ready to commence flying, smoke each colony, and drum on the hive a little. Also set the heaps of straw in the old yard on fire, just previous to smoking the bees, and have a grand smudge in the air during the next few hours. This plan will work, even if the bees flew the day previous to removal.

The Granulating of Honey.

Please tell us through "What and How":

1. Can white clover and basswood honey be prevented from granulating by sealing it up when extracted, or must it be heated?

2. If so, to what degree?

3. Will heating change the flavor?

4. Can honey be properly ripened or evaporated by keeping it in the open air or sun, in unsealed cans?

5. How can I tell when it is properly evaporated?

6. Can you give me any test?

SUBSCRIBER.

1. Sealing up honey does not prevent its granulating. Heating it will bring it from the granulated to the liquid state, but a continued low degree of temperature will cause it to granulate again.

2. Honey should never be heated to a degree above the boiling point of water, and not held at that degree any longer than is necessary.

3. Heating honey will change the flavor, and color also, damaging both if heated to a high temperature.

4. Honey sometimes improves in consistency by standing in small open vessels in a warm airy place, but while the warmth favors evaporation, it also favors bacterious development, which gives the honey that disagreeable twang. There seems to be no receptacle for honey as good for the purposes you mention as the capped wax and cells, and no place better to keep them than in the hives. Honey is properly evaporated when it is thick, rich and smooth. How thick? Why, thick, heavy or dense enough to hold a rich, oily flavor. Instrumental tests are not necessary, nor as practical to the producer as a little experience-knowledge. We used tact instead of talent in this case, because it can be so much more readily wielded.

Sections, Cases, Dysentery, etc.

Bees have been flying to-day for the first time since last fall. I have one colony of bees packed in chaff on the summer stands, to see if they can stand 38° below zero. So far they are all right. I see some signs of dysentery in the cellar in four hives. My cellar is too warm, 43°. It should be 38° to keep the bees in the cluster. My bees were put into the cellar Oct. 26; sixty-three colonies of bees nearly all strong. They will not get a fly until the last of March, if I can manage to keep them in without loosing too many.

1. Will fresh air make bees uneasy, while in the cellar?

2. Is there two kinds of dysentery?

3. If I fill your section case with sections full of foundation, and put them on the hive, will the bees enter them at once, or do they want some comb?

4. How many of the 28 sections in your case is not capped over, on an average?

5. Will foul brood spread by the sale of queens and comb foundation?

6. If I fill wide frames with sections and put them in the upper story and raise a comb of brood below at the beginning of the honey harvest, will the bees go to work in the sections and cap them in good shape for market?

7. Have you or any one else weighed bees that were filled with honey to see which kind of bees brought the largest load of honey? FAYETTE LEE.

Cokato, Minn., Feb. 1, 1884.

1. I have known a sudden influx of fresh air to arouse bees, and perhaps sometimes to their detriment. Pure fresh air is an essential to human health, but how much so to the health of bees, is yet an unsettled question.

2. I think not.

3. My experience is that the bees will enter them and draw the foundation (if it is a good article), as soon as there is any flow of honey to store.

4. During the honey flow we usually leave our cases on until all is finished, without experiencing any loss or coloring of the honey by so doing. In some instances, however, we see the need of removing a case with 3 or 5 cases unfinished. After removing enough of such cases that the unfinished sections amount to 28, we put them all in a case together, and put them in a right place to be finished together. In removing all at the end of the season, of course we take them off in all stages of development.

Undoubtedly foul brood has been many times introduced with the introduction of queens from foul-broody apiaries. My opinion is, and it is well grounded and quite positive, that foul brood is not carried in the traffic in comb foundation; the degree of heat to which the wax is heated in making

foundation, is too high to leave a possibility of the spores surviving it.

6. My experience with this method of manipulation is, that brood and bee bread are more apt to get into the sections, with such a system. The cappings of the sections are more apt to be darkened by the bees, when they are filled and finished in close proximity to dark brood combs. I can see no need for such manipulation, and think where such is needed, the rest of the system is very faulty.

7. No, we have no adequate scales; besides there would be great variance with members of the same family. We have many times weighed the aggregate results of colonies of about equal numbers, and made our preference in races and strains in that manner.

Bees in Fine Condition.

I have 100 colonies in the cellar, and another lot packed in chaff: all seem to be in fine condition. A good many colonies, in this vicinity, not protected, have succumbed to the zero weather. L. HUBBARD.

Waldron, Mich., Jan. 30, 1884.

Bees Carrying in Pollen.

My bees commenced to carry in pollen on the 3d inst. from several sources; I think from red-bud, willow and arbor vitae. I have now 81 colonies all in good condition. Some small nuclei have, so far, wintered well out-of-doors, with very little protection. I usually have drones flying about March 20. I will stimulate a few colonies by feeding, so as to have drones a little earlier this season. I will commence to rear queens early in March. I am much encouraged in bee-keeping here, and think it can be made profitable to a moderate degree in almost any locality. I have known in the South. O. F. BLEDSOE.

Grenada, Miss., Feb. 6, 1884.

Bees Fed on Sugar Syrup.

The mercury got down to 24° below zero here, which is, perhaps, about 15° colder than it has ever been in this part of West Virginia. We begin to get anxious about our bees, which were left on the summer stands, one-half of them in single-walled hives, but the last few days have been warm enough for them to take outdoor exercise, and they are in fine condition. The queens have been laying, and in some colonies sealed brood is found. All the honey was taken from 2 colonies last fall, and then they were fed on syrup made of a rather cheap grade of brown sugar,

and a small quantity of dark honey mixed with the syrup. These 2 colonies showed an anxiety for a cleansing flight, and as the temperature began to get nearly right, and a little before the other colonies made any stir, they were flying from their hives in a way that indicated that they could not much longer have continued healthy. For open winters, or for climates admitting of frequent flights during the winter, the cheaper foods will answer, but where long confinements may be looked for, the safety of the bees demand well-ripened honey or granulated sugar syrup.

J. A. BUCHANAN.

Holliday's Cove, W. Va., Feb. 4, 1884.

Irascible Cyprian Bees.

Are they vicious in the apiary if not molested, or is it just when the hive is opened? Do they go far from the hive, when disturbed, to sting any one? How long does it take them to settle down after being disturbed?

Columbus, O. P. E. BLESCH.

[It is reported by those who have kept and abandoned them that they will follow any one even in the house when on the rampage; also, that they are not soon quieted, and they do not wait for being disturbed before making the attack. We had an imported Cyprian queen, and found her bees so irascible that after a few months we superseded "her ugliness" by an amiable Italian queen. No more Cyprians for us.—ED.]

From the Cottonwood Apiary.

My 60 colonies are all alive and in good condition. They have been flying for the last two days. They did well last summer. I had half an acre of melilot clover which bloomed for six weeks; the bees worked on it all the time. I sowed my melilot clover on the first of May. I am going to sow several varieties of seeds, this season, for my bees. I would not do without the BEE JOURNAL for twice the price of it. N. DAVIS.

Emporia, Kan., Jan. 30, 1884.

Preparing Bees for Winter.

I put 29 colonies in the cellar Nov. 26; left one colony on the summer stand, in a Simplicity ten-frame hive; I took out two frames, the ones containing the most pollen, leaving the bees on 8 frames. I use no packing, only an enameled sheet over them. They had a fly Jan. 13, and another to-day. I examined them to-day; they are doing well; there are very few dead bees outside, and no signs of dysentery. For the bees in the cellar, I use no packing except an enameled sheet; over some wooden mats, and some without any cover on the frames. I took 8 colonies out to-day for a flight; examined them and found them all in good condition, not a sign of dysentery; all of them were damp; the water running out of some of them: in two of them the combs

were covered with mold. I use no ventilation in my cellar, but it is frost-proof, unless on nights like Jan. 4, when it pinched the leaves off of some flowers. The thermometer then registered 32° below zero on the morning of Jan. 5. It never goes above 45°.

RICHARD GRINSELL.

Baden, Mo., Jan. 30, 1884.

Report of a Beginner.

I bought one colony of pure Italians in the spring of 1882. It was dry during the summer, and they hardly gathered honey enough to winter on. In the spring they increased to 3, and gathered about 90 lbs. of comb honey. They are now on the summer stands, protected with chaff cushions. My father takes the BEE JOURNAL for me to read. I like it very much.

S. F. DAILY.

Mt. Hope, Kans., Feb. 5, 1884.

Bees "On the Wing" Again.

My bees were all "on the wing" yesterday; it has been 35° below zero in this county. It made me feel rather sick to have the little fellows out in the cold. I had 6 weak colonies in the cellar. There are 14 colonies in Gallup hives with dry leaves over them, and 64 in Langstroth hives without any protection but the honey board. They are all nice and dry. I think that it is the main thing, to keep our bees dry all the time. I sometimes think that chaff hives and cushions are of no use in wintering bees, when they come through just as well without. An American hive of black bees which I sold in 1882, came here in 1877 from Iowa, and never had any protection that I know of, and this winter they are still out-of-doors, 3 feet from the ground, I should think. Now this same old colony of bees gathered 75 lbs. of surplus honey last year. My son took it off.

JAS. JARDINE.

Ashland, Neb., Jan. 14, 1884.

Button Bush Honey.

I noticed R. S. Beckett's article in reference to button bush honey, and at the time intended to write out my experience with that kind of honey, but it slipped my mind, until I read in the BEE JOURNAL of Jan. 10, what the Rev. M. Mahin, D. D., said of it. I could no longer delay for my experience with this honey agrees with Mr. Mahin's to the letter, except the granulation. I cannot say as to that, for my honey was all in the comb. About one mile south from my place is an old sawmill pond of about 25 or 30 acres in extent, in which is a thick growth of button bush, except a narrow channel through the centre; the water is shallow, only from 2 to 4 feet deep; up to about four years ago this bush blossomed very full, and my bees had a very busy sweet time, for a week or ten days; and the way they carried in the honey, and such honey too, was enough to make any bee-keeper feel good-natured. During the winter of 1879-80 this shrub seemed to have badly winter-killed, since which time it has blossomed very little, and

my bees are cut off from one of their best fields. I can endorse what the Rev. M. Mahin says of button bush honey, as with me it was very white and of good flavor.

ROBERT DOWNS.

Naugatuck, Conn., Jan. 28, 1884.

Artificial Queens.

I have 45 colonies of bees on the summer stands, in excellent condition. I could never get along without the BEE JOURNAL. On page 67, Mr. Editor, you say "we have no use for the word artificial, in all the vocabulary of bee-keeping." Well, let us see about that: A year ago last summer a man stepped into my apiary to see me work with the bees. I was dividing for increase at the time, and he had a great many questions to ask. He asked me what I was looking for. I told him, the queen; he asked me whether I ever used any "artificial queens," made out of wax. After I recovered from laughing, I told him no, I had never used any artificial queens as yet. Well, he said he had heard of the like among some of the old-fashioned bee-keepers, and the bees did well. I positively was asked that question once before. Now, Mr. Editor, I will just ask you whether you would not call such queens artificial?

S. F. MILLER.

North Manchester, Ind., Feb. 6, 1884.

[Yes; of course, such a fraud as "a wax queen" would be entitled to be called artificial. One of Webster's definitions of the word would just fit that idea—thus: "made or contrived by art, or by human skill or labor, in opposition to *natural*." Next time we expect to hear of bees working on artificial "wax flowers" as well as having an "artificial" wax queen! What "bosh"!—Ed.]

Experience with Cellar-Wintering.

In the fall of 1882, I put 12 colonies of Italian bees in the cellar, and packed 26 colonies on the summer stands, according to Mr. Heddon's plan. They were packed in 5 inches of sawdust, with the frames covered with burlap, and top stories filled with wheat chaff. Now, for results. The 12 colonies wintered in the cellar were taken out on April 6, strong in bees and heavy in stores, and did exceedingly well, while the 26 colonies packed in sawdust, all died with dysentery, except 5. I have, at the present time, 18 colonies packed in chaff, 5 inches on all sides, with the top stories on and filled with chaff. I also have 27 colonies stored in the cellar. They all seem to be doing well now. I use the Simplicity hive with Gallup frames. My hive is 19½ inches long by 14 wide and 12 inches deep. I use 11 Gallup frames to the hive, and a rack which holds 20 one-pound sections, with a movable side, which I consider an improvement on the tight rack, as they are more easy of manipulation. I tier them up, making 40 on a hive, which is enough at one

time. My bees are all Italians in their purity. I want no leather-colored Italians, which are nothing more or less than hybrids. If a man wants such bees, let him purchase a pure Italian queen, and he will get hybrid bees enough without buying them. I am much interested in the warm-cellar wintering of bees, as practiced by Mr. Ira Barber. I hope Mr. Barber will tell us more about it through the BEE JOURNAL. E. W. WALES, 45.

Disco, Mich., Jan. 22, 1884.

A Square Deal.

MR. EDITOR.—In your article in the December BEE JOURNAL, on "Calling Things by their Right Names," where you criticize a writer who says his stands came out in bad shape, you seem surprised that he should convey the idea that the "stands" changed their shape, and ask, as an example, this question: "If the pieces of wood were nailed in a rectangular form, did they change of their own accord to a square shape?" Now, I would ask you: If they went into winter quarters in a rectangular form, might they not come out in the spring in a square shape, without changing in any manner? I think you will find that a square is always a rectangle, though a rectangle may not always be square.

ALSON MEAD.

Sedley, Ind.

[Mr. Mead is correct. We used the term in another sense. If we intend to "call things by the right names," let us have them right. "Hew to the line, let the chips fall where they may."—Ed.]

My Report for 1883.

On Nov. 15, 1882, I placed in the cellar 36 colonies of bees, leaving 72 on the summer stands, in good condition. I lost 1 in the cellar, and 3 on the summer stands, by starvation, and 4 by spring dwindling, leaving 100 to start with, in the spring of 1883. Though the season was only an ordinary one for honey, my bees gave me a surplus of 4,000 lbs., one-half comb and one-half extracted, and an increase of 50 colonies. On Nov. 15, 1883, I placed in the cellar 66, leaving 81 on the summer stands, in good condition; they are doing well so far, this winter, though it has been very cold.

DANIEL WHITMER.

South Bend, Ind., Jan. 26, 1884.

Sweet Home Bee Feeder.

I send one of my bee feeders to the BEE JOURNAL museum, for the benefit of bee-keepers. I have tried different kinds, but think this is the cheapest and handiest of any I ever saw. I take a common tomato can to a tinner and get a cap of about 1½ inch diameter made to fit on a flange in the center of the end, the top of the cap being made of perforated tin. When filled, invert the can on to a block of wood about 4 inches square and 1½ inches thick, having a 1¾ inch hole in it for the projection with the perforated-cap to go into, and as this reaches only ¾

of the way through the block, by cutting a $\frac{3}{8}$ inch passage-way 2 inches wide, it serves as an entrance for the bees, when that cut-away side is placed against the entrance of the hive. The fixing of this can only cost me 10 cts., and holds 3 lbs. of honey. You can feed from 1 to 3 lbs., or from 3 to 30 lbs., just as you like; all you have to do is to put more cans on the hive. I have fed 4 colonies that I secured late in the fall from a farmer that was killing them for the honey. I had the bees late in October, and put them into hives with empty combs, and placed 10 of these filled feeders over the frames of each hive, and the bees carried it all below in 5 days. If you feed at the entrance, the robbers cannot get the honey, as only the bees from the inside can get to the honey. If the bees should leave it during a cold night, the honey will not run out, for if it is held level, it will hold water. You can feed at any time of the year. In winter, feed inside of the cap; turn back the corner of the quilt, or if you use a honey board, bore a hole in it to fit the feeder. JOHN REY.

East Saginaw, Mich., Jan. 31, 1884.

[This feeder is practically the same as several others, particularly the Kretschmer, which has been in use for nearly 20 years.—ED.]

Bees did not Suffer by the Cold.

I examined all of my 75 colonies of bees in my home apiary to-day, and all answered to roll call, although the thermometer has indicated as low as 21° below zero, and the bees have had no flight for about a month, yet I never saw bees in a more healthy condition under similar circumstances. My hives are double-walled, with air space between the walls. I use a rack with 2½ inches of planing-mill shavings on the top of the brood-chambers. I want the absorbing material so porous or open on my hives that the bees can breathe through it, even if the entrances to the hives are entirely shut up with snow or ice.

SAMUEL D. RIEGEL.

Adelphi, O., Jan. 23, 1884.

Bees Never Wintered Better.

I am satisfied that bees never wintered better than they have so far this winter. I have not lost a colony yet.

C. W. SAPPENFIELD.

Crawfordsville, Ind., Feb. 5, 1884.

Young Bees Flying Now.

My bees did well last season. I commenced, in the spring, with 120 colonies; increased 40, that is, I put back all second swarms and a good many first swarms. I took 1,000 one-pound sections, and 16,000 lbs. of extracted, and there is about 4,000 lbs. on the hives to take out in the spring, that I could not take out on account of a severe spell of malarial fever last fall. We had no winter up to Jan. 1. We had it pretty cold all through January. Bees carried in pollen on Christmas day, and I had drones flying on Dec. 25. They commenced carrying

in pollen on Jan. 28, and are now working very fast on elms. I have young bees flying to-day. The honey crop has been an entire failure in Texas except in this and Brazoria counties.

J. W. ECKMAN.

Richmond, Texas, Feb. 5, 1884.

Will Syrians not Sting?

In the *British Bee Journal* for Jan. 15, page 31, speaking of Syrian bees, John Hewitt, of Sheffield, says: "If you get a single sting from them just furnish an affidavit of the fact attested by two credible witnesses and sworn before a commissioner duly appointed to administer oaths, or a justice of the peace, that it was a Syrian which did it, or I shall not believe it?" Is this "talk" or truth? Can any American bee-keeper verify or disprove this Briton's statement? He professes, in a column article, that where smoke is not used to these bees, they are the most docile of all docile bees; in fact, so peaceful that you have to tread on one to make it sting; striking and jarring will not do it! It seems to me that American bee-keepers have been mistaken, even to the extent of *fancying* that Syrians stung them. Great Scott, what next?

R. J. KENDALL.

Austin, Texas, Feb. 5, 1884.

Bees Under the Snow.

My bees in my new hives are doing splendidly. The ventilators are all I can ask for them; my hives are on the summer stands, with entrances filled with snow, and the bees are snug and warm. While a colony in a double-walled hive, by the side of them, has perished with the cold. I have at present 45 colonies in good condition, but they have not had a flight since the latter part of October.

D. B. BROWN.

Des Moines, Iowa, Feb. 7, 1884.

Giving away Honey at the Fair.

I have just read the Michigan State Fair Premium List, and in regard to the giving away on "Children's Day" of 1,000 5-cent packages, should like to make this suggestion: That Messrs. Hutchinson and Cutting get as many of the little cans and labels as in their judgment will be called for, and let any bee-keeper send for as many as he would like to fill, with the privilege of inserting his name in a blank left in the label for that purpose, and I have no doubt there will be plenty of honey forthcoming to supply all the children.

GEO. E. HILTON.

Fremont, Mich., Feb. 7, 1884.

Is Alsike Clover a Field Plant?

On page 44, Mr. Hugh Williams claims Alsike clover as a great honey plant, but he said it was no field crop. With his first sentence I agree, that it is a great honey plant, but that it is no field crop I beg to dispute, for I think that it is one of the best grasses that we can raise for hay; equal to timothy, if not better, as there is no fuzz on stem or leaves like on red clover, and rain does not hurt the hay

in curing, as it does the red and Alsike clovers; it will not freeze out, like red clover. During the past season I made about 7 tons of hay from 3½ acres of Alsike clover. There should be some timothy seed mixed with the clover seed to keep the clover from lodging. My clover was from 2½ to 3 feet high, and every bee-keeper should sow the Alsike clover, for he would get two crops—a honey crop and a hay crop, and stock like both Alsike hay and pasture better than any that I have tried yet.

E. J. C. TROXELL.

Ft. Seneca, Ohio.

How to test Thermometers.

It is easy to test a thermometer. Take a vessel large enough to put the thermometer in. Surround and cover the instrument entirely with fine chopped ice, lying or standing makes no difference. Take the vessel in a warm room or near a stove, and let it stand till the ice melts. The point the thermometer shows is freezing point, or 32° below zero; or in other words, dip the thermometer in melting ice, it shows then freezing point.

H. D. Cutting, Sec., Clifton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

At a microscopic exhibition in Boston lately the sting of a honey bee was thrown upon the screen, the point of which was so sharp as to be hardly distinguishable. At the time the finest of fine needles was shown, under the same power of the microscope, and the end of the needle measured 5 inches across.—*Exchange.*

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send *direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers; we reply, yes, any book or binder we keep for sale may be selected by those who get up clubs.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

We now club the *British Bee Journal* and our Monthly for \$2.50.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., Feb. 11, 1884.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 76@10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & CO.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly dilled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1 1/4 @ 2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—No material change to note. Demand for 1 and 2 lb. sections of white honey keeps up well for this time of the year, and prices fairly maintained at 17@18c. Dark comb honey very slow and not wanted. I am very low on nice 2 lb. sections, and could make pretty quick returns on a few choice lots. Demand for extracted fair at 8@9c. for dark fall; receipts light. I attribute the continued good demand for comb honey in this market to the careful overhauling and handling that I give it, thereby getting it to the country merchants in good condition, which encourages them to buy.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Strictly choice is required for in a small way, and for such the market is moderately firm. For common qualities there is little or no demand, and prices favor buyers. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7 1/2c.; dark and candied, 5@—

BEESWAX—Wholesale, 27 1/2@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Selling quietly at steady prices; comb at 14@18c., and strained and extracted at 7@8c. Top rates for fancy small packages.

BEESWAX—Firm at 32@33c. for choice.

W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before the all edition is exhausted.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.
Kingston, Tex., Jan. 16, 1884.

The Western Bee-keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.
Independence, Mo.

We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate.

II. C. WHITE.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Swarming Controlled!

A Drone and Queen Trap, and Drone-Excluder combined.

This Trap is the only perfect-working Drone-Excluder yet devised. A piece of perforated zinc placed at the entrance of a hive does not exclude drones. It operates exactly the reverse, as, by such an arrangement, the Drones cannot escape, and the entrance is clogged by them during the busy part of the day. This is not the case with the Drone Trap, as it is so constructed that the drones enter a chamber out of the way, and may be preserved or destroyed as desired. No Queen can leave the hive at swarming time; and the new colony can be compelled to cluster where desired, so that the bee-master will not have to climb into a tall tree for his bees when the thermometer is from 90 to 100 degrees in the shade, as is often the case during the swarming season.

Sent by mail, postage paid, on receipt of \$1.10. Liberal discount by the quantity. Our 22d Annual Illustrated Circular and Price List of **Queens and Supplies**, gives a full description of the Drone Trap, and directions for using them.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

Up to this date, Jan. 1, I have not been able to make any contract for any first-class Sections, and I neither use or sell any others. If I offer you any for 1884, you will see notice here. I have about 10,000 5x6x2 to spare now.

BEEES.

We now have in winter quarters, in first-class condition, 350 colonies of bees, of our new strain, and of pure Italian blood. As most of you are aware, for six years past I have taken pains to breed my stock for markings of character, or qualities, rather than color, using as a base, the leather colored Italian and brown German bees.

On reading my Circular, you will find some testimonials from practical bee-keepers (a few saved from many received), that will give you an idea of how well I have succeeded. Our hives and combs are in good condition, and our bees have always been free from foul brood. I shall endeavor to send out a first-class line of Full Colonies, Queens, Nuclei and Bees by the pound. Parties wishing to start an apiary, or purchase on a large scale, as well as those who wish the choicest of my stock to breed from, may do well to correspond with me.

Among the goods we have to offer, are Standard Langstroth and American Frames in the flat, a complete line of Bingham Smokers and Honey Knives, Excelsior Honey Extractors, Wax Extractors, Plated Wire, for wiring frames, our new style Nucleus Hives, both made up and in the flat, Bee Veils, Sample Shipping Crates, Comb Foundation Fasteners, Surplus Honey Registers, our three styles of Bee Feeders (for which I have numerous testimonials), and various parts of our Hive.

STUDENTS OF BEE-CULTURE.

Those who may wish to spend six months in the theory and practice of Apiculture, may do themselves a service by writing for terms for 1884.

I send out CIRCULARS to those who solicit them, only, and when ordering, will you please be sure to state whether or not you have my Circular of 1883. I believe we have no patent on anything we make, use, or sell, except Bingham smoker and knife.

As in the past, we shall do our best to satisfy the reasonable, and deal out exact justice to all. Address all orders and communications to

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keitsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republic, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OR BEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861. Chicago, Ill., February 20, 1884. VOL. XX. No. 8.

THE WEEKLY EDITION
OF

PUBLISHED BY
THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.
925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one new subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,
For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

On account of the inclement weather, only a few of the Rock county bee-keepers responded to the call to meet at the Pember House, Janesville, Wis., on the second Tuesday in February, to organize a bee-keepers' association, so we will have another meeting on the first Tuesday in March next, at 1 p. m., at the same place. All bee-keepers are courteously invited, and we hope there will be a good attendance. L. FATZINGER, Janesville, Wis., Feb. 13, 1884.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apinary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out, or fail to blow smoke up or down sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

BOOKS!

Sent by mail, on receipt of price, by THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, *Ex-editor of the British Bee Journal.* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee-culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide or Cook's Manual of the Apinary.—A full and complete, and fully illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apinary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c. 1/2 per dozen, 50c.

Preparation of Honey for the Market, including the production and uses of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages, 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, traves and heading bolt tables, wages, rent, board capacity of cisterna, cord tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measure, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, containing over 1,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Coal, Fitters, Brazers, Gold-ers, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, 32c.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Font Brood; its origin, development and cure. By Albert K. Kobnc. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apinary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Apinary Register, for SYSTEMATIC WORK in the APARY. The larger ones can be used for a few colonies, the smaller for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Biennen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—

—Der Tlichkeit des Biennenstandes—

—Honig pflanzen—Erziehung der Königin

—Füttern—Schwärmen—Ableger

—Verfehen—Italienisieren—Züfseher von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman.

Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigkuchen, Formkuchelchen, Puddings, Schaumkonfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniss der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The Honey Bird of Africa.

In the *Kaleidoscope* of February, we notice the following concerning birds and honey in Africa:

In the flower grown forests of Africa, there lives a curious little bird called by the natives, the honey bird—not because it gathers honey, but because it is so fond of eating it. This bird is gifted with a peculiar instinct that enables it to find the nests of wild bees that are hidden in hollow trees and little caves in the rock, and many a battle it has with the enraged bees before it can enjoy the banquet of honey. When it scents a nest of honey it utters a peculiar cry, which the natives have learned to know; and the honey hunters (men who make a profession of hunting wild honey) find in the birds an invaluable guide to the well hidden hives. All the man has to do is to follow the cry of the honey bird, and he is sure to find a nest of clear, sweet honey. A pretty little poem written about these honey birds contains this beautiful moral:

"We cannot all make honey,
But some can find it out
And show the hive to others—
A gracious thing, no doubt,
And in the world of thickets
And brambles, if you please,
One likes to know the birds
Who are neighbors to the bees."

Mr. H. Scovell, editor of the *Kansas Bee-Keeper*, Columbus, Kans., was married on Jan. 20 to Mrs. S. E. Murphy, of Galena, Kans. The *BEE JOURNAL* extends congratulations. May the union be happy and prolonged.

We can supply all new subscribers and renewals with the numbers from the beginning of the year, and shall do so unless otherwise ordered—presuming that it is so desired.

Old & New Methods of Bee-Keeping.

At the Farmers' Institute of Brown County, Kansas, held last January, Mr. J. W. Margrave, of Hiawatha, Kans., made the following remarks as we notice in an exchange:

Mr. J. W. Margrave, to open the subject, spoke of the old time methods of obtaining surplus honey, viz: from a few log "gums" kept around under the apple trees and among the weeds in harvest time to get a little honey. The bee-keepers would, with a hatchet, break off the cover, tearing the honey to pieces, cut out a plate full to set on the table, thus drowning many of the industrious workers and leaving the hive in a very deplorable plight for the bees to fix up as best they could—which the little industrious workers would at once proceed to do. Then, in the fall season, the bee-keeper would select a few "gums" to be "brimstoned to death" by making a hole in the earth large enough to set a small pot in with burning sulphur; then snatching up one of the doomed colonies, he would set it over the pit, and in two or three minutes all was still; not a living bee within to try to sting its merciless keeper. He then spoke of the sickening mess of stuff squeezed out, bee bread, young bees, etc., and called strained honey. This was contrasted with the clear, clean extracted honey of to-day, free from all impurities, nothing but pure honey.

He spoke of the magnitude of the industry; that the statistics for 1882 showed the honey and beeswax trade reached \$32,000,000.

That Mrs. Sarah J. W. Axtell, of Rosehill, Ill., marketed that same year from her apiaries 39,000 pounds of honey in the Chicago market. That Jerome Twitchell, of Kansas City, sold in that market, last year, 75,000 pounds of honey, and reports that he is not able to supply his trade this year.

He stated that the annual product under old-time management did not average more than 10 pounds per colony, and under the improved methods it was not uncommon to get from 50 to 100 pounds.

He then spoke of the diseases to which the honey bee is liable; he also spoke of the most prolific honey plants of this region of country.

Letters for publication must be written on a separate piece of paper from items of business.

Quite a number of our readers, when they see articles in the *BEE JOURNAL* from prominent bee-men, feel at liberty to write them, asking lots of questions. Perhaps this is all right, if they feel like giving their time to the common cause; but those who write thus, should invariably enclose a stamp, if they desire a reply. Two or three stamps are nothing, of course, but where a person has ten or a dozen a day to answer, it amounts to considerable in the course of a month. One of our correspondents lately said, "I have taken 40 letters from the mail this morning," and many of them expected replies, but generally did not contain a stamp to pay the postage on it. Therefore, we would say to all, when you ask questions of writers for the *BEE JOURNAL*, be sure to enclose a stamp for reply. This is but fair and just.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

J. V. Caldwell, Cambridge, Ills., 4 pages—Apiarian Supplies.

Jos. D. Enas, Napa, Cal., 6 pages—Queens and Bee-Keepers' Supplies.

Flanagan & Illinski, Belleville, Ills., 16 pages—Queens and Apiarian Implements.

Miller Brothers, Nappanee, Ind., 8 pages—Bee Hives and Bee Supplies.

M. C. Von Dorn, Omaha, Neb., 4 pages—Bee-Keepers Supplies.

G. B. Jones, Brantford, Ont. (now called "Ontario Bee-Keepers' Supply Co.") 44 pages—Supplies.

R. L. Shoemaker, Newcomerstown, O., 12 pages—Bee Hives and Supplies.

W. C. R. Kemp, Orleans, Ind., 4 pages—Bee-Keepers' Supplies.

E. P. Fassett & Bros., Ashtabula, Ohio—Plant Catalogue, accompanied by a bunch of nice plants, put up so as to be safely sent by mail.

Edward Gillett's Perennial Plants, etc., Southwick, Mass.—16 pages.

J. C. Vaughan's Corn and Potato Manual, Chicago, Ill.—64 pages.

CORRESPONDENCE

May Flowers.

Pale winter waves his chilly wings
Above the white, wan world;
The spectral winds abroad he flings,
And wrathful storms are hurled.

But pallid winter's sway must yield,
When wake the gentler days
That smile in sunbeams o'er the field,
And flood the world with praise.

Up, then, my heart! thy winter's day
Can work the spring no wrong;
Its ice will melt when beams thy May,
Its sorrows die in song.

DAVENPORT, IOWA.

—M. L. W.

For the American Bee Journal.

Do Workers Govern the Colony?

J. RUTHERFORD.

Allow me to lay before the many readers of the BEE JOURNAL a few unpolished observations on the influence of the worker bee.

1. The workers control the colony in the act of defending, cleaning, ventilating and preparing the brood nest.

2. The workers control the size of the brood-nest by stimulating the queen or mother bee to lay. This food consists of an almost colorless liquid produced profusely by the nurse bees, and is of the same nature as royal jelly in its original state, but on coming in contact with the air it thickens and congeals into a milk-like mass, hence we call it royal jelly. This most wonderful stimulus is fed very sparingly during most of the year, and is regulated accordingly to the flow of honey and the temperature outside the hive.

3. The workers control the colony by producing drone comb or preparing it for the reception of eggs. In the spring of 1882, while endeavoring to secure some early drones, I put a nice frame of drone comb into the centre of a strong colony, and in a few days it was partially filled on both sides of the comb, but after this short spell of fine spring-like weather, we had a cold snap for ten days, during which they had no fly, and quite a number of colonies showed signs of a disease commonly called bee cholera, dysentery, and now modern authority pronounce it diarrhoea. I was feeling anxious about the extended cold snap, as I had 96 colonies to prepare for the honey harvest, and a number of colonies to prepare for queen-cells; so the first warm day I examined the colony mentioned, and you can imagine my surprise when I tell you that the same comb was entirely empty. I took it out of the brood-nest and put it behind the division-board in disgust. You will at once perceive that the weather influenced the bees to such an extent that the workers did not bring the drone eggs to maturity, also the workers stopped stimulating the queen, and she, too, ceased to bring her eggs to maturity.

4. The workers control the colony by enlarging or building queen-cells, in preparation for and during the swarming season, and workers can and do remove eggs from one cell to another whenever the economy of the colony require it, and I have produced queens, drones, and workers from worker eggs. In the spring of 1882, I had 4 queenless colonies, and in order to keep them in good condition, I gave them these combs of eggs from 4 different colonies, and the workers produced drones from worker eggs in three of them; this led me to believe that the queen laid only impregnated eggs after meeting with the drone, which eggs are metamorphosed into drones and queens by the workers, as the economy of the colony demand it, and that the theory advanced by prominent bee-keepers that the sex of the eggs is determined by the size of the cell by the abdominal pressure in depositing the egg, is fully exploded, as I have seen eggs laid on foundation before the cells were complete, and I believe the most advanced theory is that the queen can and do lay eggs intended for queens, drones and workers by simply controlling the eggs as they leave the ovaries, and that the workers have nothing to do with the sex, but simply to nurse and feed them after the eggs are hatched. This, also, I think, can be proven a myth. I firmly believe that a queen never laid an egg in any cell intending it to be any other than a worker. Can it be possible that a queen possessing such jealousy, yea, such deadly hatred against a rival, that the workers have to guard the queen-cells in order to prevent her from tearing them down—can it be possible that such a queen would voluntarily deposit an egg in a royal cell, knowing that in so doing she was endangering her own life in case of battle, or leave the home of birth and adoption to form a colony of her own.

5. The workers control the colony during the swarming impulse by sending out scouts to reconnoitre, select and prepare a place for their future abode, which is generally much inferior to the hive they are about to leave; although I have seen them select, clean and occupy an empty hive not 50 yards distant from where the swarm issued.

6. The workers control the colony by superseding the queen in case of accident or old age. The workers know that the prosperity of the colony is entirely due to the faithfulness of the queen, and whenever they discover that they cannot stimulate her to lay the requisite number of eggs, the workers turn her ruthlessly out of the hive, and proceed to select, enlarge and complete a number of queen cells out of the worker eggs remaining in the hive, but occasionally we find mother and daughter living quietly together in the same hive. They also control the colony in the act of destroying the drones when the economy of the colony demand it, and the same restless activity that was displayed in rearing the brood and caring for it, is now turned to hatred, and I have not the least doubt but that the same bees

that nursed and cared for the larvæ but a few weeks ago, is now most active in worrying, killing and driving them away, such is the merciless law of the worker when the good of the colony demand it. Yes, the much maligned drone, though useful but a short-lived career, is born to go down "unwept, unlamented, and unsung."

Extra Prolific Queens.

W. J. DAVIS.

I fully agree with Mr. Doolittle and Mr. Heddon that extra prolific queens are not desirable when surplus honey is the object sought in keeping bees. I would not take the time to write, nor tax the space of the BEE JOURNAL, nor the patience of your readers did I not think that a large majority of bee-keepers do not believe the statement, and I will admit there are some reasons for disbelief. The inexperienced would say, "If the laying of the queen be desirable, why, the more eggs the better." I used to think so myself, but my experience does not confirm that idea, and it has occurred several times that the queens I thought in the spring to be the very best in my apiary, were the ones I would kill first in the fall. Let us see if we can assign a reason for this.

Every young bee reared in the hive represents a certain amount of out-door labor by adult bees, and that labor must be performed from 20 to 40 days in advance of the time when said young bee can engage in out-door labor. It is not difficult to see that a colony with 40,000 cells of brood must do double the labor to simply "support the family" than a colony with but 20,000 cells of brood. Yes, that is plain, says one, but there are twice as many bees to work. That may be, but I would ask when? Not when the bees are of the greatest value, viz.: at the beginning of the honey harvest.

Again, in this locality, there are so many days after breeding has begun in earnest, that bees can secure nothing from the fields, and the internal demand and external supply are sadly out of proportion. But if smiling earth and skies, or the timely aid of the bee-keeper enables the "excessive breeder" to pull through, they swarm at the beginning of the honey harvest, while the bees of the normal breeder go into the surplus department and work with a will. If the greatest number of colonies and a great amount of feeding is the object sought, the case is different.

I think there is not so much difference in the amount of real labor performed by different colonies as some might think. The labor of one may be directed to the production of brood, bringing in larger quantities of pollen, consuming larger quantities of honey, in the maturing of a greater number of bees to be of little value in the autumn, while another will show a large yield of surplus, and a medium sized colony of bees when fall frosts come. The moth, with me, is a thing of the

past, and 10 cents per year would be a liberal estimate for all the damage they do to me, but queen bees that are too prolific are things of the present. When writers, in recommending "new races," say the "queens are wonderfully prolific," I just think, score one against them.

In extra good honey localities very prolific queens would not be so objectionable, but such localities are the exception, not the common lot of bee-keepers.

Reversible Frames.

W. T. STEWART.

It will be remembered that I wrote an article entitled "The Coming Hive," and gave a description of a hive with reversible frames that "eclipsed" any that had been described. I knew that if the theory of reversing frames was practical, that I had "struck oil," and would soon be rich enough to start a free "school of apiculture." This was three years ago (1881). The season of 1882 was a very poor one for honey, and when honey was coming in slowly, my frames worked like a charm, and sure enough I had a bonanza—a bad case of "reversible frame fever." The season of 1883 rolled around, and it proved to be an extra good one for honey, and, again, I was on hand ready to give the reversible frame theory one more test practically. I had a large apiary in charge, but only a few hives with reversible frames, and watching the results of those few cured the case of fever on me. I could work them like a charm, but I could not see anything gained by reversing, when they were either full of brood or honey, and there was no room for any more. Of course it proved that bee-keeping had been reduced to a science, and that combs could be turned upside down, and many things were proved to me that I "already knew," and I am none the wiser, or none better off financially.

I have only this to say, after a trial of them in one poor season, and one good season, I have decided in my mind that reversible frames will work better in the head than they will in the hive, and that they are better to "sell" than they are to use in the apiary, and that for the average bee-keeper to use them is a loss of time, and time is money. In other words, reversible frames are good in a poor season, and poor frames in a good season. I acknowledge that I am badly disappointed in the results financially, yet I believe my hive is the best for reversing the frames of any yet found, and I shall use a few of them again, but only for the sake of experimenting with them in poor seasons.

I have been trying for years to get up a hive that was better than the Standard Langstroth, but the more different styles of hives I have tried, the better the Langstroth suits me.

I want to thank Mr. W. D. Wright for his article on setting up and running circular saws. I had just com-

menced making my machine, and was somewhat bothered about how to make it, and his article is so plain that it is almost like looking at the machine itself—mine will be run by steam power.

While I am writing, I will report my last season's work. I commenced the season with 65 colonies, half of them very weak and short of stores. I closed the season with 186 colonies in good condition for wintering, and secured about 5,000 pounds of white clover honey, mostly in one and two-pound sections. I made all my hives, myself, by hand, and I had not one hour's help in the apiary the whole season, and my increase was mostly by natural swarming too; they would swarm in spite of all theories and preventives. I have sold nearly all my honey at 20 cents per pound. "Is bee-keeping profitable?" I say, yes.

Northeastern Kansas Convention.

According to previous notice, a meeting was held in the Court House in Hiawatha, on Nov. 26, to organize a bee-keepers' association. The following officers were elected: J. W. Margrave, President; W. S. Cooper, Vice-President; L. C. Clark, Secretary; Mr. Hemmey, Treasurer. There were 18 names put on the roll. The name given the new organization is the "Northeastern Bee-keepers' Association." Meeting adjourned until Feb. 15.

L. C. CLARK, Sec.
Hiawatha, Kans., Feb. 7, 1884.

Read at the Michigan State Convention.

Are Separators Necessary?

W. Z. HUTCHINSON.

Why are not separators needed in the brood department? Because the frames are of such a width, and placed at such a distance apart that the bees can build their combs of a natural thickness. Had sections been made only 1½ inches in width, had foundation been in use when sections were brought into use, and had the glassing of finished sections never been devised, separators would probably have never been employed. That they are no longer necessary is proven by the fact that three-fourths of the members of the Northwestern Convention could dispense with them; and it should be remembered that Father Langstroth characterized that body as one composed of the "largest number of large, successful, practical bee-keepers" of any convention that he had ever attended.

One objection to separators is their cost; another is the space they occupy, or, to be more exact, the space they compel the bees to leave upon each side of them. When no separators are employed there is one "bee-space" between the combs; when separators are introduced there are two. A "case" that will receive twenty-four pound sections with separators will

receive 28 without them; and the combs will remain of the same weight and thickness for the reason that there is only one bee-space between any two combs; and, as bees will fill with honey the same amount of space in about the same time, there is a gain of one-seventh without separators. Again, many excellent apiarists have asserted that the introduction of separators divided up the surplus department into so many small compartments that the bees, not being able to enter and work in a body, were loth to commence work, and that the amount of surplus was lessened by their use.

The first step towards abandoning separators, is reducing the width of the sections. One and one-half inches will probably secure the straightest combs; but, by complying with certain conditions, sections of greater width can be satisfactorily employed. I used, during the past season, sections whose side bars were 1 11-16 inches wide with top and bottom bars ¾ of an inch narrower. By the way, having ¾-inch space between top bars and between bottom bars, instead of the usual ¼ of an inch, is a valuable adjunct in securing cratable combs without separators; as it induces the bees to leave larger spaces between the combs. With me the dovetailed sections are a favorite; one reason being that the spaces between the top bars and between the bottom bars extend clear across, with no little projecting shoulders as in the one-piece sections, to gouge into adjoining combs. I have tried putting a "starter" of foundation in each section, filling the sections half full of foundation, and entirely filling them, and I am decidedly in favor of filling them full, with the exception of ½ space at the sides and ¼ at the bottom. When a section is not filled full of foundation, the bees gradually shorten the cells as they approach the sides, and often fasten the combs at the sides with brace combs only, when, if the section is filled full of foundation, they draw the cells out full length next the wood, and the comb is thus evenly and securely fastened all around. I prefer the Given foundation, and agree with Dr. Miller, James Heddon, E. J. Oatman, Geo. Grimm and many others that it is less liable to warp or curl in being drawn out than foundation made upon a roller mill. Very thin foundation is more liable to curl and bend in being drawn, than that that is heavier. Seven square feet to the pound is about right. The surplus receptacles should always be filled with bees, in order that both sides of the foundation may be drawn out at the same time. As combs are built perpendicularly, hives should stand level, at least in a direction at right angles with the combs. There are no better comb builders than the black or German bees. Their combs are straight, white, regular and even, and bees of this variety, or Italians having a dash of German blood, are a very great help in securing cratable combs without separators. I had, the past season, a few colonies that were a cross

between the Italians and Germans, and their combs were free from "bulges," there was no indulgence in "brace combs," and each and every section was as square and true as a brick.

In recapitulation allow me to say that, to dispense with separators use narrower sections, fill them with Given foundation, keep the hives level, do not give the bees more room than they can occupy, and either keep German bees or those having a dash of German blood.

How Far Bees will Fly.

J. D. ENAS.

I notice many remarks as to how far bees will fly, and also on as to the clipping the wings of the queen, and its effects upon the wing-power of her progeny.

I live in the foot-hills where timber is not plenty, and bee trees, consequently, very scarce. Early in the spring, before the sage gets regularly in bloom, bees have to fly a good part of the time between the showers, especially until April.

I have practiced clipping wings for the last 7 years, and see no reason why I should cease to do so.

A few years ago, one of my neighbors (about 8 miles away, or about 7 in a bee line), when no one had Italians but myself, in this vicinity, called on me, and said that he got awfully fooled on my bees. He lives in the Thermal belt, and had early bloom in profusion. Noticing bees at work on bloom, near his house, he saw that they were pure, bright-banded Italians, and looked very much like what he saw at my place. Knowing that I lived (as he thought) too far away for my bees to visit him, he tried to line them, thinking to find the bee tree or their home in the rocks, and to secure a swarm of pure Italians. My elevation is 700 feet, and his about 2,000, above the sea level. From his place to the nearest valley, in my direction, is 3 miles. He lined them 3 miles to the foot of his range of hills, when they rose in the air and made a direct line for my direction. I do not know of any one in the county who had pure Italians except myself, and I had lost no swarms at that time. That was several years after I had commenced to clip the queen's wing.

The same spring was very wet, with sudden showers; bees would get caught in the showers; but, it being very warm, would soon dry and finish their flight.

I do not imagine a slight clipping of the tip of one wing, so as to make them fly uneven, affects their muscular development of wing power. I learn that there is not a blackberry patch within 5 or 6 miles of me, but what my bees visit, as there is some considerable difference in the time of bloom, owing to their position and surrounding influence. All wild bees found here are blacks or hybrids; none pure as mine have been found by bee

hunters, and there is hardly a wild colony but what has been located.

What effect has clipping on the ant? Should it affect the progeny of the queen bee any more? The queen ant has her wing severed where it joins the body: am I right?

Getting the Statistics.

L. N. TONGUE.

As Dr. C. C. Miller calls for suggestions as to the best method to secure full reports of bee-keepers, number of colonies, amount of honey crop in each state and county, I will venture to make this suggestion. Furnish each assessor in every town with blanks to be filled out by him at the time taxes are assessed; and let him report the same to the county clerks, or to such person appointed to receive such reports. I know of no better way whereby as full and complete reports can be obtained. There are a large number of bee-keepers who know nothing of the wish of those who are anxious for reports, from the fact they take no bee periodicals, and hence, they are not interested in making reports.

I know of some 35 bee-keepers within a radius of some 20 miles of my apiary, and I think I can safely say that not over 12 of the number take bee periodicals. Some of them have as high as 70 colonies; one has 25 colonies, and so on down to 5 colonies. I have talked with several of them, urging the benefit they would derive by taking some periodical devoted exclusively to apiculture, but I am met with this reply: "I do not want to subscribe now; I read an article in a paper that tells all about managing bees." Such twaddle makes me feel like letting such people enjoy their ignorance: the truth is, they are afraid to pay a dollar for something they cannot eat. If the above suggestion will help mature a plan to bring out the full report so much desired by the honey-producers, I shall be glad. I have 30 colonies in the cellar, apparently doing well; and 10 others owned by Mr. Jameson. We have 40 in all, from 10, spring count.

The Hives I Like and Use.

HOWARD W. ACKERMAN.

I can easily say what hive I like the best, although my saying so does not add to the value of it in the least. It is the one known as the Simplicity, first made by A. I. Root. It is simply a Langstroth hive without portico or permanent bottom-board, and takes 10 standard Langstroth frames. It is 20 $\frac{1}{4}$ inches long, and 16 inches wide outside, with body mitered together at the corners. The top is beveled, as is also the bottom of the cover, fitting over, telescope fashion, and making a perfect joint. To make a two-story

bive another body is used. The bottom of every body being beveled so as to fit the top of any other hive or body perfectly. You can thus have a one, two or three story hive by simply placing one body on top of another, tiering up as high as you wish. The cover and bottom board are the same, being interchangeable. But even this hive I regard as far from being perfect, as we shall see.

Mr. Heddon, in an able article in a late number of the BEE JOURNAL, describes the hive he uses, also some of his methods of manipulating, and, although I indorse much that he says, there are a few points on which I beg to differ.

In summing up the necessary principles in the construction of a hive, he says:

1. "All hives should be easily and readily movable." I most assuredly indorse that.

2. "The stories should move off and on each other without the necessity of the least upward or downward motion; that is, no telescoping principle." Why not, I ask? The telescoping principle more effectually protects the hive and bees from the inclemency of the weather than any other device, and if the hives are "easily and readily movable" (as they certainly should be), the "upward and downward motion" necessary to move the supers on and off the hive should not be very fatiguing, especially if they have a capacity of only 25 pounds of honey, as Mr. Heddon recommends.

3. "There should be no dead-air space or double covering over the surplus room." I differ here, and unless I misunderstand the latter part of the article (in which he quotes from the specifications of the Langstroth patent), Mr. Langstroth did also.

4. "The sections should never rest on each other or the brood frames." I most heartily indorse that. That is an objection I have to the Simplicity hive as now made. The full height of the upper story is all right if extracting only is to be done, but where we run for comb honey in 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ sections, I should much prefer a story of one-half the height to take 7 wide frames of 4 $\frac{1}{4}$ x17 inches, inside measurement, to hold 4 sections instead of 8; the number used in the present arrangement. A super of this style would hold 28 one-pound sections, and with a tin separator permanently fastened to each wide frame would be a very desirable arrangement indeed. Another super of the same size could be added whenever needed, tiering up three and four high in the same manner that Mr. Heddon does with his cases. The brood-chamber cover covering them all.

Two of these shallow supers could be readily tacked together, and by substituting 10 regular Langstroth brood frames, for the 14 wide frames, we would have a single upper story for extracting. A super could also be made of a suitable height to take 7 wide frames, each holding 3 prize boxes, or 21 two-pound sections in all. These could, of course, be tiered up in the same manner as the smaller ones, or a super of each could be

placed on the hive, and thus secure our honey in both of the popular sections, and satisfy the most exacting customer.

Quite a number advocate only 8 frames in the brood chamber. I much prefer the regular 10-frame hive for this reason: With a division-board we can contract the brood-chamber to hold 8 frames, or as many less as we may desire; and, if we wish, we can put in one or two wide frames filled with sections for side storing. With only an 8-frame brood-chamber, this is not possible. Extra space for two more frames adds but very little more weight to the hive, and I consider any hive having a brood-chamber of less than 10-frame capacity (provided the frames contain no more than 150 square inches of surface) to be "just that much off."

For the American Bee Journal.

Topics of the Day.

J. A. BUCHANAN.

There seems to be an inclination on the part of the bee-keeping fraternity, to take up certain questions pertaining to the art, and for a time, all conversation and correspondence hinge on these points, until they either become exhausted, or have been so thoroughly discussed as to have brought out all that is known or has been developed on the subject. This is well, since the experience and knowledge of each one made known to all, tends to a more generally information. Of the leading topics of present interest, I have two or three to be treated on in this article.

WINTERING.

This old question is not long at a time "laid on the table." One terrible cold winter is all it takes to freshen up the subject. Some bee-keepers think they have solved the problem, but by-and-by a severe winter, accompanied by an unfavorable spring, catches them, and cleans out their bees as well as their conceit. Where the conditions are favorable, and the bee-keeper understands his business, cellar or in-door wintering may be best; but for the masses, I am pretty sure the better way is to leave them on their summer stands, and if the conditions I shall, in this article set forth be complied with strictly, I feel safe in saying your chances for safely wintering your bees will be as good as any, if not a little better.

I would give the double-walled hive the preference; not so much on account of its better wintering qualities, but for the more uniform temperature it secures in the cool spring months when bees are weak in numbers, and desire to rapidly extend their brood. Herein lies the principal advantage of the double-walled hive. Since comparatively the single-walled hive is the one generally used, I will give a few simple directions for its preparation, which apply equally well to the arrangement of the chaff hive.

I deem it all folly to removing part of the frames of comb, and use division boards. The frames of comb protect just as well as anything that may be used. When you have a good colony of healthy bees, with plenty of honey stored around the bees in the natural way, you have not much needed preparation to make. I would advise the use of some device placed across the frames that the bees may gain free access to all their stores, and that there be used to cover the frames a clean cloth of good thickness on which should be placed a cushion filled with chaff or dry leaves, and that the whole hive be effectually protected from wet by a perfect cover.

There is one more important point, and that is the means of ventilation, which, according to my experience, is best secured by the use of a large entrance. This should be, if mice are not troublesome, from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch deep, and about the full width of the hive, and kept open. If any have the entrances to their hives narrowed down, I say go right now and open them up, no matter how cold the weather. The winter of 1880 was the most trying on bees of any we ever experienced here, and the only one that wintered all his bees was an old farmer who had 6 colonies, and they were raised from the bottom-board by one-inch blocks placed under each corner of his hives. One colony, that winter, went through in splendid condition, and swarmed very early, which had an entrance over two inches deep, and the full width of the hive.

A great many advise stimulating the bees to breed late in the fall, that the bees may be young to winter well. I regard this as all nonsense, and a useless expenditure of time as well as the vital forces of the queen. I have had ample experience in this matter.

EXTRACTED HONEY.

A few words on the question of selling extracted honey, and I will close. There is no use to try to conceal the fact that liquid honey is now and always will be a drug on the market. It may be boosted up for a time in some markets and sold for a while at fair prices, by being placed on the markets in small packages, nicely labeled, but its everlasting tendency to granulate in cool weather, just when it ought to be looking its best and selling well, will always entitle it to a back seat and a bad reputation. Its fate is sealed. It is not much better sale now than when first introduced. See the men who used to take all their honey in this way that have turned their attention and skill to the production of comb honey in its most attractive form.

Visit the retail stores where honey is handled, ask the proprietor about that honey sitting around in jars, looking for all the world just like bottles of prepared horse radish, and see if he does not say every time, "Slow sale." "That's a fraud." "The stuff has all gone back to sugar." "Guess we won't want any more." Again, see quotations of honey in liquid form in almost all the markets, "extracted dull, as usual, etc."

All things considered, I think it will hereafter be more profitable for the bee-keeper to turn the most of his attention to the production of comb honey—getting it up in the most attractive and convenient manner, and placing it on the market in the best possible shape. If it will not pay to do this well and truly, it will not pay to engage in this, or, indeed, in any other branch of business. So much honey has been put on the market in that careless, indifferent, don't-care-how-it-looks way, causing loss to both producer and dealer, I have thought I would write an article on this very subject at another time.

Holliday's Cove, W. Va.

To Bee-Keepers of Illinois and Iowa.

The regular annual meeting of the Eastern Iowa and Western Illinois "Bee-Keepers' Association" will be held at Moore's Hall, No. 110 East Third street, on Thursday, Friday and Saturday, Feb. 21, 22 and 23, 1884.

Mr. T. G. Newman, of Chicago, editor of the Weekly BEE JOURNAL, will be with us, and has been engaged to give two lectures on "Bee-Keeping" on the 22d and 23d.

It is hoped that the members of the Association, and others will bring or send honey, aparian supplies, etc. Any shipment of these, sent to Mr. Israel Hall, Treasurer of the Bee-Keepers' Association, Davenport, will be taken from the express office, removed to the Hall and cared for.

Also be ready to report results of last season's work.

Invitation is hereby extended, not only to the members, but also to their friends.

We want you to just swarm.

J. V. McCAGG, Pres.

I. J. NAGLE, Sec.

For the American Bee Journal.

The Successful Wintering of Bees.

GEORGE A. TAYLOR.

There has been a great deal said in regard to wintering bees successfully, but still a great many are not very successful. In this latitude I consider a cellar very necessary. In my judgment the thing most needed for success in wintering bees is a warm, even temperature. Some consider a wet cellar preferable to a dry one. I would not take an extreme either way, but would prefer a moderately-dry cellar (not dusty), the temperature not going below 45° or 50°. I believe, when bees are wintered in this way, we need have very little fear of dysentery. I quite agree with Mr. Ira Barber in regard to bees not eating enough pollen to give them dysentery, if they are kept in a warm temperature. Our cellar is neither wet nor very dry. Our bees usually store a large quantity of pollen, yet we have wintered bees 13 winters, in this cellar, without loss from dysentery. The temperature, so far this winter, has stood from 46° to 52°, and the bees, at present, are as small and bright as when put into the cellar.

We have no more trouble in wintering our bees than we do in wintering other stock. I firmly believe that just as long as bee-keepers continue to winter their bees out-of-doors, or in a cool temperature, just so long we shall hear of large losses in wintering bees. Canton, N. Y., Feb. 11, 1884.

For the American Bee Journal.

Is Extra Prolificness a Desirable Quality in Queens.

O. O. POPPLETON.

On page 30, current volume of the BEE JOURNAL, Mr. Frank Benton suggests the above question, which it may be well to have discussed, as it lies at the foundation of successful honey production.

A very large majority of bee-keepers makes honey raising a speciality, and those of us who do that care little for the large numbers of bees a queen may raise, unless those bees store a proportionate amount of surplus honey. If the statement is true in the sense used by Mr. Benton, that "If we have the workers in a hive when the harvest opens, we are sure of honey," then all colonies would have to have equal powers and equal disposition to store honey in proportion to their numbers, which, I think, all observing bee-keepers will agree with me in saying is not the case. How very common it is to notice two colonies in the same apiary, in the same kind of hive, with about equal numbers of bees and brood, and so far as the bee-keeper can see in equal condition every way, and yet while the one gives a large amount of surplus honey, the other gives little or none. This is one of the most common experiences in bee-keeping, and shows conclusively that while a good queen is one of the essentials in successful honey production, it is far from being the only one.

In my locality, nearly all our surplus honey is stored during a couple of short flows of honey each year, each flow lasting from 5 to 15 days, the balance of the season varying from getting just enough honey to keep the bees breeding nicely, to a medium flow, but at least four-fifths, if not more of our surplus honey is usually obtained during those short flows of honey. It can be seen that we get much better yields of honey from those colonies, that during heavy flows make honey gathering their first object, and brood-rearing a secondary one. The interval between these flows gives ample chance for them to raise all the bees needed in time for the next flow when it comes, these flows usually being from 4 to 6 weeks apart. The kind of bees I find the most profitable, are those that raise plenty of bees during the spring, and whenever there are only medium flows of honey, but whenever they have an opportunity to do so, will bend all their energies to gathering honey, and not do as Mr. Doolittle says: "Seem to think that a large flow of honey should mean lots of brood, so at brood rearing they go."

My colonies that contain extra prolific queens are very rarely indeed among my best honey gatherers, and what Mr. Doolittle calls the "Secret of honey-producing," I would change so as to read: "Lies in getting the right kind of bees just in the right time for the honey harvest."

Williamstown, Iowa.

For the American Bee Journal.

The "German" Bees.

G. W. DEMAREE.

A large majority of writers on apicultural subjects, when speaking of the German race of bees, use the word "black" interchangeably with "German." If we should conclude that these writers speak accurately, we would be forced to believe that the so-called German is necessarily a black bee.

While I admit the propriety of the name "German," as generally applied to this race of bees, the fact, as it appears to me, that the Eastern bees, in their make-up, carry more or less of the blood of the German, is conclusive to my mind that the German race has had a wide range in the world in the past. But I cannot admit that they are properly called "black bees." The writer can remember when there were large tracts of land covered with timber in nearly every community in central Kentucky; and in those days it was not a difficult thing to find "wild bees" in the timber. In fact, they are to be found in a wild State in many localities yet. Of the German race of bees, I have noticed in this and other States at least three types of bees, whose distinctive features are sufficiently stamped to attract the attention of any close observer.

The most common of these in Central Kentucky, years ago, was the beautiful slender gray bee. This variety may be described as rather slender in general appearance, with pointed abdomen. Their true color is a mixture of brown and gray. But the fact that the gray consists of a liberal sprinkling of light gray fuzz or downy hairs over the whole of the body, accounts for their general gray appearance. The workers have rings of white fuzz or hairs around the posterior section of the body similar to the Albino variety of the Italian; and herein, perhaps, is a key to the origin of the so-called Albino. The queens of this variety are rather slender, and quite pretty for dark queens. The drones are nearly black on the upper parts of the body, but have a sprinkling of light-colored hairs on the under part of the thorax, and some other parts of the body. I have seen these bees at several places in my travels.

In 1855, while traveling in the West, I saw this variety of the German race about 15 miles above St. Joseph, on the Kansas side of the Missouri river. Some Indians "camped" in that vicinity, and while there cut several bee trees which they found in a strip of timber some three miles from the river as you follow what was then the old California road. I examined these

wild bees, and found them to be identically the same as I have described.

Another variety which was quite common, if I remember correctly, and are yet to be found in the rural districts, would most likely be called "brown" as to their general color, by most people. Although they have rings around the abdomen much like the gray variety, but not so conspicuous. In form they are thicker and more bulky in appearance than the gray variety.

Whether or not there is any material difference in the working qualities of these two varieties, if they are in fact varieties, I have not tested the matter sufficiently to hazard an opinion. I have always fancied the slender gray bees because of their clean, spritely appearance.

The other variety, making up the three, comes the nearest of meriting the appellation "black" of any bees I have seen—still they are not true black bees. I would describe them as dark, pinched, hungry-looking little fellows. Of course they look much improved when engaged in gathering honey, at which time they show slightly the rings of fuzz around the abdomen. They are the most ungovernable of any bees I ever tried to handle. Not that they defend themselves more vigorously than some other varieties, but rather because they refuse to do anything like civilized bees. I am a little puzzled to know where these little dusky imps come from, or how they came about. I have no memory of seeing them prior to the importation of the Italian.

I have thought it possible that they might be the "tag end" of run out hybrids. After noticing, for years, the proneness of all promiscuous crosses to run down to the lowest point of animal existence, I would expect just such a result. By the way, while speaking of black bees, I call to mind the fact that several years ago, while discussing the subject of breeding bees, see Vols. XVII and XVIII of the BEE JOURNAL, I suggested that the outcropping specimens of true black bees and queens, which sometimes make their appearance when breeding from the imported Italian, is a thoroughbred of nature; and that most probably there was to be found somewhere on the earth a pure black and a pure yellow race of bees.

Well, now Mr. A. W. Osburn, in his letter from Cuba, page 642, Vol. XIX of the BEE JOURNAL, tells us that "The native bee of Cuba, is a simon-pure black; there is no German or half-breed about them." Reasoning from analogy, I have no doubts but the pure yellow race of bees will be discovered before a great while, if not wholly absorbed by contact with other races of bees. If the pure yellow race is once discovered, what a field will be opened to the scientific breeder. They would furnish him the starting point connected with other races for any number of crosses or thoroughbreds. Judging from the out-cropping specimens which I have seen while breeding from selected Italian and Cyprian stock, I would expect the workers of the original yellow race to be in color

approaching a clear yellow when young, fading to leather color when old. They should have large transparent wings, and a liberal covering of white fuzz on the upper part of the thorax. The queens should be of the same color as the workers, except that their wings should be slightly tinted with purple, perhaps.

Christiansburg, Ky.

For the American Bee Journal.

Cultivate the Home Market.

EUGENE SECOR.

I believe it is safe to say that not one town in ten is supplied with honey the year around. Small bee-keepers, who produce only a little more than enough for family use, are too apt to get excited if they happen to have 500 or 1,000 pounds of honey for sale. They, perhaps, try to sell it all at one time, or to one man, in their own vicinity, and failing in this, ship it to the large cities, flooding the already over-stocked markets, and their home market is either without honey the greater part of the year, or it is brought in from the wholesale centres. The consumption of honey ought to and will increase from year to year, if it is properly kept before the public in its pure state by reputable producers.

There is no better way to establish confidence in the product than to put upon the market only pure and fully ripened honey, with the guaranty of the producer, who is known to be honest and trustworthy. Not a pound of extracted honey should be offered for sale, that is not thoroughly ripened. A label should be put on every package showing what it is, and who produced it. The suspicion of adulterated or manufactured honey is often created by attempting to sell sweetened water instead of the rich, heavy well-ripened article that delights the customer, as well as the seller. If the bee-keeper is ashamed to put his name and address upon it, he ought for his own future good, if not for the good name of the fraternity, to keep it out of the market. Every pound of good honey that is sold at a reasonable price, will help to sell another pound; and no advertising will pay better than to let the consumer know where to go to get more of the same kind. If it is put up in attractive packages and kept in a conspicuous place in some live man's grocery, and sold at such a price that people can afford to use it the demand will greatly increase.

I think if we were willing to sell our honey near home for the same price paid by commission men, that we would sell a great deal more of it, besides decreasing the number of those who are so anxious to engage in the new and untried pursuit of apiculture. When honey is sold at unreasonable high figures at home, people think there is a bonanza in its production, and hence are more apt to make the venture; and if one new one succeeds, he divides the field and the profits with the pioneer.

Some of the Pamphlets, "Honey as Food and Medicine," wisely distributed, will create a market. The children will take their medicine in honey every time. The honey sold at home undoubtedly brings the greater profit.

If a man is producing honey by the ton, of course he cannot dispose of all of it in the small town he may happen to live near, but he should not neglect the markets nearest home if he wishes to occupy the territory.

Forest City, Iowa.

For the American Bee Journal.

What shall we do with Weak Colonies in the Spring?

J. E. POND.

The above question has been asked me several times of late, and I know of no better way of answering several inquiries at once (as all of them say they subscribe for the BEE JOURNAL), and thus save precious time.

We have been advised in days past to unite all weak colonies; this advice which is good for fall management, is of no value in the spring, unless it should so happen that queenless colonies are found, when, of course, union is strength. My experience teaches me that weak colonies united will live no longer than the same colonies would have done had they been kept separate; the reason being, that the bees are all old and can live but a short time after having borne the hardships of winter confinement. It is hardly possible to imagine that all colonies will be alike weak, if such should be the case, I should hardly know what to advise for the bee-keeper who finds his apiary in such a state, would hardly be able to strengthen up colonies successfully.

The object of an apiarist should be, not to obtain the greatest possible yield from a single colony, but to equalize the whole apiary so that he may obtain a large and an average gain from each colony. To this end he should in early spring equalize his colonies in strength as nearly as possible, and this can best be done by taking frames of brood from those that are strong enough to bear the loss, and give them to the weaker colonies. If he has, as he should have, average queens in all his hives, he will be able by careful management and judicious feeding to stimulate, to bring all his colonies up to prime condition, and have a large force of foragers ready to take advantage of the first flow of honey that is secreted by early flowers. Many, however, are not careful enough in this matter of stimulative feeding. We begin without reference to the strength of the colony to feed diluted syrups, and also spread the brood, the consequence being that a cold frosty night drives the bees into a cluster, the brood is exposed, chilled, and dies, and the colony is either ruined completely or so injured that it becomes valueless for the whole season.

In giving frames of brood to weak colonies, it is not advisable to give

them to the weakest first, as the same condition of things may happen, as is liable to follow stimulative feeding. In this whole matter of strengthening and equalizing colonies, there is an opportunity for exercise of the greatest care and judgment, and to know how to do it just right every time, can only be learned by experience. Many are apt to make the mistake of strengthening colonies too early. By so doing they lose a large amount of stores in feeding useless consumers. We want a large force of foragers when there is honey to be gathered, and at no other time, and if we could as easily arrange the matter through the whole season, as we can in the spring, our apiaries would be far more productive.

Each bee-keeper should know the honey flora of his locality, and knowing that he will know just when he will need a force of foragers to gather the nectar secreted by them. It is impossible to give particular rules to govern this matter; the rule that would well apply to one section would prove a failure in another, so every apiarist must be a law unto himself, and work in accordance with his locality and surroundings; if a beginner he must learn by experience, and not become discouraged if failure follows his first efforts; if an expert, he will know what to do, and will do it, knowing full well that if the season proves favorable, he will obtain good results.

If any queenless colonies are found, when it is too early to raise queens with any prospect of their mating in time to be of any use, they must be united with some colony that has a good queen; this, I have found can best be done by moving the hives close together, giving both colonies a little smoke, and when the bees are filled with honey, removing the frames, bees and all from the queenless hive, and alternating them with the frames in the other hive. This united colony should be closely watched, and if any fighting takes place, another blast of smoke should be given them. If the union is made in this manner on a chilly day, no trouble need be anticipated, and no pains need be taken in regard to the queen. I have united many colonies in this manner without caging the queen, and find she is not troubled at all, and that the bees unite peaceably, and are friendly at once. The reason of this, I conclude, is that the mixing up caused by alternation of frames, puts them in a condition such that they do not know what is up, and so stand on their good behavior, perhaps, for fear of consequences. Whatever may be their feelings the fact remains that they so unite peaceably, and that to the practical man is enough for present purposes, however much he may wish to know the whys and the wherefores.

Foxboro, Mass., Feb. 6, 1884.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Do Bees Thin Out Foundation?

Has foundation been thoroughly tested when made 3 square feet to the pound, with the base as thick as the side walls? If it has been tested, who has found the base when drawn out by the bees any thicker than natural comb? I have not; but have found the side walls of the same, at the base, seemingly untouched, which would make comb honey unsalable. Can it be possible that we have been "asleep" on this point, and are thinning the base and heaping up wax on the side walls, as we might suppose to be helping the bees and are helping them in the wrong place. I shall experiment further the coming season by placing small drops of wax in each cell of thin foundation. I never saw honey that could not be detected, even 10 square feet to the pound, Given not excepted. A BEE-KEEPER.

Bees act very differently at different times with the same comb foundation. My experience has been this: Bees will sometimes, but rarely, make a thick base thin. They will sometimes, but rarely, fail to draw out thin, the side walls of the Given foundation, because they are soft, not having been pressed hard in the process of making. I have never half pressed Given foundation to leave the base thick, to see what they would do in such a case. The base of that foundation is very thin, and pretty

hard pressed, I think. I have never been able to detect that the thick bases of other foundations that I have experimented with, were ever thinned in process of working into combs by bees. Such instances have been reported, and, no doubt, truthfully so, but I think from the scarcity of such reports, and my own experience, that they are quite rare.

We have had hundreds of combs built on full size pieces of Given foundation, that run about 8 square feet per pound, that none could detect any signs of foundation about. We have also had combs that showed the foundation plainly, when the same foundation as above referred to, was used. In no case have I ever had one word of fault found with any of my comb honey sold. It is *all* "salable."

Separators.

Will Mr. Heddon give, through the "What and How," his objections to separators?

1. Would not the bees wax the frames together so that you never could get them out of the hives?
2. What is the best thing for a bee sting, to keep the flesh from swelling?
3. About what is the average age of the honey bee?
4. What plants can I raise that will produce honey in dry and hot weather, and late in the summer?

Mt. Hope, Kans. S. F. DAILY.

1. My objections to separators are, that their cost and extra trouble in manipulating, are not balanced by any usefulness they possess. If you work properly without them, the bees would not glue the frames to each other without separators, any more than they do to each other and to the separators where they are used. Still, if I used anything so awkward as broad frames, I would use tin separators with them (see page 315, BEE JOURNAL for 1883).

2. As my flesh does not swell under bee stings, I hardly know what to say. I believe it is generally conceded in the medical world, that amonia is the best known antidote for animal poisons. There are a host of bee-keepers who are willing and ready to tell us what they used when they got stung, and got along with it first-rate; they are alive and enjoy fair health to-day. An antidote for the declining price in honey, is what we most need at present.

3. In the working season, 8 or 10 weeks; out of that season, 5 to 7 months. Italian bees are longer-lived than Germans; at least such has proved to be true with two experiments I have made of changing queens

between Italian and German colonies.

4. Try melilot clover (mow it in June if you wish it to blossom in September and October), and others, of more doubtful practical value.

Moving Bees by Railroad.

I expect to move 100 colonies of my bees (about one-half of them) to Michigan by railroad, in the spring. I want to know how to prepare them for this long journey. R. B. OLDT.
 New Berlin, Pa.

The period you give is rather indefinite. Supposing it to be late in the spring and warm, I would advise the following: By the aid of your freight agent, select a springy, easy-riding, well-ventilated freight car. As the colonies will be quite strong and contain considerable brood, the frames should be securely fastened, and over each hive should be an empty case, from 2 to 6 inches high, securely fastened to the hive, with nothing between the brood frames and case, and the tops of said case should be covered with wire cloth.

If the hives are Langstroth's, with all-wood top-bars and wood rabbets, a "three-line" nail in the end of each top-bar will hold the frames securely.

If the rabbet or ends of the frames are metal, or the hive is a deep one, I would advise tacking strips on to the ends of the hive, and between the frames. Place the hives in the car so the combs run lengthwise. Place only one tier in the car, unless so arranged that the upper tier rest clear above the lower one.

Go with the bees, and, with a whisk broom and basin of water, sprinkle through the screen occasionally. If the watering is neglected, the bees will be apt to eat up all the larvae. For hundreds of minor details, you must depend upon your native tact.

Convention Notices.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

W. M. R. HOWARD, Sec.
 Kingston, Tex., Jan. 16, 1884.

We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate. H. C. WHITE.

SELECTIONS FROM OUR LETTER BOX

Good Increase.

My report for 1883 is not as good as it was the year before. I commenced the spring with 20 colonies; increased to 50, by natural swarming; sold 6, and 3 took Greeley's advice and went West. I now have 44 in the cellar, all right so far. I only obtained 1,458 lbs. of comb honey and 120 lbs. of extracted.

LEVI FATZINGER.

Janesville, Wis., Feb. 13, 1883.

Bees Wintering Well.

On Sunday the weather was warm and fine; every colony of mine was up and dressed. They cleaned out the hives nicely, but respect for the day prevented me from examining into their condition. I think they have eaten up but little honey, judging from the small amount of bee bread, cappings and other debris, owing, I suppose, to continued cold weather. I found but few dead bees—11 colonies showing about a pint only. Every colony last fall covered 7 frames full, and I packed them in various ways for experiment, and shall give the result thereof by-and-by, when I ascertain the exact condition in March. I hope to prove something in wintering, as I believe I have fully solved the problem, barring accident.

J. E. POND, JR.

Foxboro, Mass., Feb. 7, 1884.

Toronto Convention Report.

MR. EDITOR:—In regard to the Toronto Convention report, in the BEE JOURNAL for Jan. 23, 1884, you advise any one that has any thing to say, to speak right out. I think this is the proper thing to do, and I will, therefore, ask Dr. Miller to "arise" and explain as to the progress of publication of the pamphlet that was to be sent to each member of the North American Bee-Keepers' Association. Dr. Miller was elected secretary, and was acting as such when a motion was offered by Dr. Brown, of Georgia; I think, and supported by Judge Andrews, of Texas, to have the minutes published in pamphlet form and distributed to the members. At this juncture I made a motion that each member's name with his post-office address be inserted in the same, and also that a suitable badge, similar to those worn by the members of the Northeastern Society, be secured and sent with said pamphlet. This motion was supported by some member, and was unanimously carried, and after this, there were three or four gentlemen sitting near me who said that they would now become members as they wanted to secure one of those beautiful badges; they immediately arose and subscribed their names and paid their fees, and the same took place from all parts of the hall, as it seemed to be a great inducement in getting members. Now, Mr. Editor,

in justice to those, as well as all concerned, I am anxious to hear all about this through the BEE JOURNAL, as I think many will be anxious to have a full explanation. If that pamphlet is not yet published, I would recommend that the names of the vice-presidents be inserted, so that we may know who and where they are.

H. BESSE,
Vice-President for Ohio.

[Do not be too severe, Doctor; we were not there, as you know; but it has been said that "business" was out of its element there, in such an enthusiastic gathering, and, perhaps, that explains it. Evidently there are neither reports, names and addresses, nor badges forthcoming.—Ed.]

Moth or Miller.

In reply to Mr. W. F. Clarke, let me say that while miller is a proper term, it is not so elegant as moth. The latter is sanctioned by the best usage. Entomologists almost never use the word miller. The term moth-miller is a barbarism. As well say a female woman. Let me add, that if John Phin shows the same wide culture and wise discretion in all his book as in a few pages sent to me, he will give us a masterpiece. We may well rejoice that a person of such wide information, and such admirable judgment, has undertaken this important work.

A. J. COOK.

Lansing, Mich., Feb. 8, 1884.

Bees Prospering.

I put 50 colonies of bees in the cellar in December, in good condition, and they all appear to be right yet; they are still dry and clean. I see reports in some papers that the extreme weather is killing a great many bees, but it is not so in Wisconsin; where they are properly housed they are all right.

L. M. ROBERTS.

Ft. Atkinson, Wis., Feb. 9, 1884.

[Some of the daily papers have published such as "news," but they obtained it, no doubt, of those who took no care of bees.—Ed.]

My Success as a Beginner.

It is only one year ago that my attention was first called to this industry through an article entitled, "Healthful and Profitable Employment for Women." At that time I was slowly recovering from a protracted season of prostration, and open air exercise had been recommended. I caught at the word "healthful," while "profitable" pleased the ear. I began to look into the subject, subscribed for the BEE JOURNAL, procured Prof. Cook's Manual and A B C of Bee-Culture. In April I called upon the Rev. O. Clute, of Iowa City, from whom I received valuable suggestions, and invested in 3 colonies of Italian bees. These were pronounced "beauties," and the only pure Italians I know of. My experience was similar to others I have read. Some lasting impressions were made upon my

memory, but I fully enjoyed my work, and consider that I was fairly successful, taking all things into consideration. I have now 8 colonies besides 1 that sought the woods, from the original three, and from 150 to 200 lbs. of honey above the full winter's supply. It was a poor season for surplus honey, and considering all things, I feel quite satisfied with my first experience in bee-keeping. My bees are wintering on summer stands, well protected with chaff cushions, etc., and seem to be all right.

