The aphidæ that trouble pot plants are green, and the tender new growth on plants often becomes completely covered with them before they are noticed. These lice are often called the ants' cows, because the ants follow them to gather a honey that exudes from their bodies; there is a white aphid that attacks the roots of plants; the ants follow this also.—*Exch.*

Are Bees an Injury to Fruit?

Mr. L. A. Lowmaster, of Belle Vernon, O., has sent us a long extract from the New York *Sun*, containing the usual charges against the bees, *i. e.*, that they are an injury to fruit growers, the following being the last paragraph:

Admitting that the accusations made against bees in regard to their destructiveness of fruits, have been fully established, the question naturally arises as to the rights of the bee-keepers in this matter. Has any man a right to raise and keep an insect that is likely to annoy his neighbors in various ways, in addition to destroying his fruits? We believe this question has already been taken into the courts, and decided against the bees, and it will, no doubt, be taken there many times in the future, if the bee-keepers continue to increase their stock of bees as rapidly in the next few years as they have in the past two or three decades. Honey is no doubt a very desirable luxury, but scarcely so important, or of so much value to man, as is fruit; and while we admire the "busy bee," and its stores of nectar, there must be a limit even to the multiplication of an ordinarily useful insect.

Mr. Lowmaster asks what we think of the article, and says that it has been copied into many of the leading newspapers, and is doing bee-keepers a serious injury.

It is the old story of re-vamped—assertions without proof—vindictiveness without alloy.

Without the bees, fruit growers would soon be in search of other employment. The value of the bees in fructifying the bloom, by carrying the pollen masses from the male to female flowers, is everywhere acknowledged. Should this war upon the bees be pursued until they become extinct, fruit and flowers would soon also cease to offer food for man and beast, as well as to beautify the face of nature. Then fruit-growers would *mourn* and *wail*—having destroyed their best friends, the bees. And the fact that "through ignorance they did it,"

would not offer the least excuse for such insane folly.

The Weather.

Cold weather in every month in the year seems to be the rule, so far. Today (Aug. 8) when it should be expected to be uncomfortably hot, it is cold enough for an overcoat; in fact we have had but little weather so far that has been what may be called "seasonable." In Europe it seems to be about the same. The London *Journal of Horticulture* of July 28, has the following "notes of the season:"

Although the weather during the latter part of May and beginning of June was dry with bright sunshine, the thermometer sank often at night during that time to 30° and 32°, consequently vegetation made little progress. Large tracts of strawberries are almost totally destroyed through the drought and insects. Plums that promised a great crop have dropped; apples and pears are stunted; gooseberries, where they were not overpruned, are a fair crop; but with the exception of the last-named and currants, the fruit prospects are very poor.

I only removed the feeders from my hives on June 25, as up till that time little or no honey was to be had. On the morning of the 26th it was doubtful whether I had acted wisely in removing the feeders, but a favorable change came, and on the 27th I put on supers, which were at once taken possession of by the bees, which wrought vigorously, especially in the afternoon, as it was too hot at mid-day. On Saturday the thermometer stood at 88° in the shade, but cooling down a little the next five days, when it culminated in a severe thunder-storm and deluge of rain. During that one week the bees increased much in weight, the strong ones completing from 12 to 15 pounds of comb honey in supers, besides storing much in the body of the hive.

Travis county, Texas, has appointed the following committee to represent it in making a Bee and Honey exhibit at the New Orleans Exposition: J. G. Taylor, Chairman; W. W. Madaris, Dr. W. Styles, B. Palmer, and R. J. Kendall.

The Stinging Bees of India.

The American Edition of the *London Lancet* contains the following account of the effects of severe stinging by the large bee of India—the *Apis Indica*. We do not think that we want any of these bees in America. The Cyprians are bad enough—but for these bees of India (*Apis Indica*), as well as their more irascible cousins of Java (*Apis dorsata*) we have no use. Let them stay where they are. Here are the letters referred to :

To the Editor of *The Lancet*.—As stinging by bees, especially if very severe, is an accident rarely met with, I have thought the following account from my brother-in-law, Mr. Herklot, a coffee planter on the Neigherry Hills, South India, of severe bee-stings suffered by himself, with the symptoms that followed and the treatment adopted, will be found by you to be sufficiently instructive for insertion in *The Lancet*. You will see by the account that the patient is still suffering from the effects of the stings.

G. HERKLOTS VOS, M. B. C. S. Eng.,
House-Surgeon, Training Hospital, Tottenbam, N.

"Coonoor, Madras, March 7, 1884.

"About Sep. 24, last, I went out with a friend to visit some property some three miles distant. We went to a steep hill-side to lay out a trace for a new road. While the men were cutting the track, or, rather, clearing the brushes away, my friend and I were looking about to see which would be the best line for the road. I took up the staff, and went with it to a small rock, when the overseer, who was by, said, 'Sir, there are bees about.' I did not perceive the force of this statement at once; but, to my surprise, I found the coolies gliding away with great caution and unusual rapidity, and leaving me. The bees, which were of a large variety (*Apis Indica*), were now flying angrily about me, and occasionally coming right at my face.

I had let go the tracing staff, and held only a small riding cane. With this I was soon actively engaged in hitting at the bees. I probably knocked down three or more of them with my cane. This must have enraged them, and I was soon made to feel the effects of their venom. They settled on the back of my hands and wrists, and all over my face, in every case piercing me with their stings. Wild with pain, I rushed to a bush, crept under it, and covered my face with my hands, coat-collar and hat as much as possible, endeavoring to remain motionless. I could not endure this more than four or five minutes; so I got up and climbed the hill-side, at the top of which were a plateau and a road. This was a very steep climb of at least 150 feet, over boulders and through jungle, with precipices; so that I had to struggle on through a regular maze, having again and again to retrace my way. All the time the bees were at me. I was soon so much exhausted that I could only move a few yards (eight or ten) without having to stop for breath. I had to use my hands as well as my feet in making the ascent. Whenever I stopped, the bees settled upon and stung me more than when I was moving on; my face was covered with them. I had the sensation that they were crawling on my face over each other's backs, as if they were fully two and three deep in number. They made the most persistent efforts to sting me in my eyes—that is, to force their stings between my fast closed eyelids; but they stung my lips most, and several went up my nostrils, and more than once I had to eject them from the latter place by a forcible expiration, closing one nostril with a finger. All this time my sufferings were severe, and it was with the greatest difficulty that I managed to reach the road on the plateau. When there, I had a plain path all the way down the hill to where my pony was, quite half, or, I should say, three-quarters of a mile. I was then able to protect my hands by placing them in my pockets. From the time of commencing to ascend the hill, I had not retaliated on the bees, but, judging it the best policy, had allowed them their way with me. Soon after I reached the plateau, as far as I can say, about half an hour after the bees had begun to sting me, I felt very ill. I had sudden slight indications of rigors, and felt very sick. But I had to struggle on, and get home somehow.

I reached my pony, which is a spirited animal, and mounted him at once. The bees, though less in number, were still at me; and I imagined that they would attack my pony, but they did not. I took the shortest route home, a very bad cross-country track. The bees followed me some distance, and gradually left me. Soon after I was in my saddle, I was vomiting very severely, though I did not bring up much, and this was followed by severe purging of the bowels, the feces being quite green. I felt very ill, and had to hold on by the pommel of my saddle. I was retching all the way home, and had two actions of the

bowels. When I was able to open my eyes I could see that my face was covered with stubble, which I knew were the stings of the bees: I took care not to touch them. On reaching home, I went to my own room and threw myself on the bed. The doctor was then sent for. I continued to be very sick and was constantly purged. The stings were extracted by my wife and others, and for several days subsequently the doctor found and extracted others. My wife tells me that she thinks there must have been quite 300 stings taken out. Food was most abhorrent to me, and for some nights I could not sleep; but within a week I was up again, though very weak. I have felt the results of this adventure in weakened health for months since, and have lately taken a short sea trip to Calcutta for a change, since which I have somewhat improved in health. The medical treatment consisted of the removal of the stings, and the external application of the following—castor-oil one part, steel-drops one part, colodion six parts; with the internal administration of full doses of steel-drops (the affected parts presented an erysipelatous blush) minim doses of impecacuanha wine to relieve vomiting, solution of morphia to relieve pain and to induce sleep. When the morphia had the former effect only, full doses of bromide of potassium and hydrate of chloral acted as efficient hypnotics."

☞ One of the oldest Queen Breeders in this country, writes thus: "Please stop our advertisement; we are getting more orders than we can fill." This shows the value of advertising in the BEE JOURNAL, for that advertisement appeared in no other paper.

☞ Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

☞ In the article on "Reversible Frames," on page 488, in the second paragraph and ninth line, read "inexpensiveness" instead of "inexperience;" and in the next paragraph and fourth line, read "strengthen" for "straighten."

☞ Letters for publication must be written on a separate piece of paper from items of business.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Too Much Tare—Is It Just?

A California Exchange says, that there is much complaint among apiculturists and not without just reason, that dealers are in the habit of extorting too much tare, that they are not satisfied with lareage of cases alone, but require the cans also. It says:

Look at the facts and see if there is not good reason for complaint. We have weighed many cases and find them to run from 10 to 12 pounds, an average of about 11 pounds, and cans at 1½ pounds, often less. The tare exacted from 16 to 18 pounds, when in justice to the producer it should not be more than the weight of the cases alone. Sixty pound screw-top cans, new at the shop, cost from 35 to 40 cents each, and cases 30 cents each; a case with cans \$1.00. It is an established practice among dealers of canned goods, in buying or selling, to deduct the weight of the case alone. Now why, we ask, should honey be made an exception? Is it just? When the apiarist purchases a can or case of coal-oil or lard, or other canned goods from a groceryman, the weight of the can or cans is not deducted, but if he should ever return the same cans filled with honey, the groceryman will deduct the weight of the same cans, thus requiring the apiarist to give them back to him, and when empty, will again sell them back to the apiarist. New cans made expressly for honey, when sold by weight with the honey, bring more than half their cost. Apiarists have good and sufficient cause for complaint, and should remedy this evil, refusing to submit to such extortion.

A Brief Sermon on Cranks.

The *Burlington Haukeye* publishes a great deal of nonsense, but sometimes in its amusing way it states indisputable facts. The following is from a very recent issue:

What would we do were it not for the cranks? How slowly the tired old world would move, did not the cranks keep it rushing along! Columbus was a crank on the subject of American discovery and navigation, and at last he met the fate of most cranks, was thrown into prison, and died in poverty and disgrace. Greatly venerated now! Oh, yes, we usually esteem a crank most profoundly after we starve him to death. Harvey was a crank on the subject of the circulation of the blood; Galileo was an astronomical crank; Fulton was a crank on the subject of steam navigation; Morse was a telegraph crank. All the old abolitionists were cranks. The Pilgrim Fathers were cranks; John Bunyan was a crank; any man who does not think as you do is a crank. And by and by the crank you despise will have his name in every man's mouth, and a half completed monument to his memory crumbling down in a dozen cities, while nobody

outside of your native village will know that you ever lived. Deal gently with the crank. Of course, some cranks are crankier than others, but do you be very slow to sneer at a man because he knows only one thing and you cannot understand him.

Traveling Sweetness.

Under this head the *Augusta, Ga., Evening News* gives the following account of the shipment of bees to the North from that place:

A large lot of boxes for shipment in the Southern Express office attracted the attention of the *Evening News* this morning, and upon investigation found them to be bees from the apiary of Dr. J. P. H. Brown, of this city. There were seventeen boxes in all, and each box so arranged as to hold four colonies of the little sweeteners in separate apartments. Capt. Boyle, agent of the Express Company, tells us that Dr. Brown ships large quantities of bees to different parts of the country, but the present one is the largest shipment ever made by express from this section. The Doctor is authority on bee-culture in the South, and bears a well-earned reputation in this line over the United States. He makes a specialty of Italian bees, which is one of the best and most prolific kind, and his methods of living and shipping are attended with perfect safety to the bees.

T. B. Peterson & Brothers, Philadelphia, Pa., will issue, in a few days, a cheap edition in book form, for the million, of Mrs. D. E. N. Southworth's Last and Best Work, "SELF-RAISED, OR, FROM THE DEPTHS," which will prove to be the most popular work ever published in book form. It is in a large duodecimo volume of 658 pages. Price 75c.

The Western New York and Northwestern Pennsylvania Bee-keepers' Association will hold its semi-annual meeting at Jamestown, N. Y., on Sept. 1 and 2. A general invitation is extended to all bee-keepers. W. A. SHEWMAN, Sec.

The bee-keepers of Decatur and surrounding counties are cordially invited to meet on Saturday, August 16, 1 o'clock p. m., at the residence of R. R. Cobb, one mile east of Greensburg, Ind., for the purpose of organizing a bee-keepers' society. HENRY CARTER.

The Ohio bee-keepers will hold meetings in which they will have lectures, essays, and reports from bee-keepers, during the Ohio State Fair, which will be held at Columbus, O., Sept. 1 and 5 inclusive. All interested in bee-culture are cordially invited to attend. C. M. KINGSBURY, Sec. DR. H. BESSE, Pres.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Aug. 11, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—The demand for extracted is fair, and to all appearances, gradually improving. It brings 6@9c per pound on arrival. There is a small demand for comb honey, but we had small offers only, and a good deal could be sold. It brings 14c per pound on arrival.

BEESWAX—Offers plentiful at 30@32c on arrival. C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—Sales of comb honey continue slow. As yet there are no arrivals of this season's crop. We have received several small shipments of new extracted honey, which sold readily. For prices on this year's crop, we quote: Fancy white, 1-lb., 16@18c; fancy white, 2-lb., 15@16c; fair to good, 1 and 2-lb., 12@14c; fancy buckwheat, 1-lb., 12@13c; 2-lb., 11@12c. Extracted, white clover, in kegs or small barrels, 8½@9c; dark grades, 7@7½c.

BEESWAX—Prime yellow, 3½@32c.
MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY—New honey is coming in, and selling at 16@18c, for best white 1 and 2-pound sections. New extracted, 8@9c. Honey in unglazed sections sells the most readily. Old comb honey all gone.

BEESWAX—35c.
BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY—This week we have had liberal receipts of comb honey, and the prices are irregular. As a rule, the honey is of first quality, and put up in good shape; a gradual improvement is noted in this respect. Prices range from 14@16c for the best; occasionally a case sells for more than that, but it is in a retail way. The extracted honey is still sluggish, at nominal prices—6@8c per pound.

BEESWAX—Fair price; prices, 30@37c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—The market is in bad shape for the selling interest, there being no shipping demand, and next to nothing doing on local account. To make matters worse, offerings are being urged on buyers by too many parties, some of whom have little or no knowledge of the honey trade, and are not in a position to be able to do it justice. Quotations are largely nominal. White to extra white comb, 12@13½c; dark to good, 9@11c; extracted, choice to extra white, 5@5½c; dark and candied, 4c.

BEESWAX—Wholesale, 25c.
STEARNS & SMITH, 423 Front Street.

KANSAS CITY.

HONEY—Choice new 2-lb. sections are now bringing 17@18c, and 1-lb. 18@19c, ½-lb. 19@20c. Extracted in fair demand at 7@8c, extra choice would bring 9c in barrels. No other packages wanted in this market.

BEESWAX—Nominal, 30@35c.
JEROME TWICHELL, 514 Walnut Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8½c.

BEESWAX—Firm at 32@32½c. for choice.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—We are glad to be able to give more definite quotations on honey. Sales have been made during the week in a small way at 16@17c for best, white 1-lb. sections; 15@16c for second shade. Of lower grades and 2-lb. sections, there has been no movement, but it might be quoted at 14@15c. There are a good many little lots scattered about our market, retarding the ready movement of large lots. Extracted honey, dull.

BEESWAX—30c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.

GEO. W. MEADE & Co., 213 Market St.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

CORRESPONDENCE

For the American Bee Journal.

The Hibernation of Bees.

WM. F. CLARKE.

Letters are pouring in upon me, criticising and asking questions about my recently announced discovery, to an extent quite beyond the possibility of answering them all by private correspondence; and as the subject is one of general interest, there is no better way of discussing it than in the bee-publications.

Apiculture is to me, and to many other "dabblers," as Mr. Heddon styles us, a most fascinating pursuit; but our life-work lies outside of it, and we can only give to it the time economized from other and more pressing duties. Let no correspondent, then, feel slighted if a private letter is unanswered. I will endeavor to meet all the really important points raised by these communications, thus far, in the present article.

MY "BASIC PRINCIPLE."

A much-esteemed friend, who was the first to write me on the subject, threw a cold, wet blanket over my enthusiasm by saying, "Your basic principle, that bees succeed better in trees than elsewhere, is all wrong." But let me say that is not my "basic principle." The fact that I had never met with, heard, or read of a colony of bees being winter-killed in a hollow-tree, was what set me to thinking. Very likely I put the thing too strongly, but I put it as it appeared to my own mind. It may be that bees are sometimes winter-killed in their tree-trunk homes, but it is quite certain that they usually do well in such places. The question *why* this is so, was what led to a course of thinking and investigation which resulted in the conviction that bees, in a normal condition, hibernate. That is my "basic principle."

"WHAT IS HIBERNATION?"

I have been surprised at receiving this question from quarters whence I hardly expected it. And yet there is no great cause for surprise when it is considered how little has been said about it in our bee-literature. I do not own a complete set of the BEE JOURNAL, (I wish I did!) but I have searched in vain through all the back volumes in my possession for anything on the subject. If you will refer to your file, Friend Newman, I should not wonder if you make the discovery that this is the first article headed "Hibernation," which has appeared in all the XX volumes of its history.

All sorts of apicultural theories have been discussed—some of them fanciful enough—but this important matter has been singularly overlooked. The same is true of the bee-books. Even Prof. Cook, eminent entomolo-

gist as he is, omits all reference to it in his valuable "Manual of the Apiary." Yet, though ignored by the bee-books, I find in as old a work on "Entomology" as that of Kirby and Spence, a long chapter on the "Hibernation of Insects;" several pages of which are taken up with a special discussion on the hibernation of bees.

"Hibernation," says the Encyclopædia Britannica (last edition), "is the term employed by naturalists to denote the peculiar state of torpor in which many animals, which inhabit cold or temperate climates, pass the winter." The article proceeds to show that not animals merely, but insects, pass the winter in this "peculiar state of torpor." Hibernation takes place in different degrees; the American black bear and the hedgehog being the most perfect samples of it. These creatures are torpid all winter long, taking no food through the entire season. Other animals, and some insects, bees among the rest, sink into a state of torpor or semi-torpor for a briefer or longer period, rousing up now-and-then, and taking "a good, square meal."

THE PHILOSOPHY OF HIBERNATION.

I cannot state this better than in the words of Kirby and Spence: "If insects can boast of a greater variety of food than many other tribes of animals, this advantage seems, at first sight, more than counterbalanced in our climates by the temporary nature of their supply. The graminivorous quadrupeds, with few exceptions, however scanty their bill of fare, and their carnivorous brethren, as well as the whole race of birds and fishes, can at all seasons satisfy, in greater or less abundance, their demand for food. But to the great majority of insects, the earth, for nearly one-half of the year, is a barren desert, affording no appropriate nutriment. * * How is this difficulty provided for? In what mode has the Universal Parent secured an uninterrupted succession of generations in a class of animals, for the most part doomed to a six months' deprivation of the food which they ordinarily devour with so much voracity? By a beautiful series of provisions founded on the faculty, common also to some of the larger animals, of passing the winter in a state of torpor—by ordaining that the insect shall live through that period, either in an incomplete state of its existence, when its organs of nutrition are undeveloped, or, if the active epoch of its life has commenced, that it shall seek out appropriate *hibernacula*, or winter quarters, and in them fall into a profound sleep, during which a supply of food is equally unnecessary." Let me lay it down as a general proposition, that all we have to do for our colonies of bees, is to provide them with "appropriate *hibernacula*."

If it be said that this is what we have been trying to do all these years in our plans for wintering bees, I answer, "No;" we have not provided "*hibernacula*," places in which bees could follow their natural instincts and

hibernate. Most of our winter arrangements have been such that they either could not go into their normal condition of torpor, or having gone into it, could not get out of it sufficiently to appease the claims of hunger.

When kept too warm, bees cannot go off into their natural state of torpor. They become restless, get hungry, eat freely, and must void their excrement; if confined to the hive, they befoul it, and then comes diarrhœa, with death in its train. The opposite extreme of temperature has a like effect. They are too cold. Hunger awakes them. Their food is as cold as they are. What is the usual effect of cold victuals on a cold eater? We all know.

Occasionally and by accident, we hit the hibernating condition. Then our bees consume but little food, and divide their time between eating and sleeping. They wake from their torpor to eat what nature requires, and, in that quiet state, but little is needed. Digestion, we may well believe, is a very slow process in a torpid bee, and when completed, the result is a dry, powdery excrement, long ago known by bee-keepers to be one of the signs of healthy and successful wintering.

One of my correspondents writes: "Friend Clarke, I want you to remember that diarrhœa is the cause of winter trouble; that is well-known, the point to get at is the cause of diarrhœa." Well, here it is: *non-hibernation*. If bees are fixed so they can hibernate, they would not have the diarrhœa. If they cannot hibernate, from whatever cause, they will have the diarrhœa. Why, hibernation is nature's contrivance to enable them to stay in-doors and not get diseased. Man says: "Yes, you shall stay in-doors all right, my dear little pets; but you shall have *one uniform temperature*." That renders hibernation difficult, if not impossible; because it is, no doubt, the mild spells thawing them out as it were, that rouse them from torpor, and give them a chance to eat. If, like the bear and hedgehog they took one long sleep that lasted all winter, then we would have only to find out the temperature at which they could take that single sleep most comfortably; but we have a harder problem to solve. We want to expose them sufficiently to the temperature of the outside world, so that they will be affected by its changes, and yet not freeze to death during a period of extreme cold. This is the point on which I desire bee keepers to experiment. The principle is clear enough. Bees must hibernate, if they are to winter naturally. We must find out how much exposure to the outer air they need in order to follow the hibernating instinct, and yet not be in danger of freezing to death. They must feel the cold sufficiently to get into a sleep out of which there is no waking.

SELF-REGULATING PROVISIONS.

Every where we see arrangements to guard against contingencies; but

man is always putting in his meddling, clumsy hand to interfere with these arrangements. This is what we have been doing with our cellars, bee-houses, clamps and straw-packed hives. We have insisted upon uniform temperature, upward ventilation, escape of moisture, and framed a variety of iron rules, all unconscious that nature is ahead of us, and has made far better provision for contingencies than we can possibly do.

We are content to let the bees attend to their own ventilation during the summer, but they are not to be trusted in winter. Oh, no! Dame Nature forgot all about winter! Did she, though? There are great variations of temperature during the summer; cool and even frosty nights in June, and chilly weather in July, alternating with extreme heat. But the bees regulate things so that a cool term does not chill the brood, and when it is very hot they convert their wings into fans and get up a circulation of air at the entrance of the hive, or a lot of them cluster outside to give those within more breathing space.

A. I. Root, in his "A B C of Bee-Culture," page 276, says: "Day before yesterday, while I was walking near a hive, a bit of chaff flew out of the entrance, as if impelled by a draft of wind. 'Halloo!' said I, 'have you really become so strong as to send out a current of air for ventilation?' and I approached and held the back of my hand before the entrance. Sure enough, there was a steady, strong blast, and what astonished me more, it was so warm that it seemed almost as if it must come from an oven."

Huber found that a strong colony of bees could get up the temperature inside the hive to 86° or 88° Fahr., when it was several degrees below zero in the open air; and that "in the depth of winter they do not cease to ventilate the hive by the singular process of agitating their wings as before described." For wintering, the cardinal principle, "keep all colonies strong," only needs to be supplemented by the axiom, "plenty of pure, still air." The bees will do the rest for themselves. Mr. Root, in his A B C book, page 273, gives a diagram of arrows representing the course of the currents of air in a hive.

The bees make these currents as they find them necessary; but when they have a meagre supply of air, or there is a drought right through the hive, they are helpless. If the great pyramid of Egypt were hoisted on pillars 10 or 20 feet high, and a colony of bees were established in a cavity at its base, they would fix the air all right in the cavity by means of the ventilating and heating apparatus with which nature has furnished them. Our uniform-temperature contrivances, and our moisture absorbents, are bungling interferences with natural law. Give the bees a chance to use their own faculties, and they will be all right. They will fan all moisture out of the hive, and get up the temperature that suits them.

THE "SYMPTOMATOLOGY" OF IT.

This is a big word, but it is a correct one, and is used by a highly-esteemed correspondent, who says: "Please detail to me the symptomatology and exact condition the bees are in, how long it may last, and how they act, etc., when hibernating." Quietude, torpor or semi-torpor, and total inactivity constitute about all I know of the hibernating condition. How many of the functions of life are suspended, I will not pretend to say.

One writer affirms: "The insect breathes no longer, and has no need of a supply of air; its nutritive secretions cease; no more food is required; and it has all the external symptoms of death." This may be too strong a statement; but inasmuch as bees form a very compact cluster when they hibernate, there cannot be much respiration even in the centre of the cluster. I cannot say how long the hibernating state lasts in the case of the bees. I only know that it is broken at intervals, when food is taken.

As to "how they act," it would seem that they do not "act" at all. It is the only state of complete repose experienced by this insect, and hence, though when active, it is short-lived, this provision of nature lengthens out "the brittle thread," and enables old bees to survive until spring.

OBJECTIONS.—"Since other hibernating creatures pass the winter underground, why are not cellars, and clamps good places for bees?" Chiefly because they are impervious to changes of temperature. Bees must feed occasionally in the course of the winter, and mild weather gives them the opportunity of doing so. Moreover, animals that hibernate in the ground, have their home there all the year round, but bees are denizens of the upper air.

"Your plan for hives and stands is not practical for general honey-producing." Why not? It is less costly than bee-houses, and saves all the trouble of carrying hives in and out of winter receptacles; but I have no doubt a simpler and cheaper plan than mine will be devised, I lay no stress on the plan. It is the principle I contend for. I simply say: "Give bees a chance to hibernate, and they will winter well." To do this, I firmly believe that we must get them up off of the ground. Possibly removing the bottom-board, and raising them an inch or so above the table-high stand will answer every purpose, though I doubt that will be "too much of a good thing." Perhaps an inch opening covered with fine wire cloth will be found to temper the air sufficiently to render this method successful.

I can think of several devices, besides the particular one I have described in the BEE JOURNAL, and intend to experiment with them. The whole thing lies in a nut-shell. In cold climates, it is the nature of bees to hibernate. We must conform our winter arrangements to this fixed habit of theirs, or pay the penalty as we have been doing.

For the American Bee Journal.

Shall we Breed Hybrid Bees?

J. O. SHEARMAN.

On page 469, Mr. Heddon asks a question which I fully expected would certainly attract the attention of the lovers of pure Italians; but as I have failed to see anything concerning it in the BEE JOURNAL, I will answer the question as if addressed to me. Shall we breed hybrids? Yes; in a certain way and for certain purposes. But *call* them hybrids, and not "new strains," as some are apt to be of the very best for business purposes, while others may not. To explain: I would say, breed a choice strain of Italians with a choice strain of black or brown bees, then you are very likely to have hybrids that cannot be beaten for business, and not very cross either; but to breed hybrids together, will produce naturally cross bees, however they may be banded.

I call them different degrees of hybrids; *i. e.*, Italians and blacks bred together are of the first degree; then a queen from them would be of the second degree, etc. After they had reached the third degree, I do not like them, nor they me. So I say, do not breed hybrids indiscriminately. I think the most experienced honey-producers of to-day agree that good hybrids are best as surplus honey gatherers; and I will add, they breed faster, and are more liable to swarm under the same treatment and condition than either race in its purity.

I have noticed for several years past, that when I reared a quantity of queens and kept account of them afterwards, there would generally be one that developed some peculiar trait, or rather characteristic in a marked degree. For instance: About six years ago I had a young hybrid queen reared from a prolific hybrid queen in the midst of the swarming season, which seemed to be possessed of a strong propensity for laying, and through the tall bloom, too. (Italians seldom do that.) She kept her hive so full of brood, that there was not room enough to store the needful supply for winter.

Again, last spring I heard of a farmer who had 8 colonies of bees which had wintered through without any care at all. Now, last winter being uncommonly severe, this led me, out of curiosity, to go over there on purpose to investigate the causes, if any, of their wintering safely on the summer stands, and in single-walled hives with no protection, *i. e.*, packing. I found them as stated, and all but two were strong, and had drones when clover first bloomed. They were blacks, and mixed by hybridizing with Italians, or rather yellow hybrid drones. I was just foolish (?) enough to possess them, and so brought them home and let their black drones fly in my yard, so as to rear some hybrids with some of my best Italian queens, and that, too, when I had my apiary nearly Italianized.

Now, the point is this: One of those queens had kept three hives

well supplied with brood for the last two months. I piled them up for the producing of extracted honey, and every time I took off the upper two stories, I found brood enough in each one to make a fair sized colony for winter quarters, and also honey enough to winter them on. Now (Aug. 3) they are heavy again, and out at all of the three door-ways. On the other hand, I once had a queen whose bees did not seem to care to swarm at all, their main impulse being for honey the season through. In the latter part of the season, I could hardly get eggs enough to rear some queens, by putting combs in their hives, as they would fill them with honey; but she kept her hive well stocked. They were Italians.

Now, I have a question to ask: Will those bees which I got from the farmer, in the spring, develop a strain more hardy for wintering than the average? or was the same condition accidentally overlooked that favored their coming through without protection, while all the others within 2 miles died? and nearly all the others in the same kind of hive, and put up for winter in the same way, *i. e.*, simply left on the summer stands? The mixed-hybrid's motto seems to be, in substance, the same as the dying miser's advice to his son: "Get money (honey) my son, get money (honey)! Honestly if you can, but any way get money (honey)." New Richmond, Mich.

For the American Bee Journal.

An Enemy to Borage.

CLARENCE M. WEED.

On account of the length of its period of blooming, and the fact of its secreting nectar during wet weather, borage justly ranks among the first of honey-producing plants. The enemy of which I wish to speak, is the caterpillar of one of our most beautiful butterflies, the Painted Lady or Thistle Butterfly (*Pyromorpha cardui*). This butterfly is very generally distributed over the United States, and has long been known, although not heretofore considered a serious pest on account of its rarity, and its habit of feeding on thistle and other noxious plants. But we can never tell what insect will be the next to multiply to such an extent as to become injurious.

DESCRIPTION:—There are two broods of the worms in a season, the first appearing in May or June, and the second in August. The small blackish caterpillars are covered with branching spines, a portion of which on the back are yellow, the rest black. When full grown, they are about an inch and a half long, and black with a greenish yellow line on each side, above which is a less distinct brown line. The head is black, and on each ring of the body are seven many-branched spines, yellow tipped with black. They protect themselves by spinning a white silken web by which they draw two leaves or the sides of one leaf together, thus forming a

tent. The chrysalids vary a good deal, but are usually of a golden brown color with slate-colored markings.

In about ten days after becoming a chrysalis, the butterfly emerges; the latter expands about $2\frac{1}{2}$ inches. The upper surface of the wings are a pinkish red near the body, and black toward the outside. In the outer angle of the front wings, are five irregular white spots. On the under surface of each posterior ring is a row of five, colored, circular spots. Prof. Cook informs me that he has never seen these butterflies so common as they are at the present season. Besides borage, the caterpillars have appeared on hollyhocks in many parts of the State.

REMEDIES:—Pyrethrum will probably be found effective in destroying them, if applied with sufficient force to penetrate the web. It would not be advisable to apply the deadly arsenical compounds when the plants are blooming, but at other times this method would doubtless be found practicable.

Bees as Comb Builders.

GEO. H. HOYLE.

The positions taken by some of our leading bee-keepers, and the results of their experiments being so different, I hope, by the aid of others, to find wherein the difference lies. I will first state my experience. On May 3, I hived a swarm of hybrid bees in a Simplicity hive, and gave them 10 half-sheets of comb foundation. A week afterward I put on another story with 10 half-sheets of foundation, and 2 weeks after that I gave them a third story and 10 empty frames with wax comb-guides. These frames I placed alternately between the others, to insure straight combs.

When I commenced extracting, I gave them 4 more half-sheets of foundation, and two more empty frames. The result was that I got 24 good combs from half-sheets of foundation, and 12 from empty frames with wax comb-guides. I have extracted 94 pounds of honey from them, and there is yet upwards of 20 pounds in the hive.

The queen of the above mentioned bees, is an Italian, and was fertilized by a black or German drone. I tried to make one of my Italian colonies build comb in the same manner, and when I gave them half-sheets of foundation, they would draw it out, fill it with honey, and seal it, but they would add very little comb to it. When I extracted the honey, I gave them good combs, and gave the half-combs to hybrids to build on. I tried them with wax comb-guides, and it did not work at all. After 5 or 6 days I took the frames out, and they had started a piece of comb on one frame. What little they had built, you could plainly see, was of old wax and had been taken from some other comb.

The Italians and hybrids rank about the same, as honey-gatherers.

Mr. Doolittle says that he can have combs built cheaper than he could buy comb foundation to put into the same number of frames. Now, Mr. D. is a successful bee-keeper of excellent judgment, which his articles in the bee-papers prove, and it is not likely that he is very far wrong. Some bee-keepers say, "How can Mr. Doolittle know, as he never used 10 pounds of foundation in his life?" I will venture to say that Mr. D. is very familiar with the results of other apiaries in which foundation is used.

If Mr. Doolittle would tell us what kind of bees he had, and the bee-keepers who have written in favor of, as well as those who have written adverse to, his plan of having combs built, would do the same, I think it would give some light on the subject.

Mr. H. V. Train, on page 278, writes under the head of "Italians vs. Brown Bees." The object of the article is to show how badly his brown bees outdid his Italians. Now we, who use foundation and extractors, all know that the Italians are as good honey-gatherers as has yet been discovered. Please tell us, Mr. Train, if you used foundation at the time.

Morgan, Texas.

Philadelphia Times.

Philadelphia Bee-Keepers' Picnic.

In a beautiful glen surrounded by woodlands and close to the rippling Wissahickon, stands a quaint old-fashioned farmstead. Here were congregated on July 26, on a space cleared around the house, some thirty ladies and gentlemen, whose conversation was entirely devoted to the relative merits of various kinds of bees and their culture, while one of their number introduced them to his large colony of honey-collectors. It was the special summer meeting of the Philadelphia Bee-Keepers' Association. The farm was Vice-President Todd's bee and poultry farm at Kitchen's Lane, Germantown. He is from the old country and has been in America only a few years, but has already identified himself with apiarian interests in this country. In his yard are arranged more than eighty hives, some of them, three stories in height.

"Now, ladies and gentlemen," said Mr. Todd, "if you will step this way we will look into some of the hives. Put on your veils if you have them. I do not think it will be necessary, but you may be nervous, and if you should be rough with the bees, they are apt to get angry."

Mr. Todd, without any covering to face or hands, lifted the lids of the hives, took out the combs swarming with bees, handled the little creatures, allowed them to crawl over him and showed no trepidation of any kind.

"Do they never sting you?" he was asked. "Very seldom. Sometimes when honey runs short and they are hungry, they are not so quiet and amiable; but they are exceptionally good-humored to-day. You see, I blow a little smoke into the hive;

that frightens them; they gorge themselves with honey in their terror and they are thus rendered quiet and comparatively harmless. Ah, there is the queen," he continued, pointing to a bee much longer than the rest and with smaller wings. "See, there are some eggs. It is all right. She is fertilized." At this statement there was considerable excitement among the enthusiasts assembled.

The apiarist took two frames of comb into the house and showed how the honey was extracted. He first shaved the covering from the cells and then placed the combs into a kind of churn, which he turned very rapidly. The honey was all ejected into the receptacle, and the combs, once more empty, were ready to be again filled by the industrious little collectors. Mr. Todd then took his visitors to see his three-acre sun-flower plantation.

"This is an experiment," he said. "I have heard that in Spain and Portugal the green leaves of the sunflower are used as fodder for the cattle. I have tried it with perfect success. My bees will obtain an immense supply of honey from the flowers, and the seed is good feed for the poultry. I shall in that way obtain three crops from my outlay. It is also possible that out of my abundance of blooms I may send some to market for sale, as they are a beautiful flower; and I may also make the experiment of making bread of the seed-flour. That is done in Spain, where the sunflower receives the title of 'the gift of heaven.'"

The party thence returned to the bee-village and resumed the inspection of the tenements. They were shown colonies of Italian bees, black bees and hybrids. The various qualities of their honey-storing abilities were descanted upon and the safety of handling the pure-bred, civilized Italians was extolled; while the fierce nature of the native black bee was vigorously proclaimed. Mr. Todd exhibited a thorough-bred Italian queen-bee and her young brood. This queen was sent over from Italy in a little wire cage, supplied with saccharine provision for her long ocean voyage, on two little bits of sponge. She is very healthy and is rearing a prosperous young colony in her new quarters with all the maternal energy and pride of which she is capable.

Dr. R. H. Townsend, president of the Philadelphia Bee-Keepers' Association, called a meeting on the hill above the house, under the shade of some fine chestnut trees, and spoke of the increasing interest which is felt in apiculture. He bemoaned the fact that more interest in this useful branch of productive art is not taken in the colleges and schools of learning in this country, saying that he thought that in every college there should be a professor of apiculture.

The Southern Indiana Bee-Keepers' Association will meet at Madison, Ind., on Sept. 4, 1884, at the Fair Grounds. DR. FIRTH, Sec.

For the American Bee Journal.

Introducing Queens—My experience.

ABEL GRESH.

Quite recently one of my colonies cast a swarm (the smallest out of five), and as usual I moved the old hive to a new stand. In due time a young queen was hatched, and she destroyed all the remaining cells. In about a week after the queen hatched, I noticed that the new colony was carrying out bees, to a large extent, so I began to investigate, when I found that those which were carried out, were of a peculiar shape and color. The colony was Italian, having purchased the mother last season, as a tested queen. The workers are very fairly marked, while those carried out are short and chubby looking, having one fair yellow band, and instead of the two hindmost bands, they are black, and some of them very shiny. I should say at least one thousand such bees were carried out alive. Some of them came running out, and appeared as if stung. They acted as if crazy, running over the sawdust floor without any aim, until they died. I looked for the young queen, and could not find her; so I continued to look 3 or 4 days (thinking that possibly I had overlooked her before), until I was convinced that the colony was queenless.

Having extra queens in nuclei, I determined to introduce one, and luckily (as I thought) along came the BEE JOURNAL of July 16, 1884; and on page 456 appeared an article from the pen of S. Simmins, on an easy way of introducing queens direct to a colony. I studied the method to suit my circumstances (from a nucleus to a colony), and the next morning I determined to try the new plan.

Luckily my old tutor in the business happened to call on me, and together we took a final search for a queen in the hive. We found none, but we did find plenty of newly-laid eggs, and on closer examination pronounced them the work of fertile workers. We closed the hive and returned to Simmins' article, and found that we still were right, and that the new method was quite applicable to my case. So we took the frame with the queen and adhering bees, to the colony, removed a comb, put the one from the nucleus in its place, closed the hive with confidence, and looked after some other colony. In 15 minutes we noticed the bees busy carrying out dead bees, and the next morning I found my beautiful young queen lying in front of the hive, dead.

I do not think one of the introduced bees were spared. I was then in a frame of mind to commune a little with S. Simmins, and also to teach my fertile-worker crew a lesson.

I read Prof. Cook's way of getting rid of the latter (as he is generally sound). I then carried the hive 2 or 3 rods away, thoroughly smoked the bees, took out all the frames and set them around, brushed the remaining bees out of the hive, then carried it to its old stand. I then took two

combs out of a nucleus, with the queen and bees adhering to it, and put it in the middle of the hive. I then brushed every bee from the combs to the ground, and placed each one by the side of the nucleus combs, until the hive was full, when I closed it, and let the bees get back as best they could. The result is satisfactory; no bees killed, and the colony is working actively.

Can some one tell what causes the small, shiny, imperfect bee that was being carried out? May not the presence of fertile workers have some connection with them, or *vice versa*?

In regard to Mr. Simmins' article, I would caution readers of the BEE JOURNAL not to place too much confidence in it, as it is one of the rules mentioned by Mr. Doolittle, which do not apply as do the rules of arithmetic. I am inclined to believe that the old queen is at fault, and unless I am convinced of the contrary, I shall not spare her. Bees are doing fairly well here this season.

Weedville, Pa., July 29, 1884.

For the American Bee Journal.

Profitable Use of Comb Foundation.

W. M. WOODWARD.

That comb foundation is one of the most valuable inventions of modern bee-keeping, I supposed was universally admitted; but I see that even so judicious a bee-keeper as Mr. Doolittle not only doubts, but decidedly opposes its use. How he could perform any decisive experiments upon less than 10 pounds of it, I fail to see. I used three times 10 pounds to satisfy my own mind, and found that proper management made it pay me; not only to use it, but to buy a machine and make my own. (I am Mr. D.'s poor man, to a dot.)

My experiments proved to me that, with the ordinary management, from 50 to 75 pounds of honey can be realized from every prime swarm, above what they will naturally produce without its use.

The point where I conceive Mr. D. in error, is in his estimate of the necessary wax secreted by bees while gathering honey. I want to ask him to examine his colonies which are run for extracted honey, where, if I mistake not, he will learn that they are able to make good use of all the wax secreted. If so, this proves that the secretion of wax is not necessary, but occurs for want of room to deposit the honey immediately on returning to the hive, and before it becomes digested. Comb foundation is certainly the remedy when rightly used.

Its profitable use then turns upon these points: 1. That there should be an abundance of it to give all the surface the bees will cover. 2. That it should be as light in grade as will admit of being drawn to storing and brooding depth, thus compelling the bees to store in a large extent of surface at the start. 3. That all space, save just enough to hold the brood as fast as it can be produced, must be filled with sections. This last point I

think Mr. D. will readily admit, as it grows out of his own system of management.

I have my hives so constructed, this season, that I have bees on 3 frames; which has so far been sufficient for 10 to 15 days, when 3 more are added, being just enough to fill the space of one side-case of sections.

Mr. D. asks those who have tried and favor its use, *i. e.*, have made it pay, to pass his article by as though he had never written it. If by this he hopes to gain a mark, we protest that he is giving general advice which is suited only to local or peculiar conditions; but like his new method of introducing queens, will not always work with mathematical precision.

Where swarming occurs in a very moderate honey-flow, and no surplus is likely to be had, it will pay any bee-keeper to try working the bees at comb building for profit, even if he finds it necessary to render the combs into wax as fast as made. But in a vast majority of cases, I think bees swarm most during a paying surplus yield. Under such circumstances foundation is certainly a great boom.

Mr. D.'s objection on account of thickness of foundation, in his last article, is entirely superfluous, as he himself can make his own foundation "thinner" than any bees will make it. At least I can.

Custer, Ill.

Prairie Farmer.

A Timely Chat About Bees.

MRS. L. HARRISON.

While visiting an apiary yesterday, I was impressed with the idea that bee-keepers are born, not made; *i. e.*, that there must be a natural adaptation for the business, in order to succeed. The proprietor of this apiary, without any protection, or aid in the way of smoke, opened hives, and pointed out the queen, without exciting the bees in the least; indeed they did not appear to know that they were disturbed, and this, too, in a time of scarcity. The cover of the hive was removed, and the frames lifted, without any jar or noise. I sometimes think that the odor of some persons, or their magnetism, excites bees at a furious rate. The frames in this apiary had no wooden projections to hang by, nails being driven in for this purpose, consequently there was no prying up.

This apiary of 140 colonies is located in Putnam Co., Ill., and up to date, July 26, only about 100 lbs. of surplus honey have been removed. At this time last year, 7,000 lbs. had been taken. There was very little honey-dew in this locality, the small quantity lasting only a day or two. The maples are in a thrifty condition, with no appearance of bark-lice.

The honey crop, with the exception of a few localities, is a partial failure. The honey secured is in many instances contaminated with honey-dew, and but very little of it will be first class. The electric conditions for the secretion of nectar from white clover,

have been deficient, and although the bloom was abundant, but little has been secured. Hot nights—good corn-growing weather—is the desideratum. The prospect is good generally, for a full autumn flow of honey; and those having their dishes right side up, will catch it. Hives that are full of bees will be the ones to pay their rent promptly. Those desiring to winter their bees well, must look after them now, and see that each colony has a young, vigorous queen.

For the American Bee Journal.

"Honor to Whom Honor is Due."

J. E. POND, JR.

It is too bad to rob, or attempt to rob another of that to which he is honestly and justly entitled, not only of filthy lucre, but of any honor that may come from being the originator of some new idea. That Mr. Heddon is justly entitled to all the honor that belongs to the origination of the "pollen theory," no one knows better than myself, from the fact that I have been fighting him on this question for nearly three years. Mr. Heddon, however, does not yet claim that he has proved the theory true. He simply says he believes it to be so, and offers such evidence as he has at hand in proof thereof, leaving it to the public to judge whether such evidence is sufficiently strong to be taken as proof. Mr. Fradenburg is more than a year behind Mr. H. in the matter, and the evidence that he offers is not nearly as strong as that of Mr. H. I do not think either of them have struck the right key yet, but the facts related by Mr. H. go far in support of the theory, while those of Mr. F. might as well be used on the one side as the other.

Foxboro, Mass.

For the American Bee Journal.

Prevention of After-Swarms.

A. A. DECKER.

On page 126, BEE JOURNAL for 1883, Mr. Heddon gives his method of preventing after-swarms, which is summed up as follows: Set the new colony by the side of the old one, and in 6 or 7 days remove the old one to a new stand when the most of the workers are away in the fields; thereby giving nearly all of the workers that are old enough to gather honey, to the new colony. This will prevent after-swarms, without a doubt; but what I do not like about this plan is, that we take about as many bees from the old colony as a second swarm would require. The old colony needs these bees, the first swarm does not. Again, will the new colony accept the workers from the old one, after being separated for 6 or 7 days, even if laden with honey? My bees certainly will not.

I believe any other colony in the yard will take them in just as soon as they, as they have become strangers. Another objection is, if we give any

help, either in bees or foundation, to early swarms, they will in a good season often cast swarms in the midst of our best honey flow (basswood), regardless of all the sections filled with the nicest of thin foundation.

Can it be possible that bees act so differently in different localities? I believe, with Mr. Heddon, that a colony and its increase will store more honey than one that does not swarm. All practical bee keepers know that there is no profit or pleasure in small after-swarms; and in this locality to get the best results, *i. e.*, surplus honey from the old colony, all the bees that are left when the first swarms leave, should stay in the old hive during the remainder of the season. The best way to accomplish this, I believe, is to introduce a queen into the old colony, on the day the first swarm issues, either a virgin or a fertile queen will do. You can smoke them in at the entrance. There are few old workers left in the hive, and no guards over the queen-cells. The queen, when introduced, makes it her first business to destroy these cells, and then everything is lovely.

The gain in time, to the colony, in getting a queen in the midst of the honey season, 3 days at the least, will pay all expenses of rearing or buying the queens in these days of progress and queen nurseries. That this plan will generally prove successful, there is not a doubt, for it has been thoroughly tested. I hope to hear from Mr. Heddon and others on this subject.

Boyceville, Wis., Aug. 1, 1884.

Bee-Culture in Texas.

An Exchange contains the following: "Bees are said to be pioneers of civilization. The early colonists of Texas found bees in all parts of the country; and on the frontier they still abound, having formed colonies in hollow trees, caves, and crevices in the rocks. In one instance it is reported that a prolific swarm took possession of the vacant space between the ceiling and weather-boarding of a house in the far West, and furnished a large family with an abundance of honey. Until recently, comparatively little attention has been given to bee-culture. Within the past few years, some apiarists have been adopting hives with movable frames, using honey extractors, and importing queens and Italianizing their colonies. A special act of the Legislature exempts bees, and the materials employed in the manufacture of hives and the saving of honey, from taxation; and while there are hog-laws and sheep-laws, and laws prohibiting other animals from running at large, there is no law limiting the range of bees. They may forage just where they can find honey-producing shrubs and flowers. Of these flowers there is a great variety and an inexhaustible abundance on our boundless prairies, and in our fertile bottom-lands. Perhaps the best and most widely diffused of the honey-producing plants is the horse-mint. This is pronounced equal to the white clover of more Northern latitudes."

SELECTIONS FROM OUR LETTER BOX

A Good Investment.

I commenced the season by buying 25 colonies of bees in Cottage hives, transferred them to Langstroth frames, and got on an average of $5\frac{1}{2}$ combs to the hive, after they were transferred. Up to this time, I have taken 1,500 pounds of extracted honey, and have sold very nearly the whole crop at 15 cents per pound. I hired a market gardener, who was good at peddling, at \$2 per day, to sell honey for me, and I found that it was a good investment. B. F. BALDWIN.

Marion, Ind., Aug. 3, 1884.

Bees Not Working.

Bees in and around this city have done but little for 2 weeks; but 4 miles below the city, on the Island, they are storing honey rapidly. Mr. T. R. Sawyer and myself are now located on the Iowa City road, one mile from the Court House. He has 100 colonies, and I have 25. Our prospects, until 2 weeks ago, were as good as they had been up to that time 2 years before, when, in the fall, he received from 45 colonies, spring count, 7,300 pounds of mostly comb honey in 1-pound and $1\frac{1}{2}$ -pound sections.

W. T. KIRK.

Muscataine, Iowa, Aug. 1, 1884.

Poorest Season Since 1869.

With us, this is the poorest season for honey since 1869. We had cold, windy, cloudy weather when there was blossoms, and good weather when our honey-producing flowers were gone.

G. M. DOOLITTLE.

Borodino, N. Y., July 31, 1884.

Main Honey Season Past.

The main honey season has past and I have no bonanza to boast of. Our failures are bound to advance the price of honey. We must admit that the freaks of nature are in advance of the skill of man. In the first part of the season, apple bloom was profuse. Clover bloomed May 20, and lasted till July 10; but there was very little nectar gathered from that source. The so-called honey dew, or nectar from the leaves of trees, was abundant from the last of May till June 30; and my 54 colonies from all those sources filled all the hives with nice capped honey and bees. On July 7, I took off 600 lbs. of comb honey and extracted about 65 lbs., and I saw signs which led me to leave the honey and bees alone for a short time and see the result; and I now can say that the 54 colonies were once richer this season than they are to-day. To-day I find the heart's-ease nearly all blasted in the bud. It is a settled fact that the bees are now consuming more honey in rearing brood than they gather each day. My queens are breeding in haste and consuming their laid-up

store. My buckwheat is in bloom and the bees sip every bloom clean in less than two hours each day. I can see no source yet from which I am likely to get any fall honey. My 52 old colonies swarmed 92 times, and every one returned to the parent colony, because the wings of the queens were clipped; consequently, I never lost a queen and have no swarmed-to-death colonies. I did not have to feed any last spring, and my hives are full of bees and honey; but I do not want to rob them so they will suffer, for the mere purpose of obtaining a large profit at the expense of the blessed bees' lives. I could, to-day, take 50 lbs. from each hive, but I prefer to keep my bees and honey in the same little house until I see that all danger is past; and then deal honestly with the little honey-gatherers, for they are honest in their dealings. They live, labor, store and die, that people may live and be happy. The Italian bees are the best bees to gather honey early and late. R. M. OSBORN.

Kane, Ill., July 24, 1884.

Swarm Separators.

In reply to Mr. Kinsel's questions on page 411, in regard to swarm separators, I would say: The division-boards do extend to the bottom-boards, and the cover rests on the division-boards so that the bees cannot enter from one division to the other. On the top the frames are $\frac{3}{8}$ of an inch lower than the division-boards. In separating, the bees pass through the entrance in the bottom of the division-boards, or through $1\frac{1}{2}$ -inch augur-holes bored 4 inches from the tops of the division-boards. I gave a description of the swarm separator as published on page 171 of the BEE JOURNAL for 1881. Although the honey interest looked rather gloomy, early in the spring, we are now having a second bloom with an abundant yield of nectar. The report from Napa county promises a good yield. As I am not quite ready for extracting, I have to tier up my hives 3 or 4 stories. I use the Simplicity-Langstroth hive, and will commence extracting next week. I have been in the bee-business in California during the past 6 years, and for bloom, this season exceeds all former ones. The hills are a perfect flower-garden. Bees are working on the sage, which is something unusual for this time of the year. JNO. L. SECOR.

Monterey, Cal., July 23, 1884.

A Good Honey Flow.

The clover harvest was a poor one here, but we had a good flow of honey for about a week from June 12 to the 20. My bees then had the swarming fever till July 1. I had 45 swarms from 50 colonies. As my frames were all one size, I had no trouble to keep the increase down to 45, by taking out the brood-frames and returning the swarm. I returned some 18 swarms in that way. Those frames of brood I would give to the other new colonies, which would be a great help to them, and would keep all strong. On July 8, basswood bloomed, and up

to this time I did not have 200 pounds of comb honey finished. The bees now began to work as I never saw them work before. They were so heavily loaded that they dropped by the thousands all over the apiary, and I never before saw sections filled up so fast. I am using the two-pound section. I was able to give them room as fast as they needed it, and in two weeks time some of my colonies had 42 two-pound sections nearly all sealed over. I had one strong colony which I overlooked in tiering up, and to my surprise they had the whole brood-chamber filled with honey clear down to the ground, a distance of 8 inches. I then smoked the bees out and extracted the honey. The combs were built as straight as a board, and all was worker comb, so I fit them into frames. I have 5 strong nuclei, which I am now building up to full colonies, to make my number an even 80. I have now 3,000 pounds of capped comb honey, and about 1,000 pounds of uncapped. I expect to get most of the latter capped yet, as the pasture fields are again white with clover. Bee-keepers here are forcing the honey on the market at 10 and 12 cents per pound, but I am still holding my crop back for 15 cents per pound, and so far I have sold but 200 pounds at that price.

H. T. HARTMAN.

Freeport, Ill., July 28, 1884.

Not More than Half a Crop.

I have not yet seen any reports of the honey crop from this part of Kentucky. The spring was wet and cold until the middle of June. We have not more than half a crop of honey this season. I had 52 colonies, and increased them to 75, mostly by division. I have taken about 3,000 pounds of honey, the most of it being extracted. My bees are in good condition. WM. G. GOSNEY.

De Mossville, Ky., Aug. 3, 1884.

Good Honey Season.

I commenced with 9 colonies of bees, in the spring, and at this time I have 26, all in the Golden bee hive. The honey season has been good here. I have sold all my honey at 16 $\frac{3}{4}$ cents per pound, in my home market. I have the Syrian bees, which are gentle and easy to handle, and I manage them without any smoke.

JESSE LOVELACE.

London, Ky., Aug. 5, 1884.

Discouraged but Determined.

I have been waiting patiently to make a good report, and here is what I have to say: I started with 148 colonies on May 1, 1884, and now have 300 colonies. They are mostly strong and ready for the fall crop, if there should happen to be one. Up to this time I have taken only about 200 pounds of honey—unfavorable weather being the cause of the failure of the white clover. Basswood was an entire failure. I, alone, have done all but one day's work in my apiary this season. I am looking for a good fall crop, as goldenrod looks well. Just

now I believe I would be satisfied with enough honey with which to winter my bees, and take my share next time. I have 2,000 lbs. of old honey which I can feed, if necessary. Early in the spring I reported that bees were wintering finely. The colonies in two cellars wintered well, while those in the other two, with little or no ventilation, lost about 90 per cent., thus making my spring and winter losses 129 colonies. Taking the whole season through (with me), it has been the most discouraging one I ever saw; nevertheless my boat is out loose from shore, and I intend, in the near future, to land it well laden with both bees and honey. **WM. LOSSING.**

Hokah, Minn., Aug. 2, 1884.

Large Crop of Basswood Honey.

I notice in the last issue of the BEE JOURNAL, that basswood has been a failure in many localities; but here it has yielded a large crop of excellent honey. I am running two apiaries for comb honey, and another one of 45 colonies entirely for extracted honey; and they have already yielded over 100 pounds of white honey per colony. **FRANK MCNAY.**

Mauston, Wis., Aug. 1, 1884.

More Honey than for three years.

With us the white clover and basswood honey season is over. I have not yet taken the honey from the hives, but think that I will have more this year than all of the honey of the last three years put together. Recent heavy showers gives the buckwheat season a promising outlook at present. Natural swarming was very light—on an average only about one swarm in 10 colonies. **H. S. SEE.**

Geneva, Pa., July 31, 1884.

A Long Hive.

On page 164, W. H. S. Grout, of Kennedy, N. Y., says he has had 13 years experience producing extracted honey, and says he uses a 40-inch hive, etc. I wish he would detail his method of managing such a long hive, and state why he prefers it to the 2-story plan. **TURNER BUSWELL.**

Solon, Maine.

Wintering Bees—A Question.

It is a fact that an exceedingly strong colony of bees will, in severely cold weather, contract themselves into a cluster of 7 inches or less in each diameter. Such being the case, and I know it to be so by actual tests, can any one give me, or the fraternity at large, a logical and scientific reason why such a colony should winter with greater safety on a set of frames from 12 to 15 inches deep, than on a set which are only 9½ inches deep? Much discussion has been already made as to the relative safety of deep and shallow frames for wintering, but in none of the arguments made, have I seen anything touching on this point. It strikes me though, that the point is a vital one, and one that should be cleared up in a scientific manner. In answer to the above, I

do not care for theories, but I do desire an answer based on the true relations of heat and cold, and to the keeping up of an equable temperature artificially much higher than that with which we are surrounded.

Foxboro, Mass. **J. E. POND, JR.**

Authorship of the Pollen Theory.

Mr. A. A. Fradenburg, who lives a few miles from me, on the Tuscarawas river, has been very unfortunate in wintering, and theorized extensively as to the cause. I was much surprised to note his claim of priority of authorship of the pollen theory in a recent number of the BEE JOURNAL. The records will show, I think, that to Mr. J. M. Shuck belongs the honor of first conceiving that pollen is a factor in the causation of bee-diarrhoea. (See BEE JOURNAL, Vol. XVII, page 165.) His experiments go back to 1875. But to Mr. James Heddon belongs the honor of elucidating the pollen theory, the full history of which may be read in the latter numbers of that very valuable and first edition of the Weekly BEE JOURNAL for 1881. Mr. Heddon also made the first application of the theory. This is cheerfully conceded; and I feel certain that growing out of an amicable discussion of his theory, we shall, undoubtedly, come to the facts, ere long, as to the causes of bee-diarrhoea, and a complete solution of the problem of wintering bees.

G. L. TINKER, M. D.
New Philadelphia, Ohio.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Removing Surplus Honey.

Will Mr. Heddon please answer the following question:

When do you remove the surplus honey from the cases? As soon as it is capped, or do you leave all the cases on until the end of the season? **Myersville, Md. W. R. YOUNG.**

ANSWER.—Always remove a case as soon as it is finished. If in that part of the season when the work is going on slowly, we often remove a case when some of the sections are still unfinished, and from 6 or 8 cases make up one of all unfinished combs and return it at once to the bees to be finished.

Weight of Extracted Honey.

On page 470, Mr. B. F. Carroll says, "The honey taken is very fine, weighing 12¼ pounds per gallon?" Which leads me to ask:

1. What is the weight, per gallon, of extracted honey?
2. Suppose I have a lot of thin extracted honey, to what weight, per gallon, should it be evaporated before it will be safe or fit to run into containers for sale?
3. How light weight, per gallon, will keep safely in sealed pails or fruit jars?
4. How heavy, per gallon, ought it to be when properly cured for market?
5. What do dealers in honey consider the proper weight, per gallon, of extracted honey?
6. Can you not give, in some article, the best method of curing unripe extracted honey on large and small scales, so as to suit the wants of all classes? **TURNER BUSWELL.**

Solon, Maine.

ANSWERS.—1. A very good article of extracted honey, that is, very well ripened, will weigh 12 pounds per gallon. Mr. Carroll's honey, which weighed 12¼ pounds, was, no doubt, very thick.

2. Not much short of 12 pounds per gallon.

3. That depends upon what is meant by "safely." Honey of any consistency rarely keeps its flavor as nicely in any other place as in the comb. Even at 12 pounds per gallon, honey will usually go far enough toward fermentation to take on a twang not often found with comb honey. If you wish your honey to remain of the smooth, oily flavor it contained when extracted from sealed combs, it should not fall short of 12 pounds per gallon, and 12½ is preferable.

4. I consider 12 pounds per gallon marketable honey for sauce purposes.

5. Dealers in honey, as a class, do not know as much about weights per gallon as producers do. Many of them buy honey for mechanical and cooking purposes.

6. In few words I will say that I consider leaving the honey in the combs until it is ripened, as the best way to get it in that condition, for those who produce it on a small scale. For those who produce it on a large scale, I think the laws of nature afford a cheaper method; but, as yet, I know of none sufficiently formulated that it is in use by bee-keepers in general. Our California bee-keepers are best posted regarding this matter.

Convention Notices.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting on the third Tuesday in August, at Leroy Highbarger's, near Adaline, Ogle County, Ill.

J. STEWART, Sec.

The Kentucky Bee-Keepers' Convention meets in Louisville, Ky., during the opening of the Exposition (day not fixed). **N. P. ALLEN, Sec.**

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.40.

A Canadian wishes us to state in the BEE JOURNAL, whether we take Canadian money for subscription or books. We do; and for fractions of a dollar, Canadian postage stamps may be sent.

Bingham Corner.

MARENGO, ILL., June 18, 1884.

The Doctor Subdues All.—Mr. T. F. BINGHAM, Dear Sir:—I've used the "Doctor" till its all daubed up with bee-glue, and although at first sight I thought I did not like anything so large, I could not now be indeed except by the direst poverty, to do with anything smaller. As a matter of "economy" I much prefer the "Doctor" to any of the cheaper smokers, of which I have worn out several. The "Doctor" has entirely cured me, so that I am now a Bingham man, as my wife always has been. If the somewhat vague remark in your letter means that nothing was charged for the Smoker sent, except the reading of your letter, I shall be very glad of another "Doctor" for the money sent, so that my wife won't take mine from me. Bees just booming on white clover.

Yours Truly, C. C. MILLER.

WOODARD'S LANDING, WASH. TER.

The Best Smoker.—TO BINGHAM & HETHERINGTON, Abronnia, Mich., Dear Sirs:—Find enclosed money for 3 Conqueror Smokers, which please send per mail—one to each, Dr. Balch, J. M. Londerback, and H. A. Towner. The Conqueror is the best Smoker I ever used. Respectfully,
 May 17, 1884. H. HASTINGS.

DRESDEN, TEX., May 28, 1884.

Conquer the "Cyps."—T. F. BINGHAM, Abronnia, Mich., Dear Sir:—Enclosed find \$1.75, for which please send, per mail, one "Conqueror Smoker" to Major H. A. High, Waxahachie, Tex. He bought a Cyprian Queen from me, and the Bees have worsted the old gentleman. I told him that the Conqueror Smoker would conquer the "Cyps," as I had tried one for two years, and "it never failed." Respectfully,
 B. F. CARROLL.

BORODINO, N. Y., Aug. 15, 1882.

Cyprians Conquered—All summer long it has been "which and tother" with me and the Cyprian colony of bees I have—but at last I am "boss." Bingham's Conqueror Smoker did it. If you want lots of smoke just at the right time, get a Conqueror Smoker of Bingham. Respectfully,
 G. M. DOOLITTLE.

Prices, by mail, post-paid.

|-------------------------------------|--------------|--------|
| Doctor smoker (wide shield)..... | 3½ inch..... | \$2 00 |
| Conqueror smoker (wide shield)..... | 3 "..... | 1 75 |
| Large smoker (wide shield)..... | 2½ "..... | 1 50 |
| Extra smoker (wide shield)..... | 2 "..... | 1 25 |
| Plain smoker..... | 2 "..... | 1 00 |
| Little Wonder smoker..... | 1½ "..... | 65 |
| Bingham & Hetherington Honey Knife, | 2 inch..... | 1 15 |

TO SELL AGAIN, apply for dozen or half-dozen rates. Address,

T. F. BINGHAM, P. M., or
 BINGHAM & HETHERINGTON,
 ABRONNIA, MICH.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an additional present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Advertisers' Opinions.

My advertisement in the BEE JOURNAL, has brought me over 400 responses.
Dr. G. L. TINKER.
New Philadelphia, O.

The queen business is *rushing*, and we think the BEE JOURNAL deserves much credit as an advertising medium.
E. A. THOMAS & Co.
Colerain, Mass.

Having advertised in the AMERICAN BEE JOURNAL quite extensively for the past two years, I would say (without solicitation) that it has sold more queens for me than any other three periodicals I have ever tried.
My bees are in fine condition this spring. I have lost but 4 out of 182 colonies. The outlook is fine for a good season.
L. J. DIEHL.
Butler, Ind.

The BEE JOURNAL does its advertising wonderfully well. It brought to me responses from Canada to the Gulf of Mexico, and from the Alleghanies to the Rocky Mountains.
WM. M. ROGERS.
Shelbyville, Ky.

THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is published SEMI-MONTHLY, at Seven Shillings per annum, and contains the best practical information for the time being, showing what to do, and when and how to do it. Rev. H. R. PEEL, Editor.
LONDON, ENGLAND.
We send the Weekly AMERICAN BEE JOURNAL and the British Bee Journal, both for \$3.00 a year.

NEW HONEY PAILS

The accompanying illustrations show a nest of pails with the sides tapering, for marketing extracted honey. The covers are deep and the pails are made with special reference to filling them for the retail honey-trade. They are made in a superior manner and are quite attractive in appearance, when filled and nicely labeled.

ESTEY & CAMP,
 188 and 190 State St., CHICAGO.

EXCELSIOR HONEY EXTRACTORS

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame. Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

| | |
|--|--------|
| For 2 American frames, 13x13 inches..... | \$8 00 |
| For 2 Langstroth " 10x18 " | 8 00 |
| For 3 " " 10x18 " | 10 00 |
| For 4 " " 10x18 " | 14 00 |
| For 2 frames of any size, 13x20 " | 12 00 |
| For 3 " " 13x20 " | 16 00 |
| For 4 " " 13x20 " | 16 00 |

COLUMN.

BEST GIVEN
COMB FOUNDATION.
Wholesale and Retail.

I now have on hand a freshly-made lot of GIVEN COMB FOUNDATION, made from strictly pure domestic wax, thoroughly cleansed from all impurities. Sizes of brood and surplus, 8 $\frac{1}{2}$ x16 $\frac{1}{4}$, or Langstroth size. I have also Dadant's best Brood Foundation of same size; also Dadant's 11x11 for American frames. Send for prices, and state amount wanted. I offer a liberal DISCOUNT to DEALERS.

HEDDON'S LANGSTROTH HIVE.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these Hives made up, and in the flat, at very reasonable prices.

One Hive complete for comb honey...\$3.00

(The above will contain two cases complete with sections).

The above Hive complete for extracted honey.....\$3.00

The above Hive complete for both in one..... 4.50

One Hive in the flat..... 2.00

Five or over, each..... 1.50

No one should ever order these Hives in the flat, without ordering one made up complete to work by. Parties are advertising Hives as Heddon Hives, that in no wise embrace my principles. Judge only by those purchased from me.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: 4 $\frac{1}{2}$ x4 $\frac{1}{4}$ x6, 7 and 8 to the foot, per 1,000, \$6.50; 5x6x2, per 1,000, \$8.00. All shipped from here.

QUEENS!

Our New Strain,

Also IMPORTED ITALIANS!

Take your choice. Prices:

Tested, to breed from.....\$ 3.00
Untested..... 1.25
Untested, after July 1st..... 1.00
Untested, (per doz.) after July 1st..... 11.00

50 TONS
OF COMB HONEY WANTED.

Believing it to be advantageous to both seller and buyer to deal with the same parties year after year, we have for several years bought the entire honey crop of many bee-keepers. In view of our increasing trade, we wish to add to our list of producers the names of a few more reliable men whose honey crop is from one to ten or more tons yearly. Through the actions of certain bee-keepers, the trade now demands mostly one-pound sections. We pay spot cash at railroad station for what we buy. Those desirous of becoming acquainted with such dealers, will state how much honey they have of each size section. How much of each quality. How soon the whole or part of it can be in shipping order. Name lowest cash price, and say how much more is in your locality. If answer is favorable, we will call on you. York State, Michigan, or Vermont preferred. Address,

F. I. SAGE & SON, Wethersfield, Conn. -31A1t

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1874.

The Original
BINGHAM
Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!
Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom. Less than 200 will have a blank where the name and address can be written.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and full up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,600,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 50c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poultryer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., AUGUST 20, 1884.

No. 34.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

☞ We have received the Premium List of the Marshall County, Iowa, Fair, to be held at Marshalltown, Iowa, Aug. 26 to 30, 1884. Mr. J. W. Sanders is the superintendent of the Apiary Department, and there is a number of premiums—amounting to \$20 in cash, besides 13 diplomas.

☞ The Maine State Agricultural Society, which meets on Sept. 9 to 13, at Lewiston, offers \$60 in premiums in its Bee and Honey Department. Also the Eastern Maine State Fair Association, which meets on Sept. 23 to 26, at Bangor, offers \$33 in premiums for bees, honey and apiarian supplies.

☞ In the bill of fare at the Jordan Hotel in White Sulphur Springs, Va., we notice that honey is daily on the tables. This is to be commended; for we believe that in only one country in the world is honey found daily upon the tables of its hotels, and that is in the little Alpine Republic of Switzerland. In the descriptive pamphlet of White Sulphur Springs, we read: "Not the least attractive feature of this delightful resort, to many visitors, is the extensive apiary of Mr. E. C. Jordan, the owner and proprietor of the Jordan Hotel, who is an enthusiastic bee-culturist, and the abundant supply of beautiful honey upon his tables, bears delightful evidence of his success."

☞ Mr. A. Todd, of Philadelphia, Pa., has sent us the Premium List for the Pennsylvania State Fair, and will forward a copy to any one applying for the same. The Collective Bee-keepers' Exhibit is in charge of the

Philadelphia Bee-keepers' Association. The committee consists of Dr. Henry Townsend, President; Arthur Todd, Vice-President; F. Hahman, Secretary; Mrs. Thomas, T. C. Davidson, and Enon Harris. The premiums amount to \$30 in cash; 3 silver and 7 bronze medals, and 5 diplomas.

A Swarm of Bees Loose on a Train.

The Chicago Daily papers record the fact that a railroad train on the Chicago Northwestern Railway was "boarded" by a swarm of angry bees, on August 1. Here is what a reporter of the press says about it:

Between Lake Bluff and Lake Forest a train of cars ran over a swarm of wild bees, which had come out of the trunk of an old tree standing in the pasture by the roadside. The bees, angered at the death of thousands of their comrades, rose suddenly, flew through the open windows into the coaches, and proceeded to get even with the Northwestern Road by attacking its passengers. The people were thrown into the wildest confusion. The little insects were swift in their work, and spared nobody. It was useless to fight them, for every effort to drive them off made them all the more vicious and determined. Before the train arrived at Lake Forest the bees had fled, leaving their victims with faces and hands swollen and burning with pain.

Bee and Honey Show in Scotland.

The London *Journal of Horticulture* gives the following report of the Honey and Bee Show of the Caledonian Apiarian Society:

The eleventh Show of the above Society was held at Edinburgh in conjunction with the Highland Agricultural Society on July 22, 23, 24, and 25, under the able management of Mr. R. J. Bennett, to whom bee-keepers are indebted for bringing together the various exhibits that formed the finest exhibition of apiarian appliances and produce that has ever been witnessed in Britain. But, although Mr. Bennet's efforts have been crowned with success, it is not wholly due to himself, nor is it known that it was through his amiable lady, working often till past midnight, that the work

was overcome, and the Society successfully launched in 1874. Members of the Society should bear this in mind; and while we congratulate Mr. and Mrs. Bennett on its success, I think both are entitled to more than a mere passing word of praise.

The bee-keepers of England were represented by Mr. Alfred Neighbour; those of Ireland by Dr. Knight, Hon. Secretary to the Irish Bee-keepers' Association; and Scotland, by Mr. Cameron, from Inverness in the north; and almost every bee-keeper of note in the south and west.

In addition to the large tent for manipulating, there was a large tent, 61 feet by 21, completely crowded to overflowing, not holding much over the half of the exhibits, the surplus having to be put outside.

The Book, "Bees and Honey."

In reference to this work, Mr. G. W. Demaree writes as follows for publication:

I want to express my appreciation of the work on bee-culture, "Bees and Honey." In my judgment the book is exceedingly well arranged. A most admirable feature of the work, is that it teaches carefully the great principles of bee culture without an attempt to dictate to bee-keepers what kind of fixtures and implements they should employ in the prosecution of their business. It treats appropriately several subjects connected with the science of bee-culture, which is absent in most other works.

G. W. DEMAREE,
Christiansburg, Ky.

The main objection to some bee-books is the fact that they attempt to dictate to bee-keepers what hive or implements should be used. This was studiously avoided in the book "Bees and Honey," and while describing all the better ones, it leaves the selection to the wants of any locality, or the "fancy" of the individual.

☞ At the District Fair to be held at Friend, Neb., Sept. 30 to Oct. 3, 1884, premiums for the Bee and Honey Department amount to \$30. For further information apply to J. O. Frantz, Sec., Friend, Neb.

Marketing Honey.

Mr. Jerome Twichell, of Kansas City, Mo., has sent us a circular, entitled "Some Light on the Subject of Manufacturing and Adulterating Honey", which we give below. This shows what can be done by one person, to benefit honey-producers, by refuting the falsehoods circulated concerning comb honey :

There is a class of people who seem to delight in trying to establish the moral depravity of man, and who would make everything and everybody out as bad till proven otherwise. This comes partly from ignorance and partly from that general distrust which is engendered in a great measure by the very weakness in one's self that he would impute to others. This world is not nearly so bad as some would like to make it ; and if a person be honest and truthful himself, he will investigate very closely before accusing others. How ridiculous, too, some people will make themselves before others who know better, by their gratuitous lies concerning the wonderful production of imitations that far exceed the original in beauty and general perfection. I would speak now only of comb honey. I have heard persons assert in the most positive way that they knew that comb honey could be, and is manufactured ; that they had seen the honey, and had also seen the person who had seen it made. But I have never yet been able to trace up the other fellow who had *himself* seen the process, nor do I think I ever will. No : this much slandered article is as yet beyond the baleful influence of fraudulent imitations, and I defy any one to prove the contrary.

To a sensibly reasoning and thinking person who has ever examined a piece of comb honey, the impossibility of manufacturing the comb, filling it up and sealing it over and preserving the natural appearance of all, will at once appear, at least so far as making it cheaper than can be done by the bees. And what other motive can there be for imitating an article of merchandise, than for the greater gain ? There may be, and no doubt are, some honest, fair-minded people who really do believe it is done, and the impression is probably gained from what they have seen, heard or read of *comb foundation*. I think it likely that this comb foundation is what first gave the idea of such a thing as manufactured comb honey, and the story has become mutilated and multiplied, till we have the very name and address of the manufacturer. But somehow never a reply has come to the numerous letters addressed to him.

Now, this comb foundation which has probably been the innocent cause of so much lying, is simply a sheet of beeswax rolled out thin, with the shape of the honey-cells at the bottom impressed in it, and corresponds with the center division of the comb. This is cut into little strips and placed in

the boxes in which the bees are to build their comb, for a guide, and by this means the comb is built in the middle of the little box. Then between each of these boxes is usually placed a sheet of tin, called a separator, so that the comb can be built out just so thick as to leave only working room between it and the separator, and thereby making the smooth, even surface which some people take to be a sure indication of the manufactured article.

Scientific bee-culture has been reduced to such a fine point that few can realize what perfect control the master has over the little workers. They are made to form the letters of the alphabet and all kinds of fancy designs, by the construction of the boxes, and they do their work, under proper management, cheaper and better, I think, than ever man can, by hand or machinery.

This much, however, must be admitted, that the bees will store honey from anything from which they can gather it, whether the orange blossom, mangrove or palmetto of Florida, the white sage of California, the white clover, linn and other flowers of the North, or from the old sugar and glucose barrels around a grocery store in town. It all becomes honey, however, when gathered and deposited in the comb by the bees, and each kind has to go through the same process of purification. The flavor, though is unchanged, and hence we find such a vast difference in the taste of honey. Honey gathered from honey-dew, which is found in great abundance on the leaves of trees at certain times, is very dark, and tastes not unlike New Orleans molasses. Honey produced by feeding the bees glucose will be a white, flavorless sweet, similar in all respects to the original article, except in being cleansed and purified, and not at all injurious, though undesirable to eat, for want of flavor. But feeding bees is done to sustain them when the honey-flow fails in the flowers, and not to produce honey for sale, as it would then cost more than it comes to. From a pound of sugar or glucose they would deposit not more than half a pound of honey in the comb, so that it would cost from 10 to 15 cents more to produce a pound of honey this way than from the flowers. So it will be seen that no fear need be entertained on that score.

WHY EXTRACTED HONEY CAN BE SOLD CHEAPER THAN COMB-HONEY.

There are many persons who, being ignorant of the way extracted honey is produced, will expand their faces in a knowing smile when told the difference in price between it and comb honey, as much as to say, "Oh, yes, I see ; the glucose in the extracted honey is what makes it cheaper." This causes a great many to avoid extracted honey as they would hotel bash. I will endeavor to explain the difference in cost of producing and marketing the two kinds, which will readily account for the difference in price.

The apiarist, in preparing to produce extracted honey, constructs the

frames in which the bees are to build the combs, large and strong, with a wire-and wax foundation in the centre. Upon this foundation the bees build the honey-cells, and when well-filled, a single frame will contain some 20 or 25 pounds of honey. This then is removed from the hive, and after "uncapping" the cells on one side, by shaving the surface of the comb with a sharp knife, is placed with several other frames similarly prepared, into the "Extractor" with the uncapped cells facing outward. The Extractor is a machine constructed upon the centrifugal principle, with a revolving cylinder, so arranged as to receive and firmly hold the honey-frames. The cylinder is then made to revolve rapidly by means of a crank and gearing, and the honey is thrown out of the cells against the casing of the machine and passes to the tank below. The frames are then reversed in the machine after uncapping the cells on the other side, and the same process repeated empties the combs entirely of the honey. They are thus uninjured and can be used over and over again, being placed back in the hives and are filled in a short time, thereby, saving the bees much time and labor in building new combs. A colony of bees will produce double the quantity of honey in this way. The honey thus extracted is put into barrels, cans, or any other inexpensive package, and can be shipped at a low rate of freight, with no risk of breakage, etc. Comb honey, on the contrary, must be produced in 1-pound and 2-pound section-boxes, at a cost of $\frac{1}{2}$ to 1 cent each, then put into crates of 20 to 25 pounds at a cost of 10 to 15 cents each, and finally sent to market at double first-class freight rates with an average of 10 per cent. to 15 per cent. damage in transit. Thus it is not strange that extracted honey can be sold 5 cents or 6 cents cheaper than comb honey. That much extracted honey is adulterated, and sold for the pure article, cannot be denied ; but plenty can be had from reliable dealers with a *Guaranty of purity*, and an *affidavit* when called for. I furnish an affidavit of purity with all the honey that I sell.

☞ The Kentucky bee-keepers and others are requested to note the following change in the place of meeting of the State Convention :

Please change the place of meeting of the Kentucky State Bee-Keepers' Association, as announced in the BEE JOURNAL, from the Exposition at Louisville, to Eminence, Ky., on Sept. 2 and 3. N. P. ALLEN,
Sec. Ky. State B. K. Society.

☞ The fifth semi-annual meeting of the Western Bee-Keepers' Association will be held at Independence, Mo., on Sept. 17, 18 and 19, 1884. C. M. CRANDALL, Sec.

☞ The Southern Indiana Bee-Keepers' Association will meet at Madison, Ind., on Sept. 4, 1884, at the Fair Grounds. DR. FIRTH, Sec.

For the American Bee Journal.

Sending Queens by Mail.

G. M. DOOLITTLE.

Having had considerable experience in sending bees by mail, and having conducted some experiments relative to the food necessary, and the temperature best for bees in confinement, I thought a few items relative to the matter might be of interest to the readers of the BEE JOURNAL. Prior to 1880 the sending of queens by mail was a mere lottery, inasmuch as the chances were nearly as favorable for the losing of the queen thus sent as they were for her safe arrival, and especially if the distance was great enough to keep the bees confined to the cage a week or more.

During the above named year I experimented with several kinds of cages, provisioned with different kinds of food, and kept them in my shop for a period of 21 days. In each of these cages was placed a queen and 10 bees, and once or twice every day I threw the cages about the shop so as to give the bees something of the rough usage they would get in the mails. Those living the longest, or 21 days, had honey in the comb for food, but as this was not allowable in the mails, I dare not use it. The next best was a cage containing a candy made of pulverized sugar and honey; but as I did not know how to keep this in the cage, as Mr. I. R. Good afterwards invented, I was driven to accept the next best thing, which was cream candy. If this was made just right, I had good success in keeping all the bees alive from 10 to 14 days; but if too hard or too soft, I lost heavily in the mails, and could not keep the bees but a few days in the shop. Thus my experiments were anything but satisfactory with what was allowable in the mails.

The next season I began experimenting to ascertain the age the bees should be to best withstand a journey when confined to a diet of cream candy. Several cages were used, and I found that if the young bees from 3 to 5 days old were taken just as they had filled themselves with honey, they would live in the shop from 15 to 18 days, but a confinement of $\frac{1}{2}$ that time in the mail bag would generally result in their death. However, as a whole, I was quite successful during 1881 and 1882, losing only about 1 queen out of every 25 sent.

In the fall of 1882, I commenced to use the cage and candy as used by Mr. Good at that time; but in 1883 I used the candy as I had made it in 1880, using pulverized sugar in place of granulated, as it made less litter in the mail bags. During the year 1883 I lost but about 4 queens out of some 300 sent in the mails, some of which were 14 to 16 days enroute.

Those which died were the ones that went to the warmest points, and which were subjected to the greatest heat. The past spring I went to experimenting regarding the proper degree of heat in which caged bees would live the longest, and although this matter of heat and cold may not be controllable where bees are shipped by mail, still the matter is not without interest, and we can, to a certain extent, modify it by the ventilation of our cages.

When putting my depopulated and empty lives out of the bee-cellar, after the loss I told you of in the BEE JOURNAL, I found several hives with so few bees in them that I knew they could not pull through to settled warm weather; and having promised several queens to different parties, I thought that if I could save the queens from these depopulated colonies, that I could use them to take the place of those sent from full colonies. Accordingly I began to look about for a place to keep them. I placed a thermometer on the mantletree near the pipe from a coal-stove which was kept burning night and day, when I soon ascertained that the temperature gave an average of 87°, going as low as 75°, and getting as high as 94°. Cages were prepared the same as for shipping queens, and the queen and 10 bees were placed therein, when they were placed on the shelf. The warmth soon made them happy, and a joyful hum, as I supposed, was to be heard nearly all the while night and day. At the end of 3 days, the first bee died, and soon others followed till at the end of 5 days all were dead except the queens and a bee or two with each.

Supposing that the lives of these bees were necessarily shortened on account of their confinement in the cellar during the winter, I thought nothing of their dying thus soon; but when I found that young bees which were now introduced into the cages lived scarcely as long as the first had, I began to wonder at it. After again putting a new lot of young bees into the cages, I placed them to the farther end of the shelf, where the temperature was not far from 80°, when I found that this lot lived on an average about 7 days, when I again had to renew the bees.

Just before this I had placed the thermometer in one of the drawers of my secretary, which stood the farthest from the stove, of anything in the room, where I found that the highest point there reached was 73°, and the lowest was 55°. I now placed the replenished cages in this drawer, and much to my surprise not a single bee had died after they had been there 18 days; and when at 24 days I used the queen, nearly $\frac{3}{4}$ of the bees were still alive.

It might be interesting to tell in detail how long these queens were in getting to laying after introducing; how some laid sparingly and others did well for a little time; how they gradually failed, etc., etc., but it would make this article too long, as well as being foreign to the subject. Suffice it to say that all are now dead,

thus showing that such long confinement is injurious to any queen.

In the drawer, whenever the mercury went below 65° (which was more than $\frac{1}{2}$ of the time), I found the bees in a sort of stupor, all clustered close about the queen; while if it went above 70°, I found them restless and humming as they did on the shelf. I believe, could I have kept them at an even temperature of 60° to 65°, they would have lived two months.

From the above we get a clue to the reason why bees and queens live in the mails so much better in moderate weather than they do in excessive hot weather. It is now a wonder to me that bees stand it as well as they do in the mails, when the mail-bag is often left for an hour or more in the hot sun, which must heat the contents to a pitch almost beyond the limit of insect life. I now ventilate my cages according to my best judgment, and so far have not lost a single queen, this season, in shipping more than I had last year at this time. During our late, cold, July weather I sent one queen to Texas without any ventilation except what got in through whole paper and wood, and although they were 9 days enroute, still every bee went through alive.

Borodino, N. Y.

For the American Bee Journal.

Reversible Frames Again.

J. E. POND, JR.

Mr. H. Davies says that he does not quite understand why I am favoring reversible frames in the *Kansas Bee-Keeper*, and opposing them in the BEE JOURNAL. I will endeavor to explain my position:

The editorial note to which Mr. D. refers, was written early this season, and before I had perfected the tests which I had begun last year. I admit that I was a "little too previous" in favoring them as I did in the *Kansas Bee-Keeper*, but my experiments of last year, which were on only one or two frames in a hive, worked so well, and I found, also, that reversing the sections caused them to be filled out so neatly, that I advised their use.

My experiments of this season with a full set of frames in a hive, "do not pan out quite so well;" in fact they prove to me, that while the desired object can be accomplished with them, viz: the getting of frames completely filled out with comb, still the labor and trouble is so much greater, than to accomplish the same thing by using the extractor, that I now advise against them; at least I advise beginners to "go slow" before making the changes necessary for their adoption.

I have already written an article for the *Kansas Bee-Keeper*, explaining my change of base, which will appear soon. I, like all others, am liable to make mistakes; but unlike some others, I am always ready to "own up and acknowledge the corn," when I find that I am mistaken. I was at first very enthusiastic in this "reversible frame" matter, and made

the mistake of praising them before I had used them as much as I ought to before recommending them.

I do not quite understand Mr. Heddon's arguments in regard to the difference in ferocity between pure Italians and the blacks, found on page 469. He there claims the best disposition for the blacks, but at the same time admits that we get the least stings from the Italians. His explanation, that the flying bees are the ones that sting, and those that stick to the combs do not, strange to say is correct; but his explanation, that the natural ferocity of the Italians is what causes them to stick so closely as they do to their combs, and that the extreme mildness of the blacks is what causes them to leave their combs and come for the face of the operator on the slightest provocation, is what puzzles me. He may be correct in drawing the inference which he does; yet I cannot help seeing it just the other way.

One thing, however, I think is certain, *i. e.*, stings we all wish to avoid; and the bees we are all looking after (coming bees) are those which will not fly out and come for us "with a vengeance" every time their hive is opened.

Pure Italians, so far, have proved to be just such bees; and, as yet, we have found no others possessing their natural disposition not to sting; and until a race, strain, or cross can be found possessing the mildness of the pure Italians, together with certain indelible and ever-present marks by which they can always be distinguished, I, for one, shall stick to the pure Italians as closely as they do to their combs, and I shall not be alone in this either.

Foxboro, Mass.

For the American Bee Journal.

Hiving Swarms—Overstocking.

JAMES HEDDON.

The smallest number of colonies that I have ever kept in one area, was 8; and the largest 225. The largest *pro rata* yields I have ever had, was when my apiary numbered not over 35 colonies. (In giving the number of colonies, I always give spring count.)

Now I have no way of determining *positively* that the difference in *pro rata* yields was owing to the number of colonies kept. Of all the apicultural problems, to me this one seems best calculated to keep itself in obscurity. We may change the number of colonies from year to year, but the seasons are also variable; and they vary so slyly that often we have no way of knowing their exact influence upon honey secretion, only by the amount gathered by the bees. The problem is one of vital importance to the growing apiarist, to him who wishes to make apiculture a business, one on a scale large enough to be worthy of the time, attention and labor of a man of thought. Many are the readers of the BEE JOURNAL who are eager to greet anything that may

shed a ray of light upon the dark and foggy problem.

Mr. Pond has just made some assertions upon the subject, but he has not yet given us anything like proof, nor do we see how, where or when he had the opportunity to gather any such knowledge as he claims to have. Previous to reading his article, I had not the least idea that there is in these United States a man who believes that a single acre is capable of supporting "25 or 30 colonies," and giving "at least 100 pounds of surplus" to each colony. Now, while I do not know that Mr. P. is in error, I do know how far my bees work to advantage. I also know *about* what proportion of the land in that area is white with clover blossoms. Figures that never lie, tell me that to utilize this one area, we must keep about 25,000 colonies in our apiary, or in this field, if Mr. Pond's estimate is correct.

I never supposed that any one thought that flowers secreted and evaporated their nectar every five minutes. I thought that they were hours and days about it. I know that basswood nectar is very thin the first day of secretion, and only gets to be quite like honey on the fourth day of secretion. I did not know but that the nectar of the first day remained in the blossoms (if not gathered) for several days. I know that there had been a decline in the gold price of honey. Some way or other I do not seem to get more than about half as much for honey as I used to, and even at that have hard work to dispose of the choicest grades; while I have letters of 12 years ago, urgently soliciting cash purchases of my crop. Well, perhaps this difference of understanding is owing to the difference of surrounding influences between Mr. Pond's location and mine.

Mr. G. M. Doolittle writes wisely in relation to the difference in the actions of bees and flora and weather in different locations, causing bee-keepers to entertain such different opinions. This brings me to a desire to give some of my earlier experience in "hiving swarms," since my experience differs so widely from his, as given on page 487; and so perfectly accords with Mr. Hutchinson's, as given on page 437.

As far as mutilating fruit trees is concerned, no one could tell where we had kept an apiary for the last ten years. I do not now remember just when I have had a swarm bother me by alighting on the trunk of a tree. They sometimes do so, but a little experience in that line teaches us how "dire evils fade if wisely met."

To show you how differently queens act here, I will say that among our clipped queens of years ago, and the overloaded ones of to-day that go down into the grass (and it is pretty short grass too), we very seldom, if ever, find them unless we are on the spot when they come out at the entrance. Many times we have looked for the queen by the attention of workers, and not more than one time in ten have we ever seen the workers pay any attention to her. On several occasions we allowed them to crawl

to see where they would go, and one time, I well remember, the queen went into a hive more than 4 rods away, and was stung and dragged out.

For years we have been using such capturing-cages as Mr. D. describes, and we have in the yard some frames about 3 feet square, covered with wire-cloth; and if one of these is set up slanting outward, in front of the entrance, just as a swarm commences to issue, nearly all the issuing bees will crawl upon it. The queen being heavier, according to wing-power, is almost sure to, when we can very easily capture her, with the cage described by Mr. D. We must be on hand at once when the swarm starts. This we cannot always do, and the result of it is of not so much importance either. At least not here.

In place of "sheets" we use large cheap spreads of second-hand burlap, only because it is stronger and cheaper. We found, like Mr. D., that we could stop the queen from running out by not letting her run in until after a portion of the workers had declared "a home." That works here. Why will they run in with the queen outside? Because they do not seem to attach much importance to her, whereabouts until they all become settled and quiet, when they find that they are destitute of her upon whom the perpetuation of the colony depends.

Now, for this same reason we could never get the bees to cluster any where at will by attaching the queen to that place. Years ago we tried the pole and dry mullein-heads; also a bush and the mullein-heads. We also would quickly attach the cage containing the queen by the use of the annealed wire to a branch of an apple tree, about which they were thickly circling; but they never seemed to recognize their "ma." I recollect only one instance among many where they "went for that cage."

Mr. E. W. Jenkins, now of New Buffalo, Dakota, has assisted me with these and other experiments many times. More than one-half of our queenless swarms would alight, clustering the same as usual, and hang there for hours, if not removed by force. Bees sometimes act very differently from what they do at other times. Quite often, when dividing up a big bundle of simultaneous swarms, as Mr. D. spoke of the bees given to each queen being of several colonies, we find it necessary to cage and introduce the queens to prevent "balling." I have also tried the plan Mr. D. speaks of, to tell from what colony the unobserved swarm issued; but we now use what here suits us better, as it is quicker and prevents "forgetting all about it." We hive the swarm, wait until they are all in, and then having previously saved a gill of the bees, put them into a quart cup with a small handful of flour, shake them up thoroughly, and taking them just outside of the apiary, let them fly, then go back into the apiary, and we have no trouble in finding the parent colony at once.

The plan of hiving swarms, as given by Mr. Hutchinson, is just what

we have practiced for several years, and any of my students reading that article with the authors name covered, would have declared that I wrote it. Knowing how easily we learn to overcome the troubles Mr. D. so fears, we still prefer it to any results we can get from clipped queens, with all the conditions and fixtures Mr. D. tells us about. This, we admit, does not prove that Mr. D.'s plan is not best in his apiary.

Dowagiac, Mich.

Spirit of the Farm.

My Plan of Transferring Bees.

ARNOLD DELFES.

In the first place, according to my observation, the stereotyped phrase, "When fruit-trees bloom then transfer", will not do. The nights are too cold, bees do not secrete any wax to speak of, and do not store any surplus at that time. Tearing down combs, honey and brood, at that period, would cause the adjoining bees to go on a vigorous, perhaps even indiscriminate, robbing expedition. I never transfer my bees before May 15, and often not even so early. But after the middle of June, the operation would, in many localities, be rather late, unless linden and sourwood trees were abundant. My way of proceeding is as follows:

Put a table in the shade, cover it with a quilt or blanket, obtain a strong chisel, an oil-cloth, hand-saw, sharp knife, spool of coarse thread, dish for holding honey, a piece of burning half-rotten elm or hickory-wood (a patent smoker is preferred by some), and a clean frame-hive fitted with frames; select a fine day when the bees are well at work, expose some honey, and observe whether the bees will notice it much or not; if they do not, you may safely proceed. Thoroughly smoke the colony which you wish to transfer; and be in no hurry, but give as many returning bees as possible a chance to enter their home. Next, carry the box-hive close to the table, spread the oil-cloth on the ground and set the full colony on the centre; a sheet will answer, but the burning wood, which you have to employ occasionally to quiet the bees, will almost invariably fire the cotton or linen.

Now place the brood-chamber—minus the frames—on the old stand and put on the lid. The bees which may still return will hover around it, but, as yet, will show no disposition to enter. With the chisel you next take off the top of the stand which you work on; if a box-hive, you sometimes can take out one of the four sides, which will enable you to cut the honey in large, solid pieces. But usually such cannot well be done—never in case of hollow logs; in the latter case you must remove the honey in the best shape that you can; for combs filled with honey can but seldom be transferred, though I have succeeded in a few cases. If the combs are well fastened to the sides, take the hand-saw and saw off

the cross-sticks next to the wall. Sometimes it is advisable to cut but one, sometimes it is safe only to saw off but one end, and then again the newly-formed end for about two inches—this latter, if the combs are very heavy and depend for their main support on the cross-sticks.

After this, take the hand-saw, or a long blade, and remove one of the outside combs; it generally has to be mutilated more or less; the removal of the first is more difficult than all the rest put together. Put this comb on the quilt, take one of the frames which lay on top, mark the inside size of frame on the comb, then fit it into this frame. If a close fit, no wrapping with thread will be needed, otherwise the necessity exists. Some use what is termed "transferring clasps" made of tin; others, specially prepared wires. Always let your first choice be those pieces containing the most of the brood, especially if capped over; reject, however, all drone brood, also empty drone comb, unless the queen be very choice. If the remaining piece of comb is too small, save it for wax, like all offal; but two or more may be patched together, some fastening then being needed. As fast as the frames are filled, or partly filled, carry them to the empty hive. After the lower story is supplied, put on the second; proceed as before, and let as many brood or worker-combs be saved as possible. You will but seldom have enough to fill both stories. Give, therefore, empty combs, if you have them; otherwise, sheets of foundation, or even strips of foundation, fastened to the top-bar. The small, empty pieces of worker (not drone) comb that almost invariably accumulate, should not be used for wax; fasten them, too, to the lower side of the top-bar, because the bees will then build with far more vigor and exactness. It is generally warm enough to make the small pieces adhere by mere pressure, but sometimes artificial heat becomes necessary; also, a cement made of heated wax and rosin is recommended.

One very important point to be observed is this: Never let the sun shine one instant on the brood, especially that not capped over. This is the reason why the transferring-table must stand in the shade. After all combs are transferred carefully, lift off the now almost empty stand; on the bottom will be found the bees; carry them on the oil-cloth to the entrance of the new hive and brush them in. If possible make sure the queen enters. In most instances they will stay; in a few isolated cases have I known them to resist stubbornly, and leave *en masse* next day. The way to do then, is to remove a strong colony while at work, and put the transferred comb and hive containing them, on their plate. If a queen can be given, so much the better. A sealed-over queen-cell will do, but even in the absence of them, the returning bees will generally rear a new queen.

I finally wish to make a few general remarks. Most writers recommend

driving bees into a box by noise or smoke, but with me this has always been slow and often impracticable work. I much prefer the plan that I have suggested. It is also well to mention, that shortly after having cast a swarm, a colony should not be transferred, as there is too great a danger of destroying the queen-cells. The case is, of course, different if a queen has been hatched. If weak, transfer and put together two and even three colonies; it is customary in that case (if job-work) to charge for but one. In this neighborhood, the usual price paid is fifty cents for each colony, unless the number exceeds one dozen; then thirty-three and a third cents is customary. As usual, it will be found true economy to hire experts to do the work; this rule holds as true in transferring bees as in anything else.

For the American Bee Journal.

"Honor to Whom Honor is Due."

A. A. FRADENBURG.

Hold, gentlemen! you are entirely wrong. In the first place I fear that you are letting a wrong spirit come up. Can we not discuss our case in a pleasant and friendly manner? In the second place, you are wrong in your conclusions of what I have been writing, and I think there is a good deal of very careless reading.

Let me here state that to the readers of the BEE JOURNAL I am comparatively a stranger, having never taken it nor written for it before this year; but the *Gleanings in Bee-Culture* I have taken, and written for, nearly all of its lifetime, so I am better known by its readers. I have written for the press more or less for nearly 20 years, but have never been so severely criticised as I am now by Mr. W. Z. Hutchinson, on page 483 of the BEE JOURNAL.

I will now see what I can prove in the way of defense. In the first place, I have never claimed that I first discovered the "pollen theory" as he states. The changing of a single phrase, word, or even a letter, many times changes the meaning of a whole sentence, and places the writer in a bad light.

In my article on page 455, I said, "Mr. P. closes by saying, he (the bee-keeper) who first discovers the 'cause' of bee-diarrhea will receive the heartfelt thanks of his grateful brethren. Now, I claim to be that one." Mr. H. has changed the word "cause" to the word "theory," and the Editor has made the same error in his comments. Now, do the two words mean one and the same thing in this connection? I think not. The first discoverer of the "pollen theory," as here applied, I think means the first one who thinks of or suggests that pollen is the cause of bee-diarrhea. Hold! Such a theory may be false, or supposed to be false until it is proven true.

Now, let us see who has the best claim to the priority of the "pollen

theory," Mr. Heddon or myself. Mr. Hutchinson says: "Has Mr. F. so soon forgotten that Mr. Heddon reported, about a year and a half ago, how he (Heddon) produced diarrhoea at will, by feeding stores well mixed with flour for pollen?" Has Mr. Hutchinson "so soon forgotten" that I reported, more than three years ago, that I had produced bee diarrhoea by feeding flour mixed with winter stores? If he has, I will ask him to turn to *Gleanings*, Vol. IX, page 189, under date of March 14, 1881, the article is headed, "Pollen and its Relation to Dysentery." Now, if he will turn to page 172 of the same volume, and towards the last of his article, Mr. Heddon writes on May 11, 1881, "I, this morning, received a letter from Mr. Shuck, and he suggests the idea that vegetable matter is the cause of the trouble, etc." Now, notice dates and see who has priority, between Mr. Heddon and myself. "Honor to whom honor is due."

In my article referred to in *Gleanings*, I refer to the Robinson letter, which letter will be found on page 151 of the same volume, and to him I think the honor is due of first discovering the "pollen theory."

Again, let us turn to Mr. Hutchinson's article. A little further on he says, "And why Mr. F. should consider his the 'first' experiment is beyond my comprehension." I did not consider my experiment the "first," neither did I say so, nor intimate such a thing. I stated that I had made such an experiment, and gave the result. Again he says, "Mr. F.'s experiment resulted in exactly what Messrs. A. B. Mason, Kohnke, Oatman, Heddon, myself, and many others would willingly have staked our reputation upon that it would." And what is that? That it shows that where there is pollen there is diarrhoea, and where there is no pollen there is no diarrhoea.

Why did not Mr. Hutchinson, and the many others he speaks of, do something, as well as Mr. Heddon, to prove what the cause of the disease in question is, if they could risk so much as he says? Surely, I think there is no question now before the American bee keepers of any greater importance than this one of bee-diarrhoea. Again, Mr. H. says, "But because Mr. Pond put him (Fradenburg) in mind of it, it is simply preposterous that he should claim the honor of priority." To this I will say, that from Jan. 31 to the day I wrote my report, it was scarcely ever out of my mind day or night. I have been awake many a time more than half of the night thinking of the subject in all its lights. I think that Mr. Pond will say that he received a friendly note from me, long before spring, saying that I had found the cause of bee-disease; at least I mailed such a note to him.

Mr. T. S. Russell, Secretary of the Ohio State Cider-Makers' Association of Ada, O., can tell you what I told him while riding in the cars from Dayton to Springfield, last March, that I had discovered the cause of

the terrible bee-disease, and that it would be worth thousands of dollars to bee-keepers; and Mr. A. I. Root can tell you that I wrote the same, in substance, to him about the same time. I can name others who I have told about the same thing. Now, is it not strange that Mr. Pond should just happen to "put me in mind of it," to claim the honor of priority.

In regard to the Editor's comments. First he says, "Mr. Fradenburg's assertion that he is the discoverer of the 'pollen theory' is, of course, not proven—merely asserted." Of that error I have already spoken. Next, he says, "He only claims to have started his experiments 'last fall.'" There again he is in error. I did not state when I had "first started" my experiments. If he will turn to page 308 of *Gleanings*, for June, 1883, he will see my report of a similar experiment; but in that I did not state that 9 nuclei had no pollen, but that was the case. I did not claim much for that experiment, as that was a mild winter, and for that reason the cry would have been raised that I could not do it again, or in a cold winter.

I cannot find any report from Mr. Heddon on this subject during the year 1883. In 1882 I find the flour experiment only. Now comes the last question, "Who first discovered and gave to bee-keepers the 'cause' of bee-diarrhoea?" Away back in my article, already referred to, of March 14, 1881, I gave a very little evidence in that direction; and at that time I asked this question, which has never yet been answered in the affirmative: "Can any bee-keeper who reads this show that a single colony of bees has ever had dysentery when they have had no pollen at all?" But the discovery that I base my claim upon, was made on Jan. 31, 1884, and the report was written on May 12 and published June 11; and Mr. Heddon's discovery was made in early spring when he unpacked his bees—report written June 9 and published June 25.

Now, if it was a patentable invention, and both Mr. Heddon and myself should apply for a patent at the same time, the patent laws and rules would most assuredly award the patent to me. A few words more and I have done. My proofs have been questioned for an illustration: Suppose a mess of potatoes should be cooked, and arsenic be put in with them and then given to 45 persons to eat, and they should all be taken sick; then, again, another mess of the same potatoes taken out of the same lot should be cooked and given to 14 persons, without any arsenic, and they should not be sick; now, who is there among you that will not say at once that it was the arsenic that caused the sickness? Is not my report a parallel case? But one says that is no proof because bees had been wintered with pollen and no sickness either. True; but hold on, I have taken arsenic into my mouth and swallowed it, and it did not make me sick either, but that does not prove that arsenic is not poison.

I think that bee-keepers owe many thanks to Mr. Heddon for his numerous, valuable articles and good hints which he has given them. I do not ask for a single item that justly belongs to him, or any one else. I will now leave this matter in the hands of the many fair-minded bee-keepers of our land, and fully trust that they will give "Honor to whom honor is due."

Port Washington, Ohio.

[We give the above article a place in the BEE JOURNAL in order for Mr. Fradenburg to give the proof of his assertion about the discovery of the cause of bee-diarrhoea. In reply we shall only notice his reference to us in the last paragraph but three. We based our remarks about his experiments upon his own article as published on page 374, where he attempted to give his proofs; and there he said nothing of any experiments being made prior to "last fall." We should not be cited to other papers for proof when he attempts to give such proof in this paper.—ED.]

For the American Bee Journal.

Honey-Dew—What is it?

W. C. R. KEMP.

In the BEE JOURNAL for Aug. 6, the Editor cautions honey-producers against selling "so-called honey-dew," and warns them, in very earnest language, of the damaging effect it will be likely to have on colonies which have been so unfortunate as to fill their hives with the vile "stuff."

Nearly all writers on this subject designate this mysterious substance as the product of insects called aphidæ or plant-lice. That it comes from any such source, I do not for a moment believe. Prof. Cook to the contrary notwithstanding. That the Professor may have found plant-lice where he found honey-dew I do not dispute; but does he give satisfactory evidence, or in any way show that these or any other insects produced it? Because both were found on the same leaf, and at the same time, is not evidence that one produced the other, or that one cannot exist without the other. As well might he say, that because a honey-bee and a drop of nectar were in the same flower, that the bee produced the nectar. I am no botanist, nor do I make any pretensions to scientific lore, but I have studied something about this honey-dew, and will give some of the "reasons for the faith that is in me."

I have seen honey-dew in great abundance on the leaves of certain trees when under a powerful microscope, and there were no insects to be discovered. That insects infest the leaves of nearly all kinds of trees and plants, that the leaves of only certain kinds of trees produce honey-dew, and also that honey-dew is

secreted only in the night-time, and never in the day, is all well known; and if the sun comes up bright and hot by 10 a. m., it is all gone, absorbed or evaporated. Hence, I conclude that honey-dew can be and is produced without the aid of insects.

Well, you ask, "How is it produced and where does it come from?" To this question I answer that I believe it to be produced through atmospheric influences; and if Prof. Cook will explain just how the leaf of a tree or plant grows, what gives it its shape, color, and other characteristics, or why one kind of tree contains sweet sap, and another bitter or sour, why one kind of tree produces sweet fruit and another sour—when he does this—then the process of the formation of honey-dew will be easy of solution.

Honey-dew is formed only upon a hard, smooth, glazed leaf, such as the poplar, oak, and others of like character, while it is never found upon a rough, soft, porous leaf. Why? Because the leaf of this kind absorbs it, passes through the twigs into the sap, and gives the sap of such trees its sweet taste; while the smooth, glazed leaf holds it on the surface to be licked up by insects, or evaporated by the rays of the sun.

I have often heard farmers say that when honey-dew is abundant, that "sugar-water" will be the sweeter; and so it is. It will be found that where there is a superabundance of bloom of all kinds covering the earth or any particular section of country that honey-dew will be more abundant, and in proportion to the quantity, the sap of the sugar-tree in the spring will yield more syrup.

In view of these facts, I am led to believe that honey-dew is produced from the aromatic exhalations of flowers and bloom with which the earth teems in the spring and early summer under certain atmospheric influences and conditions; and by some unknown process of Nature's mysterious laboratory, is distilled, and settles upon the trees, shrubs and plants, certain kinds retaining it, and others absorbing it. Is not the theory here set forth—in so imperfect a manner—more reasonable, and more pleasant to contemplate than to suppose that so necessary a product as honey-dew is the work of insignificant insects? I have some of this stuff, "unworthy the name of honey," mixed with the honey stored in my hives this season, and my customers say it is the best honey that they have ever eaten. My family have eaten honey this season that they have not relished before. I have no fears of any damaging effects on my colonies for their having in possession honey-dew mixed with other honey.

Orleans, Ind., Aug. 8, 1884.

[There are many different kinds of sweets called "honey-dew," and if that mentioned by Mr. Kemp is so nice, it is far different from the vile "stuff" which we mentioned as being placed on our desk, and all other samples which we have seen.—ED.]

From the Current.

Song of the Bee.

ERNEST M'GAFFEY.

On wings that brush the morning dew,
I search the meadows over,
And in my wayward flight I drink
The breath and life of clover;
The wine I sip is dew-distilled
For Summer's busy worker,
In nectar sweet that dwells within
The waving fields of clover.

Through all the golden days of June
A thousand knights were scattered,
And as they charged down the fields
A million shields were shattered.
A million shields of clover bloom,
In meadows bright and sunny,
Were shattered on their native heath,
To yield a jar of honey.

And through the wintry days my hoard
Weaves strange and mystic fancies,
Before men's eyes, in gladsome guise,
The light of Summer dances;
Beneath a cloudless sky they see
The clover-fields and tansy—
The sighing woods and velvet moss,
The violet and pansy.

The lofty walls of crumbling stone
Where honeysuckles quiver,
As in the breeze they nodding bend—
Toward the flowing river—
And springing grass, and rustling leaves,
That welcome ev'ry comer,
As in a dream will float along
And softly whisper—"Summer!"

For the American Bee Journal.

The Qualities of "Honey-Dew."

J. A. BAYARD.

Is it really honey or simply a saccharine matter that exudes from the leaves of the trees? Some persons, I know, attribute the whole thing as the result of aphidæ or plant-lice. This I hold to be impossible, as the whole work appears to be done in the night time, and it is found exclusively on the upper surface of the leaves of the trees, and in such quantities that no number of insects could furnish the fabulous supply.

It is seldom ever noticed except under peculiar conditions of the atmosphere. Just such a drought as we have now passed through, is prolific of such results, especially when it occurs so early in the summer.

About June 25, I noticed that my bees were diverted from the clover (which was badly smirched by the drought) to some other source of supply, from early dawn until 10 or 11 a. m. They worked vigorously and filled up rapidly with basswood and sumac, as I supposed; but I soon found that the color of the honey was about that of Orleans molasses, and that of the combs when capped, was about that of an old brown hat.

The question comes up: What shall I do with the honey, as I have in store from 600 to 800 pounds? I do not like to eat it, do not like to sell it, and of all things would not feed it back to my bees to winter on.

As the drought affected a large scope of country, there are doubtless hundreds of bee-men in the same dilemma as myself.

If Prof. Cook or Prof. Burrell, or both, will give us, through the BEE JOURNAL, the exact qualities of honey-dew, I think it would be gratefully received.

Athens, Ohio.

For the American Bee Journal.

Philadelphia Picnic.

The train which left the depot on July 26 for Germantown, shortly after the dinner hour, had on board a happy band of pleasure-seekers. Large baskets packed as full as was possible, were stowed away, hearty greetings exchanged, and anxious inquiries made for such members as had been overlooked in the general *melee*. This was the special summer picnic of the Philadelphia Bee-Keepers' Association bound for the apiary of Vice-President Arthur Todd, of Germantown.

Arriving at the apiary, Mr. Todd had all he could do to welcome the bee-keepers, who suddenly swarmed all around him with a greater buzz than ever sounded in his ears before, even in swarming time.

The apiary is situated on the slope of the hills rising to great height on either side of the stream, the dwelling-house standing in the centre closely surrounded by bee-hives on every side, numbering 80 or 90. The house itself was as much adapted for sight-seeing as the apiary proper; for here were rooms fitted up respectively, as work-shop, honey-room, and a room where the honey-extractor standing prominently in the centre, and surrounded by honey-glasses, jars and bottles, uncapping-knives, uncapping-cans, comb-buckets, strainers, and stacks of one-pound jars full of honey neatly labeled and ready for the market. In the work-shop were hives and other fixtures in various stages of completion, heaps of hives and frames in the flat, cakes of wax and sheets of comb foundation, smokers and bee-veils, section-boxes and other bee-fixtures too numerous to mention. The honey-room contained mostly extracted honey, which was being filled into jars for selling to customers.

Work was at once begun, veils were brought forth, the ladies tucked under the same with particular caution, and the members who "did not mind a bee-sting at all," and who regarded a bee-veil as superfluous, alike gathered around the colonies. Hive after hive was opened, frames lifted up, the queen pointed out, the brood carefully looked over, the bees shaken and brushed from the combs of sealed honey, and soon the extractor was whirling out the liquid sweets. All seemed to enjoy themselves highly, everywhere could the happy faces be seen, bending over the hives and viewing their teeming population, and discussing the relative merits and honey-gathering qualities of each colony.

There were present bee-keepers from the neighboring States of New Jersey and Delaware, and from the adjoining counties in Pennsylvania. As the afternoon advanced, the three-banded Italians, of which Mr. Todd possesses a magnificent strain, were much admired. During all these manipulations not one sting was received by anybody.

At 5 p. m. the apiary had settled back into its accustomed peaceful

hum, and the bee-keepers were assembled on the steep cliffs overlooking the apiary. Here the fore-thought of Mr. Todd had provided a long table and benches under a grove of trees, also a camp-fire of great logs.

To the left of the grove, Mr. Todd had four acres planted with sunflowers, just opening into bloom, from which the bees were already seen to gather honey. Mr. Todd stated that he used the leaves as forage for his cattle, and intended to utilize the seed for feeding his poultry, besides giving the bees a chance at the honey secretions. To the right were five acres recently sown with buckwheat, which had not yet made its appearance above ground.

Dr. Henry Townsend, President of the association, then addressed the meeting, making appropriate remarks upon the success of the picnic, and winding up with a good bee-talk, which was listened to with earnest attention. Miss Dora Davidson, a young lady of about 12 summers, recited from memory the following original poem, commemorative of the last meeting of the association at the apiary of the secretary, F. Hahman, Jr., which was held about two weeks before:

A MESSAGE TO THE BEES.

One eventide,

At closing of a glorious summer day,
A band of desperadoes bent their way,
In zigzag path along the dusty road,
To hahman's (or Hahman, his) abode.

What seek they there?
Their forms are masked, with meek and cringing
air
They shun the house, none will an entrance dare;
And while the timid whisper, "I'm afraid,"
The hardened ones reply, "Be not dismayed."

With soft accent,
Then up and spoke our noble President,
"Comrades assembled here with one intent,
For deeds of plunder we are here to-night,"
(Novices now shivered with affright.)

"Though small, I wean
Well armed the foe with poisoned weapon keen
With which they bravely fight for home and queen;
And history tells how they have brought disaster
To many a grave and dignified bee-master."

"Ere I have done,
I cautiously would say, let every one
Who would before the setting of yon sun,
Enrich himself at our weak foe's expense,
Enshrouded wait in ambush by the fence."

"Sire! we obey."
The thieving band now softly went their way
To where the peaceful slumbering village lay;
They hear the busy hum of honest work,
And some draw back, as though the task they'd
sirk.

Asmodens-like
They tear the roof from palace and from hall—
But what is this they hear—a dismal squall!
"I'm wounded!" "Help!" "Oh, not for any money
Will I again steal anybody's honey."

Next, the baskets were unpacked, and soon the long table was covered with the good cheer which they contained: and the pleasure-seekers suddenly seemed to realize that they were truly hungry, for the eatables soon disappeared amid rallies of wit and good humor.

As night was now approaching, the homeward journey was begun; not, however, before the members had tendered a vote of thanks to their kind Vice-President for his untiring attentiveness to insure every comfort for his guests, and the trouble he incurred to make their visit a pleasure. Long will the memory of this picnic be cherished in the hearts of its participants. F. HAHMAN, JR., Sec.
DR. H. TOWNSEND, Pres.

For the American Bee Journal.

Marshall Co., Iowa, Convention.

The Marshall County Bee-Keepers' Association met at the Court House in Marshalltown, Iowa, on July 5, 1884, with the President, Mr. J. Swift, in the chair. The minutes of the previous meeting were read and approved. The Secretary then read the Premium List of the coming Fair, to be held at Marshalltown, on Aug. 26 to 30 inclusive.

The Secretary stated that the premiums offered were not high, for the Agricultural Society could only donate \$25 to the Apiary Department this season. Our great object should not be for the money we may obtain in premiums, but that we should make this one of the most interesting departments of the Fair, whereby we may learn from each other of the many wonderful things of this important industry; and also excite an interest in the general public, which will add to the ready sale of our products. Several present thought that it could be made one of the most interesting departments of the Fair. A part of the premiums are to be raised by the bee-keepers' association: and several dollars are already subscribed for that purpose.

The essays were then called for, and the Secretary stated that he had received an essay from Mr. Putnam, of Holland, Iowa, to be read at this meeting, as he could not be present. The Secretary then read Mr. Putnam's essay on

REQUIREMENTS IN MODERN BEE-KEEPING.

A good bee-keeper always needs skill, but in the changed conditions of modern bee-keeping, a different kind of skill is needed from that required by our fathers and grandfathers. This is more largely the case in the West than in the East, but true in both places. Formerly it was mostly manual skill in the use of simple implements, such as the straw-skep, the log-gum, and the common box-hive; but now the apiarist needs to know how to adjust his hives and care for his bees in order to produce the greatest profits.

Bees properly handled call for little manual expertness to manage them; but to manipulate the present implements, requires a degree of mechanical skill that a large proportion of our bee-keepers do not possess. To comprehend the full extent of this, compare the modern Langstroth hive with the old-fashioned box-hive, or the old-fashioned Langstroth to the one of the present.

Every careful observer must recognize the fact that the lack of skill in managing and caring for his bees, is one of the most potent sources of loss to the apiarist. We have known one man to care for 100 colonies as cheaply as another one would 30 colonies—the former buying and using only what was really needed, while the latter bought more than he could use, thinking that the supplies produced the desired results. Economy

is wealth." is an old adage, but it does not apply to apiculture with more force than to any thing else; and to be too economical does not pay any better than being too extravagant. Using only what is needed, and no more, will produce the best results.

According to appointment, Mr. J. W. Sanders then read the following essay, entitled

THE NECESSITIES OF MODERN BEE-KEEPING.

To become successful bee-keepers we must post ourselves well on the many things relating to the "busy bee." In order to do this, we need to procure some good books on this subject, written by practical bee-keepers who have made this great and wonderful study of the honey-bee a life work; and who are able to give us many invaluable and instructive lessons, showing how to become successful in apiculture.

Another necessity is some good bee-paper published in the interests of bee-culture, by which we may keep ourselves posted of the many interesting things which are connected with this great industry.

We think that the first thing in order to become successful, is to use a hive that is plain, cheap, simple of construction, and easy to manipulate for all purposes. We want a hive which contains movable frames in the brood-chamber, and one that is similar to the other hives in the same apiary. Then we can exchange the combs or frames from one to another whenever necessary, which we find is often the case where we have a number of colonies to look after. A movable-frame hive also allows us the privilege of examining a colony whenever it is necessary.

Where we allow natural swarming, it is best that we examine the colony in about two weeks after the first swarm has been cast, and see that it contains a laying queen; and if it does not, we can give them a comb from another hive containing eggs and brood, or else give them a laying queen if we have one at hand, which will save much valuable time. By this means we often save a valuable colony of bees, which, without this assistance, would in a short time dwindle down, and perhaps finally be destroyed by the moth. We say that the worms have destroyed some of our colonies of bees, when the truth is, it became queenless and then beeless, and then the moths took possession.

I think it necessary to examine colonies late in the honey season, and see that they have plenty of brood and young bees for the coming winter; and if they do not, empty combs or frames may be inserted in the centre of the hive, and thereby obtain plenty of young brood, thus preventing "spring dwindling."

At this stage of the season we will find the extractor a good thing, for we can empty some of the combs which are full of honey, and place them in the centre of the hive, and by this means obtain some good honey, as well as

plenty of young bees for the coming winter.

Another important article for a progressive bee-keeper to possess, is a good bee-smoker—an article after once using, he will not do without. To be successful we want plenty of empty hives in readiness for the increase, then we will not be compelled to use hives which are not similar to the one already in use. It is also well to have our surplus arrangements previously prepared, for we may need them when we do not have them at hand, and thus be compelled to use any old box for the surplus honey, instead of the nice and neat sections which are more convenient to use, and more attractive to the buyer. I have not attempted to give all the necessities of the apiary, but of others I leave each bee-keeper to judge for himself.

Discussions of questions being next in order, the President asked, "Is it advisable to put empty combs into the centre of the hive?"

J. W. Sanders: Yes; if the central combs are full of brood, one or two combs at a time may be added near the center, to an advantage; or if you do not have combs, empty frames may be added, and you are sure to get nice straight combs built. I had a number of combs built that way last season, and they were generally clear from drone cells.

"Why do queens enter the surplus receptacles?" Mr. Cover said, for want of room in the brood-chamber. Mrs. Van Meter said that she had one colony which had all drone brood and no sign of worker brood, and asked, why is it? Mr. Cover and the Secretary made a few remarks, stating that it was queenless, and was occupied by a fertile worker, which always produced drones. The brood of a fertile worker is easily detected, for the worker cells, when capped, instead of being smooth, are very uneven; and you will find eggs laid without any regularity, many cells being missed, and others with several eggs in them. As a remedy, uniting it with some other colony, or giving it a queen, or means of rearing one, were advised.

The subject of "Summer Care of Bees" was then discussed. Mr. Cover said that he worked for honey and not increase; that he began in the spring with 58 colonies; and that he stimulated early breeding by feeding rye flour and oatmeal until plenty of natural pollen appeared. By this means his bees get through with swarming early, and are ready for the honey harvest. His first swarm issued on May 14, and the last one on June 5. He had 34 swarms by May 24, and had saved only 11 swarms. He said that he works it in this way: When the first swarm issues, he destroys the queen, and the swarm returns to the parent colony. When second swarms issues, he captures the queens and returns the swarms, or else unites two or three swarms. At the same time he gives plenty of surplus room. He has some Langstroth hives which have on three sets of five-pound boxes. Up to this date, July 5, he had taken off 200 five-pound boxes, and had 300

more in which the bees were working; the majority being about ready to take off.

The question, "How do you capture the queen?" was asked him. Answer: As she comes out, if he is at hand when the swarm issues; and if by any means he should fail, he hives them in a box kept for the purpose, shakes them out upon a sheet, and tries it again.

On the subject of swarming and hiving bees, Mr. Cover gave some very good instructions which all seemed to appreciate.

G. W. Calhoun: "How late is it advisable to put in comb foundation?"

President: As long as the honey season lasts. The President then being called upon to give his methods, said that he began in the spring with 7 colonies, and now has 14. His bees are doing well. He uses comb foundation; in the first place he used whole sheets, but now uses parts of sheets, and finds that the bees worked it out and made nice, straight combs. He had filled the whole space in the sections, but in the future would use only a little as comb-guides. He does not expect to come up to Mr. Cover this season. He thinks that exposure to the air hurts honey, and would like to hear what Mr. Cover thinks of it. Mr. Cover said that it makes some difference. He closes the entrances to his boxes by pasting something over them.

The question, "Where do you keep honey," was answered, "In a dry place, the dryer the better."

The President further said: We, as bee-keepers, want to pay some attention to the sale of our honey. In the first place, we want to have it in a good shape to suit the market, and every thing neat and clean, for the appearance will help to sell it. We must not be in too great a hurry to sell, but wait until there is a demand, and hold out for good prices.

Mr. Cover, on honey sales, said that he sells when the price suits him, and always holds out for a good price on first-class honey in good shape, and always gets his price. He pays no attention to an inferior article in poor shape and low price; for he finds that buyers prefer the good honey to the poor, and are willing to pay for it. He sells comb honey at 20 cents per pound, and does not produce any extracted.

Mr. Cover further said: Do not be scared about our honey crop, for there may be a crash to it like there was last season, and get no fall honey. There may something else happen so that the crop for the season may be short; therefore, I would advise all to hold out for paying prices.

Mr. Wickersham: "How do you get the bees out of the boxes?"

Answer: When the honey season is good, put the boxes into a shed and let the bees go out themselves. If the season is poor, place them in a dark room and give a ray of light. Boxes to be taken off in the morning.

Many other good things were said, that we did not record. By motion, G. W. Calhoun, G. W. Reeler and Mrs. J. M. Van Meter were appointed

a committee to assist the Superintendent of the Apiary Department at the Fair.

The subject for the next meeting is "Fall and Winter Care of Bees." Adjourned to meet at Marshalltown, Iowa, on Oct. 4, 1884, at 10:30 a. m.

J. W. SANDERS, Sec.

JOSEPH SWIFT, Pres.

For the American Bee Journal.

Hints about the Michigan State Fair.

H. D. CUTTING.

The Michigan State Agricultural Society have furnished a fine building for the "Bee-Keepers' Department," (size 48x32 feet) on an improved plan, and it is hoped and expected that the bee-keepers of Michigan and surrounding States will turn out and crowd it. We know that several of our prominent apiarists are preparing to make a very large exhibit; in fact, we have every reason to think that it will be the largest and finest exhibition ever held at any State Fair.

The Premium List is very large, amounting to \$300. The judging is to be done by an expert employed for this department. This is a new feature, and I trust that it will give the best of satisfaction. Exhibitors feeling the importance of our exhibitions are now making application for space, and we also expect several lady exhibitors.

As a place of interest to bee-keepers, I know of nothing that will give you as much satisfaction as to attend our State Fair. You will see a great many new appliances that will help you. I know of several important implements used quite extensively by bee-keepers that were first thought of by seeing something on exhibition in our department. A great many articles will be on exhibition that have never been placed there before. We are to have a comb-foundation machine making foundation during exhibition hours.

Application for space, Premium List, or any information connected with this department, should be made to me.

Clinton, Mich.

The Western New York and Northwestern Pennsylvania Bee-Keepers' Association will hold its semi-annual meeting at Jamestown, N. Y., on Sept. 1 and 2. A general invitation is extended to all bee-keepers. W. A. SHEWMAN, Sec.

The Ohio bee-keepers will hold meetings in which they will have lectures, essays, and reports from bee-keepers, during the Ohio State Fair, which will be held at Columbus, O., Sept. 1 and 5 inclusive. All interested in bee-culture are cordially invited to attend. C. M. KINGSBURY, Sec.

Dr. H. BESSE, Pres.

Letters for publication must be written on a separate piece of paper from items of business.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares — therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

How to Winter Bees.

I have 5 colonies of bees, and am in doubt about the best manner of wintering them. If I should put them into the cellar under my house, will they affect the health of the family living immediately overhead?

W. M. CARR.

Bradford, N. H., Aug. 1, 1884.

ANSWER.—There is a diversity of opinions regarding in-door vs. out-door wintering. My own opinion is, that when we have the inside of the hive in proper wintering condition, or perhaps I may say in any condition, in-door wintering is safest for the latitude in which you live, taking one winter with another. No, the bees will not affect the health of your family.

Transferring Bees.

1. How would you successfully transfer bees from a common to a Langstroth hive?

2. What would be a reasonable price to pay for a colony of common bees?

C. W. CASTLE.

Prairie City, Ill.

ANSWERS.—1. My answer in full to the question will be found on page 367, BEE JOURNAL for 1883.

2. That all depends upon the season, the time of year, the blood of the bees, the distance from home, how badly you need them, how heavy and large the hive is, how straight its combs are (if you mean to transfer them by the old method), and a whole lot of other things too numerous to mention. With a view of throwing some light upon this subject, I will give a list of values of full colonies according to what I consider them worth in a locality like this, and in the hands of one who knows how, or is trying to learn how to properly manage them. I will give prices of good, average, healthy colonies with good fertile queens all in normal condition on the first day of May. A colony of well-bred bees in a modern hive, with good straight combs, and with but little or no drone cells, the colony going with the body of the hive only, with cover, or if wire-cloth cover, no wood cover, is worth \$8.00; common bees (same) \$7.00; poorer combs and common bees, \$6.00; box-

hive and best bees, \$5.00; box-hive and common bees \$4.00. If bought in the autumn, deduct from the above prices 25 per cent. In any case, if the colony contains a tested queen to breed from, add \$2.00.

SELECTIONS FROM OUR LETTER BOX

Immense Honey Crop in California.

July was a very busy month for the bee-keepers of Southern California. Honey was taken out of the hives by the tons. I estimate the honey crop of these five southern counties at 10,000 tons. During the month of July I took out 15,000 pounds of extracted honey at one of my apiaries of 75 colonies; and will yet take at least 1,000 pounds more. The honey which I took was well ripened in the hive, almost every frame being well capped; and the honey was so thick that it was difficult to extract it. This is one of our good years for honey. The yield is large, and the honey is of most excellent quality.

J. E. PLEASANTS.

Santa Ana, Cal., Aug. 3, 1884.

Honey Crop a Failure Here.

The honey crop in this county (Jersey) is a failure. From inquiries made among bee-keepers, I do not think the average will exceed 12 lbs. per colony, spring count; and there is no prospect of a fall crop, as it is very dry here, and also very cold for the time of year. Bees in this section will have to be fed in order to bring them through the winter.

H. D. EDWARDS.

Delhi, Ill., Aug. 8, 1884.

Crop all that could be Desired.

I have, perhaps, the greatest yield of honey on record, 480 pounds to the colony, spring count. Now, provided we get a good fall crop, my yield, per colony, will be all that could be desired, will it not?

C. A. WHEELER.

Selma, Texas, Aug. 2, 1884.

The Worst Honey Season, so Far.

This is the poorest honey season ever experienced here; less honey and less increase. The quality of the honey is fair. White clover did not yield as well as it did last year. Basswood bloomed sufficiently to give us a fair yield, but just while it was in blossom, a steady cold northern breeze lowered the temperature below the point of nectar secretion, and the bees gathered scarcely more from it than they required to carry them through the dearth which followed. Now, just as buckwheat is out, and boneset is opening, it is so unprecedentedly cold that we fear a frost to night, though the sun shines brightly all day. Much of this state of affairs is quite general, and all we can hope for as an offset, is that it will tend to give

us something nearer old-time prices and ready demand for our product.

JAMES HEDDON.

Dowagiac, Mich., Aug. 8, 1884.

Wild Sensitive-Plant.

Enclosed find a slip of plant that grows all along the railroad here, and my bees have left the buckwheat and gone to this. It is covered with them. Please let me know through the BEE JOURNAL the name of it, and if it is a good honey-plant.

J. L. COMSTOCK.

Sac City, Iowa, Aug. 7, 1884.

[This is the wild sensitive-plant (*Cassia chamechrista*), and an excellent honey-producer. It grows in great quantity all over our part of the country, in land not too dry, and could easily be cultivated from seed.—T. J. BURRILL.]

Large Crop of Basswood Honey.

From 90 colonies I extracted 5,000 pounds of basswood honey, which was gathered in 11 days. I have taken from 80 colonies, spring count, 7,200 pounds of extracted honey, and 1,200 pounds of comb honey; but now no honey is being gathered, or at least a very little, and bees are killing drones.

B. F. LITTLE.

Brush Creek, Iowa, Aug. 12, 1884.

Desiring Progress.

In this section there are several parties who keep bees, but it is pretty much on the old plan, and we wish more light on the subject. I have 27 colonies, but do not get as much surplus as I should. I intend giving more attention to bees from this time on.

W. S. BARTON.

Washington, Ind., Aug. 11, 1884.

Loosestrife.

I enclose a small sample of a flower which the bees here are now working on. Will you kindly give me the name of it, as I am trying to keep an account of the date, etc., of the flora of this section. Our horse-mint has made another complete failure this season, and the demand for honey is in advance of the supply. I have sold extracted at 10 cents and comb at 15 cents per pound.

FRED F. ROCKWELL.

Leonard, Texas, Aug. 3, 1884.

[Loosestrife (*Lythrum alatum*).—T. J. BURRILL.]

The summer meeting of the Mahoning Valley, O., Bee-Keepers' Association will be held at Newton Falls, O., on Friday, Aug. 29, 1884. All interested are requested to be present. C. R. PAGE, Sec. Pro tem.

The Union Bee-Keepers' Association of Western Iowa will meet in Dexter, Iowa, on the second Saturday in September, at 9:30 a. m. This Association is doing a good work, and bee-men in Western and Central Iowa would do well to avail themselves of its benefits. M. E. DARBY, Sec.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

A Canadian wishes us to state in the BEE JOURNAL, whether we take Canadian money for subscription or books. We do; and for fractions of a dollar, Canadian postage stamps may be sent.

Bingham Corner.

MARENGO, ILL., June 18, 1884.

The Doctor Subdues All.—Mr. T. F. BINGHAM, Dear Sir:—I've used the "Doctor" till its all daubed up with bee-glue, and although at first sight I thought I did not like anything so large, I could not now be induced except by the direst poverty, to do with anything smaller. As a matter of "economy" I much prefer the "Doctor" to any of the cheaper smokers, of which I have worn out several. The "Doctor" has entirely cured me, so that I am now a Bingham man, as my wife always has been. If the somewhat vague remark in your letter means that nothing was charged for the Smoker sent, except the reading of your letter, I shall be very glad of another "Doctor" for the money sent, so that my wife won't take mine from me. Bees just booming on white clover.

Yours Truly, C. C. MILLER.

WOODARD'S LANDING, WASH. TER.

The Best Smoker.—To BINGHAM & HETHERINGTON, Abnonia, Mich., Dear Sirs:—Find enclosed money for 3 Conqueror Smokers, which please send per mail—one to each, Dr. Balch, J. M. Londerback, and H. A. Townner. The Conqueror is the best Smoker I ever used. Respectfully,
 May 17, 1884. H. HASTINGS.

DRESDEN, TEX., May 28, 1884.

Conquer the "Cyps."—T. F. BINGHAM, Abnonia, Mich., Dear Sir:—Enclosed find \$1.75, for which please send, per mail, one "Conqueror Smoker" to Major H. A. High, Waxahachie, Tex. He bought a Cyprian Queen from me, and the Bees have worsted the old gentleman. I told him that the Conqueror Smoker would conquer the "Cyps," as I had tried one for two years, and "it never failed." Respectfully,
 B. F. CARROLL.

BORODINO, N. Y., Aug. 15, 1882.

Cyprians Conquered.—All summer long it has been "which and other" with me and the Cyprian colony of bees I have—but at last I am "boss." Bingham's Conqueror Smoker did it. If you want lots of smoke just at the right time, get a Conqueror Smoker of Bingham. Respectfully,
 G. M. DOOLITTLE.

Prices, by mail, post-paid.

| | | |
|-------------------------------------|-----------|--------|
| Doctor smoker (wide shield)..... | 3½ ineh.. | \$2 00 |
| Conqueror smoker (wide shield)..... | 3 " " | 1 75 |
| Large smoker (wide shield)..... | 2½ " " | 1 50 |
| Extra smoker (wide shield)..... | 2 " " | 1 25 |
| Plain smoker..... | 2 " " | 1 00 |
| Little Wonder smoker..... | 1¾ " " | 65 |
| Bingham & Hetherington Honey Knife, | | |
| 2 ineh..... | | 1 15 |

TO SELL AGAIN, apply for dozen or half-dozen rates. Address,

T. F. BINGHAM, P. M., or
 BINGHAM & HETHERINGTON,
 ABNONIA, MICH.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a continual statement of account.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Aug. 18, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour :

CINCINNATI.

HONEY.—The demand for extracted is fair, and to all appearances, gradually improving. It brings 6½¢ per pound on arrival. There is a small demand for comb honey, but we had small offers only, and a good deal could be sold. It brings 14¢ per pound on arrival.
BEESWAX.—Offers plentiful at 30¢@32¢ on arrival. C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—Sales of comb honey continue slow. As yet there are no arrivals of this season's crop. We have received several small shipments of new extracted honey, which sold readily. For prices on this year's crop, we quote: Fancy white, 1-lb., 16¢@18¢; fancy white, 2-lb., 15¢@16¢; fair to good, 1 and 2-lb., 12¢@14¢; fancy buckwheat, 1-lb., 12¢@13¢; 2-lb., 11¢@12¢. Extracted, white clover, in kegs or small barrels, 8½¢@9¢; dark grades, 7¢@7½¢.
BEESWAX.—Prime yellow, 30¢@32¢.
McCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—New honey is coming in, and selling at 16¢@18¢ for best white 1 and 2-pound sections. New extracted, 8¢@9¢. Honey in unglazed sections sells the most readily. Old comb honey all gone.
BEESWAX—35¢.
BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—The demand for comb is very light. The retailers have bought a little during this month; but say that they do not have any call for it at present. Prices range from 12¢@16¢ per pound for the different sized frames and style of packages. There is a continued dullness in extracted. Some of the new crop is on sale.
BEESWAX—Is dull, and 25¢ for dark, with 30¢@32¢ for yellow, is the range of prices.
R. A. BARNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Receipts are liberal, and stocks are accumulating in the hands of receivers. In other words, the market is crowded with sellers, and there are practically no buyers. It is hardly necessary to add that the market is decidedly weak.
Honey to extra white comb, 12¢@13¢; dark to good, 9¢@11¢; extracted, choice to extra white, 5¢@5½¢; dark and candied, 4¢.
BEESWAX—Wholesale, 25¢.
STEARNS & SMITH, 423 Front Street.

KANSAS CITY.

HONEY.—Fancy white comb, ½-lb. sections, 20¢; fancy white comb, 1-lb. sections, 18¢; fancy white comb, 2-lb. sections, 17¢; choice white comb, 1¢ per lb. less, and lower grades in proportion. Extracted 7¢@8¢, according to quality.
In fancy comb honey the style of package has as much to do with it as the honey itself, and beekeepers will look to their interests by putting their honey up in the most attractive shape possible.
BEESWAX—Nominal, 30¢@35¢ per lb.
JEROME TWICHELL, 514 Walnut Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12¢@14¢ per lb., and strained and extracted 6¢@6½¢.
BEESWAX—Firm at 32¢@32½¢ for choice.
W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16¢; in a small way 17¢ is occasionally obtained, but 16¢ would be the more reliable quotation; 2-lb., best white, 14¢@15¢; second quality slow at 10¢@12¢. Extracted slow at 8¢@9¢.
BEESWAX—30¢.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 15¢; extracted, 7¢@7½¢.
GEO. W. MEADE & CO., 213 Market St.

The semi-annual meeting of the Fayette County Bee-Keepers' Association will be held in Brush Creek, Iowa, on Sept. 9, 1884. This is to be a basket picnic held in the yard and lawn of B. F. Little. All who are interested are invited to attend. Come with your baskets well-provided, and we will have a whole day of enjoyment.
B. F. LITTLE, Sec.

To Kentucky Bee-Keepers.

The president and managers of the Southern Exposition at Louisville, Ky., have appointed the following committee to solicit bees and honey for exhibition at the Exposition: N. P. Allen, G. W. Demaree, Dr. E. Drane, W. Williamson, and J. T. Connelley.

The committee have fixed the time for the exhibition of bees and honey on Sept. 4, 5, and 6. The committee cannot say that premiums will be offered, but will say that if no premiums are offered, that medals, diplomas or ribbons will be given for the following: Best comb honey in shipping condition, not less than 24 lbs.; best extracted honey in shipping condition, not less than 24 lbs.; best display of honey; best colony of Italian bees and queen in observatory hive; best display of bees and queens exhibited in observatory hives. We hope all bee-keepers in the State will take an interest in the exhibition.

It is contemplated having an adjourned meeting of the State Society on Sept. 5, at the Exposition, and that the bees and honey exhibited at the State meeting at Eminence, will be sent to the Exposition at Louisville.
N. P. ALLEN, *Chr'n Com.*

The date for holding the next meeting of the North American Bee-Keepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Bee-Keepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme.
C. C. MILLER, Sec.
L. C. ROOT, *Vice-Pres.*

Young Men!—Read This.

THE VOLTAIC BELT Co., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6D1y

ITALIAN QUEENS.

(SECOND TO NONE)

BY RETURN MAIL.

Also, Syrian and Carniolan queens, mated with Italian drones. Untested queens of either race, \$1.00; tested queens of either race, \$2.00. Special rates on large orders. Circular free. Send postal for it.

HEDDON'S COLUMN.

BEST GIVEN COMB FOUNDATION. Wholesale and Retail.

I now have on hand a freshly-made lot of GIVEN COMB FOUNDATION, made from strictly pure domestic wax, thoroughly cleansed from all impurities. Sizes of brood and surplus, $8\frac{1}{4} \times 16\frac{1}{4}$, or Langstroth size. I have also Dadant's best Brood Foundation of same size; also Dadant's 11x11 for American frames. Send for prices, and state amount wanted. I offer a liberal DISCOUNT to DEALERS.

HEDDON'S LANGSTROTH HIVE.

I believe my Hive is growing in popularity, to a much greater degree, than is the business of bee-keeping. I am now prepared to furnish these hives made up, and in the flat, at very reasonable prices.

- One Hive complete for comb honey. . \$3.00
- (The above will contain two cases complete with sections).
- The above Hive complete for extracted honey. \$3.00
- The above Hive complete for both in one. 4.50
- One Hive in the flat. 2.00
- Five or'over, each. 1.50

No one should ever order these Hives in the flat, without ordering one made up complete to work by. Parties are advertising Hives as Heddons Hives, that in no wise embrace my principles. Judge only by those purchased from me.

SECTIONS.

I am now ready to furnish white all-Dovetail Sections as follows: $4\frac{1}{4} \times 4\frac{1}{4} \times 6$, 7 and 8 to the foot, per 1,000, \$6.50; $5\frac{1}{2} \times 2$, per 1,000, \$8.00. All shipped from here.

QUEENS!

Our New Strain,

Also IMPORTED ITALIANS!

Take your choice. Prices:

- Tested, to breed from. \$ 3 00
- Untested, after July 1st. 1 25
- Untested, (per doz.) after July 1st. 11 00

Sixth Thousand Just Published!

New and Enlarged Edition OF BEES and HONEY,

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 220 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the Honey-Bee, and at the same time produce the most honey in its best and most attractive condition.

PRICE—Bound in cloth, \$1.00; in paper covers, 75 cents, postpaid.

A Liberal Discount to Dealers, by the Dozen or Hundred.

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box $6\frac{1}{2} \times 7$ inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

ALFRED H. NEWMAN,

923 West Madison Street, Chicago, Ill.

A PRIZE.

Send six cents for postage, and receive free, a costly box of goods which will help you to more money right away than anything else in this world. All of either sex, succeed from first hour. The broad road to fortune opens before the workers, absolutely sure. At once address, TRICE & Co., Augusta, Maine. 4A1Y

All intelligent people want it. Any one can become a successful agent. Terms free. HALLETT BOOK Co., Portland, Me. 4A1Y

50 TONS

OF COMB HONEY WANTED.

Believing it to be advantageous to both seller and buyer to deal with the same parties year after year, we have for several years bought the entire honey crop of many bee-keepers. In view of our increasing trade, we wish to add to our list of producers, the names of a few more reliable men whose honey crop is from one to ten or more tons yearly. Through the actions of certain bee-keepers, the trade now demands mostly one-pound sections. We pay spot cash at railroad station for what we buy. Those desirous of becoming acquainted with such dealers, will state how much honey they have of each size section. How much of each quality. How soon the whole or part of it can be in shipping order. Name lowest cash price, and say how much more is in your locality. If answer is favorable, we will call on you. York State, Michigan, or Vermont preferred. Address,

F. I. SAGE & SON, Wethersfield, Conn. 31A4t

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

CHAS. DADANT & SON,

5AB17 HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCAPPING KNIFE.

PATENTED, MAY 20, 1879.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom. Less than 200 will have a blank where the name and address can be written.

Preparation of Honey for the Market, including the production and cure of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Biene Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Herlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For fasting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

The World's Exposition.

The World's Industrial and Cotton Centennial Exposition, which will be open on Dec. 1, 1884, and close on May 31, 1885, has already become an event of such national and international importance as to commend itself to the kindly interest of every citizen of the United States. The following particulars of it will be read with interest:

This Exposition is held by virtue of an act of Congress, under the auspices of the general Government (which has appropriated \$1,300,000 for its purposes), the National Planter's Association and the City of New Orleans. Appropriations for its benefit have been made by the principal States of the Union, by numerous counties and cities, and by several foreign countries.

The main building, now about finished, is the largest structure ever erected, covering 33 acres of space under one roof. The Horticultural Hall, also nearly completed, is the largest building ever erected for the purpose, being 600 feet long by 194 in width. In the centre tower it is arranged to show 20,000 plates of fruit. The Government building will of itself be much larger than the majority of what are termed great Exposition buildings, it being 885 feet long by 564 feet in width. This building will contain the Government and State exhibits. Many other structures will be erected. This Exposition gives every promise of being the greatest and grandest ever held.

It was suggested, some time since, that it would be very desirable for the National meeting of bee-keepers to be held in New Orleans during this Exposition, and we hope that the meeting for 1885 may be held there. It would be a boon to the bee-keepers of the South, and afford an excellent opportunity for a National Re-Union.

If the officers for the present year should see their way clear to postpone the annual convention for 1884 for two months, and have it held in New Orleans, we believe that it would receive the hearty approval of nearly all, and we hereby respectfully suggest that it be taken under consideration. We think that immediate action on the part of the officers would prevent confusion, and make the National Convention for this year the best that has ever been held. This was suggested by Mr. Paul L. Viallon, some three months ago (see page 323), and if the meeting for the present year cannot be postponed, the next meeting should be held there next March or April.

We regret to announce that the Rev. L. L. Langstroth is unable to attend to his duties as President, but the Vice-President, Mr. L. C. Root, is abundantly able to fill the place with honor to himself and pleasure to the fraternity. He is the son-in-law of the late Moses Quinby, to whom we owe much for the development of progressive and practical apiculture. We hope that there will be a general rally of all apiarists, from the North, South, East and West, and that the meeting will be as harmonious as all the former ones have been, and that it will be a grand success. Here is the call for it:

The date for holding the next meeting of the North American Bee-keepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Bee-keepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme.
C. C. MILLER, Sec.
L. C. ROOT, Vice-Pres.

The great St. Louis Fair will be held Oct. 6 to 11, 1884. The premium list of this Agricultural, Mechanical and Industrial Exhibition has just been received.

There are fifteen handsome engravings of the more important points, including a general bird's-eye view of the entire grounds, which is most useful and necessary to exhibitors and visitors upon their visit to this colossal exhibition. The title page of the pamphlet is a most artistic piece of engraving, the subject being a complete miniature representation of the twenty-four departments, each in a separate and distinct vignette.—Altogether, it is a complete innovation upon the system which has been in vogue during the past twenty years, and is a credit to President Green, for its completeness in every particular. Any of our readers who may desire to use a copy of the list, can obtain one, by writing to Festus J. Wade, Secretary, 718 Chestnut street, St. Louis, Mo., and stating that they are subscribers of this paper.

Mr. G. M. Doolittle's aged and helpless father died Aug. 6, at 9 p. m., after a long and tedious illness. Mr. D. has neglected his apiary to administer to the wants of his aged parent, during the past month or more, and he is now worn out with the "hard strain" which he has endured. Now, all is over, and we may truthfully say "Blessed are the dead"—"they rest from their labors"—they are free from their sufferings! The "race" being over, they await the final issue in calm repose.

The bees have again found some honey to gather, and quite a number of "swarms" are reported—during the past 10 days—in Northern Illinois. The fall honey crop promises to be quite good.

We have received the Premium List of the Western Bee-keepers' Association, to be held at Independence, Mo., on Wednesday, Thursday and Friday, Sept. 24, 25 and 26, 1884. The premiums amount to \$180. All interested can get a copy of the Premium List of C. M. Crandall, Independence, Mo.

Bees in September.

Mr. W. Z. Hutchinson, in *American Agriculturist* for Sept., writes thus:

If a few bees are seen entering the hive, it should be examined. Perhaps from some cause the colony is queenless; and unless proper attention be given, its stores will soon fall a prey to the bee-moths' larvae, or to robbers. In localities where buckwheat or other field forage is abundant, bees sometimes swarm in the early part of September. By hiving such swarms, giving them sheets of comb foundation or empty combs, and perhaps supplying them with a frame or two of brood, they will usually build up fair colonies by winter, and will frequently be found among the best the succeeding year. Honey is a luxury. Many people do not go to the grocer expressly to buy honey, and only purchase it when seen. Comb honey is usually placed in a side glass case; and extracted honey too frequently kept out of sight. Bee-keepers would do well to furnish each grocer with a neat stand, upon which to expose his extracted honey for sale. Nearly all extracted honey will soon begin to crystallize or "candy," and it should be placed in vessels in which it is to be stored. The writer markets his honey in small tin pails, varying in size from one pint to two quarts. These are filled with honey just as it begins to crystallize, and when solid, the pails have neat labels affixed, stating that crystallization is a good test of purity, and that a gentle heat will soon liquify the honey.

The present month is an excellent time to change the stock of bees. The main honey harvest is over, and if the colony remains queenless a few days, the loss is not great. The best queens

are reared during the height of the honey season, and can be bought very cheaply. Purchase queens of the nearest reliable breeders, as long journeys by mail often exhaust them of their vitality to an injurious extent.

Davenport Bee-Keepers' Picnic.

From a Davenport, Iowa, paper we find the report of the picnic of the Eastern Iowa and Western Ill. Bee-Keepers' Association, from which we condense the following:

Black Hawk's Watch Tower was the scene of a large and animated gathering on Thursday, Aug. 14, 1884, people coming from near and far to attend the picnic of the Bee-Keepers' Association of Eastern Iowa and Western Illinois. This association, organized less than two years ago through the persevering efforts of its energetic President, Mr. I. V. McCagg, of Davenport, with thirty-two members, now has an active and enthusiastic membership of 128, with every prospect of continued enlargement. The practice of its members is to hold their annual business-meetings on February 22, and to indulge in a mid-summer outing for social rather than business purposes, though the "Busy Bee," the sign by which they conquer, is by no means ignored. The first as well as the second of these festivals was held at the Watch Tower, and President McCagg says the third will also be held there next year. The association fixes the number of invitations which may be issued for the summer picnic, at the preceding winter meeting, and apportions them among the members, who sign individually the cards issued. In this way they get together an assemblage of neighbors and friends possessing a common bond of interest, and make their picnic the equivalent of the English "harvest home."

Ex-Mayor B. Davenport, the President of the Rock Island & Milan street-railway, not only kept his word to supply tables and seats, and a brass band free of charge, but had a handsome rustic house or shelter-tent erected, and nicely seated, large enough to hold 600 people outside of the stand, where on this occasion, throughout the day, excellent music was discoursed at frequent intervals.

The street cars began making double trips between the river front and the Watch Tower, at 7 a. m., and kept it up all day. For the accommodation of the Iowa visitors, Mr. Julius Peetz was stationed in the Davenport ferry-house, where he sold ferry and street-car tickets to the picnickers. The Iowa attendance was about 500, while Illinois contributed many more, the crowd being estimated by close observers, at from 1,200 to 1,500 people.

From 7 a. m. until 12:30 p. m., the members of the Reception Committee, Messrs. J. E. Sutherland, C. H. Dibbern, and W. H. Gilbert, and the Misses Emma Goss, Emma Grummol, Emma Earhart and Gussie Gast, were busy attending to the arrivals from all quarters—though principally by

the street-car line. From Iowa came representatives of Muscatine, Washington, Cedar, Clinton, Jackson, Iowa and Scott counties; from Illinois came residents of Whitesides, Henry, Mercer and McDonough, beside a large number of Rock Island county people. Another committee which had its hands full during the forenoon was the one on dinner, and was composed of Madams C. H. Dibbern, J. J. Nagle and Mattie Melville, and Miss Kate E. Case.

The dinner was an immense affair. All the tables were occupied, and some of the groups took to the woods and spread their cloths on the grass in the good old-fashioned style. Some people will have it that a picnic is not a picnic when tables and chairs are used, but perhaps they are prejudiced against new-fangled notions.

The officers of the association arranged for a short business session in the shelter-tent, after dinner. This began at 2 o'clock and lasted until 4. The first address was given by the Rev. O. Clute, of Iowa City, an experienced bee-keeper and writer. He was followed by the Rev. E. L. Briggs, of Wilton. The third and closing address was given by Mr. L. H. Scudder, of New Boston, the apiarist who some three years ago shipped a carload of honey to Canada. After this, came a discussion of questions in which many of the members participated.

☞ The Western Bee-Keepers' Association will hold its second annual meeting in Independence, Mo., Wednesday, Thursday and Friday, Sept. 24-26, 1884. The Association will endeavor to make this the most instructive and interesting meeting it has yet held, and will spare no pains within its means to make it in every sense valuable to all.

C. M. CRANDALL, Sec.

☞ The bee-keepers of Hancock county, Ohio, met in Findlay, on Aug. 9, 1884, and organized an association to be known as the Hancock County Bee-Keepers' Association. Twenty-two persons became members by paying the dues, 25 cents. The Association meets again on Sept. 20, 1884, at the Court House in Findlay, at 10 a. m. Bee-keepers are cordially invited to attend. SAM'L H. BOLTON, Sec.

P. A. RIEGLE, Pres.

☞ The Kentucky bee-keepers and others are requested to note the following change in the place of meeting of the State Convention:

Please change the place of meeting of the Kentucky State Bee-Keepers' Association, as announced in the BEE JOURNAL, from the Exposition at Louisville, to Eminence, Ky., on Sept. 2 and 3. N. P. ALLEN, Sec. Ky. State B. K. Society.

☞ The Southern Indiana Bee-Keepers' Association will meet at Madison, Ind., on Sept. 4, 1884, at the Fair Grounds. Dr. FIRTH, Sec.

CORRESPONDENCE

For the American Bee Journal.

The Hibernation Theory.

JAMES HEDDON.

I wish to preface the statements which I have to offer upon this subject, by saying that I think that the above theory, Mr. Cornell's "humidity theory," and the "pollen theory," all of them, as they have been strenuously argued by their advocates and admirers, have done much toward getting down to the bottom of this unsolved problem of the cause of our winter losses.

To be sure, as is usually the result in such cases, the zeal and earnestness of the disputants have sometimes gone beyond their better judgment, and unnecessary and unprofitable sharp sparring has grown out of the discussion; but after all, the remaining pith and point, together with the facts the more eagerly sought for and related, have made these articles, as a class, the most profitable to me of any style or class of essays that the invaluable BEE JOURNAL has contained. If any think that I have, in an undue eagerness for controversial victory, overlooked or left unweighed the arguments of my opponents, in this they have been in error.

I am, at this time, acquainted with many facts concerning the actions of bees during their period of confinement that look favorable to Mr. Clarke's new theory (as he believes it to be), or rather arguing in favor of some of the conditions which he considers favorable to safe wintering; but I am also a yearly observer of facts which argue against the theory. Now I will present such of them as Mr. Clarke's article calls forth. It will please us all to have Mr. Clarke, or any one else, come out with the flag of victory over his head, as it will float over all our heads free of cost; but to the end that we know to a certainty that it is "the true flag," we all share the common disposition to make him hold it up in the midst of a shower of balls from the opposition, as we know, surrounded by this cross fire, only the flag of the true theory can remain in the air.

Before we can intelligently discuss Mr. Clarke's theory, we must all adopt one definition of the word "hibernation." According to Webster (all bee-keepers have long known that bees always hibernate during a Northern winter), he defines it thus: "Hibernation, to winter; to pass the season of winter in close quarters, or in seclusion, as birds or beasts." Inclination would lead me to hibernate half the year in this uncomfortable climate of Great Britain.—*Southey.*"

It seems that Mr. Clarke gives the term a definition bordering upon torpor, and quotes good authority for it. Webster to the contrary notwithstanding.

I, too, have always used, and heard used the word "hibernation" as defining that motionless, senseless, numb state of torpor that wasps and ants assume during a cold winter. Now, I do not know, but I do not believe that bees ever enter this torpid state. I have many times made investigations, both in and out-of-doors, opening colonies that were as still as death, but never found anything nearer "hibernation" or "torpor" than a seemingly perfect quietude, one so light that the least jar or admission of light immediately aroused them, showing their condition farther from torpor than human sleep, or even the sleep of a watch-dog. Possibly it may be proper to call the condition which I have witnessed and described, "semi-torpor" or "semi-hibernation." Perhaps Mr. Clarke's paragraph at the top of the middle column, on page 519, means nothing more; if not, I will refer him to the first page of the *Kansas Bee-Keeper* for April 1884, where I used the term semi-hibernations, meaning to cover the ground of this perfect quietude, though I think that the term which I then created is almost too strong, technically defined; but I then thought, and still think, that it correctly conveyed the idea which I entertained. Further than this quietude, I know of no more senseless winter sleep for bees, and I have neither read nor heard of any.

During the second or third year of my bee-keeping, by report of mouth, from not very reliable sources, I heard that "they" had nailed up a colony of filled bees in a tight box, buried them deep under the ground in autumn, and dug them up in first-class condition in the following May. That story gave me my first and last suspicion of possible perfect hibernation of bees. Having at the time an opportunity to inexpensively test the matter, I tried it in several ways, by putting the bees into the ground, both in an excited and a quiet condition; but all alike died, and I gave up the project.

One fall, just before placing some 40 colonies in a double-walled, above-ground repository, I weighed a part of them with great care. For some reason, then (if not now) unknown, nearly every colony in that house readily took on that perfect quiescent state, and the apiary wintered successfully; and when taken out in the spring, and again weighed, the most successful colony weighed but a single pound less than when put in, in the autumn. I might have thought these figures due, or partially due to some error in weighing, had it not been that the others graduated all the way from 2½ to 5 or 6 pounds less in weight. There was no time, however, when the least tap or jar would not cause a response, putting every bee at once upon his guard. Will the reader please note that what we know of the necessities of brood-rearing, show us that this colony did not breed during winter.

I am not sure, but I do not believe that any colony ever wintered without any food. If they hibernate, no food

would be consumed; as I understand the term to be defined as torpor, total inactivity or suspension of the functions of life. Now, I do not myself know, nor am I aware of any one else who knows the combination of conditions that prevailed in the case above related, or that is necessary to get bees into this quiescent state; but I do believe that if everything else was right, the condition would be defeated, provided the little food consumed was of an irritating nature. I cannot but attribute our troubles to the food, because such a theory is the only one by which I can account for the fact that, while some colonies are doing so nicely in this quiescent state, other colonies in the same room, of the same breed, and in the same style of hive are noisy and sick with diarrhoea, a condition which hundreds have witnessed.

A few days ago, while talking with an expert, and very successful bee-hunter, one who has cut his hundreds of bee-trees, a man of fact and clear perception, and the owner of 200 colonies, he assured me that the fatality caused by the disease, diarrhoea, is shared to fully as great or greater extent by bees which inhabit trees as by those inhabiting the modern hives.

Another point that Mr. Clarke seems to overlook is, that bees in a latitude where long winter confinement is necessary, are out of their natural climate, surrounded by unnatural conditions, and consequently needing the right artificial treatment. Mr. Clarke's ninth paragraph reads as follows: "When kept too warm, bees cannot go off into their natural state of torpor. They become restless, get hungry, eat freely, and must void their excrement. If confined to the hive, they befool it, and then comes diarrhoea with death in its train. The opposite extreme of temperature has a like effect. They are too cold. Hunger awakes them. Their food is as cold as they are. What is the usual effect of cold victuals on a cold eater? We all know."

Here I cannot help thinking that Mr. Clarke, like others of my controversialists, has both eyes so firmly riveted upon his theory, that he cannot see outside facts arguing positively to the contrary. If all who read this controversy, and who have known of colonies exposed to the severest cold, yet coming through the winter entirely free from diarrhoea; and again, colonies kept in repositories with prevailing high temperature coming out equally healthy, should all say "I," the next issue of this paper would be composed entirely of the pronoun I. No, this will not do. Positive experience says, "Look farther."

It is my experience, and I believe it to be the experience of others, that bees can and sometimes do come through the winter in very good condition, making fine colonies for the season following, without going into any quiescent state, but being noisy and restless all winter long. Farther, that a uniform temperature is almost or quite indispensable to the quies-

Northeastern Kentucky Convention.

The Northeastern Kentucky Bee-Keepers' Association met in Covington, on Aug. 13, 1884, in Walker's Hall, with the President, Peter McVean, in the chair. This was the largest and most interesting meeting that has been held since its organization. There were members present from both near and far.

After reading and approving the minutes of the previous meeting, the regular routine of business was taken up and disposed of. The President then called on the Vice-Presidents for essays.

The Rev. L. Johnson, of Walton, Boone county, then read an essay on "Bees, Honey, and their General Management," which was very interesting and beneficial to all.

Mr. Beach, of Kenton county, also read an essay entitled "Queen Rearing," which was criticised severely. It was a very able and masterly production.

There were several samples of very fine comb and extracted honey on the table—especially the comb honey. Several parties had some nice Italian queens for exhibition and sale; also a one-frame observatory hive.

When the question-box was opened, we had quite a discussion, especially when the question about the pollen theory was reached. This question was asked, "Is sound pollen deleterious to bees in winter?" Mr. J. T. Conley, of Gallatin county, seemed to think that it was; but with that exception it received a pretty severe overhauling.

Other questions were asked, such as: "How many colonies can be kept in one place with profit?" "Is wired foundation a success for use in the brood-chamber?" "Are winter passages in the combs necessary?" "What material is the best absorbent?" "How can we winter our bees the most successfully?" "Are the Italians the best bees for profit, all things considered?" "Which are the best bees to create a stampede, Cyprian or Syrian?" These questions and many others were discussed at some length, and duly considered.

On motion, a delegation of three members of this Association were appointed to attend the State Convention which meets at Eminence, Ky., on Sept. 2 and 3, 1884, an adjourned meeting of which will be held at the Exposition in Louisville on Sept. 5.

The President called for reports, which resulted as follows: Kinds of bees kept, Italians principally; kind of hives, Langstroth; number of colonies, spring count, 608; natural swarms, 125, and swarms by division, 140; present number of colonies, 873; amount of comb honey, 3,792 pounds, and of extracted honey, 20,224; condition the bees are in now, fair.

Several new members were added. A motion was made and carried that this convention extend to Mr. J. T. Wilson and family its sympathy in the loss of his property by fire on the night of Aug. 5; and that a copy of the resolutions be forwarded to him.

cent state, and small consumption of food reported in my weighing experiment given above.

Regarding bees possessing proper instinct for self-preservation at all times, when left entirely under the care of "Dame Nature," she either "forgot" to endow them with it, or did not care for their failure, or herself made a failure; for they do not at all times succeed any better than the tender plant against the drouth, the beautiful shrub against the frost of winter, the sparrow against the hawk, the minnow against the shark, the gazelle against the anaconda, or even man against the myriad forms of microcoxi which attack him on all sides. Only that higher philosophy can protect us, and he who lays down his Reason, relying upon her weaker sister, Instinct, will be left far behind in the race for success.

Dowagiac, Mich.

For the American Bee Journal.

Hibernation of Bees.

J. F. LATHAM.

As the correspondent, under the caption of "Mr. Heddon's Report," on page 471, asserts that a condition favoring a semi-dormant repose, is the normal condition in which a colony of bees must exist in order to winter successfully; and claimed to be original in calling the attention of bee-keepers to the new (to him) theory, perhaps a few words from some of the other "inexperienced" may not be out of place.

Without a desire to make any advances of a controversial character, I feel like submitting the assertion that there are few, if any ideas embodied in his article that support an originality of conception. Although but a 6-year-old bee-keeper, the fact that a colony of bees should be so prepared as to favor a semi-dormant or somnolent repose during winter confinement, has not been absent from my thoughts while preparing my colonies for winter.

The first impress of the knowledge was imparted to me by an aged dame, while enjoying the whilom luxury of an open, New England, primitive fireplace on a blustering winter evening. "Are the bears out to night, grandma? No; the bears are some of the of the 'seven sleepers.'" What are the seven sleepers, grandma? The bears, the raccoons, the woodchucks (a favorite personation), the bees, the ants, the frogs, and the snakes. Do they sleep all winter, grandma? No; they wake up sometimes when we have a thaw." Although the old lady's classification may not be scientifically complete, here we have the whole theory of hibernation in a nutshell without evolution or sleepy-awake cogitations.

The knowledge that, on the approach of cold weather, the final requirements for their winter's sustenance are completed, and those animals and insects subject to such requirements by nature, retire to their dormitories to enjoy the sweets

of semi-consciousness until the returning sun, by its genial warmth, arouses them to activity, is old. It is not apparent that the hollow tree-trunk, or its similitude is indispensable in producing conditions necessary for hibernation. I have had strong colonies, which, judging from the quantity of *debris* on the bottom-boards, scarcely broached their stores for two months in mid-winter; and came out strong in the spring with clean combs, and with the loss of very few bees. In fact, observation thus far in my experience, has led me to the belief that such colonies pass the winter in the very best condition, the condition which our best bee-keepers are striving to attain; and from what has just been said, the object sought can be accomplished by using the present style of frame hives. A condition which provokes restlessness is one serious obstacle to a favorable result. Another obstacle exists in the characteristics of the bees—idiosyncracies, if I may be allowed to so apply the term.

Last winter was a severe one for bees in this vicinity; and on preparing my colonies for winter, I gave them extra care, treating all alike as nearly as possible. They all (20 colonies) passed the winter safely, and the most of them in prime condition. In a few of the colonies the combs had some mold on them, and a slight evidence of bee-diarrhoea was observable for the first time in my experience. Those which remained the most quiet, came through the best. As the object sought in my winter preparations (as noted heretofore) has always been to attain a condition favoring a somnolent repose, I believe the result of my efforts have been manifested in the conduct of my bees while in winter quarters, and the general satisfactory condition in which they have passed our trying (to them) spring months.

Compactness being one of first principles of hibernation, it is assumed by a colony of bees in repose, whether their resting place be on the "fine twig," or within the walls of the movable-frame hive; and could a proper condition of warmth be maintained at all times, it would be a matter of little importance whether they occupied a partitioned half, or were allowed to roam the whole hive at will. Albeit, I cannot see anything original in my treatment, as the hints promoting it were culled from Prof. Cook's Manual of the Apiary, and more recently from the columns of the BEE JOURNAL.

Again, the attitude of one claiming, at this advanced hour, the ripening fruits of so many others' culture, looks a "leetle" suspicious; and when the mountain was delivered of the mouse, it seems that had the declaration of the wise man, that "there is nothing new under the sun," received a merited notice, the claim would not have been promulgated—or at least not with such evidence of confidence in its merits as a *valuable discovery*. "Honor to whom honor is due."

Cumberland, Maine. Aug. 12, 1884.

It was decided by vote that the next meeting be held in Covington, on Sept. 25, 1884, at 9 a. m., in Walker's Hall, corner of Sixth and Madison streets.

A bill of \$2 for the use of the Hall was presented and ordered paid. Adjourned.

Let the Bees Swarm.

W. Z. HUTCHINSON.

How often we hear bee-keepers lamenting because their bees swarm. "They were doing nicely, and storing honey in the boxes, when they swarmed, and away went all hopes of a honey crop," says one. "If they swarm, they do well; if they do not swarm, they do better," says another. I want them to swarm, for, with the exception of the present season, my honey crop has been increased by swarming. A colony and one swarm from it has, until this season, stored more honey than a colony which did not swarm.

The present season is peculiar, inasmuch that it opened two weeks earlier than usual, and closed on account of dry weather about three weeks before basswood blossomed. Cold, dry weather and high winds made a complete failure of basswood, from which comes our main honey crop. As all the honey was gathered in the early part of the season, it followed as a matter of course, that those colonies which did not swarm stored the most honey. They stored about one-third more per colony than did those which swarmed, aided by their increase.

The increase is worth what it cost in honey, and had basswood yielded even fairly, the fables would have been turned; and should the fall honey-harvest be even a fair one, they may yet be turned. So I say, let the bees swarm—just once.

I have, for two seasons, practiced the Heddon-method (page 126, BEE JOURNAL for 1883) of preventing after-swarms. Last season one colony in 25 cast an after-swarm; this season not one colony cast an after-swarm.

Mr. A. A. Decker, on page 522, does not like this plan, as it takes as many bees from the old colony as would make a second-swarm. He says, "The old colony needs these bees, the first swarm does not." Will he please tell us why? Will a bee gather more honey if the old hive is its home, than it will if its home is the new hive? Where the honey-boxes are, there should the bees be also; and with this system of preventing after-swarms, the honey-boxes are, or should be given to the new colony.

Mr. D. says: "To get the best results, *i. e.*, surplus honey from the old colony, all the bees that are left when the first swarm leaves, should stay in the old hive during the remainder of the season." Will Mr. D. please tell us whether it makes any difference if all surplus should be taken from the new colony? If the returning bees

from the old hive were killed when they attempted to enter the new hive, as intimated by Mr. D., I think that there must have been some unusual cause, as I have seen nothing of the kind in the 60 times, or thereabouts, that I have put this method to the test, in the past two years. All the bees are the offspring of one mother, have been separated only a few days, and the intruders come loaded with peace offerings.

Mr. D. speaks of the time that is gained by introducing a queen to the old colony immediately after the first swarm has issued. If the honey harvest will be over before the eggs laid in those days which are "gained" can develop into bees and become old enough to labor, is there anything of value gained? That the plan will prevent after-swarming, I know from experience. I prefer, however, to introduce a virgin queen, as a laying queen is worth \$1.00, and a virgin queen will begin laying plenty soon enough.

Last winter, at the close of our State Convention, Mr. T. M. Cobb, of Grand Rapids, the Treasurer of the State Association, visited me, and I called his attention to the Heddon-method of preventing after-swarming. A few days ago he wrote me as follows: "I remember with pleasure my visit at your place, last December, and many times have I felt thankful for the lessons you gave me, especially those in regard to the management of after-swarming. Work in my apiary, this season, has been a pleasure instead of, as formerly, full of vexation."

I must return the compliment by saying that Mr. Doolittle's article on "Hiving Swarms," with queens having clipped wings, is the best I have seen in print. However, should an after-swarm issue when four or five swarms were clustered in one mass, it occurs to me that it might complicate matters somewhat. I presume that, like myself, Mr. D. has no after-swarms. I can very readily see that having all of the queens with clipped wings makes less trouble than when only a part of them have clipped wings.

Rogersville, Mich.

For the American Bee Journal.

Lake Shore, N. Y., Convention.

The Lake Shore Bee-Keepers' Association held their fourth meeting at Forestville, N. Y., on Aug. 9, 1884. The President and Secretary both being absent, Mr. U. E. Dodge was elected President *pro tem*, and Messrs. Geo. Adams and J. J. Keyes were elected Secretaries for the day.

The discussion was opened by the following question: "Will it pay to have 30,000 to 35,000 bees in one colony to winter?"

Mr. Evans thought not, and said that when a colony is very large, by taking the combs from the hive and giving them a light shake, the old bees would fall off in consequence of their feet being worn out. He also stated that a colony of bees which is light in honey in the spring will breed

up faster than a colony which is heavy with honey, there being more room for the queen to deposit her eggs; and that until it is removed, comb filled with honey is no better than a board.

If in a damp cellar, will raising the combs from the bottom of the hive prevent their edges from molding?

Mr. Dodge said that rins put under the bottom the hives will prevent mold, with plenty of ventilation. He here gave a description of his beecellar in which he can regulate the temperature at will. He put his bees out on April 16, commencing at 1 a. m., and finished on April 19. All of the bees did equally well, whether put out in the night or day-time.

"What is the best plan for a beehouse, above or below the ground?"

Mr. Dodge said that he would, if situated as Mr. Adams is, dig into the bank and make a beecellar. In reply to a question concerning ventilation for colonies, he said that he could not easily describe the amount which he employed, but used his own judgment and acted accordingly.

Mr. Adams said that he was not satisfied with out-door wintering.

Mr. Evans said that he would make a cellar in a sand-bank, or construct one with double walls. He also said that honey has much to do with wintering bees. If the honey is bad, the bees will have diarrhoea and become weak. Good seasons help to winter bees, and the locality has much to do in the producing of good honey.

Mr. Adams darkens his hives to prevent the bees from flying during the winter.

Mr. Evans knows of a bee-keeper whose hives are made of very thin lumber, and that they were as frost-proof as hives made of thick lumber. He said that he had carried a queen home in his vest-pocket, in November, put her into a hive, and that the operation was attended with good results.

Mr. Adams desired to know why Mr. Dodge preferred a bank-cellar to an ordinary one for wintering bees.

Mr. Dodge stated that it would be more convenient than an ordinary cellar; that it would require far less labor in carrying the bees in and out of it in the fall and spring, especially if the bee-keeper had a very large apiary. With a bank-cellar, one could have a track with a small truck over which he could move the hives in and out with the utmost ease and dispatch.

Mr. Evans said that he had once wintered a colony of bees in his bedroom, that they were confined from fall until spring, and that they did well. In regard to allowing bees to have a cleansing flight in the winter, several endorsed the idea. Concerning the rearing of queens, Mr. Evans said that he would not rear too many queens to sell, and that we keep bees for the purpose of gaining money. Let them swarm naturally. One-half of the queens should be killed, for they were not fit to breed from; but some are more valuable and prolific than others, and some become barren

in one year, while the best queens are good for 3 or 4 years. He would advise beginners to get young queens.

Mr. Dodge objected to breeding in-and-in from year to year, and said that bee-keepers must be careful from whom they get queens, and to see that they have no diseased queens in their own apiaries.

Mr. Bolling stated that the queen is the life of the colony; that she must be a good one in order to produce good queens; that the first-born queen is the best, that the old queen leaves with the swarm, and that the old colony has the best queen. He thinks that colonies formed previous to June 24, do the best. He often divides swarms and puts young queens with them, destroying the worthless ones, and advises keeping new or young queens on hand.

Mr. Evans said that it is common to have early swarms, and that he cuts out the queen-cells and lays them on top of the frames in colonies which have lately swarmed; selects the best to allow to mature, and thinks many of the queens which are purchased are nearly worthless.

Mr. Bolling stated that he had seen queens in all stages of development. If queens are hatched from cells which are dry and empty, he would not use them, for they have been starved; while if they are hatched from cells with some of the royal jelly left in them, they have been well fed and are fully developed. In producing honey we must have plenty of bees. He puts on the boxes as soon as clover bloom appears, and thinks that comb foundation is beneficial. This season he had produced 1,000 pounds of honey, had 40 colonies, spring count, and now has 60.

Mr. Evans said that he would rather put 2 colonies together than to have light colonies. They will fill the hive with honey on which to live, and then store considerable surplus. He wished to know whether any of the members had any experience in using a direct passage to the boxes, but no one had such experience.

Mr. Bolling uses a skeleton honey-board and sections 2 inches wide, so set as to leave a clear passage. He prefers sections holding one-pound, and uses tin separators.

Mr. Dodge said that he could not produce honey without the use of glass or separators; could not handle sections and clean them without breaking some of the cells, and thus cause them to leak.

Mr. Bolling asked, "If a black queen is impregnated by an Italian drone, will this impregnation have an influence upon her drone progeny?"

Mr. Evans said that a fertilized queen carries the fertility in a sac, and that her drone progeny would be affected.

Mr. Dodge said that in order to insure success in a convention, there should be free and full discussion on all questions of importance in bee-culture by every member.

The next meeting will be held at Fredonia, N. Y., on Sept. 6, 1884, at 10 a. m., in the Park House.

U. E. DODGE, *Pres. pro tem.*

For the American Bee Journal.

Hints to Bee-Keepers.

J. M. HICKS.

It is not generally understood or believed that nine-tenths of the moth-worms found in the brood-combs are produced by means of the bees carrying the eggs in with the pollen or bee-bread; nevertheless it is a fact.

Never buy a bee-hive expecting to get a moth-proof hive; for if you do, you will surely be disappointed as thousands of others have been in the past, by not knowing or fully understanding the natural laws which govern the ever "busy bee."

Now is a good time to prepare a quantity of hard candy from sugar, for fall feeding, if it is found to be necessary.

I would suggest to all who contemplate keeping few or many colonies of bees, to make their increase by division, performing it in the night-time, and in accordance with natural laws, using first-class movable-frame hive for the purpose, one in which bees can be easily and quickly managed without irritating them.

Always rear your young queens from mothers whose worker progeny has desirable qualities, such as a kind and amiable disposition as well as being industrious honey-gatherers.

In order to eradicate ants from beehives as well from ant-hills, let me suggest a free use of strong brine, which, if made hot and poured on, will effectually clear them out, and is no detriment to the bees. Good brine placed in small troughs with corn-cobs or chips as floats, is good for bees, and is a preventive of foul brood as well as an antidote for bee-diarrhoea.

Battle Ground, Ind.

For the American Bee Journal.

Nor. Ind. and Sou. Mich. Convention.

On July 29, 1884, pursuant to a call, the Bee-Keepers of Elkhart and adjoining counties met at the County Superintendent's office, in Goshen, Ind., at 2 p. m., for the purpose of organizing a Bee-Keepers' Association. W. H. Barney, of Elkhart, was appointed temporary chairman, and A. Blunt, temporary secretary.

The following committee on permanent organization was then selected: A. Blunt, Goshen; E. H. Corpe, Vistula; C. C. Carmien, Goshen. The committee presented the following for officers of the association for the ensuing year, and they were unanimously elected:

President, A. Blunt; Vice-Presidents, Jacob C. Mishler and W. H. Barney; Secretary, Dr. F. L. Putt; Treasurer, M. J. Schrock.

After a few remarks, the President informed the convention that the first business in order would be to appoint a committee on constitution and by-laws, and the following gentlemen were selected; W. H. Barney, Elkhart; E. H. Corpe, Vistula; A. D. Hartzler, Goshen.

This committee reported a constitution and by-laws, which were unanimously adopted with the exception of an article of the by-laws with reference to the executive committee. On motion of Mr. Barney, this article was so changed as to constitute the President and Secretary a part of the executive committee. The President then appointed the following executive committee to act with the President and Secretary: C. C. Carmien, Goshen; Victor Garry, Millersburg; W. Buzzard, New Paris.

It was then moved and carried that the President should report this meeting in such papers as he saw proper. On motion, it was decided that the association should hold its next meeting in Goshen, on October 3, at 10 a. m. The executive committee was instructed to appoint two members to read essays at the next meeting on some subject pertaining to bee-keeping.

The association will be known as the Northern Indiana and Southern Michigan Bee-Keepers' Association.

The signing of the constitution and by-laws was considered, and 24 names placed upon the Secretary's book.

Membership fees to the amount of \$9.50 were received by the Secretary and paid over to the Treasurer. It was ascertained that over eight hundred colonies of bees were represented by those present. No one will question the advantages of united effort and frequent conferences by those engaged in so important a rural industry as that of bee-keeping; and most certainly, as a subject of natural history, it is worthy the careful study and investigation of every thoughtful person. Much interest and enthusiasm were manifested by those present, which betokens a successful future to our association, and more enlightened views respecting the management of the apiary by its members. On motion, the association adjourned to meet as above specified.

A. BLUNT, *Pres.*

F. L. PUTT, M. D., *Sec.*

Prairie Farmer.

Bee-Pasturage, Fall Honey etc.

MRS. L. HARRISON.

In a recent trip through Woodford, Marshall and Putnam counties, Ill., I was pleased to note the progress that bee-culture is making. I traveled slowly in a phaeton, and was continually on the lookout for hives. The log-gum is apparently obsolete, and the box-hive nearly so; being used only when other hives are not to be obtained, or a runaway swarm is captured. The hives in use are the Langstroth, or modifications of it.

The proximity of bee-keepers could be detected readily, by the presence of sweet clover (*Melilotus alba*) growing along the highways. Where the roads are little traveled, this plant grows luxuriantly, and the seed is carried long distances, and distributed by wagon wheels. It is not a favorite with farmers generally, although its fragrance is to be preferred to dog-

fennel, rag-weed, etc.; but white clover (*Trifolium repens*) has many friends and no enemies. It raises its modest head wherever its roots find lodgment. A heavy sod of this clover prevents the highways from washing during heavy rains, and is especially useful in this way, in clayey soils, near streams of water. Horse-mint (*Monarda punctata*) is blooming in the hedges, and from Texas comes the report of prodigious yields of honey from it. I have seen no bees working upon this plant, although now blooming in profusion, but I have noticed them literally swarming over catnip (*Nepeta cataria*). This is a very desirable honey-plant, and should receive increased attention from bee-keepers.

Reports come from Ohio of a severe drought of six weeks' duration, and that the sources of honey are all dried up. From Arkansas we learn that the reverse is the case. In this locality, rain and showers have been frequent, so there is abundance of bloom, and if the weather is hot during August and September, the yield of autumn honey will be large. On my trip, I noticed that the rain areas were quite small; for two or three miles the oats would be beaten down almost as flat as if rolled, and a few miles further on, they would be erect and waving in vigor and beauty, unscathed by winds and storms. This diversity in the rain areas will make the honey crop irregular. In some parts of the State the autumn bloom will fail, because of drought.

Peoria, Ill.

For the American Bee Journal.

Is it "Honey-Dew"?

A. GIBSON.

In May I noticed that certain trees, particularly box-elder, began to look very peculiar: the leaves stopped growing, turned a darker green, and the new shoots ceased to grow. On closer inspection I found insects, or what seemed to be small white lice on the leaves, and at the same time drops of syrup covering the leaves to such an extent as to make the branches so heavy that they would droop by sheer weight of the sticky, sweetish syrup on the leaves.

Under the box-elder trees, this syrup could be found covering the ground, and when it fell upon the boards of the sidewalk, which it often did, it left stains which looked as though hot syrup had been thrown upon them; and it was not obliterated till after several hard rains. For about two weeks in June, to walk under these trees in the morning, was dangerous to clothing. In looking at the hat and coat after going, or just passing under a tree, I found it covered with large drops of transparent syrup as thick as very thick honey. This sticky substance could be removed only by applying very hot water.

It was also noticed that early in the season the lilac bushes were covered with it to a remarkable extent; but these bushes did not suffer like the

larger trees. The box-elder trees, up to July 10, looked very hopeless; the leaves only half-grown now began to wither, and the tree bore every appearance of early and speedy death; but from some cause or other, about the middle of July, they began to live up, new twigs began to grow, and at the present writing, the trees are putting on a new growth of very light green; and those trees which were pronounced dead, have again put forth their leaves.

The season during which this syrup-flow continued, was of 4 or 5 weeks' duration. Early in the morning, bees fed almost exclusively on this substance, and later in the day it would get so stiff that they could not work it up. The honey gathered from this dew (?) has a very dark, reddish appearance, and has a sickish taste. I consider it unfit to eat.

The bees stored honey from this very fast. I have a row of hives setting under a row of box-elder trees, and this dew fell from the trees upon those hives, covering them with this sticky substance which becomes mixed with the dust blown on them by the winds, thus giving the hives such a nasty, unsightly appearance that I was obliged to wash them so as to get rid of it. I consider this substance injurious to my bees, and at some future time I will explain how.

Ponca, Neb., Aug. 12, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

How to Build a Bee-House.

Will you please answer the following questions through the BEE JOURNAL:

1. What would be the best way to build a bee-house for wintering bees and for extracting honey and storing general apian supplies during the summer? I propose building a small brick house on the east side of my dwelling, fronting the south.

2. About 100 feet to the north there is a small ravine about 12 feet deep with a close grove of pine trees, making an entire wind-break from the north. As the ground is very dry, would you recommend making a cellar, say 4 or 5 feet under ground, and build it up to 7 or 8 feet, for wintering bees in, and use the upper part as aforesaid? or had I better build a

little larger and take off a room at the north end for wintering above ground? I can build frost-proof cheaper here with bricks than with wood.

3. Which is preferable, brick or wood for a house for wintering bees? Norwich, Ont., G. W. TIDEY.

ANSWER.—I have, this season, built a new honey-house in my home apiary. I built it 18x30 feet, with a cellar of the same size under it, and 8 feet deep. It is two stories high, the lower one being sealed with wood (painted white) all over inside. I want a cellar as much all underground as I can get it. I would advise you to build your cellar as deep, or as much in the ground as you can handily, and build your house and cellar about twice as large as you now think you need it, and you will likely be very glad that you did so, if you do not remain in the business.

Killing Young Bees.

In the forepart of last June, I bought a colony of hybrid bees with an Italian queen. They were carried a considerable distance and placed upon the stand where they were to remain. On the second day after, I noticed a murderous work going on; every young bee that came out of the hive was seized and killed. Not less than a half pint of these dead bees lay in front of the hive. This was a mystery which I could not solve. The top of the hive being nailed down for purpose of safety during the removal, I did not remove it until this time. I found in the honey boxes large quantities of dead bees, which, in their fright, probably sought a place of escape through the top of the hive, and were shut in and suffocated by the falling of the comb foundation which covered the place of entrance. Can you account for this cruel and apparently wanton destruction of the young bees? This ceased as soon as the upper part of the hive was relieved.

L. FREEMAN.

Barry, Ill., Aug. 12, 1884.

ANSWER.—To fully decide in my own mind the cause of the trouble you mention, I should need to know more of the details than I gather from your account, and perhaps more than I could learn were I on the ground; but if the young bees appeared in a perishing condition (for want of ventilation), I should think that the old workers were carrying out what they considered damaged or past the point of usefulness, and dangerous to the health of the survivors.

The Michigan Fruit-Belt.

1. Is the fruit belt of the State of Michigan as hopeful a locality as other portions of the State for the production of honey as a speciality?

2. If so, what comparatively new counties would you think most hopeful? Millersville, Ill. S. S. KANAGA.

ANSWER.—Some locations in the Michigan fruit-belt (of which I live in the eastern edge of the southern

end) are first-class honey locations. The "new counties" are further north, and many of them are good fruit locations, and also good for honey-producing. Go to what localities you may, you will find it possessing some advantages and disadvantages. I have no choice in counties, to offer.

Honey-Plant for Hedges.

I want to plant a nice, thick hedge around my garden next to the fence, of some pretty flowering shrub which is also a good honey-bearer and which will keep in bloom most if not all of the season. The query is, Can such a plant be obtained? I have two large bushes of the shrub called snowball or snowdrop which fills the bill, if it is a honey-bearer. It begins to bloom early in the season and remains in bloom until the frost comes, and seems to be never free from bees and yellow-jackets that work it most industriously from early morning till after dark. I have frequently seen the bees working it when it was getting dark. Will you kindly reply to the above through the medium of the BEE JOURNAL? SUBSCRIBER.

Yorkville, Ont.

ANSWER.—This is a question which I feel incompetent to answer. Of all the branches of apiculture, I am least posted in regard to its honey-flora. I will remind you that many flowers which yield honey well in one climate, will scarcely yield at all in another, where they will grow and seed successfully. I advise you to use your own judgment. If you like the snowball as a hedge-plant, and the bees like it as a honey-plant (as yours seem to), I would advise its adoption for your purposes.

Red-Colored Honey.

1. Will Mr. Heddon kindly inform me, through "What and How," from what source some of my bees have stored red honey of a bitter taste, but otherwise of good flavor. The trouble seems to be confined entirely to 2 colonies. Would such honey be safe to feed even for winter stores?

2. Are juices gathered from bruised apples and pears suitable for winter stores, if but little pollen is gathered at the same time? W. J. RASIN.
Jenkintown, Pa., Aug. 12, 1884.

ANSWERS.—1. This question I cannot answer, having no practical knowledge of your flora; but from my experience here, I should not be afraid of the bitter honey for winter stores for the bees.

2. I should not consider such juices fit for winter stores, though I do not know that they will even tend to promote diarrhoea, but I prefer more concentrated and more highly oxygenized food during the cold winter.

The Union Bee-Keepers' Association of Western Iowa will meet in Dexter, Iowa, on the second Saturday in September, at 9:30 a. m. This Association is doing a good work, and bee-men in Western and Central Iowa would do well to avail themselves of its benefits. M. E. DARBY, Sec.

SELECTIONS FROM OUR LETTER BOX

A Good Fall Honey-Crop Expected.

From 26 colonies, spring count, I have taken 2,300 pounds of extracted honey, and 300 pounds of comb honey, making an average of 100 pounds per colony. I have increased them to 45 colonies, and should the weather prove favorable, I expect a good fall crop of honey, as the bees have been doing well for a few days past.

H. H. WARREN.

Myra, Wis., Aug. 18, 1884.

Botanical.

Will you please give the names of the two enclosed specimens of plants? also their value as honey-producers? No. 1 is a garden plant, and the bees gather pollen from it. No. 2 grows in low places, and blooms in the fall. Both grow 3 or 4 feet high.

Bloomington, Ill. H. W. FUNK.

[No. 1 is *Thalictrum anemonoides*.

It is a common wild plant. I have often seen bees on it, but do not think that it is very valuable, only as very early plants are always desirable in stimulating the bees. No. 2 is an aster. All of the asters are valuable. —A. J. COOK.]

The "Pollen Theory."

Thank you, Dr. Tinker! It seems that you read closely. The glory of first public mention of the "pollen theory" is enough to set one wild; but the idea of me, a patent-hive man, thinking of something first! I am afraid, if this is so and becomes known, that not only will pollen make bees sick in winter, but that they cannot be cured, and that "pollen theory" will be a term of reproach and I will be held accountable for it. Let us blame Bingham. I believe it is Bingham any way; at least he is used to smoke and can stand it. In the mean time, let us search for "a balm in Gilead" to heal the bruises which Mr. Heddon has received in trying to prove this theory. He is always trying to prove something. His mental economy is likened unto a great press which is specially designed for the discovery of leaks, and the consequence is that he knows of very few vessels that will "hold water." We will glorify Bingham, mollify Heddon's wounds which were received in honorable battle, and be happy.

J. M. SHUCK.

Des Moines, Iowa, Aug. 19, 1884.

Bees on the Nebraska Prairies.

I have just completed a series of journeys north and south of the Platte river in Nebraska, and have observed carefully the bee-doings of the State. The bee-belt now extends beyond the 100th meridian, into the northern counties beyond the Platte river, far

west of the Missouri, where the farmer has displaced the herdsman. This, for the preceding reason, is a manifest sign of progress. Here, the season for honey has been good so far; and there is every indication of a large gathering. When the season of Neb. is named, it really means from the first of July to the coming of the first frost, which may be towards the end of September, or late in October; and during this time, richest honey-flowers are in bloom on the prairies. Besides the Italian, there are now in the State the Cyprian and Palestine bees. The latter are not regarded as profitable as the Italians. Recently I called at the large apiary of Mr. G. W. Hawley, near Lincoln, and found him busy. Mr. Hawley called special attention to two honey-flowers which he finds useful. He was enthusiastic about the Bokhara clover, which affords honey-pasturage during the best part of the season. A patch, cultivated in the nursery, grew 8 feet high, and on one stem there were over 20 branches: the plant covering a space of six feet, and having not less than a thousand flower-heads on it, on which the bees were working all the time. The well-known matrimony-vine (*Lycium barbarum*), with its millions of inconspicuous flowers was also covered with busy bees; but, notwithstanding its usefulness, the sprawling growth of the plant prevents Mr. Hawley from recommending it for bee-pasturage.

O. A. MULLON.

Lincoln, Nebr., Aug. 11, 1884.

Honey Season almost a Failure.

So far, this season is almost a failure. The bee-keepers here were jubilant over the prospects at the beginning of white clover bloom, but we had an everlastingly heavy rain which cast gloom and sorrow over the high spirits of the bee-keepers. For the past week or more the bees have worked hard in the mornings and gathered considerable honey from the oak, buck-bush and other plants. I think we will yet have a full crop of honey. Spanish-needle and other fall honey-plants are yet to bloom, and they generally produce honey if the season is favorable.

C. H. McFADDIN.

Clarksburg, Mo., Aug. 15, 1884.

Experience with Sweet Clover.

In the fall of 1882, I bought one peck of sweet-clover seed, and sowed $\frac{3}{4}$ of it on about 2 acres of oat stubble, simply sowing it broadcast. The other $\frac{1}{4}$ I sowed during the following spring upon the same ground, and on $\frac{1}{4}$ of an acre of the same stubble field that was sown to timothy in the fall. Of the fall sowing I never saw a plant; the reason being that the fall was so dry as to scarcely start timothy; and the clover being a larger and light seed, it was not covered, but it must have sprouted or it would have come up in the spring. The spring sowing came up all right, but when I cut the timothy, all the clover sown with it died on account of the dry weather. About July 20, this year, the clover that lived began

1 blossom, and such a buzzing on it as the bees kept up was enough to delight the heart of any bee-keeper. It has proved to me: 1. That it is a splendid honey-plant here in Iowa. 2. It just fills the gap between the blooming of other clovers and the fall flowers. In order to have it bloom next year, I shall cultivate about one-half of the ground, thus leaving small furrows, and then harrow it in. Bees here have increased fairly well; my own having increased from 8 colonies to 21, and most of them are now in good condition; but I have not yet heard of any one taking a bit of surplus honey, although the clovers never bloomed more profusely. They gained some ahead, but used it afterwards in brood-rearing. Basswood bloom produced no nectar. Our time for surplus, however, is generally during the next four weeks. JOS. BEATH.

Corning, Iowa, Aug. 13, 1884.

Enjoying a Good Honey-Flow.

Last season the honey-flow was continuous from June 1 until Aug. 15, with the exceptions of rainy days and no fall honey crop. This season we had a splendid flow of honey from white clover from June 1 until July 1, and after that the bees did not make a living until Aug. 9. Since then we have had a splendid flow of honey from the second crop of white clover, and from buckwheat; and we are now in the midst of as fine a honey-flow as I ever saw at this time of the year. GEO. E. HILTON.

Fremont, Mich., Aug. 18, 1884.

No Surplus Honey.

Bees have done but little good here for several weeks. We have had no surplus honey yet. The weather is so dry and so very dusty. The outlook is very poor for a good yield this fall. Our grain and garden crops were never better in the last 20 years.

J. M. HICKS.

Battle Ground, Ind., Aug. 15, 1884.

Report for the Past Two Years.

In the spring of 1883, I began with 16 colonies, 12 in fair condition, and 4 weak. In May I fed them 50 pounds of the best granulated sugar made into syrup, so they built up and were ready for the honey harvest when it came, which was later than usual here. They increased by natural swarming to 37, and I took 3,243 lbs. of extracted honey from them. They had very little comb to build, for I had a lot of good combs to give the increase. I sold nearly all of my honey in my home market in small lots, and realized an average of 13½ cents per pound. Last winter I wintered them on the summer stands in large boxes with 6 inches of wheat chaff all around the sides of the hives, and 9 inches on the top, and lost only 2 in wintering, and none in the spring, and had no spring dwindling. I did not unpack them until after fruit bloom was over in the spring. I commenced this season with 49 colonies, and increased them to 99 by natural swarming. Forty-six of my 49 colo-

nies were in splendid trim for the season's crop, which bid fair to be a good one, but we had so much cold, cloudy, windy weather in June and in the early part of July that I got only a little over 2,000 pounds of extracted and 60 one-pound sections of comb honey. Others about here who worked for comb honey, got none. I have been very successful in preventing after-swarms this year, by giving a mature queen-cell to a colony the day after it had cast a swarm. If possible, I give cells that will hatch in a few hours, or in a day at the most. My bees are all mixed with Italian blood, and have at present full winter stores with a fair prospect of getting enough to do them for present use, or until frost. Basswood was a failure here this year, and thistles did but fairly. This year's honey is of good quality.

W. J. HONEYFORD.

Avon, Ont.

Diseased Bees.

I have a colony of bees which has been diseased during all of this season, having begun early last spring. The colony was, early in the season, a good, average one. The diseased bees were often dragged out when they were able to crawl back to the hive. Great numbers of them were black and shiny, and looked as though they had been dipped in oil. The dragging-out process has been going on all the time up to the present. A very small number of bees now remain, but what few there are, have vim, and they do not seem to be discouraged. I have cleaned away the dead bees several times, and there is now quite an accumulation of them. They may have 2 pounds of honey in the hive. I examined the colony last evening, and found that the brood in all stages of development is not in proportion to the number of old bees. The queen seems to be quite prolific. I consider the colony of no value. In the season of 1880, I had a colony in my apiary that acted in the same way up to about July 1, when the trouble ceased, and the bees stored enough honey to winter on. The season here has been a poor one for honey and increase. We have had a great deal of rain up to within 3 weeks past, vegetation has been rank, and the prospect is good for a crop of fall honey. The bees are now out early in the day, and seem to be gathering honey.

ISAAC SHARP.

Waveland, Ind., Aug. 20, 1884.

Preventing After-Swarms.

I have tested quite well Mr. Heddon's method of preventing after-swarms, and consider it a failure. It has caused several cases of very bad robbing. I always use the golden opportunity—just between sundown and dark—to discover robbing; also the first swarm will, sometimes for weeks, treat the bees of the old colony with suspicion. If I could not introduce young queens, I would shake off most of the bees in the old colony, and keep the entrance well closed for two days, and carry it away at once. Fall feeding is next in

order, and I think that I have a method of feeding and an entrance to the boxes that will not be improved soon.

CHARLES MITCHELL.

Molesworth, Canada.

Absolutely no Surplus Honey.

Cannot Mr. Doolittle or Mr. Heddon lend me honey enough to make a jug of vinegar? The silver lining hangs on the southeast corner of "the ragged edge of despair;" and unless we get a flow of honey from heart's-ease, we will have to fall back on sorghum molasses, in this section of the country.

JAMES RONIAN.

Willisca, Iowa, Aug. 16, 1884.

Honey Crop Below the Average.

The honey crop here is below the average. White clover has yielded well generally, but the yield here was mostly from red raspberry bloom, and not enough for a taste from basswood. By close extracting I have managed to get 1855 pounds where last year the yield was 3,000 pounds, with about the same number of colonies, and the crop was $\frac{2}{3}$ basswood. I am satisfied from experiments last season, that a syrup made from granulated sugar is better than natural stores for wintering bees. I think it is well to have it stored in combs that contain no pollen, as breeding need not commence before the bees gather natural pollen in the spring. If pollen is detrimental for winter food, as I am inclined to believe, bee-diarrhea will not exist, as it is very liable to do when natural stores are depended upon; and one, at present prices of sugar, can gain enough to well pay him for his labor. A very thick syrup can be made for 5 cents per pound. We have had an unusually cold July here, and it is cold now. Prospects fair for a fall crop.

W. H. S. GROUT.

Kennedy, N. Y., Aug. 11, 1884.

Bees in Northwestern Nebraska.

With the experience which I have had with bees in Northwestern Nebraska, I think it is a very poor country for the apiarist. Take it on an average, bees gather just about enough honey to decently winter on, but they do well in swarming. I had 34 colonies in 1883, and received 380 pounds of comb honey, and 120 pounds of extracted. I have 54 colonies this season. They swarmed and seemed to do well until July 15. I had some very heavy swarms hanging out. It was getting late in the season, and I put on sections to keep the colonies from swarming. I put the sections on about July 1, the bees commenced to work in them, and worked until about July 15, when I noticed that they commenced robbing, and kept it up for about 15 days. They destroyed 5 colonies which had young queens that had not been mated with the drones. I closed the entrance of the hives so that but 2 bees could pass at a time, and then smoked those which appeared to be robbing the worst, but nothing seemed to do any good. They are working very hard now, and all seem to be in good condition. I use

the double-walled hive, and I think that it is a very good one. I left them on the summer stands last winter unprotected by any wind-breaks, and the ground froze about 3 feet deep, but the bees came through all right. Until July 1, my bees swarmed and did better than ever before. I expected a good crop of honey, but I am afraid that it will fail. My bees are storing honey very fast at this time, and I am in hopes that the fall will be favorable, so that the bees can make up for lost time. I have about half a dozen colonies of Italian bees, and the balance are the native black bee. So far the black bees appear to be the best workers, but the Italians seem to build straighter combs.

ANDERSON GIBSON.

Ponca, Neb., Aug. 12, 1884.

Tree-Trunk Method of Wintering.

When I read an article like the one from the pen of Wm. F. Clarke, in the BEE JOURNAL of July 9, 1884, I feel like criticising it a little. I do not wish it understood that I am writing this against his method of wintering, for I am not; but I have known of bees dying in trees in winter, or at least they were all right in the fall, and in the following spring were dead. But of course this does not prove that they were winter-killed. That bees are sometimes winter-killed in trees, we have proof in Col. R. Walton's article on page 492. Mr. Clarke, in his article, devotes considerable space to "Bee-Life in a Tree-Top." Is it possible that Mr. C. never saw a bee-tree with the entrance near to the ground? If he has not, then the nature of bees is different here in Iowa; for out of some 50 bee-trees which were felled, and which I can now call to mind, 14 of them had entrances close to the ground, one was in a stump, and one in a log on the ground. In some of these trees the combs were actually built below the level of the ground. I am not writing this to get up a controversy with Mr. Clarke, as I would likely get the worst of it; but am merely telling facts as I have seen them.

J. W. BUCHANAN.

Eldora, Iowa, Aug. 11, 1884.

What is it?

Since my last letter, there have been heavy rains here, and the bees are doing better. They are bringing in a vast amount of pollen from corn, and working strongly on buckwheat, of which there is a large amount sown. I will describe as well as I can what to me was a curious scene: There are 140 colonies of bees $\frac{1}{2}$ mile from here, working on 7 acres of buckwheat, 20 rods from the apiary. The bees cross the road over a rise of ground in a direct line to the buckwheat field. I was in the road at this rise of ground, looking at the thousands of bees flying in the air; it was about 7 o'clock in the morning, and the bees flying directly towards the sun, when my attention was drawn to what I at first thought was fine drops of rain, but upon close inspection I

saw that it was a fine liquid spray or fine drops which was ejected from the bees. This was something new to me, and so I went back to my house and got my assistant, W. B. Smith, and returned, where we both saw it distinctly many times. I then went away $1\frac{1}{2}$ miles and returned, and again saw it repeated. Now, what does this mean? What bearing does it have on the "dry feces theory?" Also on the pollen idea? If this is common, how can bees be confined to the hive for 5 months and their intestines not become distended and diseased, thus causing the dreaded condition of the bees which we call diarrhoea? S. J. YOUNGMAN.

Cato, Mich., Aug. 4, 1884.

Only Half a Crop of Honey.

We have only about a half crop here. I began the season with 32 colonies, having lost 30 in the winter. I began to feed them on May 8, and got them in good condition by June 12. It was cold all through July, and for a month the bees have been idle; now it is hot and dry, but I hope for better times. Up to date I have taken off 950 pounds of comb honey of the best quality.

JOSEPH LEE.

Farmers, Mich., Aug. 16, 1884.

Bees Did Well on Basswood.

I commenced the season with 55 colonies, some of which were very weak. They have increased to 100 colonies, mostly by natural swarming. The first part of the season was quite favorable for brood-rearing until about July 1, when we had unfavorable weather 5 days, which almost entirely checked swarming. I obtained only about 500 pounds of extracted honey from clover, and that was all that they stored up to July 1. When basswood bloomed, my bees did well, and it lasted about two weeks; since then they have not made more than their living. I have in all about 4,500 pounds of honey, about 300 pounds of it being comb, and the balance extracted honey. We have just had quite a rain, and I am in hopes that we will have a little flow of fall honey.

A. C. SANFORD.

Ono, Wis., Aug. 18, 1884.

Not More than Half a Crop.

I have not yet seen any reports of the honey crop from this part of Michigan. We had an unusual heavy flow of honey-dew or aphide secretion during the month of June, but it is poor stuff, and a damage to the honey crop. I had 45 colonies in the spring; increased to 71 by natural swarming, and have taken 1,000 lbs. of comb honey in one-pound sections, mostly from white clover, and have extracted 500 lbs. Basswood was a complete failure, owing to cold, windy weather when it was in bloom. Buckwheat is coming into bloom, but it is not yielding much honey on account of dry weather. I hope that others are doing better.

E. W. WALES.

Disco, Mich., Aug. 16, 1884.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Aug. 25, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the price of honey, but demand is improving gradually. Extracted brings 6@8c on arrival, and choice white comb honey in sections, 15@16c.

BEESWAX—1s dull at 26@28c on arrival.

C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—Sales of comb honey continue slow. As yet there are no arrivals of this season's crop. We have received several small shipments of new extracted honey, which sold readily. For prices on this year's crop, we quote: Fancy white, 1-lb., 16@18c; fancy white, 2-lb., 15@16c; fair to good, 1 and 2-lb., 12@14c; fancy buckwheat, 1-lb., 12@13c; 2-lb., 11@12c. Extracted, white clover, in kegs or small barrels, 8 $\frac{1}{2}$ @9c; dark grades, 7@7 $\frac{1}{2}$ c.

BEESWAX—Prime yellow, 30@32c.

MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY—New honey is coming in, and selling at 16@18c for best white, and 12@14c for sections. New extracted, 8@9c. Honey in unglazed sections sells the most readily. Old comb honey all gone.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY—The demand for comb is very light. The retailers have bought a little during this month; but say that they do not have any call for it at present. Prices range from 12@16c per pound for the different sized frames and style of packages. There is continued dullness in extracted. Some of the new crop is on sale.

BEESWAX—1s dull, and 25c for dark, with 30@32c for yellow, is the range of prices.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—The market is devoid of any encouraging features to sellers. Offerings are numerous, there is no pronounced inquiry, and not a particle of competition among buyers. Some comb honey has been sold within the week at 7c, 8c, 9c and 10c for four different grades, the latter being extra choice. White to extra white comb, 9@11c; dark to good, 7@9c; extracted, choice to extra white, 5@5 $\frac{1}{2}$ c; dark and candied, 4c.

BEESWAX—Wholesale, 25c.

STEARNS & SMITH, 423 Front Street.

KANSAS CITY.

HONEY—I have to report a little easier feeling in the honey market. Buyers generally have an idea that the crop is large and are not willing to buy more than for present demands, which are, as yet, comparatively light. Then, too, the immense crop in California and low prices there have a tendency to equalize the Eastern markets. Crops, except in the extreme east, I think, are not so light as is supposed, and there will be no scarcity in the Mississippi Valley. My last quotations are hardly sustained this week. I am trying to hold this market up, but small buyers are quoting country prices on me which compel some concessions. I think our bee-keepers will find it good policy in quoting prices to these occasional buyers, to hold a stiff margin of 2 or 3c. on them, and when they do make a sale, it will count to their profit. But when they quote prices or make sales at about what their commission merchant or large buyers are getting, these fellows use it to beat down the prices in the regular channels, and it only reacts on the producers after all. I am in favor of the bee-keeper selling all he can around home and any where else, when he can get a good price; but if he places himself in the field as a competitor of the regular honey merchant, he only pulls down the market on his own head.

BEESWAX—Nominal, 30@35c per lb.

JEROME TWICHELL, 514 Walnut Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8c.

BEESWAX—Firm at 32@32 $\frac{1}{2}$ c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lbs. best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c.

BEESWAX—30c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7 $\frac{1}{2}$ c.

GEO. W. MEADE & Co., 213 Market

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

GETTING UP CLUBS.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following premiums for getting up clubs:

While no subscription to the BEE JOURNAL will be taken for less than the regular advertised prices (viz.: Weekly, \$2.00; Monthly, \$1.00),—any one getting up a club of two copies, or more, may select from "OUR BOOK LIST" anything therein named, to the amount of 15 cents for every dollar they send direct to this office, to pay them for the trouble of getting up the club; and these books will be sent, postpaid, to any address desired.

For a club of 3 Weekly or 6 Monthly and \$6.00, we will make an *additional* present of a Pocket Dictionary, bound in cloth, containing 320 pages.

For a club of 5 Weekly or 10 Monthly, (or a mixed club of both,) with \$10, we will, in addition to the 15 per cent, present a copy of the AMERICAN "POPULAR" DICTIONARY, comprising every word in the English language that enters into speech or writing; it contains 32,000 words and phrases, 670 illustrations and 512 pages; it is nicely bound in cloth, and will be sent by mail, postpaid, to any address desired.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Sample Copies of the AMERICAN BEE JOURNAL will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a *demand* that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

EXCELSIOR WAX EXTRACTOR

The advantages of this Extractor are:

1. It is more easily operated, there being no necessity for removing the top to refill with water.
2. It melts quicker, because the wax is brought into a more direct contact with the steam.
3. It is more economical, because the steam has access to the center, thereby extracting all the wax from the refuse matter.
4. The filler for water acts also as an indicator as to the amount of water in the boiler, as when the steam escapes through the filler, more water will be required.

Keep a kettle of hot water ready to fill when required. We make two sizes, the smaller one having a larger capacity than the Swiss Wax Extractor.

Price, small size, \$4.00—large size, \$5.00.

ALFRED H. NEWMAN,
923 West Madison St., CHICAGO, ILL.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

To Indiana Bee-Keepers.

Since Secretary Allen's notice on page 542, relating to the display of bees and honey at the Exposition in Louisville, from Sept. 4 to 6, I have conferred with Col. John F. Davis, Commissioner of Agriculture of Kentucky, and he has promised to give the following prizes, to encourage the display of Bees and Honey among the products of the State: Best comb honey, not less than 24 lbs., \$5.00; best extracted honey, not less than 24 lbs., \$5.00; best display of honey, \$10.00; best colony of Italian bees and queen in observatory hive, \$5.00; best display of bees and queens, \$10.00; best collection of honey-producing plants and trees, cut specimens, \$5.00. I may not have the list entirely correct, as I received it verbally from the Commissioner. We hope to meet many of the friends of bee-culture from other States, as well as from our own State, at our State convention at Eminence, Ky., on Sept. 2 and 3, and also at Louisville. G. W. DEMAREE, Christiansburg, Ky., Aug. 21, 1884.

The semi-annual meeting of the Fayette County Bee-Keepers' Association will be held in Brush Creek, Iowa, on Sept. 9, 1884. This is to be a basket picnic held in the yard and lawn of B. F. Little. All who are interested are invited to attend. Come with your baskets well-provided, and we will have a whole day of enjoyment. B. F. LITTLE, Sec.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

UNPARALLELED OFFER!

I have a fine 6-horse-p. Horizontal Engine and Boiler (new) for sale, for \$300. I paid \$425 for it, last year. Description and cuts free. O. H. TOWNSEND, 35A1t Alamo, Kalamazoo Co., Mich.

EVERY BOY or GIRL

Who sends us eight 2-cent stamps (16 cents) and the names and address of ten boys and girls who love to read, will receive YOUNG AMERICA, a large 50-cent monthly, full of beautiful pictures, brilliant stories, poems, puzzles, etc., one year, free. Don't miss this rare chance, as this is the best and cheapest youth's paper in America. Address YOUNG AMERICA, Lock Box 675, Canal Dover, Ohio. 35A2t

EXCELSIOR HONEY EXTRACTORS

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

| | |
|--|--------|
| For 2 American frames, 13x13 inches..... | \$8 00 |
| For 2 Langstroth " 10x18 " | 8 00 |
| For 3 " " 10x18 " | 10 00 |
| For 4 " " 10x18 " | 14 00 |
| For 2 frames of any size, 13x20 " | 12 00 |
| For 3 " " 13x20 " | 12 00 |
| For 4 " " 13x20 " | 16 00 |

ALFRED H. NEWMAN,

923 West Madison Street. Chicago, Ills.

W. Z. HUTCHINSON,

Rogersville, Genesee Co., Mich.

Is now making a specialty of rearing fine Italian queens. All queens bred from the purest and best of mothers, and the cells built to full colonies. WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, high-board fence and 1/2 acre of ground in a small village, only 25 rods from Depot, freight, express and telegraph offices; sawmill, store and blacksmith shop, six miles from here, on this M. C. R. R. Good cellar, cistern, and two wells.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

The Illinois State Fair for 1884 will be held at Chicago, upon the extensive and finely improved grounds of the Chicago Jockey Club, adjoining Garfield Park. The Fair will be held from September 8 to 13. A show of Fat Stock will be held in the Exposition Building, Chicago, Nov. 11-20, under the auspices of the Board.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

To Kentucky Bee-Keepers.

Since Secretary Allen's notice on page 542, relating to the display of bees and honey at the Exposition in Louisville, from Sept. 4 to 6, I have conferred with Col. John F. Davis, Commissioner of Agriculture of Kentucky, and he has promised to give the following prizes, to encourage the display of Bees and Honey among the products of the State: Best comb honey, not less than 24 lbs., \$5.00; best extracted honey, not less than 24 lbs., \$5.00; best display of honey, \$10.00; best colony of Italian bees and queen in observatory hive, \$5.00; best display of bees and queens, \$10.00; best collection of honey-producing plants and trees, cut specimens, \$5.00. I may not have the list entirely correct, as I received it verbally from the Commissioner. We hope to meet many of the friends of bee-culture from other States, as well as from our own State, at our State convention at Eminence, Ky., on Sept. 2 and 3, and also at Louisville. G. W. DEMAREE. Christiansburg, Ky., Aug. 21, 1884.

The Progressive Bee-Keepers' Association meets on the first Saturday in October, 1884, at Bedford, O. A general invitation is given.

J. R. REED, Sec.

Look at Your Wrapper-Label.

X SUBSCRIBERS whose papers reach them with this paragraph marked with a blue pencil, will please take notice that their subscriptions will expire at the end of the present month. Such are marked thus on the label, "Sept. 84." We do not want to lose any of our subscribers, and give this notice so that all may get every number of the BEE JOURNAL without any break, and no papers will be missed. When the money for renewal is received at this office, the date on the label is changed to correspond, and this change is your receipt. If there is any mistake made, notify us at once.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

150 COMPLIMENTARY,

and UNSOLICITED TESTIMONIALS from as many bee-keepers in 1883.

We guarantee every inch of our Foundation equal to sample in every respect.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives that. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quietening and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Biene Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., SEPTEMBER 3, 1884.

No. 36.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The Bee Journal for 1885.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

☞ Sir John Lubbock is attending the great gathering of the British Scientists at Montreal. Sir John has devoted much attention to bees, and is justly regarded as one of the greatest men of this age.

☞ A new and revised edition of "Quinby's New Bee-Keeping" has just been published. It has been rewritten by Mr. Quinby's son-in-law, Mr. L. C. Root, and is "fully up with the times." We keep a stock for sale at the publisher's price, \$1.50.

☞ The Toronto Exposition will be held from Sept. 10 to 20, 1884, and as usual will be very attractive. The Bee and Honey Show has the honor of being the largest, not only in Canada, but in America.

☞ The California *Grocer* of Aug. 22 remarks as follows upon the honey market: "Many tons of new honey have already been shipped East from the southern counties, and our local market is very fully supplied. Sales of new crop are only affected through the most liberal concessions. It is surprising that experienced bee-keepers will persist in sending their honey forward so early in the season as to ruin a prospect for a good market."

☞ Relative to Mr. F. H. Hunt, of Centre Point, Iowa, having placed glucosed honey on the markets of Iowa and Nebraska, some remarks were made on pages 424, 475 and 492. Mr. Hunt has sent a reply for publication, which, on account of its offensive personalities, we deem it advisable to sum up thus: He denies having sold any impure honey, and avers that the honey, spoken of on page 475, was, by analysis proven to be unadulterated. This much should be given in his defense, but we cannot burden the BEE JOURNAL with unpleasant matters growing out of personal animosities, which, by Mr. H.'s reply, would seem to be largely mixed up with the matter.

☞ In reference to the holding of the next meeting of the National Convention at New Orleans, as suggested by Mr. Viallon, Dr. C. C. Miller writes as follows:

DEAR EDITOR:—On page 548 you suggest the postponement of the National Convention for 2 months, and its removal to New Orleans. According to the constitution, the place of meeting is to be fixed by vote of the Society, and having been thus fixed, it seems that the officers have no discretion in the matter, but the Society, at its Rochester meeting in October, can decide upon the time and place of holding the succeeding meeting.
C. C. MILLER, Sec.

☞ A strange complaint has just been received. It says that the writer had sent \$2 to a subscription agency in New York for the BEE JOURNAL for one year, and has not received it. We have never heard of the agency before, and we wonder why it is that persons persist in sending subscriptions to parties they do not know, instead of sending them direct to this office. It is often a source of annoyance and loss to do so. Let us impress it upon all who desire to take the BEE JOURNAL to send subscriptions direct to this office, unless they know the parties well enough to trust them with their money.

☞ The Indiana State Fair will commence on Monday, September 29. The entry books, except in the speed ring, will close on the Saturday previous. All stock and articles must be in place on Monday forenoon of the first day. Experience has demonstrated the importance of promptness and early preparation. Special attractions will be provided to make each day equally interesting. It will be strictly an Agricultural Fair and Farmers' Annual Festival.

☞ Mrs. Sarah, relict of the late Lockwood Pringle, died at the residence of her son, Allen Pringle Esq., of Richmond, Ont., on July 22, at the advanced age of 73 years. Deceased was strong and unusually active up to within a very short period of the close of her life. She was widely known in the community and universally esteemed.

Extracted vs. Comb Honey.

Mr. F. L. Dougherty in the *Indiana Farmer* argues the point thus :

The present season's work will be convincing to a majority of bee-keepers ; that is, the season will determine which will be the most profitable to produce, extracted or comb honey. In our own immediate vicinity, the amount of comb honey is very meager, while those who worked for extracted honey report a very fair crop.

We have been long convinced that for the best results, comb honey exclusively could not be depended on. Even during the best seasons we not infrequently find colonies that are slow to start in sections, losing half the season before they get fairly started, whereas, if plenty of empty combs be given them, as in a hive fixed for extracting, they go to work with surprising vigor. After they have worked for a few days in the upper frames, if these be removed and the sections substituted, they will generally enter them without further trouble. There are exceptions to this rule, however ; for we have had colonies that would not go into the sections and build comb, with any amount of coaxing.

The outlook at the beginning of the present season was flattering in the extreme, and we had reason to expect a good harvest ; and in many localities the yield from white clover was quite good, but, on account of the previous bad weather, the bees were not in condition to gather it. At the beginning of the honey flow from clover, when the hives should have been full of brood, the combs were almost empty. Consequently all the honey gathered at the beginning was stored in the brood-combs, to the detriment of the colony, as the queen soon became cramped for room in which to lay. When these full combs were removed and empty ones returned, this made but little difference, as the honey was easily thrown out with the extractor. But when comb honey alone was the object sought, this plan would not work so well. Again we find that when bees are allowed to begin the storing of any great amount of honey in the brood-nest, they will keep it, to a greater or less extent, the entire season ; or, in other words, a colony that is allowed to cramp the queen once, is very likely to continue it throughout the season.

Again, this teaches us that very much depends on the control which is had over the brood-nest, during the early preparation of the colony for the summer's work,—such control as can be had only by the use of division-boards, reducing the size of the brood-nest to the necessities of the colony, enlarging it only to satisfy the demands of the queen, and so managing the brood-chamber, that at the commencement of the honey-flow, it will be entirely filled with brood, leaving but little space if any in which the bees may deposit honey, but forcing them directly into the sections for the necessary room in which to store it. This we think is the only manner in-

which comb honey can be secured with any certainty, but, during a season like the past, it is almost impossible to secure this end before the honey-flow ceases ; consequently the extractor must be brought into use or a major part of the crop is lost.

Bee-Keeping in England.

The *London Daily Telegraph* of July 22, 1884, points out the many improvements in bee-keeping that have been made within the past decade—many of them even since we visited Europe, in 1879, in the interests of bee-culture. We are glad to welcome our Cousins to a higher grade of apiculture. The *Telegraph* says :

Bee-Keeping as an industry of substantial importance gains ground every year, and the hope expressed by the spokesman of the Central Society, at their latest meeting, that every county would soon have its branch organization, bids fair to be fulfilled. During the six years that have elapsed since the Baroness Burdett-Coutts became one of the Presidents of the "British Bee-Keeping Association," the prosperity of apiculture has been very marked, for in the interval, scientific ingenuity has been so successfully directed to the improvements of hive-construction and the methods of taking the combs that, to quote the paper which was read at the meeting referred to above, "the bee-keeping of to-day no more resembles that of the past than a railway train resembles a carrier's cart."

Indeed, there are not, probably, many Societies which in a single decade of existence can point to more material results, and the very bees themselves, if they could compare the present with what has gone before, would be amazed when comparing the old "go as you please" procedure in the straw-hive—when the colony had to be murdered before their honey could be taken, and fifty per cent. of their best work was wasted and thrown away. They can now look around at the commodious and charming structures of wood and glass in which they are invited to store their sweet harvest, and prepare for it with a regularity and geometrical accuracy that must be eminently delightful to these small winged Euclids of orderly angles. Their lines are laid down for them in wax, and each sheet of comb is in width and depth and length exactly the same as the next, so that disparity, the bees' abomination, is impossible, and mathematical exactness, their passion, is invariably insured.

Still more to the point, perhaps, is the fact that now, bee-keepers do not suffocate their colonies whenever they wish to move them, or murder them whenever they wish to rob them of their harvests. For such a reform as this all bees should be truly grateful, and, if the truth were known, they probably are.

Great, however, as has been the expansion of this industry, there is

room enough in Great Britain for an enormous increase. The initial expense, trifling though it may seem, is sufficient in many cases to deter experiment, and, strange as it may appear, local superstition has, in some places, an effect in setting the country-folk against the industry. But the British Bee-Keeping Association is going the right way to work ; for assistance in money to those who wish to start in the enterprise and cannot afford to do so, with liberal prizes and substantial encouragement in the direction of cheapening hives and the best apparatus of the apiarist are, after all, the only methods by which this remunerative occupation can be popularized and established.

From other aspects than the money one—and there are many who are ready to confess that they recognize other than material aspects in a commercial undertaking—the culture of bees abounds in interest. Quite apart from the natural history of the insect—which sufficed, it may be remembered, for the life-long study of a great mind, and yet was left unexhausted by his researches—the tradition and folk-lore of the hives are of extraordinary abundance and most curious character. In its literature the sympathetic connection supposed to exist between bees and their owners—indeed, between the insects and humanity—forms a very curious and pleasant chapter of rural superstition.

Quarrelsome people need never try to keep bees, nor should any one hope to find honey in hives, who trespasses upon a neighbor's land-marks. If a bee comes into a house, it must not be treated like a wasp, but deferentially encouraged to go out. They hum a hymn of joy, it is said, on Christmas Eve, and on Good Friday store no honey. They love children, and share with the swallow the pretty distinction of being the returned spirits of the little ones. They are emphatically the friends of man, both in the sentimental fancies of literature and the practical results of their exemplary industry.

Convention Notices.

The Western Bee-Keepers' Association will hold its second annual meeting in Independence, Mo., Wednesday, Thursday and Friday, Sept. 24—26, 1884. The Association will endeavor to make this the most instructive and interesting meeting it has yet held, and will spare no pains within its means to make it in every sense valuable to all.

C. M. CRANDALL, Sec.

The bee-keepers of Hancock county, Ohio, met in Findlay, on Aug. 9, 1884, and organized an association to be known as the Hancock County Bee-Keepers' Association. Twenty-two persons became members by paying the dues, 25 cents. The Association meets again on Sept. 20, 1884, at the Court House in Findlay, at 10 a. m. Bee-keepers are cordially invited to attend. SAM'L H. BOLTON, Sec. P. A. RIEGLE, Pres.

Local Convention Directory.

1884. *Time and place of Meeting.*
- Sept. 4.—Southern Indiana, at Madison, Ind.
Dr. Fifth, Sec.
- Sept. 9.—Fayette County, Iowa, at Brush Creek, Ia.
B. F. Little, Sec.
- Sept. 13.—Union, Western Iowa, at Dexter, Iowa.
M. E. Darby, Sec.
- Sept. 17.—Eastern Indiana, at Richmond, Ind.
M. G. Reynolds, Sec., Williamsburgh, Ind.
- Sept. 24-26.—Western, at Independence, Mo.
C. M. Crandall, Sec.
- Oct. 1, 2.—Cedar Valley, Iowa, at Waterloo, Iowa.
H. O. McElhany; Sec.
- Oct. 3.—N. Ind. and S. Mich. at Goshen, Ind.
F. L. Putt, M. D., Sec.
- Oct. 4.—Marshall Co., Iowa, at Marshalltown, Ia.
J. W. Sanders, Sec.
- Oct. 11, 12.—Northern Mich., at Alma, Mich.
F. A. Palmer, Sec., McBride, Mich.
- Oct. 15, 16.—Northwestern, at Chicago, Ill.
W. Z. Hutchinson, Sec.

- Nov. 25.—Western Mich., at Fremont, Mich.
Geo. E. Hilton, Sec.
- Dec. 3.—Southeastern Mich., at Adrian, Mich.
A. M. Gander, Sec.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—E.D.

A New Estimate of the "Busy Bee."

Under the above heading the *London Sporting Times* gives the following article, which shows either the ignorance or stupidity of the writer, or else it was written for the same purpose as other nonsense with which the daily papers are filled now-a-days. The *Times* says :

There is no insect more thoroughly objectionable than the bee. It is even more disgustingly active than the ant. At the first dawn of day the bee sets off to hunt for honey, and continues at the sticky occupation until night. So far as is known, the bee receives no salary whatever, but works either to pamper the pride of a fat and useless queen, or because it is a prey to a miserly passion for heaping up honey. In the former case the bee deserves the contempt of all free men, and in the latter, it displays a loathsome mental and moral degradation. In either case the bee's willingness to do unnecessary work is an insult to intelligent human beings.

Scientific persons are fond of telling us of the bee's tremendous geometrical knowledge, and parade in proof thereof the fact that it builds hexagonal cells, thereby packing the greatest number of cells with the smallest possible amount of wax within a given space. They fail, however, to notice that there is no law requiring bees to build their preposterously little cells. If these were really intelligent insects, and knew the comparative value of wax and honey, they would build cells holding a pound of honey each, and thus enable a human being to eat honey without at the same time filling up the interior of his person with wax. This simple plan has never yet occurred to the bees. They go on building their antiquated and clumsy cells without once undertaking to improve upon them. They may be intel-

ligent, but they do not improve it by adhering to a pattern of cell invented by their antediluvian ancestors.

To hold up these miserly and wantonly busy insects to the admiration of mankind is a positive outrage. Dr. Watts, who openly forbade all interference with dog-fights, was in the constant habit, when he met a bee, of politely inquiring, "How doth the little busy bee!" thus treating the insect with a courtesy which would not be out of place if extended to a bishop. The pernicious influence of Watts in this matter has been widespread and enduring.

It is time that a protest should be made against the bee, and that mankind should henceforth be taught the plain and obvious truth that an insect which spends its whole existence in working and stinging is even more unworthy of emulation than is the mosquito or the book agent.

The National Convention.

The date for holding the next meeting of the North American Bee-Keepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Bee-Keepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme. C. C. MILLER, Sec.

L. C. Root, Vice-Pres.

The semi-annual meeting of the Fayette County Bee-Keepers' Association will be held in Brush Creek, Iowa, on Sept. 9, 1884. This is to be a basket picnic held in the yard and lawn of B. F. Little. All who are interested are invited to attend. Come with your baskets well-provided, and we will have a whole day of enjoyment. B. F. LITTLE, Sec.

The Union Bee-Keepers' Association of Western Iowa will meet in Dexter, Iowa, on the second Saturday in September, at 9:30 a. m. This Association is doing a good work, and bee-men in Western and Central Iowa would do well to avail themselves of its benefits. M. E. DARBY, Sec.

The Cincinnati Exposition of this year, the twelfth in the series, opens September 3 and closes October 4—one month. Every facility of low rates on railroads and by boat are offered to the stranger to visit the city. Exhibitors, and any others seeking fuller information, may address the Secretary, who will furnish rules, regulations, premium lists, etc. J. F. WALTON, Sec.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Sept. 1, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour :

CINCINNATI.

HONEY—There is no change to note in the price of honey, but demand is improving gradually. Extracted brings 6@9c on arrival, and choice white comb honey in sections, 13@16c.

BEEWAX—Is dull at 26@29c on arrival.

C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb, 18@20c, 2-lb, 16@18c; fair to good, 1 and 2-lb, 14@16c; fancy buckwheat, 1-lb, 12½@13c, 2-lb, 11½@12c; ordinary grades of dark, 1 and 2-lb, 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c, butwheat, 6½@7c.

BEEWAX—Is dull, yellow, 30@31c.

MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—New honey is coming in, and selling at 16@18c for best white 1 and 2-pound sections. New extracted, 8@9c. Honey and extracted sections sells the most readily. Old comb honey all gone.

BEEWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY—The demand for comb is very light. The retailers have bought a little during this month; but say that they do not have any call for it at present. Prices range from 12@16c per pound for the different sized frames and style of packages. There is a continued dullness in extracted. Some of the new crop is on sale.

BEEWAX—Is dull, and 25c for dark, with 30@32c for yellow, is the range of prices.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—There is plenty offering, mostly of ordinary quality, and very little demand. There is some inquiry for choice and extracted sections, extracted for shipment at not to exceed 5c. White to extra white comb, 9@11c; dark to good, 9c; extracted, choice to extra white, 4½@5c; dark and candied, 4c.

BEEWAX—Wholesale, 25c.

STEARNS & SMITH, 423 Front Street.

KANSAS CITY.

HONEY—I have to report a little easier feeling in the honey market. Dealers generally have an idea that the crop is large and are not willing to buy more than for present demands, which are, as yet, comparatively light. The immense quantity of honey in California and low prices there have a tendency to equalize the Eastern markets. Crops, except in the extreme east, I think, are not so light as is supposed, and there will be no scarcity in the Mississippi Valley. My last quotations are hardly sustained this week. I am going to hold this market up, but small buyers are making country prices of me which compel some concessions. I think our bee-keepers will find it good policy in quoting prices to these occasional buyers, to hold a stiff margin of 2 or 3 c. on them, and when they do make a sale, it will count to their profit. But when they quote prices or make sales at about what their commission merchant or large buyers are getting, these fellows use it to beat down the prices in the regular channels, and it only reacts on the producers after all. I am in favor of the bee-keeper selling all he can around home and any where else when he can get a good price; but if he places himself in the field as a competitor of the regular honey merchant, he only pulls down the market on his own head.

BEEWAX—Nominal, 30@35c per lb.

JEROME TWICHELL, 514 Walnut Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8½c.

BEEWAX—Firm at 32@32½c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lb., best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c.

BEEWAX—30c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.

Geo. W. MEADE & Co., 213 Market

CORRESPONDENCE

For the American Bee Journal.

Those Virgin Queens.

G. M. DOOLITTLE.

From the many letters of inquiry which I am getting, I do not think I can please the readers of the BEE JOURNAL better than to tell them just how I work from beginning to end, in getting and introducing my virgin queens; and as I have not lost a single queen this season, in using the plan, it speaks well for it, considering that we have had the worst season here for the queen-business that I have ever known.

First, I get the queen-cells which are generally matured by natural swarming or on the Alley-plan. When these cells are nearly ready for the young queens to hatch from them, I make a queen nursery as follows: Sixteen blocks are gotten out, $2\frac{5}{8}$ inches by $2\frac{5}{8}$ by 1 inch, which blocks exactly fill one of my frames; a $1\frac{1}{2}$ -inch hole is bored in the centre of each of these blocks, over which is tacked a piece of wire-cloth having 12 meshes to the inch, and being 2 inches square. Before tacking on the wire-cloth, I bore in one edge of the block which is designed for the top after the block is put in the frame) a $\frac{3}{4}$ -inch hole, boring it down to within $\frac{1}{8}$ of an inch of the $1\frac{1}{2}$ -inch hole. I now finish boring the hole with a $\frac{1}{2}$ -inch bit. This hole is for the queen-cell to be placed in, and the reason for the two sizes of holes is to give a shoulder so that the queen-cell can hang in the block the same as it does on a comb, and still be in no danger of slipping through into the block. This hole is bored a little to one side of the centre, so as to allow room for a $\frac{1}{2}$ -inch hole on the other side, which hole is to receive the candy (the same as made for slipping-cages) on which the young queens feed. This $\frac{1}{2}$ -inch hole is so bored that it comes out near one side of the $1\frac{1}{2}$ -inch hole, and when it is deep enough so that a hole large enough for the queen to enter is made, stop boring; for we need a shoulder at the bottom to keep the candy in place.

Now fill the hole with candy, packing it in with a 7-16-inch plunger, and tack on the wire-cloth when the blocks or cages are ready for the cells. Cut the cells off of the comb very carefully, for if handled roughly, I find that the queen will either not hatch at all or else she will have an imperfect wing or leg. Trim the base of the cell till it will go easily into the $\frac{3}{4}$ -inch hole, and just before placing it in the cage, take a little honey and put it around the point of the cell just where the queen will gnaw through in hatching from the cell. I formerly found many dead queens in the cages, and wondered at it, till by watching, I found that as soon as a queen got a small opening through the cell, she would

put out her tongue and the bees would feed her, thus giving her strength to become quite active as soon as she hatched; while if not thus fed, she would be very weak, and often-times would die. By placing the honey around the point of the cell, the queen is fed the same as if the bees had access to the cell, and it is a rare thing that I now find one dead in the cage.

After the cells are all in the cages, the frame made to receive them is placed on a board having a cleat nailed on it, when it (the board) is stood up nearly perpendicular, so that the frame rests on the cleat. Now put in the cages as carefully as possible, so as not to jar them, remembering always to keep the cells in the same upright position that they occupied in the hive.

When all are in, the frame of cages or queen-nursery is to be hung in a populous colony in place of one of the central frames of brood. In all these operations with queen-cells, the temperature of the place where you work should be from 85° to 95° , for a lower temperature will darken the color of the queens, and otherwise injure them, if exposed to it any length of time.

This nursery is used year after year, the only precaution necessary being to see that the candy in the $\frac{1}{2}$ -inch hole is kept fresh and moist by renewing or placing a little honey on the top of it, so it can soak through every time a new lot of cells are placed in it. The blocks can also be varied to suit any sized frame, or meet the notions of the most fastidious. If all has been done as it should be, you will find in 48 hours, upon lifting it from the hive, a nursery full of as bright lively queens as you ever saw, when the next thing to be done is to get them introduced where you wish them, or into nuclei if you are engaged in the queen-business.

For an introducing-cage, I take a piece of wire-cloth 4 inches square of the same kind as before mentioned, and roll it around a $\frac{3}{4}$ -inch rod which gives me a tube, after the sides are sewed together, $1\frac{1}{4}$ inches in diameter by 4 inches long. Into one end I fit a permanent stopper, and for the other end I make a plug $1\frac{1}{4}$ inches in diameter by $1\frac{1}{2}$ inches long. In the centre of one end of this I bore a $\frac{3}{8}$ -inch hole 1 inch deep, which is to receive a piece of comb cut from a frame of unsealed honey, which piece of comb should just fit the hole, with the cells standing endwise toward the cage, when this stopper is put in.

I at first used the same food in these cages that I used in the nursery, but often having nearly $\frac{1}{2}$ of the queens die in the cages, I adopted the above, and have not lost a single one since. To cut these pieces of comb, I make a punch of tin of the right size, and long enough to be convenient, which is ground sharp at the lower end before the tin is rolled up. If it is ground all from one side, and the ground side left on the outside, you will not be bothered with the piece of comb becoming wedged in the punch. To use the punch

easily, twirl it around at the same time you push down. To get the queens out of the nursery-cages into the introducing-cage, I place the nursery-cage near a window and remove the now empty queen-cell, placing the open end of the introducing-cage over the hole which is opened by the removal of the cell. If the queen should not readily run up into the cage (a thing she seldom fails to do), I leave the cages in place and fix the next one in the same way, and so on, taking care of each queen as soon as she enters the introducing-cage, by putting in the provisioned stopper and placing her in a basket. To secure the best results, the queens should be about 3 days old when placed in the introducing-cages, but a difference of two days either way will make no great difference.

Having as many queens in my basket as I wish, I go to the bee-yard, catch the queen which I wish to supersede, place one of the cages containing a virgin queen on top of the frames, and close the hive. If a honey-board is used instead of a quilt or sheet of enameled cloth, the frames will have to be spread apart and the cage placed between the combs. I now mark the hive by some means which will tell me that a queen is caged, and the date, when I wait five days; at the end of this time I go to the hive, raise the quilt and remove the provisioned stopper from the cage, when the hive is again closed and the queen allowed to go out whenever she chooses, as it is a shorter job than it is to wait for her to go out while you are there, for some of them are persistent in sticking to the cage, especially if a worker-bee enters the cage before the queen goes out.

I told you when I wrote on this subject before, that in five minutes after the release of the queen, I had seen her and the bees destroying the queen-cells, which was true, and up to July I found all cells destroyed in 24 hours after the queen was released; but as soon as the honey began to come in, I found that a part of the colonies would keep their cells and not destroy them; so in 24 hours after I take out the stopper, I look over the combs and cut off the queen-cells when not destroyed. I left some to see what would become of it, and the young queens were not molested till after they were fertilized, when, upon the hatching of a queen from the cells they had protected, they drove out the fertilized queen and held to the young one. In one case the queen went to laying with the first hatched queen in the hive, and was taken out after she had been laying 5 days, when in 5 days more the other was laying; so I had two laying queens from a nucleus in 5 days; but it does not generally work in that way, so I destroy the cells as given above. By using the above plan, I have secured a laying queen from a nucleus every 8 to 10 days during this season, which is quite a saving of time over the old or cell-plan.

In not a single case out of several hundred have I had a virgin queen killed, except by leaving the cells in

as I told you of, and then not till the young queen had hatched, so there were two queens in the hive. No bees are ever placed in the cage with the queen as some have suggested, and I believe it not wise to do so. I believe I have now answered all of the questions asked, and hope that it is plain enough so that all can understand it.

"What is It?"

C. H. COGSWELL.

Mr. Kemp, on page 536, attempts an explanation of the phenomenon called "honey-dew." He repudiates the "aphidae theory" and claims that it is a result of "aromatic exhalations or evaporation from flowers, etc." If I understand him, he argues that there is not an "aromatic" but a saccharine exhalation or evaporation from flowers, which, under favorable conditions, becomes so concentrated as to condense in the form of "honey-dew" on leaves, etc.

Now, will some of the scientists tell us whether the saccharine substance of honey—the sugar—evaporates or passes into the atmosphere in the form of insensible vapor? or is it the case with a saccharine fluid as with brine, that the water evaporates leaving a residuum of sugar (or salt) remaining? The vapor that rises from the ocean returns in the form of fresh water, and the vapor that rises from the honey-cavity of flowers, or from uncapped combs in the process of "ripening," is probably only a surplus of water, with no sensible trace of sweetness about it.

I will give one reasonable ground for believing that Mr. Kemp has not hit the true theory of "honey-dew." He says: "Honey-dew is formed only on hard, smooth, glazed leaves, such as the poplar, oak, and others." Others probably includes maples (silver), for it was very abundant on some of these trees along our streets this season, so plentiful as to drop off and thickly sprinkle the sidewalks. I noticed, however, that while it was very abundant on some silver maple trees, it did not appear on others near, or on the opposite side of the street. If it was a saccharine condensation in the atmosphere, why did it affect one tree abundantly and not appear at all on another tree with the same kind of leaves and only a few yards distant? I further noticed that all those trees, upon which I saw "honey-dew," were covered with the "scales" and "cottony" substance (spoken of by Prof. Cook and others) on the under surface of the limbs. There were no scales where there was no honey-dew, and vice versa.

Further, the foliage of the trees upon which there was "honey-dew" is now dark-colored and rusty, as if sprinkled with soot from coal-smoke, and the trees look old and sickly. On my own place, 1½ miles from town, which is largely given to orchard, nursery and groves in which maple abounds, no scale-lice nor "honey-dew" appeared.

As matters of theory and observation, I am constrained to believe that the weight of evidence is still with the scientists, though my neighbor says that he has seen all the leaves in a Missouri forest covered with "honey-dew," and no lice; but then, my neighbor, though positive, is not a close and critical observer.

Is Honey Poisonous?

DR. G. L. TINKER.

By request I have prepared this article in reply to the following questions concerning the effects of honey:

Is it a fact that honey is poisonous to some people? I have heard that a certain lady who ate some honey, died of its effects in a very short time; also, that it produces colic in some people who eat it. Is there any truth in these assertions? Is it possible for honey to produce death? and, if so, from what cause?

A LOVER OF HONEY.

There are several interesting facts relative to the ill-effects of honey on the digestive organs of many persons. It cannot be said, however, that honey is in any sense "poisonous." There is perhaps one exception in the case of the honey from the *Kalmia latifolia* or sheep-laurel, also called mountain-laurel, lambkill, etc. The beautiful shrub from which the honey is produced, is from 5 to 10 feet high, and is found in all the Atlantic States, Pennsylvania, Ohio, West Virginia and Kentucky, growing on rocky hills, and on the bluffs along rivers, etc. It is not plentiful, but occasionally forms dense thickets. The leaves are evergreen, leathery, and very smooth. The flowers are numerous, white, or rose-colored, and bloom in June.

Laurel honey is capable of producing severe effects if eaten too freely, such as headache, impaired vision, difficulty of breathing, sickness at the stomach, and diminished circulation with coldness of the extremities. Its effects are readily counteracted by a good stimulant like whisky.

The leaves of the shrub have proven a valuable remedy in the practice of many physicians, and the honey would, no doubt, prove very useful in moderate quantities in many diseases, if it could be obtained. We believe that it would be exceedingly rare to find it in the market.

The ill-effects of honey on some persons are due, almost without exception, to the small amount of acid which all honey contains, and which gives it its characteristic flavor.

Where honey disagrees with a person, it is a certain indication of weak or impaired digestion, of dyspepsia in fact. The worst cases of dyspepsia that I have ever seen, were those who complained in the early stages of their affection, that honey disagreed with them. My advice to all who cannot eat good honey without bad effects, is to apply to some good physician at once for treatment for dys-

pepsia. No one in these times, when it is so cheap, can afford to forego the luxury of eating honey.

The "reason why" it disagrees, is probably because in all cases of slow or weak digestion, acid products arise which have much to do with the discomforts of dyspeptics. Taking the acid contained in the honey only adds to their troubles in digestion, and hence, it is said to "disagree" with them, and this disagreement is often manifest in colicky pains. We do not know that eating honey while warm will cause colic, and do not think it ever would in a healthy organization. Doubtless warm honey would soonest effect an impaired stomach, as all warm fluids taken into that organ take effect sooner than cold ones.

I would not say that eating honey might not under some circumstances lead to serious results, for some poor dyspeptics may have already as much disorder as can be borne; and to add to that disorder, just a little more disturbance would be to turn the scale against them. But there are numbers of other agents in general use for food that would operate in a similar way in such a case. Hence, to say in an unqualified way that honey may cause any one's death, is to utter an absurdity.

As against the few persons who cannot eat honey, we have a large class whose general health is greatly promoted by a regular diet of honey; and add to this its valuable service in a great many forms of disease, it will be seen how true it is the good things of this life are often decried for no other reason than in some exceptional case a person may be injured thereby.

N. W. Ill. and S. W. Wis. Convention.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association met at Mr. L. Highbarger's, near Adaline, Ogle County, Ill., on Aug. 19, 1884. The meeting was called to order by the President, E. Whittlesey. The Secretary read a report regarding the foul brood question. In order to secure concerted action, the Secretary had inserted a notice in the BEE JOURNAL calling for the addresses of the secretaries of all the associations in the State; and it was hoped by this means to secure a concerted effort to influence legislation to prevent the propagation of foul brood. The notice, however, has not been responded to, and hence no correspondence has been obtained with other associations. The Secretary was appointed to present the subject before the Northwestern Association, which meets in Chicago on Oct. 15 and 16, 1884.

Six new members were admitted to the Association. The convention then adjourned for dinner, which well deserves the name of feast. One feature deserves special mention. In the centre of the table stood a pyramid of honey about 2 feet in height, and built of one-pound sections. It

was beautifully decorated with flowers, while from its apex waved the "Stars and Stripes." The time until 2 p. m. was spent in examining Mr. Highbarger's well-kept apiary. During the inspection all were shown several queens which had been lately received from Kentucky. Also an Albino queen which attracted much attention.

The convention then discussed many questions relating to bee-keeping, among which the following are the most important: "What is the best method to prevent spring dwindling?" "Is it best to set colonies close together?" "What is the best method to prevent robbing in the spring?" "What is the best method to prevent increase?" "What is the reason for the appearance of black bees in a colony of Italians?" "What is the best method of wintering bees?" "What is the best material to pack bees in for wintering?" "Should the hives be shaded?" "Toward what point of the compass should the hives face?"

A vote of thanks was tendered Mr. Highbarger and family for the generous entertainment extended during the day. The convention then adjourned to meet in Freeport, Ill., on the third Tuesday in January, 1885.

Sending Queens by Mail.

ARTHUR TODD.

I have read Mr. Doolittle's article under the above heading, on page 533, with considerable interest, and it recalls to my mind some serious losses which I suffered by loss of queens in the mails when breeding the African queens in Algeria, and shipping them to buyers in France. The temperature there was often above 90°, when I would mail a queen, and I argued thus: "Shut up in a leather mail-bag in such a heat, and then dumped into the mail-closet of a steamer for 36 hours, and then another journey of perhaps 48 hours by rail, what chance is there for ventilation?"

It struck me that if I could secure around the queen-cage as large an open space as possible, as a reservoir of pure air, I might succeed better. On inquiry, I found that the French "sample post" only allows a package of some 6x6 inches square, for such things as queens, and of very small weight. I, therefore, had space enough, but had to bring weight down to a fine point. I constructed a light wooden box 6x6 inches square, with air-holes all around it, and fastened in one corner of it my provisioned block queen-cage and its prisoners, using a candy the same as Mr. Good's.

I anxiously waited the result of my first shipment to a lady in the North of France, to whom I had shipped two beautiful queens both dying en route. I have that lady's letter somewhere, thanking me for my trouble, and expressing her delight at possessing a German, African queen.

adding that it was the plentiful supply of fresh air around her cage which saved the queen's life.

After that I lost no more queens. The advantages of my system of a "cage within a cage" are obvious. The group around the queen is kept compact, and natural warmth is not lost by fruitless rushing around a large cage, while the actual supply of air is practically inexhaustible. The extra postage was a trifle, as also the extra cost of the outside package, compared to the immunity from loss of my succeeding shipments.

Philadelphia, Pa.

Prairie Farmer.

Ants, Moths, Keeping Honey, etc.

MRS. L. HARRISON.

Bees have not gathered more than enough for their living during the past week. The nights were too cool for the secretion of nectar. Last night was warmer, and, to-day, the fragrance from buckwheat fields is wafted in through the open window as I write. As fast as the honey is sealed, it is removed from the hive, and all openings in the boxes pasted over with paper, so that the moth cannot get within to deposit its eggs. Extracted honey is kept nicely in jars with cloth tied securely over the tops, so that if it is not ripened sufficiently, the air will evaporate it. These jars can be piled one upon another, by putting pieces of wood between them. A proper place in which to store honey is a subject of much interest. Many persons complain that their honey sweats and the cells burst, causing it to run, and making a sticky, unsalable mess. If honey is kept where it freezes during winter, the capping, in the spring, will be found full of minute cracks, and as soon as the weather is warm, honey will ooze from the cells. Some recommend keeping it in a dry, cool place, but my experience compels me to differ from them. A hot room well ventilated cures the honey, and it will keep perfectly for an indefinite period. A large honey-producer has the south side of his honey-room all glass, so that the sun will heat it, and burns sulphur in it occasionally to destroy any moths lurking within.

Little red ants are sometimes a pest in the apiary and in the honey-houses. Tansy strewn around hives and upon the floors and shelves of the houses, is recommended by many bee-keepers as an antidote against them. A wire cage might be made, and sponges put within, wet in poisoned, sweetened water, which would destroy them: borax, scattered where they frequent, will kill them. I am partial to young chickens in the apiary, as they destroy the larvae of many injurious insects.

A little new honey is coming into this market, and I saw one-pound sections of white clover honey retailing at 15c. Sugar is so cheap that it will, no doubt, affect the price of other sweets. Sunflowers are a favorite in my apiary, and to-day I measured the circumference of a Russian head and found it 40½ inches. It was the only

flower on the stalk, and the birds commenced eating the seed as soon as it passed the milk. They pick off the end of the seed-shell and pull out the kernel, and if we secure any for our fowls, we must watch the heads and cut them as soon as the birds begin upon them. A lady, who called recently, said: "I have a colony of bees which I think is queenless. I examined them and found only sealed brood." In answer to my queries, I ascertained that there were only about a double-handful of bees and not a drop of honey. That little colony, no doubt, has a queen, but she is a wise mother and does not use her procreative powers to produce offspring to starve. To-day there are, perhaps, many small colonies of bees without a drop of honey, that must perish, sooner or later, if not fed.

Peoria, Ill., Aug. 15, 1884.

For the American Bee Journal.

The Origin of Honey-Dew.

T. J. BURRILL.

It is curious to notice the theories and speculations concerning the origin of what is called honey-dew. This sweet substance is certainly elaborated in the bodies of insects, and all that is required to demonstrate the fact, is a little close observation aided, it may be, by a hand-magnifier. To one accustomed to careful looking, honey-dew is as much a sign of the presence of plant-lice or their allies, as certain tracks in the corn-field indicate to the farmer the existence of depredating cattle, or as peculiar imprints in fresh snow reveal to the hunter the near occurrence of the sought-for game. That some plant-lice and some bark-lice do exude such sweet fluid from peculiar organs usually situated near the hinder extremity of the body, is as certain as that bees gather nectar or pollen from flowers, and the certainty comes from the same source, to-wit; actual observation.

It may be stated with equal positiveness, though the information is less directly based upon simple eyesight, that the sweet substance called honey-dew is never exuded from the glossy surfaces of leaves on which it is so commonly seen. Nectar is produced by many plants, not only in the flowers, but from other parts of the growing or living substance, but it is always, except, perhaps, from wounds, elaborated by special glands from which it is thence poured out. These glands are never found opening through the glossy coating of the leaves. Our native plants never become gorged with fluid in summer time so as to cause pressure from within, to force out the juices, as has been so often theoretically assumed. Even if this were true, we should look for the exudation from the pores of the under side of the leaf rather than the upper, because there is much less to prevent such escape through the thinner epidermis, or the far more numerous openings of the under surface.

It is also curious that so many conclude that the deposition of honey-dew only takes place at night, a statement as much at variance with truth as the opinion that stars exist in the heavens only after the sun goes down, and much easier proved to be false. The fact is, in most cases the exudation is commonly greatest in day time, but more rapidly dries. The only reason in the world that the substance is seen on the upper sides of leaves, rather than the lower, is that it falls from above. A piece of glass or a painted board put in the situation of the smeared leaves, will soon be found similarly spotted with the adhesive, colorless material. With us just now there is upon the leaves of our soft maple trees multitudes of a peculiar louse, and from the latter there is enough sweetish fluid exuded to conspicuously wet the sidewalks under the trees.

If we inquire why the little insects produce the sweet substance, an interesting study is opened. It must be understood that the material is not excrement. The elaboration is the work of two special glands which open through variously shaped external appendages, usually directed backward, and situated one on each side, near the hinder extremity of the abdomen. The insects are provided with sharply-pointed sucking organs projecting from the mouth, by the aid of which they all live upon the juices of plants. A portion of this plant-sap is, after absorption from the alimentary canal, converted into honey-dew and deposited at the will of the insect, often collecting at the extremity of the opening in little spherical drops which fall one after another as it slowly issues. One would at first say that it must thus be an expense to the internal economy of the little creatures without compensating benefit. It is simply elaborated and poured out. After more careful study, however, it will be ascertained that there is at least one useful purpose subserved. It secures the good-will and attention of friends who act as guards against enemies.

It is well-known that ants are extremely fond of sweet substances, and honey-dew forms no exception in their bill of fare. For it they ascend trees in great numbers, and caress in a most remarkable manner the honey-dew producers. In response to their petting, it is easy to observe the droplets exude which the ants sip with apparently great satisfaction.

Plant-lice have many insect enemies, but so long as the ants are in attendance, they are safe. The active, well-mailed, sharp-jawed creatures make excellent police. They are ever alert. They never accept a fee from the enemy; they never bargain for a share in the plunder. Honey-dew seems specially provided for ants.

Now, as to the question of quality as honey when collected by bees, there may still be differences of opinion among men, even after the source and method of production is understood. No doubt, however, most people will prefer to have that gathered

from flowers without admixture with the plant-louse product. It may be, to be sure, that different lice elaborate different grades of honey-dew, but the best may not be considered good enough for home use, whatever the conscience dictates in regard to the market.

Illinois Industrial University.

For the American Bee Journal.

Honey Show-Case.

A. H. DUTTON.

From all quarters the honey crop in this section is reported as good. My brother-in-law, G. A. Deadman, who is one of the largest honey-producers in the county of Huron, began the season with 53 colonies, and up to date has increased them to 130, and has taken surplus honey, chiefly in the extracted form, to the amount of about 5,000 pounds. The crop is principally from the white clover and raspberry, and it is of superior quality. The basswood, of which we have a considerable quantity, is proving almost a failure this season, on account of the scarcity of bloom and other causes, presumably, as the remote cause, on account of the very heavy bloom of last year, which was one of the most remarkable basswood honey seasons we have had for years past.

The bees kept by Mr. Deadman and myself are the Heddon hybrids, Germans and Italians, and have given us returns and consequent satisfaction in the consecutive order in which they are mentioned. We also have several colonies of Syrians, but have not sufficiently tested them to be able to report definitely. The distinct and well-established strains or breeds of poultry, canary birds, dogs, cats, etc., have been produced by the crossing of two varieties, and then perseveringly breeding to a pattern; and why will the rule not hold good in the case of bees also? Are they a solitary exception to laws and conditions which dominate over all the rest of animal life merely possessed of greater magnitude of body, and which under human intelligence, within certain limits, "is as clay in the hands of the potter?"

We have found that it pays every time, when running for extracted honey, to wait until the frame is about one-half sealed before extracting. The supply of wax and splendid quality of honey thus obtained more than repays for any slight increase which may be obtained by taking the honey unripened and then evaporating. Honey, properly ripened before extracting, possesses a beautiful, crystalline, refractive appearance, and is so thick as to pile high up when poured from one vessel into another. Smooth and oily to the taste, and causing no irritation to the throat in swallowing, and having all the richness of flavor of the honey sealed in the combs of the sections, and if it candies at all, after being properly bottled, it will be the last to do so.

The solar wax extractor, as made by Mr. O. O. Poppleton, is a success,

and an article which should be found in every well-appointed apiary. Aside from its furnishing the wax of the cappings, melted down and partially clarified by the wire strainer through which it drops, thus leaving it in the very best condition for subsequent clarifying, it saves honey alone sufficient to pay for itself twice over in the course of a fair, average season, when working principally for extracted, with, say 50 colonies, spring count.

We suppose that hundreds of private bee-keepers all over the land, with their 10, 20 or 50 colonies, and blessed with abundant surplus stores therefrom, are desirous of knowing the ways and means of disposing of the same to the greatest advantage; and to such would we say, "Work up a local market." For two reasons it pays the best: 1. Much better prices are obtained. 2. Shipping expenses are saved. To make for yourself a remunerative and permanent market, proceed as follows: Obtain from the Editor of the BEE JOURNAL 1,000 or 1,500 of the Leaflets entitled, "Why Eat Honey," which, when purchased in even less quantity, will be furnished with your address printed on each; mail one of these with an accompanying note stating who has your honey for sale, to the lady of every household in the village or town where you live, and throughout the surrounding country as well. Before doing this, however, make an arrangement with as many grocery and confectionery shop-keepers as possible to handle your honey; and if you can persuade them to do so, to handle it exclusively. Engage on your part to keep them constantly supplied with all kinds in good shape, of the best quality, and in every grade absolute purity guaranteed. Promise to leave the first consignments on commission, or until a fair trade has become established, and as a further inducement, supply each one who is likely to have a good scale for it, with a combined show-case and stand of the following or some similar design:

Let it be borne in mind (I am speaking from constant experience) that in 5 cases out of 6, customers for honey are captivated by its APPEARANCE in the store of the retailer. Then let that appearance be as captivating as ingenuity can possibly make it. Let the word "HONEY" on the labels, be in large, black, block type, but not so large as to extend entirely around the bottle, but to be easily

readable when facing the customer. Large, highly-colored, flashy labels which cover up nearly half of the bottle or tin, are to be avoided. Any saw or planing mill will furnish the pieces for the above case and stand, in the flat, and if the producer is possessed of ordinary mechanical ability, he can put them together himself, and not reckoning his own time, the total cost for wood, glass, nails, staining and varnish, all told, should not exceed \$1.25 per stand.

The use of this or a similar showcase aids in the sale of the honey immensely, and when properly dressed with comb and extracted honey, it forms one of the most conspicuous objects of the store wherein it is placed, and rarely fails to attract the immediate attention of every customer who has not seen it before.

The choicest sections should be placed next the glass inside the case, and a row of pint Gem or Mason jars filled with the clearest extracted honey on the highest shelf outside; on the two shelves below, place quart-jars, and on the counter surrounding the whole stand, with the exception of the back, place another row of quarts; there will thus be four rows of bottles ascending one above the other, and the case containing the comb honey springing from the midst of them, which is surmounted by a miniature pyramid of pint-bottles and cap-sheafed by a 5-pound bottle in the centre. It would be advisable to keep a tumbler of honey open behind the stand, and then if any *bonifide* inquirer should desire to know the quality of the honey before purchasing, hand him out a spoonful on a small crystal kept for the purpose.

Keep nothing but thoroughly ripened honey on hand in the extracted form, and seek to obtain your honey in sections as thoroughly capped as possible. If these methods are perseveringly carried out, you will soon find yourself the happy possessor of a paying business, and one wherein you can bid defiance to any opposition.

Brussels, Ont.

For the American Bee Journal.

Hiving Swarms of Bees.

I. H. SHIMER.

Having read with interest the several articles in the BEE JOURNAL on hiving swarms, I venture to give my method of procedure, which is as follows: I make a two-frame nuclei hive of the right size to hold the brood frames, and in place of having the sides and bottom tight, I nail strips $\frac{1}{2} \times \frac{1}{2}$ inches wide, and of the length I desire, and $\frac{1}{2}$ inch apart. The top is solid, being made of $\frac{1}{2}$ -inch lumber and fastened with a hook on each end. I now make an iron bail and attach it one-fourth of the way down on the ends. This bail is long enough to pass under the bottom, and having a socket in the centre to receive a pole or handle, I then fit two empty brood-combs into the swarmer having slots to hold them, so they cannot swing and mash bees.

When a colony sends out a swarm, I place a hive where I want them to stay, and when the swarm is clustered, fasten down the top, put my pole into place, take the swarmer and smoker in hand, and go to the cluster and place the swarmer directly over or against it, and give them a few whiffs of smoke to start them, and they cluster on the combs at once. I then lower them so I can reach the bail, remove the pole, carry the swarmer and bees to the hive, put it down in front of the hive, unhook and raise the cover, lift the frames out and place them in the hive, when I usually get two-thirds of the bees into the hive, and hardly ever fail to get the queen in also. The rest of the bees will soon follow, and there is no noise or commotion about it.

If I have no empty combs, I take out two frames from some hive, shake the bees from them, and place them in the swarmer. As I always put a frame or two of fresh brood in a new colony to help them, I have no absconding. If I wish to economize on the expense of the swarmer, I omit the bail, and nail a 3-inch strip of lumber on the bottom 1 inch thick; I then bore a 1-inch hole through the cover, and make a shoulder on the pole so that I can run it up between the combs, and use the swarmer as before. I try to guard against swarms uniting, but if it was not for saving valuable queens, that would give me no trouble as the stronger the colonies are the better. I have no use for a pair of pruning shears, or a saw or knife; I can get them as well from a trunk or fork of a tree as in any other place, if I can get the swarmer against or directly over them, I have no occasion to deface a tree.

Hillsboro, Ill.

For the American Bee Journal.

New Zealand Comb Foundation.

One who signs himself as "Another New Zealand Bee-Keeper," writes as follows to the BEE JOURNAL:

In the BEE JOURNAL of March 5, page 155, there is a communication in "What and How" columns which escaped my notice until a few days ago, from a "Bee-Keeper in New Zealand," in which there are certain queries put as to the purity of the wax in some samples of comb foundation sent by that writer, for the purpose of testing. Now, as the principal part of the comb foundation used in New Zealand is made by one firm, and that firm was accused by one party, of adulterating the wax, without any grounds for the accusation whatever, it would appear that there is some intimate connection between the accuser and the culprit. I would, therefore, ask you, in the interest of "fair play," to publish the following clipped from the *New Zealand and Australian Bee Journal* of Feb. 1, 1884:

"Some few weeks back we received a letter stating that a report was being circulated that we were adulterating the wax, from which we made our comb foundation with paraffine or some

composition. This, of course, was tantamount to accusing us of roguery in selling our customers an article made from other material than what we represented it to be. We at once wrote a letter to the gentleman, who, we were informed, had made statements to the above effect, telling him of what we had heard, and asking him if it was correct; after waiting several weeks for a reply, we received the following for publication:

To the Editor A. and N. Z. Bee Journal.—Having heard statements made which caused me to think and believe that the material used in the making of your comb foundation was not pure beeswax, but some kind of composition, I forwarded a sample of it to Mr. Pond, analyst for Auckland Province, for analysis, and I herewith hand you a copy of his report, for publication in the *Journal*. The sample was taken from a box obtained from Mr. Hayr, in the ordinary way of trade, and that gentleman had no idea that any of the purchase was intended for analysis. I have to congratulate you on the result of the test, which I may state was also made without any knowledge on your part, and I trust that the publication of Mr. Pond's report will have the effect of causing all the bee-keepers in Australia and New Zealand to do as I have done, and recommended, viz: using the foundation in full-sized sheets, and not in starters only, the latter practice being, in my opinion, a "penny wise and pound foolish" economy.—JAMES DALZIEL.

Following is the report of analysis:—Dr. DALZIEL, Pukekohe.—I have made an extended examination of the sample of comb foundation submitted by you on the 6th inst., with the result that I find it to be a fairly good sample of beeswax, containing no foreign substance. Melting point, 145° Fah.; specific gravity, 96.117; ash, a trace. Substances not wax: Fragments of bees' wings and legs, pollen grains, and water. I have the honor to be, sir, your obedient servant.—J. A. POND, *Colonial Analyst*, Auckland, Dec. 12, 1883.

"Although Dr. Dalziel has done what, of course, he had a right to do to satisfy himself whether we were practicing an imposition or not, *i. e.*, in getting an analytical test of the comb; still, we think he should have done this in the first instance, as soon as he suspected that it was adulterated, or, at any rate, before he made mention of it to others, and not have left it till written to on the subject.

"With regard to our comb foundation, we may state that in making it, we could not possibly be more particular in keeping it free from impurities than we are. The beeswax of commerce is usually in a very dirty state, especially on the outside of the pieces; these are all thoroughly scraped, and every ounce is then put through a double-refining process, in special boiling water-baths, before being made into comb foundation. We sometimes get, amongst the large quantities of wax that we purchase, pieces that have been adulterated; but having now handled some tons of

wax, we can easily detect them; these are laid aside, to be sold eventually to a candle factory. A second thought should convince any person that whatever is sent out from the Matamata Apiary is, as far as we can possibly know, exactly what it is represented to be, for we should have everything to lose and nothing to gain in deceiving our customers; and we know that the proprietor would not lend himself to any kind of deception. Since we have been connected with the bee-industry, we have done our utmost to promote it in every possible way, sparing neither trouble nor expense to further the interests of bee-keepers, and we believe that those who have known us longest will give us some credit for honesty of purpose in this respect. However, should there be any kind of misunderstanding amongst any of our customers with regard to goods obtained from us, when notified we shall only be too glad to explain or rectify any mistake that may have been made.

[We have given the above out of a sense of justice to our many Australian subscribers, but it should be borne in mind that the BEE JOURNAL decided that the wax sent here for examination was, on page 155, pronounced a genuine article.—ED.]

SELECTIONS FROM OUR LETTER BOX

My Report for 1884.

I began the season with 88 colonies; increased them to 117, and took 51 forty-gallon barrels of extracted honey. I have not yet weighed it all, but it will run considerably over 20,000 pounds. All of my top sections are full, and I should have taken more honey, but I run out of barrels and had nothing but the frames to hold it. I shall take more after awhile.

W. S. HART.

New Smyrna, Fla., Aug. 18, 1884.

Introducing Queens.

A short time ago I received a queen from Massachusetts, when I removed the old queen and put the cage and new queen in one corner of a frame and left her 24 hours. I then opened the hive and found small queen-cells which I removed and left her another 24 hours, when I looked and again they had queen-cells which I removed and let the queen out of the cage, when she flew out of sight. In about 10 minutes she returned, and several times tried to light on the combs, but the bees flew at her and drove her away, so I caught her and put her into the cage, and then again into the hive. It took 5 days to introduce her, but I succeeded, and she is now laying fast. I tried introducing virgin queens by letting them run in at the entrance when the hive contained capped queen-cells, and lost one-half

of the queens. I notice in the BEE JOURNAL something concerning the tree-trunk method of wintering bees, and I will say that there is not one colony in fifty that will live 5 years in any tree in Minnesota. I have known them to live for 3 winters and then die. I winter my bees in the cellar with a temperature of 35° and 45° above zero, and keep them in as long as possible. I shall try wintering a few colonies on the summer stands during the coming winter.

FAYETTE LEE.

Cokato, Minn.

Thoroughwort.

Please correct a mistake in my letter on page 523. You made it read, "The Italian bees are the best bees to gather honey, early and late." It should read, "The Holy Italian bees are the best bees to gather honey, early and late." Please tell me the name of the enclosed plant, and its merits as a honey-plant, to settle a dispute. We have dry and hot weather yet.

R. M. OSBORN.

Kane, Ill., Aug. 22, 1884.

[Nonsense! There are no such things as *holy* or *unholy* bees. "Call things by their proper names." We suppose you mean hybrids of the Syrio-Italian variety. To call such "Holy Italians" is *unholy* bosh.

The plant is thoroughwort (*eupatorium*). It is an excellent honey-producer.—ED.]

Bee-Keeping in Scotland.

DEAR EDITOR:—This has been a splendid season for the bees. The heat at times is most excessive. We have also had long intervals of drought during the season. The most of the bees here have now been removed to the Heather Hills for the second honey harvest. With the success of this year, I think it will do much for the future encouragement of bee-keeping. In fact, apiculture has made rapid progress all through Scotland since you visited us 5 years ago.

JOHN D. HUTCHINSON.

Glasgow, Scotland, Aug. 11, 1884.

Best Honey Season for 6 Years.

I have sent you a vial containing some of my honey mixed with "honey-dew." This should be white honey gathered during early summer, but it looks more like fall honey, and as for quality, I will let you pass your opinion. We have had the best honey season that we have had in the past six years. Although the spring was late, since the honey-flow began there has been no cessation except during a few rainy days when bees could not put in full time. At present buckwheat is at its best, and the weather hot and sultry, just right for a good yield of honey. The second crop of red clover, too, is in full bloom, and the bees work on it with a will. I have had quite a number of swarms lately, but have returned all of them, which has kept me pretty busy to add

frames and boxes and extract from those not worked for comb honey. I got rid of fertile workers in a colony by taking frames of brood with queen-cells from colonies that had swarmed, and they reared a queen, but not until after several trials, apparently when the young bees which were introduced became numerous enough to manage the household affairs. I market my extracted honey in pint and quart fruit-jars, and to hold them, make boxes with thin partitions, each holding a dozen jars, thus keeping the jars clean and separated in handling. I sell the jars along in nearly every instance, as they are used in almost every family. The boxes are made with handles at each end.

W. H. STOUT.

Pine Grove, Pa., Aug. 20, 1884.

[The contents of the bottle might pass for a very inferior article of molasses, but never for good honey. It was ruined by that honey-dew.—ED.]

An Average Season.

The honey season with us is over for this year, and it has been about an average one. However, I noticed something this season that I never before saw in this part of the country, and that was "honey-dew." I noticed it only on the maples, and it continued for about one week during the mornings. It occurred about the time the leaves had their full size, while they were yet young and tender. It formed on the top side of the leaves in small drops not as large as a pin-head, and soon died away before the morning sun, but the bees would have a lively time while it lasted; and after all I am not certain that it amounted to much. White clover and the locust trees are our main dependence here. The locust bloom was good this season. There is nothing more beautiful to me than to see a locust in full bloom, and there is nothing else that I know of which so excites bees to active work. But few bees are kept in this neighborhood.

OSMAN McCARTY.

Zollarsville, Pa., Aug. 22, 1884.

Motherwort.

I send you parts of a plant to name. The bees worked lively on it all through a good basswood field.

JOHN C. GILLILAND.

Bloomfield, Ind.

[It is motherwort, an excellent honey plant.—ED.]

The Season a Poor One.

I wintered 29 colonies, but the season here has been a poor one. I have had no swarms yet, and took the first extracted honey this week. The bees are now gathering honey from buckwheat and goldenrod, and I expect a good fall crop. The bloom has been abundant, but too much wet weather has prevented the bees from utilizing it.

JACOB EMMONS.

St. George, Kans., Aug. 25, 1884.

Mignonette Described.

About 4 years ago I bought an ounce of mignonette (*Reseda grandiflora*) from a supply dealer, which has been supplying my bees with some pasturage up to the present season. It grows to a very great size, 7 or 8 feet high, with long limbs, and all covered with yellow flowers, which are never without bees on them. The farmers around me, and others who should know better, declare that it is nothing but wild mustard, and that it will corrupt their fields. They have actually requested me to have it removed. Will you be kind enough to describe the plant, distinguishing it from the troublesome weed called wild mustard, so that my neighbors may sleep quietly without fear of having their fields contaminated?

A SUBSCRIBER.

[The most positive way to distinguish between mignonette and any and all kinds of mustard is the number of stamens in each flower. In all of the latter these are uniformly six—never more nor less; while in every flower of mignonette the number is from 10 to 40. The stamens are the thread-like organs bearing at the top and enlarged part called the anther, in which the pollen is produced.—T. J. BURRILL.]

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Was it Foul Brood?

On last Saturday evening, a neighbor of mine found and cut a bee-tree about three-quarters of a mile from my apiary. On Sunday evening he told me that he had failed to get the bees into a hive, and incidentally remarked that the comb had a disagreeable smell. That at once aroused my suspicion that it was foul brood. On Monday morning I visited the place for the purpose of making a personal inspection. I found the tree to be a post-oak with a small, dry cavity, containing only a few bees and some combs which had the appearance of being new, or made this season, and containing about one pound of honey, some pollen, and brood. The capping of the brood seemed to be torn, but I saw no small holes such

as are described by the writers on this subject. The combs emitted a very offensive odor, and were black, except the edges which were bright. The brood was all dead when I saw it. I had the tree, the bees and the comb cremated. I fear that it is a genuine case of foul brood. Am I correct? Is it usual for foul brood to exist with wild bees? If it was foul brood and having been exposed for a whole day, (my apiary being only three-fourths of a mile away) are my bees in danger? If they are, what can I do under the circumstances? I am alarmed for the safety of my colonies. I am a beginner in the bee-business, having commenced three years ago with 4 colonies, and this year I have 63. I use the Simplicity-Laugstroth hives with Quinby bottoms. This has not been a good honey season, yet I will be able to sell 3,000 or 4,000 pounds of honey. Bees have swarmed but very little this spring. I got only about 25 swarms from 34 colonies, spring count. I lost only one colony last winter, having wintered them on the summer stands. GEORGE E. BURNETT.

Harrisburg, Ill., Aug. 19, 1884.

ANSWER.—If I were on the ground, I think I could tell whether or not it was foul brood, though I have never seen a case of the disease. He who cut the tree may have smelled one bad odor, or what he called bad, and you another caused by the dying of the brood since the tree was cut. Another question, Is there any foul brood within 20 or 30 miles of you? Supposing it to be foul brood, whether or not your bees would catch the disease depends upon whether they visited the spot or not, and that depends entirely upon the amount of secretion and nectar in the flowers about you. If it was a time of honey-dearth, they would most certainly visit the spot to greater or less extent, and would more than likely contract the disease, provided the tree-colony had it. Your question, like many others, is quite delicate in detail, but I guess that it is not foul brood.

Moving Bees.

What is the best time and method of moving bees on a wagon 16 miles, between August and November?

Le Claire, Iowa. A. M. EARLEY.

ANSWER.—I wish that you had mentioned the number of colonies which you wish to move. If only 5 or 6, I should put them on a spring wagon with straw in the bottom, or a larger springless wagon filled with straw will do first-rate. Put in just twice as much straw as you think you need. If you are going to move 15 to 100 colonies, put a flat rack upon a wagon and pile as broad and flat a load of straw on the rack as possible. When it is 2 feet above the highest point of the rack, you have enough. Upon this load you can put about 30 colonies, and let the combs run cross-wise of the wagon. I would prefer to move them on a cool, cloudy day, and after the queens had ceased laying for 10 days at least, or as late in the season as you feel warranted will

give the bees a thorough flight after your arrival—a flight of 2 or 3 days duration. Ventilate the hives thoroughly, fasten the frames securely, drive very carefully, avoiding all jars possible.

Ripening Honey.

Will you kindly inform me through the columns of the BEE JOURNAL which is the best way of ripening honey, say in quantities of from 35 to 40 barrels? If a tank is used, of what material and shape should it be made? Bees have done well in this neighborhood, although the country was entirely submerged for several months. This year I have taken on an average of 100 pounds of extracted honey per colony. M. T. HEWES.

New Roads, La., Aug. 17, 1884.

ANSWER.—The subject of artificially ripening extracted honey, is one I have thought upon considerably, but having had no practical experience in the matter, I feel incompetent to give you the information desired. Our California brethren have had some experience in this matter, and if I remember correctly, have in the back numbers of the BEE JOURNAL given us some illustrations and descriptions of the methods which they use. I believe large apiarists will find it advantageous to ripen their honey artificially.

Killing Bees.

I send you a sample of bees which I have taken from a colony of Italians. There are quite a number of them, and the other bees are putting them out of the hive and killing them. For several days past, at almost any time during the day, I could see from one to a half dozen being put out. What kind of bees are they? and why are they treated thus?

H. J. NORTHROP.

Lansingburgh, N. Y., Aug. 12, 1884.

ANSWER.—After examining the sample bees, I should think that they were individuals of the colony which is putting them out and killing them, and which have devoted the most of their time to robbing, and that, too, in some place where they have become daubed. I think you have reason to rejoice that these worse than worthless bees are being destroyed.

Utilizing the Cappings of Honey.

Why could not the cappings obtained while extracting be utilized by the bees? It seems to me that if it was made very fine, that they might use it just as they use the natural wax-scales. Has any one ever tried it?

A. C. SANFORD.

Ono, Wis.

ANSWER.—We have had several reports of experiments made in trying to get the bees to utilize cappings in the very way that you mention; but so far experiment has proved it a failure, and that it is better to melt the cappings into wax and make the wax into foundation.

Special Notices.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

It must be understood that, should an advertiser desire to cancel an unexpired contract, he can do so only by paying regular rates for the number of insertions his advertisement has had.

In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierson, at 25 cts. each.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a *demand* that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Do not let your numbers of the BEE JOURNAL for 1884 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

"BOSS" ONE-PIECE SECTIONS.

We have again increased our capacity for making the "BOSS" ONE-PIECE SECTION, and are now ready to fill orders on short notice. We would advise our customers, and especially SUPPLY DEALERS, to

ORDER EARLY,
And Not Wait until the Rush Comes.

We will not manufacture Hives and Shipping Crates this season, as we have fixed over all our machinery for making the One-Piece Sections.

J. FORNCROOK & CO.,
49 Bctf Watertown, Wis., Dec. 1, 1883

65 ENGRAVINGS THE HORSE, BY B. J. KENDALL, M. D.

A TREATISE giving an Index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-buried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

and UNSOLICITED TESTIMONIALS from as many bee-keepers in 1883.

We guarantee every inch of our Foundation equal to sample in every respect.

CHAS. DADANT & SON,

5AB1Y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCLIPPING KNIFE.

Prof. Cook, in his valuable Manual of the Apis, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Unclipping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apisary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apisary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apisary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 55 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 10c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., SEPTEMBER 10, 1884.

No. 37.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Bees in the Mails.

Mr. T. A. Hougas, of Henderson, Iowa, makes the following inquiry: "When did the 'act' permitting queen bees to be shipped by mail take effect?" There was no "Law" or Act of Congress in reference to "bees in the mails." At the National Convention of bee-keepers held in Chicago in 1879, Prof. Cook was appointed a committee to visit the Postmaster General at Washington, and endeavor to have his "Ruling" reversed which "prohibited the carrying of bees in the mails." The Editor of the *BEE JOURNAL* prepared a cage having double wire-cloth over the aperture, with $\frac{1}{4}$ of an inch of space between the two pieces of wire-cloth, affording sure protection to the Postal employes, which Prof. Cook took to Washington, with other sample cages for shipping queens. By the kind assistance of the Hon. Edwin Willits, of Michigan, the Professor obtained an interview with the Postmaster General on Jan. 14, 1880, and after hearing the case, and examining the cage, the order was reversed, taking effect immediately.

The Northwestern Convention will be held at Owsley's Hall, corner of Robey and West Madison streets, Chicago, Ill., on Oct. 15 and 16, 1884. The official notice will be published next week.

The Iliawatha, Kan., Fair will be held from Sept. 16 to 19, 1884. The Premiums in the Apiary Department amount to \$45.00. Mr. J. W. Margrave is the Superintendent.

The National Convention.

Respecting the holding of the meeting of the National Society at New Orleans, Mrs. L. Harrison (who was probably re-elected Vice-President for Illinois, at the last meeting), writes thus:

"I second the motion to have the next National Convention at New Orleans. The Rochester friends could have it another year. We have had a poor crop of honey, and the railroad and boat fares will be low to New Orleans."

According to the Constitution, the next meeting *cannot* be changed. An adjourned meeting might be held there, early next season; or a special meeting could be called on the requisition of five Vice-Presidents, but as no one can tell who the Vice-Presidents are (through the bungling work at the last meeting), official action seems to be impossible. Let us hope that the next Convention will redeem itself. A "love feast" may be well enough in its way, but matters of "business" should be promptly attended to, officially recorded and duly published.

Making Honey-Vinegar.

Under this heading in the *American Agriculturist* Mr. W. Z. Hutchinson gives the following:

The "cappings" shaved off in the preparation of honey for extracting, are always allowed to drain. But even when thoroughly drained, considerable honey still adheres to them, and it is an excellent plan to have a keg or barrel of water in which to wash them, and to allow the water to ferment and become vinegar. Water which has been used to rinse out any utensil that has contained honey, can be thrown into the barrel. The scum that arises upon the surface of the sweetened water should be skimmed off.

"The bees are swarming, and there's no end to them," said Jones, coming into the house. His little boy George came in and said there was an end to one of 'em, any how, and it was red-hot too.

Bee-Keeping in Russia.

Mr. Robert Eldridge, of Cincinnati, who has returned from Russia, where he has been largely engaged in the rearing of goats and camels, says in reply to the question of a reporter of the *New York Sun*, who asked What do you know of bee-culture in Russia?