MRS. R. K. EASTMAN.

Webster City, Iowa, Feb. 11, 1884.

Making Comb Foundation.

Would it be profitable to manufacture your own foundation for an apiary of 25 to 50 colonies? Does it require much practice or mechanical skill to manufacture a good article? It is very expensive to purchase from a distance, as the freight or express charges are quite an item. Please answer through the BEE JOURNAL and oblige an interested bee-keeper.

MRS. J. W. KNADLER.

Valley Station, Ky., Feb. 11, 1884.

[It requires considerable practice to make a good article, and we fear it would cost much more than the article already made and the cost of transportation for so few colonies, unless you wanted to use it in wired frames; then the bulk would make it costly for expressage.—Ed.]

Bee Pasturage—A Correction.

Mr. M. L. Trester, Secretary of the Nebraska State Bee-Keepers' Association, made a slight mistake in his report, where I asked the question: "Will it pay to keep 80 acres of land, on which there are 1,600 basswood trees, 9 and 10 inches in diameter, exclusively for a bee pasture?" It should have read 2,500 trees, 1,600 of them from 9 to 10 inches in diameter. Taking the whole lot, they run from 3 inches to 24 inches in diameter, and 1,500 more average about the same within a radius of 1½ miles.

Watson, Mo. R. B. MUIR.

Packed in Chaff.

In 1882-83, bees wintered nicely. I had a few Cyprian swarms before the snow storm of May 22. My bees did well, considering the season. I had 28 colonies, spring count, and increased to 89; sold 37 colonies for \$310.50, and got 1,500 lbs. of comb honey, which I sold at an average of 15 cents per pound, making \$225. I now have 52 colonies, packed in clover chaff, all alive; a few are a little scant of stores, but I intend to feed them as soon as it gets warm enough. I feed corn meal, rye and buckwheat flour in the spring before they can get natural pollen. I have Cyprians, Italians and Albinos, and I think the Cyprians far ahead of the others, both for honey and increase. They are a little nervous, but if well managed are as easy to handle as any bees.

H. HANCE.

Bryan, O., Feb. 6, 1884.

Was Not Stung Once, Last Season.

I stated in the spring with 14 colonies; increased to 43, and received 1,200 lbs. of comb honey in one and two-pound sections. I did not get stung once, last season. I do not claim to be an expert (I guess I am so awkward that my bees pity me). I have them all packed on the summer stands. Up to this time, all are in good condition. I told a friend the other day that if I only kept one bee, and that a drone, I would have the BEE JOURNAL so that I could keep it intelligently. He said he could not see the point. I told him to try bee-keeping without it, and he would see more points than he wanted to.

F. J. SAWIN.

Kirkwood, Ill., Feb. 9, 1884.

Well Done.

My report for 1883 is as follows: I commenced the season with 70 colonies, increased to 93, and obtained from them 8,000 lbs. of honey; 3,000 lbs. being comb honey, and 5,000 extracted.

JAMES CORBIT.

Palmyra, Mo., Feb. 9, 1884.

Testing Thermometers.

There are only two points at which thermometers can be tested by natural standards—the freezing and the boiling points of water. A mixture of snow or pounded ice and salt may be had at different temperatures depending upon the temperatures of the air, of the ice and of the salt. Pure water freezes at 32° and boils at 212°. In the case of boiling water, we must note the barometer also, because water boils at different temperatures depending upon the pressure of the atmosphere. I have tested many thermometers for scientific purposes, and these are the general principles involved. To give long details would probably occupy too much space. If Mr. Yoder's thermometer shows 32° in a bowl of pure ice in a melting state, but not melted, it is no doubt correct enough for all ordinary work. Thermometers change as much as two or three degrees after being made, unless the tubes are filled and kept sometime before being graduated.

Cedar Brae, N. J. JOHN PHIN.

Bees Banked up with Snow.

I put into winter quarters, in the fall of 1882, 31 fair colonies, in pretty good condition, so far as stores were concerned. When the first big snow storm came, I took a shovel and banked up some 15 hives with snow and dirt, half way to the top on three sides, leaving the entrance side naked; the other 16 were left without any protection except some cushions on the top. In March, on one nice, warm day, I opened the hives of those that were covered up, and I found frost and ice all around on the inside, one-half of the bees dead and dying; the result was, I had to change them to other hives, and then they had the dysentery, and in three weeks I had only 20 colonies, and many of those reduced to a mere handful.

Those I left without banking up, came out very much better; indeed, my losses were from those that were banked. After the cold, rainy weather had passed, and I had fed many of the weakest ones, up to June 15, the honey began to come in, and they began to swarm, and so continued to keep it up until Aug. 31, in spite of all I could do to prevent it, increasing from 20 to 58, and I got 1,500 lbs. of honey (1,200 lbs. being extracted), and here let me say that I could have had 500 lbs. more if I had not been short of supplies. I now have 46 colonies buried in a clamp, and 12 on the summer stands. I expect to leave those in the clamp until about April 1, or until pollen begins to come in. I will report in the spring just how I succeed, and will possibly have to give the "other side" of successful wintering.

J. W. MARGRAVE.

Hiawatha, Kans., Feb. 7, 1884.

[Losing 500 pounds of honey by neglecting to get supplies in proper time, is a heavy penalty. Let all take warning by this and procure everything they need early in the season, and have it on hand long before it is wanted.—ED.]

Prospects in California.

It has been raining for the past ten days; over 15 inches in all for this winter. Prospects are good for a first rate honey season, as the soil has had a thorough soaking. Bee men and farmers are in good cheer over the prospects. Old residents claim it to be the heaviest rain we have had for a number of years. Vegetation is finely advanced, and it is probable the season will commence early.

M. H. MENDELSON.

San Buenaventura, Cal., Feb. 7, 1884.

Wintering Well.

We have had a very hard winter on bees so far. The thermometer indicated 32° below zero, on Jan. 5, and 20° below several times during the month. I hear some complaining of their bees being dead, but I think, as a whole, bees are wintering very well in this county. I have 76 colonies, packed with chaff on the summer stands; they seem to be all right yet.

J. A. OSBORNE.

Rantoul, Ill., Feb. 11, 1884.

A Warm Cellar for Bees.

Bees are wintering finely in the cellar; they keep very quiet, and there are no signs of dysentery yet. My bees were taken into the cellar on Nov. 13; the honey-boards were all removed and a piece of rag carpet spread over the frames (coffee sacks are just as good); the bee cellar is very large, and has an open chimney; it is kept at 45° to 50°. If it gets lower than 45°, I always raise it to 50°; if the bees have good honey they will winter well. There is not a gallon of dead bees in the cellar at present, from 51 colonies. In the cold winter of 1880-81 my bee cellar was below the

freezing point nearly all the time; and out of 35 colonies only 9 came out alive; nearly all of them being weak. That gave me enough of cold cellars; since then the cellar is kept warm. I have not lost one. I do not believe pollen is the cause of dysentery. All we want is a warm cellar. I prefer the hybrid bees and the standard Langstroth hive for comb honey.

H. T. HARTMAN.

Freeport, Ill., Feb. 10, 1884.

The Northeastern Bee-Keepers' Association will hold its second annual meeting on Wednesday, March 5, at the Court House, in Lapeer. Hotel rates reduced to \$1 per day.

W. Z. HUTCHINSON, Sec.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL. }
Monday, 10 a. m., Feb. 18, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7c. 10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1½@2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@33c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—Demand good and stocks very low. Little or no nice 2 lb. sections in this market, and a few shipments would be readily taken at 17@18c. Extracted honey—in fair demand for dark fall at 8@9c.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Market is quiet, and common qualities difficult to place at anything like satisfactory figures. Fancy qualities are scarce. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@—

BEESWAX—Wholesale, 27½@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Dull and slow sale. Comb 12@16c., and strained and extracted 6@8c. per lb. Top rates for fancy small packages.

BEESWAX—Steady at 32@33c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY.—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

A correspondent asks if any one may select a Binder for the BEE JOURNAL, among the books given as Premiums for getting subscribers; we reply, yes, any book or binder we keep for sale may be selected by those who get up clubs.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

We now club the *British Bee Journal* and our Monthly for \$2.50.

Our friends will find this the season for securing subscriptions. We offer the premiums and they can easily secure them.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

As the reading season has come with the long winter evenings, it is just the time to read the various books on Bee-keeping. When renewing your subscriptions will be a good time to get a supply of such literature. See our club rate on Books with the BEE JOURNAL, on the first page of this paper.

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis. Hamilton, Ill., Dec. 10, 1883.
 Dear Madame:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.
 Yours, **CHAS. DADANT & SON.**

MRS. FRANCES DUNHAM, De Pere, Wis. Beeton, Ont., Dec. 10, 1883.
 Dear Madame:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
 Yours very truly, **D. A. JONES.**

MRS. FRANCES DUNHAM: Genoa, Cayuga Co., N. Y., Dec. 12, 1883.
 All prefer the foundation I manufacture on one of your mills, to that made on any other machine. I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
 Yours respectfully, **J. G. WHITTEN.**

MRS. FRANCES DUNHAM: Kenton, Ohio, Dec. 29, 1883.
 After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.
 Yours, **SMITH & SMITH.**

MRS. FRANCES DUNHAM: Omaha, Neb., Jan. 18, 1884.
 I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretschmer, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is me always a jewel. You are at liberty to publish this. Yours truly, **T. L. VON DORN.**

1884.

HEDDON'S

COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I have now made arrangements so that I can again supply you with those nice white Dovetailed Sections, $4\frac{1}{4} \times 4\frac{1}{4} \times 7$ to the foot, and 8 to the foot, \$7.00 per 1,000 from here. Will be ready to ship on and after March 15th.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistake, the shipper's name should always be on each package.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax, the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents.

Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents.

Postage, 13 cents extra.

One pound spools, each, 40 cents.

Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

6 Inch, Price, \$25.00.

It makes the finest extra thin Foundation for comb honey. For Sale by

ALFRED H. NEWMAN,

923 West Madison Street,
CHICAGO, ILLINOIS.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Lookmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861

Chicago, Ill., February 27, 1884.

VOL. XX. No. 9.

THE WEEKLY EDITION OF

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE

PATENTED, MAY 20, 1876.

The Original
BINGHAM
Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of smoke and chips and stuff, and make lots of blocks and comfort, and have no dampers or match-box attachments, as they never go out or fall to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

While European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baroo of Berlepsch we are indebted for much that is kind of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2." **Queen-Rearing,** by Henry Alley. A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman. This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful recipes. It is intended for consumers, and one that is scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman. Giving advance suggestions what to plant, and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packings, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration, What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the enormous health-detracting adulterations offered as food. 200 pages 50c.

Serlber's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubic contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for costing up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc. of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Marine Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Braziers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

The Hive I Use.—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brand; its origin, development and cure. By Albert R. Kohne. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Chas. C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.50; for 200 colonies, \$2.00.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—
—Derlichkeit des Bienenstandes—
—Honig pflanzen—Erziehung der Königin—
—Füttern—Schwärmen—Ableger—
—Verketen—Talenisieren—Züfeger von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formkuchelchen, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumanten bestimmt, und sollte vieltaufendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekranheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., FEBRUARY 27, 1884.

No. 9.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

“Queen Introducing” is the title of a small pamphlet of 24 pages, by the Rev. George Raynor, M. A., Rector of Ilazeleigh Maldon, Kent, England. It is a paper read at a quarterly meeting of the British Bee-Keepers’ Association, on “the Ligurian Queen Bee; her introduction to Alien colonies, and the best means of pure propagation.” We acknowledge the receipt of a copy of this pamphlet “with the author’s compliments.”

Speaking of “Honey Dew,” which is being extensively advertised “for chapped hands, lips and face,” Mr. H. R. Boardman, of East Townsend, O., writes thus: “How many persons reading this fraud, think you, Bro. Newman, have the most distant idea as to what Honey Dew is? Oh! if we could all learn to call things by their right names. Pure honey is good for chapped hands or for the face, healing and softening the skin.” And yet how many there are who are wholly ignorant of the many uses of pure honey.

We have received from *Home and Farm* a neat pamphlet containing the letters of its Florida correspondent, Mrs. L. B. Robinson. These letters are valuable because they truthfully describe all the difficulties new settlers in that State must expect to encounter, and they give just the information about everyday life which cannot be obtained from official reports of pamphlets published by land agents. Every one interested in Florida, should send 25 cents for this pamphlet. Address, *Home and Farm*, Louisville, Ky.

More of Cotton’s Humbug.

We have received the following, which explains itself:

I send Mrs. L. E. Cotton’s circular for 1884. It is a little ahead of any I have received, up to date. We would like to have a controllable hive, for then we would never fear dysentery or any of the troubles which bees are heir to in wintering. If Lizzie had known that I had read the BEE JOURNAL for the last 12 years, she would not have sent that circular to me. Read it, Mr. Editor, it will do you good; give your readers a few extracts.

T. B. QUINLAN.

Cedar Rapids, Iowa, Feb. 4, 1884.

Oh! it is the same old story. If the orders are not filled, and the bees and hives are not sent to customers, is it not easy to prove that bees do not become diseased in winter? and also that there is no danger of any one being stung? That is science for you! The *Kansas Bee-Keeper* gives the following in its last issue:

“We notice that Lizzie Cotton, of Gorham, Me., is still trying to gull the public by her preposterous claims in regard to her controllable, reversible, double-back-action, self-hiving, and automatic drone-destroying hive. This hive, from her description, will do everything but talk, and we expect next year to learn that she has educated it even up to that point. We advise our readers to let Lizzie and her wares severely alone.”

We have received several of these circulars, but her bombastic falsehoods about the bee-papers and associations are not worth noticing.

Paraphernalia of the Bee.

Some one has sent us a newspaper which gives the following description of the wonderful working tools of the honey bee, with which it does its marvelous work in the hive:

The feet of the common working bee exhibit at one and the same time a basket, a brush and a pair of pincers. One of these articles, indeed, is a brush of extreme fineness, the hairs of which, arranged in symmetrical rows, are only to be seen with the microscope. With this brush of fairy

delicacy, the bee continually brushes its velvet robe, to remove the pollen dust, with which it becomes loaded while rifling the flowers and sucking up their nectar. Another article, which is hollowed like a spoon, receives all the gleanings which the insect carries to the hive. It is a panier for provisions. Finally, by opening them one upon another, by means of a hinge, those two pieces become a pair of pincers, which render important service in the construction of the combs, and it is with them that the bee lays hold of semi-circles of wax below its abdomen, and carries them to its mouth.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

James B. Mason, Mechanic Falls, Me., 60 pages—bees, queens and apiarian supplies.

Wm. Ballantine & Son, Sago, O., 1 page—bees, queens and apiarian supplies.

A. I. Root, Medina, O., 40 pages—bees, queens, and everything needed in an apiary, as well as useful articles for counter stores, of all kinds and prices.

E. C. Hubbard & Sons, Hamburg, N. Y., 8 pages—small fruit plants.

A. J. Norris, Cedar Falls, Iowa, 6 pages—bees, seeds, roots, etc.

J. D. Goodrich, East Hardwick, Vt., 6 pages—hives and bee-keepers’ supplies.

Henry Drum, Adelphi, O., 12 pages—hives and apiarian supplies.

Samuel D. Riegel, Adelphi, O., 4 pages—bees and queens.

E. Kretchmer, Coburg, Iowa, 24 pages—bees, hives and apiarian supplies.

W. H. Proctor, Fairhaven, Vt., 4 pages—bees, queens and apiarian supplies.

S. Valentine & Son, Hagerstown, Md., 12 pages—Italian and Albino queens and supplies for the apiary.

F. A. Snell, Milledgeville, Ill., 20 pages—bees, hives and apiarian supplies.

Chas. F. Muth, Cincinnati, O., 24 pages, bee-keepers’ supplies.

Howe & Son, Council Bluffs, Iowa, 8 pages—bee-keepers’ supplies.

Joseph D. Enas, Napa, Cal., 6 pages—queens and bee-keepers’ supplies.

J. W. K. and A. G. Shaw, Loreauville, La., 1 page—bees, queens, etc.

Rev. E. L. Briggs, Wilton Junction, Iowa, 6 pages—bees and queens.

A. E. Foster, Covington, Ky., 1 page—bees and queens.

CORRESPONDENCE

For the American Bee Journal.

More about those Eastern Bees.

G. M. DOOLITTLE.

On page 38 I find an article from the pen of Mr. Frank Benton, which is as much of a surprise to me (if he really means what he says) as the one I wrote on page 500 of the BEE JOURNAL for 1883 seems to be to him.

He says all my experience in bee-keeping has tended to make me value prolificness in a queen above all other qualities. That he wants them to be so prolific that lots of brood will be reared at all seasons of the year when the weather will permit. That he wants the hive overflowing with bees in the fall of the year, etc.

Coming from a man who has once lived in America, I again repeat, that such words are a surprise to me. If he had modified his first statement so as to make it read that he valued the prolificness of a queen above all other qualities, when it could be so regulated that such prolificness would be of the greatest profit to the bee-keeper, I would hold up both hands for it; but when he writes that he regards the prolificness in a queen at all times of the year above all other qualities, I cannot help but think that the type made him say what he did not mean to say, or else that he is very much mistaken.

Here, where we have but about six weeks during the whole season in which the bees make any gain in honey, what we want is a queen that can be coaxed to fill the hive to overflowing with brood during a few weeks previous to this honey harvest, and lay just as few eggs at all other times as is consistent with accomplishing of the above object. If Mr. Benton had a piece of work which he must accomplish at a certain time if he was to receive any profit therefrom, he would hire his help before that time expired or not at all. If he wished "help" at a certain time, and they did not come until too late, surely he would not keep and board them six to eight months because it was not convenient for them to come sooner. Oh! no, he would tell them he did not want them, for it was too late. So I say, that when he says that he wants the hive overflowing with bees in the fall, there must be a mistake somewhere.

Why I prefer the Italian bees to all others is for the reason that they are more susceptible of being handled, so as to get the hive overflowing with bees at the right time, than are the bees of any other race. Also, that as soon as the honey harvest arrives the queen will cease her prolificness, and thus we do not have a lot of "hungry hands" to board when they are of no use to the apiarist.

To show Mr. B. that I am not alone in this, I will quote the following

from one of the greatest honey-producers of the West, Mr. O. O. Poppleton, of Iowa, from page 50 of *Gleanings*, for 1884: "I get very much the best results from my purest and lightest Italians. The Italians seem to be much more disposed to partially stop brood-rearing and bend all their energies to honey-gathering whenever there is a heavy flow of nectar, than any other kind of bees I have tried, and this is a very great advantage." That the Syrian or Holy Land bees cannot be managed so as to get a large amount of brood at any other time, save in a heavy flow of honey, is one of the greatest reasons for my discarding them.

Mr. Benton tries to so twist this sentence around as to make me confess that I cannot accomplish "what is of more moment than any one other thing pertaining to honey-producing," and asks "how does this agree with his reported success in raising comb honey." Seeing Mr. B. wishes to draw me out, I will say that I have never reported success with the Syrian bees, for I have never had any to report. I had one colony of Syrian bees during the year 1883, and 3 till after the honey harvest of 1883 with their increase, and from all I did not get 50 pounds of honey, and had to feed them each fall to get them prepared for winter, taking combs of sealed honey from the Italians to do the feeding with, while the same number of Italian colonies gave over 500 pounds during the same time, with the same management I gave the Syrians. These bees would increase but little till the honey harvest arrived, when they would crowd every available cell with brood, which brood would use up nearly all the honey the few workers, reared before, could gather while the honey harvest lasted. On the contrary, when the honey harvest opened, the Italians would have a hive overflowing with bees and every comb filled with brood, and this brood would gradually decrease till at the end of the harvest I had lots of honey and but few mouths to feed. This is not mere fancy or idle talk, but facts which must be heeded if we would receive a good profit from our bees.

Next I notice Mr. B. admits that these Eastern bees are liable to have laying workers every time a change of queens occurs, but says this is not a bad feature except as the combs are filled with drones before the young queen gets to laying. Well, if this were so, the filling of the combs with drones so that the young queens have little room to lay worker eggs, and the feeding of so much honey to rear useless drones, is an admitted fact sufficient to uphold any apiarist in banishing them from his apiary; but queens are not accepted by these bees, with laying workers present, as easy as Mr. B. would have us think; at least such is not the case here in the United States, as my own experience proves, and also that of others.

On page 82, present volume of *Gleanings*, will be found an account of how these Syrian laying workers baffled all the skill at introducing queens

which Mr. Schroek possessed till he gave them combs (bees and brood) from another colony. He also there states (which I also found to be true) that these laying workers so deposited their eggs that the apiarist would suppose they had a laying queen (till the brood was capped over), as these workers lay their eggs more nearly like a queen than do those of the Italians or blacks. Thus the apiarist is "fooled" until all chance of getting the colony in condition to produce honey is passed.

Once more, Mr. Benton says in his closing paragraph, "Mr. Doolittle gets back to the race of bees with which he originally started, the Holy Lands," and then elsewhere takes me and others to task for mixing the names of these Eastern bees. If the name Holy Land was not a correct name to apply to these bees, why did D. A. Jones, the importer of them, telegraph to the Northeastern Convention, while in session in the city of Utica, N. Y., in 1881, "The Holy Land bees are the best." If an importer was calling things wrong, how could those purchasing bees of him be expected to call them otherwise? I see by the last *Gleanings* that A. I. Root calls all bees coming from Syria, Holy Land bees, and he an editor of a bee paper. I used the words Syrian and Holy Land indiscriminately, supposing both meant the same. By Mr. Benton's description, I now see that the bees I had from one party were what he describes as the Palestine bees, and those from the two other parties, were what he describes as the Syrian. As I could not see a particle of difference in them except in color, I do not feel disposed to try the Syrians further, in the vain hope of finding something tolerably fair.

In his fifth paragraph Mr. B. says of the Palestine bees, "they creep under sleeves and cuffs, biting the flesh, and then curving their bodies and stinging." Exactly; and this is a peculiarity of the Syrians and Cyprians as well. Mr. B. is the first one who has ever spoken of these bees biting, I believe. With me this is the most disagreeable of all the bad features possessed by these Eastern bees.

During the past fall, after the snow came, I feared I had been careless with my colony of Texas Cyprians, so I raised the quilt to ascertain if there was plenty of sealed honey near the top bars to the frames. Seeing but little, I marked on the hive, "Give frames of sealed honey the first day the bees can fly." The 10th day of December being warm and fine, I embraced the opportunity to feed them. To procure room in the hive to place inside the two frames of sealed honey, I must take out two frames having little or no honey in them. As Mr. Carroll wrote me that I would have less difficulty in handling the Cyprians if I used no smoke, I placed the smoker well filled and lighted on top of the next hive, and proceeded to carefully raise the quilt. I had not got it half off before two dozen bees or more darted at me. I carefully backed off a dozen steps, with these bees sticking to me, biting

my clothes and hands, and receiving about one-half dozen stings. I allowed two or three to sting my hands while I watched them. Some of them would bite a half dozen times before they would sting. Others would bite several times, singing angry notes all the while, when they would fly off two or three feet and then dart back again to sting me the moment they struck my hands. I then found some of them had crawled into my clothes, when presently "several points" made me beat a hasty retreat for the shop. Once in there I killed all that still sang in my pockets and elsewhere.

When I went out I determined to try the smoke for all it was worth. I placed the nozzle of the smoker under the quilt and puffed furiously until the smoke rolled out the entrance, when I stripped off the quilt with one jerk, keeping the smoke pouring on them all the while. With one hand I smoked, and managed to get out the frames with the other. Next I moved back one frame and placed in the full combs in such a position that the honey was in easy reach of the bees; then I closed the hive. The smoke helped some, but in spite of it I received over 25 stings, and killed fully that number of bees which had crawled into my clothes while I was at work, after I returned to the shop the second time. I give the above as an example of some of my trials during the past summer, in trying to see what these new races of bees are worth. In one instance I received 16 stings on my right hand and arm, while at the top of a ladder trying to get a second swarm of these bees which had outwitted me in preventing after swarms. As I could not get out these stings till I reached the ground, I had the most painful and swelled arm I have had for the past ten years.

One more point and I will bring this already lengthy article to a close. It will be remembered that at the Northwestern Convention in Chicago, last fall, Mr. J. A. Green reported the Syrian bees as gentle, while all the rest had found them cross. It now appears that the bees kept by Mr. Green were a cross between the Syrians and Italians, as will be found by reading page 81 of *Gleanings*. Now my experience agrees with Mr. Green's, that a cross between the Cyprian or Syrian bees and Italians, will give us gentle bees and good workers. I also find that any direct cross gives new vigor to our bees, but I fail to find that the crossing of these yellow bees give any better results than does a cross between the blacks and the Italians. The races of yellow bees are so near alike as to color that it is almost impossible to distinguish the hybrid from the pure as to their markings: hence, in a few generations it would be impossible to know in what direction we are breeding. As a cross with the blacks give just as good results, and still allows us the knowledge necessary for knowing the direction we are going, through the markings of the bees I cannot see any reason for mixing these yellow races of stinging, biting, laying workers, out-of-season brood-producing race of

bees with our already superior strains of Italians.

If Mr. Benton sees any good reasons why we should do so except the purchasing of queens of him, will he please give them to us through the columns of the BEE JOURNAL.

Pollen or Farina.

JOHN PHIN.

Mr. Clarke, in his note, doubts the soundness of my criticism on the words, "Pollen and Farina." Allow me to say that the criticism was made only after careful study of not only Webster, but Worcester, Agilvie, Richardson, and also of Balfour's Botanical Lexicon, together with much more that I need not name.

Pollen signified originally fine flour, and is so given by Bailey in his old Etymological Dictionary. In this sense it still survives in the word *pollard*, which signifies a mixture of bran and meal. Originally (in the West), it signified fine dust, and the botanists adopted it to signify the fecundating dust of flowers. At present, the use of pollen in the sense of flour or meal is obsolete, and is so noted in all our great dictionaries. And on the ground that it is always unfortunate when a word has two meanings, I trust that no one will try to revive the old meaning; let pollen mean the fecundating dust of flowers and nothing else.

As regards farina: about the same history belongs to this word, except that it now means flour or meal, and by an adoption from the French on the part of chemists, it also signifies pure starch. Craig, in his dictionary, gives the meaning *pollen*, but it has been rarely used in this sense, which may be considered obsolete.

I have as great an abhorrence as any one of hyper-criticism, but surely it is worth while to seek to attain that accuracy and precision which will enable us to say what we mean without circumlocution. I believe with Horne Tooke, that no word should have more than one meaning; and although we cannot always attain this, yet, as my good friend Prof. A. Cook says in a note just received from him, by avoiding these double-meanings, "we can hasten the expurgation of our literature."

An "Improved" Heddon Case.

C. H. DIBBERN.

After making up 80 cases after a pattern from Mr. Heddon, I came to the conclusion that a cheaper and better case could be made. After making several cases that were not entirely satisfactory, I hit upon the following, which I think even Mr. Heddon will regard as an improvement.

I make the outer rim just like the Heddon, allowing $\frac{5}{8}$ inch bee space over the sections. If glass is wanted,

so as to see what is going on inside, I use $1\frac{1}{2}$ inch strips on top and bottom of sides, rabbitted for a strip of glass to come just even inside (a board like Heddon's will do just as well). Glass, of course, requires an outer cap for the hive. Now tack on strips of tin on the bottom edge on all four sides, so it will project $\frac{5}{8}$ inches inside for sections and section supports to rest on. These supports are made by taking $1\frac{1}{4}$ wide, and as long as your case is wide inside. Have a square corner made lengthwise, so that two of these pieces will make a T when soldered together. These are for the sections to rest on, and are simply laid in the bottom of case, the ends resting on the projecting tin strips. The sizes of cases must be gaged, by the size of your sections and hives.

The advantages I claim are, that it saves the lumber for partitions. It is easily adjusted to a slight variation in size of sections. If separators are to be used, the T support makes an admirable rest for separators. The supports allow the sections to come so close together, that the two thicknesses of tin between them cannot be noticed. That, of course, economises the room occupied by the wooden partitions, and also the heat of the bees. When the sections are filled, the cases are easily emptied by turning them up-side-down, and pushing out the sections, T supports and all.

I shall have this case on exhibition at the coming Davenport convention; also an entirely new shipping case, which I will describe in the BEE JOURNAL hereafter.

Some Important Suggestions.

AMI CROSS.

Though you may not all have heard of me, I have dealt in supplies for years, and had a large correspondence of all sorts in the bee-keeping line. I have experienced many trials with this correspondence, and take this opportunity of trying to correct some of the mistakes of bee-keepers in the line of correspondence, etc.

I am thinking that it would save a good deal of trouble, loss, and nervous exhaustion if a few little details were properly attended to, and a few little alterations made in apicultural diplomacy and etiquette.

Do write your name plainly. Always mention your county. In writing to a business firm, or any person of large correspondence, never take it for granted that they know you, or where you live, or your shipping address, even if you have written to them fifty times before. Always make everything clear and plain.

While your signature looks to you the plainest of any word you write, remember to others of all words it is the most obscure. In making an order for goods, NEVER write anything on the sheet except the order and shipping directions. Use another sheet upon which to tell your dealer all about what kind of bees you like

best. How many colonies you have in the cellar, and how many neighbor S. has out-doors, and what you expect to do two years hence, etc., etc., etc., and then the poor over-taxed book-keeper and secretary can throw that part right into the waste basket without ever having to read it all over to see if some directions for shipping is contained therein, and go on with the next 39 letters of the morning mail.

In ordering a circular, make just as few words as possible. If you give your dealer brevity, he will repay you with promptness, and likely throw in considerable admiration. Each writer naturally feels as though he was the only or main customer; as though his deal was the most important one of the season. It is to him, but as it is not with the dealer, do not forget to govern yourself accordingly. Do not ask for credit; no matter how financially responsible you may be. 1. Your dealer does not know that, and 2, if he did, as he is doing a cash business, his system of book-keeping is such that it makes him much more trouble to run an additional credit system than it does you to send cash with the order. If you do not know that a dealer is responsible, do not send him money till you find that out, but if you do, and lose it, do not ask some one else to pay it, nor attach blame to any person but yourself.

Use only Full Government, high-cut envelopes. If you use the others, your letters will be glued fast to the inside of them, and the annoyance is far greater than the difference in cost. The manufacture of low-cut envelopes should at once become a lost art. No one of taste and experience will use them.

In writing, study concentration and brevity. How shall we head our letters? "Mr. John Smith, Dear Sir." Why that? "Friend Jones." Why use such a term as friend promiscuously? Does it savor of any thing wise or good? Why say "Yours Respectfully," or "Truly" in a business letter? Let us leave off all prefixes and affixes except the writer's signature, or say merely as a prefix, "Mr. Brown," and then go right to business. If we are to make general use of any term exclusive to the fraternity, I am in favor of Dr. Miller's favorite, viz: "Brother," written "Bro. Doolittle." How does that sound? It is a smooth and pretty term, and is applicable to friend or enemy. We can then use the term friend to those whom we have good and valid reasons to believe are our friends, whether bee-keepers or not. Pshaw, are not "Dear Sir," "Yours Truly," etc., all taken for granted? Please give us your opinion and send off, "Bro." Newman.
Jericho, Del.

[Our correspondent gives some very good suggestions, which should be heeded by correspondents. We detest the indiscriminate use of the word "friend," and very seldom use it, except to those whom we have proved as friends. It savors of "caut" to use it in business correspondence.—Ed.]

Drones from Worker Eggs.

S. J. YOUNGMAN.

The views of C. Theilman, given on page 594 of the BEE JOURNAL, are so like mine, given at the Northern Michigan Bee-Keepers' Convention in October, 1883, held at Sheridan, Mich., and also like a more recent article on the same subject by B. F. Carroll. This places me in a better position before the bee-keeping fraternity, especially as you say in your editorial criticism, "It will be very generally disbelieved that bees can and will rear drones from worker eggs." I think that the "old heads" will be obliged to believe, and also admit, that drones are often reared from worker eggs, even if it does clash a little with the teachings of some of our veteran writers and scientific bee-keepers. I also think that it will encourage some who are undoubtedly sometimes afraid to give their views to the public, especially those views pertaining to new discoveries, for fear of being held up to ridicule.

Cato, Mich., Feb. 4, 1884.

The Michigan Law on Foul Brood.

Many are asking me about our law on foul brood, I thought it might be well for it to be published in the BEE JOURNAL. I wrote it with much care, and think it pretty good. A. J. COOK.

To prevent the spread of foul brood among bees, and to extirpate the same.

SECTION 1.—*The People of the State of Michigan enact*, That it shall be unlawful for any person to keep in his apiary any colony of bees affected with the contagious malady known as foul brood; and it shall be the duty of every bee-keeper, as soon as he becomes aware of the existence of said disease among his bees, to forthwith destroy or cause to be destroyed all colonies thus affected.

SEC. 2.—In any county in this State, in which foul brood exists, or in which there are good reasons to believe it exists, it shall be lawful for any live or more actual bee-keepers of said county to set forth such fact, belief or apprehension in a petition addressed to the judge of probate, requiring him to appoint a competent commissioner to prevent the spread of said disease, and to eradicate the same; which petition shall be filed with, and become a part of the records of the court where such application is made.

SEC. 3.—It shall be the duty of the judge of probate on the receipt of the petition specified in section 2, of this act, to appoint within ten days thereafter a well-known and competent bee-keeper of said county, as a commissioner, who shall hold his office during the pleasure of said court; and a record of such order of appointment, and revocation, when revoked, shall be filed as part of the records of said court.

SEC. 4.—It shall be the duty of said commissioner, within ten days of his appointment as aforesaid, to file his acceptance of the same with the court from whom he received appointment.

SEC. 5.—Upon complaint of any two bee-keepers of said county in writing and on oath, to said commissioner, setting forth that said disease exists, or that they have good reason to believe it exists within said county, designating the apiary or apiaries where-in they believe it to be, it shall become the duty of the commissioner, to whom such complaint is delivered, to proceed without unnecessary delay to examine the bees so designated, and if he shall become satisfied that any colony or colonies of said bees are diseased with foul brood, he shall without further disturbance to said bees, fix some distinguishing mark upon each hive, wherein exists said foul brood, and immediately notify the person to whom said bees belong, personally or by leaving a written notice at his place of residence, if he be a resident of such county, and if such owner be a non-resident of such county, then by leaving the same with the person in charge of such bees, requiring said person, within five days, Sundays excepted, from the date of said notice, to effectually remove or destroy said hives, together with their entire contents, by burying them or by fire.

SEC. 6.—If any person neglects to destroy, or cause to be destroyed said hives and their contents in manner as described in section 5, after due notification, he shall be deemed guilty of a misdemeanor, and punished by a fine not to exceed \$50 for the first offense, and for each additional offense he shall be liable to a fine not to exceed \$100, at the discretion of the court; and any justice of the peace of the township where said bees exist, shall have jurisdiction thereof.

SEC. 7.—The commissioner shall be allowed for services under this act, \$2 for each full day, and \$1 for each half day, the account to be audited by the board of supervisors.

SEC. 8.—In all suits and prosecutions under this act, it shall be necessary to prove that said bees were actually diseased or infected with foul brood.

For the American Bee Journal.

An Analogous Case.

O. L. EARLLE.

On page 102 of the BEE JOURNAL, Mr. B. F. Carroll claims that the male sperm lodges in the mucus covering of the egg, and that it can be removed by the bees, thus changing the sex of the egg when the welfare of the colony demands it. The theory becomes more reasonable if we can find a similar case in nature. For instance, the female fish first lays her eggs, and is closely followed by the male, who sprays the fertilizing fluid over the eggs. Still greater success in their fertilization is made in the fish nurseries by gently pressing the eggs from the female into a bowl, and then over them, with the milk from the male, obtained in the same manner. To my mind, Mr. Carroll's proposition of the queen's eggs being fertilized on the outside of the eggs, lends additional strength to the Dzierzon theory.

Green Castle, Ind., Feb. 19, 1884.

For the American Bee Journal.

Wood Separators.

C. K. ISHAM.

A few reasons why I prefer them, also some of the objections to the use of any separators, considered.

In a previous article in the BEE JOURNAL, I claimed that with separators, the combs are built true and of even thickness, thereby admitting of glassing, which for neat and improved appearance, I consider indispensable, especially if we wish to put our honey upon the market in the most attractive and salable shape, and avoid leaking and musing, with which both dealer and consumer become more or less disgusted. We prefer wood separators cut 1-16 inch thick, as they are lighter, cheaper, warmer, and make a wider entrance for the bees to get into the sections, which is now considered to be of great importance.

The first and principal objection to their use, is that more honey can be obtained without than with them. How can we better judge as to correctness of these claims than by a comparison of results? Taking the report of Mr. James Heddon, a strong anti-separator advocate, and comparing it with my neighbors, Messrs. J. C. Newman & Sons, I find that for several years from an average number of colonies, they have obtained about double the amount of surplus honey; I find that Messrs. Bean and Van Eaton, of York, and also the Messrs. Benedict, of Perry, can report a far better average than I have seen in the figures used by anti-separator advocates.

One report which I will make special mention of, is that of Mr. P. D. Jones, near Mt. Morris, N. Y., who has, from 90 colonies, spring count, during the past season, obtained some 12,000 lbs. of comb honey. Were it necessary, I could give several other reports which have come under my observation, as within what we term our "bee circle," embraced in the counties of Wyoming and Livingston, there was last year produced a crop of some 100,000 lbs. of section comb honey. This large amount was produced by a limited number of apiarists who mostly make a specialty of the business, and nearly all of whom, after years of careful experimenting, are now using wood separators.

Here is a query: When a colony of bees are working at full capacity, and so intent upon storing in sections, that at the close of the yield they have in some instances, as was the case this fall, only from 2 to 6 lbs. of honey in the brood chamber, with 100 or more pounds stored in surplus arrangements above,—how in the name of reason could more honey be obtained by dispensing with separators? Here I claim another point for wood separators: They can store in tiered sections to better advantage, as they have two bee spaces instead of one, and can use the separator to travel over instead of passing, or crowding through the bees at work upon the comb in the lower tier.

I think that apiarists will agree with me, that comb honey can be more profitably built $1\frac{1}{2}$ inches thick than any thinner, as only the same amount of capping is required. This narrowing of the sections down to $1\frac{1}{4}$ inches in width in order to do away with separators, and using $\frac{1}{2}$ lb. boxes, is bringing the whole business of producing comb honey down to the same contracted proportions—uncalled for by dealer or consumer, and at best, only a whim of some apiarists whose main ambition seems to be to bring the honey business down to dimensions corresponding with the size of section the advocates use. I think it an advantage to use separators, although not wishing to glass the honey, as by fastening strips across the separator for the edges of the sections to rest against, they will be filled flush, and are ready for crating without danger of chafing; or, if desired, put into paper boxes, which is now a popular way to put it up for market.

Since writing the above, I see that in February number of *Gleanings*, among the editorials on page 101, that Mr. A. I. Root writes as follows under the heading of Wooden Separators: "These seem to have lost favor. Dr. Besse mentioned at the convention that although he made and sold a great many of them, he had discarded them. The principal objection seemed to be that they will warp. This might be obviated by making them thicker; but this would increase the expense, and also occupy valuable room in the brood apartment. If separators must be used, tin seems to be the best material to occupy little space without being affected by the dampness of the hive."

There is more absurdity contained in the above quotation, than in any thing I have read pertaining to intelligent bee-culture, for several years past. From the reports I have given, does it look as though they had lost favor?

At the last annual February meeting of the Northeastern Bee-Keepers' Association, held in the City Hall at Syracuse, N. Y., and which was probably as large an assemblage of bee-keepers as often meet together—at times the whole seating capacity of the hall being filled, the subject of using separators was discussed, and no one spoke against them, and the question was decided in their favor by an unanimous vote. Does this look like having lost favor with New York and New England apiarists, whose record the past season as successful honey producers gives authority of the highest character to their expression upon the subject?

Their warping, as Dr. Besse is spoken of as having mentioned, has not been our experience, especially when used in racks and brought together by following boards, which I consider far ahead of wide frames for top storing. When cut from properly-seasoned and suitable lumber, and afterwards slightly steamed, then pressed and dried (which is easily done), they are almost as flat as boards, and of 1-16 inch in thickness do not check or split to any amount, or do not sink when

the edges of two sections chance to mismatch.

Mr. Root's suggestion to make them thicker is unnecessary, and for economical and successful using, impracticable, and evidences that he has not had much, if any practical experience with them; besides, what do we want of them in the brood chamber? That they are affected by dampness, is something I have never seen, although I have had them in use more or less for the past 15 years. How can dampness from the bees affect storing attachments, when it is warm enough for bees to store honey in sections? I leave the question for some novice in bee-culture to answer.

After becoming convinced that wood was more desirable, I laid aside (or sold for half cost) some 2 or 3 thousand tin separators, and could not be induced to return to their use if they were furnished me gratuitously, and I think most of my bee-keeping neighbors will bear me out in making this assertion.

Peoria, N. Y.

[It should, perhaps, be stated that while the Eastern markets require glassed sections of honey, in the West they are of very slow sale. Consequently this modifies the argument concerning the use of separators. If the honey is to be glassed, separators cannot be dispensed with.—Ed.]

Indiana State Convention.

The fifth annual meeting of the State Bee-Keepers' Association convened in Indianapolis, Jan. 15. The *Indiana Farmer* says: The meeting was called to order promptly at 10:30 a. m. Vice-President Johnson in the chair. The reports of the several officers showed the society to be in good condition and full of life. Dr. J. H. Orear called attention to the work of the society, and what was expected would be gained by a close adherence to the rules of the organization. The President said that members should pay strict attention to business, work promptly, and above all call things by their proper names, thereby helping all beginners to a fair understanding of just what was meant during the discussion of the several subjects as they came before the meeting.

Spring management was the first question of general interest brought before the meeting. Mr. Davis believed that early feeding must be resorted to for the best results.

Mr. Lane also practiced early feeding to stimulate brood-rearing. He commenced his spring work first by giving all his hives a thorough cleansing of all dead bees, cappings, and the usual filth which accumulated in the hives during the time the bees were confined. He preferred candy for early spring feeding, as it was better to supply the bees in the hives than to entice them out during high cold winds.

Dr. Orear's plan was much like those already given—feeding syrups,

rye meal in lieu of pollen, and a judicious spreading of the combs, as the cluster increased.

The Secretary: Care should be taken in reference to spreading the brood cluster, as much damage was often caused by spreading too fast; wait until the first five or six frames become well crowded, before giving more room.

Hatching brood led to the subject of the best bees for all purposes. Mr. Mason had seen some good workers among hybrids, but believed none were quite so good as the Italians.

Mr. Shaw said that the real dependence was more in the honey to be had, than in the kind or quality of the bees.

Mr. Raab had tried all kinds of bees, and was decidedly in favor of the Italians.

The President, in an address, remarked that progress is the watchword of the bee-keeper, wherever found, and was the principle that organized this association, and has kept it alive and will maintain it. The idea of all associations of whatever branch of industry, should be to extend the benefits of that industry to the masses, and not to hedge it in to the selected few. We lose nothing in any science or art that we may have obtained by giving that knowledge to our fellow man that he may not only benefit by our experience, but return his own likewise.

We need not fear the overstocking of our State with bees in the near future. We have but a small number of colonies in this State comparatively. The statistics of April 1, 1883, show but 78,526 colonies, and that they gathered 798,368 pounds of honey. Mr. E. T. Sturtevant, of Cuyahoga county, Ohio, an extensive bee raiser, in an article published in 1857, says that in his opinion, on an average, 200,000 pounds of honey go to waste in each county annually for the want of bees to gather it. Let us reduce that one-half for Indiana and say that the honey bearing trees and plants produce 100,000 pounds per county annually, and we have 9,700,000 pounds of honey. Of that amount we gathered in 1882, 798,368 pounds, leaving 8,901,632 pounds ungathered. With this estimate and these figures before us we need not be alarmed about overstocking the State with bees. This ungathered honey, at the present retail price, would bring nearly \$2,000,000, which now is a total loss to the wealth of the State, and I have no doubt that the honey yield can be materially increased by the special cultivation of the honey bearing trees and plants.

A letter was then read from Prof. Smart, of the Purdue University, on establishing an apiary at the college. He said: "After consulting with Prof. Latta, we have concluded to recommend to the board of trustees, that the effort be made to encourage that branch of economic industry. I doubt not that the project will be approved provided the legislature makes an appropriation sufficiently large to enable us to carry on our present work and to add what is suggested."

The following was then passed: *Resolved*, That the thanks of this association be, and are hereby tendered to President J. H. Smart, of Purdue University, for his interest in apiculture as indicated in his letter, and that we hereby pledge that our individual and aggregate influence shall be used upon our next legislature for an appropriation sufficiently liberal to enable the University to conduct satisfactory experiments in our favorite industry.

Mr. C. F. Muth then gave his plan of preparing bees for winter. He thought it very essential that plenty of room be allowed for the bees to pass from one frame to the other, *en masse*, and preferred passages through the combs near the centre. Direct ventilation through the lives he thought bad for the bees, but believed it very necessary that provision be made to allow the escape of moisture which naturally arises from them during the cold weather.

The Secretary's plan was but little different from that of Mr. Muth, only that the latter used dry leaves in the second story of the hives as an absorbent and protection from the severe cold. He had noticed that the colder the weather the greater the exudation arising from the bees. He thought that with plenty of stores, from 25 to 30 pounds of honey, free passage for the bees from frame to frame, and for the escape for the dampness, with good protection from outside dampness also, a good colony of bees had the advantage of all that we really know as to what is best for them in winter.

Dr. Orear favored in-door wintering, but this season was wintering on the summer stands; was not now able to say how well his plans were succeeding.

In the evening the election of officers was held, and resulted as follows: Mrs. Irvin Robbin, President; Mrs. E. Stout, Treasurer, and Frank L. Dougherty, Secretary.

The session was then taken up in discussion; the subjects being "Clipping the queens' wings," "Feeding bees in cold weather," and "The desirability of producing comb or extracted honey."

The business of the second day was entered into promptly at 9 a. m. with the question as to the advisability of having the proceedings of the convention printed in pamphlet form and sent to bee-keepers throughout the State, and while it was considered impossible to supply even a small part of the number in the State with copies in the present condition of our finances, the Secretary was instructed to send out as many as possible.

Reports were heard from the several county societies, and of the good the organization was doing throughout the State, and plans were discussed for the continuance of the good work. The Secretary was instructed to assist as far as possible in the organization of county societies, and to show to the friends as far as possible that this body was purely a State institution; not being run for a favored few, as had been asserted by some, but free

and open to all; also that our constitution and by-laws prohibit the likelihood of anything of the kind; and that the society is fostered, in connection with the other societies, by the State Board of Agriculture.

The afternoon session was opened with the farther discussion of the best plans and arrangements for work in the apiary, and the time was fully taken up until the arrival of Gov. Porter, further debate being deferred to hear the Governor's address. The Governor said that he had proved by examining the State statistics that for the year ending April 1, 1880, the production of honey was 1,097,634 pounds. In 1881 the production declined to 690,141 pounds, and in 1882 it had declined to 420,204. It further appeared from the statistics for the year ending April 1, 1882, that there was a loss of 38,357 colonies of bees. The decline manifestly came chiefly from destruction of bees, owing to the insufficient supply of food in certain parts of the year, from unfavorable weather, and from the destruction of bees in winter.

The chief attention of bee-keepers should be directed to producing plants for bees, with reference to withstanding drouths and other unfavorable conditions, just as prudent stock raisers cultivate a variety of grasses so as to meet the conditions of drouths and a too great excess of moisture, some grasses flourishing in very dry seasons, and some flourishing particularly in wet ones.

An interesting discussion of the Governor's remarks followed at the close of the address. The association adjourned at 4 p. m.

Paste for Labels on Honey Pails.

ELLIS MEAKER.

Some days ago I received a few cans of extracted honey, brought to me in an open sleigh. The paste used for putting on the labels was so unfit for the work that two of the labels had fallen off whole, and several more were more or less loose, and could be easily removed without tearing, and on several cans the labels were considerably torn by the handling or rubbing against each other on the road. The otherwise neat appearance of the goods was thus very materially hurt.

Some years ago, a friend engaged in a drug store, noticed that the labels on tin packages, which they received from one New York house, adhered very firmly, while those on the packages from another house, were more easily removed or marred, although the tin had the appearance of having been sand-papered or otherwise roughened in order to overcome the difficulty. He secured the receipt for making the paste used in the first case, and as I have used it and know it to be excellent, I herewith give it for the use of bee-keepers.

Make a flour paste just as your wife does for papering walls, except rather thinner. If your wife cannot make a good paste, ask some other man's wife. When nearly done, add about

one-eighth as much of the cheapest Porto Rico molasses that can be got, and cook for about 10 minutes longer, stirring continually to prevent burning. If too thick to spread easily (as will probably be the case), thin with warm or hot water, mixing well before using. If lumpy, squeeze through a cheese cloth or a stout, loose-woven linen towel. Do not use a molasses that is adulterated. I get mine at a grocery that has a large Irish trade.

This paste, if well made of good materials, will fasten paper or cloth firmly to metal, earthenware or other packages, and labels put on with it will bear rough usage without marring. I have lately had occasion to think that perhaps a good quality of sugar might take the place of the molasses, but do not know. If it would answer, the advantage in using it would be the less difficulty in getting it.

Owaseo, N. Y.

Haldimand, Ontario, Association.

A meeting of this association was held at Jarvis, on Monday, Feb. 11, pursuant to adjournment. Minutes of the previous meeting read and approved. The membership fee was made 25 cents.

The question of the best method of wintering bees was then taken up. Mr. Kindree winters his bees on the summer stands, in chaff hives, with plenty of stores. He puts a division-board in the front part of the hive, and fills the space with chaff, and has success.

The President winters his bees in a clamp, with a foot of chaff all around them, and a place of exit through the chaff. This is the first winter he had tried it, and does not know how they will succeed.

Mr. Armstrong winters his bees in a shed or clamp, with 10 inches of chaff on the south side, and a foot on the north side, and 18 inches of sawdust on top. They are doing well, and he thinks they will come through all right.

Mr. Kitchen urged the importance of having plenty of young brood late in the fall, with plenty of stores, and he would almost guarantee them to come through all right.

The Secretary and Mr. Buckley gave their experience on cellar wintering, and thought it a very good plan.

How to prevent spring dwindling? The President thought the great cause of spring dwindling was allowing the bee to fly out too early in the spring, and becoming chilled; they were unable to return. One great preventative was to devise some means of keeping the bees in the hive until the weather is warm enough for them to fly.

Mr. Kitchen kept his bees closed up as long as possible, and after allowing them a flight, he kept them closed up for another month, or until the weather was warm, and fed them until they commenced to swarm.

The President gave some interesting reminiscences of early bee hives,

and recommended the Jones hive as being easy to handle, and simple in its operations.

Mr. Vanderburgh spoke in favor of the tenement hive as being an easy hive to handle, and an excellent one in which to winter.

Mr. Kitchen spoke in favor of a hive of his own make, and thought it was ahead of any in use.

The Secretary mentioned a few points which he considered essential, and thought the Jones hive about filled the bill.

The account of E. C. Campbell, for printing, \$4.25, was ordered to be paid.

The next meeting will be held at Hagersville, on the 30th of May, at 10 a. m.

Subjects for next meeting: "Best race of bees;" "Best way of putting up extracted honey;" "A report of losses during the winter and spring."

A vote of thanks was given to Mr. Kitchen for his attendance at the meeting, and for the information given in his remarks on the subjects under discussion.

E. C. CAMPBELL, Sec.

For the American Bee Journal.

Below vs. Above, for Section Honey.

ALLEN PRINGLE.

I notice that Dr. G. L. Tinker thinks it "impossible to get nicely capped, clean, white and beautiful combs either at the sides of or between brood combs." Some other bee-keepers are of the same opinion, contending that the upper stories are the places *par excellence* for producing good section box honey.

I beg to say most respectfully that these gentlemen are mistaken. I have produced as beautiful section box honey in the lower story or brood-chamber as can be produced above. This is the way I do it: When the surplus honey season is in, having got the colonies intended for section honey well developed and strong, occupying from 8 to 12 brood frames, I take from a given colony (that has, say 10 frames) 3 frames away, leaving all or nearly all of the bees behind. There will be now remaining in the hive 7 of the best brood frames with an abundance of bees. I then dispose these 7 frames in the front part of the hive—those having most brood in the fore front, and those having least (one perhaps with drone comb and honey) furthest back from the entrance.

The reader will bear in mind that the frames of this hive—the Jones hive—hang parallel with the entrance. I now hang 2 or 3 frames of sections containing 9 each immediately behind the brood frames, thus filling up the hive. The section frame used has 3 strips of tin something over 3 inches wide tacked on one side of it directly over the three rows or tiers of section boxes which are $3\frac{1}{2} \times 4\frac{1}{4}$ inches in size—the longest measure ($4\frac{1}{4}$) crossing the tin strips at right angles. This leaves a narrow entrance into the section boxes at the top and bottom of each row.

In putting in the frames of sections, this tinued side must of course be put facing the nearest brood frame, and the next frame put with its tinued side facing the open side of the first one, and so on, placing division-board behind all if needed to fill up. Sometimes the perforated zinc division-board is useful between the brood frames and the section frames, but I have never yet had occasion to use it, though the perforated metal as prepared by D. A. Jones is very useful for various purposes. I have never been troubled with the queen in the section boxes, nor with pollen. But the brood frames must be kept clear for the queen. Keep the extractor going upon them whenever necessary. And if the honey flow is abundant, you will have the satisfaction of taking out a full case of well-capped, beautiful honey every two or three days. The section frame nearest the brood frames will be filled and finished first. Upon removing it shift the nearest one to it (which is perhaps half full) up in its place, and put in an empty one behind all. Upon opening a hive to take out the full section frame, should you find two or three sections not fully capped over, it is, I think, bad policy to put it back again to wait for a full finish. Take out two or three unfinished ones and put them in your empty frame.

From my experience I am very strongly in favor of the lower story for section box honey, especially in a hive like the Jones hive, where the frames hang across the hive, and you can put your section boxes in the rear instead of at the sides. In such a hive I can get far more section-box honey below than above, and of a quality as good as any.

When, therefore, I notice the incredulity of some leading bee-keepers on this point, I feel amused as well as surprised. Of course it requires attention and skillful manipulation, but with those elements it can be made a grand success.

I am not condemning other methods of getting section-box honey; for I practice other methods myself in other styles of hive, but this is my most successful one. I am only refuting the notion that it is impossible to get first-class section honey in the brood-chamber.

Selby, Ont., Feb. 5, 1884.

For the American Bee Journal.

Bees Flying in Winter.

S. B. ATWATER.

Should bees be restrained from flying while the ground is covered with snow?

This is a question in the wintering problem, which, at the present time, is of interest to me. My experience, so far, has been confined to wintering bees on the summer stands. During the winter of 1880 and 1881, I had a dozen colonies that were confined to their hives from the middle of November to the 2d day of March, and during the most of this time the hives were so covered with drifts of snow

that no part of them could be seen. During all that time the weather was too cold to disturb them to ascertain their condition.

On the morning of March 2, the sun shone bright and warm; in the warmest part of the day, the thermometer stood at 70° in the shade. The ground, at this time, was completely covered with snow, but it melted so fast that day that a flood of water was sweeping down all the ravines during the afternoon.

About 9 o'clock in the forenoon I shoveled the snow away from the hives, so as to open the entrances. The bees came out for a general fly, and seemed to enjoy themselves. Bees were observed to alight on the snow, but the weather being so warm they were enabled to arise again. As the sun went down, and the bees finally returned to their hives, a few dead bees were to be seen on the snow, but not enough to indicate that the colonies had met with any great loss. The next winter, being an open one, there was no loss of bees in this locality on account of snow.

In the winter of 1882 and 1883, I had 75 colonies on the summer stands that had no flight from the latter part of November to the middle of February. During a great portion of this time the weather was extremely cold. From the first to the 10th of February we had a good many days that the sun shone very bright, but the mercury in the thermometer was all the time below the freezing point. Yet, notwithstanding the coldness of the weather, at every hive which was not covered completely with a drift of snow, some bees would every day dart out, drop and wallow a few seconds in the snow, but none lived to return to the hives.

From the 10th to the 15th of February there were slight indications of a thaw, and the bees were so anxious to fly that I shoveled snow against the front of the hives, covering the entrances. The morning of the 16th of February was cloudy, and although the temperature was above the freezing point, so long as it remained cloudy, the bees were quiet. But about noon the sun broke suddenly through the clouds, and in a minute the air was full of bees. The thermometer, at noon, stood at 45°. Towards evening a cool breeze sprung up. Bees would fall in the snow, and it appeared to be too cold that day for a resting place. Many would spin around on their backs awhile, but would get too much chilled to rise again. The next morning, the snow for 30 or 40 rods in all directions from my apiary was thickly peppered with the bodies of dead bees.

In the spring there were live bees in every hive, but many of the colonies were greatly weakened by their February flight. This winter my bees have been confined since the middle of December. I have 90 colonies, mostly in double-walled hives, on the summer stands. The ground is now, and has been for the past seven weeks, covered with snow. During this time we have had some very cold weather; on the morning of the 5th inst. it was

from 32° to 36° below zero, as measured by different thermometers in this neighborhood. Every day now that indicates a thaw, I am watching, and if many bees fly out, I close the entrances of the hives either with snow or little blocks. Am I doing right? This is a question I would like to have some advice about it.

If the entrances of the hives should be closed while the ground is covered with snow, and the temperature is low, what is the best method of doing it? There are many readers of the BEE JOURNAL who have had more years of experience in wintering bees on the summer stands than I have, and if there is as much danger from loss by their untimely flights as I apprehend, is not this a good question to discuss?

Viola, Ill., Dec. 27, 1883.

SELECTIONS FROM OUR LETTER BOX

Drones Flying.

Here, bees winter on their summer stands without packing of any kind; they have wintered well, so far. I had 78 colonies last fall, and now have 77 all in good condition. My bees were all flying to-day. One colony had drones with a good young queen in the hive. I harvested 3,000 lbs. of honey last year, and sold it at 9 and 15 cents per pound. I use square frame, 11x12, and the top-bar is 14 inches long, and 10 to a hive. Sweet clover is of no use for us. I sowed a pound 2 years ago, and it bloomed the second year, but there was not a bee seen on the bloom.

Inglefield, Ind. JOHN FERSTEL.

Request for Mr. Doolittle.

We have had the coldest weather this winter ever known in Kentucky. The mercury registered as low as 30° below zero. We had snow on the ground through the whole of January. Notwithstanding the severe winter, our bees have wintered well so far. I opened five hives on Jan. 14, and found sealed brood in two of them; the third one had a nice patch of eggs in one comb. Of course such queens would be condemned in Michigan, and probably get their heads pinched, but they are just the kind we Kentuckians expect the largest yields of honey from, and are rarely ever mistaken. I spent the most of to-day with my bees, putting in division-boards, and shaping the brood-nests according to my notion. I found young bees hatching in most of my hives. I began last season with 25 colonies of my own, and 6 on shares, making 31 in all. I took 4,225 lbs. of honey from them; about 100 lbs. in the comb, the rest extracted. My best colony gave 306¼ lbs. It was gathered in a little less than two days 31 lbs.; in seven day 102 lbs., all from clover. We have no basswood. My 25 colonies last spring, count to-day 33. The 6 I had on shares now count 9; all in good condition. I had only 4

swarms from the 31 colonies. I would like to ask Mr. Doolittle to write an article for the BEE JOURNAL on the habits of bees. What I mean about habits of bees, is this: If we attend to our business and get the queen in the habit of sticking to the lower story, will she not be likely to stick to that habit? Also, if we get the workers in the habit of storing their first honey gathered in the spring of the year up-stairs, or just where we want them to, are they not likely to keep to that habit? and wont they teach their younger sisters the same habit. I have sometimes thought the reason that some could not get Italians to work in surplus boxes, was because they allowed too much room in the brood-chamber for storing honey in the spring, and when the brood-chamber became full, they preferred to swarm or hunt up another brood-chamber rather than give up their old habit and go up-stairs; hence, it is said by some, Italians will not work in boxes, and are early swarmers. We know Italian queens are prolific, and must have room to spread themselves.

A. C. CUNNINGHAM.

Salvisa, Ky., Feb. 5, 1884.

Stimulative Feeding Not Good.

My 122 colonies all answered to roll call to-day, and are having a splendid flight. Not the slightest sign of dysentery in a single colony. For a number of years I have practiced feeding unbolted rye-meal or flour, to stimulate early breeding, and it has done it; but I am satisfied it has done my bees more harm than good. W. J. DAVIS.

Youngville, Pa., Feb. 19, 1884.

Sweet Clover.

Saturday, Feb. 2, was a pleasant day with us, and the bees had a good flight, and seemed to be in good condition. They spotted the snow some, but no bees dropped on the snow like they do sometimes. The hives are dry, and there are no dead bees on the bottom board. The prospect for successful wintering is good so far. I have received several inquiries in regard to the qualities of sweet clover as a forage or fodder plant for cattle. To be honest about sweet clover, while it is one of the best honey plants to my knowledge, I must own up that as a pasture plant for cattle, it is almost worthless. With us they will not eat it, if they can get anything else, and as for hay, I would not suppose any one could recommend it, for the stems are coarse and hard, almost of a woody nature, so utterly different from all other clovers that I do not see how any one could recommend it for fodder. There is, however, one other use for sweet clover besides honey producing, and that is its fertilizing qualities. I believe that from its enormous growth and extremely deep rooting nature, it can be classed among one, if not the best for fertilizing worn-out soils. I have known it to root two feet deep, and it generally makes a growth of six feet high, and of the rankest kind on our poorest soils.

H. S. HACKMAN.

Peru, Ill., Feb. 6, 1883.

How to Test a Thermometer.

Mr. Yoder asks on page 91 how to test his thermometer. The following is from instructions sent from the signal office at Washington to their observers at signal stations:

"The accuracy of all thermometers at each station will be tested on March 31, June 30, Sept. 30, and Dec. 31 of each year in the following manner: Place the thermometers to be tested in the vessel provided for this purpose, keep them in a vertical position, pack finely-pounded ice around them to a height a little above the freezing point, and let them remain for one hour, at the expiration of which time read of the height of the mercury, without removing the thermometers from the ice." I use a baking powder case.

Can Mr. W. Z. Hutchinson tell us any more about "feeding back" for honey, than he has done on page 656, volume of 1883. WM. F. WARE.

De Witt, Neb.

Errata.

In the article on "How to Test Thermometers," on page 108; where it says, "The point the thermometer shows is freezing point, or 32° below zero." It should be 32° above zero.

CHAS. FAUST.

Harvard, Ill., Feb. 14, 1884.

[The writing was indistinct, and the error was not noticed until it was too late to correct the type.—Ed.]

Honey Prospects in California.

Southern California has been blessed with a copious rain of 12 days duration, and raining 13 inches in that time, which makes 19 inches up to date, for the season. The ground is thoroughly soaked. It is the best rain we have had since 1868. It was an old-fashion California rain. The mercury did not get below 50°. As a matter of course, the bee-keepers are rejoicing at the prospect for a large crop of honey. My bees are working lively. Bee-keepers will have a busy time from now on.

J. E. PLEASANTS.

San Diego, Cal., Feb. 8, 1884.

Carniolan Apiary.

I cannot do without the BEE JOURNAL, even if offered a smoker for doing so. My 206 colonies in the cellar appear to be in good condition. I have met with success every season, when so wintered, but I find the chaff hive a failure; it is with me at any rate. I will try the Carniolan bees this summer. I will start an apiary of them about six miles from my Italian apiary, from a queen received of Frank Benton, last fall. I will get some Italians imported from him again this spring. A. J. NORRIS.

Cedar Falls, Iowa, Feb. 16, 1884.

Bees in Good Condition.

My bees flew to-day, for the first in 110 days. My 50 colonies are all in good condition. HENRY JONES.

Chesaning, Mich., Feb. 17, 1884.

Bees in Excellent Condition.

Bees are having a grand jubilee to-day; the first "flight" since Dec. 12. I never saw them so strong in numbers, or in better condition. One queenless colony was dead; the other 56 have plenty of stores, and apparently as many bees as when they went into winter quarters. I use a double-walled hive of my own manufacture, and, of course, winter on the summer stands. GEO. E. HILTON.

Fremont, Mich., Feb. 19, 1884.

Bee-Keeping in Georgia.

The weather has been quite warm here for the last ten days, with considerable rain during the last four days. My bees have wintered well on the summer stands, without any protection, and are gathering their first pollen to-day. No conditions are necessary to successful wintering, other than strong colonies with sufficient stores. I sell most of my honey (extracted) in the Chattanooga market, in tin pails, at from 15 to 20 cents per pound, according to quality. There is no person in this county making a specialty of bee-keeping, and but few are pursuing intelligent methods in the business as a side issue. Why do not enterprising bee-keepers at the North, who are seeking a better field for their business, come to Northwest Georgia, and help us develop our honey resources. Here we have a great variety of honey-producing trees and plants, among which poplar and sourwood are the finest producers as to quality and quantity. Land is cheap, the climate mild and healthy, good water plenty, with an abundance of timber. This certainly is an inviting field to bee-keepers. L. K. DICKEY.

High Point, Ga., Feb. 9, 1884.

Bees Flying.

It is very warm and cloudy, with rain and snow at intervals. Bees were flying yesterday. They spot the snow some; a few very late swarms seem to be the worst. With those having clover honey, it is not perceptible as yet. I shall have something new for the BEE JOURNAL, from my microscopic investigations concerning drones, dysentery, floral farina, early and late swarms, etc.

A. M. FIRMAN.

Quasqueton, Iowa, Feb. 18, 1884.

Bees Getting a Little Restless.

I commenced, in 1881, with 3 box hives of bees; they swarmed 3 times each, and the nine went into winter quarters and came out all right; 3 died in March, 1883. I bought 3 more the same spring. I transferred all from box hives into standard Langstroth hives. I put 24 into winter quarters and lost 3, so in the spring of 1883 I had 21. Last summer I had trouble. I tried to keep them from swarming more than once; when a swarm issued, I noted the date on the hive, when the young queen hatch. I destroyed all the queen cells but one. I lost 6 young queens and had to replace

them; 4 swarms came out and left no queen in the hive; in such cases I put them back and give them unsealed brood from another hive. They increased to 42 colonies. For a place to winter in, I excavated in the side of a beaver dam, 2½ feet deep by 12x14, and built two walls of logs 6 feet high, with a 3 foot space between. This is filled and covered with dirt, 18 inches deep. I have 2 ventilators in the top of the cave. I have 2 doors to the entrance, with a place at the bottom to admit fresh air. My hives are all numbered, both hive and cap. I take off the cap and leave it on the stand, and put the hive in; the next hive I set on the first, and so on, until they are all in. That makes the bottom board cover the hive underneath. I think each colony had 35 lbs. of sealed basswood honey, when they were set in for winter. All through December and January they were very quiet; but within the last week they are getting a little restless.

C. S. HAWKINS.

Sauk Rapids, Minn., Feb. 16, 1884.

Convention Notices.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate. H. C. WHITE.

On account of the inclement weather, only a few of the Rock county bee-keepers responded to the call to meet at the Pember House, Janesville, Wis., on the second Tuesday in February, to organize a bee-keepers' association, so we will have another meeting on the first Tuesday in March next, at 1 p. m., at the same place. All bee-keepers are courteously invited, and we hope there will be a good attendance. L. FATZINGER.

Janesville, Wis., Feb. 13, 1884.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

Independence, Mo.

The Northeastern Bee-Keepers' Association will hold its second annual meeting on Wednesday, March 5, at the Court House, in Lapeer. Hotel rates reduced to \$1 per day.

W. Z. HUTCHINSON, Sec.

We now club the *British Bee Journal* and our *Monthly* for \$2.50.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Queenlessness.

My bees had a flight on Feb. 11, and I saw that one colony threw out a dead queen. How can I save them at this time of the season, or get a queen? Please answer through the BEE JOURNAL. WILLIAM CULP. Snyderstown, Pa., Jan. 13, 1884.

Is it not more likely that the dead queen was a stranger from some other hive, either your own or your neighbor's? and that the queen in the hive you refer to, is alive and all right?

Spring Management.

How do you prevent "spring dwindling?" Please give in the BEE JOURNAL your system of management for March and April. W. L. GAGE. Kane City, Pa., Feb. 14, 1884.

The reply to Mr. Oswalt, will give you an idea of what I think of spring dwindling. We try to prevent it by doing all we can to prevent the bees having dysentery during the winter.

Mortality, Brood-Rearing, etc.

The writer has lost only one weak colony, so far this winter, out of 30. One neighbor 2 out of 20; another 1 out of 40; another 5 out of 60. Almost all have commenced brood-rearing, so far as examined or heard from. My bees, for several days, have been carrying in rye meal very industriously. Will they take up more than they can use to advantage?

2. Does Alsike clover bloom as early as white clover?

3. If it blooms at the same time, will it increase the yield of extracted honey? GEO. W. MORRIS. Salvisa, Ky.

1. Under certain conditions, bees will store up more rye meal than they can use. As soon as natural pollen can be gathered, they ignore the rye flour, and dig out and throw away the bread they made by its use. In this location, they often store large quantities of natural pollen that they dig out and throw away in the spring of the following year, provided they live to do so.

2. Here, alsike clover blossoms with white clover, and is of no special use to the bee-keeper where the latter is abundant.

3. Certainly, it will increase the yield of honey if your field is overstocked; but is it not better and cheaper to prevent that condition of things, by not keeping too many colonies in one

field. I think I hear you ask how many colonies are "too many?" I reply, I do not know, and ask, who does? The very important questions of the profitable length of the flight of gathering bees, and that of overstocking, have been much neglected, and at the same time, are of most vital importance to those who are, or ever expect to be specialists in bee-keeping.

Fears Spring Dwindling.

I commenced the winter with 8 colonies of bees, but during the month of January two of the weak colonies died; the rest are all doing well. What I now fear is robbing and spring dwindling. Will you please instruct me on this point. I will furnish items for the BEE JOURNAL occasionally from this locality. JACOB OSWALT. Maximo, O., Feb. 12, 1884.

If dysentery is among your bees, and the spring is cold and backward, you may be troubled with spring dwindling. To prevent this, you must begin the season before, and prevent dysentery during the winter.

To prevent robbing, keep the entrances closely contracted, and see that your bees are not allowed to get a taste of honey or other sweets, left about carelessly.

Bees in a Vault.

I commenced the season of 1883 with 29 colonies of bees in fair condition; increased by natural swarming to 61, and obtained 2,000 lbs. of comb honey in one and two-pound sections, and about 500 lbs. of extracted. Through queenlessness and other disasters they were reduced to 57 good colonies by fall, of which I put 54 in a cellar, especially prepared for that purpose, and left 3 out doors, 2 in chaff hives of my own pattern, in which bees have wintered well for the last three years, and one in a gum, which I bought last spring, and either had no time to take it out, or was too lazy to do so; I hardly know which is the truth in this case. The last named colony gave two large swarms, and good workers they are, although quite black. The young queen left in the stump, most assuredly mated with an Italian drone, for she produces yellow striped hybrids occasionally. The entrance to this gum is big enough to stick both fists in at once, and higher up than the highest space of the hollow inside. The other day, the temperature being 2° above freezing, I blew in, and the bees disturbed by my warm breath, began to hum. Now, is it not wonderful that these bees, with so big an opening and that almost at the top, to let out freely the warmth produced by the bees are (at least apparently) well. My cellar is a vault 14x36 feet, ventilated by subterranean 80 feet 6 inch tile. Up to the middle of January

last, its temperature was not lower than 38° Fahr., but thenceforth it kept falling fast, and water flowed out of the entrance of most of the hives. When it reached 33°, I put a stove in it and warmed it to 55°. I now fire up every Saturday. They are dry now, but 4 of them show signs of dysentery by somewhat soiling their hives on the outside. If this warming up process, as above stated, is not the right or safe way for my bees, be kind enough to inform me of a better procedure. I have 20 colonies in hives 11x14, which I shall transfer to the regular Langstroth. They have all nice straight combs, which I will use in extracting. Will it not do to bore holes in the bottom-board and set it on a Langstroth brood-chamber? Will not the bees with the queen soon go down in that and leave this upper story free of brood?

JOHN TRIMBERGER.

Cross Plains, Wis., Feb. 15, 1884.

You will remember I am one of those who believe that dysentery is the main cause of mortality among bees; further, that dysentery is not caused by cold, confinement or humidity. These things acting only as assistants or aggravations of the cause. Looked at in this light, it is not at all strange that your old gum, with all its upward ventilation, is in good order. It is impossible for me to tell, without being on the ground and closely observing, whether heating up the cellar makes matters better or worse. I have no idea that it will cure or stop the disease among the bees. We have seen dysentery in its worst form, in an exceedingly dry atmosphere.

Your plan for transferring the square hives is not practical. In most cases the queen will not retire to the lower chamber. Many times when we put an empty super over a common hive, the queen persists in staying above. Would it not be better to drive the queen with two-thirds of the bees from the box hive, and run them into the Langstroth, placing the box or square hive down by its side, wrapping it with old carpet or something (covering it all up for a few days until the bees mark well their new location), and in about 21 days drive the rest of the bees out of the square hive clean, when the brood will all be out, and you can do what you please with the square combs and their honey? (See article on Modern Transferring, page 367 of this JOURNAL for 1883.)

The Lorain County Bee-keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.

O. J. TERRELL, Sec.
North Ridgeville, O.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

We have a few photographs (cabinet size) just taken, of the Rev. L. L. Langstroth, which we can send to those desiring them for 50 cts. each, postage prepaid.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

"Dzierzon's Rational Bee-Keeping," bound in cloth, are now all gone. We have a large lot bound in paper covers, which we are sending to any one clubbed with the Weekly BEE JOURNAL for a year, for \$2.75. Any one who has paid for the BEE JOURNAL for 1884, may send 75 cents more for the book, and we will send it by return mail, postage paid. It is an imported book, printed in the English language, and the price of the book is \$1.50.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Feb. 25, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour :

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7@10c.

BEEWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEEWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1 1/2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 13@15c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEEWAX—Scarce, at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—Same scarcity of choice white 2 lb. sections as reported last week, and a few thousand pounds would be readily taken at 17 to 18c. One pound sections in fair supply, and brings more at present than 2 lbs. Dark comb very slow sale. Stocks are low on dark extracted, and in fair supply for white. Prices range 8@10c.

BEEWAX—None in this market.

There is some inquiry for white clover seed, for which in round lots, clean and pure, about \$10.00 per bushel could be had. Send sample before shipping.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Market is quiet, and common qualities difficult to place at anything like satisfactory figures. Fancy qualities are scarce. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7 1/2c.; dark and candied, 5@—

BEEWAX—Wholesale, 27 1/2@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb 12@16c, and strained and extracted 6@8c per lb. Top rates for fancy small packages.

BEEWAX—Firm at 33@33 1/2c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEEWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEEWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Bees For Sale!

1884.

HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I have now made arrangements so that I can again supply you with those nice white Dovetailed Sections, 4 1/2 x 4 1/4 x 7 to the foot, and 8 to the foot, \$7.00 per 1,000 from here. Will be ready to ship on and after March 15th.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS'
SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax, the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

NO. 30 TINNED WIRE

For Brood Frames.

- One ounce spools, each, - 4 cents.
Postage, 2 cents extra.
- One oz. spools, per dozen, 40 cents.
Postage, 13 cents extra.
- One pound spools, each, 40 cents.
Postage 18 cents extra.
- One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

6 Inch, Price, \$25.00.

It makes the finest extra thin Foundation for comb honey. For Sale by

ALFRED H. NEWMAN,

923 West Madison Street,
CHICAGO, ILLINOIS.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

Chicago, Ill., March 5, 1884.

VOL. XX, No. 10.

THE WEEKLY EDITION

OF

PUBLISHED BY

THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australis—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1870.

The Original
BINGHAM
Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that the original inventor has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutterd, and edited, with notes, by Charles N. Abbott, *Ex-editor* of the "British Bee Journal." Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Erlapsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific results, it should well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cordons, Fudings, Foam, Wine, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman.—This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Serlthner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Minors, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the records together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—
—Der Tlichkeit des Bienenstandes—
—Honig pflanzen—Erziehung der Königin—
—Füttern—Schwärmen—Ableger—
—Versezen—Talienisieren—Züfeker von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formkuchelchen, Biddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von V. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., MARCH 5, 1884.

No. 10.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The Report of the National Society.

Concerning this matter, we have the following from Mr. McPherson, who has been mentioned before in connection with the matter. He says:

I see by late issues of the BEE JOURNAL that numerous correspondents have asked about the report of the Toronto Convention, and also Mr. Root's and Dr. Miller's replies. Perhaps an explanation from myself would not come amiss, but first I must thank Dr. Miller for his kind words, and assure him that I shall endeavor to sustain his impressions regarding myself. Representing the *World* of this place, I caused arrangements to be made with one of Toronto's best reporters, to have him report the meeting, for the benefit of the *World* alone, and at a set figure. I had supposed there would have been other reporters there representing other papers, and that the regular minutes would be taken by the secretary. I did not imagine that my reporter was to take the *official report* of the meeting, nor was I aware that he had been doing so until after the convention was over.

During the second day (I think) my reporter came to me and said that at the rate they were going, it would be worth more than I was paying. Not supposing for a moment that he would "go back" on the arrangement first made, the matter stood, and he finished reporting the meeting. The next day Mr. Jones informed me that a resolution had been passed to have the report published and a copy sent to each member, and then I learned that mine was the official report. I called at the office of the reporter to learn how long he would be in furnishing the report transcribed, and was told that the job would be worth \$100—four times the amount of the first arrangement.

I consulted Mr. Jones, and he called twice to see what he could do. I threatened legal proceedings. The reporter had the matter in his own hands, however, and knew that he held the official report, and, I suppose, thought

we could not get along without it. After a good deal of war-like correspondence, I determined, rather than pay a premium for such unbusiness-like conduct, to let him have the labor he had been at, for his pay. Thus the matter stands. I did not think that it was going to pay me to expend \$100 for the manuscript (nearly \$1.00 per member) and then put it into shape, print and bind the reports and get, perhaps, 25 cents each for my trouble. Besides, I did not wish to encourage that style of doing business. I will endeavor to get the names of the vice-presidents of each State for the association. Kindly excuse my having taken up so much of your space.

Yours very truly,

F. H. MCPHERSON.

Beeton, Ont., Feb. 22, 1884.

Dr. Miller sends us the following in explanation of his connection with the affair:

In reply to Dr. Besse's inquiry, I can only repeat what has been already stated in the BEE JOURNAL (which Mr. Besse had probably not yet seen when he made the inquiry), that, by vote of the society, the publication of the minutes of the North American Bee-Keepers' Society was left in the hands of the old officers, so that the present secretary has nothing to do with it more than any other member of the society.

C. C. MILLER.

Marengo, Ill., Feb. 26, 1884.

A series of "blunders" seem to have made this whole matter very unsatisfactory to all concerned. As it is pretty certain now that there will be no official report, it is quite useless to further agitate the matter. If the list of vice-presidents can be obtained, it may help some, and save that much from the wreck. The "Report" is too stale now to be of much value, and may not be worth the \$100, but beekeepers generally will think that, even if had cost that sum, it should have been promptly published, as ordered by the Society. There were funds enough in the Treasury, and these should have been used to carry out the wishes of the members, as expressed by vote at the meeting, both as regards publishing the official report and procuring the badges.

However, let the matter rest until the next meeting, and then we hope

that the officers will strictly attend to *business*, and not be led astray with "emotional excitement." The National Society should, in its methodical management, be a pattern to all other societies; but we fear that, so far as the last annual meeting is concerned, it will be hardly so considered by any thoughtful or systematic person.

The Convention at Davenport, Iowa.

As announced previously, we attended this meeting, and found quite a number of the bee-keepers of Iowa and Illinois present. We have a portion of the proceedings ready for publication, but our columns are too much crowded this week to admit them. While there, we were the guest of the Rev. and Mrs. M. L. Williston and family. Mr. W. is the pastor of the Congregational Church at Davenport, is a reader of the BEE JOURNAL, and is very much interested in bee-culture. Col. McCagg, the president of the society, is a thoroughly wide-awake and progressive bee-keeper and horticulturist, under whose guidance the society has grown from 2 or 3 to over 50 members, representing 70,000 lbs. of honey production; among whom are the Rev. O. Clute, Rev. E. L. Briggs, J. V. Caldwell, J. B. Lindle, C. H. Dibbern, Capt. L. H. Scudder, and many others whose names are familiar to our readers, as will be seen when the Report is published—probably next week.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

E. L. Goold, Bantford, Ont.—44 pages—Bee-Keepers' Supplies.

H. H. Brown, Light Street, Pa.—20 pages—Bees and Apiarian Supplies.

O. Clute, Iowa City, Iowa—2 pages—Italian Bees and Queens, and Class of Students.

J. P. McGregor, Freeland, Mich.—1 page—Hives and Sections.

Hillside Fruit Farm, Palmyra, N. Y.—2 pages—Plants.

Honey Locusts.

Mr. R. Codd, of Canada, asks about Honey Locusts for honey production, and wants to know if they will prosper as far north as the Dominion, etc.

Perhaps the best way to reply to the query about its adaptability to Canada, will be to quote from a letter from the Hon. L. Wallbridge, then of Belleville, Ont., but now Chief Justice of Manitoba. He says:

"Another tree of great value to the bee-keeper is the honey locust. This tree comes in bloom quite early, and

Honey Locust Tree.

is valuable on this account. The bees visit it almost in swarms, and the honey and pollen then brought in gets up the excitement in the hive, and breeding goes on at a rapid pace. Now this is the very thing bee-keepers want. They want strong colonies ready to gather honey when white clover comes in, and I know of no tree or plant which does so much to strengthen the colony early as this locust tree."

The *New York Tribune* says that in the Northern sections of the United States, where the Osage orange is more or less injured by the winter, the honey locust is undoubtedly the most valuable plant for hedging purposes. There is no special culture necessary for it, more than is required for other species, but it needs attention for the first 2 or 3 years to form a thick base. The young hedge should be frequently cultivated and kept clear of grass and weeds all summer, otherwise mice will harbor therein and bark the young plants. In trimming, cut well back for the first 2 or 3 years, bearing in mind there is no difficulty in quickly obtaining the desired height, but it is far more troublesome to induce it to become dense and twiggy.

The best results are obtained from running one strand, or, better still, two strands of barbed wire along the

middle of the hedge, thus preventing the inroads of unruly animals, and that bane of the honest orchardist, boys with thieving propensities. To start at the commencement, honey locust seeds should be collected in the pods as they fall from the trees in autumn, and placed in a cold exposed position until hard freezing weather, when they can readily be threshed like beans. After cleaning the seeds from the fragments of pods, etc., place in bags and preserve dry until spring. At planting time soak the seeds in warm water until they show signs of germination, when they should be sown in drills like peas, in good, thoroughly pulverized soil. Like the larger portion of our native trees, this species forms more root than top the first year, consequently one-year seedlings are usually rather small for planting in the hedge-row, but they should not be left to remain longer than 2 years, else they will be on the other extreme. The cause of so many poor hedges, however, is neglect in cultivation, and the honey locust of all others will not thrive without care and attention.

The *Nebraska Farmer* gives the following valuable instructions regarding the planting and treatment of honey locust for hedges:

The secret in hedge-growing of any kind, is well-directed care and attention during the first 3 or 4 years, and if this be given to honey locust it will make a hedge every time. The plants must be good ones, vigorous and thrifty—and should be about the same size together, and not plant small and large ones promiscuously. Before setting, make the ground along the line

Honey Locust Limb—pod and seed.

rich and mellow. After setting out the row must be cultivated and kept clean until the hedge is matured or finished. Let the plants grow the first year undisturbed, and then cut them down within 3 inches of the ground; the second year, 7 inches from the ground; third year, 12 inches; fourth year, 25 inches; sixth year, 33 inches; and the seventh year, height desired for fence. This takes seven years, but the fence is good after the fourth year.

In view of the increasing destruction of our forests, and the great cost

of fencing material, any substitute for good fences will be eagerly sought after by the thoughtful farmer. Osage orange has been extensively tried and experimented with, but it fails to fill the bill, there being many very objectionable features about it, chief among which are its inability to stand excessive cold winters; but the honey locust is free from this objection. As an attractive hedging nothing can excel it in appearance, and certainly nothing is easier of cultivation. When allowed to grow in tree-form it becomes a beautiful shade tree, and the timber is among the most valuable. For honey-producing it stands among the best, and bee-keepers will do well to alternate the honey locust with linden and tulip tree or poplar, as it comes into bloom before the linden, and is a more certain producer, though not so bountiful. Bee-keepers should liberally ornament their grounds with it, and try its virtues for hedging. The seeds or plants can generally be obtained of nurserymen.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The first edition of the "Apiary Register" having been exhausted, we have just issued a new edition, elegantly bound in Russia leather, with a large worker bee and "Apiary Register" in gold on the side. It forms not only a Register of both Queens and Colonies, but has also an Account Book at the back, in which to keep a record of all the receipts and expenditures of the apiary, which will be found exceedingly valuable. We have also reduced the prices, as will be seen on another page.

For the American Bee Journal.

Priority of Location.

J. E. POND, JR.

What a delightful thing would it be to some poor fellow, who owns a few square rods of land, if he could only have the right of priority, to all the honey secreted on the thousands of acres surrounding him. What a most delicious monopoly would be at once created. All that needs to be done, if I "catch on" to the idea, of at least one apicultural writer to give such an one a moral right at least to control all the honey flora within bee range of his apiary, is simply to be the first one in a given locality to own a colony of bees.

To be sure some one else might object, but no matter for that, he is the first comer, and the honey yield is his by virtue of priority. When he has procured one hive, and by the exercise of good judgment has selected a rich location, and found that the business will pay a satisfactory profit, the law "of advantage in speciality" imbues his mind with a desire at once to enlarge his apiary till he has completely covered his diminutive tract of land with hives, as thickly as it is safe to stand them. As the season rolls on and he finds each colony giving large returns, he views his spoils by a large degree of self-complacency, and says to himself, "I've got a perfect bonanza." Ere long his neighbor, who owns the adjacent territory, ascertains that there is money to be made in keeping bees, and procures a few colonies himself, thinking in the innocence of his heart, that as the flowers are his, he has at least the right to gather a portion of the nectar from them; but he is rudely awakened to the fact that he has no such right (morally at least), because no one has the right by reason of priority to all the honey yielded within an area of five or six miles from the apiary he has established. No. 1 comes over to see No. 2 and says to him, "My dear sir, why do you keep bees and thus spoil my chance of getting rich in the business? Last season I got 200 pounds of honey per colony; this season I shall not average 100 pounds, and all because you are poaching on my manor."

But, says No. 2, "I own all the surrounding territory, and you own scarcely land enough on which to set your hives, why have I not a right to gather nectar from my own flowers?"

"Why, my dear sir," says No. 1, "don't you know that my right of priority (morally at least) prevents you from having any rights to the honey, that I am bound to respect?" And so the conversation goes on, but whether No. 2 is fully satisfied or not remains to be seen.

Is there any sense in a discussion of this kind, and will the persons who

advocate any such doctrine (if any such there are) honestly claim that any right of priority such as indicated above, in reality exists.

I am surprised at times to see the amount of selfishness that is shown by some of our able writers, when the question of honey yields is under consideration, and think of the difference in this regard that exists between our bee-keepers and those across the water. Here the idea seems solely to work for self, and to prevent every one else from engaging in the business; there societies are being formed whose sole object is to teach the best methods to the poorer classes, in order that they may have to add a small revenue from their bees to the stipend they receive for their daily labor. Here the attempt is being made to discourage making bee-culture an auxiliary to other pursuits; there the attempt is being made to urge every one who possibly can, to occupy his leisure moments with labor in his own apiary.

One day we hear the cry of "overstocking," and the claim made that ere long bees will be so thick that they will starve unless sugar syrup is supplied them for food. The next day, farmers and professional men are "pitched into" with great severity, and they are accused of taking the bread out of the poor specialist's mouth. Then the agricultural colleges are "hauled over the coals" for adding bee-culture to their curriculum, and advertisements for students are issued in the same paper by bee-keeping specialists.

Do these college students and professional men injure apiculture as a science or not? Who, I ask, have been the leaders in apicultural improvements? Has it been the specialists whose time is wholly devoted to caring for their crops of honey or the rearing of queens, or has it been the professional men, who have had the time and the desire to experiment in order to determine the value of this or that point, or the best ways and means of procuring comb or extracted honey? Who was it that invented and introduced the movable frame? Mr. Quinby, one of the ablest and most practical bee-keepers of the age, might have done this had he the time to devote to it, but he did not, and the Rev. L. L. Langstroth, one of these same professional men, did have the time and the inclination, and he did it. Who discovered and taught us the theory of parthenogenesis? Dzierzon, another professional man. And so I might go on, but the above examples are sufficient for the point I wish to present. I trust then, in the future, if selfishness does exist among our apiarists, that (if they must exercise it) they will do so in some less harmful manner than in attempting to drive those away from our ranks who really desire to enter them.

Foxboro, Mass.

The Lorain County Bee-keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.

Statistics of the Honey Crop.

WM. MUTH-RASMUSSEN.

Under the above heading Dr. C. C. Miller asks for suggestions on the best plan for collecting the statistics. I will give the plan, which, to my mind, seems the only feasible one. It should be done through county associations. In the first place the committee on statistics should get printed a number of postal card blanks, giving the questions desired to be answered, and also a like number of cards, reading about as follows:

(Date.).....

Dear Sir:

You are hereby requested to call a special meeting of your county bee-keepers' association on or about the ... day of ..., if no regular meeting occurs at or shortly previous to that date, for the purpose of collecting statistics for the North American Bee-Keepers' Society, as indicated in the accompanying blank, obtaining from the members present as much as possible information about those not present, and about other bee-keepers in your county, who are not members of your association, also estimating as near as you can such items as you cannot learn definitely; and to forward said blank, properly filled out, to the Vice-President of your State, as soon as possible.

If there is no bee-keepers' association in your county, you are respectfully requested to collect as full as possible statistics with which to fill out the blank, or, if unable to do so personally, to hand these papers to some other bee-keeper in your county, who may be willing to aid the committee in this important work.

The State reports are desired to be in the hands of the committee by the ... of ...
Committee on statistics, N. A. B. K. S.
.....Chairman.

..... Vice-President for.....

Address.....

As many blanks and cards as there are counties in each State or Territory should be forwarded to the respective vice-presidents, also a corresponding number of stamped envelopes, and one stamped and printed envelope, bearing the name and address of the chairman of the committee.

As soon as this outfit is received, the vice-president should forward a blank postal card, addressed to himself, and one of the accompanying cards filled out, signed and addressed in the proper places, both enclosed in one of the stamped envelopes to each secretary, and to any other bee-keeper designated for the work.

On return of the postal cards the vice-president will make out a State report and send it, in the printed envelope, to the chairman of the committee, keeping the county reports filed away for future reference. In each county where there is no association, the vice-president can probably find some enterprising bee-keeper who will take interest enough in the matter to collect tolerably accurate statistics; at any rate the number of

colonies can be learned from the assessor. If not otherwise obtainable, the vice-president may send a self-addressed postal card to the post-master at each county-seat, requesting him to return it with the name and address of the most prominent bee-keeper in his county.

Thus the principal expense for printing and postage will fall upon the National Society, in whose behalf the work is to be done. If any of the outfit is not used up, it can be kept for next year's report, and turned over to the vice-president's successor.

In regard to the failure in obtaining statistics, I will say that I have taken long trips on horseback through the country spending days in going in different directions in order to visit the bee-keepers at their homes, and obtain statistics from their own mouths. I did it at a time when I had leisure, but should not care to repeat the trips every year, and others probably feel the same way. At other times I have sent self-addressed postal card blanks to 20 or 30 bee-keepers, needing only a few plain figures which might be jotted down with a lead pencil right in the post-office, and the card dropped without taking it home at all; and I had the satisfaction (?) of having at most half a dozen returned. The fault lies partly in the apathy of the multitude, each one thinking there will be enough without his individual report, or forgetting, or not caring at all about the matter; partly in putting too much work and expense on a few, however willing they may be to help.

Independence, Cal.

For the American Bee Journal.

A Bit of Bee Surgery.

DANIEL WHITMER.

Last September, in looking over a number of nuclei to ascertain whether the queens had met the drones, I discovered they carried the drone appendage. In three or four days I again opened the hives to know whether they were laying, and found that all were depositing eggs very nicely and accurately but one, and she still retained the drone appendage. I closed the hive until the following day, when it was opened again and the queen examined, and found to be in the same condition as before.

She was a very fine-looking queen, and an exact duplicate of her mother, whose Royal Highness I very much admired, she being a queen purchased of Dr. Wilson, of Iowa, and as I desired to save the daughter, I concluded to examine the queen two successive days, and, if the drone organ was not yet voided, I would perform a surgical operation, and extract it from the queen.

The colony was again disturbed, and the queen found to be in the same condition. Two days later, the organ was very hard and dry, adhering very closely to the orifice of the queen. I captured her, took her to the house and inside of the screen door, by the aid of my better half, the organ was

extracted with difficulty, with a needle, and the queen was returned to the hive uninjured; the next day, to satisfy my curiosity, I again opened the hive to ascertain the true condition of my patient, and she was found depositing eggs symmetrically. Thus I saved the life of good queen, which otherwise would have been lost. I lost one, once before, by letting her alone. I do not know whether any one else ever tried the experiment or not, but it can be successfully done. My 147 colonies of bees are all right as yet, save one which was queenless. South Bend, Ind., Feb. 21, 1884.

For the American Bee Journal.

Clipping Queens' Wings.

GEO. E. BOGGS.

Mr. W. H. Stewart, in a recent article on the above subject, requests bee-keepers to answer certain questions.

Mr. S.'s argument proves entirely too much, for if any appreciable exercise of the queen's wings were requisite to not simply increase but even perpetuate wing power in the workers, nature's plan would long since have proved abortive, and the honey-bee would ere this have become extinct. If you contrast the few hours' use of the wings of a queen during her long life, with the constant use of the wings of a worker during the greater portion of its short life, they bear no proportion whatever. In comparison, it may be said the queen does not use her wings.

Mr. S.'s argument not only proves too much, but reaches the *reductio ad absurdum* when he proposes to take his queens out of the hives and toss them into the air, and compel them to use their wings more than nature designed. In this he would contend against nature, and would not simply waste his time, but inevitably do harm. All the energies of the queen seem to be concentrated in her reproductive organs. If we carefully consider the great strain put on them, we will not hastily divert them into other channels. If we do so to any appreciable extent, we will have a deterioration not only of the wings but of all the members of the workers.

Let Mr. S. apply his argument to the mandibles, the tongue and the thighs of the queen, and he would have us believe that we are in great danger of soon having workers that will not be able or inclined to make comb or gather honey and pollen.

I am a firm believer in the laws of heredity. I do not understand how laws that we consider established in regard to animal life are apparently violated in the economy of the bee, but it only shows that the Creator is not limited in his methods of working.

As a further illustration, take another fact regarding queen-bees. How strange that the stimulating food which shortens the period of arriving at maturity should lengthen life. It seems to be an established law in animal life that the length of life is in proportion to the period of time during which maturity is at-

tained. With the bee it is entirely different. The queen is born five days earlier, and begins her life work ten days earlier than the worker, and yet the queen lives to be about three years old, whilst a worker, if actively at work, hardly lives sixty days.

Columbia, South Canada.

N. E. Ohio & N. W. Pa. Convention.

This association held its fifth annual convention at Jefferson, O., on Jan. 16 and 17.

The meeting was called to order at 1 p. m. Pres. E. F. Mason being absent, C. T. Leonard, of Andover, was called to the chair, and the usual annual address had to be dispersed with. A large number of bee-keepers was present, 6 counties in Ohio and Pennsylvania being represented.

After routine business, the reports of standing committees, etc., the members opened the discussion upon the question, whether modern bee-culture is a success financially.

H. W. Hackett believes it is a paying business, if rightly managed. He makes his hives in winter, and gets everything ready before the busy season comes, so he is enabled to give his whole attention to the bees just when they need it. He has a time for every part of his work, and everything is done in time, as time tide and bees wait for no man.

D. Videto said that most of the bee-keepers present were farmers like himself, and can fairly estimate profits from this branch of industry only by comparing them with the profits arising from other departments of labor. The speaker compared the amount of money and labor invested in the production of an acre of wheat and other farm crops, with an equal investment in bees, and made a very favorable case for the latter. It is easy enough by division to increase one colony to ten, but among experienced apiculturists, the real question of interest has been to keep all the bees in a hive, and make them spend their strength in the production of honey. If a man really desires to increase the number of his colonies, they will multiply as fast or faster than is good for them, without any help.

The question of keeping bees in connection with other business, drew out some discussion, the general opinion being that it is not advisable to have any other occupation on hand, that will require your attention at any time when the bees need it.

M. E. Masou said a man who takes care of 75 or 100 colonies, making his own hives and foundation, and marketing his honey, will have done a good year's work, and will have no time to devote to any other business.

"The best method of increasing colonies," was passed with but little being said, as most old bee-keepers appeared to think that bees would increase fast enough without any "best method," and that he who could successfully prevent increase, would produce the most honey, and consequently the most dollars.

The evening session was opened by an address by Mr. Videto, on bee-

keeping in general. He talked for over an hour in his usual easy and happy style, and was listened to with marked interest.

At the close of Mr. Videto's address, the President called Capt. S. H. Cook to the stand, who, with a few appropriate remarks in behalf of the Association, presented to Mr. V. a beautiful ebony cane with a solid silver head, on which was engraved, "Presented to D. Videto, by the N. E. Ohio, and N. W. Pa. Bee-Keepers' Association."

M. E. Mason had spent much time in making experiments, and had given swarming more study than any subject connected with apiculture. The object in keeping bees is to get money, and honey is the chief reliance for obtaining the desired reward. If bees are permitted to exhaust their strength in swarming, hives and foundation are needed, which cost more money than is received. We must have bees in the hive; we must keep our colonies strong, or the business will be unsatisfactory.

He practiced the following plan to prevent increase last season. He worked 20 colonies in this manner, and is satisfied they gave him 1,000 lbs. more honey than if he had allowed them to swarm, and hived them in the usual way. He hives the first swarm that comes out in the usual way, and for convenience, he will call the hive that this swarm issued from, No. 1; the next swarm, and the hive they issue from, No. 2, etc. When swarm No. 2 comes out, he takes 2 frames of brood from hive No. 1, and puts empty combs or foundation in their place, and destroys all queen cells on the remaining combs, and then hives swarm No. 2 in this hive, No. 1, and gives them a case of empty sections. When No. 3 swarms, hive No. 2 is prepared in like manner to receive them, and thus he continued till the 20 colonies had swarmed, and had only increased one.

Mr. McGonnell said he prevented swarming in an apiary of a hundred colonies by cutting out drone brood and giving plenty of room. He had an increase of only 7 colonies from 100, and that was caused through neglect.

Statistics taken from the members showed 1,069 colonies put into winter quarters in the fall of 1882; 896 of them lived through the winter and spring, and increased to 1,656 colonies in the fall of 1883, and produced 22,388 lbs. of comb honey, 9,755 lbs. of extracted honey, and 140 lbs. of wax. About 75 per cent. of them were packed in chaff or other dry material, or in chaff hives on the summer stands; 10 per cent. were put in cellars, and the rest were without any extra protection. Of those packed in chaff, etc., and in chaff hives, about 16 per cent. were lost during the winter and spring; 22 per cent. of those in cellars died, while 36 per cent. of those without any protection died.

The next annual meeting of the society will be held in Erie, Pa., the second Wednesday and Thursday in January, 1885.

At the election of officers, P. T. Twitchel was made President, C. H.

Coon, Secretary, and N. T. Phelps, Treasurer. Vice Presidents: M. E. Mason, D. Videto, W. S. Stinson, J. McGonnell, S. B. Wheeler, J. P. Sterrett, H. W. Hackett, J. Hatton, F. M. Blanchard, C. L. Payne, H. A. Eastman, G. S. Harvey, B. F. Jenkins, J. S. Barb, H. B. Hammon, H. F. Sager, E. B. Case.

The Association is in a flourishing condition, and this meeting was a success in every sense of the word.

C. H. COON, Sec.

New Lyme, Ohio.

For the American Bee Journal.

Why Abuse Half-Pound Sections?

W. Z. HUTCHINSON.

Ever since half-pound sections were invented they have been subjected to a running fire of abuse. Everything that could be thought of has been said against them. Supply dealers have been accused of "booming" them from selfish motives. Beekeepers who did not understand the principles underlying the production of comb honey, have written long articles in which they attempted to prove that not nearly so much honey could be secured in small as in large sections. Beekeepers have been accused of being too progressive, too restless, with not being satisfied in "letting well enough alone," of creating a demand among consumers for something that they would never have thought of asking for if it had not been brought to their notice, thus compelling beekeepers, who did not wish to do so, to use small sections or be left behind, when, if all beekeepers would only place the seal of condemnation upon the "one bite" sections, they would be saved this trouble.

It has also been mentioned that more sections and more foundation would be needed, but why repeat all that has been said against half-pound sections. Of course all that has been said has not been abuse, but many of the arguments brought against them have been so exceedingly transparent that it required not a very penetrating vision to see beneath them an inducement that flowed about as follows: "I am very much afraid that somebody is going to get the start of me."

At our late Michigan State Convention the subject was but lightly touched upon, and when one dealer reported that he could get no more for them than for the pound sections, and another man reported that a certain dealer could find no sale for them, it was certainly interesting to witness the satisfaction that beamed upon many faces, and to listen to such exclamations of delight as, "Good," "I'm glad of it," and "That's all right;" in fact, the convention came just about as near applauding and cheering as it did when Mr. D. A. Jones told how many thousands of five cent packages of extracted honey were sold at one Canadian fair. As Mr. Jones went on and explained how the sale of these small packages led to the sale of larger ones, and so on and

so forth, some of the members were fairly enraptured; they could see the beauties of selling small packages of extracted honey; but half-pound sections—Oh! that was a horse of a different color.

Perhaps extracted honey can be put up for sale in small packages more cheaply than the same thing can be done with comb honey, but if the public is willing to pay for the expense, why this feeling and prejudice against half-pound sections? One bee-keeper said to me: "It just makes me mad to hear folks even talk about half-pound sections," and, in saying this, I fear that he expressed the sentiments of quite a number of beekeepers.

Now, I have no interest in half-pound sections; have never used them, and do not know as I ever shall, but it makes me "mad" to see people so unreasonably abuse them without even trying them; and that, too, in the face of the fact that some of our leading comb honey producers have demonstrated that, with proper appliances and methods, just as much honey can be obtained when using half-pound as when using pound sections; and the only question is whether enough larger pieces can be obtained to pay for the extra manipulations.

Arguments against half-pound sections, or anything else for that matter, can be listened to with pleasure, but simple abuse and unreasonable prejudice are disgusting.

Rogersville, Mich.

For the American Bee Journal.

Cedar Valley, Iowa, Convention.

The bee-keepers of Cedar Valley, Iowa, met at Waterloo, Feb. 13 and 14, at the office of J. Moshen; organized by electing C. P. Hunt President, and John Bird Secretary *pro tem*. It was moved by O. O. Poppletton that a committee of three be appointed to draft a constitution and by-laws. O. O. Poppletton, H. O. McElhany, and D. W. Thayer were appointed as the committee. They submitted the usual printed constitution and by-laws with the following amendments:

SEC. 2. Strike out all after the word interests, and the following inserted in its place: Shall discuss such questions as have a practical bearing on bee-keeping.

SEC. 8 was all struck out, and the following adopted instead: No member shall be entitled to the floor longer than 5 minutes in discussion of any question without the consent of the society.

SEC. 11. In the by-laws was changed by striking out from the word office, all the balance of article.

On vote of the convention, the constitution and by-laws as amended were adopted.

On motion it was moved that the President *pro tem* appoint a committee of three to nominate permanent officers. H. O. McElhany, D. W. Thayer, and Geo. Beck were appointed, and the following names were submitted: C. P. Hunt, of Waterloo, for President, and Dr. Jesse Oren, of La

Porte, for Vice-President, and O. O. Poppleton as Secretary and Treasurer.

All the above officers were duly elected except O. O. Poppleton, who objected to serve on account of failing eye sight. H. O. McElhany was elected in his place.

The following persons became members:

| | |
|--------------------------------|-------|
| H. O. McElhany, Brandon, | Iowa. |
| O. O. Poppleton, Williamstown, | " |
| D. W. Thayer, Vinton, | " |
| J. F. Spaulding, Charles City, | " |
| Geo. Beck, Waterloo, | " |
| James Ralston, Vinton, | " |
| A. D. Bennett, Janesville, | " |
| John Brusik, Waterloo, | " |
| D. W. Jolls, | " |
| J. I. Carr, | " |
| C. P. Hunt, | " |
| John M. Bennett, | " |
| H. Van Buren, | " |
| J. Moshen, | " |
| I. Hood, | " |
| O. Havden, | " |
| J. F. Messenger, | " |
| D. M. Diedorf, | " |
| L. L. Triem, La Porte, | " |
| H. E. Hubbard, | " |
| Dr. Jesse Oren, | " |
| Thos. Tracy, Nashua, | " |
| John Bird, Bradford, | " |
| E. R. Sparks, Cedar Falls, | " |
| A. J. Norris, | " |
| E. E. Newton, | " |
| Samuel Augst, Vinton, | " |
| J. K. Oren, Brandon, | " |

On motion of O. O. Poppleton, the order of discussions should be in the form of written questions handed in by the members to the President and read by him in rotation.

The first question for discussion was: "The most desirable width for sections." It was decided that 1½ to 1¾ inches are the most desirable.

"What shall we do with our second swarms?" Mr. Spaulding prefers to prevent them from issuing.

Mr. Bennett, Jr. would let them issue and take out all the queen-cells for future use, and return the swarms to the old hive with a laying queen.

"Is it expedient to clip queen's wings?" Several of the members thought it would. L. L. Triem had experienced some loss of some of the most valuable queens he had by the practice. O. O. Poppleton's experience was the reverse from this, which brought out considerable of a discussion both *pro* and *con*. Messrs. Spaulding, Bennett and others were not in favor of the practice.

"Best way to live swarms." By placing the hive where it is to permanently stand, and carry the bees to it.

"Which kind of honey to produce, extracted or comb?" Messrs. Tracy, Spaulding, Bennett and Triem would raise comb honey. Messrs. Poppleton, McElhany and Morris preferred to produce extracted honey on account of selling out to the wholesale dealers, and the safety of shipping in large packages.

During the discussion of this question, the President asked what extracted honey could be produced at, to be made profitable? Those producing extracted honey thought they could afford to raise honey in this way at from 8 to 10 cents per pound, wholesale. Mr. Bennett, Jr. thinks bees will winter better run for comb honey. Mr. Poppleton thought they would not. Considerable discussion ensued.

"What shall we do with surplus bees?" A. Bennett never has more than he wants. Mr. Spaulding kills all the inferior ones, and keeps the best. Mr. Poppleton does the same.

Mr. J. M. Bennett would advise uniting all the light colonies in the fall.

Adjourned till 7 p. m.

Called to order at 7 p. m., and the first question discussed was, "Which is the most desirable method of wintering—cellar or out-of-doors?" It was decided by the majority of the members that the cellar, with proper conditions, was preferable. O. O. Poppleton gave his method of out-door packing; he uses double-walled hives, packed with timothy chaff, and has success.

Question, "Does it take more honey in the cellar than it does for out-of-doors?" Answered, "Out-of-doors, always."

"Wintering in deep vs. shallow frames." Messrs. Tracy, Poppleton and Hunt were in favor of the deep frames. Messrs. McElhany, Bennett, Sr., Bennett, Jr., and Triem favored shallow frames.

"Is shade essential for bees; if so, what kind, artificial or natural?" Decided by all that it was, and the natural was the most practical.

"Should hives be raised from the ground?" Yes; from 3 to 4 inches, at the back, and 1 to 2 in front.

"The most desirable size of sections for all purposes." Messrs. Spaulding, Triem, Oren and McElhany preferred one-pound sections. Messrs. Tracy, Bennett, Jr., and Hunt used Harbison frames.

Adjourned till 9 a. m.

Called to order at 9 a. m., Feb. 14, and the first business was the selection of the time for the annual meeting; the first Wednesday and Thursday in October, 1884, was designated, and Waterloo was the place chosen.

"Can more than one yard be run successfully?" Mr. Spaulding was the only one present who had worked in this way, and was successful.

"How many bees can be kept in one locality without overstocking a location?" Mr. Triem thought that almost any number could be kept and not be overstocked. Mr. Tracy thought from 1 to 300 colonies, according to the season, with success.

"Best spring management for bees?" Mr. Bennett, Jr. would commence the management as soon as the bees were placed on the summer stands. Bees should have plenty of honey, and he would spread the brood gradually as the weather warms up; encourage the queens to fill the frames with brood as fast as possible, by giving them frames of honey or syrup, and place them in the centre of the brood-nest. Mr. Bird left the packing around the hives until late in the season.

"The best bees for general use." Some thought hybrids were, but the majority preferred pure Italians.

"What is the standard of purity, for Italians?" Three distinct yellow bands for the workers.

"At what age should a queen be superseded?" Mr. Stark said, when she showed signs of failing. Mr. McElhany would kill all the queens at the age of two years, when running for extracted honey.

"Best foundation for general use." Most of the members said the Given,

about 6 to 7 square feet to the pound.

"How to prevent natural swarming?" Give the bees plenty of room in raising comb honey. Those running for extracted honey are not bothered with this.

"Are any here troubled with foul brood?" None.

"Is a portico an advantage to a hive?" The members were about equally divided on this subject.

A vote of thanks was given D. W. Thayer for procuring reduced rates over the different railways; also to the B. C. R. & N. Ry., C. N. W. Ry., and I. C. Ry., for such reduction; also to J. Moshen and the city of Waterloo for the use of rooms occupied by the convention; also to the Logan House for reduced rates.

Adjourned.

For the American Bee Journal.

Home Market for Honey.

D. WHITE.

There are some who have no trouble in disposing of all the honey they can produce; but many cannot sell their honey, especially extracted. When I produced only from 700 to 1,000 lbs. of honey, I could scarcely find enough customers to consume it; but now, with but little exertion, I can dispose of all the honey I can produce, which was 8,000 lbs. in 1882, and 21,000 lbs. in 1883. This was nearly all extracted honey, and nearly all taken at my door by customers, who came with crocks, pails, jugs, and large milk cans in which to carry it away. They come every season in the same way, for I have never sold them honey that will get thin and sour, if kept in damp cellars; nor have I ever sold them honey that was extracted and ripened after extracting (as some tell about). I never allow a pound to be taken away that was not first-class in every respect. We are careful not to put a pound of comb honey on the market unless it is perfect, so far as ripeness and being sealed up is concerned; we will not offer honey with the top-half of comb sealed and the rest unsealed; it shows for itself, deception cannot be practiced with comb honey. When a comb is extracted, like the section I have described, it is trying to deceive the customer who buys such honey, and I admit he is deceived, but in most cases not more than once or twice, for a large majority of customers will say: "It makes my throat smart. I do not like it, and will not buy any more." Some will say it is adulterated. Now such work as this is uncalled for, and I believe any one can build up an immense home trade for extracted honey. All that is required is to have as good an article *out* of the comb as is sold *in* the comb. My price for extracted has always been 9 lbs. for a dollar, or 10 cts. a lb. for 50 lbs. or more.

I have 140 colonies on the summer stands, all in chaff hives, except 12 in simplicity hives. They have had several good flights, and all answered

to roll call. I never saw them in better condition in chaff hives. I shall lose 2 or 3 out of those in single-walled hives. Reports are coming in from farmers around here, that they are losing their bees with hives full of honey.

New London, O.

We will organize a bee-keepers' association at the Court House in Franklin, Ind., at 10 a. m., April 5, 1884. All bee-keepers are invited to attend and take part in the organization.

L. R. JACKSON.
Urmeyville, Ind., Feb. 26, 1884.

The annual meeting of the New Jersey and Eastern Bee-keepers' Association, for the election of officers and other business, will be held in the city of New York at Room 24, Cooper Union, beginning Wednesday, March 12, at 10 a. m., and continuing two days.

J. HASBROUCK, Sec.

We have received a pamphlet of 118 pages, entitled "Tea and Coffee: Their Physical, Intellectual, and Moral Effects on the Human System," by Dr. A. Alcott, with notes and additions by Nelson. Price 25 cents. Fowler & Wells Publishers, 753 Broadway, New York.

SELECTIONS FROM OUR LETTER BOX

Bees Confined 102 Days.

My bees have been in the cellar 102 days. The temperature was never below 43° or above 45° after they became settled. Feb. 4, diarrhoea appeared in one colony; to-day it is alive, and as quiet as the others. A year ago saw 2 dead and 20 afflicted; with the same preparation for winter, and temperature from 32° to 40°.

C. W. DAYTON—61.

Bradford, Iowa, Feb. 22, 1884.

That "Improved" Case.

We have tried almost exactly the same arrangement described by Mr. Dibbern on page 133. We made cases in many ways, testing each thoroughly, covering a period of over two years, before adopting the one we previously described in the BEE JOURNAL. Much damage has been done by hastily recommending untried fixtures. We are very sure that if Mr. D. will try 20 or 40 cases, just as we make them, by the side of an equal number of his, he will discard his "improvements" the second year. There is no trouble in getting the sections out of our case. It is stronger, as we make it, than with his tin T, and can be made cheaper. The tins are objectionable on account of bending when handling the cases empty, if they strike against anything. The glass is also very objectionable. The necessitated outer case is more objectionable than all else, besides adding ad-

ditional expense. We wish to use no separators under any consideration. We do not glass our honey, but if we did, we could glass two-thirds of the sections without the use of separators. We do not use $\frac{5}{8}$ space above the sections, but scant $\frac{3}{8}$. We have had no trouble whatever with any variation in the size of sections.

JAMES HEDDON.

Dowagiac, Mich.

Small Honey Jars.

To-day's mail brings you my price list for 1884. I send you also per express, prepaid, a sample of our dime and $\frac{1}{2}$ lb. honey jars, which I think, will prove quite an acquisition to the retail honey trade. The honey market is still without life, and our terrible flood had not a bit of beneficial effect on the market. I was fortunate enough to be above the high water mark.

CHAS. F. MUTH.

Cincinnati, O., Feb. 20, 1884.

[These small jars are quite attractive. The illustration shows the "dime jar of honey," and is simply marked

"Pure Honey." The half-pound jar is of the same design, but is marked " $\frac{1}{2}$ pound Pure Honey." If they are not too expensive, they will add greatly to the retail trade in extracted honey.—ED.]

Old Foundation Freshened.

In answer to many inquiries, we wish to state that foundation from the previous season, that has been kept over winter and has become pale and brittle, can be readily freshened by exposing it for a minute to the sun's rays in warm weather, or better yet, by passing it over steam from a tea kettle or other boiler. It then becomes as malleable and fresh looking as when fresh-made. If it is already fastened in frames, it is superfluous to anneal it thus, as the bees do this same work themselves by their natural heat and moisture, as soon as they take possession of it.

CHAS. DADANT & SON.

Hamilton, Ill.

Vocabulary of Bee-Keeping.

If improper names and terms are continually allowed to find a place in the bee papers, there will hardly be any change for the better very soon. Beginners and new subscribers naturally adopt such terms as they read, and hand them down to coming generations through their communications to the papers. Would it not be best, that the editors of the respective papers strike out every incorrect term from any communication sent in for publication, and substitute the proper term intended by the writer, before it goes to press? In this way beginners would read nothing but what was right, and the old hands would gradually forget the old and wrong terms.

2. I would like to ask, what is the proper name for the second story of a two story hive? Here we call it "cap." If that is not correct, we ought to have some similarly brief name for it, as "second story," "upper hive," or "top-box" are too long for every day use, unless generally adopted. WM. MUTH-RASMUSSEN.

Independence, Cal., Feb. 12, 1884.

[It would be well for the Bee Papers to do as suggested; we have been trying to do so, as much as possible, for some years, but until a vocabulary is settled upon, it will be difficult to make such corrections.

2. We know of no better term than "second story;" the other terms are inappropriate and incorrect.—ED.]

Bees Packed with Clover Chaff.

I have passed through the log gum, fire and brimstone period. I have always tried to keep about 100 colonies over winter; that number would keep me busy in my young days, at swarming time. I am now in my 75th year, but I will not admit that I am an old fogie. I take most of my honey in one-pound sections; extracting is too much work for me. I increase my bees now by dividing them. I winter about one-half of my bees in a house, on Mr. Jones' plan, but I only make the walls 20 inches thick, for this latitude; the other half I winter on the summer stands, with a box to cover, allowing 2 inches of space between the boxes, which I pack with clover chaff; for an entrance for the bees, I cut two pieces of 6-inch spouting and put between the boxes, to keep up the packing from the entrance, which is $\frac{1}{4}$ of an inch wide and 12 inches long; then I bore 2 half-inch auger-holes, 2 inches above the entrance, to give air, in case of ice. This kind of entrance will give air enough, and will keep out mice, which are very destructive to bees in cold weather. Our honey season ends with the white clover, about July 10. There is an abundance of sweet clover on all of our roadsides, for ten miles square, and has been for the last 60 years; bees gather pollen from it, but no honey. I have been a close observer of bees, and know whereof I write.

JAMES C. WILSON.

New Concord, O.

A Floating Apiary.

The problem of what to do with a floating apiary was thrust upon me last week by the unprecedented flood in the Ohio river. I can recommend the so-called "long idea" hive as the best in the world for floating. I had about a dozen of them afloat last year, and the bees kept above water, and were uninjured. This year I saved my apiary by floating about 50 colonies on rafts, and confining about the same number in a boom, where they floated four days. A great many bees have been lost in the Ohio Valley, by the flood. I have picked up a number of box hives and a few movable comb hives, but the bees were all dead in them. The water was 5 feet deep in the lower rooms of my dwelling last week. My buildings and fences are all wrecked; my workshop badly damaged, and the machinery was under water for several days. Words cannot picture the distress among the poorer classes, caused by this flood. The water was over 5 feet higher than ever before known to be.

W. C. PELHAM.

Maysville, Ky., Feb. 21, 1884.

Bees Doing Well.

I have 96 colonies of bees in the cellar under my dwelling house. Several of them are only 3 to 4 frame nuclei. The nuclei seems to be wintering as well as the stronger colonies. Some colonies have stores of honey only; some have sugar only, but most of them have both, and the pollen is generally left in. Some have brood. They have been in the cellar 101 days without a flight, and no signs of diarrhoea. The cellar temperature is from 40° to 52°; generally from 46° to 50°. I do not like it lower than 46°. The hives have bottoms, but no tops except single pieces of burlap, and some of these have holes through them. The hives are the 8-frame Langstroth. They are so piled that there are about 3 inches between the tops in one row and the bottoms in the row above. Occasionally we sweep the cellar, and, so far, have taken up about a bushel of dead bees. Our hives are dry; no mold in the cellar, except among the dead bees on the cemented floor. The cellar has an underground ventilator of 6-inch tile, and a 6-inch stove-pipe reaching to within 20 inches of the cellar floor, and connecting with the stove-pipe in the room above.

IRA ORVIS—96.

Whitby, Ont., Feb. 21, 1884.

Bee Diarrhoea.

There seems to be a sincere wish to find out if we can the cause of dysentery among bees, especially is this the case as relates to wintering; some endorse the pollen theory, but from my limited experience I am inclined to think that dysentery may be produced by either of the following causes: Sour honey, breeding and eating pollen in confinement, gorging themselves with honey without chance for a flight, and want of proper ventilation; and in this connection I wish to quote a few lines from Langstroth on the

honey bee, page 127: "I examined, last summer, the bees of a new swarm which had been suffocated for want of air, and found their bodies distended with a yellow and noisome substance just as though they had perished from dysentery. A few were still alive, and instead of honey, their bodies were filled with the same disgusting fluid, although the bees had not been shut up more than two hours." Now, how can this be explained on the pollen theory? Is it not best to be careful about endorsing any set theory until we are in possession of a larger amount of facts than we now possess? In the mean time let every bee-keeper be on the lookout to discover the true cause of this fearful disease.

J. M. GOODRICH.

South Frankfort, Mich., Feb. 20, 1884.

Are Bees Taxable in Michigan?

PROF. COOK:—As you are a brother apiarist and scholar, I address you for the purpose of gaining information. If you will tell us, through the BEE JOURNAL, whether bees are taxable in Michigan, and if so, is the whole colony taxable or only queen and hive, and are any number of colonies exempt, you will not only oblige me, but I think many others. I have kept bees about five years, and have never known any to be taxed, in this place, until last year my 42 colonies in Doolittle hives were assessed \$200. I am a farmer and an apiarist on a small scale.

A. P. COWAN.

Grattan, Mich.

In reply to Mr. Cowan, I would state that all property not exempted by special act, is liable to taxation. Bees are property, and hence taxable. Few have bees, and many who do, keep so few bees, that they have escaped notice, and so find no place on the assessor's blanks. Therefore, usage has omitted bees. The bee-keeper, however, desires the protection of the law and all the privileges of citizenship; and so there is no reason in justice why his special property should not bear the burdens of taxation. The omission in the past has resulted from an oversight. All personal property not exempted is taxable, and as bees are not specially mentioned, they would be, like all other property, taxed according to the valuation placed on them by the assessor.

A. J. COOK.

Double-Walled Hives.

In the issue of Dec. 19, 1883, of the BEE JOURNAL, Mr. F. M. Cheeney, in speaking of "double-walled hives" for summer use, says: "They are too much like a person putting on an overcoat in July to keep out the heat. The dead-air space between the outer and inner box will be of a higher temperature than the surrounding air, etc." Now, either Mr. Cheeney is mistaken in this matter, or else all the ideas of scientific men in regard to heat and ventilation are entirely wrong. Dead-air is an almost perfect non-conductor of heat and cold. Were it not so, a double-walled house or hive would be colder in winter than a single. If a double-walled hive is a

protection from cold (and there is no doubt on this point), it must also be a protection from heat, and the only objection that has been made to their use that I have seen (save this of Mr. Cheeney) is that they will not warm up as readily in the spring, as a single-walled hive. The object of a double-wall, is to secure evenness of temperature, and thus preserve quietness inside the hive. I do not write this for the purpose of starting a discussion, but to set Mr. C. right on a point which he evidently misapprehends.

J. E. POND, JR.

Foxboro, Mass., Feb. 22, 1883.

Educate the Customers.

"Why sell extracted for less than comb honey?" This is the inquiry I am confronted with almost daily, and one who put this same question, yesterday, said he always thought that there was some adulteration to cheapen it. Said he: "It looks to me as though pure honey out of the comb is worth more than that in the comb; it must be worth something to take it out of the comb." When I explained it to him as best I could, he said: "Oh, I see now," and I sold him 23 pounds of extracted honey; but he said: "Nine-tenths of the people think the same as I did." Why not get up a circular to scatter among the people, that will make this point clear to them? Let us have something short, but to the point. Then I, for one, would invest and spread them in my neighborhood, and see what would be the result. Even if we use pails, cans, jars, etc., and leave this prejudice in the minds of people, extracted honey will drag along and find slow sale.

S. SMITH.

Neoga, Ill., Feb. 27, 1884.

[We will, as suggested, get up some leaflets on this point, and supply them at 50 cents per 100, with the honey-producers' name and address free, when 200 or more are ordered at one time, and send them to any address by mail postpaid—all provided that enough will be wanted to pay expenses. Who will take them?—Ed.]

Ants' Wings.

J. D. Enas, on page 118, speaking of the queen ant's wings being clipped, asks, "Am I right?" He is right; she does it herself. I have seen her perform the operation more than once. After, I suppose a successful flight to meet the drone ant, I have seen the queen ant alight, crawl a few inches, stop, turn her head around, and with her mandibles, like a pair of scissors, clip one wing and the other close to her body.

G. O. GRIST.

North Springfield, Mo.

Bee Space.

On page 133 of the BEE JOURNAL, I am made to say: Allow $\frac{5}{8}$ inch bee-space over the sections. This is "too much of a good thing." I intended to say $\frac{1}{2}$ inch, and think $\frac{1}{4}$ inch not too small.

C. H. DIBBERN.

Milan, Ill., Feb. 27, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Economizing Wax.

I have about 2,000 Gallup frames wired, but not nealed. Can I fill them with thin foundation (made on Given press) by the button hook and melted wax process, and be comparatively sure of success if the frames of foundation are first put in the brood apartment 1 or 2 at a time and allowed to be drawn out there? In view of the scarcity of wax, I wish to use the sheets as light as possible, say 12 sheets to the pound.

A. A. E. WILBUR.

Moravia, N. Y., Feb. 22, 1884.

ANSWER.—I think you make a mistake, and perhaps an unprofitable one in using thin foundation in the brood-chamber; another mistake, by using any melted wax to fasten the foundation to the top-bar; another, by inserting sheets of foundation, a few at a time; combs will not be built as perfectly in that way. For my preferred method of using foundation in the brood-chamber, I will refer you to page 348 of last year, and page 91 of this year.

Queenlessness.

1. What is best to be done with the combs and bees of a queenless colony, during February and March, in Central Ohio?

2. Is it a good plan to remove all unoccupied combs as early in the spring as possible?

I have 82 colonies now, having lost 2 by death, and one with plenty of bees, but I found its queen in front of the hive.

J. R. ROEBUCK.

Burton City, O., Feb. 19, 1884.

ANSWERS.—1. If I had such a colony with plenty of bees, I would unite some weak colony with a good queen with them, if I had such an one; if not, would try to get a queen elsewhere. If there are but few bees in the hive, I would shake them out and lay the combs away.

2. I do not remove unoccupied combs, in weak colonies, unless they are filled with honey, and the colony is too weak to defend the entrance against robber bees. Trouble from moths is practically over here. Finding a queen in front of a hive, does not prove that colony queenless.

Pure Beeswax.

Herewith I send you samples of comb foundation. Will you kindly give your opinion regarding them?

1. Are they pure wax?

2. If adulterated wax is used in the making of them, what is the adulterating constituent?

I am constrained to ask your opinion concerning this comb foundation, because it is so different in appearance to some samples I have received, and

suggests to my mind that it is adulterated in some way. Many bee-keepers who have been supplied with it, find that they cannot work easily with the thin foundation, on account of its being so brittle. If this foundation is made from pure wax, what is the reason of its appearance being so different to that of the American?

BEE-KEEPER IN NEW ZEALAND.

ANSWER.—On examination I believe the foundation to be of pure wax. I forwarded a sample to Chas. Dadant & Son, who are not only good authority on beeswax, but bees without the wax, and they consider it pure. I will give you my opinion of its faults. First, there is a great difference in the pliability of pure beeswax. This foundation was likely made from hard, brittle wax; and secondly, it has now been made so long that it has lost much of the little plasticity it had when new. Besides this, I consider it poor print, as it has too thick a base, and small, hard-pressed sidewalls or lines.

Diseased Bees.

Will Mr. Heddon tell through the BEE JOURNAL what is the cause of my bees having the front of their hives daubed over? If they have any disease, what shall I use to cure them?

A SUBSCRIBER.

ANSWER.—The cause of your bees daubing the front of your hive is, that the food of which they have been partaking, has so loaded them with fecal matter that they can no longer retain it; not even until they can rise upon the wing. We know of no cure, but we are working at a preventive for this condition of things, which is called bee dysentery.

Midwinter Report.

In the last week in January, 1883, I examined 51 colonies, all on the summer stands in A. I. Root's chaff hives. The brood frames of 50 of these were covered with one thickness of old sail-cloth, and above these were clover-chaff cushions, filling the upper story completely but loosely, admitting free circulation. Forty-nine colonies were in splendid condition, having plenty of healthy bees and good honey. A late swarm had perished, being queenless. In preparing my colonies for winter, I had unaccountably overlooked one, and this colony had no covering whatever above the brood frames. It was one of my strongest colonies, both in numbers and stores, when the section frames were removed late in the fall, now there was only a handful of bees which showed any life, and they were partly covered by their dead companions, and there was present dysentery in its most malignant form. Had this colony been prepared for winter like the others of my apiary. I can but conclude that they, to-day, would be numbered among my best, and like them would be free from that dreaded malady, dysentery. All the colonies I have lost during the past 6 years by this disease, have perished under the same conditions which

proved so fatal to this fine colony. I am convinced that there are various causes which induce dysentery, and the one most to be feared is a long period of intensely cold weather with insufficient protection. Please answer the following question: Do bees need upward ventilation to secure best results when run for section honey? Between last frame and side of Root's chaff hive there is a space of $\frac{3}{4}$ inch the whole width of the hive; ought this to be closed when bees are working in the sections?

M. I. TODD.

Wakeman, O., Feb. 11, 1884.

ANSWERS.—1. To those who have never seen dysentery among bees with conditions just opposite to those surrounding the one colony you mention, and found just such neglected colonies with seemingly enough upward-ventilation to freeze them to death, the only ones in the apiary that was free from the disease, your experience would cause them to believe that the open chamber above caused their death. There are many, however, that must know that that was not the cause; but I am forced to believe that in your apiary, this winter, it was the aggravation to the cause of dysentery. I see no other rational way to look at it.

2. I have never been able to discover any advantage in giving upward ventilation during the honey flow. I find it advantageous to have but one thickness of material between the inside and outside of the supers, and that well shaded. An outside cap over all, I find not only expensive to make and manipulate, but a positive damage.

3. The space you speak of will do no harm, provided the bees do not build comb in it, and that will depend upon your system of management and location.

Position of Frames in the Hive.

Will Mr. James Heddon please answer this question through the BEE JOURNAL: What benefit is there in having the frame to drop below the level of the hive?

FREDERIC ALLEMAND.

Eden, Ont., Feb. 20, 1884.

ANSWER.—I suppose a host of old practical bee-keepers are smiling at this question, and wondering where I can begin and leave off, in answering it. It is something like, why is health preferable to sickness? This I consider the most valuable claim of the now expired Langstroth patent. Mr. L. discovered that bees would glue all pieces of wood together that were not far enough apart for them to pass between them readily. He found that in a space a little less than $\frac{3}{8}$ inch, bees would build but little comb, and it being sufficiently large for their passage, they would not glue it up. Now, in putting a flat cover on to a hive, if the frames did not drop below the top of the hive, the liability to crush bees in placing it, would be greatly increased. After it had remained in place sometime it would be a very difficult job to remove it. Some of the frames would stick

to it and come up with the cover, grinding the bees between the combs, giving them a Cypriatic disposition. When the cover was replaced, the bits of glue mismatching their former position, the cover would be slightly raised above its former position, then a lot more glue is added, and so on until there is a pound or less of this interesting commodity about the top of the hive. This bee space can be secured by a sink in the cover, made by nailing $\frac{3}{8}$ strips around its outer edge. If the frames come flush with the top of the hive, the surplus receptacles would need to be arranged in the same manner. It is preferable to have the sink in the hive, that is, have the frames drop 5-16 below. Much the same trouble with glue is experienced in the use of cloths for summer use. We much object to their use at any time when the bees are gathering.

After-Swarms.

On page 422, last year's JOURNAL, Mr. Heddou says, "No, sir, I do not extract to give the queen room, nor cut queen-cells. I have learned better, than that. With proper fixtures and management, there is no necessity for so doing." How does he prevent after-swarming, and what does he do with such, if there is any?

LEVI FATZINGER.

Janesville, Wis., Feb. 18, 1884.

ANSWER.—All I do to prevent after-swarming is to keep the hives well shaded, giving them plenty of room, the same as we do to discourage prime swarms. We have found that as long as we can keep the desire for increase out of the minds of the bees, we get our pay in surplus honey; but when we undertake to physically compel them to remain together, we are losers by so doing, except by the plan given on page 126 of the BEE JOURNAL for 1883. While this method does not prevent after-swarms, it prevents increase of colonies for the season.

Bees Robbing.

"Henry my bees are robbing yours." Early in the morning Henry finds his hive rich in honey, but not a bee in the hive. This was the condition of bees last fall, more so than common, not only colonies that gave swarms and then built up again, but first and after swarms also. Can you give the cause of the above unexpected deficiency in bees? One man said, as the fall was unusually poor for bees, they killed their queen. Is that right? Bees worked lively on catnip this fall, when it was so dry. I think bees would be in much worse condition for winter than they are, had it not been for catnip. A year ago bees went into winter quarters very strong in bees, and formed too much dampness; the strongest ones suffering most; but this fall it is the other way, very short in bees, some but $\frac{1}{2}$ gallon of bees, or even less. If they come out all right in the spring, then we will cheer the Minnesota-man that dumps one-half of the bees out, when he

carries them into winter quarters. I had $1\frac{1}{2}$ tons of comb honey this fall; increased too much for the poor fall that followed. I have 46 with slough-grass for wind break on the north, 17 packed in sawdust, 8 packed in chaff all around and above, without caps, and the entrance open, with a 2-inch hole in the bottom-board covered with wire, and straw under all, as last year, which did as well as any in summer. A dozen standing out, and 40, mostly the weak ones, in the bee house; the last named ones are very still at 42°, but easily disturbed. Also 6, box hive department, on a board south of the bee house, with holes in the bottom-board.

Limerick, Ill.

ANSWER.—We could give causes for the condition of things mentioned above, but as there are perhaps several, we fear we may not hit the mark at such a long range. We do not think bees kill their queen on the account of a "poor fall for bees." We think Mr. Pickup knows this.

Will Cold Kill Bees?

I have often seen it stated that cold alone will not kill bees. My experience, this winter, leads me to think differently. I left 6 colonies of bees out doors in double-walled chaff or sawdust hives, in order to test them as winter hives. The 6 colonies were as nearly equal as possible. One windy night in January the covers were blown off of two of the hives. Upon examination, a few days ago, the bees were dead, while the bees in the other 4 were all right. The dead colonies had plenty of stores, and were perfectly dry. Now, if the exposure to cold on that windy night did not kill those two colonies, what did?

E. C. CAMPBELL.

Cayuga, Ont., Feb. 19, 1884.

ANSWER.—The statement that cold will not kill bees, of course means when they are enclosed in a hive, and properly clustered so that the inner and outer members of the cluster frequently change places with each other. Of course when the exposure becomes too great, a low temperature causes instant death. As we see when they drop upon the snow, or lay out upon a board during a frosty night. Our great enemy in wintering is dysentery; that's all we care about. I presume the 2 colonies, above referred to, did not have that. Practically, it makes but little difference whether such exposure as you mention kill your bees or not, none of us expect to lose a great many from such casualties.

We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate.

H. C. WHITE.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., March 3, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 76@10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 15@21c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; $1\frac{1}{2}$ @2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarce, at 28@33c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—Same scarcity of choice white 2 lb. sections as reported last week, and a few thousand pounds would be readily taken at 17 to 18c. One pound sections in fair supply, and brings more at present than 2 lbs. Dark comb very slow sale. Stocks are low on dark extracted, and in fair supply for white. Prices range 8@10c.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Market is quiet, and common qualities difficult to place at anything like satisfactory figures. Fancy qualities are scarce. White to extra white comb, 15@18c.; dark to good, 9@11c.; extracted, choice to extra white, 6@7½c.; dark and candied, 5@—

BEESWAX—Wholesale, 27½@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb 12@16c, and strained and extracted 6@8c per lb. Top rates for fancy small packages.

BEESWAX—Firm at 33@33½c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts., the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Special Notices.

Examine the Date following your name, on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

We have received the annual Catalogue of vegetable, flower and grain seeds grown by James H. Gregory, Marblehead, Mass., which has been annually advertised in the BEE JOURNAL for the past 10 years. It is an elegantly-illustrated quarto of 60 pages, and will be sent free to all applicants.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price still lower, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Attention is called to the Engraving of the Bee-Hive Factory at Newcomerstown, O., which may be found on another page of this issue of the JOURNAL.

Bees! Queens! Nuclei!

INSTRUCTION IN BEE-KEEPING.

BEEs.—I offer For Sale 100 colonies of Italian Bees, in good, new, well-painted Hives, Gallup Frames, 12 frames to a hive; every comb straight and good; most of the combs built on foundation. One colony, \$9.00; 10 or more colonies, \$8.00 each.

QUEENS.—I breed Queens by the best methods, and from the best stock. Queens ready after May 20th. Untested, \$1.00; tested, \$2.00; selected tested, \$3.00.

NUCLEI, with untested Queen, \$3.50; with tested Queen, \$4.50; with selected tested Queen, \$5.50.

INSTRUCTION.—July 7, 1884, I shall begin instructing a class in bee-keeping—class for men and women. Full course in Theory and Practice. For Circulars of Information as to this class, and Price List of Hives, Frames, Sections, Implements, Books, etc., address, **O. CLUTE**

HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I have now made arrangements so that I can again supply you with those nice white Dovetailed Sections, 4 1/4 x 4 1/4 x 7 to the foot, and 8 to the foot, \$7.00 per 1,000 from here. Will be ready to ship on and after March 15th.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis.

Dear Madame:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.

Yours,

Hamilton, Ill., Dec. 10, 1883.

CHAS. DADANT & SON.

MRS. FRANCES DUNHAM, De Pere, Wis.

Dear Madame:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.

Yours very truly,

Reeton, Ont., Dec. 10, 1883.

D. A. JONES.

MRS. FRANCES DUNHAM:

All prefer the foundation I manufacture on one of your mills, to that made on any other machine. I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.

Yours respectfully,

Genoa, Cayuga Co., N. Y., Dec. 12, 1883.

J. G. WHITTEN.

MRS. FRANCES DUNHAM:

After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.

Kenton, Ohio, Dec. 29, 1883.

Yours, SMITH & SMITH.

MRS. FRANCES DUNHAM:

I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretchmer, of Coburg, Iowa, and L. C. Root & Bro., of Moberk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is me always a jewel. You are at liberty to publish this.

Omaha, Neb., Jan. 18, 1884.

Yours truly, T. L. VONDORN.

Send for description and Price List to

FRANCES DUNHAM, De Pere, Wis.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one new subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quiny smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of smoke and chips and stuff, and make lots of blocks and comfort, and as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Abbott. Edited with notes, by Charles N. Abbott. *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2."

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 100 plates, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c. per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quincy's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cura. By Albert H. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY.—The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Biene Kultur, oder erfolgreiche Behandlung der Biene, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Derlichkeit des Bienentandes—Honig pflanzen—Erziehung der Königin—Züchten—Schwärmen—Ableger—Versehen—Italienisieren—Züchter von Königinnen—Ausziehen—Biene behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für den Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Biene und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angeben wie man Honigkuchen, Formkucheln, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Confulenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, Dr. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdefrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN, 925 West Madison St. CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., MARCH 12, 1884.

No. 11.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Wintering Bees in England.

While in North America we have had one of the coldest winters on record—with the mercury dancing around the thirties below zero, in the neighborhood of Chicago, it is refreshing to have English papers record the fact that they have there had a *mild* winter for the bees. The *London Journal of Horticulture* for Feb. 14 has just come to hand, and in it we find the following on the present winter for bees in England, and the loss of bees by destructive birds in the spring:

This current winter has been, perhaps, the most open for many years. Bees have consequently been more or less on the move in all parts of the country; not so much so in our own apiary as with those whose hives stand in warm sunny places. Where bees have been unusually active the mortality must have been very great in winter. Bee-keepers, as a rule, are not careful enough to shade the entrances to hives, and do all they can to keep the bees in. A flight now and then during the winter is most conducive to health, and in most winters opportunities for this occur after some three or four weeks of captivity. But this season has given by far too many of such opportunities, and the consequence is that during sunny weather bees have taken longer flights than usual, and many have been out never to return. During the winter months birds are much more ready to snap up the wanderers; less food of other sort is available. Tomtits are especially voracious at this time of the year, and we have watched them keeping a good look-out before hives for their prey. Sparrows do not seem to seek for bees as food until nesting time, when a pair of sparrows will, according to a calculation we once made, after carefully watched how often the old birds returned for a bee, take a good-sized swarm during the time they are feeding up a nest of young ones. The sparrow, like the

tomtit, carefully but very dexterously first extracts the sting before giving the insect to its young or eating it itself. Thus the mild season which furnishes food for the birds thus the hive. Much food is also consumed where bees get out often when they should be clustering at rest.

Bees Suffering by Fire and Flood.

The Los Angeles, Cal., *Herald* remarks as follows on the recent disasters to bees and bee-keepers in that locality:

During the recent rains, the bee ranches in the canyons have suffered severely. Bee hives and honey houses have been swept away down into the valley and rendered nearly worthless. From the Coldwater Canyon, where Mr. Levering reported a waterspout, we learn that the water carried down all the appliances of bee ranches and strewed them over the plains below. The torrent was so great that it swept the soil, sand, boulders, houses and corrals out of the canyons with such force as to tear down board fences miles away where no stream was ever known to run before, and may not run again for a century. The loss of property is very large among the bee ranchers, and although the rain will make an abundance of flowers for the use of the bees, the rain has made havoc among the bees for this year. Hereafter more care must be exercised in our mountain canyons in protecting bees from fire and flood. Some of the large apiculturists were burned out last fall in the mountain fires, and now others are washed out. More caution is needed hereafter in looking after this great industry.

☞ The *Grand Ledge Independent* gives the following as a sure cure for croup: "One teaspoonful of blood-root pulverized and steeped in two ounces of sharp cider vinegar; strain and add three ounces of extracted honey. Dose, one-half teaspoonful as often as the case may seem to require; not to be used as a preventive.

☞ The Report of the Convention at Davenport, Iowa, is exceedingly long, and we shall be obliged to abbreviate it, but cannot give it until the next issue.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

Purdy's Catalogue of small fruit, Palmyra, N. Y.—34 pages.

Isaac F. Tillinghast, La Plume, Pa.—34 pages—Seed Catalogue.

N. E. Doane, Pipestone, Mich.—2 pages—hives, cases and frames.

H. C. White, Madison, Ind.—6 pages—Palace bee hive and apiarian supplies.

McKallip, Margrave & Co., Hiawatha, Kans.—4 pages—apiarian supplies.

☞ The "Northeastern Bee-Keepers' Association," of New York, have sent a petition to the Legislature of that State, signed by over 160 bee-keepers, asking for the enactment of a law to protect them against the ravages of foul brood among bees. The law provides for the total destruction of bees, hives, etc., where it exists, under a penalty of \$50 for the first offense, and \$100 for each additional offense.

☞ A very large and beautifully executed picture of Bartholdi's great statue of "Liberty Enlightening the World," has been presented to us by the Travelers' Ins. Co., of Hartford, Conn., who have been among the most liberal contributors to the Fund. The picture, which is 26x36 inches in size, gives an excellent idea of the superb work of art which is to adorn the harbor of New York.

☞ Several more letters have been received during the past week, containing money without giving the writers' names. It is too bad to file them away in a "pigeon hole" to await another letter, perhaps calling us hard names—a "swindler" most likely—for not filling the orders. However, we cannot help it; the only remedy is to keep on advising every one to be careful to give their names and addresses on every letter they write.

CORRESPONDENCE

For the American Bee Journal.

Review of the Bee Journal of Feb. 20.

JAMES HEDDON.

The BEE JOURNAL for Feb. 20 contains more than a usual amount of what seems to me most valuable matter. In these days, when there is so much worthless apicultural literature afloat, is not such a number truly refreshing? I feel as though I could not file away this number into the Emerson binder without commenting upon some valuable articles.

Bro. Rutherford's showing that the mother bee is in no proper sense a queen, but that the worker bees govern as one mind, is to the point, and will, no doubt, shed light to the minds of many beginners.

Bro. Hutchinson's article on separators is very close to our own experience, as many well know.

Bro. Secor's article on "Marketing Honey," suits me first rate, and I think the point made about selling cheaply about home, to keep your field clear of other bee-keepers, is well taken. I have done just this for years. We must expect, however, that as long as our agricultural papers are so liberally contributed to by so many writers who tell the farmer that "bees work for nothing and board themselves," that it costs merely nothing to raise two or three hundred pounds of honey annually, that there will be some dupes with whom to whet an appetite for honey, is to start into the bee business. I try to counteract this sentiment as far as possible by such essays as the one I wrote for our Southern Michigan Farmers' Institute, and which I have presented to many brother bee-keepers for the same use.

Bro. Enas tells us how far his bees go for nectar. This article alone is worth more to me than the yearly price of the JOURNAL. How many miss it by dividing their colonies up into different apiaries, only four miles apart! May it not prove ten miles more like the right distance? We want to have Bro. E., and as many others as can, tell us what difference there is in the accumulation of stores between the long and short flights, under what conditions bees will fly long distances for nectar, and all about these important topics to the practical producers.

Next our old friend, W. J. Davis, and Bro. Poppleton discussed the question—"Is prolificness desirable in queens?" How dare you take such a stand? Eight or ten years ago, at one of our Kalamazoo conventions, I was ridiculed for taking the same position. We want no more prolificness in the queen than her combs will accommodate. We do want as much. My claim has always been that the cheapest and best way to get is to use smaller hives. It seems to me strange that some bee-keepers do not see that

the capital which produces our bees is one dollar's worth of hive, two dollars' worth of comb, five dollars' worth of honey out of "our field," and two cents' worth of queen (queens cost merely nothing when not rearing and holding them for shipment,—the colonies producing them only as they require them).

Looked at in this light, of what value is extra prolificness? Should it be found that such superior prolificness in numbers should go hand in hand with inferior qualities of each individual bee (which is one of the rules of nature), thus it would follow that it would be a serious damage. It costs just as much, after once started, to bring into being inferior as superior stock. I have entertained these views, and have put them before the public from time to time for more than 12 years.

Now let us see if Bro. Ackerman is going astray on the hive question. I do not like the Simplicity hive for I do not consider it "readily movable" as Bro. A. does (See proposition No. 1, page 118). Of course the above is a comparative term. The large chaff hive is "readily movable" as viewed by the building mover, but for the ladies or men of light-muscle, or in fact any man who wishes to do quick and sharp work, the Simplicity can hardly be called "readily movable." We think our hive is—now let us compare. The Simplicity has $\frac{7}{8}$ inch sides; ours has $\frac{3}{4}$. It has $\frac{3}{8}$ top and bottom, heavily cleated; ours has $\frac{5}{8}$ inch, lightly cleated, the bottom only using one front cleat, it being nailed permanently to the hive. I do not consider any hive "readily movable" with a detached bottom-board, which forces one to take hold under it when lifting the hive. Bro. A. does not seem to understand our objections to the "telescoping principle." When the stories are so arranged that you can place them less than bee-space from each other (up and down), and enough sidewise so that the right side and back end of the upper story is just off from the right side and back end of the lower one, then you can move it side and endwise about an inch when it comes to place without the possibility of crushing any bees except where the edges of the four boards crossed each other. This method of adjusting stories, so far as I know, never has been, and I think never will be excelled.

The telescoping principle prevents this movement. It seems strange that any person of experience should fear the "inclemency of the weather" through a joint made by placing one straight edge on top of another, with bees inside to hermetically seal it at once. We have never experienced the least injury by it. Mr. Langstroth had reference to the space above, below, and at the ends of the brood-frames. We have discovered from actual experience that bees suffer very much more by heat during the honey flow when their surplus receptacles has another case outside of it.

I used, last season, just such wide frame supers as Bro. A. mentions in article 4, viz: one-story on the tiering-

up plan. Of course the super had no outer covering over it. We do not like it as well as our case, which uses no wide frames nor separators. He says with our 8-frame brood-chamber, that it is not possible for us to insert wide frames in said chamber. We think that with 8 or 10 frame brood-chambers that it cannot be "possible" that we shall ever use wide frames, or undertake to raise comb honey in the brood-chamber. With our system and arrangement there is no need of it, and we are glad of it, because there are serious objections to such a procedure.

Must we use wide frames and division-boards and surplus honey in the brood-chamber in order to best get along with a 10 Langstroth frame hive? If my hives were 14 inches wide, I should put in division-boards that would never come out, and when I made new ones, I should nail the ends to the division-boards, saw off the extra length of the end pieces, and have an 8-frame hive and done with it. It was not without experiencing the draw-backs connected with the 10-frame hive that I changed to the one of 8 frames.

Dowagiac, Mich.

For the American Bee Journal.

Marketing Extracted Honey.

W. H. S. GROUT.

I disagree with Mr. Buchanan in regard to extracted honey. I have had 13 year's experience in the article, and have produced no comb honey since the days of large boxes, and feel no inclination to do so.

The chief obstacle in selling extracted honey, arises from taking it from the hive before it is sufficiently cured. When I first began taking honey in this manner, it was extracted once in 3 days, and have gradually lengthened the time until now. I let it remain until the bees are through gathering from basswood. The quality and body has vastly improved, as also has the home market, until I no longer need to place it on sale in towns near me, and, after selling 2,700 lbs. before it had time to candy much last year, people came nearly every day for a month or two for more; I could easily have sold 5,000 lbs. more if I had had it, and the retail stores are anxious to have it on hand now. The sales have vastly improved, and it is taking its place with comb honey, and costs the consumer less.

I use 40-inch hives, and am to no expense for fixtures, sections, foundation, etc., having extra comb sufficient for all my hives, if well spread. Allow me to say to Mr. Youngman, that much wax can be saved in this manner. I use 18 combs to the hive, and, when the honey is extracted, the hives average 75 lbs. of honey each, and the cappings fill a common milk pan, yielding about 1 lb. of nice wax each. The proportion of honey strained from cappings last year was 800 lbs., out of a total product of 3,000 lbs.

It seems to me that the labor is much less in running an apiary in this

manner than in working for comb. Where a home market is well established, the worry and vexation is saved, besides loss in putting up and sending to some city. Each season is looked forward to with much eagerness by the apiarist, as well as his customers, being a mutual benefit to both.

There is something said about extracting often and ripening afterward by artificial means; but can the honey be as perfectly ripened in this way? I would be pleased to see an article from L. C. Root on this subject.

Kennedy, N. Y.

For the American Bee Journal

Erroneous Conclusions.

DR. G. L. TINKER.

Mr. Heddon has given us many thoughts on *a priori*, or from cause to effect reasoning. Being an expounder of principles, the inference would be that the master himself ought to be well-nigh infallible in his inductions, deductions, and final conclusion. But is he? Let us see. He says on page 653 of the BEE JOURNAL, "The reader will clearly see that *my theory can easily be tested* by simply preparing numerous colonies in such manner that they can partake only of that most oxygenized food, sugar syrup, removing all other foods." The italics are mine. In other words, Mr. Heddon concludes in a very positive manner that if bees can be safely wintered on sugar syrup alone, that the pollen theory is demonstrated?

The writer believes the above conclusion to be incorrectly drawn, and altogether erroneous. But Mr. II. stakes his all upon the cane sugar test, and adds, "Nothing can defeat us from getting what will be to us a perfectly satisfactory proof."

If the demonstration of the pollen theory is to turn so easily upon this test, why did not Mr. Heddon elaborate the idea and endeavor to establish it in the mind of the readers in the course of our late discussion, that the sugar test would be crucial and final? On page 440 of the BEE JOURNAL was given substantial proof that such conclusion would be erroneous, and Mr. II. never so much as alluded to the matter, and the inference was that the stand taken upon this point was admitted. In the quotation above made, he uses the phrase, "that most oxygenized food," meaning, as I take it, that cane sugar possesses a larger percentage of the hydro-carbons, or heat producing elements than honey. If this is his meaning, he can see that a colony on cane sugar stores is able to maintain a higher relative degree of temperature in the hive than upon the natural stores, and hence, that the conditions upon which health depends are greatly changed.

I have several times endeavored to show that, practically, heat is life to a colony of bees in winter, no matter whether their stores be honey and pollen or sugar syrup. I have assumed that it is the great antidote to bee diarrhoea, and there has been none

to dispute; that a proper degree of heat of the cluster and interior of the hive was potent to expel all dampness and keep the hive and combs dry; that under most favorable conditions in winter confinement, bees may and do eat pollen with impunity, and that they void their feces in the hive, as occasion may require, in the form of the so-called "dry powder." This I have proved to my full satisfaction last winter by numerous tests and observations.

When bees are subject to very unfavorable conditions in winter, the temperature of the cluster and interior of the hive falls below the point of health. The beginning of their ills is here. The hive and combs become damp; the temperature continues to fall; the bees become disturbed, not so much with the indigestible particles of the pollen consumed as by a yellowish watery fluid; and diarrhoea is the result quite independently of the effects of the pollen or honey.

When the excrement of the bees, owing to the unfavorable conditions, cannot be voided in the hive, except in a thin, mushy or fluid state, they have an instinct to retain it, but not otherwise. The idea prevails, that naturally bees retain their excrement in confinement, but I claim that they do not until they get into an unhealthy condition, and of this fact there is ample evidence.

But if heat is the agent upon which so much depends to avert unhealthy conditions, and sugar or syrup furnishes the most heat of any known food that bees consume, how are we to conclude that the sugar test in the absence of pollen is going to demonstrate the pollen theory? Let Mr. Heddon answer, if he can.

There is only one test that would be fair and free from error, and it is here given for Mr. Heddon's benefit. If he shall be able to produce bee diarrhoea by following these directions, I will admit that pollen may be a cause of the disorder. If, however, it cannot be so produced, then Mr. Heddon may get into that "ship" with all his honorable company and scuttle her.