In Little Russia and Lithuania the great linden forests render bee-keeping very profitable. The finest honey that I ever saw, is produced in Kovno. Kaluga produces annually about 1,760 poods of honey and 3,500 poods of wax. A pood contains about thirty-six pounds. The annual production in the Don Cossack country amounts to \$50,000, in round numbers. In Volhynia and Bessarabia the combined yield of honey reaches a value of nearly \$200,000 a year. The annual yield of the whole empire is not far from \$4,000,000, or about 18,000 tons. To this must be added nearly 5,000 tons of wax, worth \$2,000,000. This is about all consumed in Russia, the exports being very small.

Stings and Bites.

An old woodsman of Australia, who used to catch snakes for pastime, says that a raw onion bruised and applied as soon as possible to the wound is a certain cure for the bite of all the venomous serpents of that country, except the death adder, which he admits is so poisonous, and its poison is so quick in acting, that there is no known remedy for it. That the onion is a specific for the sting of poisonous insects of all kinds, has long been known to the writer of this paragraph, who, when a boy, invariably carried one on expeditions with companions against hornets' nests, etc. It was found that the application of onion juice would instantly allay the pain caused by the stinging of hornets, yellow-jackets, wasps, bees, etc., etc.—*Washington Star*.

TRIAL SUBSCRIBERS.—The Weekly *BEE JOURNAL* will be sent to any address in North America from now until the end of 1884 for 30 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

Local Convention Directory.

1884. *Time and place of Meeting.*
- Sept. 13.—Union, Western Iowa, at Dexter, Iowa.
M. E. Darby, Sec.
- Sept. 17.—Eastern Indiana, at Richmond, Ind.
M. G. Reynolds, Sec., Williamsburgh, Ind.
- Sept. 17.—Eastern Indiana, at Richmond, Ind.
C. N. Blount, Sec.
- Sept. 20.—Hancock County, O., at Findlay, O.
S. H. Bolton, Sec.
- Sept. 24-26.—Western, at Independence, Mo.
C. M. Crandall, Sec.
- Oct. 1, 2.—Cedar Valley, Iowa, at Waterloo, Iowa.
H. O. McElhany; Sec.
- Oct. 2.—Whitesides, Ill., at Morrison, Ill.
A. B. Kreider, Sec.
- Oct. 3.—N. Ind. and S. Mich. at Goshen, Ind.
F. L. Putt, M. D., Sec.
- Oct. 4.—Progressive, at Bedford, O.
J. R. Reed, Sec.
- Oct. 4.—Marshall Co., Iowa, at Marshalltown, Ia.

F. A. Palmer, Sec., McEbride, Mich.
- Oct. 15, 16.—Northwestern, at Chicago, Ill.
W. Z. Hutchinson, Sec.
- Oct. 28-30.—North American at Rochester, N. Y.
Dr. C. C. Miller, Sec., Marengo, Ill.
- Nov. 25.—Western Mich., at Fremont, Mich.
Geo. E. Hilton, Sec.
- Dec. 3.—Southeastern Mich., at Adrian, Mich.
A. M. Gander, Sec.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Introducing Queens.

Mr. D. Kepler in an Exchange gives his method of introducing queens thus:

I will detail in as few words as I can the methods that I have employed the last five years without a failure. Having procured the queen to introduce, I keep them in as comfortable a place as I can till evening. In the afternoon I hunt out the queens to be superseded, cage and return them to the central part of their respective brood-nests.

At or after sundown, I remove them, spray the bee and brood-combs liberally with diluted honey or thin sugar syrup. Daub the wings of the strange queen by turning her over in a spoonful of honey taken warm from one of the combs of the hive in which each respective queen is to be introduced, and introduce by allowing them to crawl among the workers on the brood-comb. Watch the workers a moment, and if there are any demonstrations of anger, spray bees and queen till they let her alone. Close the hive and all is done. If it is desired to introduce to divisions, it should be done as late in the day as convenient, and be sure that we know where the old queen is, ascertaining to a certainty in which division she is.

The philosophy of the above method seems to me to be in the bees never for a moment missing their queen. Aside from a little disturbance and a liberal feed, the bees seem unaware of anything unusual. Under this method of treatment, workers never molest or commence to hug a queen, and never ball one after dusk, and before sunup, and before they have forgotten their general feed, she is perfectly at home with them and is laying.

The National Convention.

The date for holding the next meeting of the North American Beekeepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Beekeepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme. C. C. MILLER, Sec.
L. C. ROOT, Vice-Pres.

The Union Bee-Keepers' Association of Western Iowa will meet in Dexter, Iowa, on the second Saturday in September, at 9:30 a. m. This Association is doing a good work, and bee-men in Western and Central Iowa would do well to avail themselves of its benefits. M. E. DARBY, Sec.

The Cincinnati Exposition of this year, the twelfth in the series, opens September 3 and closes October 4—one month. Every facility of low rates on railroads and by boat are offered to the stranger to visit the city. Exhibitors, and any others seeking fuller information, may address the Secretary, who will furnish rules, regulations, premium lists, etc. J. F. WALTON, Sec.

The bee-keepers' association of Central Illinois will hold their quarterly meeting at Bloomington, Ill., on Wednesday, Oct. 8, 1884, at 10 a. m. W. B. LAWRENCE, Sec.

The Whiteside Bee-Keepers' Association will meet at Morrison, Ill., at 1 p. m., on Oct. 2, 1884. All bee-keepers are cordially invited. A. B. KREIDER, Sec.

The Bee-Keepers' Association of Eastern Indiana will meet in the rooms of the Y. M. C. A., at Richmond, Ind., on Sept. 17, 1884. C. N. BLOUNT, Sec.

The Western Bee-Keepers' Association will hold its second annual meeting in Independence, Mo., Wednesday, Thursday and Friday, Sept. 24-26, 1884. The Association will endeavor to make this the most instructive and interesting meeting it has yet held, and will spare no pains within its means to make it in every sense valuable to all. C. M. CRANDALL, Sec.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Sept. 8, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the price of honey, but demand is improving gradually. Extracted brings 6@9c on arrival, and choice white comb honey in sections, 15@16c. BEESWAX—Is dull at 23@24c on arrival. C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18@20c., 2-lb., 16@18c.; fair to good, 1 and 2-lb., 14@16c.; fancy buckwheat, 1-lb., 12@13c., 2-lb., 11@12c.; ordinary grades of dark, 1 and 2-lb., 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c., buckwheat, 6½@7c. BEESWAX—Prime yellow, 30@31c. MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY—New honey is coming in, and selling at 16@18c. for best white 1 and 2-pound sections. New extracted, 8@9c. Honey in unglazed sections sells the most readily. Old comb honey all gone. BEESWAX—35c. BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY—The demand for comb is very light. The retailers have bought a little during this month; but say that they do not have any call for it at present. Prices range from 12@16c per pound for the different sized frames and style of packages. There is a continued dullness in extracted. Some of the new crop is on sale. BEESWAX—Is dull, and 25c for dark, with 30@32c for yellow, is the range of prices. R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—Comb and extracted are offering freely. The market is weak for both kinds. Some extra choice extracted was placed at 5c., which is a full figure to realize in the wholesale market. For the choicest comb 10c. represents the extreme views of buyers. White to extra white comb, 11@12c.; dark to good, 7@9c.; extracted, choice to extra white, 4½@5c.; dark and candied, 4c. BEESWAX—Wholesale, 25c. STUBBS & SMITH, 423 Front Street.

KANSAS CITY.

HONEY—This market now begins to show some activity with a good many inquiries and some sales. Prices, however, are not very strong under the very liberal receipts of the past week. I quote Fancy Comb, ½-lb. sections, at 18c.; 1-lb. sections, 17c.; 2-lbs., 16c. Dark honey, slow at 12 to 15c. Extracted in fair demand at 6½ to 7½c. BEESWAX—None in the market, choice to extra. BEESWAX—Nominal, 30@35c per lb. JEROME TWICHELL, 514 Walnut Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8c. None in the market, choice to extra. BEESWAX—Firm at 32@32½c. for choice. W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lbs., best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c. BEESWAX—30c. A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c. GEO. W. MEADE & CO., 213 Market.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

CORRESPONDENCE

For the American Bee Journal.

Preventing After-Swarms, etc.

JAMES HEDDON.

To Mr. A. A. Decker's article on page 522, I will respond by saying that our experience here has been that we get more profit by having the second influx of bees with the prime swarm, than as though we had left them with the parent colony. As it is about 24 days before young bees begin to replace the rapidly decreasing numbers of a swarm, and the fact that at the time of swarming, the swarm not only leaves a portion of its bees in the old hive, but at least thrice as many unhatched bees, we think we get the better and more profitable division of the colony by taking what the old colony would send out in second and third swarms, and adding them to the prime swarm.

We have sometimes waited more than 7 days and never yet under any circumstances have we known the bees to quarrel. They all seem to recognize each other as members of one family. Here we are never troubled with swarms swarming, and have hardly any swarms of any kind during the basswood flow.

I very much object to Mr. Decker's plan of doing away with the queen-cells in a colony which has cast a swarm, by introducing a fertile queen to tear them down. I will tell why: 1. You are at the expense of buying or rearing a queen. 2. Under such conditions the bees are much less inclined to receive her. 3. The gain Mr. Decker speaks of is not there. All good, average queens fill all the combs with eggs that they should have, up to their full capacity just before the swarming period. This rest of 12 to 15 days that the combs get between the time of the exit of the old queen and fertilization of the new one, is needed to allow the young queen room to give you the full benefit of her fertility. Every now and then we have been, for 15 years past, presented with the immense advantages of filling this brooding-gap with a fertile queen, but yet the general practice of our bee-keepers does not adopt it. The principal is incorrect, as I discovered and said 10 years ago when it had ten times as many advocates as now.

SHALL WE BREED HYBRIDS?

The last statement in the first paragraph of Mr. Shearman's article, on page 519, is not true as far as my experience goes. When I first advocated that if Italians and Germans, of the right strain, were bred together, they would produce hybrids not "cross." I do not remember of a second ding voice. Now Mr. Shearman and numerous others have had some exp. experience bordering upon the fact, it seems, and I have no doubt but

further on in the line of practical experiment (for he is one of our practical honey-producers), he will see that he was mistaken when, on page 519, he said that if these crosses were bred together, the result would be cross hybrids. My students, my visitors, and myself know to the contrary.

These hybrids, I think, after being bred together under the supervision and weeding of the bee-master, should be as much entitled to the name "strain," as the different strains of Italians and Germans in their purity, differentiated by undirected local influences. Mr. Shearman calls them "strains," and I know of no other term by which to better express what we mean; and just what we mean of these pure bees, we find exists with crosses judiciously conducted by the reason of the breeder. Now, who ever starts out on a new plan of breeding such strains, I think is correct in naming such bees a "new strain."

I approve of the advice given by Mr. S.: "Do not breed hybrids indiscriminately." I also add: Do not breed or allow to be bred in your apiary any strain or race of bees indiscriminately. If you cannot discriminate, it will pay you to buy queens of some one who can "Pay you" in surplus honey.

That crosses are the very best surplus-honey bees, I fully agree with Mr. S. and the numerous bee-keepers that he quotes, but that they swarm more than Italians in their purity, I find untrue in my practice. I have never had a race or strain of bees that failed to breed to the fullest extent of their capacity all through the fall bloom. During the first half of that bloom, including the dearth just preceding it, is the time when our bees breed more than at any time of the year. I am fully persuaded that Mr. S. will find that the extra safe wintering of the neighbor farmers' bees was a matter of "present condition," and not a trait susceptible of being bred in or out, or liable to repeat itself. I will not say that it is impossible to breed up a race of horses that could not catch the distemper, but even if that mark could be struck, it is so far off I have no disposition to shoot or even aim at it.

On page 534, Mr. Pond says he does not quite understand me, which, as usual, is correct. I never meant to say, and did not say, and did not write any thing that can be tortured into my saying, or even intimating that the "natural ferocity of the Italians was what made them or gave them the slightest tendency to stick to the combs" when handled. Mr. P. says that he has not yet found any race or strain of bees equal to the pure Italians for indisposition to sting. There are numerous others who have.

HONOR TO WHOM HONOR IS DUE.

Since reading Mr. Fradenburg's article on page 535, I have no reason to doubt his originality in the discovery of the "pollen theory." Mr. Robinson, no doubt, has equal rights to the same claim, and I am quite sure that I have.

At the time that Mr. F. and Mr. R. wrote upon the subject in *Gleanings*, I did not take that paper, but occasionally borrowed copies and wrote an article for it now and then. I never thought or claimed that any positive proof on my part dated from my observation of the condition of my colonies last spring. I thought that, as the best of additional evidence only, I look upon Mr. F.'s experience and observation during the same spring, in exactly the same light.

My article of May 11, 1881, in *Gleanings*, shows for itself that I had for some time entertained the idea that floating pollen in the honey might be the cause of the disease.

On page 409 of the *Bee-Keepers' Instructor* for February, 1881, will be found the following concerning bee-diarrhoea, written by me on Jan. 29, 1881: "For years past I have suspected that the mischief, or first cause, lies in the honey, and is produced either by its containing bacteria (living animal germs similar to those said to produce foul brood), or an undue amount of fine pollen always more or less found in honey." But why multiply words? I am pleased to look upon Mr. Fradenburg as a co-worker in our chosen pursuit, and additional evidence to the theory which now remains in little doubt with me.

I have not been working for honors, yet I am not without pride and gratitude in receiving them, which I consider just and right. These honors are like love, they cannot be measured, and were there a dozen of us to share them, there would be just as many for each of us. I am sorry that Mr. F. was silent for so long an interval. I will here invite him to share with me the future labor of defending the theory which we believe to be not only correct, but of the greatest importance to our fraternity, and receive a fair proportion of the slurs of those who are frightened lest some important discovery should be credited to other than themselves.

Of course it is not strange, after my labors in the matter, that bee-keepers should at once respond to the shock given them by Mr. F.'s radical claim of priority; and I here wish to express my thanks, especially to Mr. Hutchinson, for the timely and vigorous defense offered. I think all of us are not only willing but glad to pay the tribute of honor to all who discover and disseminate important truths relative to our adopted profession.

I have had much to do with patent soliciting, and I think Mr. F. is mistaken in regard to who would receive the right, were the discovery patentable; but this point is of no moment in this case, and not worthy of consideration. Let us all rejoice that we are, no doubt, soon to get at the true cause and prevention of the (what has been) greatest enemy to our success.

Dowagiac, Mich., Aug. 22, 1884.

The Progressive Bee-Keepers' Association meets on the first Saturday in October, 1884, at Bedford, O. A general invitation is given.

J. R. REED, Sec.

For the American Bee Journal.

Wintering Bees.

MR. POND'S QUESTION ANSWERED AND ONE OF MR. CLARKE'S POINTS CONTROVERTED.

ALLEN PRINGLE.

On page 524 Mr. Pond asks, "Can any one give me a logical and scientific reason why a strong colony of bees should winter with greater safety on a set of frames from 12 to 15 inches deep, than on a set which are only 9½ inches deep?" In the answer to this, Mr. P. says that he does not want theories. I will endeavor to answer his question with facts and the reasons for them.

In my apiary I use three sizes of frames, viz: 12¾x12¾, inside measurement; 12½ deep by 10¾ wide, and 9 deep by 12½ wide. Other things being equal, the bees winter better on the deep than shallow frames, for this reason: They will not store much honey in the top of a shallow frame, not nearly so much as in the top of a deep frame. In the shallow frame—the brood-nest will extend nearly to the top of the frame, thus leaving but little room for honey. The consequence is, that when the colony clusters for the winter upon frames 12½ inches apart from centre to centre (and they ought not to be less than that in winter), there will be but a small portion of their winter stores above them where it ought to be. I will not stop here to prove that the winter stores ought to be mostly above the bees, but simply postulate it as the proposition will, I presume, not be disputed, being so obvious that it is generally conceded.

Now, in the case of shallow frames 1¼ or 2 inches apart, the cluster of bees 6 to 7 inches in diameter, would only occupy 3 or 4 frames; and the amount of honey stored in these is utterly inadequate to support a colony through the winter, especially in a low temperature. They would have to depend upon a lateral supply which would be quite inaccessible in a low temperature. I do winter bees on such frames successfully, but not in the same conditions otherwise as in the case of those on deep frames. The former must be kept warmer so that they can shift about for their food. In a low temperature they will starve to death when the upper stores are gone, though they may have plenty of the "collateral" to "back them up," at their sides. On the other hand, in the case of deep frames, there will be sufficient honey stored above the bees, in connection with that in the two frames immediately on either side of the cluster, to winter a colony inside or out. This, I know to be a fact from long experience.

Before the winter supplies are stored in the hives, the frames upon which it is intended to winter the bees, should be spread apart at least 1¼ inches from centre to centre. This gives room for a wide comb of honey in the top of each frame, and also

gives more room and convenience for the cluster beneath. This is a very important matter in successful wintering, and will amply repay the beekeeper who attends to it.

In the month of August, during the last good honey flow, I always begin to prepare my bees for winter by spreading the frames after extracting, so that a good, thick comb of honey can be stored and capped in each frame. If there are frames with clover honey which I wish to leave for winter, I uncap one or both sides as may be required, spread them out, and the bees will attend to the rest.

In elucidating his "hibernation theory," Mr. Clarke says: "Give bees a chance to hibernate, and they will winter well. To do this, I firmly believe that we must get them up off of the ground." Now, if Mr. Clarke means by this that bees will not winter well on the ground, he is certainly mistaken; and if the fact that they will winter well, flat on the ground in this cold climate, must spoil the hibernating hypothesis, then the hibernating hypothesis must be spoiled.

I have been in the habit, more or less, of wintering bees on the ground. Last winter I had 7 colonies outside, flat on the ground all winter, and they came out in good condition. I am, however, inclined to think that there is, after all, some truth in this "new-fangled notion" which Mr. Clarke has, with great nocturnal travail, brought forth. I think bees do exist, a part of the time during winter, in a sort of semi-torpid state, though not so far gone into "the land of nod" as to be hibernating, in the proper sense of that word. Bees which I have wintering in the cellar, I have found betimes, in a slumber so profound that several pretty hard knocks on the hive failed to bring a response, and when the covering was lifted and the light entered, they showed even then in response to a blast of breath blown upon them, little sign of life, and less disposition to move. Still, it would be rather too much philological latitudinarianism to say they were "hibernating."

Albeit, there is another apicultural gentleman somewhere in the northern latitudes who can beat Mr. Clarke all hollow in the hibernating idea. At the annual meeting of the Ontario Bee-Keepers' Association, held in Toronto a year ago last fall, the aforesaid gentleman gravely related to the meeting how a neighbor of his had "taken up" a hive of bees in the fall, after the old plan; and after the bees had fallen into the hole in the earth prepared for them, and completely asphyxiated from the fumes of the sulphur, the earth was filled in upon them, and I think he said "tramped down." In the spring they were dug up (whether by accident or design I do not remember), and the redoubtable little fellows were found to be not only alive and smart, but in excellent health and spirits. The gentleman added (as a legitimate corollary of this fact, of course) that the plan of wintering bees after this cheap and convenient fashion was well worth considering. Our enterprising Mr. D.

A. Jones said, with dry humor, that he would be quite willing to pay \$500 for a queen that would produce bees like that.

For the American Bee Journal.

Do Bees Make Honey or Gather It?

W. H. SHIRLEY.

I have always thought that bees gather honey from flowers just as nature furnished it, with but little change; and that when bees so gathered it from the flowers and stored it in the combs, and when man took this same substance from the bees in the form of comb honey, or extracted it, we had honey in all its native purity. Such honey I have sold for the past ten years with a \$500 guaranty of purity, if one pound of the honey sent out by me was not just as left by the bees, and as gathered by them from the flowers.

In the fifth paragraph of Mr. Jerome Twichell's circular, a copy of which is found on page 532, he says that it must be admitted that bees gather honey from a number of flowers, "or from the sugar and glucose barrels found around grocery stores;" and then says that it all becomes honey, that bees cleanse and purify glucose so that it is not injurious but undesirable to eat on account of its flavor. Take 4 pounds of glucose and 1 pound of honey, mix them and then see if you do not have all the honey-flavor one could ask for. Farther, Mr. T. says that bees will store but ½ of a pound of honey from 1 pound of sugar or glucose. I succeeded in obtaining three-fifths of a pound of comb honey from one pound of extracted, this season, and I know of several beekeepers who claim that they can get back four-fifths of a pound. Let us calculate a little. I think glucose can be bought for from 3 to 5 cents per pound, according to the price of corn; good extracted honey can be had for 10 cents per pound; now take 12 pounds of glucose, 3 pounds of honey, and you will have 15 pounds of glucose, honey, flavor and all at a cost of 90 cents. From this you can get 9 pounds of glucose-honey in the comb, which will bring 17 cents per pound, or \$1.53, leaving a clear profit of 63 cents on an investment of 90 cents. Glucose manufacturers had better look this matter up, and if glucose becomes honey after being stored by the bees, my word for it that we beekeepers who depend upon the flowers of nature for our honey will have to succumb to the glucose manufacturers.

Granulated sugar, at present prices, figures out about the same profit. For instance: Ten pounds of sugar at 7½ cents per pound amounts to 75 cents; 7 pounds of honey at 10 cents per pound amounts to 70 cents; to this add 3 pounds of water and we have 20 pounds of sugar-honey at a cost of \$1.45. From this we can get 15 pounds of comb sugar-honey which will bring \$2.55, or a net profit of \$1.10. The cost of foundation and sections

should be taken out of these figures. Now, if I felt so disposed, I could feed glucose to my bees, extract it, and ship it to Mr. T. and warrant it to be pure honey—i. e. if his statements are correct.

Again, what is his guaranty worth, based upon such views? Glucose and sugar are the only things honey is adulterated with to any extent, I think, and if a customer should come back on Mr. T., all that he would have to say would be that "the bees put up the article which I sold you, and so it must be pure honey." There is more comb honey put on the market that contains glucose or sugar than, perhaps, Mr. T. is aware of. I labored hard to convince a grocer in Kalamazoo, last season, that my honey was pure. He said that he knew that there was comb honey put on the market in Kalamazoo that was one-half sugar, and for that reason his customers were afraid to buy honey that is put up in small sections. He said that if he had honey put up in the old-fashion caps, that hold 15 or 20 pounds, he could sell it out quicker than he could if put up in nice, clean, white sections of the one-pound size.

Another grocer in the same place would not listen to me at all, but if I had honey put up in three or four-pound frames, he would buy some. Still another said that I might leave one crate on trial, but he did not think that he could sell it, for people were generally afraid to buy honey that is put up in such nice shape. I told him that I guaranteed my honey pure. In a few days I called on him again, and found the honey all sold at a good figure, and more was wanted. He seemed surprised at the sale of it, and said that the guaranty of its purity was what did it.

Our State Fish Commissioner told me, last season, that it was almost impossible to get a pound of pure extracted honey in the city of Detroit. Only yesterday I was told, by a gentleman who moved from Missouri to this place last winter, that near where he used to live, there was a Doctor who was making money "hand-over-fist" by feeding sugar to his bees and selling the product therefrom, for comb honey. Some way it was found out, and it was reported that for so doing he was compelled to pay some \$1,200 in fines.

And now what is the outlook for honest honey-producers (of gilt-edged honey) if Mr. T.'s statements are true? It looks to me as though there might be a crop of honey somewhere if nature did not give us a drop, providing there was not a failure in the sugar or corn crop. I have no doubt of Mr. T.'s honesty and sincerity in his statements, but is he not mistaken?

Oh! for a simple test, so that we may know the pure article from the adulterated one. Who can give such a test? I am willing to pay my share towards discovering one, if it can be had for money. Extracted honey is gaining in favor with us every season. I have already had to buy 1,000 pounds to fill my orders.

Glenwood, Mich.

For the American Bee Journal.

The Pollen Theory.

DR. G. L. TINKER.

It has been plain to bee-keepers all along that to the accumulations in the intestines of bees in winter confinement is due the immediate cause of bee-diarrhœa. The question at once arises, "What are the sources and the nature of the accumulations?" A correct answer will give us a pretty clear idea of the various problems involved and the highway to a solution of them.

But first as to the possibility of voiding the feces in confinement. If bees could void themselves, of course the collections would not occur. We know that the queen-bee certainly does. Why not the workers? I still think they do under certain favorable circumstances, but I am ready to grant that as a rule they do not. Their instinct is so strong against voiding in the hive, that it is doubtful if we ever can rely much on this method of relief. The strongest argument in support of the theory is that they either cannot or do not. But Mr. Heddon does not appear to have noted it.

Now of what do the accumulations consist? First, water; second, the excretions of worn-out tissue and other bodily waste which gives the odor to all animal dejections; third, indigestible refuse of the food taken. As to the first, Mr. H. would hold that it proceeds entirely from an inflamed intestine. But how does he know this? I could grant that it might so arise if I knew that a bee's intestines ever became inflamed. Now this is all speculation. If not, and there is any known evidence that inflammation exists in conjunction with bee-diarrhœa, why has it not been produced before making such an assertion, and, especially, why has the term dysentery been changed to that of bee-diarrhœa? By common consent at the wise suggestion of the Editor of the BEE JOURNAL it has been so changed; but if Mr. Heddon is right in his speculations we will now have to march back to the old term, which is the correct one, if an inflammation of the large intestine of a bee having the well-known discharges, exists. We do not think that an inflammation, as that term is understood, ever exists in a bee, and we have a right to scout the idea until some evidence of it is produced.

The probable source of the water which constitutes the greater bulk of the accumulations, is the honey eaten. The first ray of light which after three years and more of study, I got on this subject, was from reading an article of Mr. S. Corneil, on page 728 of the BEE JOURNAL for 1882. We all know how great is the dampness exhaled by a colony of bees. Mr. S. has shown that at a low temperature the air in a hive may be so completely saturated with dampness, and that very little exhalation of water can take place from the bees, the result being accumulation of water in the intestines with abdominal distension.

But there is another source that must be considered, viz: the moisture collecting on the combs and the sides of the hive which I, myself, have seen bees take up as described by Mr. C. W. Dayton, on page 504. Mr. D. shows there that he could produce the disorder at will by increasing the amount of moisture in the hive by lessening the ventilation. It is almost unnecessary to suggest that this could not be if pollen-eating is "the cause."

Whether the solid matter of the excretions of worn-out tissue and other effete matters is greater or less than the indigestible refuse of the bee-bread consumed, may be hard to determine, but a little reflection should show to Mr. H. that the refuse can furnish but a small amount of the material for bacterious fermentation that is invariably present, and which is beyond question a potent cause. A great many pollen husks may accumulate in a long confinement, but there is also a large amount of purely excrementory product. It is well-known that if a man be thoroughly physicked and subsequently take no food, that the purely excrementory product is considerable for sometime.

My own opinion is, that Mr. Heddon should have stuck to the bacteria theory, as it certainly covers more facts than the latest edition of his views. There is no question about the presence of the bacteria, or of that of the fermentation; in fact, the one is an indisputable evidence of the other. If one species of bacteria may cause the yellow fever, as alleged, why not another cause bee-diarrhœa?

I have thought from the first that there were many causes of bee-diarrhœa operating conjointly and at one time, one and then again another predominating. I am unable to reconcile so many apparently conflicting facts that have been presented in the BEE JOURNAL, in any other way. Probably Mr. Heddon will agree with me on the accumulation theory. Our disagreement is principally upon the nature of the accumulations and the order of the causes leading to them. As to bee-bread, I have shown that the collections are made up of only a comparatively small amount of indigestible refuse, the same being mostly pollen husks; that this aggregation from its very nature is nearly harmless, and as such pollen is recognized as one of the minor factors in the problem of causes. If Mr. H. thinks this is "edging over" to his wonderful theory, he may make the most of it.

My position in regard to the disorder is now well-defined, and in the light of which we will examine Mr. Heddon's arguments as set forth on page 501. As to the primary cause, I have stated that sometimes one and again another cause seemed to predominate; hence, when bees suffer in a mild-tempered cellar, cold is the lesser factor in the list of causes, for anything below 50° Fahr. is cold to the bees. In such cases humidity may be the primary cause, as cellars

are always more damp than the external air. Now, Mr. Heddon "finds that bees do winter successfully where severe cold is brought against them;" yet this argument is offered as a clincher against cold being generally the primary cause, and the chiefest feature whenever extensive disasters have occurred. Only half the truth is told. Severe cold of short duration, a month or two, is often safely borne, but protracted severe cold has never in the history of bee-keeping been safely borne. Why, sir, such an argument as this would prove the most improbable cause to be primary! Confinement is a leading factor only when we have long continued cause of unrest, so that "the same line of facts" do not apply as alledged. Against the cause, humidity, there is no attempt made to rate it as secondary. It is "interesting," therefore to note that Mr. H. "errs" in making his first point, and that cold as a primary cause is an impregnable bulwark.

We give our Southern friends credit for their intelligence in perceiving that cold is a primary cause of bee-diarrhœa. And why should they not, since cold is about the only difference between the climate North and the climate South? "Well, they have it" in Missouri, Southern Indiana and Ohio, but that is about as far South as we find it. The disorder in Kentucky 16 years since, according to G. W. Demaree, in a late number of the *Kansas Bee-Keeper*, was not "dysentery" except in a few cases. The bees deserted the combs and hives, leaving all clean and dry. The "unanswerable" argument as to the losses in Southern Indiana has also been fully answered in the *Bee-Keepers' Guide*.

Examples are cited of moving bees, showing that no harm has followed a few moments or hours of agitation. True enough; but this is a small matter compared with the excitement and unrest that proceeds from the severe struggle of month after month with unabated cold. No evidence is given, not even a reasonable supposition why restlessness does not occur until after an overloading of the intestines, as held. Mr. H.'s argument consists in the simple assertion that they are "silly" enough to eat what is not good for them. Bees, he says, will have diarrhœa very soon in summer "if confined." There is no doubt of it; but what comes first, the excitement and agitation or the pollen eating? But why eat pollen? Answer: To supply the tissue waste following the wear and tear of wearied muscles. Now, this all comes of instinct or nature's prompting, and no "silly" freak about it. Bees eat the pollen or bee-bread in answer to a law of nature, but there must first be the demand which comes of excitement and unrest. The inducing cause is the same in summer or winter, and they eat much or little according to necessity. If in any case they eat too much, there is a cause for it, and that cause is primary, and to remove which, is to forever prevent the occurrence of bee-

diarrhœa. As it is impracticable to remove all of the bee-bread from the combs, or even such amounts as will prevent the bees eating too much when there is a demand for it, we can only deal effectually with the primary or inducing causes. In this Mr. Heddon seems to admit the fact, but denies the induction! He tells us how "silly" bees are to eat pollen, and then infers that if only the greater part is removed they will not touch it. Here is "consistency" for you.

Inordinate consumption of food has been the rule in all cold winters, and harmful accumulations in the intestines of bees the result. No "fatal error" about that. If colonies have died in a non-freezing cellar in less than three weeks, it has been the exception to the common result. And, again, undue accumulations may not have preceded the diarrhœa in this particular case. This loss so oft recited by Mr. H., has been obscure as to cause, because all the facts surrounding it were not known. But as he thinks the cause to be one and inseparable with his theory, he supposes that his bees were "silly" enough to gormandize on pollen without a cause.

Holding such diverse theories on wintering, we do and ought to "differ" in our views. This will be accorded to us; but is it not a little premature thus soon to claim the host of bee-keepers for the theory? Has, indeed, our good fellow bee-keeper such a hold on the fraternity that he may bag their convictions at will? No, we believe that all are thinking this matter over, still looking for "more light."

Yes, there are bee-keepers "way up North" to the 43 and 44 parallels, who can winter bees, but they give ample protection, use very large well-packed ventilated-hives; or thick-walled beehouses. In these the loss has been trifling, in careful hands, but there is greater expense at the outset, perhaps not in the long run. Cellar wintering is the cheapest, tolerably-safe plan. These statements are not inconsistent with my expressed views, nor is it at all necessary for me to show that there are as many pollen-bearing weeds a little farther North than round about Dowagiac. But why introduce this argument if I were so inconsistent?

Mr. Heddon is very happy at grasping my ideas. He inquires why I have not offered "any reason why sugar syrup is any better than honey as a winter food." He has "done so," etc. It is simply because it possesses greater "heat-producing elements" than honey. Our friend has stated it heretofore "more-highly oxygenized." Now the language used on page 440 of the *BEE JOURNAL* of 1883 is good enough. We presume it was an oversight not to give me credit. The point, however, is this: If the pollen theory is true, honey is good enough to winter bees upon, as the assumption that it contains enough floating pollen to make it objectionable, is not true. Not enough pollen could be found in ten pounds of honey to dis-

tend the body of one bee. Honey extracted from the brood combs might, but not that from the supers. And I do not think there is enough floating pollen in extracted honey to affect the bees one particle.

The indisputable fact is, that sugar syrup is a better winter food than honey, because it furnishes so much more heat to the bees that there is little if any necessity for nitrogenous food; hence, they are disposed to let bee-bread alone when they have a food so strongly heat-producing that they can keep warm and comfortable without vigorous exercise.

In making the statement that in a winter like that of 1880-81, the half of his 45 sugar-fed colonies might have been lost, it was presumed that in making the great test of last winter, Mr. H. used only single-walled, eight-frame hives and no protection. With these conditions, I repeat that such loss would be probable in a hard winter.

My theory of successful preparation for winter may be summed up in a few words. Let the bees store all the pollen they want to, but take from all colonies the combs not required to hold the necessary winter stores. Contract the brood-chamber as much as possible, remembering that six Langstroth frames will hold ample stores for the strongest colony to last from November until May. Extract no honey, but feed to each colony a few pounds of granulated sugar in the form of a moderately-thick syrup, or enough to make out sufficient stores. Give large, lower-ventilation, very little upper, and winter in the cellar, or protect well with forest leaves on the summer stands.

For the American Bee Journal.

County Convention in Indiana.

Pursuant to a call, the bee-keepers of Hamilton and Tipton counties, Ind., met at Ekin, Tipton county, Ind., on Thursday, August 7, at 10 a. m.

Considering the busy time in threshing wheat in that vicinity on that day, the meeting was attended by 150 or more, in the beautiful grove of Mr. H. Small. A deep interest in the advancement made in bee-culture, largely added to the encouragement of those taking an active part in advancing the cause.

At 10 a. m. the meeting was called to order by David Leaming, president, who also delivered an address, after which the constitution, by-laws and minutes were read by the secretary. After other business was attended to, the following officers were elected for the ensuing year: President, David Leaming, Arcadia; vice-president, C. C. Richerson, Tipton; secretary, John Fritz, Shielville; treasurer, J. McKee, Arcadia.

This was followed by a few discussions on practical bee-culture, after which a hearty dinner was partaken of.

At 1 p. m., the president again called the meeting to order, and the query-box was again opened, and lively

discussions followed on various useful topics.

The next meeting was appointed to be held in Arcadia, on the first Thursday in Nov., 1884, at 10 a. m.

JOHN FRITZ, Sec.

Prairie Farmer.

Killing Drones.

MRS. L. HARRISON.

Bees are very energetic little insects, and if they cannot find one kind of work to do, they will find another. If honey is not to be found in the floral kingdom, they seek sweets elsewhere, and penetrate groceries and warehouses, gathering up leakage from sugar-barrels and hogsheds. They even turn outlaws, and pillage their neighbors of their garnered treasures. When their out-go exceeds their income, they reduce the number of consumers by killing off the drones. It is pitiful to see the poor drone led out, like a drunken fellow with a policeman at each side. His pleading buzz does not cause them to relax their hold, and occasionally another comes and jumps upon his back. The drones band together for self-protection, running their heads under one another, until they look like shingles overlapping each other. Their pitiless persecutors have no mercy, and they are doomed to die of starvation and cold, clustered in the portico of their former home, where they had been reared so tenderly. Bees have been busy, lately, driving out the "dead-heads," carrying water, and gathering bee-bread. They collect a little honey each morning, and keep from having the dyspepsia by propolis the cracks and crevices of their hives, making all snug and warm for the approaching winter.

Peoria, Ill.

For the American Bee Journal.

Theories About Wintering Bees.

LEVI C. JOHNSON.

"Some words on theories may be well applied, And take them kindly, though they touch your pride."

Dampness, cold, confinement, bad honey, diarrhoea, pollen, each of these and many others have been given as the one cause for the loss of our bees in wintering, and we have had theories based upon each of them. All the theorists have supposed that their pet theory was capable of accounting for all winter losses. The very latest is that brilliant conception evolved from the inner consciousness of Wm. F. Clarke, viz: that our losses are due to the fact that we do not supply the conditions favorable for the hibernating of our bees.

That any one of these theories can furnish an Ariadnean clew which shall guide us out of the labyrinth of winter dangers, past the sirens of early spring into the summer of safety, is, I think, not true; because the dangers to our bees arise not from one source but from many, and hence there is no one danger-point which,

being passed, ensures safety from all the storms that blow.

We may pack our bees so warm that winter's chilling blasts can no entrance find, but this will not shield them from the deadly carbonic dioxide exhaled from their own lungs into their homes of comfort. We may so ventilate the hives from below that this death-dealing gas (which is heavier than air) will flow out from the bottom of the hives; but this does not protect them from the moisture which, rising from the cluster and condensing upon the top-wall of the hive, flows down upon the combs producing their fungous growths (moldy combs), disease and death. We may by upward ventilation keep them dry, but if we have not seen to it that they were supplied with proper food, from their long confinement, there will be inflammation of the intestines, diarrhoea and death.

But even if precautions have been taken against all preventable ills, there remain yet dangers from sudden and excessive changes of temperature, from spring warmth starting brood-rearing, then protracted cold and confinement coming upon the colony under unfavorable conditions, causing disease and death. So it is altogether unlikely that we shall ever be able to say, "Now is the winter of our discontent made glorious summer" by the valorous Heddon or Clarke, or I may add, by any other one man, for it is by the united labor and observation of "many men of many minds," in many lands, that the art of apiculture is being put upon a sure and safe foundation.

The apicultural world owes and gladly pays great homage to the masters of entomology for their solid work for this branch of natural history; and the names of those brilliant French men, Reaumur, Latreille, and Cuvier; of the solid German, Swammerdam; of the "great Swede," Linnaeus; of the unconquerable Swiss, blind Huber; and of that clear-headed Dane, Fabricius, will ever be spoken of with veneration and honor. But these were men who by a life-time of earnest work gathered facts from which they deduced broad generalizations of truth which have made strong the foundations of science. Coming to the men of our times, we delight to honor the names of Langstroth, Dzierzon and Quinby as men who sought after truth, and instead of theory they have given us facts.

While it is true that theory oftentimes goes before and points out the way whereby we may find the facts, yet we can much better serve the interests of science by each one adding his mite to the sum of human knowledge, than by striving to establish some pet theory as the "*ne plus ultra*" of our art. We should recognize the fact that we have not only a Scylla and a Charibdis to pass, but that the whole winter voyage is beset with dangers to our bees; and recognizing this fact, we should not expect one theory or one precaution to carry us through the winter with safety.

A plan which has been successful with me is to put the bees into the

lower story of their Simplicity hives upon a platform 6 inches from the ground, which platform is covered to a depth of 8 inches with sawdust, on this the hives are set side by side in close contact. Side-walls are then placed all around 6 inches from the hives; with an opening one inch in height in front of the entrances of the hives, 6-inch planks are then fitted between the hives and side-walls above the entrances of the hives which are thus left open to the full summer-size. The spaces between the walls and hives are now filled with dry sawdust, and well packed. The cover is removed and a cotton cloth spread over the frames, and 10 inches of chaff or 8 inches of very dry sawdust put in. The roof-boards are carefully laid on an inch or two above the chaff, and 4-inch alighting-boards are placed at the entrances, and the thing is done, making a very cheap and, I think, a safe winter protection.

I do not think it necessary to remove any of the ten frames, nor any of the pollen, but only see to it that each hive contains 30 pounds of good honey (or pure granulated sugar made into syrup and given early enough in the fall for the bees to have it sealed in the combs). If this amount of pure food is supplied, I should have no fears about pollen, for if the hives are packed as above stated, there will be warmth enough in them to enable the bees to procure their food from any part of the hive, and their own instinct can be safely trusted to use only such food as their conditions demand.

The above plan avoids danger from dampness by the upward ventilation through the cloth and chaff; from cold, by the thick packing; from confinement, by enabling the bees to fly whenever the weather is mild enough; and from diarrhoea by the good hygienic conditions surrounding them. Bees having pure air, pure food, and comfortable quarters will very rarely suffer from diarrhoea. As to danger from the want of hibernating: As Mr. Clarke alone has found the danger, so he alone has found the remedy, and I presume he alone will apply it.

Fountain City, Ind.

For the American Bee Journal

Planting for Honey.

CLARENCE M. WEED.

I have just visited the College Apiary, and have been struck with the practicability of Prof. Cook's oft-repeated advice to plant for honey. Around the hives the Professor has planted a series of beds, about 5 by 8 feet, of Rocky Mountain bee-plant, motherwort, figwort, catnip, mustard, borage and white, Alsike, and sweet clover.

In the present dearth of honey-supply the Rocky Mountain bee-plant, mustard, borage, motherwort and sweet clover are in full bloom, and keep the bees very busy.

The idea of planting so as to have bloom in a time of general dearth is

well worthy of consideration by practical apiarists. Mustard blooms in about six weeks after planting, but it may be made to blossom at any time by judicious mowing. The same is true of many other plants.

Planting for honey has often been recommended, but the idea of keeping bees to aid in the successful production of garden and field crops is much more recent. In a late Experiment Station bulletin, Dr. E. Lewis Sturtevant says:

"Our bean crop is dependent in a greater or less measure upon other agencies than the fertility of the soil or the character of the seed used. It may seem curious at first that our farm crops should depend upon such small agencies as insects, and yet without insects to carry the pollen from flower to flower, in some species of plant we would have no seed produced. A true list of insects beneficial to vegetation should include in addition to those which are destructive to injurious insects, those also which are beneficial to the plant. The scarlet runner bean is an excellent illustration of our remarks. This bean never seems to produce seed except when the flowers are cross-fertilized, and in Nicaragua, where insects of the proper kind do not exist, this plant is said to be sterile. If there were no insects to convey the pollen from flower to flower, this species might be as sterile in our Northern localities. The bumble-bee, however, frequents these flowers, and in seeking the nectar brings its head in contact with the pollen, which, adhering to it, is conveyed to the next flower visited, and is brought in contact with the pistil."

He also advises "the bean-grower on a large scale, to keep a colony of Italian bees in the vicinity of his fields, for the purpose of effecting the cross-fertilization of the flowers, and thus adding increase to his crop, upon the possibility that these bees might be effective for this purpose."

Michigan Agricultural College.

For the American Bee Journal.

Is it Lawful to Keep Bees?

W. H. STEWART.

Much has been written on the subject, "Who should keep bees?" but now it appears that the question is, whether any one shall be allowed to make apiculture a business. One of my neighbors, Mr. F., has for several years kept quite a large apiary and a fruit nursery, and has made a success of them. Mr. F. now informs me that a certain farmer near him is about to commence a suit against him, for damages done by the bees. The farmer claims that the bees trouble his sheep and other stock, and prevents them from feeding on the clover pastures. Also, that the clover honey belongs to him (the farmer), and not to Mr. F.; that the bees are trespassers on his farm; and, further, that bees injure his other farm crops.

Mr. F. informs me that there is no doubt but that he will have to defend

himself against these charges, and that he calculates to defend to the bitter end, if necessary. All bee-keepers will see at once, that if in this suit it is decided that Mr. F. must discontinue the bee-business, that the decision affects all bee-keepers in the land; hence the importance that each and all see to it at once; that every truth and fact evolved by scientific research and experiment, be published at once in the BEE JOURNAL. Will Prof. Cook and other scientists give us the full benefit of their knowledge of the laws of co-operation and inter-dependence of insect and plant life. Let all practical bee-keepers give what they have learned by experience and observation on this subject, and what they could state under oath in regard to this matter.

Must we all, just now, be compelled to abandon our pursuit? Must ignorance or malice annihilate all the capital invested in apiculture? Shall the human family be thus deprived of the only pure sweet now obtainable?

Shall ignorance of bygone days,
Successfully dispute our ways?
Shall law submit at its command,
And science blush to show her hand?
Shall evolution hobble back,
And frightened growth retrace her track?
Shall reproduction hide her face,
And wild confusion take her place?
Shall blooming plants withhold their sweet,
And hence no more co-operate
With insect life—turn celibate,
And fertilizing pollen hate?
Shall Order's climax be reversed,
Truth be a lie, life be a farce?
Insulted Reason answers No!
And swears these things shall not be so.

Orion, Wis., Sept. 1, 1884.

For the American Bee Journal.

The Holy-Land Bees.

HENRY ALLEY.

Mr. Daniel Howard, of Wisconsin, paid me a visit, last fall, while on his way to Palestine to obtain some Holy Land queens. Mr. Howard arrived in Palestine some time in December last, and reached Wenham, Mass., on his return, on Aug. 8, with but 12 living queens out of the 175 which he started with. This was a serious loss and disappointment to Mr. Howard, as he had hoped to preserve such a number of queens as would have paid the expenses of the long trip which he had made to obtain them. However, Mr. Howard was not discouraged, and though he is a man 65 years of age, he is willing to go again, provided he can make arrangements for the disposal of the queens on his return home. He has no doubt about safely bringing another lot through.

The queens were packed in small boxes, in which were four compartments; two for the food (Good's), and two for the bees. He made a mistake in not making holes in a solid block of wood for the food, as the honey ran through under the partitions which separated the bees from the food; consequently the bees were badly damped and drowned in their own sweets.

When the boxes were opened, there were 12 queens alive, but not one live worker-bee; and judging from the appearance of the bees, they must

have been dead several weeks. The queens were lively and quite active. I immediately introduced them to some queenless colonies, and in a short time they did not appear to be any the worse for the long journey which they had made, and the confinement of 45 days, most of the time unaccompanied by any bees. In the course of a week nearly all the queens commenced to lay.

While in Palestine, Mr. Howard wrote me several times concerning the Holy Land bees. He found them the gentlest bees that he ever saw. Mr. Howard's experience with these bees has been more extensive than any bee-keeper in America. He has seen and handled them in their native country.

Of their honey-gathering qualities, Mr. Howard says that while in Palestine, he often visited the apiary of the Baldensperger Brothers, from whom he obtained the queens. With only between 50 and 60 colonies they had taken 5,800 pounds of honey, 5,200 pounds of which were taken in 16 days. How many apiaries of this same number of colonies in America can make such a good report?

Wenham, Mass.

For the American Bee Journal.

Bee-Keeping in Cuba.

A. W. OSBURN.

We are in the "summer of our discontent," for we are having something more than a partial dearth of honey when every colony in the apiary is looking to its next-door neighbor to see where the weakest point is, that a successful attack can be made. For several weeks there has been but little honey secreted in the flowers, and owing to the great increase of colonies which we have made, many of them are out of honey, and feeding had to be resorted to, in order to save those that had not time to gather stores for themselves before the honey flow ceased. We expect this state of affairs to last until Sept. 15, when the fall flowers will begin to yield honey, and then there will be an end of the dearth of nectar until the middle of next April; so if we do have, at the longest, two months' dearth of honey, it beats six months of zero weather that the bees have to endure in the North.

FERTILE WORKERS.—A fertile worker never bothers me but a few days, for as soon as I find that a colony has fertile workers, I introduce a full sheet of hatching brood, and just as soon as those young bees are out, I give them eggs and larva, and they never fail to rear a queen; for the young bees will not tolerate the presence of a laying worker when the opportunity is given them to rear a queen. That is something that bothers us but very little; and in this apiary of 500 or 600 colonies, we seldom have such a case. But we have our own troubles, and to us they are of a more serious nature than the presence of laying workers; *i. e.*, to keep the bees from superseding their queens so

often and so much. In all my experience in handling bees, I never had one-fourth the trouble that I have had in the last ten months in Cuba. I have resorted to all the devices that my experience could suggest, but all have failed to remedy this serious trouble. Any suggestions from my fellow bee-keepers in relation to this matter would be most gratefully received.

I am in hopes, if the above named trouble can be stopped, to be able to make a favorable report of modern bee-keeping on this Island. That the natural honey-resources of this country are superior to any country I ever saw, I am convinced; and coming as it does, in the winter, makes it doubly advantageous to the apiarist, for it is at a time of the year when there is not the least danger of swarming, and however strong you build up the colonies, they will stay together and attend strictly to the business of honey-gathering. Such a state of affairs would be called a great boon, indeed a fortune, in the North, and in reality it would be. We are going to try the experiment of producing comb honey during the coming winter, and it is my impression that it will be a grand success, for the honey-flow is of long duration, the honey is white and of fine flavor, and the comb is as white as any that ever was produced from white clover or basswood; and owing to the great length of the honey-season, a great number of sections can be filled and finished by a single colony.

Cuba, W. I., Aug. 15, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares — therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Queries.

1. When parties advertise "Warranted Italian Queens for Sale," what are buyers entitled to?

2. Is C. C. Miller, of Marengo, Ill., the one who used to sign his name in "Song Messenger," "P. Benson, Sr.?"

I received 300 pounds of comb honey from 7 colonies, and increased them to 16.

JOHN O. BRANDON.

New Palestine, Ind., Aug. 22, 1884.

ANSWERS.—1. That is according to what the queen is "warranted" to be or do. Until recently the terms "tested," "warranted," and "untested" meant as follows: A tested

Italian queen was one that had been held by the one who reared her until all her progeny were seen by him to possess three yellow bands. A warranted queen was one not so tested, but warranted to stand that test in the apiary of the purelaser, which, if she failed to do, another would be sent. An untested queen is the same as the warranted queen, only without any guarantee as to what the workers would be. These queens were all to be reared from pure mothers, and all the terms have reference to the purity of the queens and their offspring. Many queens are now reared and tested for qualities instead of color. A whole year instead of 25 days being devoted to the testing of queens. Warranted queens are generally left out of the catalogues at present.

[2. Yes.—Ed.]

How to Winter Bees.

1. How do you arrange the hives for cellar-wintering? and also the cellar? Do you consider the cellar preferable to your out-door packing, in this latitude, southern Wisconsin? I have wintered bees for 11 seasons, but never with as good success as last winter, and that was with your out-door packing arrangement. It is more work, and I think that it takes more honey.

2. What grade of sugar do you use for winter feed, and how do you make the syrup?

3. Have you ever tried perforated zinc for keeping the queen out of the extracting supers? If so, what is your opinion of it? I use your honey-board and comb-honey case, and in using 100, I had no trouble with the queen above, except in two cases; but in the extracting hives the queens went through the honey-board in two-thirds of the hives, after the combs were extracted and put back; and in a few cases they went up and took possession before any extracting had been done. They were not crowded with honey below, but were all full of brood.

E. J. SCOFIELD.

Hanover, Wis., Aug. 25, 1884.

ANSWERS.—1. I consider the cellar preferable to out-door wintering in your climate, as a rule. My preferred plan of arranging the hives is to remove as much honey and bee-bread as possible, and feed sugar syrup. Also reduce the combs to about 5 in number, give the hive all the lower ventilation that you can handily, and but little upper ventilation which I would prefer should pass through a quilt, mat, cushion, or what I use, 2 inches of planer shavings in a box with a cloth bottom. Regarding ventilating the cellar, I know but little about what is required. Certainly pure air will do no harm. I prefer a cellar deep in the ground, with not too many colonies in it, and to keep the temperature as steadily at about 45° as possible. All this is mostly theory.

2. I use the best grade of pure granulated sugar. I boil it in a copper pan that covers the whole top of a stove. The pan is 24x28 inches, and 9 inches deep. It will conveniently

take a half barrel of sugar at a time. The following is the proportion: sugar, 10 lbs.; water, 6 lbs.; cream of tartar, a level tea-spoonful, or tartaric acid, a lump the size of a large pea. First put in the water and bring to the boiling point, then throw in the acid; have a wide wooden paddle and stir the sugar as you dip it into the water, that it may dissolve before it settles to the bottom. Boil it 5 minutes, and then remove it; when it has cooled down so that it is just warm, it is ready to feed. We use a feeder that covers the whole top of the hive and holds from 15 to 18 lbs., with net-work inside to prevent the drowning or daubing of the bees. We feed in the evening, and are very careful to avoid danger of robbing. Three men feed 1000 lbs. in an hour. Should you feed too late in the season for the bees to evaporate the syrup to the consistency of good, ripe honey, you had best make it so in the first place, by using 3 lbs. instead of 6 of water, to every 10 lbs. of sugar. I trust that this will answer the same question asked by several correspondents. If I have omitted any point desired, ask for it through *The BEE JOURNAL*.

3. Yes. We experimented with 4 zinc honey-boards last year, and some 20 this year. We are not yet satisfied that it is practical or best to use the perforated zinc any where. We feel that we need another season, and more zinc, to test it to our satisfaction. For comb honey we know we do not need it, much preferring the wood, skeleton honey-board, which is preferable everywhere, and for all purposes, except for excluding the queen. Should we find them possessing no serious drawback, and successfully excluding the queen, we should like them between brood-chambers and extracting-supers. We know that the queen goes through the skeleton honey-board into the extracting-supers just as you say, but this action has some advantages, and its disadvantages are quite easily gotten along with, after getting used to them.

How to Ventilate Cellars.

1. How shall I ventilate my cellar for 125 colonies of bees? It is under a part of the house not used by the family and no fire is used above it, with an inside and outside door. It is 8 feet deep, and 20x30 feet in size, all under ground, the wall is laid up without mortar, and a flue extends down into it. I can drain it by digging about 3 rods. How will it do to lay large drain-tile below the frost point? How large should they be? Is that far enough to modify the air sufficiently so that the bees will not be disturbed by a continual draft?

2. Are the fumes of a wood-stove injurious to bees in confinement?

F. MINNICH.

North Freedom, Wis., Aug. 29, 1884.

ANSWERS.—1. So far as I know the cellar-ventilation question is one of minor importance in wintering bees. I say this because I have seen bees winter so nicely in cellars with no ventilation, the air seeming very foul;

and, again, I have seen diarrhoea in its worst form in well-ventilated cellars. When we learn how to, and do winter our bees without the disease, we will then be able to find out the best methods of ventilation, and the importance of their use. I think you do not need any artificial heat, for the temperature sustained by the earth and 125 colonies of bees will be high enough at all times. I think that the probability of bee-diarrhoea does not rest with any method of cellar-ventilation.

2. No.

SELECTIONS FROM OUR LETTER BOX

Honey for Children.

The most discouraging part of bee-keeping, to me, is disposing of the honey at a paying price. If it would sell in the market like butter or cheese, it would be a great relief to me. I wonder why parents do not buy honey for their children instead of adulterated candy that will kill "40 rod."

R. BACON.

Verona, N. Y.

Half a Crop of Honey.

We have little more than half a crop of honey here. It has been very cold all through the summer. We have no basswood.

M. L. SPENCER, 81-107.

Little Genesee, N. Y., Aug. 26, 1884.

Aster.

Please give the name of the enclosed plant. It grows plentifully here, and the bees work on it all the day long.

JAS. ELLIOTT.

[It is an aster—an excellent honey-producer.—ED.]

Direct Introduction of Queens.

"Direct Introduction of Queens," as advised by S. Simmins, on page 456, has worked much damage here. Every one of the pupils in bee-keeping in this vicinity, have tried his plan, and in every instance failed; and to any one who understands the natural laws governing the honey-bee, it is simply absurd. I am satisfied that no queen was ever accepted in that way by a colony in normal condition, and it is right that they should not, or how would they protect their hives without this trait. I thoroughly tested it myself. Three colonies were selected, one being gentle Italian, one hybrid, and the other black, all had laying queens, which were removed with a frame of brood and bees, and the frame of brood and bees from nucleus with laying young queens given as directed, and the hive closed gently. Now for results: In 45 minutes the queen and every bee were dead and tumbled out of the hive of the gentle Italian and hybrid colonies, but the blacks merely balled the queen, and

the next morning she was found outside, but the bees were not killed in that case. The nuclei were all fine Italian bees and queens. It is needless to say the result was precisely as I told the lookers-on that it would be, and each one acknowledged it to be like their own cases. We have had two weeks of hot weather, but to-day it nearly freezes again, just like the weather of June and July. No fall honey here. We have our colonies about ready for winter, but have to record the poorest season in 10 years.

E. A. MORGAN.

Columbus, Wis., Aug. 25, 1884.

Garden Carrot.

I send you a blossom, will you be kind enough to tell me what it is, and whether it is a good honey-plant?

Wilcox, Pa.

A. T. ALDRICH.

[This is the common garden carrot. It is becoming very abundant in some parts of the country (Middle and Eastern States) as a weed in fields and along the roadsides, as the parsnip is in the richer soils of the West. It cannot be recommended as a valuable honey-plant.—T. J. BURRILL.]

Worst Season within 12 Years.

The honey season is over, here in the southeastern part of this State. Every thing is drying up. We have had no rain since July 4. Bees are idle the whole day long, for neither the buckwheat nor the goldenrod have secreted any nectar. Spanish-needle cannot thrive on account of the dronth. I can report but half a honey crop this season, yet the 31 colonies which I have, are in good condition; but if it does not rain soon so that they can gather some honey, I will have to feed them. In short, this is the worst season since 1872.

J. W. STURWOLD.

Haymond, Ind., Sept. 1, 1884.

Bee and Honey Show at London, Ont.

Bee-keeping in this part of Canada has been very successful this year. We have had the nicest kind of weather, and the bees have done their part by gathering a large quantity of the best kind of honey, although the basswood yield was very limited. We had a very large amount of white clover, and there was lots of it in bloom on Aug. 1. I noticed a peculiarity about my bees, and a number of others have mentioned it—they swarmed without hanging out at all. Two of mine absconded in that manner, although the $\frac{1}{2}$ story was on and not half full of honey. The bee and honey show at the Western Fair, to be held in this city during the last week in September, promises to be the best ever held in this part of Canada. Special rates on all the leading lines of railroad will be offered, so that a large number of the United States bee-keepers are expected to be present. During that week the Middlesex County Bee-Keepers' Association meet in the Board of Trade rooms, which was kindly offered them

for the occasion. Again, I extend an invitation to the United States and Canadian bee-keepers to come to London and let our honey show be one that will advertise the industry and open the eyes of the people to the fact that "there is millions in it."

WM. H. WESTON.

Honey-Dew for Winter Stores.

I have talked with several bee-keepers about this honey-dew or bark-louse honey, and we would ask Prof. Cook to tell us, through the BEE JOURNAL, what he thinks about its use for winter stores. It has been said that early-gathered honey, well-sealed, was all right to winter on, but a good many bee-keepers are a little afraid of this nasty, black stuff.

JANESVILLE, WIS.

L. FATZINGER.

[Where the stores are black and disagreeable to the taste, I should fear to use them for wintering. This insect-secretion is becoming quite a serious matter. It so perfumes the air that some bee-keepers have been anxious for fear that their bees had the "foul brood." In riding along the country, we often find the air odorous for rods away from it, only here it comes from the trees instead of the hives. Unless the honey tastes good, and would do to put on my table, I should exclude it from the hives in winter.—A. J. COOK.]

Only Half a Crop.

The honey crop in this section is only about one-half a crop.

Cuba, N. Y.

F. A. BURRILL.

Honey-Dew.

I notice on pages 536 and 537, articles from W. C. R. Kemp and J. A. Bayard, asserting that it is impossible for honey-dew to be the result of plant-lice. Such assertions are made in the absence of close observations and experiments. That scientists are sometimes mistaken, I know; but it is generally by taking other men's views without personal observation and experiment. It does not take a scientist now, in this age of progress in apiarian knowledge, to decide where honey-dew, at least some of it, comes from: but a common bee-keeper can, if he has the opportunity, satisfy any one on this subject. During the drought of last autumn, a large willow tree in this section was found to be covered with plant-lice. The ground, grass and fence under the tree were in a sticky mass with evaporated honey-dew. Upon taking a position in the morning or evening so as to bring the space between the branches and ground between us and the sun, the "vile stuff" could be seen falling, in the shape of fine rain or mist, in such quantities that the bees and flies could not take care of all of it. Upon closer examination, since it has been proven that it was exuded by these same plant-lice.

Webster, Ind.

I. P. C. STEDDOM.

Special Notices.

The Bee Journal for 1885.

\$25.00 Cash Premiums.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; **\$4.00** for the third; **\$3.00** for the fourth; **\$2.00** for the fifth; and **\$1.00** for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Notice to Correspondents.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

☞ In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

A BEE-KEEPER FROM IRELAND wishes to get on a Bee-Ranch. He understands Modern Bee-Keeping, and the care of cows, horses, etc. Address MICHAEL BUTTLER, 37A11 846 Howard St., San Francisco, Cal.

ELECTROTYPES

Engravings used in the Bee Journal for sale at 25 cents per square inch—no single cut sold for less than 50c. **THOMAS G. NEWMAN,**

925 West Madison Street Chicago, Ill.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows :

- For 50 colonies (120 pages).....\$1 00
- “ 100 colonies (220 pages)..... 1 25
- “ 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

A Canadian wishes us to state in the BEE JOURNAL, whether we take Canadian money for subscription or books. We do; and for fractions of a dollar, Canadian postage stamps may be sent.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

**DR. FOOTE'S
HAND BOOK OF HEALTH,
HINTS AND READY RECIPES,**

is the title of a very valuable book that gives a great amount of information, of the Utmost importance to Everybody, concerning their daily habits of Eating, Drinking, Dressing, Sleeping, Bathing, Working, etc.

It costs only TWENTY-FIVE CENTS, and contains 28 pages, and is sent by mail, post-paid, on receipt of price. This is just the Book that every family should have.

IT TELLS ABOUT

- Black Eyes, Bolls, Burns, Chlubsains, Cold Feet, Corns, Coughs, Cholera, Diarrhoea, Diptheria, Dysentery, Dandruff, Dyspepsia, Ear Ache, Felons, Fetid Feet, Freckles, Headache, Hiccough, Hives, Hoarseness, Itching, Inflamed Breasts, Ivy Poisoning, Moles, Pimples, Piles, Rheumatism, Ringworm, Sacring, Stammering, Sore Eyes, Sore Mouth, Sore Nipples, Sore Throat, Sun-stroke, Stings and Insect Bites, Sweating Feet, Toothache, Ulcers, Warts, Whooping Cough, Worms in Children.

It will Save Doctor Bills!

Price only 25 Cents. Sent by Mail, post-psid,

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

PURE HOLY-LAND QUEENS.

Howard's importation of Holy-Land Queen are the only pure queens of this race in this country. We have 2 of the finest queens that Mr. H. imported, and will have by Sept. 15, 100 young queens from them. They will be fertilized 3 miles from all other bees, and we guarantee them to be equal in every respect to the imported queens. Price, \$2.00 each. A copy of the Bee-Keeper's Handy-Book or one of our combined Queen and Drone Traps will be given with each queen. We can send you as fine Italian or Albino queens as can be purchased in the world. Warranted queens, \$1.00 each; tested, \$1.50; select-tested, \$3.00 each.—Secure your breeding-queens for another season. 37A4t HENRY ALLEY, Wenham, Mass.

NEW SWEET CLOVER (MELILOT) SEED.—We are now prepared to furnish New Crop Melilot Clover Seed as follows :
By Express, 20c. per lb.; by Mail, 36c. per lb.
37A1t C. H. DIBBERN & SON, Milan, Ill.

BEES FOR SALE.

I offer HYBRID BEES for Sale in Langstroth or other hives, with 30 lbs. of good honey for wintering. Price, \$4.00 per colony. R. S. BECKTELL. 37A3t Three Oaks, Mich.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

LOCAL REPORTERS WANTED.
We want an agent and local reporter in every community to represent City and Country, and furnish us from time to time such facts as we may require. Send 10 cents for credentials and full particulars regarding services and compensation. Address, Will C. Turner & Co., Publishers "City and Country," Columbus, Ohio. 24A18t

Muth's Honey Extractor,
Square Glass Honey Jars, Tin Buckets, Langstroth Bee-Hives, Honey-Sections, etc. Apply to C. F. MUTH, 876 and 978 Central Ave., CINCINNATI, O. Send 10c. for Practical Hints to Bee-Keepers.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

**65 ENGRAVINGS
THE HORSE,
BY B. J. KENDALL, M. D.**

A TREATISE giving an Index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by **THOMAS G. NEWMAN,** 925 West Madison Street, CHICAGO, ILL.

ITALIAN QUEENS, DADANT FOUNDATION, and Supplies.—It will pay you to send for Circular. E. F. SMITH, Smyrna, N. Y. 11A26t

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

GOLD for the working class. DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis. Hamilton, Ill., Dec. 10, 1883.
 Dear Madam:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of thin foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled.
 Yours,
 CHAS. DADANT & SON.

MRS. FRANCES DUNHAM, De Pere, Wis. Beeton, Ont., Dec. 10, 1883.
 Dear Madam:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
 Yours very truly,
 D. A. JONES.

MRS. FRANCES DUNHAM: Genoa, Cayuga Co., N. Y., Dec. 12, 1883.
 All prefer the foundation I manufacture on one of your mills, to that made on any other machine I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
 Yours respectfully,
 J. G. WHITTEN.

MRS. FRANCES DUNHAM: Kenton, Ohio, Dec. 29, 1883.
 After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.
 Yours,
 SMITH & SMITH.

MRS. FRANCES DUNHAM: Omaha, Neb., Jan. 18, 1884.
 I made all brood on Dugham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretchmer, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a late communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is to me always a jewel. You are at liberty to publish this.
 Yours truly,
 T. L. VON DORN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

ALFRED H. NEWMAN,
923 West Madison Street, Chicago, Ill.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any address in North America from now until the end of 1884 for 30 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

☞ The Northwestern Bee-Keepers' Association will hold its fifth annual convention at Owsley's Hall, northwest corner of Robey and West Madison streets, Chicago, Ill., on Wednesday and Thursday, Oct. 15 and 16, 1884, commencing at 10 a. m. on Wednesday, and holding five sessions. Those who have attended one of these annual re-unions will need no urging to induce them to come again; those who have not, should remember that Father Langstroth characterized the last meeting as "representing the largest number of large, practical and successful honey-producers of any convention that he had ever visited." This meeting being held during the Inter-State Industrial Exposition, reduced railroad fares may be had on nearly all of the railroads. W. Z. HUTCHINSON, Sec.
C. C. MILLER, Pres.

☞ The Northern Indiana and Southern Michigan Bee-Keepers' Association will hold its next session in Goshen, Ind., on Oct. 3, 1884, at 10 a. m. Important topics relating to the management of the apiary will be discussed. Considerable time will be devoted to answering questions from the query-box. Several distinguished apiarists are expected to be present. All persons interested in bee-culture are invited to attend. A large meeting is anticipated.
F. L. PRETT, M. D., Sec.
A. BLUNT, Pres.

☞ The Wabash County Bee-Keepers' Association will hold its second meeting on Saturday, Oct. 4, at the Court House in Wabash, at 10 a. m. All bee-keepers are cordially invited to attend. Come one and all and bring your wife and children, and we will try and make it interesting for you.
HENRY CRIPE, Sec.
AARON SINGER, Pres.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5ABty HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1879.

The Original
BINGHAM
Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that the original inventor, and only legal improver a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and the only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quitting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOPE.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Bearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive 1 Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 55 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Bibbion Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poullterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Call Things by their Right Names.

A correspondent seems to be "muddled" in consequence of his having produced "hybrids" by crossing bees from Palestine and Italy. He wrote to us to correct a former article and call his bees "holy Italians." We remarked, on page 571, that there were no such things as *holy* or *unholy* bees, and advised our correspondent to "call things by their proper names." Now he propounds to us the following questions:

Kane, Ill., Sept. 8, 1884.

I have been a pupil of the BEE JOURNAL for several years, and I thought that I was learning the bee-business right along, from its pages, but every pupil has his faults. I did not have the least idea of the using of any improper language in my letter on page 571. I am always ready to confess my errors, when I am convinced of committing any. I learned the words "Holy-Land queens" from the pages of the BEE JOURNAL. Now, I ask you to answer the following questions: I got a pure Italian queen from H. Alley, and a Holy-Land queen from I. R. Good; I reared queens from the Italian queen and bred those queens to drones reared from the Holy-Land queen. Now, what is the right name of those queens' offspring? I reared queens from the Holy-Land queen and I bred them to drones reared from the Italian queen. Now, what is the right name of those queens' offspring? If there is no such a bee as the Holy-Land bee, will you please make it plain, for I wish to "call things by their right names;" and I will likely, hereafter, be prepared to give the right names of my improved bees in future correspondence. We were blessed with a big rain fall on July 30. To-day the thoroughwort, Spanish-needle, goldenrod, smart-weed or heart's-ease, and ironwort are in a sea of bloom. The weather is very hot—94° in the shade to-day. My

bees are making good use of each day, by gathering the honey which seems to be in abundance.

R. M. OSBORN.

In the above our correspondent calls the queen a Holy-Land queen. That is another thing from a *holy* queen. The land of Palestine has been called the "Holy Land" for ages, because of the fact that it was the land where the "holy one of Israel," the Messiah lived, taught, died, and rose again, and from which he ascended.

Things set apart for sacred uses were called "holy;" such as holy oil, holy vessels, holy temple, holy day, etc., but the bees never came under that classification—they were never called "holy bees."

It is true that honey was used in the vessels of the temple, that the Mosaic law regulated the ownership of bees, that "John the Baptist" ate "locusts and wild honey," but neither bees nor honey were ever mentioned among the sacred or holy things.

The proper names of the offspring of the queens mentioned by Mr. Osborn are *hybrids*; if it is wished to designate more particularly, it may be said that they are the "Osborn strain of bees," or that they are Syrio-Italians, or Italo-Syrians, whichever may preponderate in the "mixing" or hybridization. Instead of Holy-Land bees, call them Palestine bees.

The use of the word *holy* in such a connection savors of *cant* (though we do not think Mr. Osborn uses it in that way), and of trying to enhance business by the use of sacred terms, or a parading of religious sentiments in order to catch customers.

While we adore the "religion that is pure and undefiled," we detest the prostitution of it to the base use of helping to obtain "filthy lucre."

In Texas Mr. Carroll neglected his corn crop to give the necessary attention to his bees, as they were of the most importance to him. During horse-mint bloom he offered \$2.00 a day for help to run his extractors.

Sociability among Bee-Keepers.

One of our Exchanges makes the following suggestions on the above subject:

There is no question but that great benefits can be derived by any bee-keeper, and more particularly by the beginner, from attending the meetings of some or all of the various apicultural societies, that we are pleased to see are so rapidly forming through the various sections of our great country; but all cannot attend these meetings, and consequently are debarred from the benefits to be thus obtained. There is a way, however, by which great good can be accomplished in matters connected with bee-keeping, and the fraternity caused to become more firmly cemented by the bonds of friendship. This way is to make frequent exchange of visits, each with the other; consult personally (those who are neighbors) with each other in regard to any and all matters of interest. A few, living in one locality, can easily make a short visit to those some little distance from them, and pass a few pleasant hours from time to time, both in a business and social way. Try it, and see if you do not get some good, both as bee-keepers, and as social beings.

Tanners are now using glucose instead of "oak" for oak-tanning leather. Speaking of this, the *Shoe and Leather Reporter* says: "Glucose is a fraud, however used. It is even a greater fraud when used on leather than used in adulterating syrup and sugar." It is a hard matter to think of any reasonable excuse for its existence or use! It seems to be good for nothing but adulterating.

The "Autumn Leaves" which will bring the most returns are, no doubt, the Leaflets—"Why Eat Honey?" Scatter them and see the effect in selling honey in every neighborhood, at good prices. Two hundred will be sent postpaid for \$1.00; 500 for \$2.25; 1,000 for \$4.00.

The Chicago Re-union of Bee-Keepers promises to be well-attended this year, as usual. See the Notice on the front cover page.

Local Convention Directory.

1884. *Time and place of Meeting.*

- Dec. 3.—Southeastern Mich., at Adrian, Mich. A. M. Gander, Sec.
- Dec. 10, 11.—Michigan State, at Lansing. H. D. Cutting, Sec., Chinton, Mich.
- Dec. 12.—Northeastern Kansas, at Hlawatha, Kan.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Bee-Hive Swindlers.

Mr. F. L. Dougherty in the *Indiana Farmer* has this to say about the bee-hive swindlers now infesting the country:

The voice of the patent-hive vender is heard in the land, which causes a doleful cry from his victims. We made investigation, a few days since, of a plan by which one of these gentry proposed to prove the superiority of his hive over a Langstroth hive. He had transferred two colonies, one into each of the hives, placing the sections at once in both. From those on the Langstroth hive he had removed more than half of the strip of foundation which was placed in the sections for starting. In this hive also he had spread the brood in transferring until much of it had chilled and died, but in his own hive he had done a good job, and in the center row of sections, he had filled each section with comb from the old hive, placing a little patch of brood in four of the center sections, thus compelling the bees to enter the sections at once to protect the brood, and proving to his victim that the bees were working in the sections of his hive while those in the Langstroth hive were barely getting sufficient on which to subsist. He had instructed his patron not to disturb the bees on any account until nearly all of the sections were quite full of honey, and our friend was so strong in his faith that he was hardly willing that we should examine them.

Fruit trees were just coming into bloom, but the bees had gathered no honey, to amount to anything, but by his manipulation were occupying the sections as a part of the brood-nest.

In the present age of easy enlightenment there is no excuse for any one to be gulled in this manner. While there is no way to prevent parties from traveling over the country plying their trade, they can compel no one to use their traps. So far as the comparative value of the hives is concerned, there is not one feature of importance known to the bee-keeping interest that cannot be applied to the Langstroth or American hives. The old patent, long expired, on these hives, covers all points of advantage, and they can be made and used with perfect freedom. Hence there is no necessity for paying for the right to do what you can do anyhow. We do not wish to be understood as opposed to any legitimate improvements, but we are opposed to having our friends abused in any such manner.

Convention Notices.

The date for holding the next meeting of the North American Bee-Keepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Bee-Keepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme. C. C. MILLER, Sec.

L. C. ROOT, Vice-Pres.

The Whiteside Bee-Keepers' Association will meet at Morrison, Ill., at 1 p. m., on Oct. 2, 1884. All bee-keepers are cordially invited.

A. B. KREIDER, Sec.

The Bee-Keepers' Association of Eastern Indiana will meet in the rooms of the Y. M. C. A., at Richmond, Ind., on Sept. 17, 1884.

C. N. BLOUNT, Sec.

The Progressive Bee-Keepers' Association meets on the first Saturday in October, 1884, at Bedford, O. A general invitation is given.

J. R. REED, Sec.

The Southern Wisconsin Bee-Keepers' Association will hold its next meeting at the Court House in Janesville, Wis., on Sept. 23, 1884, at 10 a. m. Statistics will be taken. All bee-keepers are cordially invited to attend.

J. T. POMEROY, Sec.

C. O. SHANNON, Pres.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Sept. 15, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY—There is no change to note in the price of honey, but demand is improving gradually. Extracted brings 6@8c on arrival, and choice white comb honey in sections, 15@16c. BEESWAX—1s old at 26@28c on arrival. C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18@20c., 2-lb., 16@18c.; fair to good, 1 and 2-lb., 14@16c.; fancy buckwheat, 1-lb., 12@13c., 2-lb., 11@12c.; ordinary grades of dark, 1 and 2-lb., 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c., buckwheat, 6½@7c. BEESWAX—Prime yellow, 30@31c. MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—New honey is coming in, and selling at 16@18c. for best white 1 and 2-pound sections. New extracted, 8@9c. Honey in unglazed sections sells the most readily. Old comb honey all gone. BEESWAX—35c. BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey sells slowly. Pries are about 14 to 16c. for very best in small frames. Receipts are not large of late. Extracted honey, quiet sales at 6 and 7c. Large offerings of California honey. Look for better demand for honey now that the weather is cooler.

BEESWAX—For best yellow or prime, 30c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Nearly 2,500 cases were received this week. Not for four years past has so large a quantity arrived in the city in the same short time. A large portion of it, however, was in transit. There is a limited demand at low figures. Market is weak at quotations. White to extra white comb, 9@11c.; dark to good, 7@9c.; extracted, choice to extra white, 4½@5c.; dark and candied, 4c. BEESWAX—Wholesale, 25@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.

BEESWAX—Firm at 32@32½c. for choice. W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 10c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lbs., best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c.

BEESWAX—30c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.

Geo. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—Demand and supply both good with prices rather in buyers' favor. Fancy white comb, 1½-lb., 18c.; 1-lb., 16c.; 2-lb., 15c. California 2-lb. frames, 15c. Dark and lower grades, lower in proportion. Extracted, 6½@7½c.

BEESWAX.—None in the market.

CLEMONS, CLOON & Co.

Successors to Jerome Twichell.

Having consolidated my business with the old and solid Commission House of Clemons, Cloon & Co. under the same firm name, we are better prepared than ever to handle honey in all shapes. We are in the market at all times for the purchase of honey in any shape or quantity, and will pay the highest market price, or will handle it on commission, as may be preferred. Ship 100 lbs. or so, enough to fairly represent what you have, and we will make prompt cash offer for the lot. We will also take special pains with orders from bee-men for any particular kind of honey which they may want to complete their orders when their own crops are exhausted, and will try at all times to faithfully represent their interests.

Jerome Twichell, 514 Walnut Street.

CORRESPONDENCE

For the American Bee Journal.

From Florida to Toronto, Can.

W. S. HART.

On Aug. 13, 1883, I started on my first trip outside of the State of Florida since I arrived in it from the West nearly nine years before. My objective points were Cincinnati, O., to make the personal acquaintance of Mr. Chas. F. Muth, to which I looked forward with anticipations of pleasure, as I had had dealings of the pleasantest kind with him during the past two years; then Louisville, Ky., where the great Southern Exposition and the Kentucky Bee-Keepers' Convention were to be held; after which the North American Bee-Keepers' Convention at Toronto, Can., and finally my old home and birth-place in N. H. were to have a fair share of my time.

After being delayed a couple of days by adverse winds, or no wind at all, a nice sailing breeze sprung up from the southeast and landed us in Savannah on Aug. 17. I took a good look about the city, and as I had a few barrels of honey along to dispose of, I tried the market, but found that there was no chance to sell so fine an article at a reasonable price, the trade being supplied with a very poor quality of dark honey bought at 60 or 70 cents per gallon. It would be an excellent place for an energetic man to build up a honey-trade, as a good quality of honey would be a revelation to the citizens.

I took the train for Atlanta on Aug. 20, arriving there a little after dark. Atlanta is a wide-awake, growing town. Evidently the Cotton Exposition has helped largely to give it a "boom." I tried the market for honey, and found it well supplied with honey of quite a dark color. I placed some of my light-colored mangrove honey here with a prospect of a fair demand in the future.

After looking over the city and its surroundings, and visiting the large cotton factory in the old Exposition building, I left for Chattanooga on Aug. 22, where I sold a couple of barrels of mangrove honey, which the dealers declared was far ahead of any thing that they had ever handled. I devoted the next two days to visiting the points of historic interest in and about the city. Prominent among these stands old Lookout Mountain two miles away to the eastward. About two-thirds of the way up the mountain, I came to Mr. Thornburg's pleasant home surrounded with orchards of peach, pear, apple and cherry trees, many of which were still loaded with luscious fruit. Among the trees were the bee-hives composing his apiary, while his fine stock of poultry ranged "at their own sweet will" through the orchard, or half-buried in the rich earth among the raspberry bushes.

After making myself known, and accepting a hearty invitation to return to tea and stop over night, with my pockets and both hands loaded with peaches and apples, I continued my climb to the top of the mountain. The view from the "Look-out" is certainly a very fine one. Chattanooga and Moccasin Bend lying directly in front, but far below, surrounded by ridges and cultivated fields where soldiers marched and counter-marched, fought, bled and died during the late war. From the top of the mountain can be seen parts of five States, when the air is clear. "Exquisite," the word used by George C. Connor in "Guide to Chattanooga," applies very well to the scene; but for rugged grandeur, there is nothing here to compare with many views among the White Mountains of New Hampshire.

Returning to Mr. Thornburg's I spent a pleasant evening sitting on the front porch talking "bees" while watching the changing lights of the little city far below, or following with my eyes the distant head-light of some locomotive whirling its load of living freight out of the city, and finally disappearing, apparently almost beneath our feet as it swings around between Moccasin Bend and the base of the mountain, a heavy rumbling sound still telling of its progress.

In the morning, after a hearty breakfast, and with a goodly supply of choice fruit for our refreshment on the way, the horse is hitched up, the wheels chained, and we, Mr. T., his father and myself, make our way down the mountain and back to Chattanooga.

On Aug. 25 I took the train for Cincinnati, and I rode nearly all day through a most interesting country, rugged and mountainous for many miles, making many tunnels and high bridges. The High Bridge of Kentucky standing 285 feet above the valley, being one of them. Then dropping down into as handsome a farming country as this continent can show, as we reach the fertile "blue grass section of old Kentucky."

I reached Cincinnati towards evening, and immediately started for Mr. Muth's. I found him making preparations for a trip to his farm, 100 miles from the city, but as his hospitable hand closes around mine, thoughts of all else but my best pleasure and entertainment seem to be put aside, and although I had intended to have left for Louisville the next morning, I found that it was out of the question to do so; as Mr. Muth and all his family seemed bent on giving me a good time, and an opportunity to see the interesting points of Cincinnati, I had to give myself up. I found quite a number of things that reminded me of my own home among the palmettoes and orange trees away down in Florida. Among these were the colonies of bees on the roof, the empty hives and other fixtures stowed away wherever a convenient nook could be found, and above all, the thousands of handsome packages of choice comb honey, and the great piles

of bottles, jars, kegs, barrels and tanks of extracted honey stowed in the store, in the cellar, and under sheds. "How can he ever find a market for all this accumulated sweet?" was a question that arose in my mind. Long years of energetic labor has solved that question for him, and brought the constantly increasing supply and demand until now, hundreds of barrels of honey come in from all parts of this broad country, and are sold with but little more effort than it took to dispose of the first 400 pounds with which this great branch of trade was started in Cincinnati by Mr. Muth years ago.

Remembering that the Kentucky Bee-Keepers' Convention was to commence on Aug. 29, I reluctantly tore myself away from my hospitable friends and landed in Louisville in the evening of Aug. 28. I attended the Exposition the next morning, and was escorted to the honey exhibit by Mrs. Prof. Todd, who left me in the hands of the Kentucky bee-keepers. I found the honey exhibit a very fine and attractive one. The quality of nearly all the honey on exhibition being of the very best. Some placed there by Mr. Demaree, President of the Kentucky Bee-Keepers' Society, was a novelty, being of a very light color, and so thick and heavy in body as to have the appearance of being half-granulated. I found, however, upon testing it, that there were no other signs of granulation, but that it was as it had come from the red clover blossoms from which it was gathered. It took the first prize for extracted honey, as it well deserved. If red clover honey is all like this, we certainly have the strongest kind of an inducement to work for the development of the honey-bee to that point necessary to reach and gather it.

After examining the honey exhibit, and making the acquaintance of several pleasant gentlemen who had contributed to its success and beauty, I was invited to go with them to one of the rooms provided for such purposes, and take part in the Kentucky Bee-Keepers' Convention. As the proceedings of this convention have been published, I will not go over the ground again; but I want to say that if the bee-keepers only knew how much sociability and instruction there is in a bee-keepers' convention, I think there would be a much larger attendance. Every Kentucky bee-keeper who failed to put in an appearance at the convention lost an opportunity for great pleasure and profit.

I stopped in Louisville until Sept. 4, except that I took a flying trip to Mammoth Cave in the meantime, then returned to Cincinnati. The big Fair was just coming off, and Rex and his fantastic followers about to appear in the city, etc. Mr. Muth insisted that I ought not to lose all this, so I stopped until Sept. 7, visiting the Fair, seeing the procession, and taking in as much of the fun and good things of the city as possible in so short a time, to compensate me for the nine long years of steady labor where the sports of forest and stream were almost the only ones at my disposal.

My visit to the Fair was rather early, and before the exhibits were nearly all in place, but at that time the number of exhibits was very large, and gave promise of the Fair as being a grand success. Of all the individual exhibits there, none surpassed, in my estimation, the grand show of honey and apiarian devices made by Mr. Muth.

Leaving Cincinnati I made a short stop at Dayton, Ohio, to visit the Soldiers' Home, and found that to see it was well worth a little trouble and expense. Sept. 10 found me in Toledo, and the next four days I spent at the Tri-State Fair and attending the bee-keepers' convention. Here also I made many very pleasant acquaintances, and enjoyed the companionship of many I have long known by reputation as the "big guns" of apiculture; and here again I met Mr. Muth, eager to catch any new points in his line, and ready to give the results of his large experience in return. The honey exhibit was quite a good and attractive one. The exhibit of apiarian implements was better than any I had yet seen. Noticeable as a part of the apiarian exhibit was a collection of pressed honey-producing flowers and plants nicely mounted and well displayed. Here again I met Mr. W. C. Pelham, who had his foundation machine on exhibition. Having met him at Louisville, we felt like old acquaintances, and so we decided to go on to Toronto in each others company.

On Saturday, Sept. 15, we started for Toronto via Detroit, Mich., regretting that more of our new acquaintances could not accompany us there. Having a little time to spare while in Detroit, Mr. Pelham and myself made the best of it by a visit to the cupola of the City Hall building, where we had a fine view of the city, and could plainly see the peculiar plan of its streets, the principal ones radiating from the spot where we stood, like the spokes of a wheel, and similar to the plan of those of Washington, D. C., as viewed from the dome of the Capitol.

Again entering the cars, they were loaded on boats and ferried to the Canadian side. Arriving at Toronto in the evening, we soon found quarters at a hotel. After securing our mail, Monday was spent in attending the Fair. I will give the Province the credit of having the best arranged and most complete buildings and grounds, and the best exhibit of agricultural products that I have ever seen. The live-stock exhibit was particularly large, and every animal a beauty of its kind. The show of manufactured articles was also very fine, but what particularly took the eye and gratified the heart of every bee-keeper, was the handsome and commodious building standing close to one of the main entrances, with "Honey Department" in large letters over its entrance. Stepping inside we saw the jolly face of the President of the North American Bee-Keepers' Society, Mr. D. A. Jones framed very appropriately with handsomely lacquered cans of extracted honey, and

still handsomer sections of comb honey, the whole making a very nice picture.

After making ourselves known we took a look about us, and for the first time saw a honey exhibit that at all approaches our idea of what one should be. There were tons and tons of honey in every shape and style of package that is popular in the market, from the cute little 5-cent cans (which, by the way, not only bring good prices for the honey in them, but are also one of the best advertisements that could be desired), to barrels holding 40 gallons or more, and from half-pound sections, setting about singly as a part of the ornamentation, to great stacks of crated sections of large size and without an open cell in them, even next the wood. I cannot here go into the details of the exhibit of honey and apiarian supplies, but before leaving the subject let me say that the apiarists who made up that display deserve the great success they are having. They take the proper means of enlightening the masses in regard to their sweet product, and the hundreds of dollars that poured into the coffers of Mr. Jones each day of the Fair, shows that their efforts are appreciated. Canada has beaten us "way out of sight" in her honey-exhibits, and has found a large profit in doing so. Shall we let the matter rest thus? or shall we take advantage of the great New Orleans Exposition to retrieve our honors, make the largest and finest show of honey that has ever gotten together, and give the honey market a boom that shall have a permanent effect on the demand and prices? We can do it if we will, notwithstanding we will have to winter the honey before the time to make the exhibit.

On Sept. 18 the North American Bee-Keepers' Convention met in the Council Chamber, where a large number were assembled. Here also I saw many new faces, which, when I heard their names, were recognized instantly as belonging to my long list of desired acquaintances; but chief among them all was the "Father of modern bee-culture," as he is often called, the Rev. L. L. Langstroth. I first met him at the Fair Grounds on the morning of the 19th (the convention being there in a body to examine the apiarian exhibit), and I was highly gratified to hear him say as he grasped my hand in friendly greeting, "Mr. Hart, I was greatly interested in that Florida palmetto honey. It cannot be excelled."

At 1 p. m. the convention re-assembled at the Council Chamber, and our reverend friend was escorted to the chair of honor. A large, well-built, dignified man whose honored grey locks resting about a smooth-shaven face of a peculiarly genial and kindly expression, he looked the "Father," and one whom we, his children, were proud to honor. At each session of the convention the number attending augmented. The interest of the meeting was largely increased by the presence of many of the members of the Ontario and the Northeastern associations. I was particularly struck with

the cordiality of the people of the Provinces toward those attending the convention from this side of "the line." Addresses of welcome and a careful attention to our welfare, both in and out of the convention, added much to our pleasure. In fact, every thing conspired to make the meeting pleasant and enjoyable, and nothing occurred to mar the pleasure of it.

Soon after noon I bade "good-by" to the last assemblage of bee-keepers that I expected to meet on my trip, and hurried away to catch the train for Kingston, there to take a steamer down the St. Lawrence, through the Thousand Islands and the Rapids to Montreal. From there I visited the White Mountains and my old home in New Hampshire. Over two happy weeks were spent rambling over those old hills where every stone and tree was an old acquaintance, meeting old friends and school-mates, and hearing of the prosperity and misfortunes of the many who like myself had left the old home and "struck out in the world." But others that I had last seen 12 years before, taking their part in the busy life of the town, were now laid to rest in the quiet country churchyard, and there among the graves made during my absence was one marked with a white stone, on which was inscribed my father's name. The old home is not what is used to be. Mother is there still, and there is much that is cheerful, but the vacant chair causes a feeling of loneliness that makes the evening meal a quiet one.

On my way South I visited Boston, New York, Philadelphia, Washington, and all the larger cities of the East. Arriving at Augusta, Ga., I fulfilled my promise made at Toronto, of calling on Dr. J. P. H. Brown, and a truly enjoyable visit I had. After being shown through his fine apiary, viewing the city and suburbs, and partaking of the many good things at their table, presided over by Mrs. Brown, I was once more seated in the cars, and by land and water reached home on Nov. 26, just in time to escape a storm that was coming on as we crossed Mosquito Barr at sundown.

Now, after the excitement of my trip is over, I look back upon it with more than ordinary pleasure to feel that I have been the recipient of so much kindness from so many, and that I am in the future to count them among my friends.

New Smyrna, Fla.

The bee-keepers' association of Central Illinois will hold their quarterly meeting at Bloomington, Ill., on Wednesday, Oct. 8, 1884, at 10 a. m.

W. B. LAWRENCE, Sec.

The Western Bee-Keepers' Association will hold its second annual meeting in Independence, Mo., Wednesday, Thursday and Friday, Sept. 24-26, 1884. The Association will endeavor to make this the most instructive and interesting meeting it has yet held, and will spare no pains within its means to make it in every sense valuable to all.

Swarming, Hibernation, etc.

ABEL GRESH.

As a beginner in improved methods of bee-keeping. I frequently find difficulty in harmonizing the teachings of old bee-masters with *my* experiences. First, I would refer to W. Z. Hutchinson's article on page 551. He says, "Let the bees swarm—just once." All of mine swarmed in June, and by applying the Heddon-plan, and cutting out all the cells but one—the best in appearance—all went well until the beginning of a flow of honey from buckwheat in September, when they all took another turn, and one colony cast an after-swarm which I returned. Can Mr. Hutchinson, by any method, control this swarming in the fall? Or, can he delay it in the spring so that the two seasons will come near enough together to have it suffice the bees to swarm but once? This excessive increase is likely to become a nuisance to a bee-keeper who desires to keep only a moderate number of bees in a locality where sales of full colonies is limited.

I commenced in the spring of 1883 with 2 colonies; the spring of 1884 with 6, and now I possess 22, after returning 2 swarms for want of sufficient hives. In the course of 3 or 4 years I would scarcely know what to do with them at this rate of increase, even though I sold all for which I could find market. Prof. Cook's Manual gives methods employed by different successful apiarists, to control this increase, but I fail to find any advocates of the methods there given, amongst the best writers in the BEE JOURNAL. I would like very much to read discussions of this subject, by the advocates of "Let your bees swarm—just once," and those who advocate "hiving back," so that we beginners could form our own conclusions as to the merits of each way of producing surplus honey, which I consider the sole aim of nine-tenths of all bee-keepers.

As to the hibernation theory: I do not believe that hibernation is indispensable to the safe wintering of bees. A friend of mine had a colony of bees packed very warmly in timothy chaff, last winter, and though the mercury here was 30° below zero, he tells me that he could hear the hum of that colony every time he went to the hive; they ate through the cloths and let the chaff into the brood-chamber, and acted in general as if impatient for the appearance of spring; and that colony has been amongst his best all summer. We have also quite recently had frequent reports of successful wintering in high temperatures, and Mr. Doolittle's is the only report adverse to it. I believe, though, that hibernation is the natural state in which bees can successfully pass through considerable severity of cold.

The "pollen theory" rather puzzles me. I have been taught, all my life, that the instincts of the lower creations are God-given and correct, as is proven in almost every instance;

man, alone, being dependent upon his reasoning powers; and that nature has, in the instinct of the bee, led it into such a grievous error, practiced by it in all times past, as to lay up stores for its winter supply, which, if it eats, will bring on disease and death. I, for one, must be excused from believing until further *positive* evidence is produced. If an individual's stomach is irritated or inflamed, many undigested particles might appear in his excrement; and what would be thought of the practitioner who would at once pronounce the undigested food as the cause of the trouble, and advocate the entire exclusion of such food from our tables? And because, where such food was excluded, persons remained well, is no argument that the portion excluded was not fit to eat, as evidenced for instance in the case of vegetarians. Sick people often partake of food which injures them, and so may sick bees; but I would as soon exclude bread from the tables of healthy people, as "bee-bread" from healthy bees.

For the American Bee Journal.

Milkweed Pollen.

CLARENCE M. WEED.

In the BEE JOURNAL of July 30, Mr. W. W. Trussel describes some bees having, what he supposed, diseased feet, which are said by Prof. Cook to be the pollen-masses of milkweed (*Asclepias*). This is one of the most common of bee-ailments at this season of the year, especially in regions where milkweed abounds.

These pollen-masses are very peculiar in structure. They consist of several filaments branching off from each other in such a way that the legs and mouth-parts of bees and other insects can easily become entangled

a.—Leg, with Pollen-Masses Attached.
b.—Mouth-Parts, with Pollen-Masses Attached.
c.—Pollen-Grain much Magnified.

in them. In the figure *a*, a part of a bee's leg is shown with these pollen-masses attached. In figure *b*, the mouth-parts are shown similarly encumbered; and in figure *c*, one of the pollen-masses is shown much magnified.

The extent to which milkweeds are injurious in thus loading their visitors' feet, is an open question. In

many cases I have seen five or six bees attached to the blossom-heads of a single plant. Prof. Cook believes that the injury is not very great. Along the river-banks, near the College apiary, there are great numbers of milkweeds in blossom, from which the bees gather much honey without serious diminution in numbers.

Pollen Logic.

WM. F. CLARKE.

Before that "buzzing about hibernation" fills my ears, which Mr. Heddon predicts will deprive me of time to "apply any literary vigor to the pollen question," I want to point out some defects in my friend's logic in support of his theory. And, let me say at the outset, that so far as I can judge, I do think the theory is honestly his. I wish to place honor or dishonor where it justly belongs, and if the pollen theory should ever come to be an established part of apicultural science, I think the discoverer's laurels will fairly belong to Mr. Heddon; but I am not ready yet to entwine and present a wreath. He will have to fight more gladiatorial battles in the arena of argument, before I consent to crown him as victor.

The whole of Mr. Heddon's long article in the BEE JOURNAL of Aug. 6, tempts criticism; but I suppose I have really no right to meddle with any parts of it except those in which he pays his respects to me. Courtesy seems to require that I should leave the other writers named to reply for themselves. When they as well as he have "said their say," I and others may express our opinions on the merits of the discussion.

The first point that properly belongs to me, is the natural silliness of bees, and all I will say in reference to it at this time is, that Mr. Heddon's logic is at fault. He begs the question by affirming that the intelligence of man is needed to protect bees against a choice of bee-bread in preference to honey as a winter diet. For, 1. It is not claimed that bees prefer bee-bread to honey as a winter diet, but that their instinct is a sufficient guide when to take pollen in *addition* to their staple diet, honey, and when to let it alone. 2. Mr. Heddon asserts that bees are "silly" enough to prefer bee-bread to honey, which is the very thing to be proved. 3. His own report shows that it is not necessary to exclude pollen from a hive in order that bees may winter well. A large proportion of his colonies which wintered well had access to bee-bread.

Mr. Heddon cites the following assertion as one which he is "not prepared to accept or reject" for want of evidence. It is this: That bees can and do eat pollen all winter long and yet winter well. Not prepared to accept or reject this statement? Why, his whole pollen theory is a point blank rejection of it. He further says, "If pollen husks (whatever they

may be) are found in the intestines of bees that have wintered well," as if there were doubt of it. Let him turn to Vol. I of the BEE JOURNAL, page 253, and he will find Donhoff's analysis of the excreta of bees, the closing sentence of which states that "according to an approximative estimate, the excreta of bees consist of about one-third uric and hippuric acid, and the residue of indigestible portions of pollen." The plain inference from this, is that pollen forms part of the natural food of bees. But this proved, Mr. Heddon says, "I should next want to get to an agreement as to what condition is meant by "well." Bees may be wintered safely; *i. e.*, so as to save the individuality of the colony, and not be wintered as "well" as I wish, and as I wintered the 45 colonies referred to in my report." Mr. Heddon's report left the impression that among the 291 colonies that were not deprived of pollen, many wintered "well," as "well" as the 44 that had no pollen. In my review of his report, I asked, "Did others that had some pollen winter equally well with the 44 that had none?" This question is not squarely met by Mr. H., although he says, it seems to him it was answered before I asked it. It seems to me it is not answered yet. He says, "We told you that the workers of every diseased colony, which we examined, except the 45 in question, had distended bodies; while those of the 44 gave no appearance of such distention." "Undiseased," mark, yet they "had distended bodies!" Can this mean any more than that they were not so slim as "those of the 44?" "Those of the 44" had more highly-concentrated food than the others." They were like highly-grained horses, while the others were like horses that had less grain and more hay. This looks very much as if it were an advantage rather than otherwise to have some pollen in the hives, for the bees were "undiseased," and in fuller flesh, or, as we are wont to say, "in better condition" than "those of the 44."

I fail to see with what propriety Mr. Heddon calls my criticism on "the comb-full of bee-bread" a "catch-quipple." According to his report, there was nearly if not quite as much bee-bread in that hive in the spring as in the fall. Many other colonies beside this No. 45 had as much pollen as it had, yet they came through "undiseased." If No. 45 consumed so little pollen, less, or at any rate, not more than many other colonies that wintered without disease, is it not reasonable to suppose that some other cause than the presence of pollen in the hive was at the bottom of the trouble? I think so. Mr. Heddon himself all but suggests another explanation, when, after speaking of the strangeness of this one case out of 45 sugar-fed colonies (and, I admit the strangeness), he thinks there might have been no trouble, but that "the late brood threw the cluster upon this comb." Being there, they were so "silly" as to eat pollen, would, I suppose be his conclusion. But may not some

other circumstance connected with "the late brood" account for this colony going wrong? As there was young brood in that hive when it was put into winter quarters, it is probable it had a large proportion of young bees in it.

I think our most experienced bee-keepers have become chary of stimulating breeding late in the fall, and will not differ much in the opinion that old bees winter better than young ones. It may be that young bees are more liable to restlessness than old ones, and do not so readily calm down into that state of quiescence which is most favorable to wintering "well." This brings me around to my theory of hibernation, on which I will only say now, that if bees are restless when in confinement, whether cold or heat causes the restlessness, they will eat voraciously; their instinctive aversion to befouling the hive will cause them to retain their feces; and they will have the diarrhoea. It is a condition of things which impels them to take so much food that they must have a cleansing flight or become diseased, and not the particular kind of food they eat that causes the trouble. Fix them so they can hibernate, and pollen or no pollen, they will winter all right.

Speedside, Ont.

For the American Bee Journal.

Does it Pay to Use Foundation?

U. E. DODGE.

There are problems to solve which constantly arise in apiculture, as well as in almost all other branches of human industry, which at times puzzles the most observing. Whether the bee-keeper can or cannot produce natural combs as cheaply or cheaper than he can produce foundation, has been a query with me for several years; and the last two years of close observation and careful experiment, has confirmed me in the opinion that money paid for foundation for use in the brood-frames, is virtually money thrown away; that bees during a good honey-flow produce and use as much wax with foundation as without it, and that it does not aid in the rapid storage of surplus, or add anything to the wintering qualities.

Now for my reasons: The season of 1883, at the commencement of the swarming season, found me with 300 good, wired frames nicely filled with full sheets of Dunham foundation, with the expectation of preparing enough more to supply all my swarms with ten full sheets in the brood-chamber; but it being an almost unprecedented season for swarming, my bees got the start of me, and the result was that all of my first swarms were hived on ten full sheets of foundation, while the second and late swarms were hived on empty frames, right the reverse from what it should be, as I supposed. Let us not draw too hasty conclusions, but patiently wait and note the condition of those late and empty-frame colonies in the fall, and their condition in the spring

of 1884. I quietly submitted to the disappointment and loss, as I deemed it, and let nature take its course.

Late in November, when an examination of the colonies having it their own way was made, revealed the startling discovery that no hive was more than $\frac{2}{3}$, and many not over $\frac{1}{2}$ full of comb, but white and nice and well filled with honey and covered with bees.

But here another problem arises concerning the empty space below the combs of those which were partly filled with frames. What should I do? Should I add full frames of sealed honey and pack them on the summer stands? or should I put them into the bee-cellar, which is much less work, and take the chances of having many dead bees and empty combs to carry out in the spring? Should I double them up or let them severely alone, to be governed by that great fundamental law, "The survival of the fittest?" I finally decided on the latter, and put them into the cellar, and piled them as closely together as hives could be, the lower ones being flat on the cellar bottom, and five in a tier, one above another.

They remained in this condition until April 19 without disturbance. On that date I nervously peered into the gloom, and sounds of insect life greeted my ears: courage and hope prompted a hasty examination. No. 1 responded promptly; No. 2 greeted my ear with that welcome sound of life; and so on through the entire number, all responding in lively tones; and an examination showed that they were bright and clean, with no dead bees or waste accumulations upon the bottom-boards, while those colonies with full sheets of foundation showed accumulations of waste and moisture.

Why this difference? Was it because the bees upon full sheets of foundation had a larger surface to cover and dissipate the moisture? or did the open space below the combs in the partly-filled hives allow room for a more free circulation of air? If this be the true solution of the cause, then reason suggests the idea that if we place a false-bottom or hoop some 2 or 3 inches wide below the combs of full colonies, we should produce the same results. But this is not what I am attempting to prove: it is whether I should have made anything, financially, by supplying each of those late swarms with foundation. They are to-day as good colonies and in as good condition, and have given me as good an average of surplus honey as have the colonies which were supplied with ten full sheets of foundation last year. These being the actual facts, I fail to see where I got my money back for foundation supplied to the early swarms of last year.

"But," says one, "you get all straight combs." True; I acknowledge that fact, but I do not consider it true economy to pay from \$1.00 to \$1.50 per colony for straight combs, when I can accomplish that object with less labor and expense than it takes to wire the frames and put in the foundation. I am a stickler for straight combs, and if there is any

annoyance in bee-keeping which excels in anger-provoking qualities, it is crooked combs.

This season's experience has convinced me that straight, natural combs are obtained like many other things in bee-keeping, by attention at the right time and in the right manner. I am an advocate for improvements, and search with eagerness for any thing that tends to the advancement and benefit of apiculture, and I test all the claimed improvements according to my best ability, and consider many of them great acquisitions to the comfort and prosperity of the bees, and the pleasure of their owners.

But the question on which I started out, is purely a financial one, a matter of profit and loss. I need not multiply words. I cannot clearly see that the balance is entirely on the credit side of the account, and if I cannot be assured that there is a gain by the use of foundation either in comfort and convenience, or in dollars and cents, then I propose to discard it, for I have never known any one to acquire any great amount of gain by merely "swapping pennies." Perhaps locations so widely differ that "what is one man's meat may be another man's poison." I hope to hear, through the columns of the BEE JOURNAL, from other localities and other experiences in this matter.

Fredonia, N. Y.

Rural New Yorker.

Careful Breeding of Bees.

PROF. A. J. COOK.

Of late there is no subject connected with bee-keeping that has attracted more attention from our best writers and most successful workers in this field, than that of breeding. We all desire the bee that will give us the greatest returns in honey, and we wish to couple with this, amiability, and if possible, beauty. The questions desirable to consider are: can our bees be improved? and how can it be done?

That our bees of all races vary in quality, no observing bee-keeper will doubt. The law of variation, then, holds among bees as well as among all higher animals. Every experienced bee-keeper is equally certain that the law of inheritance is no less potent among bees than among horses and cattle. If we breed from the queen of a colony which is cross, we are very likely to secure bees that are irritable as a result. That all our best bee-keepers select their best colonies for breeding, is full proof that this law is well understood.

These two laws once granted, it becomes at once evident that we have not attained perfection as yet, nor can we ever reach the best. Here, as everywhere, God proclaims that honest effort shall not go unrewarded.

The next inquiry is, how can we best reach toward perfection? Here, as in all breeding, we must select animals which possess desirable characteristics, and by wise mating and closest—severest—selection, we may

reach most rapidly toward the ideal bee. Thus far, I think there is no discord of sentiment among our best and most successful bee-keepers; but at this point there comes in a wide divergence of opinion. Some—probably the majority—claim that we should select the best race, all points considered, as the Italian, the Syrian, etc., for our foundation, and then breed wholly within this line—just as our breeders of horses and cattle claim that in breeding, crossing is never desirable. They claim, and correctly, I think, that each breed has its peculiar and distinctive excellence, and that to cross or mate animals of different breeds, failing to improve, introduces the element of uncertainty, and tends to confusion.

Other bee-keepers—and these are men whose opinions are too valuable to push rudely aside—claim that in our foundation we should select two, three, or even all the races, so that we may secure the valuable points of all, and then, by skillful selection long practiced, weed out the undesirable, and retain all that is best.

Is this position tenable? and, if so, how is it to be explained that the same is not true in the breeding of higher animals? Modern biology shows conclusively that all animals are much the same in their development, and that laws which hold in one case, are almost sure to be true in all. In case of horses and cattle, each breed has its separate purpose. The Shorthorn is for beef; the Ayrshire for milk; the Jersey for cream and butter. No breed can be excellent in all these directions. It is enough that an animal gives very rich milk, without giving a very large quantity. Beef and milk qualities of the highest excellence cannot co-exist in the same animal. So, too, the draft horse and the roadster are wide apart in their form and habits, as also in the kind of work which each is expected to perform.

With our bees, however, this is not so. What we all desire is the bee that will gather the most honey, take the seasons as they go. If the German bees have some points of superiority, if they go into the comb-honey receptacles most readily, and give us the whitest honey, then they may well be used in the foundation, which is to result in the best improvement. If the Italians are the quickest, the most amiable, and the quietest while being handled, then they may well be used to give their desirable characteristics in securing the best bee. If the Syrians are the most rapid breeders, the best to build queen-cells, and have longer tongues than other bees, then they should not be left out. Surely there is no such reason to avoid crossing in breeding bees for excellence, as we believe exists with cattle and horses. In case of hogs, the Poland-China ranks very high, if not first, and it was originated in just this way, if we are rightly informed. Hogs are reared for one purpose, and so the crossing of several breeds, each possessing real excellence, might result, after years of careful selection, in a breed superior to any of the founda-

tion breeds. The same is true, I think, of bees.

If any race of bees, then, has superior excellence, it may well be selected in breeding for the future. Some bee-keepers think that they have secured a superior race by crossing the blacks and Italians, and they have persuaded others of the truth of this opinion. This only shows that practice and true theory walk hand in hand. It seems to me that a judicious combination of the Carniolan bee—a variety of the German race—the Italian race and the Syrians, followed by long, close, careful selection, promises well to give us the "Poland-China" among bees.

That crossing adds vigor, is well known. One of our best breeders of cattle says that he prefers a high grade, for feeding, to a pure-bred animal. All bee-keepers know with what vigor the first cross between German and Italian bees work. This again, is a reason for combining different races.

The conclusion is, then, that in breeding bees, there is no natural law in the way of securing the greatest improvement through a judicious crossing, followed by careful selection.

Lansing, Mich.

For the American Bee Journal.

Is it Bee-Diarrhœa?

W. M. WOODWARD.

On page 536 Mr. S. J. Youngman springs a new topic for the readers of the BEE JOURNAL, which is, I think, worthy of further notice. After losing 7 colonies by disease, last winter, I became deeply interested in the study of "bee-diarrhœa," and have been on the watch for every hint that might even lead to light upon it. As some of my observations are complementary to the incident Mr. Y. there describes, I wish to place them before the readers of the BEE JOURNAL, hoping that other observations may be called out. This matter of the true nature of healthy bee-excrement, lies at the bottom of any proper understanding of the condition in disease.

From early spring, I carefully watch for the droppings of the bees, and the condition they were in, and have often seen full drops fall, and at the same time made as close examination as I could with the naked eye; and as a result, I have uniformly found it liquid, sometimes so clear as to scarcely leave a stain on paper, but at other times more or less thickened with pollen or other grains, even during the best honey-flow from white clover. After the above observations I should have much enjoyed that scene with Mr. Y., and should have expected to find the drops increased both in frequency and size as we approached the apiary; as I had before observed them pass it in the air, first a larger then a smaller, and then a still smaller drop, the three being distinctly visible. This I have observed only very occasionally when it occur-

red while circling upward from the hive.

I have also watched bees, in the agony of death, crawl out of the hive and try to fly, and being unable to do so, to fall and strain themselves in order to pass the feces, which was then so thick and stiff as to hang together like a rope, and hold its shape and dry so; but the poor suffering bee only strained itself to death. In no case have I ever been able to detect anything like dry powder save as the excrement became decomposed.

The conclusion I have arrived at is this: 1. That healthy bee-excrement is always liquid, or liquid more or less thickened with the refuse of pollen, etc. 2. That it is frequently occurring during flight; and with large numbers of bees, might be observed at almost any time on a large scale, as by Mr. Youngman.

If this is true, it has some important bearings: 1. On the disease called "diarrhœa." How can a thickening of the feces, as in the state of disease, by any right use of terms, be called "diarrhœa," which means to flow, and is used to describe an unusual and unhealthy condition. 2. It is my belief that "dry feces" is an impossibility with a live bee; but if it is possible, it is certainly not natural. If dry powder is observed, some other explanation must be sought for its existence; and until none can be found, or healthy bees are seen to pass it, I will not believe it. 3. If this is a true description, it affords a firm basis for the "pollen theory," the disease not consisting of a thinning of the feces as implied by the term "diarrhœa," but a thickening of the same, until it becomes impassable.

Will Mr. Heddon tell us the condition of those bees that died in three weeks in the cellar? Were they quiet at all? How often were they examined at the first? And what, if anything, was done to quiet them? Custer, Ill.

For the American Bee Journal.

Iowa State Convention.

The display of honey-bees and apiarian implements of the Iowa State Bee-Keepers' Association, at the Iowa State Fair, was excellent. Though the number of exhibitors was not large, the display was very creditable to the Society. Among the most important of the exhibitors were the following: In extracted honey and bees, Rev. O. Clute, of Iowa City, certainly took the lead, he having a very large and excellent display of extracted honey in glasses of all sizes.

Messrs. Simons & Humphrey took the lead on comb honey, having a large display of both fall and spring honey.

Mr. Kimball, of DeWitt, Iowa, also had an excellent display of bees and honey; his display of bees being equaled only by that of Mr. Clute.

In the display of apiarian implements and hives, Mr. Sorrick took the lead. There were a number of other good displays, among them that of Mr. Norris, of Cedar Falls.

The Society held its second annual meeting on the Fair Grounds, Wednesday evening at 5 o'clock, President O. Clute in the chair.

In the absence of the Secretary, L. E. Cardell, Mr. T. W. Livingston was elected Secretary *pro tem*. The President then gave his report, which was approved. The Treasurer, Mr. Sorrick, then gave his report, which was approved. Secretary Livingston then read the minutes of the previous meeting, which were approved and adopted.

The following officers were then elected for the coming year: President, Rev. O. Clute, Iowa City; Vice President, O. O. Poppleton, Williams-town; Secretary, Wm. Goos, Davenport; Treasurer, Fred. M. Sorrick, Des Moines.

On motion it was decided that the dues of L. E. Cardell be remitted, being in consideration of the expenses met by him for postage, etc.

There was quite a lively discussion in regard to holding a winter meeting as well as the annual Fair meeting, some thinking it best and others not. It was finally suggested that it be left to the executive committee to decide. Mr. Clute then said that we could get a tent for about \$50 in which to hold our annual Fair meeting.

A motion that the executive committee be instructed to get a tent, was carried. After some discussion in regard to the programme to be carried out for the evening, it was decided to have a question-box; the questions to be answered by any of the members present. A motion to leave the making of the programme for the coming year, to the executive committee, was carried. On motion the meeting then adjourned till 7 p. m.

The evening meeting was called to order by President Clute at 7 o'clock. The programme for the evening being carried out, in which the members took a lively part, on motion, the meeting then adjourned.

Wm. Goos, Sec.

Texas Farm and Ranch.

Organization for Bee-Keepers.

R. J. KENDALL.

Probably one of the greatest causes of the spread of apiculture throughout the entire country during recent years, is the growing practice of holding conventions and meetings of apiarists. These meetings, either county, State, district or national, are of the utmost importance, and the more nearly they become perfect in organization, full in membership, and regular in attendance, the more useful they will be.

The average bee-keeper has not the money to spend in making long trips to a quarterly meeting, and the same reason seems to operate against his attendance at an annual meeting. The question is, how shall we obviate the difficulty? In my poor opinion it is to be overcome in only one way—by county organizations. If we were to zealously go in for these, and every member faithfully attend each monthly meeting, we would help ourselves

amazingly, not only in mutual instruction as to our apiaries and their care, but also in that equally important branch of our business—the sale of our honey and the prices we should get for it. I believe that there is scarcely a county or district but what could be educated to use more honey than could be produced, so to speak.

What we want is system and organization. Instead of each one of us going on his "own hook" and separately and individually soliciting store-keepers for orders, this should be done by an agent, or by circular, from the county society. If this method were practiced, the store-keeper would not be able to play one bee-keeper off against another in the way he does now. We should have a market price, and that price the store-keeper would have to pay, or go without his honey. Some reader may think that if this course were adopted, much of the honey would remain unsold. I do not think so. As soon as people found that there was honey—good, pure honey—in the markets, they would have it, and would gladly pay 15 cents per pound for it, right along. We can produce honey to retail at that figure and do well; but when we go to a dealer and ask him a certain figure, he replies as promptly as if he had learned his answers: "Oh, I can buy it at so and so." In this way he creates a doubt in the mind of the seller, that other honey-producers are offering their honey at less than he does, and he puts down his own price, believing that the store-keeper told him the truth, which he may or may not have done, just according to his belief in the adage that "honesty is the best policy."

If honey-producers were organized, agreed on their prices at each monthly meeting, and had a central depot in each town from which could be sold to retailers, all this beating down could be checked and stopped. Have my readers never heard that there are such things in the cities as "trades unions," and that "in union there is strength?" If they have, do they imagine that the same principle would not work equally as well to their advantage as to other businesses? If they do, they are missing a splendid means of self-help, and losing money every season because of it.

Austin, Texas.

For the American Bee Journal.

Northwestern Ohio Convention.

According to the announcements, the bee-keepers of Defiance and adjoining counties met, and Mr. O. Welch was called to the chair. After some preliminary remarks, the chairman appointed Messrs. W. V. Thomas, Wm. H. Ralston, and I. T. Parker a committee to draft a constitution; this they did, and reported one, which, after some slight changes, was adopted; thereby naming this association "The Northwestern Ohio Bee-Keepers' Association."

The permanent organization was then formed by the election of Mr. Lake E. Myers, President; Mr. O.

Welch, Vice-President; Dr. Wm. H. Ralston, Secretary; and Rev. W. V. Thomas, Treasurer. Sixteen paid into the treasury, 50 cents each, and became members by signing the constitution. The next meeting will be at the office of the Secretary of the Defiance County Agricultural Society, on the Fair Grounds, at 3 p. m. sharp, on Oct. 2, 1884.

WM. H. RALSTON, Sec.
L. E. MYERS, Pres.

For the American Bee Journal.

Northwestern Indiana Convention.

The bee-keepers of La Porte and adjoining counties met in the city of La Porte on Thursday, Sept. 4, 1884, at Lay's Opera House at 2 p. m., to organize a permanent bee-keepers' society. A. Fahnestock was elected Chairman, and Oscar J. Parkell Secretary.

After a few preliminary remarks by the chairman, as to the objects to be accomplished in thus forming a society for the advancement of the interests in bee-keeping, he informed them that it would now be in order to appoint a committee to draft a constitution and by-laws, and appointed W. Banks, O. J. Parkell, G. R. Tyrrell and D. Furness as such committee, who, in due time, reported a constitution and by-laws, which were unanimously adopted.

It was resolved that our annual meeting should be held on Oct. 22, 1884, at 2 p. m. at Lay's Opera House, in the city of La Porte; and that this organization shall be known as the Northwestern Indiana Bee-Keepers' Society, and that the membership fee shall be one dollar annually. The Secretary then enrolled 22 names, and received \$21. A committee was then appointed to nominate permanent officers for the society, who should preside at our annual meeting, whereupon the chairman appointed the following: O. J. Parkell, B. Furness, and Wm. Banks, who presented the names of G. R. Tyrrell, President; E. Furness, Vice-President; A. Fahnestock, Secretary; and O. J. Parkell for Treasurer, all of whom were unanimously elected. The Secretary was then requested to hand a report of our proceedings to the La Porte city papers, and request their publication, and also to send a copy to the AMERICAN BEE JOURNAL and to *Gleanings in Bee-Culture*.

The President and Secretary were requested to read an essay on some important subject in the interest of bee-keepers, at the annual meeting. Owing to many bee-keepers being engaged in threshing grain and preparing ground for seeding, our convention was not as large as anticipated, but we have assurances that all such and others will be on hand at our next meeting. Quite a lively interest was manifested by those present sufficient to betoken a successful future for the society. On motion the society adjourned to meet Oct. 22, as before stated.

A. FAHNESTOCK, Sec.
G. R. TYRELL, Pres.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares — therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,
925 West Madison St., CHICAGO, ILL.

Diseased Colony.

I have a colony of bees which has been diseased during all of this season. A large portion of the brood dies before it is sealed, and some after. The live bees appear all right. The queen is a fine-looking one, and seems to be quite prolific. After the brood dies, it does not dry away, but remains soft and ropy, and smells very offensive, even at the entrance of the hive when passing by it. They have gathered just about honey enough to winter on. E. LOOMIS.
Smithville Flats, N. Y.

ANSWER.—You give a perfect description of malignant foul brood, which I would not have enter my apiary for less than its entire value. I know nothing about successfully treating it.

Fermented Honey.

Will you please answer the following questions through the BEE JOURNAL: I have some extracted honey that has been working, and tastes a little sour; can I put it through any process to bring it back to a salable state? If not can you give me a recipe for making honey-vinegar? There was one in the BEE JOURNAL recently, but it did not detail quantities or management.

Lacolle, Can. WM. A. PEARSON.

ANSWER.—If you expose your honey to heat, it will greatly lessen the fermented condition. You can not boil it, however, without injuring it in that way. I know of no way to make it into first-class, sweet sauce. I would advise you to put some in a tin pail, set the pail in a vessel of water which circulates freely under and all around it, and boil the water 10 minutes; then let the honey cool, and be your own judge as to whether or not it is merchantable. If fermentation has not gone *too far*, it will be all right, I think. Perhaps it will be worth more to you for feed for your bees, than for vinegar. You must have a neighbor who can tell you how to make vinegar successfully out of any properly diluted syrup or honey. A little good cider vinegar containing "mother," will help to start it; the secret then consists only in having

the liquid contain just the right quantity of sweetness, to ferment readily and emphatically. We hear that a Chicago vinegar factory has recently discovered a chemical that will turn anything into vinegar, and have hoisted a sign over the door, that reads, "Who will care for 'mother' now?"

Wintering Bees in a Barn.

As I wish to avoid the expense of packing my bees on the summer stands, and having a cellar that is drained, and is still very damp, would it do to put the bees in the cellar provided that I would be sure of wintering them, or at least the most of them? The cellar is under a building which is used as a store-room, and is without a fire all winter. I thought I might put them in the second story of a barn which is provided with a door, and pack around them with chaff or straw. Would the bees come back to their hives, in the barn, if I opened the door (which is 7x4 feet) and let them take a cleansing flight? Which would be the better place for them, the barn or the cellar? The cellar can be kept at a certain temperature, and in winter is quite cool.

DANIEL DUFFIELD.

Dearborn, Mich.

ANSWER.—As I understand your "barn" proposition, I am very sure you would meet with failure if you should carry it out. Your cellar is the place for your bees. Put in enough of them to keep the temperature above the freezing point during the coldest weather. While I have no evidence that dampness is deleterious to bees in confinement, you can dry out your cellar by leaving all the doors, windows, or any other ventilators it may contain open during all that weather during the fall when the temperature outside is below 42° Fahr. before you put in the bees.

SELECTIONS FROM
OUR LETTER BOX

The Bee-Killer.

Honey is not one-half a crop here this year. Bees did not work on white clover as they have done in other years. Smart-weed has yielded scarcely any honey. I have commenced to build a two-story shop, 20x28, so as to provide for my little workers. I begun the bee-business during the spring of 1882, with 3 colonies, and increased them that season to 24 strong colonies. In 1883 I commenced with 20 in fair condition, and increased them to 52. In 1884 I commenced with 50 colonies, and increased to 83, which will soon be ready for the cellar. I got about 1,500 pounds of honey this year. I send an insect which I saw catching a bee near my little apiary. They were at work on the nice Spanish-needle bloom when I saw this insect rest on a bloom, and it waited until the

bee lit on the bloom, it caught it, and in an instant the bee was dead. There seemed to be plenty around that bloom.

J. A. REEDS.

Hindsboro, Ill., Sept. 1884.

[The insect is *Asilus Missouriensis*, often called the bee-killer. They are very destructive to bees.—ED.]

Excellent Report.

It has been a great year for honey here. I have one colony which has given me, on June 30, a swarm of bees and 60 pounds of white clover honey; and on Aug. 30 another swarm of bees and 27 pounds of goldenrod honey. About that time the first swarm cast a swarm and yielded 25 pounds of honey. If one could have all of the colonies do that well, bee-keeping would beat the cattle-ranch business all to pieces.

R. E. HOLMES.

West Winsted, Conn., Sept. 1, 1884.

Golden Hive Sharpers.

Some parties have come to this city who are engaged in the sale of a bee-hive, or rather, are engaged in the hive swindle, and are selling territory on what is called the "Golden hive." The reason that I will not breed any more queens this season is that they have brought hybrid and black bees in the place, and they have drones by the thousands. The parties who are selling territory for the Golden bee-hive are telling the farmer bee-keepers that this is the very best time of the year to transfer, and that now is the time to extract the honey; when the facts are that the bees are not gathering enough honey to supply their wants, but are drawing on their stores. The hive which they are selling is not what a practicable bee-man wants, for it will not permit the use of sections. They advocate the use of the five-pound surplus frames made in the same way as the Langstroth brood-frame. My experience is this, that I cannot sell brood-frame honey for 8 cents per pound, when I can readily sell all my honey put up in the one and two-pound sections.

L. J. DIEHL.

Butler, Ind., Aug. 30, 1884.

Bee-Keeping in the City.

I started with one colony in March 1883, increased it to 4, and got 50 pounds of comb honey that season. I began the season of 1884 with 4 colonies, bought one in a common beegum, and transferred it, but lost the swarm. The balance have increased mostly by natural swarming to 23 colonies and 2 nuclei: 20 of the colonies are very strong, and three have only 7 frames each filled out; but the brood-chambers are well filled with brood and honey, and all in good condition. I have taken 33 pounds of comb honey, and about 200 pounds of the purest, clearest honey you ever saw in supers. I will be able to take, from about ten hives, three frames each from the brood-chamber, of the same kind of honey. An old bee-

keeper told me yesterday that it was the prettiest honey that he ever saw in his life. All this was gathered from figs. I am in the heart of the city, and forage was light until about July 10. Bees swarmed inordinately. One queen, by natural swarming, is the parent and grand-parent of 9 colonies this year. About July 10 the figs ripened, and the miserable English sparrows would make a hole in the figs, fill their crops and leave the balance for the bees, of which they were not slow to avail themselves. Almost every lot has from one to a dozen trees, and the trees are numbered by the thousands over the city.

S. C. BOYLSTON.

Charleston, S. C., Sept. 3, 1884.

The Cone Flower.

I send you a sample of a flower that I wish you would name. It has been in bloom about two weeks, and the bees seem to gather honey from it, from early morn until late at night. It grows in the hollows and fence corners, and reaches 6 or 7 feet in height. I have 110 full colonies and nuclei. I have been in the business for 5 years, and have received about 3,500 pounds of surplus honey this year. The honey season has been a fair one in this State.

C. T. BIGGERS.

Minerva, Ky., Sept. 2, 1884.

[It is called cone flower (*Echinacea*), and the bees get considerable honey from it.—ED.]

That "Adulterated" Honey.

In the BEE JOURNAL for July 23, page 475, Mr. Von Dorn charges Mr. F. H. Hunt of having sold as honey, in Iowa and Nebraska, a stuff unfit to eat. He adds that, after having promptly published a caution under his signature, he had put the matter into the hands of a chemist. In reply to this charge, Mr. Hunt, on page 563, says that the honey spoken of, had proved, by analysis, to be unadulterated. Now, I think that all of the readers of the BEE JOURNAL will agree with me if I say: First, that Mr. Von Dorn was too hasty in publishing his caution, under his signature, against Mr. Hunt, before having ascertained the veracity of his charge; second, that he was too hasty also in publishing it in the BEE JOURNAL; and third, that, as soon as he found that he had made an accusation unsupported by the facts, his duty, his strict duty was to publish, under his signature, that he had made a wrong accusation; and that his duty also was to immediately publish in the BEE JOURNAL the result of the experiment of the chemist; and that these duties were increased by the fact that these accusations were published under his name, as President of the Nebraska State Bee-Keepers' Association. Such public accusations are always detrimental to the honey-business; for they perpetuate in the minds of customers the false notion that bee-keepers adulterate their honey.

CHAS. DADANT.

Hamilton, Ill., Aug. 6, 1884.

Motherwort.

Of clover honey there was only about half a crop; but it was of good quality. Bees are in fine condition for the fall harvest, which commenced about Aug. 12, and promises to be good, as we have had considerable rain, and bloom is plenty. I have 59 colonies, most of them ready for the harvest. Please name the enclosed plant; bees appear to like it. Is it of any value for honey? F. J. SAWIN.

Kirkwood, Ill.

[Motherwort, (*Leonurus Cardiaca*); a good honey plant.—T. J. BURRILL.]

Honey Crop a Failure for 3 Years.

The honey crop in this part of the country has been a failure for the last 3 years. Each year we have had a very good flow of honey from poplar sufficient to build up a good working force and yield us on an average, about 20 pounds of surplus honey per colony, the season commencing about April 25, and closing about May 25. Soon after that, the linn puts out an abundant bloom which has been destroyed by rain each year. This year the bees commenced work on it on Friday and worked well until the Monday morning following; we had five showers of rain that day, and about 21 showers per week for the next six weeks. I have not seen one pound of linn honey, that was gathered here within the last three years. With the exception of the first year, my bees have run me in debt each year since I have been here, which is four years; and that year we got about 45 pounds of honey per colony.

NELSON PERKINS.

Princeton, Ala., Sept. 4, 1884.

Wild Sensitive-Plant.

I enclose two specimens of plants which grow very abundantly here, and upon which the bees work. No. 1 blooms from July 1 to Sept. 1. No. 2 from Aug. 15 to frost. The pollen gathered from No. 2 is deep red, and, judging from the bees entering the hive, a large per cent. of the honey gathered is from the plant, while goldenrod and buckwheat is abundant. Please give the names of the plants in the BEE JOURNAL.

Elk Point, Dak. H. H. BLAIR.

[No. 1 is the wild sensitive-plant (*Cassia chamaecrista*). No. 2, *Dalea alopecuroides*, a somewhat near relative of clover. Both are excellent honey plants.—T. J. BURRILL.]

Best Honey-Flow for 26 years.

The weather for 10 days past has been very hot—90° in the shade on every day but one, Aug. 28. I did not have a colony that had over 5 lbs. of honey, but at this date (Sept. 9) every hive has its combs completely filled. As fast as the young bees hatch out, the cells are filled with honey. I have kept bees for 26 years and have never seen anything like it before. There is no immediate prospect of a change in the weather. HENRY ALLEY.

Wenham, Mass. Sept. 9, 1884.

Special Notices.

The Bee Journal for 1885.

\$25.00 Cash Premiums.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

Subscription Credits.—We do not acknowledge receipt of each subscription by letter. The label on your paper, or on the wrapper shows the date to which your subscription is paid. When you send us money, if the proper credit is not given you, within two weeks thereafter on your label notify us by postal card. Do not wait for months or years, and then claim a mistake. The subscription is paid to the end of the month indicated on the wrapper-label. This gives a *continual* statement of account.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a *demand* that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Notice to Correspondents.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks. American Express money orders for \$5, or less, can be obtained for 5 cents.

We wish to impress upon every one the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

☞ When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but on separate pieces of paper.

☞ In reply to many correspondents let us say that we take any kind of postage stamps as money, but coins should never be sent by mail, as it endangers the loss of the letter either by thieves, or else breaks through the envelope and is lost in that way.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

We will supply them by the dozen at 25 per cent. discount, post-paid.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

☞ Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows :

- For 50 colonies (120 pages).....\$1 00
- “ 100 colonies (220 pages)..... 1 25
- “ 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

Prices Reduced.

Owing to a decline in the price of Beeswax there will, hereafter, be a reduction of

5 cents per pound

on all orders for Comb Foundation.

I pay 26c. per pound delivered here, for yellow Beeswax. To avoid mistakes, the shipper's name should always be on each package.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

QUEENS!

Our New Strain,

Also IMPORTED ITALIANS!

Take your choice. Prices:

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

ALFRED H. NEWMAN,
923 West Madison Street, Chicago, Ill.

IF YOU WANT VEHICLE,

SEND A POSTAL CARD TO THE
COLUMBUS BUGGY CO.

COLUMBUS, OHIO.

When Catalogue and name of nearest dealer, where our SUPERIOR Vehicles can be seen, will be sent.

We have the LARGEST FACTORY in the world for manufacturing first-class and SUPERIOR

Buggies, Phaetons, Light Carriages, Surrey Wagons,

AND OUR POPULAR

American Village Carts,

the latter most perfect and free from horse motion.

We make our own wheels from the best timber (sawed by our own mills) that can be obtained from the hills of Southern Ohio—famous for the second-growth hickory.

Any of our readers who will inclose 18 cent stamps, in a letter to the COLUMBUS BUGGY CO., Columbus, Ohio, will receive in return a beautiful engraving in colors representing an "Australian Scene," and their manner of traveling in that country with ostriches as a motor. 24A18T

OLDEST BEE PAPER IN AMERICA

THE WEEKLY BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861

Chicago, Ill., September 24, 1884.

VOL. XX.—No. 39.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P. O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents. To Australia—Weekly, \$1; Monthly, 20 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCAPPING KNIFE.

PATENTED, MAY 20, 1878.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Conk, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY AILEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KINO.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

International Convention.

In reference to the holding of an International Convention, Exposition, and Bee and Honey Show, at New Orleans, La., next winter, Mr. Wm. Williamson, of Lexington, Ky., remarks as follows:

It has been suggested that the next National Convention be postponed to meet in New Orleans during the World's Exposition, which, according to the constitution, it seems, cannot be changed. It may prove well that it cannot. When the National Convention meets they should take into consideration the advisability of an International Convention and Exposition to be held in New Orleans some time in February, 1885. By fixing the date in February, it will allow plenty of time for the holidays and settling of January accounts, and those in business will feel more at liberty to attend. If such an exhibition is properly managed, and the bee-keepers and supply dealers throughout the United States and Canada will take right hold of it, their can be such an exhibition made as will surprise the World, and a world-wide market for American honey and supplies can be created. I hope a general expression on these suggestions will be made through the BEE JOURNAL.

That there could be such a Convention and Exhibition of Bees and Honey we have no doubt, if energetic and enterprising men should take hold of it, *push* it, and *make* it a success. But the great question is, where to find them. They must have experience, unbounded energy, and (more important than all else) plenty of time and money to devote to it.

Several, both in the North and South, have suggested that the Editor of the BEE JOURNAL should take the matter in hand, but we must *positively decline* the honor. We have neither

the time nor the energy to spare to make it a success; nor will our health permit us to take any more burdens than those we now have in connection with publishing the BEE JOURNAL.

We would suggest that Dr. J. P. H. Brown, Mr. Paul L. Viallon, and Mr. Williamson be appointed such committee by the National Association—if that body entertains the proposition at all. If we were able to attend the meeting at Rochester, we certainly should vote to have such an Exhibition, and also that the above-named be the committee to take charge of it.

Bees and Honey at Louisville, Ky.

The following are the premiums awarded the best displays of bees and honey, placed on the tables at the Southern Exposition:

Best colony of Italian bees and queen, \$10; G. W. Demaree, Christiansburg, Ky.

Best display of bees, \$10; Jut. McDowell, Louisville, Ky.

Best display of ten pounds comb honey, \$10; Lewis Hofstatter, Louisville, Ky.

Best display of honey-producing plants, \$10; Lewis Hofstatter.

Best sample of comb honey and wax, not less than ten pounds, \$5 premium; Lewis Hofstatter.

Best samples of extracted honey, not less than ten pounds, \$5; Lewis Hofstatter.

Best sample of honey, \$10; premium awarded to Lewis Hofstatter.

Mr. A. R. Kohnke is making a good display of honey, aparian supplies and books, at the Fair at Youngstown, O., held from Sept. 23 to 26. Five dollars seems to be the extent of the premiums on honey, however.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

The Sting Amid the Sweets.

Under this heading, the Troy, N. Y., *Daily Times* gives the following incident, in the apiary of Mr. G. H. Adams, one of the prominent bee-keepers of the State of New York:

Bee-keeper G. H. Adams, of Nassau, has divided his apiary into three parts, and distributed them as follows: One yard in Nassau, one in Sandlake, and one in the vicinity of Troy. Mr. Adams visits the several yards weekly, extracting honey. Saturday he was engaged at the yard near this city. Bees, it is well-known, are neither amiable nor hospitable, but regard all visitors as intruders. Two young ladies desired to witness the interesting operation of extracting honey, *i. e.*, transferring the liquid nectar from the hives into vessels suited to transportation, without injury to the honey-comb except "uncapping." The operator made no objection. But scarcely had the young ladies placed themselves in position to enjoy the scene before a fiery-tempered bee flew viciously at the "bangs" of the nearest lady and declared war. Piercing screams and frantic gesticulations followed till the little assailant was dislodged. The ladies had now seen enough, and retired in good order to a dwelling in the immediate neighborhood, but just as they reached the supposed place of safety, it was discovered that another spiteful honey-gatherer had improvised a masked battery under some portion of the other lady's dress and proposed to fight it out on that line. Screaming and violent demonstrations were resumed till this venomous little fellow was also disposed of, and the ladies finally departed, considerably wiser than when they started out in pursuit of knowledge. "Each pleasure has its poison, too, and every sweet a snare."

Cultivate a home market for your honey. If you cannot sell for cash you can often make good trades in other things that will pay you as well if you farm. If you can sell honey at 12 cents a pound to your store-keeper, to be taken out in trade, you are not doing badly at all.—*Texas Farm and Ranch.*

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Bees and Honey at the St. Louis Fair.

Mr. R. Grinsell, Baden, Mo., writes as follows concerning the Bee and Honey show at the St. Louis Fair, to be held from Oct. 6 to 11, 1884:

Please publish the Premium List offered by our St. Louis Fair Association. As they have increased the amount offered for premiums last year from \$50 to \$150 for this year, with the understanding that we increase the exhibit, and to do so we need more exhibitors, and we invite bee-keepers from all parts, as well as supply dealers, to bring on their goods and compete for premiums. As bee-keeping is only in its first stages here, we need to give it a boom. Here is the list of premiums offered:

| | | |
|--|---------|------|
| Best colony of Italian bees in movable comb hive..... | 1st | 2d |
| Best colony of Cyprian bees, in movable comb hive..... | \$10 | \$5 |
| Best colony of black bees, in movable comb hive..... | 10 | 5 |
| Best collection of queen bees alive..... | 8 | 4 |
| Largest and best display of comb honey, quality and manner of putting up for market to be considered..... | 10 | 5 |
| Largest and best display of extracted honey, quality and manner of putting up for market to be considered..... | 10 | 5 |
| Largest and best display of samples of extracted honey of different kinds..... | 5 | 3 |
| Largest and best display of honey-producing plants, pressed and mounted, or in bloom..... | 3 | 2 |
| Largest and best display of aparian implements..... | 10 | 5 |
| Largest, best, most attractive, interesting and instructive exhibit, all things considered..... | 10 | 5 |
| Best comb foundation..... | 5 | 3 |
| Best specimen of comb foundation made on the grounds..... | 3 | 2 |
| Best specimen of beeswax, not less than 5 lbs..... | 2 | 1 |
| Best machine for piercing frames for wiring..... | 3 | 2 |
| Best bee-hive for all purposes..... | 5 | 3 |
| Best crate of honey in comb..... | L. Sil. | Med. |
| Best bee-hive for all purposes..... | Dip. | |
| Best honey extractor..... | Dip. | |
| Best wax extractor..... | Dip. | |
| Best bee-smoker..... | Dip. | |
| Best honey knife..... | Dip. | |
| Best bee-veil or face protector..... | Dip. | |

The National Convention.

The date for holding the next meeting of the North American Bee-keepers' Society, in the city of Rochester, N. Y., has been fixed for Oct. 28, 29 and 30, 1884. At the last meeting of the Northeastern Bee-keepers' Association a committee was appointed to secure a Hall and make other necessary arrangements for this meeting. Knowing the men who compose this committee, we can assure all who are interested, that the matter is in good hands, and that everything will be arranged for one of the best meetings ever held by the Society. Rochester is one of the finest cities in the United States, and this should be an enjoyable meeting for all who are interested. We hope soon to announce a complete programme. C. C. MILLER, Sec.
 L. C. ROOT, Vice-Pres.

The bee-keepers' association of Central Illinois will hold their quarterly meeting at Bloomington, Ill., on Wednesday, Oct. 8, 1884, at 10 a. m. W. B. LAWRENCE, Sec.

The Progressive Bee-keepers' Association meets on the first Saturday in October, 1884, at Bedford, O. A general invitation is given. J. R. REED, Sec.

The Monroe City, Mo., Bee-keepers' Ass'n will meet at Mr. J. H. Poage's apiary on Wednesday, Oct. 1, 1884. A full report of the year's labor will be expected from every member. All who are interested in the production of honey, or the marketing of it, are cordially invited to be present. A. NOLAND, Sec.
 MRS. AMANDA KNOX, Pres.