The test is as follows: About the middle of September take from a single-walled standard Langstroth hive containing a full colony upon combs recently built, four brood combs having much pollen. Extract the honey and place them in the super of another colony until all the honey is licked up and the pollen alone remains. After the brood has all emerged from the remaining combs of the colony, take them out and return the four prepared ones. Space them in the centre of the hive $\frac{1}{2}$ inch apart, and place thin division-boards at the sides. Do this at a date when nectar ceases to come in in appreciable quantity. Then feed rapidly a moderately thick syrup of granulated sugar until the combs are filled. Lay a few short sticks across the frames and put a case 8 inches deep, the same size as the cover on the hive, and make both tight fitting. On the first frosty morning, put a clean wooden cloth over the frames, and fill into the hive sifted timothy chaff until the case is

full. Protect the hive on the bottom by setting it up from the ground on a stand as described on page 500 of the BEE JOURNAL, and subsequently ventilate and manage the colony as there directed.

Of course it would be impossible to say how far North such a test might be made in out-door wintering without unfavorable conditions arising, but the test should be fair as far North as Grand Rapids, or the 43 parallel.

I have 3 colonies prepared as above except the combs contained a little sealed honey besides much pollen. From their comparative activity it is plain to be seen that their diet is strongly stimulating or heat-producing. No dead bees are to be seen about these hives as yet, while all the others have lost more or less.

But I must not close this article without saying that Mr. Heddon's earnest and honest efforts to solve the mysteries involved in the causation of bee diarrhoea are appreciated by myself, and I believe by all other beekeepers. Surely, he can have "nothing to regret or to cause remorse;" far from it. But I have to regret that he should have undertaken such extensive and costly experiments in a manner to prove nothing for or against the celebrated theory.

For the American Bee Journal

Cause and Prevention of Dysentery.

WM. H. BALCH.

I am well aware that this is a delicate subject to handle. I do not write to start a controversy, nor to wound any one's feelings, but simply to give facts that came under my observation from actual experiments, with some truths that have been brought to light by others that have been experimenting and studying the cause of the great mortality of bees during the winter and spring.

I have often said that it is no trouble to winter bees until about March 1, or even to April, and then before June to lose $\frac{1}{4}$ or more.

The cause of dysentery in bees has been discussed until it would seem that there was not a feature left that had not been examined on all sides, in the light of science, theory, practice and experiment. To enumerate all my experiments is unnecessary. From all that I can gather, the cause is indigestion; but indigestion is not the primary cause; there are many causes behind this, that lead to indigestion of the food. The one great cause behind this is prostration, partially or wholly of the digestive organs or nervous system. What brings on this prostration in summer?

Close up a hive of bees that are in a normal condition for 3 or 4 days, and leave them exposed to the sun and light, although they may have ventilation sufficient, yet the excitement so prostrates their nervous system that many are found dead the first day, while on the 3d or 4th day, dysentery is sure to be developed. One asks: "How is it that my bees

wintered well out-of-doors, packed in straw, chaff, or whatever it may be, and yet dwindled and died with bodies distended?" The bees were exposed to changes of weather; had to move their stores at times into the brood-nest. But, you may say, "They did not rear brood until spring." But the handling of cold honey has the effect to wear out the nervous system; the load of food to keep up the required warmth while thus engaged, and the extra labor of preparing food for the larvæ, and before it matures, the parental bee has succumbed to the plague. We often find brood in all stages, or, perhaps, three or more combs, and the hive depopulated.

But some say, it was old bees; yes, but how was it with A. C. Balch's bees, of Kalamazoo, Mich.? They were put into an underground repository 10 days after it was finished, it being laid up with stone mortar; 10x16 feet, and 60 or 70 hives of bees in it, the entrances to the hives contracted to $\frac{3}{8}$ x4 inches; the cellar with only upward ventilation, and small at that; the ceiling over-head dripping with water, given off from the newly-made walls! These bees were placed there in November, and taken out in April, in good condition, while his neighbor's bees were in very bad condition! His hives had no upward ventilation, and but little below; his cellar was small with no lower ventilation; there was no draft; the walls, being new, not only gave off moisture, but heat; the humidity of the atmosphere of this bee repository "acting like the clouds of a cold December night," although the thermometer may indicate freezing, or even colder, without their presence, yet let them cover the horizon and how soon the mercury rises, although they are three miles above our heads? This enabled the bees to spread over their winter stores, to keep them warm and dry during their winter confinement. Being warm they consumed less honey, and were quieter; neither their digestive organs nor their nervous system having been over-taxed, what could we expect but health? See BEE JOURNAL for 1884, page 6.

Hear what one of our best bee men says on page 11: "From June 3 to June 28, 156 swarms issued from 150 colonies, all that was in the yard. Will any one say that they were not well wintered? And yet hundreds of bee-keepers will raise their hands in horror when told that this lot of bees were wintered in a temperature from 65° to 90° of heat." Further on he says: "I do not agree with Mr. Heddon in regard to pollen and dysentery. Keep the bees warm, and they can eat all the pollen they care to, and unless some of them get to breeding, you will see no signs of dysentery, and then it will be on the outside of the hive, and does no harm."

I will give but one of the many instances that have come under my own notice: During the summer of 1875, 4 second swarms persisted in coming out after they were put back into the old colony from whence they came; well knowing it would be doubtful about comb honey if they were separ-

ated from the old colony, and persist in setting up for themselves, I thought I would experiment with them. So I partially filled a full set of honey-boxes with comb and placed them on the top of the empty frames of a Langstroth hive, and then hived them. The bees filled the boxes and commenced to work in them first; when the honey season closed the boxes were filled, but the hives had but little comb and but little honey, and that mostly unsealed. I took off the boxes of honey and placed the hives in a warm repository. All came through in fair condition.

These experiments with many others show me conclusively that if bees are kept in a warm condition, without excitement, so that they will not wear themselves out with over-eating or worry, it matters not so much about pollen or honey; therefore, whenever we decide to winter, be sure that they are not only warm themselves, but that their stores are warm also. This is the reason that bees, placed on solid frames of honey, with their hives reduced to the size of the colony with division-boards, and the hives well-packed by some warm material, winter better than those without protection on the summer stands.

My Management and Honey Crop.

CHARLES MITCHELL.

I commenced the honey season with 39 colonies, 3 being very weak, and, in consequence, they gave very little honey; but I think it bad policy to injure good, strong colonies by taking brood from them to build up weak ones, so I left them as they were. I applied all my labor and skill to my bees, so as to have them all producers instead of consumers of honey.

From the condition of my bees in the spring, I expected to take 4,000 lbs. of extracted honey, and find now I made a mistake, but this time on the right side of the ledger. For a few weeks I got all the physical exercise, and a little more than was conducive to sound sleep. After everything was full, I had to get barrel after barrel, and work, after night, scalding and waxing them, and putting foundation into frames. I do not recommend bee-keeping as an occupation for lazy people, or those incapacitated for hard work, when requested. I had 6,500 lbs. of honey, and an increase of 42, but I was still behind with my work. I could have taken 1,000 lbs. more, many of the hives weighing from 58 to 80 lbs. I wish to know the largest yield from one colony, left just as it came out in spring, no feeding, doubling or strengthening by brood from other colonies.

My best colony swarmed on June 12, and this threw off another in August. I hived this last swarm on old combs, and in two days it gathered 57 lbs.; no guesswork about it. The honey was weighed, and there is plenty of proof, if it is required. From the old

colony and these two swarms, I extracted 612 lbs., leaving the upper stories still to be extracted, and these would have run it up to 700 pounds. Reckoning the honey at 15 cts. per lb., and the two swarms at \$6.00 each, the net proceeds from one colony was \$103.80. That colony has always proved to be extra good for honey-gathering. If it winters well, I shall make good use of its queens next year. The income from my 39 colonies is \$1,215.00. Of course this looks well on paper, but beginners had better go slow, for it takes good muscle and keen intellect to compete in bee-keeping.

For the American Bee Journal.

Creating a Market for Honey.

H. D. EDWARDS.

The question of the most importance to the practical bee-keeper of today is, "How and where can I find ready sale for my honey at remunerative prices." This question, it seems to me, should interest bee keepers more than—"Which is the best race of bees?" "The best hive," "How to winter successfully?" and many other questions of like nature, which are all proper questions, and need discussion; but the disposition and sale of our honey after we have produced it, it seems to me, is a question that takes precedence of any of the others mentioned. For, what will it avail us if after we get the best bees, the best hive, and have learned to winter successfully, if we are unable to dispose of our honey at prices that will justify us in producing it.

What we want now is a greater consumption of honey. Where one family uses it now we want ten; and where ten families use glucose now we want only one. When we can bring about such a state of affairs we will find a ready sale for our honey. I have been observing, for sometime, the consumption of glucose by the people in the shape of syrups. They come into the stores and buy it by the jug full, and by the five and ten gallons at a time; and seem to eat it with a relish, and claim they think it not unhealthy. Sometimes we find a man that says he does not use glucose, but takes his in New Orleans molasses, forgetting, or rather not knowing that all New Orleans syrups are largely adulterated with glucose.

Some three years ago we were engaged in the grocery business, and sent by a friend, who was going South with stock, for several barrels of pure New Orleans molasses. The gentleman we sent by traveled among the sugar plantations selling stock. After being there some time he wrote us he was unable to find a pure article, either in New Orleans or in the country. He said the planters bought the glucose and hauled it out on their plantations and mixed it with their molasses; and he said the merchants told him that if a lot of pure molasses came into the city it was adulterated before it was sent out. He said the

boat he went down on had on board 600 barrels of glucose consigned to New Orleans.

Look at the quotations of honey in the different cities to day. "Honey dull and of slow sale" is what usually greets our eye. While there are some localities where the home market is good, the field is not yet fully occupied, and the producer may expect ere long to see others engaged in the business, induced, no doubt, by the ready sale of honey in their vicinity and the reports of enormous yields of honey published by some of our bee-keepers. If some of our honey producers were as ready to report their small yields as well as their exceptionally large ones, those about to engage in the business would have a better idea of the profits they could expect. The home market is undoubtedly the best, and is the one to cultivate. Every inducement should be held out for the people to use honey instead of glucose, as it is much healthier, and, therefore, conduces to their welfare, and at the same time increases the sales of honey. Comb honey should be put on the market only in attractive packages, and kept on sale the year round.

We should be very careful of our extracted honey, put nothing on the market but what is fully ripened and is first-class in every respect; put nothing on the market which you are ashamed to put your name on, for if there is anything the matter with it they will say at once it is adulterated with glucose, for which they seem to have a holy horror when mixed with honey, but in syrups they eat it without even a protest.

For the American Bee Journal.

The Last Number of the Bee Journal.

W. Z. HUTCHINSON.

About once a week I feel like writing an article with the above heading. The JOURNAL of Feb. 20 was especially good.

When I asserted that, in my opinion, the almost abnormal prolificness of the Syrians was an undesirable characteristic, especially when kept for honey-producing purposes, I believed that I was making a truthful assertion; but I expect that my views would be strongly opposed, but when I find such men as Messrs. Doolittle, Heddon, Poppleton and Davis giving testimony in support of my views, I feel that, should there be any controversy upon the subject, I shall not be left to defend single-handed what I believe to be the truth.

Another thing pleases me, and that is the frank and honest manner in which W. T. Stewart "owns up" that reversible frames are not exactly what they have been "cracked up to be." If I understand the matter, there are two desirable features claimed for reversible frames. First, by reversal the bees will fasten the combs to the bottom bars, and if any honey is stored along underneath the top-bars the bees will remove the honey to the

section boxes. Now, by using wired frames the first desirable feature is rendered "null and void;" while in regard to the second point, would it not be much more desirable to employ such a method of management that the honey would be stored in the sections in the first place? If reversible frames were a very desirable thing, I think a reversible hive would be still more desirable.

In reference to Mr. Ackerman's article on "The hive I like and use," as I have used both the Simplicity and the Langstroth hives, I cannot resist the temptation to "say something." This beveling of the upper and lower edges of the hives (to which Mr. Heddon objects, and of which Mr. Ackerman approves) looks nice on paper, but no one who has ever tried the simple square joints by the side of the "telescopic" will ever think of adopting the latter. The thin edges of these beveled joints are easily broken off; this breaking often being done in prying off the upper stories. I believe that some one has told us how to make a sort of hinged lever with which to pry off the upper story, one end of the lever being inserted in the "handle hole" in the upper story, while the lower end of the support in which the lever turns is inserted in the "handle hole" of the lower story; but who wants to carry a "wagon jack" around with him when opening hives. Hives that go together with "telescopic" joints afford much better facilities for the bees to use propolis than those with plain, square joints. Mr. Ackerman says that the telescopic joint more effectually protects the hive and bees from the inclemency of the weather. How can this be? The square joint certainly fits as closely, and there is no colony strong enough to require an upper story that does not immediately proceed to stop all cracks as soon as it is added.

Mr. Ackerman does "misunderstand" the latter part of Mr. Heddon's article, in which he (Heddon) quotes from the specifications of the Langstroth patent. If Mr. Ackerman will re-read that quotation, and read it carefully, I think he will find there nothing even remotely touching upon a "dead-air space or double covering over the surplus room." Could I be induced to use wide frames, I should use them exactly as Mr. Ackerman recommends, only one tier of sections high.

Mr. Ackerman advocates 10 frame hives, and then division-boards to make them smaller. Why not make them the right size in the first place, and thus avoid the expense of division-boards? Had hives been made small enough so that ordinary queens could keep them full of brood, reversible frames would probably never have been thought of. The only reason that he gives for using 10 frames instead of 8 is that "side storing" can be indulged in. I wonder how much more writing and talking and "pounding" must be done before bee-keepers will give up that expensive luxury, if luxury it can be called, side storing.

Mr. Buchanan's remarks in regard to the light in which, or rather the

suspicion with which many people regard extracted honey, and his suggestions as to the advisability of bee-keepers turning their attention to the production of comb honey, reminds me that, perhaps, it would be well to be a little more careful in "booming," through the agricultural press, the "feeding back" question. Let the public be once led to believe that extracted honey can be "fed back" at a profit, and comb honey will be viewed with as much suspicion as was ever extracted honey. That "scientific pleasantry" of Wiley's only needs some such corroborative testimony to be believed more universally than ever.

Rogersville, Mich.

For the American Bee Journal.

Foul Brood in the Mails.

W. H. STEWART.

On page 524 of the BEE JOURNAL for 1883, Prof. T. J. Burrill proposes to make a thorough examination of the subject of foul brood, its cause and cure, etc., asking for specimens and information as to the nature and violence of the disease, to be sent to him by mail. And on page 611 he says: "That several packages have already been received by him; and one sent in a pasteboard box, shows indications of being genuine foul brood."

I would most heartily thank Prof. B. for offering to investigate the unfortunate matter of foul brood among bees, and hope that he may be encouraged by all bee-keepers when the matter is conducted in a proper manner, but I would most earnestly protest against any specimens being sent him by mail at any time. I have read carefully what I could get on the subject of foul brood, and as yet I can get no satisfactory proof that those who have had the most experience with the disease know to a certainty in how many ways it may be conveyed from one colony to another. It is the opinion of some that it may be carried by bees that carry honey from an infected hive to their own. If this be so, then it would seem that the spores are on the honey combs, scattered all through the infected colony, and robber bees may get them on their feet or tongues and unwittingly carry them home.

While these poison germs are so small and easily carried about and left on whatever they touch, is it not reasonable to conclude that bees having them on their feet or other parts would, on visiting flowers, leave the contagion to be taken up by other bees that visit the same flowers afterward? And in this way alone, bees working on buckwheat, would soon scatter it far and wide. This shows how careful we should be to give it no possible chance to come to our apiaries.

Let us suppose that Mr. A. is putting up some foul brood for the mail bags. He, of course, handles it with his fingers, and it is reasonable to suppose that many of the germs would adhere to the fingers, and that more or less of them would be left on the outer surface of the box, and if an

envelope were put over the box by the same fingers, the effect would be the same; and, on being shipped in the mail bags, those spores would be left not only on letters and papers, but if a queen-cage was in the bag with the foul brood, the germs of foul brood would be liable to be attached to the cage, and there wait patiently for some unsuspecting bee-keeper to take the cage in his hands and introduce his new queen to a nice colony, fasten the cage on a comb, and leave the seeds of death to bud and blossom. Then, perhaps, he opens a hive or two more, handles the combs, and leaves a germ or two, and the work is done, or soon will be. If no queen-cage is in the bag with the foul brood, there are letters that may convey the germs to the fingers of the bee-keeper just as easily as would a queen-cage.

The pasteboard box that Prof. B. received, containing the diseased brood, might have been crushed, and the comb left in small fragments all over the inside of the bag and on all its contents, and if a hive is unsafe, after containing foul brood until it has been boiled or burned, how could this mail bag ever be cleansed to safely ship queens in?

Again, this pasteboard box was marked "cobalt." Whoever put up this package, felt conscious that it was improper to put such a thing in the mail, and, hence, used deception, and marked it "cobalt." I hold that every person mailing things of like nature, should be required to label the package correctly, and give his name and place of residence.

I would ask bee-keepers to give this matter serious consideration, and give their conclusions through all the bee papers. Is there a bee-keeper who would like to take a queen-cage from the mail bag that he knew contained one or more packages of foul brood, and put that cage and queen with his bees if they were in a healthy and prosperous condition? We cannot afford to be careless in regard to this matter.

Orion, Wis.

For the American Bee Journal.

Marketing Honey in the South.

M. T. HEWES.

Bees are kept in Langstroth, Van Deusen, Simplicity and Dixie hives. The Dixie is, I believe, only to be found in Louisiana. It is like the Langstroth hive, but is made of various sizes, so that one often sees hives holding from 8 to 14 frames and all called Dixie. The frames are of the Langstroth size, but the top and bottom bars are made an inch thick, which is an advantage as they never bend, no matter how heavy a load of honey they are called upon to sustain. They hang upon wooden rabbets, and are suspended by four-penny nails, one in either end of the top-bar, instead of having the top-bar lap over as in the Langstroth frames. This is a great disadvantage as the nails are continually coming out. We pile on stories 3 or 4 high; I have frequently seen 48 frames

in one hive; 36 of these will be filled every week during the extracting season, the other 12 are left in the brood-chamber.

We extract our honey as fast as possible through the entire season, which sometimes lasts from May 5 to September; generally, however, things are not in working order until June 10, and everything closed up for the winter by Aug. 25. The honey is run into Cyprus barrels directly from the extractor. As there is a continual honey flow during the season, it is impossible to separate the different kinds of honey; so in one barrel of 45 gallons there may be a dozen different flavors, and as it is in different stages of ripeness (or rather greenness), one can easily see that it will not bring very much in the market. Most of the honey is shipped to St. Louis and Cincinnati by boat; and, in the hands of commission merchants, bring from 6½ to 9 cents, according to the season. Some of the merchants know about as much about honey as "the man in the moon;" in point of fact, one of our largest apiarists was creditably informed by them that his honey was half cane juice; this in the month of July, when sugar cane is not large enough to yield one barrel of juice per acre. But does not every one know that should cane juice be mixed with honey, the entire contents of the barrel would turn to vinegar long before it reached its destination.

For the American Bee Journal.

At What Age do Bees Gather Honey?

N. M. CARPENTER.

On page 308 of Vol. 19 of the BEE JOURNAL, is an article under the above heading from G. M. Doolittle. It will be remembered that according to his experiments a young bee does not gather honey until it is 16 days old. I was surprised at the results of his experiments, as I had come to the conclusion, many years ago, that in about 30 days from the laying of the egg, a young bee would be gathering honey, if there was a good yield.

As I received some very fine yellow Italian queens from a breeder in Maryland a few days after reading Mr. Doolittle's article, I thought I would make some similar experiments, to see what the results would be with me. Consequently I introduced a fine yellow queen into a colony of native bees. In about 48 hours afterwards, the queen began to lay vigorously, and in 21 days thereafter, the little "yellow boys" were hatching out of the cells in great numbers. In 5 days more some of these young yellow bees brought little pellets of pollen; and when 7 days old, I found by crushing them as they dropped upon the alighting board, that quite a proportion of them had their sacs filled with honey. When 9 days old they were gathering honey as freely as any in the hive, and came as well-laden as the older bees.

There was no possibility of a mistake in the matter, for before the hatching of brood from the new Ital-

ian queen, not a yellow bee could be found in the hive. In fact, most of my bees are of the common kind, and the colony experimented with was especially free from any yellow-banded or hybrid bees.

This experiment was made during an abundant honey yield from basswood. In such a case undoubtedly bees would work much younger than when the honey flow was less. In our spring management this question becomes of some importance, as we would like to know about when the young bees, which we have taken so much pains to increase by spreading brood, etc., will be ready to go to work for us.

For the American Bee Journal.

How to Make Bee Gloves, etc.

MISS H. F. BULLER.

I promised some time ago to tell the readers of the BEE JOURNAL the way I preserve mine without going to the expense of having them bound. After arranging each month in the proper order, I take a strong piece of brown paper for a cover and a strip of stout cotton about 2 inches wide which I fold over the back to prevent the stitches tearing out; then with a fine awl pierce half a dozen holes through all, and sew them firmly together. I then write the month and date on the cover, so that I need lose no time in hunting up the numbers I wish to refer to.

For the benefit of my sister bee-keepers, who, like myself, are so constituted that they cannot work amongst bees with bare hands, I will tell how I make my gloves. I take a piece of strong unbleached linen jean, which wears well, for the outside, and for lining, use canton flannel with the fluff next to the hand. Cut them after the pattern of the gloves used in Canada for binding grain with thistles in it. Dipping the gloves in cold water keeps the hands cool, and the bees will not readily sting through the wet gloves. I find that by having the finger and thumb fit snugly, I can work in them very well.

For the American Bee Journal.

The Outlook for 1884.

REV. L. JOHNSON.

Although the past winter has been one of the severest ever experienced in Kentucky, yet our loss of bees, so far, has been quite small. I attribute this to our excellent and abundant crop of honey last year. The fall was quite dry, and consequently but little pollen was gathered in late. The spring pollen, mostly at the bottom of cells, was covered with honey, and no molding and rotting of pollen took place to cause dysentery. I hold that if pollen is pure and sound, even if eaten by the bees in their long confinement, it will do them no harm. But on the other hand, if either honey

or pollen is impure, or in a decaying state, they will have a deleterious effect on bees in winter. This, to me, is the whole theory of the dreaded dysentery in bees. Bees are, therefore, both strong in numbers and in fine condition, so far as have been ascertained.

As the ground was covered with snow in the coldest weather, our clovers have been but little injured. White clover looks thrifty and strong. As we had but little fruit last year, we will have an abundant bloom in the spring, although peaches and the more tender varieties of cherries are killed.

Altogether the outlook for the Kentucky bee-keepers is quite encouraging, and those who will give their bees timely attention, will again realize the happy results of 1883. Last fall, at the suggestion of Mr. J. T. Connelly, of Walnut Lick, Ky., I used corn silks for packing over the bees, and after a fair trial, I pronounce them superior to any thing I have yet tried. They are clean, sweet, and remain perfectly dry at all times. As non-conductors they are far ahead of chaff, and hereafter I shall use nothing else.

Walton, Ky.

For the American Bee Journal.

Feeding Bees in Winter.

R. H. SMITH.

Now and again I see in the BEE JOURNAL inquiries about feeding bees in winter. Of course it should not have to be done, as a rule, but sometimes circumstances compel us to do that, or lose our bees. I saw a paragraph in a paper lately where the writer said he would rather let his bees die in peace than disturb them by feeding in the winter. That I cannot agree with.

Last winter I purchased 3 colonies in box hives; one was strong, one weak, and one very weak. The first week in March I brought them home, a distance of 16 miles, over a rough road. On examining them I found No. 1 had plenty of stores, No. 2 was weak in bees and had little honey, No. 3 had all but died of starvation. The strong one I set into the cellar, out of which it came in fine condition about the end of April. I removed the bottom-board from No. 2, turned the hive upside down and laid a cake of candy on the cross sticks of the hive (the combs were only built half way down), laid the quilt and cushion over them and set them away, with little hope of their living until spring. When I set them out, the last week in April, I again examined them, and found brood in all stages. They were more advanced than some of the strong colonies. No. 3 seemed a hopeless case, but I made a little hive capable of holding three section boxes, transferred the few bees and queen into that, fed them honey and candy, and found them also alive at the end of April. I set them out in the hot sun; they swarmed out and that was the end of them.

This fall I rescued 3 colonies from the brimstone pit too late to feed them sufficient syrup to winter on, so on the first of January I commenced feeding them candy. I laid them away prepared for this feeding, and had no trouble in doing so. I put the candy on two sticks laid across the frames, without disturbing them, and trusted to their finding it.

A few days ago I made another supply, and on opening the first hive I found the cake eaten out and only a shell left; inside this shell the bees were feeding quietly, and took no notice of the light held over them. I gave them a second cake and again tucked them up comfortably. There are no signs of dysentery, and they are perfectly quiet.

I make the candy as follows: To 4 pounds of granulated sugar add one of water, boil till thoroughly melted; while cooling, stir in enough sugar to make a mush, pour into moulds and let it harden, when it is ready for use. For a mould I take a section box, set it in a pan, lay a paper in the bottom and pour in the partly cooled candy; when it sets, I take off the section box and set away the cake till it is wanted. I warm it a little before feeding. Be sure not to burn the sugar.

Falkenburg, Ont.

For the American Bee Journal.

The New Races of Bees.

L. R. JACKSON.

It has been a mystery to me why some who I thought competent to judge of the good and bad qualities of bees, differed in their opinion of the Syrian bees from what my experience has caused me to think of them.

Mr. Benton's article, on page 38 of the BEE JOURNAL, gives new light on this subject, and is just what we needed. As Mr. Newman remarks, they are all Syrian bees, yet that does not hinder there being a difference in the bees south of the mountains, from those on the north. If there is a difference, we should know it, and who is as well qualified to draw the line as Mr. Benton? If we know the bees south of the mountain as Holy Land, and those north as Syrians, then we know what we are buying. If we call them all Syrians, we know not what we buy until we test them.

I have a few colonies of Syrian bees, and I think they have more good qualities and less bad ones than any bees I have handled. They can be handled more easily than the Italians, and one is not as liable to be stung with them as with the Italians. They are more easily brushed from the comb and fly about less than any bees I have worked with. They gather a surplus of honey and keep strong longer at the close of the honey harvest than any bees I have, and if any of the bees have not honey enough to winter on, the Syrians are the first I call on for help.

I have crossed a few Syrian queens with Italian drones, and a few with the brown German drones, and will test them this year, and still cross the

blood of the three races further. I do not believe that "the coming bee" will be a pure one of any race. The best bees I have, except the Syrians, are a cross between the Italians and brown Germans.

I winter my bees on the summer stands, and the Syrians are the quietest during the winter, and are wintering well, though the thermometer has marked 28° below zero.

Urmeyville, Ind.

Convention Notices.

☞ We will organize a bee-keepers' association at the Court House in Franklin, Ind., at 10 a. m., April 5, 1884. All bee-keepers are invited to attend and take part in the organization.
L. R. JACKSON.
Urmeyville, Ind., Feb. 26, 1884.

☞ The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.
C. M. CRANDALL, Sec.

☞ The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

☞ The Lorain County Bee-Keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.
O. J. TERRELL, Sec.

North Ridgeville, O.

☞ We intend to organize a bee-keepers' association for Southern Indiana on March 20, 1884, to meet at the Merchants and Manufacturers' Club Rooms, Madison, Ind., at 9:30 a. m. Kentucky bee-keepers are invited to participate.
H. C. WHITE.

☞ The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest, for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twichell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Excessive Swarming.

In the spring of 1883 I bought 2 colonies of black bees. When swarming time came I found that I had my hands full of business. I knew just enough about bees to know how to get a swarm into a hive, but one colony seemed to have the swarming fever, for it swarmed six times in the month of June (three times in one week), and twice in one day. Now, where there is such an effect, there must be a cause. What is it?

J. A. KING.

Rochester, Minnesota.

ANSWER.—Such excessive swarming usually happens under the following conditions: 1. The old colony is very strong. 2. A part of its prime swarm returns to the parent colony. 3. The same thing takes place with some of its second swarms. 4. The second swarms are not large. 5. Often a swarm comes along, or from some other hive in the apiary, and, unnoticed, enters the old colony. We know of no cause which can produce the following effect: That one bushel of bees can be divided into six parts, and each part will contain a bushel and a half of bees. *Ex nihilo nihil fit.*

A Curious Freak of Bees.

One colony swarmed out on Nov. 6, and settled in two clusters near each other. I was looking them over, to find the queen, not thinking that there were two. As they crawled back and forth from each cluster, I saw they had balled a queen. I threw the ball into some water near by; when released I caged the queen, intending to clip her wings and put her back, as they had plenty of honey. I got my swarming box, in which to gather the bees, when I discovered that they had another queen balled. I released her in the same way, but they had wounded her so that she soon died. I then gathered the bees, looking all the time for another queen, but I found none. I put them back where they came from, with a caged queen over the cluster or centre of the hive, and spread a piece of carpet over them. In three days I opened the cage gently, let her come out, and the bees met her, and seemed satisfied. After a while more came around, and one seized her and they commenced to fight her. I caged her again with some bees still holding her. I smoked them till they released her, and left her in a cage for seven days. Then let her out gently, on the top of the frames; she started down, when some unfriendly bees met her and seized her, and I caged her again. I looked them over three times for another queen, but found none. I then moved the hive away and put another in its place. I then brushed the bees all off

in the hive, and put frames in the new hive, on the old stand. I looked them over carefully, let them fly back to the other hive, but I found no queen. It was a warm day, and I let them take their time to return. I had liberated the queen in the new hive. When the bees had nearly all gone to their new home, I looked in, to see if the queen was received or not. To my utter surprise, I found her again balled. I released and caged her; as she did not appear hurt in any way, may it not be a friendly balling, to keep her out of danger's way. Did Mr. Heddon tell us why she was balled? G. W. ASHBY.

Valley Station, Ky.

ANSWER.—Your case acts like the clustering of bees from different colonies, when some bees are antagonistic to every queen in the cluster, even if there be a dozen. It is seldom that they hold their malice so long a time. I do not think the "ballers" had any feelings of friendship toward the balled queen. She was, in my opinion, all the time balled by hating bees of no relation.

Lime to Prevent Dampness.

Has dampness in hives ever been prevented by the use of fresh-burnt lime being stored in the bee cellar? As it absorbs water from the atmosphere, would it not also from the hives? or would the resulting gases prove deleterious to the bees?

S. RUFUS MASON.

Purple Cane, Neb., Feb. 25, 1884.

ANSWER.—Lime has been used in repositories for bees, both in and out of the hives, but it has not yet come into general use, nor do I think it ever will. It is by no means settled, that dampness has much to do with the loss of bees in winter. You will find, however, that repositories are much drier than out-door air during the winter, even where streams of water pass through them.

Lifeless Bees.

There are only two apiaries of Italian bees in this section of Pennsylvania (my own and a friend's), and we have Italianized ours since June 15, 1883. My own only averages 40 lbs. of comb honey per colony. The spring opened cold and rainy, and I transferred mine from box hives to frames, and gave them Italian queens, so they have not had a chance, but I will state that after all, that one of my colonies gave me over 30 lbs. of comb honey, but none of my colonies stored any surplus after Aug. 1; it was so dry after that until frost killed all the flowers. The buckwheat and fall flowers yielded but little honey. A neighbor of mine stated he has had an average of 50 lbs. to the colony; a good yield for the season, but I think the average for this section will not run over 15 lbs. per colony. My hives are all tucked up for winter in forest leaves, and I hope, next year, to report a better yield, as I shall use one and two pound sections instead of two and five pound boxes, as I used last

year. I purchased my queens from D. A. Pike; they are very prolific queens, and the bees are good honey gatherers. I have a strong colony of bees, and they are well tucked up for winter. We had on Nov. 14 to 16 cold weather for the time of year, the mercury went down to 14° above zero; and, on looking on the foreboard of this hive, I saw several bees apparently dead. After being brought in a warm room, I found they came to life, so that lead me to think something was wrong, so I made an examination next day (it being a little warm), and I found the bottom-board covered with bees, not dead, but just able to crawl about, also, all through the hive it seems as if they had no life in them, but after they were warmed up in the sun they seemed to be all right, only they, or some of them, would crawl out and fall on the ground, and the other bees would pull some out, in the same condition. For 2 or 3 days, the weather being warm, I found they had plenty of good sealed honey within easy access at any time, and plenty of bees for the space they occupy, but I cannot account for this lifeless condition at the time mentioned. I found a little moisture in the hive; they had a honey-board over them, with a thick pad over that, with a packing of leaves over that. Please tell me the cause of this condition, and dwindling so early in the season.

Fallsington, Pa. J. E.

ANSWER.—I can give no solution to the above case, except that possibly there might be some poisonous or stupefying honey in the hive. It is entirely unlike any thing I have ever seen.

Spring Management.

Bees brought in pollen on the 13th, but since that, it has been raining, or cloudy and cool, nearly every day; but to-day it promises to be clear and pleasant, and already they are beginning to fly at 8 a. m. Last season was a failure in the honey crop here. From 100 colonies, spring count, I only got about 1,500 lbs. of comb honey. Increased to 155, and put into winter quarters 152 (on summer stands); lost 2, leaving now 150 in fine condition. If spring dwindling should not be too bad, they will be strong at the opening of spring. I desire to use one-pound sections this year. My hives are Langstroth 2-story; would it be best to leave off the honey board when the one one-pound sections are used? Will the use of these sections prevent swarming, if put on in time?

Kenton, Tenn. J. W. HOWELL.

ANSWER.—It would depend entirely upon the style of the honey board you use. If it is like our skeleton honey board, by all means we should leave it on. If of the style of the old Langstroth, we should be sure to take it off. Plenty of comb-surplus-room has a tendency to prevent swarming. Plenty of extracting-surplus-room (that is, empty combs), exerts a still greater tendency; but in some localities in certain seasons, bees will swarm excessively for all of these.

Double-Walled Hives, etc.

A friend asks privately for an answer through this department in regard to my opinion of double-walled hives for protecting the bees against heat in the summer. In this I agree with Mr. Cheeny in the BEE JOURNAL of Dec. 19, 1883, page 659, and not with J. E. Pond, as contained on page 154, present volume. If the sun was allowed to strike a hive during the heat of summer, the double-wall would have a tendency to equalize the heat between night and day, but where hives are shaded, as all should be, the thinnest wall hive is cooler than any double-wall. No matter what may be the outside temperature, the presence of animal life will raise that temperature if it can exist within it. Mr. Cheeny is also correct in saying that "the dead air space will contain a higher temperature than the air outside," if shaded. Mr. Pond says scientific men tell us that "dead air is an almost perfect non-conductor of heat and cold." True scientists never speak in this manner. There is no such thing as cold. We mean only a condition indicating the absence of heat; hence, nothing is a conductor or non-conductor of cold. If bees were in a hive that was a perfect conductor of their heat, and admitted of no circulation of their heat outward, the combs would soon melt down, place the hive where you might. When the outside temperature is cooler than that needed by the bees, the non-conducting wall is good for them the same as before, it preserves their heat, raising the temperature.

Another inquirer asks if foul brood would be propagated by the introduction of queens from foul-broody colonies? As I have before said, I have no experience with foul brood, but I think if the accompanying workers and cage were burned or buried, and the queen introduced in a cage in which she was kept for a few hours, until the honey in her stomach was all digested, that no foul brood would be disseminated. Whether I am correct or not, I would urge upon all, the expediency of this practice in these days of the alarming spread of foul brood. I will reply to Bro. Pond's article on page 149, as soon as time and space will permit.

Bees all right yet.

The winter has been very cold here. The mercury having been as low as 30° below zero a good many times, and was this morning, Feb. 29. My bees have been buried under the snow all winter, packed in sawdust. I examined lately, and found them all right yet. I hope for an early spring, but every thing bids fair for plenty of cold weather yet. I have just received a Heddon hive for comb and extracted honey, and I think it is the easiest hive to manipulate that I have yet

seen, and the sections are the nicest I ever saw, nearly as white as snow. I think any person having one colony of bees ought to take the Weekly BEE JOURNAL; it will pay them twice over in the extra amount of honey that they would get, by following its teachings.

G. L. PRAY.

Petoskey, Mich., Feb. 29, 1884.

Straw Bee Hive.

EDITOR OF BEE JOURNAL.—I send to the museum one of my square straw bee hives for Langstroth frames; they can be made for any frame that is in use. The walls of the hive can be made of any thickness desired. You were right when you said, "prepare your bees for a cold winter, and if it is warm it will not harm them." Mine are safe so far, by your advice.

A. HOKE.

Union City, Ind., Feb. 29, 1884.

[The hive is placed in our museum. It is made of straw tied with wire; the straw walls are on the four sides of the brood chamber; the bottom and cap being like a regular Langstroth hive. The end walls of straw have rabbets cut out for the ends of the frames to rest on—the straws standing "up and down" on their ends. Our advice in "preparing the bees for a cold winter," if left on the summer stands, was "good and timely," and such should always be done; if it proves to be a warm winter, there is no harm done, and if it should be a cold one, they are ready for it.—Ed.]

Temperature of Bee Cellars.

Will Mr. H. S. Hartman please describe through the BEE JOURNAL, how he raises the temperature in his bee cellar from 45° to 50°, as mentioned on page 124? A BEE-KEEPER.

Burgessville, Ont., Feb. 28, 1884.

Drones from Worker Eggs.

In reply to an editorial note on "Drones from worker larvæ," Oct. 31, 1883, I would say that after removing all eggs and brood from a colony and giving them a small piece of comb containing eggs only for queen rearing, I, in due time, found not only queen cells but drone and worker cells also, but as I did not see them again after the queens hatched, I could not say what hatched from them. I also had another case, similar to the above, where I had placed a strip of comb containing eggs between top-bars of frames of a queen-rearing colony; they were nearly all capped over as drones, but, as in the first case, I did not watch the result. I will, however, another season, try the experiment of rearing drones from worker eggs, if it can be done. We are now having the coldest weather of the season, it being 30° below zero at 6 o'clock this morning. What the result will be to our pets (the bees) none dare conjecture. S. J. YOUNGMAN.

Cato, Mich., Feb. 29, 1884.

Planting Honey Trees.

I began bee-keeping in 1880, knowing but little about it. I have met with many losses, yet I am encouraged to continue. I am a carpenter, and make and use the Langstroth hive, except one glass hive of my own make, which has proven to be the best for wintering and increase of bees. That colony sent off 4 large swarms last season; the first on May 26; the other 3 within 12 days; the first swarm sent off 2 swarms; making an increase of 6 from 1, in one season. In 1882, I planted 2 rows of mignonette in my garden; rows 3 feet apart; plants 1½ feet in rows. It made a perfect mat of flowers 6 feet wide, and for 6 weeks (not remembering about the dates) the bees worked on it continually from morning until night. The pollen is red like that of red clover. I think it a profitable plant for bees in this climate. This is a "blue grass" and "white clover" region. Some lindens; and after these are gone, there are but few honey plants here in this section.

1. Would it be advisable for a middle aged man to set out 50 or 60 young linden trees this spring, as the older trees are getting scarce? The young trees can be had without cost, except time and labor, from thickets that are being cleared up. Five miles south of me there are none. I have only one grown linden tree on my place; a few more near by, and you cannot pass without noticing the swarms of bees at work on them, while in full bloom.

2. Where can teasel seed be bought, and at what price? They could not be obtained in Louisville in any seed store, in 1882.

3. Would teasel be a profitable honey plant in this climate, clay ground, lime stone country.

Todd's Point, Ky. J. M. PRATT.

[1. All things considered, we think it would pay you to set out the young lindens. In this climate we have nothing better as a shade tree.

2. Probably N. N. Betsinger, Marcellus, N. Y., can supply it. 3. We do not know. Ask Mr. Betsinger.—Ed.]

Poorest Honey Crop in Ten Years.

Since Aug. 15 there has been no honey for the bees to gather; even the buckwheat yielded none in consequence of drouth. The white clover was excellent while it was in bloom, which I should have taken advantage of, by means of an extractor. The honey crop of last year was almost a total failure; 22 bee-keepers around here, with over 200 colonies of bees, report less than 2,000 lbs. in all.

Rolla, Mo.

WM. ROBSON.

Good Beginning.

In 1882 a stray swarm came to me, and in a few days another came. I hived them and got a third one out of a tree. I wintered the three in the cellar, and in the spring transferred them to chaff hives. I now have 11 colonies in good condition.

JOHN HOOD.

Iron Hill, Iowa, Feb. 28, 1884.

Bees Gathering Honey.

On Feb. 1 my bees commenced to bring in honey from the soft maples and elms, of which there are many here. My bees wintered without loss, except 2 or 3 that were robbed. I got a good crop last year. From 97 colonies in the spring, I got about 20,000 lbs. (600 lbs. in the comb, the rest extracted), and they increased to 160 good colonies. I like natural swarming for increase, but increase as little as possible when honey is my object. Many are engaging in the bee business here, who expect to make it a speciality, and they are going at it in a way to make it a success. Thanks to the indefatigable efforts of Dr. O. M. Blanton, of Greenville, Miss., for much practical instruction and advice. We are all overflowed here, and our bees are on scaffolds, etc. It will be some time before we can overhaul our bees. I expect to see swarms come out before long.

W. G. MCLENDON.
Lake Village, Ark., Feb. 27, 1884.

Given Foundation.

Please give me through the BEE JOURNAL the address of some one in our State that I can get to make wax into Given foundation.

GEO. BROWN.
Conesus Centre, N. Y., March 2, 1884.

[We do not know; if there is any one doing so, they will probably advertise in the BEE JOURNAL soon.—ED.]

Foundation with High Side Walls.

We send you some samples of the deepest foundation we have seen yet. It is made on a mill from J. Vandervort, of Laceyville, Pa. It is three-sixteenths of an inch thick, and goes 4 feet to the pound. Such foundation evidently will not need any wiring; 4 sheets of it equal in depth 5 sheets of Dunham. CHAS. DADANT & SON.

Hamilton, Ill., March 4, 1884.

[It is well-made, and the cells are deep enough to satisfy any one.—ED.]

Two Queens in a Hive.

Five days ago Mr. Bryan, an apiarist from Nashville, Tenn., spent a half day with me among the bees. We found all in fine condition with brood hatching rapidly. In one hive we found a great deal of brood and two fine-looking queens on frames that were closetogether. We divided the colony, and to-day I examined them, and almost every empty cell contained an egg, showing both to be prolific. There are no drones in the country, and, of course, they wintered together.

J. M. KILOUGH.
San Marcos, Texas, Feb. 28, 1884.

Bees Getting Uneasy.

It is 22° below zero this morning, with over 2 feet of snow on a level. Bees are getting uneasy in the bee house, but are healthy otherwise.

C. THEILMANN.
Theilmann, Minn., March 4, 1884.

Winter Still with us.

Bees are much weakened by the winter, and are dwindling some, losing heavily. If it remains cold much longer, at least half the bees will be lost. Bees flew too late, shortening the lives of the old bees, and there were no young ones to take their place. Some have died from starvation, not being able to leave the cluster to reach their stores. Some were short of stores, especially late swarms. The fall season was very dry here.

W. MASON.
Fillmore, Ind., March 7, 1884.

Bee-Sting Remedy.

Tobacco wet and bound on, is the best remedy with me, but the sting should be removed as soon as received, cutting it off with a pocket knife, when it will be lifted out, and very little or no swelling will occur.

F. M. CHENEY.
Sutton, N. H., March 3, 1884.

Bees Wintered on Summer Stands.

I put into winter quarters, on the summer stands, 200 colonies, all in good condition except 4 late swarms, which had very little honey. I did not think it would pay to feed up for winter; so they died, and I was not disappointed. I always winter my bees on the summer stands, and I never lost over 10 colonies out of 200, when they were in good condition in the fall. I close the front entrance to about 3 inches, leave the honey boards on, open a few holes on top, spread over a cloth so that the dampness can pass off, and never have any trouble with dysentery in my bees. Bees have been flying a little this month, and gathering some pollen from the maples. I will feed about 12 bushels of rye as soon as it gets warm enough.

H. P. DEAN.
Berryville, Va., March 4, 1884.

Thermometers.

Will Mr. John Phin, of Cedar Brae, N. J., please answer the following questions through the BEE JOURNAL:

1. Does extreme heat or cold cause the mercury or spirit thermometers to incorrectly register degrees of temperature?
2. Will a thermometer that registers incorrectly by the ice test, run uniformly up and down the scale the same number of degrees that it varies?
3. Will an old tested thermometer, say ten years old, mark the degrees as perfectly as a newly tested one?
4. Which, in your opinion, is the most perfect, spirit or mercury thermometers?

Mrs. R. E. KNAPP.
Kane City, Pa., March 4, 1884.

[Will Prof. Phin kindly reply to these inquiries?—ED.]

☞ We have a few photographs (cabinet size) just taken, of the Rev. L. L. Langstroth, which we can send to those desiring them for 50 cts. each, postage prepaid.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., March 10, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7c@10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basawood in 1 and 2 lb. sections, 17@18c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.
H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect sales are made of 1 lb. sections at 15@20c.; 1/4@2 lb. sections, 14@18c.; dark and mixed in color, very slow, at about 12@13c. Extracted honey steady, but limited demand; prices range from 7@10c. per lb.

BEESWAX—Scarcely at 28@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY, MO.

HONEY—This market is now rather quiet, and fairly well supplied with comb honey in all shapes. Prices are a little off, only the choicest white comb either 1 or 2 lb. sections bringing 18c. Last week's report made me say, 1 lb. sections bring "us" more than 2 lb. It should have read, 1 lb. sections bring "no" more than 2 lb. Extracted in fair demand for full products at 8@9c.; white at 9@9 1/2c.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Not much choice honey offering, but there is an accumulation of off-lots, which are slow of sale. Prices here are too high to admit of exports to other markets. The outlook for the coming crop is very good. White to extra white comb, 15@18c.; dark to good, 10@13c.; extracted, choice to extra white, 7@8c.; dark and candied, 5@--

BEESWAX—Wholesale, 27 1/2@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb 12@16c. and strained and extracted 6@8c. per lb. Top rates for fancy small packages.

BEESWAX—Firm at 33@33 1/2c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 16c.; 2 lb. best white, 16@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY.—Demand light. 1 lb. sections comb honey, 18@20c.; 2 lb. 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

☞ The first edition of the "Apiary Register" having been exhausted, we have just issued a new edition, elegantly bound in Russia leather, with a large worker bee and "Apiary Register" in gold on the side. It forms not only a Register of both Queens and Colonies, but has also an Account Book at the back, in which to keep a record of all the receipts and expenditures of the apiary, which will be found exceedingly valuable. We have also reduced the prices, as will be seen on another page.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

For a club of \$20, for 10 Weeklies, or an equivalent in Monthlies, we will present, besides the 15 per cent. in books, a tested Italian queen, by mail, postpaid.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

For a club of 100 Weekly (or its equivalent in Monthlies), with \$200, we will send a Magnificent Organ worth \$150. See description on page 614 of the Weekly for Nov. 28, 1883.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

| | |
|----------------------------------|--------|
| For 50 colonies (120 pages)..... | \$1 00 |
| " 100 colonies (220 pages)..... | 1 25 |
| " 200 colonies (420 pages)..... | 1 50 |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price still lower, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

 H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

MISSING,

From Kenner, La., Fred S. Carrier, who was in the employ of E. T. Flanagan at that place, 16 miles from New Orleans. He left indications of mental derangement, and it is believed that he has either perished, or is wandering among strangers. He was one of Mr. Heddon's last year's students—a bright young man, of the sound mind; about 5 feet 3 inches in height, rather slender built, weight about 140, smooth face, nervous sanguine temperament, eyes bluish gray, hair dark brown. A little peculiarity in his walk was a hitch in the steps, as if there was a stiffness across the small of the back, though he was strong and well, with no such weakness. He was well versed, and very enthusiastic regarding bee-culture. Will any person who may think they have any clue to the whereabouts of the above described person, please report the same to James Heddon, or E. T. Flanagan, Kenner, La.?

BASSWOOD, MAPLE AND ELM TREES, 2 ft. to 10 ft. each, \$2 per 100; 2 to 6 ft., \$3 per 100; 6 to 10 ft., 10c. each. N. E. DOANE, Pipestone, Mich. 11Dt

WANTED—A mechanic to assist in apiculture. Wages according to knowledge of both industries. Reference exchanged. Call at this office, or address R. J. ADAMS, Lakeport, O., Chicago Co. Ark. March 3, 1884. 11A2t

ITALIAN QUEENS, DADANT FOUNDATION, and Supplies.—It will pay you to send for Circular. E. F. SMITH, Smyrna, N. Y. 11At

SEED CORN!

For ENSILAGE or GREEN Fodder, 15 ft. high, 40 to 60 tons per acre not unusual. Stock eat stalks and all, clean. Sample and price by mail. Dairy goods. Instantaneous Cream Separator. BURRELL & WHITMAN, Little Falls, N. Y.

55 ENGRAVINGS

THE HORSE,
 BY B. J. KENDALL, M. D.

A TREATISE giving an Index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by

925 West Madison Street, CHICAGO, ILL.

NEW Vegetables A Specialty.
GREGORY'S SEED CATALOGUE.
 1854-1884

My Vegetable and Flower Seed Catalogue for 1884, the result of thirty years' experience as a Seed Grower, will be sent free to all who apply. All my Seed is warranted to be fresh and true to name, so far that should it prove otherwise, I agree to re-fill orders gratis. My collection of vegetable Seed, one of the most extensive to be found in any American Catalogue, is a large part of it of my own growing. As the original introducer of Eclipse Beet, Burbank Potatoes, Marblehead Early Corn, the Hubbard Squash, and scores of other new Vegetables, I invite the patronage of the public. In the gardens and on the farms of those who plant my seed will be found my best advertisement.
 JAMES J. H. GREGORY, Seed Grower, Marblehead, Mass.

1884.

HEDDON'S COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I have now made arrangements so that I can again supply you with those nice white Dovetailed Sections, $4\frac{1}{2} \times 4\frac{1}{2} \times 7$ to the foot, and 8 to the foot, \$7.00 per 1,000 from here. Will be ready to ship on and after March 15th.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax, the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

CLOVER SEEDS!

The present prices are as follows :

White Clover, \$15.00 per bushel, \$4.00 per peck, or 30 cts. per pound.

Alsike Clover, \$12.00 per bushel, \$3.25 per peck, or 25 cts. per pound.

Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents.

Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents.

Postage, 13 cents extra.

One pound spools, each, 40 cents.

Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

6 Inch, Price, \$25.00.

It makes the finest extra thin Foundation for comb honey. For Sale by

CHICAGO, ILLINOIS.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegao, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

| The 8 above-named papers..... | 9 00.. 7 75 |

The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.

☞ The first edition of the "Apiary Register" having been exhausted, we have just issued a new edition, elegantly bound in Russia leather, with a large worker bee and "Apiary Register" in gold on the side. It forms not only a Register of both Queens and Colonies, but has also an Account Book at the back, in which to keep a record of all the receipts and expenditures of the apiary, which will be found exceedingly valuable. We have also reduced the prices, as will be seen on another page.

Advertisements.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives that. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

For mail rates and testimonials, send card. To sell again, send for dozen rates to

BINGHAM & HETHERINGTON, 6A2B1f ABRONIA, MICH.

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stuterd, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25, paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 180 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine. by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 50c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions as to what plant, and when and how to sow. Includes engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, waxes, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest, wage tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and other than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Navice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger one can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Beherrungen über folgende Gegenstände—Vortlichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königin—Zütern—Schwärmen—Ableger—Verzeigen—Italienisiren—Zücker von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angedend wie man Honigfuchen, Formküchlehen, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conjointen bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdefrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN, 925 West Madison St. CHICAGO, ILL.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., MARCH 19, 1884.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The Vice-Presidents of the National Convention.

A recent letter from a Canadian gentleman, who was at the Toronto Convention, throws some light on the subject of the vice-presidents of the North American Bee-Keepers' Convention. He says:

Toward the close of the convention, some one who managed to keep his mind on business a little during the general jollification, said that the vice-presidents ought to be elected. This was agreed to, and after some talk it was decided to re-elect all the old ones except where any objection was made. The next thing was to find out who the old ones were, which was solved by the Rev. W. F. Clarke pulling a small pamphlet out of his bag and handing it to the chairman. The list was read, and some changes were made, including appointments for Manitoba (Hon. Mr. Wallbridge), and some States not before represented. After it was all done, it was found that Mr. Clarke's list was not for 1882-83, but for a year or two before. However, it did not seem to make much difference—something had been done, and the gasmeter was rapidly filling, and the stream of talk was turned on again. As far as I can remember no record of the vice-presidents was taken, except by Mr. Bengough, the short-hand reporter to whom Mr. McPherson refers in his letter to the BEE JOURNAL of the 5th inst. That is the plain, unvarnished tale. It is to be hoped that Dr. Miller will be a more methodical secretary than his predecessor, who did not take a note during the proceedings.

It seems rather a queer thing that at such an important series of meetings no minutes were read or kept, but everything left in the hands of an outside party, and on account of some disagreement between him and his reporter that the bee world should be deprived of valuable information.

The following, from the Reporter who was censured for not furnishing the report, is due both to him and our readers:

EDITOR BEE JOURNAL:—A friend has shown me your issue of March 5, containing your article on the "Report of the National Society." I have, no doubt, that your readers would be interested in *my* story, after reading Mr. McPherson's reference to "warlike correspondence," "unbusiness-like conduct," etc. The following letter sent by me to Mr. Jones will, I think, make the whole matter clear. The Mr. Moore mentioned is the friend to whom Mr. Jones first spoke, and who in turn told me (on the morning of the first day's session, only a few minutes before it commenced), that Mr. Jones wanted a report of the convention.

"TORONTO, Oct. 16, 1883.

D. A. JONES, ESQ., Beeton, Ont.—
Dear Sir: I regret very much that I was not in the office when you called on Saturday. Mr. Moore has shown me a letter to him in which it is stated that you could have got a reporter to report the convention for \$25. I have seen reason to regret that this reporter was not engaged, as I consider three days and two nights of my time are fully worth that amount, to say nothing of the time consumed in transcribing the notes.

"I spoke to Mr. McPherson at the convention when he attended—I believe the first evening—and thus gave him timely notice of the probable cost of the report. He spoke as though the matter was in your hands, and, therefore, when you brought the matter before the convention, I again mentioned to you that at newspaper rates the transcript would be worth over \$100. I afterwards spoke to Mr. Muth and yourself, hoping that an arrangement might be made, before the officers of the convention dispersed, by which the whole business would have been thoroughly understood and properly settled. Mr. Muth said that a few officers could make up the amount if necessary, and as there was to be a meeting in the honey house that evening, I felt satisfied to leave the matter in the hands of the committee.

"When the matter was mentioned to me at first, on the morning of the first day, by Mr. Moore, I supposed that Mr. McPherson was one of the officers of your association, as it was stated to me that he was willing to contribute \$25 towards the report of

the proceedings. I presumed that you intended to make arrangements with the committee by which Mr. McPherson's share of \$25 would be accepted as part, and the association would be asked for the balance. I, therefore, went on with the work, trusting you to make it all right. On the morning of the first day, when the Rev. Mr. Clarke asked me for whom I was reporting, I told him you had engaged me, and he said, 'Mr. Jones is good for it.' That is the way I felt, and this is why I did not make a definite arrangement at the start. I knew that the association would not allow any member to pay out of his own pocket for work done for them as a body. I trust that you will appreciate my proposition in this matter, in order to bring it to a conclusion. I am willing to forego the time already spent on it, and hereby offer without prejudice to furnish a report of the proceedings for \$75.

Yours truly,

THOS. BENGOUGH."

I submit that this letter answers all charges preferred against me. It shows: 1. That I never undertook to furnish a report for \$25. 2. That at a very early stage in the proceedings I told Mr. McPherson what the report would cost, and that later on, and while the matter was being discussed in convention, I informed Mr. Jones on the same point. 3. That I never refused to transcribe my short-hand notes, but, on the contrary, I offered as early as October to do the work for 25 per cent. less than the price mentioned. 4. That I spoke to the Treasurer of the National Society with a view to instructions. 5. That the convention deliberately decided to have the report published, and that I am dot responsible for the failure, as I never received an official requisition for the transcript.

The report is actually much longer than I anticipated when I spoke to Mr. McPherson, and at newspaper rates would be worth at least \$150, while at tariff rates for convention work, it would be worth nearly \$200. I am willing, however, to take \$100, the amount calculated on, and will guarantee a first-class report. In order to avoid further "unbusiness-like conduct," I would suggest that a check be deposited by the Treasurer with some responsible person here, with instructions not to pay it until I have delivered the report into his hands. I will then proceed at once with the work, and will guarantee perfect satisfaction.

Allow me to add that I shall be surprised if, after reading the above, the officers and members of the National Society will be parties to a policy of repudiation that involves a breach of faith. The loss of my time and labor, though it occurred at a time of the year when I could least afford it, is nothing compared with the loss of the Society's honor which repudiation involves. My only fault has been over-confidence in those who seemed to me to speak as representing the Society. I think it is too bad that I should lose time and labor, and the Society should lose its reputation and its report, simply because "some one has blundered."

How does the matter strike you now, Mr. Editor?

THOS. BENGOUGH.

It "strikes" us as being a very un-business-like affair on all sides. If the convention desired a stenographic report, it should have appointed a committee clothed with full powers to procure it. On the other hand, the Reporter should have made an agreement for some definite sum, either by the folio or the job. As none of these things were done, bee-keepers in general are not to blame. The Society took no steps to procure the Report, and are not responsible for the representations of those who were not even its members.

Of course a "blunder" has been made—or, rather, many of them, by the lack of a business-way of procedure. The Society voted that its proceedings should be published in pamphlet form, but appointed no one to do it; and while it has the "funds" to procure it, no steps were taken to do so—hence there can be no just charge of *repudiation*.

If President Jones had ordered it for the Society, he would have taken and paid for it out of the Society's funds, at the proper time; but now it is *too late* to be of value to any one.

It is an unfortunate affair; and we would suggest a compromise—pay for the "notes" already taken, and let the matter drop—the copying is the costly part—let that remain undone. We paid for the report published in the BEE JOURNAL, and no charge of repudiation can be made against us—let that be considered the official report—and—"let us have peace."

Having given both sides a chance to present their version of it, we cannot spare room in the BEE JOURNAL for arguing, so now let the matter drop.

We have received a pamphlet giving the report of the Hants and Isle of Wight Society, in England.

We are now preparing a new book for the pocket, to be called "The Bee-Keepers' Convention Assistant." It will contain a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making reports for statistical information—and much other useful matter for those who attend Conventions. One of the latter will be a suitable Programme of questions for discussion at such meetings, model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs; a few blank leaves for jotting down interesting facts, etc. We shall aim to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world. It will be of a size suitable for the pocket, nicely bound in cloth, and the price will probably be 50 cents.

The Dutch papers mention the discovery of a "certain cure" for gout. A peasant who was confined to his bed by a sharp attack was stung by a bee, and almost immediately he felt better, and next day he was well. A short time after another patient thought he would try the same remedy, and, having induced a bee to sting him on the part affected, he also was cured.

THE HYGIENIC HOME COOK BOOK; or Healthful and Palatable Food without Condiments. Fifth edition. Price, paper 25 cents, cloth 50 cents. Fowler & Wells, Publishers, 753 Broadway, New York.

A new edition of this manual of healthful cookery is on our desk. It is not a work on the philosophy of food, but one giving recipes for its healthful and palatable preparation.

The Glucose Factories seem to be in trouble everywhere. The Toronto, Ont., factory was recently sold because the "share-holders had lost \$135,000, which they had invested in it." It is not being operated now, and the purchasers are losing \$20 per diem, on their investment. For this reason they have petitioned the City Council for exemption from taxation. Would it not be more honorable, as well as more profitable for them, to turn the factory to some legitimate and beneficial use?

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

- W. J. Ellison, Stateburg, S. C.—1 page—Italian Bees and Queens.
- F. H. Chamberlin, Dexter, Iowa,—6 pages—Given Comb Foundation.
- John T. Smith, Bellevue, Mich.—1 page—Comb Honey Rack.
- Rev. Wm. Ballantine, Sago, O.—1 page—Queens and a New Bee Book.
- Thos. Gorsuch, Gorsuch, Pa.—1 page—Acme Honey Case.
- H. H. Flick, Lavansville, Pa.—1 page—Aparist and Fine Stock Breeder.
- Z. K. Jewett, Sparta, Wis.—4 pages—Evergreen and Deciduous Tree Seedlings, Small Fruits, etc.
- Geo. Neighbour & Sons, 149 Regent Street, London, England—8 pages—Second-hand Bee Books.
- James M. Hyne, Stewartville, Ind.—8 pages—Bee-Keepers' Supplies, Bees, Queens and Honey.
- Paul L. Viallon, Bayou Goula, La.—8 pages—Aparian Implements and Italian Bees and Queens.
- Howard U. Ackerman, North Indianapolis, Ind.—2 pages—Poultry.
- Reynolds Brothers, Williamsburg, Ind.—10 pages—Bee-Keepers' Supplies, Bees, Queens, etc.

The Caledonian Aparian Society's eleventh grand show of honey, hives and bees, will be held at Edinburgh, Scotland, in connection with the Highland and Agricultural Society's Show, on the 22, 23, 24, and 25 of July, 1884.

CORRESPONDENCE

For the American Bee Journal.

How Far will Bees Go for Honey?

G. M. DOOLITTLE.

On page 36 I notice an extract from Mr. Pettigrew's "Handy Book of Bees," in which the claim is made that "bees will perish and die for want of food within three miles of good pasture." Mr. P. farther states as his opinion "that very few bees go more than two miles for food."

As this is a matter of interest to all, I will give some facts which have come under my observation, going to prove that Mr. P. is incorrect in his conclusions as applied to the United States, however the case may be, regarding the flight of bees in the Old World.

If bees only went two miles in search of food it would take but a limited conception to see that a very few colonies of bees would overstock many localities where now large apiaries are kept. This matter of overstocking my location with bees used to worry me quite a little when I had from 20 to 40 colonies of bees, but when I became convinced that bees went from 3 to 4 miles from choice for honey, I ceased to worry about it, and I find that at the present time bees do as well as ever with over 300 colonies within a distance of a mile of me.

When I had been keeping bees about two years, and had some 18 to 20 colonies of black bees, I chanced to go into the orchard near by to watch the bees at work on the apple blossoms. The spring before this, Italian bees had been introduced into a town adjoining ours, and were increased to some 30 colonies, the increase being made wholly by division, so there could have been no stray swarms of Italian bees in the woods. These bees were fully three miles from me in a straight line, and as I then believed the same as does Mr. Pettigrew, you can imagine my surprise when almost the first bee I saw proved to be an Italian. Upon examination I found that on an average one bee in five was Italian, which were at work on the apple bloom, and this with apple blossoms in profusion every where.

Still later, this same season, I was cutting a field of clover one mile from home, or four miles from these same Italians, when I saw bees at work on the clover. As I had read, previous to this, much about Italian bees working on red clover, I stopped the horse, got off the machine, and to my surprise counted five Italians to two blacks, and this with fields red with clover every where. I was now convinced that there was little need of fearing that I would not be able to keep 100 colonies without overstocking my pasturage, as that was the number I then desired to attain. But so far I had only proved that bees would go

at least four miles from home to work, but could not say whether they could work to advantage that distance or not. In the latter part of August, 1874, I ascertained that the bees were getting honey from buckwheat, by the odor which greeted me from the bee yard on damp evenings. As there was not a field of buckwheat in sight of the apiary, I was curious to know where the honey came from. At two miles from home I found a small field of about three acres, and a mile further on was another field of about the same size, while at a distance of about five miles there was from 30 to 50 acres all in full bloom. The result of the buckwheat season showed that from about 60 colonies I sold 900 pounds of buckwheat comb honey, and the bees had at least 1,500 pounds of the same kind to winter on, as the hives were nearly destitute of honey before, and at the end of buckwheat they had a great abundance.

Again, the nearest teasel fields are from $2\frac{1}{2}$ to 3 miles from my apiary, while they extend from there on ten or more miles. A bee which works on teasel gets her abdomen covered with a whitish dust, so that she is as readily distinguished as is one which works on pumpkin or squash blossoms. As teasel commences to bloom at about the same time the basswood does, the bees must leave the basswood to work on the teasel, which thing they do, for where both are secreting honey, I find about half of the bees going into each hive covered with teasel dust, and at times when basswood yields but little, nearly all the bees will be thus dusted. Besides this reason for believing that the bees work on teasel as above, I have another: I attend church $2\frac{1}{2}$ miles from home, in the direction of these teasel fields, and when the teasel is in bloom I have seen them by the score pass the church, going to and from the fields when the wind was unfavorable.

Once more: Seven miles to the southeast is a hill which is the highest point in our country, it being nearly 800 feet higher than my apiary. After a distance of one mile, there is a gradual rise until the top of the hill is reached. There are from 10 days to 2 weeks difference in time of the basswood bloom between that at the top of this hill and the same near my apiary. The past season, the bees labored to just as good advantage, as far as I could see, for 7 days after the basswood bloom was all gone 3 miles distant, as they did when it was in blossom nearer the apiary.

In this, my experience is different from the author of Quinby's New Bee-Keeping (L. C. Root), who says: "During the large yield from basswood in 1874, as the blossoms failed in the valley, the bees continued bringing in the same quality of honey, following the basswood day by day as it opened on the hills, until the first week in August, when they still came in heavily loaded, but very tired from a long flight. I drove to the heights, 6 miles distant, and found the basswood was there just coming into bloom. I immediately moved 48 colo-

nies to this location, and in the following week these 48 colonies gave me one ton of surplus honey, while the 71 colonies left at home did not secure one-half that amount, yet they continued working upon the same ground during the entire period."

However, there is one thing Mr. Root failed to note, which is, that if a continuous good yield is to be secured, it is necessary to have continued good weather, for if 2 or 3 days of rainy weather should occur when the bloom had receded 4 or 5 miles (thus allowing the bloom to fail for a distance of a mile or so beyond where the bees had gathered honey), they will never go to the hill-top, be the honey ever so plenty there.

The solution seems to be that after the rain they go to the trees where they last procured honey, and finding none, nor any near by, conclude that the harvest is over without going over the strip where the honey has failed to that which is beyond. In the above I believe I have given good proof that bees do labor to advantage from 4 to 7 miles from home. If any are still skeptical let them turn to page 181 of *Gleanings* for the year 1882, where they will find an article from the pen of H. A. Marsh, which will convince all. Borodino, N. Y.

Peculiarity of Laying Workers.

R. M. OSBORN.

On June 1, 1883, I prepared 5 three-frame nuclei with bees and brood; and No. 2, in a few days, had laying workers, and for 27 days they would not take care of a queen-cell, and I put a virgin queen into this hive, and they drove her out in two days, and at the end of 27 days I believe they had 1,000 laying workers, so at night I killed them with sulphur, and cleaned out the hive and refilled it with bees and brood; the other 4 nuclei were full of bees for four months. I kept replenishing them from other hives, and they were queenless all the four months except while their queens mated. I did not let them stay in after about 10 to 100 eggs were laid. I grafted in queen-cells as soon as the queens were taken out. These four nuclei have never had a laying worker yet; they are yet on the summer stands.

Colony No. 14 (pure Syrian) had 7 combs all solid with capped brood on May 1, 1883. About May 10 all was hatched, and the combs were all filled with eggs in a few days, and some cells had 6 to 8 eggs in each, and when all was capped, it was a curiosity; the 7 combs were all worker cells containing about 20,000, and about 12,000 of them were drones; the workers were all regularly capped, and the drones were regularly at intervals all over those combs.

About June 24, at 2 p. m., I was alarmed, and I rushed to the scene of action, and it was a sight to see about 12,000 degraded drones swarming from this hive, and worker bees guarding the entrance, refusing the drones to

return; I closed the entrance, and the drones that clustered on the hive, I killed that night. In the morning I found all the rest of the drones clustered inside of the hive, near the entrance, and I killed them all. I had no queens to mate, and in a short time they had the combs all filled in the same style as before, and when capped I shaved all the two-story cells down level with the capped worker cells, and the laying workers were quiet.

No. 32 (pure Italian) was infested in the same manner, and about the same length of time.

No. 30 (pure Italian) was queenless from May until September. I kept them replenished from other hives, and never had any laying workers.

No. 48 (Syrian-Italian) was queenless three months, and replenished from other hives, and never had a laying worker.

No. 29 (pure Syrian) was queenless, and had no laying workers.

I found drone cells in several other hives through the season, all through the worker brood, and I removed the queens to learn the cause, and afterwards returned the old queens. I found more of those laying workers in June and July. Those drones do not make long trips from the hive; they are lazy; and the bees do not let them live long. The Syrian-Italian bees are my favorites.

Kane, Ill.

Middlesex, Ont., Convention.

A meeting of prominent bee-keepers was held at Ailsa Craig last week, for the purpose of forming an association to advance their mutual interests, and discuss matters appertaining to the keeping of bees. An organization was effected with the following officers: President, Mr. Campbell, of Parkhill; Vice-President, Mr. Atkinson, of Ailsa Craig; Secretary, Mr. Stewart, of Ailsa Craig. A profitable and interesting discussion followed, on "Bees and their Habits and Improvement," after which a deputation consisting of Messrs. Aikes, Campbell and Atkinson, was appointed to interview the directors of the Western Fair, with a view of securing better accommodation and inducements for bee-keepers wishing to make exhibits. The next meeting will be held in London, Ont.

Spring Dwindling.

J. E. POND, JR.

March is the month of terror to bee-keepers. Few colonies die during winter if any care at all is used in fall preparation, but spring dwindling, which does not affect the colony till the severity of winter is over, decimates more apiaries than all other causes combined. What is spring dwindling, and how can it be prevented?

These are serious questions, and as yet no positively correct answer has

been given. The matter is largely one of theory, and possibly a solution may never be found, still in matters of true theory it does well to agitate, for by agitation only can we arrive at truth; that is, if no agitation is made, and no discussion had, the matter may be allowed to slumber into forgetfulness never to be awakened. Spring dwindling is characterized by diarrhoea, misnamed dysentery; find the cause and you prevent the disease; discover a remedy and you can cure it.

There is a remedy, but the great trouble is, it cannot be applied. Cleansing flights will cure this diarrhoea, for it is not a disease, but only an overloaded state of the bowel; and this overloaded state is found at just the time when the bees cannot safely fly, else there would have been no such condition. It being impossible then to apply a remedy, we must bend our energies to seeking out the cause, for that is the only course now left us. As many causes almost as there are bees in a colony, have already been given us, none of which, however, have proven to be correct; and in my opinion their authors had little faith in their correctness, when they presented them. The trouble is, there are many causes; or a combination of causes is needed to produce it. The bee in its normal state can exist for many months without the need of a cleansing flight; and during that confinement can partake of both honey and pollen without producing any disturbance of the bowel, all effete matters being carried off therefrom in a dry state. If this is so, and I defy proof to the contrary, we must then look for some poisonous condition of the food, as the cause of this acute inflammation which causes diarrhoea; for acute inflammation there must be, to change the contents of the bowel from a dry to a watery state. Now, what is it?

I propose to answer the question at the risk of calling down heaps of scorn and derision, from those who have already spelled, but have not got to the head. Unsealed honey may be, and at times is a cause of this complaint. Confine a colony on a warm day, and when you let them out, do they not show symptoms of diarrhoea? And if the confinement lasts for several days, they are very largely affected by it.

Again, sealed honey may contain enough moisture to cause it to ferment. Does any one deny this? If so they can easily verify it. But the real cause is, no doubt, lack of proper ventilation. This will cause moisture in excess; the bees in their endeavor to get rid of the moisture, are forced to partake of food; this food has become soured, and ferments, and the consequence is, that the bowels are inflamed.

Now if a warm pleasant day follows immediately, no trouble ensues, but if it continues cold for a number of days, food must still be partaken of, and the bowel constantly becomes more and more distended, till at last poor bee nature can stand it no longer, and must discharge its offensive contents in the hive or die, and if relief by rea-

son of warm weather does not come soon, the whole colony succumbs and dies.

The above is my answer in brief, and I shall stand by it till some one gives a better one. If I am correct, the remedy is easy to ascertain, but, perhaps, difficult to apply. It consists in so ventilating the hive that a perfectly natural condition of things is constantly kept up during the whole term of freezing weather. How this state can be brought about, I leave for others to determine. I have my own ideas on the subject, and at some future time may be tempted to make them known. For the present I am content if I have started up a little spark, which may, in the near future, form a big blaze.

Cyprian and Holy Land Bees.

D. D. DANHER.

I have had both kinds for 3 or 4 years, and would like to give my opinion of them. I obtained Cyprians for two breeders to see if they would be alike. Their manner was alike, but one was dark in color and the other light. I think the dark ones the hardiest, the best honey gatherers, and they do not rob as much as the others. I have 8 or 10 colonies of them, and am not sick of them. If Mr. Doolittle wants to get rid of his, I will take them, for I think they will just suit me.

I have two Holy Land queens; they are very dark, and so are the bees, but they are good workers, always strong in numbers and stores. They are always ready for defense. You can leave home for a month and leave the honey board off, and they will take care of themselves.

I have 28 colonies of bees buried; they are mostly in deep frame hives, but some are in straw hives, logs, and box hives. Two are on the summer stands, and all are wintering first rate.

Madison, Wis., March 5, 1884.

For the American Bee Journal.

An Important Point in Wintering.

ALLEN PRINGLE.

In a late issue of the *Canadian Farmer*, a correspondent, in giving his apiarian report, tells us how he put 25 colonies into a cellar "built expressly for the purpose" in the fall of 1882, and when he came to take them out in the spring, they were "one mass of mold." He says they did not appear to have sufficient ventilation; that the entrances were completely choked up; and between dysentery and mold were a terrible mess. After the spring dwindling was over, he found himself with only 4 colonies.

Now, this case furnishes a good text. It affords an excellent opportunity to point out a radical defect in the construction of hives; a defect

I have not unfrequently noticed even in the hives of leading apiarists and supply men.

In every hive, no matter what the style, there ought to be a ventilating hole in the back part 2 or 3 inches above the bottom-board. This should be covered with strong wire gauze inside, and a good button outside, so that it can be opened and shut at pleasure. In hot weather it can be left open, and then serves as a good ventilator. In the spring and fall, when a leading object is to keep the bees warm, and there is a sufficient ingress of fresh air at the entrance, this hole can be filled with wool from the outside, the button closed, and the cold thus kept out.

But it is in wintering that this arrangement is imperatively needed and becomes especially important. Indeed, I regard it as quite indispensable whether the bees are wintered outside or in. When wintered in a cellar or in a bee house the button can be left open; and then, no matter how many dead bees may be deposited on the bottom-board, choking up the entrance, the air can still enter at this hole.

And it is of equal value and importance in wintering outside. Lately I have noticed in more than one of the bee papers correspondents anxiously inquiring about the safety of colonies covered up in the snow drifts. And well they may, if they have not looked after this matter. A strong colony of bees under a snow bank, with other winter protection, will generate so much heat that even though the entrance may have been left wide open, the snow surrounding it will be melted from time to time until the entrance becomes completely closed with a thick glade of ice. Then if there is no other medium of air ingress, goodbye to the bees in a majority of cases. Still, there is probably this exception: In the case of a double-walled hive filled in with sawdust, and "ship-lapped" like the Jones double-walled hive, I am inclined to think that bees would not smother even though all the entrances were closed, that is, if the hive had not been so long occupied as to be hermetically sealed up inside the walls with wax. But these hives are not yet in general use, and even though they were, it would hardly be safe to depend upon the collateral ventilation through the walls of the hive under a snow drift. But it is quite impossible for the ventilating hole described above to become filled with ice; and it will serve to ventilate when the entrance gets either clogged up with bees or frozen up with ice.

This winter I am wintering 8 of the stronger colonies outside on the summer stands. Some 2 or 3 weeks ago, soon after the first heavy snow storm, I went to examine them, as some of them were quite covered up with snow. As I had stuffed the back ventilating holes with wool in the fall, and closed the buttons, I thought they might need some attention. I have three or four styles of hives in my apiary—the Jones hive, double and single-walled; the Thomas hive

improved; and a hive I make, which is quite different from both, and for which I have no name, and holding 14 frames below and 14 above, which I use mostly for extracted honey. I have also one Langstroth hive—a hive which has good features, but I do not like the frames for extracting. The bees I have wintered outside are in two double-walled Jones hives; two single-walled ditto; three Thomas improved; and one of my own non-descripts, making eight.

They are all, of course, provided with the back hole ventilator, for I always try to practice what I preach. One of the double-walled hives which I had not made myself, was without the hole, but I put it in during the fall while the bees were in the hive. Of course the double-walled hives, filled in, require a tube in the hole to keep the sawdust or other filling from running out. In this last hive mentioned, the bees were crowded up in the fall on about six frames; and behind the division-board was packed with dry forest leaves with some dry pine sawdust on top of them. (The frames in the Jones hive run parallel with the entrance instead of at right angles with it as is the case with most styles of hives.) Above all this was spread the cloth and then the heavy quilt packed with sawdust. As already stated, the hole behind in all the hives was filled with wool and the buttons closed in the fall. Upon examining the entrances after the snow storm, I found some of them completely stopped up with ice. The bees, however, were all right, as the hives clogged were the double-walled ones, besides they had been but a very short time in that condition. I opened the buttons behind, took out the wool, placed a piece of woolen cloth, three or four double, over each hole and filled in again with snow, and covered them up as they were, leaving the front entrances alone. Two or three heavy snow storms since have covered them up still deeper; but I am content to risk them though ten feet of the "beautiful" should rise above them. Indeed, I would rather have the snow on them than not, especially when the mercury is dancing around below zero most of the time.