The Whiteside Bee-keepers' Association will meet at Morrison, Ill., at 1 p. m., on Oct. 2, 1884. All bee-keepers are cordially invited. A. B. KREIDER, Sec.

The Northern Indiana and Southern Michigan Bee-keepers' Association will hold its next session in Goshen, Ind., on Oct. 3, 1884, at 10 a. m. Important topics relating to the management of the apiary will be discussed. Considerable time will be devoted to answering questions from the query-box. Several distinguished apiarists are expected to be present. All persons interested in bee-culture are invited to attend. A large meeting is anticipated. F. L. PUTT, M. D., Sec.
 A. BLUNT, Pres.

The Wabash County Bee-keepers' Association will hold its second meeting on Saturday, Oct. 4, at the Court House in Wabash, at 10 a. m. All bee-keepers are cordially invited to attend. Come one and all and bring your wife and children, and we will try and make it interesting for you. HENRY CRIFE, Sec.
 AARON SINGER, Pres.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
 Monday, 10 a. m., Sept. 22, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14@15c on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 8@9c on arrival.
 BEESWAX—1a dull at 26@28c on arrival.
 C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18@20c., 2-lb., 16@18c.; fair to good, 1 and 2-lb., 14@16c.; fancy buckwheat, 1-lb., 12@13c., 2-lb., 11@12c.; ordinary grades of dark, 1 and 2-lb., 11@12c. Extracted white choice, in kegs or small barrels, 8@9c., buckwheat, 6@7c.
 BEESWAX—Prime yellow, 30@31c.
 MCCAUL & MILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-glassed sections sell best.
 BEESWAX—35c.
 BLAKE & REPLY, 57 Cbatham Street.

CHICAGO.

HONEY.—Comb honey sells slowly. Prices are about 14 to 16c. for very best in small frames. Receipts are not large of late. Extracted honey, quiet sales at 6 and 7c. Large offerings of California honey. Look for better demand for honey now that the weather is cooler.
 BEESWAX.—For best yellow or prime, 30c.
 R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Arrivals this week were lighter than last. Stocks in store being a larger demand, but they are larger than the demand. There is an absence of competition among buyers. Parties who show any disposition to purchase, refuse to operate at the slightest advance on quotations. Several hundred cases of choice extracted were taken for shipment at 5c. White to extra white comb, 9@11c.; dark to good, 7@9c.; extracted, choice to extra white, 4@5c.; dark and candied, 4c.
 BEESWAX.—Wholesale, 25@30c.
 STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8c.
 BEESWAX—Firm at 32@32½c. for choice.
 W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lbs., best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c.
 BEESWAX—30c.
 A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.
 GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—Active and in good demand at former quotations. Choice comb, ½-lb., 18c.; 1-lb., 16c.; 2-lb., 15c. Off lots, anywhere from 10 to 14c. Extracted, dull, 6½ to 7½c.
 BEESWAX.—None in the market.
 CLEMONS, CLOON & Co.
 Successors to Jerome Twitchell.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

For the American Bee Journal.

Is Honey Poisonous?

A. OSBORN.

On page 567 is an article headed as above, to which I desire to add my mite in the way of personal knowledge and experience. The subject of poisonous honey is nothing new to me. I do not believe that pure honey is poisonous in the least; yet there are some persons who claim that they dare not eat even a very little of it. Some persons tell me that if they would eat only a little of it that it would cause cramping pains, colic or sickness at the stomach. Now, these persons were all perfectly honest in their belief that it was the honey which caused all this mischief.

I say that any one can eat pure extracted honey and be in no danger of any bad effects. After I had explained the cause of the trouble to such persons, in every instance I have succeeded in getting them to eat honey without any bad effects. I desire to ask this question: When a bee stings you, what is it which causes the pain? Is it simply the sting piercing into your flesh, or is it the poison which is deposited in the flesh through the sting? I think that you all will say that it is the poison. I presume that most of you have noticed on opening a hive on a cool day, or early in the morning, that the bees would be buzzing around on the combs with their stings pointing outward, and on the point of the sting would be a drop of fluid which is the poison that the bee deposits in your flesh that causes the pain from the bee-sting. Now, the bees being disturbed so often in this way, causes them to run all over the combs, and this drop of fluid either drops off or is rubbed off on the comb or the capping of the comb honey and dries there; and among so many bees in a full colony, and disturbed so often as they are, causes a large quantity of this poisonous fluid to be deposited on the comb and remains there, as it soon dries. If a poisonous substance will give such great pain externally what hinders it from giving pain when taken internally? There is where the whole secret of this poisonous honey is. All who eat comb honey, eat more or less of this bee-poison, and not poisonous honey as some call it.

To all "lovers of honey" who claim that they cannot eat honey without its causing them colicky or cramping pains, I will say: Try eating pure extracted honey; not strained honey, as that is as unsafe to eat as the comb honey. Try eating a little extracted honey at a time, and you will soon become eaters as well as lovers of honey. Try it, and be convinced that pure honey is not poisonous.

Now, probably Dr. Tinker or some one else will ask the question, "Why does not the eating of comb honey affect all persons alike, if it is the bee-poison on the comb which causes the trouble?" In the first place, if all persons' stomachs were the same in every way, and all persons' constitutions were the same in every way, then you would see all affected alike with whatever they eat or drink, all being in same condition of health; therefore, all persons not being constituted alike is the cause of the different effects of the same substance taken into different stomachs.

Centerville, Iowa.

For the American Bee Journal.

The Origin of Honey-Dew.

CHAS. DADANT.

As I see two contradictory opinions in regard to honey-dew, I desire to bring before the bee-keepers a few quotations from a French book, *Les Nectaires*, containing 130 figures, published in 1879 by Mr. Gaston Bonnier, *maitre des conferences a l'ecole normale superieure de Paris*.

In this book Mr. Bonnier relates innumerable experiences made by himself and scores of other scientists of France, Germany, England, Italy, etc. He writes on page 165: "The nectar is produced by floral and extrafloral nectaries. The floral nectar is what is known as honey; the extrafloral nectar is known in France as *miellee*, and in the United States as honey-dew."

In some parts of France, in Saone and Loire for instance, the bee-keepers bring their bees in the vicinity of plants producing this *miellee*. The sugared liquid contains the same sugar as honey.

Mr. Bonnier has seen honey-dew *without aphide*, on two kinds of oaks, ash, two kinds of linden, sorle-tree, barberry, blackberry, raspberry, poplar, birch, two kinds of maples, and hazel-nut. These trees were covered with insects.

On page 78: "The sugars belong to two general groups. The saccharoses and the glucoses. The first are found accumulated in certain parts of the vegetals, very often plainly located as in beets, sugar-cane, and carrots. The second are spread in nearly all the parts of the plant as long as it is growing."

On page 89: "We can study the accumulations of the saccharoses and glucoses in the nectariferous tissues of the plants. We find them: 1. In the cotyledons; 2. in the leaves; 3. in the stipules; 4. in the bractees; 5. between the leaf and the twig; 6. in the sepals; 7. in the petals; 8. between the sepals and the stamens; 9. in the stamens; 10. between the sepals, petals or stamens, and the carpels; 11. in the carpels; 12. at the common base of all the floral organs."

Then he related all the experiments which he made on all these parts of the plants, with quotations of a number of other experiments made by scientists. Page 149: "Generally it

is in a state of vapor that water is perspired by the tissues of the plants; yet, in certain circumstances, when some tissues emit a great amount of water, and when the air is loaded with dampness, a part of the water remains condensed on the epiderm, and exit in part in a liquid state."

The water, which passes through the tissues and exit at the surface of the plants, may contain several soluble substances. It is easy to understand that, according to the tissues crossed, the proportion of the substances dissolved will vary. Of course the water which has crossed the sugared tissues is abundantly loaded with sugar. A leaf can or cannot emit liquid, all the other conditions being the same, this emission depending on its anatomical structure.

On page 151: "Under the influence of several causes, the liquid absorbed by the plant arrives in the nectariferous tissues, it loads itself with sugared substances, and, in a number of plants it may exit, in a great many circumstances, in the form of sugared liquid."

On page 157: "On account of the evaporation which occurs at the surface of the plant, the quantity of liquid will be more or less abundant according to the greater or smaller dampness of the air. So, dampness of air, moisture of the soil and temperature cause the smaller or greater volume of the nectar produced, and the quantity of the water that it contains."

A great many of the experiments made by Mr. Bonnier, took place at Lonye, in the apiary and with the aid of Mr. DeLayens, a well-known French bee-keeper, whose apiary was lately pictured in the BEE JOURNAL.

I beg to give a little of my experience about this honey-dew: As my home is joining a timber, I have had many occasions of seeing this production of honey-dew; yet, so far, I have been unable to see any aphids on the trees.

I beg the partisans of this aphid theory to answer the following questions: In March, when a very few warm days have just begun to swell the buds of the oaks, if we have a sudden diminution of temperature, we are sure of seeing bees working on the buds of oaks; yet these buds are hardly swelled. From where did these aphids come, which have produced this honey-dew? Is it not the result of the emission of sugared liquid by the stipules?"

During this spring we have had several sudden changes of temperature, every one followed by honey-dew; why after such changes, or when a cold night followed a warm day, and not every day? Of course I do not pretend that the bee-keepers who saw the aphids on the leaves of maples, were mistaken; but I think that the great number of aphids was caused by an abnormal production of honey-dew and not the cause of it.

When a tree emits honey-dew, while some other of the same kind does not, it is either because one is in a soil more damp than the other, or because it is in a morbid state, a

were the maple trees which have been seen loaded with honey-dew and aphidae.

Hamilton, Ill.

For the American Bee Journal.

St. Joseph, Mo., Bee and Honey Show.

APIARIST.

The sixth annual exhibition of the St. Joseph, Mo., Exposition closed to-day. The weather was fine, the attendance large, and the displays in all departments were good.

The amount of honey displayed in the apiarian department was not so large as last year, but the premium list was much larger and more comprehensive, and there was a greater variety of articles on exhibition. Increased space was given to the department; and at the suggestion of the Superintendent, the Board had a space enclosed with wire-cloth for the special display of the internal workings of a colony of bees.

The Superintendent of the department, Mr. E. T. Abbott, of St. Joseph, got out a very neat eight-page paper, cut and pasted, in the interest of bee-culture, and distributed 2,000 copies of them during the week. It attracted considerable attention, and will, no doubt, aid the cause of advanced bee-culture in the future.

There were three very fine displays of apicultural literature, which represented about all of the bee-books and bee-periodicals published in this country, besides a number of foreign publications.

Mr. E. Armstrong, of Jerseyville, Ill., had a fine display of hives, honey, bees, etc. The neat and tasty way in which his honey was put up and arranged, attracted much attention and had a great deal to do in securing him a number of the first premiums. We hope that another year others may profit by his example.

One of the things which called forth many inquiries from the curious, was an Excelsior Extractor on exhibition by Mr. A. H. Newman, of Chicago. As Mr. N. was not present, the Superintendent was kept busy explaining that it was not a "churn," an "ice-cream freezer," or a "washing-machine"—all of which the ladies persisted in calling it, notwithstanding the fact that the name was plainly written upon it.

Mr. Alley's drone excluder, which, by the way, reached here too late for entry, was carefully examined by many bee-men, and received much favorable commendation.

The event which attracted the most attention was the transferring, by the Superintendent and Mr. Armstrong, in the manipulating-room, of a colony of bees from an old box-hive to one of modern make with movable frames. The transfer was quickly made, and excited the wonder and astonishment of many present who had never seen any thing of the kind performed.

It may be worthy of mention that among the exhibitors was a young lady who had a very fine display of comb and extracted honey, and whose

work indicated that she was "up to the times" in bee-culture.

In conclusion we would remark that the officers of the Exposition deserve much praise for the encouragement and space which they gave to this department. It is to be hoped that the action and interest of apiarists will be such in the future as not to cause them to regret it.

St. Joseph, Mo., Sept. 6, 1884.

For the American Bee Journal.

Marketing Honey in Small Sections.

B. E. FASTS.

After five years of toil and care I have learned a little about bees, and this year I had about 1,000 pounds of honey in one and two-pound sections. So, after I had it ready to market, I started out to see how much I could sell; but before I started, I looked the BEE JOURNAL over to see how the honey markets were, and I concluded to charge about 17 cents per pound for the two-pound sections, and 20 cents for one-pounds. This was on Saturday, and I sold nearly all of the two-pounds. I did not take any of the one-pounds with me, for I thought that if I did, the people would want both at the same price.

On the next Wednesday I delivered my orders, and at the first store they told me that I had charged them too much, for some other fellow bee-man had been around with his honey at 16 cents per pound; but I told them that my honey was all in good shape, and that I did not want to take any less for it, so some paid 17 cents and some 16 cents.

Another bee-keeper had been around with a load of one-pound sections, and did not wish to take it home, so he sold it at 16 cents. Now, where am I, at 20 cents? I did not sell any. I think the last-mentioned bee-keeper did not take any bee-paper or inquire as to the price of honey, or he never would have sold one-pounds for 16 cents. I am afraid this will be the outcome of the one and the one-half-pound sections, that we will have to sell them for the same price as the two-pounds.

I, for one, do think that every bee-keeper should look at this one-half-pound section question in the right light. Some say that there will be more of them used, but I do not believe it. I think that it will be just the other way. Any one who will buy one-half-pound sections will take one-pounds. One-half-pounds do not show as well as the one-pounds, and do not pay as well, nor can any body get the price to make it pay as well. I think we all should drop out the one-half-pounds, and never think of such a thing again. The one-pounds are small enough, and nobody will make them pay as well as the two-pounds. I think, perhaps, we shall have to use them some, but let us cut them down to as few as possible.

Sections without glass, is another thing which we ought to consider. I found 3 or 4 merchants who told me that they would not keep honey for

sale: for it runs all over every thing and makes too much of a muss. Every one knows that honey without glass is not as safe to handle as with glass. The glass helps to keep the honey in the sections, and by its use nobody can stick their fingers into it, and if it should fall over, it does not break. Just so many stores as there are that do not keep honey, just so much less honey will there be sold. I would rather give the glass away than to let my honey go to market without glass, and I think it will pay us all better.

I do not want any bee-keepers to think that I am telling them something new, nor do I want to find fault with anybody, but I do think that honey should be sold before bringing it to market. I am only a beginner in the honey-business, but I am going to try to keep up with the times.

Utica, N. Y.

For the American Bee Journal.

Will County, Ill., Convention.

The meeting of the Will County Bee-Keepers' Association was held on Sept. 1, 1884, at the house of Mr. W. Cassens, in the village of Monee, Ill.

Mr. A. Wicherts, chairman, being absent, Dr. Ruden, of Beecher, was elected to act as temporary chairman. After reading the minutes of the last meeting, a motion was made by E. P. Philipps, that the report be adopted, which was unanimously carried.

The topics proposed for discussion were the following: 1. "How many colonies of bees can be kept at one place with profit?" 2. "Is wired foundation a success in the brood-chamber?" 3. "Are winter passages in the combs necessary?" 4. "Why is it that bees did not do as well this year as last, in this neighborhood?"

The first question was discussed at some length, and almost every member agreed that a locality could not be overstocked; and that there are millions of honey-producing flowers which are never visited by the honey-bees.

In regard to the second question: It was decided that the wired frame is the one, and the only one, that should be used in the brood-chamber; although some of the members differ as to how the wire should be placed in the frame. W. Cassens prefers a straight up-and-down wire in three places of the frame, one in the centre, and one on each side, say about 2 inches from the end. G. Kettering favors altogether a different wiring, claiming that he can make a stiffer frame, and secure just as straight a comb with less wire and much less work, by commencing in the centre of the top-bar, just above where you fasten the foundation, and punching a small hole through it with an awl, and two holes on the bottom-bar, say about 2 inches from the end on each side; then run the wire through those three holes and fasten it. This makes a very good support for the foundation, and it also makes a good brace for the frame.

The third question did not take much time, and was decided that it was not necessary to have winter passages in the combs.

In regard to the fourth question: Mr. B. Hayden, one of our oldest bee-keepers, claimed that our bees swarmed altogether too late, this year. He laid it to a spell of cold, rough weather just at the time when colonies ought to cast swarms. He further says that if our bees had swarmed as they should have done, or as they generally do, we would have had fully as much honey, this year, as we did last; and when we had our best honey-flow, this year, bees laid before their hives looking at us, and waiting for a swarm to issue. Every member present agreed with Mr. Hayden that this was the cause, and nothing else.

Mr. Cassens made a motion that our next meeting should be held at Beecher, Will County, Ill., on Nov. 10, 1884, at the office of Dr. Charles Ruden, which was unanimously carried. By motion the meeting then adjourned.

GUSTAVUS KETTERING, Sec

For the American Bee Journal.

Winter Management of Bees.

J. M. HICKS.

It is usual for the apiarist to look after his colonies of bees and see that each one is in good condition for wintering. We will suggest, as a rule, that from Nov. 1 to the middle of December is a good time to look after the bees, and see that they have a sufficiency of honey to last them through the winter. Perhaps in some seasons it should be attended to earlier. A good colony of bees should have at least 15 to 20 pounds of honey stored in the combs. It is now a mooted question as to whether it is advisable for a colony to possess a very great quantity of pollen in their winter stores.

It has been asserted, and we think very justly too, by some who profess to be well versed in the science of apiculture, that pollen is the true cause of so much disease among bees during the winter months, and especially very early in the spring do we often hear of complaints about the bees having diarrhoea. As a remedy for this trouble, we further suggest that salt-water be placed in wooden troughs and set within a few yards of the bees, and then we think there will be but little risk to run in bees keeping perfectly healthy if all other things are in proper condition, such as ventilation, good, pure food, and a comfortable shed, which should always be provided for them by the bee-keeper. The shed should have an eastern front, but if it cannot be thus made, our next choice would be a south front. All bee-sheds should have a close-fitting back, and a well-shingled roof.

If these suggestions are attended to at the right time, and prepared with as due regard to comfort for the bees as any other stock on the farm,

we would have no cause for complaint. A good farmer never thinks that he has done too much for his horses, cows, sheep and hogs, by building good barns, stables and pens in which he can have all his farm stock protected from inclement weather.

The question has often been asked, "Is it necessary to build good winter quarters for bees?" We answer that it is just as essential as it is for any other stock. It is true that we do not pay as much for a colony of bees as we do for a cow or a horse; but it is no less the duty of the husbandman to protect and care for the bees by providing the proper sheds for them, when they "board themselves," and often return a large surplus of honey. Battle Ground, Ind.

For the American Bee Journal.

Management of Long Hives.

W. H. S. OROUT.

Mr. Buswell wishes me to describe my system of management of long hives, and why I prefer them to two-story hives. I use, substantially, the Kidder frame, 13 inches long and 11 inches deep, inside measure, and hives 40 inches long inside, made double-walled at the sides, and high enough to allow of packing over the frames. Finishing nails are driven into the frames to hang by, and hoop-iron to hang on, which facilitates rapid handling, and very few bees are crushed. Italian bees are preferred, for it is generally conceded, I believe, that they will labor best near their brood. I use a division-board, and when the bees are strong enough—say, crowd half their hive—give them the whole length by alternating frames of empty comb with the brood (when the honey flow comes). When the honey is ripe enough to extract, the bees are shaken inside more readily than in two-story hives, and a frame nearly filled with brood is left for them to cluster on, and all the rest emptied by a 4-frame extractor, and then returned. When the honey-flow is abundant, I spread the combs so as to use 18 in a hive. I have repeatedly tested two-story hives against the long ones for extracted honey, and every time I have received more honey from the long ones. They are very convenient to use as tenement hives; in fact I usually winter 2 colonies in a hive. Feeding is very readily done, and by means of the division-board the colony can be contracted at will. I could always get more honey in two-story hives by putting part of the brood into the upper story and filling out with empty combs, than by having all empty combs in the upper story. The swarming-impulse is more readily controlled in long hives, as there is plenty of room and shade reducing it to a minimum. None have issued this year, and when they do all the queens' wings are clipped, so that they cause little trouble. I think that the queens are more prolific in this style of hive. One queen, this summer, kept up 17 frames of

brood, averaging $\frac{3}{4}$ full. Right here allow me to say that natural queens either reared under the swarming-impulse or supersedure are, in my opinion, much superior to artificial queens unless they are reared by some such method as Alley's. They are more readily packed on the summer stands for winter, there being no loose boxes to move away during each spring. The main entrance is in the front end, and by placing the hives 3 or 4 feet apart, one can have a side entrance midway, and artificial swarms are made very readily by the use of a division-board. I think two or more colonies will winter better together than in separate hives. It is a question with me whether they are as suitable for comb honey, but I think that I would risk it. By using a side entrance, and only one colony in each hive, one could have side storage as well as top. Their main disadvantage is in being too cumbersome to readily move into winter quarters.

Kennedy, N. Y.

Somerset, Maine, Convention.

The fourth semi-annual convention of the Somerset and Western Piscataquis Bee-Keepers' Association met at the residence of W. H. Norton, at North Madison, Me., on the 20th ult. The meeting was well attended, there was an unusual interest evinced in the objects of the meeting, and all seemed to enjoy the occasion highly. There were representatives from four different counties.

The first hour of the forenoon was spent in Mr. Norton's apiary, examining his bees, queens, appliances, furniture, etc., and in an informal talk by all in relation thereto. Mr. Norton has about fifty colonies arranged in due form on his lawn in front of his house, with as many small nuclei colonies for rearing queens, arranged systematically between the other colonies. His bees are of the Holy Land or Syrians, and a cross between them and the Italians.

At eleven o'clock the members were summoned to the stand beneath the wide-spreading foliage of Mr. Norton's noble apple trees, where ample seats were provided. After the usual opening exercises, Mrs. Wm. Lawrence, of Wellington, gave a *resume* of the essentials of practical and successful bee-keeping for beginners, or those who would keep only a few colonies for supplying honey for their own tables. It was an able digest of those necessary things which go to make bee-keeping a pastime and a profit. At noon the whole "swarm" of bee-keepers in attendance were invited by Mrs. Norton, to dinner, where several bountifully laden tables were provided for regaling the physical system, and no "drones" were there among the "busy workers" during the repast.

The afternoon's exercises consisted in discussing the care and preparation of bees for the fall and winter months, with brief addresses by the principal members, on their methods of management of bees.

Mr. Reynolds, of Clinton, said that he reduces the number of frames to six or seven, puts chaff-cushion division-boards on each side of the frames in the ends of the hive. He winters his bees in the cellar and on the summer stands, and has strong preference for the black bee. He would also prefer the cellar as the safer place in which to winter bees.

Isaac Ames, of Skowhegan, winters his bees out-doors and in the shed; covers the entrance with perforated tin, to prevent the bees' coming out during a warm spell, and keeps the hives exposed to the rays of the sun in winter. He uses the old box-hives, and was advised to transfer the bees at once.

Gilbert Dunbar, of Embden, winters his bees, both out-doors and in the cellar; puts the frames in the middle of the hive, and uses division-boards in each end with chaff packed in. When he takes them out of the cellar in spring, he puts straw around each hive to ward off the cold and wind.

Jotham Whipple, Jr., of Solon, finds that the black bees are harder than Italians, and prefers the former every time, as far as his experience goes.

Z. D. Ingalls, of New Vineyard, had three colonies last spring; now he has eleven. His bees have not stored much honey, but have bred well. He is very much interested in bee-keeping, and by earnest effort and study he hopes to succeed.

Mr. Paine, of Cornville, had two colonies in the spring and now has eight; has the Holy Lands and blacks, four colonies of each, but does not see much difference in the two races as regards honey.

Horace Hall, of Canaan, experienced some trouble in living swarms. He was advised to shake the cluster down in front of the hive and drive them in with a smoker. He keeps the Holy Lands.

W. H. Norton, of North Madison, said that he usually has bees enough in each hive, when winter sets in, to fully cover eight Gallup frames so as to form one solid cluster. If some hives have less, he takes from those which have more, and thus equalizes all his colonies. If any have not stores enough to winter on, he feeds them with sugar syrup during the fall. He said that he would rather have a colony with no honey, on September 1, than to have it with a full supply of summer and fall honey; for then he would be sure that they would winter better. He would spread or put the frames apart in the autumn, so that the bees can cluster in larger masses, thereby keeping up more warmth. He winters them in the cellar, gives no direct upward ventilation, and puts two inches of chaff in a burlap sack on the top of the frames, with a chaff division-board in the ends of the hives, at the side of the frames. His hives are all about eighteen inches long with Gallup frames.

Several others made more or less remarks until the hour for parting arrived. It was decided to hold the next meeting at Harmony, on Saturday, May 9, 1885.—*Home Farm.*

For the American Bee Journal.

"Honey-Dew—What is It?"

CHAS. SAMSEL.

Mr. Kemp, on page 536, writes on this subject, and tries to prove that honey-dew is not the product of an insect, but is produced by atmospheric influences. He argues that, because both insects and honey-dew are found on the same leaf, and at the same time, it is *not* evidence, that one produced the other, or that one cannot exist without the other. If this is not positive evidence, it is at least strong circumstantial evidence. Men have been hanged on evidence less convincing.

He further states that this dew is formed only upon a hard, smooth, glazed leaf, while it is never formed upon rough, soft, porous leaves. This proves nothing; for while we are willing to admit that the latter absorb the dew, it is just as possible to absorb it when thrown upon them by the insect, as from the atmosphere.

Now, if Mr. K.'s theory, namely, that it is produced by atmospheric influences (which I take that it means saccharine condensation) is correct, how does he account for its presence in green-houses and conservatories, in a building say 15x40 feet, in the dead of winter with an artificial temperature ranging from 50° to 80° Fahr.? It is simply impossible, and yet it abounds.

The orange and the lemon tree, the climbing stephanotis, and the roses, as well as many other exotics, if not closely watched, soon fall a prey to the scale and the mealy-bug (those scourges of the green-house), and become covered with this dark-colored, sooty, sticky stuff to such an extent that if not washed leaf by leaf with sponge and water, all the summer rains will fail to remove it entirely.

When the florist finds this dew upon his plants, it is often the first indication of the presence of these insects; and when Mr. K. says that he has found the honey-dew upon leaves, which, under a powerful microscope, showed no insects, I think that his search was not thorough enough; for, be it remembered, these insects seldom infest the leaf itself, but harbor upon the soft, young wood, and are generally so flat, and of a color of the wood, that they may readily be overlooked, besides they may be found upon adjacent plants or trees.

But we have positive proof that the insects, aphidæ, do produce honey-dew, and refer the reader to Langstroth on the Honey-Bee, page 286, where he cites as follows: "Mr. Knight once observed a shower of honey-dew descending in innumerable small globules near one of his oak-trees. He cut off one of the branches, took it into the house, and, holding it in a stream of light, admitted through a small opening, distinctly saw the aphidæ ejecting the fluid from their bodies with considerable force, and this accounts for its being frequently found in situations where it could not have

arrived by the mere influence of gravitation, etc."

Now, while we deny that honey-dew is formed by saccharine condensation, we do not contend that it is produced by insects exclusively, but believe it possible that it may exude from the leaves of some plants and trees under favorable circumstances.

Easton, Pa.

For the American Bee Journal.

W. N. Y. and N. Pa. Convention.

The semi-annual meeting of the Western New York and Northern Pa. Bee-Keepers' Association was held in Armory Hall, at Jamestown, N. Y., on Sept. 1 and 2, 1884. The meeting was called to order by President Elkins at 1 p. m., on Sept. 1. Mr. Shewman, the Secretary, being absent, Mr. Page called the roll, read the minutes of the last meeting, and also the constitution and by-laws, and stated that it would be impossible for the Secretary to be present at this meeting. Mr. Page was then elected Secretary *pro tem.*; but also being Treasurer, he resigned, and Chas. E. Gates was appointed in his place. The Treasurer then read his report for the last six months, which was accepted.

Nothing else being before the convention, discussion of questions was next in order. The first question was, "In how short a time can a queen be reared?"

Mr. Caswell: I have reared a queen and placed her in a queenless colony in 13 days.

Mr. Grout: I have used what are called artificial queens (*i. e.*, those reared from a worker larva), but they are short-lived.

Mr. Sleeper: I think that the amount of royal jelly makes a good deal of difference. I have always found that queens hatching out and leaving the cells dry, proved to be poorly-developed, and were generally superseded by the bees; while those hatching out and leaving royal jelly in the cell, proved to be excellent queens and long-lived.

Mr. Moon related his experience of over 40 years in bee-keeping, which was comical indeed; and he inquired how to make money in bee-keeping.

Mr. H. D. Gates: I believe any one ought to make money in keeping bees. I have kept bees only 2 years, and in frame-hives, but taking bee-keeping in general, year in and year out, it is profitable.

Mr. Hubbard: I have about 100 colonies, but I have not done as well as I ought this season, because of my health. If one expects to make money, he must take care of his bees, and work.

Mr. Page: While talking with another bee-keeper about the pollen theory, he described to me a novel way of cleaning old combs containing pollen which had been in them for years; and as it may be useful to most of you, I will describe it: Take a wash-boiler, or any vessel large enough to contain your combs, and fill it with cold water; put in the

combs (one at a time), and take out immediately, continuing this process until the cells are filled with water, then place the combs in the water, and let the water cover them; then fasten them down with a weight, so that they will remain there. Leave them in the water for 24 to 48 hours, or until the pollen is thoroughly soaked up, and then place the combs in the extractor, and the pollen will be thrown out as easily as honey, when the combs will be clean and just as good as new ones.

The rest of the afternoon session was occupied in discussing the wintering question.

Dr. E. H. Danforth offered the use of his office for an evening session to those who could attend.

The association adjourned at 5 p. m. to meet at 8 a. m. the next morning. All who could attend the evening session did so. The topic of the evening was, "Scientific Facts of Queen-Rearing," which was well discussed, and quite interesting.

The convention was called to order on Tuesday, Sept. 2, at 10 a. m., Vice-President Sleeper occupied the chair. The wintering question was then again taken up.

Mr. Page: I think bees ought to be prepared for winter by Oct. 1.

Mr. Everett: I think that bees ought to be prepared for winter now—at least contract the brood-nest now.

Mr. Williams: The amount of honey ought to be considered.

Mr. Hubbard: I have found that those bees which are prepared late, winter poorly.

Mr. Carpenter: I think that bees ought to be put up early to be ahead of cold weather. My bees are kept packed during the winter and the summer.

Mr. Crooker: I have not produced much money from my bees until lately, but I think that they ought to be put up early.

"How many bees should each hive contain to winter well?"

Mr. Babcock: I think that colonies ought to be strong to winter well.

Mr. Page: I think that they are more apt to have diarrhoea if they are very strong.

Mr. Everett: I winter my bees on 6 frames, if possible. If many frames are used, they are liable to get too much cold air in the hives.

Mr. Williams: I have wintered both light and strong colonies, but prefer strong ones.

Mr. Crooker: I contract the brood-nest all that is possible, and use sticks across the frames.

"Should bees be old or young to winter?"

Mr. Danforth thinks that this is a curious question. Mr. Davis thought that it was an indefinite term, but thinks that they should not breed late.

Mr. Crooker: I am not troubled about late breeding. I do not care if my bees do breed late, for they winter just as well.

Mr. Davis: I think poor honey is a prolific cause of poor wintering.

"What is the proper condition in which to winter?"

Mr. Crooker: I do not want any outside packing. I have wintered colonies in December, and had them winter all right.

Mr. Everett: I think that plenty of bees and not too much food, but enough, are essential to good wintering.

"Which is best for storing, honey or sugar syrup?"

Mr. Everett: Good honey is preferable to sugar syrup, and sugar syrup is preferable to poor honey.

Mr. Danforth proposed the following amendment to the constitution: Any member may withdraw from this Association by notifying the Secretary when all dues are paid. It was seconded and carried.

"Can a locality be overstocked?"

Mr. Page: In the locality where I am situated, in an area 3 by 6 miles, there are over 500 colonies.

Mr. Elkins: For basswood, the locality in which Mr. Page and I live, could not be overstocked; but if we had nothing but white clover, I think it would be.

"Are the best results from those colonies which are wintered on the summer stands, or from those wintered in cellars or bee-repositories?"

Mr. Davis: I have a house for wintering my bees, which I prefer to outside wintering in chaff-boxes. It has 6-inch walls of dry earth, and ventilators to control the temperature. When cold weather comes, I bank up the house all around with snow. I can keep them quiet in cold weather, but when the warm spells come they get uneasy.

Mr. Everett: I want my bees on the summer stands, where I can examine them at any time. It is not cold which kills bees, but poor ventilation is the cause. I use sawdust for side-packing, and forest leaves on the tops.

Mr. Sleeper asked Mr. Davis if his apiary was ever troubled with spring dwindling.

Mr. Davis: Sometimes, but bees generally winter all right.

Mr. Carpenter: I believe that defective ventilation is the cause of poor wintering. I believe there should be a current of air circulating through the hive, but not strong enough to affect the bees.

Adjourned to meet at 1 p. m. The afternoon session was called to order at the appointed time.

"Is the production of comb honey or extracted honey the most profitable?" The majority of those present were in favor of extracted honey.

Moved and carried that the names and addresses of all of the members of this Association be printed on postal cards and mailed to each of the members. Moved and carried that the next meeting of this Association be held at Cuba, N. Y., on the first Tuesday in May, 1885.

The President asked if any one present had ever tried to fertilize queens inside the hive. Mr. Williams replied that he had, and described the process which was very interesting to all.

It was moved and carried to adjourn at 4 p. m. Sixteen members were added to the roll.

Mr. G. W. Stanley had a smoker and a honey extractor on exhibition. Mr. V. Page exhibited a bee-feeder and samples of light and heavy foundation. W. T. Falconer showed a chaff-hive. W. J. Davis exhibited a comb honey-rack which was different from any described in the BEE JOURNAL. Mr. W. H. S. Grout showed a sample of red-raspberry honey, and Dr. E. H. Danforth had a sample of "honey-dew" on exhibition.

How to Ship Extracted Honey.

C. F. MUTH.

Please let me explain through the BEE JOURNAL how to ship extracted honey. I am getting honey mostly in barrels, half-barrels and kegs. As I handle a good deal in a great variety of packages, I have some experience, and ascribe to myself a certain amount of judgment in the matter. Wishing to be understood by every shipper of extracted honey, I wish to tell things in my own manner, and go into details a little more than I should if these things were of less importance.

A lot of honey arrived here from Shreveport, La., within a few days; 2 barrels had entirely leaked out, while 23 more barrels were more or less damaged. The owner of the above lot happened to be here at the Exposition, and present on the arrival of the honey, which, no doubt, saved some unpleasant correspondence. The honey was in second-hand cypress barrels. A party in Florida, two years ago, sent me two barrels of honey put up in second-hand molasses barrels. These barrels arrived, with a large lot of honey from other parties, but were entirely empty. I admit that the railroad company should not have accepted at the other end, but I am certain that the railroad company here would have succeeded in proving that the fault of the shipper would have caused the damages. The same party shipped again, last year, in new cypress barrels, which were poorly made, as the grooves for the heads were insufficient. Four barrels arrived here entirely empty, and the fifth one had a few gallons of honey left in it. The shipper again was the loser. A party in Mississippi had shipped to us five barrels of honey in good, second-hand alcohol-barrels, out of which about $\frac{1}{3}$ had leaked before there arrival here. The shipper had made the mistake of soaking his barrels with water for several weeks previous to putting in the honey, instead of driving the hoops, or getting his barrels tight by good coopering when they were dry. This should never be neglected when second-hand barrels are used. Have them coopered up securely when they are dry. When, after the rinsing process, one is satisfied that they are tight, they are ready to receive the honey. Honey-barrels never get tight by soaking them in water, because

honey, unlike water, absorbs the moisture from the wood.

Common-sense should tell every one that goods worth \$30 to \$40 should not be trusted to a package worth 40 to 75 cents and shipped any distance. Four to five hundred pounds of honey are worth a good, new barrel, if it can be had, even if it costs \$2 or \$2.50; and one should see to it that a good cooper made it, and that staves and heads are sufficiently heavy to carry the weight of the honey, no matter if they are made of oak or cypress, if with iron or good oaken hoops.

A barrel of honey rolled through our yard had a pebble pressed clean through a stave. No loss occurred because we saw it in time, but that it did not happen some place else and had the contents spilt, was merely accidental.

In regard to the question whether barrels should be waxed, I answer that I have no objections to barrels being waxed. It is not necessary. But barrels must be tight before they are rined, and the honey is put in. This is of vital importance to the producer, shipper and dealer. It may be of interest to some to know that oaken honey-barrels, when emptied, cannot be excelled for wine, cider or vinegar barrels, but cypress barrels should not be used for such purposes.

Honey has again commenced to accumulate, and I request every one not to ship any to me without previous arrangements. I had on hand, one day last fall, no less than 600 barrels of honey. I was overstocked, and I do not wish to have the same occur again this year. No break in the market was caused by me, because I held the honey until the supply was needed. But a reckless shipping to commission houses should be avoided by all who expect to make a living profit out of their product.

Cincinnati, O., Sept. 16, 1884.

For the American Bee Journal.

Bee-Keeping in Nebraska.

A. GIBSON.

My bees are doing well for this country; and are now storing honey very fast. They have been swarming ever since Aug. 15, but I think that they are through now. I have one colony which lost its queen in June, and I have been trying ever since to get them to accept a queen, but they either lose or destroy her every time. I have kept up the colony by giving them brood from another colony. I gave them queen-cells two or three times, and they seem to hatch the queens all right, but by some means they were destroyed afterwards. There were no eggs of any kind laid in the comb. I have had the worst luck that I ever had in losing queens, this summer. I lost 5 colonies during July, on account of the young queens being destroyed and the bees robbing. I have two rows of hives standing about 10 feet apart, and I thought that the trouble might have been on account of the queens being misled. I doubled up the troublesome colony with another one this morning, that

had no queen, and I now have 53 colonies all in good condition. I have not taken off any honey yet, but several boxes will be ready to take off during this week. The fall flowers are abundant this season, and if the frost does not come early, we will yet have quite a little crop of honey. A number of my neighbors keep bees, and most of them use the box-hive or log-gum. I scarcely know whether to put my bees into the cellar this winter or leave them on the summer stands. I have a good, dry side-hill for making a cellar; but I do not know which would be the better, cellar or out-door wintering. I send you a leaf of a box-elder tree which is affected by the honey-dew that we have had in this section.

Ponca, Nebr., Sept. 4, 1884.

For the American Bee Journal.

Iowa State Convention.

In last week's BEE JOURNAL will be found the report of the apianian display at the Iowa State Fair, and also a report of the Convention held at that time during the day. The following is a report of the evening meeting which was held during the Fair:

The evening session was called to order by President O. Clute at the appointed time. All business having been attended to in the afternoon, the evening was spent in the asking and answering of the following questions:

"Is there any foul brood in the State of Iowa?" Foul brood is supposed to have existed for some time in Clinton, Clinton county, and in the neighboring towns, and is steadily spreading and working its way down the Mississippi river, until now it is supposed to exist at Le Claire, Scott County, Iowa.

"Has anybody an idea or method of preventing its spreading?" In Michigan they have a very strict law to prevent its spreading. It requires every one who has foul brood in his apiary to burn the hives in which it exists. I think that it would be advisable to have a committee make out a good Bill in regard to foul brood, and bring it before the State legislature.

"If exposed, will bees carry it to their own hives, if they are in a good condition?" Yes.

"Will some one describe it?" It is so well described in all of the bee-publications that it is useless to describe it here.

"Can a locality be overstocked?" A good many members thought that it could be, and others thought not. After considerable discussion it was left undecided.

"Has any one made a success in planting for honey?" Some thought that it paid to plant for honey, and others thought not.

"Is catnip a good honey-plant?" On some soil it does well, but it is easily choked out by weeds.

"Does it pay to plant buckwheat?" Yes.

"Will it do to sow the buckwheat among the corn?" Yes.

"Will it injure the corn by so doing?" Some who had tried it thought not, and some thought that it would pay to give the farmers so much per acre to sow buckwheat in their neighborhood. To encourage them they might be paid in honey.

"What is the best way to dispose of honey?" Send to some reliable commission merchant. If you send extracted honey, they prefer it put up in barrels, it being a cheaper way to put it up in proportion to the quantity of honey, and quicker to handle, and easier to store away than when put up in small packages. It will net about 9 cents per pound. Always dispose of as much as possible in your home market. For home market put it in small tin-pails.

"Do you ever have trouble by the commission men keeping it on hand very long?" No; the longest time being three months.

"Is it necessary to use separators for comb honey?" Some thought that it was, and others opposed it. So far as profit is concerned it is about equal, as that produced with separators brings a little more in price; but enough more can be produced without separators to pay the difference in price.

"Can virgin queens be safely introduced?" In answer to this question, Mr. O. O. Poppleton read an essay on introducing queens.

After some discussion it was decided that virgin queens could not be introduced with safety at all times; but that fertilized queens could be introduced with certainty.

"Does it pay to supersede a queen when she becomes old?" Yes.

"Does it pay to double up colonies?" Some favored it, and some did not.

Owing to the fact that a large number of the members did not stay on the grounds over night, and that a storm appeared to be brewing, on motion the meeting then adjourned.

Wm. Goos, Sec.

REV. O. CLUTE, Pres.

Read at the Maine State Convention.

Extracted or Comb Honey—Which?

JOHN REYNOLDS.

I have been a bee-keeper for many years, yet this is my first year's experience in producing extracted honey. My apiary, after recovering from spring dwindling, yielded 410 lbs. of extracted honey, and 1450 lbs. of comb honey, which furnishes a practical answer to the question under consideration.

I find by actual calculation, that on an area of 36 square miles, there was produced last year, about 4000 lbs. of comb honey, (reckoning two pounds of extracted honey equal to one pound of comb honey.) Now, as there are about 18½ inhabitants to the square mile in Maine, this would give 666 as the number of the inhabitants on 36 square miles. By dividing 4000 lbs. of honey by 666, gives a little over 6 pounds of comb honey to each inhabitant in Maine, (taking the year's product on 36 square miles, as a basis

Controlling Increase, etc.

G. W. DEMAREE.

It is not my purpose to "moralize," as the manner of some is on such occasions as this. Let the past with its successes and failures suffice us. It is with the present and future that we have to deal. It is enough to say that the past honey season has not been satisfactory to most of us.

The flow of nectar from white clover was marvelously profuse, but the period was too short to give a full crop. Many of us made the mistake of laying our plans too broad for the short harvest, which we did not anticipate. I, for one, have learned something in that direction, and from that experience. Hereafter, I shall work my bees for what is in sight, and broaden my plans if the occasion demands and justifies it.

I wish to call your attention to the fact that many persons begin to talk and write as though bee-culture, as a science and as a practical industry, has reached the top round of the ladder. Let no one be deceived by the exhausted ideas of such. I am willing that it shall go to record when I say here, that the present mode of handling or manipulating bees and bee-implements, in short, the present system of bee-keeping, which we proudly call the "modern system," will, in the near future, be revolutionized and made a thing of memory only.

There is no question, pertaining to apiculture in the South, of so much importance as that of controlling increase. In the North, where long, cold winters hold the "balance" with the grip of death, it is well enough to say, "let the bees swarm." With us, bees succumb to nothing but the expiration of the lease of life, or straight-out starvation. Not a fatal case of the disease known as dysentery or diarrhoea, in the North, has ever come to the knowledge of the writer, in all Central and Southern Kentucky. Most of us have seen bees with distended bodies when confined to the hives unusually long during unusually cold winters; but a single flight in the open air is all that is necessary to restore them to a normal condition. The Southern apiarist smiles at the conceit of the pollen and hibernation theorists. Our bees gather pollen eight months in the year, and "snap their fingers" at pollen chimera.

As to the "sleepy-headedness" of bees: In January, 1881, my bees could be seen either on the wing or stirring about the entrances of the hives every day but three in that month. They wintered well without sleep (?). Why, sirs, if I should follow the advice of some who say, "let the bees swarm," my apiary would multiply to 2,000 colonies in four years, provided that I would covenant to let none of them starve!

In the light of these facts, any system of management that does not put the matter of increase entirely at the disposal of the apiarist, needs

of calculation). Now, divide 4000 lbs. by 36, and we have about 112 pounds as the product of one square mile; then multiply 35,000, the number of square miles in Maine, by 112, and we have 3,920,000 lbs. of comb honey as the actual possibilities of production in Maine last year. This at 20c. per pound, amounts to \$784,000. Now, as bee-keeping is but in its infancy, and our apiarists unskilled in the application of the science, it is not unreasonable to suppose that this estimate might be doubled. This would give 7,840,000 lbs. as the probable possibilities of Maine's yearly honey crop.

Now then, as we usually get two pounds of extracted honey to one pound of comb honey, we shall have, if we run wholly for extracted honey, 7,840,000 lbs. of extracted honey, as the actual possibilities of Maine this year, or 224 pounds per square mile. We find 6 pounds of comb honey as the amount annually allotted by nature to each inhabitant of Maine, in our present knowledge of the science. Are we satisfied with this small allowance of 6 pounds of comb or 12 pounds of extracted honey? We cannot have both, and thus it remains for each one individually to decide which he shall produce, comb honey or extracted honey.

I find, by talking with quite a number of grocers, that the market demands comb honey in their immediate vicinity. I find, also, by reading some bee-papers, that the market demands comb honey and that its production is setting strongly in that direction. Mr. T. G. Newman in his work "Bees and Honey," says; "To-day comb honey is the preference for table use; and if we would cater to the public want, we must put that article in its most attractive shape." In regard to extracted honey, he says, "none but a thoroughly good article should be produced and placed upon the market, as the price depends on its quality;" and further, "a good article of extracted honey has excellent qualities, which when well known will commend it to all consumers, and is equal in every respect to the best comb honey."

"Every bee-keeper should fully supply his own locality, and he should let it be distinctly understood that it is the pure honey, taken from the combs by centrifugal force; that nothing is added to it and nothing taken from it, except the comb; that it is not the old-fashioned "strained honey," which was obtained by being taken from dead bees, pollen, mashed brood, etc., but that it is the pure liquid gathered from the flowers, which will give health to the body, force to the mind, and strength to the intellect of those who eat it."

"The fact should be known that granulated honey can be reduced to its liquid state in a few moments, by placing the jar containing it in warm water. When thus liquefied, it so remains for some time before again crystallizing. Consumers may be sure of a wholesome article by purchasing granulated honey and reducing it." I was shown a jar of honey in the liquid state which had been thus liquefied

for two years since it was reduced from the granulated state.

I find that grocers are willing to take comb honey in limited quantities, but have a decided objection to extracted honey. Why is this so? One grocer told me that there was a decided prejudice against extracted honey in his locality. Another grocer took fifteen jars on commission and said that he did not know whether he could sell it, but would try. I saw him the other day, and he had disposed of ten jars of it at the same price as comb honey; and he said that his customers liked it.

But another says, "How much do you ask for your comb and extracted honey?" "I wholesale comb honey at 20 cents and extracted at 12 cents per pound." "What is wax worth?" "32 cents." "About how much wax will a pound of honey yield?" "Oh, perhaps an ounce, more or less."

The grocer looked thoughtful a moment and turned away without comment, as comment to his mind was unnecessary. The fact was, the whole thing smelt of adulteration to him and we had given him the figures with which to prove it. But his actions spoke louder than words, "you bee-men sell us honey in the comb for 20 cents. When you go to the trouble to extract other honey and sell it for 12 cents, when you might have had 20 without extracting, and the ounce of wax you sell for 2 cents more, making your pound of extracted net you only 14 cents, when we would have been glad to have given you 20 cents for it in the comb!"

And when we try to explain by telling him that we use the comb over again in the hive, and that it costs in honey nearly two-thirds as much to make the comb as the comb holds, then he is puzzled again, and when the question is put, "Sir, will you have some of our extracted honey, today?" he first looked thoughtful, then wise, then turned away with a shake of his head or a "no I thank you," as much as to say, "maybe what you say is true, but this bird is not to be caught with chaff a second time."

I saw at once that my chance to get twenty cents for my extracted honey was fully as good, if not better, than to get a less price, and as the cost of creating a market was quite an item, I then resolved to put comb and extracted at the same price hereafter.

To those who are now using an extractor and know what you can do, I would say, do not make much change, unless you can do it for the better sale of your honey. To those who have not yet gone into it, I would say, "don't," or not largely, unless you have the brain force to create your own market and maintain it by square, honorable dealing.

The Cedar Valley Bee-Keepers' Association will hold its second annual meeting in Beckley's Hall, South Side, Waterloo, Iowa, on Oct. 1 and 2, 1884. Reduced rates over the different railroads. All interested are cordially invited to attend and make this one of the best meetings in the State.

H. O. McELHANY, Sec.

improvement, and is sure to be improved. It occurred to me years ago that if queenless bees could be employed to produce honey, the problem would be solved; and, now, after experimenting considerably in that direction, I am prepared to say that I can control increase by employing queenless bees to gather my surplus crop of honey; and in order that others may aid me in perfecting the new system, I will here give you a description of the practical working of the plan:

In the early part of the honey season, the surplus cases are adjusted on the hives in the usual way, and "further proceedings continued" till the colonies show signs of swarming. I then move the old hive from its stand and put a new (or empty) hive in its place, and fill up the new hive with empty combs, one of which must contain some larvæ just hatched from the eggs. The case or cases for surplus honey are now lifted off of the old hive and set, with all the bees in them, on the new hives. You now look up the queen and put the combs in which she is found, in your comb-box, and then proceed to shake the bees from the combs into the old hive right in front of the new one, having first provided a slanting board to lead the bees to the entrance. Place the combs back in the old hive, to which add the comb with the queen, and set the old hive at right angles with the new one. It is best to spread a cloth over the old hive to disguise it for a day or so.

It will be seen that the new hive contains nearly all of the field workers, and a large portion of the young bees for comb-builders, while the old hive has all the brood with the queen, and enough workers and nurses to push forward brood-rearing.

The bees in the new hive will start queen-cells and gather honey with the greatest rapidity. In five or six days we begin to turn the old hive, a little at a time, so as to stand close by the side of the new one, bringing the entrances of both hives, practically, together. At the expiration of ten days—if the honey season continued good—the old colony will be strong enough to spare additional working force to the honey-producing colony in the new hive; and to accomplish this, all we have to do is to turn the old hive back to its former position, at right angles with the new one, at a time when the bees are in the fields in full force, and as they come home loaded, they will enter the new hive and recruit its failing strength.

Of course the queen-cells must be removed, and freshly-hatched larvæ given in their place. When all danger of swarming is over, the old hive is brought in line with the new one, and the bees are united by "tiering up" the new hive on the old one, and thus the honey-harvest is finished up by the united colony.

It will be noticed that I speak of employing two hives for each colony, which I distinguish by the terms "new" and "old." Well, now I propose to dispense with the extra cost of the "new hive," and in its place

use the supers or surplus cases adjusted on a recess bottom-board. When running a colony for comb honey, I will work a case of shallow extracting-combs on the recess board, and underneath the section-cases, to catch the pollen, if any is brought in.

My recess bottom-boards are made just the width of the hive I use, and two inches longer. A strip of wood $\frac{3}{8} \times \frac{3}{8}$ of an inch is nailed to three sides of the board to give "bee space" under the cases which rest on the elevated rim formed by the strips of wood. The extra two inches in the length of the board is for an alighting-board.

I have now given my new system of controlling increase—suppressing swarming, if you prefer the terms, and producing honey with queenless bees. Of course there will be much criticism. A large minority of bee-culturists have always refused to accept anything "new" until they have added some "improvement," worthless though it may be, to the new improvement or device. I do not object to this. Many fine inventions have been born of absurdity.

Christiansburg, Ky.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Strange Noise in a Bee-Hive.

Every afternoon for the last two weeks I have heard a noise in one of my strong Italian colonies, which sounds exactly like a boy blowing in an empty vial or bottle. When I first heard it, I thought that was what it was, but my wife said it was in one of the bee-hives, and upon examination I found that she was correct. It can be heard 80 feet from the hive. What is it?
J. N. SMOOT, M. D.

Fulton, Ky., Sept. 9, 1884.

ANSWER.—I will give up this puzzle before I attempt an answer. I have had no experience in any such case, and you being on the ground, are best able to get under the cause of the strange phenomenon.

The Purity of Drones.

In the Texas Bee-Keepers' Convention, the report of which was published in the BEE JOURNAL, I find this as one of the questions discussed: "Are drones from an Italian queen

that has mated with a black drone, pure Italians?" The committee having the question under advisement, reported "yes;" the convention dissented. As it is a matter of vital interest to all beginners in bee-keeping, I had hoped that some of the "lights" would have noticed the theory. If the queen, unmated, can produce the drone, the Italian queen the Italian drone, why may she not have the power to do the same when impurely mated? With me this is no idle question. I am trying to Italianize my apiary, and I have but 4 pure queens, and 20 pure ones but unpurely mated. After a protracted drouth of some 4 months, my bees are now on a "boom" on the second bloom of the Brazil or red-wood. I extracted about 400 pounds of honey last week, making in all, thus far, some 2,000 pounds. If the Brazil holds out another week, I will have a full extracting from my 70 colonies. Heretofore I have only extracted from 30 colonies. I will report when the season is over.
JNO. A. EMISON.

Missouri Valley, Tex., Sept. 5, 1884.

ANSWER.—The best I can do in answering the above, is to say that Dzierzon and many other students of entomology have declared the same as the "committee" to which you refer. Several of our leading apiarists have observed what induced them to believe that the drones of a pure queen which was impurely fertilized, were not pure. I do not consider myself yet decided upon that subject. As yet I have never seen any thing to warrant me in believing that the great naturalist, Dzierzon, is mistaken in his theory, though such men do sometimes err.

Killing Bees.

Your answer to my questions about the killing of the little black bees, is wide of the mark. It is now 26 days since I first noticed the killing of them, and they are still at it. Nearly all the oldest and most experienced bee-keepers in this vicinity have seen them, and all agree that they have never seen anything like them. The black bees do not work, and that, I think, is the reason they kill them. Sometimes the workers get so much excited about it that they kill each other. I opened the hive yesterday and found plenty of brood. This was my strongest colony, and I have taken 185 pounds of comb honey from it this season. Can you not give another guess, as I am still in the dark?

H. J. NORTHRUP.

Lausburg, N. Y., Sept. 5, 1884.

ANSWER.—I shall have to give up your peculiar conundrum, for I, too, have never seen any thing like it.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

SELECTIONS FROM OUR LETTER BOX

Delightful Weather for Bees.

We are now having very hot days and warm summer evenings. It is the best fall for bees to gather honey that we have had for some years. Yesterday the bees returned from the fields by the thousands, before the showers came. The air seemed not like September—but we are liable to have almost any thing up here, yet more apt to have early frosts than such delightful midsummer-like weather as we are now enjoying.

JNO. MORRIS.

Mauston, Wis., Sept. 11, 1884.

Only One-Half a Crop.

We are now in the midst of goldenrod bloom, and the weather is splendid for bees to gather honey from it. We need it too, as bees have not gathered any surplus honey since July 3. I am now looking over all of my colonies, and examining their condition, and those which have combs to spare I take them and give them to those that are in need of any. This is a good time to open the hives, as there is no danger from robbery. We can count this year's honey harvest only half a crop.

WM. BOLLING.

Dunkirk, N. Y., Sept. 8, 1884.

Blue Vervain.

Enclosed, find specimen of plant, which please name through the JOURNAL. It yields a good deal of honey and of fine flavor. It grows on low, wet land and from three to five feet high, with a great many branches.

Wyoming, Iowa. J. E. HUNTER.

[This is the blue vervain, *verbena hastata*, which has been very often described as an excellent honey-plant.—T. J. BURRILL.]

Report for 1884.

I commenced to extract honey on July 2, and finished on Aug. 11. My average is 237 pounds to the colony. Both bottom and top-boxes are full now for their own use. My whole crop was put in 5-gallon tin-cans. I used new cans and cases, and sold my honey, delivered at the depot, at 6½ cents per pound. Twelve tons was the amount of my crop.

J. E. PLEASANTS.

Santa Ana, Calif., Sept. 12, 1884.

Best Season for Several Years.

The honey crop of this vicinity is the best that we have had for several years. White clover yielded a surplus of 25 pounds per colony, which was good in view of the empty condition of the hives at the opening of the season. Sweet clover was abundant in blossom, but produced but little honey. Buckwheat was the great

crop, and with favorable weather a large crop of honey has been produced; yet a near neighbor who put on boxes at the close of the clover bloom, and let the weeds grow over his hives until they could hardly be seen, has received no surplus, and thinks that "this has been a very poor season." We have never had any honey-dew, but an abundance of pollen; yet with loss in wintering not exceeding 1 per cent., our bee-keepers feel no alarm about the pollen theory.

Athens, Pa. D. F. PARK.

Not One Pound Per Colony.

This region of country is nearly a total failure, so far as a honey crop is concerned. My apiary will not average one pound to the colony. No honey was secreted in the flowers. All of our hopes are blighted this year.

J. W. MARGRAVE.

Hiawatha, Kans., Sept. 17, 1884.

Bee-Keepers' Meeting.

We had a very pleasant and profitable meeting at Purdue College on Tuesday, Sept. 2, with President Dr. L. Snyder in the chair. Our next meeting will be on the first Saturday in October, at which time we shall discuss several subjects of much interest to bee-keepers. We cordially invite all who have an interest in the "faithful little workers" to be present at 1 p. m. on the appointed day, at Purdue College, Lafayette, Ind.

J. M. HICKS.

Battle Ground, Ind.

Crop Almost a Total Failure.

The honey crop in this part of the country is nearly a total failure. From 75 colonies, spring count, I have increased to 120, and while the most of them have ample stores for their own winter use, I have not yet taken 200 pounds of surplus honey. Some of them are now working quite lively in the sections, but I cannot hope for much honey, because of the lateness of the season. We are having our July weather in September.

J. R. BAKER.

Keithsburg, Ill., Sept. 10, 1884.

Marshall Co., Ia., Honey Show.

The Apianary Department at the Marshall County Agricultural Fair was a grand success for a beginning. The exhibition of bees and honey was quite large, although the premium list was not all represented. It was one of the most attractive features in the Floral Hall, and was viewed by hundreds of inquisitive spectators. The display of comb and extracted honey was grand and beautiful to behold. But one colony of bees was exhibited in an observatory hive. Mr. S. W. Myers had a fine display of queens, so that they were easily seen by spectators, many of whom had never seen a queen bee. Mr. Koefer, on the third day of the Fair, brought a fine bouquet of honey-producing flowers in bloom, consisting of 22 varieties, and all properly labeled, which was interesting to examine.

The honey-extractor was a novelty to many. Several supposed it to be a "refrigerator" of some kind, but a little explanation changed their minds. The following are a few of those who received premiums: Best colony of bees, S. W. Myers; largest display of queen bees alive, S. W. Myers; largest and best display of comb honey, G. W. Keeler. Mr. Keeler also received the first premium on the best display of extracted honey, and best sample of comb honey not less than 10 pounds. Largest and best display of samples of different kinds of honey, S. W. Myers. The general feeling with our bee-men, and bee-women, too, was to try to do better next year. The display seemed to add a new zeal to apiculture, and many bee-keepers were led to inquire when the next county bee-keepers' meeting would be held, for they wanted to attend. The Marshall County, Iowa, Bee-Keepers' Association will meet at the Court House in Marshalltown, Iowa, on Saturday, Oct. 4, 1884, at 10:30 a. m. Subjects for discussion, "Fall care and winter care of bees."

J. W. SANDERS.

Le Grand, Iowa, Sept. 18, 1884.

Goldenrod.

Please give the name of the enclosed flower and its value as a honey-plant. It grows around here in large quantities, and bees leave buckwheat for it.

H. HERRICK.

Grand Rapids, Mich., Sept. 16, 1884.

[It is goldenrod, and is an excellent honey-producer.—ED.]

Worst Season for 10 Years.

We have no new honey this year, and all of the old honey is gone. I have 80 colonies of bees, and not five pounds of honey. One man had a little early honey at the Fair, and he will have to feed that back for winter. We have less honey this year than for ten years past. Cannot some one send us enough for a taste when company comes?

R. C. AIKIN.

Shambaugh, Iowa, Sept. 15, 1884.

Convention at Chicago.

The Northwestern Bee-Keepers' Association will hold its fifth annual convention at Owsley's Hall, northwest corner of Robey and West Madison streets, Chicago, Ill., on Wednesday and Thursday, Oct. 15 and 16, 1884, commencing at 10 a. m. on Wednesday, and holding five sessions. Those who have attended one of these annual re-unions will need no urging to induce them to come again; those who have not, should remember that Father Langstroth characterized the last meeting as "representing the largest number of large, practical and successful honey-producers of any convention that he had ever visited." This meeting being held during the Inter-State Industrial Exposition, reduced railroad fares may be had on nearly all of the railroads. W. Z. HUTCHINSON, Sec. C. C. MILLER, Pres.

Special Notices.

The Bee Journal for 1885.

\$25.00 Cash Premiums.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 30 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

The Tuscarawas County Bee-Keepers' Association will hold its next meeting at the apiary of Geo. F. Williams, in New Philadelphia, O., on Thursday, Oct. 23, 1884.

G. F. WILLIAMS, Sec.

A. A. FRADENBURG, Pres.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

It contains a copy of a model "Constitution and By-Laws" for the formation of Societies for Bee-Keepers—a simplified manual of Parliamentary Law and Rules of Order for the guidance of officers as well as members, a blank form for making statistical reports—a Programme of questions for discussion at such meetings—model Premium Lists for Fairs which may be contracted or enlarged, and then recommended to the managers of adjacent County or District Fairs—32 blank leaves for jotting down interesting facts, etc.

We have aimed to make it suitable for any locality, and a book that will commend itself to every bee-keeper in the English-speaking world.

We have had some bound in Russia leather, with colored edges—price 60 cents.

150 Colonies of ITALIAN BEES FOR SALE.

They are in Langstroth portico-hives, with standard L frames. All in first-class condition, with from 20 to 30 pounds of good honey for winter. The combs are all straight and all worker, and are built mostly on wired frames. In lots of 1 to 10 at \$4.50 each; 10 to 25 at \$4.25 each; 50 or more, at \$4.00 each.

G. H. SHIBLEY.

39A4t Richmond, McHenry Co., Ill.

Land-Owners, Attention!

All persons who have lost Real Estate in Iowa, by reason of TAX OR JUDICIAL SALES, are invited to correspond with RICKEL & BULL, attorneys at Law, 41 First Ave., Cedar Rapids, Iowa, and they will learn something to their advantage.

PURE HOLY-LAND QUEENS.

Howard's importation of Holy-Land Queen are the only pure queens of this race in this country. We have 2 of the finest queens that Mr. H. imported, and will have by Sept. 15, 100 young queens from them. They will be fertilized 3 miles from all other bees, and we guarantee them to be equal in every respect to the imported queens. Price, \$2.00 each. A copy of the Bee-keeper's Handy-Book or one of our combined Queen and Drone Traps will be given with each queen. We can send you as fine Italian or Albino queens as can be purchased in the world. Warranted queens, \$1.00 each; tested, \$1.50; select-tested, \$3.00 each.—Secure your breeding-queens for another season. 37A4t HENRY ALLEY, Wenham, Mass.

BEES FOR SALE.

I offer HYBRID BEES for Sale in Langstroth or other hives, with 30 lbs. of good honey for wintering. Price, \$4.00 per colony. R. S. BECKETT, 37A3t Three Oaks, Mich.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

LOCAL REPORTERS WANTED.

We want an agent and local reporter in every community to represent City and Country, and furnish us from time to time such facts as we may require. Send 10 cents for credentials and full particulars regarding services and compensation. Address, Will C. Turner & Co., Publishers "City and Country," Columbus, Ohio. 2A18t

Muth's Honey Extractor,

Square Glass Honey Jars, Tin Buckets, Langstroth Bee-Hives, Honey-Sections, etc. Apply to C. F. MUTH, 976 and 978 Central Ave., CINCINNATI, O. Send 10c. for Practical Hint to Bee-Keepers.

DR. FOOTE'S HAND BOOK OF HEALTH,
HINTS AND READY RECIPES,

is the title of a very valuable book that gives a great amount of information, of the utmost importance to Everybody, concerning their daily habits of Eating, Drinking, Dressing, Sleeping, Bathing, Working, etc. It costs only **TWENTY-FIVE CENTS**, and contains 28 pages, and is sent by mail, post-paid, on receipt of price. This is just the Book that every family should have.

NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., October 1, 1884.

VOL. XX.—No. 40.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Anyone intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

X SUBSCRIBERS whose papers reach them with this paragraph marked with a blue pencil, will please take notice that their subscriptions will expire at the end of the present month. Such are marked thus on the label, "Oct 84." We do not want to lose any of our subscribers, and give this notice so that all may get every number of the BEE JOURNAL without any break, and no papers will be missed. When the money for renewal is received at this office, the date on the label is changed to correspond, and this change is your receipt. If there is any mistake made, notify us at once.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

- Doctor smoker (wide shield) . . . 3 1/2 inch. . . \$2.00
- Conqueror smoker (wide shield) 3 " . . . 1.75

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "finly up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

THE AMERICAN
BEE JOURNAL
ESTABLISHED 1862

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Death of Mr. D. S. Given.

Mr. D. S. Given, the inventor of the Given Foundation Press, died in Los Angeles, Cal., on July 10, where he went in November 1881, hoping to regain his health. He was born in Muskingum County, O., Dec. 22, 1843, and removed to Illinois in 1864. In 1866 and 1867 he was secretary of the Freedman's Bureau. In 1868 he married Miss Hill, of Pennsylvania, who has survived him; they had one child. His partner in business is Mr. J. R. Caldwell, who, in company with the widow, will hereafter carry on the business, as will be seen by a notice on page 638.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the *Monthly BEE JOURNAL* for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

Urge the store-keeper to whom you sell your honey to keep it in view. People seldom go to a store expressly to buy honey; they are induced to do so by seeing it on the counter or shelves. The neater and nicer it looks, the quicker and better it will sell.—*Texas Ranch.*

Convention at Chicago, Oct. 15. It promises to be a very interesting re-union of the bee-men of the West.

The Northern Michigan Bee-Keepers will hold a Convention at Greenville, on Oct. 6 and 7. The notice did not reach this office, until the forms were all made up. We squeeze in this item.

Bee and Honey Show in Indiana.

The Porter County, Ind., *Vidette*, gives the following items about the display of honey at the Fair:

It is only a few years since bee-culture has taken a prominent part in the products of the land called Indiana. The old-fashioned bee-hunting, where a man's trowsers was in constant danger in climbing in search of honey, with a fair chance of meeting Mr. Bruin to dispute the way, has been done away with, and but an occasional land-mark is found of yestern times. Porter county, as well as portions of the State, are progressive; and among the exhibitors at the Fair we notice T. S. Bull & Sons, who have a fine exhibit of honey from their apiary, five miles north of the city. They have 200 colonies of bees, and the products of the year are 1,200 pounds of comb, and 10,000 pounds of extracted honey.

Another exhibitor in the bee-department, is Dwight Furness, of Furnessville. He has a large number of colonies, and his specialty is comb honey. He has a fine exhibit, and a new idea he shows is in pound packages enclosed in a neat paper basket which makes a neat package for dealers to handle.

MARRIED.—In Cleveland, Ohio, Sept. 18, 1884, by the Rev. William Gaston, pastor of the North Presbyterian Church, at his residence 1083 Superior street, Alfred J. Fisher and Miss Lora M. Kinsey, both of East Liverpool, Ohio.

The *BEE JOURNAL* acknowledges the receipt of a box of wedding cake, and wishes the happy pair all the joy they wish themselves. Mr. Fisher has been a correspondent and subscriber to the *BEE JOURNAL* for years, and is well-known to our readers. Last year he argued, on page 108, that "more honey would be stored without than with separators." Acting upon this idea himself, he has concluded to allow nothing to separate him from his Lora, and both may now be expected to fill their hive [home] with honey [sweetness] unalloyed and unadulterated—beginning with the "honey-moon," and ending with life's journey.

Bees at the Iowa State Fair.

The *Times*, a paper published for the Fair, has the following items relative to the Bee and Honey exhibit of the Rev. O. Clute:

A very interesting display was that of Rev. O. Clute, of Iowa City, consisting of fine extracted honey, and also of numerous glazed cases showing different kinds of bees.

Hon. Thomas B. Wales, came from Iowa City with a magnificent herd of thorough-bred Holstein cattle, his party consisting of himself, daughter and son, the Misses Nellie Younkin and Edith Shipley, of Iowa City, and the Rev. O. Clute and his two assistants in the apiary display. This happy family had at their disposal two large wall-tents, subdivided into reception room, dining hall, boudoirs, sleeping apartments and kitchen, and lived *al fresco* in most luxurious style. A *Times* artist has attempted the portrayal of their canvas home. That the young ladies can prepare an excellent picnic dinner, another *Times* representative will testify.

The engraving shows the family tent to good advantage. They must have had an enjoyable time.

Bees Gathering Honey.

The *Kansas Bee-Keeper* gives the following rules to indicate to novices when bees are gathering honey from the flowers:

In giving instructions for general management in the apiary, the expression, "when the bees are gathering honey from the flowers," is often used, and the question is almost as often asked by the novice in bee-culture, "How am I to know when my bees are gathering honey from the fields?" The experienced bee-keeper judges of this by the action of the bees in and around the hive. The novices may judge with equal certainty by the following test: place a little honey or sugar syrup in the open air, if it is quickly found and carried away by the bees, we may safely judge there is no nectar being secreted in the flowers; but if it remains untouched a greater part of the day, we may know that at such times there is a plentiful flow of honey from the flowers, which engages the attention of the bees.

Death of Mr. John Madden.

The Davenport, Iowa, Daily *Gazette* of Sept. 20, contains the following notice of the death of one of the prominent bee-keepers of Iowa:

On Sept. 19, 1884, occurred the sudden death of Mr. John Madden, in Winfield township, near Long Grove, Iowa.

The news of Mr. Madden's death soon spread through the country, carrying sadness with it; for having lived here for 30 years, he was well-known, and had the respect and confidence of all his friends.

At about 6 o'clock on Thursday evening, the deceased was driving with a single horse and buggy from Donahue to Long Grove, when the horse becoming frightened at some children trying to get a bed-tick over a fence, ran westward until it came to the house of Henry Madden, brother to the deceased, where it entered the yard. During the run Mr. Madden had been thrown from the buggy. Mr. Henry Madden hurried back along the road, and at its side found his brother lying dead; his whip in his hands, and the lap-robe wrapped about his legs.

There was no evidence of intended violence, but death had apparently resulted from concussion of the brain. The jury returned a verdict "that the deceased came to his death by being thrown from his wagon, his horse having been frightened."

Mr. John Madden was born in Wigton, England, on Aug. 8, 1817, and came to the United States in 1850, landing at New Orleans and ascending the river to Davenport. He purchased land in Winfield township, out of which he soon made a farm, and has occupied it as his home ever since.

Mr. Madden has always been an enterprising citizen, with a heart full of kindness, and possessing good judgment in all business transactions. He has for a great many terms of the District Court been foreman of the grand jury. He always took great interest in public affairs, and was a member of the Scott County Agricultural Society from its foundation. He leaves a wife and eight grown-up children.

The officers of the Eastern Iowa and Western Illinois Bee-Keepers' Association have sent us the following for publication:

Mr. Madden was a successful and progressive apiarist, and one of the first to help organize what is now known as the Eastern Iowa and Western Illinois Bee-Keepers Association, and until the time of his death, he was always an active member of this Association, and many who attended the annual meetings of this Association, and there made his acquaintance, will receive with profound sorrow the news of his untimely death. The esteem in which the deceased was held, was demonstrated by the fact that 225 vehicles (10 of which held bee-keepers) followed the remains to its last resting place. The members

of this Association express their heartfelt sympathies with Mrs. Madden in her great bereavement.

I. V. McCAGG, Pres.

Transferring Bees at a Fair.

A Philadelphia paper gives the following account of public manipulations with bees in the bee-tent at the Fair in that city:

The bee-tent at the Fair was the scene of a remarkable entertainment yesterday afternoon. Mr. Arthur Todd gave an exhibition of the method in which bees are manipulated. Quite unprotected by head-net or gloves, he opened a box-hive full of bees, took out the comb and transferred it to a new hive. He carefully sliced off the coverings of the cells, and placing the comb in the extractor, emptied them of their sweet contents. He sought among the crowded colony for the queen-bee, and having found her, showed her to his audience, who were safely standing outside his gauze tent, then deposited her in a little wire cage made expressly for her, introduced her in a polite manner to her friends, and put her into the handsomely furnished hive, which he had prepared for her reception.

Mr. Todd handled the little insects as if he were ignorant of the fact that they all carried a very ugly weapon, and he appeared to be on terms of affection with them all. They crawled over the bald part of his head, swarmed on his hands and arms, and got caught in his beard, but they seemed to think it was all play, and he appeared to enjoy the fun. The astonished visitors looked on with mute admiration as he lifted a frame of comb from the box-hive and showed them the eggs in some cells, the honey in others, and again others covered with the curious waxy substance the bees gather.

In the gauze tent with Mr. Todd were Mrs. Louisa Thomas, of Tacony, one of the earliest practical bee-keepers in this country; Mrs. Foote, of New Haven; Dr. Townsend, President of the Philadelphia Bee-Keepers' Association; John Shallcross, of Frankford, and John Pyewell, an enthusiastic bee-keeper from Bridgeport, Pa.

"Bee-keeping," said Mrs. Thomas, "is one of the most absorbing employments. Bee-keepers become so interested in their work that any trouble that may attach to the care of an apiary is completely overlooked in the pleasure it gives. This exhibition is, without exception, the very best I have ever seen, both as regards the bees and the honey. The whole work of transferring a colony of bees from one hive to another only occupied 40 minutes."

Arthur Todd has been awarded six prizes for his honey and bees, and will receive a special award for his clever manipulation of his busy little favorites.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Sept. 29, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14@15c. on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@3c. on arrival.

BEESWAX—Is dull at 26@28c on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-b, 18@20c., 2-b, 16@18c.; fair to good, 1 and 2-b, 14@16c.; fancy buckwheat, 1-b, 12½@13c., 2-b, 11½@12c.; ordinary grades of dark, 1 and 2-b, 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c., buckwheat, 6½@7c. BEESWAX—Prime yellow, 30@31c.
MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-glassed sections all best.

BEESWAX—35c.
BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—No movement of consequence. Stocks are of fair proportions, but are in some instances limited to figures not obtainable. Choice extracted is in demand at the quotations below noted. White to extra white comb, 9@11c.; dark to good, 7@9c.; extracted, choice to extra white, 4½@5c.; dark and candied, 4c.

BEESWAX.—Wholesale, 25@28c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8c.

BEESWAX—Firm at 32@32½c. for choice.
W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—The honey market seems to be improving, so that there is a larger demand. Best 1-lb. sections were sold in quantity at 16c; in a small way 17c is occasionally obtained, but 16c would be the more reliable quotation; 2-lbs., best white, 14@15c; second quality slow at 10@12c. Extracted slow at 8@9c.

BEESWAX—30c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.

Geo. W. MEADE & CO., 213 Market.

KANSAS CITY.

HONEY.—There is no change to report. The demand is good with liberal receipts and prices at about last quotations, with some concessions in round lots. Choice Eastern comb, ½-lb. sections, 18c.; 1-lb. 16c.; 2-lb. 15c. California comb, 2-lb. frames, 15c. Lower grades, move slowly, at 2 or 3c. less. Extracted, 6½@8c. according to quality. We could use a few thousand pounds of choice white clover extracted, in barrels, and will be pleased to receive consignments or will purchase outright as much as 5,000 lbs. at a reasonable price.

BEESWAX.—None in the market.
CLEMONS, CLOON & Co.
Successors to Jerome Twichell.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

CORRESPONDENCE

For the American Bee Journal.

Doolittle's Report for 1884.

G. M. DOOLITTLE.

Not long ago I received a letter from one of our most prominent bee-keepers saying that his yield of honey was very light. "In fact," said he. "it is so light that I shall not report at all." If he had added that he had never reported except once, that being a few years ago when he had secured almost the largest yield of honey on record, he would have given a truthful statement. This bee-keeper is not an exception by any means, for we have many others who never report except when they can report a *very large* production. In this way the showing in our bee-papers and elsewhere is very largely on the bright side of bee-keeping; for these large reports are copied into nearly every paper in the United States, and perhaps of the world, as was the large report above referred to.

Our bee-keepers have been severely criticised by selfish apiarists for their giving these large reports, who argue that such reports are given by the editors for the purpose of enticing others to enter the ranks of bee-culture, thereby giving these papers a larger patronage, and enabling the editors to sell a larger bill of supplies; which thing is claimed to be for the interest of the supply dealer, and against the producer's interest. It is not my desire, at this time, to argue this point; for, be that as it may, I claim that it is the bee-keepers who are to blame (if there is any blame) for only this bright side of bee-keeping being given. If every bee-keeper should give a report, only in years when they secured but a small crop, or none at all, the thing would be reversed; or if, as some claim, that the editors of the different papers would not publish reverses, then no reports at all would be given, till these selfish fellows could be accommodated by a decrease regarding those who are entering the business.

But no; these same men who censure will rush into print with a large report, if they have such, while if the yield is light, no report will be given, as the person alluded to at the beginning of this article, decided to do. Now, bee-keepers, either report your failures or else be consistent enough to not blame the bee-papers for publishing large reports when you give them only such to publish. My idea has been that, if all would faithfully report, each year, that we should know about the truth regarding the profitableness of apiculture, and for this reason I have not failed in giving my report for the past 11 years, and shall now report for 1884.

I must say it is, by far, the smallest yield of honey that I received since

1869, which was the first year of my experience with bees. On page 356, I gave you a report of my loss of bees during the winter, which, together with the sale of bees that I had previously contracted, reduced my number (80) in the fall to 40 at the time spring was fairly opened. Fourteen of the weakest of these were set apart for queen-rearing, which left 26 to be worked for honey. As I had more orders for queens than I could fill with the nuclei made from the 14 weaker colonies, I had to draw quite largely of bees and brood from the 26 set apart for honey, to form more nuclei; so had there been an early supply of honey, this would have been a disadvantage; but as there was not, the loss from this source would not exceed 100 pounds.

The first honey, obtained was from the golden willow, which was so meagre that it was consumed for brood-rearing nearly as fast as obtained. As there was no hard-uraple blossoms, and my bees were short of stores, I looked forward to the apple-bloom with much interest, hoping that it would yield enough honey to carry the bees over the honey-dearth, which we always have for the next two weeks after the bloom from this source is gone. But I was doomed to disappointment; for with the opening of the blossoms came on a cold rain which lasted all through this bloom, with the exception of one-half of a day. I now had to resort to feeding to keep all my weaker colonies and nuclei alive, which feeding I kept up for nearly four weeks. Locust opened about June 12, when the bees got for a day and a half the most honey they had gathered so far; but with the afternoon of the second day, clouds and a cold wind arose, followed by rain which lasted until the bloom was past. After this we had splendid honey-weather till July 6; but as our fields are kept constantly under the plow, we have little white clover save along the sides of the road. From this, and the little raspberry and sunac bloom, the bees got a living, while a few of the stronger colonies stored a few pounds in the combs.

On July 6 it came off cold, with disagreeable, cloudy and windy weather which lasted for over a month, with the exception of now and then a day when the sun would shine a part or all of the day. Basswood, which gives our main honey-crop, opened on July 14, but it was of no use to the bees for a whole week, for they could not get to it on account of the wind, clouds and cold; besides, in such weather, honey does not secrete to any amount. At the end of a week one good day came, and the bees rushed for the basswood as if they were crazy; but with the next day the cold and clouds came again, when four days more passed with the beeyard nearly as still as winter. At this time we had another day of honey, with one-half of a day more, after another cool day. Then the cold and clouds kept the bees at home during all the rest of the bloom, except as they got a chance to go out an hour or so occasionally when the sun

would light out a little through the clouds.

After the basswood bloom was over, a little honey was secured from teasel during the next ten days when the weather would allow the bees to fly, after which no more honey was secured, although the month of August (after the 10th) and the first half of September were very warm; the absence of fall flowers and but very little buckwheat accounting for it.

Thus ended the poorest honey-season since 1869—the poorness of which was caused by bad weather during the bloom of all our honey-producing flora. As a result I have taken only 711 pounds of honey—272 pounds being extracted, and 439 pounds comb. This gives an average of 27¼ pounds for each of those set apart for honey, in the spring; and considering the few days in which they could work, they secured more than I could reasonably expect. I shall put in winter quarters 55 full colonies and about 20 small ones which will be made up by uniting nuclei. Most of the full colonies have nearly enough honey to winter them, but the united nuclei will have to be fed.

I have received nearly \$500 for queens and bees, while the comb honey at 15 cents, and the extracted at 10 cents per pound amounts to \$93, thus giving \$593 the gross amount received from my apiary. From this I have to deduct about \$63 for the sugar which was fed, which leaves \$530 as my pay for the labor expended on the bees. By dividing \$530 by 40, the number of colonies, spring count, it will be seen that I received an average of \$13.25 each, as a cash profit; which is not a bad showing. However, had it not been for the queen-rearing part of it, I could well say that bee-keeping for 1884 has been nearly an entire failure.

Borodino, N. Y.

For the American Bee Journal.

Wintering Bees.

A. H. DUTTON.

One who is but slightly acquainted with practical bee-keeping might suppose that the above subject, if he were to glance over the past numbers of the BEE JOURNAL, was an apianian topic stale, dry as dust, and threadbare to the point of general dissolution. This *a priori* notion, however, is a mistake, and that for two reasons: 1. Perfect certainty in wintering is a thing yet unattained by our oldest and most scientific apiarists. 2. New men are continually entering the field eager for the latest information concerning this, one of the most vital matters in connection with the bee-business. Hence, we shall give a general recapitulation of the subject up to its latest developments, and if any hint may be dropped to those who are veterans in the ranks, or guidance to those who are just enlisting, I shall feel repaid for my trouble.

In the problem of wintering, failure springs from the violation of natural

laws in connection, either with food, heat, ventilation, moisture or physical characteristics. These cover the whole ground; and whilst one apiarist contends for one of these points, and another for some other one, and each seems to think that if the popular misapprehension in regard to the special phase of the point which he views as the seat of the difficulty, could be removed, unsuccessful wintering would be a thing that was. Whilst this is the case, the fact remains the same, that the points which I have enumerated embrace the whole field wherein the controversy lies, and which, without a shade of doubt, holds in the rectification of the popular practice in respect to one or more of these things, the solution of the problem.

Having thus defined in a general manner the ground where the danger lies, I am not going to make the claim that I can lay my finger on it and say, "Here it is," nor be so egotistical as to pretend to turn this article into a bullet of deadly aim, and lay it low at one shot. My powers of observation must be further cultivated, and my experience more extended before I could presume to make this attempt; but as one who recognizes the field wherein "the lion's den" must be located, I shall throw out some cautionary signals, or to employ another figure, by firing a "broadside" at the enemy, slay him by quantity, if not necessarily by correctness of aim.

Before laying out my methods, however, to more thoroughly clear the way, let us inquire: first, "What are the native instincts of the bee regarding the change from summer to winter?" second, "How far is it within the domain of human reason to interfere with these instincts beneficially?" In respect to the first, it is a rare thing in the state of nature to hear of a colony of bees being winter-killed. How many of us have heard of such a thing? In 99 cases out of 100, where do we see bees winter-killed when they are located in their untrammelled condition of nature—a hollow within the trunk or limb of some tree at a distance from the ground? So much for situation. Let us examine the internal economy of the house, and what do we find? We find the honey above the cluster principally, and everything overhead as air-tight and snug as propolis and wax can make it. No upward ventilation in nature; this is a rule with scarcely an exception. Below the combs and cluster is a large air-space or column of dead air, and by means of this the ventilation of the hive is secured; and with what success, observation has revealed to us. These then are the conditions under which the bee exists when left to follow its own inclinations, and we see them carried out, as far as circumstances will admit, in every box-hive and "log-gum" in the land, and with the degree of success following which their restricted quarters entail.

The foregoing, then, is what observation teaches us concerning the instincts which impel the bee to carry out "the first law of nature" in its

preservation during the winter season. Now, let us ask, who is the author of these instincts? and is it placed within the province of man to interfere with them, with benefit to himself? In other words, are these instincts of the bee insufficient to secure its own highest well-being in the economy of nature, apart from human aid? Let it be understood that when we speak of instincts, that we mean what we say, and have no reference whatever to those slight changes in form, size, color, activity, etc., which may be produced by crossing two varieties of bees, or building up and perpetuating some freak of nature. For instance, such as we see in the so-called Albino bee, which, as Prof. Cook truly says, may frequently be found in our ordinary Italian colonies. These variations from nature constitute what Agassiz classes in his *Natural History*, as "breeds."

But I refer to none of these things, but exclusively to those cardinal principles which are implanted by God in the nature of the bee, which constitute its characteristics, make it what it is, and which no amount of scheming or contriving by man can destroy. What, then, is the very first of these principles or laws of its being? Is it not the same as that which hold the like position over the whole range of animated nature; viz: its self-preservation? Then is it within the power of the human mind to improve upon this grand, impelling motive of its being—a motive which leads it to "provide its meat in the summer," and to give itself no upper ventilation for the winter? Yes, it is within man's power when he also has reason to think that his ingenuity could teach the bee to gather clay for pollen, water for honey, or place its stores beneath the brood instead of above, or the drones to spend their energies in honey-storing instead of using them in the fertilization of the queen. Yes, when he seriously imagines that he can improve upon these other instincts of bee-nature, then will he also have license to think that he can improve upon their wintering-instincts as well.

However, to those who prefer to view the case in a different light, and are willing to fall in line with the wisdom of God, and shape their plans and activities to best promote the full execution of the principles which He has established in the economy of the bee, (and I profess to be among the number), to those I would say, let us so endeavor to enlarge our powers of observation, and increase our faith in the doctrine that the mental characteristics of the bee are as completely defined in their way as its physical; as to so regulate our manipulation in the apiary, as to best promote the fullest development of those divinely-furnished attributes, which, so far as concerns its own preservation, is as much shared by the bee as the head of creation—man.

Hence, we conclude first, that the instincts of the bee in its own preservation, are definite qualities given it by its Maker to secure this end, and are best fitted to do so; and second,

that these instincts have a defined territory which is beyond the province of human reason to invade with benefit to man, and that inasmuch as it does so, injury to the bee is sustained, and loss to its owner results.

Then with these foundation-principles before us, we shall come to the question in hand, and on account of my favorite method of wintering, being on the summer stands, I shall treat the matter from this standpoint; but the principles which may be elucidated are equally applicable to every other style of wintering, although we leave it to others to do so.

Now, as we have before remarked, failure in wintering infallibly proceeds from incorrect practice in connection with one or more of the five points already alluded to. We shall enumerate them once more, and then after giving our system of fall preparation of the colony for wintering, shall deal with each in detail: Food, heat, ventilation, moisture, and physical characteristics.

As regards the fall preparation of the colony for wintering, much has been said concerning stimulative-feeding; some would have brood-rearing in full blast until the middle of October, and to this end often feed from 6 to 8 pounds of syrup to each colony during the fall. We believe this to be mistaken economy, for three reasons: 1. Because a good, prolific queen (and the apiarist should tolerate no other), and one not too old, will, under any circumstances, providing there is a good supply of honey in the hive, keep on breeding during the fall quite sufficiently to give a good force of young stock for winter, and thus the trouble of feeding is saved. 2. Unnecessary expense is entailed both during and after the stimulative-process; for the money for the syrup is gone, or all that represents it are colonies boiling over with hungry consumers. 3. Such is not the practice of a large part of our most successful apiarists of the day; and what they can dispense with and yet succeed so well, giving reports every whit as large as those who practice it, I should certainly not recommend; but this advice, however, only applies in those cases where the colony has had a proper queen during the honey-season, and when a good supply of brood in all stages was in the hive when the season closed. Now, as this begins to hatch out, contract the brood-chamber, if a large hive is employed (my own takes 18 frames $14\frac{3}{4} \times 11\frac{1}{4}$), by removing the empty frames and placing them outside the division-boards. This causes the remaining frames to be better covered with bees, and so less danger of the brood becoming chilled; and at the same time, on account of what little pollen and honey that may be gathered, being stored in less compass in the hive, the queen, in our opinion, is stimulated to lay longer and more largely than otherwise.

When the time has come to finally prepare the colonies for wintering, the first precaution to be taken, is in respect to the first point in my category.

FOOD.

This must answer to two demands: First, healthfulness; second, sufficiency. To secure the first, if the colonies are to be wintered on honey, save 3 or 4 well-filled and sealed combs from the basswood or clover harvest, from each colony in the apiary, or if in number of pounds, we shall suppose that 15 or 20 are held back. Now place the frames containing the honey in the centre of the brood-nest; outside of them again, at each end, place one of the ordinary frames of fall honey and a frame of pollen, the last to be on the outside of all; the colony will thus be crowded on 7 or 8 frames, and will have an abundance of good food, and sufficient pollen in the hive to enable it to start brood-rearing in the early spring. Thus every opportunity which they have in nature, to thrive, so far as food is concerned, will have been supplied them by the careful apiarist.

If one be desirous to feed principally syrup, remove 3 or 4 frames from the centre of the brood-nest, and in their place put the same number of frames of nice, straight, empty worker-combs; outside of these, at each end, leave a frame of honey and pollen as before. Now feed the colony 16 or 18 pounds of sugar syrup made from white or coffee A sugar (1 pound of sugar to $\frac{1}{2}$ pint of water). The feeder may be placed, after removing the frames outside the division-board, in the body of the hive, and the division-board slightly raised to permit the passage of the bees.

In furnishing syrup for winter stores it is advisable to feed it before the cold weather sets in, so as to give the bees an opportunity to seal the combs. The whole amount had better be fed in one or two installments. The reason we feed white honey or syrup, almost exclusively, to the bees for winter stores, and remove all of the pollen but that in two frames, is on account of deleterious substances which are often gathered by the bees in the fall after the regular honey-flow ceases, and which are apt to cause mischief if left in the hive. This bad food consists of the refuse from sugar and molasses barrels, juice of fruits, cider-mill refuse, honey-dew, etc. As regards pollen, Mr. James Heddon and others have pretty satisfactorily proven that too much of it is unadvisable for the same reason. Bees, like all other creatures, can only thrive on a proper supply of healthful food.

Our colonies are crowded on 7 or 8 frames in order to economize heat; and this brings us to the second subject on my list.

HEAT.

The hive which we employ, and which we believe cannot be excelled as a hive for wintering, has a double-walled brood-chamber with one inch of dead-air space between. This brood-chamber rests on a single-walled, enclosed stand, 14 inches deep, and this in turn (in winter) rests on the bottom-board. This stand has a variety of highly important uses

which we shall refer to under "ventilation," our next head.

Now, in preparing the colony for winter, we place against the two side-walls of the stand, on the inside, two boards, each 14x15 inches, with one-inch cleats nailed to each end, so that when they rest in position against the walls of the stand, a space of one inch will exist between the boards and walls of the stand. Between the boards at each end, we place division-boards, and cause them to come immediately under the division-boards at the ends of the brood-nest above. The space outside the division-boards, at each end of the hive, we next fill with chaff or forest leaves above and below; and then over all in the half-story above the brood-chamber, we place a 5-inch chaff-cushion. This completes our arrangements so far as the interior of the hive is concerned.

We now place against the outside of the brood-chamber and stand, on each side of the same, what we have chosen to call "winter covers." These are constructed of any kind of rough lumber, and extend the whole length of the stand and brood-chamber, and as high as to protect the whole of the sides of the latter. At each end of these covers are nailed cleats 4 inches deep, so that when the covers are placed in position against the hive, a 4-inch space will exist between them and the sides of the hive and stand. They are now secured firmly in place by a lath nailed to the cleats of the covers over each end of the hive, and the 4-inch space of either side is filled with chaff or forest leaves. Over the top of the "winter covers," from cleat to cleat, now place two strips of wood about 5 inches wide, so that when the rain falls on the cover of the hives it will not run into the chaff spaces on either side. The cover is now placed on the hive proper, and its edges made to lap over the strips of wood on top of the "winter covers." This completes our wintering preparations, and we believe that they are amply sufficient to safely carry the colony through the most rigid winter known to Ontario.

VENTILATION.

This and proper food, conjoined with a good queen, we regard as the grand centre of importance in wintering bees successfully. Much has been written on the merits of upper and lower ventilation, and with some, it still remains a vexed question. But after reading and comparing the reports of years past by, and with numbers of experiments with either method, I am forced to give my verdict in favor of lower ventilation; and even had we not so read and compared, we should advise this plan, simply on the ground that it is in accordance with the teachings of nature. Good ventilation is the great corrector of dampness in the hive, and the remover of foul gases, such as carbonic acid and nitrogen, which are exhaled from the cluster above, or sulphuretted hydrogen which may arise from dead bees below; besides which, it is the means whereby the bees are constantly supplied with

good, pure air for breathing. How important then is it that it should be duly attended to, and that its theory be thoroughly understood!

Air-currents take place, according to fixed principles; viz: when any part of the atmosphere becomes heated it ascends, and the cooler air closing in on all sides, fills its place to undergo the same operation, if the source of heat continues. It will thus be seen that it acts in identically the same manner as does water in the process of boiling. In this case the heat being applied to the bottom of the vessel containing it, portions of the water become converted into steam, or is rarified, so to speak; and this being lighter than the water surrounding, it rushes upwards to the surface, whilst other portions of water less heated, take its place. Thus a current is established in the vessel, and continues to move so long as the water lasts.

Now, what is the source of heat in the bee-hive? It proceeds from exactly the same chemical process as we see exhibited when a fire is kindled in a stove, but merely without the attendant phenomena of light possessed by the latter. In the case of the combustion of wood, the oxygen of the atmosphere enters into combination with the carbon of the wood, forming carbonic-acid gas, and attended with the development of heat and light. In the case of our bees, the air finding its way into the tubes of their respiratory apparatus, part of its oxygen combines with the carbonized particles in the blood, with the formation of carbonic-acid gas, which, with the nitrogen of the air is exhaled, and being heavier than the surrounding air, falls to the bottom of the hive; and this chemical action carried on in the air-tubes of the bee, is accompanied with the exhibition of heat.

Now, as we employ the same cloth over our frames in winter (if it is un-*turn*) as we made use of during the previous summer and fall, it will be seen that very shortly after our final fall-preparations of the colony for wintering are concluded, everything over the bees will be as air-tight as it is possible for propolis to make it. Taking this into consideration with the fact of a 5-inch chaff-cushion being placed over the cloth, it will be found that nearly the whole of the heat emanating from the cluster is confined in the hive. Ascending from the bees it reaches the cloth, and from thence is deflected downwards on all sides, and the cooler air from below being absorbed at the base and sides of the heated column, a circulation of air in the hive is established, which continues so long as the source of heat remains constant, or until the heat of the whole interior of the hive has become uniform with that momentarily given off by the cluster.

Knowing these facts, we recognize their importance if we desire at all times to maintain a circulation of good, pure air in the hive, to provide for a constant supply of cool air in the lower part of the same, and this we manage to secure in the following

manner: Two holes, each $2\frac{1}{2} \times \frac{1}{2}$ inches, are made in the lower edges of one of the sides of the stand, and two similar holes in the wall of the "winter cover" opposite. Wooden tunnels are now constructed to connect the holes in the stand and cover, and through the passages thus made, the cold air has access to the interior of the stand, and from it to the hive above. But, if the cold air only has access to the hive, and no outlet be made for the descending columns of heated air subcharged with the vapor of water, carbonic-acid gas, nitrogen gas, etc., one of our most valuable features in the proper ventilation of the house is lost; hence we construct another passage through the opposite walls of the stand and "winter cover," to that containing the others, and thus the ventilation of the hive is perfected. This last passage is placed at about 1 inch from the upper edge of the stand whereon rests the brood-chamber, and in size it is $\frac{3}{8} \times 4$ inches.

The general utility of the enclosed stand for the brood-chamber will now be recognized by providing a large air-space beneath the cluster. The ventilation of the hive is far more effectively secured than if the entry and exit of air all took place through the ordinary passage for the bees at the base of the side-wall of the brood-chamber; and, further, by employing this stand and the ventilation it affords, we, at all times, have a concentration of heat in the upper part of the brood-chamber—keeping the honey warm, and everything dry and comfortable around the cluster; besides which, by elevating the brood-chamber to the height off the ground that it does, instead of being back-aching labor to handle the brood and extracting-frames, it is converted into a comparative pleasure. What apiarist is there with his 75 or 100 colonies in one-story, or one-story-and-a-half hives, that will not hail this as an advantage?

MOISTURE.

The fourth point has also had its strenuous advocates, as being the prime factor in unsuccessful wintering, but whether it is so or not, we leave it to others to demonstrate; however, of one thing we are certain, that unless its formation is understood and provided against, mischief will be the penalty of neglect. The moisture in a bee-hive in winter is generated exclusively by exhalation from the respiratory organs, and, possibly, the bodies of the bees, the air entering the lungs of the bees (or what answers thereto), becomes saturated with the vapor of the water continually evaporating from the pulmonary tissues. In this condition it is then thrown off, and unless removed by a proper ventilating current, condenses on the colder portions of the hive and combs, which, in the case of many hives not so well protected as my own system calls for, becomes converted into a hoar frost, or runs down and freezes into a solid mass on the bottom-board, and sealing up the entrance which furnishes

air to the cluster, thus smothering the bees; and further, by condensing on the combs, it often causes the honey which is in them to sour, and the bees feeding on this, disease is induced among them, and frequently, also, the combs become moldy and almost spoiled.

How, then, is this condition of things to be remedied? A well-protected hive like the one we advocate partially meets the question, and a thorough system of ventilation almost solves it; but to get rid of the remnants of the evil, place pieces of broken brick well dried, or still better, two or three lumps of quick-lime on the bottom-board under the stand, and this having a powerful affinity for water, will absorb any particles not carried off through the ventilator, thus the hive is left dry and healthy.

Just here we should like to notice one thing in connection with upward ventilation, and how frequently does it occur. The moisture in its passage through the chaff cushion is condensed in the same, and gradually increasing in quantity, forms at last a wet, soggy mass, immediately over the cluster, and exhaling at the same time a musty effluvia, thus, in our opinion, giving rise to the most favorable circumstances for the development of disease and death in the colony.

PHYSICAL CHARACTERISTICS

Under this caption, the fifth and last topic on our list, we shall notice briefly two things: 1. The hibernation of bees. 2. The duration of bee-life. To Mr. W. F. Clarke, undoubtedly, belongs the priority of having specially called the attention of bee-keepers to the subject of hibernation of bees; but whether in reality it is a truth, in our opinion, remains yet to be proven. True, Mr. Clarke has struck some heavy blows, but the nail yet remains to be clinched. However, be the issue as it may, every bee-keeper knows that bees certainly do pass the winter in a condition very much resembling, if not altogether, that of hibernation; hence, it becomes the scientific and progressive apiarist to study well and supply all the conditions favoring this state of repose, and to remove everything obnoxious to it.

Bees live during the honey-season, from 30 to 45 days; but all bees hatched about the time basswood bloom closes, and after that time, will probably live from 8 to 9 months, their energies not being exhausted in the field, are spent, so to speak, in the prolonging of life. However, after the first out-door activities of spring are set in, these rapidly die out, and then, unless a good queen is present and is filling the frames with brood to take their place, "spring dwindling," as it is termed, is the inevitable result. To make sure that all is right in this respect, and that the bees have plenty of stores in the hive, examine all the colonies on some fine day as soon as possible after the snow has gone off the ground. Note the condition of each colony, and if any require aid, supply it immediately.

And now in conclusion we would observe that if the objection should be raised to the foregoing methods, that they involve a great deal of labor, and, hence, are not suited to the practical apiarist, to this we would make a threefold reply:

1. That in reality very little extra labor is entailed beyond any good method of wintering.

2. Nothing pays better than a careful preparation of the colonies, year after year, and hence the most practical apiarist will be the most careful.

3. If any one enters the bee-business under the delusion that it is all play, that he has only to sit down and watch the bees put money into his pocket, and is unprepared at certain seasons of the year to perform downright hard labor from daylight till dark, if he owns 75 or 100 colonies and expects to succeed therewith, then I say, the quicker he gives it up, the better it will be for his bank account and his peace of mind.

Brussels, Ont., Sept. 17, 1884.

For the American Bee Journal

Lake Shore, N. Y., Convention.

Pursuant to a call by the President of the Lake Shore Bee-Keepers' Association, it met at Fredonia, N. Y., on Sept. 6, 1884. Mr. U. E. Dodge was elected temporary chairman, and Mr. J. A. Benedict, Secretary *pro tem*. Those present then engaged in the following discussion:

Mr. Case: I would like to inquire how to take care of my bees to secure the best results possible.

Mr. Davis: You can get more surplus honey from old than new colonies.

Mr. Wilcox: I think Mr. Case has done well if he has doubled the number of his colonies this year.

Mr. Dodge: There is a great difference in different kinds of bees. We cannot tell why Mr. Case did not get more honey. He did well, at least, as he has doubled the amount of his capital invested in profit therefrom, the present season. He ought to be satisfied. One hundred colonies would not be a bad investment if they cleared five dollars per colony. If I can get my bees through the winter safely, I can generally succeed well enough the remainder of the year. Last winter out of 139 colonies I lost only 4.

Mr. Davis: I have had colonies near each other that varied greatly in productiveness. From one colony I obtained 3 swarms and 12 boxes of honey, and the next colony, standing near, did nothing.

Mr. Hall: How did this prolific colony do the next season?

Mr. Davis: It did remarkably well. I divided one of my colonies and it produced 12 boxes of honey and the old colony did well also. I would like to know if it is good policy generally to divide bees?

Mr. Dodge: People differ on this question. If you wish honey, keep the old colony at work and let the division alone. But if you want bees, then divide the colony, etc.

Mr. Jaarda: Last fall I bought 3 colonies of bees, and put them into the cellar and they came out all right. In the spring I bought 2 more, and they were looking finely. The 3 bought in the fall stored nearly 100 lbs. of honey and did not swarm. The other two colonies swarmed and did not store much honey. My profit is out of bees that do not swarm. Only by perseverance can we succeed. If we can prevent our bees from swarming, then we can reach the acme of success in the honey business.

Mr. Case: I would like to ask, that if our main object is to get honey, how can we manage to get surplus of bees?

Mr. Gage: It is a well known fact that bees store more honey when not allowed to swarm. I would cut out all the old queen-cells but one, after the 7th day from the issue of the first swarm. When the swarm issues, the old queen goes with it. I cut out all but one so as to insure, if possible, better success in their future work. I have 50 colonies, and find it best to continue this course. In utilizing queens by this method I do not fail one time out of 50.

Mr. Davis: If you divide colonies they will not go to the woods.

Mr. Gage: You are not sure of that. When bees get the swarming fever, it is hard to break it up.

Mr. Hall: Do you think that this season is a favorable one?

Mr. Gage: I do not. While there is an abundance of clover, etc., it does not contain as much nectar as usual. The more closely we follow nature, the better we will succeed. I have had a prodigious yield from one colony alone.

Mr. Dodge: A colony that is divided does not go to work as readily as one that is not. It is considerable work to divide colonies. I cannot divide one usually in less than half an hour. If I had time I would divide more than I now do. It would save trouble. We must use tact and precaution if we expect to succeed. What about upper ventilation?

Mr. Wilcox: My bees, last winter, did not have upper ventilation and came out all right.

Mr. Dodge: My experience is that all this talk about ventilation is a waste of time. I do not think that it makes any difference about ventilation. My bees came through safely. I let in sufficient air from the bottom of the hive.

Mr. Fay: I have kept bees a lifetime. Last winter my bees had upper ventilation and I lost several colonies, but my son-in-law gave his bees nothing of the kind and he did not lose a colony.

Mr. Case: My opinion is that ventilation lets off the surplus animal heat.

Mr. Dodge: I do not believe that bees, of themselves, get very damp. But if they do, it is from some extra moisture that comes in from the outside of the hive. I find that bees kept in the cellar, gather moisture more rapidly than those outside. My bees that I wintered in the cellar were not ventilated at the top, or even very much any where.

Mr. Fay: My neighbor has an apiary that seldom freezes. It is near a hedge and is covered with snow nearly all winter.

Mr. Haven: I covered a hive over with straw and then with dirt, and the bees came through safely. This experiment shows conclusively that bees do not suffer so much from lack of ventilation as from lack of warmth.

Mr. Dodge: I would ask if there is danger from overstocking?

Mr. Gage: Not with honey, but with bees, perhaps.

Mr. Dodge: I believe that the opinion of overstocking is a delusion. Mr. Pond, of Mass. says that one acre of white clover will furnish 25 colonies with sufficient honey. We need not fear from overstocking. But in a poor season we are always overstocked. In a good season I would risk 1,000 colonies in my locality.

Mr. Fay: In my locality we must be overstocked, for out of 17 colonies I have only 3 lbs. of surplus honey. How is that for clover and goldenrod? My bees on foundation did no better this season than those without any.

Mr. Bolling: I do not think that this question can be exhausted. We express very much guess work in our different theories. The condition of the atmosphere has something to do with storing honey. Once I had one hive fill up with honey in five days, which had been entirely empty. This shows conclusively favorable in atmospheric conditions. They will not do well with the same number of flowers in some seasons as compared with others.

Mr. Dodge: If Mr. Bolling had owned 500 colonies, my opinion is that they would have worked in that special season with the same energy. We cannot expect, when there is no honey in the flowers, that we can get our hives filled. I affirm that we cannot overstock when the blossoms are full of honey.

Mr. Bolling: To have goldenrod yield honey plentifully, it must be warm weather. To-day, it is warm enough to suit the most fastidious bee or hornet.

Mr. Dodge: How and where to market our honey?

Mr. Bolling: That is a hard question. Honey to-day seems to be quite a drug in the market. People are suspicious. There has been too much adulteration by crafty dealers. We must have the "clear quill," and when they find us out we will have buyers enough. Our motto must be, "warranted pure."

Mr. Gage: By proper methods the trade can be worked up near home. Last season I had 960 lbs. of extracted honey and sold 900 lbs. of it at my own door.

Mr. Bolling: In seasons of great success in clover, goldenrod and heart's-ease blossoms, we will have a large surplus for distant markets; but ordinarily we can dispose of such goods at home. I do not imagine that our climate will allow us to be much overstocked.

The subject for the next meeting is "The best method for wintering bees."

Adjourned to meet at Brocton, in Moss Hall, on Saturday, Oct. 4, 1884, at 10 a. m. Good attendance requested.
J. A. BENEDICT, Sec. pro tem.

For the American Bee Journal

Sexual Functions of Queens, Drones, and Worker Bees.

A. R. KOHNKE.

Having found, within the last year or so, articles by two or three different apiarists expressive of disbelief in "parthenogenesis," together with some reasons, which would apparently justify the same, I have considered the subject not a little. I may be pardoned for not attaching much importance or weight to the observations of the average American apiarist, because I know that if it is not a question of dollars and cents, the average American does not trouble himself much about new discoveries, the knowledge of which is apparently of no practical use to anybody. For this reason it has seemed to me that observations to establish new discoveries were not thorough enough to accept them as proven facts.

Let us consider proven facts first: The queen is the female bee, the drone the male bee, and the worker is a stunted female bee. To produce the worker, the queen must mate, or be fertilized; if she does not, the eggs, which she may lay hatch drones. It has been proven by microscopical investigations made by Professors Siebold and Leuckart, and Rev. Schoenfeld, that eggs laid in worker-comb, by a queen mated in the regular way, contained from two to five of the seminal filaments. These eggs were examined as soon as deposited, and the sperm-cells or seminal filaments were always found within the eggs and not on the outside. Enough eggs have been examined to establish this as a fact. Consequently, to assume that the workers change the sex of the egg, on the supposition that the sperm filaments adhere to the outside of the egg from which they may be easily removed, is contradictory to perfectly reliable authority, which have verified the opposite by ocular demonstration.

The same scientists have also proven by ocular demonstration that freshly-deposited eggs laid by a mated queen, in drone-cells, or those laid by a queen not having mated, as also those laid by workers, are devoid of these sperm filaments. Now, as one and the same fertilized queen has been used by these scientists to obtain both kinds of eggs which she deposited while being watched in an observatory hive, I think that we are justified in believing that such exact work by such close observers and investigators precludes all chances of error, as far as their investigations extended, which was to demonstrate the true sexual relation of queen, drone, and worker, and to show why eggs laid by the same queen should hatch workers or drones.

As a natural consequence, it has been assumed that it is voluntary with the queen to either impregnate the eggs that she deposits, or not.

This assumption is supported by the observations above stated, but does not, of course, admit of ocular demonstration. Well, this much we know of queen and drone. The workers, on account of their number, have escaped individual observation. Those which were dissected proved sufficiently, that they are stunted females.

The next problem was to discover what caused their being stunted. It has been found that it is the difference in food which has the effect to more or less develop the individual bee, and produce either a worker, on a diet of honey and pollen, or a queen, on a diet consisting of the secretion of the salivary glands situated in the heads of the young worker bees; this secretion is what is known as royal jelly. I may also remark here, that in old bees these glands dwindle or shrivel to such an extent that secretion is entirely suspended; this makes it apparent why mainly young bees should be employed to rear queens, and then the same bees not more than once, as their salivary glands, once exhausted, cannot resume their function afterwards; hence they are not fit, because unable to rear a good queen. But even if they can not or do not rear a queen, the desire to preserve their existence as a colony, is generally present, in consequence of which one or more workers begin to lay eggs.

It has been and still is a puzzle to the apiarist, how workers are fitted to assume the royal duty of depositing eggs. Many bee keepers do not believe it, giving as a reason that they have not seen it; still it is a fact that they do lay eggs, but these eggs always hatch drones. To entertain the idea that such a worker could or would be fertilized by a drone was considered so far from the probable that no bee-keeper ever mentioned it as possible.

But a bee-keeper, by the name of Kremer, in Germany, has made a remarkable discovery. He caught a worker and drone in the act of mating. When so caught, they were still connected by their sexual organs, and thus sent to Rev. Schoenfeld, who, at present, is the keeper of the large microscope bought by the bee-keepers of Germany. After an examination of them, he pronounced the worker to be not more nor less than any other worker-bee; a real, genuine worker it was, and not a stunted queen as was at first believed; nor were the sexual organs of this worker any more developed than any of the others which he had examined.

This discovery caused a great sensation among apiarists in Germany, as well it might. A writer in the *Illustrated Bienenzeitung* asks some questions which he partly answers, maintaining that the queen never lays any eggs which hatch drones, but that it is the business of the fertilized worker. Where that drone comes from, to do the first fertilizing in the spring, he does not say. The following is a translation of the main points and answers which he submits: "1. May a worker be fertilized? According to Kremer's discovery and the

investigation of the bees by Rev. Schoenfeld, the question must be answered in the affirmative. 2. Had the worker, in question, a desire to mate? Certainly; otherwise the act would not have taken place, for a worker possesses the means to repel a drone in case the latter should want to enforce copulation. The observed fact is also proof conclusive that the stunted or smaller sexual organs of the workers admit of copulation. Microscopical investigation proved, also, that no part of the sexual organs of the said worker had been in any way injured or torn. Experience also proves that in a colony some workers are larger than others, and some drones are smaller than the average. 3. May such workers, in mating, become fertilized? Certainly; nature does nothing without an object. The object of mating is to fertilize. 4. Have laying workers been observed? Experience says, Yes; especially in a queenless colony. 5. What did such eggs hatch? Only male bees or drones."

The other points are of minor importance, in one of which he asserts that it has not been proven that queens ever lay eggs which hatch drones, which is contrary to facts; and he winds up by saying, "A queen which is fertilized lays such eggs only, which hatch either perfect or stunted female bees, according to the food with which the larvæ are supplied. The less stunted and fertilized workers lay the eggs which hatch perfect male bees or drones."

The Ontario Convention.

Many kind references on this occasion were made to the large gathering of a year ago, when our city was honored by the presence of the many great bee-men brought together at the meeting of the North American Bee-Keepers' Association. We held our annual meeting during the time of the Industrial Exhibition, at which, too, the honey exhibits formed no unimportant part. The present increased interest manifested in bee-culture, as compared with only a few years past, is truly astonishing. Three evening sessions of nearly four hours each, and two forenoon meetings were all attended by many who, for the first time in their lives, had been present at such a meeting; and being invited to ask questions, they afforded no small amount of amusement as well as displaying intense anxiety in their efforts to master the mysteries of the bee-hive.

The themes and questions discussed covered most of the ground which is generally gone over, and the common conflict of theories had ample development. The answers as to methods and uses of ventilation were so flatly conflicting as to sadly bewilder the solicitous inquirers, and sometimes looked more like thickening the darkness than evolving any light. "Shall we clip the queens' wings?" "Yes!" "No!" "Which is the better for bee-forage, a new section of country

or an old, well-cleared and cultivated one?" "New!" "Old!"

"Which is the best race of bees?" "Survival of the fittest," "Tree-top conditions," "Foul brood," "Preventing spring dwindling," "Fall feeding," "Shape of frames," "Swarming, and bacteria theories," none of them seemed to lack freshness of live treatment. Upon the whole, perhaps the special good-nature evidenced amid so spirited a discussion may have been somewhat promoted by lingering recollections of how hardly and good-naturedly big-bee-men (here, a year ago), without mercy, hit each other's pet theories. In fact, the sort of enjoyment of the ease with which a good brother's "castles in the air" could be demolished, seemed to lend a charm to the exercises. Then, amongst all, the "toes" so rudely trod upon, so few seemed in the least tender.

Several of the number present wondered why we do not have these annual meetings oftener; as Pat Monahan wanted to have "quarterly meetings" held "monthly." Some of us suggested that Rochester, N. Y., is not so very far away, and a big meeting is to be held there in the near future. A number expressed a desire, nearly amounting to intention, to be there.

It is all very well to read articles on "hybrids" and all that, but for a real good time, some would say, give us a genuine, live International Bee-Keepers' Convention with a respectable sprinkling of lady members present; and absent all dry, long, well-written papers. To this should be added two or three bee-paper editors, and one or two crank advocates of "Queen-larvæ fertilization in the cell." But then we, of course, require on hand, too, a few large producers of No. 1 comb honey, and a fair proportion of anxious-to-be-instructed novices. Then, ho, for next, nearest bee-keepers' convention! S.

Toronto, Can., Sept. 20, 1884.

For the American Bee Journal.

A Dark Picture.

J. M. HAMBAUGH.

A more promising season than that of the present year never dawned upon the enthusiastic apiarists in this region. Mother Earth seemed abundantly clothed with the tiny petals of white clover, and as the days increased in length and warmth, our hillsides and valleys were soon carpeted with living green. None were more enthusiastic than myself in the cause, and nothing was left undone to secure our portion of the nectar from white clover.

March 23 marks the first joyous impulse of the eager little bees, as they hovered over the opening buds of the soft maple. Living as I do at the western terminus of the sloping bottoms of the Illinois river, with the abrupt bluffs to the north and west heavily studded with timber, and basswood abundant, to the south and east a vast landscape of waste land

subject to overflow, gives me a vast and diversified range. The banks of the river, four miles distant, are skirted with timber of various kinds, and soft maple, willow and button-brush intervenes in hundreds of acres from there to tillable lands. It is in this direction that the attention of the honey-bee has been drawn during the entire season.

My surplus arrangements were all put on by May 10, and my bees were in prime condition to reap the clover harvest. How happy I was on May 19, when the first white petals began to show above the ground, and I prided myself of soon being in possession of the nectar suitable for the gods. The hillsides and the valleys became white, and my bees labored—but where? Not to hillsides and valleys, but to the bottom lands; and when my hives became burdened, I excavated some of the sections that were nicely sealed. We sampled one, and our verdict was similar to that of the Editor's, when he saw fit to term it "vile stuff," etc. Our brilliant anticipations were blasted, and we consoled ourselves with our brethren's and sister's experience—Mrs. Harrison for instance—for misery likes company, you know.

Basswood bloomed on June 28, and no benefits resulted therefrom. The unruly little laborers still preferred the regions of the honey-dew to that of the basswood bloom. I would like to know if this honey-dew is likely to stay with us from year to year; if so, we want recipes to manufacture vinegar at 75 cents per gallon, or hunt a new occupation.

It was, perhaps, the middle of July ere they ceased to carry in the "vile stuff," and their attention turned to a more legitimate channel, since which time the quality is much better, though the quantity not so great.

Our Spanish-needle harvest has been good, and the general condition of the bees on the bottom-lands was never better; but after one reaches the uplands, three miles back from the Illinois bottom, the situation is quite the reverse, and which is the dark picture mentioned in the heading of this article.

There has been no harvest for the bees during the entire season, save the white clover, and that yielded but a scant supply. During the balance of the long season they have remained inactive, and were compelled to draw on their own resources for sustenance. Demoralization from protracted idleness, or something else, has caused "spring dwindling," or something akin to it, till many which were strong colonies at the close of the clover harvest, at present can scarcely muster a queen's retinue. One man in Mt. Sterling, this State, with 75 or 80 colonies, thinks that but few of them will survive the winter.

The bees appear inactive when they attempt to fly, and fall to the ground; and after futile attempts to regain their wings, they crawl about and die. Dead bees are found over the sidewalks quite a distance from the hives. Feeding is the order of the day, where the colonies are sufficiently

strong to justify it, as what little they accumulated in the spring is about consumed. Has this occurred in other localities? and am I right in my conjectures as to the cause? I have examined the brood, and so far as I can see, it is in a healthy condition. The trouble seems general throughout the uplands.

Versailles, Ill.

For the American Bee Journal.

Comments on Several Subjects.

JOSEPH M. WISMER.

I beg to state that the BEE JOURNAL has been carefully perused, searching for the long-felt want, information, to enable me to substantiate my experiences in producing honey in its different forms. On page 215, Mr. Wm. H. Balch, in the second paragraph of his article, concludes that all animals have their peculiar scent, which exactly expresses my sentiments. I well remember, but a few years ago, a neighbor of mine had a small quantity of butter packed and ready for market. During the night the dog killed a skunk under the veranda of the house, just outside of the cellar; the following morning the butter, milk, and part of the eatables presented a greenish hue, and were unfit for use.

On page 485, Vol. XVIII, Mr. Heddon gives a good description of the effects of the odor of the honey-bee, when disturbed, has upon the body of man; and even when in the apiary, bees flying around within smelling distance, would create such a tinkling sensation in the head so as to produce asthma.

On page 567, present volume, is an article from Dr. Tinker, concerning poisonous honey. I do not wish to undermine the Doctor's practical profession, or to interfere with the Heddon-theory, but merely to present to the readers of the BEE JOURNAL my experience as a honey-producer. In my youthful days I could not eat honey without causing severe colicky pains. Being a lover of bees and honey, I could not abstain from the sweets which the bees had stored in their well-made cells.

For more than 20 years as a bee-keeper in the old-fashioned way, I have suffered from its effects, not knowing the reason why such a sweet as honey, so highly spoken of in the holy writ as wholesome food, should be poisonous, until I commenced keeping bees on the new or modern plan, and following the instructions of the BEE JOURNAL. I noticed that extracted honey, when eaten, would be more mild than comb honey in my stomach, thereby proving that honey ripened by the bees was where the cause existed. This extracted honey is impregnated with this same discharged poison as Mr. Heddon speaks of.

Observation induced me to make further investigation in this matter. On one morning in 1882, when clover and basswood honey was at its best, I extracted all the honey which 2 col-

onies had, and then in the evening, again, in order to get this vegetable sweet in its natural state and ripened by evaporation. This honey I found that I could eat with safety, and with pleasant sensations.

Not being satisfied with this experiment, I knew of three friends who used the same precautions as I had in eating honey. I persuaded them to eat of this prepared honey, and with the same results. So that led me to believe that honey ripened by the bees contained enough of the so-called poison to produce colic to some people, and, again, to others premature death. With this prepared honey I healed or cured my delicate or weak stomach so that I can with safety eat any kind of honey. In order to more fully substantiate these facts, I would ask the Doctor a question: Why does the sting of a bee produce greater pain with some people than with others?

On page 536, Mr. A. A. Fradenburg asks, "Can any bee-keeper who reads this, show that a single colony of bees has ever had diarrhoea when they have had no pollen at all?" which I cannot pass without relating a few facts in my own experimenting with bees to winter successfully. Last fall I prepared 20 colonies in four different ways, all equally in good condition; 5 colonies were in nature's own way; 5 with pure granulated sugar and without pollen; 5 with sugar and pollen; and the remainder with pollen, sugar and honey. I was very anxious to winter at least a part of my bees.

I found that they were doing well until Jan. 20, when the thermometer indicated 16° below zero, and the bees on the summer stands began to show uneasiness, and continued so until Jan. 22, when the mercury was 24° below zero, which was uncommonly cold for this locality. The colonies prepared with sugar and pollen were the first ones to spot their hives and die. On opening the hive to see their condition, I thought to myself, "There! pollen cannot always be the cause of bee-diarrhoea." For instance, Mr. F., on the same page, in the first paragraph, quotes this: "I (Heddon), this morning, received a letter from Mr. Shuck, and he suggests the idea that vegetable matter is the cause of the trouble, etc." The case that I had last winter goes to show that sugar or honey in their best forms, is vegetable matter as well as pollen, which I conscientiously believe will, in a certain condition, or in a low, wet temperature, produce diarrhoea in its worst form.

On page 556, Mr. S. J. Youngman writes: "Upon close inspection I saw that it was fine liquid spray or fine drops which was ejected from the bees." Nature has so constructed or devised the honey-bee as to have means to separate the water from the sweets contained in the nectar in its raw state, which I will try to explain. Four years ago last spring, I fed my bees in order to stimulate breeding, and I found that sweetened water fed outside of the hive, would induce the queen to lay with a good will. I also noticed a similar phenomenon as that

witnessed by Mr. Y. and his assistant.

Three following springs, when too cold for my bees to forage with safety, I would introduce sweetened water to keep them from the danger of dwindling. I found that around the feeder would be as wet as though it had been raining, which induced me to search for the cause. Hundreds of bees circulating through the air just above my head, and having been at the feeder, was what kept the air as though fine liquid spray or fine drops of water was falling, so long as the bees continued to feed and the air was perfectly clear.

On close inspection of the bees that worked with a good will, I found that they would fill themselves and take wing to eject the water accumulated, and then would again come down to the feeder to refill themselves with sweetened water before entering the hive. This process I believe to be a common feature in the bees in the foraging field. Mr. Y. further says: "Now, what does this mean? What bearing does it have on the dry feces theory? Also, on the pollen idea?" I emphatically say—*none*.

Jordan Station, Ont.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Brood-Cells.

How soon, after the young bee has emerged, will a cell be used again? or how many times may it be used during 4 months of the breeding season?

F. F. G.

Waterville, Me.

ANSWER.—I think almost immediately, so that each cell will sustain the production of a worker-bee every 21 days, drones 24 days and queens 16 days. This is the average length of time with but slight variation.

Will Bees Produce Dampness?

Will putting bees into the cellar cause dampness to such an extent that vegetables and other things will be injured? I have 30 colonies of bees in the vicinity of Troy, and I wish to place them in the cellar where they have been kept; but before I am permitted to do so, the gentleman desires to know, from good authority, whether they will produce dampness or not. I have taken from three bee-

yards about 5,000 pounds of honey, which I consider only half a crop. Two thousand pounds of it was comb, and 3,000 pounds of extracted honey. A large portion of it is of a very fine quality. Our bee-papers speak of honey-dew, but there is none of it here.

G. H. ADAMS.

North Nassau, N. Y., Sept. 16, 1884.

ANSWER.—I have wintered my bees (some 30 to 60 colonies) in our house cellar several times, and have never seen any damage done to the vegetables or anything else in the cellar. Neither do I remember of any report of any such damage from bees.

Absconding Swarm.

I hived a very large swarm of bees on June 3, and on June 10 they left for parts unknown. The hive was new and clean, and had Dadant's foundation in it. They filled the hive with honey before they left. Please explain the cause of their actions.

Plier, Wis.

HENRY STARK.

ANSWER.—No one has ever been able to account for many strange freaks of bees; especially such actions of swarms as the one which you mention. I have had a few swarms leave new, clean hives well supplied with choice foundation, and that, too, after they had made a good start therein, and lodge in a small (too small) rotten cavity of a tree where the rotten wood lets the combs drop as fast as they became heavy. The natural instinct of bees, in many instances like other insects, leads to failure and death.

Winter Stores for Bees.

1. Neighboring bee-keepers state in the last issue of the BEE JOURNAL that they have but half a crop. From 150 colonies, spring count, I have increased them to 200, and secured 9,000 pounds of comb honey in one and two-pound sections. What per cent. of full crop do you regard this?

2. Upon examination I find many colonies which are fully supplied with honey, without brood or eggs, yet having queens and plenty of room. Why is this? Would you at once begin to stimulate such colonies to brood-rearing?

3. I winter my bees in the cellar, and put into winter quarters from Nov. 1 to 15. Would you now supply colonies which have not sufficient stores for winter? or is it best to wait until a few days before placing them into winter quarters?

E. W. THOMPSON.

Hindsdale, N. Y.

ANSWERS.—1. Your yield is a good one, and though not as large as has been taken before from the same number of colonies, it is far above the average of the country.

2. I cannot account for such a condition of your brood-chambers, never having any such conditions here. During the honey-dearth, just after basswood, is when our bees breed the most. Can it be that your hives and field are both destitute of pollen?

3. I would feed the deficiency now, while the weather is warm.

SELECTIONS FROM OUR LETTER BOX

Only One-Third of a Crop.

The season here has been a poor one—only one-third of a crop of surplus honey, and but few swarms, but those were very large ones. The weather was too dry and too cold.

R. B. WOODWARD, M. D.

Somerset, O., Sept. 20, 1884.

Terrible Loss.

I have lately lost a good, comfortable house, worth \$2,000, by fire. In it I lost nearly all of last year's crop of honey, and hundreds of volumes of an excellent library.

WM. BALLANTINE.

Sago, Ohio, Sept. 17, 1884.

It Pays to Use Foundation.

The honey crop here is rather light this year. Some colonies have done well, while others have gathered but little honey. From 7 colonies I received 9 swarms, of which only two have gathered enough honey to winter on. Having seen Mr. Doolittle's question, "Does it pay to use comb foundation?" I thought I would try the experiment, so on June 17 I hived an Italian swarm of bees in a Langstroth hive containing 10 frames filled with comb foundation, and 64 one-pound boxes filled with foundation. In 7 days they had the 10 frames filled with honey, and were working in the surplus boxes. I have taken from that colony 70 one-pound boxes well filled with fine honey, while other swarms coming a week or two later have not honey enough to winter on. The cost of the comb foundation did not exceed \$1.75. To me it looks as though it pays to use comb foundation.

FRANK HATCH.

Lisle, Ill., Sept. 22, 1884.

Killed by a Bee-Sting.

On Sunday, Sept. 21, 1884, Mrs. Sturdevant, who lived in Fairfield, Fayette County, Iowa, while walking home from a neighbor's, where she and her husband had been visiting, was attacked by a honey-bee that got into her hair. Her husband killed it, and immediately she was attacked by another, which stung her 9-16 of an inch below the upper margin of the lower left eye-lid, and about $\frac{1}{2}$ of an inch nearer the outer than the inner canthus of the eye. She was about 30 rods from her home when stung. She requested her husband to extract the stinger, when, upon examination, he could see the place where she was stung, but did not see the stinger. She immediately went home, and on going into the house, her daughter asked her what was the matter, when she replied that a bee had stung her. She asked her daughter for the camphor, and immediately went to her bed-room, and lying down upon the bed, her daughter then saturated

a cloth and applied it to the wound. She went into what appeared to be an apoplectic fit, no spasmodic jerking of the muscles, and in five minutes, this being about 15 minutes after she was stung, she was a corpse. To all appearances she had been a strong, healthy person. A good physician was sent for, but got there sometime after she died. The Doctor thinks that the bee-sting was the immediate cause of her death. B. F. LITTLE.
Brush Creek, Iowa, Sept. 22, 1884.

Short Honey Crop.

We have had a short crop of honey in this region. I began in the spring with 210 colonies and increased them to 390, apparently in good condition. My honey crop is 6,500 pounds, nearly all of it being comb honey.

J. F. SPAULDING.
Charles City, Iowa, Sept. 24, 1884.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

National Bee-Keepers' Association.

As has already been noticed, the next annual meeting of the North American Bee-Keepers' Association will be held in the city of Rochester, N. Y., Oct. 28, 29 and 30, 1884. Essays will be read as follows: "Wintering Bees," by W. F. Clarke, of Canada; "Nectar," by Prof. A. J. Cook, of Michigan; "Marketing Honey," by Thos. G. Newman, of Illinois; "Foul Brood," by D. A. Jones, of Canada. The committee has decided to use the balance of the time in discussing these and other questions of importance. Those who cannot be present, and have questions that they desire to have discussed or answered, will please send the same to the Secretary, Dr. C. C. Miller, of Marengo, Ill., or to Rochester, in care of the convention, on or before the first day of the meeting. Notice as to place of meeting will be given hereafter.

C. C. MILLER, Sec.
L. C. ROOT, Vice-Pres.

Convention at Chicago.

The Northwestern Bee-Keepers' Association will hold its fifth annual convention at Owsley's Hall, northwest corner of Robey and West Madison streets, Chicago, Ill., on Wednesday and Thursday, Oct. 15 and 16, commencing at 10 a. m. on Wednesday, and holding five sessions. Those who have attended one of these annual re-unions will need no urging to induce them to come again; those who have not, should remember that Father Langstroth characterized the last meeting as "representing the largest number of large, practical and successful honey-producers of any convention that he had ever visited." This meeting being held during the Inter-State Industrial Exposition, reduced railroad fares may be had on nearly all of the railroad roads. W. Z. HUTCHINSON, Sec.
C. C. MILLER, Pres.

The bee-keepers' association of Central Illinois will hold their quarterly meeting at Bloomington, Ill., on Wednesday, Oct. 8, 1884, at 10 a. m.
W. B. LAWRENCE, Sec.

The Whiteside Bee-Keepers' Association will meet at Morrison, Ill., at 1 p. m., on Oct. 2, 1884. All bee-keepers are cordially invited.
A. B. KREIDER, Sec.

The Wabash County Bee-Keepers' Association will hold its second meeting on Saturday, Oct. 4, at the Court House in Wabash, at 10 a. m. All bee-keepers are cordially invited to attend. Come one and all and bring your wife and children, and we will try and make it interesting for you.
HENRY CRIFE, Sec.
AARON SINGER, Pres.

The Cedar Valley Bee-Keepers' Association will hold its second annual meeting in Beckley's Hall, South Side, Waterloo, Iowa, on Oct. 1 and 2, 1884. Reduced rates over the different railroads. All interested are cordially invited to attend and make this one of the best meetings in the State.
H. O. McELHANY, Sec.

The Northern Indiana and Southern Michigan Bee-Keepers' Association will hold its next session in Goshen, Ind., on Oct. 3, 1884, at 10 a. m. Important topics relating to the management of the apiary will be discussed. Considerable time will be devoted to answering questions from the query-box. Several distinguished apiarists are expected to be present. All persons interested in bee-culture are invited to attend. A large meeting is anticipated.

F. L. PUTT, M. D., Sec.
A. BLUNT, Pres.

The Tuscarawas County Bee-Keepers' Association will hold its next meeting at the apiary of Geo. F. Williams, in New Philadelphia, O., on Thursday, Oct. 23, 1884.

G. F. WILLIAMS, Sec.
A. A. FRADENBURG, Pres.

The Progressive Bee-Keepers' Association meets on the first Saturday in October, 1884, at Bedford, O. A general invitation is given.

J. R. REED, Sec.

Special Notices.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzoz, at 25 cts. each

Young Men!—Read This.

THE VOLTAIC BELT CO., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6DIY

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

QUEENS BY RETURN MAIL.

I am now up with my orders, and can send choice queens by return mail. Send me your orders, and help me "out of the fire." 34Dt J. T. WILSON, Morionsville, Ky.

Friends, if you are in any way interested in

BEES OR HONEY

We will with pleasure send a sample copy of the Semi-Monthly Cleanings in Bee-Culture, with a descriptive price-list of the latest improvements in Hives, Honey Extractors, Comb Foundation, Section Honey Boxes, all books and journals, and everything pertaining to Bee Culture. Nothing Patented. Simply send your address written plainly, to A. L. ROOT, Medina, O.

He has a large stock of Queens on hand, and can fill orders by **RETURN MAIL.** 35Dt

Sixth Thousand Just Published!

New and Enlarged Edition

OF
BEES and HONEY,

OR THE
Management of an Apiary for Pleasure
and Profit; by

THOMAS C. NEWMAN.

Editor of the Weekly Bee Journal.

925 West Madison Street, Chicago, Ill.

It contains 220 profusely illustrated pages, is "fully up with the times" in all the improvements and inventions in this rapidly developing pursuit, and presents the apiculturist with everything that can aid in the successful management of the Honey-Bee, and at the same time produce the most honey in its best and most attractive condition.

PRICE—Bound in cloth, \$1.00; in paper covers, 75 cents, postpaid.

A Liberal Discount to Dealers, by the Dozen or Hundred.

37AB17

Given's Foundation Press.

PUBLIC SENTIMENT affirms that the PRESS is SUPERIOR for making Comb Foundation either in Wired Frames or for SECTIONS, and insures straight and perfect combs, when drawn out by the bees. Send for Circular and samples.

D. S. GIVEN & CO.,

1AB17 HOOPESTON ILL.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

PURE HOLY-LAND QUEENS.

Howard's importation of Holy-Land Queen are the only pure queens of this race in this country. We have 2 of the finest queens that Mr. H. imported, and will have by Sept. 15, 100 young queens from them. They will be fertilized 3 miles from all other bees, and we guarantee them to be equal in every respect to the imported queens. Price, \$2.00 each. A copy of the Bee-Keeper's Handy-Book or one of our combined Queen and Drone Traps will be given with each queen. We can send you as the Italian or Albino queens as can be purchased in the world. Warranted queens, \$1.00 each; tested, \$1.50; select-tested, \$3.00 each.—Secure your breeding-queens for another season. 37A44 HENRY ALLEY, Wenham, Mass.

LOCAL REPORTERS WANTED.

We want an agent and local reporter in every community to represent City and Country, and furnish us from time to time such facts as we may require. Send 10 cents for credentials and full particulars regarding services and compensation. Address, Will C. Turner & Co., Publishers "City and Country," Columbus, Ohio. 24A18

Indianapolis, Ind.,

Manufacturers of and Dealers in BEE-KEEPERS' SUPPLIES and HONEY. Langstroth HIVES a Specialty. Dadant's Foundation, Bingham Smokers, Wired frames and Foundation from the Given Press, Sections, Extractors and Honey Jars. Send for our Price List. 14A267

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

MRS. FRANCES DUNHAM, De Pere, Wis. Dear Madam:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machine for surplus boxes, and it has been equally a success, but for brood chamber foundation, yours is still unexcelled. Yours, CHAS. DADANT & SON.

Hamilton, Ill., Dec. 10, 1883.

MRS. FRANCES DUNHAM, De Pere, Wis. Dear Madam:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it. Yours very truly, D. A. JONES.

Beeton, Ont., Dec. 10, 1883.

MRS. FRANCES DUNHAM: All prefer the foundation I manufacture on one of your mills, to that made on any other machine I have no difficulty in rolling it from 10 to 12 feet to the pound for sections. Yours respectfully, J. G. WHITEN.

Genoa, Cayuga Co., N. Y., Dec. 12, 1883.

MRS. FRANCES DUNHAM: After using one of your foundation mills for the past 3 years, we can't say too much in its favor And for brood foundation, it stands head and shoulders above all. Yours, SMITH & SMITH.

Kenton, Ohio, Dec. 29, 1883.

MRS. FRANCES DUNHAM: I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretzmer, of Coburg, Iowa, and L. C. Root & Bro., of Mobawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is to me always a jewel. You are at liberty to publish this. Yours truly, T. L. VON DORN.

Omaha, Neb., Jan. 18, 1884.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apianian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

QUEENS!

OLDEST BEE PAPER IN AMERICA

THE WEEKLY BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861 } Chicago, Ill., October 8, 1884. VOL. XX.—No. 41.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money sent as above described, is at our risk, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Topics Presented in this Number.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each Insertion,
 For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
 To Australia—Weekly, \$1; Monthly, 20 cents.
 George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE

The Original BINGHAM Bee Smoker

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 will see us not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., OCTOBER 8, 1884.

No. 41.

ESTABLISHED 1864
THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

"Honey-Dew" for Winter Stores.

Notwithstanding the caution that we gave in the BEE JOURNAL for Aug. 6, 1884, we learn that there are quite a number of bee-keepers who assert that their bees will have nothing else for winter stores. We do not wish to interfere with their rights or privileges, but will present the matter again, so that they must "sin against light and knowledge" if they "still persist in their murderous designs" towards their bees.

To allow the bees to go into winter quarters with naught but the so-called honey-dew, is sure to result in nearly a total loss. As proof for this assertion we will cite a bee-keeper of Wisconsin, who, to our knowledge, last winter, lost 107 colonies out of 125, because they were condemned to try to subsist on the vile stuff called "honey-dew." That they did not all die is due to the fact that the 18 colonies happened to have some white clover honey stowed away in their hives where they could get at it, and hence this little gleam of light among the darkness—the few *living* bees among the myriads of *dead*! "What shall we do?" asks an enquirer, who adds: "We have nothing else to give our bees; they have gathered no honey this year." Nothing else to give them, when confectioners' or granulated sugar can be bought for less than 7 cents per pound! Let them die for want of food when a dollar will save a whole colony! Pshaw!

Would you let your best cows or horses shift for themselves, and live or die, as the case may be, depending on the grass they could find during our cold winter blasts—rather than

spend a dollar or two for winter food for each of them?

What would be thought of the business sagacity of farmers who would manage as before described with their stock? Aye, what would be thought of their claim to *sanity*?

Will bee-keepers show any more business sagacity or sound sense if they let their bees shift for themselves, gather "honey-dew" because there is naught else to gather, and then leave them to live or die, as the case may be, when a dollar a colony would save them?

Let it be borne in mind that the bees will not eat the honey-dew fraud, except as a dernier resort—when it comes to that or nothing! And what is the result? It takes but a short time to wind up their existence.

Fortunately, in some localities the fall crop of honey is quite good, and the bees will have enough from that source for winter use, for the weather is very favorable for gathering honey. The "honey-dew" may be utilized for spring feeding, when the bees have frequent flights—but not for winter stores under any circumstances.

Several persons have reported quite severe sickness after eating the trash on empty stomachs. And now let us add a word about the placing of such stuff on the market.

A tour through the honey marts reveals the fact that quite a lot of the *vile* stuff is marketed under the cognomen of "thick buckwheat honey," in the extracted form. It is equally a serious matter to state (though it is the truth) that some of the comb honey on this market is tainted with it—so great was the supply of "honey-dew" when there was a general dearth of nectar in the flowers. Now, what will the effect be on the market? It will retard and contract sales—those who buy it once, want no more.

But this is not all; at the beginning of this season comb honey retailed at 25 cents, wholesaling at 20 and 22 cents; now we hear of lots being

sold at 12 cents per pound, and extracted has been sold as low as 6½ cents per pound. All this because some bee-men have thought more of the "filthy-lucre" than of honor and integrity! Let us hope that there are none among the readers of the BEE JOURNAL who would be guilty of selling the "vile trash" as honey. If they have, and it is labeled with their names—Good-by to their honey trade in the future.

This shows the importance of Conventions and Bee-Literature. Educate! Educate! is the watch-word. Drive out ignorance, non-progressive management, and old-fogy notions, by hard arguments and wise counsels. Let all think these things over, and *be wise*.

☞ Convention at Chicago, Oct. 15. It promises to be a very interesting re-union of the bee-men of the West. Mrs. L. Harrison, Peoria, Ill., writes to the *Prairie Farmer* as follows:

I can indorse fully all that is said in the call for the Northwestern Bee-Keepers' Convention. The membership of this Association contains the names of prominent bee-keepers of Iowa, Wisconsin, Illinois and Michigan. No other city is so accessible to the apiarists of the North and West as Chicago, many diverging lines of railroad centering there. The officers of the Association yearly secure reduced rates at hotels and restaurants, so that the expense of attendance is trivial, in comparison with the benefits gained.

☞ The preparation of bees for winter should now be the study of all judicious bee-keepers. If not yet decided as to how to prepare them, read up at once; apply the knowledge obtained to practice, and be prompt in making all the necessary arrangements.—*Indiana Farmer*.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

Foul Brood, its Propagation and Cure.

Mr. Frank Cheshire, than whom there is not a more progressive and scientific apiarist in England, has spent much time in studying the cause and cure of that terribly-fatal disease called "foul brood," and is very confident that he has discovered a satisfactory cure for it. At the request of the British Bee-Keepers' Association, he has prepared the following very exhaustive article, which we copy from the *British Bee Journal*.

We feel sure that the apiarists of America will extend to him a hearty vote of thanks for his patient study and careful investigations, as well as for the following treatise in which he has given to the world a new remedy—or at least a newly-applied remedy—for that most-to-be-dreaded disease—FOUL BROOD. The article is rather lengthy, but it will repay a careful perusal:

About two months since I was invited by the committee of the British Bee-Keepers' Association to address the present Congress, then to be convened in connection with the International Health Exhibition, on the absorbing but apparently well-worn topic of Foul Brood. My consent to that invitation was mainly given on two grounds: first, a confidence that I had a method of curing this terrible malady far in advance of any that had previously been brought before the bee-keeping community either by others or myself; and, secondly, that the writing of the paper would furnish me with an excuse and reason for that large devotion of time which I foresaw a new and independent investigation of the subject from its scientific side would require—an investigation which I had long intended to undertake, in order to test facts which I had noted during previous years, and which it seemed impossible to reconcile with commonly received opinions. To these facts and to the results of my recent inquiry, so far as I have as yet been able to complete it, I now, therefore, ask your kind and indulgent attention, in order that we may all apprehend together the grounds upon which I venture to diverge somewhat widely from theories which have been admitted during the last seven years at least as things undisputed, because indisputable.

Apiculture is attracting more attention in this country than it has ever previously received. Bee-keepers are multiplying on every hand. From the throne to the humblest cottage the charms or the profits of apiculture are getting a recognition. The bee-keeping of to day is no more like that of the first half of this century than the goods train is like the carrier's cart. We have our combs built in days instead of weeks. Bees rear drones or workers as we give them order. Supers have gone and sections are finished as though bees had recently learned the use of the rule and the plumb-line. Honey is demanded by the ton in the manufacture of biscuits. The poor cottager may add to his comforts and his culture by attending to his hives; and yet, amidst all this pleasant prospect, seeming to promise greater things for the future, a dark cloud—causing most to fear, and even breeding despondency in the breasts of not a few apiarists—is hovering amongst us. Foul brood, despite all the information given, is now not only present, but rapidly increasing; and were it just to the owners, I could point not to diseased colonies merely, but to apiaries of 60 or 80, where, perhaps, not one has escaped contamination. Letters daily, and lately almost every post, arrive with some sad tale of disaster. If the unqueening and comb-excising, or burning or starving plans must be adopted, ruin is meant, profit anticipated becomes loss realized, and hope yields to despair. Nor is the reason of this far to seek. In former days, when bees were kept in the same garden, descending from father to son, increasing their number in the spring by swarming, to be reduced to the old limits in the autumn by the sulphur pit—when none left their native spot, except an occasional swarm, perhaps, as a gift to a near neighbor, and when none were ever imported from afar, foul brood might have lurked here and there, but the facilities for its propagation were wanting. Now, how different! Bees are ever traveling by our railways through the length and breadth of our land, these, reared often in company with many colonies where are to be found queens hailing from the Sunny South, where the disease has been often rampant, and coming, as these swarms sometimes may, from colonies not above suspicion, are, it is to be feared, but too often the instruments for communicating the germs of destruction in localities previously free. I delight, however, to recognize that this sad state of things need not, and I believe will not, continue, for, from reasons which will be presently apparent, instead of now regarding a visitation of foul brood in my apiary as a terrible disaster, I should esteem it as a trifling and temporary inconvenience very far less grave than the loss of a queen. I will now consider the subject under three heads: 1. The nature of foul brood as a germ disease; 2. The means of its propagation; and, 3. The methods of its cure.

THE NATURE OF FOUL BROOD AS A GERM DISEASE.

The appearance of foul brood is, undoubtedly, familiar to nearly all bee-keepers. A larva, if attacked early, begins to move unnaturally, and instead of lying curled round on the base of the cell, frequently turns in such a way as to present its dorsal (back) surface to the eye of the observer. A little attention will then show that the color of the larva is inclined to yellow instead of being pearly white. Such grubs are only rarely sealed over. Those more advanced before the disease strikes them, are in due course sealed, but death overtakes them, their bodies become brown and foetid, and as the sealing sinks it becomes pierced by an irregular hole. From this may be gathered the general indications of the disease, which is usually accompanied by very energetic fanning at the hive entrance, from which, in advanced cases, an indescribable and nauseating odor is emitted. The larvæ and chrysalids which are dead of the disease, dry to a coffee-colored, tenacious mass lying at the bottom of the cell; so tenacious, indeed, that it may be drawn out into long threads like half-dry glue. The drying-process being completed, a blackish scale is all that remains. This was formerly supposed to be the only condition in which the foul-broody matter, so-called, was a centre of infection; but we shall presently discover that this notion has no foundation in fact.

The disease is terribly contagious, and once started, soon spreads from cell to cell, and not infrequently from colony to colony. The knowledge of bee-keepers extended little beyond this, in December 1874, when a translation from the German by Mr. J. S. Wood, of Nyborg, gave an account of some experiments by Dr. Schonfeld, which may be thus summarized: Some foul-broody matter was placed on a plate pierced by a hole, below which, and passing into it, was a glass tube 2 feet long; a bell-glass covered the plate, and it bore another tube inserted into a hole in its crown. The lower tube was perfectly open, but the upper one was plugged loosely with cotton wadding. The sun shining on the glass, warmed the contained air, and a current was produced. Dr. Schonfeld describes the foul-broody matter as being full of micrococci, and, examining the cotton wadding, he tells us that he discovered innumerable micrococci. Some of this wadding was placed over larvæ in a hive, and the larvæ were removed three times, but upon the fourth experiment seven larvæ died, their bodies being found full of micrococci. He also informs us that blowfly-larvæ, by the cotton wool being placed upon them, contracted the disease, and the bodies, upon examination, revealed innumerable micrococci. These experiments were accepted as so satisfactory and conclusive that the matter here rested; and again and again I examined microscopically, specimens of foul-broody matter sent to me without for a moment suspecting the very serious error underlying these observations, upon which I do not wish to cast any discredit, although two very accomplished microscopists whom I have consulted, agree with me that any supposed observation of micrococci on cotton wool could only be accepted with extreme caution.

But the fact of being able at once to spot foul brood by a microscopic examination of the coffee-colored matter was an advantage. In October 1879, a well-known bee-keeper sent off two small brown masses found in a super, one to the "*British Bee Journal*" and the other to the "*Journal of Horticulture*." The latter came to myself, and I pronounced it foul brood instantly. I saw it under a power of 500 diameters. The "*British Bee Journal*" affirmed it to be simply dried pollen—a pardonable mistake. But the bitter scolding I received in the aforesaid "*Journal*," for my folly in pronouncing this to be foul brood, induced me to visit the apiary from which it came, and in which every colony turned out to be a prey to the dread malady. The microscope here was the means of starting remedial measures ere too late.

In spite of all that has been written or said since that time, we appear, so far as the nature of the disease is concerned, to have made no advance. The expressions "bacteria," "tungs," "micrococci," have been used without any very definite idea lying behind them, and there the matter apparently has rested. Before attempting to explain what I venture to believe the disease actually to be, it will be necessary to give a few definitions and explanations.

Science has recently shown that all putrefactive changes, fermentations, and very many diseases, are brought about entirely by minute organisms, which are, in fact, rudimentary vegetables. To them the general name of Schizomyces has been applied, because their method of increase is by splitting or fissuration.

These micro-organisms are divided into four genera—micrococcus, bacterium, bacillus and spirillum. We shall presently see that two only of these, micrococcus and bacillus, are essential to our present purpose, and so the others will be left out of view. There are many species of each, and they may be classed as—septic, those causing putrefaction; zymogenic, causing definite chemical changes, such as butyric fermentation, chromogenic, or color-forming, and pathogenic, or disease-producing. Confining our inquiry within the narrowest possible limits we have to do with pathogenic micrococci and bacilli. The former may be roughly described as minute globular bodies, which, at intervals, become slightly elongated, and then

show a compression at what may be called the waist, giving them the form technically known as the dumb-bell. The compression becomes more pronounced until by separation two tiny globes are produced from the one; each of these will in turn divide, and so multiplication may go on at an astonishing rate.

Bacilli, on the contrary, are rod-shaped, and if we could suppose a common ruler to elongate without increasing in thickness, and then at a definite point break into two, to again increase in each part in like manner, we should have a fair idea of the whole matter; but sometimes this increase in length is not accompanied by separation, so that a line of bacilli may be formed comparable to a long string of sausages, and such is denominated a leptothrix. Under certain conditions, however, the bacilli produce spores (or seeds), which the micrococci never do; while in addition, bacilli, unlike micrococci, are provided at their extremities with wondrously delicate filaments called flagella, with which they strike the fluid containing them, and so swim much as a fish does by the use of its fins; so that shape and the power of spore-production and self-directed locomotion sharply divide one from the other.

This explanation, for the introduction of which no apology is needed, since upon it turns a right understanding of the line which I took in the inquiry, will, I trust, be sufficient to enable

FIG. 1.—Healthy Juices.

even those who have not studied the question of micro-organisms at all, to follow the details now to pass before us; concerning which I must express my thanks to G. F. Dowdeswell, Esq., M. A., member of the Council of the Royal Microscopical Society, for the lively interest that he took in my investigations, and for the many helpful suggestions which he gave me. I happily mentioned to him at one of the Royal Microscopical Society's meetings the work in which I was engaged.

Taking a small quantity of the juices of a healthy grub, and spreading it out under a thin glass under the microscope, one is presented with such an appearance as is seen at Fig. 1; fat globules are numerous, while blood-discs abound, and everywhere may be noticed tiny particles which are constantly slowly dancing with what are called Brownian movements; but if a speck of coffee-colored, foul-broody matter be similarly treated, we find neither fat globules, blood-discs, nor molecular base, but observe the field crowded with very small ovoid bodies, as we have them represented at Fig. 2. These are the micro-

FIG. 2.—Foul Brood, last stage.

cocci of Schonfeld; but if this substance be stained according to the modern plan of Weigert and Koch, and then carefully examined, in all probability we shall discover, associated with the ovoid bodies, a very few other organisms, longer, and rod-shaped, while we notice that the so-called micrococci are neither round nor dumb-bell-like, but oval, or boat-shaped. This led me at once to suspect an error, and further searching showed me, if, instead of coffee-colored matter, such as that usually sent for microscopic examination, the body of a grub, dead, but in a fresher condition, were taken, the number of the rod-like bodies very considerably increased, while that of the ovoid ones diminished, as seen in Fig. 3.

My own inoculated colony—inoculated for experimental purposes—was cured, and gave me no material; but soon I obtained a comb from a suffering colony, and then had the opportunity of expressing the juices from a death-stricken larva. These, when examined under a power of 600 diameters and carefully illuminated, were seen, to my great delight, to be full of active rods, swimming backwards and forwards, and worming their way between the degenerate blood-discs and fat globules, as represented in Fig. 4; while here and there were long strings of them, the leptothrix form previously referred to. Three questions now required answers: 1. Was this undoubted bacillus always associated with foul brood? 2. If so, was it cause or effect? 3. If the cause, what was its life history? It

would weary to explain how these answers were obtained, as the work involved many days of incessant application at the microscope, the preparation and comparison of about 200 microscopic slides, and the rough or somewhat careful dissection of

FIG. 3.—Foul Brood, late stage.

at least 100 grubs, taken from various colonies, in different conditions of the disease, and at sundry periods after their removal.

I found that in every instance that the beginning of the attack was marked by the appearance of bacilli in the blood; that these bacilli were, in many cases, at first long, thin, and marked by the presence of bead-like points; that as this form disappeared, the bacilli, pure and simple, multiplied by repeated division, that these bacilli, when magnified about 1,300 diameters, presented the appearance seen in Fig. 5; that these were active,

FIG. 4.—Foul Brood, early stage.

swimming rapidly either backwards or forwards, and that when an end-view could be obtained of one of them, it was seen to be describing a small circle; that when the disease was in rapid progress leptothrix forms were common, some of them reaching even the 1-100th of an inch in length; and that as the fluids of the grub failed by loss of fats and albuminoids, the bacilli put on the spore condition. They widened and drew up their protoplasm or mycoprotein from their extremities, as we see

FIG. 5.—Foul Brood.

indicated in Fig. 6, and thus became what Schonfeld had in error called micrococci. After the death of the grub, and during the assumption of the viscid, putrid condition, this constant alteration of bacilli into spores continues. After removal from the

FIG. 6.—Foul Brood.

hive, it goes on so rapidly that in three or four days scarcely a bacillus, as such, is discoverable, but the spores are innumerable. The reason of Schonfeld's mistake, so far, is intelligible; he saw the spores only, and judged them to be micrococci; but the

continuance of his error through all this investigation is a mystery which I am quite unable perfectly to explain.

Foul brood, then, is a bacillus disease; and in these days, when the 'germ theory' is the question of questions amongst pathologists and physiologists, it is extremely interesting for us to note that science has lately shown that different species of bacilli also cause consumption, cholera, typhoid, leprosy, and many other diseases afflicting the human family; whilst amongst animals, glanders, splenic fever, septicæmia, etc., arise from a similar cause. This particular bacillus seems not unlike "Bacillus anthracis," which the researches of Pasteur have lately brought so much before public attention.

Since the force of conviction thus obliged me to contradict the conclusions of Schonfeld, I felt it incumbent upon me to repeat his experiments; for if the disease be really a bacillus, how could the communication of it to the larvæ of "Musca vomitoria" (blowfly) produce, as he says, micrococci in that insect? I experimented on 60 specimens: Twenty were not brought near foul-broody matter, 20 I attempted to infect with bacilli in their active condition, and 20 by spores. At the end of 24 hours I examined carefully two from each lot, but with no apparent result. In 24 hours more, two again, but still failed to see any evidence of disease. By a further delay of 24 hours, one of those infected with coffee-colored matter was found to have a pretty considerable number of active bacilli swimming in its fluids. The non-infected showed many micrococci. This was most completely confirmatory of my position; but how could it be reconciled with Schonfeld's assertion, that he found the dead flies full of micrococci. Had he searched further, he would have discovered that dead blow-flies are generally full of micrococci. They take in with their food (decomposing flesh substances) swarms of septic micro-organisms, and these at their death multiply within them; but any observation carefully made with a decent instrument, would show the immense difference between these micrococci and the spore condition of the bacillus. Schonfeld's last assertion, that by means of these micrococci he established foul brood in the larvæ of the bee, and found these larvæ containing innumerable micrococci, is past my comprehension. The only solution, if we accept these statements, that I can at all suggest, is, that the Brownian movement of the molecular base of the fluids was mistaken for micrococci; but this supposes most unskillful observation, and possibly a very poor instrument, while, for anything that I know, Dr. Schonfeld may be possessed of ample skill and elaborate appliances.

I cannot refrain from expressing my conviction that it is much to be regretted that so misleading an account of experiments, to all appearances conclusive and complete, should have been given to the apicultural world. In their absence, it is hardly possible that we could have all been in the dark so long. I find in my notes that actually eight years ago I saw these bacilli, and should very possibly, have not allowed the observation to drop unless I had felt that the question of foul brood was a sucked orange. Not a few others of us from a similar cause have been kept from the path of discovery.

But in yet another way I have striven to prove irrefragably that the etiology I have given is correct. Taking a number of well-developed drone-larvæ from a healthy colony, their juices were expressed and strained into two test tubes 3 inches long and $\frac{1}{2}$ inch wide. No. 1 now received a very minute quantity of coffee-colored matter containing spores mostly, while No. 2 was infected with a trace of bacillus-containing fluid from a larva just dead. These test tubes were each supported by a tin slip having a hole in its centre through which the tube passed, but the lip could not, and they were thus suspended, loosely corked, between the frames of a colony, so that the exact temperature for germination should be kept up. In twenty-two hours, I found the spores had in large part disappeared, and that bacilli in threads existed in considerable numbers, while the bacilli added to No. 2, were increasing by division, proving again that the spores produce bacilli so soon as they pass into conditions for germination, the reverse process obtaining when these conditions cease.

For many years I have entertained the conviction that the often-repeated statement that the disease affected the brood only, was not merely not proved, but opposite to the evidence at our command. This statement has been again and again made as though it were as certain as that 'two straight lines cannot enclose a space,' but I am glad to note that Mr. Cowan has shown that deeper insight which is the outcome of scientific training as he merely says: 'foul brood does not seem to affect the bees.'

We may take from a colony two or three frames containing 5,000 larvæ each, and it will continue to progress pretty much as though it had lost nothing, while if foul brood attacks and kills, say 1,000 of its grubs, it, as a rule, very perceptibly diminishes in strength. The only explanation that appears is, that the bees die with the disease, but that according to a necessary instinct, they leave the hive and finish their course alone. I, therefore, resolved to try to settle this point. Going to the experimental colony, then in my possession, I noticed one bee nearly dead, on its back, another hopping in abortive flights of 3 or 4 inches, and presently found a third and fourth worn out and too far gone to enter the hive again. The first bee con-

tained nothing remarkable, but the second was almost an empty shell, the air-sacs occupied nearly all the abdomen. The stomach and colon were exceedingly small, and the amount of fluid I could obtain truly microscopic, but this was enough for the microscope, which showed it at once as full of active bacilli. The question was answered. The large consequences flowing from it were clear. Swarms must no longer be stated as incapable of carrying the disease. Bees from a presumably clean hive, if in an infected apiary, may carry the infection. And so, to set all at rest, I placed the bee in spirits, and now offer it to any microscopist of repute for examination; but this bee is not needful, for Nos. 3 and 4 gave me similar results, and so have some others since, making it clear that a very large proportion of imago (adult) bees from a foul-broody colony, die of bacillus, or, as Mr. Hooker remarked to me a few days ago, when talking of this matter, 'In a foul-broody colony the candle is burning at both ends.'

This discovery is pregnant with consequences. As workers and drones are liable to it, why may not queens suffer from it? Although I have had, of course, no opportunity of giving direct evidence here, analogy says they must; and if so, may not those who assert that imported queens have introduced foul brood be, after all, right? In a case occurring to myself last year, a Ligurian queen was successfully inserted and laid fairly, but foul brood appeared and she died. At that time I did not connect the circumstances, but they rise to my remembrance and bring a doubt. Further, if the queen may be infected, why not the egg? So far as I have been able to investigate, I believe that it occasionally is. Some would say that the size of the egg would forbid this, but these spores are relatively minute. The egg is 1-14 of an inch long and 1-70 of an inch in diameter, yet it could contain above 100,000,000 bacilli in the spore condition; the spore being no more in relation to the size of the egg than a single drop would be in a cistern containing 1,500 gallons of water. The investigation of this point I must leave to others, or to the future, as it may be necessary to infect one of my colonies, and it would also appear to be necessary to infect the queen to get the eggs in proper condition; but great caution will have to be exercised as the sources of error are so numerous and the manipulation so difficult, but an example in point is at hand which shows that the idea is not improbably correct. "Carpenter on the Microscope," page 375, says:

"A most notable instance of such propagation is afforded by the spread of the disease termed "Pebrine" among the silkworms of the south of France; the mortality caused by it being estimated to produce a money-loss of from three to four millions of sterling annually for several years following 1853, when it first broke out with violence. It has been shown by microscopic investigation that in silkworms strongly infected with this disease, every tissue and organ in the body is swarming with minute cylindrical corpuscles about 1-6000 inch long; and these even pass into the undeveloped eggs of the female moth, so that the disease is hereditarily transmitted. And it has been further ascertained by the researches of Pasteur, that these corpuscles are the active agents in the production of the disease which is engendered in healthy silkworms by their reception into their bodies, whilst if due precaution be taken against their transmission, the malady may be completely exterminated."

A matter for consideration now presents itself of some moment. The name, foul brood, has been given under a misapprehension, and is manifestly inappropriate since the disease is not specially of the brood at all. Popularly it may yet pass, for the title is so crystallized into bee-literature that it would be difficult to displace it, but scientifically it cannot be admitted. I, therefore, with due respect claim the discoverer's privilege of giving a name which shall represent generically and specifically what the disease really is. I suggested to the Rev. Herbert R. Peel that he should be sponsor to a new name meaning Bacillus of the hive. He consents, but his sponsorship will, I am sure, in this instance, consist not in training and guarding, but in pursuing to the death that terrible and noxious pest hereinafter to be called "Bacillus alvei." Let us now turn to our second point.

THE MEANS OF THE PROPAGATION OF THE DISEASE.

Although the methods of propagation of this disease are in all probability varied, and, as yet, not in detail fully understood, it may be said without hesitation that the popular idea that honey is the means by which it is carried from hive to hive, and that mainly through robbing, is so far an error that only occasionally and casually can honey convey it from colony to colony. I have searched most carefully in honey in contiguity with cells holding dead larvæ, have examined samples from colonies dying out in rottenness, inspected extracted honey from terribly diseased colonies, and, yet, in no instance, have I found a living bacillus, and never have been able to be sure of discovering one in the spore condition; although it must be admitted that the problem has its microscopic difficulties, because the stains used to make the bacilli apparent, attach themselves very strongly to all pollen-grains and parts thereof, and so somewhat interfere with examination. This is quite what would have been anticipated, because honey by its very viscosity is somewhat antiseptic, and the rapid movement of

these especial micro-organisms, which seem essential to their propagation, is prevented by it. I have tried infecting honey and growing bacilli in it, but without the smallest approach to success.

Nevertheless, to feed honey from foul-broody hives (or, as I ought to say, colonies infected with *Bacillus alvei*) to healthy ones without taking some precaution would be absurd; but boiling is neither the most convenient nor the best plan, as we shall see presently. I anticipate here the question, "Is honey, taken from diseased bees, fit for human food?" Morally, I should object to sell for table purposes honey which had been stored in the feto of a diseased colony, but scientifically I could see no cause for impeachment if the flavor of the honey were good, for the chance contamination of a bacillus would be no risk. Even pathogenic bacilli may be swallowed, apparently without harm, if there be no internal rupture of the mucous membrane, while human saliva, containing as it does micro-organisms, derived from the air, will often kill small animals if a particle of it be inserted beneath their skins.

My belief is that the grubs are most usually infected by the antennæ of the nurses. These traveling in the darkness of the hive become aware of the condition and needs of each occupant of the brood-cells by constantly inserting their antennæ, which must continually, where disease reigns, be brought into contact with larvæ full of bacilli, and also into contact with those sticky masses into which the larvæ change about two days after death. The removal, then, of spores is highly probable, and these transferred to the next grub fed, will there start the disease. These sticky masses will be found, too, to extend to the very front of the cells, and as the bees perambulate their combs, the claws, or more probably the pulvillus, which stands between them will be in danger of removing spores, and depositing them upon other cell-edges, to infect other grubs at the critical time of cocoon-spinning.

The supposition that in the dried condition of the dead larva the "micrococci" (?) are thrown off into the surrounding air must be replaced by facts founded upon observation. The first authorities are in general agreement that micrococci are not thrown off at all; and even if their opinion stood the other way, it would not affect the question, since I hope I have successfully shown that no micrococci exist in these dried larvæ. If it were otherwise, the face of every honey-cell would be closely dusted with death-dealing germs, and the case would appear hopeless; but this is not contradicting that it is possible, or even extremely likely, that the tramp of the bees does frequently detach numbers of spores which fly about in the air, and settle here and there, often where they take effect, many of them being carried into healthy colonies by the indraught set up by the fanners. When a hive is robbed, I strongly incline to the belief that it is rather the feet and the ANTENNÆ which carry infection home with the robbers than the honey in their sacs. Indeed, the ordinary opinion would appear to have no better foundation than very many other of the guesses which have impeded the progress of truly scientific apiculture; and I find that Mr. Cowan remarking nearly six years ago, "The honey is supposed to contain the spores, although I must say I have never been able to detect any by the microscope." This part of my subject is extremely difficult of positive proof, but with a body of facts before us our conclusions are not likely to be seriously wide of the mark. A very large number of observations has shown me that the disease is not found at all, except as infrequent exceptions in the digestive tube of the larva, but it lies wholly and absolutely in the blood; but did honey convey it we should certainly often see its traces in the alimentary sac. In the adult bee, on the contrary, the disease, although present in the blood, is generally very acute in the chyle stomach, and the effects seem to be those of consumption of the bowels. The reason for the difference, I have no time now to explain, but will simply point out what I believe no observer but myself has discovered—that the bowel of the larva is cast off with the skin at the time the chrysalis condition is assumed, and that the digestive apparatus of the imago bee is an entirely new and different organization from that possessed in the larval state. The size of "*Bacillus alvei*" is such that a quadruple string of them extending from London to New York could be formed out of one cubic inch of material. Ordinary dust motes to these organisms would be like hen's eggs to sand-grains, so that the difficulty, if any had been felt, respecting their being carried about, should vanish. Nor is their multitude less astonishing. I have examined many grubs which must at least have contained 1,000,000,000 of them. A statement which, after inspection of the many microscopic slides I have prepared, will be accepted without question. In the royal jelly, so-called, of a queen dead of bacillus, I could discover no bacilli, nor have I succeeded better with the food provided to the workers, notwithstanding that I examined several hundreds of the cells containing feeding grubs, surrounded by dead larvæ; so that, although I would not dogmatize, my strong opinion is, that commonly neither honey nor pollen carry the disease, but that the feet and ANTENNÆ of the bees usually do. I also think it probable that occasionally, at least, nurse bees infected bring the disease germs to the mouth in feeding the LARVÆ, and then turning foragers, leave a germ or germs in the nectary of a flower, which visited by another bee becomes the means of infection to it; the malady is thus carried by adult bees into other, and

perhaps somewhat distant, apiaries. Balancing all the probabilities, it would appear that most generally the adult bee takes the disease, and then carries it directly or indirectly to the brood. An ailment of a rather different kind, from which the house-fly suffers, is known to take effect by its germs settling on the spiracles, or between the abdominal rings. The spiracles of the larva of the bee may also be the especially vulnerable points. But I must hasten to the third, and practically the most important section of the subject.

THE METHOD OF CURE.

Those whose apiaries are suffering from the ravages of foul brood have had two classes of advisers: those recommending curative measures, and those counselling destruction. The former class has been but a small one; and I remember that years ago Mr. Cowan and myself almost stood alone in this matter. We had had, unfortunately, to deal with foul brood; we had attempted curative measures, and had succeeded. We were anxious that others should share the knowledge of our methods of treatment, for they were not identical; but from reasons, which from my point of view I will endeavor to explain, the destroyers seem for the moment to have the best of it.

Salicylic acid has been the substance which has been hitherto constantly used as a remedial agent; but it has had three main difficulties to contend with. First, it is troublesome in application; next, the question of dose has never been properly worked out; and lastly, it has, from a mistaken idea of its insolubility, been associated with borax, which has reduced its curative effect, and made the treatment somewhat dangerous.

1. It is troublesome in application. It has been recommended to uncap the dead nymphs, removing their bodies when possible, and to spray the combs and frames thoroughly, and next feed with syrup containing salicylic acid. All this must be done regularly and through a considerable period. My observations, more especially during the last three summers, lead me to believe that the good effects almost all arise from the food, and that the spraying is often a mischief instead of a benefit. 2. The question of dose has never been worked out. Mr. Cowan recommends 1-80 salicylic acid, 1-80 borax as a spraying fluid (1-40 of the whole); or if the drugs be bought by Troy weight, which they almost certainly would be, 1-37 of the whole; while my formula was 25 grains in 8 ounces of water, or 1 in 140; and Mr. Hilbert recommends 1 in 200. In addition, spraying is a most uncertain and variable quantity. One man will soak combs and bees by the spray, another will only dampen them. I think in any case 1-40 too high a proportion. Three weeks since I received a comb in a box, accompanied by a letter, asking what was to be done. Foul brood had broken out, and salicylic acid had been used, but without benefit. The comb contained a large number of dead grubs; and I commenced a microscopic examination, expecting to find the usual living bacilli, and in other cases the spores; but to my bewilderment, the first eight dead LARVÆ contained neither bacillus nor spore, the ninth was filled with the former, and had undoubtedly died of the disease in the normal way. But what of the others? My suspicion was that they had been poisoned by excessive drugging, and writing at once for details, I obtained information which puts the suspicion beyond doubt.

Mr. Raitt, some years since, complained that salicylic acid was a humbug, and gave as one reason that he had used so much that he had killed the grubs, and yet it did not cure. Depend upon it, the order of mind that concludes if 1 ounce of salts will keep off a bilious attack for a fortnight, $\frac{1}{2}$ of a pound will keep it off for two months, exists in the bodies of many bee-keepers amongst the humbler classes, and so the extremely uncertain quantity given by spraying has its dangers, beside which, spraying chills terribly, and takes all pluck out of the bees. Salicylic acid is a poison. The French "Comite Consultatif d'Hygiene Publique" has twice reported against the employment of salicylic acid, even in small quantities, as a preserving agent in food. These reports have been strongly opposed by interested parties; but it has been shown that it has frequently acted as a cumulative poison, and has in several instances proved fatal.

The borax shall be dismissed with a word. It does nothing but, by making a new compound with the salicylic acid, gives it great solubility. Using hot spray, as I have recommended, makes it needless. It adds to the complexity and nauseousness of the remedy; and I notice that Mr. Cowan, in the last edition of his "Guide-Book," has substituted Hilbert's for Muth's formula, and so omits the borax. But Mr. Cowan now introduces to us Bertrand's Fumigator. If all bee-keepers were as scientific as Mr. Cowan, I should believe in its being a great service; but it is simply a subliming apparatus in which for every sized hive, and every strength of colony, and every possible number of frames, 15½ grains of salicylic acid must be used. The dose seems to have been worked out here with great refinement; although no doubt the 15½ grains is but the equivalent of 1 gram named as the quantity by M. Bertrand; but when we call to mind that at 156° C. salicylic melts, and at 220° decomposes; when we remember, too, that in chilling the acid drops in a dew, we can easily see that one operator with the same 15½ grains would get twenty times as large a quantity into the hive as another; and so my hope of Bertrand's invention is but slight indeed. The plan, too, of feeding with mediated syrup those colonies that are not, but may be attacked, is one that I think the best understanding of the ease

would not recommend, at least I do not now join in the recommendation. A drug is, by its very nature, a poison, and even though only used as a prophylactic, must have its damaging effect.

I am not by any means well acquainted with apicultural literature, and so do not know by whom or when the idea of shutting diseased bees up until their honey was consumed before putting them into their permanent home was originated. I would here only say, that with our present knowledge, that in a colony taken from an afflicted hive, many, at least, of the bees are themselves filled with bacilli, we can see that the plan of shutting up is the very worst that could be adopted. The bees that drop, as Mr. Simmins suggests, "from exhaustion," would most probably be those dying of foul brood, and being confined (the stricken with the sound) are likely to perpetuate the disease. The real benefit arises here, not from consuming the honey as I have shown, but from delaying the time of egg-production, and so letting the diseased bees die off before they have a chance to act as nurses. If this ruinous, and to me cruel, plan were in any way necessary, I should say, unqueen your diseased colony, cutting out all queen-cells ten days after, and giving from a healthy colony a cell just sealed. When the queen hatches, make a swarm of the whole into a skep, and transfer next day to a frame hive. The skep is only needful because making the swarm is likely to throw spores into the air. The queen will, in eight or nine days begin to lay, and all would most probably go well, much more probably than by the starving plan. The diseased bees would be dead and gone before any nurse-work commences. All the brood that will hatch is secured, and the queen gets no chance of contamination by constantly putting her abdomen into infected cells. A possible contingency if she be allowed to begin ovipositing in the old and diseased hive. My last point is reached—the method of cure which I suggest.

About three years since, Mr. Robert Sproule, an Irish gentleman of culture, with whom I several times had had the pleasure of a conversation, mentioned to me that he had used phenol in the treatment of foul brood with some success. I replied that I would seek opportunities of experimenting, and if I found the result advantageous, I would do as I am always glad to do, mention his name with thanks for the suggestion. The suggestion was, however, not quite novel, but no one appears to have done more than think that phenol was out of the question; bees would not take it. This idea is correct, and I find by a letter received from Mr. Sproule, dated 18th ult., that he with the remedy in his possession, for want of noting the way of giving it, lost a large part of his apiary. Mr. Sproule's plan was to feed with syrup, into which he put a small quantity—how much I do not know—of Calvert's No. 1 Phenol. He says that in 1882 he was successful with it, "but"—I quote from his letter—"unfortunately I queened all my colonies, save one of black bees, with Ligurians. The disease re-appeared, and as the Ligurian bees refuse to take the carbolyzed syrup, I lost them all by foul brood, except the black colony."

"What man has done, man can do" was my motto, and I sought opportunities of treating the pest, and up to the close of 1883 had so manipulated six diseased colonies that I felt convinced I had, with proper management, a remedy beside which salicylic acid was but vexation of spirit. I imagine that with Mr. Sproule's method I should have failed as he did, as I operated entirely on Ligurians and hybrids. Reference to my writings in the "Country" newspaper ten years since, shows that my argument has always been in favor of the remedy being given in the food. We have here a constant quantity; every grub must receive the same amount of nourishment, and if we can find a curative agent and the dose, the difficulty is accomplished. I wrote thus, seven years since, in speaking of salicylic acid: "When combs are in a very decomposed condition, they may have to be taken away, but I do not believe, rather I have not found, this step to be necessary. It is, in my opinion, far more necessary to remove the store; for, supposing, the honey to carry no infection, it is at least the means of preventing one remedy being given to the grubs. Remove the store; and the bees themselves become the dispensers of the drug which we have provided."

To place the food bottle with added phenol on the hive will, however, do nothing in the greater number of cases. If honey be coming in, the bees will not touch it; but open the hive, remove the brood comb, and pour from a bottle having a dropping-tube, loosely placed in its neck, the medicated syrup into those cells immediately around and over the brood, and the bees will and do use a curative quantity of phenol. The syrup is best poured in by holding the comb at about the inclination of ordinary writing, not by placing it on its side. (For tender combs an appliance may be made like a chemist's wash-bottle, by which the combs can have the syrup poured into them while they are in the upright position.) Sometimes it is enough to simply pour the syrup into the back comb, when they will fetch it into the brood-nest as needed, and the disease will disappear. But success comes through failure, and I had to experiment and destroy colonies in experimenting in order to find the curative dose. The vapor of phenol, the phenol being poured on blotting paper, on two occasions, killed all the brood. Last autumn I inoculated a colony and allowed it to get into bad condition. I then inserted a comb of store in the centre of the brood-nest and treated one side. The disease disappeared, but raged, although with abated fury, in the other half. Possessing a skep which might

be scented from afar, I divided the combs by transferring into two of my colonies, and after allowing the disease to get ahead, quickly had them perfectly sound again.

I found that 1-200 was refused by the bees altogether; that 1-400 might be given constantly to a sound colony without appearing to limit the queen in breeding or touch her health; that 1-500 dispatched foul brood quickly even while honey was coming in, and that 1-750 appeared enough when it was not. I have established these quantities as the correct ones. I then, in the interest of apiculture, requested the British Bee-Keepers' Association to provide me with a bad case so that the attention of bee-keepers might be arrested. The colony has been supplied me by the kindness of Mr. Mills, and has been open to visitors, marked by Mr. Hooker, and officially attested. When it arrived on the night of June 21, it contained seven frames, only enough bees to cover two of them, and queen-cell afterwards found to contain foul-broody matter only, scarcely any living brood, and a good deal of dead brood. A casual counting of one of the best frames gave 371 dead LARVÆ on one side. The odor was pronounced. A case such as this would have been utterly hopeless on any plan but the one I am now advocating.

With me queenlessness presents the worst of all difficulties. No grubs, no physis, no cure. Unqueening a foul-broody colony is giving up at once, it is decapitating to cure the head-ache. I had stipulated that the colony should have a queen, so my difficulty was greater than I anticipated, and yet the colony is here to-day strong, vigorous, and healthy and has been so for a week past. No cell has been uncapped, and no diseased grub removed by me. My treatment has been, giving food and getting that food converted into bees as rapidly as possible.

Seeing, early next morning, June 22, the utterly disheartened condition of the poor bees, I went to a nucleus, took out a very fine Italian mother, having just proved as purely fertilized, and putting her under a dome cage on a card, placed the card over the frames. The bees came up and seemed to see in her a new hope. I lifted the card, she was welcomed, and the colony was now queened. I waited three days till she was regularly laying, giving them syrup phenolated by 1 in 500, and then took two frames from a colony containing the very comb once used in experimental inoculation to which I previously referred. The combs were ugly, and I wanted to be rid of them. They were full of brood. This step would not have been necessary, but from the fact that I required a strong, healthy colony by the time of the Congress. The bees were now shut up to four frames, and those behind the division-board, waiting introduction as the bees multiplied, smelt so badly (the weather being hot), that for comfort of myself and bees I was forced to spray with water 200, phenol 1. Every evening the medicated syrup was given. The smell vanished, the bees became active and earnest. The comb with 371 dead larvae on one side was last added, and in six days I could only find five smitten caps in the whole of it. Now and again a grub took the disease, but quickly, perfect immunity was the issue. The brood is now as bright, pearly, and healthy as an, I have ever seen. The hive has not been touched except for manipulation, and yet its bottom-board has been kept most perfectly clean by the bees themselves.

Here a caution is needful. Carbolic acid is an impure phenol, and is useless. (Phenylated soap of good quality with plenty of water is the best cleanser of hives and apparatus.) Carbolic acid contains cresol and cresols, and bees abhor it. Absolute phenol must be used. My tear is lest dealers should profess to supply what is required, and substitute a cheaper for an absolutely pure article; if so, difficulties will arise.

Pardon me in saying that I feel proud that I have been so fortunate as to contribute something to the science of the question, while I feel delight in that the worst difficulty of bee-keepers has almost ceased to be a difficulty. I could take an apiary in the beginning of March with every colony diseased, and by May 1, with but very little labor, deliver it up clean and strong, as strong as though the disease had never appeared. These experiments and investigations have cost me much in time, and money, and mental effort; but as they will, I feel assured, be the means of saving thousands annually to bee-keepers generally, I rejoice, and ask them to rejoice with me.

Acton, London, England.

FRANK R. CHESHIRE.

By the apiarists of England the above is regarded as one of the greatest discoveries of the age. Phenol is carbolic acid, and must be *pure* to have the desired effect. We shall give more on this subject in future numbers of the AMERICAN BEE JOURNAL. To show how positive Mr. Cheshire is of its being an absolute cure, he says:

"I assert with all the positiveness I can command, that phenol, upon my plan, is a specific, and only needs a careful and correct application. And, best of all, no loss is occasioned; the food given stimulates and strengthens, as well as restores health, and a smitten colony will, from the little extra attention it gets, soon become probably the best in the apiary. This notion, too, about infected hives is largely a delusion. Burning is sheer folly. Boiling is utterly useless, for it would not kill the spores, if such were present. Washing with carbolyzed soap is all-sufficient."

CORRESPONDENCE

For the American Bee Journal.

Statistics of the Honey Crop.

G. M. DOOLITTLE.

Much has been written during the last few years relative to a statistical report, regarding the honey production of our country, and all believing that such a report would be of great value to the bee-keepers residing in North America. To this end the National Convention, in the fall of 1882, appointed a committee to gather together all the individual reports possible from every State in the Union and Canada; so that these reports might be condensed into a suitable table, thus showing the extent of the honey-production of our country. Although the work of this committee was a partial failure, owing to various causes, still we have the table as given by Dr. C. C. Miller, on page 221 of the BEE JOURNAL of 1883, which does much credit to the committee, and gives us, together with Dr. Miller's remarks on page 222, a fair idea of the honey-production of our country. Again, on page 51 of the same volume, is a report of the honey-production of the State of Illinois, as gathered by the assessors of that State, which is probably the most complete report ever published in the bee-papers.

Now, while these reports are of much value in giving the honey resources of our country, still they are not just what the wants of the honey-producer demands; inasmuch as they come too late to help us in marketing our product. What we want to know is, how much white honey there is in the country previous to Sept. 1 of the same year in which the report is collected, for nearly all of the disposing of our crop is done for the next six months after that date. Hence, it becomes almost a necessity that we have some reliable means of knowing what the crop of white honey is each year, previous to the time of selling, if we would dispose of our crop understandingly. Thus far, all of our statistical reports have not helped us in the least in this matter, in that they have been nearly a year behind the time that we have use for them. Some object to any one having access to a statistical report save the producers, but I think this a mistake; for we should be willing to "let live as well as to live." Thus the report becomes of as great value to the buyer as to the producer, and he should have the benefit of it to enable him to buy understandingly.

In the above, all will, I think, see the necessity of a reliable report on or about Sept. 1 of each year; but how we are to get such a report is the thing which has baffled us so far. I see by a late monthly bee-paper that there is talk of establishing a bee-keepers' bureau for this purpose, and

if all will take hold of it, it may prove a good thing; although the thing as proposed looks like shutting out all but the producer, under a penalty of any producer who shall divulge any information to the merchant or consumer. I claim that the merchant and the consumer have as good a right to facts regarding the honey-production of our country as any one; and a staple market price for honey cannot be obtained until they do have that right.

A method for obtaining statistics which will benefit all is what we want. I am led to give one which has already partially developed in the BEE JOURNAL without any labor or thought being expended upon it—through the columns of "Our Letter Box." In these columns we find reports from nearly every State and country in the world, which reports are given free; so that no great expense is attachable to my plan. It was these reports and the cheapness of them which led me to study into the feasibility of obtaining a statistical report through them.

By taking a complete Postal Guide (the January issue) we find that the location of every county in every State is given by a little ☉ with a point being attached to all of them except the circle for the central counties, which are left plain. The point is attached to the side of the circle, so as to designate the relative position of each county in relation to an imaginary division of the State. Thus, if a county is in the northern part of a State, it is designated thus ♂, if south, thus ♀, etc.

Now, as I read the reports in "Our Letter Box" from the different States, I took my Postal Guide, and by the Post-Office given, found the county, and then found the relative position that this county held in the State, and thus I got a limited idea of the honey yield of that portion of the State. When several reports were given from one State, I got a limited idea of the yield of that State. Take the State of Indiana for instance: I find under date of July 28, a report from S. Hathaway of "less than one-half a crop," and by turning to the Postal Guide, I find that he lives in Delaware county, which is in the eastern part of the State. Under date of Aug. 3, B. F. Baldwin reports 60 pounds of honey per colony; Le living in Grant county, which is in the central part of the State. Then J. M. Hicks reports from the northern part of the State under date of Aug. 15, "no honey;" while under date of Aug. 20, J. Sharp reports from the western part, "poor season for honey." Could I get a report from the southern part of the State, I would have the report from five different parts of Indiana. But as it is, I have only a report from four parts from which to summarize.

In summarizing, I call an average crop 50 lbs. of comb honey, per colony, or 75 lbs. of extracted; but as none of these reports say whether the honey is comb or extracted, I must guess them at one-half of each, hence 62 pounds is an average crop. Mr. Hathaway says "less than one-half,"

which would be 30 pounds; Mr. Baldwin says "60 pounds;" Mr. Hicks says none; while Mr. Sharp says "poor season," which I call 15 pounds. Add these together and I have 105 pounds, which, divided by the number reporting, or 4, gives 26 pounds as the average yield of honey per colony in the State of Indiana, or a little more than one-third of a crop. In this way I take all of the States reporting, and summarize the whole United States and Canada, when I find the yield for 1884 is below an average yield.

Now, if we consider that only those who get large yields are given to reporting, we must reduce this amount about one-third, when I guess that the crop of 1884 is about two-thirds of an average yield, which guess I will wager is not far out of the way. But, says one, "we want no guessing in the matter." True, and the reason we had to guess was, because so few volunteered to report. However, the plan was what I was after, not the guessing at the 1884 crop; for the plan can be made to produce a reliable report.

About Aug. 1, let the Editor of the BEE JOURNAL, or any one interested to the amount of about \$5.00, write a postal card to bee-keepers who take the BEE JOURNAL, and who live in the central, north, east, south, and western part of each State (or print the cards when \$5.00 will cover the cost) to collect the reports of at least one bee-keeper in each county which he thinks is covered by his territory, or have that bee-keeper summarize reports in his own county, when a summarized report of such counties is to be sent to the Editor of the BEE JOURNAL.

He will now have about 200 to 250 summarized reports which he can summarize by States, and again as a whole, giving it in the first issue of the BEE JOURNAL for September. Thus we shall have a report of all the average yields of white honey, in time to be of value to us. All will be looking forward to this report as a guide to their future actions regarding the buying and selling of the crop. All will have sufficient interest in the work to cause them to take action in it.

Most bee-keepers know the amount of the crop in their respective counties, as early as Aug. 10, and a report could be made out with but little writing, save to the one who is to send the report to the BEE JOURNAL; bee-keepers, as a rule, are a set who tell their bee-keeping neighbors of their welfare. I had heard from nearly all the bee-keepers, in this county, previous to Aug. 10, this year; and the highest report was 50 pounds per colony, while nothing was reported by others. A summarized report of the county would give an average yield of 18 pounds to each colony in the spring. Then I had letters from Cayuga, Cortland, Madison, Oneida, Tompkins and Chenango counties, which would bring the average yield of the honey crop in Central New York down to about 16 pounds per colony, or less than one-third of the average yield, as given by practical

bee-keepers in this section, for the past ten years. If, added to such a report as the above, we could have a reliable census report every ten years, showing the growth or decline of our business, it seems as if all might be satisfied.

If my plan is looked upon with favor, and it is so desired, I will see to the getting of a report from Central New York, and would suggest Ira Barber, De Kalb, N. Y., to look after a report of the north part of the State; J. H. Martin, Hartford, N. Y., for the east; M. A. Williams & Co., Berkshire, N. Y., for the south, and G. W. Stanley, Wyoming, N. Y., for the west.

Now, fellow bee-keepers, let us take hold of this thing in some shape, and have a report each year in time to be of benefit to us. If my plan does not look feasible to you, give your plan, and let us take action on the plans till we strike one that is feasible. If my plan is considered as a good one, then let some one from each State volunteer to do his part of the work, and suggest names from the other parts of his State as I have done; so that by next July we may get the thing in working order.

Borodino, N. Y.

[This plan looks more simple and practical than anything heretofore suggested. We have procured a lot of the marks, and will use them for awhile and see how the plan will work. This diagram will represent a

State, and the 9 points of compass will be indicated as shown. One of these marks will be put after each person's name, to show in what part of the State he resides.—Ed.]

For the American Bee Journal.

That Strange Noise—Shiny Bees.

WM. MALONE—23-37.

This has been a peculiar season for honey. The forepart of it was promising, and did tolerably well up to July 10, and then the storing of surplus honey was ended for the season of 1884. But the bees still kept up breeding, and showed no signs of robbing until Sept. 20; since then we dare not open a hive. From 23 colonies I have extracted 1,100 pounds, and have taken some 25 or 30 one-pound sections, which contained white clover honey and honey-dew mixed, and I sold it at 8½ cents per pound. I think that the honey-dew in this county is caused by small, green insects, the most of them being invisible to the naked eye. On page 620 is a question by Dr. J. N. Smoot, in regard to a peculiar sound heard in one of his bee-hives, and Mr. Heddon

gives it up. This peculiar sound is caused by the drones at the time when the bees drive them out of the hive. Bees seldom, if ever, sting the drones, but they starve them to death. This noise I have often noticed, and have, on examination, found the drones covered up in the hive and making this noise. You will have to open the hive very carefully if you want to see them making this noise; and you will pity them when you realize that they are starved to death. On the same page Mr. H. J. Northrup asks a question about shiny or black bees. I have had the same in my apiary, more or less, every year since I have been in the bee-business, which is 5 years. They are old bees, and we find them in our strongest colonies. We need have no fears as to the future prosperity of these colonies. To explain: If a queen lays 2,000 eggs in 24 hours, of course 2,000 bees must die of old age in the same length of time. Old bees sometimes die on the floors and sometimes in the hive at night, and some are carried away from the hive in the day time. Another reason, I think, is that strong colonies are more liable to rob, and in this way become shiny and worn out sooner than they would if working in the field. I have seen lots of such bees that were not much larger than large, black ants, and some that had no stinger. This, I think, proves that they have been in mischief somewhere. Still another reason: Queens that are extra prolific will lay more eggs than the colony can properly care for, and, of course, the bees will die sooner than if they had been properly cared for in the larval state. Let me second Mr. G. W. Demaree's plan of obtaining surplus honey, as given on page 619. That is the way that I do just before basswood blooms. I take the queen and enough bees and brood with which to start a nucleus; or if the queen is old, destroy her, and then give them all the room that they need. In this way, in 1882, I got 200 pounds per colony, from 10 colonies, in 16 days.

Oakley, Iowa, Sept. 26, 1884.

For the American Bee Journal.

Southern Wisconsin Convention.

The convention met at the Court House at Janesville, Sept. 23, 1884, in an equinoctial storm. The meeting was called to order by President C. O. Shannon. The usual order of business was transacted, and statistics were taken. In looking over the incomplete table, we find that the amount of comb honey is more than double that of extracted. The best average yield was 121 pounds of surplus comb honey per colony, and an increase that more than doubled the number of colonies.

The most important honey-producing plant is white clover, and it has furnished nearly all of the surplus honey. Fruit bloom furnished enough to stimulate the bees and start breeding. The honey-dew was in great abundance in some localities for a short time; however, the quantity

gathered was not large. The golden-rod, of which there are many varieties in the district, bloomed well, but it furnished no surplus. Buckwheat is reported as having produced little or no honey. The surplus-honey harvest commenced with June, and practically ended about the middle of July.

The convention indulged in a hearty discussion on some of the many knotty problems which bee-keepers have to solve. The following are some of the questions asked and answered: "What kind of bees build the straightest combs without the use of separators?" The prevailing opinion was in favor of the native or black bees.

"What kind of bees are easiest to handle when swarming?" The black bees, because they hang to the cluster, and are less liable to sting.

"Is doubling up colonies, in the fall, advisable?" Doubling up colonies which are weak is advisable.

"What is the best way to prevent swarming?" Swarming may be prevented by keeping the drones killed off, or by extracting the honey. Should a swarm issue, return it to the hive, and destroy the queen-cells every week.

"Are any pure Italian queens known to be black?" Yes; some are quite black.

"What width of section is best adapted for securing straight combs without the use of separators?" Sections which are 1¾ inches wide.

"How do you get the bees out of surplus boxes?" Drive all the bees that you can below with smoke, then take off the boxes and carry them into a dark room, leaving the door partly open; all remaining bees will return to the hive.

"Is it advisable, on the whole, to encourage beginners?" Some complain that there is a tendency, on the part of amateur bee-keepers, to dispose of their surplus honey at dealers' prices, which, of course, is always low, and sometimes below the actual cost of production. They put their honey on the market in every conceivable shape, and are willing to "take it out in trade." The price is established, and the man who depends upon bee-keeping for his bread and butter must hold his honey until this lose product is consumed; or if obliged to sell, then he must do so at a great sacrifice. It is agreed that 12½ cents for extracted, and 15 cents for comb honey is very cheap, and that anything less is ruinous to the business.

Exhibits of aparian supplies were furnished by a member from Illinois. The samples of foundation were very fine. Also a frame of wired foundation. The top-bar of the frame was nearly square, being a substantial support for the comb when filled with honey. The top bar of some frames are so light that unless supported in some way, they will sag when filled with honey, and are liable to be broken when taken out of the hive.

The table of statistics will not be completed until our next meeting, which will be held at the Court House in Janesville, on Oct. 28, 1884, at 10 a.

m. At that meeting the best methods of wintering bees will be discussed.

Bee and Honey Show at London, Ont.

WM. H. WESTON.

The bee and honey show at the Western Fair, which was held at London, Ont., during last week, was far from what it should have been. I had been led to suppose that if the directors would only give a good premium list, that the bee-keepers of this section would make a very large display, but my anticipations were far from what was realized. The exhibit, although small, was very tastily arranged on the shelves prepared for the purpose, in a neat building kindly set apart for the bee and honey show.

Upon entering the building the first exhibit was that of Mr. Jos. Aches, of Amiens, who had the largest show of comb honey in the building. He also exhibited extracted honey, queens, beeswax, and a full colony of bees. His exhibit was a very attractive one, and calculated to teach the public that advanced bee-keeping has come to stay, and that by careful attention money can be made at the business. His exhibit of queens of his own rearing, was splendid.

The next was that of Mr. D. P. Campbell, of Parkhill, who showed a large amount of extracted honey, also comb honey, hives, queens, extractors, smokers, etc.; also an Olm comb foundation mill, and foundation with it. Mr. Campbell displayed very fine queens of his own breeding. I might say that Mr. Campbell is President of the North Middlesex Bee-Keepers' Association.

Mr. G. B. Jones, of Brantford, representing E. L. Goad & Co., next attracted our attention, and pleases us very much with his large show of apiarian supplies. It was the most comprehensive exhibit ever shown in this part of Canada. Mr. Jones was kept very busy all the week explaining the many articles used by bee-keepers. It is not necessary to mention that he had to explain a great many times that his honey extractor was not a new style of "churn" or "ice cream freezer;" or that his wax-extractor was not a "coal-oil stove."

We now come to a very nice display of extracted honey in Gem jars, which, I have no doubt, made many thousand mouths "water" during the week, as it looked simply delicious. Mr. Smith, of Ealing, who has it, says that the people like to see what they buy, and, therefore, glass jars are the best for the purpose. He also showed hives, both wax and honey extractors, and a very fine cake of wax. Mrs. John Rudd, of London, Ont., exhibited a quantity of extracted honey on which she took the first prize. Mrs. Wm. Bigg, of Granton, also took the prize for comb honey.

Mr. John Rudd showed hives, extractors, smokers, bee-feeders, etc.; also queens and a full colony of Italian

bees. He did a large trade in selling honey by allowing persons to eat what they wanted to for 5 cents each, which caused much merriment for the spectators. Many thought that they could eat more than what was set before them, but went away satisfied.

Mr. Alex. Scott, of Ealing, displayed a honey cake, honey vinegar, and comb and extracted honey. There was also a number of other exhibits, but nothing worthy of special remark. The North Middlesex Bee-Keepers' Convention was to have been held during the week, but the other attractions were greater, and only a small number made their appearance, who held an informal meeting in the hall of the Masonic Temple, where they talked over matters pertaining to bee-culture to the edification of all present. London, Ont.

Bee-Diarrhoea—Hot Weather.

B. F. CARROLL—115.

I wrote an article for the BEE JOURNAL about April 1, giving the condition of my bees at that time, with my experience on the pollen theory as advanced by Mr. Heddon; but, as so much had been already said, I thought I would not send it, and as I see a statement in the late number of the BEE JOURNAL, that bees are not bothered with diarrhoea South of Kentucky, I write to correct this mistake.

It is true that we bee-keepers "down South" have no long winters and severe freezes to keep our bees confined longer than eight to twenty days at a time. Our bees are not often bothered with "spring dwindling" and diarrhoea, but last winter they began bringing in pollen on Feb. 2, and continued to do so up to Feb. 12, during which time the queens began laying rapidly, and everything was lovely. The mercury stood at 65° Fahr. in the shade. A regular Texas norther comes howling from the northwest with sleet and hail until the ground was covered with ice. The mercury went down to 20° Fahr., and my bees were confined six days. The cold broke off as suddenly as it came up, and the bees all tried to come out at once. The earth was fairly sprinkled with little worm-like pollen-masses voided by the bees, showing plainly that every colony (80) in the yard was diseased; and had the cold lasted ten days longer, I truly believe that every colony would have died. One colony was attacked by robbers, and in order to keep it down, I tacked a piece of wire-cloth over the entrance, and put on an empty story above, after removing the enamel cloth, so the bees could have all the air that they needed.

I did not look at them again for two days, when I found that nearly all of the bees were dead or dying. The hive was badly besmeared with the same pollen-masses, only thinner, and what few bees that were left, were so badly swollen that but few of them could fly. The proof is this: That a

colony must first start to brood-rearing—active for awhile, and then suddenly stopped by cold, with plenty of pollen and confinement—and diarrhoea is inevitable. Pollen, confinement and cold is the true cause of bee diarrhoea; and if the Northern bee-keepers can overcome one or all of the above by plenty of warm packing and warm rooms, I think that they may be able to winter their bees well.

An item about the weather. Early in June the rains ceased, and it is still dry. For 68 days the thermometer has shown 100° Fahr. and upwards. Aug. 29 was the hottest day ever known in Texas. Pop-corn, in the ear, popped in the fields. I lost over 200 frames of comb by melting down, and the hives were in the shade of peach trees. Many combs built on wired frames, melted down as badly as those without wires. The bees were gathering honey-dew at the time very rapidly, and the hives were all full. As soon as I discovered that the combs were tumbling, I began to throw water on the hives, and by this means I partially kept down robbing. I lost only 4 three-frame nuclei. The thermometer at 4 p. m. indicated 107° Fahr. in the shade. On every day of September the mercury has been from 100° to 103° Fahr. in the shade; today, Sept. 22, it was at 102° Fahr.

For the American Bee Journal.

Kentucky State Convention.

The Kentucky State Bee-Keepers' Association met in Helm's Hall, at Eminence, Ky., on Sept. 2, 1884, and was called to order by President Demaree. Mr. E. Drane was elected Secretary *pro tem*. In the absence of the Secretary the calling of the roll and reading of the minutes of the preceding meeting was dispensed with. The attendance was slim.

President Demaree explained the action of the committee on the honey resources of Kentucky. It was the wish of those present that the committee endeavor to raise money to have the report published in pamphlet form. The President delivered a short and interesting address.

Rev. L. Johnson, of Walton, Ky., was unanimously chosen President for next year; Wm. Cook, of Bowling Green, Vice-President; J. T. Connelly, of Sherman, Secretary; J. B. Nalt, of Louisville, Treasurer.

The following gentlemen were appointed County Vice-Presidents to look after the interests of bee-culture in their sections, and report to the next meeting:

W. P. Gibson, Grant Co.
Geo. L. Beach, Kenton Co.
Dr. N. P. Allen, Smith's Grove.
W. F. Storm, Lexington.
A. W. Stith, Dividing Ridge, Pendleton Co.
G. W. Ashby, Valley Station, Jefferson Co.
W. B. Moody, New Castle, Henry Co.
Enoch Brown, Little Mount, Spencer Co.
Wm. Wilson, Nelson Co.
E. Drane, Eminence, Henry Co.
E. M. Argo, Paint Lick, Garrard Co.
W. T. Stuart, Madison, Ind.

Covington, Ky., was chosen for the place of the next meeting, and the time Sept. 23 and 24, 1885.

E. DRANE Sec. *pro tem*.

G. W. DEMAREE, Pres.

SELECTIONS FROM OUR LETTER BOX

Strange Noise in a Bee-Hive.

I think that the strange noise of which Mr. J. N. Smoot speaks, on page 620, is the result of the workers trying to drive out the drones, and the latter getting into some hollow place, make the noise referred to. I have heard the same thing, and have come to the above conclusion.

A. F. ROBSON.

Italy, N. Y., Sept. 29, 1884.

My Report for 1884.

Another honey season has passed, and as the reports of the season are in order, I will give mine also. Last spring almost all of the bees were not in a very good condition, the most of them being somewhat weak, and it took half of the season for them to get sufficient bees to work in the sections, excepting the Syrians which were ready for the honey harvest, and they commenced to work in the sections a month before any of the Italians and hybrids began. The Italians and hybrids gathered only about 30 pounds of honey, while the Syrians and Syrian-hybrids gathered from 50 to 80 pounds per colony, and the honey season was not as good as that of last year. I think that the Syrians are the best bees that ever landed on the American shores. It was almost too cold here all summer for bees to work, so I got only about one-half of a crop of honey. To-day I received a fine Syrian queen from Mt. Lebanon in Syria. After a journey of 21 days she was as lively as if she had just been taken out of the hive, and only about a dozen bees were dead.

L. A. LOWMASTER.

Belle Vernon, O., Sept. 20, 1884.

A Poor Season.

The season here was a fair one up to June 25, when it turned cold and remained so during basswood bloom, which was plentiful enough in this immediate locality, but there was too much cold, northwest winds to receive any honey from that source. Bees built up nicely on fruit bloom, and then filled up the hives with honeydew; then came white clover which was mixed more or less, thus damaging what little surplus that was obtained. I have heard several complaints from parties purchasing honey that they could not eat, or was very poor stuff. Since June 25, bees have barely obtained a living, and there is not a drop of fall honey. They will have to be fed some for winter. The honey-flow seems to be in spots throughout this part of the country, as some bee-keepers in favorable localities have secured a fair crop, but, as a whole, the season is a poor one. Our County Fair held here during the past week, was a grand success. The Society coming out enough ahead so that they will be enabled to

put improvements on the new grounds purchased this season. The bee-keepers' display was good for as poor a season as we have had. There was a lady bee-keeper who exhibited an observatory hive made by herself, which attracted considerable attention. With better accommodations, and an enlarged premium list, we hope, if possible, to make a much larger display next fall.

A. M. GANDER.

Adrian, Mich., Sept. 29, 1884.

Report for 1884.

I commenced the spring with 68 colonies of black bees; increased to 110; and they produced 4,200 pounds of comb honey, and 1,000 pounds of extracted. How is that for a poor season?

J. HODGSON, JR.

Pewaukee, Wis., Oct. 1, 1884.

[Good enough.—Ed.]

Season Almost an Entire Failure.

We had about one-half of a crop of honey in 1883, but this season is almost an entire failure. Bees came through the winter healthy and strong. Fruit bloom was very abundant. We have some 700 apple trees besides cherry and plum trees. There was as good a stand of white clover as I have ever seen, and it was in bloom rather longer than usual. Other honey-plants were about as usual, and yet little or no surplus honey was stored.

S. S. KEIGWIN.

Springfield, Ill., Sept. 29, 1884.

Apiarian Display at New Orleans.

I am appointed by the Agricultural Department of the United States to make an apiarian display at New Orleans in connection with their collections. The exhibition will not be large, but I shall aim to show that which will be the most instructive: Hives, apparatus for surplus honey, honey in all forms to ship and in market, and all kinds of apparatuses and material used or produced in the apiary. If any bee-keeper thinks that he has that which will be instructive, and is new or peculiar, I shall be glad to hear from him. I am given but little means for this object, and I desire to limit the exhibit to the practically useful. I shall also be glad of suggestions.

A. J. COOK.

Agr'l College, Mich., Sept. 26, 1884.

Report for the Season.

This has been the best season for the production of honey from fall flowers, that I have ever known. The yield from white clover was small, but enough, however, to keep brood-rearing going constantly forward. Goldenrod began to show itself about Aug. 28, and from that date till Sept. 22, my bees have been fairly rushing it into their hives. I have been obliged to extract every week; my practice being, not to extract at all until capping is commenced in the upper part of the combs; thus I am assured of well ripened honey. The honey, too, this season, from golden-

rod, is exceedingly light in color; in fact, almost as light as that from white clover, although not as limpid in appearance. I have found it so heavy that two or three samples tested by weight, pulled down the scale at 14¼ pounds to the gallon. My entire surplus comes from fruit bloom gathered in early spring, and goldenrod this fall. I had 8 colonies last spring, sold 6 and delivered them before May 25, increased to 10 strong colonies well prepared for winter, and have over 900 pounds of honey besides. I give this report to show what the possibilities are in a poor locality, but beginners must bear in mind one thing, viz: that I have devoted some 18 years to the study and practice of apiculture, and have applied the experience thus gained, to the care of my little apiary. What I have done, others can do equally as well; but in order to make even a partial success of apiculture, requires hard study, hard work, and more than all else, the knowing how to do the right thing at the right time and doing it.

J. E. POND, JR.

Foxboro, Mass., Sept. 25, 1884.

St. Joseph Co., Ind. Convention.

The convention of St. Joseph county, Ind., bee-keepers assembled on Saturday, Sept. 27, in the commissioners' room at the Court House. W. D. Rockbill acted as temporary chairman, and presided over a good-sized body of men interested in bee-keeping. Mr. Geo. H. Stover, of Centre township, acted as temporary Secretary. The morning session was devoted to the treatment of general topics of interest to those engaged in bee-keeping. The convention adjourned to meet at 1:30 p. m., after appointing a committee on permanent organization and one on constitution and by-laws.

The committee on constitution and by-laws reported at its afternoon session, through its chairman, A. J. Hatfield. The report was adopted.

The following were selected as officers of the convention: President, A. J. Hatfield; Vice-President, Wm. D. Rockhill; Secretary, Geo. H. Stover; Treasurer, A. Lindley.

The name decided upon was "The Bee-Keepers' Association of Northern Indiana."

A. J. & E. Hatfield, the well-known bee-breeders of New Carlisle, have a novel and tempting exhibit in Exposition Hall, consisting of honey in the comb, as well as extracted. There is a pyramid of white-clover honey in boxes on one side of the booth, on the other side honey from the basswood blossom, and on the other side, honey from fall flowers. A colony of industrious Italian bees is among the collection, and through the glass sides of the box, the bees can be seen at work. The Messrs. Hatfield are practical bee-men, and have some 200 colonies.—*South Bend, Ind., Tribune.*

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares; therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Honey for Bees in Winter.

Will Mr. Heddon please answer the following questions:

1. Is buckwheat honey good for bees to winter on?
 2. As a general thing, is the honey produced this year going to be very good for bees to winter on?
 3. Is it necessary to put a quilt over the bees, when wintering in a cellar where the temperature can be kept at from 45° to 50° Fahr.?
 4. Is it best, or not, to leave off the upper story with all the combs taken out?
- WILSON SHERMAN,
 Chester Centre, Iowa, Sept. 29, 1884.

ANSWERS.—1. So far as my experience and observation has gone, it is.

2. I can only answer for my own location, and that answer is, yes.

3. A quilt will not cause or prevent bee-diarrhea, which is our only successful winter enemy. I am of the opinion that it is of little value.

4. I presume that you mean to leave the upper story "on" and not "off." While I do not think that it would do any harm, I have not enough faith in its possessing any benefit to advise having it to carry and take up room in the cellar, though I must confess that I do not know. I only know that bees will have diar-

rhea and die both with and without this empty super over the brood-chamber, for I have tried it. Neither theoretically nor practically have I any reason to think that colored honey has any tendency to produce the disease because of its color. Here, we have three surplus honey crops each year, and more than half of the time have August, colored honey to winter the bees on, and we do not have any more disease when we winter them on this weed honey than when wintering on pine, basswood and clover honey. It is my opinion that the consumption of pollen during confinement, is the cause of the disease, and that often the honey contains this pollen to some extent in cells that have bee-bread in their lower half, and honey in the upper half. When we learn the cause and prevention of bee-diarrhea, then we shall readily learn the beneficial and detrimental effects of all the other conditions, such as ventilation, etc., upon the quantity of food required to bring the colonies through in the strongest condition.

Cellar Ventilation.

Please inform me through the BEE JOURNAL whether or not I can properly ventilate my bee-cellar (18x24 feet) by two pipes connecting with the outside atmosphere, both at the top of the cellar, but one is a short pipe and the other extending to the bottom of the cellar. Is the method practical? and are the pipes sufficiently large, each being 2 inches in diameter.

SUBSCRIBER.

ANSWER.—This subject is one upon which I lack experience. I know of no person who has had enough to warrant a reasonable reply. As it is a fact that bee-diarrhea is the cause of our loss of bees in winter, and also that bees have it, and do not have it, in all sorts of cellars and out-of-doors, with and without all manner of both cellar and hive ventilation, how can we ever find out what sort of ventilation is best for bees until we first learn how to prevent that devastating disease? I should think that your two ventilation pipes would ventilate your cellar sufficiently; but because your bees go through the coming winter in nice condition, will not prove it. It will only prove that it will do, other things being all right. Again, should your colonies all die with diarrhea, that will not prove that your ventilation is imperfect. I have known a whole apiary to come out in the spring in perfect health with very bad or no ventilation, and again, nearly all to die with diarrhea in cellars that were well ventilated.

Convention Notices.

The Tuscarawas County Bee-Keepers' Association will hold its next meeting at the apiary of Geo. F. Williams, in New Philadelphia, O., on Thursday, Oct. 23, 1884.

G. F. WILLIAMS, Sec.

A. A. FRADENBURG, Pres.

National Bee-Keepers' Association.

As has already been noticed, the next annual meeting of the North American Bee-Keepers' Association will be held in the city of Rochester, N. Y., Oct. 28, 29 and 30, 1884. Essays will be read as follows: "Wintering Bees," by W. F. Clarke, of Canada; "Nectar," by Prof. A. J. Cook, of Michigan; "Marketing Honey," by Thos. G. Newman, of Illinois; "Foul Brood," by D. A. Jones, of Canada. The committee has decided to use the balance of the time in discussing these and other questions of importance. Those who cannot be present, and have questions that they desire to have discussed or answered, will please send the same to the Secretary, Dr. C. C. Miller, of Marengo, Ill., or to Rochester, in care of the convention, on or before the first day of the meeting. Notice as to place of meeting will be given hereafter.

C. C. MILLER, Sec.

L. C. ROOT, Vice-Pres.

Convention at Chicago.

The Northwestern Bee-Keepers' Association will hold its fifth annual convention at Owsley's Hall, northwest corner of Robey and West Madison streets, Chicago, Ill., on Wednesday and Thursday, Oct. 15 and 16, commencing at 10 a. m. on Wednesday, and holding five sessions. Those who have attended one of these annual re-unions will need no urging to induce them to come again; those who have not, should remember that Father Langstroth characterized the last meeting as "representing the largest number of large, practical and successful honey-producers of any convention that he had ever visited." This meeting being held during the Inter-State Industrial Exposition, reduced railroad fares may be had on nearly all of the railroads.

W. Z. HUTCHINSON, Sec.

C. C. MILLER, Pres.

The Northern Ohio Bee-Keepers' Association will hold their next meeting in the Council Chamber at Norwalk, O., on Wednesday, Oct. 15, 1884.

H. R. BOARDMAN, Sec.

The Northwestern Indiana Bee-Keepers' Association will hold their annual meeting in the city of La Porte, at Lay's Opera House, on Wednesday, Oct. 22, 1884, beginning at 10 a. m. Essays will be read as follows: "The preparation and wintering of bees in the cellar," by G. R. Tyrrell, President; "The profitable use of comb foundation," by Dwight Furness, Vice-President of Porter County, Ind.; "The preparation and wintering of bees on the summer stand," by A. Fahnestock, Secretary; "Introducing queens and how to get rid of fertile workers" will be subjects for discussion. A full attendance is requested. Ladies are specially invited.

A. FAHNESTOCK, Sec.

G. R. TYRRELL, Pres.

Special Notices.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$1.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Oct. 6, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. to the jobbing way, and brings 14@15c on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-uses, as well as for darker grades in barrels. It brings 6@9c. on arrival.

BEESWAX—1a dull at 28@29c on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb, 18@20c., 2-lb, 16@18c.; fair to good, 1 and 2-lb, 14@16c.; fancy buckwheat, 1-lb, 12@13c., 2-lb, 11@12c.; ordinary grades of dark, 1 and 2-lb, 11@12c. Extracted white choice, in kegs or small barrels, 8@9c., buckwheat, 6@7c. BEESWAX—Prime yellow, 30@31c.

MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Unglassed sections sell best.

BEESWAX—3c.
BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—No movement of consequence. Stocks are of fair proportions, but are in some instances limited to figures not obtainable. Choice extracted is in demand at the quotations below noted. White to extra white comb, 9@11c.; dark to good, 7@9c.; extracted, choice to extra white, 4@5c.; dark and candied, 4c.

BEESWAX.—For oleale, 25@28c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.

BEESWAX—Firm at 32@32½c. for choice.
W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—Our market is at present overstocked with honey, large quantities having been brought in wagon, and every place is filled up. Some lots have sold as low as 10c. for 1-lb. sections of white comb. We have not changed prices, but find sales very slow at 16c. for best white 1-lb., and 14c. for 2-lb. Dark honey we are offering as low as 10 to 12c. without being able to effect sales. Extracted is not wanted at all, and no sale at any price.

BEESWAX.—28@30c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We quote comb honey in 2 lb. sections, 15c; extracted, 7@7½c.
GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY—There has been a good demand with liberal receipts, and prices remain the same. Choice Eastern comb, ½-pound sections, 18c; 1-pound, 16c; 2-pounds, 15c. California comb, 2-pound sections, 15c. Lower grades are slow at 2 or 3 cents less. Extracted, 6½@8c, according to quality.

BEESWAX—None in the market.
CLEMONS, CLOON & Co.
Successors to Jeroma Twichell.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50; 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Book Notices.

MRS. EMMA D. E. N. SOUTHWORTH, the author of "SELF-RAISED; OR FROM THE DEPTHS," published this day by T. B. Peterson & Brothers, Philadelphia, considers it to be the best work she has ever written. In it, the hero rises from the depths of poverty, misery and humiliation, and to trace his progress, step by step, has been with her a labor of love. There has been a curious blending of realism and romance in this work—the result, it may be, of the leading incidents having occurred in actual life. It contains 658 pages. Price 75 cents.

We have secured a copy of the AMERICAN ANTIQUARIAN AND ORIENTAL JOURNAL, which has come to be recognized as authority on the subject of archaeology. We have been much interested in its perusal. It is edited by Stephen D. Peet, and is published at Clinton, Wis.

OGILVIE'S HANDY BOOK of Useful Information, is the title of a modest little book of 128 pages we have just received, which contains more information of practical value than many books that cost from \$2.00 upwards. It contains statistical tables of practical value for every department of human effort. The Political, Historical, and Biographical information alone, is worth double the price of the book. It is bound in handsome leatherette, flexible covers, and will be sent by mail for 25 cents; or bound in silk cloth for 50 cents, by J. S. Ogilvie & Co., Publishers, 31 Rose Street, New York.

3 Months FREE

We will mail THE RURAL HOME for three months ON TRIAL, to any address on receipt of only 10 cents to help pay postage, packing, etc. Or for 30 cts., silver or stamps, we will mail THE RURAL HOME for one year. Do any person sending us a club of four 30 cts. subscriptions we will send a sample of silver-plated ware premiums, choice of Sugar Shell, Salt Spoon, Mustard Spoon, Butter Knife, Solid Gold Propelling Pencil, Gold Thimble, etc. Or we will send, for four 30 cts. subscriptions, a copy of any of the Poets in 12mo. volumes illustrated, and hand-sewn bound in cloth, fifty authors to choose from, including Burns, Milton, Shelley, Shakespeare, Pope, Tennyson, etc. Or to the ladies, we will give a copy of the "Ladies' Manual of Fancy Work," an illustrated guide to all kinds of needle work, containing over 400 illustrations. The above goods are warranted first-class, and if not satisfactory we will refund money. Address,

THE RURAL HOME, Philadelphia, Pa.

HEDDON'S COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

QUEENS!

Our New Strain,

Also IMPORTED ITALIANS!

Take your choice. Prices:

OLDEST BEE PAPER
IN AMERICA

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., October 15, 1884.

VOL. XX.—No. 42.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies to the same or different post-offices; \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies for the same or different post-offices for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1879.

The Original
BINGHAM
Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies, but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 will be not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 25 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee Houses. A chapter from "Bees and Honey." Price 5c.

Biennen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Only Used for Adulterating.

Mr. E. C. Jordan, of Virginia, has sent us the following article from the *Virginia Standard*, and desires it answered in the BEE JOURNAL:

The fact that the firm of Candiani & Giannini were preparing to engage in the manufacture of syrup, or glucose from potatoes, has caused considerable inquiry into the uses of the article. The manufacture of it has not been attempted in this State before, so far as we can learn, but it is made extensively in the Western States, from corn, etc.

It is used mostly as an *adulterant* in the manufacture of table syrups and in *adulterating* the dark, moist sugars used largely by the poor. Its next largest use is in the manufacture of candies. All soft candies, waxes, taffies, caramels, etc., are made of glucose. Children are, therefore, large consumers of this substance.

The *honey bees* are also fond of it, and will carry it away by the ton if it is placed within their reach. The honey from it is no better than the PURE GLUCOSE, as it is stowed away in the cell without change.

Human ingenuity, it is stated, has reached the point of making the honey and storing it in the comb without the intervention of the bee. By appropriate machinery a nice looking comb is made out of paraffine, and after the cells are filled with glucose syrup, this fictitious "honey" is warranted true white clover honey.

The *Standard* is honest enough to admit that the only use to which glucose is put is to *adulterate* syrup, sugar and the like, but condones the offense because forsooth the sugars are "used largely by the poor."

Any article which has no legitimate use is a *fraud*, and its manufacture should be stopped. All honest men should frown upon its very existence.

One point in the above article is worth more than a passing remark, viz.: that children are large consumers of it in the shape of candies, taffies, etc. Yes; and thousands go to premature graves, and this glucose consumption is largely the cause. Out of mistaken kindness, mothers will let their children eat candies because they want *sweets*, never once thinking that they are dealing out trash to poison their blood and send them to early graves.

That sulphuric acid, a strong poison, is used in the manufacture of glucose, cannot be denied; that it can be purified from its effects by proper care is true, but it is undeniable that in the usual glucose of commerce this acid is found in deadly quantities.

How much better it would be to feed "the little ones" with honey, make it into honey cakes, honey cookies, honey ginger-snaps, honey liquorice, or honey pop-corn balls, recipes for which are found in the little pamphlet, "Honey as Food and Medicine!" or give them honey on plain bread and butter, which will give them strength and health in a pleasant way.

The *Standard* asserts that the honey-bees are fond of glucose—yes; so fond are they of it, that they will not touch it except when deprived of the nectar of flowers—when it comes to that or nothing—and certain death to the bees is the result!

Then comes that *lie* of Prof. Wiley, about human ingenuity making honey out of glucose, and putting it into combs made of paraffine, without the aid of bees! This falsehood was written by Prof. Wiley as a "scientific pleasantry," he says, but it is a mischief-making *lie* all the same! And one that should gnaw at his conscience (if he has any) like a serpent, every time his eye meets it, in its everlasting rounds in the newspapers!

Oh, no! man's ingenuity stands aghast before the waxen cells of beautiful virgin comb, made by the bees

to hold the delicious and God-given honey! Man's ingenuity has never dared to enter that contest, and probably never will—but Wiley's lie rides over the land like a fast-running engine, while his feeble excuse and explanation—that he meant it "only as a scientific pleasantry"—limps along behind as a cripple traveling at a snail's pace! It can never catch up with that *wily lie*, while the world lasts!

☞ We have received a pamphlet of 32 pages from the Michigan Agricultural College, by Prof. A. J. Cook, on "Injurious Insects." It is very interesting, and we presume it can be obtained by addressing the Professor, as it is evidently for free circulation—at least in Michigan.

☞ Mr. E. T. Flanagan and Miss Lillie R. Mithoff were married at Jefferson, La., on the 1st inst. We hope Mr. F. will realize much "honey" since the "introduction" of this new Southern "queen" into his "hive" at Belleville, Ill.

☞ In handling bees, do it quietly and easily. Avoid rapid, quick motions, but, at the same time, do not be all day at one hive, or so long as to induce robbing. Black or fuzzy clothes should not be worn in the apiary. White cotton, or linen, and a white straw hat is best. Veils have to be black to be seen through, but this should be all the black worn.—*Texas Ranch.*

☞ The "Autumn Leaves" which will bring the most returns are, no doubt, the Leaflets—"Why Eat Honey?" Scatter them and see the effect in selling honey in every neighborhood, at good prices. Two hundred will be sent postpaid for \$1.00; 500 for \$2.25; 1,000 for \$4.00.

☞ Some severe frosts have been reported, but the weather is now very pleasant again.

The North American Convention.

The annual convention of the beekeepers of North America is to be held at the City Hall in Rochester, N. Y., commencing at 1 p. m. on Tuesday, Oct. 28, and continuing three days. Reduced rates over the railroads are promised, and there will, no doubt, be a large attendance of those near the place of meeting, and many from other States.

As this is to be a National gathering, *wise counsels* should prevail, and whatever action is taken, should be based upon the interests of the beekeepers of the whole American continent.

A youthful bee-paper, published in the East, contains the following hints concerning some "matters of *VITAL importance*" to be brought before that meeting:

"Be sure, if possible, to attend the convention at Rochester, N. Y., as matters of *vital importance to bee-keepers will be discussed*, and come prepared to do all in your power to advance the best interests of apiculture. Our conventions are the life of apiculture, and the interests of the beekeepers are protected and advanced just in proportion as we take active interests in association work."

It then avers that it is desirable that "one journal shall be well-supported, which shall be the mouth-piece of the beekeepers and work for their interests"—*i. e.*, making it the "official organ." Is this one of the "matters of vital importance" which is to be discussed at that meeting? If so, it is well to know it in advance, so that all may be prepared to *discuss* the subject and investigate it in all its *important* bearings.

If such were desirable, of course the oldest and most influential bee-paper should be made such "official organ," but we protest against any such action. There are 6 or 7 American bee-papers, and it would be unreasonable and unjust to endorse one to the exclusion of all the others—for all are interested in the success of our pursuit, and all should alike be recognized as co-workers under the National banner.

A local society might select a local organ, but the National Society should extend its influence through *all the bee-papers*, and engage all as co-laborers for the general good. To attempt to do otherwise would divide its interests and fritter away its power to be useful, and in the end it would be *suicidal* to the parent society, and

work a positive damage to all. Of the National Society it should truthfully be said—

"No pent-up Utica contracts our powers;
The whole unbounded Continent is ours."

If *wise counsels* prevail at the coming meeting, the "National" may continue to be a power in the land—an energizing influence to aid the pursuit in its struggle for prosperity, and place honey-consumption upon the top-most round of popularity.

Honey Exhibits at Mich. Fair.

Mr. H. D. Cutting, in the *Michigan Farmer* gives the following, which will be of interest to our readers, showing the growth of honey exhibits, and some of the benefits accruing therefrom:

Bee-keeping is one of Michigan's growing industries. It has to a great extent passed the experimental state, and has been recognized as a business possessing both pleasure and profit. It is but a few years ago since a few of the progressive bee-keepers began to make exhibits of bees and their products at the fairs. It was a small beginning, and the premiums were small.

A few years ago the attention of the State Agricultural Society was called to this growing industry, and the persistent efforts of a few to make a creditable exhibition, and they with their usual liberality, made a new department with a much larger premium list, giving the bee-keepers a building to themselves, with competent judges to make the awards. It was an experiment with the Society, but with Mr. W. J. Baxter as superintendent of the department, everything moved off finely, and the exhibition proved a success. And to encourage the bee-keepers to greater efforts, the Society increased the premium list to \$300, the largest amount offered by any State Agricultural Society at that time. Mr. J. C. Shoemaker was made superintendent of the department, and he proved to be the right man in the right place, and it was the unanimous expression of all exhibitors, that Mr. Shoemaker was just the man for that department.

After detailing the exhibits, Mr. Cutting remarks:

Last but not least came M. H. Hunt, Belle Branch, Mich., and from the extent of his exhibit, he has been on a lively "hunt" all summer. He occupied the whole side of the building, 48 feet, with the largest and most interesting exhibit of this kind I ever saw. He and his friendly assistant, Mr. Chas. Collings, were kept busy from early morn till the building closed at night, answering questions, and explaining the different articles in his exhibit. The first to attract your attention on entering, was the large monument of solid wax, about

200 lbs., with the name Huber on the base. It was secured by Prof. A. J. Cook, for the government to send to New Orleans. Next was the great pyramid of extracted honey, in every conceivable shape, in glass, tin, earthenware and paper, all decorated with fancy labels, a large number of cases of comb honey, and a large collection of apiarian implements. Mr. Hunt received many premiums.

Preparing to Winter Bees.

The *Tribune and Farmer* gives the following on the subject of feeding bees for winter stores:

Experience has proven that a changeable climate is the worst for bees, for when they remain in a semi-torpid state they consume less stores than when the atmosphere changes from warm to cold and *vice versa*. Then our aim must be to winter them in such a place where the thermometer will remain mostly near the freezing point. If this be in the open air, then winter your bees there; if in a cellar or bee-house, then in one of the two latter places. When you have decided upon the place, and have established your apiary for the winter, it is best that they should not often be disturbed.

In order to guard against this you must examine and make a record of the condition of each colony. If some have little honey and others a surplus, equalize the quantity that each may have a corresponding supply. Should there be no surplus, make a note of these that have a small quantity, and make an estimate how long that quantity will last, and after a certain period visit such colonies and feed them, if necessary.

Those that use honey for feeding bees generally dilute it with water, bringing it nearly to the boiling point, thereby uniting it better. A cheaper food is composed of sugar and water. Purchase the sugar, and to three parts of sugar, add one part of water and scald, and you have a good and digestible food easily made.

Mr. Blake, of the firm of Blake & Ripley, the Boston honey merchants, called on us a few days ago. He reports that honey is a staple in the Boston market, and obtains a fair and uniform price.

Honey as Food and Medicine.

Single copy 5 cts.; per doz., 40 cts; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

For the American Bee Journal.

Controlling Increase.

JAMES HEDDON. ♀

Before discussing the above subject I wish to make just a word of reply to Messrs. Tinker and Clarke in regard to their last attacks upon—well no, not my "pollen theory," but myself as a controversialist. I presume that many readers of the BEE JOURNAL are tired of controversy, for controversy's sake. Just here, where I cannot see that either of the attacks referred to bear the least weight toward answering the propositions of my theory, or substantiating any other theory satisfactorily accounting for our winter losses, is a good place for us to rest the discussion, to be finally settled by experiment.

To come to the question of prevention of increase, I wish to say that for years I have plead for a "readily-movable hive"—a light hive with a fast bottom; separate from the stand, but fast to the bottom board, or having the bottom securely nailed to the hive. With this movable-hive system I intended doing much work proposed by others to be done by moving the contents of the hive—the combs.

My system of preventing after-swarms by this movable-hive system, is described on page 126 of the BEE JOURNAL for 1883, and many other pages both before and after that date. I have also studied and written upon its application to the prevention of increase, *via* of prime swarms; but to-day we prefer the system of accepting the prime swarm as so much increase—except in cases where such increase is unsalable, and has already gone so far as to become a nuisance. Further on I will give you my theory and slight practice in regard to the best methods (as viewed by me) for this latitude, as Mr. Demaree has, in his article on page 619, invited friendly aid in working out the problem. His sharp sentence, in the last paragraph, tending to ward off all criticism from his article, is not kind, nor is his statement that the theory and system which he advocates as "new," correct.

This system of moving the old colony, or the new one about, to different angles, disguising the hive with a piece of cloth, then moving it to and fro by way of reducing the bees of one part, and strengthening the others by way of preventing increase, is by no means "new," but is just what I have been writing about for several years, and what several bee-keepers have been reporting as a successful practice, during the past season.

It seems to me that Mr. D.'s sharp criticism upon his anticipated critics, exactly applies to himself, as he simply gives some minor detail alter-

ations of the old system, considering them "improvements." Let us "reason from what we know" about them, and see if our fellow bee-keeper has added one more ray of light to the apicultural torch.

All have known that colonies containing brood in all stages would work the same without any queen, but this condition of a colony is not what is meant by the term "queenless" in its strict sense; so says Father Langstroth. Mr. D.'s statement in his third paragraph is so peculiarly worded that it will bear much twisting to suit the developments of that future alluded to. I cannot think that the "near future" will so perfectly change and revolutionize our system of apiculture that the facts of to-day and mechanical appliances so well adapted to those facts, will all be laid aside and so soon forgotten. I believe that to-day we have many practical fixtures and methods which will live far beyond any person reading this sentence. Some 25 years ago, Father Langstroth said of his movable frames, that he did not claim perfection, for that rested alone with Him who made all things; but that so long as the honey-bee kept its present instincts, all frame-makers must either go over his road, or go around. He thought that he had found the best mechanical adaptations to positive known facts regarding the instincts of bees; and if he was not mistaken, such a statement was a true one. Well, 25 years of radical growth in the bee-business have left those words just as true to-day as when uttered a quarter of a century ago.

"Let it go to record" that I predict to-day, that our methods and appliances will undergo some changes and growth by way of keeping all which is best, and superseding that which is not best by that which is better; that the bee-keeping methods of the future will be like those of the past, a slow growth toward a higher standard of excellence. I believe that we now have some appliances which will never be forgotten; also some appliances and methods that will be forgotten. Among the latter, I think that I may count some of the methods or details cited in Mr. D.'s outline of manipulations for "preventing increase."

Mr. D.'s outline of operations is not only more work than the hiving of swarms, by those who have learned the short-cuts and supplied themselves with the proper implements for that work, but it violates some of our immortal laws relative to apiculture: 1. Bees work on comb honey in sections with the greatest vigor above combs of brood containing a queen. The more prolific that queen the better. 2. Nothing is worse to have below the supers than combs of sealed honey. 3. The bees will first fill these combs, and then if left, seal them up. If exchanged for more empty ones, as often as changed, so often the bees will refill them, and your comb-honey system is changed to the extracting system, and your comb-honey fixtures are just in your way.

The next noticeable objection is the positioning of the queen. Let it not

be lost sight of that the major portion of our permanent capital rests in the combs. The instinct of bees and their consequent acts, is fitted to this fact. The queen, during the month of May (in this latitude), finds her laying capacity greater than usual, and greater than the proper size of hive. She fills all available room, then leaves with a prime swarm which builds her more combs to lay in, and during the 15 days of queenlessness of the old colony, room is made by the hatching of bees for the use of the new queen, a room which the new queen soon occupies. It seems to me that Mr. D. has his queen in the wrong place. He most certainly does if he has an August and September surplus harvest, which he is very liable to have. In this point, I prefer the instinct of my bees to the philosophy of his theory, for my locality.

So far in my experience, I have never found it profitable to prevent increase while running for comb honey. I have further found it very unprofitable to prevent swarming by any method except such as caused the bees to forget it in their enthusiasm after surplus honey. But the prevention of swarming, and the prevention of increase are two different subjects. I have little doubt but that very soon we shall winter our bees with the same certainty that we winter our cows. If a practical solution of the pollen theory does not lead to this result, I feel sure that some other one will. The ball is now rolling fast; every close observer and inquisitive Yankee is on the alert, and we are sure to succeed, soon, under some leader. At our late Michigan State Fair, Prof. Cook said that indications, so far, favor the pollen theory. Dr. Mason, almost out of patience, said that the matter was no longer "theory" to him; for the practical tests of 4 or 5 winters had settled it with him.

I expect the time is near when most of us will find it best to keep down our increase, but not to prevent swarming by forced methods, such as dividing the bees that we do not wish divided, nor the necessity of clipping queen-cells. In its stead I would suggest a policy of this kind. Use shallow hives, at the same time giving plenty of surplus room, thus giving the queen more room in the brood-chamber by keeping the honey out of it. Shade and ventilate the hives well. Use bees containing some German blood. All this tends to prevent any desire to swarm on the part of the bees; but it is no sure remedy. In some locations, and some seasons, colonies seem unaccountably seized with a craze for swarming, and no known methods of operation will stop this desire, and no bee-master can account for the impulse.

Now, as to my theory in regard to the prevention of increase of colonies, I will here say, as I have before written, that my readily-movable live system can also be used to prevent increase by prime swarming, as well as after-swarming; and this is how I should expect to accomplish it, at the

same time co-inciding with the most profitable instincts of the bees.

As stated above, try to reduce the number of colonies that will try to swarm, to the lowest minimum. When one does swarm, hive the prime swarm on frames filled with foundation or full combs, and place it on the old stand, transferring all the surplus cases to the new colony. Put the old colony on the north side (supposing the hives of the apiary front east) at right angles with the new colony on the old stand. (Of course it is understood that the hives are exactly alike in construction and color.) Now, to prevent after-swarming and to accept the increase of the prime swarm, we wait about 48 hours, and then turn the entrance parallel with the old colony, and about 6 or 7 days later, when the most of the bees are in the field, we remove the old hive to a new location; all of which process is described on page 126 of the BEE JOURNAL for 1883.

But now to prevent increase by way of this prime swarm, instead of taking away the old colony, just place it directly behind the new one on the old stand, with the front end of the hive about 6 inches from the rear end of the hive containing the new colony, and cover it with a cloth (we use burlap), as directed in a previous article. The cloth must cover the front of the hive, but not so completely as to prevent the circuitous exit of its bees, which will constantly leave it and return to the old stand, and join with the prime swarm thereon. In a few days more this feeble colony will have a fertile queen, and these removals have made it so weak that no second-swarming will take place. No clipping of queen-cells is needed, nor even the opening of either hive, as yet. The young queen will be one of natural selection by the law of the survival of the fittest. There will be no trouble arising from overlooking a cell, that was so retiring in the comb as scarcely to be perceptible.

Now, when this young queen begins to lay (which can be readily determined by looking for eggs), you can very easily find her in so weak a colony. Open both hives, and in both you will not find more than 8 combs of brood. Put these 8 in the new hive on the old stand, under the surplus honey, and the other 8 combs of honey into your honey house. Do what ever you choose with this extra queen. If I had no sale for queens, I should prefer to supersede the old queen with the new one, thus being reared under most natural conditions. An apiary worked on this partially non-swarming plan, will contain many queens that need superseding, and you can do it by using this newly-hatched and fertilized queen.

Regarding the 8 combs of honey, you can extract them, throwing out a first-class consistency of honey; or you can select 5 of the heaviest with honey and most free from pollen, and use them to winter the colony with; by trading these 5 for their most pollenized 5 combs, just as soon as brooding is finished in the fall. I know that this method, like Mr. D.'s, has

the disadvantage of having to keep on hand a supply of extra hives and combs, and forces one to run for extracted honey in part, whether he wishes to be a comb-honey specialist or not.

I have written this not because I think that it surely is the best way to keep down the increase of an apiary, from year to year, but as illustrative of the different detail of management that Mr. D. and myself would apply to the movable-hive system that I have been advocating for a few years past. It will not be at all of a surprise to me if the experience of the future will prove that the most profitable way will be to accept of all prime swarms that offer, preventing after-swarms by the method depicted on page 126 of the BEE JOURNAL for 1883, and unite the colonies with the original numbers, either in the fall or in the spring following. Certainly the latter plan will be the best for all who still lose a portion of their colonies during the winter.

Regarding the matter of swarming tending to lessen the yield of surplus comb honey, let it be remembered that the largest yields on record, have come from the colonies which cast not only one, but two and three swarms. Some of our leading bee-keepers have declared it unjust to put these yields against the yield from a colony that did not swarm. Of course different locations and climates require a different treatment; but how any location can find any economy in keeping the queen with the full combs instead of the empty ones, and storing surplus comb honey above solid combs of honey, I shall have to have further light in order to understand the mysteries of such location. Dowagiac, Mich.

For the American Bee Journal.

Haldimand, Ontario, Convention.

The Haldimand Bee-Keepers' Association met at Nelles' Corners, on Friday, Sept. 26, 1884. The minutes of the last meeting were read and adopted.

The first question taken up was the best method of marketing honey. The President thought that it was a bad plan to rush to market with honey as soon as it was extracted; by doing so the price was lowered.

After considerable discussion on the above subject, it was decided that Messrs. Armstrong, Williamson and Campbell be a Committee of this Association to ascertain the best market for sale of honey, and that the members furnish the Committee with the amount and quality of the honey that they have for sale.

"Best method of preparing bees for winter." The President described a clamp which he had built for packing his bees in for winter. Mr. Atkinson said that each colony should be kept breeding late, and well supplied with plenty of stores. Mr. Kitchen advocated plenty of ventilation at the bottom, a little at the top, and the purest honey left for the bees to winter on.

Mr. Vanderburgh stated that he used a double-walled hive, with chaff on top of the frames, and had not lost a colony in three years. In answer to a question from Mr. Armstrong, he stated that he put a clean cloth over the frames instead of the one used in summer.

Mr. Armstrong winters his bees in different ways; some of them in double-walled hives packed in chaff on the summer stands; others in a clamp, packed in sawdust with strips over the frames, and 16 or 20 inches of sawdust on top. Each colony should have a good, vigorous queen, kept laying as late as possible, so as to go into winter quarters with plenty of young bees.

Mr. Kindree packs his bees the same as Mr. Vanderburgh, and uses his judgment as to the amount of packing that each colony requires, giving a light one more packing than a strong one.

Twenty-two members reported 265 colonies in the spring, 520 fall count, and 13,162 lbs. as their total crop of honey for the season of 1884.

E. C. CAMPBELL, Sec.

E. DECEW, Pres.

Michigan Bee and Honey Show.

W. Z. HUTCHINSON, O.

Once more has Michigan out-done herself in the exhibition of bees, honey, and apian implements at her State Fair. A building 28x48 feet was literally filled to overflowing, part of the exhibit being shown outside in a neat little shed. Prof. Cook pronounced the exhibition the largest and best that he had ever seen in the United States. There were 150 entries made, and the value of the exhibits amounted to \$2,780.80.

Mr. H. D. Cutting exhibited 81 volumes of apicultural literature, his improved hive, a Langstroth hive, the walls of which were made of straw, samples of 15 different varieties of honey, besides a collection of implements such as feeders, smokers, queen-cages, etc.

Dr. Besse, of Ohio, made quite a large display of extracted honey put up in two-pound glass bottles, samples of 13 varieties of honey, a one-frame nucleus of Italian bees, a Root foundation mill, a collection of queens, and also a few implements.

Mr. E. E. Mason, son of Dr. A. B. Mason, of Wagon Works, O., had on exhibition a Vandervort foundation mill and a Given press.

W. Z. Hutchinson's exhibit was much the same as that of last year, except that it was larger. His pyramid of comb honey contained 3,500 pounds, but he made no display of extracted honey. His display of honey-producing plants, pressed and mounted, numbering 77 specimens, were fastened to the wall and upon the roof back of his exhibit, and formed an appropriate back-ground. His collection of bee-literature, 79 volumes, contained full sets of both the AMERICAN BEE JOURNAL and *Gleanings*.

His collection of implements numbered 80; and his display of full colonies of different varieties of bees was the largest shown, there being Italians, Carniolans, Syrians, hybrids and blacks; also a one-frame nucleus of Italians and a queen.

Elmer Hutchinson (W. Z.'s brother) showed 73 varieties of honey-producing plants pressed and mounted. Perhaps I should not say that he showed them, as they were not put up, simply because there was no room. He had on exhibition full colonies of blacks, Italians, Syrians, and Cyprians, two crates of comb honey, and a collection of queen bees.

R. L. Taylor, of Lapeer, Mich., occupied one entire end of the hall with a display of comb honey. Beginning about 2 feet above the floor, the crates of honey were piled up in one solid pyramidal pile, the top of which lacked only about 2 feet of reaching the peak of the roof. With light red for a back-ground, this pyramid of more than 4,000 pounds of comb honey, made a bright, handsome, and striking display. Mr. Taylor also exhibited a colony of Italian bees, a bee-hive, a machine for piercing holes in frames for wiring, and a Given press.

Mr. M. H. Hunt occupied one entire side of the building. His display of extracted honey, foundation, wax, and implements was the finest in the building. The extracted honey was put up in tin cans, tin pails, glass pails, glass jars, glass bottles, jugs, etc., all of which were tastefully arranged. The foundation hung in long strips and festoons from the "plate" of the building, the bright, yellow wax forming a pleasing contrast with the dark-blue back-ground. One strip of foundation was 50 feet long. Mr. Hunt seems to have learned the art of sheeting wax, so that it will be tough even in cool weather. Perhaps the finest thing in his whole exhibit was a wax monument nearly 4 feet high, and weighing nearly 200 pounds. The base was $17\frac{1}{2}$ inches square, and upon one side, in raised letters, was the word HUBER. The other sides of the base, as well as the sides of the second block, and the sides of the upright shaft were appropriately paneled. Taken all in all, it was a fine piece of work. Mr. Hunt also exhibited full colonies of Italians, Syrians and blacks, and a Syrian queen in a one-frame nucleus of black bees.

Mr. C. M. Weed made a display of over 50 specimens of honey-producing plants pressed and mounted.

Through the centre of the building was a long table 4 feet wide, covered with a miscellaneous collection of exhibits. One of these exhibits was a pyramid of square bottles of different sizes filled with honey having a very slight, amber tinge. There was a door at each corner of the building, and many pleasant minutes were passed in watching the sunlight stream in at these doors and shine upon this pyramid of amber-colored honey. What beautiful tints were brought out! This exhibit belonged to Mr. O. H. Townsend, as did a bee-

hive, a one-frame nucleus, and a case of comb honey.

A Mr. Quick showed cans of extracted honey, cases of comb honey, a bee-hive, and made a very fine display of Van Deusen foundation.

Mr. G. K. Hubbard, of Indiana, exhibited his patent hive, two one-frame nuclei, and some fancy specimens of comb honey.

Premiums awarded amounted to nearly \$300.

A few years ago, when attending the Michigan State Fair, the writer made a diligent search for some display in the apiarian line, and at last found, sandwiched in between the dairy products, a few brood-combs of honey hung upon a rack. "Look on this picture and then on that." Michigan bee and honey shows are now "up with the times."

Rogersville, Mich.

The Maine State Fair.

The Maine State Fair closed on Saturday, Sept. 29, 1884.

The number of individual entries in the bee-department of the Maine State Fair were not large, but comprised many implements and fixtures, several colonies of bees under glass, and a capital exhibit of honey, both in quality and quantity.

Mr. E. P. Churchill, of North Auburn, exhibited one full colony of Italians, one nucleus-colony of Italians in observatory hives, showing all the movements of the bees as they cluster about their queen. Many were the inquiries elicited by this exhibit of real, live bees, in which the various processes of comb-building could be explained. Two section-cases were included in this collection of fixtures. Another useful implement exhibited was an entrance-spring press for moulding entrance clasps, a combined bee-pass and feeder in the sections, box-nailer, holder for nailing frames, mould for forming division-boards, uncapping knife, foundation-fastener, chaff and single division-boards, and pattern for making hives. In this exhibit were shown two samples of nice, extracted honey.

J. B. Mason, of Mechanic Falls, had a fine and large exhibit, including one full colony of pure Italian bees, and observatory hive in which the bees and combs are shown under glass.

Two geared honey-extractors were shown, also Churchill's improved chaff-hive, and a Simplicity-Langstroth hive.

Among the numerous fixtures in Mr. Mason's exhibit, were included foundation-fastener, samples of comb foundation (heavy and light), dove-tailed sections, wire for frames, large collections of bee-literature (comprising seventeen bee-papers and eighteen books), frame with foundation, setter for some three styles of bee-feeders, machine for putting sections together, Blake's and Clarke's bee-smokers, Jones' drone-guard, perforated zinc honey-board, metal rabbits and corners, nucleus hive and frames, chaff division-board, separators for sections, a reversible frame, queen cages,

comb basket, and atmospheric feeder. In this exhibit were a dozen, or more, beautiful Italian queens confined in separate cages, with a few of the worker bees in each. Preserved in alcohol, Mr. M. had specimens of the queen in embryo, embracing each change from the eggs to maturity.

The honey exhibit included extracted honey in glass jars, and three glass monuments of exceeding beauty and richness, also one case of sections filled with nice clover honey.

I. F. Blaisdell, of Fort Fairfield, made a very nice display of comb honey. His exhibit was in three-pound glass boxes, and comprised 425 pounds.

Another fine sample of comb honey was that of Edward Tarr, of Castle Hill. He is also a large honey-producer, his crop being, this season, a ton and a half.

Mr. G. W. P. Jerrard, of Caribou, made his usual fine display of comb honey and bees. The bees were blacks and Italians in observatory hives. Mr. Jerrard keeps his bees on the most improved plans, using fixtures and inventions of his own of peculiar merit for display of comb honey and for transporting the same, long distances. Mr. Jerrard has produced about 8,000 pounds of finished honey, that is, in neatly-capped sections, besides 2,000 pounds in partly-filled boxes.

Mr. Blaisdell, of Fort Fairfield, said, "On two square miles where I live, some 500 colonies of bees are kept, producing many tons of pure honey." Aroostook county is truly "a land flowing with milk and honey."—*Leuiston, Me., Journal.*

Moisture in Bee-Cellars.

C. W. DAYTON. 6

In the fall of 1883, I selected 8 colonies of bees, to each of which I gave 6 combs, the lower half of each comb being well occupied by pollen, and most of the cells above, which contained honey, were about half full of pollen. The brood-chamber of each colony was covered with enameled cloth.

Three of the colonies wintered well. Three having less honey and more pollen than I expected, starved about 10 days before the time to put them out of the cellar. None of the starved colonies contained a half dozen bees having distended bodies.

In another colony that clustered low on the combs after being in the cellar about 70 days, moisture commenced accumulating in drops around a circle directly over the cluster on the under side of the enameled cloth. This circle continued to grow smaller, and the drops of moisture continued to grow larger until the enameled cloth was entirely covered with drops of water, which ran down on the combs or dropped into the cluster. Previous to this the bees had appeared almost lifeless when looking in at the top of the hive with a light; but now they acted as when swarming, and cluster-

ing without a queen, and there was a smell of diarrhoea without evacuation.

On entering the cellar, one morning, the cluster was found broken and the bees performing in a way peculiar to bees badly afflicted with diarrhoea. I doubled back the enameled cloth one half and left them until evening, when I found them quietly clustered at the tops of the combs. After drying and replacing the enameled cloth, they remained as quiet as they had been during the 70 days, when they were taken to the stand and found without brood, and (with the exception of a few slightly-distended bees) in prime order.

The other, having the enameled cloth perforated in the centre and covered with coarse straw, remained quiet 85 days, when my attention was drawn by the appearance of a distended bee. More days brought more distended bees, increasing symptoms of diarrhoea, and a quick, spiteful roar about once a minute. On examination I found the straw near the perforations, in the enameled cloth, dripping wet, and that the roars corresponded to the drops of water that passed through the perforations into the cluster. After the straw was removed, the moisture passed off, and the bees gradually returned to their former quietness, and so remained to the end of the winter.

In answer to a question on page 37: After wintering bees in a cellar that resembled the one described on page 6, in the place built, number of colonies put in, material used in construction, ventilation, size, moldy combs with the bottom-boards left on the hives, arrangement of hives, and the dropping of water from the walls and joists, I believe it to be another instance of the condensation of moisture, the same as that on the pitcher of water on the summer dinner-table, as the moisture on the joists varied with the outside temperature; and if I should open the door letting warmer air into the cellar, condensed moisture would soon drip from the walls, and shutting the door caused the moisture to disappear.

To all appearances my cellar is very damp, yet last winter when the bees were in it, salt would lose moisture while moisture condensed as before described, and ran down, swelling the wood on the inside of the hives, which caused them to split open. The draft in the ventilator was able at times to carry pieces of paste-board, and again it moved in an opposite direction.

In the early part of the season I sometimes feed diluted honey to my whole apiary, in the open air, from a pan about 4 feet square, the bottom of which is filled with slats set up edge-wise $\frac{3}{8}$ of an inch apart. I have often fed 75 pounds in a couple of hours, with perfect satisfaction, excepting that I believed from the searching by bees and flies on the grass, in a line from the feed to the apiary, and the fact that the quality of the feed varied the size and number of drops, that the bees wasted a share of the feed in the spray described by Mr. S. J. Youngman on page 556: "I have seen this water-

like spray, day after day, for 50 or more days, and at the same time in each day I saw pollen-colored excrement (that was too thick to be called a liquid) well strewn on everything over which the bees flew, and it was always of about the same consistency, and conformed in quantity to the amount of brood-rearing going on.

Northeastern Kentucky Convention.

The Northeastern Kentucky Bee-Keepers' Association met in Walker's Hall, at Covington, Ky., on Sept. 25, 1884. The attendance was good. The minutes of the previous meeting were read and approved, after which regular business was transacted. The committee appointed at the last meeting to attend the State Association, which met at Eminence, Ky., on Sept. 2 and 3, reported as follows: "Owing to some misunderstanding, the attendance was very small; the meeting was, nevertheless, very interesting. The Rev. L. Johnson, of Walton, Boone county, was elected President, and John T. Conmley, of Walnut Lick, Gallatin county, Secretary for the ensuing year." The above named gentlemen are both members of the Northeastern Kentucky Association, and the remaining members heartily endorse their election.

To return to our own meeting: Several members who were absent at the last meeting gave in their reports, which were about the same as those previously given. A great many subjects were discussed, the winter problem receiving the most attention, although a threadbare question to many. Still its solution is occupying the talent of the fraternity. The general opinion seemed to be that a plentiful supply of pure, ripe honey, with a moderate consideration of other necessities, would insure success.

Mr. Wm. Blick, of Covington, reported that he had but 3 colonies of bees, all of which were badly infected with foul brood. How it came, or where it came from, he knows not. Mr. Chas. F. Muth, of Cincinnati, O., stated that he had seen Mr. Blick's bees, and advised him to suffocate them with sulphur and then cremate their hives and all connected with them. Mr. Blick promised to do so immediately after the meeting of the Association, as he wished the members, who had never seen a case of foul brood, to see this. On motion, Messrs. Blick and Cree were appointed a committee to visit apiaries in this vicinity in quest of foul brood.

Rev. L. Johnson offered the following resolution:

Whereas, Foul brood in its malignant form has appeared in Covington, Ky., we, therefore, request all persons who discover bees so affected, to immediately burn all hives and fixtures so affected.

The resolution was unanimously adopted.

It was reported by some members present that there is a party in New-

port, Ky., adulterating honey and then selling it as pure. All agreed that this is injurious and detrimental to the bee-keeper's interest. The Rev. L. Johnson again came forward with a resolution:

Whereas, It is reported that a certain party is selling adulterated honey in Newport and elsewhere,

Resolved, That we request the Secretary of this society to ascertain the name of such party, and properly inform the public against him.

Rev. L. Johnson advanced some very wholesome suggestions in regard to the meeting of the State Association here (Covington) on Sept. 23 and 24, 1885. He proposes to give a portion of his time, this coming winter and spring, to lectures on "Bees and their Management;" to which Mr. Chas. F. Muth offered the following: In consideration of the proposition of Rev. Johnson, President elect of the State Association, that he contemplates to give a series of lectures on bee-keeping, during the coming winter and spring, for the benefit of bee-keepers, be it

Resolved, That Bro. Johnson is requested to take a collection at every meeting to defray his own personal expenses, and put the surplus, if any, to the "Langstroth Fund." We are aware of the gratitude which every one of us feels towards Mr. Langstroth, and knowing that he is in needy circumstances, the assistance of sympathizing associations is invited.

Our own meetings are growing in interest, and the bee-keeper, be he a novice or an expert, can always learn something new. We certainly consider it a treat to listen to such men as Muth, Johnson, Stith, Conmley, McVean and others discourse on the science of apiculture.

On motion it was decided to hold the next meeting at Walton, Boone County, Ky., on the first Wednesday in April, 1885. G. W. CREE, Sec.

PETER McVEAN, Pres.

Poisonous Honey—Fertile Workers.

C. M. HIGGINS. ◊

On page 613, Mr. A. Osborn strives to be ingenious in finding the cause of poisonous honey, but his argument is "too thin." If all honey were alike in quality, color, etc., then a clear reason might be found to fit; but all honey is not alike. Who ever heard of well-ripened honey producing serious effects? Uncapped honey from the yellow jessamine in Florida is actually poisonous, and has produced death; but after it is once capped, there is no honey nicer or more wholesome. Besides in good extracting weather—when the weather is clear and warm, and honey is being gathered rapidly, bees pay very little attention to disturbance, and can often be handled without smoke or a veil, and do not show those little poison drops on their stings that they do when the weather is unfavorable for manipulation. This seems to be

another one of the "views" of bee-keepers.

I had several colonies, during the present summer, which contained fertile workers. How to get rid of them and save breaking up the colonies, puzzled me for a long time. Finally I thought that I would try what was to me an experiment; for all the information that I had ever gotten before, advised breaking up the colony. I found that by the time I was enabled to tell the presence of a fertile worker, the bees had become old enough to be called old bees. Of course they would not receive a queen, neither would they rear a queen-cell, and I could not find the fertile worker. I concluded to try putting one frame of eggs and young larvae into the hive, and changing positions with a strong colony. The bees that entered the hive now had no use for a fertile worker, and killed her; and then having the means, I found them building queen-cells in a couple of days afterwards. Since then I have had no trouble with fertile workers.

In one case I changed a colony into a fertile-worker colony to see the result. A few minutes afterward I opened the hive and found the queen balled, but unhurt, by one set of bees, and the fertile worker was balled and killed by the other set of bees. I then caged the queen for 24 hours, when I set her at liberty, and she began laying unmolested.

Stoneville, Miss.

Colorado State Convention.

A meeting of the Colorado State Bee-Keepers' Association was held on Sept. 14, 1884, at the Court House, in Denver.

As was anticipated, but few members were present, and in the absence of President Godfrey, Vice-President Milleson presided. Mr. Robert James was chosen Secretary, J. L. Peabody being absent.

It was learned that most of the records, as well as all copies extant of the constitution and by-laws, had been irrecoverably lost, which rendered necessary the adoption of a new series as nearly similar as possible to the former, and on motion of Mr. J. M. Clark, a committee to consider the subject was appointed by the chairman, who named as such committee, Mr. Clark and Robert James, and directed them to report at the next meeting.

After some discussion regarding the affairs of the Association and the passing of a resolution of thanks to the County Commissioners for the use of their room, it was voted to adjourn.—*Colorado Farmer.*

The name of the Monroe City, Mo., Bee-Keepers' Association was changed on Oct. 1, 1884, to the North-eastern Missouri Bee-Keepers' Association. The next meeting will be held on Oct. 21, 1884, at Hunnewell, Mo.

The Hibernation Theory.

W. F. CLARKE. ♀

I have every reason to feel pleased and satisfied with most of the references which have been made by correspondents of the BEE JOURNAL, to my theory concerning the hibernation of bees. They have been kind, appreciative, respectful, and very much to the point. Mr. Heddon's critique on the subject was especially good. Its tone was admirable. In fact, I thought the whole article quite a model of controversial writing. The suggestion of a possible co-partnership between the pollen and hibernation theories interested me not a little; as it showed great magnanimity in Mr. Heddon to be willing, should facts require it, to share the honors of discovery with one not actually devoted to bee-keeping as a business. I am not a little proud of the admission so frankly made by him, that I have contributed one of the points in that triangular discussion which has done much to solve the hard problem of our winter losses. The complete solution of that problem which now seems to loom up in the near future, will be the jubilee of bee-keeping in which we shall all rejoice together.

It would trench too much upon the valuable space of the BEE JOURNAL, which has already been largely taxed in relation to the subject, for me to reply to each and all of my brother bee-keepers who have been kind enough to take the matter up. Besides, "the game is young," many of our most experienced bee-keepers have not yet taken a hand in it, and the experiments of the coming winter will doubtless throw much light on it. I only desire, at this time, to say a few things by way of keeping the ball rolling.

Mr. Heddon is right in wishing a clear definition of the word "hibernation." He has given the Dictionary explanation of it. I gave the scientific use of the term, as it is employed in works on natural history. There are these two significations of it. Let us agree in this discussion to use the word in its scientific meaning, which imports the state of torpor or semitorpor into which various animals and insects are wont to go during the season of winter in a cold climate. Let it also be understood that hibernation may be complete or partial. The bear is an example of complete hibernation. Mr. Heddon says, "If they hibernate, no food will be consumed." It would be more correct to say *while* they hibernate no food will be consumed. But I have already stated very distinctly that bees hibernate like squirrels, at intervals, and do not take one long winter sleep. Hibernation too, has its degrees. In some cases there is, as Mr. Heddon says, "total inactivity or suspension of the functions of life." I do not claim this in regard to bees. I have only contended for what Mr. Heddon admits, viz: "a quiescent state." Nor do I desire a better example of the hibernation of bees than he himself

gives in the case of that particular colony, which consumed only a single pound of honey during the winter; or of those colonies which varied all the way from 2½ to 5 or 6 pounds in their winter consumption of honey. I put it to him and to the bee-keeping fraternity in general, if it will not be a grand discovery to find out how to winter colonies of bees well with so small a consumption of honey? He testifies that it has been done at least once by himself. If we can ascertain the conditions on which we can all do this each and every winter, what an immense gain it will be to the bee-keeping interest, in the preservation of colonies, and also in economy of winter stores. I do not pretend to have done more than to have evolved the principle that the state of hibernation, or, if you please, "quiescence" is the normal condition into which we should seek to bring our bees in a cold climate like ours, and that if we do this, they will winter in the best possible manner.

Here let me say that my position is not thoroughly understood by some who have written on the subject. Thus, Mr. Gresh says, on page 599, "I do not believe that hibernation is indispensable to the safe wintering of bees." Nor do I. Mr. G. states my position more correctly when he remarks a little further on, "I believe, though, that hibernation is the natural state in which bees can successfully pass through considerable severity of cold." No doubt bees can be wintered "safely" in a high temperature, but it is difficult to do it in our climate, and involves a prodigal consumption of honey.

My fellow-Canadian, Mr. Pringle, says, "If Mr. Clarke means that bees will not winter well on the ground, he is certainly mistaken." I do not mean that. Under certain circumstances bees have wintered well on the ground and under the ground, but for all that, I think it a mistake to put them where they are exposed to dampness, to foul air, and liability to suffocate from accumulations of snow and ice. Mr. Pringle thinks that there is, after all, "some truth" in my "new-fangled notion." I am surprised, therefore, that he should poke fun at the "nocturnal travail" with which it was brought forth. I suspect that he is a sound sleeper, and I envy him, if it be so. He, too, gives an example of what I mean by hibernation. Certain of his bees were in a "profound slumber," gave no response to "several pretty hard knocks on the hive," and showed a lethargic indisposition to move. Mr. Heddon says that he never knew bees to get into such a state of torpor as not to respond to "the least tap or jar." Many bee-keepers, however, like Mr. Pringle, disagree with him—notably Mr. L. C. Root, who, in his new edition of "Quinby's Mysteries of Bee-Keeping," mentions a case of wintering which is very similar to that narrated by Mr. Pringle.

Mr. Latham's article on page 550, is pretty sound, and quite interesting as furnishing proof that bees incline to go into "a semi-dormant repose" as

he calls it, and winter well when they do so; but if these are facts, is it not important that they should be recognized as such by bee-keepers generally, and acted on in their winter arrangements? If these are facts, they demonstrate the theory of hibernation to be correct. It is quite true that "there is no new thing under the sun" but the practical use of many things old as the everlasting hills has wrought great revolutions in modern times. Steam and electricity are not new things; they are old as the aged earth itself, but their modern applications are new. When an old principle is brought to light, public attention directed to it, and practical applications made of it, the fable of the mountain in labor is hardly applicable to it. If hibernation is the key to successful wintering, as I firmly believe it is, the recognition of this principle, in its practical applications, may surely, without any impropriety, be characterized as a *valuable discovery*. Such, I trust and hope it will yet prove to be in the future history of apiculture.

Speedside, Ont.

Bee & Honey Show at Louisville, Ky.

G. W. DEMAREE. †

Owing to bad management on the part of the managers of the Exposition, our bee and honey show was not what it should have been. The Exposition Company appointed a committee to arrange matters for the "display." The committee set the time for Sept. 4 to 6, and just one week before the time set by the committee, the managers of the Exposition changed the time just six days in advance. This short interval gave no time for public notice except through the daily papers, and these do not reach many bee-keepers at all. The consequence was that the display was rather slim, and to add to the discomfort, the weather turned intensely hot.

The display of bees and queens was much better than that of last year, but the honey show was light. On Wednesday, Sept. 10, in the afternoon, the heat in the Exposition building was well nigh intolerable. At one time I believed that all the bees in the building would perish. One large colony in a Langstroth hive, with glass sides, with a case of one-pound sections on top of it, though pretty well ventilated with wire-cloth, began to sweat profusely, and I could smell the unpleasant odor incident to such a condition, several feet from the hive. Being a member of the committee on the display, I procured some ice, and all the bees were saved by its application to the glass sides of the hives.

Your correspondent captured the prize for the finest Italian queen and bees; while an old gentleman from the city of Louisville, Mr. J. McDowell, took the prize on the best display of bees. Mr. Lewis Hofstatter, of the same city, carried away

the prizes on honey. I feel sure that Mr. Hofstatter would have been compelled to share the prizes with me had it not been for the neglect of the Adam's Express Company, which failed to deliver a consignment of honey to me at the Exposition building. Mr. Hofstatter also took the prize on the best display of honey-plants. He was left without competition in this line on account of the neglect of the before-mentioned express company, as they failed to deliver a box of prepared honey-plants of over 50 varieties, which I designed to have on exhibition. Mr. Hofstatter was aware of these expected exhibits, and humorously remarked that it was an "ill wind that blowed no one any good."

Among the implements exhibited was a solar wax extractor of the devising of Mr. Hofstatter. This class of wax extractors ought to be better known among bee-keepers, for I feel sure that by their general use a better article of beeswax will be the result. A peculiar feature about this particular solar wax extractor, worthy of note, was a double "lid" or cover which was hinged together, the one of glass being underneath the wood cover. By the way, the wax exhibited by the owner of this apparatus, was peculiarly fine both in color and quality. He had the figure of an eagle with outstretched wings perched on top of his pyramid of honey, which was ingeniously wrought of the finest quality of yellow wax.

Perhaps the wax on exhibition looked peculiarly nice to me after trying, the past season, to use foundation made in Ohio, which was so full of dirt that one could imagine that he could hear the dirt "grit in the teeth" of the bees when drawing out the cells.

A real novelty in the form of an automatic honey extractor and surplus case combined, was to be seen among the implements of the apiary. This curiosity is the emanation of the grasping, fertile mind of Mr. Lewis Hofstatter, of the city of Louisville. It was a cylinder-shaped drum adjusted on a honey-board, inside of which is a revolving cylinder with a continuous honey-comb around it. There is no septum to the comb, the cells being all over the outside. To illustrate: If you should wind a sheet of foundation around a cylinder, making it fast to the cylinder with melted wax, and adjust it in a metal drum of the proper size to give proper bee-space, the bees would draw out the cells to the full length, and you would have Mr. Hofstatter's revolving super. One set of "geared" wheels will fit all of them, and the honey is "slung" out without moving the super from its place on the hive. Of course the extracting is done before the cells are sealed, and the bees are driven down with smoke before the comb cylinder is set in motion. The honey runs out of a spout at one side of the super. As impractical as this whole scheme looks, the inventor had a jar of pure extracted honey taken in this way, and by this curious device. Of course the whole thing is

impracticable, but is mentioned here to illustrate the wonderful grasp for things new in the bee-keeping world.

On Wednesday afternoon, after cooling down the bees with ice, we repaired to the "park" adjacent to the building, to imbibe the pure air and to "talk bees." Mr. Hofstatter, who is of German extraction, and thoroughly posted on every topic pertaining to the science and practical working of the apiary, led off in the conversation. We had no faith in the pollen chimera. Bees in the South winter perfectly, no matter how much pollen is in the hive, provided that there are plenty of stores present in shape of honey or sugar syrup. The fact alone ought to convince any intelligent person that dysentery or bee-diarrhœa is the result of climatic causes. I would not hesitate to offer a reasonable prize for well authenticated proof that a colony of bees in normal condition, when put into winter quarters, ever perished with the disease known in the North as bee-diarrhœa, in all central and southern Kentucky.

Aprôpos of the hibernation theory, Mr. Hofstatter says that he has seen unmistakable proof that bees do sometimes—even in this climate—sink into a quiescent state resembling the state known as "hibernation." On one occasion, when looking through his bees in the latter part of the winter, he found one colony motionless, and passed it as dead; but it afterwards turned up all right.

I do not object to this, but it is the exception and not the rule. In the winter of 1880-81 my bees were not confined longer than a week at a time, and in January they were able to stir out on every day but three, and I never had bees to winter better. Mr. H. believes that a contracted entrance to the hive is dangerous to the safety of young queens when returning from the wedding tour. He says that every colony contains more or less old bees that are unfriendly to the aspirations of young royalty. He says, "Give them a wide entrance that they may 'slip around' these hostile, jealous 'old crab' and take refuge among the young bees, and there will be less loss in this line. I felt much interested in the suggestion, as my loss on this account has been very heavy during the past season. Mr. H. is an advanced thinker. He believes that "royal jelly" is largely composed of "animal substance," viz: masticated larvæ. He suggests the idea that the fertile worker is a worker bee, made such by the process of "balling."

Mr. G. W. Ashby is an enthusiast in the bee-business, but in a practical way. He owns a farm of over 700 acres, situated on the Ohio river below the city of Louisville. His farm is largely stocked with mules and short-horn cattle, and yet he keeps a large apiary, and stays in it much of the time. His wagon goes to the city every Saturday, loaded with honey, fruit, melons and vegetables. It occurs to me that a man situated as Mr. Ashby is, with his farm of 700 acres stocked with droves of mules and cattle, and with his large apiary of

"pure" Italian bees, would be a "foe worthy of Mr. Heddon's steel" in a battle for "priority of location." Many of our best practical apiarists are never heard of through the bee-papers.

Mr. Hamilton, a German of the city of Louisville, and his wife, who is a "helpmeet" indeed, are silently working their apiary for the money that is to be gotten out of the business. This gentleman has made his apiary pay good profits under unfavorable circumstances, being located within the city limits, where there is but little white clover. They have determined to look up and move to a good country location, and there prosecute the business of honey-producing.

I have ascertained the fact that we have quite a number of such apiarists as Mr. Hamilton and his wife, in our State. To these people bees are not "pets." They are managed and handled with care, just as the judicious farmer handles his stock. The owners of the bees take a deep interest in them, because they are a source of livelihood. They are troubled by no false sentimentalities. The question with them is, "How shall we make our bees pay best?"
Christiansburg, Ky.

For the American Bee Journal.

Queen Rack and Nursery.

FRED C. SMITH.

I send one of my queen-racks or queen-nurseries, and would like very much to have you give it a place in your Museum, and this description of it in the BEE JOURNAL. It is made to fit the honey-crate, one that is used for comb honey. My crates are made so as to hold 24 one-pound sections, or 6 of them in each department. Then I have 4 of my nurseries for each honey-crate, holding 7 queen-cells each, or 28 in all. These racks I place on the slats of the crate, just as I would the sections for comb honey.

The sides of this nursery are $11\frac{1}{2} \times 1$ inch, and $\frac{3}{8}$ of an inch thick, the end pieces are $3\frac{1}{2} \times 1$ inch, and $\frac{3}{8}$ of an inch thick. These pieces are to have a rabbet cut 1-16 of an inch deep on the upper edge, so as to form a rest for the glass strips. Nail the frame together, and put on the lower side of this frame a piece of wire-cloth cut 1-16 of an inch smaller than the frame, so there will be no wire edge; then have some thin slats $\frac{3}{8}$ of an inch wide and $\frac{1}{8}$ of an inch thick, lay the wire-cloth on the frame and brad these thin slats over the wire-cloth, so as to cover up the edge, and to hold it fast to the frame; this will make a smooth finish. Now you are ready for the partitions, which are $\frac{1}{2}$ of an inch thick and $\frac{3}{8}$ of an inch wide, and $3\frac{1}{2}$ inches long. Nail these in from the side of the nursery at equal distances apart, and your nursery is complete.

I always have a nice lot of queen-cells after the first swarm issues; and to do away with after-swarms, I cut out all but one cell, or do some mov-

ing of the hive, and in the end only have but one queen. By using this rack I save all of them, and I am not bothered with after-swarms. These cells should be cut out very carefully and placed one in each department of the nursery, and each queen-cell should have a piece of comb honey put in with it. Now they are to be covered with a glass strip fitting each department.

This being done, place the honey-crate with the nursery, on the hive, and cover it up with a heavy blanket. These queen-cells should be cut out and placed in the nursery two or three days before hatching. By lifting the blanket you can see through the glass, and I think one would be surprised to see 28 nice, yellow queens, which can be seen if handled with care. If you cannot find 28 cells, put in what you can find, from 1 to 28.

In taking out one of the queens, lift a slip of glass, and hold an introducing-cage over the queen, when she will crawl up into it. There are no bees to bother with, for they cannot get above the wire-cloth bottom.
Aurora, Ind.

[Mr. Smith's "Queen Rack and Nursery" was duly received, and placed in the Museum. It is fully described above, so that the ordinary reader can grasp the idea with ease.—ED.]

For the American Bee Journal.

A Visit to Maryland.

HENRY CRIFE, ♂

On May 29, 1884, I started on an excursion to Middleburg, Md., and as I gave some attention to bee-keeping and honey-plants, a short report may be interesting to some. I took the P. F. W. & C. railroad to Columbia City, and I saw only one apiary while riding through the State of Ohio, and that was in a little town of which I have forgotten the name. That was an apiary of about 110 colonies, and which appeared to be well cared for. I saw no honey-plants of special note through Ohio; and only in a few places along the road, in spots of several acres where the soil appeared to be very thin, white clover was abundant, the ground looking almost as white as snow. Near Pittsburg, Pa., along the Ohio river, it began to look pretty favorable for bee-keeping, but there were no bees that I could see. White locust was just coming into bloom, with which some of the mountains are thickly covered. Thus I passed on through the great Spruce Creek tunnel which is 270 feet under the ground, and $\frac{3}{8}$ of a mile long. At Hagerstown I noticed a large apiary in nice condition; and at Blue Ridge Summit, which is located at a rather high point along this road, there is a good outlook for bee-keeping. Along the mountains are all kinds of wild flowers, and some basswood, but the latter is not so plentiful as in other places. At Middleburg, Frederick county, is as good an opening for bee-

keepers as I have ever seen. Here locust was in full bloom, and bees were gathering honey at a rapid rate. Nearly all the colonies had begun to work in the boxes, some being nearly full; but this neighborhood has not a tenth part of the bees for which it would be able to furnish nectar. On my return I stopped about four hours in Hagerstown, and visited the apiary of Messrs. Valentine & Son, who were busily at work. They have about 175 colonies of bees, mostly Albinos, all in good working order. My departing time having arrived, I pocketed an Albino queen, and wishing Messrs. Valentine a prosperous season, I started for home, where I found the bees all right, but not gathering honey as fast as in the East.
North Manchester, Ind.

Bees at the Virginia State Fair.

One of the principal attractions at the State Fair at Richmond, on Oct. 22, will be the bee and honey exhibit. This feature will be shown under a mammoth tent, forty by sixty feet, with an annex twelve by twenty. Every bee-keeper in the South should turn out and witness this display, and the wonderful workings of these little busy bodies, which will be shown in glass cases so arranged that the transformation from the larva to the full-developed queen or mother-bee can be fully studied. One exhibitor will show eighteen cases of living bees, representing twelve species or varieties, with their queens and progeny, which alone will well pay any bee-keeper to attend the Fair. In addition, one of the latest and best systems of queen-breeding will be fully demonstrated and explained. In fact, the display will be a model apiary, conducted on scientific principles, by one of America's bee-keepers who has spent over thirty years in its study.

Transferring bees from a box, hive, or "gum" to the movable-frame hive, and all the manipulations necessary to conduct a first-class apiary, with a view to profit, will be fully and practically illustrated. Ye olden time broom-straw and box-hive adherents, turn out in force and witness this exhibit, and when you return home, it will be with the satisfaction of having spent the most profitable day in your existence. Think of the "sample box" of luscious nectar placed on exhibition by a lady who has managed thirty colonies this season, and, as her reward, over 3,000 lbs. of honey that will readily command \$600 for her three months' work. Every lady in the land can handle bees just as well as this dame; and such "pin money" is not to be sneered at. Let every lady visiting the Fair inspect this exhibit.

Another exhibit will be a pyramid of honey produced by a prominent Virginian, representing over three hundred pounds, the product of one colony of Bellinzona bees, this season. Several other exhibitors will contribute machinery, beeswax, honey and bee-keeping appliances, making the exhibit the finest ever seen in this

country. A collection of hives of the very latest design for profit and ease of manipulation will repay the trouble of inspecting by any bee-keeper of the South.—*Southern Planter.*

SELECTIONS FROM OUR LETTER BOX

A Good Report.

My yield, this year, is from 16 colonies, spring count, and is 733 pounds of comb honey and 62 pounds of extracted honey. Over 700 pounds of it was from 10 colonies. The largest yield, 130 pounds, was from a colony of hybrids. I now have 26 colonies.

R. E. HOLMES. ∞

West Winsted, Conn., Oct. 8, 1884.

Tar-Weed.

Here is a specimen of one of our autumn honey plants. Please give its botanical name in the BEE JOURNAL.

J. W. STUART.

Sonora, Cal., Sept. 23, 1884.

[It is *Hemizonia virgata*, one of the so-called Tar-weeds.—T. J. BURRILL.]

A Louisiana Hive.

I would like to explain, through the BEE JOURNAL, the hive which I use. I claim that it is the very best hive of any in use for producing extracted honey. It is 22x20½ inches and 10½ inches high, holding fifteen frames. The frames are 20x9½ inches. During a good honey-flow, the bees will fill these fifteen frames with sealed honey every week, and five of these bives will average forty gallons of honey per year. Now, the reasons why I claim that this hive is better than a two-story one are these: The bees will store more honey in them more readily than in others and will do it in less time. 2. They are more easily made and handled, as well as being cheaper than others.

A. V. LENNOX. ♀

Plaquemine, La., Oct. 4, 1884.

Only One-Third of a Crop.

We have only about one-third of a crop of honey this season, or about one-half as much as last year. After apple bloom everything failed until heart's-ease blossomed. Smart-weed was almost worthless. The average was about 25 pounds comb and 20 pounds of extracted honey per colony.

T. A. HOGAS. ♀

Henderson, Iowa, Oct. 10, 1884.

The Season and my Honey Crop.

I started in the spring with 60 colonies, and I now have 100 strong ones. I have taken 2,300 pounds of comb, and 1,000 pounds of extracted honey besides what we have used in our family (which is quite an item, as the children are very fond of it, and the parents think it not unpleasant to the taste), having had it on the table three times a day for nearly every day in

the year. I see many very discouraging reports in regard to the season, such as those of Messrs. Heddon and Doolittle. Although the season for surplus honey here was very short, it has been as good as the average. The most of the surplus was gathered in the month of June, as there was not a pound of basswood, and but very little buckwheat honey on account of cold, north winds throughout the basswood season, and dry weather during the buckwheat season. Here, the price of honey is very low on account of the anxiety of many producers, because of the large surplus in June. I hold best extracted at 10 cents per pound, and best comb honey at 16 cents. The price in Grand Rapids is only about 12½ cents for the best comb honey. A. P. COWAN. ∞

Grattan, Mich., Oct. 3, 1884.

Report for 1884.

In the fall of 1883 I put 9 colonies into clamps, and last spring took them out and found 2 dead, and all but 2 had the diarrhoea. Before the opening of spring I had lost all but 4, and 2 of the latter were very weak—having only the queens and a handful of bees. I increased them by division to my original 9, and have taken about 300 pounds of extracted and 100 pounds of comb honey, and they are all now in good condition for winter. I took all of my extracted honey from supers.

WM. F. WARE. ∞

De Witt, Neb., Oct. 4, 1884.

An Average Season.

The last winter was the worst one for bees in 4 years in this locality, the loss being about 40 per cent. My loss was 2 out of 16, but I had some weak colonies. This has been only an average honey-season. I have taken 1,050 pounds of honey, 100 pounds of it being comb, and the balance extracted honey. I now have 23 colonies in good condition for winter, with about 35 pounds of honey to the colony. I sold my honey at an average of 13 cents a pound. My best colony produced 175 pounds of extracted honey, and one swarm. I have one colony of Syrian bees, and I usually handle them without smoke. It is the strongest colony that I have. I hope that I shall be able to tell you more about these bees next fall.

B. W. PECK. ♀

Richmond Centre, O., Oct. 8, 1884.

Unprofitable Season.

Bees have done poorly this season. The colonies which did not swarm stored from 25 to 35 pounds of honey. Those that sent out swarms produced little or none; neither did the new colonies store any in the boxes. The fall bloom was very profuse, and the weather has been warm; but contrary to all previous experiences, very little honey was gathered. It is said by some bee-men and women, that one might just as well expect milk and butter from a cow without feed as honey from bees without feed. I supposed that it was the business of bees to gather honey from flowers and

not to store away sugar and different kinds of syrups and to be called honey; nor did I think such could be honestly sold for honey. I do not propose to feed bees for honey, nor to watch the queens to see whether they are lazy and unprolific, or the reverse. Their ways are beyond my comprehension, and I propose to let them keep house as is most agreeable to themselves, and in the future spend as little money on them as possible.

Waverly, Mo. A. M. CREEL. ∞

Wintering Bees.

In my opinion the only practical method of preparing bees for winter is that described by Mr. A. H. Dutton in the BEE JOURNAL of Oct. 1, 1884. As much as has been written concerning the wintering of bees, in my judgment, nothing came so near the proper way as that given by Mr. D.

ROBERT CORBETT. ♂

Manhattan, Kans.

Only a Drone.

Dr. J. N. Smoot is puzzled about a strange noise like a boy blowing in a bottle, emanating from one of his beehives. It was only a poor drone driven into a vacant part of the hive, by the workers, when the hive acted as a sounding-board, and the poor fellow gave vent to loud lamentations over the cruelty of his heartless sisters. I frequently have heard the same lugubrious sounds in my apiary this fall, after the bees began to drum out the drones.

E. E. E.

Convention Notices.

☞ The Iowa Central Bee-Keepers' Association will hold their annual meeting in the Court House at Winterset, Iowa, on Friday, Nov. 7, 1884. All interested in bee-culture are requested to be present.

J. E. PRYOR, Sec.

A. J. ADKISON, Pres.

☞ The Mahoning Valley Bee-Keepers will hold their fall meeting in Ravenna, O., on Nov. 14, 1884. A cordial invitation is extended to all.

E. W. TURNER, Sec.

Newton Falls, O.

☞ Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$5 per 100.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

☞ For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

Virginia Bee-Keepers' Convention.