Such a winter as this, so far, they are better under the snow than over it, and when it drifts off them, I shovel it on again. Had I known that this winter was going to be so terribly severe as it has been so far here, I doubt whether eight of my colonies would have been left out to winter. Of course they are "protected," but when the mercury persists in remaining below zero for days at a time, no ordinary winter protection will keep frost out of the hives. The truth is, we are all disappointed in the winter. The weather prophets—Vennor, Oats, *et al.*—predicted a mild, open winter; and as last winter was so exceptionally severe, we, too, thought it would not likely be immediately succeeded by a similar one. But the "weather clerk" has sold us again, and our out-door bees must, I suppose, take their chances.

In addition to the ventilating hole already described, there ought also to

be one in every hive in the front about the same distance above the lower entrance, or perhaps a little higher. As this is to serve sometimes as an entrance, the wire gauze must of course be omitted; but there must be a well-fitted button to cover it when not wanted open. This front avenue has more than one use, the principal one of which is to serve as an exit in winter and spring flights, when the bottom entrance is closed either with ice or dead bees, and before the hive is overhauled in the spring. At other times it can be kept shut if desired, except in hot weather when it can be left open for ventilation.

Southern Wisconsin Convention.

The bee-keepers met in Janesville, Wis., on March 4, and organized a permanent society, to be known as the "Southern Wisconsin Bee-keepers' Association." The following named persons were elected officers for the ensuing year: President, C. O. Shannon; Vice-President, Levi Fatzinger; Secretary, J. T. Pomeroy; Treasurer, W. S. Squire.

The regular sessions of the association will be held on the first Tuesday of March in each year. Special meetings will also be held, the time and place of which will be determined at previous meeting.

The object of the association is to promote scientific bee-culture and form a bond of union among bee-keepers. Any person may become a member by signing the constitution and paying a fee of 50 cents. The next meeting will be held at the Pember House in Janesville, on the first Tuesday in May, at 10 a. m. All bee-keepers are cordially invited to attend. The secretary, J. T. Pomeroy, of Edgerton, Rock County, Wis., will conduct the correspondence of the association. J. T. POMEROY, Sec.

Bees Eating Grapes.

HENRY ZEIS.

The following item is from the *Gardner's Monthly*, and I saw it in the *National Farmer*. As I wish to give my experience, I will quote the item here:

"It has been clearly demonstrated by Australian experience, that the honey bee can open flowers from outside as well as the humble bee in this country. We have never had any doubt ourselves that they do manage to cut open grapes somehow, and eat them; but as good entomologists declare that their tongues are not equal to the task, it was not wise to argue the point too strongly. But now that it has been clearly proved that they can cut open flowers to get the honey easy, there is no reason why they cannot cut a delicate grape skin also. We now regard the question settled. Bees do cut into and eat grapes, and to that

extent are an injury to the fruit grower."

I have two acres of vines, of different kinds, close by my apiary of over 50 colonies, but I never saw a grape punctured yet by a bee, though I laid grapes in front of the hives. I know that they will not touch a sound grape, but if wasps injure them first, the bees will suck up the juice.

Pacific, Mo.

For the American Bee Journal.

Convention at Davenport, Iowa.

The second annual meeting of the Eastern Iowa and Western Illinois Bee-Keepers' Association was held at Moore's Hall, Davenport, Iowa, beginning Feb. 21 and lasting three days. President I. V. McCagg called the meeting to order at 2 p. m. Secretary J. J. Nagle being absent, Wm. Goos was appointed secretary *pro tem*. The roll being called, most of the members were found to be present.

The minutes of the last meeting were read and approved. A motion to have a committee prepare a programme so that it could be published in the daily papers, was carried. The committee was as follows: C. H. Dibbern, J. V. Caldwell, and J. B. Lindley.

The Treasurer's report was read and approved.

A letter of invitation from the Academy of Sciences of Davenport, was read by the secretary, and accepted.

The report of the committee on Programme was made and adopted.

A motion to hold evening sessions was lost.

The following were elected officers for the ensuing year: I. V. McCagg, President; Geo. L. Gast, Vice-President; Wm. Goos, Secretary; Israel Hall, Treasurer; all of Davenport. An executive committee was appointed as follows: J. V. Caldwell, of Cambridge, Ill.; J. B. Lindley, of Muscatine, Iowa; and C. H. Dibbern, of Milan, Ill.

After receiving the reports of members, the convention adjourned to 10 a. m., Friday.

President McCagg called the meeting to order at 10 o'clock, there being a much larger attendance than on the first day.

According to programme, Mr. T. G. Newman then gave an address on "Marketing Honey." He spoke of the importance of the subject, and then of the antiquity of the business. More than 2,500 years ago is the first record we have of commerce in honey, in Tyre, and since then it had been marketed in various ways until we have the excellent methods of to-day. The product of the world is estimated at about \$25,000,000, and of this 100,000,000 pounds is produced in America. A mistake made in the marketing of honey that reduces the price one cent per pound for the crop, would lose \$1,000,000 for the producers, and to add one cent per pound would put that amount in the pockets of the producers. Comb honey, being a fancy article, we must so manage it, as to

get a fancy price. We should make it attractive, assort and label, keeping each kind separately. Small crates sell the quickest, and are of the most advantage. Extracted honey should be ripened and placed upon the retail market in small packages, such as cans, jelly cups, kegs, etc., and being good for years, it has an advantage over comb honey. Candied honey could be carried in paper boxes. The candying is a proof of purity, and all honey should be labeled with the keeper's name and address; and that name should always be a synonym for purity, so that when a person purchases this honey he may feel sure it is absolutely pure, and in that way the producer could build up a local market that would last for years and increase constantly. He closed by advocating large exhibits of honey at all the fairs, in order to educate the people to the importance of the product, and to induce them to use honey both for food and medicine, and thus increase the demand.

Mr. Briggs, of Wilton, spoke on the subject of freights, and said he could get better rates by express than by freight.

The Rev. O. Clute heartily endorsed the ideas of Mr. Newman, and dwelt particularly upon the advantages and necessity of building up a home market—but then stated that more money could be made by keeping more bees, and producing more honey, and shipping it off to the great central markets than by fussing with the little home markets. Mr. Clute recommended large packages—600 pound barrels; it can be more easily handled as freight, and the merchants prefer it, as more economical in room in the store houses; besides, it sells more readily to the large purchasers for manufacturing purposes. Packages which hold 175 to 200 pounds may do for purchasers of small quantities, but 600 pound packages are the most profitable.

A very large part of the honey crop is now taken in the form of extracted honey. Comb honey is good and beautiful, but it has the disadvantage of the wax, which is indigestible, and which nobody cares to eat. In the extracted honey we have no wax, it is honey in its purest form. Many people associate extracted honey with strained honey; they suppose that all honey out of the comb is strained honey, but this is great injustice to extracted honey. In getting strained honey all the combs from a hive, combs containing capped brood, and growing larvæ and pollen and honey, are mixed up together and then the liquid squeezed out. In this way there is obtained some honey, but there is also obtained the juice of the growing larvæ of the young bees, and of the pollen, so that the honey has a rank flavor, a dark color, and associations by no means appetizing. But extracted honey is as different from this strained honey as it is possible to be. In getting extracted honey, we get no pollen, no juices of bees or larvæ. We get simply the pure honey, without any admixture whatever. He, who on a cold winter morning has

never had pure, candied, white clover honey to spread on his hot cakes, has lived in vain! Life has lacked for him one of its chiefest charms! He said that he never understood the full meaning of the scripture description of "the land flowing with milk and honey" until he went into the honey business. Take a dish of pure extracted honey, and pour cream from your Jersey or Ayrshire cow over it, and you have a dish fit for any god or goddess that ever dwelt upon Olympus.

Mr. Joshua Wadsworth, of Moline, Ill., said that talking about 600 pound packages for shipment was all well enough, but he did not believe that many there raised enough honey to fill even two packages of that kind in a year. What is wanted is information as to the best method of disposing of honey in local markets. He spoke of the importance of neat packages, avoidance of overstocking the market, etc., and other matters of interest to the bee-keeper.

A recess for 15 minutes was taken, when new members were received, and the membership fees collected.

The executive committee reported that they did not think it advisable to hold more than one annual meeting, and recommended that the annual picnic be held on Blackhawk's Watch Tower, four miles south of Rock Island, on the second Tuesday in August. That the Secretary be instructed to notify the members at least two weeks previous to the holding of the picnic. They also recommended that the portion of the President's address relating to the members being sociable with each other, be adopted. That the invitation of Mr. O. Clute, of Iowa City, to visit his apiary, be accepted. The time to be set by Mr. Clute sometime during May. Also that the invitation of Mr. E. L. Briggs, to visit his apiary at Wilton sometime in September, be accepted; the time to be arranged by Mr. Briggs.

It was voted to refer this back to the committee to fix the dates for the picnics.

Mr. J. V. Caldwell, of Cambridge, Ill., spoke of the difference in flavor of extracted honey and comb honey. People, as a rule, liked comb honey the best. It was more tasty.

Mr. Newman said that the difference in the pleasure experienced in eating comb and extracted honey, was probably explainable thus: In eating extracted honey, a spoonful was taken into the mouth on the tongue, back of the tip, and was swallowed without obtaining the full richness of taste, while the comb honey was taken by the teeth, and the tip of the tongue received the full flavor and deliciousness of the honey, permeating the organs of taste, and giving the whole system a feeling of ecstasy that would fill even a mythical god with delight.

Adjourned till 2 p. m.

The afternoon session was called to order by Pres. McCagg at 2 p. m., when the bee and honey reports were taken of those who were not present in the morning.

The Rev. E. L. Briggs gave an address on the different varieties of bees. After describing the large bees of Java, the little stingless bees of South America, the native black and brown bees of North America, the Carniolan, Egyptian, Italian, Cyprian, and Syrian bees, he said that he preferred the pure Italians, which were both prolific and hardy.

The Rev. O. Clute described his method of wintering bees, and said: I am careful to see that they have honey enough in the fall; as a rule, 25 lbs. is a large amount. Keep the bees strong in the fall, but it is better for them not to have any brood when you move them into the cellar, for all the young bees ought to have a fly before putting them into the cellar. I give no upward ventilation. I have shallow trays made that fit over the hive; the bottoms of the hives are covered with muslin, and the trays are filled with sawdust. They are wintering very good; better than usual. I carry them into the cellar after cold weather has set in, but not too early in the season. I then pile them from 3 to 4 feet high, and put the lower row some distance from the bottom of the cellar. The chimney goes to the bottom of my cellar, and the draught carries off all the foul air. In my cellar the ground is dry—the windows are covered to make it dark; but I have them so I can open them, if I want to. I have a stove in the cellar to keep the temperature between 40° and 45°; they do not eat as much honey at that temperature as they would in a higher one.

Mr. Mead asked if there was any objection to putting the bees in a cellar where there are vegetables?

Mr. Clute said if the vegetables are not decayed it will make no difference. I leave the button open when I put them into the cellar.

Mr. T. G. Newman being called on to give his views concerning the best bees, said that the Italians no doubt possessed many of the most valuable traits of character. What we need is to "breed up," all the time keeping our eye upon the characteristics of "our ideal bee." To obtain the best results, we must possess the highest grade of bees that it is possible to obtain. Our object being to elevate the race, no deterioration should be countenanced, and the most thorough and rigid treatment must be employed, all looking to the building-up of a strain of bees that will give the best of results.

The queen must be prolific to be able to keep the hive full of bees, to gather the honey harvest when it comes; the bees must be industrious to let nothing escape their vigorous search while gathering the sweet nectar; they must be docile to allow the apiarist to manipulate them with ease and pleasure; they must be strong and hardy, to withstand the rapid changes in climate; and must be of singular beauty, to attract the admiration of the fancier of fine stock.

"The bee of the future" will be present at the very moment when the slumbering flower, under the penetrating dew, awakes to consciousness, and unfolds its buds to take in the

first rays of the morning sun. The ideal bee will dip into that tiny fountain, which distills the honey drop by drop, and bear off its honeyed treasure to its cells of virgin comb.

In developing the highest strain of horses, not all their offspring are equal to the best; careful selection of those coming the nearest to the ideal animal must always be chosen, from which to breed, and the closest scrutiny is necessary while making that selection. The same is true of cattle, sheep, hogs, poultry and bees. "Sports" and "variations" continually occur, producing inferior progeny; but all careful breeders who have an eye to the improvement of the race, will reject those that do not come up to the "standard of excellence," sending such animals and poultry to the shambles—so let us carefully select the best queens and drones to breed from, and remorselessly sacrifice all others.

Rev. O. Clute spoke of the effort being made to get a good exhibit at the State Fair and suitable premiums for honey exhibits. The present premiums offered amount to about \$175, obtained largely through his efforts, and he had strong hopes of succeeding in obtaining a still larger amount as an inducement to bee men to improve the quantity and quality of the exhibits. He also thought that the bee-keeping industry could be made of sufficient importance at the State Fair to cause the Fair managers to put up a separate building for that department, when the Fair is made a permanent institution.

Adjourned to Saturday, at 10 a. m.

On Saturday morning President McCagg called the meeting to order at 9:30 o'clock. Several communications were read, and among them was one from Mr. Jerome Twitchell, of Kansas City, giving advice on shipping honey.

A model of a straw hive, made by a Hollander, was presented to the Society by the Apiarian Supply Company of Wilton, Iowa.

Those who had articles on exhibition were each given five minutes to describe them.

Mr. Nagle then asked if bees are short of stores at this time of the year, what is best to feed them?

Mr. Wadsworth said he always kept a few full frames of honey for that purpose, and when a warm day came, he took out an empty frame and put in the full one.

Mr. Nagle thinks it is best not to disturb bees in the winter.

Mr. Gast thinks that feeding rock candy is good.

Mr. Younkin says he feeds taffy made of honey stirred in with powdered sugar pretty stiff, and put it on the top of the frames.

The members then went in a body to the Academy of Sciences, as per invitation, when the little straw hive before mentioned, was presented to the Academy of Sciences by the association; Mr. E. L. Briggs making the presentation address. Mr. H. C. Fulton, President of the Academy, replied in a few well-selected words of welcome and thanks. Mr. T. G.

Newman, being called on, made a few appropriate remarks. Mr. E. L. Briggs said that he would present to the Academy a model hive, with all the modern improvements, to put with the more-ancient straw hive, and show by contrast the advancement made in apiculture.

Adjourned to 2 p. m.

The afternoon session was called to order at 2 p. m. by President McCagg. The minutes of the former meetings were read and approved.

Mr. Kimball said he thought some of the most important things have been overlooked, such as introducing queens, fertile workers and foul brood. One of the members has foul brood in his apiary. I would like to know the cure and preventive.

Mr. Goos said, burn the hive.

Mr. Briggs said, it was probably brought about by introducing a queen or buying a nucleus, and unless something is done it will spread; the only way to cure it is to burn the hives and contents. It can be cured, but only with the greatest of care.

Mr. Kimball said that some one had shipped bees here that had it.

Mr. Carpenter: Some persons told me not to say that we had foul brood. We have our bees in a clamp, and they cannot get out; if they have it, I shall burn every one.

Pres. McCagg: Has your neighbor the same opinion of foul brood that you have?

Mr. Carpenter: Yes, sir; he says he will burn every one. Some bees were sent here from Illinois, four years ago, that had foul brood, but they were cured.

Mr. Briggs thought it was handed down from them.

Mr. Gast: I was in Clinton 16 years ago, and saw foul brood there, and it was spreading about Lyon, and even across the river, to Fulton. The cell is somewhat sunken with a small hole in the centre; you can tell it by the smell.

Mr. Nagle: I would like to say that our committee have been invited to hold their meeting at the Academy of Sciences, and if we send flowers or birds they can be identified there.

It was decided to hold all meetings between now and the next annual meeting at the Academy.

According to the programme, Mr. T. G. Newman then gave a lecture for an hour, on the necessity for providing bee pasturage. He described the advancement of the art of bee-keeping from its earliest date, and said that the unfolding of each invention was the result of the necessity for its existence. The woodman's axe had felled the trees, and the march of civilization had destroyed the wild flowers, from which the bees formerly gathered their stores—now it became a necessity that bee-keepers must supply the want, and provide pasturage for the bees, if they would have the best results. This subject was of immense importance, because if we failed to provide the bloom, the bees could not gather the honey, and the golden dollars would not glide into the pockets of bee-keepers, by the sale of that sweet article of commerce.

Rev. E. L. Briggs: If any one sets out shade trees, let them set out basswood or linden. Nature gives us a succession of bloom; first there is the willow, then the plum, peach, cherry, apple, gooseberry and raspberry, keeping the bees always busy enough to keep up breeding and have the hive full of young bees in time for the great honey flow in June from white clover. Young bees never fly until they are 16 days of age, and they will be ready just in time for this great honey flow, lasting about four weeks; then comes the linden, after that a vacancy in the honey flow comes in the right time, as the brood has been pretty well crowded out, and now the queen will fill every corner with brood for the young bees, for the fall flow of honey. Now comes the fall flow from heart's-ease, smartweed, goldenrod and catnip. I should sow seed, as Mr. Newman suggests, but not depend upon it alone. I just arose to supplement what Mr. Newman said. Mr. Muth, of Cincinnati, has his apiary on his house-top, and depends on Nature for his supply in the midst of that large city.

The Statistical Report for 1883 of the members of the association was announced as follows: 1,703 colonies in the spring; 2,669 colonies in the fall; these produced 38,385 pounds of comb honey; 29,515 pounds of extracted honey, and 546 pounds of wax; 13 wintered their bees in cellars; 7 in bee houses, and 23 on the summer stands; 32 reported the bees in good condition, 4 fair, and 2 poor.

Mr. Moore: Do chickens eat bees?

Mr. Carpenter: Chickens eat drones; they catch them on the fly.

Mr. Nagle: Do they never catch other bees?

Mr. Carpenter: I have watched them, and have never seen them catch worker bees.

Mr. Briggs: If he has such chickens, I would like to buy some of them.

Mr. Nagle and Rev. E. L. Briggs explained their methods of rearing queens.

On motion the time for holding the next annual meeting was fixed for the third Wednesday and Thursday in February, 1885.

Mr. Newman suggested that the fact that reduced fares may be obtained, be incorporated into the notice for the next meeting.

On motion the convention adjourned till the third Wednesday in February, 1885.

Wm. Goos, Sec.

For the American Bee Journal.

Specimens of Foul Brood.

T. J. BURRILL.

I notice Mr. Stewart's criticism on page 167, upon sending specimens of suspected comb through the mails. The points are well taken, and should be well heeded. My requests were not sufficiently guarded—indeed, I did not at the time think of the possible infection of a healthy colony through the mails. While the chance must be considered a remote one, and may be altogether avoided by proper wrapping, still men are not always prudent

and careful, and as the matter is important, all ought to agree with Mr. Stewart. Please do not send me any more specimens in this way; perhaps it is better not to send any more in any way. I have enough of the genuine stuff on hand now to start any number of cultures.

The main point to determine by a large number of specimens is whether or not what bee-keepers call foul brood is always the same thing, and, if not, to ascertain reliable characteristics of the different diseases. Of the considerable number of packages received, all save one were clearly of the same nature. Two said to be a mild form of foul brood, contained the same microscopic organism found in malignant cases, and I have no doubt would upon inoculation of a healthy colony produce the same effect. But this latter might not prove true, because it is now known that some of these minute parasites or "disease germs" differ in their physiological effects while the appearance remains without change. Their virulence is modified, somewhat as cultivation changes the poisonous properties of certain flowering plants. This is a most proper subject for investigation, yet it cannot be done without material of all kinds and forms of the disease.

As spring approaches I find myself face to face with another serious impediment to a complete study of this dreaded scourge of the apiary. Manifestly an investigation to be practically valuable must include direct experiments on the bees themselves, including, of course, the young from the egg onward. Mr. Heddon queries (on page 164) whether ten miles is not a proper distance apart for apiaries. Suppose my experimental bees fly the distance thus suggested, and suppose the disease be distributed by the successive visits to flowers, what a pretty "kettle of fish" I should soon have on hand!

It is true that many think they know that foul brood is not conveyed from colony to colony by such means, but it seems certain that no one does know. To prove or disprove such points is the object of an investigation. I find it feasible to cultivate successfully the organism (*Bacillus*) in meat broth in little glass flasks stopped with sterilized cotton-wool. From a minute speck of the material in a diseased comb any quantity can be furnished by the aid of these flasks, and microscopical examination can be made at any time, and as often as desired without introducing other organisms from the air or otherwise.

In this way the life history of the "disease germ" can be made out—its method and rapidity of propagation, the effects of stated temperatures, of disinfectants, etc. So far there is no trouble, but how can we be sure that growth and development in meat broth is the same as in the brood of bees? Is it feasible to keep a sufficient number of bees shut up with brood comb to try results?

Champaign, Ill.

We now club the *British Bee Journal* and our Monthly for \$2.50.

Convention Notices.

We will organize a bee-keepers' association at the Court House in Franklin, Ind., at 10 a. m., April 5, 1884. All bee-keepers are invited to attend and take part in the organization.

L. R. JACKSON.

Urmeyville, Ind., Feb. 26, 1884.

The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest, for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twichell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

The Lorain County Bee-keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.

O. J. TERRELL, Sec.

North Ridgeville, O.

The Progressive Bee-keepers' Association will meet for their spring meeting May 3, 1884, at the apiary and residence of J. B. Haines, Bedford, Cuyhoga County, O. All interested are invited.

J. R. REED, Sec.

The Union Bee-keepers' Association of Western Iowa, will meet at the Emmett house, in Dexter, on Saturday, March 29, at 10 a. m. sharp. All who are interested in apiculture are invited to attend.

M. E. DARBY, Sec.

W. B. KENYON, Pres.

The next meeting of the Bee-keepers' Association of Central Illinois, will be held in the office of the County surveyor, in Bloomington, on Wednesday April 9.

W. B. LAWRENCE, Sec.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Why did they Die?

I bought 15 colonies of bees in December, which are in a cellar where water will freeze, in cold weather; 14 colonies are apparently in good condition; the 15th having died from some cause unknown to me. I send some dead bees and honey, also a piece of the frame and empty comb. Please give me your opinion of them, and what to do with the rest, through the Weekly BEE JOURNAL.

CHARLES GARVEY

Hammondville, N. Y.

ANSWER.—Your colony of bees is afflicted with what is known as bee diarrhoea, dysentery or cholera. We think it is caused by eating improper food. It is not contagious, and regarding your other colonies, I know of no advice to give, better than to say set them out for a flight as soon as the weather is suitable. The worst time for realizing the havoc of this disease is yet before you.

Entrance to Sections over the Frames

1. Will Mr. Heddon please tell us in "What and How" whether the strips in his honey-board come directly over the top-bar of the frames, below or over the spaces between the frames?

2. Does the entrance to the honey boxes match the entrance in honey-board, or do they come directly over the strips of honey-board?

3. Would the queen be more liable to find her way to the surplus boxes if the entrance to them matched the spaces between the honey-board and frames below, than she would if otherwise?

4. Are the bees more liable to build bits of comb between the frames and honey-board, if the spaces match, than they would if otherwise?

5. Will the bees find their way to the honey boxes as soon if the entrances to them did not match the spaces below?

A. J. FISHER.

East Liverpool, O., March 8, 1884.

ANSWERS.—1. The slats in the honey board which are $1\frac{1}{2}$ inches, are so placed that their centers come directly over the spaces between the top bars of the brood frames below, while the center of the top-bars of the brood frames come directly under the spaces between the slats of the honey board.

2. There is no regularity regarding the matching or mismatching between the spaces in the honey board, and between the bottoms of the sections. This cannot well be, when using different widths of sections, nor with any width, unless as narrow as the room occupied by each brood frame. I find, however, that with our $1\frac{1}{2}$ and $1\frac{3}{4}$ sections, the honey board breaks

the joints between the sections, almost completely. This, however, is not of so much moment, as nearly all the brace combs are built between the honey board and brood frames, and not between the honey board and sections.

3. Yes.

4. Last year we had some hives so arranged that the spaces between the brood frame and honey board matched, and we were seriously troubled with bits of comb between the bottoms of the sections and honey board.

5. You will notice that with our style of honey board, if we put the cases on the hive without any honey board, proper bee spaces are still preserved. For the past 2 years we failed to make enough boards, and so worked about half of our colonies without them. We experienced much more trouble with brace comb, and daubing, but no more surplus honey, or greater tendency to enter the sections where the honey board is not used.

A Query.

Why does not honey run out of the cells when placed there by the bees, being at the same time thin and not capped?

SUBSCRIBER.

ANSWER.—Because it is held in place by the law of capillary attraction. Perhaps thin honey would not be as likely to run out as thick. It would shake out more readily, or obey any immediate command, but you know how a drop of water will hang to the underside of a board, and how a drop of honey would slowly but surely drizzle down.

SELECTIONS FROM OUR LETTER BOX

Bees All Right Yet.

My bees are all right, as far as I know. They have been shut in by the cold for the last 3 weeks. I lost one from starvation. I presume it was robbed last fall. My brick hives seem to do well this winter, and it was a hard one—last week 6° below zero; to-day the snow is 4 inches deep—hard bee weather. My bees were very heavy last fall. I have 24 colonies in the yard now.

ABE HOKE.

Union City, Ind., March 10, 1884.

Alsike Clover.

In answer to G. W. Morris' question in regard to Alsike clover, I would say that I have cultivated it for many years, and would advise Mr. Morris to sow it and furnish seed for his neighbors, if they will sow it. I have never known it to fail in honey, when the white furnished but little. I have known my bees to get honey from Alsike when they never visited the white. Alsike makes the best of hay, is good for pasturage, sweeter and better than any of the clovers,

and is an excellent fertilizer. Has any one ever seen a case of dysentery in the far Southern States? As to the prolificness of queens, what Mr. Doolittle would cherish in his section, Mr. Benton would discard in his. There is nothing strange in this. Mr. Doolittle says: "Here we have but six weeks during the whole season in which the bees make any gain in honey;" and, of course, he wants plenty of workers to gather honey during that time. Here we have from May 10 (if the season is favorable) till Aug. 1, and from the last of August till frost. What kind of queen would Mr. Doolittle want for such a locality? We have an occasional failure in the fall, but Alsike has never missed yet. This season my bees will have 46 acres of Alsike, and by early pasturing with cattle and hogs, it will bloom till the last of August. My observation is, that what is good in one locality will be so only in sections where season, honey flow, pasturage and climate are the same. Let all give facts as existing in their localities; this will benefit many readers.

C. W. SAPPENFIELD.

Crawfordsville, Ind.

Wintered Successfully for 11 Years.

My bees have wintered safely. This now makes 11 successive years without a loss of a single colony, except a few from queenlessness.

H. H. FLICK.

Lavansville, Pa., March 7, 1884.

Bees in Georgia.

Our winter has been unusually cold, though bees have wintered well; and are now busy working on plum and peach bloom, and building up rapidly. It is to be hoped that bee-keepers will reap a bountiful honey crop this year.

J. P. H. BROWN.

Augusta, Ga., March 11, 1884.

Bees Still Confined to the Hives.

Bees are still confined to the hives. There has not been a day since last November that has been warm enough for them to fly. I think they are wintering very well, though this I only guess at.

HENRY ALLEY.

Wenham, Mass., March 13, 1884.

Building up a Home Trade.

Bees, so far, are wintering pretty well considering the fact that we have had a very steady cold winter. Mine have only had two flights since Dec. 15, 1883. I have, up to this date, lost 3 out of 44 on the summer stands. I have had a good honey trade this winter, and I am doing all I can to build up a home trade in extracted honey. I have succeeded in getting our Fair managers to enlarge their premium list for next Fair.

W. H. GRAVES.

Duncan, Ill., March 7, 1884.

[Building up a home trade is the most desirable thing to do. It not only consumes more honey, but gives the producer better prices.—Ed.]

Bees Doing Well.

On Feb. 2 all the bees in Northern Ohio had a splendid flight, and are in the best condition possible. I have 21 colonies packed in buckwheat chaff; they have had no flight since Nov. 5 until Feb. 2. The weather is and has been very cold; often as low as 26° below zero. I have made inquiries of men who own an aggregate of 300 colonies, and have found but 4 dead colonies. Success to the BEE JOURNAL; it comes to hand chock-full of news, and as regular as a clock.

W. S. BAIR.

Bollersville, O., March 7, 1884.

[The Weekly BEE JOURNAL ought to be regularly received everywhere, for we never vary an hour in getting all of them into the mails at 4 p. m., every Tuesday.—ED.]

Not Progressive.

I have had bees for thirty or more years. I now have 70 odd colonies, all in "King" hives. Excepting 2 or 3 years I have obtained annually from 1,500 to 2,000 lbs. of comb honey in boxes weighing, when full, 20 lbs. net. Last year I had some larger boxes holding 25 lbs. I have been in the habit of shipping to my commission merchant in St. Louis, who generally obtained very fair prices, 12 and 18 cents per pound, with no loss, damage or trouble, for 2½ per cent. commission, and returns made quickly. This I considered doing pretty well, as I never had any more trouble with bees than to put them in hives as they swarmed; and two weeks afterward putting on boxes, and just before the first box was finished, raising it up and placing an empty one at the bottom. I rarely get more than two boxes from one colony. Have lost upon an average 3 to 4 colonies yearly from the moth; never any from outdoor wintering. Judging from the present weight of my hives, they now have stores sufficient to carry them through another winter. I never saw more than three queens; never gave a new queen to a colony; never knew of a colony being queenless; never tried to prevent swarming; and the wonderful stories I read of about manipulating bees and honey, confuse me. I cannot tell where or how to begin.

A. M. CURL.

Waverly, Mo., March 11, 1884.

Bees in Arkansas.

We are having the greatest overflow here since 1884, so say some of the old folks. I put my bees on a ridge that I never saw under water since I have lived in this country (which is about 14 or 15 years), and now the water is 2 feet deep under some of the hives. As soon as the water began to come upon the ridge, I raised the hives between 2½ and 3 feet, and so far I have lost only a few that fell into the water. The bees were working finely until a few days ago; the weather became cold, and with it a heavy rain fell. For near two weeks now they have not been able to

do anything. When I want to see how they are getting along, I get into my skiff and rap on each, and it is answered by their buz; sometimes, if I give a second rap, the guards will come to the entrance to see what is wanted. They were wintered on the summer stands, and out of 125 colonies I have lost 4 or 5, and I think they were robbed. I was away from home one warm day, and on returning late in the afternoon, the robbers' voices were the first thing I heard. On going to them, I found they had cleaned out two weak colonies. The maples, elms and peach trees were in bloom some 2 or 3 weeks ago, but we have had cold wet weather most of the time, and the bees have had but little chance at them. We hope the water will go down in a few days, and then the bees can come out in full force.

CHAS. H. KINCADE.

Sterling, Ark., March 7, 1884.

Educate the Customers.

Mr. S. Smith, on page 154, expresses my sentiments exactly. I have had the same question asked me probably over 100 times. When I would explain it to a customer and show him the extractor, how it worked, and all about it, I had no trouble to sell him extracted honey; but just so sure as it is offered in a locality where it is not known, they will raise the cry of "adulteration," glucose-sugar, etc. The uninitiated think, of course, it should sell for more than comb honey; they do not know the why and wherefore; so we must teach them. You, Mr. Editor, offer to help us out, in your foot note, and want to know who will take them? I can make good use of about 500, at the price you offer.

E. J. SCOFIELD.

Hanover, Wis., March 10, 1884.

[The responses have been sufficient for us to announce positively that the Leaflet of two pages will be issued at once, so that orders may be sent in at any time. The prices will be: 200 copies for a dollar; 500 for \$2.25; 1,000 for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address free, at the bottom. Less than 200 will have a blank in which the name and address can be written. All by mail, post-paid, at the prices named.]

Leaflet No. 1 is entitled, "Why Eat Honey?" It describes what pure honey is—explains how the bees place the comb in the sections—how pure honey is extracted from the comb, and why it can be sold at a less price than comb honey—shows the difference between "strained" and "extracted" honey—and explains the cause of candying, and how to liquefy it, etc. It is illustrated with a honey extractor, a section of comb honey and a pail of extracted honey. Samples are sent to all who have responded to our query—"Who will take them?"—ED.]

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., March 17, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the honey market. No change in the price of extracted honey, but there is an improvement in the demand. Comb honey is in large supply, and the best in 1 lb. sections brings no more than 16c. a lb. from store. Extracted, 7c@10c.

BEESWAX—Fair demand, and arrivals are fair. It brings 28c@32c. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17c@18c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9c@10c.

BEESWAX—Prime yellow, 34c@35c.

H. K. & F. B. THURBER & CO.

CHICAGO.

HONEY—Goes off slowly, and prices are lower on sections that are imperfectly filled. The demand seems to be chiefly for lots that are fancy in appearance, and in every way perfect selections made of 1 lb. sections at 15c@20c.; 1¼@2 lb. sections, 14c@18c.; dark and mixed in color, very slow, at about 12c@13c. Extracted honey steady, but limited demand; prices range from 7c@10c. per lb.

BEESWAX—Scarce, at 28c@35c., according to color and cleanliness.

R. A. BURNETT, 161 South Water St.

KANSAS CITY.

HONEY—Receipts of comb honey quite liberal, and prices lower. Choice white 1 and 2 lb. sections, 16c@17c. with probability of still lower prices. Dark and irregular combs, 10c@12c. and slow sale at that. Extracted dull at 8c@10c.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Reports from the bee districts are to the effect that the prospect is excellent for a heavy yield, the only discouraging news being the loss of a good many bees which were located in the bottoms of canyons, and were washed away by the freshets. Market is inactive. White to extra white comb, 15c@18c.; dark to good, 10c@13c.; extracted, choice to extra white, 7c@8c.; dark and candied, 5c@6c.

BEESWAX—Wholesale, 27½c@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12c@16c. per lb., and strained and extracted 6c@8c.

BEESWAX—Firm at 33c@33½c. for choice.

W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market has been dull with us during the month of January, but the past week it has been better, so that stocks are again reduced. Choice white 1 lb. in good order, sold at 18 cts.; the same quality when broken sold at 18c.; 2 lb. best white, 16c@17c.; second quality, no sale. Extracted as usual, not at all wanted in our market.

BEESWAX—In great demand, but no supply; nominally 30c. per lb.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 15c@20c.; 2 lb. 16c@18c. Extracted, 9c@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Cbatham Street.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

The Western Michigan bee-keepers, will hold their spring meeting at Berlin, on April 24.

F. S. COVEY, Sec.

Bee Pasturage a Necessity.—We have issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for ten cents.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send *direct to this office*, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

| | |
|----------------------------------|--------|
| For 50 colonies (120 pages)..... | \$1 00 |
| " 100 colonies (220 pages)..... | 1 25 |
| " 200 colonies (420 pages)..... | 1 50 |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Italian Bees and Queens For Sale.

Tested Queens, May, \$3.00; June, \$2.50; after July 1, \$2.00 each. Untested, after June 1, \$1.00; 6 for \$5.40. Full colonies in May, \$7.00; 2 for \$13.00; 10 for \$80.00. After June 1, \$1.00 less each colony. Satisfaction guaranteed. L. S. CROWFOOT,

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis.
 Dear Madame:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of thin foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.
 Yours,
 CHAS. DADANT & SON.

Hamilton, Ill., Dec. 10, 1883.

MRS. FRANCES DUNHAM, De Pere, Wis.
 Dear Madame:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
 Yours very truly,
 D. A. JONES.

Beeton, Ont., Dec. 10, 1883.

MRS. FRANCES DUNHAM:
 All prefer the foundation I manufacture on one of your mills, to that made on any other machine I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
 Yours respectfully,
 J. G. WHITEN.

Genoa, Cayuga Co., N. Y., Dec. 12, 1883.

MRS. FRANCES DUNHAM:
 After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.
 Yours,
 SMITH & SMITH.

Kenton, Ohio, Dec. 29, 1883.

MRS. FRANCES DUNHAM:
 I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretchmer, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is me always a jewel. You are at liberty to publish this. Yours truly,
 T. L. VON DORN.

Omaha, Neb., Jan. 18, 1884.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: 4 1/4 x 4 1/4 x 6, 7 and 8 to the foot, per 1,000, \$6.50; 5x6x2, per 1,000, \$8.00. All shipped from here.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax, the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beewax. To avoid mistake, the shipper's name should always be on each package.

CLOVER SEEDS!

The present prices are as follows:

White Clover, \$15.00 per bushel, \$4.00 per peck, or 30 cts. per pound.

Alsike Clover, \$12.00 per bushel, \$3.25 per peck, or 25 cts. per pound.

Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents. Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents. Postage, 13 cents extra.

One pound spools, each, 40 cents. Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO SCIENTIFIC BEE-CULTURE AND HONEY PRODUCTION.

ESTABLISHED IN 1861

Chicago, Ill., March 26, 1884.

VOL. XX. No. 13.

THE WEEKLY EDITION OF

THE AMERICAN BEE JOURNAL

PUBLISHED BY
THOMAS G. NEWMAN,
 EDITOR AND PROPRIETOR.
 925 WEST MADISON ST., CHICAGO, ILL.
 Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one new subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
 To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion.
 For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

☞ Letters for publication must be written on a separate piece of paper from items of business.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75.

☞ We have a few photographs (cabinet size) just taken, of the Rev. L. L. Langstroth, which we can send to those desiring them for 50 cts. each, postage prepaid.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

CLUBBING LIST FOR 1884.

We will supply the American Bee Journal one year, and any of the following Books, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

| | Price of both. | Club |
|--|----------------|------|
| The Weekly Bee Journal..... | \$2 00. | |
| and Cook's Manual, last edition (In cloth) | 3 25 | 3 00 |
| Cook's Manual, (In paper covers).... | 3 00. | 2 50 |
| Bees and Honey (T.G. Newman) cloth | 2 75. | 2 50 |
| Bees and Honey (paper covers)..... | 2 50. | 2 25 |
| Binder for Weekly Bee Journal..... | 2 75. | 2 50 |
| Apiary Register for 200 colonies.... | 3 50. | 3 25 |
| Dzierzon's New Bee Book (cloth).... | 4 00. | 3 00 |

The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.

☞ The first edition of the "Apiary Register" having been exhausted, we have just issued a new edition, elegantly bound in Russia leather, with a large worker bee and "Apiary Register" in gold on the side. It forms not only a Register of both Queens and Colonies, but has also an Account Book at the back, in which to keep a record of all the receipts and expenditures of the apiary, which will be found exceedingly valuable. We have also reduced the prices, as will be seen on another page.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCAVING KNIFE

PATENTED, MAY 20, 1878.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncutting-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

For mail orders and testimonials, send card. To sell again, send for dozen rates to

BOOKS!

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Diehl and S. Kluterd, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy." Cloth, \$2.

Queen-Rearing, by Henry Ayer.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide (or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey, etc." It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 40c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—One of our views on this important subject, with suggestions what to plant and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—122 pages, pocket form. Gives useful tables for casting up grain, produce, hay; cost of pork, interest, wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc. of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of useful knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use.—Giving a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "every thing pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey-Bee.—This is a standard scientific work. Price, 52c.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Breed; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Derthlichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königin—Füttern—Schwärmen—Ableger—Versezen—Italienisiren—Züfeker von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigtuchen, Formküchelchen, Puddings, Schaumconfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Caution to Beginners.

Since Huber opened out the combs of the hive "like the leaves of a book," to the inspection of the bee-keeper; and since Langstroth placed these combs into frames so that they may be handled, and the whole hive may be spread out for inspection from end to end and top to bottom, at any moment the operator may desire;—since then progress and improvement have followed each other and made rapid strides toward that perfection to which we are ever pressing on, but never attain. These facilities for inspection place before beginners a temptation to make a "toy" of the hive, and upon every occasion to "play" with and open it. We want to impress them with the idea not to disturb the bees except when it is essential to do so. To be continually opening the hive in the spring often exposes the brood to a "chill," and brings destruction to the colony, and does no good whatever. This "chilled brood" is sometimes the forerunner of "foul brood" so much to be dreaded by every bee-keeper. We, therefore, strongly advise *caution* in this particular to all novices.

An exchange very wisely gives this advice: "Whether chilled brood will eventually bring about the fell disease, "foul brood," depends on various circumstances; but whether or not this be the case ultimately, a whole neighborhood is endangered by a reckless owner of hives. We would, therefore, attempt to impress on all young bee-keepers the great care they should make it incumbent on themselves to take as to the manner and time of overhauling their hives, and this ad-

vice especially applies to this season of the year."

Bee-Keeping in Canada.

The growth of the bee interests in Canada is quite remarkable. Two things have been instrumental in its rapid development. First, the energy and push of Mr. D. A. Jones, and his efforts, in connection with Mr. Frank Benton, to procure the Bees of the Orient, and bring them to America for development and improvement; and secondly, the encouragement received by bee-keepers from the Toronto Fair, and the large premiums offered on bees and honey. The result of this was to "astonish the natives" with an exhibit, which was perhaps the largest ever made on American soil.

No wonder, then, that a late number of the *Free Press*, published at London, Ont., should remark that "there is a growing interest throughout Western Ontario in the matter of bee culture, and if the directors of fairs, and especially those of the Western Fair, were to give greater encouragement to exhibitors, the public generally would learn more of the extent and value of the yearly honey yield."

Then, as to the production of honey in Canada, the *Free Press* adds: "A colony comprises from 20,000 to 40,000 bees, and, under proper management, each of these should produce two new colonies every season. The character of the season has, of course, a good deal to do with this. As to the yield, it may be roughly stated that each colony should produce from 60 to 100 pounds of honey, according to the favorable character of the season; and, at the present time, such a production would represent a vast profitable result to the owner.

It is very certain that a liberal Premium list draws together exhibits, which, when aggregated, make a magnificent display. These, in turn,

create a demand for honey, among the masses, for general consumption, that is more than paramount to the increased number of bee-keepers. These astonishing displays are wonderful educators of the people, and it should be bourn in mind that it is to the interest of bee keepers generally to have them at every Fair, in every County, State and Province in America. Let the display at Fairs for 1884 be of such magnificence as to create a market for honey ten times as great as it ever has before attained.

The committee having in charge the matter of legislation against the spread of "foul brood" in Canada, has had a "set back." They were met with a refusal to introduce the bill into parliament.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

O. Clute, Iowa City—4 pages—Bees, Honey, Bee-Keepers' Supplies, and Class for Students of Apiculture.

Bright Bros., Mazeppa, Minn.—24 pages—Apiarian Supplies.

Dr. J. P. H. Brown, Augusta, Ga.—20 pages—Italian Bees, Queens, and Bee-Keepers' Supplies.

Nellis' Floral and Garden Instructor—58 pages—Mohawk Valley Seeds, Canajoharie, N. Y.

Wm. C. Wilson, 45 West 14 Street, New York—116 pages—Plants and Seeds.

☞ We have received a copy of a pamphlet entitled, "a Dictionary of Baptismal Names for Children." It contains 2,000 names with their meaning, and the countries from which they originated. It is published by John C. Stockwell, 25 Ann Street, N. Y., and the price is 25 cents.

☞ Cook's Manual in cloth and the Weekly BEE JOURNAL for one year will be sent for \$3. We have no more of the old edition left, and, therefore, the club price of that edition at \$2.75, is withdrawn.

☞ We now club the *British Bee Journal* and our Monthly for \$2.50.

CORRESPONDENCE

Read at Belleville, Ont., Convention.

Spring Management of the Apiary.

ALLEN PRINGLE.

Hitherto wintering has been considered the greatest obstacle in bee-keeping. But the difficulties of successful wintering are being gradually overcome; so that the experienced and intelligent bee-keeper, with proper facilities, can count, with a fair degree of certainty, upon being able to bring at least a large proportion of his colonies safely through the winter. But, owing to certain changes which the seasons are undergoing, a comparatively new difficulty has lately arisen, to supplement, as it were, the wintering problem.

This difficulty is, after the bees have been successfully wintered, to get them safely through the spring to the honey season, and have them ready for the honey flow when it arrives. From some causes, planetary or otherwise, the character of the seasons is undoubtedly changing; and as we cannot alter the face of Nature, we must, as far as possible, adapt ourselves and our bees to Nature's moods and variations.

Last spring, especially, was a very exceptional one; indeed, the whole season through seemed to be quite out of joint. The spring and forepart of summer were so cold and wet that the poor little bees suffered much; and many of those not specially cared for and protected had to succumb. So far as I could learn, there was greater mortality among the bees in Canada, last spring, after they were taken out of winter quarters than there was during the winter. For my own part I lost none at all in wintering; but lost 3 or 4 colonies in the spring, in spite of the most assiduous attention to them. Only 2 of these, however, succumbed to "spring dwindling"—the other 2 having lost their queens. But so very unpropitious was the spring, and also up to the middle of June, in this district, that had I not given my bees extra attention and proper treatment, I am satisfied I would have lost the most of them. Doubtless some of you had a similar experience.

I have, therefore, thought that this question of spring management is the most important one for our consideration at this meeting. Our bees are now fixed up in various ways for the winter. Whether the manner of their disposal in winter quarters has been wise or otherwise, it is past; and our next proceedings with our "little pets" will be in connection with the spring management.

The question is, "What ought the spring management to be?" In answer to the question, I propose to give my own views in the matter, subject, of course, to the criticism of others of you who may have had larger experi-

ence than myself. My own experience with bees has covered, altogether, about 20 years; yet I have much, no doubt, to learn. We all, perhaps, can still learn, no matter how much experience we have had, or how many books we have read. We have, it is true, our standard works. We have Langstroth, and Quinby, and Cook, and Newman, and Dzierzon, and others; but I have noticed one thing here, which is this: In a progressive system like bee-culture, the best and latest books on the subject get *left behind*, especially in practical details. They may not be left behind in principles, so far as they contain principles, for first principles never change. But it sometime happens in bee literature, as in other departments, that theories are adopted as principles before they are fully verified by facts and experience. In such cases oftentimes mere hypotheses have ultimately to yield to the stubborn facts of practical experience.

In the spring management of an apiary, there are some 2 or 3 paramount objects the bee-keeper ought steadily to keep in view, and endeavor to accomplish. The first is to preserve his bees from what is called "spring dwindling." The second is to get them in good strong condition by the time the first honey flow comes, so that they can duly take advantage of it. And the third is to make such provision for early queens and good drones as he may deem requisite.

As to the spring dwindling, it seems to be a fact that the bees wintered in cellars and bee houses are more liable to it than those wintered outside, properly protected. And here a mistake is, I think, often made in setting out the bees wintered inside too early. A colony well wintered and strong is not apt to dwindle in the spring if it gets anything like fair treatment. Do not set them out too early; keep them thoroughly warm after they are set out; and feed judiciously of both pollen and honey, and you will reduce the spring dwindling to a minimum. The best time to set them out must, of course, much depend on circumstances, and the bee-keeper must use his own judgment.

I do not think it prudent to put them out for good much before the first natural pollen appears, especially if the spring is cold and backward. If, however, they get restless in their quarters, and dysentery should appear, they ought to be put out for a flight the first day that is sufficiently warm and fine. They can then be carried back again. But as pollen is required for the rearing of brood, in some cases where there is little or no old pollen in the hive, the colony might do better out if well protected and managed; for in such cases the artificial pollen for breeding can be more easily supplied them outside than in. I would, therefore, other things being equal, put the colonies with *least* old pollen out first, and keep those with *most* pollen in the longest. But how can I know how much pollen they may have in the spring before I put them out, you ask? Note the fact in the fall.

If bees are kept warm enough during the winter, and have plenty of honey, they will not use pollen until they begin to breed. If they are cold, and have to move about and exercise their wings to keep warm (for they do this), they will need nitrogenous food, and will then eat pollen. But even in view of this contingency, colonies with no old pollen may, if desired, be left in the cellar after breeding has commenced. The nitrogenous food, to supply the albumen for the eggs and the pollen for the brood, can be fed inside the hives in the shape of meal cakes soaked in honey; but it is better, I think, to feed the raw meal outside in the open air when the weather is fine. No definite or invariable rule can be given as to *when* to set out colonies, or *what* colonies to set out. The thinking and observant apiarist must consider all the circumstances and judge for himself. A good plan is, to have a strong colony out pretty early, and when it begins to carry in natural pollen the rest may pretty safely be put out.

If, however, we cannot give the inexperienced bee-keeper very definite instructions as to the exact time to put his bees out in the spring, we can give pretty explicit directions how to manage them after they are out. And the bee-keeper's season's crop of honey will depend largely upon his spring management of his bees. If this part of his work is wisely and skillfully conducted, his chances for an abundant return, other things being equal, will be good; if poorly managed his chances are slim; for the bee-keeper who does not know or care to manage his bees right in the spring will not know or care to manage them properly during the honey season. To be successful as a bee-keeper, his enthusiasm and care must reach beyond the inspiring honey season, and extend through the whole year.

Now, the very first thing to be done with the bees after they are set out in the spring, is to make them warm by closing all ventilating and other holes except a very small entrance; putting warm quilts on top; and taking such other measures as may be necessary to prevent the undue escape of heat from the hive, always bearing in mind that our protection does not *create* heat at all, but simply confines the animal heat which is generated by the bees. In the warm days when the sun is strong, there is, of course, *external* heat; but in cold windy days, and especially when the atmosphere is humid, the escape of the animal heat from the hive, unless it be well protected, is very rapid and very injurious to the bees. Every avenue and crevice ought, therefore, to be tightly closed except a very small entrance. In the spring, remember we want no "upward ventilation," as that matter will, in the open air, take care of itself—we want *heat*, or rather the bees and brood need it.

Having thus duly attended to this first spring requisite, the next thing to do, the first sufficiently warm day, is to overhaul every colony and clean out dead bees, etc. Also take away all superfluous combs, and crowd the

bees up into as small a space as necessary by means of division-boards. If the colony is weak, two or three of the best frames are sufficient to leave with it; and sometimes even one frame is enough at first for very weak ones. I have very little faith in *uniting* weak colonies in the spring, especially at this early season. I never unite in the spring except, perhaps, to get rid of a poor queen. My experience is decidedly against the practice, that is, when the weak colonies are properly handled. Having crowded the weak colonies up into small, warm quarters upon one, two or three frames, the stronger ones and strong ones may, of course, be given more room and frames, from three to a dozen, depending upon their strength and condition.

During this overhaul of the hives, note should be made of two or three important matters, and careful record made of them, so that the hives need not be opened any oftener during the cold, spring weather than is absolutely necessary; for I regard frequent spring openings of the hives as a very bad practice. Besides the danger of chilling the young brood, there is another serious objection to this practice. At such a season, especially in bad weather, it not infrequently happens that the disturbance caused by overhauling a hive, causes the bees to "ball" and kill their queen. I have known such instances. In the honey season, when the bees are gathering freely, you can knock them about almost with impunity with no bad results; but at all other times they ought to be handled with the utmost care. The one necessary spring overhaul should, therefore, be done with great care, but with dispatch, so as not to expose them too long; though the first opening in the spring seems never to disturb the bees as much as subsequent openings.

The two or three matters to be noted and recorded at this time are: First, is the queen all right? Second, how many bees? Third, how much honey is left in the hive? Fourth, is there any old pollen? And finally is there any young brood, or has the queen commenced to lay? These points can be all noted in your apian register, or simply upon a piece of paper left under the cover of each hive. You can then tell at any time, without opening the hive, what its condition was at the time of examination.

To illustrate the importance of this matter: Suppose just after the natural pollen season has commenced, and the bees, some of them, are freely breeding, a cold, rainy spell of weather comes on, lasting for a week or longer, as sometimes occurs, and the bees cannot get out with safety. The colonies that are breeding and short of pollen will undoubtedly suffer more or less; and part of the brood will perish unless the bees are fed the artificial pollen within the hives. This very thing happened last spring. At a time when the bees were breeding more or less, and natural pollen had appeared, there came a week or ten

days of very bad weather in which bees could not go out to forage without being, many of them, lost. In such a dilemma the breeding colonies short of pollen must be supplied with it or a portion of the brood will perish; and the bees in their desperation will go out in search of it and also perish. Now, the hives cannot be opened with safety in such weather to see which need assistance; but the aforesaid memorandum can be consulted, and all that are supposed to be short of pollen can be supplied. I simply take a cake made of barley or rye meal, or linseed cake meal, and place it over the bees on the frames under the quilts. This can be done in a moment or two without chilling the brood.

During the fine days of spring, just after the bees are set out, and before there is much natural pollen, nitrogenous food may be fed in the open air near the hives. Of such food the very best is cotton-seed meal, which is richer in nitrogen than the other kinds of meal. Next comes linseed cake meal, and next bean meal. In the absence of any of these, wheat, rye, pea, or corn meal may be used. Spread the flour or meal out on flat dishes or grain bags, and expose it in the warm sun near the bees, and you will see the busy little fellows fairly revel in it! If you put out different kinds, as I have often done, you will notice that they will literally swarm upon the kinds richest in nitrogen.

One prominent American beekeeper has, I am aware, "gone back" on the spring feeding, declaring it useless, and that he will feed no more; but it would take a much stronger argument than that to induce me to abandon the practice. Let us look into the merits of the matter for a moment. Take, for instance, a strong colony of bees wintered outside, and with little or no old pollen. As soon as the warm days of April come, and before the natural pollen appears, the bees begin to fly out and forage about in quest of *nitrogenous* food; for, bear in mind the queen, in order to lay, must have albumen, and the young brood must have pollen. Now, unless the nitrogenous food be supplied them, either inside the hive or outside, the queen cannot lay freely, the brood cannot be reared, and the colony can do little or nothing until the natural pollen appears. Meanwhile the old bees are dying off; and this is "spring dwindling."

Before the young bees, so lately started, are fit to carry on the operations of the hive, the old bees are perhaps all gone, or nearly gone; for it is well-known that as soon as an old bee begins to exercise freely on the wing, in the spring, his "pilgrimage in this world" becomes very short. And the worry of looking in vain for pollen is not calculated to delay the "shuffling off." In such a case, especially if the colony is not strong, the old bees disappear before there are young ones to take their places. This, in my opinion, is one of the principal causes of the much dreaded spring dwindling.

There are, it is true, under ordinary circumstances, few colonies but have

some old pollen, more or less, in the spring to go on with until the new supply comes in. But if Mr. Heddon's theory that pollen in winter is the prime cause of dysentery, has any truth in it, and is practically acted upon to any great extent, there will be many colonies from which the pollen has been removed in the fall, and hence *minus* pollen in the spring. All such, unless supplied with nitrogenous food in the early spring, could do nothing but dwindle.

I, therefore, maintain from these premises that spring feeding both of sweets to stimulate the queen, and of nitrogenous food to supply the albumen for the eggs and the pollen for the brood, is beneficial, and, withal strictly scientific rather than empirical. At the same time I freely admit that spring feeding and stimulation are sometimes attended by at least one evil; and must, therefore, be done with judgment and careful attention.

The evil is this: The daily feeding of sweets and pollen in the early spring sometimes has the effect of misleading the bees in regard to the season and weather. From this regular supply of the good things they conclude for certain that the honey season has commenced. Consequently they are apt to sally forth to work in bad, unseasonable weather, and many may get lost in this way. It is well, therefore, to shut them in on cold, windy days, and give them a nibble of cake and honey to keep them busy, and to keep the queen at her post of duty. The regular feeding should be done in the evening. As the spring advances and the weather gets warm, with increase of young bees, each colony must get more room and more comb. Keep the queen busy by supplying her with a frame of comb from time to time. Take a frame with some honey at the top and empty comb below (I speak here of the deep frames), scrape the caps off, and place it in the centre. But in enlarging the space of each colony, and supplying additional frames of comb and honey, we must be careful to "make haste slowly." Do not go too fast. It is very easy to make a mistake here, especially if the weather is cool. Use your best judgment. And in taking out frames of brood from the strong colonies to reinforce the weak, never give much brood at once to a weak colony. If you do you will feel the pain and mortification of finding your nice frame of brood lost. The handful of bees, not being able to protect the brood, it perishes.

Years ago I made that mistake, but have got over that as well as other errors. Experience is the best school, but the tuition is high, the expenses sometimes heavy. But this plan of building up the weak colonies in the spring at the expense of the strong is not, by any means, an unmixed good. There is this one evil about it which, no doubt, some of you have experienced. It sometimes happens that in robbing the best colonies to build up the others so as to get them all strong by the time the honey flow comes, you find when it does arrive that instead of having all of them fit for

good work you have all in fair condition, but none at all in first-class order to take advantage of the flow.

This is a great mistake, and entails great loss. You might far better have a portion of your colonies strong and in first-rate condition to work when the flow comes, and the rest simply able to go on nicely without giving you any surplus, than to have all in fair condition, but not able to give you much surplus. And a portion of them would be in first-class order when needed, were they not systematically and unscrupulously depleted to build up the others. No watchful bee-keeper will be apt to make this mistake more than once. Here, again, experience is salutary but dear. Of course in calculating beforehand, in the spring, how long it will be before your young workers will be needed for action, it is hard to hit the mark every time; and we do not care to have to feed a lot of idle bees for two or three weeks before the battle commences.

Knowing the time from the egg to the perfect bee, and also the time your young bee hangs around the house and chores inside before it goes to work outside, you may add these times together and calculate (as you may think) with mathematical certainty just when to urge your queens up in laying; and, after all, Nature, in her freaks, may sell you in the most ridiculous fashion! We had a realizing illustration of this last season. The fruit bloom was abundant, indeed super abundant, and rich in the coveted nectar; but when did it come? Why, about two weeks or more after the usual time. So you see the bee-keeper must keep his "weather eye" open in the spring on Dame Nature as well as on his queens, or he will surely get "left," with all his bee-lore. In bee-keeping, as in almost every other avocation of life, "eternal vigilance" is the price of success.

Selby, Ont.

For the American Bee Journal.

Size of Brood Frames.

W. J. DAVIS.

About two years ago I gave a description (in the BEE JOURNAL) of a brood frame I was using by way of experiment, with a view of adoption in case results proved satisfactory. I was not at the time aware of the fact that so many bee-keepers were looking for better returns from their bees by the use of a shorter brood frame. The size I chose was $11\frac{1}{2} \times 8\frac{1}{2}$, inside measure, with a 14-inch top-bar. I am so well pleased with their use, that all the hives I now make are for frames of that style. I have tried from 8 to 12 frames per hive. For my home apiary I prefer 8 frames.

The reasons for my preference of short brood frames are these: 1. The better clustering of a colony for winter; that is, less unoccupied space at

the end of the frames. As bees in this latitude must resist the cold for 7 months in the year, this consideration should not be over-looked.

2. As I secure my surplus comb honey above the brood nest (not at the side), the bees are forced to enter the surplus boxes at the beginning of the honey harvest.

3. As every square inch of nice worker brood comb represents that amount of capital in the hands of the bee-master, and the amount should not be greater in any one hive than can be used to the very best advantage; and any store comb or drone comb above a very limited amount is a positive damage in the brood nest.

4. Greater ease in equalizing colonies in spring and summer, and equalizing stores in autumn. Other reasons might be given, but the above will suffice for the present.

Some, I have no doubt, are ready to say, such a hive is altogether too small and bees would not secure a winter supply of honey. With improved bee-culture it does not matter whether they do or not, if they give a satisfactory amount of marketable honey. But in point of fact and actual experience, I find small hives, quite as likely as large ones, to contain sufficient stores for winter. Another, probably may say such small hives could not have a strong working force by the time white clover blooms. Let us see; a colony of bees can better warm a small hive in early spring, and, hence, can surely breed as fast as in a large hive.

In this locality we have no need of a strong working force before June 10, which is the time the white clover begins to bloom. Let us suppose a hive contains 8 combs of above size, on May 1, and each comb contains 98 square inches, or say 780 square inches of comb in the hive; each square inch contains 50 cells, or 39,000 cells in the hive. Let us allow one-half for pollen and honey for immediate use (which is a very large estimate for the month of May, including a reasonable amount of drone comb), and we still have room for the production of 19,500 worker bees every 20 days, or nearly 1,000 per day. It will readily be seen that a small hive will be crowded with bees much earlier in the season than a large one.

In accordance with a suggestion of one of your correspondents (which, I think, a good one), I will say that I have handled bees for over 35 years, in the same locality, and with an average of about 100 colonies. Have used the standard Langstroth frame for 23 years. Have used from 8 to 24 frames to the hive. Have 50 hives that take 12 frames in the brood-chamber, and can add 12 to an upper story of the same hive for extracting, or in place thereof two sets of surplus frames. I have my bees now, about one-half of them in long (Langstroth), and the balance in short (Langstroth) frames.

I cannot agree with Dr. Tinker that all brood frames not of a certain length should be called by some other name than the Langstroth. If I understand it aright, the main features

of the Langstroth patent consisted of separate comb frames resting on rabbets, with small space above, and at ends of frames. I could not tolerate any hive with close fitting top-bars, or without the shallow space above the frames. In the matter of brood frames, I am in favor of every man using such size as he pleases. In the controversy between Mr. Demaree and Dr. Southwick, I think, for his latitude, the Doctor has the argument on length of frame, and Mr. Demaree on the depth, for any latitude. Youngsville, Pa.

For the American Bee Journal.

Use Separators? Yes.

H. D. BURRELL.

For four years I have made a speciality of honey production, keeping an average of about 100 colonies, spring count. These have produced in that time over 23,000 pounds of surplus honey, mostly comb. Separators were used with about half the amount; hence, I have had ample opportunity to judge which is the better way. The old argument (not often heard now), "separators take off one-third the honey crop," was long a stumbling block with me. I labored long and faithfully to persuade myself that I could do without separators, but signally failed. Different locations, seasons, races of bees, sections and methods of management all have an influence, and must be considered in examining the subject. I have experimented long and carefully, and on a large scale, during eight years' experience with bees, to determine the facts. Have used wide frames holding sections both one and two tiers deep, and cases and racks of many patterns; sections $1\frac{1}{2}$, $1\frac{3}{4}$, $1\frac{1}{2}$ and 2 inches wide, holding from 12 ounces to $2\frac{1}{2}$ pounds of honey.

This season I shall use no sections without separators, although I have quite a stock of one-pound sections on hand $1\frac{3}{4}$ inches wide. That separators reduce the honey yield at all, I have been unable to discover. But I have found that where separators are used the honey cappings are whiter, and not nearly so many combs are soiled, many of the bees, I suppose, walking on the separators instead of on the honey.

The main objection to using separators, in my opinion, is their first cost, but this is far outweighed by the greater ease with which separated sections can be manipulated, the projecting wood side pieces protecting the combs. This is an important item where inexperienced and often careless help has to be employed; also in the wholesale honey house. Buyers or salesmen usually draw sections for examination from different parts of the crates of honey on sale, and not very carefully either. If combs are bulged, broken cappings and leaking honey result, and those crates are not wanted. Often I have watched this tableaux in wholesale houses. Honey stored between separators will meet with fewer accidents, causing leakage,

and give better satisfaction to retailer and consumer.

What an unsightly object a crate of leaking honey is! It is much more convenient to retail sections of honey by the piece, than to take time to weigh each one, and they are sold largely in that way. When separators are not used, the sections vary so much in weight it cannot be done. Then the smooth, symmetrical snowy blocks of semi-transparent honey, which fairly make the mouth water, look far more attractive than the irregular, warty, bulged or hollowing ones, and meet a more ready sale. Many a time have visitors in my honey room pointed to these blocks in a pile of less even sections, and exclaimed, "What a nice one that is!" I think I have never had 50 sections which could not be crated for shipment, but I can crate the separated ones twice as fast as those not separated.

The leading honey dealer of Chicago told me he would far rather sell separated honey. Buyers are constantly becoming more discriminating, and I predict that soon separated honey will sell quicker, even if it does not bring more money—quite an item in our overstocked markets. Even here in the West, where the market does not call for glassed sections, time will tell that it pays to use separators.

I use a section case, and practice a system similar to Bro. Heddon's well-known and deservedly popular one. I have used the Heddon case largely with individual tin separators for each section. This necessitates much labor and expense, but I should certainly follow that plan if there were no better one. I will not use wide frames. They are an abomination. Last year I used about 150 cases similar to the Heddon case, but in which the partitions are omitted and the sections held in place by narrow band-iron supporters across the bottom of the case. This case allows the use of separators, separators of wood 1-16 inch thick were used to give entire satisfaction in these cases. I prefer them to tin. The same separators tacked to wide frames I do not like.

In the modified Heddon case they are fastened to nothing permanently, and when not in use are piled up out of the way, and no warping or splitting occurs, though they are pared from basswood logs in a berry box factory. Not being tacked to a frame, propolis is easily scraped from them. Bees seemed no more inclined to attach comb to them than to tin separators. Indeed, I have been annoyed more by bees building into and attaching combs to the sides of adjoining narrow sections where no separators were used. I carefully set all hives with a level, too. (No cases or separators for sale.)

I have found the chief advantage of separators in my method of using surplus section cases. They are tiered up in the usual way until $\frac{1}{2}$ to $\frac{3}{4}$ of the sections in the upper case are finished. Then the case is quickly and easily cleared of bees and carried to the honey house. Here, away from robbers and angry bees, the case can be manipulated when convenient. The

unfinished sections, being straight and regular, are easily placed in cases and returned to the bees. By this plan combs are seldom soiled by remaining too long with the bees, and fewer cases are in the hive at a time, thus concentrating the work of the bees and economizing the heat of the hive. By this plan, too, more sections are finished, and fewer unfinished ones are left at the close of the season. I find that usually where cases are tiered up more than two high, work goes on very slowly above that point. Especially is this true during the cool nights of late summer. More time is usually required to get the last half dozen sections in a case finished, than all the others.

Where separators are not used, it is a vexatious, tedious task to return the unfinished sections to the bees. If they are not perfectly matched, trouble ensues. Those where the combs come but a trifle too close, are bridged together, and cannot be separated without causing leakage. If but a trifle too far apart, and the adjoining combs are capped, new work is commenced on top of the capping, making unsightly sections.

With me the use of separators avoids more of the annoyances and petty vexations of our calling than any other improvement in bee-keeping. I would willingly, if necessary, lose 5 per cent. of each honey crop rather than dispense with them.

For the American Bee Journal.

Single-Walled vs. Chaff Hives.

G. M. ALVES.

Mr. Heddon makes some remarks in a recent number, that set forth a correct theory. Bee-keepers frequently make the mistake of assuming the habitations of bees as analogous to their own, viz: that walls for bees, as well as those for man, should be at all times as non-conducting as possible. Now a little reflection will show that the same conditions do not obtain in both cases. A man's bodily heat has no appreciable effect on the temperature of his room, whereas with bees, the heat of their hive is generated by their bodies.

In our dwellings the walls should be good non-conductors at all times, for the reason that "what will keep out the cold, will also keep out the heat." The walls of hives should be good non-conductors in cold weather certainly, but in very warm weather a hive, provided it is shaded, with conducting walls, would be more comfortable to the bees, for the reason that the accumulated and excessive heat generated within, could pass off more readily into the atmosphere.

In this respect, bee hives are not analogous to our dwellings, but to our clothing; i. e., to be comfortable should be fair conductors in summer, and non-conductors in winter.

The soundness of this theory is self-evident, and should teach us to make our hives of rather thin walls, which should be well-shaded in the heat of

the summer, and if suffered to remain out-of-doors all the year, should be protected by an outer covering in winter. This plan would seem also to be agreeable to cheapness of construction, and facility of handling in the working season.

It would hence seem that the use of chaff hives should be avoided.

Henderson, Ky.

For the American Bee Journal

Tiffin, O., Convention.

In response to the call a number of the bee-keepers met March 15, and organized by calling Mr. Wm. C. Hamilton to the chair, and Mr. J. T. Martin to act as Secretary.

The first question discussed was: "Shall we have a county bee-keepers' association?"

Several spoke of the necessity and benefits that would be derived from an association, holding meetings every three months, or oftener if thought best, when the motion was carried unanimously.

On motion, the chairman appointed Messrs. J. T. Martin, Marcus Holtz, and Michael Bower a committee to draft a constitution and by-laws and report the same in the afternoon.

The merits of different forms of hives, sections and frames were discussed, when the meeting adjourned till 1 p. m.

At 1 o'clock the chairman called the meeting to order, and called for the report of the committee on constitution and by-laws.

J. T. Martin read the report, which was received and the committee discharged. The report was taken up, discussed, portions re-read, and with a few slight changes was adopted.

Eighteen then signed the constitution, representing 260 colonies of bees.

The election of officers followed, resulting in the election of E. J. C. Troxel as President; J. L. Fisher, Vice-President; J. T. Martin, Secretary; Wm. C. Hamilton, Treasurer, and M. Holtz, J. L. Fisher, and J. T. Martin as executive committee.

The topic, "Early spring treatment," was discussed, different views being advanced as to how bees should be managed in the spring.

Quite an interesting discussion followed on the qualities of the different breeds of bees.

Mr. Feasel gave his experience with Italians, Cyprians, Albinos and Holy Land bees.

In connection with the different varieties of bees, the merits of honey producing plants were discussed with much interest.

Marcus Holtz exhibited a couple of his make of hives, having established a factory near the city.

Mr. Hamilton placed on the table a glass jar of beautiful extracted honey.

Mr. H. Overmyer sent in a dozen jars of very nice extracted honey; being unable to be present himself, on account of a death in his family.

The meeting adjourned till the third Saturday of April, at which time a much larger attendance and a more interesting meeting is anticipated.

J. T. MARTIN, Sec.

singular that bees should eat a substance that will prove so destructive, especially when they are well-supplied with honey.

North Manchester, Ind.

For the American Bee Journal.

Planting for Bee-Pasturage, etc.

LEONIDAS CARSON.

From the first of February to the evening of the 27th, we had fine, open spring weather, and bees that were on their summer stands could fly almost every day. On the evening of Feb. 27, we were struck by the cold wave that came down from the west, and ever since we have had cold winter again, the ground being frozen and covered with snow.

Bees, as far as I can learn, appear to be in fine condition. I left 14 colonies of my bees on their summer stands, and lost two through the month of January; the others are in fine condition. I set 67 colonies in my winter depository. They appear to be in good condition up to this date, March 4th.

On page 139 L. K. Diekey, of High Point, Ga., enquires why enterprising bee-keepers of the North, who are seeking a better field for their business, do not go to Northwest Georgia and help develop the honey resources? The answer is plain. Enterprising men of all occupations at the North, are loth to settle in the Southern States so long as lawlessness is excused and goes unpunished. I have reference to the trouble at Danville, Miss., last fall. I have long had my eye Southward. I have traveled over many of your pleasant hills and vallies. You are blest with the finest climate in the world. Many of your States would be the paradise of the bee-keeper.

I am pleased to see that bee keepers are becoming awake on the subject of foul brood. I do not know of any in this county, but if bee-keepers continue to procure queens from abroad, how long will it be until we have it here too? Why do not the State Associations see that there are similar laws enacted in every state in the Union, to the one they have in Mich.? It is to the interest of every bee-keeper in the land.

I am very much interested in pasturage for bees, and I would like to impress on bee-keepers the necessity of a continual honey flow all summer. If we are not so situated, we should not suffer another spring to pass without considerable effort on our part. After fruit bloom, comes the wild cherry with its abundance of bloom, and if the weather is favorable, our pets gather considerable fine honey; but if the weather is cold and wet, bees can do nothing until white clover. I would admonish bee-keepers to set out cuttings of the golden willow and plant the black or common locust, plant basswood or linden. Do not forget to set out a nice patch of raspberries; for black caps, plant the Tyler & Sonhegan for early, and Gregg for late; of the reds, plant Hainsell, or crimson beauty, for early; and

Cuthbert, for late, and you will not only secure a fine lot of raspberry honey, but plenty of fine berries. I have yet to see the man, woman or child that do not love raspberries. After raspberries, plant the blackberry; the hardiest blackberry is the Snyder; Taylor's prolific is fine, and is some larger than the Snyder.

It is claimed that the box-elder and catalpa are profuse bloomers, and yield considerable honey. The clovers all yield honey, and are all good forage plants, unless it is melilot, and I have seen cattle eat melilot clover, when it was young, with great relish.

Diamond, O., March 4, 1884.

For the American Bee Journal.

Swarm Controller.

JOHN LONGMATE.

In accordance with my promise I now give a description of my swarm controller and queen and drone trap. By reference to the engraving, the reader will see that it is a box about 12 inches long, 6 wide, and 6 high.

Swarm Controller and Drone and Queen Trap.

A, Entrance. B, Perforated Zinc for egress of Workers. C, Tube of Wire Cloth for Queen and Drones to pass into upper room. D, Zinc cover slid back to show inside of Trap.

having the front side open to within 1½ inches of the top. From the left-hand front corner to within 2 inches of the opposite corner, is a plate of zinc perforated from the inside.

The back side of the box is open along the bottom up to the second floor, to let the bees pass freely from the hive into the box. When the bees pass into it, they are directed by the angling side to the right, and the workers pass out through the holes near the corner and make their escape. The queen and drones cannot pass these holes, and are attracted by the light from above and pass up through a tube into the upper room, and are there confined. The workers that find their way into the upper room, pass out through the perforated side. When the workers return from the fields, they naturally alight at the point of egress, and in their laden and distended condition cannot pass readily through the holes, having the rough edges outward, and are directed by the angling front to the right and to the lower corner through a tube of ample size for the heavy-laden workers to pass readily into the hive. This tube reaches about 3 inches into the hive, where it is comparatively dark, and as the queen and drones are at-

tracted by the light at the large passage way, they pass out that way, and do not find the end of the tube; and if they should, the force of the incoming workers would turn them away from it, and they are compelled to pass into the box.

This attachment can be made very useful in many ways, some of which I will mention: When we wish to reduce the number of drones in a hive, we place the trap at the entrance, and in the latter part of the day, when the drones have attempted to fly out, we find them in the trap, and can destroy them. Or, if we wish to use them for any purpose, we can easily catch them in this manner.

When a swarm issues, the workers pass out, then quietly step to the hive and be ready for their return, for it will be only a few minutes before they will be rushing back. Look into the queen cage, to be sure that the queen is there. Now move the old hive to a new stand, and place a new one on the old stand, and when the swarm returns, draw back the sliding floor between the upper and lower rooms, and cover the cage to darken it, and

let the queen pass back into the hive, and the large swarm, perhaps with a valuable queen that we were so fearful might go to the woods, are nicely located in their new home. Let the controller remain at the hive for a few days, or until there is no danger of the swarm re-issuing.

When we have after-swarms, and the controller is used, we can ascertain if there is more than one queen, return the one of our choice and utilize or destroy the others, and our swarm is returned to the old hive with no further trouble. If the division floor is left out, and the swarm issues in our absence, it and the queen are returned to the old hive without any attention.

It is not intended to prevent swarming, but to control it. I agree with Mr. Chas. Dadant in his article on page 57, that swarming can be prevented, or nearly so by proper management, but when we do not prevent it by this previous management, either by design or failure, then we should control the swarms, and I am of the opinion that it is best to have the first swarms in new hives, and if that had been done, and they had not been returned, the "ill-treatment" of the queens would not have occurred.

Mating queens in confinement, I believe, has thus far been a failure, and we must look in some other direction for a means of controlling that matter. When we wish to improve the blood of our flocks and herds, we confine the males that we do not wish to mate, and let those of our choice run with the females. With this attachment to our hives, we can confine the impure drones and let those that are pure fly with the queens. This controller can be made of tin at any tin shop at a small cost. I make them partly of wood. I form a box of thin boards 12x6x6 inches, letting the sides project above the ends with grooves in which to slide this cover. The front is 1½ inches wide; the back 4 inches, with a groove 3 inches from the top. Two inches from the right hand corner, on the inside, tack a perpendicular strip. From this strip to the left hand front corner, slide in a piece of zinc perforated from the inside, with holes 9-64 of an inch in diameter. The left end should be in two pieces, and put together with an opening corresponding with the groove in the back. Through this opening, slide in a triangular piece of tin or wood with a notch in the side next to the perforated zinc 3x¾ inches, for the queen to pass into the upper room. Over this opening, and attached to the zinc, form a wire cloth tube reaching to within ¼ of an inch of the top, having the opening about ¼ of an inch wide. Slide in on the top a piece of glass or perforated zinc for a cover.

At the right hand corner form a tin tube reaching into the entrance of the hive about 3 inches, with the inside opening 2x¼ inches.

Farmer City, Ill.

For the American Bee Journal.

How to Settle the Pollen Theory.

H. O. MORRIS.

I have several times read that by closing up a hive of bees so that they could not escape, at the same time giving them ventilation and sunlight, the bees would have the dysentery in three or four days, even in summer. I think I have read of some other ways of giving them this disease in a short time. If anybody knows of other means that will surely bring it about, I wish they would report.

My proposition is this: Take 4 colonies of bees in normal condition. No. 1 to have plenty of honey and pollen, No. 2 to have honey and no pollen, No. 3 to have sugar syrup and pollen, and No. 4 to have syrup and no pollen. Treat these all alike, with the conditions necessary to produce dysentery. If the colonies that are provided with pollen have the dysentery and the others do not, we will have evidence that is conclusive, much more so than the winter test; for in some seasons and in some places bees are not affected with it at all. I will make this test next summer and report, and hope others will do the same.

Tiskilwa, Ill.

For the American Bee Journal.

Marshall County, Iowa, Convention.

The Marshall County, Iowa, Bee-Keepers' Association, met at the Court House, in Marshalltown, Feb. 2. Five new members were admitted.

The subject for discussion, "Promotion of Bee-Keeping," was taken up, and well discussed by several members, and, we believe, benefitted all present.

On the subject of "Fair Exhibitions," all desired to have a chance to make a better display of bees and honey products, and the Secretary was appointed to confer with the officers of the Marshall County Agricultural Society, and see what arrangements could be made for the fair of 1884.

It was decided that the election of officers for the coming year, should take place at the next regular meeting, April 5. Subjects for discussion at the next meeting: "Spring and Summer Care," and "Profits of Bee-Keeping."

The Society then adjourned to meet Saturday, April 5, at 10.30 a. m., at the Court House in Marshalltown, Iowa. Bee-keepers of adjoining counties interested in bee-keeping, are invited.

J. W. SANDERS, Sec.

Convention Notices.

The Wabash County bee-keepers intend to organize a county association on Friday, April 11, 1884, at 10 a. m., at the Court House in Wabash, Ind. All bee-keepers of this and adjoining counties are requested to meet with us.

H. CRIPE.

There will be a meeting of the Kansas Central Bee-Keepers' Association at the Grange Hall in Manhattan on April 5, 1884. The following papers have been secured: "Forage plants for bees," by Thomas Bassler, K. S. A. C.; "Pleasures and dangers of bee-keeping," by Robert Corbet, of Manhattan; "Ancient and Modern bee-keeping contrasted," by S. B. Kokanour, of Manhattan, and a paper by Aug. L. Entsminger, of Silver Lake, Kans. There will be election of officers, etc.

THOMAS BASSLER, Sec.

The Union Bee-Keepers' Association of Western Iowa, will meet at the Emmett house, in Dexter, on Saturday, March 29, at 10 a. m. sharp. All who are interested in apiculture are invited to attend.

M. E. DARBY, Sec.

W. B. KENYON, Pres.

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

The Western Michigan bee-keepers, will hold their spring meeting at Berlin, on April 24.

F. S. COVEY, Sec.

The Progressive Bee-Keepers' Association will meet for their spring meeting May 3, 1884, at the apiary and residence of J. B. Haines, Bedford, Cuyhoga County, O. All interested are invited.

J. R. REED, Sec.

The next meeting of the Bee-Keepers' Association of Central Illinois, will be held in the office of the County surveyor, in Bloomington, on Wednesday April 9.

W. B. LAWRENCE, Sec.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

W. M. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest, for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twichell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

We will organize a bee-keepers' association at the Court House in Franklin, Ind., at 10 a. m., April 5, 1884. All bee-keepers are invited to attend and take part in the organization.

L. R. JACKSON.

Urmeyville, Ind., Feb. 26, 1884.

The Lorain County Bee-Keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.

O. J. TERRELL, Sec.

North Ridgeville, O.

The Mahoning Valley bee-keepers will hold their next meeting in the Town Hall at Newton Falls, O., on Thursday, April 10, 1884, at 10 a. m.

E. W. TURNER, Sec.

L. CARSON, Pres.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Local Convention Directory.

1884. *Time and place of Meeting.*

- Mar. 29.—Union Association, at Dexter, Iowa.
M. E. Darby, Sec., Dexter, Iowa.
- April 5.—Marshall Co. Iowa, at Marshalltown.
J. W. Sanders, Sec.
- April 5.—Kansas Central, at Manhattan.
Thomas Baasler, Sec.
- April 9.—Ass'n of Central Ills., at Bloomington.
W. B. Lawrence, Sec.
- April 9.—Lorain Co., at Elvria, O.
O. J. Terrell Sec., North Ridgville, O.
- April 10.—Mahoning Valley, at Newton Falls, O.
E. W. Turner, Sec.
- April 12.—Texas Central, at Waco.
I. W. Grayton, Sec.
- April 18.—Iowa Central, at Winterset, Iowa.
J. E. Pryor, Sec.
- April 22.—Des Moines Co., at Middleton, Iowa.
John Nau, Sec.
- April 24.—Western Michigan, at Berlin.
F. S. Covey, Sec.
- April 24, 25.—Western, at Independence, Mo.
C. M. Crandall, Sec.
- April 24, 25.—Texas State, at McKinney.
W. R. Howard, Sec.
- May 3.—Progressive, at Bedford, O.
J. R. Reed, Sec.
- May 6.—Southern Wisconsin, at Janesville.
J. T. Pomeroy, Sec.
- May 26.—Will County, at Monee, Ill.
P. Nelson, Sec.
- Oct. 11, 12.—Northern Mich., at Alma, Mich.
F. A. Palmer, Sec., McBride, Mich.
- Oct. 15, 16.—Northwestern, at Chicago, Ill.
W. Z. Hutchinson, Sec.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Bees in Excellent Condition.

I commenced the spring of 1883 with 20 colonies of Italian and hybrid bees, and took from them, during the season, over a ton of honey. I use the Langstroth hive exclusively. I use comb foundation in the sections, and find it pays. I would have it, if it cost \$1.50 per pound. I prefer that which runs about 10 feet to the pound. I can see no difference in the flat or natural bottom; my bees take as well to the one as to the other. I have now 30 colonies, and hope to get at least 3,000 lbs. of honey. C. E. CANOLES.
Hereford, Md., March 14, 1884.

Bees Wintering Fairly.

Our bees seem to be in more than average good condition for this date. We are anxiously looking forward to the final result of our carefully prepared experiments with the wintering problem. I have already seen enough in past years to convince me that Bro. Pond is clear off the track on the cause of spring dwindling. I will give my views on that subject, and reply to Dr. Tinker's last article, when giving in my wintering report for 1884. The Doctor seems as far astray as Bro. Pond. The Doctor's effort to answer that report before it comes to light, is "taking time by the front forelock." Our test will be clear of any such errors as the Doctor mentions. Bees do not keep warmer with sugar than with honey; they just eat considerable less of it, that is

all. The thermometers shows no difference. We will try to make it all clear to the Doctor. Our report may be a frank admission of a big mistake; we shall see, and report facts just as they appear, and "let the chips fall where they may." JAMES HEDDON.
Dowagiac, Mich., March 19, 1884.

Why Eat Honey?

DEAR EDITOR:—I have received the sample of Leaflet No. 1, entitled, "Why Eat Honey?" I think that bee-keepers owe you a vote of thanks and liberal patronage for your endeavors to create a market for honey. The get-up of the Leaflet is good, and I think they will do a great deal toward correcting the ideas of consumers of honey. In general they have no idea of the perfection of methods of bee-culture, and if they have any knowledge of the business whatever, it is of management with the old-fashion way with box hives. In view of this, it is not strange that when people are told that we can take honey from the comb and return them to the hive to be filled again, that they should ask with evident distrust, how we are going to put our combs back in the hive and have them filled again? Would it not be well to explain in the Leaflets, that with the methods in modern bee-culture we compel the bees to build their combs straight in sectional frames, and that these sections can be removed from the hive in an instant, the bees brushed off, the honey extracted, and the combs returned to the hive to be again filled, etc. W. N. HOWARD.

Derby, Vt., March 19, 1884.

[Yes; we will elaborate a little on that idea—though we mentioned it briefly in the Leaflet.—ED.]

My Feeder.

I wish to describe the feeder I use, and think among the best. It is a common brood frame, from the top $3\frac{1}{2}$ inches down, is placed a second triangular comb guide, then on each side is fastened picture-back material, reaching within $\frac{1}{2}$ of an inch of the top triangular guide. This is fastened in paint, and beeswax is run along each side of the lower comb guide. This makes a feeder 3 inches deep and $\frac{1}{8}$ inches wide, and as long as the frame. Near one end, through the top-bar, is made a half-inch hole; this hole is placed at the back of the hive (put comb foundation in below the lower guide, or see that the bees build worker comb there), cover with a quilt of single thickness first, cut through this quilt into $\frac{1}{2}$ inch hole a straight slit $\frac{1}{2}$ inch long; have a small funnel made that will go through this hole into the feeder. I use an old teapot to pour the feed into the funnel; and it will surprise one at the short time it will take to feed 50 or 100 colonies, and that, too, without seeing a bee. The holes will close up after the funnel is removed, keeping every bee below. Keep this frame in the middle of the hive, especially in the fall, winter and spring. In the summer it can be moved next to one side of the

hive. This feeder is practicable, if made right; if more than $\frac{3}{8}$ inch space at the top is left, comb will be built into it, but it must be left in the hive, as it cannot be easily removed on account of the bees that are always in it; but, if it must be removed, shake the bees to one end; then with a quick downward motion, the bees will slide out, each side of the upper comb guide (which is better than a flat surface for them to strike against). A lot of lose feeders lying around are a nuisance; these are always in the hives, out of the way, and just where you want them for use.

Medford, Minn. J. E. CADY.

Cyprians, Syrians and Italians.

I put into winter quarters 53 colonies of Italians, Cyprians, Syrians, Albinos and a few hybrids. I have nearly all in double-walled chaff hives, and a few are in single-walled hives. I give these some protection by packing leaves around the outside. I have one in the American double-walled hive. It is a two-story hive in summer, and a double-walled hive in winter. It has nine frames 12x12. It is a good hive. The rest of my bees are all on Simplicity frames, $9\frac{1}{2}$ x17 $\frac{1}{2}$, outside measure. For six years I have wintered all my bees out-of-doors. This winter I have yet lost none. I find that Italians crossed by Cyprians or Syrians are good honey gatherers. Syrians and Cyprians excel the Italians for gathering honey, but they are very cross. I prefer bees or queens that are kept where the different races are kept in one apiary. I think they are worth nearly one-third more.

OTTO KLEINOW.

Detroit, Mich., March 20, 1884.

Preparing Bees for Winter.

As we have just wintered about 40 colonies of bees on the summer stands, and without the loss of a single one, we will explain the manner in which we prepared them. In the first place, we pay little attention as to whether the combs contain pollen or not, but see that each hive has 20 pounds of honey, at the least, and if more, all the better. We use the 10-frame Langstroth hive, and remove a frame from each side, leaving eight; in the place of the frames removed, division-boards are inserted, and over the frames sticks are placed, in order to allow the bees to pass to all parts of the hive; for the same purpose a hole is cut through the centre of each comb remaining in the hive. We now place a coffee sack over the frames, and fill the remaining space in the upper story with corn shucks, which absorb the moisture, and give freer ventilation. Keep the hives and combs dryer than anything we have yet tried. So long as our bees are dry, warm, and have plenty of good honey (or a syrup made from the best quality of sugar will, perhaps, answer as well), we can defy the severest winter. Our prospects here for a crop of honey is good, but it mainly depends upon the management between now and the harvest.

A. E. FOSTER.

Covington, Ky., March 20, 1884.

Educate the Customers.

Leaflet No. 1 is received, and I pronounce it very good. I think it will be a great help to many, situated as I am, among people totally ignorant of the improved methods in bee-culture, which includes about nine-tenths of the country people. Why, I have those who keep bees in the "go-as-you-please" way, come for me to go and extract from box hives and log gums, and when told that it is necessary to have movable frame hives in order to extract the honey, they look amazed, and when shown comb foundation, they look as if they would have the lock-jaw.

S. SMITH.

Neoga, Ill., March 20, 1884.

Four Per Cent. of Loss in Winter.

Last fall I packed 100 colonies of bees on the summer stands, with planer shavings and chaff. They flew quite freely to-day, for the first time since winter set in. They were confined to the hives 98 days, and some of them were badly affected with diarrhoea. The loss thus far is 4 per cent. Colonies on new combs are wintering much the best, which I noticed was also the case last winter. The bees in my cellar are quiet.

W. D. WRIGHT.

Knowersville, N. Y., March 13, 1884.

Iced Entrances.

It is too early to report yet, but some in this section are losing bees pretty lively. Diarrhoea appears to be the trouble; also smothering, from ice accumulating in the hives. Mine are still in the cellar, and most of them appear to be doing finely, but more about them later, after I see just how they come out.

M. BAILEY.

Winterset, Iowa, March 12, 1884.

Successful Beginners.

To-day our bees are flying; and some are gathering sap from the sugar maple. We commenced, last spring, with 6 colonies in box hives. We had never used frame hives, and, therefore, nearly everything was new to us. Having the BEE JOURNAL and Cook's Manual we made fast progress, and after a bee-keeper had shown us how to transfer a colony, we transferred the rest without any trouble, and also several for neighbors. We increased to 15, and got over 200 lbs. of honey, most of it in one-pound sections; the rest extracted. Nearly all of our honey was from linden. We got none from white clover. Our comb honey sold for 22 cents per pound, and the extracted for 15 cents. Our colonies brought us about \$20 each, spring count, which, I think, is excellent for the first year. We planted a piece of mignonette about 30 feet square; the bees worked on it early and late, till frost. We intend planting more extensively the coming year. I have seen remedies for bee stings in the BEE JOURNAL, and have used many different ones, but the best was common salt and water immediately applied to the wound. We have Italianized about half of our

colonies, and expect to Italianize the rest in the spring. We intend to work for extracted honey in the future, and build up a home market for it. We use a frame $9\frac{1}{2} \times 13\frac{1}{2}$ inches, outside measurement, and prefer it to all others for our use; it will work cross-wise in a Simplicity body; we call it the Crosswise Langstroth frame. Quite a number of bee-keepers in this part of the State use it, and like it better than others.

H. D. GATES & SON.

Gerry, N. Y., March 18, 1884.

Hard on Bees.

My 57 colonies of bees wintered on the summer stands very well until the last blizzard, which caused the brood to be almost entirely destroyed, which will be a very heavy loss to all who have bees in this section of Northern Kentucky. Success to the BEE JOURNAL. May it outlive all the adulterators of sweets, so that pure honey will be one of the staples of this country.

WM. G. GOSNEY.

De Mossville, Ky., March 14, 1884.

Feeding in Winter.

I have read quite a little about feeding bees in cold weather, so last fall I thought I would try and feed 2 colonies all winter. Late in October, I put all my bees in winter quarters; these 2 with the rest. The latter had less than 3 lbs. of honey each. I put on a Nellis feeder; it will hold about 2 quarts; I filled it once in October, and have fed them every month since, and they are, to-day, in as fine condition as you could wish to see. The food was granulated sugar, about as thick as thin honey. They have to leave the cluster and come up about 4 inches to get the food. I only feed them when it is warm enough for them to fly; then pour it in quite hot. The feeder is very easily made, and I like it better than any I have had yet. I have kept bees 7 years; have always wintered on the summer stands; never lost any until this winter, when I lost one with dysentery. The rest are all right so far. I thought, perhaps, this might be a help to some that would like to feed.

D. S. BASSETT.

Farnumsville, Mass., March 18, 1884.

White Clover Not Winter-Killed.

The weather has been very fine here for the past two days, and the bees are making good use of it, seeming glad to get out once more, after their long confinement. Much to my surprise they were carrying in pollen quite freely this afternoon, but what they gather it from is a puzzle to me, for there are no trees in bud or bloom yet. I have a row of very large maples on the east side of my place, and the severe freezing weather of the past winter has cracked them open pretty badly; the sap is now oozing out freely, and running down the bodies of the trees. These places are literally covered with bees sipping the sap; the little fellows do not wait for something better to turn up—as human

beings sometimes do, but pitch into the first thing that has any sweetness about it, and work at it with a will while it lasts, and then when the better does come, they can enjoy that all the more. The past winter has been a very severe one, on bees that were left on the summer stands, but owing to the good quality and quantity of well capped honey, and being strong in numbers, and mostly all young bees bred late in the fall, they have come through in good condition, with but very few losses, in this section, although the thermometer stood away below zero most of the time, and on Jan. 5, it was 32° below. The white clover has not been winter-killed, and looks very promising up to date.

E. ARMSTRONG.

Jerseyville, Ill., March 13, 1884.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL,
Monday, 10 a. m., March 17, 1884.

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no life in the market. Extracted honey sells in its regular way and do its wonted channels, without any speculative feeling about it, and brings 7@10c on arrival. Comb honey sells at 15@16c a lb. from store for choice.

BEESWAX—Is in good demand; choice yellow brings 35c a lb. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basewood in 1 and 2 lb. sections, 17@18c. Dark and second quality, 15c.; extracted white clover in kegs and barrels, 9@10c.

BEESWAX—Prime yellow, 34@35c.

H. K. & F. B. THURBER & CO.

CHICAGO.

HONEY—Of late receipts of comb honey has been scattered amongst many firms, and as all are desirous of realizing on their receipts at as early a day as possible, prices have been irregular and low, some lots being offered from 5c to 7c per lb., less than 30 days ago. I quote white comb 13@16c; fancy 18c. Extracted honey—demand light, at 7@9c.

BEESWAX—30@37c.

R. A. BURNETT, 161 South Water St.

KANSAS CITY.

HONEY—Demand for comb honey good, and stocks reduced quite low. The recent concessions in prices have brought orders in quite freely. Choice white 1 and 2 lb. sections, 16@17c. Extracted in better demand, at 8@10c.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Stocks are mostly of fair to medium quality. There is very little inquiry. Prices are nominally unchanged, but the undertone of the market is weak. White to extra white comb, 15@18c; dark to good, 10@13c; extracted, choice to extra white, 7@8c; dark and candied, 5@—

BEESWAX—Wholesale, 27@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@16c per lb., and strained and extracted 6@6½c.

BEESWAX—Firm at 33@33½c. for choice.

W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market is improving a little; are selling first-class 1 lb. sections quite readily at 18c, with an occasional sale at 19c; 2 lb. is not quite so active, at 17c. Second quality is dull at 15c. Extracted not wanted.

BEESWAX—5c, but very scarce.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18@20c; 2 lb., 16@18c. Extracted, 9@11c.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

| | |
|----------------------------------|--------|
| For 50 colonies (120 pages)..... | \$1 00 |
| " 100 colonies (220 pages)..... | 1 25 |
| " 200 colonies (420 pages)..... | 1 50 |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

We are now preparing a new book for the pocket, to be called "The Bee-Keepers' Convention Assistant." It will contain a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making reports for statistical information—and much other useful matter for those who attend Conventions. One of the latter will be a suitable Programme of questions for discussion at such meetings, model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs; a few blank leaves for jotting down interesting facts, etc. We shall aim to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world. It will be of a size suitable for the pocket, nicely bound in cloth, and the price will probably be 50 cents.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

HONEY EXTRACTORS!

20 per cent. discount on all orders received for the next 30 days on Honey Extractors of the most improved designs. Bokhara Clover Seed, 20 cts. per pound. Extracted Honey Wanted.

EDMUND J. BERRY,

13A1t BROME CORNERS, QUE, CANADA.

WANTED—A young man of some experience in Bee-Keeping to work in the apiary. Reference required. Address, stating age, experience, and wages wanted, W. D. WRIGHT, Knowersville, Alb. co, N. Y. 13A1t

PLEASE SEND FOR MY PRICE LIST Of Langstroth Hives, Sections and Supplies in general, before buying your supplies for 1884. HENRY CRIFE, N. Manchester, Ind. 13A2t

100 COLONIES OF Bees For Sale

They are in Langstroth hives, one or two story. The Bees are Italian, Arkansas Brown, Cyprian and Hybrids—the best honey-bees in the world. Price \$3 per colony, at the apiary. Safe arrival guaranteed.

1868. 1884.
HEDDON'S
COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: 4x4x6, 7 and 8 to the foot, per 1,000, \$6.50; 5x6x2, per 1,000, \$8.00. All shipped from here.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax, the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

CLOVER SEEDS!

The present prices are as follows:

White Clover, \$15.00 per bushel, \$4.00 per peck, or 30 cts. per pound.

Alsike Clover, \$12.00 per bushel, \$3.25 per peck, or 25 cts. per pound.

Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents.
Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents.
Postage, 13 cents extra.

One pound spools, each, 40 cents.
Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

6 Inch, Price, \$25.00.

It makes the finest extra thin Foundation for comb honey. For Sale by

BOOKS!

Sent by mail, on receipt of price, by
THOMAS G. NEWMAN,
 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A translation of the *Masterpiece* of that most celebrated German authority, by H. Dieck and S. Stuttered, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2."

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-FIVE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide, or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, source, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 40c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 25 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous food-destroying adulterations of our food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay, cost of work, interest, wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every mechanic, Farmer, and Business Man. Gives 20,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind. The work contains 1,076 pages, is a veritable Treasury of useful knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Honeyed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Chas. C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can not be instructive for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncepping-Knives first. We neither make nor handle any other supplies; but if these we are the original inventors, and only legal makers, and have had over 35,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Counterfeit Comb Honey.

Mr. S. X. Clarke, Delavan, Wis., sends us the following :

In the *Century Magazine* for October, 1883, on page 816, I find the following paragraph in an article entitled, "Outdoor Industries in Southern California," by which, I think, many of its readers may be misled :

"A still more tyrannical circumvention has been devised, to get extra rations of honey from bees; false combs, wonderful imitations of the real ones, are made of wax. Apparently the bees know no difference; at any rate, they fill the counterfeit full of real honey. These artificial combs, carefully handled, will last 10 or 12 years in continued use."

I think a contradiction or explanation of such paragraphs by bee papers of such standing as the AMERICAN BEE JOURNAL may tend to lessen the ill-effects of such mistakes of reporters, who are mostly ignorant of modern bee-keeping, and, of course, make a botch of what is told them by well-informed bee-keepers. S. X. C.

It is very damaging to have such articles as that quoted by Mr. Clarke appear in the agricultural and literary papers and magazines, but we are almost powerless to prevent it. The reporters "dish up" such things with much "gusto," all for sensational effect, without any regard for truth, just as they do items of scandal and infamy in the daily press; and, just as long as the readers relish that kind of trash, they will find it everywhere. It is truly deplorable, and, apparently there is no potent remedy at hand to stop such misrepresentation.

In the item referred to by Mr. Clarke the reporter is not referring particularly to the "Wiley story" about "paraffine combs filled with glucose," so often quoted in the papers, and which the distinguished "Professor

Wiley" confessed was without foundation, and gotten up by him as "a scientific pleasantry" just for the fun of telling a *lie* so large that it might make him notorious! That has been exposed so often that it is, we may reasonably hope, about "played out."

What the reporter was endeavoring to describe was evidently the use of comb foundation, and made the blunders alluded to by his ignorance of the matter.

Bee-keepers, too, are very much at fault in this matter, by persistently calling it artificial comb, when speaking of comb foundation. This is done at Conventions and in general talk quite often. A prominent bee-keeper of Ohio has cut out and sent to us an advertisement of Mr. A. I. Root, also enumerating "artificial comb" as one of the articles he keeps for sale. We hope Mr. Root will see that his advertisements are all corrected, as he promised in *Gleanings* some time since. This matter is becoming quite important on account of the public misrepresentation in the press about "artificial combs being filled with glucose and sold for comb honey." Let all be careful to "call things by their right names."

California Honey Crop.

We have received the Annual Review of California Crops for 1883, by Geo. W. Meade & Co., San Francisco, Cal. They have put the crop of honey for the past year at 960,000 pounds, and divided thus: Comb honey, 125,000 pounds; extracted honey, 835,000 pounds. They make the following remarks about the honey crop: "The product of California comb honey, last year, was very light, scarcely more than enough to supply the home demand, and prices generally ruled high. Extracted turned out far better than was anticipated, but owing to the large crop of domestic honey East, the sale here has been dull and slow, and a considerable surplus will have to be carried over into the new year.

The European demand for California honey has also been limited, though our honey is preferred there when prices here will permit of business."

Nearly a million pounds for California in a poor season is not a very bad showing, after all.

Removing the Bees from Cellars.

Mrs. L. Harrison gives some good advice about this matter in the *Prairie Farmer*, from which we condense the following :

Good judgment and care must be exercised in removing bees from the cellar, or disastrous results will follow. We know of an apiary of over 100 colonies that was badly injured, indeed, nearly ruined, by all being taken from the cellar all at once on a fine, warm day. The bees all poured out of the hives for a play spell, like children from school, and having been confined so long together in one apartment, had acquired, in some measure, the same scent, and soon things were badly mixed. Some colonies swarmed, others caught the fever, and piled up together in a huge mass. If a few hives are removed near the close of the day and put in different parts of the apiary, the danger from swarming out is avoided, for the bees will become quiet before morning, and being far apart will not mix up when they have their play spell. The success of bee-keeping depends upon the faithful performance of infinite little items.

The hives should be higher at the back, inclining to the front; if the height of two bricks are at the back, one will answer for the front. This inclination to the front is an important matter; it facilitates the carrying out of dead bees and debris from the hive, the escape of moisture, etc.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

Wm. Lossing, Hokah, Minn.—3 pages—Apiarian Supplies.

P. Spërke, Fond du Lac, Wis.—4 pages—Comb Foundation Mills, with sample of nice thin foundation.

J. H. Nellis, Canajoharie, N. Y.—8 pages—Apiarian Supplies.

H. K. Beecham, Traverse City, Mich.—4 pages—Bees and Apiarian Supplies.

For the American Bee Journal.

Weight of Sections.

C. C. MILLER, 172-249.

Heretofore there has been some surmizing as to what size a section should be, to weigh a given amount. I had five different sizes of sections the past season, and can now give the average weight of each. They were all $4\frac{1}{2} \times 4\frac{1}{2}$, differing only in thickness. The largest size were the common one-pound sections, used with separators, measuring in thickness 1 15-16, or 2 inches, but as the wide frames in which they were used were 2 inches, it virtually made the sections 2 inches. All the others were used without separators. The weights for the different thicknesses were as follows:

| | | |
|----------|---------|--------------|
| 2 inches | weighed | 14.3 ounces. |
| 1 5-7 | " | 13.8 " |
| 1 1/2 | " | 11.75 " |
| 1 2/3 | " | 10.5 " |
| 1 1-5 | " | 9.6 " |

We can, by no means, come to any final conclusion from this, for "bees never do anything invariably," and the same experiment at another time might not, and very likely would not give exactly the same results. I think likely these weights are all unusually light, for heretofore the size first given has always averaged 16 ounces or more, and this time only 14.3 ounces. If we take 16 ounces as the ordinary weight of the section 2 inches wide, and increase the weights in the above table in proportion it will make

| | | |
|--------------|-------|---------------|
| 1 5-7 inches | weigh | 15 44 ounces. |
| 1 1/2 | " | 13.14 " |
| 1 2/3 | " | 11.74 " |
| 1 1-5 | " | 10.74 " |

Referring back again to the actual weights, some interesting results may be obtained. The sections were of such thickness that when put into a Heddon super (all but the 2 inch ones were raised in Heddon supers) a foot space would be *exactly* filled by 6, 7, 8, 9, and 10 of the different kinds respectively. If we now fill a foot space with the different kinds successively, we will find a foot of

| | | |
|-----------------|--------|--------------|
| 2 inch sections | weighs | 85.8 ounces. |
| 1 5-7 | " | 96.6 " |
| 1 1/2 | " | 94. " |
| 1 2/3 | " | 94.5 " |
| 1 1-5 | " | 96. " |

The one and five-sevenths inch sections take 7 to the foot, and the 1 1/2 inch take 8; so there is one more space between the combs in the latter than in the former. The difference in weight of a foot of each is 2.6 ounces, and we may say the extra space takes away 2.6 ounces of honey, and that for every additional space in the foot there will be 2.6 ounces less of honey.

Let us see if this holds good. In the case of the 2-inch sections there

are 6 combs to the foot, making 7 spaces (of course the outside spaces are counted) without separators, but as 5 separators are used, we have 5 more spaces, making 12 spaces, or 4 more spaces than in the 1 5-7 inch sections. Deduct 2.6 ounces for each of these 4 spaces, making 10.4 ounces from 96.6 ounces, leaves 86.2 for the weight of six 2-inch sections, which is only 4-10 of an ounce more than the actual fact. Following down the list from the 1 5-7 inch sections each kind has just one more space than the preceding kind, consequently the weight in each case should be 2.6 ounces less than the preceding one. Instead of this we find, as the sections grow smaller and spaces increase, an actual increase or half an ounce, and then another increase of an ounce and a half. This looked so unreasonable to me that I tried to find some mistake, for surely any reasonable set of bees ought to get less honey into a super if more room was taken up with empty spaces.

However, finding no mistake, I give the facts as I found them. Perhaps it is best not to theorize, but it is just possible that the inconsistency of the bees may be explained somewhat after this fashion: If left to their own will they prefer to make their combs about 1 1/2 inches from centre to centre, and if compelled to build farther apart a larger space is left; if forced to build closer together a smaller space is left, by the attempt in each case to approximate their favorite thickness of comb.

For the American Bee Journal.

Premiums at the London, Ont., Fair.

WM. H. WESTON.

Last year only \$43 in prizes was given for bees and honey, but this year the bee-keepers of this county have been very successful in getting premiums; in fact, have succeeded far beyond their expectations. A committee composed of Mr. D. P. Campbell, President; Mr. Frank Atkinson, Vice-President, and Mr. J. B. Aikes representing the West Middlesex Beekeepers' Association, also your humble servant (by special request) met with a committee of the Western fair board, in their rooms in this city, to make every arrangement, and to form a prize list for the coming exhibition to be held in the month of September next. We succeeded in securing a prize list amounting between \$150 and \$200.

The gentlemen forming the committee have signified their intention to do all in their power to make the next show of bees and honey the best ever held in Canada. To that end they have set aside a building which will be placed at the disposal of all persons wishing to show. The only charge will be \$1 for membership, for which members can enter as many articles as they please; they also have four tickets given them to admit them to the grounds. The committee have also granted the bee-keepers the free

use of the Board of Trade rooms in this city for two nights, in which to hold their convention, which they will do during the Fair; the exact date I will give at some future time. The building to be used for the bee and honey show is in the best locality on the grounds, and not placed in some "out of the way" place, as it is at some shows.

All possible arrangements will be made so that exhibitors from the United States will be able to exhibit without having to be at expense for duty. I will forward the full prize list at some future time. They also provide the lumber and a carpenter to arrange tables and shelving to suit exhibitors, free of cost. So you see what enormous advantages we have secured, and which, I think, will bring together the largest gathering of bee-keepers ever held in this city.

London, Ont.

For the American Bee Journal.

Tuscola County, Mich., Convention.

As regards bee-keepers' associations, Michigan is the banner State. Her State organization is the oldest in the country, while her local associations out-number those of any other State. The youngest of the local associations is the Tuscola county, which was organized March 15, at Vassar. The officers are as follows: President, N. Van Patten; Vice-President, A. Haines; Secretary, M. D. York; Treasurer, A. Haines. The afternoon session was called to order at 1:30 p. m., with President Van Patten in the chair.

The first topic discussed was: "Is it desirable to prevent increase in raising comb honey, if so, how?"

President Van Patten: If our apiary is overstocked it may be desirable to prevent increase, but I know of no practical way of preventing it.

W. Z. Hutchinson: If I had too many bees in the spring, so many that my field was overstocked, I would sell bees at some price rather than try to prevent swarming.

The President: I did not exactly mean if the field was overstocked, but if there was not room in the yard for more bees.

W. Z. Hutchinson: If we cannot afford to furnish even "standing room" for the increase of an apiary, bee-keeping must be a poor business indeed. As the President remarked, there is no practical method of preventing swarming when working for comb, and I, for one, would not prevent it if I could. I would not begin the season with more than one-half the number of colonies that my locality would profitably support. I would shade the hives, furnish them with good large entrances, and give plenty of room in the boxes. With this treatment a few of the colonies will cast no swarms, and none of them will swarm until they are populous and will furnish large swarms. When a swarm issues I would put it in a new hive and place it upon the old stand; set the parent hive to one side, the back end of the hive touching the

back end of the new hive, but the front turned to one side at an angle of perhaps 45°. The honey boxes remove from the old to the new hive. Each day slightly move the old hive until at the end of 5 or 6 days it would be standing close by and parallel with the new hive. At about the seventh day remove the old hive to a new location, when all the flying bees would return to the old location and enter the new hive; thus "booming" the new colony, where are the section boxes, and so reducing the numbers in the old hive at the time when the the queens are hatching, that all thoughts of swarming would be relinquished. If the honey harvest continued when the young queen began to lay, I would put a case of sections upon the old hive. With this system of management there is no opening of hives, no hunting for and cutting out of queen-cells, no fussing and bother; and, in my experience, only about one colony in 25 has cast an after swarm.

D. York: I practice putting a swarm into a hive from which a swarm has issued a day or more previous; there is then spent that energy that a new swarm always has in storing honey in the boxes.

W. Z. Hutchinson: Some who have tried Mr. York's method say that the bees swarm out again in a few days, but if they do not, there is no increase, and in my opinion increase is desirable. When we start out in the spring with our apiary in such a condition that increase is undesirable, we show a lack of business management or ability. I secure more honey from a colony and its increase, that swarms, than I do from a colony that does not swarm, and I have the increase into the bargain. Again, I say, why prevent increase?

Question: "How tell from which hive a swarm has issued?"

Mrs. Wright: When we see a swarm clustered, and do not know which hive it came from, how can we ascertain?

President Van Patten: By noticing that the bees are not "hanging out" at some hive, that there are but few bees going out and in, and by looking into the boxes and noting the absence of bees.

D. York: After a swarm has been hived, there are a few bees that will "cluster" again, watch these "stragglers" and see into which hive they go; that is the hive from which the swarm came.

W. Z. Hutchinson: We do not allow our bees to "hang out," neither is there time in a large apiary to go around and examine all the surplus departments, nor to wait to see where the "stragglers" go. I wish I knew of some quick, reliable method of determining from which hive a swarm has issued. We usually have some one in or near the apiary during swarming hours, but occasionally a swarm manages to hang itself up unobserved, and the best that we can do, on short notice, is to note the absence of bees going out and in at some hive, look upon the ground in front of the hive for young bees that are too young to fly, but have attempted to go with the swarm, then if the indications are

favorable, take a "peep" into the honey boxes. By opening the hive, of course all doubts can usually be set at rest.

Question: "Are old combs better than new ones for wintering bees?"

W. Z. Hutchinson: I have given foundation to colonies in the fall, fed sugar and had the foundation drawn out and filled with the sugar, and the bees wintered as well as those having old combs. Old combs often contain old stores, and when the bees winter better than upon new combs having new stores, the success has been attributed to the age of the combs.

D. York: I have hived swarms upon old, empty combs, and allowed other swarms to build their own combs, and the swarms having the old combs wintered best.

Question: "How to winter bees?"
Noble York: I have tried different methods, but consider an equable temperature of great importance.

The President: My bees out-of-doors have suffered this winter severely; the bees in the cellars, too, have suffered. I have lost 30 colonies, mostly from those out-of-doors. Last fall I buried 16 colonies; a few days ago I feared that water was getting in, and I dug them out. Two colonies were dead, but the remainder were in fine condition.

A. Haines: I have wintered bees by burying them in clamps. I did not take them out until soft maple was in bloom. They came through all right.

Geo. Gunnell: Several years ago I wintered a small colony by burying it 4 feet deep in the sand. I stood some barrel staves up around the hive, put straw around them, and then shoveled on the earth.

M. D. York: Although the character of the food may have much to do with the success of wintering, I think that outside influences play an important part. The breath of the bees, aided by the alternate freezing and thawing, wet the combs and lead to dysentery.

W. Z. Hutchinson: What kills our bees in winter? Do they starve to death? Not often. Do they smother? Seldom, if ever. Do they freeze to death? It is possible that occasionally a weak colony does, but it does not occur very often. Is it not the so-called dysentery that causes nine-tenths of the losses? If we could prevent dysentery, what would the other losses amount to? One man thinks it cold that causes it, and he builds a frost-proof cellar in which to winter his bees. All goes well for a few years, and then comes a spring when he carries from his cellar hive after hive containing nothing except dead bees and soiled, ill-smelling combs. The cold theory is dropped. If this man has a neighbor whose hives were well ventilated, and whose bees wintered well, even if they were out-of-doors, he probably adopts and adheres to the ventilation theory until there comes a winter when his neighbor's bees die and his own live, when he drops it for something else.

Bees have passed the severest winters unprotected and came through perfectly healthy; under similar cir-

cumstances, in another winter, they have died before the winter is half over. Bees have been wintered in dry warm cellars, and in other winters they have died in the same cellars. They have lived and again they have died in damp cellars. These statements appear to be conflicting, and also discouraging, but they are facts, why ignore them? It is only upon one hypothesis that I can explain these apparently conflicting statements, and that is that the primary cause of the so called dysentery is improper food.

Honey is not a chemically pure sweet. It is sometimes gathered from cracked or decaying fruit, from cider mills, from the secretions of plant lice, and is almost more or less composed of vegetable matter, floating grains of pollen, for instance. To sustain life and keep up the animal heat, bees eat food; in time the intestines become over-loaded with fecal matter, and if the confinement is continued long enough the contents of the intestines are discharged in the hive. The less vegetable matter in the honey the longer confinement the bees can bear. Just so far, protection lessens the consumption of food, just so much it prevents dysentery; as the less food consumed the longer can confinement be borne. Let us suppose that the honey of one season is largely composed of vegetable matter, and the combs well filled with pollen, and the winter that follows is unusually severe. Bees in cellars and clamps will suffer, and many will die from dysentery; those out-of-doors will be almost entirely swept away, and the universal verdict is in favor of cellars. Let us suppose that the winter had been an "open" one, the bees in the cellars would have suffered just the same as before, while those out-of-doors, having enjoyed frequent flights, would have come through in a healthy condition. Let us suppose that a long, cold winter should follow a season when the honey was of an excellent character. The bees in doors would suffer but little if any from dysentery, while those out-of-doors might suffer to some extent. Now, if the winter had been warm, the bees in cellars would have wintered just the same, while those out-of-doors would have remained entirely free from it.

Unfortunately we have no practical means of determining whether or not honey is fit for winter food, and the only thing that remains for us to do is to remove the honey in the fall and substitute for it a food of whose fitness as a winter food we are assured. Such a food we have in cane sugar. It is a better winter food than even the best of honey. Its heat producing qualities are very much greater, while the residue left, after digestion, is almost nothing. I have conducted experiments for several years with granulated sugar for winter stores, and I am convinced of its superiority. I have had every colony out-of-doors die of dysentery except those that had sugar stores. I have had two-thirds of the colonies in my cellars perish with dysentery; the third that sur-

vived was mostly sugar-fed colonies. They were clean, sweet, dry and healthy, while colonies with natural stores by their side were dead and fairly rotten with dysentery. I have yet to have a colony with sugar stores die of dysentery.

How shall we "spring" our bees? "Spring management of bees," was the next question. W. Z. Hutchinson: If they are wintered in perfect health, they will "spring" themselves. President Van Patten: That is it. Put down his answer, Mr. Secretary, we do not need any more discussions on this question.

Question: "When to remove bees from winter quarters?" W. Z. Hutchinson: I would not remove them until willows and soft maples were in bloom. Last spring I removed the bees the middle of April. They seemed to prosper, and soon had brood in 3 or 4 combs. The fore part of May the thermometer showed the mercury at 32°, and this temperature lasted a day or two. The bees formed themselves into a compact cluster in the centre of the hive, and large quantities of brood perished. Not only this, but the extreme cold for the season seemed to be, to the old bees, like "the last straw that broke the camel's back." large quantities of them dropping down dead; and small colonies soon dwindled away to nothing. Now, would it not have been better if these colonies had not been removed until after the cold weather had passed? When at the convention at Lapeer, Byron Walker mentioned leaving a colony shut up accidentally until the season was well advanced, but it seemed to be none the worse for its confinement, and gave as good results as those that had enjoyed their liberty from the first.

On "Shade for Hives." W. Z. Hutchinson said: I use a shade board 2x3 feet, made by nailing the butts of shingles to a strip of inch board 4 inches wide and 2 feet long. One edge of the board is placed even with the north side of the hive; the board thus projects east, south and west from the hive, and shades it in the middle of the day, but not at night and morning. The board is kept in place by a stone.

Mrs. Coffeen: Why not place the hives under apple trees?

W. Z. Hutchinson: If there were only a few colonies, and the limbs were not so low as to strike over head, it might answer; but with a large apiary, the hives would be too much scattered.

M. D. York: I like to have the hives so arranged that I can work at the rear.

Comb foundation received considerable discussion, but nothing new was elicited.

Adjourned to meet in Vassar the second Wednesday in January, 1885.

Rogersville, Mich.

The Union Kentucky Bee-Keepers' Association will hold its spring meeting at Eminence, Ky., on April 24, 1884.

Automatic Honey Extractor.

G. W. STANLEY & BRO.

I would like to describe my honey extractor, which not only takes the honey from four combs at once, but also reverses or changes sides with the combs, after one side has been extracted entirely, by reversing the motion of the crank. The comb baskets, or pockets to hold the combs, are made of wire cloth, large enough to contain the size of the comb used, with sufficient space inside so that the combs may be conveniently placed in the comb baskets, without injury to the comb.

As the machine stands at rest, the comb baskets hanging from the outside of the reel, point directly toward the centre. The top of the reel is made by an iron cross, attached to a hoop that will just revolve inside the can. Midway between where the

arms of the cross are attached to the hoop, are fastened four small metal hooks, to support the four comb baskets. The bottom of the reel is made with a cross, like the top, with the exception of having a cross-piece at the end of each arm. Two holes are drilled through these cross-pieces near the ends, 3 inches apart, and through these holes are passed the two rods of an arch, which rises 3 inches above the cross-piece; the arch is fastened in the cross-piece by a nut above and below the cross-piece. A vertical rod passes through the two crosses at the centre. The pinion to connect with the cog gear wheel at the top is placed near the top of the rod with the end of the rod running through the pinion and into a bearing in the casting that forms one of the bearings for the crank shaft. The bottom of the vertical rod rests on a cross bearing at the bottom of the can. The lower cross is fastened to the vertical shaft, by means of a set screw; after which the upper cross is turned, so that the hooks come directly above the centre of the arches at the bottom of the reel; the top cross is now secured to the vertical shaft by another set screw.

To make everything secure, and also to form the sides of the reel for the comb baskets to swing against, we provide as follows: Take a strong galvanized rod and fasten one end to the hook at the top of the corner of No. 1, and the other end to the bottom of corner No. 2; now take another rod and run from the top of corner No. 2 to the bottom of corner No. 1; fasten securely at the ends, and at the centre where the two rods cross. When all sides are provided for in this way, the reel is complete.

The comb baskets are made to slip on to the hook at the top, and at the bottom they have a double crotch that fits the arch at the lower corner.

As the extractor stands at rest, the comb baskets all point toward the centre, and the crotches rest squarely against the rods of the arch at the bottom corner.

As the reel begins to turn, the comb baskets are all thrown off the vertical centre, and all pass around in one direction, resting on one rod of the arch, and take their place against the sides of the reel.

As the comb baskets pass around to the sides of the reel, the edge that hung next to the centre will be carried upward about one inch; hence, as soon as the motion stops, the weight of the combs and baskets carried them back again, pointing toward the centre. By reversing the motion the comb baskets are carried around in the opposite direction, and the honey is thrown from the other side of the combs. By applying the "brake" to the pulley near the upper end of the rod, the motion is again stopped, and the combs again swing back, pointing toward the centre, and the combs are removed.

In order to make the action of the comb baskets more rapid, we attach one end of a small coil spring to the bottom of the comb basket, and the other end to the rod of the arch on the same side. This holds the bottoms of the comb baskets in place, and aids in bringing them back to the centre more quickly, so that they will be ready to remove as soon as the motion stops. The extractor will work well without the springs, but time will be saved by using them.

Wyoming, N. Y.

For the American Bee Journal.

Jefferson County, Neb., Convention.

The Jefferson County Bee-Keepers' Association met at Endicott, Neb., on Saturday, March 15.

The President being absent, Mr. Hincle was chosen President *pro tem*, after which the constitution and by-laws were read and new members were enrolled.

The first business was listening to a report from members on the present condition of bees, and the methods of wintering.

Mr. Atkinson uses Langstroth hives and wintered in the cellar. He reported all in fine condition.

Mr. Wing wintered on summer stands; confined his bees to 5 frames; used the Langstroth hives, division-

boards, chaff cushions on sides and top, and reported all in prime condition.

Mr. Hincle uses Laugstroth hives, and winters his bees in the cellar. He also reports the bees doing finely.

Mr. Myer uses Mitchell hives; winters his bees on the summer stands, without any special preparation or extra care, and all are healthy and in prime condition.

The question of how to prevent spring dwindling was discussed.

Mr. Hincle gives his bees a flight in the spring; cleans their hives and returns them to the cellar until there is something in the field for them to work on.

Many other questions of interest were discussed.

On motion, Dr. Abbott was requested to prepare a 30 minute address for the next meeting, which will be held April 12, at 1 p. m., in Touzalin Hall, Endicott. S. HINCLE, Pres.

J. H. TAIT, Sec.

For the American Bee Journal.

When Shall we Extract ?

WM. H. BALCH.

This is a question of importance, and one that I have been asked so many times that I ask a little space in the BEE JOURNAL to answer.

I am aware that many tell us that honey must be sealed and ripened on the hives to give it the right flavor, consequently we have to tier up or lose much honey. This is expensive, for it takes hives, combs and the cappings which are used, which the bees would use in building comb, if we left them an empty frame where it is prudent to do so.

All animals, cats, dogs, horses, cows, and sheep, have a scent peculiar to themselves. Any one that has opened a nest where mice congregate in a mow of grain, during the cold winter months, will not quickly forget its odor.

What would be the result if butter was stored in the cow stable? Any dairy maid will tell you it soon would partake of the odor to such an extent that it would be spoiled for use. Honey is just as sensitive to odor as butter, and my experiments have led me to think more so.

Honey ripened on the hive has a flavor peculiar to the bees; while if extracted as fast as gathered and ripened afterwards, it has a much finer flavor. How shall we ripen it? I will tell you the results of my home trade which satisfies me that the honey is all right.

If the honey is very thick, as it is in a dry season, I leave it in the receptacles used for storing, with the covers off. Sometimes the top of the honey will have to be taken off and be warmed a little. During the past season I did not heat any. If the honey is thin and has a raw taste, I place it on the stove and heat it slowly, stirring occasionally until scalding hot, stirring occasionally while cooling.

I have practiced the above for ten years, and have yet to learn of one complaint. Be very careful not to scorch it, for that will spoil it. If heat to near scalding, it will not candy very quickly. I sell most of my extracted honey after it is candied. My home trade has grown so that I have orders for 150 pounds from a single farmer, for family use. Perhaps, sometime, I will tell you how I have built up my home trade.

Oran, N. Y.

Bay of Quinte, Ont., Convention.

This Association met at Belleville, Ont., Feb. 19, at 11 a. m., Pres. P. C. Demsey in the chair. Subjects discussed were as follows:

1. "Marketing honey."

A. McClatchie said that honey was often forced on the market far below the market value, by persons who really did not know its commercial value.

W. C. Wells said that the honey marketed was often injured by persons not knowing the quality or value of honey they had to dispose of, so long as it was honey; basswood and buckwheat honey frequently sold at the same price, when in reality there was at least 4 or 5 cts. difference, per pound.

J. A. Chapman sold most of his honey at Port Hope, Cobourg and Baltimore; sold his extracted honey at 11 to 12½ cts. per lb., and comb honey, in 1 lb. sections, generally at from 15 to 20 cts. Had crates, nicely fitted up, holding 9 lbs. and 52 lbs. He thought it advisable to make a good display of honey at our county fairs. He exhibited 800 lbs. of honey at the Industrial Exhibition at Toronto last Sept.

H. G. Stafford thought the honey market was ruined by peddling honey around. He sold his extracted honey at 10 cts. per lb., wholesale, and retailed it at 12½ cts. per lb.

C. W. Post said he could produce honey better than he could sell it; sold extracted honey from 10 to 12½ cts. per lb.

The President said we should educate the people, so that they could readily tell poor from good honey. He had seen honey selling in Toronto market at 15½ cts., while his sold at 20 cts. per lb., simply because his honey was in good condition for marketing; he said that frequently one cent per pound extra cost in putting honey in first-class condition for marketing, would command 4 or 5 cts. more per pound on the market. Great care should be taken to place honey on the market in first-class condition.

J. H. Ruttan sold his honey principally at Cobourg, at 20 cts. per lb. for his comb honey.

L. W. Saries had been engaged in bee-culture for 8 or 10 years, and sold extracted honey at 11 cts. in cans. He thought the best way to put up honey was in kegs, holding from 100 to 150 pounds.

Edmund Caverly had no trouble to sell his extracted honey at 11 cts.

A. McClatchie sold his honey principally in the Montreal market by the barrel at satisfactory prices; he did

not like foundation comb unless very thin.

D. J. Hawley sold his honey at Trenton at 12½ to 15 cts. for extracted, and 20 cts. for comb honey.

Wm. Rose sold his comb honey in Rednerville, or on Belleville market, at from 10 to 12 cts. per lb. Did not extract any.

2. "Putting up Honey for Market."
W. C. Wells said small packages sold best; 1 lb. glass jars and small kegs. It was then

Resolved, That in the opinion of this meeting, 10 lb. tin and glass cans, and kegs holding from 150 to 200 lbs., for extracted honey, and 1 lb. sections, and honey boxes from 5 to 10 lbs. for comb honey, are preferable for marketing.

3. "Preparing bees for winter."

L. W. Saries put a rack on the top of the hive after removing the cap, with 2 inches of dry sawdust; gives plenty of good honey, and about the middle of November, puts them into their winter quarters.

W. C. Wells gives each colony about 6 sections of 3 or 4 lbs. each, of best sealed honey, and put them into the cellar not later than the middle of November.

C. W. Post: When the honey flow is over, examines all his hives, and if he finds any weak colonies, he immediately feeds them, or gives them additional frames of honey, and thus makes each strong before it is put into winter quarters; and he usually made a small hole through each frame, so that the bees can pass through from one frame to another.

W. A. Roblin thought it would be desirable to smoke the bees lightly before putting a hole through the frames.

A. McClatchie keeps his bees in a cellar built especially for wintering his bees, at a uniform temperature of 41°; does not disturb them; believes it a mistake to meddle with bees after they are put into winter quarters; thinks that vegetables stored in the same cellar are somewhat injurious to bees; keeps his hives at least 2 feet above the ground and below the ceiling, and 2 feet away from the walls, and always keeps his cellar dark.

W. C. Wells keeps sawdust, about 2 inches thick, on the top of his hives, and ventilates from the bottom of the hive; has his cellar ventilated by 4-inch tile, and finds his bees are healthier when a proper distance from the bottom of the cellar.

A. B. Mallory leaves the quilts on the top of his hives; puts chaff on the top end sides, and with proper ventilation they winter well; thinks the month of April the most trying month in the year on bees.

D. J. Hawley said that a cellar may be too dry as well as too damp; recently his bees were very much disturbed, and he placed some water in a small vessel in front of each hive, and in the evening of the same day found them all quiet.

P. C. Dempsey would not disturb bees in winter; frequent handling causes much uneasiness among bees in winter; his cellar is perfectly dry, and thoroughly ventilated.

3. "Spring Management."

J. H. Peck read the essay as published on page 196 of last week's BEE JOURNAL, on spring management, by Allen Pringle, of Selby, Ont. The concluding paragraphs, not there published, are as follows:

I have said nothing about early queen rearing, or the production of drones. Nor is it necessary for me to do so, as almost every bee-keeper of any experience has a plan of his own for queen rearing, which he considers the plan and the very best plan. Of course, like all the rest, I have my plan too, but as I have never made queen rearing a specialty—having simply raised for my own use—I do not suppose I could instruct many of you on this point. And my paper is already long enough, perhaps too long.

In conclusion I must express my great satisfaction at the present bright prospects of apiculture in this Province. We have now not only some very able practical apiarists in Ontario, but we are getting a corps of good writers and exponents as well. In both respects we will, I hope, soon be able to hold our own very creditably with our American brethren across the Lake. D. A. Jones, our fellow countryman, as an enterprising, practical and successful bee-keeper, stands in the front rank, is perhaps the greatest, in these respects, in the world. In Western Ontario the bee-keepers are, no doubt, ahead of us here in the East, that is, in the extent of the business. That they know any more about the science and art of apiculture than we do, we will just have the egotism to deny.

Bee-culture in this section of Ontario lost a valuable representative when the Hon. L. Wallbridge, ex-President of Ontario Bee-Keepers' Association, left the Province. The science of apiculture ought, in the interests of its literature and cultured exposition, to have among its devotees in any country a few learned and cultured men to creditably represent the system in its scientific aspects. In this respect the learned Chief Justice of Manitoba is a serious loss to us as bee-keepers.

In conclusion be assured of my best wishes for the success, and my active co-operation in the work, of the Bay of Quinte Bee-Keepers' Association.

A very hearty and unanimous vote of thanks was tendered to Vice-President Pringle for his able and exhaustive paper on "Spring management of the apiary." After a brief discussion on the paper, the association adjourned till 9 a. m.

Feb. 20 the association resumed at 10 a. m. The question of "Spring Management" was taken up. Mr. Sarles spoke on the advisability of spring feeding of "weak colonies," and Mr. Dempsey disapproved of that system.

Mr. Dempsey advocates heat under the hive, by means of manure pits, with a board placed over the manure, for the hives to rest on, thereby receiving bottom heat, and by judicious feeding he had caused his weak colonies to become strong much earlier in

the season, and ready to commence with the natural flow of honey.

J. A. Gilbert says his bees will produce young brood at a temperature of 50°. He put 13 colonies in the cellar, and in the spring had about "3 pecks of dead bees," but he never had bees come out stronger.

B. J. Hawley realized about 20 per cent. more by producing comb honey than by extracting.

P. C. Dempsey could make more money by selling his comb honey at 18 cents per pound than by extracting, but it was more trouble to produce it.

T. A. Chapin said that extracted honey would be the honey of the future.

4. "Best method of removing bees."

Mr. Stafford had removed bees at all seasons of the year, but did not like to remove them in winter.

J. A. Gilbert removed bees at all seasons, and had always been successful.

P. C. Dempsey had removed bees at all seasons of the year, but he had sometimes had sustained losses, which, on investigation, was the result of mismanagement, but, on the whole, he had been successful.

5. "How to prevent swarming."

Mr. Stafford said plenty of room and lots of air would keep down the swarming impulse to a large extent.

6. "Best hive for comb honey."

Mr. Stafford uses the two-story Langstroth hive, and never had a section of honey to melt from excessive heat.

L. W. Sarles makes his hives and frames all the same size. He thought the Langstroth hive the best.

T. A. Chapin had been troubled considerably by the use of different sized hives and sections.

A. McClatchie kept only one size, and preferred the Langstroth.

After some routine business, the Convention adjourned.

Convention Notices.

The Wabash County bee keepers intend to organize a county association on Friday, April 11, 1884, at 10 a. m., at the Court House in Wabash, Ind. All bee-keepers of this and adjoining counties are requested to meet with us. H. CRIFE.

There will be a meeting of the Kansas Central Bee-Keepers' Association at the Grange Hall in Manhattan on April 5, 1884. The following papers have been secured: "Forage plants for bees," by Thomas Bassler, K. S. A. C.; "Pleasures and dangers of bee-keeping," by Robert Corbet, of Manhattan; "Ancient and Modern bee keeping contrasted," by S. B. Kokanour, of Manhattan, and a paper by Aug. L. Entsminger, of Silver Lake, Kans. There will be election of officers, etc. THOS. BASSLER, Sec.

The Eastern Indiana Bee-Keepers' Association meets at Richmond, Ind., April 24, 1884.

C. N. BLOUNT, Pres.
G. REYNOLDS, Sec.

The Northern Ohio Bee-Keepers' Association will hold its annual meeting in the City Council Chamber at Norwalk, O., April 24, 1884, commencing at 10 a. m. A full attendance is requested. S. F. NEWMAN, Sec.

The bee-keepers of Tuscarawas County will meet in the Town Hall at Port Washington, O., on Thursday, May 15, 1884, to organize a bee-keepers convention. All are earnestly invited to attend. A. A. FRADENBURG.

We will organize a bee-keepers' association at the Court House in Franklin, Ind., at 10 a. m., April 5, 1884. All bee-keepers are invited to attend and take part in the organization. L. R. JACKSON.

Urmeyville, Ind., Feb. 26, 1884.

The Mahoning Valley bee-keepers will hold their next meeting in the Town Hall at Newton Falls, O., on Thursday, April 10, 1884, at 10 a. m.

E. W. TURNER, Sec.

L. CARSON, Pres.

The Progressive Bee-Keepers' Association will meet for their spring meeting May 3, 1884, at the apiary and residence of J. B. Haines, Bedford, Cuyhoga County, O. All interested are invited. J. R. REED, Sec.

The next meeting of the Bee-Keepers' Association of Central Illinois will be held in the office of the County surveyor, in Bloomington, on Wednesday April 9.

W. B. LAWRENCE, Sec.

The sixth annual convention of Texas bee-keepers will be held at the "Bee Garden" of Judge W. H. Andrews at McKinney, Collin Co., Tex., on April 24 and 25, 1884. A larger number of leading bee masters than ever assembled on a similar occasion in the South, is anticipated.

WM. R. HOWARD, Sec.

Kingston, Tex., Jan. 16, 1884.

All bee-keepers of Northern Kentucky, and persons wishing to engage in bee-culture, are requested to meet in the city of Covington, on April 9, 1884, at 10 a. m., for the purpose of organizing a bee-keepers' association. The meeting will be held in Walker's Hall, southwest corner of Sixth and Madison streets.—L. A. Armstrong, H. J. Aylor, Alex. Stith, Peter McVane.

The Marshall Co. Society will meet Saturday, April 5, at 10.30 a. m., at the Court House in Marshalltown, Iowa. Bee-keepers of adjoining counties interested in bee keeping, are invited. J. W. SANDERS, Sec.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association, will be held at Rockton, Winnebago Co., Ills., on May 20, 1884.

JONATHAN STEWART, Sec.

SELECTIONS FROM OUR LETTER BOX

Home Market for Honey.

My honey was all sold in my home market, and I would advise all bee-keepers to adopt the same plan, at least as far as possible.

W. Z. HUTCHINSON.
Rogersville, Mich., March 20, 1884.

Wintered Well.

Bees managed by improved methods have wintered very well, but box hive men and careless bee-keepers have lost heavily in this section.

DWIGHT FURNESS.
Furnessville, Ind., March 21, 1884.

Winter Severe, but no Loss of Bees.

Our winter has been very severe, but up to date my bees have wintered well and without loss.

WM. BITZER.
Wheeling, W. Va., March 21, 1884.

First Swarm of the Season.

I hived my first swarm to-day. Elm, maple, plum, peach and pear trees are in bloom. It has been warm for about two weeks; bees are booming, the hives are full of young bees, and they are working with vim.

Z. A. CLARK.
Arkadelphia, Ark., March 25, 1884.

Feeding Bees Now.

My 56 colonies of bees never wintered better. I have lost 7, all by starvation. I never had them consume stores as they have this winter; caused by not having any flights to decimate their numbers, and very few dying in the hives. There was a large force to be fed all winter. I was not aware of their condition. I am feeding them heavily with confectioner's sugar, and think I shall lose no more.

WM. MORHOUS.
Dearborn, Mich., March 25, 1884.

A Good Beginning.

The BEE JOURNAL is read weekly with great satisfaction. After Dr. Baker sent it to me, I thought I could not do without it, although I did not have a single bee; so, of course, I sent \$2 for it. In the spring of 1883 I bought 2 colonies, blacks, in box hives, with a few moths in, which I cleaned up, sent for Langstroth hives, which came in time for the swarms, which were hived according to its instructions and were worth the whole year's subscription; but that is not all the value received from it, in addition to the 7 swarms—strange as it may seem—I have taken 398½ lbs. of comb honey, mostly in two-pound sections, which I have sold at from 2½ to 5 cents above the market for crushed jar honey. I had to feed but little sugar besides the unfinished sections (which were not weighed) to 3 colonies. I have kept a strict book ac-

count with them, which stands thus: Hives, foundation, sections, smoker, JOURNAL, and 2 colonies of bees, cost \$25. 400 pounds of honey at 15 cents, brought \$60, leaving a balance besides the bees, etc., of \$35. The result on our market is our merchants return very reluctantly to their jars at 12½ cents. Their customers also do so, only after inquiry for "the little boxes." In canvassing for my club to the BEE JOURNAL, I met one box-hive man who had paid \$10 for the right to make a hive for his own use, and instructions how to feed his bees beef, and they would make him honey all winter.

B. F. HAMILTON, M. D.
Terre Haute, Ill.

Honey Granulated in the Fall.

Spring opened beautifully, and but for the two or three freezing checks since, the bees would have swarmed by the middle of this month; as it is, it will be deferred until about the first of April. My crop, the past season, was 8,500 pounds from 40 colonies, spring count: increased to 70. All honey quickly granulated last winter, and even in full colonies, both capped and uncapped, honey granulated in the cells. Can you tell me why it should have done so? Can it be removed in any way, or will the bees do it?
W. T. MADDOX.
Alexandria, La., March 17, 1884.

[The granulation was caused by some peculiarity of the atmosphere, no doubt. The bees will take care of it, and use it all to advantage.—ED.]

Bees all Right.

My 25 colonies of bees were put in my cellar about Nov. 1, with plenty of honey, and I left all of the pollen or bee bread in the hives this winter, and they have been shut up by the cold ever since. Up to this date they are all right, with no signs of dysentery, and have plenty of capped brood, and brood in all stages. My cellar was prepared for them with tile, and has a 2-inch tin pipe connected with the stove pipe, and running within about 2 feet of the cellar bottom. The thermometer has been all winter from 45° to 50°, until the last cold snap, 2 or 3 weeks ago, when it went down to 32°; but now it has got back to 40°, and seems to stay there. My bees seem to keep very quiet, and every one answers to roll call.

E. L. FREDENBURG.
Fentonville, Mich., March 21, 1884.

How Far do Bees Fly?

Mr. Pettigrew is certainly very much mistaken in his opinion of the distance bees fly for stores, else the bees in the United States are better travelers than those in the old country. I take pleasure in adding my testimony in corroboration of that of Mr. Doolittle in regard to the matter as follows: In 1865-66 I stocked my apiary with Italian bees; they being the only ones within miles of me, except those of a friend some five miles south. During the fall of 1865, I was

asked to look over some black bees kept by a friend some 4½ miles north from my apiary, and, after examining them, was led by curiosity to see whether any yellow bees were visiting a field of buckwheat in the vicinity. To my surprise I found at least one-half the bees in this buckwheat field were Italians, that either came from my own apiary or from that of my friend 5 miles further off. The next season, upon again examining these same black bees, I found the old colonies were well mixed with yellow bees, owing to the young queens meeting my yellow drones. I do not know how far bees do really fly, but in the above case they went in large numbers, at least 4 miles in a bee line.

J. E. POND, JR.
Foxboro, Mass., March 20, 1884.

Experiments in Wintering.

All experiments and observations show that the bees that have been reared here for the greatest number of years, and have consequently become climatized, as it were, have wintered best. Pure Italian stock, and bees reared from queens bred in the South, have nearly all perished, where wintered on the summer stands. Chaff packing has been of no advantage, as used by the average apiarist; some losing all of their bees; some having a few sickly colonies, which swarm out and leave the hive on warm days. Hybrid and native bees have come out ahead, and is another victory for the old-fogy bee man, who keeps his "black imps" in an undressed box hive, and whom the modern and more intelligent apiarist will be obliged to seek out and purchase bees of again, to preserve his moldy combs, and to continue his experiments on the wintering problem another season. I will give you the result soon of experiments on wintering on the summer stands, packed in chaff; also, of cellar wintering and of burying in the earth.

S. J. YOUNGMAN.
Cato, Mich., March 26, 1884.

From Tennessee.

I have sold out here and intend moving my apiary to Sparta, Tenn., next week, where I will have a much better place for an apiary than here. Sparta is the county seat of White County; lies at the base of the Cumberland Mountain. The bees will have access to immense quantities of whitewood, or poplar as it is called here, sourwood, basswood, cucumber, soft and hard maple, white clover, etc. I am receiving a great many letters of inquiry concerning this county, or this State, from Northern bee-keepers who think of coming South. I advise them not to be in a hurry to leave homes in the North to come South. Moving costs money, and while you will find some things here that you will like better than in the North, there will be many things that you will not like as well. If you do come South, do not be in too much of a hurry to buy land. Stay out of the hands of land agents; if you want reliable information, go to some na-

tive that has no land for sale. Stay off of the barren lands. I know of some good localities for bees that are not occupied, but as a general rule the best places are a considerable distance from the railroad. It has been a very wet, cold and disagreeable winter here; the mercury was as low as 15° below zero. Farmers say the spring is a month later than usual.

I. B. GOOD.

Tullahoma, Tenn., March 22, 1884.

From Wataguga Apiary.

My bees all wintered well; they are in the Deihl improved hives. I lost none, and they are storing honey very fast, for this season of the year. I saw one sheet of drone comb full of eggs to day, and I think I will have a swarm off in less than three weeks. This is my second year, and I am having splendid success.

H. C. AUSTIN.

Austin's Springs, E. Tenn., Mar. 24.

Better than Average.

We have had a very cold winter. The mercury was at and below zero 27 times. We put 124 colonies in the cellar before they got frosty. To-day we finished taking them out. All answered to the roll, but one. They seem to be in more than average good condition for this date. The cellar is dry, kept above the freezing point, and mostly at about 45°.

S. L. VAIL.

Coal Creek, Iowa, March 27, 1884.

Bees Wintered on Summer Stands.

Total number 60; loss 6; queenless, to-day, 3; total decrease 9; first pollen gathered March 23; had hatching bees Feb. 1. Bees flew less in February and March than any other months; in fact, they only flew 3 or 4 times in this month. There was some dysentery in January, but good flights checked it. Would have lost heavily, had they been confined all winter, but as it is, I never had bees in better condition at this time of year.

R. C. AIKEN.

Shambaugh, Iowa, March 27, 1884.

Tests in Cellar Wintering.

When my bees were put in the cellar, one dozen brood-chambers were covered with enameled cloth, another dozen with thick cushions, and all others with thin cushions. Every colony was supplied with the purest of honey and pollen for stores. All were perfectly dry, and almost as still as death, until they commenced rearing brood. Then those with thick cushions showed uneasiness and signs of diarrhoea. An examination found them wet; but more ventilation produced quietness, and the disagreeable odor disappeared. Those with thin cushions have remained as quiet as possible. Those with the enameled cloth are in fine condition, but make a great hubbub when they see a light or small a little fresh or warm air, while the others keep perfectly quiet. With a few thick cushioned exceptions the bees appear as small as when

set in. I have made one other test similar to this in a cold cellar, and the colonies having the thickest cushions and enameled cloth over the brood-nest came out decidedly in the rear. Dead bees do not accumulate on the bottom boards, as I leave them on the stands, and set the hives on inch blocks. While I am uncertain whether diarrhoea is caused by the annoyance of water getting into the brood-nest, the sipping up of it after getting there, its getting into the honey, or all combined. I am positive that water is almost invariably present in or nearly if not directly above the clusters of diarrhetic colonies, and that it can and does get there by an easy and well understood method.

C. W. DAXTON.

Bradford, Iowa, March 25, 1884.

Hives, Frames and Bees.

I have handled bees for several years, but I am not experienced in apiculture, as I keep them chiefly for pleasure. I am a farmer, and bees are not very profitable in this portion of the State. I expect to make bee-culture profitable, if it can be done in this portion of the State. I have nothing but the native or German bees. In 1882 bees did well; every flower and shrub of the forest seemed to secrete an unusual amount of nectar, while 1883 was the reverse; bees having to be fed almost the entire season to prevent them from starving. This season bids fair for a good crop of honey. Bees winter well here on the summer stands, in box hives, without protection. My bees have built up very fast and seem to be storing honey. I had drones flying March 15. I say box hives because frame hives are just coming into use here.

1. What hive is the best for beginners?
2. Should the frame be placed parallel with the entrance?
3. How many distinguished races of bees are now known in the United States?
4. Did not all the yellow banded bees descend from the Italian race?
5. What race of bees have the most yellow bands?

L. B. SMITH.

Cross Timbers, Tex., March 28, 1884.

- *[1. We prefer the Langstroth hive for all purposes.
2. The ends of the frames should run towards the entrance.
3. The natives or blacks, Italians, Cyprians and Syrians—all others have come from the above.
4. Yes.
5. The Italians.—ED.]

Honey Dealers and Separators.

I heartily endorse H. D. Hubbel's article in the BEE JOURNAL of March 26, on the advantages of the use of separators, from a commercial standpoint, and wish that every one would use them, or something else to insure a smooth and uniform comb. I occasionally have a complaint of tardy returns, but it has never been on a lot

in which the combs were nice, white and smooth, and cases not too large. I believe I could average 10,000 pounds of comb honey a month, the year round, if it was uniform in all respects, so that one lot would be a fair sample of all. It is the irregularity of shape and condition of comb honey that renders it so difficult to sell, with out the purchaser's seeing it before hand. Let sections, combs and cases be uniform, and all will be benefited.

JEROME TWICHELL.

Kansas City, Mo.

Bee-Keeping in Indian Territory.

My 14 colonies in frame hives are in splendid condition. Here honey is worth 20 and 25 cents per pound. There is no cultivated forage nearer than seven miles. My main source is rattan vine and ague-root, though there are flowers for bees to work on from the time cottonwood blooms till frost. I should like to hear from other bee-keepers in this territory, if there are any.

G. PRIEST GRINSTEAD.

Oakland, Indian Ter., Mar. 25, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Shall I Feed Sour Honey?

In the fall of 1882 I put 6 colonies of bees into the cellar in Langstroth hives, 3 1 packed with chaff, and the rest were not packed. I took them out in January; they had a cleansing flight, and I replaced them. I took them out again one year ago to-day, and they had all died of diarrhoea. I had purchased 10 chaff hives, and so I started again with 3 colonies in the spring of 1883; 2 blacks and 1 Italian. I divided the blacks; and had bad luck in introducing queens, losing 5 queens. The Italian colony gave a swarm which went to the woods; I divided the Italians that were left, and had 2 swarms from the blacks. I had 8 colonies to put into winter quarters, each having 25 or 30 pounds of honey. I took off 50 pounds of comb honey from 2 colonies. In October I packed them with leaves and chaff, with racks over the frames, and a "Simplicity" filled with leaves, and chaff packed around the outside of it. There is not a single sign of diarrhoea. They have been flying for the last 2 or 3 days. Question: Will it do to feed the honey that was taken from those old combs last year? It is slightly sour, and is candied; if so, when and how shall I feed it? O. J. Post, Jr., Chagrin Falls, O., March 17, 1884.

ANSWER.—I should have no fears in feeding the partially soured honey you mention anytime during the next three months. Bring it to the boiling point before feeding, and feed it right away that it may be consumed before the surplus season commences. Bring it to the boiling point as quickly as possible, removing it from the fire immediately after it boils. I would advise diluting it with pure water, to the consistency of nectar, just before you put it over the fire. In this diluted state it must be kept in a cool place, and fed out as soon as possible or it will sour again.

No Winter Loss.

My bees are in the best condition I ever had them. They were wintered on the summer stands, and without any loss. I left pollen and honey as they gathered it from Spanish needles, a frame in each hive, and there are no signs of dysentery. Will Mr. Heddon please give (1) the inside measure of the rough case for winter packing of the Langstroth hive? (2.) What supports it, besides the front entrance? (3.) How high is it above the brood-chamber, when packed and set away for winter? (4.) Does it go below the bottom of the hive?

D. C. McLEOD.

Pana, Ill., March 21, 1884.

ANSWER.—The rough packing box for the Langstroth hive may be made from 6 to 12 inches larger each way than the hive. This would leave a

space of from 3 to 6 inches all around. The front part of the box rests upon the bridge, while the sides and back end rest upon the ground, or if shallower, up upon blocks or stones, as shown in the cut on page 169 of the BEE JOURNAL for 1882. By looking at both cuts you will see how much the sides and back end reach below the bottom of the hive. If you pile in chaff, leaves or sawdust, it runs out on the ground until it piles up, when the inter-space can be filled. This packing comes above the hive, piling up to the dotted line around the case D. Many of our boxes have sides and back ends enough deeper than the front end that they rest on the ground. All boxes go below the bottom of the hive because the hive is upon a stand 6 inches high.

Virgin Queens in March.

I want to ask whether such a queen is profitable or not? I am aware there are no drones yet; but the question arises here, whether such queens will be as prolific as any other or not. The cause of this queen is, that a colt got among my hives and upset one of them, and the next morning I found the bees all on the ground. I gathered up the bees and combs, put them in the hive, and brought them in the house by the stove, and brought them to life. I noticed they had brood in all stages, consequently they built a queen-cell, and now they have a virgin queen. I suppose the old queen perished.

L. B. MELLATT.

Baker, Kans., March 17, 1884.

ANSWER.—Queens seldom become fertilized after they are 20 days old, in which case they are of no value. If, however, they become fertilized before that age, I have no knowledge that they are in any way inferior.

The Cause of Dysentery.

I will give my experience with it, for we all want to find what is its cause and cure. It is not a disease, but is the result of long confinement. I have now kept bees for 7 or 8 years, and, of course, I have made some observations. In the spring or fall, if the bees are kept in a few days by cold or wet weather, they will act the same as they do when we set them out in the spring; not so much, but you will see a few specks on the hives and boards around. Bees take a flight every day; most people call it playing, but I do not. It is the young bees taking a flight to exude their feces. They do this every day when it is good weather, and if they are kept in 2 or 3 weeks, they will have dysentery. The young bees have these flights in the fall. They do not have young bees from October till January. Old bees pass it off when flying after stores. Last spring a colony reared a few drones in the winter; they did not allow them to live, but threw them out at the entrance. In March or April they tried to rear a young queen; after she was from 1 to 8 days old, when I was watching the bees, I saw her come in. She was not in more than 2 or 3 minutes when she

came out again. There was no young bees in the hive for 25 or 30 days, and one-fourth of them were drones. About the first of June they reared another queen, and I killed the old one, whose wings were all in strips and broken. The young queen hatched all right. The old queen's bees were one eighth black or Italian-hybrids. The young queen's bees are all Italians, and are as yellow as I ever saw. Did they kill the old queen in the first place, or did they kill the young one? I think they killed the young one and kept the old one, as the bees all looked alike. I had a colony that had the dysentery last spring; the hive was clogged with rubbish and dead bees, so that only a few bees could come out at a time. I drew the nails, and 2 or 3 frames fell down to the bottom of the hive. A little knot-hole under the honey-board they made black with their faces.

BORCOE, III. DAVID WATTERSON.

ANSWER.—As it is more convenient to handle every thing by its proper name, let us first settle the question of "disease." Webster defines it "lack of ease; meanness; distress; trouble; trial; derangement of any of the vital functions, causing or threatening pain and weakness; morbid or unhealthy condition; disorder." If bees, possessing what bee-keepers call diarrhoea, dysentery and cholera, and a something which Mr. Watterson proposes to prevent and cure, is not properly a disease, then what is it? Whatever it may be would it be likely to destroy the life of the bees and yet never become a disease? (See Webster.) We frankly admit the disease is produced by too long containance of residue from food eaten. We know that a short confinement in the spring will be more productive of the disease than one of much longer duration in winter.

If confinement alone was the cause of dysentery, there would be no such difference in time. If cold or humidity were the cause, the facts would reverse and accumulation of feces would take place in a shorter time in January and February than in April or May. If the "pollen theory" be correct, we should expect a much more rapid loading of fecal matter during the breeding season, and this is just what we realize. We cannot see from what source your colony could rear a queen, as we understand the first young queen was never fertilized or laid eggs. The only way out is to suppose that a young Italian queen came to the hive of her own accord and was accepted.

Keeping Moth Out of Combs.

Please tell me through the columns of the Weekly BEE JOURNAL what will prevent moth from getting into the combs, as I have lost several colonies?

D. F. PALMER.

Yorkville, Ills., March 16, 1884.

ANSWER.—Keep the bees strong in numbers in proportion to the amount of comb they have in your possession. Keep bees with enough Italian blood in them to make them excellent guards

against the moth and other enemies. Never leave any bits of comb where moth can breed in them. Whatever empty combs you may carry over the winter (not in use) expose to a temperature of 14° or below. Follow these rules and moths will be almost an extinct species in your apiary.

Making Comb Foundation.

Please answer in "What and How:"

1. In making Given foundation, is it necessary (or better) that the wax sheets should lie a couple of days after dipping, before they are pressed?

2. A manufacturer of a roller foundation machine recommends using 2 per cent. of resin in wax, to cleanse it. Would it be objectionable? If so, why? A SUBSCRIBER.