At the Virginia State Fair, to be held on Oct. 22-24, it is expected that there will be an unusually fine display of everything in the apiarian line; a great variety of bees and queens, smokers, hives, bees at work, etc. The wax-working department will be fully shown, from rendering the comb into wax, refining, and making into sheets, with samples of wax from the wax extractor from the crude to the sheets ready for the hive, together with the outfit of a full apiary.

The Agricultural Society is doing what it can to render this department an interesting feature of the State Fair, and by this means to supply the best practical information to persons desiring to keep bees, either as a business or to provide themselves with honey for home-use.

To carry this intention more fully into effect, the Society proposes that the bee-keepers of Virginia and other States shall hold a bee-keepers' convention on the third day of the Fair, October 24, for the full discussion of every matter connected with bees—food, handling, preservation, apiarian implements and hives, best varieties, etc.; and as this industry has now become of wide extent and importance, it is expected that there will be a large assembly of amateurs as well as professionals, and as the meeting will be open to all, much valuable information will be imparted to those who attend for the purpose of obtaining knowledge on the subject.

Convention Notices.

The Tuscarawas County Bee-Keepers' Association will hold its next meeting at the apiary of Geo. F. Williams, in New Philadelphia, O., on Thursday, Oct. 23, 1884.

G. F. WILLIAMS, Sec.
 A. A. FRADENBURG, Pres.

National Bee-Keepers' Association.

As has already been noticed, the next annual meeting of the North American Bee-Keepers' Association will be held in the city of Rochester, N. Y., Oct. 28, 29 and 30, 1884. Essays will be read as follows: "Wintering Bees," by W. F. Clarke, of Canada; "Nectar," by Prof. A. J. Cook, of Michigan; "Marketing Honey," by Thos. G. Newman, of Illinois; "Foul Brood," by D. A. Jones, of Canada. The committee has decided to use the balance of the time in discussing these and other questions of importance. Those who cannot be present, and have questions that they desire to have discussed or answered, will please send the same to the Secretary, Dr. C. C. Miller, of Marengo, Ill., or to Rochester, in care of the convention, on or before the first day of the meeting. Notice as to place of meeting will be given hereafter.

C. C. MILLER, Sec.
 L. C. ROOT, Vice-Pres.

Convention at Chicago.

The Northwestern Bee-Keepers' Association will hold its fifth annual convention at Owsley's Hall, northwest corner of Robey and West Madison streets, Chicago, Ill., on Wednesday and Thursday, Oct. 15 and 16, commencing at 10 a. m. on Wednesday, and holding five sessions. Those who have attended one of these annual re-unions will need no urging to induce them to come again; those who have not, should remember that Father Langstroth characterized the last meeting as "representing the largest number of large, practical and successful honey-producers of any convention that he had ever visited." This meeting being held during the Inter-State Industrial Exposition, reduced railroad fares may be had on nearly all of the railroads.

W. Z. HUTCHINSON, Sec.
 C. C. MILLER, Pres.

The Northern Ohio Bee-Keepers' Association will hold their next meeting in the Council Chamber at Norwalk, O., on Wednesday, Oct. 15, 1884.

H. R. BOARDMAN, Sec.

The Northwestern Indiana Bee-Keepers' Association will hold their annual meeting in the city of La Porte, at Lay's Opera House, on Wednesday, Oct. 22, 1884, beginning at 10 a. m. Essays will be read as follows: "The preparation and wintering of bees in the cellar," by G. R. Tyrrell, President; "The profitable use of comb foundation," by Dwight Furness, Vice-President of Porter County, Ind.; "The preparation and wintering of bees on the summer stand," by A. Fahnestock, Secretary; "Introducing queens and how to get rid of fertile workers" will be subjects for discussion. A full attendance is requested. Ladies are specially invited.

A. FAHNESTOCK, Sec.
 G. R. TYRRELL, Pres.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
 Monday, 10 a. m., Oct. 13, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c in the jobbing way, and brings 14@15c on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@9c on arrival.

BEESWAX—Is dull at 28@29c on arrival.
 C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb, 18@20c, 2-lb, 16@18c; fair to good, 1 and 2-lb, 14@16c; fancy buckwheat, 1-lb, 12½@13c, 2-lb, 11½@12c; ordinary grades of dark, 1 and 2-lb, 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c, buckwheat, 6½@7c.

BEESWAX—Prime yellow, 30@31c.
 MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c; 2-lb, 16@18c. Extracted, 8@9c. Un-glassed sections sell best.

BEESWAX—35c.
 BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c, is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c, when in good order. Stock of comb honey is not large at present. Extracted, 7@8c, for new.

BEESWAX.—For fair to yellow, 28@30c.
 R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—There is little life to the market and a lack of firmness. Good comb honey is changing hands slowly in a jobbing way at 8@9c. Choice extracted is offering at 4½c, without finding buyers. White to extra white comb, 9@10c; dark to good, 6½@8c; extracted, choice to extra white, 4½@5c; dark and candied, 4c.

BEESWAX.—Wholesale, 25@30c.
 STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.

BEESWAX.—Firm at 32@32½c. for choice.
 W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Our market is at present overstocked with honey, large quantities having been brought in wagons, and every place is filled up. Some lots have sold as low as 6c for 1-lb. sections of white comb. We have not changed prices, but find sales very slow at 16c. for best white 1-lb., and 14c. for 2-lb. Dark honey we are offering as low as 10 to 12c, without being able to effect sales. Extracted is not wanted at all, and no sale at any price.

BEESWAX.—28@30c.
 A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2-lb. sections, 15c; extracted, 7@7½c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—There has been a good demand with liberal receipts, and prices remain the same. Choice Eastern comb, ¼-pound sections, 18c; 1-pound, 16c; 2-pounds, 15c. Californias comb, 2-pound sections, 15c. Lower grades are slow at 2 or 3 cents less. Extracted, 6½@8c, according to quality.

BEESWAX.—None in the market.
 CLEMENS, CLOON & Co.
 Successors to Jerome Twichell.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Special Notices.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

My advertisement in the AMERICAN BEE JOURNAL brought all the orders that I wanted, and many more than I could fill, except for selected breeding-queens. We have had heavy rains and the weather is intensely hot. I fear the rains are too late to help our bees much. G. W. DEMAREE, Christiansburg, Ky., Oct. 3, 1884.

Opening December 1, 1884; Closing May 31, 1885

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Young Men!—Read This.

THE VOLTAIC BELT CO., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6D1y

HEDDON'S
COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

QUEENS!

OLDEST BEE PAPER IN AMERICA

THE WEEKLY BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861.

Chicago, Ill., October 22, 1884.

VOL. XX.—No. 43.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P. O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies to the same or different post-offices; \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Anyone intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street, Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCAPPING KNIFE.

PATENTED, MAY 20, 1873.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are still in working order. They burn lots of blocks and chips and stave, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

Bees and Honey, or Management of an Apiary for Pleasure and Profit. by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 230 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey! by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Poul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$5 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., OCTOBER 22, 1884.

No. 43.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The North American Convention.

Mr. William Williamson, of Lexington, Ky., writes us that he has been in correspondence with the authorities of the World's Exposition at New Orleans, La., relative to the holding of the next meeting of the National Convention next March at that place, instead of in the fall.

Under date of Oct. 4, 1884, Hon. G. C. Brackett, Superintendent of the Farm and Garden Products, writes as follows: "If the National Bee-Keepers' Convention is called at New Orleans, during the Exposition, I can only assure you of a cordial welcome, and every reasonable courtesy which the management of the Department of Agriculture can give you. This Department includes the apiarian interest in its provisions. I shall be pleased to receive your further communications bearing upon this matter in detail."

If the National Society desires to accommodate the bee-keepers of the South, and at the same time to place the pursuit to advantage before the world, here is a grand opportunity for it to do so.

Married, on the first day of October, 1884, at the residence of William Coulter, at Black Oak Grove, by Elder E. S. Riley, Mr. Ira Bull, of South Liberty, to Miss Ida B. Coulter; all of Indiana. Many elegant presents were made, and the wedding festivities were very interesting. The bride and groom have our best wishes.

Messrs. J. VanDeusen and Son, of Sprout Brook, N. Y., were at the Chicago Convention last week.

Maine Bee and Honey Show.

From the *Home Farm* we glean the following concerning the Maine show:

In the upper story of the main building, in the west wing, was the display of bees, bee-equipments, and literature, under the superintendency of Mr. Horace B. Cony, of Augusta. This department, although not very large, was extremely interesting, and during the Fair was visited by scores of those directly interested in practical bee-culture, and by hundreds who came out of curiosity and to learn of the habits and management of these thrifty workers. The principal exhibits were made by Jas. B. Mason, of Mechanic Falls, E. P. Churchill, of North Auburn, Edward Tarr, of Castle Hill, T. F. Blaisdell, of Fort Fairfield, and G. W. P. Jerrard, of Caribou, whose exhibit is included in the special exhibit of Aroostook county, on the second floor.

Canada Bee and Honey Show.

At the Toronto Fair the splendid bee and honey show attracted much attention this year. The *Toronto Mail* gives a lengthy notice of it, from which we extract the following items:

Mr. Jones exhibited about 30,000 pounds of honey, a vast quantity of which was in cans, beautifully labeled; and in addition to this he presented a wonderful exhibit of apiarian supplies, arranged in a pyramid in the centre of the honey house, which attracted much attention.

Another pleasing feature was introduced by Mr. Jones, by the exhibition of not fewer than forty different kinds of honey-producing plants, showing, as they did, that Canada has more honey-plants than any other country in the world. The uninitiated or novice in bee-farming has only a very crude idea of the extent of our honey-plants, which include many known only thoroughly to the busy bee, whose duty and pleasure it is to find them out.

As an evidence of Mr. Jones' faith in the development of bee farming in Canada, he has lately increased his productive power of apiarian supplies by an expenditure of \$8,000 or \$10,000 on new machinery, including a new Corliss engine, manufactured expressly for him by Messrs. Inglis & Hunter, of this city.

Among the other exhibitors of honey was Mr. Hall, of Woodstock, who succeeded this season in having gathered about 16,000 pounds, but in order to do this he was compelled to greatly increase his stock, owing to the coldness of the honey season.

Messrs. William Ellis, of St. Davids, Ont., Mr. Geo. Tye, of McPherson Avenue, North Toronto, and Messrs. Grauger & Duke, of Deer Park, North Toronto, were also exhibitors of the nectar. Each of these exhibitors secured prizes for various classes of honey, the latter getting a prize for fruit preserved in honey instead of in sugar, the usual method. Mr. Goold, of Brantford, also showed a few apiarian supplies. Altogether the exhibit of honey and apiarian supplies was well worth inspection, and more especially by those contemplating bee-farming as a lucrative and enjoyable occupation.

From the *Chicago Tribune* we copy the following item: "The yield of the apiary of H. C. Parks, of Riverside, San Bernardino County, California, is the most remarkable on record. From 33 hives $7\frac{1}{4}$ tons of honey were obtained, an average of 439 pounds to the hive."

There is a large crop in California this year, and 439 pounds is a large average, but not "the most remarkable on record," when we remember that it is on "record" that B. F. Carroll, in Texas, had 1,200 pounds of honey to the colony, in 1883.

The B. & O. Red Book for Illinois is ready for distribution, and in more than one respect, is the most valuable of any of the editions hitherto based upon this State. As has always been the rule, the forwarding of a stamp to C. K. Lord, Baltimore, is all that is necessary to secure a copy, and in fact the only way, as the Red Book issues are all for mail circulation. The present volume is replete with political statistics and condensed data, not only as regards the Presidential, State and Congressional elections in this State, but relating as well to elections since admission into the Union. It will be difficult to imagine a more complete showing of past results in the State, or a more neatly put together and printed little book.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Northwestern Bee-Keepers' Society.

The Northwestern Bee-Keepers' Society met at Owsley's Hall, Chicago, Ill., on Wednesday, Oct. 15, 1884, at 10 a. m., Pres. C. C. Miller in the chair.

The annual fee was reduced to 50 c.

The Secretary's and Treasurer's reports were read and adopted.

The following became members :

Geo. Asher, Naperville, Ill.
 L. Adams, Mayfair, Ill.
 Wm. Blake, Buchanan, Mich.
 S. N. Black, Clayton, Ill.
 Geo. Bischoff, Burlington, Ill.
 T. S. Bull, Valparaiso, Ind.
 Wm. Burrus, Buchanan, Mich.
 H. D. Baker, Prairie Centre, Ill.
 A. J. Cook, Agricultural College, Mich.
 T. W. Dougherty, Wyanet, Ill.
 P. J. England, Fancy Prairie, Ill.
 Jas. Forncrook, Watertown, Wis.
 H. W. Funk, Bloomington, Ill.
 A. Fahnestock, La Porte, Ind.
 Dwight Furness, Furnessville, Ind.
 Chas. H. Green, Berlin, Wis.
 S. E. Gernon, Waukesha, Wis.
 I. E. Gere, Riceville, Wis.
 J. A. Green, Dayton, Ill.
 Frank Gunderson, Alderly, Wis.
 Mrs. C. H. Green, Berlin, Wis.
 James Heddon, Dowagiac, Mich.
 W. Z. Hutchinson, Rogersville, Mich.
 J. M. Hume, Macomb, Ill.
 Richard Hyde, Alderly, Wis.
 J. Hendricks, Spring Grove, Ill.
 Mrs. L. Harrison, Peoria, Ill.
 Gottfried Harseim, Secor, Ill.
 J. L. Harris, Wheeler, Ind.
 Dr. J. B. Hawks, Arlington H'ts, Ill.
 F. H. Hannah, Hinsdale, Ill.
 John Hodgson, Jr., Pewaukee, Wis.
 Frank B. Hesse, Bartlett, Ill.
 L. Highbarger, Adeline, Ill.
 Aug. Jensen, Channahon, Ill.
 Geo. W. Jones, West Bend, Wis.
 R. Johnson, Valparaiso, Ind.
 G. B. Lewis, Watertown, Wis.
 W. C. Lyman, Downer's Grove, Ill.
 J. G. Lucas, Kingston, Ill.
 J. R. Lindley, Georgetown, Ill.
 E. Lucas, Kirkland, Ill.
 Dr. C. C. Miller, Marengo, Ill.
 James M. Marvin, St. Charles, Ill.
 S. J. McKinney, Burlington, Iowa.
 Thos. G. Newman, Chicago, Ill.
 B. F. Newcomb, Roger's Park, Ill.
 Oatman Bros., Dundee, Ill.
 H. W. Lee, Peatonica, Ill.
 Helen C. Platt, No. Manitow, Mich.
 W. F. F. Petty, Pittsfield, Ill.
 Abraham Pontious, Akron, Ind.
 J. Stewart, Rock City, Ill.
 Geo. Thompson, Geneva, Ill.
 D. C. Spencer, M. D., Augusta, Wis.
 Mrs. W. A. Smith, Chicago, Ill.
 A. M. Strong, Naperville, Ill.
 C. Schrier, Peotone, Ill.
 Mrs. M. E. Spencer, Augusta, Wis.
 J. O. Shearman, New Richmond, Mich.
 E. F. Schaper, Chesterton, Ind.
 Miss Sara Shibley, Richmond, Ill.
 N. L. Stow, South Evanston, Ill.
 Jacob Schumm, La Porte, Ind.
 Wm. T. Smith, La Porte, Ind.
 Mrs. S. L. Thomas, Plattsmouth, Neb.
 G. R. Tyrrell, La Porte, Ind.
 I. A. Travis, Lyons, Wis.
 T. L. Von Dorn, Omaha, Neb.
 Rev. Daniel Whitmer, So. Bend, Ind.
 Dr. J. A. Walker, Mason City, Ill.
 E. Whittlesey, Peatonica, Ill.
 L. C. Wemple, North Evanston, Ill.

Different Races of Bees.

The first topic discussed was the different races of bees.

Geo. Thompson: I prefer the Syrians, or a cross between them and the Italians.

Prof. A. J. Cook: We have had very conflicting reports regarding the Syrians. Mr. Frank Benton, as, perhaps, many of you are aware, says that there is a difference in these Eastern bees, depending upon the locality from which they come; and that only those bees which come from Syria should be called Syrians. This may explain why there are so many different opinions. Then, again, the Syrians so closely resemble the Italians that many may have Italians when they think that they have the Syrians. At the College we find them very gentle. I do not object, so much as some, to a cross, and I think that much may be gained by a judicious crossing. We secured a Carniolan queen, last year, with the intention of crossing the Syrians with the Carniolans, but the queen died, and we shall have to try again. I do not think that any one should condemn any race of bees until he has tried them.

James Heddon: Is there any difference in the appearance of the Carniolan and the German bees?

Prof. Cook: There is a slight difference.

James Heddon: They very much resemble the German race, do they not?

Prof. Cook: Very much, indeed.

James Heddon: I think that there are, perhaps, only two distinct races—the black and the yellow, and the Carniolans are of the dark color. Before introducing a new strain of bees into a large apiary, I should like to know something in regard to the bees, otherwise much loss might result. Such men as Prof. Cook, with an experimental apiary, are the ones to try these new varieties. I am strongly in favor of the German bee, it builds such straight, white combs, and in these days of cheap honey, we must look out for every advantage, otherwise we are "left." I almost wish, sometimes, that I had never had a yellow bee in my apiary.

When to Put Bees in the Cellar.

Upon taking a vote, it was decided that Nov. 1 was too soon to put bees into the cellar.

James Marvin: I do not think that Nov. 1 is too early. If left out, the bees fly about, consume more honey, and weak colonies are liable to be robbed. I have kept bees in a cellar six months, and had them come out in fine condition.

Prof. Cook: If one has no cellar, and circumstances are such that he cannot have one, what shall be done?

Mr. Adams: I have a cellar built above ground, the walls being double and made of building paper.

Dr. C. C. Miller: Perhaps it is not in order, but I presume that Mr. Heddon is loaded to the brim upon the subject of wintering.

James Heddon: This question of wintering is not one of cellars, ventilation, hives, pieces of laths, sticks,

quilts and cushions over the combs—what kills our bees is diarrhoea; and the question is, "What causes bee-diarrhoea?" When that question is settled, then these minor topics of ventilation, protection, humidity, etc., will be easily settled.

Securing Statistics.

Upon this subject Prof. Cook said: I have been informed that, if the proper steps were taken, we could secure statistics of the honey crop through the medium of the crop correspondents.

After considerable discussion, Mr. Von Dorn moved that the President appoint a committee consisting of one person from each State, coming under the jurisdiction of the Northwestern Bee-Keepers' Association, and that this committee be empowered to take the proper steps for securing the legislation necessary to have honey included in the crop correspondents' report. The motion was carried.

Mr. Black moved that this committee be empowered to make an effort to secure proper legislation upon the subject of foul brood. Carried.

How a Cell is Filled with Honey.

Dr. D. C. Spencer: In my observatory hive one cell was built against the glass, and that afforded an excellent opportunity of seeing how bees deposit honey in the cell. First, a bee deposited a thin coating of honey upon the base of the cell, making a sort of varnish, as it were, to the base of the cell. The next bee that came with honey, raised up the lower edge of this film of honey and forced its honey beneath this film; the next bee did the same, and this film acted as a kind of diaphragm, keeping the honey in the cell. When the cell is full enough to be sealed, the bees commence contracting the opening with wax, until there is only a small hole left in the centre, when they appear to take one little flake of wax and pat it down over the opening. At any time during the process of filling the cell, the honey could be withdrawn with a hypodermic syringe, and the "diaphragm" left hanging in the cell.

Reversible Frames.

James Heddon: I have used, the present season, two or three thousand reversible frames, but it will require at least another season to decide many points in regard to them. Of one thing I feel certain, and that is, that one reversal will pay for the extra cost in the solid framefuls of comb thus secured. This point is settled; reversal will induce the bees to attach the combs to the bottom-bars. Then there is the question of reversal of sections; if done at the proper time, it secures their completion and attachment to the bottom-bar, which is now the top-bar of the sections. In the forepart of the season, the queen and bees are inclined to fill the brood-combs with brood and store the honey above in the sections; then if the brood-combs are reversed, the bees will carry up the honey and fill the combs with brood, thus secur-

ing more brood and stronger colonies in smaller hives, and the honey in the sections. If the sections are reversed during the honey-flow, it will secure their completion. As the season draws to a close, breeding is carried on less extensively, and the bees are inclined to carry the honey into the brood-combs; to reverse now would only hasten the operation of bringing the honey down from the sections and storing it in the brood-nest.

Dr. Miller: I am not particularly interested in the reversal of brood-combs, but I am interested in the reversal of sections, as it secures the attachment of the combs to the bottom-bars, and the honey can be shipped with greater safety; and if it secures the finishing of unfinished sections, I shall be more than pleased.

James Heddon: I have tried reversing sections, and if done early enough in the season, it will secure their completion. I reverse the whole case at once. I do not advocate reversing sections. I am working out another plan, with prospects of success, by which I can get all sections uniformly and completely filled with honey.

Pres. Miller: Please give us the plan.

James Heddon: It is not yet fully developed, and I protest against easting upon the public, partially-worked-out systems.

The convention adjourned to meet at 2 p. m.

AFTERNOON SESSION.

The convention was called to order at 2 o'clock, President Miller being in the chair. The first question discussed was:

Queen-Excluding Honey-Boards.

W. Z. Hutchinson: I have used, for two years, ten of the perforated zinc honey-boards. They are the old style, or Jones' perforated zinc. The first year no queens passed through, this year two queens passed through. I prefer, however, a honey-board of thin wood, having perforations or slots made with a saw of exactly the proper thickness. Bees can pass more readily through the same sized aperture, in a thin zinc sheet, than one in a $\frac{1}{2}$ -inch thick, wooden honey-board. I have found that the old style, or Jones' perforated-zinc, has exactly the right-sized apertures for a wooden honey-board. I have, the present season, used 60 of these wooden honey-boards, and not one queen has passed through. I have managed some hives with no honey-boards at all, some with perforated zinc, some with the Heddon slat honey-board, and, as I just said, some with honey-boards of thin wood perforated with a saw, and I have been unable to discern that there was any preference so far as the amount of honey stored was concerned. I prefer the wooden honey-board, because it is cheaper, and is more rigid, thus keeping the bee-spaces perfect.

James Heddon: I have used the queen-excluding honey-boards, both metal and wood, and for the production of comb honey, I do not think

that I care for them. With my skeleton or slat honey-board, in which the openings come directly over the centres of the top-bars, thus breaking the connection, and preventing the building of brace combs between the brood-frames and the bottom-bars of the sections. I have so little trouble with queens invading the sections, that I do not care for a queen-excluding honey-board: but when it comes to the production of extracted honey, the queen is almost certain to enter the upper story and "spread herself," and it is possible that a queen-excluding honey-board is a good thing here. There is another point, though, right here, and that is, if the queen is allowed to "roam at her own sweet will" all over a large hive, there is less likelihood of the bees swarming.

Pres. Miller: Well, Mr. Heddon, whether or not queen-excluding honey-boards shall, in the future, be pronounced a success, I wish to thank you for your skeleton honey-board. It keeps the sections so nice and clean, and enables us to remove the sections from the hive with so little trouble and darning.

Size of Sections.

James Heddon: I have experimented considerably with half-pound sections, and I think that I shall use more of them in the future. Of one thing I am positive, and that is, that I can get just as much honey in a small as in a large section. It is not a question of the amount of honey to be secured, but of the cost of sections, foundation and manipulation. I can secure 3 cents more per pound for my one-half pound sections, and sell them much more quickly; but for all that, we do not want all half-pound sections, and I should not advise everybody to go to using them.

Dr. Spencer: I have received 5 cents more per pound for my half-pound sections. The restaurants are the best customers for the half-pound sections.

How Far Apart to Establish Apiaries.

E. J. Oatman: Our apiaries are four miles apart.

James Heddon: This is what I should like to know: How many colonies shall I have in one apiary before establishing another? and when I do establish another, how far out shall I go? This is really a question of overstocking, and of how far bees can fly and store honey profitably.

Dr. Miller: Let me ask how many there are who would not think it profitable to keep more than 75 colonies in one apiary?

Two members held up their hands. Five members would not have more than 100 colonies, and three would not have more than 150.

J. O. Shearman: Much might be said in regard to pasturage, seasons, etc.

James Heddon: We take all this into consideration; but I would like to know how many think that bees will fly two miles and store honey profitably?

Ten members thought that two miles is as far as bees could work at a

profit; fifteen put the distance at $2\frac{1}{2}$ miles; seven put it at 3 miles; while four thought that they might place the distance at 5 miles.

Bee Pasturage.

Dr. Miller: Does it pay to raise plants for honey alone?

S. N. Black: It has paid to raise buckwheat, and to scatter the seed of catnip or sweet clover along the roadside and in waste places.

A. J. Cook: I wish to speak in favor of the Rocky Mountain bee-plant. It blossoms after white clover and basswood, is very hardy, and yields honey abundantly.

Dr. Miller: While it may pay to raise plants for honey, the question arises, will it not be still more profitable to establish new apiaries where nature has already done the planting? Mr. Oatman has answered that question, practically, by moving out.

James Heddon: Where bees are kept, honey-producing plants are more perfectly fertilized; hence, where bees are kept, honey-plants will increase; but I do not think that it will pay to raise plants for honey alone, upon land that can be used for raising corn, oats, wheat, potatoes, etc.; yet I would not discourage the scattering of seeds of honey-plants in waste places.

A. J. Cook: But we do not know from experience, whether it is really profitable or not to raise plants for honey alone. Perhaps men may yet demonstrate, with a large crop of honey, that it does pay to raise plants for honey alone.

Dr. Miller: I have tried an acre of figwort. I kept it carefully cultivated one year, the plants thrived finely, and the bees worked upon it almost incessantly, but the use of the land and the cultivation is too expensive. The next year I dropped the cultivation, and the plants dwindled, and, comparatively, amounted to but little. I sowed 20 acres to sweet clover, but it did not come up so well as I could have wished, and various causes have prevented it from attaining the proper growth. If the seed is sowed along the edge of the wagon tracks, just at the line where the grass begins, it will come up well, but it does not germinate and grow when sown upon a pasture. However, sweet clover is the one plant in which I have not entirely lost faith.

T. L. Von Dorn: In our locality, Rocky Mountain bee-plant was once plentiful, but now it is seldom seen.

A. Fahnestock: I think that it is foolish to raise weeds, when we can just as easily raise crops that will produce honey. I have raised Alsike clover, and found it one of the best of honey-producers.

S. N. Black: I have tried Alsike clover, but it produced no honey, and soon died out.

J. L. Harris: I have tried Alsike clover, and found it so very profitable that I am furnishing the neighboring farmers with seed.

James Heddon: As you have raised some Alsike clover, now what per cent. of your honey crop do you think comes from it?

J. L. Harris: Perhaps 1 per cent.

James Heddon: Now, then, Mr. Harris, do you not think that this furnishing of seed to your neighbors will have a tendency to create bee-keepers, with whom you will have to divide your field; and you will thereby lose more than the 1 per cent. that you now gain?

J. L. Harris: Oh, that phase of the business has been gone through with in my locality. When my neighbors saw me getting good crops of honey, they, of course, must "do so too," and they engaged in business just long enough to get a taste of honey, and now they buy their honey of me. One touch of winter losses, and they dropped bee-keeping. There will be no trouble of that kind, Mr. Heddon.

Comb Foundation.

A. Fahnestock: In the brood-nest, I would use foundation that is about 6 feet to the pound.

James Heddon: When wax is warmed it expands; when firmly attached to the top-bar, of course the upper edge cannot expand, and, as the lower part of the sheet expands and the upper does not, it waves and curls; for this reason we wire the frames. Years ago, many bee-keepers said that they did not need wired frames, foundation did not warp, nor curl nor sag with them, they were satisfied; but now they use wired frames. Then, again, what is "good enough" for one man does not satisfy another. I want foundation upon which I can have a prime swarm, close up the hive, and not open it again for a year, and then find every comb as straight as a board.

S. N. Black: I would use 8 feet of foundation to the pound.

II. W. Funk: I would not use it lighter than 5 feet to the pound.

J. A. Green: I would use 5 feet to the pound unless I used wired frames, when I would have it 7 or 8 feet to the pound.

A. Fahnestock: I have tried using one-half sheets, that is, filling the frames one-half full of foundation, and the bees fill out the frames with drone-comb.

James Heddon: If we should use narrow strips of foundation for starters (and, if necessary, I would pay \$5 per pound for foundation for this purpose), perhaps it would be well to have two or three rows of cells of drone-comb next to the top-bar, and then have it changed to worker-comb. This might satisfy the bees, and, being next to the top-bar, it will be filled with honey most of the time.

T. L. Von Dorn: I use no wires, and my foundation never stretches nor sags.

Geo. Thompson: Some bee-keepers have thought it unprofitable to use foundation in the brood-chamber.

James Heddon: The question is, whether or not the secretion of wax is voluntary with the bees. We have made no experiments upon this subject, but expect to during another season.

Prof. Cook: We have tried hiving swarms of the same strength, both with foundation and upon empty

frames, and those with foundation stored the most honey. To secrete wax in the largest quantities, bees must have repose, hang themselves up in a cluster, and not be compelled to work. We would not secure much milk from our cows if we worked them; it is the same with our bees, in regard to wax-secretion.

J. A. Green: When bees are hived upon foundation, I do not find any wax scales upon the bottom-board, but I do find them quite plentifully when hiving them upon empty combs.

Honey-Dew.

Prof. A. J. Cook: In many parts of the country there have been, during the present season, quantities of honey gathered which originated in the plant and bark-louse. That from the plant-louse is quite fine and agreeable honey when compared with that from the bark-louse. We had some at the College, and nearly all of the students liked it; but we would not put it upon the market. We let a baker try making some cookies with it, telling him what it was, and, after a trial, he bought all we had at 7½ cents per pound.

President Miller: Well, Professor, to come down to the practical, what shall we do with this honey-dew question.

Prof. Cook: Do? Why, rejoice and be glad! It comes early in the season, stimulating the bees, thus giving us strong colonies early in the season, and, as I just said, the honey can be used by bakers, or it might be kept until spring and fed to the bees to stimulate them. That from the plant-louse I should be willing to risk as a winter food, but not so that from the bark-louse, which is abominable stuff. Just as soon as the bees can gather honey from the flowers, they desert the "honey-dew," then the combs should be emptied with the extractor. I would advise bee-keepers to be on their guard another season. It is all foolishness to say that honey-dew "rains down;" it is either from some insect or vegetable origin.

The convention adjourned to meet at 7 p. m.

EVENING SESSION.

President Miller being absent, Mr. T. G. Newman took the chair, by request.

Increase of Colonies.

James Marvin: Why have increase at all, when there is no market for it? I prevent increase by hiving a swarm into a hive from which a swarm has issued a short time previous.

Geo. Thompson: I have my queens' wings clipped. When a swarm issues, I catch the queen, cut out the queen-cells, wait until the swarm returns, and then allow the queen to run in at the entrance. If they swarm again, I repeat the operation, and continue to do so until the bees give up swarming. In this manner I can prevent increase almost entirely.

W. Z. Hutchinson: Did you never have the bees kill the old queen, rear another, and then swarm?

Geo. Thompson: No, sir.

James Heddon: I think that I stated, years ago, that I could secure more honey by allowing my bees to swarm. A few years ago, a man in Texas secured 1000 pounds of honey from a single colony that did not swarm, and considerable bragging was done about it. I called attention to the fact that Mr. Vandervort had secured more than 1,000 pounds from one colony and its increase, and everybody said: "It is not fair, it is not fair. You must not count the increase;" and every one who shouted thus, virtually admitted that more honey can be secured by allowing increase. It is probable, however, that in those localities where there is only one honey harvest, and that comes early, more honey will be secured if there is no increase; but where there are three honey harvests, as in my locality, it certainly pays to increase, to the extent at least, of doubling the original number of colonies.

Secretary Hutchinson: For several seasons I have secured more honey from colonies (and their increase) that swarmed than from those that did not. This last season has been the only exception; and the reason is, that the honey-harvest came very early, was cut short by the drouth, and no honey was stored afterwards during the remainder of the season. My views in this matter have been very clearly expressed by Mr. Heddon.

Prevention of After-Swarming.

G. R. Tyrrell: I prevent after-swarming by introducing a laying queen, after the swarm has issued.

Secretary Hutchinson: A laying queen costs one dollar!

G. R. Tyrrell: Not if you rear her yourself, and have no sale for queens.

T. S. Bull: I prevent after-swarming by allowing a virgin queen to run into the hive as soon as the swarm has issued.

J. A. Green: I have practiced the Heddon-plan of preventing after-swarms (see page 126 of the BEE JOURNAL for 1883), and it worked to perfection. I have secured more honey when I allowed the bees to increase.

Dwight Furness: I, too, have tried the Heddon plan, and it is a perfect success.

Secretary Hutchinson: I have, for two years, practiced the Heddon method of preventing after-swarms, and I am more than pleased with it. I should like to know if there is any one present who has tried it, and has not been successful?

S. N. Black: It has not always been a success with me, but I think that it usually is a success.

A. Fahnestock: After a prime swarm issues, I take out the outside combs, extract the honey, and then return them to the centre of the brood-nest; this gives the young queen room to lay, and prevents swarming.

Secretary Hutchinson: As the young queen does not usually commence laying until about the 18th day after the swarm has issued, and the brood will all be hatched by the 21st day, it occurs to me that the queen

will find plenty of room to lay in without extracting the honey.

James Heddon: I think that after-swarms are the results of quarrels among the young queens; and to avoid killing another queen, or being killed, a queen leads off a swarm. Now, I do not see how extracting the honey is going to prevent this quarreling. With my plan, the old colony is so reduced in numbers just at the time when the queens are hatching, that there are no bees to swarm, and the young queens are obliged to fight it out on the line of the "survival of the fittest."

Queenless Colonies.

The question was asked: "Will the bees of a queenless colony store as much honey as those having a queen?"

James Heddon: Perhaps it is not exactly understood what is meant by the term "queenless colony." Father Langstroth defines it thus: "A colony having no queen, nor the power of rearing one." And I do not think that the bees of such colonies work so well; neither do I think that bees that have simply been deprived of their queen, will work so well. Bees never work in the sections with such energy as when there is a laying queen upon the combs below. Bees do love to have their own way, and I think it best to humor them; either let them have their own way, or let them think that they have it, and never work contrary to their instincts, but with them. If colonies are divided, they sulk for awhile, and then when they get strong they swarm, thus having their own way. The honey-season was nearly over, one year, and a large number of nearly-finished boxes of honey were upon a hive containing a strong colony which had not swarmed, and I hoped that they would not, as I wanted the honey finished; but they swarmed. I said to myself, "This will not do. I must have that honey finished." So I removed the queen, and put the swarm back, or attempted to, for they hung out in the portico, and would not enter. I waited nearly all day, and then drove them in with smoke, and in a short time they were out again. I drove them in again, clear up into the boxes, in a little while they were out again, and those bees just laid their ears back and sulked, and stored no honey until they had reared a queen, when, as I ventured down town one day, they swarmed and went to the woods. Now, if I had hived that swarm, how they would have gone to work and filled their hive, and I should have secured more surplus honey, and had the increase "to boot." I give my bees plenty of air, by the way of wide entrances, give them shade, and room to work in the boxes—this discourages, but does not always prevent swarming. When it does not, I say, let them swarm, and then prevent after-swarming.

Tiering-up Sections.

J. A. Green: I have practiced tiering-up sections and I prefer that method.

Mr. Adams: I prefer that method.

Mr. House: When tiering-up one tier at a time, I like the method; but with wide frames containing two tiers of sections it has been unsatisfactory with me.

James Heddon: Years ago, closed-top sections were used quite extensively, now there is scarcely a call for them; this shows that the majority believe in the tiering-up system.

A. Fahnestock: I practice tiering-up. The first tier of sections that I put on contains closed-top sections.

Secretary Hutchinson: What covers the top of the second tier of sections, after the first tier is removed?

A. Fahnestock: Oil-cloth.

Mr. House: Why not have a bee-space above each tier of sections, and not have anything touch the top-bars of the sections?

James Heddon: There should be a bee-space, not only above the sections, but between each tier. This evening them up with oil-cloth, setting the sections down on the brood-frames, or allowing one tier of sections to touch another tier, is all wrong. I am astonished that in this day and age of the apiarian world, any one should go so far as to patent a hive allowing "continuous combs and continuous passage ways." Like Mr. Hutchinson, I say the bees put their propolis where two surfaces come in contact. If sections are covered with oil-cloth, the bees will put propolis where the edges of the top-bars come in contact with the cloth. When the cloth is removed and put down again, the bees will put in more propolis, and, as the process is repeated, more propolis is added until the cloth is finally so raised up that the bees can put great lumps of propolis between it and the sections. When one tier of sections come in contact with another, not only are bees killed when the case of sections is put in place, but propolis is put along the edges of the sections where they come in contact. Sections can, of course, be set down in contact with the tops of the brood-frames, but it is a great saving in jack-knives when removing the sections, and no more honey is received; I know, for I have tried it.

Separators.

A vote was taken, and about three-fourths of the members could dispense with separators; one-fourth wanted them.

Mr. McKinney: I have tried separators and discarded them, and it is my observation that many others are doing the same.

James Heddon: We have used a large number of one-story broad-frames, in supers with separators, and a large number of cases in which no separators were used; and although there are advantages and disadvantages in separators, yet they have nothing to do with the amount of honey stored. Although only one-fourth of you now vote in favor of separators, the time may come when the vote will be the other way. If you can produce honey without separators so that it will suit yourself, your commission man, the consumer, and everybody, all right; if you cannot, then use them.

T. G. Newman: From the appearance of some of the honey on our market, I must say that many who do not use separators, ought to use them. A bee-keeper and myself visited a commission honey-house on South Water Street, in this city, and while there we saw a clerk showing a customer some comb honey. With his hatchet he pried loose a cover of a crate, and grasping a section near the center, drew it up. As he did so, the comb scraped against the adjoining combs, and instead of coming to view as "a thing of beauty," it came up dripping, dauby and disgusting. As long as there are so many careless bee-keepers it seems unwise to discourage the use of separators. If a bee-keeper can secure straight, neat combs without separators, (and I must admit that some of them do), well and good; if not, use them by all means.

James Heddon: It is certain that straight combs can be secured without separators. At the Mich. State Fair, our secretary and Mr. R. L. Taylor had fine displays of comb honey, all built without separators. It was really finer than my own, and it was these gentlemen who secured all the premiums upon comb honey, although their honey was in competition with several lots of separated honey.

The convention adjourned to meet at 9 o'clock on the following morning.

MORNING SESSION.

The meeting was called to order at 9 a. m. by President Miller. The first topic was:

Susceptibility to Bee-Poison.

President Miller: The more we are stung the less susceptible we become; at least this is the case in the majority of instances. Whether this is a desirable stage to reach, I do not know. It is possible that the aches and ills, rheumatism and neuralgia, from which some suffer, are the effects of our system being filled with bee-poison.

S. N. Black: If I were going to be stung very much, I should be compelled to abandon the business. I do not wear a veil, but by washing the face and hands with ammonia, alcohol, salt and water, or something of that sort, bee-stings can be greatly avoided.

James Heddon: The first stings cause the flesh to swell; after the system becomes filled with the bee-poison, such is not the case, and I am inclined to agree with the President that rheumatism and neuralgia are caused by the system being brimful of bee-poison. It is acknowledged by all, that ammonia is the best remedy for animal poisons, and the best advice that I have, is to carry a bottle of it, and, when stung, scrape, not pull out the sting, put the mouth of the bottle over the wound and invert the bottle.

A. Fahnestock: I found that soda wet with saliva is an excellent application.

S. N. Black: The best remedy that I ever tried is spirits of turpentine.

Secretary Hutchinson: My remedy is a tincture of plantain leaves, pre-

pared by covering the fresh leaves with alcohol, allowing it to stand until the alcohol turns dark, then pour it off and bottle it. I seldom use it myself unless stung near the eye, but it entirely prevents swelling and pain when applied immediately after being stung. If severely stung, a few drops can be taken internally.

STATISTICS.

Mr. T. G. Newman, who had prepared a table showing the increase of bees for the year, and also the production of comb and extracted honey and beeswax, by request, read the totals, and the statistical table was made a part of this Report.

CELLAR VS. OPEN-AIR WINTERING.

Twenty-five members voted in favor of cellar-wintering, 15 for the open-air, and 12 voted both ways. When the latter were asked for an explanation, they said that sometimes bees wintered better in the open air; at other times better in the cellar.

After some more discussion in regard to upward ventilation, downward ventilation, quilts, cushions, sticks, size of cellar, etc., the following question was put: "Is the cause of bee-diarrhoea in the food?" Twenty-six members voted yes; five voted no.

James Heddon: Now, how many of the 26 who think that the cause is in the food, think that the cause is pollen?

Eleven held up their hands.

James Heddon: Now, of the 26 who think that the trouble arises from improper food, but do not think it pollen, how many can tell what it is?

J. O. Shearman: Perhaps sour honey may cause it.

H. W. Lee: If pollen causes bee-diarrhoea, why do not the bees suffer from it every winter? They have pollen in their combs every winter.

James Heddon: Bee-diarrhoea is caused by an overloading of the intestines. Fall honey does not produce it, for I have had my bees winter tip-top on fall honey, and had them die, rotten with diarrhoea, when they had fine, thick basswood honey. Cider does not cause bee-diarrhoea. I have wintered my bees with stores from cider. Cider may ferment, but you cannot overload a bee's intestines with "fizz." Bees do not have diarrhoea every year, because they do not eat the pollen every year. Sometimes the pollen appears to be dried down hard, glazed over, as you might say, and when the cells are filled with honey, on top of the pollen, the pollen mixes but slightly with the honey. The bees eat out the honey and leave the pollen intact; at other times the pollen appears more soft, something like mush, and partially mixes with the honey, so much so that were the honey extracted, considerable of the pollen would come with it. When the pollen is thus mixed with the honey, does it not appear reasonable that the bees should consume more pollen than when the pollen is hard and unmixed with the honey? Again, should the cold weather confine the bees for a long time in one particular place upon the combs, until they had

consumed the honey, would they not be more than liable to consume some of the pollen? Cold and confinement, although aggravating causes, are not the primary causes of bee-diarrhoea; else, why were bees in Indiana and Southern Michigan swept away, and we had to go to Northern Michigan to buy bees with which to replenish our apiaries? Pollen is a nitrogenous food, needed for building and repairing tissue, but it is not a heat-producing food; hence, it is not needed in winter when a carbonaceous food is needed. Pure cane-sugar is the best food known to us for winter stores for bees. To give them this we put empty combs free from pollen into a hive, shake the bees into it, put on a feeder and feed them sugar syrup; taking the combs of honey to the honey-house and extracting the honey. We hope, however, by using a small brood-nest, to secure brood-combs so free from both brood and pollen, at the end of the season, as to render extracting unnecessary.

Adjourned till 1 p. m.

AFTERNOON SESSION.

President Miller called the meeting to order. The first topic was:

MOVING BEES.

T. L. Von Dorn: I move bees upon a hay-rack. I nail fast the ends of the frames, but put no hay under the hives.

J. O. Shearman: In hot weather bees need water as well as air; it should be sprinkled upon them.

President Miller: I moved a colony in cool, fall weather, with no ventilation.

J. A. Green: I have moved bees successfully in the hottest weather by covering both the top and bottom of the hive with wire-cloth.

Secretary Hutchinson: I took several colonies to our State Fair, covering the top only with wire-cloth, and the bees died fearfully; another exhibitor, who had wire-cloth on the bottom as well as top, lost but few. Mr. T. F. Bingham, who was present, said that there should be a 3-inch space between the wire-cloth and the frames, both above and below.

STANDARD WIDTH OF SECTIONS.

The majority preferred sections seven to the foot when used with separators, and 1½ inches wide when used without separators.

BROOD-NEST IN THE FALL.

Mr. Bull: Simply put the brood below and the honey above.

James Heddon: If we are working for extracted honey, and the queen is allowed access to the supers, there is less likelihood of bees swarming. If managing bees in this manner, I would, near the close of the season, put the brood below.

EXTRACTED VS. COMB HONEY.

After considerable discussion, the majority decided that about twice as much extracted as comb honey could be obtained from a given number of colonies.

TEMPERATURE FOR BEE-CELLARS.

The decision arrived at was, that the proper degree was that at which the bees remained the most quiet. The majority thought that 42° was, usually, about right.

FOOD FOR BEES IN WINTER.

James Heddon: I weigh the sugar, and, to every ten pounds of it I put 6 pounds of water. I put the water on the stove to heat, and when it boils, I put in a piece of tartaric acid as large as a small hickory nut, to each ten pounds of sugar, then stir in the sugar and bring to a boiling heat. If the feeding is to be done late in the season, when it is probable that it will not be sealed over, I put in only 3 pounds of water to 10 pounds of sugar. The acid and the boiling are to prevent the crystallization of the sugar.

FEEDING BACK EXTRACTED HONEY.

J. A. Green: I have tried feeding back extracted honey to secure the completion of unfinished sections. At first the bees work well, but they soon seem to tire of it and loaf around and live out of the feeders.

Secretary Hutchinson: Last year I reported success in feeding back. This year I have fallen so far short of last year's success that I begin to consider feeding back an unsolved problem. There is a difference in colonies, some doing good work, others not.

S. N. Black: I have tried it, and it required the feeding of five pounds of extracted to secure one pound of comb.

President Miller: We sometimes have sections that are almost finished, and perhaps it might be advisable to feed back to secure their completion, even if the feeding did give us only one pound of comb for five of extracted. I have fed 400 pounds, the present season, but the result was unsatisfactory, and, in the future, I think that I shall leave the experimenting to others.

James Heddon: There need be no loss on unfinished sections; extract the honey and put them away until the "honey shower" comes from next season's basswood, and you will have a bonanza in those sections. I made quite a good many experiments this season—have weighed the feed, the sections, the hives and brood-nests; have fed hot and cold feed, thin and thick feed, but as yet, I look upon feeding back as in an experimental stage, and the prospects not bright at that. I fear that those who advocate feeding back have not counted the cost of feeders, and the fuss, trouble, bother, muss and waste of feeding back.

The election of officers resulted as follows: President, Dr. C. C. Miller, Marengo, Ills.; Vice-President, Mrs. L. Harrison, Peoria, Ills.; Secretary, W. Z. Hutchinson, Rogersville, Mich.; Treasurer, T. G. Newman, Chicago, Ills.

The Convention adjourned to meet on the Wednesday and Thursday of the last week of the Chicago Exposition in 1885.

W. Z. HUTCHINSON, Sec.
DR. C. C. MILLER, Pres.

STATISTICAL TABLE

OF

BEEES AND HONEY FOR 1884,

Represented at the Northwestern Convention.

| Names and Addresses. | COLONIES. | | Honey Crop—lbs. | | Bees-wax. |
|---------------------------------------|-----------|-------|-----------------|-----------|-----------|
| | May. | Oct. | Comb. | Extract'd | |
| L. Adams, Mayfair, Ill. | 47 | 64 | 12 | 18 | 10 |
| Geo. Asher, Naperville, Ill. | 70 | 90 | 300 | 4,000 | 25 |
| Wm. Burrus, Buchanan, Mich. | 110 | 145 | 2,500 | | 40 |
| T. S. Bull & Son, Valparaiso, Ind. | 116 | 190 | 1,000 | 10,000 | 100 |

"Killed by a Bee-Sting."

C. G. BEITEL.

On page 686 is chronicled the death of a Mrs. Sturdevant, of Fairfield, Fayette County, Iowa, alleged to be caused by the sting of a bee, to which spirits of camphor had been applied. This recalls to the mind of the writer a case, which, although not fatal, was pronounced a case of apoplexy.

In last May or June, a lady of our borough, aged about 40 years, and who takes a great interest in bee-culture, frequently attending to a number of colonies kept by her son, was stung by a bee on the forehead. She at once applied camphor liniment which kept down the swelling, but she soon became very sick; the symptoms were vomiting, purging, bulging of the eyes, failure of vision, painful palpitation of the heart, and momentary unconsciousness. A physician was called in, and pronounced it a stroke of apoplexy. Nothing was said or thought of the bee-sting at the time, as she had frequently been stung, always resulting in but simple swelling, soft mud or clay usually being applied. In the course of three days the lady had completely recovered.

In a week after the above occurrence, she was again stung on the hand. She again applied the camphor liniment, and the symptoms as above stated again followed. This time she thought of the liniment, and, of course, attributed the result to that, and in order to satisfy herself, after she had entirely recovered, she voluntarily allowed a bee to sting her again, and applied not the camphor liniment, but soft mud as at first, and the result was a simple swelling, since then she has frequently been stung with no serious results.

The writer is not a physician, nor is he a chemist, but he is a sincere friend of the bee, and as such, would fain protect its character, and allow no unjust accusations to rest upon it, and would be exceedingly pleased, did Dr. Tinker, or some other able scientist pass his opinion upon this subject.

It seems to the writer that these two cases, so much alike, point in the direction that camphor is not an antidote to bee-poison; on the contrary, that it is an assistant or co-operant—or whatever else in medical parlance it might be called—of the poison.

I have simply stated facts, withholding, by request, the lady's name, which, if necessary, will, however, be freely given upon application to the writer.

Easton, Pa.

[We believe that a diseased condition of the system is the cause of death, accelerated, of course, by the

"poison" introduced by the sting. Soft mud or clay has been successfully used as a remedy. Will Dr. Tinker please reply about the camphor.—ED.]

For the American Bee Journal.

New Method of Uniting Nuclei.

G. M. DOOLITTLE. ©

Many plans have been given for wintering nuclei or weak colonies in the fall, the best one of which was to move the little colonies to be united toward each other a foot or so each day until they were brought together; so that after uniting (by alternating the frames, or otherwise mixing the bees up so that they would not quarrel), they would occupy so nearly the same place which they did before uniting, that no bees would be lost by their going back to their former location, which they always will do unless some precaution is taken. This plan involved a large amount of work, especially if the nuclei were far apart, and it would often happen that they did not occupy such a position that they could be thus brought together at all. When the work was considered too great, or the colonies could not be moved a little each day, they were carried and united at once; and to avoid having the bees return to their old location, a wide board was leaned against the hive in front of the entrance, so that the bees would see that they were in a new spot by bumping this board, if they attempted to fly without marking where they were. With me, many bees would return to the old spot in spite of these precautions; and, although, heretofore I have always used these plans, yet I have never been quite satisfied with them.

In looking over the first volumes of the BEE JOURNAL, not long ago, I chanced to turn to page 11 of Vol. 4, where E. Gallup tells "how to make natural swarms artificially," by first smoking the bees and then alarming them by rapping on the hive with a stick, thus causing them to fill themselves with honey. After they were filled with honey, they were, the larger part of them, to be drummed into the cap of the hive by the means usually pursued in drumming out bees. When they were gotten in the cap, the cap was taken and carried to where the swarm was to be located, where it (the cap) was to be set leaning up against something for about an hour, at which time they were to be hived the same as any natural swarm, when, he says, "they will work precisely like one in every respect."

Having a large number of nuclei to unite this fall, I thought, "Why can I not use something similar to this plan, in uniting?" but I found that I could not make oneenless bees stay until I could get two or more nuclei put together, at which time I wished to give them such a queen as I desired. After considerable study, proving of no value at the end of an experiment, I chanced to think of what I had read of the traffic in bees by the pound,

and applying this to the Gallup plan, I soon saw that I could control the bees as I pleased. Accordingly I went to a tinsmith and told him I wanted a funnel made 14 inches in diameter at the top and slowly tapering to a 2½-inch hole in the bottom, which hole was to have a 2-inch piece of 2½-inch conductor pipe soldered into it. I next made a box by getting out two pieces of wood 9 inches long by 8 wide by ¼ of an inch thick, and two other pieces 14 inches long by 9 wide by ¼ thick, which were nailed to the first two pieces so as to form a box 14 inches long by 9 wide by 8 deep, without sides. I next got two pieces of wire-cloth 14 inches long by 8½ wide, one of which was permanently nailed to one side of the box, and the other piece was nailed to strips of wood ¼ of an inch square, and then placed around the outside of it, after which it was fastened to the other side of the box by means of a small wire nail being driven through each of the strips of wood into the box, so that four nails held it nicely; still it could be easily pried off. I next bored a 2½-inch hole through the centre of the top for the funnel, over which hole I fixed a tin slide. Near one end I bored a 1-inch hole through which I could drop the queen that I wished to put with the united bees, which hole I closed with a large cork.

Thus rigged, I proceeded to a queenless nucleus and blew a little smoke into the entrance, after which I struck 5 or 6 heavy blows on the top of the hive, when I went to another and did the same thing. I next waited a minute or two for the bees in the first hive to fill themselves with honey. As soon as they were filled, I proceeded to shake them into the funnel which had been placed in the hole in the box, when as fast as they struck the sides of the funnel, they rolled into the box below. In this way I soon had all the bees in that nucleus (except a few that were in the corners of the hive, or that might take wing before they struck the funnel) in the box, when I went to the next one I had smoked and served it in the same manner. However, before doing this, if I wished to put more than two together (I often use 5 or 6 nuclei to form one colony), I would smoke the next one the same as I did the first, so that each could be filling with honey while I was shaking the previous one into the box. When I had all that I wished in the box, the funnel taken out and the hole closed, I proceeded to get the queen I wished for them, when, by a sudden jar of the box, I brought all the bees down on the bottom, at which time I immediately uncorked the small hole and put in the queen. I now rolled and tumbled the bees about in the box until all were mixed up, when the box was put in my bee-cellar and the door closed so all was dark, when it was left until sunset, when a hive was prepared with combs of sealed honey sufficient for their winter stores.

Next I brought the box from the cellar, took off the movable wire-cloth side, dumped out the bees and hived

them as I would a natural swarm. If I did not have enough combs of sealed honey for all, I gave empty combs and fed enough sugar syrup for winter. By making four such boxes I soon had my nuclei all united in the best possible manner, and all the bees would stay where put—provided all were well-filled with honey. I find this part very essential, for if they are only partially filled, they are inclined to be cross, and a few will go back to the old stand upon the first flight; but if all are well-filled none will return. If they have not all the honey that they can hold, I jar them down as I did to put in the queen, when ¼ of a pound of syrup or honey is turned in upon them, and by rolling them about each gets a share till all are filled.

"Honor to Whom Honor is Due."

W. Z. HUTCHINSON. ©

It may "tear agape the healing wound afresh," but I feel that I *must* say a few words in self-defense upon the above subject.

Mr. Fradenburg says that he has never claimed that he first discovered the "pollen theory," but that he was the one who first discovered that pollen was the cause of bee-diarrhœa. This is getting it down pretty fine; but is the assertion true? Is Mr. Fradenburg the one who first discovered that pollen is the cause of bee-diarrhœa?

On page 536, Mr. F., himself, admits that he does not consider his experiment as the "first;" if so, why does he claim to be the one who first discovered that pollen is the cause of bee-diarrhœa? Farther along, upon the same page, he says that the discovery upon which he bases his claim was made on Jan. 31, 1884. Mr. Heddon had previously reported experiments that were as conclusive as this experiment of Mr. Fradenburg's. Considering all this, is it not strange that Mr. Fradenburg should put forth the claim which he does?

Mr. Fradenburg says that the report of his experiment (the one upon which he bases his claim), made during the winter of 1883-84, was published prior to Mr. Heddon's report of his experiment of the same winter; in this he is mistaken, as he will see by turning to the *Kansas Bee-Keeper* of June 1, 1884.

Mr. F. quotes from *Gleanings* to show that he (Fradenburg) publicly hinted, prior to Mr. Heddon, that pollen might be the cause of bee-diarrhœa; but it appears, from reference to the *Bee-Keepers' Instructor* for February 1881, that Mr. Heddon was more than a month ahead of him.

LATE SWARMING.

In reply to the questions of Mr. Gresh, on page 599, I would say that I have had no experience with September swarms, and I know of no practical method of controlling swarming at such times; *i. e.*, of preventing the

issuing of first swarms when working for comb honey. Neither do I know how swarming can be delayed earlier in the season, aside from what can be done by shading, ventilation, and giving plenty of room.

Rogersville, Mich.

For the American Bee Journal.

The Pollen Theory.

DR. C. C. MILLER. ♂—200, 300.

I have been watching with interest the pollen discussion, quite inclined to the belief that pollen may be at least a prominent factor in the wintering problem. A case coming under my observation puzzles me to explain in accordance with the pollen theory. On Feb. 20, 1884, I found one of my colonies dead in the cellar. Upon examination I found not a very large colony, some drones among the bees, a few cells of sealed brood (evidently drone-brood in worker-cells), not a drop of honey in the hive, and more or less pollen in every comb. The pollen had a fresh and shiny appearance, as if the honey had just been taken from it. There was no trace of diarrhoea about the hive or combs. Every comb appeared as sweet and clean as if it had just been taken from a healthy colony.

Some of the facts which I have here given may have no bearing on the case, but I have thought best to give full details. The main points are, that here was a colony apparently starved to death with plenty of pollen easily accessible, and no appearance of diarrhoea.

On the supposition that pollen is the only or the main cause of bee-diarrhoea, the question arises, "Did these bees eat all the pollen that they could, so long as life lasted, without being affected by diarrhoea? and, if so, cannot all bees eat it with the same immunity? Or did these bees finish their honey, and then starve rather than eat enough pollen to injure them? and, if so, do not all bees act in the same way? Or, is there some other explanation of the affair?"

Marengo, Ill., Oct. 10, 1884.

For the American Bee Journal.

"Does it Pay to Use Foundation?"

W. M. WOODWARD. ♂

I take strong ground in favor of the use of comb foundation as a means of profit in the management of an apiary. Mr. U. E. Dodge, I see, is also a doubter of the profit in its use, and calls for the showing in dollars and cents. Mr. D. might have seen the benefit and profited by its employment had he not failed to comply with the first great principles of its use for profit.

First, why are bees profitable at all? Simply because they will gather and store more sweets than they consume. If it is shown that foundation aids them to store more honey in a given time, and that honey in a marketable shape, then the case is decided;

otherwise the proposition fails. I believe that both of these may be done. There are several principles which underlie all profit in the production of comb honey: 1. That the size of the brood-chamber should correspond with the present wants of the queen, allowing no space to be filled with honey, and thus blocking up against the increase of brood.

2. That the brood should be wrapped in, as it were, with surplus receptacles.

3. That there be absolutely no impediment to the bees in carrying the honey away from the brood-chamber.

4. That the heat be uniformly distributed throughout the hive.

5. That ventilation be amply provided for, without requiring many bees to fan air in or out.

Mr. Dodge certainly neglected the first of these principal conditions, according to his own statement; and I suspect the second, and probably the third also to some extent. Of what use were those 10 frames when they only served to store honey in, and block in the queen until, perhaps, she might even be compelled to go into the surplus receptacles for room? On the other hand, had Mr. D. taken the honey stored in the 10 frames, in the early part of the season (only to the detriment of his bees and of himself), in marketable surplus-honey, he would long since have seen the profit. Bees are profitable from the honey they gather, and whatever aids them to gather more, and store it in better shape, is profitable so long as it costs less than the gain. Comb foundation does that in two ways: First, by relieving large numbers of field bees to gather honey; and, second, by distributing the comb-builders over a much larger space to receive the honey gathered. Both of these propositions are proved by the speed with which a large hive may be filled.

I, too, had an experience in 1883, one that quite exceeds Mr. D.'s; but it did not prove anything to me against the use of foundation. I also lived several large swarms, some double ones, in 10-frame hives, and being afraid of brood in the surplus case, I waited two days after hiving, to put it on. But the bees were at work, and no inducement would tempt them from this work below until it was full; and at the end of six days one hive (which contained my choicest colony) was full of sealed honey, with about the space of a man's head filled with brood, and the queen thoroughly blocked in, and I did not extract. In ten days the colony began to reduce, and soon were unable to cover all their combs, and finally, every one so lived on ten full frames of comb foundation, died before spring opened, from cold weather, cold honey, or something else.

"But why let this thing go on so?" one asks. Simply to learn the lesson it teaches, and I learned it well. I saw that the foundation gave the bees great advantage of the queen, and that I must devise some plan by which to deprive them of the fruits of their labors, and preserve the equilibrium, and then all would go well. Had I

given them 50 one-pound sections for honey, instead of the last seven frames, they would have been better off, and I richer 6 or 7 dollars per colony.

To meet such an emergency in 1884, I constructed about 30 division-board side-cases, taking sections crosswise, and used them, 20 sections in each side instead of frames, and gave the queens, with prime swarms, three frames for the first ten days. From several colonies I secured every pound of honey in sections which they stored, until the queens began to breed.

Every pound of honey can be taken in marketable shape, which any colony of bees can store, by granting only what room the queen actually keeps full of brood, and compelling the bees to work in sections so arranged as not to impede, but aid them in their work, and when that is done there will be no more crying down of comb foundation, but a searching about for better to aid them to perform quicker work.

The secret of profit lies simply in the taking away of the honey when stored, and compelling the bees to store it just where you want it. I will only add that if the foundation is ever paid for by the bees, the pay must be secured during the time required to build the same comb.

Custer, Ill.

For the American Bee Journal.

Bee-Keeping in Utah.

JOHN DUNN. ♂

In my former letter I gave an account of our blighted prospects, and I can see from reading the BEE JOURNAL that it has not been confined only to Tooele, but other places have cause to complain, and can sympathize with us. I have just sent our fall report to the Territorial Convention, which meets to-night in Salt Lake City, and as far as I have been able to glean, the report for Tooele is, 851 pounds of honey, 214 colonies of bees, fall count, loss 38, and increase, 15. So you see that there will be no bragging in the *News* about the Tooele report for this year; but I am satisfied with the little that we have done, and hope to be able to give a more favorable report for next year.

The weather has been rather changeable, having had snow and rain at intervals for the past month, just at the time when the bees would have stored the surplus honey; although I think that the most of the bee-keepers have left the bees ample stores for their own winter use in the hives, and should they only come out all right in the spring, we will have little reason to complain.

Some have become discouraged and sold out very cheap, while others were willing to share the loss, and have even bought more bees. About a month ago I lost nearly a colony of bees in rather an amusing manner. A neighbor of mine has quite a herd of horses, and in order to be able to go after them, he generally kept up

one or two horses to ride upon. So when he was away, one day, his wife being left in charge of a favorite horse of his, she tied it to the fence which separates his lot from mine, and rather close to my colony of bees. It was not long until it began to snort and paw the ground, which it continued, the people thinking that the flies were annoying it; but the snorting turned into a groan, and attracted the attention of my family, so they sent over to tell them to come and see what was the matter with the horse, for it was then lounching, rolling and groaning most pitifully. The bees having mastered the horse, they thought that they could serve the people in the same way, so they made after them, and it was a sight to see the people "make time." I not being on hand, they sent for all the neighbors; one came with a hay-fork and a broom, but he was soon seen flying, broom and all, in "double quick" time. In fact all was left *hors de combat*, until Mr. Craver, a bee-man, came prepared with gloves, veil, etc., but even then he got the javelins sent into him. They succeeded in getting the horse away, for the poor thing had been left to take its chances when all but it was gone, except the bees. The horse did not need to be tied up again, for in about two days after it died, thus ending its misery. I have not seen a horse around since, for I had told them not to tie too near the bees, or they might feel sorry for it. So, if the bees have not done much in the honey business, they have done something to create a stir.

Tooele City, Utah.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

That Strange Noise.

When Mr. Smoot made an inquiry about the noise, he gave me the impression that he referred to a louder and different noise than that made by drones. I well remember the drone noise, which we do not often hear now, as only a few of our choicest colonies rear many drones; full sheets of foundation being the cause.

Bees in Good Condition for Winter.

Will Mr. Heddon please answer the following questions:

1. Are queens which accompany after-swarms fertilized before or after leaving the parent colony?

2. Is buckwheat honey considered good for winter stores?

3. In extracting honey, do you "shake" the queen indiscriminately with the other bees at the entrance, when taking the combs from the hive? or would it be likely to prove injurious to her?

Bees have done finely in this section since July 20, and as hardly any swarming has occurred, they will go into winter quarters strong in numbers, and with stores to spare. I am using these stores to provision some fine colonies (belonging to some of my neighbors) which were doomed to the "brimstone pit," but I interposed, to the satisfaction of all concerned, giving them their honey and taking the bees which are doing well. Immediately after transferring, the queens almost invariably begin to lay.

E. K. DEAN.

Amenia Union, N. Y., Oct. 4, 1884.

ANSWERS.—1. Afterward.

2. Not by all bee-keepers, but it is considered so by me.

3. We never have any fears in so shaking the queen down with the rest of the bees. We use and prefer the two-story system, and we smoke down most of the bees before taking out the combs for extraction. We seldom extract from the brood-chamber.

What to do with Boxes in Winter.

What do you do with boxes that have more or less comb in them? Would it do to leave them on all winter?

Waverly, Mo. A. M. CREEL.

ANSWER.—I have no evidence that the leaving on of your boxes will injure your bees during the winter; but many experiments have proven such conditions to be favorable to wintering bees. It may, or may not injure your boxes and combs. If the bees remain healthy, it will not.

Feeding Bees.

Mr. Heddon and Mr. D. A. Jones both use tight-bottomed hives; but in feeding, Mr. Jones pours in the feed at the back end of his hive, after elevating the front a little; while Mr. H. always recommends using a feeder to be placed on top of the frames. Why does Mr. Heddon prefer the latter method? The Jones' system is the more convenient.

ANSWER.—Have you ever used, or seen used the top-feeder which I use? If not, how can you reasonably decide that the Jones' method is the most convenient? The reason I prefer the latter method, is because it has no tendency to excite robbing, whether the feed is all taken or not; also, because I can feed 15 or 20 pounds at one time, to each colony, and in less time than any man can pour one ounce in at the back end of any hive. Further, because I do not have to use

the smoker, nor come in contact with the bees at all. I feel confident that the future will verify my decision.

How Far do Swarms Go?

Several years ago, and again last year, I lost a number of swarms of bees by their going away before hiving. I should like to learn whether there is any known way to recover such swarms. Also, what is the longest distance swarms have been known to go. I have read what most of the standard bee-books have to say on the subject, but can learn nothing definite about it.

C. H. HOWARD.

Raritan, N. J., Oct. 3, 1884.

ANSWER.—I know of no way to recover your runaway swarms. The best way is to prevent such runaways by a judicious use of the fountain pump. I have good and satisfactory evidence, that here, where we have woods interspersed all through our country, our swarms often go 25 to 50 miles before selecting a home. A swarm alighted on a ship's mast in the middle of our Lake Michigan.

Wintering Queens Alone.

Why cannot queens be kept over winter, each one by herself, *i. e.*, without any other bees being with her, and in a small box in the house where they will not freeze, yet being kept in a cool room? Of course, give to each their own honey to live on. I would like to know why that cannot be done with good results?

WM. FOLKE.

Peotone, Ill.

ANSWER.—Of course, you could not keep them "in a cool room," because the temperature in such a room would be lower than that in a cluster of bees in winter. But why cannot we keep them in a proper temperature? A single bee cannot live in a state of isolation. It has been said, that it dies of lonesomeness. My own opinion is that it would die from a lack of animal magnetism, if from no other cause.

Spring-House Wintering of Bees.

I am an amateur in apiculture, and I am in doubt as to how I shall winter my bees. I have read the Monthly BEE JOURNAL for nearly a year, but have never seen spring-house wintering advocated. I happened to think of it last fall, and put one colony in the spring-house for an experiment, and the bees come out in the spring nice and strong. I had a chaff-cushion on the top of the frames to absorb the moisture, but it failed to absorb all of it. After experimenting some time, I found that the air inside of the hive was, on an average, 16° Fahr. warmer than the air at the entrance. The temperature of the water was 50° Fahr., so in order to have the bees 46°, I had to leave the spring-house door open a little; the air at the entrance, 36°, plus 16°, animal heat, equals 46°, at which temperature they kept very quiet. Does any one know any thing about spring-house wintering of bees? If so, please give a few hints concerning it. Is it a good and safe plan?

How about keeping the moisture absorbed? It formed in drops in my hive. This has been a very bad year for bees. Most of my neighbors keep a few bees, but there was very little increase, and not much honey. There were very few natural swarms. No fall honey was gathered, and the bees being almost starved, would come into the house and get into everything. A great many were killed. Is cider good for bees? The cider mills around here are just full of them.

JNO. P. CONFER. ☉

Yellow Springs, O.

ANSWER.—Special repositories (entirely above ground) for wintering bees, have been used for years, with varied success. They, like cellars, all sorts of out-door packing, and total neglect, will neither produce, prevent nor cure the disease, bee-diarrhoea—the one great cause of our winter losses. Whether I winter my bees in a cellar, or a double-walled house all above ground, I should like very much to have a spring therein, or a stream of water passing through the beeroom in as noiseless a manner as possible. It acts as a regulator of the temperature, and as a ventilator. On two or three occasions I have had my bees store a little cider in the hives, late in the fall, but never saw any bad results therefrom. I should, however, prefer that they would have none of it in their hives; I think it might work an injury in a secondary manner.

Not One-Fourth of a Crop.

We have not had one-fourth of a honey crop this year. There are but few bees in the country. Comb honey sells at 25 cents per pound, and extracted at 20 cents. Please give the best formula for making candy for winter feed for bees.

J. M. DOUDNA, ☉—14, 42.

Alexandria, Minn., Oct. 11, 1884.

ANSWER.—If your case were my own, I should not feed candy, but granulated sugar syrup, made and fed as directed in numerous places of the BEE JOURNAL. It has been a long time since I have made any bee-candy; but I believe that I boiled down confectioners' A sugar to the point of consistency when it would "thread," as confectioners say, and then removed it from the fire and stirred it lively until the "dough" was pretty stiff, and then caked it in pound sections.

Convention Notices.

☞ The Southern Wisconsin Bee-Keepers' Association will hold its next meeting in the Court House at Janesville, Wis., on Oct. 28, 1884, at 10 a. m. It is hoped that all members will be present at this meeting.

J. T. POMEROY, Sec.

C. O. SHANNON, Pres.

☞ The bee-keepers of McDonough and adjoining counties are requested to meet at Bushnell, Ill., on Nov. 20, 1884, for the purpose of organizing a bee-keepers' association.

J. G. NORTON.

SELECTIONS FROM OUR LETTER BOX

Does Bee-Keeping Pay?

The honey crop was a total failure in this parish this year. On an apiary of 9 colonies, I lost \$20, for I did not get one drop of honey, and the queens and labor cost me \$20. In another apiary of 9 colonies not one drop of honey was obtained, but the bees had to be fed during the whole year. I could mention many more worse failures, but these will suffice. If this ever meets the public eye (but I doubt if it will, for our bee-paper editors like to keep dark things together hid), I hope all those who are embarking in bee-culture will "go slow," for it is risky business. I have been a bee-keeper for six years, and I am worse off now than I was at the beginning; but I will "try again," and let you know how I succeed in 1885. In 1879 I had 106 colonies, and in 1884 have 8. Now, the question is, "Does bee-keeping pay?"

ALVIN V. LENNON, ♀

Plaquemine, La., Oct. 7, 1884.

Experience with Foul Brood.

After reading the article on foul brood, by Frank R. Cheshire, in the BEE JOURNAL for Oct. 8, and knowing the effect that carbolic acid has on the human system, I esteem it my duty to donate to the National Convention, soon to be held at Rochester, the cause and harmless remedy for foul brood. Providence permitting I will be present in person.

N. N. BETSINGER, ☉

Marcellus, N. Y., Oct. 11, 1884.

Short Honey Crop.

My honey crop was very short this year. I got about 500 pounds of clover honey from 28 colonies, spring count; but got no fall honey, and only had 4 swarms in all.

A. WORTMAN, ☉

Seafield, Ind., Oct. 11, 1884.

Bees not Working.

I started in the spring with 70 colonies of bees, and have increased them to 95. My spring honey crop was a little over 3,000 pounds. Bees have been idle ever since Aug. 1.

JOHN FERSTEL, ♀

Inglefield, Ind., Oct. 13, 1884.

Report for the Season.

The surplus honey season of 1884 is about closed in this vicinity; and as many bee-keepers report but a small crop, I deem my success in producing a large crop mainly due to constant care, and a perfect control of after-swarming, which is usually a great detriment in the way of producing comb honey. I commenced the season with three apiaries, situated from five to ten miles apart, in my own care, and report as follows: First, Pine Bluff Apiary of 65 colonies in

Langstroth hives, run for comb honey in one-pound sections, produced 4,600 lbs. and increased to 110 colonies; and two colonies, run for extracted honey, produced 520 lbs., with no increase. Each of the latter occupied 30 Langstroth frames, and were not helped in any way except by receiving good care. One of them stood on scales during the honey season and produced over 300 lbs. of honey. Second, Rock Valley Apiary, 24 box-hive colonies, were transferred and increased to 38, and produced 1,400 lbs. of honey in one-pound sections. Third, Baraboo Apiary of 45 colonies, produced 6,000 lbs. of extracted honey—two-thirds of it being white honey. I increased them to 55 colonies. Summarizing the products of the three apiaries, I have, as total amount for the season, 12,620 lbs. of honey.

FRANK MCNAY, ☉

Mauston, Wis., Sept. 1, 1884.

☞ Seeing that during the past season much interest has been manifested in the subject of bee-keeping, and believing it to be a profitable industry, and one that ought to be protected and encouraged, we have thought fit to call a meeting of those interested to meet in the Court House at Cynthia, Ky., at 10 a. m., on Saturday, Oct. 25, 1884, for the purpose of effecting a permanent organization of the bee-keepers of this and adjoining counties, and for the mutual protection and information of its members, and the promotion and encouragement of apiculture. The meeting will be addressed by Mr. Chas. F. Muth, of Cincinnati, O., one of the most successful bee-keepers of this country, who will also assist in organizing the society. W. S. Cason, W. L. Godman, M. C. Swinford, J. J. Whiteker, Harvey Kearns, S. W. Collins.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

☞ To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

 A. M. Gauder, Sec.
 Dec. 10, 11.—Michigan State, at Lansing.
 H. D. Cutting, Sec., Clinton, Mich.
 Dec. 12.—Northeastern Kansas, at Hiawatha, Kan.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

National Bee-Keepers' Association.

As has already been noticed, the next annual meeting of the North American Bee-Keepers' Association will be held in the city of Rochester, N. Y., Oct. 28, 29 and 30, 1884. Essays will be read as follows: "Wintering Bees," by W. F. Clarke, of Canada; "Nectar," by Prof. A. J. Cook, of Michigan; "Marketing Honey," by Thos. G. Newman, of Illinois; "Foul Brood," by D. A. Jones, of Canada. The committee has decided to use the balance of the time in discussing these and other questions of importance. Those who cannot be present, and have questions that they desire to have discussed or answered, will please send the same to the Secretary, Dr. C. C. Miller, of Marengo, Ill., or to Rochester, in care of the convention, on or before the first day of the meeting. Notice as to place of meeting will be given hereafter.

C. C. MILLER, Sec.

L. C. ROOT, Vice-Pres.

The Tuscarawas County Bee-Keepers' Association will hold its next meeting at the apiary of Geo. F. Williams, in New Philadelphia, O., on Thursday, Oct. 23, 1884.

G. F. WILLIAMS, Sec.

A. A. FRADENBURG, Pres.

The Iowa Central Bee-Keepers' Association will hold their annual meeting in the Court House at Winterset, Iowa, on Friday, Nov. 7, 1884. All interested in bee-culture are requested to be present.

J. E. PRYOR, Sec.

A. J. ADKISON, Pres.

The Mahoning Valley Bee-Keepers will hold their fall meeting in Ravenna, O., on Nov. 14, 1884. A cordial invitation is extended to all.

E. W. TURNER, Sec.

Newton Falls, O.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL,
 Monday, 10 a. m., Oct. 20, 1884 }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14@15c on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@9c. on arrival.
 BEESWAX.—Is dull at 26@28c on arrival.
 C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18@20c., 2-lb., 16@18c.; fair to good, 1 and 2-lb., 14@16c.; fancy buckwheat, 1-lb., 12½@13c., 2-lb., 11½@12c.; ordinary grades of dark, 1 and 2-lb., 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c., buckwheat, 6½@7c.
 BEESWAX.—Prime yellow, 30@31c.
 MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-
 classed sections sell best.
 BEESWAX.—35c.
 BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.
 BEESWAX.—For fair to yellow, 28@30c.
 R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—A moderate movement has been effected in extracted, within range of the same low figures which have been lately current. Offerings unplaced are still large. In comb honey there is nothing doing beyond a small jobbing trade.—White to extra white comb, 9@10 cents; dark to good, 6@8 cents; extracted, choice to extra white, 4½@5 cents; dark, 4@5 cents; and 4@5 cents.
 BEESWAX.—Wholesale, 25@30.
 STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.
 BEESWAX.—Firm at 32@32½c. for choice.
 W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Our market is at present overstocked with honey, large quantities having been brought in wagons, and every place is filled up. Some lots have sold as low as 9c. for 1-lb. sections of white comb. We have not changed prices, but find sales very slow at 16c. for best white 1-lb., and 14c. for 2-lb. Dark honey we are offering as low as 10 to 12c. without being able to effect sales. Extracted is not wanted at all, and no sale at any price.
 BEESWAX.—28@30c.
 A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2-lb. sections, 13@14c; extracted, 6@7c.
 GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—There has been a good demand with liberal receipts, and prices remain the same. Choice Eastern comb, ½-pound sections, 18c; 1-pound, 16c; 2-pounds, 15c. California comb, 2-pound sections, 15c. Lower grades are slow at 2 or 3 cents less. Extracted, 6½@8c, according to quality.
 BEESWAX.—None in the market.
 CLEMONS, CLOON & Co.
 Successors to Jerome Twichell.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Special Notices.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

The "Autumn Leaves" which will bring the most returns are, no doubt, the Leaflets—"Why Eat Honey?" Scatter them and see the effect in selling honey in every neighborhood, at good prices. Two hundred will be sent postpaid for \$1.00; 500 for \$2.25; 1,000 for \$4.00.

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in

CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

QUEENS!

OLDEST BEE PAPER
IN AMERICA

ESTABLISHED
IN 1861

THE WEEKLY

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., October 29, 1884.

VOL. XX.—No. 44.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps of any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Unoccupying Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers to Europe and America.

BOOKS!

Sent by mail, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Biene Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROO.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PRIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 10c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poultryer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., OCTOBER 29, 1884.

No. 44.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR.

At the late Northwestern Bee-keepers' Convention in this city, it was voted that a committee should be appointed to endeavor to secure by legislation accurate crop reports of bees and honey in the different States of the Northwest; and also to present to the several legislatures the draft of a law concerning the bee-disease called "Foul Brood." The following were duly appointed as such committee:

Thos. G. Newman, Chicago, Ill.
T. L. Von Dorn, Omaha, Neb.
Prof. A. J. Cook, Agricultural Coll., Mich.
Chas. H. Green, Berlin, Wis.
O. Clute, Iowa City, Iowa.
A. Fahnestock, La Porte, Ind.
C. F. Greening, Grand Meadow, Minn.
Dr. G. L. Tinker, New Philadelphia, O.
D. G. Parker, St. Joseph, Mo.
Jas. A. Nelson, Wyandotte, Kans.

Of course the committee will commence its labors at once, and whenever there is anything to report it will be given to the bee-keeping public. The work laid out is important, and it will require much persistent labor to accomplish even a small part of it. Had we been present when the names of the committee were announced, we should have declined the honor, on account of indisposition, and the present multitudinous duties.

Honey Exhibit at Lennox, Ont.

The Napanee *Beaver* thus notices Mr. Allen Pringle's exhibit of bees, honey, wax, and apiarian implements at the Lennox, Ont., exhibition:

Mr. Allen Pringle made an exhibit of articles required by the apiarist, among which was the double-walled hive for wintering bees. It is arranged so as to secure perfect ventilation, and at the same time being filled in with sawdust, keeps the bees warm. He also showed an improved honey extractor and a summer hive. In the

palace Mr. Pringle exhibited a pyramid of honey in comb and extracted. His comb honey was taken from both the brood-chamber and the top of the hive. A more complete or finer display of honey has never been made in this county.

Mr. Joseph M. Wismer, of Jordan Station, Ont., has sent us a copy of the *Canadian Horticulturist*, containing a lithograph likeness of Mr. Wm. Saunders, President of the "Canadian Fruit-Growers' Association," a gentleman of broad views and indomitable energy. Having the confidence of the fruit growers of Canada, he is enabled to accomplish much for the pursuit. That is the secret of success. Jealous opposition to a standard-bearer always retards progress, and damages the interests of all. The *Horticulturist* says:

In 1880 the Government of Ontario appointed a special commission to inquire into the progress and condition of agriculture in the Province. Mr. Saunders was appointed one of the commissioners, and was charged with the special duty of inquiring into the subjects of fruit growing and forestry, insects and insectivorous birds, and bee-keeping. The results, mainly of his work, are embodied in a volume of over 350 pages, which was published by the Ontario Government as one of the series of reports presented by the commission.

Feeding Bees for Winter Stores.

The *Bee-Keepers' Guide* gives its method as follows:

It is the opinion of many experienced bee-keepers that there will be heavy losses sustained this winter, and the predictions, no doubt, will be realized; yet there is no necessity of such a calamity. If each colony is weighed and fed sugar syrup until it reaches the standard weight, there will be no need of anxiety. If the strength of the colony is impaired, extra protection may be necessary. Some apprehend difficulty from unhealthy stores gathered from the maples, and commonly known as honey-dew—a secretion of the maple bark-louse which has been so numerous this year. Consideration of how to overcome this difficulty has resulted

in an attempt to contrive means of removing honey of this character from the combs. We think it would be a very difficult task even if we were able to distinguish the good from the unwholesome stores. The most desirable colonies to winter are those which lack about 10 pounds of enough for winter stores, then by supplying the deficiency with sugar syrup, fed as late as October, the bees will store it within and around the cluster. We would certainly adopt this plan if our hives contained what we should consider unhealthy stores. With this management the bees will consume the healthful stores during the severe weather, or during the time of their confinement, thus leaving their own stores for brood-rearing purposes in early spring.

Selling Honey at Home, etc.

In the *Texas Farm and Ranch* we find the following items of interest to bee-keepers:

I do not believe it pays to ship honey in the barrel to commission merchants, and if a man tries he can sell his honey at home when put up in little cans and labeled. Besides, the label is an advertisement, and if the honey is good, it is an advertisement that is noted.

In selling honey, reputation for a good article establishes your trade. A good name is your fortune. Never try to be smart and get ahead of your customer. This is being dime wise and dollar foolish. If you please a customer, you make one; if you "beat" him you lose one.

The best honey weather is when it is warm and moist, when the air is full of electricity and a storm approaching.

Now it is being proposed that instead of the National Convention of Bee-keepers being held at the New Orleans Exposition, that an international convention and exhibition be held there. We think the latter proposition the better one, although it is to be feared it is a little late in the day to begin. However, if it is taken hold of at once, promptly and with a will, it may be done yet. Anyway, "better late than never"—although we prefer "better never late."

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Phenol and Foul Brood.

On page 698 Mr. Kohnke has made some criticisms on the use of phenol for curing foul brood, as suggested in a late number of the BEE JOURNAL. Criticisms are always in order on every subject, if conducted in a friendly spirit. On the discovery of the method, which Mr. K. notices, the *British Bee Journal* remarks as follows:

Mr. Cheshire, in his paper read before the bee-keepers at the International Exhibition, gracefully expresses his indebtedness to Mr. Robert Sproule for suggesting to him the use of phenol as a probably successful means for the cure of foul brood. Mr. Sproule, in a communication which appears on page 284 of the present issue, says "that whatever credit there is for the suggestion of carbolic acid as a cure for the disease is due to Prof. Tichborne, of the Apothecaries' Hall, Dublin, with whom he had a conversation in October, 1881, on the subject." As the order of the day appears to be, "*Suum cuique tribuito*," we may be permitted to trace the suggestion of carbolic or phenic acid back to the year 1876. In that year there appeared in the columns of the *Bee Journal* (vol. iv. page 113) a letter from Captain Danyell, author of *The Italian* [Giotto's] *System of Bee-Keeping*, in which he details with considerable minuteness the mode adopted by Signor Brassi and Dr. Dubini, two advanced Italian bee-masters, for the cure of foul brood; and mentions among other curative means the use of "phenic or carbolic acid." This letter is referred to by the then editor of the *Bee Journal*, in a subsequent number, as a letter which may be read "with much advantage."

In a communication recently received from Mr. Cowan, he says, "With regard to Mr. Cheshire's treatment of foul brood, I think he has overlooked the fact that it has already been recommended by Vogel and Gravenhorst; and in 1877 Dr. Cech published a book called *Phenol, Thymol und Salicylsäure, als Heilmittel der Brutpest der Bienen*. For various reasons it has not been popular; but you will find in last number of the *Alsace-Lorraine Bee Journal* an article on the cure of foul brood with phenol according to Gravenhorst's method, by F. Vierling, who also calls it 'Bacillus' of foul brood."

Mr. John M. Hooker, another English apiarist, comments upon the above item as follows:

If, indeed, Mr. Cheshire did not in the first place suggest phenol either as a preventive or cure for *foul brood*, there can be no doubt that he first fully saw the enormous value which this substance, when properly used, would prove to bee-keepers. Had, indeed, the other gentlemen been fully aware of its value, do you not think we should have heard more about it?

Signor Grassi, I see from Captain Danyell's letter, does mention *acido*

phenico: but the considerable *minuteness* of detail in his description to which you refer, is *wholly* devoted to the use of salicylic acid. Moreover, phenol is suggested here only for washing purposes; and then as second to salicylic acid, which the writer says it may replace on account of its being cheaper.

Phenol has, however, been shown by Mr. Cheshire to be immensely superior to salicylic acid; and here we have experimental corroboration of an inference to be made by any one well acquainted with the general properties of phenol and salicylic acid.

The thanks of all bee-keepers are due to Mr. Cheshire, not only for his very able, interesting, exhaustive, and original researches upon the true nature of the disease, but also for the cure he has placed in their hands; and here I refer more especially to those formulæ which he has published. In less scientific, careful, and experienced hands than those of Mr. Cheshire, phenol would have been immediately discarded, owing to the difficulties and want of success which must necessarily attend first experiments in a case of this kind; but with a knowledge of the benefits derived from its use in other cases of germ disease, and with the perseverance which characterizes the truly scientific man, Mr. Cheshire has successfully carried on and completed his work, and has thus rendered powerless one of the worst enemies the bee-keeper has as yet had to contend with.

In our next issue we will give a subsequent article on this subject from Mr. Cheshire, which will explain some points, and add further details of his experiments.

Honey at the Indiana State Fair.

The *Indiana Farmer* describes as follows the honey display at the Indiana State Fair:

The display of honey and things pertaining to the bee-keeping interest at the State Fair, was the best that has ever been made at any of our Fairs, and was very creditable to those who took part in the undertaking; much more so than might have been the case in former years, on account of the present poor season, requiring a very great amount of care and work to put things in a creditable condition. Mrs. C. Robbins, President of the State Bee-keepers' Society, and the Treasurer, Mrs. L. Stout, have been untiring in their efforts to induce bee-keepers to show what an advancement had been made in the business, within the last few years. Mrs. Cox and Mrs. Lane, of Boone county, were both contributors and took part in entertaining friends. Mrs. Robbins, Mrs. Stout, and Mrs. Cox each made a display of honey-producing plants, the two former being very fine indeed, including, as they did, almost the entire list of the honey-producing plants of this State, and we think, if the truth were

known, it would appear that the committee had to resort to straws to decide which was entitled to the "red ribbon," the long straw falling to Mrs. Stout.

Mr. S. H. Lane, of Whitestown, Ind., was awarded the first premium on extracted honey in the most marketable shape; also on comb honey, and for the best display of honey, Mr. Cox receiving the second premium on the latter. Both gentlemen exhibited a show-case filled with one-pound sections; one side of Mr. Cox's case being filled with sections heart-shaped and diamond. They also showed honey in many sizes and kinds of retail packages. A globe, jar and cross in the collection of Mr. Lane, attracted much attention.

The greatest attraction to the uninitiated was the word "HONEY" in letters of comb honey, as made by the bees, directly in the sections; the spaces forming the letters being filled by the bees with comb, afterwards the outside blocks being removed leaving the letters standing in bold relief. All of which was performed under the careful hand of Wm. Hutchinson, whose apiary is near Acton, Marion county.

Taking the honey display as a whole, it was creditable to our State Society, to which all the exhibitors belong, and we are well satisfied that it has done much good, not only among bee-keepers, but in the way of educating the people as to what we as bee-keepers are enabled to offer them in the way of an enticing luxury for the table.

Seasonable Hints.

The *American Agriculturist* for November contains these seasonable hints to bee-keepers:

Small fruits and flies are now gone, the cooler weather excites the appetites for sweets, and if your comb honey crop is not sold, now is the time to dispose of it. The local market should be looked after first, and no honey sent to the distant markets until the local demand is supplied. If there is no local market, make one; if you have never tried, you will be astonished at what can be accomplished by a little push. Honey should not be "kept over" in hopes of receiving better prices, as old honey is not preferred to that which is new.

Contract the entrances to the hives so that mice cannot enter. If the bees, which are to be wintered out of doors, have received no protection, furnish it at once. Have everything in readiness if they are to be wintered in a cellar or a "clamp." When it is evident that the bees have enjoyed their last autumn flight, carefully carry them in.

☞ The "Autumn Leaves" which will bring the most returns are, no doubt, the Leaflets—"Why Eat Honey?" Scatter them and see the effect in selling honey in every neighborhood, at good prices. Two hundred will be sent postpaid for \$1.00; 500 for \$2.25; 1,000 for \$4.00.

CORRESPONDENCE

For the American Bee Journal.

Ventilating Bee-Hives.

H. W. S. P

The subject of ventilation of bee-hives is often mentioned in the BEE JOURNAL, and yet I do not remember that any writer has ever said anything as to how much ventilation should be provided for, or in what direction, whether through, around the mass of bees, or whether occasionally or at all times. Once in awhile upper or lower ventilation is spoken of, but nothing of what is meant by either. The subject seems to be very carelessly thought of, and, I suppose, often very carelessly practiced, when practiced at all. Now, I wish to "ventilate" my thoughts on the subject.

When bees are hibernating (by which I mean, passing the winter in close quarters, generally in a quiet and sometimes dormant state), they throw off a great deal of vapor, which, in a state of nature, generally in a hollow tree, passes into and is absorbed by the rotten wood, and there retained until used up by the living tree, or evaporated by the heat of the succeeding summer. Bee-keepers often neglect to make any provision for imitating this natural process, consequently the vapor condenses and runs down the sides of the hive, as water, sometimes freezing up the entrances, and always incommoding the bees, thus making the combs damp and moldy, and otherwise causing injury.

To remove this accumulating vapor, in any manner imitating the natural way, seems to me to be very desirable, and to do so, many plans are used, which plans are generally called "ventilation." But here comes one of the difficulties. Some seem to think that a strong breeze should blow through the hives, and thus, I think, many weak colonies are actually killed, although a very strong colony with ample supply of honey can stand almost any amount of ventilation. In practice, it seems to me that a very slow ventilation is what is wanted, and *all* that is wanted, any other than a slow one being injurious. This is often accomplished by filling the second story with chaff, or any loose material which will allow the vapor-laden air to slowly pass through, or will retain it and hold it as water until spring comes, when it can be dried out for use again during the next winter.

There are many inconveniences about this plan which I avoid by the plan I use, and which I have practiced for several years, having learned it from Mr. Joseph Savage, of Ludlow, Ky., opposite Cincinnati. I make a frame of thin lumber, say half or three-quarters of an inch, of the same size as the second story of a Langstroth hive, but only 6 inches high.

On the bottom, or a little way up from the bottom (varying, as I use them on the lower or second story of a hive), I use coarse, strong muslin. This receptacle I fill with layers of cotton-batting. I use one and a half pounds in each, but that is, perhaps, more than is necessary. Mr. Savage makes them only four inches high, and uses less cotton. Before putting these over the colonies, I put a couple of small strips across the frames, and above them a cover of muslin.

The sticks keep the muslin slightly raised in the middle, so that the bees can pass over the tops of the frames, from one frame to another, without being chilled in very cold weather, the top of the hive being the warmest place. Whatever vapor is produced by the bees, rises and passes through the muslin cover, and the muslin bottom of the top-box and passes into the cotton-batting, rising as long as it is in the state of vapor. If it condenses, it is held as water.

In putting on the wooden cover or roof, I leave one end raised about 2 or 3 inches, which allows any wind to pass through, over the cotton-batting, taking up any vapor which may happen to be there; and I find that when thus arranged, the cotton is always dry; but if the cover is put down close, the cotton is often wet, and thus partially hinders the passage of the vapor. The muslin and the cotton-batting seems to allow just about rapid-enough ventilation. If it were more rapid, it would not only take off the vapor, but also the heat; and if it did not freeze the bees, it might make them uncomfortably cool, and thus cause a greater consumption of honey.

The muslin and cotton-batting resemble the bed-clothes upon a sleeping person. The bed-clothes allow the moisture to pass through sufficiently, but retain the heat. You will see that this arrangement resembles very much the plan of filling a top-box with chaff, and perhaps, so far, is no better; but it is much handier.

Whenever you wish to look at your bees in winter, you can lift off the top-box without the least danger or hesitation, and then you have only the muslin cover, of which you can turn up one corner or more, dependent upon the activity of the bees, or other circumstances; whereas, if you have a box filled with chaff, perhaps with a loose bottom, you very likely have to operate 15 or 30 minutes before you can see the bees. I have found this plan very successful, and so has Mr. Savage.

I have several times noticed the mention of the use of enameled cloth over the bees in winter. It appears to me that the use of such material, directly hinders the desired effect, as it is impervious to air or vapor. On page, 663, Mr. C. W. Dayton relates his experience in using enameled cloth, and shows how the vapor condensed on the under side of the cloth, which he got rid of by turning back part of it, thus opening a passage upward; and in another case by perforating it, and thus allowing the moisture to pass through. The whole secret, in my opinion, is to cause a

slow, upward passage of the vapor, by the use of a porous cover. Then a roof must be used to shed the rain, but it must be open at the sides to allow the wind to blow the vapor away. By raising it at one end it makes a greater slope to carry the rain off.

I put my ventilators on the hive as soon as cold weather approaches, say in the latter part of September, and leave them on until May or June, and I do not think that it would do any harm, but possibly would be best, to leave them on through the summer. They are excellent equalizers of heat, keeping it in in winter, and I think that they would also act to keep it out during the summer; but I have never tried them in the summer.

Cincinnati, O.

For the American Bee Journal.

Utah Bee-Keepers' Convention.

The Bee-Keepers' Convention met at 7 p. m., at the City Hall in Tooele, on Oct. 6, 1884. Mr. A. M. Musser called the meeting to order.

Tooele City was represented by Mr. T. W. Lee, of Tooele county. There are thirty bee-keepers in Tooele City. Last fall they put into winter quarters, 214 colonies of bees, and during the winter their losses were 38, and their increase was only 15; hence a decrease of 23. They have taken 851 pounds of honey this season. Mr. T. W. Lee has 60 of the above colonies, and has taken 240 pounds of honey. In the spring their bees did very well, and their prospects were rather flattering, but the caterpillars and worms damaged vegetation and deprived the bees of good pasture, hence their report would not be as favorable as last year. There was no foul brood in the county, and the bees are now in a good condition. Bees gathered honey fast, although many colonies had to be fed in the spring and summer. Honey was selling for 20 cents per pound and in good demand.

John Morgan, of Mill Creek, took care of two colonies of bees, and increased them to six, besides taking considerable honey. He was beginning to enlarge his stock of bees, but his ill-health had kept him from paying attention to his apiary. Although the smelters, he thought, were a detriment to bee-culture, yet he thought it was not that alone which had caused so much loss, as the two colonies being increased to six was a proof to the contrary. He further said, that we must keep up the bee and honey interest, for the Territory could not afford to go back on so profitable an industry.

Alvin Stewart, of Mesa, Maricopa county, Arizona, reported that their new settlement had sent to California and imported 25 colonies of bees. Daniel Bagley took 7 colonies and increased them to 27. He also told of a neighbor who took 2 colonies and now has six. Bloom was very abundant and the season long, so much so that he cut his lucern five times.

George Baily of Mill Creek, had taken about 2,500 pounds of honey,

and had kept his bees in two divisions, one part of them at his home in Mill Creek, the other, up on the bench, about 150 colonies; he had been too busy to give his bees full attention, or the results would have been better.

Wm. M. Egan, of this city, began last spring with 19 colonies and now has 25, and has taken 1,500 pounds of honey. He considers this season a very poor one for bees and honey; for wintering he approves of Hill's device, as an opening on top of the frames with chaff protection proves a success with him. When necessary in early spring he gives them smut dust, placing it outside where they can work on it for pollen; he thinks that it is far better than flour, and when they are scarce of honey, he gives them a frame of comb honey.

T. B. Clark, of Davis county, said that in Farmington there are about 150 colonies of bees. They averaged 50 pounds of honey per colony. He was pleased to say that the foul brood which had infected their bees so lamentably is fast disappearing. Protect the bees and spare the toads. In France, gardeners often bought toads to devour the vermin in the gardens.

G. W. Bean, of Sevier county, says that the bees have done poorly this season.

In St. George, John Campbell said that the bees did well in the spring, but protracted rains followed by drouth disappointed the bees, and the keepers, too, early in the spring. Some colonies cast 3 swarms. There are about 400 colonies in the place.

Samuel Nowel, of this city, had 2 colonies in the spring, has six now, and has taken 200 pounds of honey.

E. Stevenson, of this city, has 45 colonies on cottonwood. He has been absent one year and considers the season a very poor one. His bees have produced 1,500 pounds of honey in 2-pound sections.

J. E. Murphy, of Mill Creek, has 66 colonies, 36 of them being on Mill Creek bench. He has taken 2,500 lbs. of honey, and about 1,000 more of comb honey yet to take.

It was advised by the meeting to extend the organization of bee-keepers' association through the various counties, and it might be expected that Mr. Stevenson would visit the settlements in this interest.

The convention adjourned until next April. E. STEVENSON, Sec.

Sexual Functions of Bees.

WM. MUTH-RASMUSSEN, C.

Having read Mr. Kohnke's article on this subject, on page 633, I desire to ask him a few questions, and also to add a few comments: First. Does a laying worker ever deposit eggs in drone cells? If so, is there any difference in the size of the drones reared in such cells, from those reared in worker-cells? I do not now remember of ever having noticed this, nor have I seen it mentioned in print. I know that the drones reared from laying

workers, are usually a little larger than a worker-bee. Second. Does Mr. Kohnke know whether laying workers, or any workers, are in possession of a seminal sac capable of receiving and retaining the seminal fluid from the drone?

Now, in regard to the fertilization of worker-bees: "The same scientists have also proven by ocular demonstration that freshly-deposited eggs laid by a mated queen in drone-cells, or those laid by a queen not having mated, as also those laid by workers, are devoid of these sperm-filaments." Of what use, then, would fertilization be to a worker-bee, when it cannot lay female eggs, but can produce male eggs without the sperm-filaments, that is, without fertilization? Why cannot a worker-bee produce female eggs? I think, because it cannot become fertilized. And why not? Because the seminal sac has been so stunted with the whole organism of the individual bee, that it is incapable of receiving and retaining the seminal fluid. The writer in *Bienenzeitung*, commenting on Mr. Kromer's discovery, asks: "Had the worker in question a desire to mate? And further on he says: "The observed fact is also proof conclusive, that the stunted or smaller sexual organs of the workers admit of copulation." I admit that this may be so. I believe that young horses, after castration, sometimes show signs of sexual excitement; but the fact of copulation does not prove that fertilization takes place. "What did such eggs hatch? Only male bees, or drones." As drones are produced by queens without fertilization, reasoning from analogy, they should likewise be so produced by laying workers; consequently the mating of a worker-bee with a drone may be only a freak of nature, induced perhaps by higher development and vigor of some individual worker. "Nature does nothing without an object;" but the object is not always accomplished.

Tiering-up Sections—Hibernation.

C. THEILMANN, C.

I commenced the season of 1884 with 110 colonies, which I increased to 190 by natural swarming, on Mr. Heddon's plan of preventing after-swarms, which I found to be the best method of any that I have ever tried. I obtained about 2,000 pounds of comb and 400 pounds of extracted honey.

The forepart of the summer was middling good here for bees, with a good prospect for basswood honey; but as the blossoms began to open, the greater part of them turned black and fell off, so the bees secured but little honey from that source. The hills and valleys were covered with flowers until the latter part of September, when they ceased without being frosted, although the bees got but little fall honey. Red clover, pumpkins, tomatoes, and here and there some wild flowers are in bloom

yet; the bees have brought in some pollen every day, for the past 10 days, as the weather has been unusually warm for this time of the year. It has been 15° to 80° in the shade at noon, though the nights have been cold enough for a slight, white frost in places.

In June, when about $\frac{2}{3}$ of my colonies had their surplus arrangements about $\frac{3}{4}$ filled with honey, and the prospect for more being good, I tried Mr. Heddon's tiering-up plan. All of these colonies were very strong, and they immediately occupied and commenced to work in the empty sections. After they had them partly filled, they did not find honey enough, with all the abundance of flowers, to complete the work which they had begun; the result being that about $\frac{2}{3}$ of my surplus honey was not capped over when the season closed. I never had my comb honey in such bad condition since I began to keep bees, and I hope that it never will be repeated. I am sure that I never will have it occur with the tiering-up plan, as I will never again tier-up until the first set of sections is capped over, or the sections sealed. This tiering-up plan beats me in a poor honey season, but I do not think that it has been so with others. It would be all right, if Mr. H. or some one else could foretell the season ahead.

I cannot close without making a few remarks on hibernation. Mr. Clarke writes a great deal about it, and yet does not say anything; that is, he does not tell us how to proceed or to perform with our bees in order to have them hibernate.

All practical and experienced beekeepers know that bees winter best when they are in a quiet state, but I have never seen or heard of one who knew of a method to get and to keep the bees in that quiet state, or "to hibernate," as Mr. Clarke terms it, during their winter confinement. In all my wintering of bees, I remember of only one winter through which they passed in that dormant state all winter, and until I put them out in April.

In the fall of 1872, I had 24 strong and heavy colonies in Langstroth hives, for which I built a bee-house in a side-hill near the apiary. I banked it up to the shingle roof, except the front which was double-walled and filled with sawdust between. It was frost proof. I made benches all around the inside about one foot from the ground, on which I put the hives, on Nov. 15. I weighed them while taking them in. After I had them all in, I took the caps and honey-boards off of all the hives, which left the frames bare. The entrances were left wide open, and no holes were made in the combs, nor spreading of frames. I shut the door and let them take care of themselves.

During the winter I went into the bee-house two or three times to see the bees, and each time found them as if they were asleep. They came through the winter in the best condition of any bees that I ever wintered. They consumed only from 3 to 7 pounds of honey per colony, for I

weighed them again when I put them out on April 15, 1883. No mold or dampness could be seen, the combs were as bright as they were during the summer, the colonies seemed to be stronger than they were in the fall, and not a handful of dead bees could be seen in the bee-house.

The next winter I put them and their increase (74 colonies) into the same bee-house, but I did not take off the honey-boards. During that winter all but 4 became diseased, and by spring died. I could not account for that.

Since then I have never tried to winter my bees as I did the 24 colonies spoken of, but I will try it again with some of my bees during the coming winter.

In my earlier days of bee-keeping, I did not read any bee-periodicals; but since I do read them I see many ways in which bees are wintered. Some of the writers of the BEE JOURNAL must have different bees than mine are, when they can stand 65° to 90° above zero in their winter confinement. Mine do best at 42° above zero; that is, they are the most silent at that point. The farther above or below 42°, the stronger the noise becomes in the bee-house. This has been my experience for the past ten years.

Bees and Flower Petals.

CLARENCE M. WEED. ♀

Eminent botanists believe that many ages ago there were none of the large-petaled, parti-colored flowers that now give such touches of grace and beauty to our landscapes. Then flowers consisted only of the essential pistils and stamens, as is the case of the inconspicuous blossoms of our hickory, oak, and other trees of the present day. These flowers must have been almost wholly wind-fertilized, but with the introduction of insects, and especially the bees and wasps, it became desirable for some species to be fertilized by other means than the very wasteful process of wind-fertilization. The way in which the showy parts were evolved is supposed by our greatest botanists to have been somewhat as follows:

Every gardener is familiar with the fact that plants, under certain conditions, will vary, or sport as it is called, from the one which produced the seed from which it sprung. This often occurs, not only in our cultivated plants, but also in many of our wild flowers. It is by some such process as this that the first petals are supposed to have been developed. Some of the outer stamens on a primitive flower became flattened, thus making the blossom more attractive than its less-favored, non-sportive neighbors. As it was more conspicuous, it would be more freely visited by bees and other insects, and, hence, would be more certain of fertilization by pollen from another plant; because of which, as was so clearly proved by the illus-

trious Darwin, the seeds produced by the flower would be better developed and produce stronger plants than the others. These plants would, in turn, produce flowers having similar peculiarly-developed stamens, which would again be more freely visited by insects, and consequently develop thrifter seeds. And so the process would go on until a row of the insect-attracting petals would be developed, as in the case of our apples, pears, and the great majority of our common flowering plants.

While writing, I have before me one of our beautiful white water-lilies which admirably illustrates the evolution of petals. Toward the centre of the flower are a large number of the yellow stamens with the pollen-bearing anthers upon their summits. A little farther out, some of these stamens have become flat, with the anthers only partially developed, while still farther out are stamens wholly flattened and with no trace of anthers, only differing from the petals by their smaller size and yellow color. Here we have, as Grant Allen, the English naturalist, expresses it, "stereotyped as it were, the mode of evolution of petals from stamens."

Wabash Co., Ind., Convention.

The Wabash County Bee-Keepers' Association met in the Court House at Wabash, Ind., on Oct. 4, 1884. The meeting was called to order at 11 a. m., by President Singer. As there were only a few of the members present, the reading of the minutes was deferred until the afternoon session. The programme of questions was next read by the Secretary. The first question taken up for discussion was, "Does bee-keeping as a business pay?"

Mr. Singer said that his bees netted him over \$2 per colony, the present poor season, and he thought that in a good season bee-keeping would pay well. Mr. Cripe said that he realized \$8 for comb honey from his best colony, without any feeding or special care. Mr. Coffman thought that this was the poorest season since he began to keep bees, which has been over 40 years. All agreed with Mr. Coffman that this had been a very poor season. The most of the members were of the opinion that, in a good season, bee-keeping pays well, compared with other pursuits.

"Does it pay to use comb foundation? If so, at what price?"

Mr. Singer said that if a colony of bees was provided with foundation, it would give all its energies to gathering honey, instead of building comb. Consequently the bees would enter the sections sooner. Mr. Hess said that when a swarm issued it was prepared to build comb; but had not enough wax secreted to fill an ordinary hive with the necessary combs. He says that all swarms should be provided with some foundation. Mr. Singer said that when bees were secreting wax, they would cluster in large

bunches, and if a swarm was hived on full sheets of foundation, it would break the cluster, and would immediately stop secreting wax. The majority of the members agreed that foundation was profitable even at \$1 per pound. For sections, flat-bottom foundation was preferred.

"Which is preferable, natural swarming, or increasing by division?"

Mr. Cripe had had some experience in dividing colonies, but preferred natural swarming. Mr. Singer had increased his number of colonies by division, and prefers the method when working for increase only. It was decided that natural swarming is the best way, if producing comb honey.

"Will bees swarm when they have plenty of room in the hive?"

Mr. Cripe said that if plenty of room were given them early in the season, they would not be so likely to swarm. Mr. Hess said that bees were not likely to swarm when in large hives, as he formerly used very large hives and had had no swarms. Adjourned to 1 p. m.

At the afternoon session the minutes of the previous meeting were read and adopted. The discussion began with the following question: "How shall we prepare bees for winter?"

Mr. Whitlow described his method of packing them in sawdust, about 4 inches deep all around the hive, and a chaff cushion on top, and had lost only one colony in 4 years. Mr. Singer crowds his bees to one side of the hive, by means of a division-board, and packs chaff in behind them. He puts his hives in a row and boards up at their sides and backs, and fills in with chaff or fine straw, leaving the front open. So far he had lost none by this method. Mr. Gray objected to the use of fodder for a protection, as he had used that last winter, and had much bother with mice getting into the fodder, and also into the hives. Mr. Maures packs his bees in chaff, being something similar to Mr. Singer's plan, with the exception that he packs in front of the hives also. Mr. Coffman winters his bees without much protection, except chaff cushions on top.

The feeding of bees was next discussed. Mr. Coffman feeds his bees in the open air, late in the evening, and says that they take the feed up so quickly that his neighbors' bees have no chance to rob. When he prepares his bees for winter, he takes frames of honey from his best colonies and gives them to the weaker ones, thus giving all plenty to winter on. Mr. Fulton feeds his bees inside the hive, and prepares the food by taking coffee A sugar, dissolving it in water, as much as the water will dissolve; he then puts it in glass cans or bottles and sets it in the sun until it is quite warm, after which it is ready for use. Mr. Hess prepares his feed in a similar manner, except that he uses granulated sugar. Nearly all of those present favored inside feeding, and thought it much the safer plan, on account of the danger from robbing, and no strange bees would be fed in that way. Mr. Singer feeds his bees

in the morning, in order to give them something to do during the day, so as to keep them away from the cider mill, as they will carry home great quantities of cider if left without any thing else to work on.

Mr. Singer read an essay on "Feeding Bees."

It was decided that the Secretary should make out a programme for the next meeting, and have it published in all the county papers at least four weeks before the time of meeting, in order to gain a large attendance. The next meeting will be held on the second Saturday in April, 1885.

HENRY CRIPE, Sec.

AARON SINGER, Pres.

For the American Bee Journal.

My Report for 1884.

EUGENE SECOR. ♂

"How doth the little busy bee
Delight to buzz and bite;
'To gather honey all the day,
And eat it up at night!"

I do not know who is the author of these lines, but whether it is Cowper or William Nye, they express the disappointment, if not the disgust, of some of the bee-keepers of this year.

It is, perhaps, just as well that bee-keeping is not all sunshine and flowers, else the business would soon be overdone. If every novice embarking in the business could, without any experimental preparation, achieve just as good results as the older members of the fraternity, and if there were no drawbacks, such as bad seasons, wintering troubles, swarming frenzy, etc., honey would soon be so cheap that the poetry of bee-keeping would soon degenerate into the dullest prose, with about nine-tenths of the persons now engaged in it.

To preface my honey report this year, I shall say that the weather was against me. But to lay all the blame at the door of the clerk of atmospheric conditions, is a little more than even my elastic conscience will approve of; for, to tell the whole truth, my bees were not always attended to precisely at the time when I knew they needed attention. Other, and as I thought more profitable business, claimed my time, and only the spare hours were given to the "little helpers."

Spring opened auspiciously. From early in April, when snow disappeared, there was hardly a frosty night. The genial sunshine and bursting buds made glad the heart of every lover of Nature; the flowers sprang up to kiss and welcome the fair maiden, and the "busy bee" sang its delight by a constant hum of busy contentment. The prairie anemones shot out of the recently snow-covered ground; the willows came on apace; the fruit blossoms filled the air with their fragrance; dandelions in profusion invited to the feast, and the fields of white clover seemed to consummate the climax of hope in the enthusiastic apiarist. Thus matters ran along in the poetical groove for a month or two, when it was discovered that the season was not yielding its promised

fruition. While we got some white clover honey, we received none from sumac, which is one of our best honey plants, and basswood yielded but little. Then came a drouth for a month or so during July and August, from which the fall flowers never fully recovered; and our fall crop, which is usually our most certain one, was hardly up to the average.

I began the season with 23 colonies, nearly half of them being very weak. I set apart 11 of them to run for extracted honey exclusively, and the others were run for comb honey. Of extracted honey I obtained 770 pounds, being an average of 70 pounds per colony. The largest yield from one colony was 144 pounds. No increase was obtained from them. I secured 501 pounds of comb honey in $\frac{3}{4}$, $1\frac{1}{4}$ and $1\frac{1}{2}$ -pound sections—an average of only 42 pounds per colony, and increased them by 9 natural swarms. The largest yield of comb honey from one colony and its increase was 70 pounds, spring out.

While our season's work has not been as satisfactory as we desired, yet we have something with which to sweeten our pancakes the coming winter. Honey retails, in our local markets, at 20 cents per pound for nice comb, and 10 to 12 cents for extracted. I should have no difficulty in selling twice what I produce, right here in our local market. No one that I have inquired of has done as well as I this season. There is not enough honey in this part of Iowa to supply the home demand.

Forest City, Iowa.

For the American Bee Journal.

Filling and Capping of Honey-Cells.

DR. D. C. SPENCER. ~

How does the bee deposit the honey in the cell and manage it while so doing, is a question that has doubtless puzzled naturalists in all ages; and its answer has been hidden, hitherto, among the secret mysteries of this wonderful insect; at least so far as the knowledge of the writer extends.

Having seen in the current volume of the BEE JOURNAL, an answer given by one of the "oracles," that the honey was held in position by force of capillary attraction; and having seen no exception taken, nor objection presented to that answer, I concluded that that was the limit of present knowledge in this direction, and so I put forth the "what and the how" of that wonderful *modus operandi*, as I have seen it; thus endeavoring to add another laurel to the reputation of these marvellous little architects.

This very interesting discovery came to the knowledge of the writer in this wise: In the summer of 1880, during a sudden flow of nectar, the bees in his observatory hive built a piece of comb as a "wing," or an "L" extending from the side of an outer comb to the glass. As the new comb was extended to the glass, it was so arranged by the builders as to have the glass form one side of the last cell, thus affording a rare opportunity

for the observer to watch the interesting process of constructing and filling of the cells.

When the construction of the walls had so far progressed that the cell was nearly ready to receive the honey, it was prepared in this manner: A bee was seen to approach the further end of the cell and eject from its mouth a clear liquid which it spread with its mandibles over its concave surface. This process was repeated several times, and forming, when dry, a thin, transparent, varnish-like coating or lining to the end of the cell. This done, the cell was ready for the reception of its treasures. Soon a loaded bee was observed to enter, and proceeding to the lower edge of the lining just finished, began to peal it up until it was detached a little, then it ejected its load beneath and behind the lining, and then replaced the lower edge of the portion that had been pealed up, and patted it down nicely, leaving a slightly convex appearance resembling a blister filled with one solitary load of nectar.

This process was repeated rapidly until this lining was seen to be detached entirely, except at its edges, where it still adhered to the sides of the cell, forming a complete diaphragm, securely confining the honey and holding it in its perpendicular position, and being forced along the walls of the cell until it was filled, usually leaving a space between it and the capping. It seemed to acquire additional strength with age, resisting considerable force before it gives way.

When viewed edgewise, this diaphragm may be distinctly seen with the naked eye, its thickness being judged to be about one one-hundredth part of an inch. Its color, when thus seen, is of an amber hue. By means of a hypodermic syringe this cell wall may be pierced behind the diaphragm, and the honey withdrawn, leaving it intact. Thus fully demonstrating its existence, and the "what and the how" of one of the many interesting processes of these wonderful God-given servants—"our pets."

Augusta, Wis.

Western Bee-Keepers' Convention.

The third annual meeting of the Western Bee-Keepers' Association was held at Independence, Mo., on Sept. 24, 1884. There was an exceptionally large exhibition of bees, hives, and products of the apiary.

The business session was short on the first day. At 4 p. m. the Secretary, C. M. Crandall, called the meeting to order, and Jas. D. Meador was called to the chair. The following committee was appointed to solicit members: Jas. D. Meador, L. W. Baldwin, and Jas. A. Jones.

After the preliminary exercises, the subject of "Introducing Queens" was fully discussed.

The Thursday morning session was held from 10 a. m. to 4 p. m. Officers were elected for the ensuing year, and a number of new members were re-

BEES AND HONEY FOR 1884,

ceived, some of them being ladies. The meeting decided to hold its semi-annual meeting next spring, at St. Joseph, Mo. It was left to the executive committee to choose the time and place for the next annual meeting.

The minutes of the Wednesday afternoon session were read and approved, immediately after which the report of the committee on subjects for discussion was received, and was as follows: 1. "Is it profitable to extract honey for the purpose of finishing up partly filled sections?" 2. "Is it profitable to rear queens after the honey season fails?" 3. "Is it advisable to manage an apiary so as to get a larger part of the honey gathered as surplus, for feed in winter?" 4. "Taking all things into consideration, what time of the year is the best for Italianizing an apiary?" 5. "Which is the best method for rearing queens?" 6. "Is the extra prolificness of the queen an advantage to herself and colony?"

The report was adopted, and the first proposition of the report was taken up for discussion. Mr. A. A. Baldwin regarded the plan as profitable, from his own experience, and had fed extracted honey with favorable results. Mr. Conser reported his experience as having met with contrary results, and would not advise the feeding of extracted honey. Mr. W. B. Thorne gave his experience as being, that his bees had a tendency to swarm as soon as he began to feed them.

The second question was then discussed. Mr. E. M. Hayhurst regarded it profitable, as did also Mr. Jas. A. Nelson. Mr. A. A. Baldwin expressed the opinion that queens reared at such a time were not as good as they otherwise would be.

Upon the third proposition, Mr. Armstrong expressed himself as favoring the plan. He had done so, using A sugar with good results. Mr. P. B. Thaxton stated that from his limited experience he had formed the opinion that bees always wintered best on honey. Mr. Jas. A. Jones was of the opinion that either honey or sugar could be used for wintering, and that he would take all the honey possible, as could be sold at a price exceeding the cost of sugar. Mr. W. B. Thorne stated, rather to the amusement of the Association, that he would feed his bees on sweet cider, this fall, and report the result at the next meeting. Mr. A. A. Baldwin stated that his plan was to manage so that his bees would store all their honey in sections, and then feed them white sugar for winter food; that at the present price of extracted honey, the feeding of sugar was advisable.

The fourth subject was taken up in the regular order, and, as had the other question, it met with general discussion.

Upon the fifth question Mr. E. M. Hayhurst expressed the opinion that if an apiarist buys his queens, the fall is the best time; but in case an apiarist rears his own queens, the best time is when the honey-flow ceases. Mr. F. G. Hopkins' opinion was, that the best time was when it best suited

the apiarist. Mr. Phidel Baldwin regarded the best time to be during the flow of honey, at which time the bees were less inclined to rob. Mr. E. Armstrong regarded the best time for the apiarist, as well as for the bees, as being as early in the season as possible. Mr. L. W. Baldwin considered the best time during the flow of honey, and regarded queens reared at other times as inferior to those reared during the flow of honey. Mr. J. D. Meador regards the time as the best during the swarming season.

The afternoon session was called to order, and the question which had occupied the time just previous to the noon hour was taken up.

Mr. Conser considers the height of the honey-flow as the best time for Italianizing, and that queens can be reared cheaper at that time. Mr. D. G. Parker concurred in the same opinion.

The following officers were elected for the ensuing year: President, Mr. A. A. Baldwin, Independence, Mo.; Vice-President, Mr. E. Armstrong, Jerseyville, Ill.; Secretary, Mr. C. M. Crandall, Independence, Mo.; Treasurer, Mr. Phidel Baldwin, Independence, Mo.

Immediately upon the election of Mr. Baldwin, as President, he was escorted to the chair, and made some remarks.

Under the head of miscellaneous business, Mr. P. Baldwin was appointed a committee of one on statistics, to report on the following day.

After some further discussion the session adjourned until 7:30 p. m.

The evening session was occupied in discussion. The committee on subjects for discussion made report of the following additional subjects, viz: 7. "What is the best practical method of controlling swarming?" 8. "Is pollen in the hive detrimental to suc-

cessful wintering?" 9. "Which is the most profitable production, comb or extracted honey?" 10. "Does the bee-keeper or the hive, practically, have the most to do in securing the largest amount of honey?" 11. "Are vicious bees better honey-gatherers than gentle bees of the same race?" 12. "Will it pay to plant for honey only?" 13. "What is the best remedy for bee-fever?"

The discussion of the evening began upon the sixth subject.

Mr. A. A. Baldwin said that he preferred a queen that would just keep up the colony. Mr. E. Armstrong said that the present year had been an exceptional season for bees to breed, and asked for information as to how such could be prevented.

Mr. J. D. Meador said that he thought that it was due to the extra amount of pollen. The most of the members concurred in the opinion that it had been an unusual season for breeding; and further, that bees had bred later than usual. A vote being taken to decide whether, in the opinion of the Association, it was the queen or bees that caused an excessive production of brood, it was decided that it was due to the bees.

Mr. L. W. Baldwin said that while his bees were at work on the Spanish-needle, they would return to the apiary and fly around as if lost, and then alight on the brush and die. His colonies were very much weakened by death in this way.

The seventh question was discussed.

Mr. P. Baldwin said that he had been trying to control swarming, for many years, and in his experience, what would work successfully one year would fail the next. He had tried caging the queens, and they would swarm on the next day, over the caged queen, and so on for several days.

Mr. L. W. Baldwin expressed the opinion that it was best not to attempt to control swarming, but to know what to do with swarms. His method, during the past season was, as soon as a swarm issued, to take the old queen, and in three days destroy all the queen-cells but one, and give a ripe queen-cell. The method had worked to his satisfaction. Mr. C. M. Crandall had successfully operated the same plan.

As to the eighth question discussed, the following resolution was introduced:

Resolved, That the pollen is not detrimental to successful wintering.

Upon the tenth question the Association almost unanimously agreed that the secret lay in the management of the bees, and consequently to the apiarist was due the amount of honey.

The Association was called to order at 10 a. m., on Sept. 26, by President A. A. Baldwin. Under the head of miscellaneous business, Mr. F. G. Hopkins was appointed as a committee to arrange for the spring meeting, which will be held at St. Joseph, Mo.

The discussion was again resumed, by taking up the eleventh question. The discussion became general, and the general opinion expressed was that the vicious bees were not the best honey gatherers.

"Are bees more inclined to sting a dark complexioned than a light complexioned person?" was the next subject for discussion, and upon it the Association generally agreed that they were. With the discussion of this question the morning session closed.

Upon convening in the afternoon, the various committees of judges busied themselves in awarding nearly \$200 in premiums, which were announced immediately after the Association was called to order at 4 p. m.

After the awards, the convention received the reports of the different committees, and then adjourned.

The Use of Phenol on Foul Brood.

A. R. KOHNKE, ♂

On page 644 is an article on the above subject by Mr. F. Cheshire. I am not enough of a microscopist to know whether or not Mr. Cheshire is right in his classification of microorganisms; in fact, these nice distinctions may well be left to the expert in scientific microscopy, without affecting the main question of prevention and cure. But to certain claims and statements of Mr. C. I must take exception. I will first take into consideration the means of the propagation of the disease.

Mr. C. speaks of "spores which fly about in the air and settle here and there." Well, if that is the case, and most likely it is, the air in a hive containing a diseased colony must certainly be full of them, and permeate every nook and corner, settling also on the cappings of sealed honey, and

on the surface of honey not sealed; this, Mr. C. thinks, is very rarely the case. It is not only equally probable but certain, that the spores are carried from one hive to another, not only by the winds and feet and antennæ of the bees, but also the honey-robbing bees carry them from the diseased colony to healthy ones. If it were a fact that no spores settled in the honey, as Mr. C. says that he never found any, why would it be so very absurd to feed such honey to healthy colonies, as Mr. C. also claims? These statements and claims are not consistent with sound reasoning. Mr. C. again says, "The disease lies wholly and absolutely in the blood," but he denies that the food given to the larvæ is the transmitting agent of the spores. May I be pardoned for asking the question, how they got inside the larvæ and into the blood?

Again, whether or not the seed-germs of the disease are called micrococci, or simply spores, does not make so much difference, but they *do* pervade the dried larvæ, and *are* the means of transmitting the disease. Mr. C. lays great stress on the "antennæ" of the bees as being the chief means of carrying the spores from one place to another; those spores which he says, "fly about in the air." If that be true, it would be equally as reasonable as to suppose that men may carry more dust on their noses than on the rest of their bodies. Whether or not bees carry the spores on their toes or on their noses, from one hive to another, has, perhaps, not yet been discovered, and is not of so much consequence as to know that everything coming in contact with an infected hive or colony will transmit the disease. And now to his method of cure.

As a remedial agent, he mentions salicylic acid, and raises three points of objection to its use: "First, it is troublesome in application, on account of having to spray the infected combs and then feed the bees with medicated syrup." But I notice that in treating the colony which was furnished him for a test, he sprayed, too, and the feeding was done by filling the cells of the combs in the diseased colony with his medicated syrup out of a bottle with a very small opening. If no spraying is done, how can the spores in contaminated combs be destroyed, unless the combs are entirely removed, which is certainly the best plan? His method of feeding is certainly much more troublesome and tedious than to feed salicylic acid in syrup from any common feeder, out of which the bees will not take his remedy; unless it is poured upon their backs and forced down their throats, so to speak, they will not accept it.

2. He says, "The question of dose has never been worked out." Mr. C. is evidently not well versed in apicultural literature. The doses, as given in my little pamphlet on foul brood, are as exact and definite as are required for the administration of the most virulent poison. They were published in Germany as early as 1877.

3. "It has," Mr. C. says, "from a mistaken idea of its insolubility, been associated with borax. It adds to the complexity and nauseousness of the remedy." Just so; but why should bee-keepers adhere to this mistaken idea, when by using the remedy as used by its discoverer, one has a certain specific—a specific which in solution is entirely inodorous and readily taken by the bees.

To cap the climax, Mr. C. claims to have discovered in phenol a remedy to cure foul brood. One might be led to think that no means of communication existed between England and the rest of the world. I will give here a translated extract from a little book by Prof. Cech, published in 1877, pages 13, 14 and 15: "To disinfect infected apiaries with phenol proved entirely useless. Bee-hives were washed with a diluted solution of phenol, at least once a month, and all decayed brood was removed. But even if all the combs were removed, and the bees put into new hives, the brood reared afterwards died, all the same. It was impossible to disinfect hives or stay the progress of the terrible disease by the use of phenol, as proven by the treatment of a number of colonies. The experiment to also disinfect the bees, combs and decayed brood, failed entirely. The bees are so averse to the odor of phenol that they leave the hive within half an hour after its introduction, sometimes even within a few minutes. If they were confined for several hours, they would leave as soon as released. However, it seems that not all colonies are alike sensitive to the odor of phenol; although this drug, as a remedy in the hands of the unexperienced, is not to be recommended. It must be admitted, that according to the experiments of Prof. Butterow, of St. Petersburg (*Bienenzeitung* 1874 to 1876), the bees may be induced to take syrup medicated with phenol without any apparent injury, but 1-600 is the maximum dose they are able to stand. In a report sent to me by Mr. Koscec, administrator in Maximir, it is stated, that in his apiary from May 1 to Sept. 1, 1875, 40 colonies succumbed to the disease in spite of being treated with phenol in every possible manner." That is nine and ten years ago; how does Mr. C. come to claim priority of discovery? Has he remained in ignorance of these experiments all this time.

Phenol has been tried and found-wanting. Salicylic acid is not a poison, at least not any more so than vinegar; but phenol is a corrosive poison, having a very penetrating, disagreeable odor. I will quote two more of Mr. C.'s assertions: "This notion about infected hives is largely a delusion," but still, "boiling would not kill the spores." That is confusion worse confounded!

Youngstown, Ohio.

[Some of Mr. Kohnke's criticisms are as unjust as they are severe, as will be seen by referring to an editorial on the same subject on page 692 of this week's paper.—Ed.]

For the American Bee Journal.

Does Honey Agree with Everybody ?

WM. F. CLARKE.

The above question rather than "Is Honey Poisonous?" is the one Mr. A. Osborn should have placed at the head of his article on page 613 of the BEE JOURNAL. This is the question he really discusses, and the only one on which there is room for discussion, it having been settled long ago by the best authorities that honey is a most wholesome article of food for the generality of people. But it is an old and true proverb that "what is one man's meat, is another man's poison."

Mr. Osborn, in the article now referred to, while virtually admitting the principle embodied in the proverb just quoted, asserts that pure honey will not disagree with any human stomach. He claims that whenever a person finds that eating honey induces "cramping or colicky pains," the reason is that the bees have been disturbed a great deal, and have dropped poison from their stings on the comb, which has dried there, and inoculated the honey with an injurious quality. Mr. Osborn advises all thus affected to eat pure extracted honey.

He appears to be ignorant of the fact that there are those who have tried again and again only to find that the purest of honey does not agree with them. I am one of that number, and regretfully own that I am obliged to forego the luxury of eating this luscious sweet, precisely as dyspeptics are compelled to deny themselves the use of many articles of food supposed to be wholesome for the million. I am not a dyspeptic, my digestion is good, and there are few articles of food fit for human use that disagree with me, but honey, unfortunately, is one of them.

Mr. Osborn virtually takes the ground that poison agrees with most people; for, while well aware that the majority can eat comb honey with impunity, he ascribes the inability of some to use it without painful results, to a peculiarity of their stomachs. No doubt some human stomachs are tougher, and can withstand poison better than others, but Mr. Osborn's explanation, while applicable to an article of food, is hardly admissible to an article, more or less poisonous, as he asserts comb honey to be.

But I take issue with Mr. O. in regard to his assertion that bees bedaub comb honey with more or less of poison dribbling from their sting ends. If this is so, alas for the producers of comb honey! Mr. O. affirms that "all who eat comb honey, eat more or less of bee-poison." I do not believe this. I venture boldly to deny it, and throw down the gauntlet to Mr. Osborn, on behalf alike of producers and consumers of comb honey. Let us have the proof of this damaging assertion, if there be any. Without the most convincing proof, a bee-keeper should certainly abstain from asserting that all comb honey is besmeared with poison, and calculated to injure all except those whose stomachs are of the strongest.

Bees do not squirt their virus like skunks, but first provide for its reception in a living body by puncturing a cell or receptacle for it. If the poison drop were not conveyed by a hollow tube at the rear of the sting with unflinching accuracy, bees would be less formidable antagonists than they are. A little poison spray on the surface of the person would be a very trivial affair. I am confident that Mr. O. is both wrong as to what he reports as a fact, and the inference he draws from it, and if so, he ought to be set right, in order that the interests of bee-keeping may not suffer from his mistakes.

Speedside, Ont.

For the American Bee Journal.

The Results of the Present Year.

JAMES HEDDON.~O

To illustrate the extreme sensitiveness of flowers, and how they will first withhold their nectar upon the slightest neglect by the weather, I desire to call attention to the fact that we have correct reports of average yields within 25 to 40 miles from where they have almost total failures under equally good management. How uncertain is our business! I have not received over one-fourth of an average yield. I think that basswood, our greatest of all yielders of nectar, gave us, for the first time since I have been in the business, not an ounce of surplus.

I have to report the smallest honey crop and increase in my experience, except my first year, when much of the failure was the result of my mistakes in management. In round numbers I began with 400 colonies (in two apiaries), and closed the season with only 460, and about 6,000 pounds of comb and 1,000 pounds of extracted honey. Extreme cold and drought were the cause. With the usual heat and moisture, our fall crop alone (which was a total failure) would have reached beyond the above figures.

As usual we have been making many experiments on quite an extended scale, and as these experiments were placed entirely in the hands of my foreman and class of student-apprentices, I herewith quote their decisions which are unanimous:

SEPARATORS.—We recommend the use of separators to those who cannot get nice, straight, cratable combs without them.

COMB FOUNDATION.—After several careful trials we prefer the Given foundation for use both in the brood-chamber and surplus boxes.

HIVES.—We prefer a light, small, readily-movable hive.

SURPLUSAGE.—Have it always exclusively on top, and manipulated upon the tiering-up plan.

HONEY-BOARDS.—After careful experimenting, we are positive that the skeleton-sink honey-board used with slats and double spaces, has no tendency to retard the immediate entrance of the bees to the sections as soon as the honey begins to flow, and

we deem it an indispensable convenience and comfort.

QUEEN-EXCLUDING HONEY-BOARD.—We see no need of them when ruining for comb honey, but for extracted honey we are not yet ready to decide.

ONE-HALF POUND SECTIONS.—We get just as many pounds of honey stored in that size as in any other receptacle, in the same length of time.

OLD VS. NEW FOUNDATION.—We prefer the new.

RACE OF BEES.—Germans for comb honey, and Italians for extracted honey. For general purposes, for most localities, we favor the cross between the brown-German and leather-colored Italian, and we find them good-natured. (I will here say that these two races and their crosses are all we have used, and nearly all the German colonies had a little Italian blood in them.)

SWARMING.—We prefer natural swarming to increase by division, and can get as much or more surplus honey with as without any increase.

REVERSIBLE FRAMES.—We favor their use.

WIRED FRAMES.—We prefer them whether used with full sheets of foundation or the merest comb-guides.

DEPTH OF HIVE.—While we do not advise any change from the standard Langstroth frame, if such a change were made, we would favor a shallower frame.

The above is the unanimous decision of my class of 1884—who were selected from many times the number of applicants.

Dowagiac, Mich.

Indiana Farmer.

Bees in the Fall and Winter.

F. L. DOUGHERTY.

The drouth of the present fall has been severe and wide-spread, and will leave many colonies of bees in bad condition, and unless they are given assistance, the disasters of the coming winter will be equally as far-reaching in their fatality. Many colonies may be saved with very little feeding. Others may pass the winter safely by putting two or three together, giving all the stores to one.

As to what is best to feed, we believe syrup made from good coffee sugar is cheapest and best—best because it contains less impurities, cheapest because it requires less in amount and weight per colony. And though nearly all of our colonies have stores enough to carry them through, we shall equalize the stores and feed each colony one quart of syrup.

The combs contain much of what appears to be unripe honey from pomace, spoiled fruit or plant-lice, and past experience teaches us this extra food is cheapest and best. Feeding should be done inside the hives. We not unfrequently simply drop the rear end of our hives the lowest and pour the feed directly in the hive. Before frost breaks the propolis the hives are generally sufficiently tight to hold the syrup.

Indianapolis, Ind.

SELECTIONS FROM OUR LETTER BOX

The Honey Harvest in Scotland.

The honey-gathering season has now closed. All colonies which have been at the Heather-hills have now been brought home, and their stores of honey have been found very greatly to exceed any gatherings for many years past. This, coupled with a heavy return from colonies that had fed upon clover, well repays apiarists for their trouble. Independent of a heavy yield to the apiarist, a goodly store of honey is left as winter food for the bees, which are now nearly all covered up for the winter. I hope that you have been as successful as we.

J. N. D. HUTCHISON, ♀
Glasgow, Scotland.

Croton.

I send you a specimen of a plant which we call wild sage. Will you please inform us whether we are correct or not? for many of the readers of the BEE JOURNAL are anxious about this plant. Do you think that it produces any honey? Bees are not often seen on it. Bees have done very poorly in this section, this season.

E. S. TAYLOR, ♂
Houston, Tex., Oct. 14, 1884.

[This is *Croton capitatum*, and is common with several others usually called simply *croton*. It cannot be recommended as a honey plant. The plants of the whole family are more or less poisonous, though the nectar may be entirely free from the acrid qualities of the sap. Still the amount of honey produced is small and not likely to be of much value at the best. Croton oil, well known for its severe effects upon the human skin, comes from an allied species.—T. J. BURRILL.]

Good Yield and Large Increase.

From 12 colonies, spring count, I have secured 300 pounds of comb and 325 pounds of extracted honey. The largest yield was 116 pounds from a colony of hybrids. I now have 28 colonies.

WALTER WOODRUFF, ♂
Rockdale, Iowa, Oct. 20, 1884.

Report from the Sweet Home Apiary.

My yield, this year, is from 35 colonies, spring count, and is 3,392 pounds of comb honey in one and two-pound sections, and 600 pounds of extracted honey. My largest yield from one colony was 153 one-pound sections of honey. I sold \$70 worth of bees at \$5 per colony, and have remaining 56 colonies, all prepared for winter on Oct. 1, with 30 pounds of good ripe honey per colony.

JOHN REY, ♂
East Saginaw, Mich., Oct. 20, 1884.

A Wonderful Yield of Honey.

This has been a busy season for me. I obtained a fraction over 172,000 pounds of honey from 550 colonies, spring count, and increased my apiary to 1,250 colonies. I have just sold my honey at 4 cents per pound. This county (Ventura) has a population of about 7,500. The honey production for the season has been about 9,000 tons. I had 57 swarms, this year, and saved all of them except one.

S. M. W. EASLEY, ♀
Springville, Calif., Oct. 10, 1884.

A Poor Season.

I began the season with 140 colonies in fair condition, and increased them to 156 in good condition for winter. I have taken, in all, 3,125 pounds of comb honey, and 225 pounds of extracted—an average of about 24 pounds per colony, spring count. The season here was a poor one. My bees were in good order for the honey harvest, but it did not come.

J. V. CALDWELL, ♂
Cambridge, Ill., Oct. 15, 1884.

My Report for the Season.

I think as Mr. Doolittle said, that is, that every bee-keeper in the United States should send in a report, at least once a year, to one of our principal bee-papers. With hopes of seeing some of our brethren fall into line, I here give my report: In January 1884, I had the care of 80 colonies of bees; I did not get a drop of honey until July 7, and none after Aug. 10. One colony produced 500 pounds of honey, while the rest (79) produced only four barrels. How is that for 1884, eh? R. JOHNSON, ♀
Iberville Parish, La.

Convention Notices.

The Southern Illinois Bee-Keepers' Association will meet at Duquoin, in the Opera House on Thursday, Nov. 13, 1884. All are cordially invited.

F. H. KENNEDY, Sec.
W. M. LITTLE, Pres.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

The bee-keepers of McDonough and adjoining counties are requested to meet at Bushnell, Ill., on Nov. 20, 1884, for the purpose of organizing a bee-keepers' association.

J. G. NORTON.

The Iowa Central Bee-Keepers' Association will hold their annual meeting in the Court House at Winterset, Iowa, on Friday, Nov. 7, 1884. All interested in bee-culture are requested to be present.

J. E. PRYOR, Sec.

A. J. ADKISON, Pres.

The Mahoning Valley Bee-Keepers will hold their fall meeting in Ravenna, O., on Nov. 14, 1884. A cordial invitation is extended to all.

E. W. TURNER, Sec.
Newton Falls, O.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Oct. 27, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14@15c. on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@9c. on arrival.

BEESWAX—Is dull at 16@28c. on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18@20c., 2-lb., 16@18c.; fair to good, 1 and 2-lb., 14@16c.; fancy buckwheat, 1-lb., 12@13c., 2-lb., 11@12c.; ordinary grades of dark, 1 and 2-lb., 11@11½c. Extracted white choice, in kegs or small barrels, 8½@9c., buckwheat, 6½@7c.

BEESWAX—Prime yellow, 30@31c.
MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-graded sections sell best.

BEESWAX—35c.
BLAKE & RIPLEY, 57 Chatham Street.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Stocks are large and the demand slow. Qualities other than choice are particularly difficult to move. White to extra white comb, 9@10c.; dark to good, 6@8c.; extracted, choice to extra white, 4½@5c.; dark and candied, 4 cents.

BEESWAX.—Wholesale, 24@27c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Steady; demand and supply both small. Comb, 12@14c. per lb., and strained and extracted, 16@18c.