Carthage, N. Y., March 10, 1884.

ANSWERS.—1. The sheets seem to stick a little less after they are a few days or a week old.

2. I object to using resin or anything but pure wax in comb foundation. So far as I know, the bees have objected to all foreign substances. I have never tried or seen resin tried, but it is bitter and hard, and I should guess would make the foundation less pliable. I do not believe it would have any tendency to cleanse the wax, and think that the object in using it has been to lessen the sticking of the wax to the rollers.

Space Above Frames.

I thank Mr. Heddon for his reply (on page 155) to the question which I asked him as regards the dropping of the frame below the level of the hive. I fear he shows a lack of knowledge when he says a host of experienced bee-keepers are smiling at the question. He does not seem to know that D. A. Jones, who exhibited the greatest amount of honey at the Toronto exhibition, has his frame level with the top of his hive. Nor yet that Mr. Emeigh, who took first prize on comb honey at Toronto, has his frame level with the top of his hive. Mr. McFarlane, Tilsonburg, Ont., calls the hive he uses (being the patron of Mr. Heddon's) the Langstroth improved by Heddon. I have seen no flat cover put on the frame without a cloth between. In reference to killing the bees, there is no danger by having a cloth on top of the frame. When you put on the cloth, take it by two corners, then by throwing it a little beyond and drawing it gently to its place; if there are any bees, they will be drawn between the frames. I had asked the question of some who pretend to have the same hive as Mr. Heddon, and they all referred me to him. F. ALLEMAND.

Eden, Ont., March 18, 1884.

ANSWER.—Many of our largest producers do not exhibit their honey at all. The practice of using a cloth over the frames in summer, I cannot help thinking has grown out of illy-constructed hives. Without the cloth there is no danger of killing bees, and you can adjust the cover in one-fourth the time. If you will try a proper

bee space above the frames, with flat cover and no cloth by the side of an equal number of any other arrangement, I am very confident that you will discard all others for that one.

Prevention of Swarming.

Can you tell me how to prevent bees from swarming only once? I have 15 colonies. I made a house for them, 6 inches thick, with matched boards on both sides, and filled in with sawdust. They are all raised from the bottom board $\frac{1}{4}$ of an inch. They are all right yet. The glass has been 45°, and as low as 28°. I have 2 colonies on the summer stands raised $\frac{1}{4}$ of an inch from the bottom board. This is my fifth year with bees. Last winter I lost all, and this spring I bought 7 more blacks. I do not think they did very well; they increased to 17, and gave 200 pounds of honey. Which are the best bees to keep? I find black bees a little too hot, for they will sting in mid-winter.

Utica, N. Y.

B. E. FOSTER.

ANSWER.—There are many ways to prevent bees from casting first, second or any swarms. I know of none which I consider practical, or as well for the apiarist as to let them swarm, and then prevent increase of colonies by the plan I gave on page 126 of the BEE JOURNAL for 1883. Perhaps you would be better pleased with Italian bees than your Germans. It may be that your Germans are of the little black stinging strain.

The Western Bee-keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

The Western Michigan bee-keepers, will hold their spring meeting at Berlin, on April 24.

F. S. COVEY, Sec.

The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest, for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twichell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

A bee-keepers' association is to be organized in Western New York on Tuesday, May 6, 1884, at Randolph, Cattaraugus County. In this southern-tier district there are a large number engaged in bee-keeping, and an association of this kind has long been needed. A general invitation is extended to all interested in bee-keeping.

W. A. SHEWMAN.

The Lorain County Bee-keepers' Association, will meet at Elyria, O., Wednesday, April 9, 1884.

O. J. TERRELL, Sec.

North Ridgeville, O.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., March 31, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no life in the market. Extracted honey sells in its regular way and to its wonted channels, without any speculative feeling about it, and brings 7¢@10¢ on arrival. Comb honey sells slow at 15¢@16¢ a lb. from store for choice.

BEESWAX—Is in good demand; choice yellow brings 35¢ a lb. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17¢@18¢. Dark and second quality, 15¢; extracted white clover in kegs and barrels, 9¢@11¢.

BEESWAX—Prime yellow, 34¢@35¢.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Of late receipts of comb honey has been scattered amongst many firms, and as all are desirous of realizing on their receipts at as early a day as possible, prices have been irregular and low, some lots being offered from 5¢ to 7¢ per lb., less than 30 days ago. I quote white comb 13¢@16¢; fancy 18¢. Extracted honey—demand light, at 7¢@9¢.

BEESWAX—30¢@37¢.

R. A. BURNETT, 161 South Water St.

KANSAS CITY.

HONEY—Demand for choice white comb 1 and 2 lb. sections continues good at 16¢@17¢. Dark and irregular comb not wanted. Extracted in fair demand at 8¢@9¢.

BEESWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—Only in a jobbing way is there anything doing. Stocks are not heavy, but are larger than holders care to have them at this time of the year, especially as liberal receipts of new are expected in a couple of months. White to extra white comb, 15¢@18¢; dark to good, 11¢@13¢; extracted, choice to extra white, 7¢@8¢; dark and candied, 5¢@6¢.

BEESWAX—Wholesale, 27¢@30¢.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12¢@16¢ per lb., and strained and extracted 6¢@9¢.

BEESWAX—Firm at 33¢@33½¢ for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market is improving a little; are selling first-class 1 lb. sections quite readily at 18¢, with an occasional sale at 19¢; 2 lb. is not quite so active, at 17¢. Second quality is dull at 15¢. Extracted not wanted.

BEESWAX—35¢, but very scarce.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18¢@20¢; 2 lb. 16¢@18¢. Extracted, 9¢@11¢.

BEESWAX—35¢.

BLAKE & RIPLEY, 57 Chatham Street.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

See M. Bailey's advertisement; he has Clover Seed for sale.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

- For 50 colonies (120 pages)..... \$1 00
- " 100 colonies (220 pages)..... 1 25
- " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

NEW INVENTION.

Patented Oct. 17, 1882.

Bees forced to leave their surplus honey before removing it from the hive. Saves valuable time and labor; prevents robbing, and the liability of being stung. The Bees are first cut off from the brood hive, by closing the openings in a slat honey board; the conductor is then placed in position, which connects bees in surplus honey with brood hive. They soon find that they are imprisoned, and being anxious to escape, pass out through the Conductor into the brood hive. It also prevents their return.

- Conductor and Langstroth hive complete..... \$6 00
- Conductor and Honey Board, any size, and Sections to fill, which shows all the improvements..... 1 50
- Conductor, by mail..... 50

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis.
Dear Madame:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.
Yours,
CHAS. DADANT & SON.

MRS. FRANCES DUNHAM, De Pere, Wis.
Dear Madame:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
Yours very truly,
D. A. JONES.

MRS. FRANCES DUNHAM:
All prefer the foundation I manufacture on one of your mills, to that made on any other machine. I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
Yours respectfully,
J. G. WHITEN.

MRS. FRANCES DUNHAM:
After using one of your foundation mills for the past 3 years, we can't say too much in its favor And for brood foundation, it stands head and shoulders above all.
Yours,
SMITH & SMITH.

MRS. FRANCES DUNHAM:
I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretzner, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) give the best results of any tried." I write this that you may be fair play, which is me always a jewel. You are at liberty to publish this. Yours truly,
T. L. VON DORN.

Send for description and Price List to

1884.

HEDDON'S COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I am now ready to furnish white all-Doyetail Sections as follows: $4\frac{1}{2} \times 4\frac{1}{2} \times 6$, 7 and 8 to the foot, per 1,000, \$6.50; $5 \times 6 \times 2$, per 1,000, \$8.00. All shipped from here.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION

On account of the prevailing scarcity of beeswax the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay 12c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

CLOVER SEEDS.

The present prices are as follows:

White Clover, \$15 00 per bushel, \$4.00 per peck, or 30 cts. per pound.

Alsike Clover, \$12 00 per bushel, \$3.25 per peck, or 25 cts. per pound.

Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents.
Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents.
Postage, 13 cents extra.

One pound spools, each, 40 cents.
Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

6 Inch, Price, \$25.00.

It makes the finest extra thin Foundation for comb honey. For Sale by

ALFRED H. NEWMAN,

923 West Madison Street,

CHICAGO, ILLINOIS.

GOLD for the working class. Send 10 cents for postage, and we will mail you free, a royal, valuable box of sample goods that will put you in the way of making more money in a few days, than you ever thought possible at any business.

Capital not required. We will start you. You can work all the time or in spare time only. The work is universally adapted to both sexes, young and old. You can easily earn from 50 cents to \$5 every evening. That all who want work may test the business, we make this unparalleled offer; to all who are not well satisfied, we will send \$1 to pay for the trouble of writing us. Full particulars, directions, etc., sent free. Fortunes will be made by those who give their whole time to the work. Great success absolutely sure. Don't delay. Start now. Address STINSON & Co., Portland, Maine. 4A1y

STANLEY'S AUTOMATIC HONEY EXTRACTOR.

Reverses the combs without the aid of the hands; the reverse motion of the crank is all that is required. No time is lost, as we provide every machine with a brake to stop the motion, and the combs are half reversed when the motion stops. Can be used for 2 or 4 combs, as desired. No chance for combs to fall or get injured. The Comb Baskets always stop in the most convenient position for removing or putting in combs. We use XXXX Tin or Galvanized Iron for Cans. The Cylinder of Can is all in one piece. We challenge any Extractor, taking any number of combs, to do one-half the work of our 4-frame Machine. Prices reasonable.

We want to employ good live Agents everywhere. Address,

G. W. STANLEY & BRO,

14A1t

WYOMING, N. Y.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCLIPPING KNIFE.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apicary, states that "Mr. Bingham was the first to improve the old Quinby smokery by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Unclipping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates, on larger quantities, given upon application.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutterer, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2."

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-FIVE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00

Bee-Keeper's Guide; or, Cook's Manual of the Apicary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but is intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit.—By Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine.—By Thomas G. Newman.—This pamphlet discusses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey every where. Published in English and German. Price for either edition, 5c.; per dozen, 40c.

Preparation of Honey for the Market.—Including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity.—By Thomas G. Newman—Giving advance views on this important subject, with suggestions what to plant, and when and how to be sown. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter. with instructions about Chaff-Pan, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered us food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Fisher's Grate Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measure, reed reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic. contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping. by L. C. Root—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use.—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture. by A. I. Root—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.

King's Bee-Keepers' Text-Book. by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers. by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher,
Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Vortlichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königinnen—Füttern—Schwärmen—Ableger—Versetzen—Italienisieren—Zusatz von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschreiben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formkucheln, Puddings, Schaumconsect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniss der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung wertvoller Recepte. Preis 25 Cents.

No. 15.

ESTABLISHED 1863
THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

☞ We have received a Postal Card dated at Bristol, O., and post-marked at North Bristol, O., without signature. If this meets the eye of the writer, perhaps he will be kind enough to give us that very important part of any letter—the name and correct address of the writer. We have quite a number of letters, some containing money for books and subscription, without names or addresses of the persons sending. Such careless work is very annoying, and prevents any reply, as well as the filling of the orders.

An Early Bee Plant.

A writer in a cotemporary journal mentions *Draba verna*, or Whitlow grass, as one of the earliest honey flowers. "It is the most diminutive plant of the Mustard family, *Cruciferae*, the first flower to delight the industrious honey bee, and his homely face, no doubt, rubs against its minute white petals with particular pleasure, as he steals from it both honey and pollen, as the earliest fruits from the first harvest. So slender is the scape with its bractless raceme, that the bee has to lie on its back while working upon it, as I have often witnessed. The instant he touches a flower it yields to his weight, and the fragile scape will bend over until the bee's back rests upon the ground, and in this position he remains until each expanded flower of the raceme has been visited and enjoyed. The *Draba* delights in sandy soil, and springs up in the corn fields after the last working, and quickly covers the ground. It is wonderful how they stand the intense cold, germinate, grow and expand flowers dur-

ing freezing weather, especially as they are very juicy plants."

The Convention at Davenport, Iowa.

The very large quantity of matter on hand, awaiting a chance to appear in the BEE JOURNAL, compelled us to omit President L. V. McCagg's address, when publishing the report of of the above named Convention. As it is now taken from its connection it is not of as much interest. We will, however, give the following as a brief synopsis of it:

In my first annual report, I shall endeavor to give you a short sketch of the past, desiring you, at this meeting, to adopt some new measures, by which we may meet more frequently to discuss the science of bee-culture.

Any one, 50 years ago, who would have foretold the progress and advancement of this country, would have been deemed a fit subject for the Insane Asylum. Eight years ago, when I commenced keeping bees, those already engaged in the business were simply amateurs, not adepts in bee-keeping. They had a few colonies and a way of their own for managing them; yet thirsting for knowledge, in order to become more successful.

One year ago, believing that much good would result from an association of this kind, I took the liberty of calling a meeting. After repeated calls, 32 bee-keepers responded, and we formed this association. Our first meeting, held in Davenport, Iowa, was well attended, and much enthusiasm manifested. Since then, quite a number of the members have passed many enjoyable hours at private gatherings, basket picnics, etc.

I now urge you to fix a time in the spring, and one in the fall, at which times we shall meet and discuss the best methods of preparing bees for wintering. It is, also my desire to have the members of this association try to become better acquainted with each other. This can be accomplished, only by frequent gatherings or reunions.

☞ Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Catalogues for 1884.—The following new Catalogues and Price Lists are received:

J. I. Parent, Charlton, N. Y.—4 pages—Bees and Apiarian Supplies.

T. S. Hall, Kirby's Creek, Ala.—24 pages—Bees, Queens, and Apiarian Supplies.

J. W. Clark, Moniteau, Mo.—8 pages—Combination Crate, Honey-Board, Section Rack, and Bee-Keepers' Supplies.

Adin A. Smith, St. Johnsville, N. Y.—1 page—Hives.

J. M. Young, Three Groves, Neb.—6 pages—Bees, Queens, and Apiarian Supplies.

Geo. H. Knickerbocker, Pine Plains, N. Y.—20 pages—Bees, Queens, and Bee-Keepers' Supplies.

B. F. Carroll, Dresden, Texas—4 pages—Cyprian Bees.

G. W. Stanley & Bro., Wyoming, N. Y.—4 pages—Automatic Honey Extractor, and Smoker.

Wm. Connelly, Ogden, Iowa—4 pages—Poultry.

Lucio Paglia, Castel S. Pietro dell Emilia, Italy—Bees and Apiarian Supplies.

☞ It will probably be welcome news to Canadians to learn that E. L. Gould & Co., Brantford, Ont., keep a stock of Binders for the BEE JOURNAL, on hand, which can be sent by mail to those who wish them. They cannot be sent by mail across the lines from the United States.

☞ Scores of articles are in the drawers of our desk, waiting for a chance to appear in the BEE JOURNAL, and our friends will have to exercise patience. We have "condensed" quite a number, cutting them down so much as to leave only a small portion of what was originally written. We have decided to do this rather than keep them waiting any longer. We have confined the editorial matter to one page for several weeks, in order to give place to those who want to have their articles appear.

☞ Now is the time to plant young basswood trees, for future pasturage for your bees. You may see them advertised in this paper.

CORRESPONDENCE.

For the American Bee Journal.

Priority of Location.

JAMES HEDDON.

As this heading and other phrases used by Bro. Pond, on page 149, have previously been used by me only, I rightfully infer that his article refers to me. I would be far from charging Bro. Pond with "selfishness" as the basis of his widely differing opinion, though unlike myself, he would hardly be able to clear the charge as I can; because, if I am rightfully informed, he is only an amateur, attaching a little apiculture to a great deal of writing and law practice. Laying aside the self-interest in the matter, Bro. Pond's position is not the best from which to form a correct judgment in the matter under discussion, which is one of great interest to the near future.

Now, to Bro. Pond's arguments. It seems to me he will have a hard time to make the readers see that his Mr. No. 1 is more selfish than No. 2. You seldom find an enterprising man, rich or poor, that is less selfish than to say, "I will do what I can to monopolize this business." Is a desire on the part of the poor No. 1 to monopolize the use of the surrounding flowers, that, prior to his genius to make them pay, have lain a dead waste for ages, more selfish than the actual monopolizing of all the soil they grow upon, for all purposes, for "him and his heirs forever?"

Is it entirely unselfish for the one who already has so much of this world's goods that in consequence thereof *some one must be poor and needy*, to hang around until he borrows, or thinks he has, from the skill of the poor man, and then starts a greedy and destructive opposition? But this avaricious No. 2 will fail. He has no better natural or legal chances than his poorer fellow worm. No, not as good, as his mind will necessarily mainly cling to his greater financial problems. The case is worse, however, where both parties are poor, and where the failure scrimps the poor wife and little ones.

Has it never struck Bro. Pond that the price of honey must necessarily be a figure intermediate between maximum and minimum cost of production? That he who produces a maximum cost must fail. That only those who produce at a lesser cost can succeed? That where two apiarists each ask for a share of one field, they must produce at maximum cost. The actions of the Hetheringtons, Oatmans, Grimms, etc., prove this to be true. Has he never been able, from his position, to look at the apiculture of the near future as a business with the same dignity, and surrounded with environments, the same as other lines of business?

Does he not know that the figures he gives are not average yields, and, consequently, figures of exaggeration?

That in this exaggeration he has admitted the weakness of his case? Recent reports from some of our more practical producers tend to show that our bees go over six miles in each direction for nectar. We all know very well that the little workers do a good business when traveling four miles from the hive to the flowers. As above quoted, our ablest apiarists agree that we can readily practically overstock a location. An area of eight miles diameter would contain over 20,000 acres of land.

As Bro. Pond's No. 2 gentleman has hardly succeeded in honestly, and unselfishly earning more than a one-hundredth part of that area, and should he embark in bee-keeping, more than nine-tenths of his honey must come from flowers he does not "own," will he have the cheek to talk to No. 1 about the ownership of nectar? Would it not have been better if Bro. Pond had not mentioned the word "own," and does not the nectar, in a legal and moral sense, class with the air and sunshine, free to all?

As there are so many unoccupied fields where the nectar is never gathered, and as the second half of that number of colonies that one area will support, can be managed in the same field with less than one-half the expense, they can be equally well handled in another, does not the "prior" occupant of a field have the "moral right" to that field? I still think, YES.

Bro. Pond cites us to the gush "across the water." Let us see, there are two distinct classes. Past generations have so arranged it there that those who work most have least, and those who work least have most. The one class consumes the earnings of the other. The consuming class are the ones who are most interested in educating the producers how to produce more. Our own country is not entirely exempt from this condition of affairs; in which respect it is growing no better from day to day.

The dabbler who takes one loaf of "bread out of the specialist's mouth," will take two out of his own; but this does not pay either party. The "Gusher" who urges on this dabbling, is the one who fills his sack. Every apicultural teacher shirks his most solemn duty, if he fails to teach his pupils these great truths. If he does teach them, the more such-taught apiarists he sends into the field, the better for the pursuers of honey-producing. Bro. Pond asks: "Who has given us our improvements—the specialists or professional amateurs?" I answer, both. I would be glad to-day if I had such a professional amateur in my field with his 5 or 10 colonies. He could show me some entomological truths, while I showed him what are the necessary methods and fixtures to make the production of honey a successful speciality. The greatest blight on the fair fruit of apicultural literature has been the presumptuous writings of professional amateurs. Specialists (since there have been any) have done nearly all that has been done in devising practical methods of operation and procedure, as well as improving and adapting the fixtures

invented by professionals to the wholesale honey-production of to-day.

By the way, is the rich Mr. No. 2 about to become a professionalist? Does the large yield, taken by No. 1, excite his unselfishness to spend his time devising improvements for the poor and needy of the following generations? Why should we not expect good implements and methods of operation as the outgrowth of the brain of him who is trying to pile up the largest number of tons of honey, with the least cost and friction. "Necessity is the mother of invention." And would it be strange, if what is most needed by the specialist should be invented by him? Does nothing good and wise ever evolve from the brain of him whom circumstances have forced to mingle his physical labor with his thoughts? Have not most of the best thoughts given to the world come from this source? Is not Bro. Pond a little too aristocratically inclined?

About three years ago, an honest, world-beaten young man, one who looked as though he might have been an orphan at a tender age, came nearly a hundred miles to see and talk with me. He said he was poor; never had been helped by any person (no doubt he had the reverse), and all he then had was about 30 colonies of bees, and his health and strength, without skill with which to support a good wife and two young children. He asked me to advise him regarding the probabilities of his sinking or floating on his apiarian plank. I looked at him, watched his step and manner of speech, and made up my mind that with a little help at the start, and good advice, he could win. I have tried to give him both. He is succeeding, I believe. Now, reader, you know that this man loves his family as well as you do. I well remember when I was anxious; when it was win with bees or go hungry, and no one to shed one feeble ray of light.

You know that our pursuit is not all gold; that many fail; that another bee-keeper in this man's field would more than likely cause failure. How do you feel when one of these "gushers," from the most selfish motives, or blind ignorance, steps up to the neighbor of this young man and says, "Why don't you keep bees?" "There is lots of money in it." "Why, bees work for nothing, and board themselves." Do you not feel like saying to this class just what they used to say to me. "Put him out?"

Dowagiac, Mich., March 24, 1884.

For the American Bee Journal.

Experiments with Bees.

G. L. PRAY.

During the past six years I have been experimenting with five different strains of bees. They were the light-colored Italians; the imported Italians; the German or black bees, and a cross between the German brown bee and the imported Italians. I tried them both separately, and side by side; and for both extracted and comb honey. I prefer the cross. I

have five reasons for my preference, viz.:

1. When I put on the sections, I know I shall find the bees at work there the next time I look at them.

2. They are not half so apt to swarm until after storing a fair crop of surplus honey.

3. When I take off the sections, they are always capped over, if there has been any reasonable flow of honey.

4. They make whiter combs than the pure Italians.

5. They are better honey gatherers; at least, to me, they have proven so. In every respect they are just as easy to manage as any race of bees.

My best colony of bees, this season, was from a Heddon queen; she was from the cross to which I have already referred. I introduced her into a fair-sized colony of blacks, and set them by the side of my best dark Italians, and worked them for comb honey.

When I took off the sections at the close of the season, I had 40 pounds more of comb honey from her colony than from the dark ones. I also reared two nice queens besides; and then had 2 strong colonies in good condition for wintering, besides the old one which had the body of the hive full of capped honey, on which to winter. The hive, in size, is the same as the 8-frame Langstroth.

Bees have done very well, considering the shortness of the season. I averaged about 100 pounds of comb honey to the colony; and one more than doubled from spring count. All went into winter quarters with the hives full of comb honey, well capped. Petoskey, Mich.

For the American Bee Journal.

Bees and Honey in Kentucky.

DR. N. P. ALLEN.

The Kentucky State Bee-Keepers' Association, at their last Convention, appointed a committee to collect information in reference to Kentucky as a honey-producing State. Two kinds of circulars were printed, and sent to some 300 or 400 bee-keepers of the State. One circular requesting a statistical report of the crop of honey, etc., for 1883; and one, asking for a sketch of the different counties, as to their adaptability as an apicultural field. While 99 bee-keepers responded to the call for statistical reports of their bees and honey, last season, only a few sketches were received. The 99 reported 3,603 colonies of bees (including swarms;) and 57,108 pounds of comb honey, which sold at an average of 17½ cents per pound, and 130,302 pounds of extracted honey, which sold at an average of 12¾ cents per pound. The total number of pounds of honey were 187,400; which sold at an average of 15 cents per pound; making \$28,110.

We find the average per colony 51¾ pounds; making returns of \$7.76¼ per colony. At least ⅓ of the colonies reported were new ones, and the greater part of them furnished no honey. There were over 100 reported

as used for queen-rearing, which furnished no honey, and a number of colonies of black bees in box hives were reported as having but little honey. We find that Italian bees in movable frame hives give a much larger average.

One bee-keeper reported an average of over 300 pounds to the colony, and four others with 370 colonies, report an average of 110 pounds per colony, bringing an average of \$16.30 per colony. Thus showing the advantage of Italian bees and movable-frame hives, with the liberal use of comb foundation and the honey extractor. The committee contemplate publishing a pamphlet setting forth the advantages of Kentucky as a honey-producing State. We would be glad if all bee-keepers in the State would report, giving a sketch of their counties as to the advantages for honey production.

We also find that nearly all have Italians and hybrids, and Langstroth hives; and that white clover is the great honey-producing plant, furnishing more honey than all others combined. We do not make this as a full report; but hope yet to hear from many more.

Smith's Grove, Ky.

For the American Bee Journal.

Statistics of the Honey Crop.

D. S. M'KINSTRY.

As Dr. C. C. Miller asked for expressions on this subject, I take this opportunity to give my opinion. He remarks that the plan for each bee-keeper to report to their vice-presidents is a good one, if they can secure the report; but bee-keepers will not report, excepting about one in twenty, who are interested in gathering statistics. Nearly all of the plans suggested are made after the idea of individual reports every fall, which plan, I think, has been tried long enough to prove its failure. I think the only practical way to do it is by the plan the Department of Agriculture pursues in gathering agricultural statistics.

1. Have the assessors gather the statistics of the preceding year, each spring, and report them to the Department of Agriculture, as they do at present in the State of Illinois.

2. Appoint from one to four crop correspondents in each county to report, first, about the middle of May, how the bees have wintered, and give the prospects for the honey crop; and, secondly, about the last of September, report the results of the season as compared to an average; stating it in percentage, that is: if there is 10 per cent. more honey than an average, report 110 per cent.; if 10 per cent. less, report 90 per cent.

In this State we have nearly all we can desire in complete statistics as to the honey crop, excepting to get it in time for use in disposing of the crop, which can be done by the correspondents reporting the state of the crop in the fall, as stated above; and if we cannot get the correspondents to

make accurate reports, whose duty it is, you surely cannot expect bee-keepers in general to make reports, especially where they point out a failure of the one reporting.

This plan, I am sure, will work in this State, and I think in any State where they take agricultural statistics. For further information on State statistics, I refer to Mr. S. B. Atwater's article on page 57. I should not try to get statistics of so many things, as we have in the past. Methods of increase, how wintered, kind of hives, etc., although interesting in themselves, should be left out of statistics. What we want to know is the number of colonies and the amount of honey produced. The plan of giving papers to the assessors to fill out, will do but little good, unless they are compelled by law to see that they are filled. The assessors in Illinois have these two blanks to fill, in relation to bee-keeping: 1. Number of colonies on hand; 2. Amount in pounds, of the honey crop of the preceding year.

If we could have this added to the assessor's blanks in all of the States, where they take agricultural statistics, and laws were passed in such other States as do not, by the aid of correspondents we might have our object accomplished. What objection is there to this plan, Dr. Miller?

Grant Park Ill.

For the American Bee Journal.

Adulteration.

E. A. THOMAS, D. D. S.

"What is the world coming to?" is a frequent expression, and when I think of the increasing adulteration of food, sugars, etc., I feel like dropping my hands and saying, "I don't know."

Adulteration seems to be on the increase, and that to an alarming extent. I was told by two heavy wholesale dealers that their sales of oleomargarine had more than doubled during the past year, and the amount of their sales was simply astounding. It has come to be a question whether a man can sit down to a table in our large cities and be sure of what he is eating. A wholesale grocer in Philadelphia told me that he sold spurious butter to some of the best retail dealers, and sold it as such.

It is almost an impossibility to get any good old-fashioned West India molasses now, so extensively is it adulterated with glucose. Why, I have just heard of a farmer in Vermont who has just bought seven barrels of white sugar, the latter being very cheap, to mix with his maple syrup. Another farmer I know of, mixed so much glucose with his syrup that there was no maple taste left.

The adulteration of honey has been so fully discoursed upon that I will say nothing upon that point, further than to remind the reader of its magnitude, and the necessity for continued and united efforts for its suppression.

The point I wish to call attention to, is the manufacture of fancy syrups.

The reader may wonder how this can concern the bee-keeper. Let us see how it does. The fancy syrups which are now put on the market, look nice, and compare favorably with honey in this respect. And as they can be sold for a low price, they prevent the sale of enormous quantities of extracted honey. I am satisfied that were it not for the abominable adulteration of these syrups with glucose, the sale of extracted honey would increase to such an extent that the whole resource of the country would be taxed to supply the market.

Now the question arises, what shall we do to suppress this growing evil? The first thing to do, is to educate the people to an appreciation of a pure article. It is their ignorance and desire to get one hundred and fifty cents for a dollar, that makes the adulterator's work easy, and builds him up a trade that is as large as it is illegitimate. This question suggests another. How can we educate the people? I know of no better way than for bee-keepers to write short articles for their county papers, and for city papers, showing up the frauds that are being practiced to such an alarming extent. Do not confine your writings to the honey question, but search out and expose every fraud. Remember the object is to excite the indignation of the people; that done, they will act as their own detectives, and search out the genuine, and only be satisfied when they find it.

When this re-action comes, the bee-keeper can push his pure extracted honey to the front, and it will take the place of the gold-drop, and silver-drop, and diamond-drop, and all other "drop" syrups, and advance the health of the people, and the interests of bee-culture. Let us all go to work, then, and see what we can accomplish during the present year.

Wax Comb Guides.

FAYETTE LEE.

To produce extracted honey, use wax guides, the same as Mr. Doolittle recommends. I have always used such guides; and, last year, nothing else. In ten days from the time the colony began to work, the hive was full of comb as straight as a board. I have not a crooked comb in my apiary of over 60 colonies. One and one-half pounds of wax will make guides for 10 colonies. I do not want comb foundation in the brood-chamber. To keep out the drone comb, divide your bees, and give the old queen the old stand and one brood comb, and you will get nice worker comb.

To produce comb honey, use comb foundation to fill the sections, to make the bees build comb all of one thickness; and to get them to build in all at the same time. When the honey is ripe, they will cap it; but they will come just as close to the next comb, if it is 1 or 4 inches over.

I want to produce some comb honey this year; and I shall use boxes 6x6½

in wide frames, two boxes in a frame, in a half story on top of the brood-chambers. I shall try to have all the boxes sealed over, even if I do not get quite as much honey as though they were not. Let us test the comb foundation and wax guides, side by side, and see which is the cheapest. If we use comb foundation, we want pure wax regardless of its cost. I once used some foundation, and, owing to adulteration, the bees would not touch it. Death to adulteration in every form, is my principle.

Cokato, Minn.

Call Things by their Right Names.

F. A. MALTBY.

I see an article from Mr. Wm. F. Clarke, on page 9, criticising the vocabulary of bee-keeping words and phrases given by the editor of the BEE JOURNAL in No. 48; in which he made some errors. In the first place:

Apiary.—"A place where bees are kept." That is true, just as much as a tract of land laid out for farming purposes is a farm; whether the owner's stock or tools are there or not. A man may have an apiary a mile from home without a single article of apiarian supplies there; yet it is an apiary.

Bee Moth.—"A miller which preys upon the combs." "The bee-moth is an insect whose larvæ prey upon the combs." There both are at fault. They are perfect in two states. While the miller, or what would naturally be called insect, does no harm about the hive, of itself; yet it lays an egg that develops into a worm that does much harm. So that the first definition would convey erroneous meaning.

Manipulation.—"The handling of bees." In criticising this, he stubbed his toe badly. Finding such a word as this, under the head of "things pertaining to bees," is sufficient without "lugging" another long syllable and adding to the five already there. No one would ever suppose it had any reference to handling a horse or shovel. He is also in the same "fix" with "robbing." If it had occurred under the reports of the penitentiary, it would not express the idea of robbing by bees; but under the head he proposes to place it, its definition as given in No. 48, is sufficient. The shortest and most concise meaning that can be given, is best to avoid all repetitions possible.

Prof. John Phin made another error of the same stamp as the above in No. 51; when he tried to take "strong exceptions" to the definition of "worker eggs." To say "drone eggs" or "worker eggs" are the only ways that the two sexes in the egg can be expressed. It does not express what kind of an insect lays them. It may be the ant, or some other insect. If the kind of eggs are inquired after, we must say they are "bee's eggs," the same as we say "hen's eggs," and that gives an idea who or what produced them. But "egg workers" does not convey an idea of anything. If we

speak of "coral workers" or "ivory workers," there is an idea of something being done to those things; but as eggs are not wrought or worked, generally, that expression would be senseless.

For the American Bee Journal.

Overstocking the Location.

E. J. SCOFIELD.

In my opinion, it is not to the interest of the man who is making the production of honey his occupation and support, to encourage others to engage in apiculture, and settle down by his side, thus dividing the field. A majority of such will prove a detriment, by producing a few pounds of honey, taking it to market, and selling it for whatever is offered, thereby ruining the market for the specialist. Where is the merchant or tradesman who would instruct and encourage another of his craft, to come and locate under his nose, to share the field and divide the profits with him?

Mr. Pond, in his article on page 149, alludes to No. 1 as owning a few square rods of land, and No. 2 owning all the surrounding territory. What honey is taken by the bees of No. 1 from the territory of No. 2, certainly leaves No. 2 none the worse off, for if it was not thus gathered by the bees, it would go to waste, or, in other words, "waste its sweetness on the desert air." Moreover, No. 2 owning so much territory, should devote his time and attention to farming and stock-raising, and buy his honey of No. 1; and No. 1, in turn, should buy his bread and meat of No. 2, and thus each get along better.

Any locality can be overstocked: some much easier than others, especially in poor seasons. I am always willing to aid and instruct parties in the fraternity, but do not want them to settle under my nose. The world is wide; there is room for all; there are many new fields, as good as the ones already occupied. Fully one-half of those who rush into bee-keeping make a complete failure of it, and leave it in disgust, poorer if not wiser.

Not over one in fifty, take them as they come, will make successful bee-keepers. If I find one, who bids fair to make a success of it, I always encourage and instruct him all I can. Mr. Pond says he is surprised to see the amount of selfishness that is shown by some. I am surprised to see the self-interest manifested by others who may be more interested in some new bee publication or supply trade, than the welfare of the honey-producer.

For the American Bee Journal.
Bee Diarrhœa.

J. E. POND, JR.

Mr. H. O. Morris, on page 202 of the BEE JOURNAL, desires the experiment made of feeding a colony of bees on sugar syrup alone, and then closing it into a hive for a few days to see if diarrhœa is caused thereby. I will say to Mr. M. that the experiment has been tried, and the bees when released, would discharge the bowels as freely as when released after long confinement in the winter. Whether the cases are analogous or not, I do not pretend to say positively, but the facts are as above stated, and any one can take his choice in the matter.

My bees have all wintered well, and every colony I had in the fall is now strong and well stocked with brood. They were confined from Nov. 17 to Feb. 19 without once flying, and when they did come out, hardly a spot was seen on hives or snow. I put up 2 or 3 colonies, last fall, especially to test the pollen question. I had seen enough in past years to convince me that excess of pollen has no more to do in causing bee diarrhœa than does bacterium; but in order to fully test the matter for myself, I left a large amount of pollen in each of three hives; so much, in fact, that a considerable portion of it was consumed, but no bee diarrhœa has followed. I still think that the whole trouble is a simple inflammation of the bowels, caused by eating incongruous food, which acting as we know it does on man, promotes excessive watery secretions, which must be evacuated, and which evacuation carries off the exciting cause and thus produces a cure. I may be wrong in my opinion, but can only draw my inferences from analogy; and analogy, as a rule, amounts to probability. If I am wrong, I certainly wish to be set right; but shall require something more than mere assertions, or statements of opinions with only a guess work basis, to cause me to change my views. Foxboro, Mass., March 27, 1884.

Read at the S. E. Michigan Convention.

Cause and Cure of Foul Brood.

DR. A. B. MASON.

The subject of foul brood is one of great interest to every bee-keeper, whether he be an amateur, keeping only a few colonies for pleasure, or a large number for the sake of the profit there may be in the pursuit. With some, it is of all absorbing interest. Many, perhaps, have passed over the articles on foul brood in the bee papers without reading them, probably feeling that the subject was of no interest to them; when, in fact, the disease was in their own apiary; in saying this, I am giving my own experience as well as that of others.

At the recent meeting of the Michigan Bee-Keepers' Association, it was stated that there was no foul brood in the region where the convention was

being held, but before the close of the session, a comb with the malignant disease was shown that was taken from an apiary in the town where the convention was in session. This is not an exceptional case. Localities supposed to be free from the disease, are found to be badly infected, and those suffering from its ravages are not aware of the nature of the trouble that is keeping their colonies weak.

I was much surprised, last season, at receiving a sample of the disease from this locality (Adrian, Mich); the person sending it wishing to know if it was foul brood, and stating that it was taken from one of several box-hives from which the honey had been taken by a neighbor, and the hives and combs left exposed so that the bees from other colonies could clean up and save the waste honey.

During the season of 1879, I had charge of a neighbor's apiary, three miles from home. The bees were all in box-hives, and I transferred them to movable frames, and there was where I first saw foul brood. With as many as 150 colonies at one time, he had done well with them, but they had gradually dwindled down to 12.

I did not then know what was the trouble, and did not think of foul brood; and for several days it did not occur to me that I was handling that which has proved such a scourge to many, and, unless checked, is bound to spread through the length and breadth of the land, and prove itself to be one of the items on the "other" (or dark) "side" of bee-keeping that Mr. Hutchinson has recently been calling our attention to. It is a disease that was known and mentioned by ancient agricultural writers. Its origin is said by some to be owing to the exposure of the brood to cold, or cold and dampness; by others, to the lack of proper food and nourishment; and that, under certain conditions, it will start from young brood whose heads have been cut off with the unapping knife, and pulled out by the bees, and left to decay on the bottom board of the hive.

A writer on foul brood says "a poor queen may be the cause; the queen's progeny being so weak as not to have life enough to grow to maturity, but die when they are five, six or seven days old." It is said by others that none of these conditions will produce the disease.

At the Northeastern Convention, in 1881, Mr. Betsinger is reported as saying, "No honey, plenty of foul brood; plenty of honey, no foul brood." Such has not been the case with me. The season of 1882 was the best honey season I ever had, and 1883 the poorest, but foul brood was no worse with me in 1883 than in 1882.

It is said that bacteria are the real cause of the disease. If such is the case, we have a very small specimen of animal life to deal with, for it is said they are about the nine-thousandth part of an inch across, allowing about 3,000,000 of them to be in one layer on the bottom of a worker cell.

Prof. Cook, in his Manual of the Apiary, says "it is the result of

fungous or vegetable growth." Not being a microscopist, I have not attempted to ascertain whether its cause is of a vegetable or animal nature, and in curing the disease, I do not care which it is.

That it is contagious, and very easily communicated by one colony (or bee) to another colony, is well known by those who have had to deal with the malignant variety. It may also be communicated by the apiarist or an infected hive or implement, or any thing that has been in contact with the infected colony.

At the Michigan State Convention a member, whose name I did not learn, was giving his experience with foul brood, and stated in effect that he thought it was produced by the chilling of the brood; for he was in a new country and the disease had never been known to be in that region, and he did not get it in buying bees or queens. I asked him if he had ever bought and used foundation. He said he had. I then asked him if he had the disease in his apiary before or after getting the foundation, and he said "after." Mr. D. A. Jones then asked me if I did not know that the heat necessary for melting wax and making it into foundation killed the disease. I said I did, but the foundation may have been handled by some one that had been handling the disease.

There are many ways in which it may be spread, and that innocently too, as regards some of those that aid in spreading it. For instance, I make my own foundation, and some for my neighbors. To make that foundation I have to buy wax. Now, suppose some one or more bee-keepers have lost their bees by foul brood, as many have. They melt the old combs and sell the wax, and are not careful about handling the wax and hives; some of the disease may be on the wax I buy. The last thing I do, perhaps, before doing up some foundation, is to handle that wax, and you can readily see what might be the result.

Some bee-keepers dread the disease so much that when they purchase a queen, they let her and the accompanying bees out of the shipping cage and destroy all the bees, letting none escape; put the queen in a new cage, and burn or disinfect the old one. Much more might be said of the different ways of spreading the malady, but it is not necessary to enumerate further.

A dwindling away of the affected colony is sometimes given as the first sign of the disease. In my experience, a colony must be very badly diseased before this occurs. In a work on foul brood by Mr. Kolnke, it is said: "Before foul brood makes its actual appearance, certain signs forestall the disease. The colony is not as industrious as others of the same size and stamp; the brood will be found not to be compact, but scattered. On examining the colony, after a few days, some cells will be found with small holes in the sealing, which will also present a sunken appearance." Such has not been my experience. The first noticeable dis-

ceased condition has been a small putrid larva in the bottom of one or more cells among healthy larvæ. As the disease advances, larger larvæ become putrid and settle in the lower back corner of the cell, and still larger larvæ extend farther up on the bottom of the cells, nearly, or quite covering the bottom, and extending out on the lower side of the cells. When it first becomes putrid, the larva is of a grayish color, and becomes darker with age.

My sense of smell has not been acute enough to detect any odor when it first becomes putrid; but it soon gives quite a strong odor not unlike bad glue, and when the colony is badly diseased, the same odor may be readily noticed when standing near the closed hive. If an attempt is made to remove the putrid mass, especially the larger ones, it will adhere to the implement and to the bottom of the cell, and admit of being strung out an inch or more, and will then let go the implement and return to the cell. When the cell containing the foul mass is sealed over, the capping will often, but not always, have a sunken appearance, and may, or may not have a small hole in it. Sometimes the capping will be somewhat convex, like the capping of a drone cell, and still others cannot be distinguished from healthy cells.

There are different ways of treating the disease. I have tried only three of them, and have been successful with each. The first I tried was Mr. Muth's method, with salicylic acid. I took disinfected hives and put in frames filled with foundation, and set the hive *near* where the diseased colony stood. I then shook and brushed all the bees into, or in front of the new hive, (none of the bees should be allowed to enter any other colony). I then removed the infected hive and combs to a place where no bees could find them, till I had time to extract the foul honey, melt the combs, and boil the hive. I then fed the colony about a pint of boiled honey each day for a week. To this honey I added salicylic acid as directed by Mr. Muth. His directions are 16 grains of salicylic acid, 16 grains of borax, and an ounce of water, and put this amount in each quart of honey. I boil all infected honey before using it to feed bees. Some have reported that this method has proved a failure with them, but with myself and others in this locality, it has been a perfect success. It will more than pay any one having foul brood, to send 10 cents for Mr. C. F. Muth's "Hints to Bee-Keepers."

Another method of curing the disease, is the starvation plan, and I was as successful with this as with the acid plan. I shook the bees into a clean hive and confined them until they had consumed the honey taken in their honey-sacs, which was shown by their beginning to fall from the cluster. A more convenient way would have been to put wire cloth on the top of a hive, or box, and place it on its side, so as to be able to see when the bees fall from the cluster. I then gave them clean hives with foundation. I had 2 colonies that

seemed bound not to starve. One held out for nine days, and the other for ten days, before showing any signs of giving up the struggle.

The other method I call the California-plan; and it proved to be so much more troublesome, that I tried but few colonies by it. In the evening, cage the queen; the next evening tie the queen cage to an empty frame; place it in a clean hive and shake all the bees into the same hive; leaving them so that they can fly for three days, and then shake them into a clean hive, and release the queen. I prefer Mr. Muth's plan with salicylic acid; because the bees can be at work, drawing out foundation and gathering honey, and the queen may deposit eggs.

All infected honey should be boiled before feeding to the bees; all combs melted; and all hives boiled before being used again. Washing with the acid solution, I believe, will answer the same purpose as boiling, but is more trouble for me. I have kept a bottle of the solution on hand with which to disinfect my hands, smoker, knife, etc., before going to any other colony or work, after handling a foul-broody one.

Failure has been reported from all these methods; but I believe something has been omitted, or something over-done where such failure has occurred, and here is such a case: A party trying the California method reported it a failure, but they did not follow the instructions. Instead of putting the bees in an *empty* hive, he put in "some drone combs for the bees to cluster on," and the bees put the honey taken with them, in the empty cells, and so had a good start for foul brood.

I have a few combs free from honey and pollen, taken from infected colonies last season, saved to experiment with. I shall thoroughly saturate them with the salicylic acid solution, and then use them, in colonies free from the disease, to ascertain if such combs cannot be saved.

Some parties in this county claim to have a process (a secret with them) for curing the disease and saving some of the infected combs. I have been told that they fumigated with salicylic acid, but as the disease does not seem to have left them as yet, the efficacy of the process, whatever it may be, is yet to be demonstrated.

Wagon Works, O.

For the American Bee Journal.

How My Bees are Doing.

P. F. TWITCHELL.

Saturday, March 22, was a warm spring day; perhaps the first really fine day since October, although we had some very comfortable days in the early part of December. As I had not disturbed my bees since I packed them in October, I then gave them a thorough examination.

I found some things that surprised me; for instance, the first hive that I opened contained quite a strong colony, which had apparently starved to

death, with at least 8 pounds of honey in the hive; there were two others in the yard, with not a cell of honey to be seen, and the bees apparently healthy. I found an equal quantity of bees in like condition, excepting in two points: they had from 8 to 12 pounds of honey, and quite a patch of sealed brood on two frames. I might say here, that I found brood, eggs, or both, in all but two hives, excepting the two without honey, where there was *neither*. A 3-frame colony had nearly as many bees as in October, and plenty of honey, but no eggs or brood.

In preparing the hives for winter, I aim to give full colonies not less than 25 pounds of honey, and smaller ones in proportion, or a little more. I pay no attention to pollen. The honey was all gathered early, as I had no other. The bees did not make a living after basswood bloom.

I use the "Simplicity" hive, with 3 to 9 frames left in the hive according to the strength; but generally the bees were on from 6 to 7 frames, with division-boards at the sides, packed in shells, with 3-inch space all around; and the bottom packed firmly with clover chaff, and some in cushions on top, except 8 that I did not have shells for. These I set on a platform; made a bin around them, packed heavily with dry forest leaves, and covered with a shingle roof. These I found in the worst condition: 1 dead, 1 very sick, and 3 light. I prefer to have them set well up from the ground.

My bees are a mixture of Italian and German; and are very good honey-gatherers. I packed 33 colonies in the fall. On March 22, I found 1 was dead, 1 very sick, 6 light, 5 fair, and 20 in fine condition. I am well satisfied. The bees were bringing in pollen then.

Andover, O., March 24, 1884.

For the American Bee Journal.

Preparing Bees for Winter.

ROBERT CORBETT.

The first thing I did was to examine the colonies. I found them minus young brood, which I have understood to be detrimental to successful wintering. Besides this, there was more than two-thirds of the honey uncapped, which is another detriment, according to bee-ology. In the face of all this, I proceeded to weigh them; 33 colonies averaged 33 9-10 pounds; not appearing to be much lighter in the spring.

My packing process is simply this: Lay scantling on blocks about 6 inches high, and long enough to hold 12 colonies, with 4 inches space between them. Also, another row setting back to back with this row; packing well between both, also beneath. Then take three boards 4 or 5 inches wide, running between the hives, in three places, extending 6 inches; on each side of the hives, place a board 6 inches wide; at the outer edge of these, drive stakes, and on the inside set up boards wide enough to reach to the top of the hive; tacking these to

the stakes. Then pack well between these and hives, and over the tops of the hives some 15 inches deep. In front of the entrances set up a board wide enough to fill the space between the ground and the packing above the entrance. This can be laid back or set up at pleasure; but during cold weather you can pack over this any thing suitable. When warm enough for bees to fly, this board can be let down, and closed again in the evening, when they are through flying.

In the spring my 24 colonies were all in good condition, except one that was queenless. I think it was queenless when put into winter quarters. During early fruit bloom my bees became very strong, and began to put honey into surplus boxes; but before late fruit bloom was over, there came a cold wave, which lasted nearly a month. The bloom was excellent, but the weather was too cold for the bees to utilize it. During the whole of that cold period the bees worked only two days, and then with so little vigor that it did not sustain the brood they were rearing.

I think I may safely say that at least one-third of the bees in this vicinity succumb during the months of May and June. During the season of 1882 I received 700 pounds of honey, which brought 25 cents per pound for comb, and 20 cents per pound for extracted honey. Besides what I have used in my family, and about 100 pounds on hand, I have cleared \$515 during the last two seasons; and now I have 37 colonies on hand.

Manhattan, Kansas.

For the American Bee Journal.

Reversible Frames.

W. H. SHIRLEY.

With some of the bee fraternity, there seems to be a great mania for reversible frames. When we have a frame all fixed, so that it will reverse when we say the word, of what advantage is it over the common Langstroth frame that will not reverse? The first thing to do is to find a man with a reversible strain of bees, to go with the reversible frame. My bees have a way of building comb with the cells a little out of the horizontal; that is, the cell pitches down a little, when the comb is held up plumb. When the combs are full of sealed brood, perhaps it might help the young bees to gnaw out, if we reverse the combs. Again, we have seen honey so thin that to reverse the frame would be sure to give the bees a job of house-cleaning.

Mr. Baldrige described a good kind of reversible frame, in *Gleanings* for March. One thing I like about his frame, is the depth, 7 inches. I had 25 hives cut to order this winter, with frames just 7 inches inside measure. I have a great deal of faith in that size of frame for all practical purposes; but in the reversible part, I can see no advantage. I will lay it to my thick-headedness, and await developments. I have 165 colonies.

Glenwood, Mich.

For the American Bee Journal.

Union Association of Western Iowa.

The spring meeting of this Association, was held March 25, at Dexter, Iowa. The meeting was called to order by Pres. Kenyon. The roll was then called, and the Secretary's report was read; 18 names were on the roll, and 23 new ones were added; 8 of whom were ladies. 481 colonies of bees were represented in the Association.

Mr. Humphrey being called for, was subjected to a running fire of questions on many subjects.

"Laying Workers" was next discussed. One member thought there was usually but one in a colony; but this view was not accepted by others.

"Stimulative Feeding" was the next subject, but was not very warmly endorsed; those who favored it, advised caution. Adjourned until 12:45 p. m.

The afternoon session was called to order by Pres. Kenyon. The members who had been assigned special subjects, were called for.

"Size of Sections and Surplus Arrangements," by M. E. Darby; "Best Race of Bees," by W. C. Humphrey, who favored dark Italians; "Swarming, or Dividing," by E. V. Hennon. M. L. Thomson gave his method of dividing. Mr. McGrew was the only champion of "swarming." "Spring Management of Bees" was the subject of an able essay by Pres. Kenyon. "Clamp Wintering" was well handled by Thos. Chantry, who has been successful with this method.

A vote was taken on the time and place for the next meeting, resulting in the choice of Sept. 13, at Dexter, Iowa. Mr. Chantry spoke of the necessity of uniform prices for honey, and manner of marketing. A schedule was adopted. Adjourned to meet Saturday, Sept. 13, 1884.

M. E. DARBY, Sec.

For the American Bee Journal.

Pollen and Bee Diarrhœa.

THOS. H. SHEPHERD.

Sixteen years of experience in bee-keeping, in Michigan, has taught me this much about bee diarrhœa. Late swarms that come after fall honey begins, always have the diarrhœa the next spring, if they live that long; but they never have it unless the winter is very open. I find that diarrhœa commences soon after fall honey begins; but, as the bees are flying every day, it is not noticed by the bee-keeper. They will have this disease in the spring, till fresh honey comes, then it will stop. Can winter be the cause? Surely not. Winter only shows us the effect from keeping the bees confined to their hives until their bodies are distended beyond endurance. They then die in large quantities on the bottom of the hives; daubing the hives and combs with their excrement, which is generally well mixed with small bits of pollen, which, no doubt, caused some to think

that pollen is the cause; but I do not.

I find nearly, if not quite as much pollen in my healthy colonies as in those that die; but I find it different with the honey. Healthy colonies have their combs filled with summer honey, clover, raspberry and basswood; the sick ones have boneset, aster and a number of other kinds of fall honey; boneset being the principal part. As it comes in bloom the first in the fall, it is stored in the hive for winter use; and, in my experience, it is the principal cause of the disease.

Dr. Tinker, on page 165, says, "When bees are subject to very unfavorable conditions in winter, the temperature of the cluster, and interior of the hive, falls below the point of health; the beginning of their ills is here." Where he gets his proof, I do not know. A little further on he says: "And diarrhœa is the result, quite independent of the effect of the pollen or honey." That statement is correct. Bees that are all wintered alike, would come out alike in the spring; but they do not, in this part of Michigan. Where Dr. Tinker lives, the principal crop of honey may be clover and basswood; if it is, Dr. T. does not know much about bee-diarrhœa; and the signs that he does see, might be caused as he says.

I find, where diarrhœa does so much damage, there is an abundance of fall honey, and a famine before it commences, which leaves the bees short of winter stores, causing them to store fall honey for winter use.

Dr. Tinker believes that Mr. Heddon is far astray; but I think Dr. Tinker is yet further astray. Mr. W. M. H. Balch is nearer right, when he says, "the cause is indigestion." But indigestion is not the primary cause; there are many causes back of this. The one great cause is prostration. He makes the mistake of thinking that excitement, or nervousness, is the cause of indigestion; if it is, there is another cause for that, and that cause is in their food. I find that all my sick bees are uneasy and nervous; that is an effect, not a cause. We must get down to the first cause.

In conclusion, I would say, let every bee-keeper winter his bees on the best and earliest honey he gets; and it matters little whether wintered out, or in cellars, so long as they are protected from cold, and are in a quiet place.

Udly, Mich.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Unripe Honey, etc.

1. Will pure honey ferment below 40° Fahr.?

2. I had an Italian colony to leave its hive and enter another, leaving about 25 pounds of honey and brood and fresh-laid eggs. What was the cause? Does water rise to the top of unripe honey before it ferments?

G. PRIEST GRINSTEAD.
Oakland, Indian Territory.

ANSWERS.—1. Not a particle, if it is not too thin, or in a very damp place. Water does not usually rise to the top of honey before it ferments.

2. There are many cases of spring desertion, that seem to violate all rules; and which are very difficult to account for. I think internal derangement with the individual bees is the cause of such desertion.

Queens, Dampness, etc.

1. Will a colony of bees supply their own queens, or will I have to give them queens? How long will queens be good?

2. Are there a certain part of the bees who build comb, and part seal the honey?

3. What is the cause of the dampness above the frames, and the chaff cushions?
A BEGINNER.

ANSWERS.—1. Your bees will supersede their own queens in proper time, cheaper and better than a beginner will be apt to do it.

2. Probably the same bees that build comb, seal the honey. How bees divide up the work among their numbers, depends much upon circumstances.

3. If your covers do not leak, the dampness comes from the respiration of the colony.

Young Bees venturing out in the cold.

1. I have one colony of bees, where, on pleasant days, the young bees will crawl out on the ground and get chilled before they get back in the hive, and, of course, stay out all night. I found them crawling around, the next day, when they got warmed up. Can I prevent them from coming out? Would it do to keep them shut in, by putting wire cloth box in front of the hive, so that they can have a flight in it?

2. In what way would you now feed sugar to bees which have no stores? Should it be made into syrup or candy, and fed fast or slow, in order to produce the best results and most honey?

3. Will it induce robbing, to feed bees candy at the entrance of the hives that are outside.

Ainger, O. C. E. BOYER.

ANSWERS.—1. I think all will come out right, if you let the bees take

their own course. I would not advise imprisoning the bees.

2. I should make the food into syrup, and feed what was needed as rapidly as possible, from the top of the hive, well protected from robbers and low temperature.

3. Yes.

Wired Combs, etc.

1. What do you think of wired comb foundation?

2. What meal is the best to feed bees?

3. Is common catnip a honey-producing plant?
C. W. CASTLE.

Prairie City, Ill.

ANSWERS.—1. We do not believe in wiring comb foundation. We believe in wiring the frame and then pressing the foundation upon the wires. Let us not get these two systems mixed.

2. Among those most accessible are rye and Graham flour. I do not believe in stimulating brood rearing early; especially in an early spring like this, if bees get natural pollen in ordinary season.

3. Yes; in almost all locations.

Preparing Honey for Market, etc.

1. The entrances to the Heddon hives are $\frac{1}{2}$ inch deep. Is it not best to contract to $\frac{3}{8}$ inch deep for winter, to economize heat of hive, and to prevent mice from gnawing the combs?

2. Do you advise the use of supers, for extracted honey made to hold frames only $\frac{1}{2}$ the depth of the Langstroth frame?

3. What sized packages for extracted honey sell best in your home market?

4. In an article in the BEE JOURNAL, on selling honey in the home market, you spoke of furnishing the grocers with stands to hold comb and extracted honey for retailing. Please describe the stands used by you, giving best form and size, and cost of same; also, whether or not it pays to use them?

5. Have you ever seen or heard of a parasite somewhat resembling a louse, that feeds on and consumes the pollen of exposed combs during warm weather? I would like to hear from others in regard to the above.

DWIGHT FURNESS.

Furnessville, Ind.

ANSWERS.—1. A $\frac{3}{8}$ inch entrance will not exclude mice, by any means. We object to using an entrance so narrow as to be mouse-proof. We think an open, airy entrance is the best for both summer and winter.

2. No; I think them too shallow for economy in construction and manipulation; otherwise they would be good. Nothing less than $\frac{3}{8}$ Langstroth depth would please me, and while I am about it, I prefer to go the whole depth, and use the same style of frames above and below.

3. One and two pounds in glass.

4. The "stands" I used were reclining shelves for jars of extracted honey, with a glass case on top, and a door to open at the back, for comb honey. They pay if properly managed.

5. Yes; I have seen these little pollen eaters; and in this locality of excessive pollen, it is a good thing to have it removed sometimes.

Feeding Bees, etc.

1. Last fall I packed my hives on the inside, crowding the bees on four frames; and the other day I opened the hives and they appeared to be quite strong. As I am not quite sure about the amount of honey they have, do you think it would be advisable to lift out one of the outside frames to be sure, or, as I have some frames of honey, how would it do to lay a frame on the top of the others, under the quilt?

2. Would it do to put an emameled cloth over the frames, instead of cotton and cushions? I could then feed above the bees.

3. I use a deep hive, and have not much time to spare with my bees. Would you advise me to put a second story on top, to run for extracted honey? As I have a number of empty frames, I think I could get quite a large yield, but would like to get your opinion before I try it.

A. B. KEEPER.

ANSWERS.—Certainly; you should know if they have sufficient honey. A frame of honey laid on the frames would feed them, in this locality, after this date. Why not put it into the hive in place of an empty comb?

2. Yes; I should prefer the emameled cloth after this date. What I prefer to either is a good board cover.

3. Yes; a second, and even third story used on the tiering-up plan would save you much labor, tend to prevent swarming, and give you a surplus crop of nice honey.

Rearing Queens.

1. I do not know whether I thoroughly understand what is meant by rearing queens under the swarming impulse—will Mr. Heddon please explain it.

2. Is not the following as good a way as any to build up an apiary: Watch the few colonies one has, and when they begin to build queen-cells, preparatory to swarming, then make as many nuclei as one has queen-cells, and let these build up?

TOMMY DODD.

ANSWERS.—1. A queen reared under the swarming impulse, is one hatched from a cell that was built with the old queen present in the hive, with evident designs of swarming.

2. I would not increase in any such way, though you could do so successfully, if you did the work properly. Not one-half of the queen-cells, usually built, would please me from which to rear a first-class queen. I would not increase my stock any faster than they paid their way in surplus honey.

Successful Wintering.

I took my bees out of the cellar yesterday; I put 99 colonies in the cellar, and I took out 96 seemingly in pretty good condition. I hope that no bee-keeper will have a greater loss than this. I consider it good wintering; I would have taken them out earlier, but the snow was drifted badly on the ground, where the bees have to stand.

J. STEWART.

Rock City, Ill., March 28, 1884.

Gathering Pollen.

Bees gathered the first pollen today. Last year the first pollen was gathered April 10; in 1882, April 2; in 1881, April 20. I put into winter quarters 111 colonies; have 111 still, and all seem to be lively and energetic. They have been working for a week or more on water, and from the business-like air which some of them manifest, I should not be surprised if they find something even stronger. They probably recognize the truth of the saying: "It is an ill wind which blows nobody any good," while they appropriate the hoarded treasure of their dead neighbors.

JAMES MCNEIL.

Hudson, N. Y., March 29, 1884.

Bees in Utah.

Our winter has been, so far, a light one. Bees have had several flights since they were put into winter quarters, and are now rearing brood. The loss has been light. I have lost only one out of 23 colonies. I have wintered all but 4 on the summer stands; the 4 were put into the cellar. As yet, but few take any interest in bee-keeping. People are so much engaged in other business that they have not the time to devote to make it a success. The bee pasturage is here in the willow, wild flowers, plants, clover, lucerne, and other things. I was successful in raising a few Simpson plants, which the bees, for miles around, visited. I also have what we call the bachelor-button; that is a favorite of the bees all the season. Last fall I visited a station on the Utah & Nevada railroad, and I saw there some Rocky Mountain Bee Plant, but not a bee was at work on them. I am so much interested in bees that I would keep a colony of them if I did not get any returns from them.

JOHN DUNN.

Toole City, Utah, March 5, 1884.

Too Many Bees in One Cellar.

On being informed that my bees were swarming out of the hives, in the cellar, I hastened to them. The hives were literally covered with bees, and the air in the cellar was very hot. I have wintered 193 colonies in the same room with perfect success; while it appears that 225 colonies are too many. How the bees will divide off, I cannot say. They are not on "the run," as one might suppose. I will report when all are out. The weather has been very fine during the past two weeks. The snow is off the fields, and clover is in good condition.

IRA BARBER.

De Kalb Junction, N. Y., March 31.

Not Lost a Colony.

Bees appear to be wintering finely in this section of the country, and there is a good prospect of an early spring. I have not lost a colony, and they all seem to be very strong.

E. A. THOMAS.

Colerain, Mass., March 31, 1884.

No Loss in Wintering.

My 19 colonies of bees wintered upon the summer stands, and came through without loss so far. One weak colony put in the cellar under my store the last of November, was put out a few days ago in good condition. I have sustained no loss as yet, and I have no fears of loss now; the worst is over. Several commenced carrying in pollen, March 23; upon examining them, I found them very strong in bees and breeding rapidly. I commenced bee-keeping about 14 years ago with one colony in an old rotten box hive, given me by my father. I knew little about bee-keeping at that time. I kept the colony some three years, without obtaining any surplus honey or increase of bees. They did not issue, to my knowledge.

Finally I procured H. A. King's Text Book, and in that I learned how to transfer bees; so I made a hive after the Langstroth pattern, and in apple blossom I successfully transferred them. That season, I got about 25 pounds of comb honey and a fine swarm, which wintered (the following winter) without any special care, and came out in fine order in the spring. I have had considerable comb honey and increase, every season since, until at present I have 19 good strong colonies, mostly Italians and hybrids. The spring of 1883 found me with 14 good strong colonies, having wintered without loss, prepared on James Heddon's plan; in fact I have suffered the loss of but one colony in wintering since I kept bees, and that was on account of the entrance to the hive becoming choked with ice. The wintering problem, as it is called, gives me but little thought or trouble. I do not consider there is any trouble at all in wintering bees without loss, in this latitude, provided they can get one or two flights between the end of January and the end of March, a thing I have not known to fail since I became a bee-keeper; provided always that the bees are ordinarily cared for, and are in proper condition in the fall. Hence, with me, the wintering problem is solved.

L. G. REED.

Kent, O., April 1, 1884.

Open-Air Wintering.

I have long believed that the open-air wintering of bees is preferable and more natural than any other method; although the details of the same may not be perfectly understood. It may be a fancy, but I think bees wintered in the open-air are more vigorous and hardy, and resist the influences which cause spring dwindling, better escaping those diseases which are sometimes contracted by long confinement. I wish those who can do so, and who have large apiaries, would make a series of observations on a few colonies, during the next five years. I have improved and applied a wire cloth portico, the use of which, when well understood, will obviate the objection that bees, when left to their "sweet will," fly too often or too much.

FRANCIS WEST.

Lonsdale, Ont., April 1, 1884.

No Bee Cholera.

I put 53 colonies into winter quarters; 30 in my cellar, and 23 out on the summer stands. All are now in splendid condition, with the exception of one or two. Sometime during the last of April or first of May, when it is warm enough so that the brood will not chill, I will give the weak colonies a frame of brood. If given too early, the brood is liable to chill in the hive, because of a lack of bees to keep up the warmth. I aim to have plenty of bees by May 25, when the white clover makes its appearance. Warmth can be economized in weak colonies at this season by keeping the entrance of the hive as small as possible, and still give sufficient

room; also, by confining the bees to 4 or 5 frames by using an adjusting-board. I have had bees for 45 years, and I have never lost a colony from the so-called bee cholera. Bee cholera and spring dwindling can be prevented by a proper preparation in the fall.

THOMAS HEATON.

Moore's Hill, Ind., March 29, 1884.

Are Bees Property?

Mr. Southwick, who, on page 200 of the BEE JOURNAL, says bees are not property, has not "caught Prof. Cook" wrong this time; as he, Mr. S., is laboring under a mistake in thinking that bees are what in law are termed "*feræ naturæ*." They are not only considered in law as property, while in hives; but, if a swarm leaves my apiary and flies directly to my neighbor's yard, and I can keep in sight of them all the time, so as to be able to positively identify them, I can reclaim and hold them. This has been the law for more than 300 years, and many cases can be cited in proof of the same if it was necessary so to do. I simply correct Mr. S. in order that no wrong impressions may be given as to the status of our pets.

J. E. POND, JR.

Foxboro, Mass., March 28, 1884.

Why Eat Honey?

BRO. NEWMAN:—Sample of "Leaflet No. 1" is received. You ask: "Does it please you?" I answer, most emphatically, yes. You are always at the helm, ready to help us out; which, I hope, all enterprising bee-keepers will appreciate.

E. J. SCOFIELD.

Hanover, Wis., March 29, 1884.

White Clover Promises Well.

Bees have wintered well here, for so cold a winter. White clover promises to be a good crop. Some patent-right bee-hive men got in some of their work, in an adjoining county, about the middle of March; claiming that then was the right time to transfer, and have the bees to begin to make new comb and get ready for the honey harvest. These men knew better. The frost was not out of the ground, and not a bud had started.

ISAAC SHARP.

Waveland, Ind., March 29, 1884.

Warm Cellar for Wintering Bees.

I have kept bees during the past 20 years, for pleasure only, and not for profit; therefore, I did not take the care of them that I knew they required. Two years ago last winter, there being no cellar under the house in which I lived, I built one 14x21, and 8 feet high. I enclosed it with planks; studded the width of sills, 8 inches, and sealed up the inside, making a 10-inch space, which I filled up with sawdust. I also lathed and plastered the room, then divided it into two nearly equal rooms; one of which we used for a kitchen, the other as a store-house for vegetables, etc. In this latter room I placed my 3 strong colonies of bees in Langstroth

hives; then darkened the room; raised the front end of the cap, and laid pieces of carpet over the entrance; thus making it very dark. A thermometer near, ranged from 50° to 90° the whole winter. In the spring, upon taking them out of their winter quarters, all the dead bees that I could find could have been put into a teacup. I can endorse Mr. Barber's idea of keeping bees warm. I think if those bee-keepers would study as hard how to fix a warm place for their bees as they do to find out the cause of dysentery, foul brood, spring dwindling, etc., there would be less loss in winter. Keep your bees as warm as Mr. Barber or myself, keep ours, and you save all trouble.

Forestville, N. Y.

A. POPE.

Wintering Bees in Cellars.

For over 8 years, 40 of my neighbors have wintered their bees in cellars, and have not lost one-tenth part as many as those who have tried it only once, and given it up. We do not look for bee-bread: all we care for, is a good, prolific queen, and as much as 20 pounds of honey. Neither is it all capped; yet we hardly ever lose one colony out of 50, unless the queen is "played out" in the fall. For 7 years I had not lost one colony, until last year, when several colonies were lost by starvation, which was an oversight of mine. If any one should come here and say to some of those 40 men, take this chaff hive and save trouble, they would reply: "As long as Crowfoot Bros., near Hartford, keep their 1,000 colonies in cellars, we can ours." Who of those men would take Doolittle's advice about foundation being no profit in the brood-chambers. If a man can make foundation to hold 15 inches without wire, it matters not whether he uses a wash-wringer or press. I told Mr. Given that I could get along without wiring, after a little practice. By the use of 2½ pound foundation and one Cyprian queen, a woman extracted 350 pounds of honey from one colony during the past season. The secret is merely a quilt, not a honey board in the cellar, if put there in time.

JOHN H. GUENTHER.

Theresa, Wis.

Wintered in Langstroth Hives.

My bees are flying freely; have lots of brood, and are now in as good condition as I ever saw them; although they were wintered on the summer stands in that outrageously poor hive (?), the Langstroth!

J. E. POND, JR.

Foxboro, Mass., March 27, 1884.

Convention Notices.

The Des Moines County Bee-keepers' Association, will meet in R. C. Crawford's Hall, in Middleton, Iowa, on Tuesday, April 22, 1884, at 10 a. m. sharp. All who are interested in apiculture are invited to attend. We will have a programme on various subjects of interest to bee-keepers.

JOHN NAU, Sec.

The Central Illinois Bee-keepers' Association, will meet at the Court House, in Lincoln, Logan Co., Ill., on Thursday, April 17, at 2 p. m.

L. C. SCHWERDTFEGUS, Sec.

A general meeting of the County of Oxford, Ont., Bee-keepers' Association, will be held in Woodstock, Ont., on Saturday, April 19, commencing at 10 a. m. Important subjects will be discussed, among which will be, "Foul Brood," "Spring Management of Bees," "Best Methods of Increase," etc.

M. S. SCHELL, Sec.

J. B. HALL, Pres.

The Union Kentucky Bee-keepers' Association will hold its spring meeting at Eminence, Ky., on April 24, 1884.

G. W. DENAREE, Sec.

A bee-keepers' association is to be organized in Western New York on Tuesday, May 6, 1884, at Randolph, Cattaraugus County. In this southern-tier district there are a large number engaged in bee-keeping, and an association of this kind has long been needed. A general invitation is extended to all interested in bee-keeping.

W. A. SHEWMAN.

The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest; for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twitchell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

The Iowa Central Bee-keepers' Association will hold its semi-annual meeting in the Court House at Winterset, Iowa, on April 18, 1884, at 10 a. m. All are cordially invited. All visitors from abroad will be hospitably cared for. Members are requested to bring their baskets well filled, and we will have a general good time. Any one having new apian implements, or any thing that will advance the interest of the association, are requested to bring them for exhibition.

J. E. PRYOR, Sec.

A. J. ADKISON, Pres.

Maple Grove, Iowa.

Special Notices.

• Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5. or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

☞ It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

☞ All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

☞ In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

☞ See M. Bailey's advertisement; he has Clover Seed for sale.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

| | |
|----------------------------------|--------|
| For 50 colonies (120 pages)..... | \$1 00 |
| " 100 colonies (220 pages)..... | 1 25 |
| " 200 colonies (420 pages)..... | 1 50 |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

☞ Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price *still lower*, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

☞ We are now preparing a new book for the pocket, to be called "The Bee-Keepers' Convention Assistant." It will contain a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making reports for statistical information—and much other useful matter for those who attend Conventions. One of the latter will be a suitable Programme of questions for discussion at such meetings, model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs; a few blank leaves for jotting down interesting facts, etc. We shall aim to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world. It will be of a size suitable for the pocket, nicely bound in cloth, and the price will be 50 cents.

Advertisers' Opinion.

My advertisement in the BEE JOURNAL, has brought me over 400 responses.
DR. G. L. TINKER.
New Philadelphia, O.

The queen business is *rushing*, and we think the BEE JOURNAL deserves much credit as an advertising medium.
E. A. THOMAS & Co.
Coleraine, Mass., July 18, 1883.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., April 7, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour :

CINCINNATI.

HONEY—There is no life in the market. Extracted honey sells in its regular way and to its wonted channels, without any speculative feeling about it, and brings 7¢@10¢ on arrival. Comb honey sells slow at 15¢@18¢ a lb. from store for choice.

BEESWAX—1a in good demand; choice yellow brings 35¢ a lb. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basawood in 1 and 2 lb. sections, 17¢@18¢. Dark and second quality, 15¢.; extracted white clover in kegs and barrels, 9¢@10¢.

BEESWAX—Prime yellow, 34¢@35¢.

H. K. & F. B. THURBER & Co.

CHICAGO.

HONEY—Of late receipts of comb honey has been scattered amongst many firms, and as all are desirous of realizing on their receipts at as early a day as possible, prices have been irregular and low, some lots being offered from 5¢ to 7¢ per lb., less than 30 days ago. I quote white comb 13¢@16¢; fancy 18¢. Extracted honey—demand light, at 7¢@9¢.

BEESWAX—30¢@37¢.

R. A. BURNETT, 161 South Water St.

KANSAS CITY.

HONEY—Demand for choice white comb 1 and 2 lb. sections continues good at 16¢@17¢. Dark and irregular comb not wanted. Extracted in fair demand at 8¢@9¢.

BEESWAX—None in this market.

JEROME TWITCHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—There is not enough doing to enable us to give much more than nominal quotations. The demand is very light, and present stocks are of small proportions. Holders are anxious to close out all offerings, before the new crop begins to arrive. White to extra white comb, 15¢@18¢; dark to good, 10¢@13¢; extracted, 5¢@6¢; choice to extra white, 7¢@9¢; dark and candied, 5¢@6¢.

BEESWAX—Wholesale, 27¢@30¢.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12¢@16¢ per lb., and strained and extracted 6¢@6¢.

BEESWAX—Firm at 33¢@33½¢ for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market is improving a little; are selling first-class 1 lb. sections quite readily at 18¢, with an occasional sale at 19¢; 2 lb. is not quite so active, at 17¢. Second quality is dull at 15¢. Extracted not wanted.

BEESWAX—35¢, but very scarce.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18¢@20¢; 2 lb. 16¢@18¢. Extracted, 9¢@11¢.

BEESWAX—35¢.

BLAKE & RIPLEY, 57 Chatham Street.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

STANLEY'S AUTOMATIC

HONEY EXTRACTOR.

Reverses the combs without the aid of the hands; the reverse motion of the crank is all that is required. No time is lost, as we provide every machine with a brake to stop the motion, and the combs are half reversed when the motion stops. Can be used for 2 or 4 combs, as desired. No chance for combs to fall or get injured. The Comb Baskets always stop in the most convenient position for removing or putting in combs. We use XXXX Tin or Galvanized Iron for Cans. The Cylinder of Can is all in one piece. We challenge any Extractor, taking any number of combs, to do one-half the work of our 4-frame Machine. Prices reasonable.

☞ We want to employ good live Agents everywhere. Address,

HEDDON'S COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: $4\frac{1}{4} \times 4\frac{1}{4} \times 6$, 7 and 8 to the foot, per 1,000, \$6.50; $5 \times 6 \times 2$, per 1,000, \$8.00. All shipped from here.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address.

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION

On account of the prevailing scarcity of beewax the price of comb foundation is now advanced **3 cents per pound** above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay **32c.** per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

CLOVER SEEDS.

The present prices are as follows :

White Clover, \$15.00 per bushel, \$4.00 per peck, or 30 cts. per pound.

Alsike Clover, \$12.00 per bushel, \$3.25 per peck, or 25 cts. per pound.

Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

One ounce spools, each, - 4 cents.
Postage, 2 cents extra.

One oz. spools, per dozen, 40 cents.
Postage, 13 cents extra.

One pound spools, each, 40 cents.
Postage 18 cents extra.

One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

Vandervort Foundation Mill.

CHICAGO, - - - ILLINOIS.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1878.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stuterd, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. I. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful recipes. It is intended for consumers, and should be scattered by the merchant, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c., per dozen, 40c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman.—Giving advanced views on this important subject, with suggestions as to what to plant and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages. 5c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurements of all kinds of lumber, logs, and plank by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c., postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay, wool, pork, interest; wages tables, wood measurer, ready reckoner, and useful tables for farmers and others than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 terms for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postpaid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohne. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Vertiklichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königin—Züftern—Schwärmen—Ableger—Verfegen—Italienisiren—Zuseher von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formkucheln, Puddings, Schaumkondect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Recepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Bee-Keeping in New Zealand.

By the New Zealand *Herald* of Feb. 26, we learn that the first convention of bee-keepers in that colony was held on Feb. 23, at Pukekohe, Auckland. The *Herald* gives the following as a report of the meeting.

It may be stated that the project has been under consideration for some time; many persons interested in bee-keeping having expressed a wish that a society might be commenced. Accordingly, a short time since, Dr. Dalziel, an enthusiast in bees, sent out a number of circulars, calling a meeting for the express purpose of starting such an association. This meeting was held last Saturday afternoon, the 23d inst., in a large hall belonging to Mr. Buchanan. Though the attendance was not very numerous, those present took up the matter with a good deal of earnestness, and seemed fully alive to the benefits which might arise by associating together with a view to promote the advance of the bee industry.

Mr. William Morgan was called upon to take the chair, and in doing so, expressed the pleasure he had in presiding over such an assembly. He called upon the convener of the meeting to explain the particular object for which they had been called together.

Dr. Dalziel stated that the object of the meeting was to commence a bee-keepers' association, of the advantages of which it was hardly necessary for him to speak. The principal advantage would be that a society of the kind would give an impulse to scientific bee-keeping, and at the same time be the means of diffusing the knowledge and information required by those who were desirous of entering upon the industry. Between the members of the association there would be, of course, an interchange of ideas, and so, by mutual communication of facts and experiences bearing upon the subject of bee-keeping, might be made, at the same time, a source of profit and pleasure.