BEESWAX—Firm at 32@32½c. for choice.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Our market is at present overstocked with honey, large quantities having been brought in wagons, and every place is filled up. Some lots have sold as low as 9c. for 1-lb. sections of white comb. We have not changed prices, but find sales very slow at 16c. for best white 1-lb., and 14c. for 2-lb. Dark honey we are offering as low as 10 to 12c. without being able to effect sales. Extracted is not wanted at all, and no sale at any price.

BEESWAX.—28@30c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13@14c.; extracted, 6c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The receipts of honey are very large and fine, with a splendid demand, and we are very low in stock of all kinds of comb honey. While the tendency of everything is to lower prices, honey is in active demand, with us, at steady prices. One-half lb. sections, none in the market; one-pounds, 16 cents; two-pounds, 14@15 cents; California 2-lb., 14@16 cents. Choice California extracted is selling at 7@9 cents per lb.

BEESWAX.—None in the market.
CLEMONS, CLOON & Co.
Successors to Jerome Twichell.

Local Convention Directory.

1884. *Time and place of Meeting.*
 Oct. 31.—Northeast Mo., at Hunnewell, Mo.
 A. Noland, Sec.
 Nov. 7.—Iowa Central, at Winterset, Iowa.
 J. E. Pryor, Sec.
 Nov. 10.—Will County, Ill., at Beecher, Ill.
 Gustavus Kettering, Sec.
 Nov. 13.—Southern Illinois, at Duquoin, Ills.
 F. H. Kennedy, Sec.
 Nov. 14.—Mahoning Valley, O., at Ravenna, O.
 E. W. Turner, Sec.
 Nov. 25.—Western Michigan, at Fremont, Mich.
 Geo. E. Hilton, Sec.
 Dec. 3.—Southeastern Mich., at Adrian, Mich.
 A. M. Gander, Sec.
 Dec. 10. 11.—Michigan State, at Lansing.
 H. D. Cutting, Sec., Clinton, Mich.
 Dec. 12.—Northeastern Kansas, at Hiawatha, Kan.
 1885.
 Jan. 14.—Central Illinois, at Bloomington, Ills.
 W. B. Lawrence, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

brood. While I have never had a case of foul brood to look at, I do not hesitate in saying that there is no foul brood about either comb.
 2. The method you speak of for saving the bees, would not be safe if it were foul brood.
 3. I do not know what caused the moldy bee-bread or dead brood, because I know nothing of the condition of your colonies.
 4. The bees will take care of your trouble, and clean up the combs if the colony is strong in numbers.
 5. Cork is not an absorbent.

Moving Bees.

I have 7 colonies of bees in good condition in sawdust hives, and all nicely packed for the winter. I expect to move two blocks from my present residence on Nov. 15; would you advise me to move the bees 2 or 3 miles away at once, and return them in the spring to my new residence? or do you think that I can safely take them direct to the new location, two blocks distant, after they have been confined, say 3 or 4 weeks?

F. A. GEMMILL.

Orangeville, Ont.

ANSWER.—I should feel safe in moving them very quietly as soon as they are closed in by winter to stay until spring. When they first fly, lean a board up partially in front of the entrance, and all will mark their new location. Remove from the old location as many old marks as possible.

Selling Glass as Honey.

Will Mr. Heddon please answer the following questions:

1. In glassed sections, does the glass sell as honey? that is, should it be weighed as "net?"
2. If so, would it pay for itself with honey at 15 cents per pound and glass \$3 per 50 square feet?
3. What is the outside measure of the half-pound sections?
4. Do bees ever cap cells containing pollen covered with honey?

C. A. KNOWLTON. ☉

Hope Villa, La.

ANSWERS.—1. With glassed sections the glass is always sold and weighed as so much honey.

2. Yes.
3. Ours are 4 1/2 x 2 13-16 with 7 to the foot, with separators, and 8 to the foot without separators.
4. Certainly.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

- For 50 colonies (120 pages).....\$1 00
- " 100 colonies (220 pages)..... 1 25
- " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any new subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Is it Foul Brood?

I send you two samples of comb which I took from a colony of bees in my apiary. I found the same in 4 colonies which were in different parts of the yard with good, strong colonies between them. Will Mr. Heddon please answer, through the BEE JOURNAL, the following questions concerning it:

1. Is it foul brood?
2. If so, will it injure my apiary after giving the bees new hives and new combs from healthy colonies?
3. If it is not foul brood, what is it, and what had I better do with it?
4. Is the white substance in the one piece dry pollen? and will it do any harm in my extracting combs?
5. Do you recommend ground cork for cushions to absorb the moisture of bees in winter?

CHAS. W. VANDERVOORT.
 Napanee, Ont., Oct. 17, 1884.

ANSWERS.—1. The two pieces of comb I have examined, and one contains some cells of bee-bread moldy on top; the other, dead, dried-up

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

CLUBBING LIST.

We will supply the American Bee Journal one year, and any of the following Books, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

THE BEST CABBAGE SEEDS

in the world may hereafter be procured under the above Trade Mark, and we want every Cabbage Grower in the Union to test them this season so he will know what to use in future. They are called

TILLINGHAST'S PUGET SOUND BRAND

WHY ARE THEY THE BEST IN THE WORLD?

1st. Because we have for years been perfecting the best strains, and seedling from perfect head
2d. Because they are grown in the extreme northern part of the Union, on Puget Sound, Washington Territory, where the soil and climate are more perfectly adapted to the complete development of the Cabbage than any other section of the Union. Not only do Northern Grown Cabbage Seeds do best naturally than those grown farther South, but the more perfect development of the heads than from which the seeds are grown enables us to more critically select the true types which may thus be reproduced. The seeds also are much larger and more perfectly developed and produce larger and thriftier plants which better withstand insect ravages than any other seeds in existence

3d. Because they are grown directly under the careful and personal supervision of a brother of the advertiser, who has our reputation at stake, and will see that they are kept the best in the world

PRICES, &c. We now supply Early Jersey Wakefield, Early Bleichfeld, Berkshire Beauty, Hendson's Early Summer, Fottler's Improved Brunswick, Premium Flat Dutch, Excelsior Flat Dutch, La American Drumhead, Marblehead Mammoth and Red Dutch, all of this justly famous P. S. brand, 5 cts per pkt., 25 cts per oz., \$4.00 per lb., by mail postpaid. (Eastern stock much lower)

AN AGENT WANTED,

every town where we have none, (over 500 already established,) to sell our superior seeds, and plan grown from them, to his neighbors. Full instructions for successfully growing and selling plants will be furnished with such favorable rates on seeds that you can make money rapidly. If rightly situated to act apply at once for full particulars. Depend upon it, this is a rare chance to establish yourself in remunerative business at your own home. For reference send list of agents. Some sold 500 000 plants

CAUTION! The great popularity already attained by "Tillinghast's Puget Sound Seeds" has induced some dealers to offer inferior seeds as nearly under our name as they dare to. Some of them we know have been grown on Puget Sound, but from common mixed stocks by very careless and irresponsible parties, who expect to sell on the strength of the justly earned reputation of our famous brand. To avoid all such see that they are sold under our Registered Trade Mark, or send directly to us for them

Address,— ISAAC F. TILLINGHAST, LA PLUME, Lack'a Co., Pa.

SEND FOR IT.

We have just issued a new four-page circular that will interest any bee-keeper. Send your name on a postal card for it. 44Atf HENRY ALLEY, Wenham, Mass.

We will send you a watch or a chain BY MAIL OR EXPRESS, C. O. D., to be examined before paying any money and if not satisfactory, returned at our expense. We manufacture all our watches and save you 30 per cent. Catalogue of 250 styles free. Every Watch Warranted. Address STANDARD AMERICAN WATCH CO., PITTSBURGH, PA.

YOU NEED the National Real Estate Index. Full of TRADES, Bargains and Real Estate news. 50 cts. a year. Sample copy free. Address, 27C6t W. L. GRIGGS, Kirksville, Mo.

NOW IS THE TIME.

I have less than 60 copies of the Bee-Keepers' Handy-Book. No more will be printed until the type is reset. One of our improved Drone and Queen-Traps and the book bound in cloth will be sent by mail for \$1.50 44A2t HENRY ALLEY, Wenham, Mass.

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

OLDEST BEE PAPER IN AMERICA

THE WEEKLY BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861

Chicago, Ill., November 5, 1884.

VOL. XX.—No. 45.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 7 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

Advertisements may be inserted one, two or four times a month, if so ordered, at 20 cents per line, of space, for each insertion.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Nelghour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

150 COMPLIMENTARY.

2nd UNSOLICITED TESTIMONIALS from as many bee-keepers in 1883.

We guarantee every inch of our Foundation equal to sample in every respect.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

- Doctor smoker (wide shield) . . . 3 1/4 inch. \$2 00
- Conqueror smoker (wide shield) 3 " " 1 75

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quitting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and snitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. J. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Bearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive 1 Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

THE AMERICAN
BEE JOURNAL
PUBLISHED WEEKLY

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The National Convention.

As we were unable to be present at the meeting of the North American Bee-Keepers' Society, last week, (not feeling well enough to leave home), we sent a reporter, so as to be able to present our readers with a detailed account of the proceedings, as early as possible. Our reporter wrote us on Oct. 28, as follows:

Your correspondent and reporter cannot resist the temptation to narrate "the wanderings of a pilgrim" in search of the annual meeting of the North American Bee-Keepers' Society. The last notice that he saw in the BEE JOURNAL, prior to starting for Rochester, closed by saying that particulars as to place of meeting would be given "hereafter". Supposing that the time of assembling would be 10 a. m., he rode on the cars all night, arriving in Rochester at 7 a. m. The morning papers which he got on the train, gave no notice of the hour or the place of meeting. One of them said, "The North American Bee-Keepers' Society will commence its annual meeting in the city to-day."

On reaching the city, he set out in search of the convention, called at several hotels, and at two or three stores where honey was sold, but failed to learn anything more about the meeting. Sallying out after breakfast, he recognized among the pedestrians on the sidewalk, the pale but familiar face of Silas M. Locke, of Salem, Mass., from whom he learned that the City Hall was the place of meeting, 2 p. m., the hour, and the Litster House the Apicultural Head-quarters. Mr. Locke kindly guided him to where Messrs. L. C. Root, W. E. Clarke, F. C. Benedict, and others of the early arrivals could be found, so that he was very soon at home. During the forenoon, Messrs. I. Barber, R. Bacon, F. Bacon, J. Thompson, and perhaps a dozen more turned up at the City Hall, and an hour or two of good fellowship was enjoyed.

Your correspondent blames nobody, but it was unfortunate that the hour and place of meeting were left to be announced "hereafter". The President and Secretary state that notification of time and place was sent to the bee-periodicals, and are at a loss to know why the information was not put before the public. The Editor of the BEE JOURNAL can, no doubt, clear himself from the "soft impeachment" herein implied, and others are hereby invited to "do likewise."

Our correspondent must have been asleep, or dreaming! On page 660 of the BEE JOURNAL for Oct. 15, is an editorial notice stating that the meeting was "to be held at the City Hall, in Rochester, N. Y., commencing at 1 p. m., on Tuesday, Oct. 28, and continuing three days." It is a fact, however, that the Railroad and Hotel arrangements have not been published, and this probably was what vexed our correspondent, and made him call for an explanation.

The BEE JOURNAL can very easily clear itself from the slightest blame in this matter. We presume that the cause was a complication of circumstances; unavoidable, perhaps, but none the less perplexing. We do not know why the Committee did not make their arrangements earlier, nor why the notice was not sent direct to the BEE JOURNAL, seeing there was no time to lose in order to give even one insertion of such an important matter.

The facts are that the notice was sent to the Secretary, Dr. Miller, of Marengo, Ill., while he was in attendance at the Chicago Convention, and he did not return to his home until the evening of Oct. 20. He wrote the "notice" next morning and we received it on Oct. 22, one day after every number of the last BEE JOURNAL before the meeting, had been sent out to subscribers. Had the notice been sent to the BEE JOURNAL direct, it would have duly appeared.

Accompanying the notice, Dr. Miller wrote us that he feared "it would not be in time." He was not well during the Convention, and for that reason

was absent at one session and he did not return to Marengo as soon as the Convention adjourned, but remained at Austin, with his wife, with some friends. On this account he seemed to think it was his fault that the notice could not be published, and he added:

"Although there is some excuse, it is my fault. I think it may be as well for you to say as much, for it is possible that the BEE JOURNAL may be blamed for the delay."

We think this explanation will wholly clear us of blame in the matter. We regret that the notice was not *in time*, for we have always done all we could to further the interests of the National Society, as our readers must be well aware. We regret this circumstance the more so, because some of the Eastern apiarists have an idea that those in the West are not in accord with them. This idea, however, is unfounded and should be instantly dismissed. The Western apiarists are united and harmonious, and will, if permitted, labor with all others for the best interests of the fraternity in America.

We announce with pleasure the fact that the Continental Convention was well attended, and, so far as heard from, the deliberations were conducted so as to merit universal approbation. For the next place of meeting Detroit was unanimously selected, and from the fact that it is centrally located and easy of access from all sections of the United States as well as Canada, there will doubtless be a large attendance.

We publish as much of the Report in this JOURNAL as we have received, and will give the rest next week.

TRIAL SUBSCRIBERS.—The Weekly BEE JOURNAL will be sent to any *new* subscriber in North America from now until the end of 1884 for 25 cents. This offer is intended to aid those who are getting up clubs at Fairs, Conventions, etc., and should add several thousand to our readers during the next month.

Local Convention Directory.

North American Bee Convention.

The fifteenth annual session of the North American Bee-Keepers' Society convened at the City Hall in Rochester, N. Y., on Tuesday, Oct. 28, 1884.

At the hour of 2 p. m., upwards of fifty bee-keepers being in attendance, the meeting was called to order by Mr. L. C. Root, of Mohawk, N. Y., First Vice-President, who proceeded to deliver the following

ADDRESS OF WELCOME:

In welcoming the bee-keepers of North America here to-day, I do it with mingled feelings of pleasure and deep regret. I am indeed thankful to the members of this Society who met one year ago at Toronto, for the honor of being chosen Vice-President of this body of bee-keepers. This appreciation is the greater because this position is second only to his whom every progressive bee-keeper delights to honor.

While I am thankful for the good cheer which comes to me through these associations, I most deeply regret that our honored President, the Rev. L. L. Langstroth, cannot be with us and preside over these meetings. I feel that the heart of each one present must beat in sympathy in the sadness which comes to us in the disappointment we feel in not being able to welcome our veteran friend to his appropriate place. I wrote to him, not long since, in the hope of the possibility of his attendance; but while the reply came in his own hand writing, it was as follows:

"OXFORD, O., Oct. 6, 1884.—MR. L. C. ROOT:—*My Dear Friend*—Many thanks for your very kind letter. My head is some better, but not enough so to allow me to do any work. I suffer so much that I lie down most of the time. Under these circumstances you will see that it is impossible for me to attend the Convention. I can only express my good wishes to

those who attend. With kind regards to yourself and family. Your sincere friend, L. L. LANGSTROTH."

I present you this letter that you all may know the condition of our friend, who for so many years has done so much that we of to-day may conduct our bee-keeping according to more scientific and improved practical methods. Let us not fail to be appreciative of these privileges, and mindful of our aged friend who is worthy of all honor.

Brother bee-keepers, we are here to represent the best interests of the bee-keepers of the United States and Canada. Let us see to it that our discussions are considerate and just to all; that they may tend to better methods which shall raise the standard of bee-keeping to a higher, broader, and more permanent plane than it has ever before occupied.

In behalf of the members of the Northeastern Bee-Keepers' Association who have been working earnestly, many of whom are present, and who are anxious to do all in their power to make this meeting a pleasant and profitable one, I again welcome you all to this beautiful city of our Empire State.

In the absence of Dr. Miller, the Secretary of the Society, and Mr. C. F. Muth, the Treasurer, Mr. C. F. Benedict was appointed Secretary *pro tem*, and Mr. R. Bacon Treasurer, *pro tem*.

The following committee on programme was appointed: J. B. Hall, of Ontario; Ira Barber, W. E. Clark, F. O. Peet, of New York, and Arthur Todd, of Pennsylvania.

A call was made for the minutes of the last meeting, which led to explanations to the effect that no official report had appeared, and that the only one available was the report which was published in the AMERICAN BEE JOURNAL. It was further stated that a report was in existence in short-hand, made by a phonographer who was engaged by Mr. D. A. Jones, the ex-President, for the sum of \$100; but that owing to some misunderstanding, the report had never been completed in long-hand, the reporter considering that he had a claim on the Society for compensation, and the probability was that more would be heard about the matter at a later stage of the meeting.

The President then produced the AMERICAN BEE JOURNAL's report, and asked if it was the pleasure of the meeting to have that read by the Secretary, as the minutes of the last meeting. No motion being made on the subject, the Secretary proceeded to read the AMERICAN BEE JOURNAL's editorial summing up of last year's meeting.

A motion was then made to reduce the membership fee of the Society from \$1 to 50 cents; but on a question being raised as to the constitutionality of the motion, there being no copy of the Constitution at hand, the matter was laid on the table to be considered later on.

The committee on programme referred recommending the reading of

a communication to the Convention, from Mr. Frank Benton, accompanying a sample of his queen shipping-cages, to be followed by a discussion on sending queens by mail. On assent being given to the report, the Secretary read Mr. Benton's essay, after which a number of members spoke on the subject, all expressing their appreciation of Mr. Benton's efforts and success. Among these was Mr. Peet, originator of the queen shipping-cage which bears his name, who spoke highly in praise of Mr. Benton's device. Mr. W. F. Clarke prepared a resolution, which, at his suggestion, was moved by Mr. Peet and seconded by its author. After some highly appreciative remarks by the President and others, the resolution passed unanimously. The resolution reads as follows:

Resolved. That we have listened with much pleasure to Mr. Benton's essay, and have inspected his sample cage: rejoice in his success in mailing queens to long distances, and we tender him our sincere thanks.

The committee on programme next presented some questions forwarded by mail by A. J. Fisher, of East Liverpool, O. The meeting agreed to take up the questions *seriatim*. The first was: "What is the best and most successful method of preventing first and second swarms?"

The discussion which arose on this question took a wide range, and excited considerable interest; in fact, the meeting began to show signs of warming up to its work.

Mr. J. B. Hall, of Woodstock, Ont., would do all in his power to prevent swarming, but confessed his inability to wholly stop it. His plan was to put on section-cases early in the season, and do all in his power to coax the bees to work in them. Bees were like ladies, they could not be driven, but might be coaxed.

Mr. Wm. F. Clarke, of Ontario, said that the question under consideration seemed to imply that it was desirable to prevent swarming altogether. Is that desirable? Bees in swarming obey a law of nature which commanded them to increase and multiply. Is not a first swarm a sort of necessity? We call it "the swarming fever." That is not a proper term, unless it becomes a disease, or in other words, is carried to excess. Until it is excessive, it is in obedience to an instinct which we should not wish to entirely eradicate.

The President said that he would eradicate it if he could, and makes it a point to prevent natural swarming as much as possible, making his extra colonies by division.

Mr. Clarke raised the question whether bees worked with the same will and enthusiasm when divided as when they swarmed naturally? Several members testified that they did not. The President believed that we should bend nature to our own purposes, and for practical results in running an apiary, dividing judiciously was better than natural swarming.

Ventilation, air, shade, and introducing young queens when surplus

honey began to come in, were severally advocated. Finally, the sense of the meeting on the subject was embodied in the following, which was moved by Mr. F. C. Benedict, seconded by Mr. Peet, and unanimously carried:

Resolved, That this Convention can give no fixed rules for the entire prevention of swarming while producing comb honey; but the following methods tend to its prevention: plenty of room, air, shade, and introducing young queens at the beginning of the surplus honey harvest.

Wm. F. Clarke drew the attention of the Convention to the desirability of some provision for social intercourse among the members of the Society. Some of them were busy reporting, others were occupied with business on committees, or with the introduction and sale of apiarian fixtures, during the intervals between meetings. His namesake, W. E. Clark, said that last year, at Toronto, the sociality was the best part of the meeting. He wanted to get personally acquainted with the bee-keepers, and he thought that that was a general feeling. The President and others followed up the suggestion, and finally it was moved by W. E. Clark, seconded by Wm. F. Clarke, and unanimously

Resolved, That it be an instruction to the committee on programme to arrange for a social time during part of this evening's session.

The Convention then adjourned to meet at 7 p. m.

SECOND SESSION.

The Convention met at 7:30 p. m., First Vice-President, L. C. Root, being in the chair.

The committee on programme reported to resume consideration of the second question transmitted by Mr. A. J. Fisher, viz: "When we as bee-keepers cry down adulteration, are we working to our interests when we use full sheets of foundation in our surplus boxes? especially if we use seven or eight feet to the pound are not we ourselves ruining our markets?"

Mr. Hall, of Ontario, used foundation 7 or 8 feet to the pound, and was never troubled with "fishbone," as it is called. He had tried foundation 10 or 12 feet to the pound, but it was difficult to keep it straight; it would curl. He had used foundation 4 feet to the pound in the brood-chamber, and found that the bees drew it out very thin, so that if you sold a sheet of it to a dealer it cut up into pound and half-pound squares, and gave satisfaction to customers. He had never had any complaint about "fishbone."

Mr. Benedict said that bee-keepers must be careful in using very thin foundation in section-boxes, otherwise the sale of honey would be injured.

Mr. S. T. Pettit, of Ontario, thought that we were starting an unreal difficulty. He heard nothing of "fishbone" in comb honey, except at conventions. He deprecated creating a prejudice when there was no need for it.

Mr. W. E. Clark, of New York, concurred with Mr. Pettit.

Mr. Peet, of New York, narrated a case of objection to comb honey, on the part of a purchaser, because of a hard centre.

Mr. Locke, of Massachusetts, gave an account of comb honey with a centre wall that resembled chewing gum when taken between the teeth.

Mr. Vandervort, of Pennsylvania, was of the opinion that when thin foundation was used, no one could tell the difference between comb honey with and that without foundation. He and four of his neighbors shipped a car load of comb honey to New York, and out of the five lots only one was natural comb. It was the least salable of any of the lots. The four lots with foundation in them were more salable, and brought a better price in the market than the other lot.

Mr. C. C. Van Deusen had tried foundation of various thicknesses, and while some of the thicker samples were characterized by objectionable "fishbone," the thinner ones were free from the objection.

Mr. Vandervort said that when the right foundation was used, even an expert could not tell it from the natural comb. He, himself, had been deceived several times.

President Root thought that much of the objection to foundation in surplus sections arose from its being a novelty and an innovation. He remembered when mowing machines first came around, what opposition there was to them on the part of many farmers. It was so with many things. There was no doubt that in some respects art was an improvement on nature. We certainly get more attractive and marketable honey by the use of comb foundation, and it was in no sense an adulteration, since both natural comb and comb foundation were alike made of beeswax.

It was moved by Mr. Peet, and seconded by Mr. R. Bacon, "That it is the sense of this Convention that it is detrimental to our honey trade to use, in section-boxes, comb foundation less than 10 feet to the pound."

Mr. Hall, of Ontario, could not concur in the resolution, as his experience was against it. He used none lighter than 8 feet to the pound, and he got beautiful comb honey, so nice that Dr. C. C. Miller thought it must have been produced by the use of separators.

Mr. Locke had seen Mr. Hall's honey for two or three seasons, and could testify that it was first-class.

The resolution was put to a rising vote, when a large number voted, many did not vote, and only two rose in opposition. The President, therefore, declared the resolution carried.

A motion was made by W. E. Clark, and seconded by S. T. Pettit, that a committee of five be appointed by the chairman to consider what modifications, if any, should be made in the North American Bee-Keepers' Society.

Mr. Wm. F. Clarke, of Ontario, spoke at some length on this resolution. He said that he was the only member present who was at the or-

ganization of the Society, and claimed the indulgence of the meeting in a brief review of its history. It was first intended to call the Society by the name "National," but at his request it was called "North American," so as to include Canada. It was often called the "National Society," but it would be more proper to call it the "Inter-National," for such was its real character, and such he hoped it would continue. At the inception of the Society, there was a ring or clique among bee-keepers, which the organization was the means of breaking up, and he boldly affirmed that there had never been a ring or clique managing the Society. Some appeared to think that the Society had had its day, and that there were those who wished to split it into three fragments, the Northeastern, the Northwestern, and the Southern; personally, he hoped that this would not be done. It was true that the constituency was a vast one, and we usually had a large local attendance with but a small distant representation. But there was a prestige about a Continental body which gave it a good influence, and rendered its meetings important. It was an educating power wherever held. He would deprecate a division of the Society into three, mainly because it would destroy its international character. Canada and the United States had been happily united in this apicultural fellowship, and he hoped that it would continue. He had no doubt that the Society might be modified and improved in various respects, but he would not like to see it broken up.

Mr. Clarke's remarks were well received, and several members expressed concurrence in the opinion that the integrity of the Society should be maintained, and that it should continue to embrace both Canada and the United States. The resolution was unanimously passed, and the President appointed the following committee: Ira Barber, Wm. F. Clarke, W. E. Clark, Arthur Todd, and J. Van Deusen.

The meeting then adjourned, and passed about an hour in free, social converse.

THIRD SESSION.

The Convention came to order at 10 a. m., with President Root in the chair, the attendance being about double that of yesterday. Enrollment of members was the first order of business. It was decided to accept 50 cents as the membership fee for the current year. The following then gave in their names to the Secretary, and paid their dues, with the exception of the ladies, who are admitted free, according to the Constitution of the Society:

Thomas Pierce, Gansevort, N. Y.
S. B. Wheeler, Union City, Pa.
U. E. Dodge, Fredonia, N. Y.
L. C. Root, Mohawk, N. Y.
G. H. Ashby, Albion, N. Y.
W. Bacon, Delta, N. Y.
C. J. Densmore, Iyonia Station, N. Y.
E. C. Campbell, Cayuga, Ont.
G. W. Pating, Scipioville, N. Y.
R. Bacon, Verona, N. Y.
O. G. Ranssell, Albion, N. Y.
M. M. Wright, Castile, N. Y.

J. Van Densen, Spront Brook, N. Y.
 Geo. K. Wright, Cambria, N. Y.
 W. E. Moulton, Alexander, N. Y.
 Miles Morton, Groton, N. Y.
 Jesse Mekeel, Poplar Ridge, N. Y.
 Arthur Todd, Germantown, Pa.
 Geo. M. Lawrence, Warsaw, N. Y.
 Theo. O. Peet, Brooklyn, N. Y.
 J. A. Andrews, Philadelphia, Pa.
 E. W. Thompson, Hinsdale, N. Y.
 Chas. S. Hurlbut, West Bethany, N. Y.
 W. L. Coggshall, West Groton, N. Y.
 E. W. Landon, Brockton, N. Y.
 W. G. Fish, Ithaca, N. Y.
 Chas. Faville, South Wales, N. Y.
 O. G. Smith, Seneca Falls, N. Y.
 O. H. Sage, Churchville, N. Y.
 Wm. Bray, Gainesville, N. Y.
 Ed. Hutchinson, East Avon, N. Y.
 Elias Mott, Norwich, Ont.
 F. C. Burmaster, Irving, N. Y.
 Dr. J. P. H. Brown, Augusta, Ga.
 L. S. Newman, Peoria, N. Y.
 S. M. Publ, South Toledo, Ohio.
 N. N. Betsinger, Mareellus, N. Y.

On recommendation of the Programme Committee, it was agreed to hear the communication on Marketing Honey, etc., forwarded by Mr. T. G. Newman, Editor of the AMERICAN BEE JOURNAL. It was then read by the Secretary as follows:

MARKETING HONEY, ETC.

Mr. President, and Members of the North American Bee-Keepers' Society:

I am requested to send you a short article on the above subject, but I shall not attempt to go over the well-defined and oft-repeated rudimentary rules for the management and preparing honey for the markets of the world. These items have been fully discussed at previous meetings, and I have nothing further to add to the views already expressed. But there is one thing that it will be well to discuss, and not to leave it there, but to appoint a committee whose duty it shall be to address the railroad companies of America and demand, in the name of this Society, redress in the matter of the classification of bees and honey.

Hives of bees are classed at double first-class rates, which is very unjust—making the charges equal to those for sending by express. Then, by the mistaken use of the word "hive" for colony—empty hives are, by many railroads, classed the same as those containing bees, greatly to the detriment of those who buy hives from manufacturers. They should go as "empty boxes," at about one-eighth of the cost now demanded for freight by some railroads.

In the matter of shipping honey to market—the classification is so high that it amounts to almost a robbery—

and to seek relief, some bee-keepers ship extracted honey as "syrup," at less than half the rates demanded for honey. Tariffs ought to be revised, and liquid honey should be rated the same as syrup.

Those bee-keepers who have a desire to be exactly right, and feel delicate about the matter of shipping honey as syrup, are, therefore, compelled to pay double the amount which their less scrupulous neighbors have to pay for freight to the large marts of the world.

Some grades of syrup sell as high as honey, and there is no reason why both should not be graded alike, when one is as easily and cheaply handled as the other.

Regretting my inability to be present, allow me to suggest that you appoint a committee to confer with the different railroad companies, and instruct them to endeavor to get these things adjusted on an equitable and reasonable basis.

Hoping that your Convention will be entirely harmonious and successful, I remain fraternally yours,

THOS. G. NEWMAN.

Mr. Pettit, in commenting upon the communication, urged the importance of taking more trouble to get grocers and others to keep honey for sale, saying that much more honey would be sold annually if people could buy it from the grocers.

Mr. Van Densen said that the reason why some grocers refuse to handle honey is because of the leakage.

Mr. Pettit stated that in Ontario, honey is put into boxes and glassed on one side, and tissue paper is put on the bottom so as to prevent leaking.

Mr. Dodge related his experience in trying to market both extracted and granulated honey. He believed that the difficulty in disposing of extracted honey is owing to the fact that they do not ask a high enough price for the extracted in comparison with the honey in the comb. The very little higher price charged for extracted honey, over honey in comb, suggests adulteration.

W. E. Clark explained that the local market in Oneida county could have been kept at 20 cents per pound, had not a man, who happened to have a good crop, rushed into the market and was in such a hurry to sell, that he broke the market. He advocated holding on to honey. He advised that holders should not all endeavor to sell under each other, causing a glut and lower prices.

Mr. Betsinger advocated making efforts to secure reduced freight rates, and urged that the local market be watched and not overloaded under any circumstances. It is a fact, he said, that extracted honey must be sold for less than comb honey, because it can be prepared at about half the cost of comb honey. The latter will always be a luxury, and never can a great demand be created for a luxury. He would encourage the use of extracted honey because of the large consumption of honey, especially in the place of other materials; butter, for instance.

Mr. Bacon believed that the trouble in marketing honey is, that people are not properly educated, else they would understand the fact that comb honey costs more than extracted honey, and would not believe that any "hookery" is going on when they buy comb honey at a higher price than extracted honey. Mr. Dodge said that he agreed with Mr. Clark that local markets could be built up to a certain extent, but where a dealer has 8,000 or 10,000 pounds, he must find a market beyond the producers, and he wanted to know how he could get a market for his extracted honey.

Theo. O. Peet said that extracted honey is not as good as comb honey, unless it be extracted after the cells are capped, and then it cannot be extracted at much less expense than comb honey.

Mr. Hall said that there was a deluge of honey during the latter part of June, at which time honey was sold at 10 cents a pound, and finally at 9 cents by J. W. Hall & Co. These men who go wild with their honey, should be treated with contempt, because they cannot be controlled nor educated.

Mr. Will Ellis explained that the great cause in the fall in prices is, that the producers, instead of the consumers, manage to cut prices by competition.

Mr. Vandervort said that he has sustained his severest losses by trying to get more for his honey than it would bring. He has sold his honey for what it would bring, spent his money, gone to work to get another crop, and kept out of the poor-house.

Mr. Bacon said that the market for honey is injured by some slouchy men who send honey into the market in dirty boxes, causing dealers to beat down producers who have nicely prepared honey, to the same prices at which they can furnish the article in the poor and dirty boxes.

Mr. Pierce stated that he had met with just such experience in selling comb honey. He had found that nice honey put in clean boxes would find a good market as soon as the producer's reputation is established.

A question having been handed in by Mr. U. E. Dodge, of Fredonia, N. Y., bearing on the same subject, it was agreed to consider it in connection with Mr. Newman's communication. The question was, "How and when shall we market our extracted honey?" It was moved by Mr. Peet, and seconded by Mr. Hall.

Resolved, That this convention recommend to bee-keepers, the desirability of taking more care in placing our honey on the market in the most attractive manner, both extracted and comb honey, and attaching their names thereto; and that they discountenance all efforts to beat down the market by slovenly bee-keepers and dealers who adulterate it.

In reference to the railroad rates of freight on honey, brought before the meeting by Mr. Newman, Mr. L. C. Root said that he believed that the point made by Mr. Newman, regarding railroad freights, was well taken,

and that a committee be appointed as suggested.

Mr. Bacon moved the appointment of a committee of three to consult with the railroad authorities regarding rates. The motion prevailed, and then it was suggested by Mr. Root that the matter be left to the Vice-Presidents of the Society.

A motion was next made to reconsider the motion previously adopted, which was carried, and the convention voted to adjourn until 1:30 p. m.

At the adjournment of the morning session, the members assembled on the front steps of the City Hall, and the group was photographed.

FOURTH SESSION.

The Convention was called to order at 2 p. m., with the President in the chair. At the suggestion of the programme committee, reports from Vice-Presidents were read as follows: O. O. Poppleton, Iowa; Dr. J. P. H. Brown, Georgia, and W. S. Hart, Florida.

Wm. F. Clarke, of Ontario, was then called upon to read his paper on

WINTERING BEES.

The subject of wintering bees is in a chaotic state. Our best bee-keepers frankly admit that we have no absolutely safe methods of wintering bees. There is no method before the public that has not proved a failure in some seasons and under certain circumstances. All must own that as yet we are only learners on the subject.

While almost every other branch of bee-keeping has made wonderful progress during the last 20 years, wintering has been at a standstill. It seems clear to my mind that all trouble is traceable to the fact that we have overlooked a principle of bee life not wholly unknown to us, but whose vital importance is not sufficiently appreciated. I refer to hibernation. Hibernation is a term often employed in general literature to express simply the idea of passing the winter; but in the world of science it stands for that state of complete or partial torpor into which bees sink at the advent of cold weather. Let me lay down the proposition that bees in a cold climate invariably sink into this torpor; also the proposition that when provided with proper shelter and sufficient food they winter well if they can hibernate.

The hibernation of bees is no new discovery. What I claim, and all that I claim in regard to the hibernation of bees is the discovery that furnishes the key with which to solve the winter problem. Mr. Clarke cited proofs of the two propositions, and continued: At the meeting of the Northwestern Bee-Keepers' Society, held in Chicago two weeks ago, Mr. Heddon said this question of wintering was not one of cellars, ventilation, pieces of wood and laths, quilts and cushions over the combs. What killed our bees was diarrhoea? I take up the question and unhesitatingly say, inability to hibernate. If bees can get into this condition and maintain it while cold weather lasts, they will not have diarrhoea. If they cannot, they will infallibly contract the disease.

I venture to assert that if you will give bees a domicile impervious at the top, having side walls, so that frost will not strike through and condense vapor inside, give them food, and supply a perpendicular air-column beneath, you will solve the winter problem. The great desideratum is pure air and plenty of it in a receptacle not too large for them to regulate the temperature. To warm a receptacle by holes at the top, is as hopeless as it is to attempt to fill a perforated tub with water. Why do the bees propolize holes as big as a pinhole at the top of their hives? Because instinct teaches them to retain all the heat they make. The bees generate their own heat, and if it be wasted, they must consume too much food, and then they become distended with forces and cannot sink into perfect quiet, which is the normal condition in winter.

Mr. Clarke discussed cellars, clamps and bee-houses, and pointed out the objections to these modes of wintering bees. In speaking of chaff-hives, he said: If these hives were placed two feet from the ground, and an air shaft was put in below, they would meet all conditions for hibernation. Want of air and excess of food cause diarrhoea. If the hives are too warm or too cold the bees eat too much, and the bodies are distended and must have relief. They eat more than they can get rid of in dry powdery excreta, they become diseased and die. When in too cold hives the bees eat large quantities of honey to generate heat, and the same fatal result happens. Bees want in addition to what we give them, pure air; only that and nothing more.

Mr. Clarke described a hive-stand, a model of which he exhibited. It was so constructed as to give the bees a vertical air-shaft under the hive. He requested each bee-keeper present to give his method a trial with at least one colony of bees the coming winter. Concluding, the speaker said of his method: "It involves no moving of hives from summer stands. It saves expense and the trouble connected with cellars, clamps and bee-houses, and it is confidently believed it will prove a remedy for bee-diarrhoea and for spring dwindling. The only objection to the method is that it will so simplify bee-keeping that it will be common and greatly lessen the profits of bee-keepers."

A spirited discussion arose on Mr. Clarke's essay. Mr. Barber gave an account of his wintering bees in a warm cellar, from 48° to 58° above zero.

Mr. Hall corroborated Mr. Barber's statement. He found that his bees were quiet anywhere from 45° to 56° above zero if the temperature were raised gradually; if raised suddenly, they became uneasy. He had but a small per cent. of losses when wintering them in a warm place.

Mr. Clarke stated that no doubt bees could be wintered in a warm place; they were so wintered in the South, but the question was, "What was the normal condition of bees during winter in a cold climate?"

Also, as to the consumption of honey?" While hibernating, they consumed very little honey; if kept warm, the consumption would be greater. It was a great thing to save even five pounds of honey per colony, and multiplying that by all the colonies kept on this continent, see the immense saving. We were so demoralized about wintering bees that we were glad to get our colonies through alive, though with depleted numbers, exhausted stores, and in poor condition. They might survive, and yet not be well wintered. He had shown that if fixed so as to hibernate, they would winter well in all respects.

Mr. Pettit deprecated the idea going abroad that bees might be wintered on from 2 to 6 pounds of honey.

Mr. Clarke replied that the idea would do no harm if connected with the condition that they hibernated.

Several members expressed interest in the hibernation theory, and a purpose to try the plan during the coming winter.

The President spoke favorably of the essay, and hoped that its positions would be fully and fairly tested.

Mr. Clarke said that if bee-keepers would try the hibernation method during the coming winter, they would be in a position to discuss the matter more intelligently a year hence.

The next place of meeting was then considered, the result being that Detroit, Mich., was chosen by a large majority, and then made the unanimous choice of the Convention.

The election of officers was the next order of business, with the following result:

President.—L. C. Root, Mohawk, N. Y.
First V.-Pr.—H. D. Cutting, Clinton, Mich.
Sec.—W. Z. Hutchinson, Rogersville, Mich.
Treasurer.—C. F. Muth, Cincinnati, Ohio.

VICE-PRESIDENTS.

Vermont—A. E. Manum,
Massachusetts—J. E. Pond, Jr.,
New York—W. E. Clark,
Delaware—W. J. Gibbons,
Virginia—J. W. Porter,
Georgia—Dr. J. P. H. Brown,
Florida—W. S. Hart,
Mississippi—Dr. O. M. Blanton,
Louisiana—Paul L. Viallon,
Texas—W. H. Andrews,
Kentucky—W. C. Pelham,
Tennessee—W. P. Henderson,
Ohio—A. J. Root,
Illinois—Dr. C. C. Miller,
Iowa—O. O. Poppleton,
Missouri—C. M. Crandall,
Wisconsin—George Grimm,
Kansas—Jerome Twichell,
Nebraska—M. L. Trester,
Ontario—S. T. Pettit,
Manitoba—Chief Justice Wallbridge,
Quebec—H. F. Hntt.

It was voted that a committee be appointed by the President to fill vacancies in the list of Vice-Presidents. The following were so nominated: Messrs. Peet, Vandervort, and C. C. Van Deusen.

It was moved by Wm. F. Clarke, seconded by J. B. Hall, and unanimously

Resolved, That the President, First Vice-President, Secretary, Treasurer, Miss Lucy A. Wilkins (Cynla Linswick), of Farwell, Mich., and A. B. Weed, of Detroit, be the executive committee of the Society for the ensuing year.

The subject of reversible frames was mentioned by the President, and

J. Van Deusen asked to open a discussion on it; but it being close on the hour of adjournment, it was deemed best to defer the matter until the evening session.

Proofs of the photograph taken at noon were then produced by the Secretary, and it was announced that copies could be had for \$2 each.

The meeting then adjourned.

Iowa Wild Honey.

The Hon. A. R. Fulton, of Des Moines, one of the old-timers in Iowa, and one of the best collators of facts in the history of the State, has an interesting article in the last Annals of Iowa, on the golden days of the bees in that State, from which we condense the following:

There are those who remember that, away back in the "forties," in the States further east, we used to read and hear of "Iowa honey," an article then as highly-prized and as much sought-for as the "California honey" has been with us at a later period. At that time Iowa was literally a land of wild honey; nor has there since been anything in our experience to disprove her right to the claim of being the special habitat of the honey-bee. The great profusion of wild flowers, though they bloomed and blushed unseen by human eye, afforded a delicious pasturage for the myriads of colonies of honey-bees which were snugly housed through the winter months in the trunks of the tall trees of the forests bordering on the water-courses.

During the autumn months a favorite pastime and source of profit among the pioneer adventurers was bee-hunting. By watching a single bee as it took its flight, laden with its rich burden, the experienced bee-hunter could determine with certainty nearly the exact locality of its treasure-house. The bee-hunter had only to take the "course" and follow it in a direct line to the timber. Generally, before penetrating far into the forest, he could observe the converging lines of bees as they returned, laden with the sweets of the prairie, to the common line. Then it was only necessary to keep a sharp lookout for some hollow knot or opening, far up in some tall tree, to discover the depository of the precious treasure. After a brief search, this was generally discovered, and known to a certainty by the thousands of little workers entering the hive or departing therefrom. Then it was only necessary for the hunter to mark the tree with his initials to insure its safety and protection as his own property, against any and all other claims, until the season arrived for securing the honey. If a "bee-tree" was found to be "marked," it was a rule, invariably observed as a matter of honor, to leave it unmolested.

The timber lands bordering on the Skunk river (by the Indians called the *Che cau-que*) were especially noted as

the paradise of the bee-hunters, and in advance of any permanent settlement of this country, parties of them penetrated that region in quest of honey. Several incidents, the details of which are in the possession of the writer, will serve to show something as to the nature of this primitive, Iowa industry.

In October, 1835, one, John Huff, who subsequently settled in Jefferson county, accompanied by a lad named Levi Johnson, went to the west side of the Skunk river and encamped, a short distance above where the village of Rome, in Henry County, is now situated. At this latter point, at that time, there was a trading-post kept by one, William McPherson, as the Sac and Fox Indians still occupied that region. The purpose of Mr. Huff and his young companion was to spend a month in bee-hunting. They continued to ramble through the heavy timber skirting the river and its tributaries, until the middle of November, when they began preparations for returning to the Mississippi. Huff had collected eighty gallons of honey, and Johnson about forty, which was put into barrels manufactured by themselves at their camp.

The river now beginning to rise a little, they prepared a couple of canoes or "dug-outs," into which they placed their freight, consisting of three barrels of honey, guns, axes and auger, with some other tools and camping utensils; also a small stock of provisions, including five dressed, wild turkeys and some venison. Passengers and freight being aboard, they set out on their voyage for Illinois, being, so far as we know, the first craft manned by white men, that ever navigated the waters of the Skunk river from a point so far up as the place of the embarkation. With the two canoes lashed together, they glided along smoothly until about sundown, when they ran upon a "sawyer," which capsized the canoes, turning the contents into the river, with the exception of one barrel of honey, which, fitting so closely, remained fast in one of the canoes. All the rest of the freight went to the bottom, in twelve feet of water. The canoes were drawn ashore, and the remaining barrel of honey rolled out. In his effort to save the property, Mr. Huff even lost his shoes.

The weather was now becoming quite cold, and the situation was not a pleasant one, but those backwoodsmen of early Iowa were not unaccustomed to hardship. Leaving canoes and honey, Mr. Huff, barefooted, set out for Burlington, where he obtained another pair of shoes, and some grappling hooks to use in searching for the sunken freight. Young Johnson returned to his mother's home in the eastern part of Henry county.

After an absence of about twelve days they returned to the scene of their disaster to seek for the lost treasure. By means of the iron hooks, the two barrels of honey were soon recovered, but the other articles were not so easily found. An Indian who was present, agreed, for one dollar, to dive and get the gun. He went down

once, but did not succeed. While he was warming himself for a second trial, Mr. Huff, himself, drew up the gun with the iron hook. The two axes, drawing-knife and auger were found during the next January by cutting a hole in the ice.

Without further disaster, Messrs. Huff and Johnson succeeded in getting their cargo of honey to Carthage, Ill., where they sold it for fifty cents a gallon. During the same season, another party collected, on the east bank of Skunk river and along Big Creek, in Henry county, some fourteen barrels of honey, which they sold in Burlington.

Mr. Huff, himself, declared that, at that early day in Iowa, honey-bees were so plentiful that it was difficult, on a warm day, for a man to keep them from flying into his mouth while eating a piece of honey. In the fall of 1836, he found ten "bee-trees" on a small branch near where Fairfield was subsequently located. He sent the product of this "find" to Carthage, by one, James Lanman, who sold it for \$22.75. During the same year a man named Ballard, settled or encamped on the same small stream, and for a time followed the business of bee-hunting. The stream was afterward known as Ballard's Branch. Ballard's camp was about two miles northeast of Fairfield, and his "claim" embraced the fine grove of timber in that vicinity. As soon, however, as the country began to be settled, he found his occupation gone, became discouraged and went west.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the *Monthly BEE JOURNAL* for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

The Mahoning Valley Bee-Keepers will hold their fall meeting in Ravenna, O., on Nov. 14, 1884. A cordial invitation is extended to all.

E. W. TURNER, Sec.
Newton Falls, O.

"WALLS OF CORN" is the title of a neat little pamphlet received from the Department of Immigration of the Atchison, Topeka & Santa Fe R. R., which goes to show that Kansas raises poetry as well as corn, and a high-grade article, too. Mrs. Ellen P. Alerton, a Kansas farmer's wife, wrote a charming little poem entitled "Walls of Corn," which has been handsomely illustrated, with full page colored plates. An appendix of peculiar value to any one desiring information concerning the State, gives the official government figures in a striking comparison of Kansas with other leading agricultural States. Send your name to Mr. C. B. Schmidt, Commissioner of Immigration, A. T. & S. F. R. R., and he will mail a copy FREE to your address.

Stingless Bees of Cuba.

Mr. A. J. King gives the following editorial in the *Bee-Keepers' Magazine*, descriptive of these insects and their habits:

During our stay on the Island of Cuba, we employed much time investigating its honey-flora and the quality of honey produced by each variety.

On one occasion we were examining the flowers of a Royal Palm which, standing at the foot of a rather steep hill and ourself at an elevation, brought the circle of flowers within twenty feet of us, we could, with our powerful field-glass, bring the bees, so to speak, so near that the characteristics of the different kinds were easily discovered. There were wasps, yellow-jackets, bumble-bees and Italians, but what particularly attracted our attention was a little insect, which to our recollection, was exactly like the stingless bees of South America, which we had seen on one or two occasions several years ago, and we at once surmised that they were identical.

After much inquiry we found our surmises correct and that a colony of these delightful insects was in the possession of a native living several miles away in the dense forest, and who was engaged, in a primitive way, in the production of charcoal.

Mr. Pedro Casanova and myself set out on horseback, and arriving at the cabin of the Cuban, just as the sun was going down, discovered the object of our search. The little beauties were located in the section of a hollow log about six inches in diameter and two feet long which was suspended in a horizontal position on the side-wall of the cabin.

A round hole hardly a quarter of an inch in diameter in the center of one end of the log formed the only entrance or exit; the other end was closed with what seemed to be a conglomeration of pollen, wax, resin and some other moist and sticky material.

On looking into the entrance-hole, all we could discover was a little, white, fuzzy head peering out in a cautious, half-wardly manner. The last of the foragers were just returning, and it was amusing to see how swiftly, yet surely, they would always dart into the little entrance without once missing or having to crawl in, like our ordinary bees.

In all their movements they are as swift as lightning, and we had great difficulty in catching one, but far more in keeping it.

The other end of this log-hive contained a plug, which was withdrawn and several of the honey-bags having been perforated, a tumbler was soon filled with a very delicious but rather thin honey.

This honey is supposed by the natives to possess medicinal properties and is sold at a high price—something like the "bumble-bee honey" in the city, with the difference that the former is real honey while the latter, so far as the bumble-bee is concerned in its production, is a myth, but in either case the medical superi-

ority over ordinary honey must reside entirely in the faith of the patient.

We purchased this hive and taking it on our shoulder, remounted and carried it safely to the Casanova apiary. Here, we fitted up a nice bamboo log for a hive and undertook to drive out the pets, but we found that they would not "drum for a cent." We then tried smoke, with no better result. Finally we procured a saw and by being very cautious, succeeded in separating the log from end to end. Then taking out the nest, pollen, honey, bees and all, we fitted it into the bamboo, left it for three weeks until the bees had it all fastened in, then brought it to New York; but forgetting to wrap it up one cold night, the little inmates had chilled and died.

Many have been the speculations of the would-be wise in regard to these bees, nearly all of which are mistaken notions. The idea that there is any danger in handling them bare-faced and bare-handed is untrue. They will not mix with any variety of our true honey-bees, and they are unprofitable except as objects of curiosity.

A fair-sized colony is composed of one thousand to fifteen hundred bees, occupying a space of perhaps eighteen inches long and four inches in diameter. About five inches from the entrance to their log-hive are the brood-combs, suspended from the roof in parallel rows of four combs.

The combs are nearly round, not as thick as ordinary brood-comb and not more than three inches in diameter. The sacks containing honey and pollen look very much alike, but do not resemble cells in any sense, being somewhat irregular in shape, an inch long and three-quarters of an inch in diameter, and each holds about two table-spoonfuls of honey. They are of a dark color and lie on top, bottom and sides, packed like so many bags of grain, three-fourths of them being filled with pollen and the balance with honey.

In shape these bees are much like the bumble-bee, and in color like the yellow-jacket, but are not more than one-fifth as large as a burable-bee, and perhaps its body is longer in proportion than that of its "big cousin." The queen is really beautiful and differs in shape from the workers in the same way that ordinary queens differ; but the bees are much more vigorous and can cling to objects with greater tenacity than any other insect that we have ever seen.

Convention Notices.

The Southern Illinois Bee-Keepers' Association will meet at Duquoin, in the Opera House on Thursday, Nov. 13, 1884. All are cordially invited. F. H. KENNEDY, Sec. WM. LITTLE, Pres.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Nov. 5, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14@15c. on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@9c. on arrival.

BEESWAX.—1s dull at 26@28c on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel sure in making the following quotations: Fancy white comb, 1-lb, 18@20c., 2-lb, 16@18c.; fair to good, 1 and 2-lb, 14@16c.; fancy buckwheat, 1-lb, 12½@13c., 2-lb, 11½@12c.; ordinary grades of dark, 1 and 2-lb, 11@11½c. Extracted white choice, 11 kegs or small barrels, 8½@9c., buckwheat, 6½@7c. BEESWAX.—Prime yellow, 30@31c.
MCCAUL & HILDRETH, 34 Hudson St.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Good to choice qualities are selling slowly, mostly in a jobbing way. Inferior grades are neglected. The market is weak at the quotations. A sale of 100 cases extracted, mostly choice white, was made at 4½c. One hundred tons extracted, barrels and cases, a/c going aboard ship for Liverpool. White to extra white comb, 9@10c.; dark to good, 6@8c.; extracted, choice to extra white, 4½@5c.; dark and candied, 4c.

BEESWAX.—Wholesale, 24@27c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.

BEESWAX.—Firm at 32@32½c. for choice.
W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a 1/16c lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.

BEESWAX.—28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote best white in 2 lb. sections, 13@14c; extracted, 6½c.

GEO. W. MEADE & CO., 213 Market.

KANSAS CITY.

HONEY.—The receipts of honey are very large and fine, with a splendid demand, and we are very low in stock of all kinds of comb honey. While the tendency of everything is to lower prices, honey is in active demand, with us, at steady prices. One-lb. sections, none in the market at one-pound, 16 cents; two-pounds, 14@15 cents; California 2-lbs., 14@16 cents. Choice California extracted is selling at 7@9 cents per lb.

BEESWAX.—None in the market.

Bee-Stings, Camphor, etc.

DR. G. L. TINKER, C.

Mr. C. G. Beitel, on page 681 of the BEE JOURNAL, desires an opinion on the effect of camphor applied to bee-stings. My reply is, that spirits of camphor has probably been applied as a remedy for bee-stings times innumerable, without serious results; but in my opinion it or any other stimulant and irritant is contra-indicated on the principle that adding fuel to fire is never advisable where you wish to put out the fire. Sedatives, and more particularly cooling applications, are indicated. In the list of sedatives, belladonna and hot water rank first; and among cooling applications, ice, cold water, clay, etc., are best. Non-stimulating alkalis locally and internally are useful.

The primary effect of a large number of stings, and possibly sometimes of only one in very susceptible persons, is to powerfully depress the nervous system, to impede and even to stagnate the circulation of the blood. The reduction of temperature is marked, and a chill or intermittent rigors may supervene, the skin meantime becoming mottled as in the poisoning by some kinds of animals. These symptoms are the indications for strong stimulants internally, like whisky. If reaction is established, recovery is generally assured; but it is followed speedily by a very frequent pulse and a very high temperature, much swelling and a peculiar itching sensation with more or less pain and heat in the affected parts. These symptoms indicate sedatives internally, like belladonna, aconite and nitrate of potassa, to control the active capillary circulation, and locally, ice, cold water, or other cooling applications; especially should the head be kept cool.

Recovery takes place in 24 to 48 hours from the active symptoms, leaving swelling, itching, and stiffness of the parts stung, for several days afterward. The patient should be kept as quiet as possible, and in a cool place until the swelling subsides. The above is the treatment which I have successfully followed in severe cases.

In the case of Mrs. Sturdevant, alluded to on page 636, it seems probable that the relation of cause and effect, as held by the physician in attendance, was well taken. However, the aggravating effect of the spirits of camphor may have precipitated a fatal result. The notable feature of this case is the point at which the sting was received. The physician, probably, in locating it so accurately, had in view the possibility of the large sensory nerve (the *superior maxillary*, which emerges from the *infra-orbital foramen* at or near the point entered by the sting) being

punctured. It is my opinion that this nerve, or some part of the *infra-orbital plexus* joining with it, and which could be reached by a bee's sting, was so penetrated and the poison lodged in its substance. Such an accident would produce a powerful impression upon the great life-centre, the *medulla oblongata*, with which the nerve communicates by a very short route. Probably the most dangerous point where one can be stung is just beneath the eyes.

Care should be taken in working with ugly colonies, not to leave them in a mood, as is too often the case, to attack any one. Persons passing near are liable to be stung by them unexpected and seriously. I would advise the superseding of all ugly colonies promptly; but if they are to be kept and handled, they should first be thoroughly smoked with tobacco before opening the hives. I use Scotch snuff thinly spread upon dry cotton-cloth; roll it up, set fire to the roll, and put it into the smoker. It takes the fight all out of the ugliest colony in short order, and they are not apt to volunteer an attack for a week afterwards. Tobacco does not seem to do them any harm. By the way, the Germans, and the German hybrids are the only bees which have, in my experience, required the use of much smoke.

In answer to Mr. Wismer, on page 635, I will say that the animal scent of bees and the odor of bee-poison are quite different. The first may be readily detected on any evening in summer, when the bees are briskly fanning at the entrance; the latter, on opening a hive on a cool day, when numbers of the bees will elevate and protrude their stings, at the ends of which may be seen a tiny drop of the poison. I would ask Mr. Wismer whether he thinks that the venom of a bee's sting and the acid secreted in the stomach of the bee, are identical? If not, I am unable to see the point in the question he propounds.

Again, it is improbable that bees ever deposit the poison of their stings in the honey; nor do I believe, as has been suggested, that sealed honey is ever coated over or permeated by it in any way. I am sure that I have taken hundreds of pounds of comb honey without a particle of the poison getting upon it while taking it off. It is not at all likely that the cause of disagreement of honey with some people is due in any way to the venom of bees' stings.

In this connection I desire to thank Mr. Wismer for bringing to the notice of bee-keepers, not only other cases where bees have perished upon winter stores exclusively of sugar or syrup, but for the presentation of several cases in which bee-diarrhoea has resulted where nothing but sugar stores were provided.

New Philadelphia, Ohio.

The bee-keepers of McDonough and adjoining counties are requested to meet at Bushnell, Ill., on Nov. 20, 1884, for the purpose of organizing a bee-keepers' association.

J. G. NORTON.

Country Gentleman.

After-Swarming.

W. Z. HUTCHINSON, C.

The first swarm which leaves a hive is called a "first" or "prime" swarm, and it does not usually issue until several queen-cells are well under way, and perhaps one or more of them sealed over. As soon as the first queen hatches, if a flow of honey continues, she leads off a second, or "after-swarm," and as the young queens continue to hatch, they also continue to lead off after-swarms, the number which issue depending upon the yield of honey, the amount of brood left in the hive by the prime swarm, and the weather. Of course, each successive swarm is smaller than the preceding one, the last one often not containing a pint of bees, and if hived in the usual manner, would amount to nothing; but by hiving it upon empty combs, and perhaps giving it a frame or two of batching brood, and feeding it a few pounds of sugar syrup, even if it does not secure a sufficient amount of honey for winter stores, it can usually be brought into good condition for passing the winter; and having a young and vigorous queen, it is almost certain to prove an excellent colony during the succeeding season.

One peculiarity about after-swarms is, that they are likely to issue at almost any time of the day, or in almost any kind of weather, instead of choosing the middle of a fine day, as does a prime swarm; they also go farther from the hive to cluster, or perhaps go off without clustering.

When honey is more desirable than increase, even prime swarms are not welcomed by some bee-keepers, while each after-swarm is looked upon as a misfortune. One method of preventing after-swarming is to open the old hive after the first swarm has issued, and cut out all the queen-cells except one. The objections to this is the trouble of performing the operation; and, if the cell which is left fails to produce a perfect queen, the colony is left hopelessly queenless. Giving the old colony a laying queen, as soon as the first swarm has left, will usually prevent after-swarming, at least for the time being, as the queen will at once destroy all the queen-cells; but as soon as the hive becomes populous, she will often lead out a swarm. Giving the old colony a newly-hatched queen, or a queen-cell nearly ready to hatch, will also prevent after-swarming, and is preferable to giving it a laying queen, unless increase is desirable. A newly-hatched queen, or a queen-cell ready to hatch, is of little value, while a laying-queen is worth at least one dollar, and the colony, not having a laying-queen until the young queen is fertilized and laying, does not become populous quite as soon, and, consequently, is less inclined to swarm. A colony with a young laying-queen, is not so apt to swarm as one with an old queen.

The writer has, the present season, practiced to a considerable extent, this method of preventing after-

swarming; that is, giving the parent colony a mature queen-cell soon after it has cast a swarm, and in no instance has a colony thus treated swarmed again. He has a small slate hanging upon a nail driven into the back of each hive, and when a swarm issues, the date is marked upon the slate. He has learned by experience that more of the young queens hatch sooner than the sixth day after a swarm has issued, usually about the seventh or eighth day; and, when a colony from which no after-swarms are wanted, casts a swarm, it is an easy matter, by examining the dates upon the slates, to find a colony which has swarmed six or seven days previous, from which to obtain a queen-cell nearly ready to hatch, to give to the colony which has just swarmed.

Another method of preventing after-swarming, is to place the new swarm upon the old stand, removing the parent colony to a new location. The flying bees all return to the old location, and join the new swarm, which so reduces the strength of the old colony that it often casts no second swarm. The writer, however, carries this method one step farther, and makes of it a complete success; in fact, it is his favorite method of preventing after-swarming, and is as follows:

The new swarm is hived in a new hive and placed upon the old stand, but, instead of carrying the old hive to a distant new location, it is placed beside the new swarm, the rear of the hive being in contact with the new hive, but the front turned to one side at an angle of 45°. So far as the flying bees are concerned, the old hive occupies a new location fully as much as though it had been carried away rods distant, for they all enter the new hive on the old stand. Each day the old hive is slightly turned toward the new hive, until, at the sixth day, it stands close beside and parallel with it. The bees of each hive recognize and enter their respective homes, but let either hive be removed, and all the flying bees will enter the hive left upon the old location. On the seventh day, the old hive is picked up and carried to a distant stand, when, of course, all the flying bees join the new colony upon the old stand, leaving the old colony so reduced in numbers just at the time when the young queens are hatching, that all thoughts of swarming are abandoned, the first queen that hatches biting into and destroying the remaining queen-cells, together with their occupants. If several queens hatch at about the same time, there are royal combats which result in the "survival of the fittest."

When this method is adopted, the honey-boxes should be removed from the old hive to the new one at the time of hiving the swarm. The great mass of workers will then be where the honey-boxes are, which is as it should be. In the writer's opinion it is better always to put on boxes at the time of hiving a swarm, and then contract the brood-nest to such an extent as to crowd some of the bees into the boxes. (When this is done,

unless a queen-excluding honey-board is used, the queen will often make mischief by invading the surplus department.) A delay of even 24 hours in giving boxes to a newly-hived swarm is often fatal to securing the best results; as, where bees commence work when hived, there they will continue to work until they are compelled for lack of room to work somewhere else; if given boxes at the time of hiving, and crowded into them, they will commence work in both them and the brood-nests, and all will go well. The only reason why the writer did not practice the last-described method exclusively the present season is, that he had 25 cumbersome chaff-hives which were extremely difficult of removal; hence, when a swarm issued from a chaff-hive, the colony was given a mature queen-cell taken from one of the other hives which had just been removed to a new stand.

Some bee-keepers manage after-swarms by hiving each one upon sheets of foundation, and placing the hive containing it, by the side of the parent colony. If another one issues from the same colony, it is hived in the same manner as the first, and placed upon the opposite side of the old colony. As soon as one of the young queens is found laying, all the bees are shaken down in front of the old hive, and the drawn-out combs of foundation put away for future use.

The point to be considered, in many localities, is this: The main honey-harvest is of short duration, not usually more than six weeks, and to secure the best results, there must be an abundance of workers, during this period, in the hive where the honey-boxes are. If the body of workers is divided up, by swarming and after-swarming, into mere squads, the harvest is ended ere any of them have recruited their ranks sufficiently to gather and store it in proper shape for market.

Pollen and Hibernation Theories.

JAMES HEDDON. ♀

Many observations have puzzled me to harmonize perfectly with the "pollen theory," and that is the reason why I still call it a "theory." Let us look fairly at Dr. Miller's puzzle on page 683.

Are we not all well aware that bees have, for many years, wintered well with pollen in their combs? That they oft-times starve before they will touch it? That in many cases, as the honey gave out, they eat the pollen (bee-bread) and quickly die with diarrhoea? Many thought, after witnessing such a phenomenon, that "starvation was the cause of bee-diarrhoea."

We know that starvation is no direct cause, but we believe it to be the consumption of bee-bread in confinement. In the diarrhetic excreta we find pollen, not starvation.

Now, Doctor, none of us have crawled into a hive and passed the

winter with the bees. We have seen but very little of their actions during confinement, from without. We depend much upon rational and logical theorizing. We can easily imagine many reasons why, in one case, the bees would commence on the bee-bread just where the honey left off, and in another stop all consumption when the supply of honey ceased. What I am trying to find is a case where the intestines of the bees become loaded with fecal matter without the presence of bee-bread, or honey laden with floating pollen. As soon as I find such a case, I will give up my theory and at once announce it, so that we may waste no more time and money in this line, but throw all our energies in another, and what we deem the most profitable direction.

Sometimes when a cell containing pollen below and honey on top is extracted of its honey, we find a dried, glazed surface upon the pollen, making a perfect division between the two commodities; at other times we find no such glazed division, but find that the honey has soaked into the pollen, as it were, and when we extract the honey, some of the top portion of the pollen comes out with the honey and injures its flavor. This is rarely seen except when extracting combs from which bees perished during the winter. Think of these things.

THE HIBERNATION THEORY.

Just as I feared, there now seems to be a misunderstanding regarding what different persons mean by hibernation. As I understood Mr. Clarke's first article on that subject, he had what was to me a "new" and false theory. As I understand him now, he has an old, well-known, and true theory. He told us some time ago that to get bees into this hibernating state, we must have a low temperature; cold, and, as he thought it necessary that they should often arouse from that hibernating condition, he would occasionally advocate the other extreme. From this I inferred that he believed that circulation, motion, and heat-throwing-off and producing power all ceased, as is the case with wasps which pass the winter in a state of perfect torpor and isolation.

I do not claim to know, but I do not believe that our colonizing bees ever enter for one moment into any such condition. If Mr. Clarke will hold to this former ground, he will have a new theory, and one on which we radically differ; but if he only holds to the theory that bees often do winter the best and the cheapest when they enter an almost perfect state of quietude (one in which they consume very little food, hardly making a sound or motion of the air; one which is aided by an even cool temperature, but not a low or changing temperature; one in which at all times circulation is going on in their bodies, the same bodies exuding warmth—bodies which will move at once if touched, and always possessing sensation), then we will agree in regard to the best condition for bees during winter. But the theory is not

new, but old and well-known to us all, and is a theory of effects and not causes.

To show the ground which Mr. Clarke must take to get up an opposition with me, or any legal claims to newness of theory, I will quote one paragraph from the *Kansas Bee-Keeper* for April 1884, which is several months older than his first article on the hibernation subject.

"Now, for the 'pollen theory.' What is it? In short it is this: The bee, unlike many other insects, exists in two different states during its life, viz: The fully-animated, and the 'semi-hibernations.' It would seem that any animal, existing at different times, in such extremely different states, would require for success, extremely different conditions and food. This is just what we find to be the facts in the case. In summer the bees are active, and require a home and food adapted to the needs of activity; in winter, when in the quiescent state, they require surroundings and food adapted to that condition. As above stated, these conditions differ widely."

Now, I would like to know what is new in Mr. Clarke's theory.

For the American Bee Journal.

Too Much Drone-Comb.

G. M. DOOLITTLE. ©

A party writes, saying, "I have many frames of comb in which I find both drone and worker comb. How shall I proceed to get rid of the drone-comb, and not have the bees build the same kind in again? Please answer in the BEE JOURNAL."

Too much drone-comb in the brood-chamber is a very serious damage to the honey crop, as drones are only useless consumers, being of no value except to fertilize the queens; and in these days of progression, no person can afford to allow a promiscuous production of drones. One or two square inches of drone-comb is all that should be allowed in any hive, except in one or two containing the choicest colonies, which should have enough drone-comb to rear all the drones that are needed in the apiary.

As all colonies will have a little drone-brood, anyway, even if they have to cut down worker-comb to get a place to build comb for it, it is well to let each colony have about 2 square inches of drone-comb, which should be all in one frame. This frame should be marked so that where the production of all kinds of drones is not wished, it can be lifted from the hive every 20 days, and the heads of the drones shaved off.

From the above it will be seen that our correspondent has asked a very pertinent question, as the bees will nearly always again fill the place, where drone-comb has been cut out, with comb of the same sort. The only way I know of to stop their doing this, is either to give the combs having drone-comb removed from them, to nuclei having a young queen (as

such nuclei will always build worker-comb), or after cutting out the drone-comb, fit worker-comb in its place. While the latter does not give as perfect combs as the former, it has in its favor the immediate use of the combs in full colonies; for it is often mid-summer before many nuclei are strong enough to build combs at the bottom of the frames, where most drone-comb is found. Hence, I generally use the fitting-in plan, in doing such work.

If there is a large patch of drone-comb in a frame, I cut it out with a narrow-bladed, sharp knife, after which the frame is laid over another frame of comb, which has some drone-comb in it also, so as not to spoil a good comb. I lay it so that the empty space comes over the worker-comb, when the lower comb is worked a trifle larger than the space to be filled, after which the marked piece is cut out and pressed into the place where the drone-comb came from. If the piece should happen to be a little small, a few drops of melted beeswax will hold it in place till the bees fasten it.

For small patches, from an inch to 4 inches in diameter, I use punches of the proper size, made of old fruit cans. These can be found about hotels if canned fruit is not used in your own family, and need not cost anything. When you have collected your different sizes, place the ends on a hot stove when the solder will melt, thus letting the top and bottom off, as you place either end on the stove. After the tops and bottoms are off, make the whole circumference of one end sharp, with a file or grindstone, sharpening wholly from the outside. Now lay the comb down flat on a smooth board, and with the right-sized punch, cut out the patch of drone-comb by twirling the punch or can around as you press down on it. Now push out this drone-comb, and with the same punch, and in the same way, cut out from some discarded frame a piece of worker-comb, which will, of course, exactly fit the place you took the drone-comb from. In this way it is no great task to rid all the frames of drone-comb. If any have honey in them so you cannot tell where the different kinds of comb commence or leave off, you will have to wait until the honey is taken out by the bees, when these can be fixed also.

In this way I go over all my combs, nearly every spring, just after pollen becomes plenty, getting out the drone-combs. "But," says one, "your plan cannot be effectual, or you would not need to thus go over your combs every year." To such an one I would say, that combs are not always like a piece of iron which will stay for years as first made; but with me the mice sometimes will get in a hive in the winter, in spite of all precaution, and gnaw a hole into the combs, which hole the bees fill with drone-comb unless I get the start of them and fill it with worker-comb, as above described.

Then, again, the moth-larva will get in while extra combs are stored away, or the bees, in cutting down

old queen-cells, or removing old, moldy bee-bread, will cut out the comb also; and by numerous ways drone-comb will get in after the combs are comparatively perfect; hence, it requires vigilance in this as well as in other things, if we would reap a reward. One of the objections I have to wired frames, is their liability, from some of the above causes, to get drone-comb in them, in which case it is not as easily replaced with worker-comb as is the case where no wire is used.

Borodino, N. Y.

SELECTIONS FROM OUR LETTER BOX

Report of Honey Crop for 1884.

I commenced the season with 52 colonies, spring count, and increased them to 56 colonies. I have taken 910 pounds of comb honey from 34 colonies, 160 pounds of extracted honey, and 10 pounds of beeswax. Every colony is in good condition, and each has at least 50 pounds of good, capped honey to winter on. To-day I covered all the brood-chambers with old rags, and I will winter my bees on the summer stands. The bees have failed to bring me in a profit this year, the cause of the failure being beyond their or my power, so I prepared them for another winter, hoping for brighter prospects in the season of 1885.

R. M. OSBORN. 9

Kane, Ill., Oct. 22, 1884.

Getting Sections Completely Filled.

At the Chicago Convention, Mr. Heddon is reported to be working out a plan to get sections completely filled with honey. Some years ago, when I was engaged in the bee-business, I used to let my bees build and store in the ordinary frames; then, with a sharp knife I cut the combs from these frames, laid them gently on a piece of clean blanket, re-cut them to the sizes required, slipped the sections over the pieces, and in the evening placed them in the hive to have the bees dry them off. Early on the next morning, I removed them. The plan worked well, was not much trouble after I got used to it, and the sections looked neater and cleaner than I could get them in any other way. Perhaps this may be Mr. Heddon's plan.

A. MALONE.

Garden Island, Ont., Oct. 25, 1884.

Cure for Bee-Stings.

At the late meeting of the Northwestern Bee-Keeper's Association, we notice various remedies for bee-stings, nearly all of which we have tried, but have found nothing so effective as the following: Take equal parts of the tincture of aconite, laudanum and chloroform, bathe the wound once or twice, and the pain and swelling will leave. For many years as druggist, I have known of

this remedy being used successfully in neuralgia and other like diseases. Three years ago, in working in my wife's apiary, we first tried this remedy, and it was a success, although we seldom use anything unless stung in the face; and such are about all who wish a remedy for bee-stings. Remember this and try the recipe next season.

M. F. TATMAN. ☉
Rossville, Kans., Oct. 23, 1884.

My Report for 1884.

The spring of 1884 was cold, windy and rainy, and it remained so up to July, being intermingled with only a few warm days. Bees did not gather much honey during fruit blossom, as it was almost too cold and rainy. White clover blossoms were plenty, but they had a brownish appearance and secreted very little honey. Bees just got enough honey to make them crazy for swarming, which they commenced on June 1, and kept it up till July 18, and at that time the flow of honey ceased from all sources; weak colonies had to be fed up to Aug. 20, when Spanish-needle made its appearance; and what a sight it was to see the fields covered with yellow flowers. The colonies which were strong at that time, stored considerable surplus honey of a very good quality; and weak colonies gathered enough to last them during winter. I commenced, last spring, with 63 colonies, 23 of them being very weak, and the balance were in good condition. I have increased them to 100 colonies, mostly by natural swarming. I obtained 200 pounds of comb honey from white clover, and 250 pounds of extracted, some of it being honey-dew, which I fed back to the weak colonies during the honey-drouth. My surplus fall honey amounts to 420 pounds of comb, and 1,400 pounds of extracted, making in all, 2,270 pounds for the season, being an average of 36 pounds per colony, or one-third of an average crop. I have made inquiries of my neighbor bee-keepers, and find that some have received no surplus honey. Some of their colonies are very weak in bees, and have but little honey, and, I think, will hardly live through the winter. Their bees are all blacks; mine are Italians, Holy Lands, Cyprians and hybrids.

JOHN NEBEL. ☉
High Hill, Mo., Oct. 27, 1884.

Wintering Bees in "Clamps."

In the fall of 1883, I buried 8 colonies of bees just as we bury potatoes in Iowa to keep them from freezing. Two of them were in 1½-story Langstroth hives, with the honey-boards on, and the holes in the honey-boards open. The other 6 colonies were in i-story hives with quilts and covers on the tops of the frames. They were put into the clamp on Nov. 28, and taken out on March 25, 1884. Eighteen inches of earth, and 3 feet of coarse hay was on top of the hives, and no ventilation was given to the 6 colonies. The 2 that had ventilation through the honey-boards, wintered

the best. I never saw bees in better condition than they were in March. The others which had no ventilation at the top, did not winter as well, but came out in better condition, on an average, than those which were wintered on the summer stand; but those taken out of the clamp dwindled so that on May 1, they were the weakest in the apiary. One of the 8 colonies I got out of the woods during the last of October, 1883. I hived them on three frames about one-half full of honey, and they staid on the summer stands for six weeks before I put them into the clamp. I do not think that they had over 6 pounds of honey. When I took them out in the spring, they did not have one drop of honey in any shape, but had brood in two combs, and young bees hatched. Two other colonies had no brood in any stage, and I thought that they had no queens, but on the next day I examined them and found that the queens had just commenced laying, and I watched them very closely to see whether Mr. L. C. Johnson, of Fountain City, Ind., was correct in his article on page 592 of the BEE JOURNAL for 1883. These bees were Cyprians crossed with Italians, and the bees were hatched in 17½ days. I made another test on a Cyprian queen whose eggs hatched bees in the same length of time, and queens in 12 days. In the first test I did not try to rear queens. On Oct. 15, 1884, I put 8 colonies of bees into "clamps." They were late swarms; some had not more than 1 pound of honey, and the heaviest had not more than 3 pounds. I knew that they would die if left on the summer stands, but I thought that if I could get them to hibernate, that they might winter. Am I correct?

WM. MALONE. ☉
Oakley, Iowa, Oct. 24, 1884.

Report for the Season.

Last spring I commenced with 21 colonies of bees in box-hives, and lost two by robbing. When the bees first began to bring in pollen, I thought it best to feed them a little; so I made some bee-feeders, put a pound of sugar syrup into each, and at sundown I put them on the hives. On the next morning before sunrise, I took them off, and the feed was all gone. So far all was well; but right here I will say that this was, I think, the most important day of the season. Box-hives with anger holes in their tops are not very good things to feed on; and, although, I tried to be very careful with both feed and bees, at 8 a. m. I had every colony in the yard robbing and being robbed. You who have had experience with bee-robbing can have some idea of what I did and what I did not do, as I had no veil, no smoker—in fact I did not have anything that I needed; and to you who know nothing about robbing bees, it would be no use for me to tell what I did, for you might have some doubts about it. However, night found me very tired, 2 colonies less, and a wiser man. During the season I lost several swarms by their going off. They would swarm out, fly above the apple

trees, circle a few times, and then leave without settling. I administered everything that I had read or heard of, but it seemed only to drive them away the quicker. I believe that if a swarm intends to cluster, they will do so without any help; and if they intend to leave, they will do that also without help. I think that I had my bees built up pretty strong by the time white clover blossomed, but they did not get into the sections for two weeks, and then they were rather slow about it. There was a good bloom of basswood, but it only lasted about six days, and four days of that time were cold and rainy. Between showers, the bees would come out as though they were swarming, but before they could load up and get back, there would be a shower; and as the bees had to cross the river, I think I lost lots of them after the rain was over, for they would be floating thickly on the water. I did not get one-third of a crop of honey. My bees did better than the most of the bees near me. I increased them to 32 colonies, and would have secured about 500 pounds of comb honey had it not been stolen. I took off about 160 pounds of honey, and left, as I thought, 400 pounds on the hives. I went away from home over night, and when I returned there was not a full section in the yard; they had stolen all of it, and had done a clean job, so much so that I have yet gotten no track of the thieves. If I did not gain anything in dollars and cents, I learned something.

DAVE H. LISLE. ☉
Chebanse, Ill., Oct. 25, 1884.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

Young Men!—Read This.

THE VOLTAIC BELT CO., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6Dly

YOU NEED the National Real Estate Index. Full of TRADES, Bargains and Real Estate news. 50 cts. a year. Sample copy free. Address, 27C6t **W. L. GRIGGS, Kirksville, Mo.**

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Domett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6 1/2 inches.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

Address, **THOMAS G. NEWMAN,** 925 West Madison St., CHICAGO, ILL.

Bee Hives AND SECTIONS.

NEW SHOP AND NEW MACHINERY !! The Largest Manufacturer of Bee Hives Sections, etc., in the World!

ESTEY & CAMP,

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

- MRS. FRANCES DUNHAM, De Pere, Wis. Hamilton, Ill., Dec. 10, 1883.
 Dear Madam:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of this foundation on the Vandervort machine for surplus boxes, and it has been equally success. but for brood chamber foundation, yours is still unexcelled.
 Yours,
CHAS. DADANT & SON.
- Mrs. FRANCES DUNHAM, De Pere, Wis. Beeton, Ont., Dec. 10, 1883.
 Dear Madam:—I have made over 100,000 lbs. of foundation on one of your mills, to that made on any other machine not now take double the price I paid for it.
 Yours very truly,
D. A. JONES.
- MRS. FRANCES DUNHAM: Genoa, Cayuga Co., N. Y., Dec. 12, 1883.
 All prefer the foundation I manufacture on one of your mills, to that made on any other machine I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
 Yours respectfully,
J. G. WHITTEN.
- MRS. FRANCES DUNHAM: Kenton, Ohio, Dec. 29, 1883.
 After using one of your foundation mills for the past 3 years, we can't say too much in its favor. And for brood foundation, it stands head and shoulders above all.
 Yours,
SMITH & SMITH.
- MRS. FRANCES DUNHAM: Omaha, Neb., Jan. 18, 1884.
 I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretzmer, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is to me always a jewel. You are at liberty to publish this. Yours truly,
T. L. VON DORN.

1884.

HEDDON'S COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County MICH.

Prices Reduced.

Owing to a decline in the price of Beeswax there will, hereafter, be a reduction of **5 cents per pound** on all orders for Comb Foundation.

OLDEST BEE PAPER
IN AMERICA

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861

Chicago, Ill., November 12, 1884.

VOL. XX.—No. 46.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent us above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Anyone intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

VALUABLE

ORIGINAL PATENTS.

BINGHAM & HETHERINGTON
UNCAPPING KNIFE.

PATENTED, MAY 20, 1870.

The Original
**BINGHAM
Bee Smoker**

Patented, 1878.

Prof. Cook, in his valuable *Mannal of the Apiary*, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc.—220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple *Mannal of Parliamentary Law* and *Rules of Order* for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees,—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Mannal of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping,—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

No. 46.

THE AMERICAN
BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

The National Convention.

We have this week given the report of the concluding sessions of the Continental Bee-Keepers' Convention at Rochester, N. Y., as sent to us by our special reporter, and we heartily endorse the sentiments he has so ably expressed in the following letter :

On the morning of the first day, as the advance guard began to arrive, there were symptoms of nervous uneasiness on account of so many prominent Western bee-keepers having intimated their inability to attend. Ontario was represented by several prominent bee-keepers, but throughout the meetings the absence of Western brethren was a lamentation. This, no doubt, had something to do with the movement to try and make future meetings of the association more representative in character. It was thought by some that parties appointed as delegates by local societies of bee-keepers would be more likely to make an effort to attend.

The Eastern men showed an excellent spirit, and no disposition was manifested to make any undue use of their power in monopolizing future meetings. There was a feeling often expressed in favor of doing nothing but what was for the greatest good of the greatest number.

President Root won golden opinions from all by his urbanity, kindness, and able discharge of the duties of chairman. Both in public and private he was most genial, polite and kind. Truly, the mantle of Father Quinby seems to have fallen on his worthy son-in-law. Long may he live to honor it, and be honored by it.

Any little sectional jealousies that may have existed at the outset were allayed and disappeared. It was a time of hearty good fellowship. No doubt the discussions would have taken a wider scope, and been more instructive if more of our prominent bee-keepers had been present, but the general feeling was that the meetings had been pleasant as well as profitable, and on separating all were

ready to say, "Happy to meet, sorry to part, and glad to meet again."

The Convention passed a resolution recommending the *American Apiculturist* "as one of the best bee-periodicals published in the interest of bee-keeping." This resolution was mild and friendly, but we do not think it was wisdom to select one paper (and that the very youngest) upon which to pass such a resolution in a Continental Society. It begets a feeling of jealousy and unfriendliness among the others towards the one selected, and thereby *damage it*.

This we regret, for we regard the *Apiculturist* as a good paper, and fully agree with the sentiment expressed, but regard it as very unwise action on the part of the Convention.

☞ One of our friends has sent us the following letter, which explains itself :

EDITOR BEE JOURNAL :—Enclosed you will find a "paster" of a monthly bee-paper published in the East, which was sent to me with the request to use it on all my circulars, business letters, *postal cards*, etc., and the inducement was the insertion of my business card in the paper one year. I do not wish to accept the offer for the reason that I do not consider it "the best bee-paper in the English language," but I could consistently put on such a notice of the old AMERICAN BEE JOURNAL. Can you not have a lot of them printed and gummed, and send them to the supply dealers? I will put them on all my correspondence. V.

One word of caution is necessary. Such "pasters" cannot be attached to Postal Cards without causing the one to whom it is addressed to be assessed *two cents extra* for extra postage.

Yes; we will cheerfully supply, without cost, such labels to any one for attaching to Letters, Circulars, etc., if desired.

☞ The subsequent article on Foul Brood, by Mr. Frank Cheshire, has been crowded out by the report of the National Convention. It is in type, and will appear next week.

Selling Honey-Dew as Honey.

The following letter will explain itself :

Reading about some men selling honey-dew, it has occurred to me that there might be some way to prevent such frauds. If men who handle honey would insist that every man should put his name on every package which he sends to market, it could easily be traced to the guilty party. There was one man who sold perfectly worthless stuff about Cresco, Iowa, and it nearly ruined the market for extracted honey. Bees have done fairly well in this section, my average being 150 pounds per colony.

L. E. WEBSTER. 6

Bonair, Iowa, Nov. 4, 1884.

We have for a long time insisted that every apiarist should label the honey sent to market, and that the label should be a guaranty of its purity. In that way a steady and regular demand will spring up, which will also be remunerative to the honey-producer, and at the same time be a "safe-guard" against imposition. Honey-dew should never be sold as honey; and those who do it once will have cause to regret it ever after.

☞ The fare on the different railroads centering in Chicago, is \$25 for the round trip to New Orleans during the World's Exposition. What a fine chance for a World's Exposition Bee and Honey Show!

☞ At the Fair at Fremont, Mich., there was a good honey display by Mr. George Hilton. The *Indicator* remarks as follows concerning it: "George Hilton was on hand with a complete outfit of articles necessary to carry on the honey business, and also displayed some very handsome honey. No one in the State pays more attention to the comfort and welfare of the busy bee than George, and his entire outfit is of the best improved order. His 'bee village,' in this town, is a good-sized Fair of itself."

Local Convention Directory.

1884. *Time and place of Meeting.*

 J. T. Pomeroy, Sec.
 Jan. 14.—Central Illinois, at Bloomington, Ills.
 W. B. Lawrence, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Hunting Adulteration.

In reference to the honey of Mr. F. H. Hunt (claimed to be adulterated), mentioned on pages 424, 475, 492 and 563, we have received the following, which will explain itself:

EDITOR BEE JOURNAL.—*Sir*: I am in receipt of a communication which reads as follows:

"Chicago Sugar Refining Co., Chicago, Ill., Oct. 25, 1884. T. L. Von Dorn, Esq., Omaha, Neb.—Dear Sir: The sample of honey left by you has been tested in our laboratory, and was found to be strongly adulterated with glucose syrup, containing over 50 per cent. of its weight of the latter substance. Yours respectfully,
 DR. ARNO BEHR."

The sample tested was the contents of one of the bottles which I exhibited at the Chicago Convention, and was obtained of Mr. Tamblin, of Lincoln, Neb., by Mr. S. L. Thomas, Vice-President of the Nebraska State Bee-Keepers' Association. This so-called honey was obtained by Mr. Tamblin of F. H. Hunt, of Centre Point, Iowa. Mr. Tamblin had nearly one ton of it on hand a short time ago.

I hope that this will settle the question of who is right in this controversy, and it ought to cause a blush of shame on those who have upheld the fraud. I think that bee-keepers, generally, will not think my efforts to uphold their good name and expose the frauds, have been guided by any but the best of motives.

T. L. VON DORN,
 Pres. Neb. S. B. K. Ass'n.

Mr. Von Dorn claimed, on page 475, to have submitted some of Mr. Hunt's honey to a chemist for analysis.

Mr. Hunt claimed, on page 563, that the result of that analysis was a vindication of his honey.

Mr. Von Dorn brought some of the honey to Chicago, last month, and left it with Dr. Behr to be analyzed, and the above report is the result, as

stated by Dr. Behr, showing that it contained 50 per cent. of glucose.

Without desiring to prolong this controversy, the BEE JOURNAL would say that this looks conclusive, providing there is no mistake as to the identity of the honey.

We have long maintained that the producer's name should be a synonym of purity, and that fraud and adulteration should be condemned and severely punished. Therefore, if Mr. Hunt cannot clear himself of the charge, he is by the above, proven to be an adulterator, either by feeding the bees glucose or "mixing" honey and glucose afterwards.

This is a serious matter, and calls for proof to the contrary, if it can be given. We will say in advance that Mr. Hunt's reply (if he offers it) must give the facts, calmly recited, without abuse of those who have caused the investigation. If Mr. Hunt has any facts, proofs, explanations, arguments, confession or apology to offer, such will duly appear, as we have no wish to injure him or his business. But we cannot admit personal quarrels or vituperation (such as the last communication he sent for publication). The facts are now demanded, alike by friend and foe.

A Lady's Success with Bees.

Mr. J. J. H. Reedy, in the *Nebraska Farmer*, gives the following description of Mrs. J. N. Heater's apiary and its management, and of her excellent exhibit of bees and honey at the Fair:

The bees were of pure Italians, three-banded brood in all stages was in the exhibit. We will first mention the appliances shown, viz: Noine honey extractor, queen-cell, cages for shipment, Langstroth single-walled hive, frames, etc.

Mrs. Heater has done remarkably well, and the earnestness with which she labors is a fit example for others to imitate. The care of many bees is a tax on one's time and strength, but with a wise use of proper implements, much better work will be accomplished. Mechanical ingenuity is a great promoter of home comfort, and the possessor of an ordinary talent for the work may attain success in the line of providing for the protection of the bees under his care.

Mrs. Heater has devoted several years to the care of bees, and her interest is quickened much by her great success.

The honey, both in comb and extracted, was of fine quality and nicely arranged, evidencing good taste and excellent judgment in the details of the work. The profit to the keeper, and the benefit to the community of

having such home enterprises is our joint plea in behalf of bee-culture. The business is ennobling, and leads to better perceptions of the useful and beautiful. In it there is no element of degeneracy; nor does it lead to the destruction of anything that is of any special benefit to the community. It enlarges our minds in the reception of the truths of natural history, and paves the way for a more liberal culture in the art of home adornment and in the supplying of innocent employment for otherwise dull and unemployed hours.

To say that the occupation is a constant incentive to industry, and draws away the mind from intemperate or dissolute habits, is but a feeble expression of the influence of the work upon those engaged in it. It does much more: it moulds character, whenever the enterprise has the soul-sympathy of the one engaged in it—lessons of industry, sobriety, earnestness, zeal; all these are aids in correct habits. The blessing of God and man rests on the apiarist, in the honorable pursuit of his calling!

A few words as to the wintering of bees: Mrs. H. favors the double-walled chaff hive, which she uses with some small changes during the summer, believing it as necessary as in the winter. Her colonies number 56, and her experience in wintering has been such that her words are entitled to some weight.

The objects of the bee-keepers' association of Nebraska, are commended by this lady, and we hope that in the near future the results of her past experience will be recorded for the benefit of beginners in so laudable an undertaking.

To all new subscribers who send us \$2 for the Weekly BEE JOURNAL next year, we will send the rest of the numbers of this year free from the time the subscription is received at this office.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

North American Bee Convention.

[Concluded]

FIFTH SESSION.

The Convention was called to order at 7:30 p. m., with President Root in the chair. A discussion on comb foundation was the first order of the evening. It was opened by a brief essay read by J. Van Deusen, as follows:

COMB FOUNDATION.

The importance of comb foundation is evident to the great majority of bee-keepers. Its early stages of experiment have passed. The apiarist of to-day can justly boast of the best comb foundation in the world. Time was when the highest ambition of the apiarist was to obtain a *starter*—a comb-guide; but with the improvement in foundation, the guide is a thing of the past. The necessities of to-day are full sheets of worker foundation to build up colonies by which we are enabled, in a great measure, to control the number of drones in the hive, which has always been a serious drawback in the production of honey.

The bee-keeper of to-day can give his colony on full sheets of comb foundation, and in less than 24 hours, under favorable circumstances, can see the queen supplied with cells in which to deposit brood as fast as she can use them, and the workers storing honey. They can also fill their sections with foundation, and under favorable circumstances, have them nicely filled and sealed over in 4, 6, or 8 days. With these facilities, it is left with individual bee-keepers to decide whether they will use a clean, light foundation which will make a surplus honey to please the most fastidious taste, and build up a reputation for nice honey such as no other Nation can produce; or whether they will use a dirty, heavy foundation and make such a honey as no one ever wants the second time. Choose ye between the two.

Make a nice surplus honey and establish a reputation which will command a ready sale at a good price. You have the facilities for making either. It is for you to decide whether you will use an inferior foundation and ruin your reputation for nice honey, or use a superior foundation and establish a reputation such as no other Nation can compete with.

A long and rather dull discussion followed the reading of this essay. For the first time during the meeting of the Society, the chariot wheels dragged heavily. Nothing new or interesting was developed, and at length in sheer weariness, the subject was dropped, and it was voted to take up something else.

The question of the bill of the Stenographic reporter, who took the minutes of the last convention, was brought up and referred to a committee consisting of Messrs. Pettit, Pierce, J. Van Deusen, W. F. Clarke and W. E. Clark.

REVERSIBLE FRAMES.

The question, "Is it advisable to use reversible frames?" was introduced by the President, and the Convention agreed to consider it.

Mr. Peet explained the chief advantage of reversing frames to be that the bees would then build comb to the very bottom of the frame, thereby making the sheet of comb stiffer, and providing more room for brood.

Mr. Pettit said that Mr. Wm. F. Clarke was a strong advocate of sticking as closely to nature as possible, would he think it unnatural to reverse the frames?

Mr. Clarke replied: That depends. We used to be told that the bees did not build their cells horizontally, but tilted them slightly upwards; and our bee-masters were in the habit of cautioning us in transferring bees, to keep the comb in the same position that they were in in the old hive. I have never tried reversible frames, but if the bees tilt their cells upward, I should be indisposed to turn them upside down.

This led to a most animated debate. Mr. Hall, of Ontario, stating that the bees tilted the cells upward a little; Mr. Betsinger denying it.

In the thickest of the debate, a sheet of comb on the Quinby frame was produced, and the majority considered that the cells were slightly tilted upward, but Mr. Betsinger insisted that they were perfectly horizontal. Still there seemed to be no difficulty arising out of reversing the frames on this account.

Mr. Hall saw no good in reversing. It was not needed to stiffen the frame. He preferred not to have the combs built clear to the bottom of the frame, for it left such a nice place for queen-cells. But if it was desired to have the combs built solid at the bottom, all that was necessary was to hoist the frame into a super. He had a large number of these frames which had been so built out.

President Root thought that there was no great object to be gained by reversing frames.

Mr. Betsinger differed from him, and predicted that the reversible frame was the coming frame. He had over 1,000 of them now in use in his apiary.

After some further remarks, the subject was dropped.

The committee on revising the Constitution of the Society reported as follows:

The committee on revision of the Constitution, on consultation with Mr. Betsinger, who was present at the meeting held in Philadelphia in 1876, find that the North American Beekeepers' Society should be composed of delegates from all the local societies throughout North America. They would, therefore, recommend and urge that the local societies do carry out this feature, and send delegates to the meeting of this Society at Detroit in 1885. The local societies will please correspond with the Executive Committee in reference to this matter.

On motion, the report was received, and a discussion on it sprung up. The fear was expressed that this

action might discourage personal attendance at future meetings. It was also urged that if the Society became representative, a much larger attendance might be expected.

W. F. Clarke moved, seconded by U. E. Dodge, that the report be adopted with the following addition: While it is desirable that the Society should mainly be composed of delegates as originally contemplated, it is to be understood that individual members will, as heretofore, be eligible and welcome.

The hour of adjournment arrived while this matter was under discussion.

SIXTH SESSION.

The Convention met at 9:30 a. m., President Root being in the chair. A communication was read from the Warner Astronomical Observatory, inviting the Convention to visit it. On motion, it was resolved to do so at 1:30 p. m.

The programme committee reported the subject of Bee-Literature for discussion. Several speeches were made on this topic, indicating what is often manifest, viz: That almost everybody thinks that he knows how to run a paper better than the editors and proprietors. The evils of bee-papers being connected with the supply business were freely ventilated, and the importance of having bee-periodicals without any axe to grind, was insisted upon. Many things "wise and otherwise" were said, and finally it was

Resolved, That, while by no means disparaging the value and usefulness of other bee-papers, we as bee-keepers in convention assembled, recognize in the *American Apiculturist* a paper worthy of our support, and would recommend it to the bee-keepers as one of the best bee-periodicals published in the interest of bee-keeping.

An essay on "Foul Brood," from the pen of D. A. Jones, was read by the Secretary, entitled

CURE OF FOUL BROOD BY FASTING.

There has been much said of late on this subject, that it would seem to be pretty well worn out, but there are yet many apiaries suffering from the malady, where a simple and effective treatment would be gladly tried if known. I have experimented considerably, and I have found that the disease can be cured without any difficulty, without any medicine, without any danger of spreading the disease, when properly managed, and without any possibility of its ever returning.

Perhaps I may be allowed to describe the disease as I have found it in Canada. In speaking of foul brood, I would first distinguish it from all other bee-diseases, such as chilled brood, over-heated or scalded brood, neglected brood, starved brood, dead brood caused by shipping bees, and another kind of dead brood which resembles foul brood in some respects, and is doubtless what some call a mild type of foul brood.

It would make this article too long to describe minutely the appearance

of the various kinds of dead brood above referred to, and the various causes of its appearance. I also do not wish to interfere with any other person's system of curing foul brood, but simply to give my own (which has proven successful with myself and scores of others), in the hope that those who have tried various remedies unsuccessfully, may be encouraged to try once more, and with no further expense and with but little trouble, rid their apiaries of this foul disease.

I do not believe, with some, that there is only *one* method of cure (and that their own). I know, by experience, that it can be cured in various ways, and I intend to continue my experiments, with the aim of still further simplifying, if possible, the method of cure.

Some imagine that foul brood may be discovered by the foul smell arising from the diseased colonies. This is true as far as it goes; but if one waits until then, there is a probability that very many if not all the colonies in his apiary have become diseased. Before such a condition had resulted, the disease would have been running for a long time in some one or two colonies, from which, especially in the spring or fall when robbing is carried on more or less, the surrounding colonies would surely be contaminated, and become themselves centres of infection. A single drop of honey taken from a diseased colony, if fed to the larvæ of a healthy colony, is sufficient to start the work, which, if unarrested, is inevitable destruction.

When the disease becomes very bad, much of the brood dies before it is capped over, and never is capped after it once dies. I have frequently seen colonies which had become so diseased that a very large portion of the brood had died just before it was capped, and some of the larvæ before it had its full growth.

In examining the larvæ just before and after it dies, I find that a dark spot first appears about its centre, and increases in size very rapidly. Shortly after its appearance, short, thread-like veins extend from this centre towards both extremities of the larvæ, and appear to plant two new spots, from which more veins soon radiate. The veins and spots then gradually enlarge until the entire larvæ is uniformly affected. The skin of the larvæ also commences to wrinkle and shrivel up on the top-side, the larvæ flattens down and gradually recedes to the back of the cells, and finally becomes the brown, putrid mass which so clearly distinguishes foul brood from all the above-mentioned maladies.

This brown, ropy matter has a sticky and tenacious, almost elastic, consistency, and if a pin-head be inserted in it and drawn slowly out, it will stretch like India rubber and jerk back into the cell again. The bees make efforts to remove it, but, after a few trials, give it up in disgust, and philosophically endure what even they find too incorrigibly obdurate to cure. Allowed to remain, this viscid substance, in time, dries up at the bot-

tom of the cell and would not be noticed except by close observation.

Diseased larvæ, which is capped over, is indicated by a sinking of its capping compared with the fuller appearance on the capping of healthy larvæ. A small puncture is also made by the bees in the capping, varying in size from that of a pin-point to a pin-head. This seems to satisfy them that there is nothing to expect, and the cell is left to itself. If the apiarist opens such cells carefully, and finds the contents as above described, he may be sure that his bees have foul brood; but if the larvæ retains its shape and size, and the skins seem perfect, even though somewhat shrivelled, that is *not* foul brood. These punctures are sometimes made in merely dead-brood capping, their non-emergence at the proper time being noticed, doubtless, by the bees and thus investigated. Wherever foul brood exists in a colony during the breeding season, the brown, ropy matter in the cells may be found.

I could describe several methods of cure, but the following, I think, will be ample, and as it is very simple and easily performed, it comes within the reach of everybody: If the bees have any brood, I do not destroy that; but I remove the queen and all the bees that can be spared from the hive, leaving only a sufficient number to take care of the brood while it is hatching. I endeavor to have them all filled with honey before removing. They are then shaken into a box having a wire screen lid, and placed in a dark and cool cellar. The box should be turned down on its side, when the bees will cluster on the other side, which will then be upper-most, and the wire screen forming a side, for the time being, will allow of free ventilation.

They should be left thus from 3 to 6 days, according to the temperature and condition of the bees, which may be determined by watching, and when a few bees fall down and begin to crawl in a weak, stupid manner, and those still clustering appear to have shrunken, they may then be removed and placed in a hive supplied with empty comb or comb foundation. A little honey or syrup should be given them, when they will soon be out foraging again for themselves. I have not been able to see any difference between colonies so fasted, until the foul honey which they contain has been consumed, and an ordinary colony of similar size. Both seem to go to work with the determination which characterizes their race.

Some still say that this fasting-plan is a failure; but where that has been said, it cannot have been properly tried. As soon as the brood, which was left in the foul-broody hive with some bees, as directed, is hatched out, they should be treated like the others, the combs rendered into wax, and the hive and frames boiled in water for a few minutes.

The wax in the form of comb foundation may be inserted in the same and be ready in the purified hive to receive, with perfect safety, the former inmates as soon as their puri-

fication is complete. The honey in the foul-broody combs, if extracted and boiled for ten minutes, can be fed to bees without any fear of injurious results. Boiling will kill *only* the germs of the disease.

I have subjected foul-broody combs to a temperature of 35° below zero, and allowed them to freeze all winter, then placed one of them in a healthy nucleus, and as soon as it was filled with brood and commenced to hatch, I have found, at the first examination, a very large number of larvæ affected with foul brood. Frost will, therefore, not kill the disease.

Every case of foul brood which I have found in this part of Canada, I have never failed to cure at the first attempt. In fact, there are a great many bee-keepers in Canada, now, who no longer dread foul brood in their apiaries, as they used to, knowing that they can cure any colony in one or two hours.

We have had some valuable hints on foul brood, in the bee-papers, and also some sheer nonsense. Fine spun, scientific theories are sometimes good, but solid facts from extensive practical experience is what suits me the best.

As soon as I shall be able to find the time, it is my intention to write up more fully, a complete and exhaustive article, treating on this disease, its origin, and its cure, and by illustrations I hope to make it perfectly plain and clear, so that the disease may not be looked upon, as at present, by many, as an incurable one.

D. A. JONES.

Mr. Hall said that in 1875 he lost his whole apiary by foul brood. From his experience he believed it better to make a bonfire of hives, comb, and bees, than to attempt cleaning them.

Mr. Betsinger regretted that the time was too short for discussion. He knew the cause of foul brood, and a simple remedy for it, which he would state at the winter meeting of the Northeastern Bee-keepers' Association.

President Root said that he should be inclined to leave the bee-business altogether, if he thought such another scourge of foul brood would ever be experienced as that which visited this country some years ago. It came mysteriously and mysteriously departed.

No reference was made to Mr. Cheshire's remedy, phenol, recently published so fully in the AMERICAN BEE JOURNAL.

The report of the committee on revision of the Constitution of the Society, which was not disposed of last evening, came up in the order of business, and was adopted, Messrs. W. F. Clarke and U. E. Dodge, with the permission of the Convention, withdrawing their amendment.

The programme committee reported a number of questions, which there was no time to discuss, and to most of which the committee had attached brief replies. They were as follows:

Question. Shall we use in the surplus department, sections of empty comb, when, from any cause, honey has been removed from the same?

Yes; especially in the spring, when the first sections are put on.

What is the best non-sticking substance to use in making foundation? Starch, made from rye flour.

Will the killing of drones early stop first swarming? No.

Should our section-boxes of honey be glazed? Four of the committee voted yes, one no.

What is the best package in which to ship extracted honey; and is it possible to get a practical wooden package which will not have to be boxed? Submitted to the Convention.

What is the best plan to get rid of fertile workers in a colony of bees? Carry each frame with the bees about 20 feet from the hive and shake them off on the ground. Put the frame back into the hive and give them a queen.

At what time should sections be placed on the hives? The bee-keeper must be the judge of that himself, as he has a knowledge of the honey-flow.

How late, as a general thing, will a queen become fertilized? As long as drones are around and the bees fly.

Is there any gas in honey which should be allowed to escape after extracting, before sealing it in jars? Probably some carbonic-acid gas, oxygen and hydrogen in the combined state of water, which is gotten rid of by evaporation.

What is bee-sting poison composed of, and is it an acid or alkali? Poison is composed of the liquid secretion of two glands—one secreting an acid liquid, the other secreting alkali liquid. The mixture is always strongly acid.

Shall we practice stimulative feeding before flowers bloom in the spring? Yes. No.

What is the best method of keeping combs over winter? Put them in a moth-proof room.

To obtain the best results from cellar-wintering, should bees be taken out for a cleansing flight during winter? Cannot say.

J. Thompson wished to get the views of the Convention on the latter point. Some said no, others yes. A vote was taken, but not "a baker's dozen" committed themselves one way or the other.

Mr. Wm. F. Clarke said: "Adopt my hibernating hive-stand and you will neither have to take them into or out of the cellar; and if there is a chance for a cleansing flight, the bees will take it."

The programme committee reported resolutions of thanks as follows:

To the Mayor and city authorities for their courtesy in placing the public buildings at the disposal of the Society.

To the daily papers, whose reporters have been very attentive and efficient.

To the brethren who prepared essays for the Convention.

To the President and officers for making preliminary arrangements, and for management of the business of the Society.

To the hotel-keepers for their polite attentions to members.

The committee on Mr. Bengough's claim on the Society for short-hand reporting at the last meeting, recommended settlement on Mr. Bengough's proposition submitted through Wm. F. Clarke, offering to take \$25 for work already done, and hand over the short-hand notes to the Secretary of the Society, to be put on file. The report was adopted.

Several small bills were ordered paid, and the janitor, who had been at a large amount of trouble, and had been in constant attendance to look after warming, ventilating, and lighting the building, was voted \$10 for his services.

The question was asked, whether any official report of this meeting would be published? President Root stated that the AMERICAN BEE JOURNAL had made arrangements to give a full report, and he presumed that Mr. Locke would have a report in his paper. It was not the intention to get out a report at the expense of the Society, but the Secretary of this meeting, Mr. Benedict, would write out the minutes which he had made, and transmit them to the newly appointed Secretary, who would produce them for reference at the Detroit meeting.

Mr. Clarke, of Ontario, said that this would entail a considerable amount of after-work upon Mr. Benedict, which it was not fair for us to expect him to do for nothing. He, therefore, moved that the Secretary be allowed \$20 for his services. The motion was seconded and carried unanimously.

President Root gave a brief address expressive of his satisfaction at the success of the meeting. Though it was not so large as usual, owing to the absence of the Western brethren, it had been most harmonious, and there had been many interesting and useful discussions. He hoped that there would be a general rally at Detroit, next year.

The Convention then adjourned until the fall of 1885.

 The Mahoning Valley Bee-Keepers will hold their fall meeting in Ravenna, O., on Nov. 14, 1884. A cordial invitation is extended to all.
E. W. TURNER, Sec.
Newton Falls, O.

 The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.
W. B. LAWRENCE, Sec.

 The bee-keepers of McDonough and adjoining counties are requested to meet at Bushnell, Ill., on Nov. 20, 1884, for the purpose of organizing a bee-keepers' association.
J. G. NORTON.

 The Massachusetts Bee-Keepers' Association will meet on Nov. 19, 1884, at 432 Southbridge Street, Worcester, Mass. All interested in bees are cordially invited.
J. G. JEFFERDS, Sec.
D. S. BASSETT, Pres.

A Distilling Insect.

Livingstone met with a wonderful distilling insect in Africa, on fig-trees. Seven or eight of the insects cluster round a spot on one of the smaller branches, and these keep up a constant distillation of a clear fluid-like water, which, dropping to the ground, forms a puddle. If a vessel is placed under them in the evening, it contains three or four pints of fluid in the morning.

To the question, whence is this fluid derived? the natives reply that the insects suck it out of the trees, and naturalists give the same answer. But Livingstone could never find any wound in the bark, or any proof whatever that the insect pierced it. Our common frog hopper, which, before it gets its wings, is called "cuckoo spit," and lives on many plants in a frothy, spittle-like fluid, is like the African insect, but is much smaller.

Livingstone considers that they derive much of their fluid by absorbing it from the air. He found some of the insects on a castor-oil plant, and he cut away about 20 inches of the bark between the insects and the tree, and destroyed all the vegetable tissue which carried the sap from the tree to the place where the insects were distilling. The distillation was then going on at the rate of one drop in every 67 seconds, or $5\frac{1}{2}$ table-spoonfuls every 24 hours.

Next morning, although the supplies of sap were stopped, supposing them to come up from the ground, the fluid was increased to one drop every five seconds, or one pint in every 24 hours. He then cut the branch so much that it broke, but they still went on at the rate of one drop every five seconds; while another colony of the insects on a branch of the same tree, gave a drop every seventeen seconds.—*The World of Wonder*.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Depressed Industry—Organization.

R. J. KENDALL. ©

The following article is from the *Anaheim Gazette*. It explains itself, and I will make a remark or two about it:

"One of the unfortunate features the present season is the depression under which the honey industry is laboring. For several years past the yield has been scant, and yet the price was, as a rule, below the point of profit. This season the crop was very good, but to offset this the price has gone down to a shameful depth. Sales of pure mountain sage honey are reported in Anaheim, this week, at 3 cents per pound, and he was a peculiarly bold operator who paid that price, 2 $\frac{1}{4}$ cents being the next highest offer. It is needless to say that even with the natural advantages enjoyed by the bee-keeper of Southern California, there is no profit in the business when such prices rule. And it is all the more exasperating to know that it is not a fluctuation in the consumption of honey which causes this low price. It is reasonable to suppose that the use of honey is steadily increasing, and more than keeps pace with the production. The real cause of the depression is to be found in the so-called honey with which the markets of the East and of Europe are flooded—honey in the production of which the 'busy bee' had neither hand nor part. It is glucose pure and simple, and as it can be produced cheaper than the natural product can be sent from California, the latter is unmarketable. Such, indeed, is the frank statement of a commission house of New York, who were asked by an Anaheim firm to give a reason why they would not handle pure California honey. Against such unscrupulous competition as this, it is almost useless to struggle. The only hope is in legislation, which will make it a punishable offense to sell glucose under a honey-label, just as it is an offense in some States to sell oleomargarine for anything but what it is. Until some such step as this is taken, there is nothing very alluring in the honey business.

I always believe that "to be forewarned is to be forearmed," provided the warned heed the warning. To me there are evident signs that the honey market is in peril so far as the pockets of honey-producers are concerned. They ought to be able to get 10 cents per pound for their honey, and when the price gets below that, I have very grave doubts whether it pays to produce it, the supply dealers to the contrary notwithstanding.

The honey crop is a precarious crop, and as "one swallow does not make

a summer," so also one year of honey-glut does not make the honey business a substantial or paying one; and even when we do get the glut, the effect seems to be of injury to the business.

"Three cents a pound"—the words are a comment and a warning, a comment on the want of management, and a warning that unless bee-keepers turn their attention as well to the management of the market as to the management of their bees, they are going to be "worker bees" with a vengeance; and also to find that at the end of the season they have been so robbed of their honey that they will have to look for outside feeding to winter on. But unlike the bees they have no owner, and none to do the feeding.

What is the remedy? Undoubtedly co-operation and organization. If every skilled bee-keeper were a member of his district association, every district association affiliated to its State association, and every State association connected with a National association, such organization could control the honey market, arbitrate the price of honey, and see to its being evenly distributed. This could be done by holding regular "grange" sort of meetings, paying small lodge dues, having representatives, agents, correspondents, and a perfect ramification throughout the whole country. Such a society would be a perfect barometer of the honey trade, and would be its safeguard, or could be made so.

Suppose such an organization; suppose that it had its own trade-mark and label; suppose every pound of honey it sold was guaranteed to be honest, pure honey; suppose every member was a *bona fide*, expert honey-producer (I mean not a mere novice or amateur); and suppose membership meant knowledge of the business, and honesty in it; do you not suppose that such a brand of honey would knock "higher than a kite" this adulteration and every other brand? If instead of every man shipping on his own hook, he would send his honey to his district association bottling, canning and packing house (where honey was tested and graded), would not a system of this sort, or something like it, be the best answer to cheap prices, and the glucose business.

I am afraid we think too much of managing our bees, and too little of managing our market. If we are to be successful we must give as much thought to the latter as the former. Honey will not sell itself, but if left to do so, it will sell us. I wish that those readers of the *BEE JOURNAL* who have more and longer experience would determine to take up this branch of the business and let us see if we cannot evolve some scheme to better our present positions, and become the masters of the honey market, and not its victims.

Austin, Texas.

N. Ind. and S. Mich. Convention.

The first regular meeting of the N. Indiana and S. Michigan Bee-Keepers' Association met at 10 a. m. in Goshen, Ind., on October 3, 1884, and was called to order by President A. Blunt, who briefly stated the object of the meeting. The first on the programme was the reading of the minutes of the previous meeting which were adopted. The roll was then called, when 15 members responded. An opportunity being then offered for any person to join the Association, by signing the constitution and by-laws, 6 new members were received. The number of colonies owned by the new members were 152, making 975 in all belonging to the Association. This does not include the increase of the new colonies belonging to the old members, as they could not give the number that were strong enough to winter. The Association favored the doubling up of weak colonies for wintering, instead of feeding them.

A general report was then called for by the President and the members responded promptly. It would be useless to attempt to give a full report of everything that was spoken. The facts are all that will interest any one, and they were: 1. That this has been a remarkably poor season for bee-keepers in this section, owing to the extreme dryness of the weather. 2. That the production of honey is far below the average and inferior in quality. 3. That many colonies are unable to winter without assistance. 4. The best food to supply them with is the best granulated sugar, dissolved in sufficient water to make a thick syrup, and to be fed in the hive, by filling empty combs and replacing them, or by the various other methods. A good and convenient way is, by filling a tumbler nearly full and placing it upside down in one end of the hive, and admitting the bees by raising one division-board. The only difficulty experienced by feeding syrup was from diarrhoea, caused by the sugar. This was also produced sometimes by bees eating soured or moldy honey. The best means of preventing this disease has been found to be some alkali, as bi-carbonate of soda, one tablespoonful to each gallon of syrup.

The discussion then turned on the best method of preparing bees for winter, after which the meeting adjourned until 1 p. m.

Promptly at 1 p. m., the meeting was called to order by the President, and the discussion continued on wintering bees. By the suggestion of A. Blunt, the physical condition of bees during winter, was added. This was: 1. Ventilation and the amount of air necessary for bees. 2. How this air should be admitted. 3. How to prevent moisture.

These subjects were discussed for some time, and the following resolutions unanimously passed:

Resolved. That regular and continued heat with dryness are the essentials in keeping bees during winter; therefore, this Association recom-

mends the packing of the hives at each end and at the top, with absorbents, such as wheat-chaff or leaves; and ventilation from the entrance only, with room above the honey-board for the bees to pass over the combs, and for shelter, only covering sufficient to keep them dry and from the direct blasts of the storms.

A vote of thanks was tendered the La Porte Bee-Keepers' Association, for the kind invitation extended to our Association, to be with them on Oct. 22, and a delegate was ordered to be sent to represent our Association at that time.

The executive committee was directed to procure Mr. James Heddon, of Michigan, and Mr. Newman, of Chicago, Ill., as speakers for our next meeting.

Adjourned to meet on the first Friday of April, 1885, at 10 a. m., in the same room. F. L. PUTT, M. D., Sec.

How to Feed Sugar Syrup to Bees.

C. THEILMANN, O.

This fall I have fed my bees for winter stores 900 pounds of granulated sugar syrup in two days. I fed it as described last year by one of the correspondents in the BEE JOURNAL; *i. e.*, by raising the front of the hive high enough so that the syrup, which is poured in on top of the back end of the frames, does not run out. When I read the article, last year, I did not think much of that way of feeding bees, as I feared that the bees might bedaub themselves too much; but I find by actual trial that the bees take up the syrup in a shorter time than in any other way that I have ever tried to feed them; but very few daubed bees can be seen at the entrance, and it is otherwise all right, no excitement for robbing has appeared.

Theilmanton, Minn., Oct. 30, 1884.

Read at the Wahash Co., Ind., Convention.

Feeding Bees.

A. SINGER.

The first question which I will notice is, "Why do we feed bees?" There are several reasons why the progressive bee-keeper will feed his bees. 1. In the spring, when no nectar is to be found, we should feed the bees in order to stimulate breeding, as it is of great importance to have all colonies strong as early as possible in the spring, so that they may be prepared to improve the first honey-flow. We are all aware that the queen is stimulated to greater activity in depositing eggs when the workers are carrying in food (which we may give by stimulative feeding), than when they get nothing from the fields.

2. When the flow of nectar has not been sufficient to enable the bees to store enough honey for a winter supply, then it becomes necessary to supply enough stores for them to feed on during the winter, which stores

should be capped over before cold weather sets in.

3. This fall, I intend to try an experiment with something with which, perhaps, some of you are annoyed. My bees have access to a cider-mill which is located within one-quarter of a mile from my apiary. Daily the bees make visits to the mill in search of food, and when there is no honey coming in, as has been the case during this fall, the bees will carry in great quantities of cider, which we all know is not fit for their winter stores. Then the question arises, "What shall we do to overcome this difficulty?" I am trying the plan of feeding, as an experiment, and gladly await a discussion of this point at this meeting.

I feed my bees in the morning, so that they may have something else to do during the day than going after cider. I find that many bees are thus deterred from going to the mill, as I have furnished them work nearer home.

I believe that where no great amount of cider is in the hive, if we mix a quantity of honey or syrup with it, it will sweeten it so much that when the water is properly evaporated from both, fermentation will not take place; at least not to any great extent. I am not certain of success, but I can report the result of my experiments at our spring meeting, and you can then be the judges.

The advantages of feeding bees are of some importance to any who have either few or many bees. As to the manner of feeding bees, I may say that each has his own method. The result desired should determine the manner of feeding. If we desire to stimulate breeding in the spring, we need not feed a large amount; a piece of old comb put into the cap of the hive will serve to hold enough syrup for the purpose. But when we desire to feed for winter stores we would need something more commodious. I have used Shuck's bee-feeder, and find it excellent for feeding small quantities at night. It is used at the entrance, and would, therefore, be objectionable if it were desirable to have the bees fly out during the day. I am using tin cups for heavy feeding. I make a little wheel out of a shingle or thin board that will fit inside the cup, leaving a little space around the edge where the bees may sip. This may be bored full of small gimlet holes, and serves as a float, settling as the syrup is consumed. This I find to be the cheapest feeder that I have seen. I notice some objections to it, though, as the bees become besmeared sometimes, and are unable to help themselves for a short time, but others come to their rescue, and they are thus relieved.

The question now arises, "What shall I feed my bees?" 1. Honey, if it is fit for table use; if not, Prof. Cook says that it is not fit for bees.

2. Sugar syrup made the consistency of honey when first gathered.

3. Coffee A sugar is considered the best to use in making a syrup. I would never use cheap sugar for winter feeding.

For stimulative feeding in the spring, before any pollen comes in, I have used Graham flour and also bolted flour. I put it on boards in front of the hives. This serves as a substitute for pollen, and I find that the bees work at it with a will on warm spring days.

Now, as to the amount to feed: I have nothing to offer in particular, but I would say, if you expect to extract from the brood-chamber, do not feed more syrup than the bees will be likely to use up before the honey-flow comes, as the surplus of syrup will spoil the sale of honey, and customers will say that it is adulterated.

Great care must be exercised in feeding syrup during a honey-drouth when sections are in place for surplus honey, as no syrup whatever should be deposited in comb honey for market. Let our motto be: "Build up the market for pure goods only."

I am often confronted with this question from customers: "What makes your honey go to sugar. (They mean granulate.) I always explain to them that this is one of the tests of its purity; and I believe that it will be a benefit to all if each will do the same thing towards educating the public so as to be able to recognize pure honey.

Some persons say that the honey can all be extracted and sold in the fall, and with that money enough sugar can be bought to winter their bees on, yet having a fair sum left to pay them for their trouble. I am not inclined to think that there would be anything gained in doing this, as it is considerable trouble to melt the sugar and distribute the feed.

Feeding late in the season should not be done if possible to avoid it, as it encourages breeding, and the cold weather approaching, the bees are driven to cluster, and the brood left to chill. If the cold continues, the bees cannot remove the dead brood, and it is left in the hive all winter in a decaying state, from which arise odors and gasses which bring disease and death to the rest of the colony.

In feeding at any time, great precaution should be exercised against robbing, which, when once started, is sometimes hard to stop. No syrup, sugar or honey should be dropped about the apiary, or exposed where the bees will find it, as these are great incentives to robbing. If we feed at night we need not have any fears of robbing, if the above precautions are well observed. Feeding at night can only be done while the nights are warm; for when the nights become cool, the bees will not carry the food to their cells, as they are all needed in the brood-chamber during cool nights, therefore the necessity of early, fall feeding for winter stores. Early in the fall each colony should be examined to see whether it is lacking anything, and then a remedy can be given accordingly.

In conclusion I will say this: Each person who keeps bees either for profit or for pleasure, should obtain some reliable authority on the subject, and then read it carefully and make as many observations as pos-

sible to attest his reading. If each were to do this it would put us to thinking on the subject, and by hard thought all our inventions and improvements are brought about, and mankind is thereby benefitted. Keep thinking as Galileo did when he saw the chandelier swinging to and fro at Pisa. His thoughts gave us the pendulum; your thoughts may give us something as beneficial. Improve the evenings by reading bee-literature.

No time is lost by the "busy bee,"
In running its daily train;
From the rising sun till dewy eve,
It treasures its honest gain.

For the American Bee Journal.

Will Honey-Dew Granulate ?

HENRY JONES. ☉

The best report that I have ever made is the following : Last fall I put 50 colonies of bees into winter quarters. Eight of them died, I sold 6, and began the season with 36 good colonies. From these I have taken 3,546 pounds of comb honey and 210 pounds of extracted. This is not an estimate, but all of it was carefully weighed. I now have 78 colonies with which to try the coming winter. I winter my bees on the summer stands and pack them with dry sawdust. Will honey-dew, or the product of aphidæ, granulate ? I had the impression that it would not, but some honey which I extracted on June 5 granulated solidly before July 1. Nearly all who tasted it pronounced it honey-dew.

Chesaning, Mich., Oct. 31, 1884.

[Prof. Cook's reply to the above inquiry on the granulation of honey-dew is as follows : "So far as I have been able to determine, the better kind of honey-dew (that from aphidæ and ergot) is quick to granulate; that which I have from bark-lice shows a tendency to solidify."—ED.]

Apiarian Display at New Orleans.

H. BESSE, M. D. ☉

I am appointed Assistant Commissioner for Ohio to represent and arrange the apiarian display at New Orleans. The exhibition will not be large, but I shall aim to show the most instructive articles, such as hives, honey-packages for surplus honey in all forms to ship and in the market; and all kinds of apparatus and material used or produced in the apiary. I am given but a small amount for this object, and will, therefore, have to limit the exhibit to the practically useful. If any bee-keeper, or any one in the supply business, thinks that he has that which will be instructive, and is new and peculiar, I shall be glad to hear from him at once. Any articles donated will be arranged in the most tasteful manner. (This will give an excellent opportunity to advertise goods.) Those

desiring to loan them goods for the Exposition (and this is urgently requested) will send all articles to my address at Delaware, O., I paying the express or freight charges. All desiring to respond to this call please do so at once, as all articles must be sent to me by Nov. 20, 1884.

Delaware, O.

For the American Bee Journal.

Southern Wisconsin Convention.

The fourth regular meeting of the Southern Wisconsin Bee-Keepers' Association was held on Oct. 28, 1884, at Janesville, Wis., President C. O. Shannon presiding.

After the reading of the minutes of the previous meeting by the Secretary, Mr. Levi Fatzinger read an essay on the "Advancement in Apiculture," commenting on the benefit of organized associations, the improvements made in handling bees since the days of the old log-hive, the value of the pioneers in bee-keeping, and the various experiences through success and failure.

The different methods of wintering bees was discussed at some length. Wintering in the cellar was first considered with the following conclusions: It is most important to have a dry cellar and sub-earth ventilation with a constant temperature of about 45° above zero. The hive-stand should be one foot high. Place the hives in rows and in three or four tiers high. The caps should be removed, and the honey-board shoved forward 1/4 of an inch for ventilation. Keep the room dark, and handle as little as possible. The bees should not be put into the cellar until the cold weather comes to stay. Their food must consist of the best honey or granulated white sugar made into a thin syrup. All dead bees should be removed from the bottom of the hive.

Wintering bees out-of-doors, the hives being packed in chaff, was next considered, and was generally admitted as the best method. Build a house large enough to allow a packing of five or ten inches thick around each hive. Arrange the hives in rows facing to the south. The entrance must be left open so that the bees can pass out and in at will. Ventilation must be provided at the top of each hive so that the moisture will be absorbed by the packing. Do not put the bees into winter quarters until the warm days are past, otherwise the bees will return to their old stand and be lost. The entrance should be kept clean from dead bees. The great advantages of wintering out-doors are: The bees can take a cleansing flight on warm days (it being necessary to scatter straw in front of the house for the weak ones to light upon). Also, they may be left in winter quarters until frosty nights are gone in the spring, thus saving much spring dwindling.

The exhibit of apiarian supplies was better than at any previous meeting. A case holding 24 one-pound sections, made for tiering up, and so arranged that the bees could not soil

the outside of the sections, was considered the best for the purpose. A patented bee-smoker was shown and highly recommended.

A novel queen-nursery attracted considerable attention. It consisted of a block of wood 1 1/4 inches thick and 3 inches square, having a 2-inch hole in the centre, covered with fine wire-cloth. In the end were two 1/2-inch holes connecting with the large one. A queen-cell is placed into one of the holes, and a sponge saturated with honey into the other. Any number of these may be put into a brood-frame and placed into the centre of the hive to be hatched.

A reversible frame was shown. It is the ordinary frame except the support or projection of the top-bar was cut away and supplied with strap-irons fastened at the centre of the end-pieces with a screw, and reaching to the top. Here it is bent over and back and terminating in two points. These irons may be turned to either the top or bottom of the frame. The frame may be hung bottom upward in the hive; the bees will then carry the honey into the upper story, leaving the entire brood-chamber for the queen.

Hints and suggestions were made as follows: A colony may be placed on its own stand or any other in the spring. Hives should be numbered so that a record of each colony may be kept. To insure the successful wintering of bees, honey-dew and buck-wheat honey should be extracted in the fall, and replaced with the best sugar syrup. The weight of a colony of bees is from 3 to 5 pounds. It is the common opinion that extracted honey changes its flavor, and is not equal to comb honey. It is claimed that some people do not know the difference between extracted and strained honey. Extracted honey is pure, and is extracted from the combs by a machine made expressly for the purpose; strained honey is comb honey mashed up with bee-bread, beeswax, bee-glue, and the dirt of the hive.

We give below the statistics for 1884, which we regret to say is incomplete, many members failing to report:

| | |
|--|-------|
| Colonies put into winter quarters..... | 286 |
| Colonies taken out of winter quarters..... | 283 |
| Colonies lost by robbing and sprig dwindling | 24 |
| Colonies sold..... | 25 |
| Colonies bought..... | 27 |
| Colonies commenced the season with..... | 269 |
| Increase of the season..... | 209 |
| Comb honey produced..... | 9,256 |
| Extracted honey produced..... | 3,722 |
| Wax produced..... | 63 |

The investment may be estimated as follows:

| | |
|--------------------------------------|---------|
| 269 spring colonies at \$8 each..... | \$2,152 |
| 209 fall colonies at \$6 each..... | 1,254 |
| Total..... | \$3,406 |

The product is as follows:

| | |
|--|------------|
| 9,256 lbs. of comb honey at 16 cents..... | \$1,480 96 |
| 3,722 lbs. of extracted honey at 12 cents..... | 485 25 |
| 63 lbs. of wax at 25 cents..... | 16 38 |
| Total..... | \$1,962 59 |

From the above it will be seen the profit is over 55 per cent. Had our table been complete, we could have made a better show of figures. The next meeting will be held at the usual place in Janesville, on Jan. 6, 1885.

Mr. J. C. Lynch will read an essay on apiculture. A general discussion will be indulged in on the subjects of bee-culture.

C. O. SHANNON, Pres.

For the American Bee Journal.

How Shall we Winter Bees?

J. E. POND, JR. ✪

The winter problem is the important matter in the minds of apiarists at the present time. All others sink into insignificance when compared with it, and with good reasons too; for other questions are easy of solutions, or depend upon whims or fancies, while this one stares us in the face, as one that affects the very life of the bee-business. If a sure method can be given by which every colony can be wintered safely, the occupation of bee-keeping will be placed upon a solid basis, and stand there permanently; as the matter now stands, great insecurity is felt by all in regard to the method which they advise and use themselves; for while they may have been uniformly successful heretofore, no one can predict what the results in the future will be. The ablest and most experienced are forced from time to time to report large losses, which would not be the case were there any positively certain method which they can use.

Mr. Heddon, to-day, is sure that he has the question settled, and fully believes that his "pollen theory" is the solution of the problem. Perhaps he is right; it is possible he may be; for one, however, cannot accept that theory, and fear that Mr. H., in placing too much present dependence upon it, may be prevented from giving the matter that attention which he otherwise would, and thus a loss will ensue, by reason of his ceasing to experiment.

While I do not accept the "pollen theory," there is one point incidentally made by Mr. H. in discussing it, viz: that if a colony is fed upon granulated sugar syrup only, and all pollen is removed from the hive on the approach of winter, that such colony will invariably winter safely. Now, if such is the case, there is an easy remedy for us all to adopt, and we need not bother our heads at present about the prime cause or immediate effect; it is enough for present purposes to know that safety lies in pursuing a certain course; and when it is established as a positive fact, we can all pursue that course in perfect confidence of the results which will follow.

It is easy enough to make assertions in regard to almost any matter; and where the matter is wholly theoretical it is not easy to disprove assertions, no matter how much they are at variance with our preconceived ideas. In this matter of wintering, however, we have now a chance to prove or disprove one thing, viz: whether the absence of pollen, and the presence of sugar syrup alone, in a given colony, will insure its safety during the coming winter. If it does so, and in

a sufficient number of cases in different localities, to as nearly prove the rule correct as is possible, why have we not got the remedy, even if we do differ as to the cause of the disease? The science of medicine is one of experiment largely; so with bee-keeping; and he who experiments the most wisely is the one who will meet with the greatest success.

The main point which we are now after, is to get our bees safely through our severe winters. If a certain means is offered by which it can be done, we can well afford to accept it, even if we do not admit the soundness of the theory upon which it is based. The matter is well worth a trial. It certainly can do no harm, and if good results follow, we are all benefited thereby. And then, too, in accepting the remedy, we need none of us give up our peculiar views or notions; we can still theorize and experiment as to the cause, and do so with the certainty of meeting with no losses, while thus theorizing. I for one shall give the matter a test for the coming winter, and I trust that enough of my fellow bee-keepers in various localities will do so also, to show whether we can with perfect safety adopt sugar syrup for winter stores.

Foxboro, Mass.

Lake Shore Bee Convention.

The September meeting of the Lake Shore Bee-Keepers' Association was held at Brocton, N. Y., but there was a meager attendance.

The subject of wintering bees was discussed as follows:

Mr. Gage said: Sometime in October I remove the honey-board and lay on a few thicknesses of newspaper or a carpet, and on the top of this I place a chaff-cushion about 4 inches in thickness, for an absorbent more than for protection. The entrances to my hives are about 7 inches wide. These I close up to about 2 inches. The most I ever lost in any winter, was 3 colonies. I have wintered 63, or near that number, at times.

Mr. U. E. Dodge: I generally pack the bees by the last of November. I pack them in a day when it is warm, so that stray bees will easily get back to the hive again. Packing is only one of the items for winter preparation. I commence in September to inspect my bees carefully, and aid each colony for wintering according to the condition in which it is found at that time. If I have a surplus of honey in one hive, I often take a part of it away and give to one that is deficient. But I do not advocate this method in general practice. I save quite a good supply through the summer for extra fall and winter feeding. Be very careful in feeding, or robbing will commence. If it does, look out for trouble that may be lasting. It disorganizes a whole apiary when robbing commences. I do not allow a drop of honey to be spilled near the hives, or a bit of comb where the bees can reach to excite their appetites. We cannot be too careful in this direction. If a drop of honey is seen

on the alighting-board, I wipe it off at once. Bees have guards at the entrances of hives, and if not demoralized by carelessness, they will protect themselves from foreign invaders that come for self in their natural way.

Mr. Hall: I consider myself under lasting obligations to this Society for what knowledge I have obtained in these mutual gatherings.

Mr. Rossiter: I have followed Mr. Bolling's plan of wintering, and had perfect success.

Mr. Dodge: I leave the entrances open all winter. If any get drifted under, I let them alone. They come out generally the best in the spring.

Mr. Hall said that Mr. Moon covers his hives with snow in the early part of the winter, for protection.

Mr. Dodge: Although we speak favorably of snow-drift covering and scientific packing, my conclusion is that a properly constructed cellar is the only true safe-guard for the wintering of bees.

Adjourned to meet at Fredonia, N. Y., on Dec. 6.

SELECTIONS FROM OUR LETTER BOX

Handling Bees Scientifically.

I commenced the season of 1884 with 26 weak colonies, 15 being Italians, and the balance blacks. I doubled them back to 15 colonies, killing all the black queens, and have taken 1,300 pounds of extracted honey, sold \$7 worth of queens, and have increased them to 25 colonies. My neighbors who handle bees scientifically have succeeded very well, but those who did not, have no honey for their pains.

GEO. W. MORRIS. ©
Salvisa, Ky., Oct. 28, 1884.

Bees Ready for Winter.

I began the season with 35 colonies, spring count, sold 13, and increased the balance to 39 by natural swarming. My surplus is 500 pounds of comb honey in one and two-pound sections, and 600 pounds of extracted honey. My bees are in first-class condition for winter, and all are ready to remove into winter quarters when cold weather sets in. All have ample stores well sealed to last until May, 1885. Here, this has been a fair season for honey. Last winter I wintered 3 colonies on the summer stand, with no protection except a quilt over the frames, resting on sticks, so as to give room for the bees to partially cluster above the frames, and so that the bees could move in a body to any part of the hive and not get chilled. The super was resting on a quilt filled with oat chaff, and the covers were raised $\frac{1}{4}$ of an inch to allow the moisture to escape. These 3 colonies wintered the best of any. I shall experiment farther during the coming winter.

C. F. GREENING. ©
Grand Meadow, Minn., Nov. 5, 1884.

No Fall Honey Crop.

I started in the spring with 6 colonies of bees, increased to 16 by division, and have taken 195 pounds of extracted, and 165 pounds of comb honey. I had to feed 95 pounds of sugar in order to bring my bees through the last winter. It has been a very poor season here. Bees have gathered no honey since July 15. I have done better than the most of the bee-keepers, the average being, as near as I can find out, from 15 to 30 pounds per colony, with no swarming to amount to anything.

H. L. WELLS.~

Defiance, O., Oct. 28, 1884.

Northwestern Convention.

In the report of the Northwestern Convention, on page 678, second column and second paragraph, the last word in the paragraph should be *frames*, not *combs*. Page 679, second column, seventh paragraph and third line, *evening* should be *covering*. Mr. J. A. Green writes me that he has not practiced the Heddon method of preventing after-swarming, nor the "tiering-up" of sections, and thinks it probable that I "contounded him with Mr. Furness, of Indiana."

W. Z. HUTCHINSON, § 68—108.

Rogersville, Mich., Nov. 3, 1884.

A Very Poor Season.

This has been a very poor season for honey in this section. But few bee-keepers have secured any honey at all. Nevertheless bees swarmed a great deal, and I think that most of the colonies will starve before spring, unless they are fed. There was an extra good crop of white clover, and colonies which were in just the right condition, gathered honey rapidly for a few days, when the honey-flow ceased almost entirely. There was but little honey in any of the fall flowers. Last fall I had about 195 colonies; I lost 5 weak ones during the winter, doubled the balance down to 165 in the spring, and increased them to 192, besides taking 1,500 lbs. of comb and 1,600 lbs. of extracted honey.

J. M. VALENTINE. §

Carlinville, Ill., Oct. 29, 1884.

Tiering-up Sections.

Here in Minnesota we cannot tier-up sections and get them capped so that we can use only one tier. Now, which are the best side-sections to use, and how shall we use them in order to have them ready to take off at one time? The $5\frac{1}{4} \times 6\frac{1}{4}$ section is too large, and the $4\frac{1}{4} \times 4\frac{1}{4}$ is too small for one tier, for the case will not hold enough. I believe that a section $4\frac{1}{4} \times 5\frac{1}{4}$ and 7 to the foot is the best size. To get them all capped at one time, we must have a case made of such a shape that the sections will come out easily, so that when the centre ones are capped we can put them at the sides, and move the outside ones to the centre. We need to know what would be the best case for this purpose. If I can get 35 pounds of cap-

ped comb honey from every colony, I shall be well pleased. Out of 1,000 sections I had 500 capped on the tiering-up plan. I believe that the pure blacks or German bees are the best bees in America for producing comb honey, but they have two faults. My bees were bringing in pollen on Oct. 19, and I put them into the cellar on the 27th. I hived 2 second-swarms and they did as well as any. I returned about 30 first-swarms. I began the season with 48 colonies, spring count, have secured 400 pounds of comb and 1,300 pounds of extracted honey, being a little more than 35 pounds per colony, and have increased my apiary to 80 colonies. I believe that dampness is the cause of bee-diarrhoea.

FAYETTE LEE. ©

Cokato, Minn., Nov. 1, 1884.

Much Bloom, but Little Honey.

Last winter bees wintered well in hives properly prepared. The spring and the whole season was good as far as rain, heat, wind, etc., are concerned, but although we had a profusion of bloom, it yielded but very little honey. White clover did well, but it is not yet well grounded in this country, still it is coming very fast, and will be a great help. Fall bloom produces our main crop. My hives had 10 pounds of honey, and I have fed 10 pounds of thick syrup to each colony. They have very little pollen, so that I think they are safe for winter. I use chaff-hives. Bees fly 3 days during every week. My comb honey in sections received the first premium at our County Fair (Nodaway Co.) I am doing all that I can for the bee-business here.

JNO. C. STEWART.~

Hopkins, Mo., Nov. 4, 1884.

Report for the Season.

My honey crop for this season is short. I commenced in the spring with 160 colonies, and increased them 90 per cent. by natural swarming and building up nuclei to full colonies. I have taken 3,000 pounds of extracted, but no comb honey. From the sale of bees, queens and honey, I have realized about \$500. In this locality I have never seen two good seasons in succession, but never an entire failure. Linden and wild china yielded very little honey this season. They only yield well every other season. The bees have been gathering honey from goldenrod during the past four weeks, and are still working on it. I will extract some yet. I have been busy doubling up colonies, and I now have 200 in first-class condition. My method is to make 4 or 5 colonies queenless on one day, and on the next evening, a little before sunset, I take a queenless colony to the one with which I wish to unite it, smoke both well, take a few frames from a stationary hive, fill them up with the queenless one, put on an upper story, put in the balance of the frames, sprinkle them well with sugar water, close them up, smoke in the remaining bees, and then I am ready for the next one. I

have had but one to quarrel, and that did not amount to much, and very few bees have returned to the old stand. I have now, in my honey-house, two Langstroth frames of honey which weigh 27 pounds. Who can beat it? I took from one hive, last season, 7 frames from which I extracted 59 pounds of honey. It takes about 15 pounds of honey to winter each colony here. My hives now will average about 30 pounds of honey. My plan is to let them have plenty of honey in the hive during winter, and then extract the surplus in the spring. Our bees stop working about Nov. 15, and commence again on Feb. 1. We scarcely ever have more than 4 or 5 days at a time when bees do not fly out. I have plenty of drones flying now.

J. W. ECKMAN. ©

Richmond, Tex., Nov. 1, 1884.

Bee-Keeping in Canada.