The following resolutions were then passed: That a Bee-Keepers' Association be formed; that the name be the Auckland Provincial Bee-Keepers' Association; that the association be managed by an executive committee, comprising the president, vice-presidents, treasurer, secretary, and three members of the general committee; that the subscription be 5s per year; that J. C. Firth, Esq., be requested to accept the office of President; that the following officers be elected: Vice-Presidents, Captain Hamlin, M. H. R., Captain Jackson, R. M., Messrs. Proude, Bagnall and Hopkins; Treasurer, Mr. J. Collins; Secretary, Dr. Dalziel.

It was proposed that the following constitute the general committee, with power to add to their number: Messrs. Allen, Beloe, Brown, Elliott, Jamieson, Morgan, Savage, and Sproul.

We have received Vol. III of the "Proceedings of the Davenport Academy of Natural Sciences." This is a volume of over 100 pages, nicely printed, illustrated, and bound, and contains a lithograph of Prof. Joseph D. Putnam, late President of the Academy, and an eminent contributor to the progress of science. His untimely death was an irreparable loss to the Academy as well as to the world of science.

The first two numbers of "The Family Circle," now published in this country, have been received. *The Family Circle* is an attractive 16-page weekly, handsomely illustrated; full of interesting matter, and containing no advertisements. The first six numbers will be sent FREE to all who have not applied, by sending a postal card to *The Family Circle*, Detroit, Mich.

Our readers will find the handsomely-illustrated Manual, published by the American Manufacturing Co., Waynesboro, Pa., on evaporating fruit, valuable and interesting. Sent free.

We have received the Catalogue of Arthur Todd, Germantown, Pa.—4 pages—Bees and Apiarian Supplies.

It will probably be welcome news to Canadians to learn that E. L. Gould & Co., Brantford, Ont., keep a stock of Binders for the BEE JOURNAL, on hand, which can be sent by mail to those who wish them. They cannot be sent by mail across the lines from the United States.

In a good article on the "Spring Management of Bees," in the London, Ont., *Free Press*, Mr. W. H. Weston remarks as follows:

If April proves to be as cold this year as it was last, there is almost sure to be a serious loss of bees. The warm sun of noon tempts the industrious bees to fly out, and many are caught in the cold winds that spring up, and die. This is true in a sense of human life in spring. The only safeguard against this is to keep the hive shaded from the sun, so that its deceptive rays may not decoy the bees out into the chilling air. In a few more weeks this danger will be past.

From the edition of Messrs. Geo. P. Rowell & Co's AMERICAN NEWSPAPER DIRECTORY, now in press, it appears that the newspapers and periodicals of all kinds at present issued in the United States and Canada, reach a grand total of 13,402. This is a net gain of precisely 1,600 during the last 12 months, and exhibits an increase of 5,618 over the total number published just 10 years since.

We acknowledge, with thanks, the receipt of a copy of the Report of the Commissioner of Agriculture for the year 1883, sent us by Commissioner Loring.

"THE WIFE OF MONTE-CRISTO," just published by T. B. Peterson & Brothers, is a remarkable novel that will surely attain immense popularity, and that immediately, for never has a romance of greater interest or power been published. It teems with excitement and adventure, absolutely bristles with thrilling incidents, and has an element of mystery that vastly augments its wonderful fascination. It is a continuation of Alexander Dumas' world-renowned creation, "The Count of Monte-Cristo," and is fully worthy of being associated with that masterpiece. Price, 75 cents.

CORRESPONDENCE

For the American Bee Journal

Honey-Boards and Section Boxes.

W. Z. HUTCHINSON.

Mr. A. J. Hatfield, of New Carlisle, Ind., asks the following questions, which I will answer in the BEE JOURNAL, as requested:

"At the Michigan State Convention, you mentioned using a queen-excluding honey-board, with spaces 5-32 of an inch wide. I would like to inquire whether you observed any difference in the disposition of the bees, in regard to the readiness with which they entered the sections through this small space, compared to that usually given them to pass through; and, judging from your experience, you would recommend the 5-32 of an inch space, in making queen-excluding honey-boards.

"I am thinking of changing the size of my sections, which are $4\frac{1}{4} \times 4\frac{1}{4} \times 2$, to some size that can be used without separators; and I would like your advice in regard to what size to adopt. Dr. Tinker says that sections $4\frac{3}{8} \times 4\frac{3}{8} \times 1\frac{1}{2}$, when filled, will weigh on an average, 14 ounces. Mr. B. says that $4\frac{7}{8} \times 4\frac{7}{8} \times 1\frac{1}{2}$ will weigh 18 ounces. Now, would not a $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$, weigh about 15 ounces, and be a nice size to use?

"As others besides myself would probably like to know your opinion upon these subjects, please answer through the BEE JOURNAL."

I have used the Heddon slot or skeleton honey-board, in which the spaces are about 5-16 of an inch across; and I have used a honey-board of similar construction, in which the slots were $\frac{5}{8}$ of an inch wide, and placed just the merest trifle less than 5-32 of an inch apart. I have also used the perforated zinc, in which the perforations are 5-32 of an inch in width. The bees do not pass quite so quickly through the wooden honey-boards with the narrow slots, as they do through the regular Heddon honey-board, or through the perforated zinc; but they pass through quickly enough to be able to carry the honey "upstairs" as fast as necessary; at least I have never noticed any difference in the amount of honey stored over a regular Heddon honey-board, one with the narrow slots, or one of the perforated zinc. Although I have crowded the brood next, until there was but little in the brood combs, except brood; yet I have never had a queen pass through the perforated zinc; although they have been reported as doing so; and, for this reason, I would have the spaces in queen-excluding boards a trifle less than 5-32 of an inch. Aside from their cheapness, I prefer the wooden boards, because they are always straight, and the spaces above and below remain equal, while the zinc is apt to sag, or

become kinked or warped; thus making one of the spaces so large that comb is built in it, while the other becomes so small that the zinc is glued fast.

The majority of the fixtures, all over the land, are adapted to the use of the $4\frac{1}{4} \times 4\frac{1}{4}$ sections. In fact, this size is regarded as the standard; hence, it would require a most excellent reason to induce me to change from that size. I would advise sections $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$ to be used without separators. Of course, such sections would contain but little, if any more than $\frac{3}{4}$ of a pound; and it is possible that such a section might eventually be adopted as a compromise, by both the defenders and the enemies of that innovation, the half-pound section. No sections are of such a size, nor filled in such a manner, that they can be sold for a pound each, without weighing; and it is better that a section weigh a few ounces less, than a few ounces more, than a pound.

Rogersville, Mich.

For the American Bee Journal.

That Improved Heddon Case.

C. H. DIBBERN.

I was pleased to notice Mr. Heddon's criticisms on my improvements on the so-called Heddon Case, on page 153. I do not believe that Mr. Heddon, himself, is entirely satisfied with the Case, as he makes it; as he wrote me that he had tried numerous improvements, but failed. I do not claim that my Case is perfection; but I am certain it is an improvement. In this view, Mr. Caldwell, of Cambridge, Ill., Mr. Hackman, of Peru, Ill., and others, fully agree with me. I have neither patents nor Cases to sell; and my only interest in this matter is to give bee-keepers a better method than many now have.

I do not use glass in the sides of Cases, but many prefer it. I simply described in my first article, how it could be used. The principal points of advantage in my Cases are as follows:

1. The sections set on hives in as compact a shape as possible to put them; thus saving the lumber and space of the partitions. This saving of space, on some hives, will allow of an additional tier of sections.

2. Many of us cannot dispense with separators, and this Case is admirably adapted with or without separators. I have never yet been able to produce one-pound, and larger sections of honey, to my satisfaction, without separators. I find many other beekeepers in the same boat. What we may be able to do, with half-pound, or sections $1\frac{1}{2}$ inches wide, remains to be seen.

3. The Case being instantly changeable to different sized sections. For instance, it holds 5 tiers, 7 in a tier, $4\frac{1}{4} \times 4\frac{1}{4} \times 2$ sections. It will, also, hold 7 tiers $4\frac{1}{4} \times 3 \times 1\frac{9}{16}$ scant, or 7 half-pound sections.

This will be found a great convenience where it is desired to produce both one, and half-pound sections; as

the Cases are the same sizes, and perfectly interchangeable. Also, should the bee-keeper run out of either sized sections, during the hurry of the honey harvest, he can just fill them up with the other size, without any fixing over of cases, or vexatious waiting for sections to arrive, which may still be in the original planks.

As my tin T's lay perfectly loose in the Cases, when empty, I would take them out entirely. I fail to see Mr. Heddon's objections about getting them bent, when not in use. In regard to the T's not being strong enough, Mr. H. is certainly mistaken. If they are properly made, they are like a piece of railroad iron, surprisingly strong; and if sections fit properly, will hold them in place, preventing any warping. The bees do not stick the sections very securely to the tins. I have used Cases with partitions, for years, and know the difficulty of variations in size of sections. For instance, your Case is made for a $4\frac{1}{4} \times 4\frac{1}{4}$ scant section. The next lot of sections, perhaps, coming from a different manufacturer, are a little full, just enough so they will not go between the partitions. If there is anything more vexatious, it is when the fire in your smoker goes out, and the bees begin to feel well.

In regard to bee-space, I have always used a $\frac{3}{8}$ space; but I have noticed that this space, by warping of boards and accumulation of propolis, never becomes any less. I have been surprised, when I thought I had a $\frac{3}{8}$ inch space, to find, after a few years, that I actually had $\frac{1}{2}$ inch, or more. It may happen as Mr. H. thinks, that I will discard the improvement, in a few years; but I rather guess that I will be knocking the partitions out of those made after his model.

Milan, Ill., March 17, 1884.

For the American Bee Journal.

Reversible Frames.

M. M. BALDRIDGE.

My attention has been called to an article on "Reversible Frames," on page 117 of the BEE JOURNAL, written by a bee-keeper in Kentucky, from which I quote as follows:

"The season of 1882 was a very poor one for honey; and when honey was coming in slowly, my reversible frames worked like a charm; and sure enough I had a bonanza. But the season of 1883 proved to be an extra good one for honey; and, although I could work the reversible frames like a charm, still I could see nothing gained by reversing them when they were full of brood or honey, and no room for any more. So, after a trial of reversible frames in one poor and one good season, I have decided that such frames work better in the head than in the hive. In other words, reversible frames are good in a poor season, but poor in a good season."

The above contains some food for thought. I am glad, indeed, to learn that "reversible frames are good in a poor season" for honey; but the

writer fails to tell *why*. If they are good in poor honey seasons, then, perhaps, this will cover their *extra* expense, which is the only objection to them, that I know of. That they work "like a charm" at all times, is important; but *why* reversible frames in good honey seasons are poor, is not very apparent. This statement needs an explanation. I see no reason why a frame should be reversed when it is full of brood, and "no room for any more!" And I do not see why any one should reverse a frame when full of honey, and "no room for any more." Because frames are made reversible, I do not see that we must reverse them when nothing is gained by so doing. The object of making frames reversible, as I understand the matter, is to enable the bee-keeper to reverse them when necessary. The same is true in making the frames movable; not to compel us to lift the frames out and put them back again simply, and thus keep us busy and out of mischief, but to enable us to manipulate the combs at will and for a sensible purpose.

St. Charles, Ill.

For the American Bee Journal.

Wintering, Double-walled Hives, etc.

HIRAM RICHEY.

Mr. O. O. Poppleton, on page 56, says: "Show me a practical method of keeping the entire inside of my hives perfectly free from dampness, and I have no further fears of unsuccessful wintering." Mr. P. is correct. Mr. P. E. Van Etten has the same opinion; but gives his plan of dead-air spaces over the brood-chamber, which is not correct. The dead-air spaces should be around the entire brood-chamber, not over it.

Mr. J. A. Buchanan, on page 119, says: "This old question is not long at a time laid on the table." He gives the double-walled hive the preference. He deems it folly to remove a part of the combs, and use division-boards. I agree with him; and if bees have plenty of stores, and two strips across the frames for a passage way, there need be no fear. Another important point is ventilation. Mr. B. states that a large entrance should be used. I beg to differ. The entrance to my hive is $\frac{3}{8} \times 3$ inches. I do not rely on that for ventilation. The hive I prefer has double-walls with dead-air space of $\frac{1}{2}$ inch. I have used one of these for three years, and never have seen any dampness in it. No cold air can directly strike the bees, if the entrance is covered with snow. I pay no attention to that, so long as the ventilator is clear; and then I have no fear of mice. For three years I have used this hive without loss. All that is necessary is, that the bees have plenty of stores, and keep the inside ventilators open. The first warm day in the spring, lift the brood-chamber, and sweep the bottom board clean; put down the feeder and feed every day until they can get food from other sources.

About three years ago, was a discussion about taking bees out of and

into the cellar. Some thought it too much trouble. One person thought it no trouble, as he had buildings on a track, containing 36 hives each. He took the brood-chamber, leaving the hive on summer stands. This I could not understand at first; but finally hit on the plan, and made one hive; it suited me; so I remodeled all my hives; put my bees into them, and have lost none since. Previously I lost about two-thirds in each winter.

Mr. Henry Alley thinks dry sugar is the best food for bees if water be also given. I do not agree with him. Give them syrup made from granulated sugar, if you can find it unadulterated. I bought some sugar at a grocery store; boiled it, and the scum was of indigo hue; when it became cold, it was like flint. I think it poison; for, several times, I think it affected my stomach. Each barrel of this sugar contained an affidavit, and a written guarantee of its purity.

Mr. Editor, I send you a box containing the scum of the sugar referred to above. What is it?

Sing Sing, N. Y.

[The right name for the stuff is "poison," as our correspondent suggests. The adulteration of sugars is now so common that it is very difficult to obtain any pure. That sent us by Mr. Richey has, no doubt, had too strong a dose of adulteration. When put on coals of fire, it burns blue and smells very strong of sulphur.—Ed.]

For the American Bee Journal.

Does Bee-Keeping Pay?

E. W. WALES.

I have kept bees for the past 15 years; and from my limited experience, I should say that it pays with the experienced, year after year, 100 per cent.

The worst trouble with beginners is in getting started in the business: hives, implements, bees, etc., costing considerable. If a beginner who has only a few colonies, meets with loss in wintering, he is apt to become discouraged too easily. I have found it so in my experience.

After "stocking up" with a suitable number of colonies, hives, fixtures, etc., even with great loss during a severe winter, and cold spring, the hives remain, also a large amount of combs, implements, etc., with which again to commence. By purchasing bees, the hives may be again filled by the end of the season, and honey enough to net him 50 per cent. on the investment.

I never have made bee-keeping a specialty, having worked at farming in connection with it. In the fall of 1882, I put into winter quarters 38 colonies of Italian bees. Of this number I lost 21; leaving 17 with which again to build up. Of the 17, there were only 3 strong colonies, 3 fair, and 11 weak.

Here in Michigan, all know that the spring was very late and cold; but by

feeding and good care, I managed to bring them safely through to fruit bloom. By fall I had increased them to 45 strong colonies, which are in winter quarters, and at this writing, apparently in good condition. The past season, my bees have produced 500 pounds of comb honey, for which I received 16 cents per pound; making \$80; and 470 pounds of extracted honey, for which I received 12½ cents per pound; making \$58.75; selling all of it in my home market.

Besides the honey produced, I have an increase of 28 colonies, valued at \$5 each, making \$140. Total gain, \$278.75. My expenses were \$22.50. Consequently leaving me a net gain of \$256.25, from 17 colonies; and that, too, in a very bad season. I rather think it pays. In the above figures, I have omitted the value of the honey used in the family, or given away, which must have exceeded 100 pounds.

Cause of Dysentery in Bees.

THOS. H. SHEPHERD.

The cause of bee-dysentery, I think, is in the food the bee eats. Long confinement and cold show us only the effects, not the cause. My bees often show signs of dysentery in the fall, when driving them out of the sections, as early as the middle of September, while the flowers are yet in bloom. I have noticed them on warm days, late in the fall, while flying up, drop their excrement, after being confined not more than a week by cold weather. Thus showing that they have the disease at such times. Now, if this is true, the disease must result from either the honey or pollen, or both. That all honey or pollen is unlike is true. Just the particular kind that brings on the disease is what we wish to discover. To reach this, we must know when the bees begin to show signs of dysentery.

In the spring or summer, bees always eat, and feed to the brood both honey and pollen, which is gathered at that time. So, I think, it would be an easy matter to find out what it is, by the kinds of flowers out that time. Yet, there are so many kinds of honey-plants out at that time, that, perhaps, it would be difficult to determine. The disease here begins with, or after boneset is in bloom. Then the asters bloom next. In this latitude there is a famine after clover bloom, which lasts until boneset comes in bloom; thus leaving the brood-combs in shape to hold the boneset honey and pollen, which is stored for winter use, and consumed early.

There are quite a number of other plants, such as mint, golden-rod and wild sun-flowers; but boneset, asters, and fall flowers are the principal honey-producing plants in this part of Michigan; but as for which one causing dysentery, pollen or honey, I think it honey. I have found in every case, upon examination, that there were honey and pollen in the abdomen of the bee; but a larger portion of the

liquid substance I believe to be honey. After all, it may be that pollen is the cause. Bees are badly diseased in this section. If bees could be wintered on clover, basswood or raspberry honey, they would not be affected with dysentery.

Bee-Keeping in Cuba.

A. W. OSBURN.

On page 25, is a most worthy article from the pen of Samuel Simmins, on "The Coming Bee, Pure Mating, etc." While I agree with Mr. S. upon the sources that we are to look for, for the "coming bee;" yet, I am obliged to state how widely different has been my experience, in relation to the distance queens usually go, to mate. I will give one year's experience as evidence: In 1881, while in California, we had 270 colonies of bees; 27 pure Italians, 243 blacks and hybrids. I reared, that summer, 243 Italian and Syrian queens, and introduced one to every hive, that had formerly had black and hybrid queens.

About 2½ miles from our apiary, were 280 colonies of all Italian bees. Remember in our own apiary there was 243 black and hybrid colonies against 27 Italians. Now, for the mating of our queens. When, in the fall, the progeny of all the young queens were old enough to fly, I took pains to count all queens that produced bees that were not 3 banded; and just 3 queens, only, had mated with black drones; 240 producing as fine 3-banded bees as any one would wish to see. Now, is it natural to suppose that the 27 colonies of Italians produced all the drones; and that the 243 black and hybrid colonies produced none at all? I think not; if it proves anything, it proves that queens, when all conditions are favorable, that for choice, they go away from their own yard to mate.

In my opinion, the important condition to be considered, is the climate in which the bees are located. As it is conceded, by all close observers, that bees are good judges of what the weather is to be for the next few hours, with me, it is natural to suppose that "her majesty," when she wishes to go on her bridal tour, has not the slightest objection to traveling a mile or so further, if, in her judgment, there is no danger of being caught in a thunder storm, before she could return; and in no country, that I know of, could the last named conditions be more favorable than in California. For they seldom have any rain there from April to November. Whether my suppositions, as to the real cause of our queens going away from home to mate, is correct or not, the result was precisely as I have stated it.

But this is only one instance. I never have been located since then, so I had not as good an opportunity to test this question of queens mating, as I had that summer. In my last article, I made a statement, that

I am forced to retract. I said: "I never expected to see honey flow in Cuba as I had seen it flow in the North, and in California." Now, I am disposed to give Cuba credit for all that is justly her due, and in doing that, I am compelled to say that, in my opinion, there is no country that can equal this for bee-keeping. I have been here a little over 3 months, and it has been one continual honey flow, and the end is not yet; for there is no "let up" to the flowers, or to the amount of honey coming in.

I assure you that when colonies store their 50 pounds of honey a week, continually, it is no mean country for bee-keeping; and that is what our strong colonies have been doing, and are still doing. But we are rearing queens and dividing now, and from this on, there will be an end to storing honey for surplus.

It is the intention to run this Home Apiary to 600, if not 1,000 colonies; and after the last three months experience, I cannot see how it is possible to exhaust the supply, even with 1,000 colonies in one yard. We are making calculations to that effect, with one 4-frame extractor on hand; and the proprietors have ordered another with capacity for 6 frames: sheets, honey-house, and evaporating tank in the same proportion; of the evaporating tanks, they have two that hold 400 gallons each. The pioneers and owners of this great enterprise, are two brothers, J. and P. Casanova, Americanized Cubans, who have amassed large fortunes by their energy and integrity; and with progressive views as broad as their wealth.

San Miguel, Cuba, Jan. 24, 1884.

Sweet Clover for Stock Pasture.

C. L. GAY.

Several miles from the city of Montgomery, Ala., on what is known as the "old Tarver Plantation," we find the origin of this valuable plant in America. The seed being first imported and deposited there, these in turn producing their seed, and being borne by the wind until traces of it can be found in almost any portion of the prairie belt of Alabama. Yet, the interest which long since should have been turned to it, is just now developing itself. Our farmers are beginning to realize the fact that large advances and no cotton, in return, is unprofitable. Their attention is more directed to diversified farming, and to all farmers—prairie farmers especially—this subject of melilot is one of importance. Early in the fall this plant may be seen to be putting in its appearance for the winter, attaining to the height of several inches by January, if left unmolested. In this climate it being the only green plant to act as food for stock during our severe winters.

An enterprising farmer sees his chance for an early spring hay cutting, and preserves it; even after once being cut at its best, the remnants are sufficient to voluntarily re-

plant the spot. Yet, to keep a good stand it should be replanted every two or three years. In fertile, or poor prairie spots, I have seen this plant reach the height of 12 feet from the top to the ground. Its branches spread in every direction from the main stem, shooting forth in the same manner as the branches of the cotton plant, tapering in pyramidal form from the tip of the lower branches to the top. At this age, or before attaining its full growth, it begins to blossom, and this is its beautiful feature, furnishing one of the most fragrant odors. This is the cause of the fondness stock have for it. At all times having a sweet odor, and imparting a fine taste.

Again, during the honey season, the busy bee seeks the cavities of its blossom, and from it extracts the sweets which impart the most delicious taste to honey. Early in the fall, the seed begins to mature, and is ready to be gathered about the first of September. One other important point: possessing only a tap root it penetrates deep into the soil, and thereby is not affected by the driest of summers. The principal difficulty is the gathering of its seed; they being so small. Yet they are gathered faster by the so-called art of *stripping*. At this writing it is five inches high, and giving the sheep a send off. During the month of April, I will plant, and get a fine cutting of hay, or preserve it for seed. Again in August I will plant for my winter crop. At an early date I shall begin to cut the hay for another winter's supply. As a hay it ranks with the foremost, still retaining after cut, its fragrant odor. Of course it should be cut during its most tender age; between the heights of 12 and 25 inches is considered the best.

In conclusion, I will say, there is no plant that can be employed to such an advantage, and made to serve so many purposes on the farm, as melilot.

Montgomery, Ala., March 31, 1884.

For the American Bee Journal.

The Swiss Wax Extractor.

OSCAR F. BLEDSOE.

No work connected with the apiary, is more important than the rendering of wax; and, as I have had some practical experience in it, I will, for the benefit of others, give the same. With the first supplies I purchased for my apiary, I bought a Swiss Wax Extractor; the one commonly advertised for sale. After repeated, and vexatious trials, I found that the machine did not serve its purpose perfectly, for the following reasons:

1. The comb basket is too small; and as the the interstices through which the wax flows, are also small, it becomes a very tedious process to get the wax from a large quantity of comb. It is very troublesome to empty the comb basket often; and streaks of wax may almost always be found in the refuse.

2. The receptacle in which the comb basket rests, prevents the direct ap-

plication of the heat and steam to its bottom. Hence, it takes too long to thoroughly melt the comb; and, in most cases, after the refuse is emptied, and cools, remnants of wax will be found remaining in it. The heat and steam are also dissipated through the spout, which is required to be always kept open, and between the extractor and the pan which holds boiling water. All these facts make the melting of comb in this extractor, especially if they are black and tough, slow, tedious, and imperfect. Hence, I discarded it, and resorted to various devices, including the old-time bag-process. No plan, however, suited me as being speedy, neat and perfectly effectual.

I, at last, went back to the Swiss extractor; discarded the comb basket; took out the receptacle in which it rests, and had a bottom put in the Can. I also had a rim soldered on the inside of the Can, an inch above the spout; on this I placed a circular piece of tin made strong by wire around the rim, and full of perforations. Wire cloth, as coarse as possible, provided only that the interstices are not so large that dead bees will pass through, would be better than tin. I also had a second story added to the Can, thus doubling its height and capacity. After the Can is full of comb, I pour in water till it flows from the spout. Care must be taken not to allow the water to be so high as to reach above the perforated tin, as capillary attraction will retain it, and prevent a free flow of the wax from the combs. The spout is now closed. I use a wooden stopper; but an iron faucet would be better. Heat is now applied to the Can until the steam thoroughly melts the contents. The stopper is then removed, and the wax run off into a vessel.

This plan suits me, as it cleans the combs perfectly, and any quantity of them; and twice rendering will make very clean cakes of wax. My practice is as follows: I keep my wax-extractor near my honey-extractor, and put in all the cappings. As the honey is easily run off through the spout, it serves an excellent purpose in this respect. When I get the extractor full of combs, I set it in the sun. The intense heat of the sun kills any moth or larvæ, and causes the combs to sink, and the honey to drip from the cappings. I then add more comb, and pour in water. Late in the evening I build a small fagot-fire between two sticks of wood, at my wood pile; adding a few pieces of the refuse of the comb from a previous melting, to make a hot fire. The extractor is placed over the fire. I then leave it, giving it no further attention until after supper. I then remove the stopper, and let the wax and about half the water flow into a vessel. The stopper is then replaced, and the extractor placed over a few coals to keep the contents hot, till every particle of wax drips from the combs. The next morning I remove the refuse from the extractor, by using a steel garden trowel to loosen it; and I never find any particles of wax remaining in the refuse.

I have thus been minute in describing my plan and machine, as its use has been a great convenience and comfort to me, and may benefit other bee-keepers. Any one who lives near a tin shop, can easily have one made. As wax is one of the most valuable products of the apiary, every bee-keeper should produce and save as much of it as possible.

For the American Bee Journal.

Bees Wasting Wax.

C. P. DADANT.

Several persons have lately spoken of bees wasting wax for want of room for building combs; and held that this proved that bees could not help producing wax in a certain amount, even if they have empty combs.

If we open the "Mysteries of Bee-Keeping," by M. Quinby, page 251, we read the following: "When constructing comb, bees are constantly wasting wax, either voluntarily or accidentally. The next morning, after a swarm is located, the scales may be found, and will continue to increase as long as they are working it; the quantity often amounts to a handful or more. It is the best test of comb making that I can give. Clean off the board, and look the next morning; you will see the scales in proportion to their progress. Some will be nearly round as at first; others more or less worked up, and a part like fine sawdust."

The above being the report of one of the ablest, observing, and practical bee-keepers of this century, it is certainly worthy of attention. It proves that bees can, and do waste wax when they are building combs, at times, and not especially when short of room for comb building. Now for the explanation, or cause, which Quinby did not give.

Bees do not willingly waste wax, and their saving and industrious habits will convince all that something must be wrong when they thus throw away the costly wax.

The cause can be told in two words: *cool nights*. When bees harvest honey in largest quantities, the weather is often cool in the night, and very hot in the day. The wax-producing bees hang in clusters; but in a cool night those which are on the outside of the cluster feel the change of temperature, and when the scales of wax come out of the rings of their abdomen, if they are not at once taken by other bees and fastened to their place, they become too hard for easy manipulation, and are then allowed to drop to the floor.

We saw a very clear instance of this, one day, in a small swarm (about two handfuls) that had been hived late in September. On opening the hive, in which they had been given only narrow strips of foundation, we found a couple of pieces of comb, 3 or 4 inches square, a lot of wax scales, white as snow, on the bottom-board; and about 3 dozen bees upon which the wax had cooled so promptly that

the little white scales were still fastened in the rings of their abdomen.

It is very probable, also, that when bees harvest honey in large quantities and have no empty combs in which to place it, such a large proportion of the bees devote themselves to wax secreting, that when this wax is produced, there are not enough other bees to take care of it as fast as it comes, and part of it is wasted.

If, on the other hand, the bees have plenty of empty combs, only a few of them will produce wax, and it will easily be cared for; the greater part of the bees depositing the honey in the cells as fast as harvested; the small amount of wax produced will be used in sealing and lengthening the short cells, or filling up deficient places.

There are, however, some other occasions in which bees will unwillingly waste wax. When the heat of the sun, or lack of ventilation in hot weather, causes one or more of the combs to melt down, the bees have to gorge themselves with the wasting honey, and nearly all the bees in the hive are forced to produce wax, so to speak; since they have no comb in which to place it, and if the hive is still inhabited, in 24 hours, on account of the damage and heat, they will deposit their wax in small lumps wherever they may happen to be.

In 1878 we had some 20 cases of this kind, in an apiary, exposed to the 3 o'clock sun. The bees had stopped the ventilation by clustering in front of the entrance, and nearly all the combs in each of the 20, broke down. There is also a waste of wax when the hive is completely full of both comb and honey; and in such case, the waste is very easy to understand; but our many bee-keeping friends around us, all agree that they have never seen wax wasted in a hive containing plenty of empty combs.

Now for the cost of producing this wax. All large honey-producers can test this to their satisfaction, in 2 or 3 seasons. Select the best 20 colonies of your apiary; let them be of the same size, and all without drone comb. Divide them into two lots of equal force, so that by treating them alike you would stand a fair chance of having a like result from each side.

Now run 10 of them for comb honey, giving them supers with only starters enough to have straight combs; and run the other 10 for extracted honey, with all the empty combs (not foundation) they can fill; but not too many at a time.

Let each colony that swarms be discarded; also a colony of equal strength from the other side, and keep account of all the net honey harvested, clear of wood or glass. One year will not decide it, as it might be that a few changes will take place in the condition of some colonies, that would alter the result; but try it for 3 years, and tell us the result. The net cost of the wax will be the difference in the amount of the crop. Did we try this ourselves? Yes; but we will not here tell it for fear of frightening our comb-honey producers. Let them try it for themselves.

For the American Bee Journal.

Those Half-Pound Sections.

W. D. WRIGHT.

Mr. W. Z. Hutchinson, on page 151, seems to be very solicitous for the welfare of the half-pound sections. He thinks they have been sadly abused, etc., etc. Well, from some cause or other, perhaps over-abuse, or perhaps from the experiences of the past season in their use, they appear to be on the decline. Bee-keepers in general, appear to be more at rest on this subject than they were last winter and spring, and I have noticed that these sections have not even been quoted in the market reports during the past fall and winter. For what reason, I know not.

I have also noticed that the columns of the different bee periodicals have not been over-crowded with reports of the success of these half-pound sections. Cannot some one come to the rescue and give us a booming report on them, financially and otherwise, insuring their success beyond all doubt? Mr. Heddon's report on half-pound sections has just come to light in the March number of the *Bee-Keepers' Magazine*; and that is not very re-assuring. He acknowledges that they have been a damage in his trade, and as far as he has used them they have also been detrimental. Probably just what "those who were frightened (?) at their advent" expected.

Like many of our commodities of the present day, I believe the demand (what little there is) for these half-pound sections, has been created by the supply. Mr. Hutchinson says: "Bee-peepers, who did not understand the principles underlying the production of comb honey, have written long articles in which they attempted to prove that not nearly so much honey could be produced by the use of small, as by the use of large sections."

On page 8, Vol. XIX of the BEE JOURNAL, Mr. F. C. Benedict gives the conclusions arrived at after three years' experience in the use of these sections. He also gives the opinions of J. C. Newman & Son., and W. S. Benedict; all of whom were pioneers in the use of half-pound sections. They claim that not nearly as much honey can be obtained by their use as with larger sections. They do not now attempt to prove it, but have proved it by past experience, and probably their experience is just as valuable as the experiences of "some of our leading comb-honey producers," as Mr. H. states. But, perhaps, these men do not "understand the principles underlying the production of comb honey," which, of course, would account for their adverse experience.

Again, Mr. H. says: "Perhaps extracted honey can be put up for sale in small packages more cheaply than the same thing can be done with comb honey." Just so; it is not a parallel case, at all, with comb honey; as extracted honey is adapted to almost unlimited division. It can be

put up in penny packages if desired, or even "two for a cent," as it does not increase the labor during the busy season, and is taken from the bees in bulk. It can be put up in these small packages at any time, and that by cheap inexperienced help.

I suppose that Mr. H. will admit that there are extremes to be avoided in either direction, in deciding the size of sections that will be most advantageous to both producer and consumer. At the present day, I believe the six-pound box would be the extreme in one direction, and if the half-pound section is not the opposite extreme, it savors very strongly of it.

Probably these half-pound sections were profitable at the start, when monopolized by a few apiarists, as few knew anything about them; but I believe them to be wholly impractical for general adoption, especially by men who have hundreds of colonies to manipulate.

Knowersville, N. Y.

For the American Bee Journal.

Drones from Worker Eggs.

C. THEILMANN.

B. F. Carroll, in his able article on page 102, explains how bees can change a worker egg, so as to produce therefrom a drone bee, by removing the sperm of the egg which it receives in passing the seminal sac of the queen in the act of laying.

I am convinced by the experience of last summer, that bees can, at their will, rear drones as well as queens out of worker eggs; but I am not so sure that bees change the sex by removing the sperm from the egg. If this is true, the egg, of course, would be without male-sperm, and powerless to generate after the drone is matured. Is this reasonable in nature? If the drone-eggs which are laid by a perfect queen are not impregnated by the queen, where do the drones of such eggs receive the sperm or power to generate? Some will say: they get it in the food in their larval state. Is this answer correct? If it is, then bees produce queens by feeding them with royal jelly; but does this prove that the eggs from which the bees rear queens, are impregnated by the mother? Or, does it prove that the larva, or egg, which is fed on drone jelly, is not impregnated, or the sperm removed by the bees? Has Mr. Carroll any way to explain it?

O. L. Earle, on page 134, writes thus: "The theory becomes more reasonable, if we can find a similar case in nature. For instance, the female fish first lays her eggs, and is closely followed by the male, who sprays the fertilizing fluid over the eggs." It looks to me as though there is as much difference in the fertilization of the eggs of fish and the eggs of bees, as there is between the eggs of a hen and of a fish. The fish is not impregnated before laying eggs, as bees are, and is of another nature. I believe that all the eggs laid by a properly impregnated queen, are fertilized before they are deposited in the cells,

and that the bees make the sex at will, by way of food.

One thing is certain: if bees can make either a worker or a queen from what is supposed to be a worker-egg, impregnated, then the impregnation of such an egg has, surely, nothing to do with the sex; and it must be all in the food. This makes me believe that the eggs only receive from their parents the sperm to generate.

Why are drones produced by laying workers, not able to generate? Because the worker bee possesses no generating sperm, as she is not fertilized. It is also shown on the offspring of the different hybrids of black and yellow bees, that drone-eggs are impregnated before laid by the queens, and have received the sperm of the drone to enable them to generate.

Theilmanton, Minn.

For the American Bee Journal.

That "Priority of Location" Theory.

JOHN A. BUCHANAN.

My observation through 20 years of experience, fully coincides with Mr. James Heddon's views on this question. I understand his proposition to be this: A field that has been selected and occupied, either partly or wholly, and sustaining, or in the new future to sustain, all the bees that would be profitable to keep in that floral field; it would be folly in the extreme for others wishing to engage in the same pursuit, to enter that field to pursue the same calling, either as a specialty or only as a side issue. True, the civil law does not recognize any one as the sole proprietor and controller of any apicultural area; but, with Mr. H., I do claim that the law of right, reason, justice and common sense, will make it plain that none have a right to enter that field, more especially since it would not be found difficult to enter others unoccupied. If one has secured a fair field where he is able to make the business fairly profitable, no need of getting excited over a fortune at the business any place, it would be a great mistake, and an injustice to the first occupant of that field, for others to attempt to reap any part of the harvest. And should the rights of the first, especially the law of advantage, be ignored by others entering the same field regardless of consequences, the chances are that the first occupant will be greatly crippled in his business, and the transgressors on his rights will make an ignominious failure, losing their bees and capital, as well as credit. Many of us have seen this truth verified.

There is scarcely a community where, at some time, the bee-fever has not run its course. The only medicine that ever was discovered that would allay this fever, was a dose of stuff called by some, "overstocking syrup." We have seen people grow very enthusiastic, using every effort to increase their bees to the greatest number of colonies. Did the field become overstocked, or not? Does this state of affairs make more or less bee-keepers? Is it wisdom on the part of bee-

masters, ever to encourage others to enter a field already occupied? I have been ground through this same mill twice; but after the smoke of the battle had cleared away, and I took a survey of the wreck and ruins, I was able to rejoice in a clear field with no opposition; and while my interests were seriously affected, the intruder's interest was a total wreck. There are almost countless numbers of unoccupied "bee-boxes" laying about, rotting, in almost every neighborhood. Let this decide whether you will attempt to enter another's "bee-ranch," whose it is by "priority of location."

Mr. Pond would have us believe that the "bell wether," leaders in apicultural improvements, are professional gentlemen. Well, I would agree with him if he had said or meant—professors in the science and art of bee-keeping; but he did not mean that; he meant professors in other callings. True, much credit is due some professional men for the great benefit they have rendered the bee-keeping world, but the specialist has had by far the best opportunities with all his practical experience, and all his time and attention bent in the direction of making the business financially, a success; and it is to this class of men who have made money in the business, and have shown others how to do the same, to whom we especially owe gratitude. As a rule, professional men who study bee-culture, do so simply for recreation, and do get well-stocked with theory on the subject; but the practical part we get, and all we need, from the specialist whose bread and butter is to be gotten out of his occupation.

Mr. Pond's citation to Rev. Langstroth and Dr. Dzierzon, proves nothing. We are all familiar with the fact that while these gentlemen were actively engaged in the pursuit of their respective callings, giving but little time to bee-culture, they made no very rapid strides in apicultural improvements. It was only when their almost undivided attention became enlisted in this fascinating pursuit, that they succeeded, and brought out such wonderful improvements.

Holliday's Cove, W. Va.

For the American Bee Journal.

The Cause of Bee-Diarrhœa.

W. M. WOODWARD.

I believe Mr. Heddon was reported as saying, at the Northwestern Convention, last October, that "all our losses were nothing to those caused by diarrhœa." To this, I think, we would all agree.

There is, therefore, no other subject which so imperatively demands the attention of the bee-keeper, and yet it almost eludes human sagacity, to discover either its cause or cure.

The subject has already been largely discussed in the BEE JOURNAL. Various theories have been formed, and stoutly opposed and defended; and yet, while no conclusion has apparently been arrived at, I think there has been some good underbrushing

done; and yet it seems to me that enough rubbish has been cleared away, so that I can begin to understand something of its true cause. I would not condemn any man for his theory on this matter, nor yet any theory, in itself, unless it be that of cold or *bacteria*; if the latter is ever advanced as a cause of bee-diarrhœa. Cold, I am satisfied, when all else is right, acts as a preventive rather than a cause; but may tend to aggravate it, in connection with excessive dampness, when already set in. There are left, then, three views of the cause of which I wish to speak, viz: (1.) Excessive moisture, etc., as set forth in Mr. Corneil's recent article. (2.) The pollen theory as represented by Mr. H.; and (3.) Breeding out of season.

I have no new theory to advance, but wish to concentrate the light we already have. It seems to me that the reason why there is so much difference of opinion, is not because our experiences differ, but because no one of the theories advanced is broad enough to cover all of our experience with the disease. What is the cause?

I think Mr. H. is somewhere reported as saying, that "bees almost never have dysentery without brood-rearing." Would it not be the truth to drop "almost," and say never? As that agrees with my experience, I will give a little of it. Last year I put 7 colonies into winter quarters; they were well supplied with bees and honey. Five out of the 7 died of diarrhœa, and were the only cases I had out of 33 colonies. Three out of the 5 were known to me to be breeding all winter; and when the other hives were emptied, brood was found in all stages of development. There was no reason to suppose that the 5 had more pollen than many others, nor that they suffered worse with moisture, or cold. Now, what was it?

I also had 9 colonies wintering with honey-boards and everything off clean, and the frames all opening $\frac{1}{2}$ inch wide up into the caps, which were large, and tight as a good workman could make them; and, although, one of the 9 was queenless in the fall, all wintered well without disease; and, moreover, they consumed but little honey; no one of them reaching the top of a 12-inch frame, by 2 inches, until warm weather came. Now, why was it? The only protection given, in either case, was a little hay packed loosely around the body of the hive up to the cap, and a board leaned up before the entrance. I leave the reader to draw his own inferences from these facts.

But what is the relation which the several theories sustain to the disease? Brood-rearing is almost, if not an invariable accompaniment of diarrhœa. Is it secondary to the disease? In other words, bees are at first in a normal condition at the close of the honey season; and in a fatally abnormal one shortly after—dying with diarrhœa. Brood-rearing is also a normal condition, in warm weather. Is it abnormal in cold weather? If so, why? Is it to be supposed that the normal condition, *i. e.* health, begets the abnormal, direct? In other

words, do bees pass directly from a state of health to a living death; and is their disease the cause of their attempt at self-propagation? Do bees raise brood *because* they are dying with diarrhœa? I think not.

What causes brood-rearing in mid-winter? What causes it any time of the year? It is true that a large number of nurse-bees may begin the work by over-feeding the queen, just the same as we may by stimulative feeding. It is also true that the presence of pollen may serve as a temptation. But is it the cause?

The pollen theory has some truth in it. Its advocates are one step in the right direction, by excluding it; not because it causes diarrhœa, but because it is made use of to get up a state which other means serve to abort, I might say, and thus cause disease. I am satisfied that brood-rearing is not, other things favorable, a cause of disease; neither is eating of pollen a preventive of starvation.

Confinement must now be considered in its relation to the disease. All agree that, when in a healthy condition, bees can stand confinement for a very long time. The difficulty arises when other conditions are not favorable. Bees are sometimes healthily wintered without a flight for 3 or 4 months. Confinement is not, therefore, a cause of disease, except to aggravate some abnormal process already set in. But confinement and brood-rearing cannot go on together for any length of time, without disease.

No one single cause ever produces diarrhœa, (not even sour honey); but a chain of causes, each of whose links constitute some one's theory of the disease. I will name the links of this chain, viz: brood-rearing in confinement, in damp hives, and cold weather. These, when taken together, are all abnormal and unhealthy.

Cold we must have, but why heat up our hives inside, or suffer the bees to do so, to generate steam to cover combs and hives with frost; and to induce the rearing of "brood out of season," which, I aver, is the *first* on the list of causes of diarrhœa. Protect the bodies of the hives just enough to keep frost from forming on them; but open thorough ventilation into a large cap made to serve as a movable condensing-chamber, and when frost forms in it, and is in danger of melting, lift the cap and scrape or brush it out; replace the cap again, cold or hot, and I know there will be less complaint about dampness and diarrhœa. The prime first-cause lies in over-heating within the hive; thus causing brood-rearing when it is too cold for a flight without. This causes a state of matters in January which should take place in April.

I believe that there are two ways to avoid winter-breeding, and all this train of evils: (1.) By keeping them cool enough to be quiet, slightly numb with dry cold air, which is easy enough to get at any time; or, (2.) Winter by "high pressure," excluding pollen and dampness from the hive; thus making extensive brood-rearing impossible.

Custer, Ill.

SELECTIONS FROM OUR LETTER BOX

Willows and Maples Budding.

Spring has just opened, and the soft maples and willows are beginning to bloom. My bees are getting some pollen to-day: just six days sooner than last spring. We expect a good summer for bees and honey. I will start with 35 colonies this spring. I wintered 45 on the summer stands: but lost 5, and sold 5. Bees are light in honey. I had to feed some.

JOHN REY.

East Saginaw, Mich., April 6, 1884.

Bee-Keepers' Excursion to Iowa City.

Bees, in this vicinity, as far as reported, are in much better condition than last year at this time. Miss Katie Case, out of 5 colonies, lost 1. The loss of O. Clute, of Iowa City, is nominal. G. B. Engall's loss, out of 156 colonies, is 40. They were wintered in a house packed with sawdust, and the bees drew dampness. My own loss is 3 per cent. I shall send to all the members of the Davenport Association for a full report, and endeavor to have it at farthest by May 15. All bee-keepers who wish to join the excursion from Davenport to Iowa City, in the latter part of May, as fixed by resolution at our last annual meeting, will please report to me at once, by mail; and if we can raise a sufficient number to hire a car, the fare will be much reduced, and the facilities for convenience and comfort much increased.

I. V. MCCAGG.

Davenport, Iowa, April 7, 1884.

Bees Gathering Pollen.

My bees have wintered well, but consumed more food than usual. Out of 176 colonies, 14 have starved. The remaining colonies are in fine condition. On March 18, we had 2 feet of snow; and on the 31st bees were gathering pollen from soft maple.

C. THEILMANN.

Theilmanton, Minn., April 9, 1884.

My Experience with the Cyprians.

In the fall of 1881, I procured some bees from a neighbor. Among them was a colony of Cyprians. They are reported as being a very cross race of bees. I set them in the cellar, along with my other bees, not caring whether they lived or not. Upon putting them out, in the spring, I was astonished to find only about a dozen dead bees; but they were later in commencing to fly than any other colony in the yard. They cared nothing for smoke, and I soon discovered that I succeeded best without it. I am now handling my whole apiary mostly without using the smoker. My experience in handling Cyprians has been of great value to me, and I think, after one week, I can successfully handle the crossst bees, without smoke. I have lost only one colony of

Cyprians in 3 years; and that died of old age. My 32 colonies have produced 4,800 pounds of extracted honey, and 1,950 pounds of comb honey in one season. So much for the abused Cyprians. Give them the credit they deserve. I believe that their being so cross, is the result of the manner in which they are handled.

Medford, Minn.

J. E. CADY.

Drones Flying.

My bees are in fine condition: I lost but one colony in wintering, out of 70. I saw drones flying on the last day of March, from two different colonies.

JAMES RONIAN.

Villisca, Iowa, April 5, 1884.

My Experience with Separators.

Last spring I had a tinner cut 600 tin separators, and I gave them a fair trial. I do not like them. I had very nice honey, as straight as I want. I could have glassed it, but there was not enough of it. I use the two-pound sections, and one separator between each; putting the sections on the top of the frames, the thickness of a lath between them and the sections. I use the "Simplicity" hive. My Cyprian colony produced 156 lbs. of comb honey during the past season. I had 3 stories in the hive; the two upper ones without separators, and the lower one with separators. They filled the upper ones, but the lower one was not more than half filled. Why did the bees go through the first story, which had separators, to the upper stories which had no separators? An Italian colony did likewise. I use the best thin comb foundation that I can procure; and I shipped the honey produced on that, without separators, to Boston, and it went through all right. From this time on I shall discard the use of separators; or only use one to every 3 sections.

Casey, Ill. D. R. ROSEBROUGH.

My Bee Feeder.

I have sent you one of my bee-feeders. I make them to cover 5 or 6 frames, or enough to cover frames for winter. You will see it can be set on the frames in the fall, and all the troughs used to quickly feed for winter; and there let it remain until they are ready to apply sections. As they are already on the frames, a very little feed can be given in one trough, for stimulative feed; or water can be given, and that, too, just where we wish, as we can see where the cluster is, right through the screen. As there is a passage way all over the frames, the bees can reach all the feed either in the combs or feeder. You will see one very great advantage, viz: the cloth can be lifted, or rolled up from over the feeder, and not enrage the bees; nor can they fly out. As it is so low, there is ample room for cushions and any amount of warm packing, etc., so we can keep the bees just as warm as if no feeder was used. To apply the syrup, set a funnel over the wire cloth, or centre of a trough, and turn in the feed slowly; or it does fairly well if no funnel is used. You

will see that the rim that holds the wire cloth is loose, so that if we wish to clean out the feeder we can do so; and again, to ship the bees we take off the rim with the wire cloth, and pack all the troughs with moss; then return the rim, and wet the moss; and invert over the frames, of course, on another wire cloth, which covers the whole hive. After used as a shipping waterer, the moss can be removed, and used as a feeder again. You see, with this feeder, the feed is right where it is warmed by the bees, and where a light stock will hive; when, if away down at the side, they would starve. The feeder is large enough to feed up winter stores very quickly, and still feed as little as we wish. In fact, it answers a variety of purposes; even as a passage way, and one through which we can see the bees. In my mind it is very desirable. I am testing it on some of my colonies; and I am much pleased, as are all who have tried them. I think they are well worth 50 cents; and as I have no patents on any invention, I feel pleased to show it to the bee-keepers, with a feeling that I have done a little good, at least. I have been studying on this thing for a long time. I like everything connected with bees.

E. P. CHURCHILL.

North Auburn, Me.

[The feeder is placed in our Museum. It looks as if it might be a practical one.—ED.]

What was the Trouble?

Last June I removed an imported queen from a large colony for the purpose of exchanging with a friend; the colony was kept queenless about five days, and then a young queen was introduced, accepted, and began laying. In 4 or 5 days after, I found this queen balled, and she died the next day. I introduced another queen to this colony; she was accepted, began laying, and continued so to do for some 6 or 7 days, when, at night, I found her alive in front of the hive, and queen-cells started. I introduced this queen at once to another colony by exchange, where she now is, and the queen exchanged with her was introduced into the first colony. She began laying, and filled several combs, when the bees went for her, and drove her out of the hive, and started more queen-cells. This time I allowed the colony to take its own course, and rear a queen for itself, which was done, and all has been quiet since. Can any one give a satisfactory reason for the above?

J. E. POND, JR.

Foxboro, Mass., March 20, 1884.

Bees in Southern Michigan.

Upon examination, a few days since, I found my bees all well and in fair condition. We hope for a good crop of honey this season, in southern Michigan; and if our hopes are realized, it will be the first good season for 4 years. Willow and soft maple are in bloom; but no pollen is being gathered.

F. L. DRESSER.

Hillsdale, Mich., April 8, 1884.

Why Bees Swarm Out, etc.

Recently, a colony belonging to one of my neighbors, swarmed out. He immediately endeavored to discover the cause. Combs all dry and clean, and enough honey, were found in the hive, but not a particle of pollen. If others, whose bees do likewise, should find like conditions in the hive, it may prevent a swarming out by seeing that the bees have a supply of pollen as well as of honey. Two years ago, I had the curiosity to time the flight of an Italian bee. She filled herself with honey, went home and unloaded, and returned in $4\frac{1}{2}$ minutes. The hive being $2\frac{1}{4}$ miles from the place I fed her, made her time 1 mile a minute, including stops. When honey is coming in freely, I will try to find how long a time is required for a bee to go to a field, gather, load and return.

W. M. MORHOUS.

Dearborn, Mich., April 9, 1884.

Bees Attending a Wedding.

Mr. J. C. Wilms, of Waupun, Wis., concludes he would rather be to the expense of swarm catchers than to be obliged to climb church steeples. He relates this anecdote: His daughter was to be married July 10, 1883, at 8 p. m. in the church near by. About one week prior to this event, he had put 2 swarms into one hive. Later developments proved they had gone to house-keeping, on opposite sides of the hive; and when they happened to get near enough to quarrel about the residence, one swarmed out at 7 p. m., July 10, deciding to locate in the church steeple by entering just above the belfry, and passing through a hole in the ceiling over the bell. They are about 75 feet above the ground. The wood-work enclosing them is some 4 inches thick. Those bees were determined to, and did attend the wedding; for it came off just one hour after their arrival. This is one of the peculiar freaks of bees. On Feb. 7, 1884, the bees were alive; and upon ringing the bell a few live ones dropped down.

J. W. BAILEY.

Ripon, Wis., April 9, 1884.

Backward Spring.

My 44 colonies of bees wintered on the summer stands without the loss of one; but the spring is backward, and they will have no peach bloom this year, for the cold winter nipped them all in the bud, and killed the most of the trees; but I expect there will be plenty of apple blossoms.

JACOB COPELAND.

Allendale, Ill., April 9, 1884.

Convention Notices.

The fourth semi-annual meeting of the Western bee-keepers will be held at Independence, Mo., April 24 and 25, 1884. This will be the most interesting convention of bee-keepers ever held in the West. The association numbers among its members some of the most successful bee-keepers in the country, and many outside the association, from abroad, will be

here to take part in the discussions. Let each one come prepared to take part in the discussions, and bring something to exhibit. The programme, when completed, will comprise all the interesting subjects of the day. The committee appointed at our last meeting on "marketing honey," will report the first day, and it will be of great interest; for the committee is composed of thorough men who have given the subject a large amount of attention since our last meeting. Jerome Twitchell, of Kansas City, has kindly consented to address the convention on the subject of "Preparing honey for market."

C. M. CRANDALL, Sec.

Independence, Mo.

H. SCOVELL, Pres. Columbus, Kans.

The Des Moines County Bee-Keepers' Association, will meet in R. C. Crawford's Hall, in Middleton, Iowa, on Tuesday, April 22, 1884, at 10 a. m. sharp. All who are interested in apiculture are invited to attend. We will have a programme on various subjects of interest to bee-keepers.

JOHN NAU, Sec.

A general meeting of the County of Oxford, Ont., Bee-Keepers' Association, will be held in Woodstock, Ont., on Saturday, April 19, commencing at 10 a. m. Important subjects will be discussed, among which will be, "Foul Brood," "Spring Management of Bees," "Best Methods of Increase," etc.

M. S. SCHELL, Sec.

J. B. HALL, Pres.

The Union Kentucky Bee-Keepers' Association will hold its spring meeting at Eminence, Ky., on April 24, 1884.

G. W. DEMAREE, Sec.

A bee-keepers' association is to be organized in Western New York on Tuesday, May 6, 1884, at Randolph, Cattaraugus County. In this southern-tier district there are a large number engaged in bee-keeping, and an association of this kind has long been needed. A general invitation is extended to all interested in bee-keeping.

W. A. SHEWMAN.

The Iowa Central Bee-Keepers' Association will hold its semi-annual meeting in the Court House at Winterset, Iowa, on April 18, 1884, at 10 a. m. All are cordially invited. All visitors from abroad will be hospitably cared for. Members are requested to bring their baskets well filled, and we will have a general good time. Any one having new apiarian implements, or any thing that will advance the interest of the association, are requested to bring them for exhibition.

J. E. PRYOR, Sec.

A. J. ADKISON, Pres.

Maple Grove Iowa

The Western Bee-Keepers' Association will meet at Independence, Mo., Thursday, April 24, 1884.

C. M. CRANDALL, Sec.

The Western Michigan bee-keepers, will hold their spring meeting at Berlin, April 24. F. S. COVEY, Sec.

The Progressive Bee-Keepers' Association will meet for their spring meeting May 3, 1884, at the apiary and residence of J. B. HAINES, Bedford, Cuyahoga County, O. All interested are invited.

J. R. REED, Sec.

The Eastern Indiana Bee-Keepers' Association meets at Richmond, Ind., April 24, 1884.

C. N. BLOUNT, Pres.

G. REYNOLDS, Sec.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association, will be held at Rockton, Winnebago Co., Ills., on May 20, 1884.

JONATHAN STEWART, Sec.

The Kentucky Bee-Keepers' Convention meets in Louisville, Ky., during the opening of the Exposition (day not fixed).

N. P. ALLEN, Sec.

The Bee-Keepers of Tippecanoe and adjoining Counties, will hold their regular quarterly meeting at room No. 3, in Purdue College, in the city of Lafayette, Ind., on May 6, 1884. All lovers of the honey bees are respectfully invited to be present and take part in the discussions.

MRS. JAS. L. HAVENS, Sec.

DR. L. SNYDER, Pres.

Local Convention Directory.

| Dec. 10, 11.— | Michigan State, at Lansing. H. D. Cutting, Sec., Clinton, Mich. |

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Now is the time to plant young basswood trees, for future pasturage for your bees. You may see them advertised in this paper.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Potatoes as Bee Food.

We have found out, last winter and this spring, that sweet potatoes baked in the stove and well peeled, answer very well for bee feed. They will suck and eat a common sized potato in little or no time. Perhaps this is an old discovery; but as we have heard no comments about it yet, we bring the subject out as new to us.

Marksville, La. J. E. DIDIER.

ANSWER.—I have many times heard that bees would use nitrogenous food in the way of bread, potatoes, etc. I have never had any occasion to experiment in that line; but should think that baked sweet potato might be used by bees as a substitute for pollen.

Bee-Moth.

Will Mr. Heddon please say whether there is any danger of moth injuring frames of comb foundation packed in a honey-house? HALLETT & SON, Galena, Ill.

ANSWER.—Though I have handled foundation quite extensively from its first advent, I have never yet seen the larvæ of the bee-moth any where about it.

The Value of Queens.

Will Mr. Heddon please answer the following:

1. How long are queens prolific; and how long should they be kept?
2. Will a colony kill off its aged queen and supply itself with another; or must we kill her? What time of the year is the best for supplying queens?
3. Of what value, if any, are the drones after the queen is mated?
4. Do you believe in clipping the queen's wings?
5. After having diarrhœa, if bees fly freely again, are they not all right?
6. I noticed my bees flying out of the entrance, directly into the grass in front of the hive. What caused such actions?
7. Will you give some instructions, through the BEE JOURNAL, on the care of queens? SUBSCRIBER.

ANSWERS.—1. Queens naturally reared, or properly artificially reared, are usually prolific, and worthy for 3 or 4 years; and will at once be superseded by the bees when they become unprofitable, as they will fail all at once.

2. I believe that where other management is right, it is best to leave the superseding of the queen to the bees. If you attend to it, the proper time is when you find the old queen is worthless, and the bees fail to supersede her.

3. The old theory is—no value; but I am not sure that that theory is correct.

4. I do not. Not that I am sure that it injures her, or her progeny; but with my system of securing swarms, I find less labor and trouble when the queen's wing is not clipped.

5. After the disease has developed to a certain point, an unloading of the intestines is followed by immediate death.

6. I could not say without witnessing the phenomenon.

7. As you will see by the answers above, we depend mainly on the bees to take care of the queens, which they are sure to do in almost all cases.

Removing Bees from Cellars.

1. Is it advisable to remove bees from cellars, for a cleansing flight, while they seem to be doing well?

2. If so, is it important to place them on summer stands, exactly as they were during the previous season? W. W.

ANSWERS.—1. No; I think not.
2. Not if they have been in the cellar any considerable length of time.

Bee Pasturage.

How many bees will a piece of land support, where the bees are north of a lake, with elm, cotton, ash, willow, locust, and lots of vines in plenty? There are about 10,000 acres in a half-circle of four miles. Would you advise keeping the bees all in one yard? Bee Dale, La. WM. J. DAWSON.

ANSWER.—I am so little acquainted with Southern honey resources that I would hardly venture a reply. I could not say, in regard to keeping all your bees in one apiary, as you nowhere state how many colonies you have.

Age of Queens, etc.

Will Mr. Heddon please answer the following:

1. Can a person keep pure Italian stock in a field where other races of bees are kept?
 2. How old is the queen which issues with the swarm?
 3. Do you use drone-traps to exclude the drones; or is it just as easy for the bees to kill them off when they see fit? S. F. DAILY.
- Mt. Hope, Kans.

ANSWERS.—1. You cannot have all your queens purely mated in a field where the drones from other races are in the air in considerable numbers.

2. The queen that issues with the first, or prime swarm, is, as a rule, one or more years old. With all after-swarms, the queen is from a few hours to a few days old.

3. I am yet rather of the opinion that there is something impracticable in trying to exclude, retain or separate the different genders of bees, in a hive, by using different sized openings.

Japan Plum Tree.

Having one of those trees in my yard, near my bees, I had occasion to watch the actions of my bees on it.

The tree was itself a "swarm of bees." As it blooms in December, it seems to me it ought to be the best thing out, as a life preserver for bees in winter. The sweet scent of the bloom is that of honey itself, and it blooms at such a propitious time of the year. Would it not be well to plant some of these trees about the apiary?

JULES E. DIDIER.

Marksville, La.

ANSWER.—I should think so; though I am not at all posted in regard to Southern honey flora.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., April 14, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no life in the market. Extracted honey sells in its regular way and to its wotted channels, without any speculative feeling about it, and brings 7¢@10¢ on arrival. Comb honey sets slow at 15¢@16¢ a lb. from store for choice.

BEEWAX—Is in good demand; choice yellow brings 35¢ a lb. on arrival.

CHAS. F. MUTH.

NEW YORK.

HONEY—White clover and basswood in 1 and 2 lb. sections, 17¢@18¢. Dark and second quality, 15¢; extracted white clover in kegs and barrels, 9¢@10¢.

BEEWAX—Prime yellow, 34¢@35¢.

H. K. & F. B. THURBER & CO.

CHICAGO.

HONEY—Of late receipts of comb honey has been scattered amongst many firms, and as all are desirous of realizing on their receipts as early a day as possible, prices have been irregular and low, some lots being offered from 5¢ to 7¢ per lb., less than 30 days ago. I quote white comb 13¢@16¢; fancy 18¢. Extracted honey—demand light, 7¢@9¢.

BEEWAX—30¢.

R. A. BURNETT, 161 South Water St.

KANSAS CITY.

HONEY—Demand for choice white comb 1 and 2 lb. sections continues good at 16¢@17¢. Dark and irregular comb not wanted. Extracted in fair demand at 8¢@9¢.

BEEWAX—None in this market.

JEROME TWICHELL, 514 Walnut Street.

SAN FRANCISCO.

HONEY—We again advise our shippers not to put their extracted honey in old or second-hand tins and cases. The wotted sections and frames saturated with oil, the nails will not hold, and the cases often arrive in a broken and dilapidated condition. They smell of coal oil, look rough, and are not as salable as good, clean, new packages.

Have a partition to your cases between the cans, thus making them strong enough to ship to Europe. Comb honey in European sections and frames is the most salable in this market, and it is our experience of 18 years, if you want the top price for comb honey, put in your cases only the white and that which is straight, and will come out clean with the sections. You will do better to extract the un-even and crooked combs.

White to extra white comb, 15¢@18¢; dark to good, 10¢@13¢; extracted, choice to extra white, 7¢@8¢; dark and candied, 5¢—

BEEWAX—Wholesale, 27¢@30¢.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12¢@16¢ per lb., and strained and extracted 6¢@8¢.

BEEWAX—Firm at 32¢@32½¢. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market is unchanged with us. There is a continued steady demand for choice white 1 lb. sections at 18¢; 2 lbs. move more slowly at 16¢@17¢; but for second quality there seems to be no demand. Our supplies of 1 lb. are kept well down. Extracted does not sell at all at any price.

BEEWAX—Wanted at 35¢.

A. C. KENDEL, 115 Ontario Street.

BOSTON.

HONEY—Demand light. 1 lb. sections comb honey, 18¢@20¢; 2 lb. 16¢@18¢. Extracted, 9¢@11¢.

BEEWAX—35¢.

BLAKE & RIPLEY, 57 Chatham Street.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

All money orders from foreign countries, should be made payable at Chicago, as the "Madison Street Station" is not an International office.

In reply to many correspondents let us say that we take any kind of postage stamps at their face value—including the 3 cent ones. Silver should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper, shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter, on your label, notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

See M. Bailey's advertisement; he has Clover Seed for sale.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Dzierzon's new work entitled "Rational Bee-Keeping," we now club with the BEE JOURNAL as follows: The Weekly for one year and the book, bound in cloth, for \$3, or in paper covers for \$2.75. The Monthly BEE JOURNAL and the book, \$1 less than the above prices. It is an imported book, printed in the English language, and the price of the book is \$1.50 bound in paper covers, or \$2.00 when bound in cloth.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Honey as Food and Medicine.

A pamphlet of 16 pages giving Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price still lower, to encourage bee-keepers to scatter them far and wide. Single copy 5 cents, postpaid; per dozen, 40 cents; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

We are now preparing a new book for the pocket, to be called "The Bee-Keepers' Convention Assistant." It will contain a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making reports for statistical information—and much other useful matter for those who attend Conventions. One of the latter will be a suitable Programme of questions for discussion at such meetings, model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs; a few blank leaves for jotting down interesting facts, etc. We shall aim to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world. It will be of a size suitable for the pocket, nicely bound in cloth, and the price will be 50 cents.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Bingham Smoker

Borodino, N. Y., Aug. 15, 1882.
Cyprians Conquered—All summer long it has been "which and tother" with me and the Cyprian colony of bees I have—but at last I am "boss." Bingham's Conqueror Smoker did it. If you want lots of smoke just at the right time, get a Conqueror Smoker of Bingham. Respectfully,
 G. M. DOOLITTLE.

Prices, by mail, post-paid.

NEW INVENTION.

Patented Oct. 17, 1882.

Bees forced to leave their surplus honey before removing it from the hive. Saves valuable time and labor; prevents robbing, and the liability of being stung. The Bees are first ent off from the brood hive, by closing the openings in a slat honey board; the conductor is then placed in position, which connects bees in surplus honey with brood hive. They soon find that they are imprisoned, and being anxious to escape, pass out through the Conductor into the brood hive. It also prevents their return.

Conductor and Langstroth hive complete.....\$6 00
Conductor and Honey Board, any size, and Sections to fill, which shows all the improvements..... 1 50
Conductor, by mail..... 50
Send for Circular giving full particulars.

STANLEY'S AUTOMATIC HONEY EXTRACTOR.

Reverses the combs without the aid of the hands; the reverse motion of the crank is all that is required. No time is lost, as we provide every machine with a brake to stop the motion, and the combs are half reversed when the motion stops. Can be used for 2 or 4 combs, as desired. No chance for combs to fall or get injured. The Comb Baskets always stop in the most convenient position for removing or putting in combs. We use XXXX Tin or Galvanized Iron for Cans. The Cylinder of Can is all in one piece. We challenge any Extractor, taking any number of combs, to do one-half the work of our 4-frame Machine. Prices reasonable.
We want to employ good live Agents everywhere. Address,

1884.

HEDDON'S COLUMN.

My New Langstroth Hive.

Thanking you for past years' patronage, I solicit what I may justly merit for the coming season. I am led to believe that the goods I offer, and my ways of doing business, give at least an average satisfaction, from the fact that my trade has more than doubled every year since I have dealt in supplies, and that nearly all of my former customers are customers still. True, we have had complaints, but we have more than 50 testimonials of best satisfaction, to every one such complaint.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

Given Comb Foundation, after having been thoroughly tested by many of our most experienced, most successful and most extensive bee-keepers, now stands, at least, second to none. I have on hand a large and choice stock of pure, domestic wax, together with improved facilities for making an article of that Foundation excelled by none.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: 4 1/2 x 4 1/2 x 6, 7 and 8 to the foot, per 1,000, \$6.50; 5 x 6 x 2, per 1,000, \$8.00. All shipped from here.

STUDENTS OF APICULTURE

Will receive terms for 1884 on application.

BEEES and QUEENS.

If you contemplate the purchase of Bees in any shape, tested or untested Queens, it may pay you to send for my

CIRCULAR for 1884

And be SURE to state whether or not you have my Circular for 1883.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County, MICH.

BEE-KEEPERS' SUPPLIES.

Send a postal card for my Illustrated Catalogue for 1884.

COMB FOUNDATION.

On account of the prevailing scarcity of beeswax the price of comb foundation is now advanced 3 cents per pound above the price quoted in my Catalogue for 1884.

BEE SWAX.

I pay 32c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

CLOVER SEEDS.

The present prices are as follows:

- White Clover, \$15.00 per bushel, \$4.00 per peck, or 30 cts. per pound.
- Alsike Clover, \$12.00 per bushel, \$3.25 per peck, or 25 cts. per pound.
- Sweet Clover, \$10.00 per bushel, \$2.75 per peck, or 20 cts. per pound.

NO. 30 TINNED WIRE

For Brood Frames.

- One ounce spools, each, - 4 cents. Postage, 2 cents extra.
- One oz. spools, per dozen, 40 cents. Postage, 13 cents extra.
- One pound spools, each, 40 cents. Postage 18 cents extra.
- One pound will wire about 175 frames.

WIRE NAILS,

On account of a decline in the price of Wire Nails, I will make a discount of 15 per cent. from the prices quoted in my Catalogue, until further notice.

CHEAP FOUNDATION MILLS.

These Mills will make Foundation of any desired thickness, for either Section Boxes or Brood Frames.

BEEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey Bee, and at the same time produce the most honey in its best and most attractive condition.

Appreciative Notices.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

Valuable for all who are interested in the care and management of bees.—Dem., Allegan, Mich.

Engravings are fine. Gotten up in the best style and is cheap at the price.—Farmer, Cleveland, O.

Carefully prepared for beginners.—Farmers' Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

PRICE—Bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

OLDEST BEE PAPER
IN AMERICA

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861

Chicago, Ill., April 23, 1884.

VOL. XX, No. 17.

THE WEEKLY EDITION

OF

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

PREMIUM.—Any one sending one *new* subscription for the Weekly, or two for the Monthly, for one year, besides their own subscription for a year for the Weekly, will be entitled to a copy of "Bees and Honey," bound in cloth.

☞ The receipt for money sent us will be given on the address label on every paper. If not given in two weeks after sending the money, write us a Postal card, for something must be wrong about it.

☞ Any person sending a club of six, is entitled to an extra copy (like the club), sent to any address desired. Sample copies furnished free.

☞ Papers are stopped at the expiration of the time paid for, unless requested to be continued.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at the Chicago P. O. as Second Class Matter.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCOUPLING KNIFE.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncoupling-Knives first. We neither make nor handle any other quality, but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

For mall rates and testimonials, send card. To sell again, send for dozen rates to

BINGHAM & HETHERINGTON, 62AB1F ABRONIA, MICH.

Dzierzon's Rational Bee-Keeping.—A Translation of the Masterpiece of that most celebrated German authority, by H. Dieck and S. Stutter, and edited, with notes, by Charles N. Abbott, *Ex-editor of the "British Bee Journal."* Dr. Dzierzon is one of the greatest living authorities on Bee Culture. To him and the Baron of Berlepsch we are indebted for much that is known of scientific bee culture. Concerning this book, Prof. Cook says: "As the work of one of the great masters, the Langstroth of Germany, it can but find a warm welcome on this side of the Atlantic." Mr. A. L. Root says of it: "Old father Dzierzon... has probably made greater strides in scientific apiculture than any one man... For real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. Cloth, \$2.

Queen-Rearing, by Henry Alley.—A full and detailed account of TWENTY-THREE years experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Price, \$1.00.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—This Manual is elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means can afford to do without. Cloth, \$1.25; paper cover, \$1.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Fourth Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 100 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 5c.; per dozen, 40c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. This is a chapter from "Bees and Honey." Price 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how; 26 engravings. This is a chapter from "Bees and Honey." Price, 10c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. This is a chapter from "Bees and Honey." Price, 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 300 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, contents of heading bolt tables, and round timber, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35c. postpaid.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for reference. Cheaper than any similar book ever published. 40 cents.

Moore's Universal Assistant, and Complete Mechanical, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

The Hive & Use.—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Novice's ABC of Bee-Culture, by A. L. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. 15c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Apiary Register, for SYSTEMATIC WORK in the APIARY. The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book. Prices: For 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Deutsche Buecher, Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—Derlichkeit des Bienenstandes—Honig pflanzen—Erziehung der Königin—Fütterer—Schwärmen—Ableger—Verfetzen—Italienisiren—Zusetzen von Königinnen—Ausziehen—Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. Preis 40 Cents.

Honig als Nahrung und Medizin—von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angehend wie man Honigtuchen, Formtügeln, Puddings, Schaumkonfect, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten—Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrantheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

CHICAGO, ILL., APRIL 23, 1884.

No. 17.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Honey Crop of California.

In the BEE JOURNAL for April 2, we remarked as follows concerning the honey crop of California for the past year, and the prospects for the present season:

We have received the Annual Review of California Crops for 1883, by Geo. W. Meade & Co., San Francisco, Cal. They have put the crop of honey for the past year at 960,000 pounds, and divided thus: Comb honey, 125,000 pounds; extracted honey, 835,000 pounds. They make the following remarks about the honey crop: "The product of California comb honey, last year, was very light, scarcely more than enough to supply the home demand, and prices generally ruled high. Extracted turned out far better than was anticipated, but owing to the large crop of domestic honey East, the sale here has been dull and slow, and a considerable surplus will have to be carried over into the new year. The European demand for California honey has also been limited, though our honey is preferred there when prices here will permit of business."

Now we have received the Annual Review of the crop by Stearns & Smith, who supply us with the weekly honey market report. They write us as follows:

"We believe our report to be as near correct as can be got at, and we produce our figures from the only sources they can be obtained, and are facts. As orders are coming in lively for empty packages for the new crop, the present outlook is for a large one."

From their Review we glean the following:

Number of cases received in this market during past six years:

| Years. | Cases. |
|-----------|--------|
| 1878..... | 38,337 |
| 1879..... | 8,443 |
| 1880..... | 26,782 |
| 1881..... | 10,658 |
| 1882..... | 14,489 |
| 1883..... | 13,804 |

The average weight of cases being about 60 pounds.

Receipts in barrels and kegs for past four years:

| Years. | Barrels. | Kegs. |
|-----------|----------|-------|
| 1880..... | 1,156 | 126 |
| 1881..... | 456 | 84 |
| 1882..... | 291 | 23 |
| 1883..... | 3 | 2 |

Receipts from Jan. 1, 1884, to date, 370 cases.

Exports for the past six years by sea and land from San Francisco, and by rail from interior points have been

| Years. | Cases. | By sea from San Francisco. | | By rail from S.F. & Interior. | |
|-----------|--------|----------------------------|-----------|-------------------------------|------|
| | | Lbs. | Lbs. | Lbs. | Lbs. |
| 1878..... | 4,978 | 518,714 | 1,254,859 | | |
| 1879..... | 13,675 | | 214,216 | | |
| 1880..... | 7,890 | 150,806 | 861,050 | | |
| 1881..... | 8,849 | 62,700 | 378,370 | | |
| 1882..... | 3,612 | | 527,680 | | |
| 1883..... | 6,663 | | 266,400 | | |

Of last year's shipments overland, 90,720 lbs. were sent from San Francisco, 174,630 lbs. from Los Angeles, and 1,050 lbs. from Sacramento.

Exports for 1884 to date, by sea, 1,953 cases from San Francisco; by rail, exclusive of March shipments, 5,070 lbs.

Since the first of June last, receipts have been 12,684 cases, 2 barrels and 2 kegs. Allowing one-third of the cases to have been comb honey, we have the following showing in pounds:

| | |
|------------------------------------|-----------|
| Extracted—8,456 cases..... | 1,014,720 |
| Extracted—barrels and kegs..... | 1,000 |
| Comb—4,228 cases..... | 253,480 |
| Shipped by rail from interior..... | 118,340 |

Total..... 1,387,540

The above total does not include stocks consumed, or still held in the interior, or shipments by sea from Southern Coast points. These are unknown quantities, but if they could be definitely arrived at, would, beyond doubt, materially increase the figures showing last year's product.

Assuming the unknown quantity the past season to be about the same as it was in 1882, last year's yield appears 220,000 lbs. less than in the preceding season.

Throughout the season choice comb and extra white extracted have found custom at good figures. The market is now practically bare of what may be termed fancy qualities. There is considerable off grade honey still offering, and prospects are not encouraging for a clean-up of this stock, except at very low figures.

Now, as to the indications for the present year, Messrs. Stearns & Smith give the following as their opinion:

Present indications are that the coming yield will be large, and in excess of any crop since 1878. As the local consumption will only absorb a small proportion of a large yield, and as the figures current here for some time past have been too high to encourage large shipments to distant points, it is probable, if the crop proves as large as now anticipated, that prices in 1884-85 will show a lower range than they have in the season nearly closed.

They are of the opinion that the local consumption of honey is not on the increase, and remark as follows on that point:

Although the population of the coast is steadily and rapidly increasing, the local consumption of honey is not so large as it was some years ago. Honey is now regarded more of a luxury than a necessity, and as a consequence, only strictly choice is in favor with local buyers. The decreased local consumption is to a great extent due to the abundance and cheapness of fruits during late years, encouraging the more extensive use of the latter by persons of ordinary means.

Instead of the crop of the past year being 960,000 pounds as stated by Messrs. Geo. W. Mead & Co., it seems that it was 50 per cent. more than those figures, or 1,387,540 pounds.

These figures will be very interesting to the many who are now anxious to get statistics of the honey production of America.

The Price List of Thomas L. Thornton, Dividing Ridge, Ky., is on our desk. Bee-Keepers' Supplies.

Cure for Gravel.—Sweeten your tea with equally parts of honey and sugar. It never has been known to fail. If possible secure honey from clover instead of wild flowers and buckwheat.

We have received the Price List of S. A. Dyke, Pomery, O.—4 pages—Bees and Bee-Keepers' Supplies.

CORRESPONDENCE

For the American Bee Journal.

Bee-Space above Brood-Frames, etc.

G. M. DOOLITTLE.

On page 58, I see a desire manifested that the BEE JOURNAL call forth the expression of the honey-producers of the world relative to the bee-space above the brood-frames, now used in most of the hives in the country.