I started bee-keeping in 1883 with 2 colonies of black bees in box-hives. These I increased to 8 by natural swarming. I put some of the swarms into hives holding 12 Gallup frames, letting them build comb as they liked, and the balance I put into common boxes. I transferred one of the old colonies in August, and obtained about 25 pounds of honey from it. This was the amount of my honey crop for 1883, although a good season. I put them into winter quarters with very scanty stores, the 6 new colonies having not more than 100 pounds of honey altogether. I wintered 3 colonies out-doors, packed in straw, and 5 in the cellar. One of those outside starved to death, and 2 of those in the cellar; thus leaving me but 5 weak colonies to commence this season with. The cause of my loss was neglect to feed them a little syrup last fall. I would also have lost another had I not fed it some syrup in the cellar, which did not seem to injure it in the least. Although those out-doors seemed to suffer most from bee-diarrhoea, they built up much faster in the spring, and gathered nearly double as much honey as the others. I transferred my bees early in the spring, and then during the honey-flow I extracted over 800 pounds of No. 1 honey from these 5 colonies and their increase (1 swarm and 3 nuclei). I consider this an extra good yield for this season, for I only used 3 or 4 pounds of comb foundation. I also made my own extractor, the material for it costing me just 45 cents. This fall I obtained 5 colonies from bee-keepers near me, who were going to brimstone their bees. I built up my nuclei into full colonies, and formed two new ones, so that I now have 11 colonies in all. I have my bees nearly all prepared for winter, some with all honey, and some with nearly all sugar syrup; some I will put into the cellar, and some into clamps out-doors. I know from the past season's work that spring feeding and good spring protection pays well.

WM. JNO. HINCHEY,

Tamworth, Ont., Nov. 1, 1884.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Placing Separators.

Will Mr. Heddon please explain the best and most economical way to place separators in his super? also, how best to do away with the cross-supports and take up the room at the ends of the supers, if cross-supports are abandoned and separators adopted?

CHARLES MITCHELL,

Molesworth, Ont.

ANSWER.—I have never been able, nor has any one else so far as heard from, to do away with the cross-partitions of my case or super, and yet have a good practical case left. With these cross-partitions we have a very strong yet light super or case free from complication or great expense, yet very solid and durable. I think I have now found a practical separator for the case just as we use it, who do not use separators. It will consist of a thin wooden separator the size of the section used, and not much thicker than tin; we will scant the sections just a trifle to take the separator, and make the bottoms and tops of the sections fully $\frac{3}{8}$ of an inch narrower than the ends, so that when the separators extend flush to the top and bottom of the section, there will be free passage room for the workers. There will never be any trouble with extended cells above or below the separators. Those who may wish can hollow the separators a little, but I prefer them square. I think these separators can be purchased at less than one-fourth the price of tin ones. A friend has kindly sent me the material, as he uses it, and it has proven a success with him, and looks practical to me.

Was It Foul Brood?

Will Mr. Heddon please explain and answer the following questions: I had a colony of bees, this fall, which I think had the foul brood. When I examined them for winter, to see how much food they had, I did not discover it; but about four days later when I had fed them about six pounds of sugar syrup, I smelled an awful stench from the hive, both at the top and at the entrance. I opened the hive and found every indication of the disease from what I can learn

from bee-books and from the BEE JOURNAL. I was very careful with it, shut up the hive, and when there were no bees flying from the other hives, I removed the honey board and placed a pan of sulphur in the hive and killed the bees. I then buried the bees and combs, put the hive out of the reach of other bees, and disinfected it with carbolic acid. First, Is it necessary for the acid to come in actual contact with every part of the hive in order to disinfect it? Second, Do you think that if 4 ounces of sulphur were burned in a closed hive, after removing the bees, it would disinfect it?

H. W. ROOP, ♂

Nashville, Tenn., Oct. 30, 1884.

ANSWERS.—Having never seen a colony affected with this dread disease, which seems so common of late, you will, no doubt, be as good a judge whether your colonies have it or not, as I would be. If they have it, it seems strange that it could develop so fast in "four days." There must be some mistake here, if it is foul brood.

1. Yes.

2. I think there would be danger in depending on the sulphur. Hot water (boiling hot) brought for a few moments in contact with every part of the hive and fixtures, will surely disinfect it, and is what I advise you to use.

Moving An Apiary.

I winter my bees in a cellar. Can I slightly change the location of the hives when I set them out next spring? I would like to change them from their present location, say 30 to 40 feet; how shall I manage the matter? I practice Heddon's method of preventing increase. One first-swarm cast a swarm, however, but I saw my mistake after it was too late to remedy the evil: viz. want of surplus room in which to store honey. I had not removed the honey-board. They were only 8 days old, but they had filled 10 frames full. I had failed to appreciate their industry, but frames will not catch me napping again.

T. F. KINSEL ♂

Shiloh, O., Oct. 31, 1884.

ANSWER.—Certainly you can; and you will find an answer as to the "How" which we advise to arrange conditions, in an answer to the same question, by another, on page 701 in No. 44.

Preventing Granulation in Honey.

In Alley's Queen-Rearing he says Mr. L. C. Root has a method of preventing extracted honey from granulation, and advises a trial; but he does not give the method. Will Mr. Heddon kindly give the method in the BEE JOURNAL?

W. JOHNSON & Co.

Kingston, Ont., Oct. 38, 1884.

ANSWER.—There are various ways to keep liquid honey from granulating. The addition of acids will do it. Heating will tend to do it. To make either of these processes effectual, the honey will thereby be injured. So

far as I know, there is no practical way, and by "practical" I mean any known method which is not more trouble or damage than to let the honey grain and then return it to the liquid state by the indirect heat process. When it is sold to a customer the package should be labeled with a label containing explicit directions for returning granulated honey to the liquid state.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Nov. 10, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—Nothing stirring in the market for the last few weeks. The approach of cooler weather is expected to impart more life to the trade. Comb honey sells at 16c. in the jobbing way, and brings 14 $\frac{1}{2}$ @15c on arrival for choice. Offerings exceed the demand. Extracted honey has commenced to accumulate, but demand is fair for small packages for table-use, as well as for darker grades in barrels. It brings 6@9c. on arrival.

BEESWAX—Is dull at 26@28c on arrival.

C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb. 18@20c., 2-lb. 16@18c.; fair to good, 1 and 2-lb. 14@16c.; fancy buckwheat, 1-lb. 12 $\frac{1}{2}$ @13c., 2-lb. 11 $\frac{1}{2}$ @12c.; ordinary grades of dark, 1 and 2-lb. 11@11 $\frac{1}{2}$ c. Extracted white choice, in kegs or small barrels, 8 $\frac{1}{2}$ @9c., buckwheat, 6 $\frac{1}{2}$ @7c.

BEESWAX—Prime yellow, 34@31c.

MCCAUL & HILDRETH, 34 Hudson St.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—Good to choice qualities are selling slowly, mostly in a jobbing way. Inferior grades are neglected. The market is weak at the quotations. A sale of 100 cases extracted, mostly choice white, was made at 4 $\frac{1}{2}$ c. One hundred tons extracted, barrels and cases, are going aboard ship for Liverpool. White to extra white comb, 9@10c; dark to good, 6@8c.; extract d. choice to extra white, 4 $\frac{1}{2}$ @5c.; dark and candied, 4c.

BEESWAX.—Wholesale, 24@27c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8 $\frac{1}{2}$ c.

BEESWAX—Firm at 32@32 $\frac{1}{2}$ c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; $\frac{1}{2}$ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.

BEESWAX.—28c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13@14c; extracted, 15c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, $\frac{1}{2}$ -lb. sections, none in the market. They would bring 18c.; 1-lb., 14@15c.; 2-lb., 13@14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6@7c.; white clover, 7@8c.; Southern, 5@6c.

BEESWAX.—None in the market.

CLEMONS, CLOON & Co.

Successors to Jerome Twichell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Unglazed sections sell best.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

"The Mysteries of Marseilles; or, The Loves of Blanche and Phillippe," by the author of "Nana," is an intense love story, overflowing with excitement and absorbing interest from beginning to end, while it bristles with the spiciest of details put in Zola's best and most effective manner. It is published in a large, square, duodecimo volume, paper cover, uniform with "Nana," and "L'Assommoir," price fifty cents, and will be found for sale by all Booksellers and News Agents and on all Railroad Trains everywhere, or copies of it will be sent to any one, to any place, post-paid, on remitting fifty cents in a letter to the Publishers, T. B. Peterson & Brothers, Philadelphia, Pa.

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Donnett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6½ inches.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

The "United States Democrat," published weekly at 171 Broadway, New York, at \$2 a year, is a first-class Democratic weekly publication. Ten copies one year for \$16.00 and one copy extra to the getter up of the club. It is edited by Mark M. [Brick] Pomeroy, who formerly edited the "La Crosse Democrat."

WANTED—HONEY.

46AU R. GRINSELL, Baden, Mo.

EXCELSIOR HONEY EXTRACTORS

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

| | |
|--|--------|
| For 2 American frames, 13x13 inches..... | \$8 00 |
| For 2 Langstroth " 10x18 " | 8 00 |
| For 3 " 10x18 " | 10 00 |
| For 4 " 10x18 " | 14 00 |
| For 2 frames of any size, 13x20 " | 12 00 |
| For 3 " 13x20 " | 12 00 |
| For 4 " 13x20 " | 16 00 |

COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE.

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address, **JAMES HEDDON,**
DOWAGIAC, Cass County MICH.

Prices Reduced.

Owing to a decline in the price of Beeswax there will, hereafter, be a reduction of **5 cents per pound** on all orders for Comb Foundation.

OLDEST BEE PAPER
IN AMERICA

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., November 19, 1884.

VOL. XX.—No. 47.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Honey as Food and Medicine.

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

ADVERTISING RATES.

20 cents per line of space, each Insertion.

For either the Weekly or Monthly Editions.

A line of this type will admit about 7 words. ONE INCH will contain TWELVE lines.

Transient Advertisements must be paid for in advance.

Editorial Notices will be inserted at the rate of 50 cents per line.

Time Discounts on advertisements will be made as follows: **On 10 lines** and upward, 3 insertions, 5¢ cent; 6 insertions, 10¢ cent; 9 insertions, 15¢ cent; 12 insertions, 20¢ cent; 26 insertions, 25¢ cent; 52 insertions, 40¢ cent.

On 50 lines and upward, 1 time, 5¢ cent; 3 insertions, 10¢ cent; 6 insertions, 15¢ cent; 9 insertions, 20¢ cent; 12 insertions, 25¢ cent; 26 insertions, 30¢ cent; 52 insertions, 50¢ cent.

On 100 lines and upward, 1 time, 10¢ cent; 3 insertions, 15¢ cent; 6 insertions, 20¢ cent; 9 insertions, 25¢ cent; 12 insertions, 30¢ cent; 26 insertions, 40¢ cent; 52 insertions, 60¢ cent.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quietening and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 53 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back, 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

Research Concerning Foul Brood.

Several weeks since we re-published from the *British Bee Journal* the very interesting article on the Cause and Cure of Foul Brood, by Mr. Frank Cheshire, which was read before the Health Congress in London, England.

In the present number of the BEE JOURNAL we re-publish another article from Mr. Cheshire, giving additional particulars concerning his experiments and method of treatment of *Bacillus alvei*, commonly called foul brood, which we feel certain will be read with an extraordinary amount of interest. His experiments, critical examination, and scientific research are very valuable to the pursuit of bee-keeping, and should receive the general commendation of apiarists the World over—no matter whether his conclusions are correct or not.

Particularly will his remarks be interesting to apiarists on the point contained in the first part of the article, where he concludes that the disease is sometimes contained in the ovaries of queens as well as in the eggs and larvæ. If this is so, we may the more easily account for the many strange cases of "foul brood" reported from time to time.

Mr. Cheshire concludes that "*Bacillus alvei* is a disease affecting all and every condition of bee-hood." His proofs seem to be quite conclusive, and if this is the case, it shows how "some have blundered" even in giving it a name! If the disease is contained not only in the brood, but also in young nurse-bees, in old worn-out bees, in drones, in queens, and in the egg yet unladen—how incorrect it is to call it foul brood, when we are en-

deavoring to "call things by their right names!" But this more fully illustrates the position we have so often taken, that the science is ever advancing, and will not permit any "stakes" to be "driven" by saying to it "Thus far shalt thou go, but no further." It "bursts all our bonds asunder," and "casts all our cords from" its onward-marching developments.

In accounting for the prevalence of the disease, we have often said that it might have been communicated by healthy bees in search of honey, appropriating it from some "tree in the woods" where the bees had the so-called "foul brood." Now, if this be so, a still wider field presents itself when we consider that young queens from a perfectly-healthy colony may have mated with diseased drones from a neighboring apiary, or with diseased drones from "the woods."

Another point of interest is the inquiry whether there may not be danger to apiarists who are constantly handling diseased bees. Mr. Cheshire's answer to this inquiry is positive and re-assuring. He says: "*Bacillus alvei*, about which we know as yet the most, is utterly unlike any disease-germ affecting men or animals. Bees are almost certainly its only habitation. Mr. Watson Cheyne has up to now failed most completely in his endeavor to influence cats, rabbits, guinea-pigs, or mice by it."

We would commend the article by Mr. Cheshire, in this issue of the BEE JOURNAL, to every bee-keeper for careful perusal; no matter whether it begets approval or condemnation, it will pay every apiarist well to read it carefully.

☞ The *California Grocer* remarks as follows:

Packages now-a-days afford no criterion as to the character of their contents. It is said that much of the tea that is sold in fancy little boxes, artistically adorned in Chinese and Japanese designs, is made up of vegetable *debris* and chemicals that pass,

after due manipulation, as genuine tea. It seems to be a popular delusion that these little lacquered packages indicate pure contents, put up with the nicest care and the most scrupulous honesty in the native lands of the plant. The boxes, however, are made by New York manufacturers, and their wide distribution shows the great expanse of the trade in the home-packed and home-manipulated article which imitates so closely the genuine tea of China or Japan.

Yes; but parties who have any reputation *dare not* put their names on such bogus packages! To label honey or other goods with a producer's name is a safeguard against imposition.

Bees & Honey at Franklin Co. Fair.

The Franklin County *Chronicle* gives the following notice of a Honey Show:

One of the principal attractions at the County Fair was the Bee and Honey Show exhibited by Dixon & Dillon, of Parrish, Ill. They had two thousand pounds of comb and extracted honey. Their comb was neatly arranged in a pyramidal shape in the center of the building, which extended about 12 feet high. The niches between the crates of honey were filled with books on bee-culture, smokers, photographs of bee-keepers, cans of extracted honey and comb foundation, bleached and unbleached. On one side was the name of Dixon & Dillon neatly cut in fine, yellow comb-foundation, which gave the whole thing a fine and neat appearance. Their extracted honey was in Mason fruit jars, and were in a pyramidal shape on the platform on the west side of the north wing of the hall, which was occupied by them also, it being filled by apiarian supplies, such as honey-extractor, foundation-mill, living-box, section boxes, smokers, frames, wire and comb foundation. They also showed Italian and native bees in observatory hives. The Italian queen was reared from their imported queen. Many persons saw the first queen during the Fair. They distributed 500 Leaflets entitled "Why Eat Honey," by Thos. G. Newman, of Chicago, and the consequence was, they sold \$114 worth of honey on the Fair grounds. They were awarded 10 first premiums out of 12; the other two were carried off by Mr. W. Hutchison, who had on exhibition about 200 pounds of honey and a good many apiarian supplies.

British Bee Journal.

Phenol and Foul Brood.

QUEEN AND EGGS CONTAINING BACILLUS ALVEI—FOUL BROOD (?)

FRANK CHESHIRE.

In my former article theoretic grounds were given seeming to show that probably the queen, and even the eggs, might be infected, and that foul brood (?) might be communicated by heredity, as in the case of the disease called pebrine.

Statements have been made to me of the singular behavior of some infected colonies, which, although weak and decreasing, seemed ever bent on the building of queen-cells, and that they sometimes also were earnest in rearing drones. Two or three similar instances had come directly under my own observation, and as soon as I made the important discovery that adult bees were sufferers as well as the larvæ, it struck me that in all probability the explanation of the singular behavior referred to was that the bees knowing that the queen was defective were endeavoring to replace her, but that her defects constantly prevented their efforts from being successful.

It was to me remarkable that only two or three days before the Congress, Mr. H. F. Hart, of Stockbridge, wrote to me stating that he had observed a hive in which the disease appeared to strike some of the larvæ immediately after hatching, and that the bees built queen-cells. He then showed very keen insight by suggesting that it seemed to him to point to disease in the queen. At the Congress I heard more of the case, and felt convinced that the queen was actually infected.

Mr. Hart, with much kindness, agreed to secure her, if possible, and forward her to me. Finding this queen as nearly as possible dead at her arrival, I forthwith commenced a careful dissection under my Stephenson's binocular dissecting microscope; the only form of instrument really equal to very minute examinations. Having opened the abdomen and removed the left air-sac, which was very much above the average size—this I have found a constant indication of the presence of bacillus—I came upon the ovary and felt certain at once, from its appearance, that I should find the "missing-link," as Mr. Hart had called it. The ovary, of which I have on previous occasions removed many dozens, was in this instance abnormally yellow and extremely soft, so that it was very difficult to detach it from the tracheæ without tearing. I separated an ovigian tube and placed it under a second microscope (using 600 diameters), and at once, to my extreme gratification, four or five bacilli were seen swimming along with a lazy sort of progression. Detaching now a half-developed egg, and exercising great care to eliminate every possible source of accidental contamination, I placed the egg, with a trace of water, upon a glass slip and crushed it out flat with a thin cover, and in a few minutes I had counted no less than nine bacilli.

The right ovary was very nearly free from disease. During a prolonged search I found two or three bacilli only. All this is extremely interesting, as showing that this bacillus disease, like some attacking the human subject, may take both an acute and a chronic form, and may also settle in some special organ or part of an organ, as bacillus tuberculosis may attack one lung and destroy it and leave the other many years intact.

All will, I hope, forgive my esteeming myself fortunate in having thus been able to make out the only points I had to leave undetermined on the 25th of July last. Then I had found the disease in young larvæ and those fully fed, in chrysalids in all stages, in drones, in workers just gnawing out of the cell (a depression in one compound eye, or in the thorax, or in the fifth abdominal segment, is an indication of bacilli being present), in young nurses and in old worn-out bees, and now in a queen and eggs unladen. Bacillus alvei is then a disease affecting all and every condition of bee-hood.

Can it continue to be called foul brood? To say the queen is suffering from foul brood would be as illogical and ridiculous as talking of toothache in the liver, or rheumatism in a wooden leg. Surely, our better educated bee-keepers will usually name it "bacillus," and when speaking carefully "bacillus alvei," while those less

instructed will by degrees learn the desirability of dropping the old and utterly unsuitable term in favor of the one I give, which will, with a little practice, be no more difficult of pronunciation than its predecessor.

BEE DISEASES IN RELATION TO APICULTURE AND GENERAL SCIENCE.

All diseases may be classed as either functional, organic, or contagious. The latter are now very widely admitted to consist of ailments which are brought about by the growth and rapid multiplication within the living frame of vegetable organisms, commonly spoken of as germs. These organisms (micro-organisms) may be passed from individual to individual, and hence the possibility of infection.

Let us suppose we had never seen bees, but that we are told respecting them, that they live in very numerous colonies, of which the members are always in the closest contact; that their usual system of communication is by actual touch; that they habitually pass the food from one stomach to another; that all the food they have has been carried either within or upon the bodies of their fellows; that their very home is formed of one of their secretions, and that their beds, cradles, and larders, are all interchangeable. And then our informant asks whether we imagine such creatures would be liable to contagious diseases or no. Should we not reply that all the circumstances seemed such as must favor the development of such disorders?

At any rate, during the last two months, I have been able to make out no less than five, or, possibly six, distinct disorders arising from that number of specifically different germs, all of which will require prolonged attention if anything very definite is to be arrived at respecting them. In addition, I suspect strongly that true bee-diarrhœa will also turn out to be an infectious disorder, but since specimens fail me, the question must remain, so far as I am concerned at least, till another season.

A considerable number of cases have occurred in which numerous bees, small, hairless, and glossy, have been dragged *volentes volentes* to the hive door and then and there evicted, while in other cases crowds of these abnormal bees have died immediately in front of their homes. The question has been referred many times to the pundits, "What are these bees?" The reply has usually given the information that "the bees are robbers, old felons indeed who have so often been severely mauled in being turned out from the communities they were plundering, that all the hairs of their bodies had been pulled out." Quite satisfactory is this, if one knows nothing of the subject, but a little acquaintance with the form of the mouth and foot of the bee would show this reply to be most opposite to known facts. The hairs of bees are of four distinct kinds, but none of them are of such shape or size that they can be pulled off in an encounter. The foot has a most beautifully delicate pad centrally placed together with four very long and pliable feeling-hairs. On its sides are two double claws widely set, and so contrived that they cannot nearly meet. With such an instrument the grasping of hairs is impossible, as it is also by the jaws, for reasons upon which space forbids me to enter. But, although, the stereotyped reply is no longer tenable, a new and sufficient explanation is beginning to appear.

Miss Gayton, so well known for her very successful bee-keeping, has, fortunately for our subject, shown herself to be a most accurate and careful observer. This lady has furnished me with a number of bees of the kind referred to, together with her notes and observations running over a period of three years. These bees I find in every case filled with a bacillus somewhat smaller than *Bac. alvei* (the bacillus of foul brood), and which from experiments made at South Kensington in the Biological Laboratory have been already proved to be quite specifically distinct. At present I will content myself by saying that in this as in two or three cases the loss of hair is due to defective nutrition, the same cause that makes the writer so sympathetic with those whose heads are poorly clothed. Some years ago I discovered that if hairs of young bees are by accident broken, they are reproduced by growing from the ends as does an injured lobster's claw. I have some most interesting cases of partial reproduction of hairs of bees mounted for the microscope.

All this would lead to the supposition that weakness and loss of vital energy would tend to premature baldness, if I may be allowed the use of such an expression. This bacillus, undoubtedly, produces this effect, and so again I claim the right of giving a name, and so suggest *Bacillus depilis*, or the bacillus of hairlessness, as a fitting one.

The bees are, undoubtedly, reared in the hive from which they are ejected; but having in some way taken the disorder (Miss Gayton thinks probably from the queen; I have, as yet, no ground for an opinion), they are driven out as a danger to the community, for the disease once contracted, there can be but little question that it may be spread from one to another. Very large numbers of bees sent me from different parts of England and Scotland having the same general peculiarities also contain what at present I conclude to be the same bacillus.

With regard to the other germs found, my knowledge is at present so slender that I must advance nothing beyond the discovery of an enormously large bacillus which takes what is called the zooglea form, two, or possibly three, very minute kinds of bacilli and a micrococcus. The micrococcus will most probably turn out to be a putrefactive kind accidentally present. The whole subject is of great interest, and will, no doubt, hereafter explain, or help to explain, some enigmas in connection with apiculture which cannot be other than useful. *Bacillus depilis* is a very mild offender beside *Bacillus alvei*, but it will be interesting to note whether it succumbs to the same treatment. The merest beginner will not be likely to suppose that we are here discussing robber-bees pure and simple, but merely the "abnormal bees" or "black robbers."

That bees are not, or only very slightly, subject to functional or organic disease, is, no doubt, correct. Such disease would forbid increase, and so put a check to their own propagation. By natural and relentless weeding out of the sickly, the survival only of the fittest is secured. I have, however, traced a disorder which seems very rare, in which the liver-tubes degenerate into a thick yellow oil, of which an enormous quantity was collected in the body of one bee I lately examined.

I must hurry on as I have yet to take up the most important questions. 1. Is foul brood produced by chilled brood? Most positively not. Chilled brood, however, furnishes a very favorable resting place for the foul brood germ, and so one is practically often followed by the other. Chilled brood is most absolutely unlike foul brood when microscopically examined. Yet if chilled brood be found, I should begin treating the colonies with medicated syrup at once, as the smallest trace of infection would run riot amongst the dead and neglected larvæ, and establish a diseased condition as a consequence.

2. How does *bacillus alvei* get into a colony? I am now morally certain that very many bees of a colony may be diseased for several months with this bacillus, and yet foul brood may not be found. The bees do clear out solitary cases of infection in the grub often, so that the malady may not at all be suspected and yet exist. There is not one single old idea about this disease which is not incorrect, except that it is contagious. Time, I am convinced, will fully prove that the old bees almost invariably are the channels of infection.

3. Is bacillus the cause or result of the disease? Undoubtedly the cause. The reasons are numerous. Every attack is marked by their presence, whilst in specimens from healthy colonies bacilli never appear. The bacilli increase in number during life, and at death pass into the spore condition. The bacillus, during its growth, like other micro-organisms, produces a definite chemical product. By example, *Bacterium lineola* produces lactic acid, *i. e.*, it sours milk. *Bacterium subtilis* produces another decomposition in milk, forming butyric acid. Without these organisms neither can lactic nor butyric acid be evolved in the normal way. In the Biological Laboratory, Mr. Watson Cheyne and myself placed exceedingly minute quantities of coffee-colored matter from a diseased cell into tubes containing a mixture of meat broth, gelatine, peptone, and salt, guarded carefully from every kind of germ in the manner known to those who have studied the question. The bacilli multiplied and formed a growth in which were hundreds of thousands of millions of individuals in a peculiar characteristic arrangement somewhat like an inverted fir-tree. The

finest speck was then from this collection inserted into a second tube, and so on until now the seventh is reached. In every case the same characteristic growth appears, a growth never previously seen with any known germ; and upon examining the sixth tube, what is found? The meat juice, etc., has been converted into the definite chemical product formed in and giving the characteristic odor of foul-broody hives. For if one of our most accomplished bee-keepers were blindfolded and asked to smell this tube, he would exclaim, "What an awful case of foul brood this must be! There's no mistaking it, but it is the very worst I was ever brought into contact with." Can anything more be wanting? Bacillus produces "foul brood," and not "foul brood," bacillus. Our last proof shall be duly reported upon. When twelve tubes have been grown by successive inoculation, the contents of the last will be diffused through water, and some of it blown by a spray-producer over a card of healthy unsealed brood. I will not prophesy, although I foresee the result.

In the same manner *Bacillus alvei* has been cultivated in Japanese isinglass (*Agar-agar*), and here it quickly forms spores at 98.4°, the temperature of human blood; and nothing has given me greater pleasure, in connection with this inquiry, save the curing of the disease, than to watch in this cultivation the conversion of *bacilli* into spores and spores into *bacilli*—the ocular and most absolute proof of the lines of explanation which I felt to be the only possible one from the outset in my investigation.

TREATMENT OF BACILLUS ALVEI (FOUL BROOD.)

The interest evoked by my discoveries in relation to the most-dreaded malady to which bees are subject has, as I imagined it would amongst bee-keepers, principally centred around the method of cure.

While examining the great number of specimens of infected combs sent me by friends and strangers, two points received, to my mind, demonstration: 1. That Dzierzon is in error in asserting that there are two kinds of foul brood—one, mild, chiefly affecting the larvæ; the other, malignant, making its main impact upon the chrysalids. There is but one kind of foul brood. The same bacillus causes all, and, contrary to Dzierzon's idea, that form of attack which strikes the larvæ early is the more active and the more difficult of treatment, if there be a difference; and that if this early falling of the brood be caused by disease lurking in the queen, she will, so far as we as yet know, need to be supplanted. 2. That, although all cases are produced by the bacillus which I have called *alvei*, and so far are identical, yet the spores are at times more robust and virulent than at other times. Those who have given any study to germ diseases know that this has not only been observed, but actually made of practical use.

Amongst the specimens forwarded, two or three when examined microscopically, indicated, or seemed to indicate great activity, and the apiaries from which they came had in each case been ravaged by the scourge from end to end. In one instance the colonies, running very nearly if not quite to three figures, had not a sound one amongst them; in a second, 19 colonies were dying out in rotteness, and here, also, not one had escaped.

The colony supplied to me by the kindness of Mr. Mills, came with a sufficiently bad repute; the malady had in a very short time smitten in an apiary of about 20, every colony save 3. I regarded it as a fair typical case of advanced foul brood, quite beyond the reach of ordinary curative measures as they have been usually advocated. The manner in which the disease in this instance died out before my treatment is now matter of history, but I had not, at the time of the Congress, tried conclusions with the malady where it had been most relentless, and where it had worked the most devastating effect. Although I felt confidence that the disease was in all cases alike, and so must in all instances be amenable to the same methods, yet I could not rest until the experiment had been tried; and so, having secured three combs from the larger apiary previously referred to, stipulating that they should be the worst that could be found, and one from the second saturated with disease, and having possessed also for 18 days a comb given me by Mr. Mills as a specimen of what the disease could do, which comb had become rotten, mildewed so that half the cells could not be seen, and had little maggots feeding on the bodies of the decaying larvæ, I determined with these to make a colony.

On the morning of Wednesday, Aug. 6, these 6 terrible combs were placed into a hive and stood in the position of a good colony, which was removed to a new stand; the queen having been found, was popped in under the chaff-tray (which I use instead of a quilt) between the diseased combs. The poor foragers, with heavy loads and light hearts, began dropping in numbers upon the alighting-board; but the confidence with which they ran in gave almost ludicrous contrast to the dismay with which they instantly re-appeared. Circling in the air and taking their bearings, they tried again and again to discover what had happened, when in sheer rebellion they refused to enter, and clustered at night thickly on the outside of the hive, buzzing and fanning with a noise audible at many yards distance. The following morning saw no improvement, and at about 11 o'clock they went off bodily and settled as a swarm in a cherry-tree, in the very spot to which every natural swarm of mine has this year betaken itself. Having hived them in a skep, I was about to return them when they again took wing and gave me a journey into a neighbor's garden. "Prudence is the better part of valor," so a concession was made, and one of their combs divested of bees and containing mostly unsealed larvæ was given to them at the front of the hive. They were now returned and very many entered, but a big lump remained clustering about the porch. I really felt sympathy for the worried little insects, for as a lady said in a letter to me a few days since, "I love my bees." A point was to be proved, however, and so temporary discomfort could not be considered.

Early next morning I began by pouring my medicated syrup into their combs. This they re-arranged, and in doing so started the cleansing process. Day by day, at an early hour to prevent robbing, I fed as described, while the improvement became marked. Medicated syrup which at first would be utterly refused unless poured into the combs, will often, after a few days, be accepted freely from a feeder in the usual way. But in treating all cases such management must be adopted as will secure the using of a liberal allowance of the remedial agent. Noticing that the syrup was freely taken at the sixth morning, I determined to pour into the combs no longer; but made an impromptu feeder, with which I should be able to watch the movements of my small assistants. A shallow tin box about 3 inches by 6 inches was supplied with strips of very thin wood, which were stood on edge, and spaced apart by little uprights which gave room between for the bees to enter, after the fashion of a Gray's feeder. This was placed behind the dummy; the latter being raised sufficiently to allow the workers to pass beneath it. Into this box now the food was poured, the bees continually carrying it into the combs. As the weather was dry, the syrup was given thin, and the box was never allowed to become empty. Eggs continued to be laid rapidly, the colony became active and content, all smell vanished, and to my joy the brood as reared in these previously deplorable combs was almost perfectly healthy from the first. Most, however, of the grubs on the lower edge of the added comb took the disease, and passed through the first well-known stages; but they all disappeared, being undoubtedly carried out by the workers. This circumstance supports most completely my theory as to the means of infection, as given in my paper at the Congress. Three or four sealed cells still remain, which I know have the remains of dead grubs. When their covers break, the bees will clean them out; but with these exceptions the hive is now (Aug. 23, 17 days after commencing operations) as perfect in all respects as could be desired; while every dead grub, all coffee-colored matter, and dried putrid scale, is completely removed.

TREATMENT OF FOUL BROOD AT THE END OF SEASON.

The plan of pouring phenolated syrup into the combs, which I have found to succeed so magnificently during spring and summer, presents some difficulties at the close of the season which it would be well, if possible, to overcome. In the spring the bees are growing in activity, and then my remedy enables them triumphantly to clean their combs and put all quickly into proper form; but my experience, this autumn, shows that dispirited colonies are content, as the period of rest approaches, to take little trouble in cleaning combs which would not naturally be required in the near future, for brood-rearing purposes;

besides this, the pouring of syrup into the comb is extremely likely to start robbing, and in addition must have a chilling effect on the colony.

My supreme desire is not to be able to cure colonies myself merely, but to enable all to do likewise; and so I have continued to experiment, and in the result have conquered the difficulty referred to. Cake, consisting of sugar and pea-flour, given at the close of the season, is an unailing stimulant. This I have made in the usual way, but after removal from the fire during the stirring and cooling process, I have painstakingly mixed with it 1-5 of an ounce of absolute phenol to each 7 pounds of sugar; i. e., $\frac{1}{5}$ of the bottle of remedy. This cake, placed flat-side downwards over the frames, is rapidly taken, and with the very best results. Unfortunately, most hives—I had almost said almost all—have, to my mind, two very radical defects: 1. Their top edges are so narrow that any displacement of the covering causes a most disastrous leak of the vital heat of the colony, which, under all circumstances (except in the height of summer), should be heedfully guarded. In diseased and weakened conditions, if this heat be allowed to escape, the case is hopeless. 2. They are covered by stubborn, ill-fitting, often most untidy bits of carpet. Hives so formed and furnished do not admit of cake-feeding without exposing the poor bees to the highest discomfort. The plan I advocated ten years since, will, I hope, become the plan of the future. Instead of carpet, place calico over the frames, and upon this stand a chaff-box, a simple ring of wood 3 inches deep, and resting on the hive edges. Upon the under edge of this ring of wood tack loosely—loosely, I repeat—sacking of some such substance, and fill the whole with chaff or cork-dust. This placed over the calico covering, the cake will fall into form, and keep all in the most comfortable condition possible, and give the bees a chance. This cover, too, is always most convenient, especially if one feeds behind the dummy. Any bee-keeper once trying these chaff-boxes would feel but little content with any of the more usual covers. New cakes would, of course, be supplied at intervals, as regulated. As a help also, spraying every three or four days, the combs awaiting introduction, with 1 per cent. phenol solution might be adopted.

I have been keeping the disease going, in order to simplify as much as possible the mode of treatment, and, as a result, have felt the need of giving additional hints.

DISEASED SPERMATHECA.

Almost all know that the spermatheca is filled by active, thread-like bodies called spermatozoa, and which are formed within the body of the drone and transferred by him to the queen at her flight. These spermatozoa singly pass into all eggs which afterwards become either workers or queens (drone-eggs they do not touch), the egg having in it a minute hole called the micropyle to give the spermatozoon entrance.

I wish to call attention to the queen sent by Mr. R. Andrews, a gentleman whom I have not the pleasure of knowing. She was in appearance perfectly healthy, but was accompanied by a letter stating that she swarmed out June 20, laid in about 6 square inches of comb, and then, although she had everything in her favor, never laid again. I found in her ovaries and juices nothing abnormal. Her spermatheca was round, full, and of usual size. Under the microscope I removed its skin containing the tracheæ (air-tubes), some spermatozoa were left out on a glass slip and examined, when, to my great surprise, I found numbers of *bacilli*. Some were then dried and stained, when thousands of *bacilli*, now deep blue, revealed themselves. The inflamed condition of the mucous gland and valves was clear, and the reason that ovipositing had been arrested was evident. This queen was a young one; possibly the old colony had lost its queen, or had swarmed unobserved. She had flown, met a diseased drone, and had contracted the condition which the microscope revealed. Mr. Andrews, unaided by any hint of mine, in his second letter, says this, "Do you think that the diseased spermatheca arises in any way from foul brood? If so, my friend's bees, from which the queen was taken, have never been infected with the disease; but the disease did exist (up to a few days ago) within a distance of 400 yards of his apiary." Here it is. I have found many drones with spermatozoa badly touched by *alvei*, and such a one has done the mischief.

For the American Bee Journal.

Preparing Bees for Winter.

G. M. DOOLITTLE. ☺

Having my bees nearly prepared for winter, I thought it might not be uninteresting to the readers of the BEE JOURNAL to know how I have done it. In the first place, about Sept. 10, I examined every colony in the yard, and noted their condition upon a piece of a honey-section. This piece tells just how much honey each colony had, just how much they were fed, and also all about the pollen, some having no pollen, others but a few cells, while others have several combs nearly solid with pollen. As this piece is to be left on the hive, I shall know next spring about what there is of the pollen theory, if we should happen to have a severe winter. Although I have watched carefully, I have seen no proof yet to disprove the statement which I made a year ago, that bees of mature age do not eat pollen, except as it is used to form chyme for the young brood; while Dr. C. C. Miller gives in a late number of the BEE JOURNAL conclusive proof that I was right in my statement.

After having the exact condition of each colony put down on a piece of section, I next fed each colony enough food to make up the requisite amount needed for winter. Some were fed but two or three pounds, while others were fed the full amount, 25 pounds. As a careful minute was made of this, I shall also know how those come out which had 15 pounds of honey and were fed 10 pounds of sugar syrup, according to the plan of the editor of the *Bee-Keepers' Guide*.

After trying all plans of making a winter feed for bees, and being pleased with none of them, I hit upon the following: Take 15 pounds of water and put it into a tin vessel over the fire, leaving it there till it boils, then put in 30 pounds of granulated sugar, stirring for a moment or two till the sugar is partially dissolved, so that the sugar shall not settle down on the bottom and burn. Leave it on the fire till it boils, when it is to be taken off, after which pour in 5 pounds of well-ripened honey, and stir till the honey is thoroughly mixed with the syrup. This gives about 48 pounds of nice, thick syrup which will not crystallize, sour or granulate, no matter how long it is left before it is used.

For feeders I took pieces of boards 1 inch thick by 3 inches wide by 11 inches long, and nailed to the ends two side-boxes of my frames, having the ends of the frame-stuff come even with one side of the board, which left the side-pieces sticking above the boards $7\frac{1}{4}$ inches. On each side of these I nailed thin stuff which was only $\frac{1}{8}$ of an inch thick by $7\frac{1}{4}$ inches wide by 11 inches long, which gave me a feeder holding 4 pounds. The

feeder was now filled with hot beeswax, which was next poured out into another feeder, and so on until all were well coated. A top-bar of a frame was now nailed on to the ends of the frame-stuff, having a hole bored in it, in which to insert a funnel in feeding, when I had something in the shape of a division-board and feeder combined. If I wished to feed rapidly, I could place three or four of these feeders in the hive at a time; if slowly, pour only as much into one as I wished to feed.

The beauty of the thing is, that it works equally well as a division-board in connection with a quilt or sheet of enameled cloth, as the quilt can hang over the outside of the feeder, thus keeping all snug and warm. Also, this feeder can be kept in the hive all the while, so as to be ready for use at any time. No float is needed to keep the bees from drowning, as the feeder is so narrow than they can climb out on either side, even if you pour the feed all over them.

Having the bees all fed, I next packed fine oat-straw in behind the division-boards, after first putting a strip of cotton-cloth over and down on the outside of them. These strips of cotton-cloth are long enough to reach over the top of the brood-chamber, so that when both sides are packed there are two strips of cloth above the bees.

I next made cushions by taking two pieces of cotton-cloth 18 inches square, and sewing them to a strip 72 inches long by $4\frac{1}{2}$ inches wide, this strip extending all the way around the edges of the two square pieces. Before sewing the two ends of the strip together, I filled the cushion or sack with fine, dry basswood sawdust which I saved last winter when sawing sections. After the sawdust is put in, the two ends are sewed together, when I have a cushion 18 inches square by 4 inches thick, which projects 2 inches over my brood-chambers on all sides, as that is but 14 inches square on top.

The hives on which I use these cushions are chaff-hives, permanently packed front and rear, and made according to the description that I gave in the little pamphlet, "The Hive I Use." After these cushions are put on, the entrance to the hive is regulated to 6 inches long by $\frac{3}{8}$ of an inch deep, and an 8-inch wide board set leaning up in front of the entrance, to keep cold wind and snow out of the hive, when the bees are left to care for themselves until the arrival of spring. In this way one-half of my colonies are fixed; the other half are in single-walled hives, and have been fed the same as the first; but instead of using strips of cotton-cloth above the frames, I use a quilt made by sewing a strip of cloth 40 inches long by 15 inches wide, sewing up the sides after doubling it, so as to form a pillow-case or bag 20 inches long by 15 wide. Into this is slipped a sheet of wadding, four double, which just fills the quilt so that I have two thicknesses of cloth and four of wadding above the bees. The cap or hood to the hive is now filled with fine straw,

so tightly pressed in by means of a follower, that it will stay in the cap in lifting it on or off.

On Nov. 20 these last named hives are to be placed in my bee-cellar, which I described two or three years ago in the BEE JOURNAL. In putting them in, the tier of hives at the bottom of the cellar are raised $\frac{1}{2}$ of an inch from their bottom-boards, so as to give abundant lower ventilation; while the next tiers stand on the caps of the first, being raised on $\frac{1}{2}$ -inch blocks as are the others.

As I shall try no artificial heat this winter, I expect the cellar to keep at an even temperature of 42° , as it always has done heretofore when no artificial heat has been employed. The plan of cellar-wintering is the same as that which I successfully employed previous to last winter; but the other is new to me, except as 2 colonies were successfully wintered in that way during the winter of 1883 and 1884.

Why do Bees Eat Pollen?

J. F. LATHAM. ☺

Bees eat pollen only at such times when their physical requirements demand as food something containing elements necessary for the support of bodily stamina; or in other phraseology, food necessary for the renewal of the waste of tissue at times when muscular labor calls for extra support. When pollen is used only in compliance with the promptings of nature, it is taken into the mandibles, masticated and swallowed, after the manner of herbivorous animals, in considerable quantities, as may be readily noticed, especially in the spring, when brood-rearing is progressing rapidly on the first new pollen of the season.

Aside from the calls of circumstances, bees will not eat pollen unless, perchance, it is mixed with the honey in the combs, or with the nectar when gathered from the flowers. When mixed in the latter way, it seems that the quantity eaten is too small to do harm, even if pollen were the prime cause of diarrhœa. If the intestines were loaded to distention with honey free from pollen, it is evident that the result would be the same as though their contents were honey pollenized in the nectar (unless a special disease be created for a special condition).

I have seen bees, during their first spring flight, attempt to rise in the air; but, being unable to do so in consequence of their distended bodies, they would fall on the snow, discharge their fœces and die, the excreta scarcely making a stain. What would evidently have been the consequence had those bees been confined to their hives awhile longer? Had they evacuated their intestines in the hive, it would have been styled, in apicultural parlance, bee-diarrhœa. Had they died without relieving their surcharged organs, their demise could have been from no other cause than

intestinal inflammation. "mortification," virulent secretion, one or all.

When bees "spot the snow" during a flight in winter, they are generally declared to be affected with diarrhoea; but I have not always found this to be true, in its broadest sense. I have seen the surface of the snow completely stained in front of some of my hives during a "flight" of the bees, and no indications of soiling by evacuation from the bees, was within when the hives were opened for the first time in early spring. This evidence has led me to the belief that the color of the excreta is not a sure exponent of bee-diarrhoea; for, if pollen is the ingredient which causes the coloring, as is generally attributed, it did not cause diarrhoea in the instance named.

Perhaps it may be asserted that the bees did not stay in the hive long enough to become diseased with diarrhoea. Well, they did not; and if they had, pollen would not have been the *prime* cause of the malady.

Bees will winter well on combs containing a super-abundance of pollen. A man and a rifle loaded with powder and ball may bear companionship and no harm result. Pollen and bullets may be instruments of destruction, but the prompting power must exist behind them. Whisky never caused intoxication when let alone; a prompting thirst induces the victim to imbibe, and inebriation with its direful consequences follow. The same lustful desires which prompted Pandora to open the box and flood the world with evils, induced the accredited progenitors of the human race to pluck and eat the forbidden fruit. The same appetite which induces bees to eat pollen to their destruction, would lure them to indulge in some other act, as detrimental to their existence, were the means within their reach. Pollen may feed the smouldering embers of morbid desires, but it will not cause them.

The food of the laboring man must be rich in muscle-producing elements; the horse or mule will not "hold its own," when put to hard work, unless it is fed a goodly quantity of provender rich in nitrogen; and the fox-hound runs best when fed on fresh beef. When the conditions of the brood-nest are such that bees need no pollen to support an extra drain on the organic stamina, their inclination to conform to hibernal requirements is strengthened, and it is very apparent that they must lapse into that quiescent state of semi-dormant repose favorable to their safety.

If all of the pollen be removed from the combs, and bees have pure, well-ripened honey, or good sugar syrup for stores, they are supplied with the aliment necessary to maintain animal heat, which, with quietness, including its cause and effects, will carry them through the cold winters of our Northern climate in good condition. As the labor of providing combs free from pollen would be great in large apiaries, not considering the removal of pollen from the combs by artificial means and feeding, there appears to be two practical methods by which

the bees may be guarded from its bad effects: 1. By keeping them in conditions which will not stimulate its use. 2. By contracting the brood-nest so that the combs may be kept about full of eggs and brood from spring until fall, thus leaving but few cells for its storage. The first is the most conformable to nature; the second looks feasible. By the first method *all* of the obstacles to successful wintering are neutralized; by the second, but *one*.

Since the foregoing was written, I have found, on page 694, a paragraph in Mr. Theilman's article in which he writes: "He (Mr. Clarke) does not tell us how to proceed or to perform with our bees in order to have them hibernate." In the last part of the closing paragraph of the same article, he writes: "Mine do best at 42° above zero: that is, they are the most silent at that point. The farther above or below 42° the stronger the noise becomes in the bee-house. This has been my experience for the past ten years."

If Mr. T.'s bees conform to hibernal requirements at 42° above zero, it seems that that degree of temperature, with good air, good stores, and a severe letting alone, are, if they are constituted so as to make the best of such favorable surroundings, all that their welfare demands.

Cumberland, Maine.

For the American Bee Journal.

Marshall Co., Iowa, Convention.

At the recent session of the Marshall County Bee-Keepers' Association six new members joined the Association. The following is a condensed report of the proceedings:

Mr. O. B. Barrows said that he feeds his bees in the fall, if he finds it necessary, in order that a colony may have plenty of good stores for the winter. He winters his bees in a cellar, and puts his hives with the front to the wall; he also has the front of the hive lower than the back, so that the bees will easily keep it clean.—He keeps plenty of good air in the cellar, and the temperature just so vegetables will not freeze. He uses quilts over the frames in place of honey-boards. He said that when he was a boy, it was thought that a cellar should be kept very warm, but he finds it best for all vegetables and fruits to keep a cellar cool, just above the freezing-point as near as he can regulate it. He finds this a good temperature for his bees, and the light of the cellar does not disturb them. His stove flues come to the bottom of the cellar, which he finds a great help in ventilation.

Mr. Hunt, of Centre Point, has an apiary of 300 colonies. He finds it necessary to keep out all light where so many bees are in one cellar. He has the cellar well ventilated by two sub-earth pipes which run about 60 feet out from the cellar before coming to the surface of the ground. This admits fresh air, while the stove-flue carries off the foul air. He wants colonies in Langstroth hives to weigh

50 pounds at least; and if pollen is plenty, a little more. He thinks that fall honey is not as good for winter stores as the early honey or coffee A sugar. He has never used a thermometer in his cellar, but thinks it a good plan. He lost a number of colonies in the winter of 1882-83, by not giving them proper care.

The President, L. Coleper, Mr. Jackson, and several others claimed that one of the essentials in successful wintering, and a preventive of spring dwindling, was to have a good supply of young bees at the close of the honey season.

The majority present thought it best to contract the size of the hive by the use of division-boards, according to the size of the colony. By this means a colony would keep at a more even temperature, either wintered in the cellar or on the summer stands; and quilts or chaff-cushions were recommended by nearly all in place of heavy boards.

Mr. L. Coleper said that he begins in September to prepare his bees for winter. He tries to renew all colonies that have queens over two years old, with good young queens. He wants plenty of young bees at the close of the season, and about thirty pounds of good honey to each colony. He uses quilts over the frames, and has no other cover when his bees are in the cellar. He places the first row of hives about one foot from the cellar floor, and then puts one above another, and takes them out in the spring when the weather permits.

Nine of the members present reported 497 colonies, spring count, and 596 colonies, fall count; and 15,170 pounds of extracted, and 3,940 pounds of comb honey.

The President said that he began the spring of 1883 with 4 colonies, and increased them to 7. He wintered them in a cellar which varied from 32° to 38° in temperature. All came out strong, and he has since increased them from 7 to 22 colonies. His surplus amounted to 145 pounds of extracted and 102 pounds of comb honey. His bees have stored but little honey since July 15.

Mr. J. L. Comstock, of Sac City, said that he was not well versed in bee-keeping. He had begun with 2 colonies about June 5; these had increased to 7, and he had taken 225 pounds of comb honey in two-pound sections, which he sold at 20 cents per pound.

Several bee-keepers spoke on the subject of feeding where necessary, so that bees may have plenty of good stores for winter; and also the advantage to be derived by spring feeding to encourage early breeding.

Mr. Hunt described his method of rearing queens, and the way in which he placed eggs into good cells already built and containing plenty of the royal food, so as to produce extra queens from the queen which he desired to breed from, and in an unlimited number. He had used the method for four years.

The Convention then adjourned to meet on Saturday, Jan. 21, 1885. The subject for the next meeting is

"Spring management and apiarian supplies." For essays, M. A. Jackson, subject, "Over Production," and F. H. Hunt, "Queen-rearing, and how to Italianize an apiary."

J. W. SANDERS, Sec.

J. SWIFT, Pres.

Canadian Farmer.

Canadian Honey Crop for 1884.

R. F. HOLTERMANN.

The honey season for 1884 having closed, it is to be regretted that more accurate statistics cannot easily be obtained. However, all bee-keepers are aware that where in Canada one colony was kept in 1880, there are ten kept at the present day; and this can be accounted for only as follows:

There was comparatively little known about bees, and the risk was too great; but to-day with the knowledge gained being utilized, the loss in wintering, etc., is decreasing, and the superior management has increased the profit, which, when combined with the fact that it wants but a small capital to purchase stock enough to yield a handsome profit, apiculture is becoming a favorite pursuit.

The spreading of this pursuit, together with the bright prospect when the season opened, caused many bee-keepers to become alarmed, they rushed to market with their honey, and again and again do we find that they have sold beautiful extracted clover honey at 8 cents per pound, and honey in one-pound sections was retailed at 15 cents throughout Haldimand and Norfolk. These men forgot that where 5 years ago one pound of extracted honey was used, ten or more are used to-day, with plenty of room to further develop, especially when honey sells at the moderate price of from 12½ to 15 cents per pound; and one may safely add that there is less honey on the producers' hands in Canada to-day than there was at this time one year ago.

From careful inquiries, it appears that the eastern part of Canada has not done as well as the western, and in any case only those bees in first-class condition, early in the season, were able to gather a surplus; and that for the following reasons: The honey-flow lasted only for a short time in the forepart of the season; if a colony had to build up on this, by the time they were strong enough to gather a surplus, the honey-flow had stopped.

Through western parts of Canada the season was earlier, thus giving the bees more time to work before the unfavorable season set in. Owing to the unfavorable weather, basswood yielded but little; in some places nothing at all, few places being favored with more than two days. The best season for thistle is hot, damp weather, so it yielded but little, leaving the entire surplus to be derived from clover and buckwheat. Where Alsike clover and white clover grew side by side, the bees always preferred Alsike, which, for the last

four years, has proven to be the surest honey-producer. Fall flowers did not yield abundantly; they seldom do. Buckwheat has proven itself valuable both for winter stores and prolonging brood-rearing; but little can be obtained for it when sold for consumption.

The following are some statistics obtained: In sending in reports many neglected to mention if bees have to be fed for the winter. This should always be done, stating how much, as it may make a difference of 30 pounds per colony. If the Government were to ask, "How many colonies of bees in the spring—what increase—how many pounds of honey, comb and extracted did you obtain?" when submitting other questions to the farmers, it would be a step in the right direction.

Thirty-one bee-keepers, having 1,484 colonies in the spring, 2,569 colonies in the fall, had 37,250 pounds of comb honey and 59,845 pounds of extracted honey.

It will be seen that by the above valuation of 1 pound of comb as 1½ of extracted, the yield has been about 80 pounds of extracted honey per colony; that the increase has been about 90 per cent.; and that several reported that they had exerted themselves to prevent increase.

Now this year is considered scarcely up to the average, but the result has, on the whole, been very satisfactory; and if the grand total of honey gathered, and increase of bees obtained in Canada, were reported, it would show what a quantity of secretions from various flowers has been utilized, heretofore almost entirely wasted; and not only has the nectar been utilized, but it has served more fully the purpose for which it was distilled, viz: to attract insects—the bees—to fertilize the flowers and thus give a more abundant harvest wherever bees are kept. Many complained that they were unable to get comb foundation in time, and their yield was smaller because they were unable to get it when required.

For the American Bee Journal.

Comb Foundation in the Brood-Nest.

W. Z. HUTCHINSON, C-68-108.

When producing extracted honey, I consider the use of comb foundation in the brood-nest as profitable, and I see no reason to change my views; although I must admit that I have made no decisive experiments to determine whether its use is profitable when producing extracted honey. Three years ago I thought it strange that Mr. Doolittle should hold such views as he does upon this subject, and I have heard bee-keepers remark that they looked upon Mr. Doolittle as having the most level head of any apicultural writer; and it was a great wonder to them how he could be so "off" on this foundation question. When asked for reasons, they could give plenty of them; but when asked for experiments, none were given.

After producing comb honey for one year, I thought I could see reasons why Mr. Doolittle might be right; and in order to know, from my own individual experience, whether it was profitable for me to use comb foundation in the brood-nest when producing comb honey, I began experimenting last spring. The first swarm was hived on empty combs, the second on foundation, and the third on empty frames; that is, they were empty except that a "starter" of foundation ½ of an inch wide was in each frame. This order of procedure was continued until 15 swarms were hived, when no more were hived on empty combs, as it was very evident that such a course could be continued only at a loss.

The first thing that the bees did, was to fill the brood-combs with honey; not a drop of honey would they store in the sections until the brood-combs were filled so full that the queen had no room in which to lay; and, even then, when invited to commence work in the sections, they seemed to "roll up their eyes" in a knowing sort of way, as much as to say: "Oh, we are pretty well fixed down here;" and when they did finally commence storing honey in the sections, it was in such a slow, easy, "loafing" sort of manner that these 5 colonies fell far behind (about 40 per cent.) those hived upon foundation or empty frames; and as the queens were cramped for room to lay in, they were not so strong in numbers when fall came, which, had there been the usual fall honey harvest, would have been quite an important factor. I presume that many will say that they should think that the bees would carry up the honey stored in the brood-combs, and thus give the queens room in which to lay; I cannot help what they think, but I know that they did not to a very great extent.

When the use of empty combs was discontinued, there was no appreciable advantage in the use of foundation in the brood-nest, as compared with empty frames; and each alternate swarm was afterwards hived upon foundation, and the other swarms hived upon empty frames. It was the intention to continue this course throughout the rest of the season, but an accident and sickness put things in bad shape, and, although an equal number of swarms were hived upon foundation and upon empty frames, yet they were not hived alternately, the majority of those hived upon foundation being earlier swarms than those hived upon empty frames. Twenty swarms were hived upon foundation, and an equal number upon empty frames, the honey from each colony being weighed; and those hived upon foundation had stored only 2 pounds more per colony than those hived upon empty frames, and this could be more than accounted for by those which had foundation having been, by a small majority, earlier swarms. The empty frames were filled with straight combs without any "looking after," and but very little drone-comb was built.

When hived upon foundation, the bees could store no honey in the brood-nest until the foundation was drawn out, and as soon as a few cells were even partly drawn out, the queen was ready with her eggs; and, as the bees had access to the surplus boxes, they began storing honey in them, leaving the brood-combs to the queen. The bees seemed to reason and act about as follows: "Downstairs is the place for the brood, and there it shall be; upstairs is the place for the honey, and there will we put it." When given empty combs they seemed to say: "Here are the combs all ready made for us, let us fill them." And fill them they did, after which, to a certain extent, they appeared to consider their tasks at an end.

Where bees begin to work when first hived, there they continue to work until the space which they occupy is filled; and to commence work in an adjoining apartment when the season is partly over, seems to be contrary to their instincts; hence, I think that bee-keepers make a mistake when they wait a week or ten days, yes, or even 24 hours before putting boxes on a hive containing a newly-hived swarm. Put on the boxes at once, before the swarm is put into the hive, and let them go into the boxes when they are hived, and commence work there and in the brood apartment at the same time; then there will be no crowding the brood-combs with honey.

When a swarm is hived upon empty frames, there can be no honey stored in the brood apartment until comb is built; and as fast as it is built, the queen fills it with eggs while the honey is stored above in the surplus department. Let a swarm be hived upon empty frames, and be given access to the surplus boxes, and in a week or ten days after let an examination be made; if the bee-keeper's experience, who does this, is like my own, he will find the frames full of combs, the combs full of brood, and the surplus boxes full of honey.

I believe that the time is not far distant when we will have the brood in one part of the hive, and the honey in another to a much greater degree than at present; then nearly all the honey which is stored will be in shape to be sold at a good price, and nearly empty brood-combs, that autumn will find in the hives, can be filled by cheaper but better winter food, sugar syrup.

In hiving bees upon empty frames, and immediately giving them access to boxes filled with foundation, or with partly-finished combs, I have found a queen-excluding honey-board a necessity; otherwise the queen would at once invade the sections. Although I have made no experiments, at least no very extensive or conclusive ones, yet I think that the use of comb foundation in sections is profitable. We desire to have combs built in the sections very quickly, at least as fast as the bees can fill them with honey, and there is no question but what the use of foundation facilitates the building of comb.

In the brood-nest, when working for comb honey, we, or at least I, wish

to have the combs built no faster than the queen can occupy them with eggs. It has been asserted that the secretion of wax is voluntary with the bees; that when given foundation they secrete but little wax comparatively; hence, the inference is drawn that the use of comb foundation is profitable in all places. I have neither the power nor the desire to disprove the statements in regard to the secretion of wax; the question with us is: "Does it pay to use comb foundation in the brood-nest when producing comb honey?" It is probable that, in producing extracted honey, its use is profitable; but my limited experience says: "When producing comb honey, give swarms upon empty frames, and give the bees access at once to the surplus department." Of course "one swallow does not make a summer," but one experiment, such as I have made, proves enough, at least, to show that the subject is worthy of consideration and careful experiment, which I shall certainly give it during another season.

Since writing the above it has occurred to me that in producing extracted honey, it might be profitable to have a swarm in a hive, the brood department of which is furnished with empty frames, and the surplus department with foundation, a queen-excluding honey-board being placed between the two departments.

Rogersville, Mich.

Exchange.

Extracted Honey.

REV. O. CLUTE.♦

All people know the excellence and the beauty of comb honey. It is in need of no praise. But extracted honey is a new article with which many people are not familiar. They have never seen its lovely amber gleam from the glass on the tea-table; they have never caught its delicate aroma, "fragrant as spicy winds that blow o'er Araby the blest;" they have never tasted its delicious flavor, compounded by the fastidious bees from nectar gathered from flowers of woodland and field. The only liquid honey with which they are familiar is the old-fashioned "strained honey," which was taken by mixing comb, and bread, and dead bees and dead larvæ into a sticky mass, and straining from it all the liquid which could be obtained by pressure. This liquid contained the juices of bee-bread and bees and larvæ as a flavoring for the dark, rank honey which this squeezing process secured. Such honey was coarse in flavor, and most repulsive in associations. If extracted honey were of the same quality it would deserve no favor. But it is as different in quality as anything can possibly be.

Extracted honey is honey in its purest condition, exactly as gathered by the bees, without any foreign admixture whatever. All day long, week after week, do the happy bees revel among the clover blooms, or in the nectar-laden chalice of the lofty linden trees, or among the many flowers

that in fall cover hills and valleys with brilliant hues. When their hives have become heavy with luscious stores the careful bee-keeper prepares to take the stores, but in such a way as not to injure his "faithful friends," the bees. He opens the hives, removes the cloth that covers the frames of comb, and directs a stream of smoke from the smoker in his hand, down upon the bees. Before the smoke they rapidly retreat toward the bottoms of the combs. He lifts out a comb, heavy with its sweet store, and covered at its bottom with the alarmed bees. He gives the comb a sudden and swift jerk downward and thus dislodges most of the bees, which fall into the hive. If any bees still cling to the comb he brushes them off with a swift, light stroke with a common whisk broom, then hangs the comb in a carrier by his side. So he takes comb after comb until all are taken that he desires. These he carries to the extracting room. Then, resting a comb on a light frame placed on an empty barrel, he shaves off the cappings of the cells with a sharp knife made for the purpose. When the combs are uncapped they are ready for the extractor.

The extractor is made in several different styles. In all styles the principle is the same. Everybody knows that water poured on the surface of a rapidly whirling grindstone flies from the surface by the motion imparted to it by the whirling stone. The honey-extractor is a machine which utilizes this centrifugal force by so applying it that it throws the honey from the combs. The extractor is essentially a fixed can with a revolving frame in it, in which frame the combs of honey are set and rapidly whirled. The centrifugal force causes the honey to fly from the cells against the sides of the can. It runs down the sides, collects in the bottom and is drawn off through a faucet. It is as charming in color and as delicate in flavor as when the eager bees sought it in the depths of clover or of linden blooms. When the mistress at the tea-table dips it with silver spoon from the beautiful cut-glass bowl into the china dishes of fairy-like thinness, its sparkling gleam suggests the mysterious amber from the shores of the storm-tossed Baltic. When the ruddy boy spreads it in generous flow on the cakes that come smoking to the breakfast table he surely has a "royal dish to set before a king."

It is only a few years since the honey-extractor was invented, and it has already come into very wide use. Nearly all progressive bee-keepers use it more or less, even if they run their apiaries mainly for comb honey. A great many bee-keepers are, by its aid, producing only extracted honey, which they find a profitable business, some advantages of which I will briefly state:

In getting extracted honey the combs are not injured, hence they can be returned to the hive and filled several times in one season, then stored away for use in other years. When the combs are thus returned to the bees to be refilled, the little workers

do not have to spend their precious time in making comb, but can devote every moment to the glad work of gathering the rich harvest with which the flowers overflow. This enables them to store many more pounds of honey than they could secure if they had comb to build.

Again, honey comb is made of bees-wax. Wax is made by the bees from honey. When bees need comb in which to store their honey, they fill themselves with honey, and hang themselves up in large clusters in the hive. While they thus remain quiescent for several hours the honey undergoes a process of digestion, and is changed into wax, which appears in minute scales on the underside of the rings of the abdomen. Then they help each other in taking off these little scales, and in kneading them into comb. It has been estimated by competent observers that it takes from fifteen to twenty-five pounds of honey to make one pound of wax. The producer of extracted honey, by saving his combs and having them filled several times each year for many years in succession, saves all the honey which would otherwise be used in making wax, and thus largely increases his annual honey product.

Moreover extracted honey can very easily be transported to any part of the world. It has but to be put into good barrels and it can go wherever railroad or steam-ship will carry it. It is injured by neither cold nor heat. It may be kept for months, or even years, without losing its good qualities. Hence it may seek a market the whole world around, in torrid or frigid zone.

These advantages are so evident that not a few bee-keepers are giving exclusive attention to the production of extracted honey. The production is already so large that some are beginning to fear that prices will fall very much. I am convinced that this fear is well-grounded. The prices of extracted honey will undoubtedly fall. Already the best honey can be bought for ten cents a pound. Once sugar was so expensive that it appeared only on the tables of the rich. After a time, improved cultivation and machinery rapidly increased the production of sugar. The increased quantity largely reduced the price. Pretty soon sugar began to appear on the tables of the poor, and its consumption increased enormously. When only the rich could buy it, enough to supply the demand was produced by a few planters and laborers. When the prices fell so as to bring it within the reach of the masses, the consumption increased so greatly that very large numbers of laborers were needed, and planters, though getting a small profit on each pound sold, were able to make large incomes because the market demanded a large number of pounds. Extracted honey will take the place of much of the unhealthful syrup and poor sugar that are now consumed, and a very large quantity will be needed to supply the demand. Then the bee-keeper, who now gets an income of five hundred dollars by the production of five thousand pounds of honey, can get an income of five

thousand dollars by the production of one hundred thousand pounds.

A Visit Among Indiana Bee-Keepers.

W. T. STEWART.

The second week in August I started for a two weeks' visit among Indiana bee-keepers. The first one that I visited was S. E. O'Neil, of Dupont, who has about 70 colonies of good Italians, and does not like Cyprians. He had a good fall crop of honey, and his bees winter on it with good results; he uses the Heddon case for sections and Jones' perforated-zinc honey-board, and likes both. Mr. O'Neil is a good bee-keeper.

I then visited Mr. J. M. Brooks, who has been breeding queens for beauty, but says he got them "bred up" so that they were above work and put on "airs," while he had to draw on the more common bees for honey enough to supply queen-cages to ship them with. Mr. Brooks is a scientific bee-keeper, and has a fine apiary. It being centrally located, he has a honey store in front and retails his honey at home.

I next went to Wesley Morgan's apiary, near Burnsville. He works mostly for extracted honey, and gets it, too.

Next, I called on Elias Morgan, a brother of Wesley; he has a small apiary, but is somewhat enthusiastic on bee-culture. All the above named are readers of the BEE JOURNAL.

Willis Gully, of Burnsville, has a small apiary, but is well up with the times in bee-keeping. The next was G. W. Vandergrift, of Vernon, who has a fair-sized apiary, uses the Mitchell hive, but does not give his apiary the attention necessary to make it profitable; besides that, Vernon is rather a poor location for bees.

I next visited Dr. C. C. Firth, of Wirt, and remained there all night. We talked about bees till a late hour. Dr. Firth is Secretary of the Southern Indiana Bee-Keepers' Association. He is well up in the knowledge of bee-keeping, and has a nice apiary, but he is young in practical bee-culture.

Frank Mayfield was next interviewed. He has a large apiary. His bees are all in box-hives, and he trusts to "luck" for surplus honey.

I next called on H. C. White, of Madison. He is enthusiastic, and has been successful, but his location is not good for honey.

I remained all night with Jonas McKay, near Vevay. Mr. M. is the big bee-man of the vicinity. He shipped eight tons of comb honey last year. His bees are mostly in beehouses.

Chas. Cain has a bee-house, and a dozen others in Switzerland county have bee-houses, and I think that it is the best county in Indiana for bee-keeping.

Wm. Borcharding, near Madison, is an enthusiastic bee-keeper, and will rank high in the near future.

Mr. Augustine, of Madison, is another able bee-keeper, and will some day make his mark in scientific bee-culture.

All through my journey I was looking for a good location to which to move my bees, and found what I believe to be the best I ever saw, all things considered. I secured it, and the last week in August I shipped my bees (nearly 100 colonies) by rail and river nearly 100 miles. My loss in shipping was about 15 per cent. by combs breaking down and drowning the bees. I have learned a lesson on shipping bees, and at some future time I will give to those interested the benefit of my experience.

I am now located three miles west of Madison, Ind., on the Ohio river, above highwater mark, where I shall give bee-keeping my entire attention. My address hereafter will be Madison, Ind., instead of Eminence, Ky.

Madison, Ind., Nov. 8, 1884.

For the American Bee Journal.

Bee-Sting Poison.

B. F. LITTLE.

Having shown Dr. Horton the article by Dr. Tinker, he kindly furnished me the following opinion:

"Brush Creek, Iowa, Nov. 6, 1884.—I had my attention called to an article in the BEE JOURNAL, by Dr. Tinker, relating to my patient, Mrs. Sturdevant, who died from the effects of a bee-sting. I cannot agree with the Doctor in the way the poison is taken into the system. In the case referred to, I believe that the poison was injected into the circulation by the sting entering the *inferior palpebral* vein, the poison being carried from there into the facial vein, and from that into the *internal jugular* and directly into the heart. I believe that the poison acts much the same as that of poisonous reptiles. I reported the case to Prof. Laning, of the Hahnemann College in Chicago, and he also holds to my theory, citing Bollinger as the highest authority. The camphor treatment of which the Doctor speaks, I know nothing about; but in the other treatment to which he alludes, I quite agree with him. I consider iodine as the best antidote for bee-stings. W. H. Horton, M. D."

I think that my bees are going into winter quarters in fine condition. I began the season with 80 colonies, and now have 123. I run 90 of them for extracted honey, and obtained 7,200 pounds; the rest I run for comb honey, and got about 1,200 pounds. I have taken no honey since the basswood flow ceased; although I might have taken six or eight hundred pounds. It is in the combs yet; but for so nice a fall the honey-flow was wonderfully short.

Brush Creek, Iowa.

The bee-keepers of McDonough and adjoining counties are requested to meet at Bushnell, Ill., on Nov. 20, 1884, for the purpose of organizing a bee-keepers' association.

J. G. NORTON.

W. B. Lawrence, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

No Surplus Since July.

I began the season with 20 colonies, sold 12 in the spring, secured 550 pounds of honey from the 8 remaining colonies, and increased them to 15. Bees in this section did well during June and July, but since then they have produced no surplus honey to speak of. A. L. P. LOOMIS, Co.
Rosendale, Wis., Nov. 6, 1884.

Poorest Season for 8 Years.

In the fall of 1883 I put into winter quarters 44 colonies of Italian and hybrid bees, and had 44 with which to begin the spring of 1884. I increased them to 61, besides selling 4 colonies, have obtained 1,000 pounds of comb and 200 pounds of extracted honey, all of it being somewhat dark, there being none of it pure, white clover, but, perhaps, a good deal of it is "bug juice." I got no fall honey at all, and, taking the season through, it has been the poorest season for honey that I have seen in the eight years in which I have kept bees in this locality. The Italian bees worked strong on the first crop of red clover, but what they got from it I do not know. JACOB COPELAND, Co. 44—61.
Allendale, Ill., Nov. 6, 1884.

Unfortunate.

This week finds me a helpless man except that I can use my right hand. I became disabled in this way: I was at one of my neighbors on Saturday evening, and a little before 9 p. m. I started for home; and in order to hasten I ran, and had gone but a short distance when I came in contact with a tight, wire clothesline across my path, with such force (it striking me between the eyes) that I was brought to the ground with such violence that my left collar bone was broken. After some moments of groaning, I finally arose and reported to my neighbors the effect of the wire line. I was assisted to my home, a doctor was called, and the bone set (which is a difficult one to keep in

place, as it cannot be splinted), and at this writing I am getting along as well as could be expected. I find it a hard stroke on all my fall work. Unless I can get assistance, I will have to do as some of our old fogies say, "Let the bees care for themselves or abide the consequences." This theory I do not believe in, for I think it just as essential to look after the wants of our bees as it is to look after the wants of our hogs and cattle. The honey crop through this section of Iowa has been quite short since the middle of July. There was a fine lot of fall bloom, and the frost staid off unusually late, too, but there seemed to be but little secretion of honey compared with what we generally have, so we got only a small surplus. I fear that many new colonies, and some which were extracted from the body of the hive in the latter part of the white clover honey-flow, will be short of stores, unless they are fed or evened up from those which have to spare. J. W. SANDERS, Co.

Le Grand, Iowa, Nov. 6, 1884.

About Bumble-Bees.

Will Prof. Cook please describe the nature of the bumble-bee? Are there any drones among them in the nest? If so, what are their habits and nature? Can they sting?

WM. MALONE, Co.

Oakley, Iowa, Nov. 8, 1884.

[Bumble-bees have the same kind of bees in each colony as do our honey-bees. The large queen lives over the winter, no others. So in early spring the lilacs, etc., are gay with the large queens, which now must do all the work. The queen gathers a great mass of pollen, and lays her eggs in it; from these, workers are developed, and later, queens and drones may be seen. So in August we find in each nest a large queen, many workers, several small, unmated queens, and several drones. When the first bees come forth in the spring from extemporized cells, caused by eating holes in the pollen, the bees wax these cells and so form the honey-cells. The queens and workers sting, not the drones.—A. J. COOK.]

Selling Extracted Honey.

I have just overhauled my 200 colonies of bees, and have equalized their stores. I left them very rich, about one-half of them three stories high when the honey-flow ceased, about June 25, since when, there has been no honey to store; and to my surprise I did not have to feed them, but on the contrary I took off and put away 900 combs containing various quantities of honey, from $\frac{1}{2}$ of a pound to full, thick combs of 6 to 7 pounds. Just about one-half of my surplus combs had honey in them. I have packed my combs in my tin-lined evaporating-tanks and in dry-goods boxes, and have nailed them up tight

to keep out the mice. By distributing "Honey as Food and Medicine," and the Leaflets, "Why Eat Honey," I have sold 6,000 pounds of extracted honey at home, but have 2,000 pounds yet on hand. I have realized, on an average, something over 9½ cents per pound.

E. DRANE, Co.
Eminence, Ky., Nov. 10, 1884.

An Unfavorable Season.

This has been an unfavorable year for those of us who are engaged in producing honey in this section of the country. Our honey-flow lasted only about three weeks and that was when clover bloomed. During this time the bees worked hard, but the nectar ceased flowing as soon as the dry season set in, and as a result we got but little surplus honey. My apiary did not average over 13 lbs. of honey per colony, spring count. Many of my neighbors who have from 5 to 10 colonies, have not taken a pound of honey, and they say that their bees will die before spring for want of honey. I began in the spring with 28 colonies and have increased them to 63. All are now in good condition, excepting 3 colonies which I have been feeding.

NATHAN M. WOODMAN, Co.
Bushnell, Ill., Nov. 12, 1884.

Getting Sections Completely Filled.

I notice on page 716, that Mr. Heddon is working out a plan to get sections completely filled with honey. I think that I have something new, at least it is new to me, and "it works like a charm." Cut the comb foundation for the $4\frac{1}{2} \times 4\frac{1}{2}$ sections, $3\frac{3}{4} \times 4\frac{1}{2}$, that will then give you $\frac{1}{4}$ of an inch to fasten the foundation on both ends, and the bees will have $\frac{1}{4}$ of an inch space on the sides, thus the comb foundation is fastened perfectly, and will not warp or drop down as it will sometimes in sections only half-filled with foundation. This plan works well without separators, and without reversing the sections. The bees will fasten the foundation all around and build it straight and solid.

JOHN REY, Co.
East Saginaw, Mich., Nov. 11, 1884.

Convention Notices.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

Excursion rates from all points on the Chicago & West Michigan R. R. have been secured for the benefit of those desiring to attend the Western Michigan Bee-Keepers' Association, held at Music Hall, in Fremont, Mich., on Nov. 25, 1884. Certificates can be had by applying to Mr. T. M. Cobb, President, Grand Rapids, Mich., or to Mr. Geo. E. Hilton, Secretary, Fremont, Mich. Prominent bee men from abroad are expected, and an interesting time is anticipated.

Geo. E. HILTON, Sec.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Winter Weight.

I read in the BEE JOURNAL of Oct. 29, that if bees are weighed and fed sugar syrup till the hive reaches the standard weight, there is no need of anxiety. I would like to know what the standard weight is, as I have some colonies which are very heavy, and some which are light. Can I even them up until each becomes the required weight? R. M. CARTNEY.

Rose Hall, Ont.

ANSWER.—The different materials of which hives are made and the different styles of hives vary so much in weight that I do not know of any standard weight that is a safe guide to go by, to warrant a sufficient amount of stores for wintering.

Feeding Bees, etc.

Will Mr. Heddon please answer the following questions:

1. How many pounds of honey or sugar syrup does it take to winter a strong colony of bees? and how many pounds to winter a weak colony?
2. How many $\frac{1}{2}$ -feul Laugstroth frames does it take for a colony of bees to winter on?
3. Is it best to boil sugar syrup before feeding it to bees?
4. Is there any harm in putting more water with the sugar than is generally used?
5. Which is the best way to feed bees?
6. Do bees work on warm days in winter when they fly out, or do they only take a cleansing flight?
7. What kind of bees are the best for increase? A. V. LENNOX. ♀
Plaquemine, La.

ANSWERS.—1. That all depends upon the healthfulness and quietude of the bees during their confinement and what you mean by wintering. It requires more food to carry the colony from the cessation of the honey-flow of 1884 to the beginning of the honey-flow of 1885 than just to carry them through from flight to flight. How much more, will depend upon the prolificness of the queen, and many other conditions. In most winters, not as much food will be consumed by colonies in frost proof repositories, as

those left on the summer stands, packed or unpacked. I usually wish my colonies out-of-doors to have about 20 lbs. of stores, and those in the cellar, not less than 10 lbs. and these stores all available. These will reach until such time in the spring as I can feed any colonies that may have eaten an unusual amount.

2. Sometimes one or two, and sometimes seven or eight.
3. Yes, I think so; especially if fed later in the season.
4. No, not if you feed early enough, so that the colony has a chance to evaporate the extra water out of the syrup.
5. My preference is radically in favor of a large feeder on top.
6. Generally, only a cleansing flight; though sometimes later in the winter, they begin house-cleaning.
7. Italians for increase, and Germans for nice comb honey.

Bees Dying Fast.

I have two colonies of bees which are affected in a manner that is unaccountable to me, and I desire information in regard to what is the trouble with them, and also for a remedy. The appearance of the outside of the capped honey is gray—about the color of mold—though the honey appears to taste all right. The comb and the hive are dry and emit no bad smell, but the bees are dying faster than they can carry them out. The colonies were strong in bees and heavy with honey. ROBT. HENDERSON ♂
Ogdensburg, N. Y.

ANSWER.—I do not think that anything ails your two colonies of bees referred to. The bluish gray tinge on the caps of the honey is all right. I presume, from all you say, that the mortality of these two colonies is natural, and a circumstance often seen in other apiaries.

Bee-Feeders, Honey-Boards, etc.

Will Mr. Heddon please answer the following questions:

1. In uniting black bees in the fall where one has not the time to find and destroy one of the queens, and they have to "fight to the death," I would like to know whether the survivor is injured in any way. Are both ever killed?
2. Please describe your top bee-feeder.
3. What is the thickness of your honey-board, the distance between the slats, and how much bee-space is there above and below?
4. In cellar-wintering, what should the outside temperature be, when the bees might safely be set out for a flight; of course to be returned to the cellar when all have gathered home?
5. Is it possible to cure bee-diarrhoea, when not too far advanced, by setting a single hive in a warm, dark room for a short time?
6. How is the common basswood propagated? WM. JNO. HINCHEY.
Tamworth, Ont., Nov. 1, 1884.

ANSWERS.—I have never known any injury to the surviving queen, from

such struggles for life. I think the fatal position is such that fatality cannot happen to both queens at the same time.

2. To describe such fixtures so that the description would be of any value, would occupy too much time and space.

3. The same is also true of this question. I prefer a scant $\frac{1}{4}$ inch for a bee-space where there is no liability of a change coming about by way of swelling or shrinkage.

4. Much depends upon the stillness of the air, whether the ground is bare or covered with snow, whether the sun shines or not, and what is the humidity of the atmosphere. Usually 45° to 50° Fahr.; but my rule is, never to take bees from a repository expecting to return them unless they show signs of diarrhoea.

5. Some claim that they have now and then cured one or a few colonies by so doing, and changing their food. I do not consider that there is any real, practical cure, but I think that we shall soon learn how to prevent the disease.

6. By seeds and slips, but usually by seeds.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL.
Monday, 10 a. m., Nov. 17, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as dime, ¼-lb., 1-lb., and 2-lb. jars, from the retail trade. Prices are low as arrivals exceed the demand. Extracted honey brings 5¢ on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15¢ @16c. in the jobbing way. We have several small lots of dark comb honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb., without finding a buyer. Dealers most certainly misled producers by quoting buckwheat and poplar comb honey, if they are not more successful than we are in disposing of the same.

BEESWAX.—The demand is slow and arrivals are few. Good yellow brings 26¢ @27c. on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—As we have already commenced receiving consignments of this year's crop of honey, we feel safe in making the following quotations: Fancy white comb, 1-lb., 18¢ @20c., 2-lb., 16¢ @18c.; fair to good, 1 and 2-lb., 14¢ @16c.; fancy buckwheat, 1-lb., 12½¢ @13c., 2-lb., 11½¢ @12c.; ordinary grades of dark, 1 and 2-lb., 11¢ @11½c. Extracted white choice, in kegs or small barrels, 8½¢ @9c., buckwheat 6½¢ @7c.
BEESWAX.—Prime yellow, 30¢ @31c.
MCCAUL & HILDRETH, 34 Hudson St.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15¢ @16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7¢ @8c. for new.
BEESWAX.—For fair to yellow, 28¢ @30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—A rather quiet market has been experienced this week. The market for desirable grades: Fancy white comb, 9¢ @10c.; dark to good, 6¢ @8c.; extracted, choice to extra white, 4½¢ @5c.; dark and candied, 4c.
BEESWAX.—Wholesale, 24¢ @27c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12¢ @14c per lb., and strained and extracted 6¢ @6½c.
BEESWAX.—Firm at 32¢ @32½c. for choice.
W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. While the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.
BEESWAX.—28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13¢ @14c; extracted, 6½c.
GEO. W. MEADE & CO., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, ½-lb. sections, none in the market. They would bring 18c.; 1-lb., 14¢ @15c.; 2-lb., 13¢ @14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6¢ @7c.; white clover, 7¢ @8c.; Southern, 5½¢ @6c.
BEESWAX.—None in the market.
CLEMONS, CLOON & Co.
Successors to Jerome Twichell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18¢ @20c.; 2-lb., 16¢ @18c. Extracted, 8¢ @9c. Unglassed sections, sell best.
BEESWAX.—35c.
BLAKE & RIPLEY, 57 Chatham Street.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Domett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6½ inches.

The Southeastern Michigan Bee-Keepers' Association will hold their annual meeting in Adrian, Lenawee Co., Mich., on Dec. 3, 1884, in Plymouth Church Chapel. All bee-keepers are cordially invited to attend, and bring with them anything for exhibition that will be of any use or benefit to bee-keepers. Let all turn out and have a good time.

A. M. GANDER, Sec.

F. W. GILBERT, Pres.

Young Men!—Read This.

THE VOLTAIC BELT Co., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6D1y

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

To all new subscribers who send us \$2 for the Weekly BEE JOURNAL next year, we will send the rest of the numbers of this year free from the time the subscription is received at this office.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

BEE-KEEPERS' GUIDE;

OR, MANUAL OF THE APIARY.

11,000 SOLD SINCE 1876.

12th Thousand Just Out!

11th Thousand Sold in Just Four Months!

2,000 Sold the past Year.

More than 50 pages, and more than 50 fine illustrations were added in the 8th edition. The whole work has been thoroughly revised, and contains the very latest in respect to bee-keeping. It is certainly the fullest and most scientific treatise of bees in the World. Price, by mail, \$1 25. Liberal discount to dealers and to clubs.

HEDDON'S
COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County MICH.

Prices Reduced.

THE WEEKLY BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., November 26, 1884.

VOL. XX.—No. 48.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

We have received the "Second Annual Price List of the Victor Hive, Syrio-Albino Queens, and Apiarian Supplies, of Dr. G. L. Tinker, New Philadelphia, O.," 24 pages. This is the first catalogue for 1885 we have received.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two. This is a rare chance to obtain two good papers for about the price of one.

ADVERTISING RATES.

20 cents per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will admit about 7 words. ONE INCH will contain TWELVE lines.

Transient Advertisements must be paid for in advance.

Editorial Notices will be inserted at the rate of 50 cents per line.

Time Discounts on advertisements will be made as follows: On 10 lines and upward, 3 insertions, 5¢ cent.; 6 insertions, 10¢ cent.; 9 insertions, 15¢ cent.; 12 insertions, 20¢ cent.; 26 insertions, 25¢ cent.; 52 insertions, 40¢ cent.

On 50 lines and upward, 1 time, 5¢ cent.; 3 insertions, 10¢ cent.; 6 insertions, 15¢ cent.; 9 insertions, 20¢ cent.; 12 insertions, 25¢ cent.; 26 insertions, 30¢ cent.; 52 insertions, 50¢ cent.

On 100 lines and upward, 1 time, 10¢ cent.; 3 insertions, 15¢ cent.; 6 insertions, 20¢ cent.; 9 insertions, 25¢ cent.; 12 insertions, 30¢ cent.; 26 insertions, 40¢ cent.; 52 insertions, 60¢ cent.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

and UNSOLICITED TESTIMONIALS from as many bee-keepers in 1883.

We guarantee every inch of our Foundation equal to sample in every respect.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always do!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

- Doctor smoker (wide shield) . . . 3/4 inch . . . \$2 00

BOOKS!

Sent by mail, on receipt of price, by **THOMAS G. NEWMAN,** 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quitting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey! by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY AILEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c, in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, no which are printed a large bee in gold, 10c. each, or \$5 per 100.

Poultryer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

World's Exposition Honey Show.

The World's Exposition opens at New Orleans, La., on Dec. 1, 1884. Under the "Apiary Exhibits" heading, we notice, in the Premium List, the following list of premiums:

| | 1st | 2d |
|---|------|------|
| | Pm. | Pm. |
| Class 81—Colonies. | | |
| For the best colony of Italian bees in working order, and in an observatory hive with movable frames..... | \$25 | \$15 |
| For the best colony of Cyprian bees in working order, and in an observatory hive with movable frames..... | 25 | 15 |
| For the best colony of Syrian bees in working order, and in an observatory hive with movable frames..... | 25 | 15 |
| For the best, most varied exhibit of foreign bees or their descendants, having the most distinct markings according to race..... | 25 | 15 |
| Best exhibit of native or black bees in an observatory hive with movable frames. | 25 | 15 |
| Best exhibit of queen-rearing in nucleus observatory hive..... | 25 | 15 |
| Best and most extensive collection queen bees, any race, caged so as to be capable of observation, with retinue of bees.... | 25 | 15 |
| Class 82—Honey. | | |
| Not less than 50 lbs. each sample. | | |
| Best and largest collection of comb honey | \$15 | \$10 |
| Best 6 two-pound sections, or best 12 one-pound sections..... | 10 | 5 |
| Best and largest collection of extracted honey..... | 10 | 5 |
| Best 12 two-pound or 24-pound glass jars, extracted honey..... | 10 | 5 |
| Class 83—Hives, Manufacturers' Exhibits | | |
| Best movable frame for general purposes, summer and winter..... | \$20 | \$10 |
| Best manufactured of straw, fully equipped with movable frames and sections.. | 15 | 10 |
| Class 84—Manipulations. | | |
| For the most skillful transferring of bees, comb and honey from a bee-hive or straw skep to a movable frame hive, at the same time capturing and exhibiting the queen in the presence of judges.... | \$20 | \$10 |
| For the most skillful manipulation of the interior of a populous hive, in presence of the judges..... | 10 | 5 |
| For the most skillful extraction of honey from comb without injury to the brood. | 10 | 5 |
| Class 85—Implements and Beeswax. | | |
| For the most complete collection of apian tools, fixtures and implements.... | \$30 | \$20 |
| For the best honey extractor, to be tested in presence of the judges..... | 10 | 5 |
| For the best collection of beeswax in shape for apian and commercial purposes, obtained from comb made by exhibitor's bees..... | 10 | 5 |
| For the best wax extractor, to be tested on old comb in presence of judges..... | 10 | 5 |

Mr. Paul L. Viallon, Bayou Goula, La., will send a copy to any one on application.

Dodder—A Parasitic Honey-Plant.

For the following information concerning this interesting plant, we are indebted to W. A. Pryal, of North Temescal, Calif.:

The dodder, of which the accompanying sketch is a true representation, is a parasitic plant, many varie-

ties of which are found in different parts of the world. The one here shown is known as *Cuscuta racemosa*, and is found in many of the alfalfa fields of California, to which place it

was originally brought in imported Chilli alfalfa seed. It grows surprisingly fast, and from a single tiny seed a whole alfalfa field will become its prey. It is an exceedingly profuse bloomer, flowers of a yellowish white, and delightfully fragrant.

Bees are perfectly eager to get at its blossoms, and they do not have to fly from one bloom to another, but simply do all their work on foot, as the vine and flowers form a perfect mat all over the ground, so that the bees can "step" from one blossom to another. It is quite amusing to watch bees working upon this curious plant. At times they may be seen crowded together so closely that one would think they were endeavoring to make their way into a lot of honey-cappings. Its time of greatest efflorescence is during the fall.

On account of its being destructive to alfalfa, it will never be cultivated as a honey-producing plant, although it is rich in nectar.

Premium for Club of 10 Subscribers.

The book for every farmer is the one entitled "Affleck's Farmer's and Planter's Record and Account Book," in which there is the most systematic, complete and convenient arrangement of headings for every Farm Account and memoranda of all important events which may occur in connection with his business. Every progressive farmer certainly desires to make a success of his occupation, and should adopt every possible means of bringing about that result. He, then, should have a correct knowledge of his entire business, which he can have only by keeping a correct account of every crop produced on his farm, the cost of production of all his live stock and an itemized account of all his expenses. Then at the close of the year, when he takes off his balance sheet, which is admirably arranged in the book above referred to, he will be able to see at a glance whether his farm does or does not pay.

This valuable book contains 166 pages, is nicely printed on writing paper, ruled and bound, and the price is \$3.00. It can be sent by mail for 24 cents extra.

We can supply these books at the publisher's price, or will make a present of one copy for every club of TEN subscribers to the Weekly BEE JOURNAL for one year, with \$20. Four subscribers to the Monthly will count the same as one for the Weekly.

Now is the time to get up Clubs. Who will work for a copy of this valuable book?

CORRESPONDENCE

For the American Bee Journal.

The Carbonic Acid Gas Question.

S. CORNELL.

On looking through the back numbers of the BEE JOURNAL for the current year, I notice that some of the contributors are in error in regard to the carbonic acid gas produced by the respiration of a cluster of bees. I refer to the articles of Messrs. J. F. Latham, page 342, Warren Pierce, page 408, Levi C. Johnson, page 585, A. H. Dutton, page 629, and Rev. W. F. Clarke, page 438.

These writers seem to think that because carbonic acid is more than half as heavy again as air, it falls to the bottom of the hive, and that provision should be made for getting rid of it at that point. It is true that it would so fall, if it were of the same temperature as the air in the hive, and if it were not mixed with other gases, some of which are very light. The air exhaled by the bees is saturated with aqueous vapor for instance, the specific gravity of which is only $\frac{1}{2}$ of that of ordinary air. Then the respired air is several degrees warmer than the air in the hive. Owing to these circumstances the carbonic acid will rise with the other gases at first, but will afterwards diffuse evenly through the air in the hive, if no provision has been made for its escape at the top. In any event it will not separate and fall to the bottom. It seems that when gases are once mixed they remain so, no matter what may be their relative specific gravities. On this question the leading scientists are agreed. Huxley says: "If we shake up a mixture of liquids of different densities—say mercury, water and oil—the liquids soon settle down after agitation, in the order of their relative weights, the heavy quick-silver sinking to the bottom, and the lighter oil floating on the top of the water. Such a separation does not, however, take place when gases of different densities are mixed." On page 69 of the BEE JOURNAL for 1883, the carbonic acid gas question is discussed at some length. The evidence there produced is conclusive that the carbonic acid of respiration diffuses equally through the air of the room. Lower ventilation has its advantages, but they do not depend upon the density of carbonic acid gas.

On page 693, H. W. S. gives one of the best plans there is for ventilating hives in winter. The principal reason why bees get sick in winter quarters, is because the air in the hives becomes damp and impure from respiration, and the remedy is to change the air without perceptible draft, and without reducing the temperature of the cluster. Instead of using cotton wool, however, I use carded sheep's wool. It is, perhaps,

the only substance available, which, while conducting only the minimum of heat, permits that free escape of the products of respiration and transpiration, so essential to the perfect health of the bees.

Count Rumford's experiments on the conductivity of substances used in clothing, show that, while a warm body, wrapped in cotton, cooled to a certain degree in $17\frac{1}{2}$ minutes, 22 minutes were required to cool it to the same degree, when wrapped in the same bulk of sheep's wool; and Pettenkoffer found that the capacity of wool for absorbing moisture is more than double that of cotton wool. Every one knows that in his own case woollen garments are better than cotton for retaining heat and carrying off perspiration. If H. W. S. will pack a few of his colonies with sheep's wool, I venture to say he will find that the consumption of honey will be less, if wintered outside, or in a cool temperature inside.

The only other point which I desire to mention is that the combs should be raised above the bottom board by placing a rim under the hive, or if the bottom is nailed, by suspending the combs in a rim placed on top, because sometimes dead bees fall to the bottom and accumulate in the spaces between the combs, preventing a free circulation of air through the hive.

With his bees prepared thus, the bee-keeper may "sleep easy" about the pollen question. No matter how much pollen may be in the combs, the bees will eat no more of it than is good for their health, and they will come through safely, in any place, where bees should be expected to winter.

Lindsay, Ont.

For the American Bee Journal.

The Apicultural Outlook.

JAMES HEDDON. ♀—460.

There is not so much difference between the opinions held by myself and J. E. Pond as there was; not so much as he imagines there is. His article on page 731 induces me to believe that he thinks more of the pollen theory than he formerly did. Also that he errs greatly concerning my views upon the subject. Had he read my articles upon the subject carefully before he began commenting upon them, I cannot see how he could make the statement that "to day I am sure." Have I not all the time said that it was a theory in which I fully believed, and that I did not claim to know; that I was seeking more light on the subject, and was always open to conviction? For this conservatism, did not Mr. Fradenburg set up the "priority" claim and Dr. Mason get out of patience with me? Each year brings forth new evidences to make me feel surer of the correctness of the theory; but still I do not yet say "I know," nor shall I until I do know. Mr. Pond cannot have read correctly.

But of what good is it to safely winter our bees if their product will

not bring the cost of production in the open markets of the world? On page 728, I find the lament of Mr. Kendall; Mrs. Harrison and Mr. G. M. Doolittle having already put in theirs. For years I have feared this state of things. Mrs. H. and Mr. K. charge the bad condition of affairs to reckless producers and adulteration. Mr. Doolittle places it where it belongs, as I see it, viz: to supply and demand.

If the bee-keepers of this country had said nothing about adulteration in the past, scarcely any consumer would have dreamed of any such thing as bogus honey. All the cry has done nothing to stop the increase of the amount of honey offered to the public by the way of adulteration.

It is no less true with our business than with all others that "honesty is the best policy;" and any system which is wrong, will finally kill itself. The quieter we remain the sooner the death will occur. Just as sure as a bee-paper contains a report of a large yield of honey somewhere in the United States, or a case of the discovery of a few pounds of adulterated honey, many of the different agricultural papers of our country will copy the wonderful statements, and thus do ten times more in adding to the production of our goods than all that is done by adulteration. They also detract greatly from the consumption by uselessly frightening consumers. The result is, that the greatest sufferers are the producers of pure honey. Some way or other they never copy from our papers such an article as that able one of Mr. Doolittle's on the cost of honey-production. Any honey-producer, at all familiar with the natural channels of trade and the conditions affecting the same, must have known what was coming.

Allow me to predict that organization will not stop this condition of affairs. Ignorant and unscrupulous supply dealers and enthusiasts will be sure to push the thing to a legitimate re-action, and no shouts of adulteration, nor efforts to organize against it will do us aught but harm.

Well, what shall we do? and what is the outlook? The outlook is all right. My stock in this business has not, and will not depreciate in the least. All the combined forces at work against our interests as producers, cannot prevent our receiving the full benefit of the laws of action and re-action. "After clouds, sunshine; and "He who produces at maximum cost will fail, and he who produces at minimum cost will succeed."

If you wish to hasten the day of re-action, say no more about adulterated honey; tell no more about what a lucrative business honey-producing is; tell the truth, that all dabbling with bees results in loss, as regards honey-producing; that farmers, carpenters, and small children, together with invalids and widows, can buy their honey cheaper than they can produce it; advise all to keep out of the business unless they have natural qualifications for it, and propose to make it a SPECIALTY, and

locate in a field entirely unoccupied by any other. Withdraw your patronage from all bee-papers and supply dealers who are working against your interests, by inducing all classes to attach apiculture to their other business.

To any man who is trying to increase the surplus honey crop of our country by aiding those already in the business to secure larger and better yields, I extend the right hand of fellowship; but to those who are trying to increase the number of producers of this already fully-supplied luxury, I have nothing to offer but pity for the mistaken, and contempt for the designing.

I advise all who mean only to dabble with the business, to abandon it; and all those who wish to embark in it as a business, to have no fears, but go right ahead.

Dowagiac, Mich.

New Jersey and Eastern Convention.

The New Jersey and Eastern Bee-keeper' Association assembled in the Cooper Institute building in New York City, on October 29, 1884.

The meeting was called to order by the President, Joseph H. M. Cook. The Secretary reported that he had received neither the roll of membership nor minute book from his predecessor, and was, therefore, unable to report, except as to what took place at the last meeting, and with which all the members were familiar, having seen it published in the April number of the *Bee-Keepers' Magazine* for 1884, commencing on page 54, which report was accepted and ordered to be placed on the minutes.

The Treasurer was absent, but having sent his report to the President, the same was read and accepted.

No programme had been prepared for the convention. Mr. A. J. King stated that the condition of the Association to-day was due to the neglect of the officers in not doing their duty, excepting, however, the President, who was always on hand.

The President explained that other duties had probably prevented him from giving all the time necessary to the success and for the benefit of this Association, and that he was ready to share his part of the blame. He then delivered a short address, saying that the past year had shown him something that he had not been aware of before; he had lacked faith, but this year had convinced him that there was no ground for this lack of faith, and that he was now satisfied that New Jersey can rely on bees producing a good crop of honey, and that the bee-keeper had an equal chance with the farmer in the raising of any particular crop. The farmer had only this advantage: That he was not relying on any particular crop, and that while his corn may fail, his potatoes would be a success. Bee-keepers do not receive that profit from their bees, because they do not qualify themselves for the profession—for such it must be considered; but if they do this, they will adapt themselves to it

and will realize the greatest possible profit. The season with him had been a prosperous one. He had received 2,500 pounds of comb honey and about 500 pounds of extracted honey from 40 colonies.

The taking up of miscellaneous business was recommended, and discussion arose as to the method of answering questions, whether some should be appointed for the purpose or have them answered by any one having had experience bearing upon the point enquired about. The latter method was adopted.

Mr. Blauvelt: "Is it practical, and, if so, is it of any benefit to reverse the frames in the hives? Will it not cause the honey to run out?"

Mr. Dean said that he had never heard any objections regarding the running out of honey, but thought that the reversing of frames would cause the bees to fasten the comb more substantially.

Mr. King said that the reversing of frames was for the purpose of having the honey stored in the top of the frame, placed in the bottom for the purpose of having the bees carry it into the surplus boxes.

Mr. Dean; I have heard the statement repeatedly from bee-keepers, that in feeding bees with honey for the purpose of storing, it would lessen from one-third to one-half.

Mr. King said that this loss was due to the rearing of brood; but in reversing the frame, the brood being already in it, but placed in the top of the frame, the bees would not, therefore, store the honey there, but would carry it into the top boxes.

Mr. Vescelius said that feeding was generally done when there was a lack of honey; this accounted for the loss.

The President thought that he would make reversible frames if he had practical knowledge of using them in the spring, when we have the apple blossoms; and, considering the small number of bees in the hive, they would bring in a large amount of honey during the day, and having at this time only a little brood, they will fill all the empty cells in the top of the frame, and we will find about two inches of solid honey in the top; then comes the benefit of reversing the frame. He had tried it with a few hives, and found in reversing the frames, that it started the bees in the boxes. He said he considered reversible frames a step in advance in bee-culture.

Mr. Samuel Miller explained on a black-board how these frames might be made, and stated that the reversible frames would prove a success, and that more honey could be obtained from a single colony by their use, but he thought that the best way to get a good return was to choose a good locality and have more colonies and give them less attention, than to have less colonies and give them much attention. He said he knew of some bee-keepers who get from 50 to 60 lbs. of honey from a colony, and who gave them but very little attention.

Mr. Dean said that he thought that if an extractor were used there would be no need of reversible frames.

Mr. King said that Mr. Dean had struck the key-note. Extracted honey was taking its stand in the market and that considerably more honey could be obtained from a colony by the use of the extractor, and there was no cause to worry ourselves about reversible frames.

Mr. Miller: How would you extract honey from the brood-chambers?

Mr. King: It is my experience in a good-sized hive, to extract from the outside combs and replace them in the center of the hive, and in this manner keep the brood-chamber in good condition.

Mr. Vescelius said that reversible frames would be of no benefit to him; that he must extract from the brood-frames, or else he would have no bees to gather honey, for they would fill every cell with honey, and crowd out the queen which would have no place to lay her eggs. He thought that an extractor was an actual necessity to the bee-keeper.

Mr. Terraberry: Bee-keeping is a business that a person may engage in profitably, provided he has an average locality. My honey crop this season has been very light. The month of May, with us, was very cold. June warmed up at once and came out very dry. White clover bloomed and dried right up. My plan of management is about the same as that of other practical bee-keepers. I do not think it advisable to equalize brood too early in the spring, but do it later in the season—on the approach of white clover. I secured some honey from apple blossom; after that, from raspberry. I believe in, and practice swarming by division. Out of an increase of twenty-five, I have had only one natural swarm. In making new colonies, I take a frame from several hives, rear queen-cells in full colonies, and transfer to a new colony or nuclei. I use two kinds of hives, a chaff hive with one tier only, and another when I tier the boxes. I do not use side-boxes, except early in the spring, and when they are drawn out and partly filled, I transfer them to the top—bees and all. I use foundation in both brood-nest and surplus boxes. I never practiced "feeding back," except in one hive, which I had in my store window, but found that it did not work well. I do not believe that they will store in boxes, all the honey fed to them. I have some of all kinds of bees in my apiary. I aim to keep pure Italians, but black bees will sometimes come in. I do not see any very great difference in their honey-gathering qualities, but I prefer pure Italians. I started my apiary with the old-fashioned brown bees, but could not succeed as well with them as I do with the Italians. I consider that it is necessary to study the bloom and get bees ready for it. Where natural swarming is resorted to, I would not place boxes on immediately after hiving, but would wait a few days, unless I had two or three combs to give them in which to store pollen and start the queen to laying. I do not use any drone-excluders, except in that I use foundation with worker-cells. I rear no more drones

than are necessary. If I had a colony which had only fifteen pounds of honey in the hive, I would feed immediately so they could store it. I have wintered a colony fed on syrup as late as the middle of November. I do not use a queen-excluding board between the frames and section-rack. I use both wooden and tin separators and find no difference. I have tried without separators to my sorrow. I do not allow natural swarming if I can prevent it. I have my apiary about 300 yards from my store, but connected with a telephone. I winter my bees on their summer stands, and contract the entrances in cold weather.

Mr. Vescelius: The first thing that I did to produce a crop of honey, was to rear plenty of bees. This I did by breaking the caps from the honey of outside combs and placing them in the center of the hive and starting the queen to laying. I got but little from white clover. There was no honey in my hives on August 1, but shortly afterward the buckwheat crop came on and I commenced to extract and have taken from 13 colonies, spring count, over one ton of extracted honey and have increased them to 35 colonies. I set some frames aside in the early part of the season, the honey of which is not so nice, and on these I propose to winter my bees. My hives to-day are full of bees, all owing to constant extracting.

Mr. King said that what Mr. Vescelius had said, proved that if the bees are in good condition, they will gather sufficient honey if the harvest lasts only a short season, and prove profitable to the bee-keeper.

Mr. Vescelius: I will now give you the other side of the question. I have a neighbor who has movable frames. I have, on various occasions, given him advice. He has nine colonies, and his honey crop, this season, amounts to about nine two-pound cans of squeezed-out honey. He does not believe in extracting, but considers it too expensive.

Mr. Waite: Are queen-excluding boards necessary?

President: I have had no experience but I do not believe in using them.

The Secretary announced that he would be absent during the winter months; that he was going on a pleasure cruise through the Southern States and would not probably be able to attend to the duties devolving upon him as Secretary.

It was, on motion, ordered that a committee be appointed to call upon Prof. J. Hasbrouck and obtain from him the roll of membership of this Association, and also the minute book and minutes of its former proceedings.

The President appointed Mr. A. E. Cunkey, as such committee.

Considering that the proper officers had failed to prepare a programme for the use of this convention, it was, on motion of Samuel Miller, ordered that the President, with the assistance of any one whom he may choose, prepare a programme for the next session of the convention, and to notify the members of the Association by postal, of its next meeting, and

see to it that the room is opened at the proper time in the morning for its next session.

The President named Mr. A. E. Cunkey to assist him in that work, on account of the absence of the Secretary.

The meeting was then adjourned.

JOHN ASPINWALL, Sec.
J. H. M. COOK, Pres.

Read at the Rochester National Convention.

Wintering Bees.

REV. W. F. CLARKE.

The subject of wintering bees is in a chaotic state. It is like the primeval earth, "without form, and void, and darkness is on the face of the deep" places in the ground to which so many apiarists consign their colonies for burial from four to six months of the year. But, as at creation's dawn, there were already subsisting elements which only required the birth of light and the wand of order to transform chaos into paradise, so, it is believed, we have the requisite data out of which to construct a theory of wintering bees, which only require intelligent application to prevent our apiaries from being transformed into charnel-houses and cemeteries by the advent of cold weather.

Our best bee-keepers frankly admit that as yet we have developed (?) no absolutely safe and sure method of wintering bees. The directions given in our apiarian manuals only encourage the *hope* of successful wintering, in case they are followed to the letter. They make no definite promises. There is no method before the public which has not proved fatal during some seasons and under certain circumstances. Some of our leading spirits in apiculture, who seem to have mastered every essential point in summering their bees to the best advantage, are still only experimenting in the matter of winter management. When we find men like Hutchinson of Michigan, and Doolittle of New York, "trying their luck" with such devices as "clamps" and coal-oil furnaces, only to lose a large proportion of the colonies thus treated, we may be sure that wintering bees has not yet risen to the dignity of one of fixed or exact sciences.

Now and then a bee-keeper starts up and tells us that he has no difficulty whatever in this respect, and can winter bees as easily as he can winter cattle or sheep. He crows lustily for a single summer, but the next season we hear nothing from him; he has failed, and very naturally does not like to tell his losses. He quietly repairs them by purchase, and so keeps his apiary up to its numerical standard, but sings low thereafter as to the ease with which the winter difficulty can be conquered. Our frank and honest bee-keepers who make a clean breast of it in confessing their failures, occupy the front rank among us both as *men* and as *bee-keepers*, and are deserving of all praise for disdaining to sail under false colors. Let us own that, as yet, we are all of us

only learners in regard to this subject, and that not one in our numerous ranks is entitled to write M. A. after his name—Master of Arts, or Master of Apiculture, for want of proficiency in this most perplexing art of wintering bees.

While almost every other branch of bee-keeping has made wonderful progress during the past twenty years, wintering has been at a stand-still. A reference to the bee-papers of twenty years ago, will show that about as much was known on this subject with certainty at that period as now. No more despair could have been expressed then, than was uttered by Mr. H. S. Hackman in the AMERICAN BEE JOURNAL of April 23, 1884, who, after detailing heavy losses under various plans of management, sums up all by asking: "So what do we know about wintering bees?"

It is, I hope, with becoming diffidence, and most certainly without any assumption of superiority, that I venture to propound a theory, which I firmly believe will prove the Ariadnean clew to guide us out of the labyrinth of winter difficulty in which we have been so long bewildered and entangled. It seems perfectly clear to my mind that all our trouble is traceable to the fact that we have overlooked a principle or law of bee-life, not wholly unknown to us, but whose vital importance to the matter in hand, we have hitherto failed to recognize and appreciate. I refer, of course, to HIBERNATION, a word with which my name has been conspicuously connected for some months past in the bee-periodicals. Doubtless it was on this account that our worthy Vice-President, L. C. Root, requested me to address this meeting on the time-worn, hackneyed, threadbare, but yet unexhausted theme of wintering bees. I am glad of the opportunity to broach my theory before this august apicultural assemblage, for such it may without any flattery be called. It is the supreme court of bee-keeping on this Continent, and before such a tribunal by which the utmost impartiality and the highest judicial acumen may be expected to be exercised, I have much pleasure in submitting a statement of my case.

Hibernation is a term often employed in general literature to express the simple idea of passing the winter, but, in the world of science, it stands for that state of complete or partial torpor into which certain animals and many insects are wont to sink on the advent of cold weather. At the outset of this discussion, let me lay down the proposition that bees in cold climates instinctively sink into this condition of torpor or lethargy; also, this other proposition, that when provided with proper shelter and a sufficiency of food, they will infallibly winter well, if they can hibernate. What proof I am able to furnish in support of these two propositions, I now proceed to submit.

The hibernation of bees is no new discovery. Science proclaimed it long ago. Observing bee-keepers have noticed it time and again. Steam

and electricity are not modern discoveries. As natural phenomena they were known in past ages. The discoveries have been in their practical applications. What I claim, and all that I claim in regard to the hibernation of bees is the discovery that it furnishes the key wherewith to solve the winter problem.

Now then, in proof of the proposition that the instinct of bees leads them to hibernate in a cold climate, I propose to cite only the testimony of bee-keepers. As I do not profess to be an entomologist, I will leave that branch of the subject to Prof. Cook, whose business it is to teach it in the Michigan State Agricultural College.

In Vol. IV of the AMERICAN BEE JOURNAL, as long since as June, 1869, Mr. J. H. Thomas wrote as follows: "What is the natural condition of bees during winter? I answer, it is a semi-dormant state—a sleepy, stupid condition. The reasons why such a state is the natural one, may be given as follows: First, it is a state in which the least amount of food is required; hence, the bodies are less distended under this condition, and the excrements are more easily retained. Secondly, a semi-dormant state is secured at a temperature calculated to carry off by evaporation the watery substances from their bodies, thus securing a more healthy condition of the colony. Thirdly, the temperature being always above the freezing-point, the bees are able to reach any part of the hive at any time for food. Fourthly, bees wintered in a semi-dormant state always come out in the spring healthy and vigorous. This fact alone is sufficient to prove it to be a natural condition for winter. How, then, can it be secured?" Aye, there was the rub. Mr. Thomas then believed in the cellar-plan, which he afterwards abandoned for a bee-house, while that was in turn superseded by double-walled hives and wintering on the summer stands. Neither method infallibly secured the hibernation of bees; not the principle, but the practical application of it being at fault.

In 1872, Herr Schonfeld, in the *Bienenzeitung*, said: "The first winter that would pass over our temperate zone would destroy almost all the insects had not Providence provided for their preservation. There are four methods of preservation: 1. In the egg. 2. In the larvæ, to all of which belong those insects requiring two or more years for their development. 3. In the chrysalis. 4. The developed insect. The most of those belonging to this latter class pass the winter in a state of torpidity. To this latter class belong the bees, and it is well known that these, in order that their depressed vitality may not be wholly extinguished, require for their successful wintering, besides the necessary food and rest, especially a protected dwelling." He goes on to lay it down as a maxim, that "the hive should be so constructed that the bees, during their period of torpidity and when without brood, are able to obtain and sustain a warmth of 10°

R." Dr. Dzierzon, in an elaborate criticism on the article just quoted, while agreeing in the main with the positions taken, contends that no very exact regulation of temperature need be prescribed, and that, within certain limits, and not very narrow ones either, bees can and will generate the degree of heat which is best for them—a most important fact in bee-life, of which more anon.

Dr. E. Gallup, in the AMERICAN BEE JOURNAL of July, 1870, page 19, wrote: "The fact is, if the bees have the right kind of ventilation, both in the hive and in the cellar," (he was a cellar-man then) "they remain in a semi-torpid state, as it were throughout the entire winter, even as long a winter as the last one was." Mr. Gallup afterwards abandoned cellar-wintering and took to wintering on the summer stands, and gave a remarkable statement concerning a colony which subsided into semi-torpidity, consumed but little honey, and came out bright, strong, and prosperous in the spring. In recent numbers of the BEE JOURNAL, Messrs. Pierce, Latham, Allen Pringle, Johnson, Gresh, and others have recognized the fact that bees hibernate. Mr. Latham says that the first impress of this knowledge was imparted to him when a child in his New England home, by a dame whom he asked on a cold winter evening, "Are the bears out to-night, grandma?" "No," was the reply, "the bears are among the seven sleepers." "What are the seven sleepers, grandma?" Answer: "The bears, the raccoons, the woodchucks, the bees, the ants, the frogs, and the snakes." "Do they sleep all winter, grandma?" Answer: "No, they wake up sometimes when we have a thaw." I do not want a better statement of the hibernation of bees than that given by the old lady whom Mr. Latham quotes. Bees do not, like bears, sleep all winter in one unbroken slumber, but "wake up sometimes when we have a thaw."

I have given sufficient proof that the disposition of these insects to hibernate has not escaped the observation of practical bee-keepers; and some of my quotations have also shown that when bees hibernate they winter well. But on this second proposition, I wish to cite two or three testimonies. The first is that of Mr. Gallup given in Vol. VII of the BEE JOURNAL, page 258, dated May, 1872. Referring to a colony which bred late in the fall, he says: "They went into winter quarters with all young bees, and the result was (they were housed about the middle of November, and taken out on April 4), that they remained comparatively dormant all winter, and the consumption of honey was almost nothing, and on their first flight there was no discharge, not even to speck the snow one particle, and a table-spoon would have held every dead bee in both hives." I pronounce that a case of perfect wintering. What bee-keeper wants anything better than that?

Mr. L. C. Root, in his new edition of Quinby, page 255, says of a case of

wintering, "I set my bees from the cellar on May 3 and 4, after they had been housed since Nov. 17, in a dry and well-ventilated room, and kept exceedingly quiet during the entire period. When put upon the summer stands, the bees were in so nearly a dormant condition that they were slowly aroused; the weather being quite warm, the usual voiding of feces in a liquid state did not take place, and clean, new roofs were not soiled in the least." Another instance of perfect wintering.

My third witness on this point is Mr. James Heddon, author of the pollen theory, who, in his able and admirable review of my hibernation hypothesis, makes the following interesting statement:

"One fall, just before placing some 40 colonies in a double-walled, above-ground repository, I weighed a part of them with great care. For some reason, then (if not now), unknown, nearly every colony in that house readily took on that perfectly quiescent state, and the apiary wintered successfully; and when taken out in the spring and again weighed, the most successful colony weighed but a single pound less than when put in, in the autumn. I might have thought these figures due, or partially due to some error in weighing, had it not been that the others graduated all the way from 2½ to 5 or 6 pounds less." A third example of perfect wintering. I do not need to multiply testimony. "In the mouth of two or three witnesses shall every word be established."

A quotation from a private letter, written me by Mr. Heddon, will bring us to the very pith and heart of the question under discussion: "Of course you know, that I know, that you do not know the cause of bee-diarrhœa, unless you know that it is pollen, you know. Friend Clarke, I want you to remember that bee-diarrhœa is the cause of winter trouble. That is well known. The point to get at is the cause of bee-diarrhœa. You must know that the inmates of old box-hives have it as badly as those of any other hives; also, that several winters here have killed all the bees in the trees."

Again, at the meeting of the Northwestern Bee-Keepers' Society held in Chicago two weeks ago, Mr. Heddon said: "This question of wintering is not one of cellars, ventilation, pieces of laths, sticks, quilts and cushions over the combs—that kills our bees is diarrhœa; and the question is, What causes bee-diarrhœa?"

I take up the gauntlet thus thrown down, and to the question, "What causes bee-diarrhœa?" unhesitatingly reply: Inability to hibernate.

Let us not mistake the issue here joined. By hibernation, I mean what Mr. Heddon calls that "perfect quietude" in winter quarters, which he and other bee-keepers have noticed, and I say, if they can get into this condition and maintain it while cold weather lasts, they will not have bee-diarrhœa. If they cannot go into this state, they will infallibly contract the disease.

Now what are the essentials to the successful hibernation of bees? I have pointed them out in connection with their favorite natural home, the trunk of a hollow-tree; having been led to the discovery, as I think, of the missing link in our theories of wintering, by remembering that I never met with a case of bees being winter-killed in a hollow tree-trunk. Observe, I merely said I had never met with such a case, and I took the ground that bees usually winter well in such a place. It has been thought by some that an example of bees being winter-killed in a hollow tree-trunk was fatal to my theory. This is a mistake. In referring to the hollow-tree-trunk home of bees, I merely detailed the process of thought which led me to my present position. Suppose they are sometimes winter-killed in these receptacles, I only ask the admission that they generally do well in them, to serve the purpose of my argument. I reasoned that bees, when left to their own instincts, choose a home in a hollow tree-trunk, and so far as my observation and experience go, I find it answers their purpose excellently.

In the trunk of a hollow tree, bees find a hive without a particle of upward ventilation, its sides composed of porous, non-conducting material, and having a perpendicular shaft or column of air beneath them. Add to these a sufficiency of stores, and you have all the essential conditions of hibernation—in other words, of successful wintering.

Now, leaving the hollow tree for our artificial hives, I venture to assert without fear of successful contradiction, that if you will give bees a domicile, impervious at the top, having side-walls constructed so that frost will not strike through and condense vapor inside; supply them with an adequate stock of food; and provide a perpendicular air-column beneath them, you will be able to cry "Eureka" in regard to this winter problem. The great desideratum is, pure air, plenty of it, under the control of the bees, and in a receptacle not too large for them to regulate the temperature of it. This implies no upward ventilation, for that makes the bees helpless. To warm up a hive with holes at the top, however minute, is as hopeless a task as that of filling a tub with water that is perforated with holes at the bottom. I believe there never was a more fatal mistake of wintering bees than that of upward ventilation. We all know that warm air ascends, and it must escape through any apertures which allow the escape of moisture, which goes off in the shape of vapor. With a perpendicular shaft of pure air, the moisture will descend along with the carbonic-acid gas, and all other foul gases. But the heat will not descend. It will stay at the top. The infatuation of bee-keepers about upward ventilation is perfectly amazing. In the last edition of *The Apiary* by Neighbour, the highest English authority in apiculture, I suppose, I find the following in a plea for upward ventilation: "Holes the size of a

pin-head will allow the moisture to escape, and these must be re-opened as fast as they are propolized by the bees." I would ask, "Why do the bees propolize even pin-holes?" Because instinct teaches them that they need to retain all the heat they make. The bees generate their own heat, and if it be wasted, they must consume food in excess, become distended with forces, and cannot sink into the "perfect quietude" which is their normal condition for wintering.

There is no more perfect system of ventilation for human beings than that furnished by an open fire-place with a chimney leading from the room into the outer air. In such a chimney there are two currents of air always in motion, an ascending and a descending one, but it is well known that it wastes a large amount of heat. The open chimney is necessary for the escape of smoke. If there were no smoke, the air could and would be changed from below. This is what takes place in a bee-hive, partly from the natural descent of the heavier gases, and partly by the ventilating operations of the bees themselves, which can fan cool air into their lives during summer, and fan it out during winter. That bees possess this power has been often demonstrated.

Now let us consider how bees fare in regard to ventilation on the systems of wintering at present in vogue. On the cellar plan, they are condemned to a receptacle, the air of which is always more or less foul. Would any of us like to pass the winter in a cellar such as those into which bees are put? Can any one tell me why bees do not need just as pure air as human beings? Their sense of smell is most acute, and they cannot but be at once affected by air which has any taint of impurity in it. A cellar built in a sandy or gravelly soil, and supplied with air from a shaft in the wall, may approximate to purity, but even such a cellar is not so pure as the atmosphere without. Another objection to cellars is this: Each hive ought to have an independent self-regulating power, which is impossible when a large number of hives is stored in one common receptacle. Each colony must have the same conditions as all of the others.

Substantially the same objections lie against clamps and bee-houses, and need not be repeated. Another difficulty with all these is that a uniform temperature is and must be maintained in them. According to the theory of hibernation, or "perfect quietude," *a la* Heddon, bees need occasional variations of temperature. As the New England dame already quoted, wisely observed, "they wake up sometimes when we have a thaw." These are their opportunities for unlocking their winter clusters, stretching their legs a bit by walking around upon the combs, and taking something to eat preparatory to another period of repose. How often they need to partake of food we do not know, but they will be able to do it often enough if the outer air, with its alterations of temperature, has free access to them.

Now as to out-door wintering: Double-walled chaff hives are excellent save in two particulars: the chaff cushion on top, which gets saturated with moisture, and becomes worse than a wet blanket over their heads; and the provision for ventilation which is defective, first, it being horizontal instead of perpendicular, and secondly, in its liability to be clogged up by dead bees, ice, and snow. If these hives were lifted a couple of feet from the ground, and an air-shaft put in below them, they would meet all the conditions of hibernation, provided the cushions were thrown away, and an impervious air-tight top given them. But the horizontal air-shaft imposes extra trouble on the bees, which must drive out cold foul air by wing-fanning that would with a perpendicular outlet, sink down by its own dead weight. Bees winter well in chaff-packed hives if the entrances are kept open. "Cyula Linswik" and her sister have had very few losses for many years in wintering bees out-of-doors, but one or the other of them daily visits the hives, and sees that the entrances are unclogged. With a perpendicular air-shaft, there is no trouble of this kind. It is always open, and besides providing a constant supply of pure air, with a hopper beneath the hive connecting with the tube containing the air-shaft, the dead bees and excreta infallibly drop out of the hive.

Either want of air or an excess of it will cause bee-diarrhœa. If bees are either too warm or too cold, they will eat too much, their bodies will become distended, and they must have relief. When too warm, they are restless, cannot subside into "perfect quietude," eat more than they can get rid of in dry, powdery excretions, become diseased and die. When too cold, they eat large quantities of honey to generate heat, and the same fatal result happens. When too warm, they are apt to commence brood-rearing, and to do this consume pollen as well as honey, and this is the only vestige of truth I see in the pollen theory. But whether honey or pollen, if they eat more than they can excrete without fouling the hive, diarrhœa is the sure and fatal result.

If these views are correct, and I think they will stand the severest criticism, then our bees want, in addition to what we already give them, *air, PURE AIR.* "Only that and nothing more." To parody the well known humorous address "to the sextant of the meetin' house," our bees may well say: "You give us nice double-walled hives, let us keep lots of honey or feed us plenty of sugar syrup:"

"But o bee-keeper! there are I commodity wich's more than gold, wich doant cost nothin', worth more than anything except the sole of man! i mean pewer are, bee-keeper, i mean pewer are! O it is plenty out-of-doors, so plenty it doant no what on airth to dew with itself, but flies about scattering leaves and blowin' off men's hats! In short, it's jest as 'free as are' out dores. But o bee-keeper, in our hive its skurce as dimons, skurce as bank-bills when

agents begs for mischuns, wick sum say is purty often (taint nothin to me, wat I give aint nothin' to nobody), but o bee-keeper, U shet ten thousand bees, workers, an brood, speshally the latter, up in a tite place, an every I on 'em brethes, in an out, an out in in, say 50 times a minnit, or I million breths an our; now how long will a hive-ful of are last at that rate I ask you—say 15 minnits—and then wats to be did? Why then they must brethe it all over agin, an then agin, an so on till all has took it down at least 10 times, an let it up agin, an wots more, the same individual doant hev the privilege of brethin his own are, an no one else's. Each one must take whatever comes to him. O bee-keeper, doant you know our lungs is belluses; to blo the fier of life, an keep it from going out; an how can belluses blo without wind; an aint wind *are*? I put it to your conschens. Are is the same to us as milk to babies, or water to fish, or pendlums to clox, or roots an airbs unto an Injun doctor, or little pills unto an omeopath, or boys to girls. Are is for us to brethe. What signifies lots of honey if i cant brethe? What matters pollen or no pollen to bees that are ded, ded for want of breth, why, bee-keeper, when we dy, its only coz we cant brethe no more, that's all. An now, o bee-keeper, let me beg of you, tu let a little are into our hive. It a'nt much trouble, only make a hole, an' the are will come of itself; an' we will warm it up to suit us."

I have said enough to make the principle plain, and I ask my fellow-apiarists to co-operate with me in working out the practical application of it. I make the modest request that you will each try at least one colony on my plan by way of experiment. The method I have devised has been already described in the BEE JOURNAL, and I will here repeat it. I have constructed a hive-stand, consisting of a box about table-high; just the height at which you can handle bees without getting the back-ache. The bottom of the box is one wide board $1\frac{1}{2}$ inches thick, 20 by 26 inches; the dimensions being calculated for a Langstroth-Simplicity hive. The box is air-tight, with the exception of having four one-inch auger holes covered with wire gauze, which are bored within 6 inches of the top. The extra size of the box is meant to afford an opportunity of covering the hive with a rough shell in winter, to be packed with chaff. It also gives a wide alighting-board in front, and some shelving on the sides, and at the rear, which will be found handy during the working season. The hive to be used is without a bottom-board, but a sliding bottom-board, put in and taken out from the rear is to be used during the honey harvest. When that is over, and all danger of comb-extension is past, it is to be removed. Immediately below it is a hopper fitting tightly to the stand just beneath the hive, its flaring sides terminating in a square tube $\frac{1}{4}$ inches wide each way inside, which reaches down to within a few inches of the bottom of the box. The usual entrance to the hive

is to be left sufficiently open to admit of passage out and in by the bees. Through it, and the four auger holes, abundance of air will find its way into the hive. No dead bees will choke the entrance, as they will fall to the bottom of the box. A little door in the box enables the bee-keeper to see the dead bees, dry excrement, etc., that may have dropped from above, and thus the state of the colony may be seen at a glance, and without the slightest disturbance of the bees, to the extent that these signs reveal it.

A correspondent of *Gleanings* thinks that all this box-arrangement is needless. He says: "There's that man Clarke, of Canada, who had a rheumatic vision of tree-top wintering. What'll I do with him? * * * To elevate his hive above the foul, damp gases, we would put it on four 3-foot locust pins, driven a foot in the ground; to secure plenty of pure, still air, we would get them within a high board-fence enclosure. For the removal of dead bees, etc., having the whole entrance open, clean off the bottom-board weekly with a bent wire." I have already stated why this rough-and-ready plan will not answer. It is not enough to leave the ordinary entrance, even if it were sure of being always unobstructed, which it is not. A few hours stoppage of it may prove fatal. Besides, I want a perpendicular column of air beneath the hive. Moreover, why be at the trouble of poking a bent wire in at the entrance, when a perpendicular air-shaft will be a self-regulating affair? My box gives me a reservoir of pure, still air, obtained two feet from the ground, and being tight, cuts off dampness and excludes foul gases. It should be added, that the bottom-board of the box is spiked to pieces of round cedar, slightly flattened on the lower side, giving the least possible contact of the box with its round sills.

Mr. Heddon objects that my plan is not practical. I cannot, for the life of me, see why it is not. It is less costly than cellars or bee-houses, and avoids all the trouble of setting bees into and out of repositories. As long ago as 1868, Mr. Langstroth said in Vol. III of the BEE JOURNAL, page 209: "For many years I have been persuaded that bee-keeping would never flourish as it should, unless some cheap and simple method could be devised, by which bees may be safely wintered on the summer stands, instead of being placed in special depositories. To say nothing of the cost of such structures, and the great labor and judgment needed for their proper use, they are open to disadvantages which cannot be remedied, even by the most skillful and prudent management. After the bees have been placed on the stands, if the weather suddenly changes, a cold wind springing up and clouds obscuring the sun, it is often found that as many bees are lost as if the colonies had wintered in the open air. Colonies which have wintered well on the summer stands, are usually more forward in breeding than those of equal strength which have been put

in special depositories. When first put out, the latter have a deceptive appearance of strength; for the old and feeble bees which would have died if they had been wintered in the open air, perish soon after they begin to fly." These are wise and true words. But I believe that if bees are wintered so that they can hibernates, fewer bees will die. They will attain greater longevity if they get a natural and prolonged winter rest. Moreover, I have little doubt that the method I have been advocating will prove an effectual antidote to spring dwindling—next to bee-diarrhœa, our chief trouble in keeping bees. But on this and various other points, I cannot now enlarge. In closing, let me insist upon it that the mortality of our bees in winter is the result of some violation on our part of natural law. We have on this Continent the best honey field in the world. It was, therefore, plainly designed by Providence that bees should flourish here. There must then be some feasible plan of wintering these insects, and we ought to find it out. We must wrench this secret from nature's store-house of mysteries. As already said, I believe I have the clue which has only to be followed to secure the result which we all so earnestly desire. If, however, I am mistaken, let us "try, try again." I have stated my views, modestly, I hope, yet with all the confidence of firm conviction. I only beg that they be fairly tested, and not pool-pooched as childish and chimerical. This is the only method of wintering bees that is based on a scientific principle. If the principle is correct, the details will not long be wanting. My one fear about it is, that it will so simplify bee-keeping that it will become distressingly common, and that those who follow it as an exclusive business, may have cause to mourn over "Othello's occupation gone."

For the American Bee Journal

Those Continuous Passage-Ways.

DR. G. L. TINKER, O.

At the Northwestern Bee-Keepers' Convention, as reported on page 679, Mr. Heddon took exceptions to the principle of "continuous passage-ways" in hives used for the production of comb honey.

I believe that Mr. Heddon was honest in his views, but like many who have hastily condemned inventions, he condemns without cause. This is apparent from the statement made, that it is "a great saving of jack-knives" not to allow the top and bottom pieces of sections to touch each other; and again, "not only are bees killed when the case of sections is put in place, but propolis is put along the edges of the sections where they come in contact." In answer to these objections, I will say that there is no sticking of the sections on hives the supers of which are properly arranged for "continuous passage-ways," thus requiring no lever to pry

them up; the sections are removed and replaced without annoyance from propolis, and that, too, very quickly at any time. Propolis will be placed along the inside edges of the side pieces of the sections in the same manner as upon any hive, but there is so little attached to the edges of the top and bottom pieces of well made sections that it is not noticeable, and hence not necessary to clean it off at all.

With the Heddon "case of sections" there is ordinarily twice the amount of propolis stuck upon the ends of the bottom pieces of the sections where they rest upon the tins, and upon the corners of the sections on top, as is placed upon sections on a hive provided with "continuous passage-ways." Moreover, it requires to be cleaned off in order to make the sections of honey presentable. The worst of all is, if the sections are not removed as soon as filled, the tops and bottoms will become so soiled with propolis as to mar the appearance of a nice section of honey. On a hive provided with "continuous passage-ways," the sections will not be soiled, if left on from one year's end to another.

The section-cases can be tiered up easier and quicker, and rarely is a bee killed. In adjusting, tiering up, and removing the section-cases of 30 hives having "continuous passage-ways," during the past season, only one bee was killed. There were never any bits of wax to clear away, and all operations were easily and readily performed. Still another advantage was the facility with which the bees entered the sections and began comb-building.

Bees will loiter in the bee-spaces above the brood-frames of other hives for days after the colonies in hives arranged for "continuous passage-ways" are at work in the sections. Such bee-spaces, representing about 180 cubic inches beneath the first case of sections on the Heddon hive, is so much useless space, which must always be occupied by bees to no purpose. Again, in lifting off the top-board and cases of his hive, especially if they have been left on very long, they come up with a jar which startles every bee in the hive. On a hive provided with "continuous passage-ways," the cases may be lifted off and replaced so noiselessly as to scarcely disturb an ugly colony.

One year ago last winter, Mr. Heddon made statements similar to those above, and said that the advice to bee-keepers to use "continuous passage-ways" in the production of comb honey was "the worst kind of advice." He had made an experiment long ago, and because it did not prove satisfactory, he assumes that no other device can. He evidently realized that there was an advantage to be gained, but turned away from the project upon a single failure! He looked upon it then as does Mr. Doolittle, who not long since stated in the BEE JOURNAL that he had sought a practicable arrangement of this nature for the past 12 years. There is every reason to believe that "continuous passage-

ways" tend to the building of straight combs, to say nothing of the probability of a larger surplus being obtained where they are provided. The only trouble which I have encountered is with the German bees. Whatever Mr. Heddon's German bees may do, those of this locality naturally and irremediably build crooked combs, and it would be folly to try to get them to build straight combs without the use of separators. The German hybrids do a little better, but the naturally straight and most regular comb-builders are the Syrian bees whose single fault appears to be in the capping of their combs.

Farm and Workshop.

Women as Bee-Keepers.

MRS. L. HARRISON. ☉

Some women love to be dependent and to be compared to clinging vines which are lifted into the sunshine by sturdy oaks; there are others again who scorn dependency and can stand erect being guided by the light from heaven and true womanhood. The latter class of women love to be producers, and in olden time found abundant range in manufacturing cloth. Solomon said: "She seeketh wool and flax, and worketh willingly with her hands; she layeth her hands to the spindle and her hands hold the distaff." The use of steam has almost entirely dispensed with the old spinning-wheels and looms from the household, and so self-reliant woman is prying into every nook to discover some other avenue wherein she can develop her mind and energy.

Scientific bee-culture is an open field to all women of energy and brains; here is a free range for discovery, improvement and production. Why, we do not even have to pay one cent to be admitted to membership of bee-conventions, being regarded as superior beings or as ornaments of sufficient value to balance all admission fees, badges, etc.! If we compete with the opposite sex, in making pantaloons or in teaching school, we will be obliged to accept less remuneration than they command; but who ever heard of a pound of honey selling for less because it was produced by a woman? No "vines" had better embark in the business, or even women of means who know nothing practically of bee-keeping, but who purpose to hire their bees cared for by others, and expect to reap a rich reward from their investment; but any woman who can make good bread, pick a goose, milk a cow, or harness a horse, can make bee-keeping a success.

I know a woman who is going out to wash by the day in order to earn enough money to purchase a colony of bees. I opine that she will make bee-keeping a success as she is bright, smart and self-reliant. She has the misfortune to have a paralytic husband, and thus exerts herself to make a comfortable living and to educate a feeble son. All honor to her and other brave women who never shirk the burdens of life.

There is nothing connected with bee-keeping but what a woman can do as well as a man. She should not be expected to manufacture her beehives any more than a house-keeper to build her own house; but as hives, frames and surplus boxes, can be purchased so cheaply in the "flat," I know no reason why she cannot learn to nail them together. I should have tried my hand at it long ago, if I had not a partner who is an expert at it.

No one should engage in the business expecting to find a "bonanza;" but any woman may reasonably expect fair returns for the time and money expended. One or two colonies is sufficient to commence with; and if her knowledge increases in like ratio with her bees, all will be smooth sailing and a prosperous voyage.

That Wonderful Yield of Honey.

S. M. W. EASLEY, ☉

On page 700 is an article from a letter, which was not intended for publication, in which I place the honey yield of Ventura county at 9,000 tons. I should have said 900 tons from 9,000 colonies, spring count. I made the estimate on a basis of 200 pounds per colony; mine produced 314 pounds. Some small apiaries have secured more, and some larger ones, less. I think that 200 pounds per colony is a fair average, which would amount to 900 tons. Mr. Warring bought this apiary of 441 colonies in March 1883, for which he paid \$1.15 per colony, and also paying cost of material in bee-houses, tanks, extractors, lease and implements. He leased me the apiary to run on shares, for $\frac{1}{2}$ of the honey and increase. Last season was a poor one, and I extracted about 14 tons. I had, on March 1, 1884, 550 colonies in two apiaries one mile and a half apart. About one-half of the hives had on supers. I increased the number of colonies to 1,250, all of them with supers. I extracted from the 550 colonies 172,700 pounds of honey, besides what has been used in the family. I had 57 swarms on May 1, which was my twenty-fifth wedding anniversary, and my wife wanted to have a celebration, but I told her that if the weather was good, we would be too busy. I had 44 swarms at the home apiary hived by myself and daughter, and 13 at the other apiary hived by two of the boys. That was the busiest day I had during the entire season, though we were busy all the time. My daughter and boy (the boy only 15 years old) uncapped and extracted, during the first week in July, 15,000 pounds of honey, and on July 4, they extracted 3,000 pounds. I use an eight-frame extractor; the frames are turned without being lifted out. In a future number of the BEE JOURNAL I will, if I can find the time, give a description of the hive which I use, my management of the apiary, swarming, etc. It differs some from that generally given.

For the American Bee Journal.

Origin of Honey-Dew.

J. M. MCKEY.

No subject brought before bee-keepers has ever elicited more different opinions and reports than the subject of honey-dew; but this matter, like many others, has been so thoroughly ventilated, that it is not difficult for one who has heard and read every side to decide which is right. We see that some contend that honey-dew falls from the atmosphere on leaves of trees and plants, just as common dew. This idea, however, had to be abandoned, from the fact that sometimes honey-dew is found only on one kind of tree, such as hickory, oak and linden. Occasionally it is found only on the buds of one species of trees. I have, on more than one occasion, seen it in certain localities confined to the dry leaves of the beech only, and at other times I have noticed it only on the hickory, or some other special class of timber, such as papaw.

It is plain then, that the so-called honey-dew was no dew at all, for if it had come from the atmosphere it would have been found on all kinds of trees at the same time. It has also been stated by many that honey-dew is a secretion from aphidæ or other insects; but none of the experiments related, prove conclusively that such was the case. It is true that in several instances, aphidæ, or plant-lice, were found under the leaves which secreted honey-dew, but in most cases no insects were found. I have, at various times, investigated this subject which seems to puzzle so many, and having found some honey-dew on the leaves of oaks, as well as hickory, I hunted for aphidæ, and found some on the under-side of several leaves; but after further research, I found leaves which had aphidæ and no dew.

Another fact worthy of notice is, that the dew is always found on the upper-side of the leaf, and the aphidæ on the under-side. The most rational theory, to my mind, in this matter is that which asserts that the honey-dew is an exudation from the leaves of the trees, caused by a certain state of temperature. This would account for the honey-dew appearing only on one kind of tree at times. A strong evidence in favor of this theory is to be found in the fact that honey-dew only takes place during changes of temperature, before or after storms. It appears that honey-dew can be found on many kinds of trees (as all who lay any claim to knowing anything about it, will not deny) and plants, at times, but most generally on hickory, oak, linden, beech and willow, and often on the tulip or poplar trees.

The honey harvested from honey-dew is generally of poor quality and of dark color. I well remember the honey-dew of 1871 in Madison county, Ind., how abundant it was, and the bees seemed to eagerly work while the harvest lasted, which was truly bountiful, and yet it was of a dark as well as a poor class of honey. It is

also true that during the winter following, many of the bees were very much affected with disease, and the mortality was great; many thousands having perished, causing much loss to bee-keepers, and at the same time most or nearly all the depopulated hives were filled with honey, showing conclusively that honey-dew is not of the best class, nor to be relied upon for wintering purposes.

Battle Ground, Ind.

Indiana Farmer.

The Best Frame for all Purposes.

T. J. COOK.

As there is a demand for opinions in regard to which frame is the best, I will give my reasons for adopting the standard Langstroth frame. When in the spring of 1881 I found myself beeless, I made the subject of frames a special study for more than six months. I considered the experiments of Mr. Langstroth and others, and from their experiments they decided that for practical success a frame should be longer than deep, also for convenience both for the bees and for the manipulator.

In regard to wintering, the Langstroth frame has stood the test; for while bees died on the Langstroth frames, they were also dying on all other frames and box-hives too, and if there are any odds, they are in favor of the Langstroth frame. The Langstroth being a standard frame, the fixtures pertaining to it are also standard, thus avoiding a complicated lot of hives and apiary fixtures, which are an abomination to successful bee-culture.

The satisfaction of having interchangeable goods is quite an item. It embraces about all the good qualities required of a frame, from comb honey to queen-rearing, and avoids many bad qualities found in many other frames. Hives can be piled up four stories high in the same space where frames 12 inches deep are only three stories high. Side storing can be accomplished nearly or quite as well with them as with deeper frames, but as bees have a natural instinct to store the surplus above the brood-chamber, it is only in exceptional cases where side storing is a success.

In point of manipulation the shallow frame is best. The Langstroth frame is very easy to handle. I do not remember ever hearing of its being discarded where a practical trial had been given it.

Now there is a belief among a certain class that if bees have the right kind of a hive, they will thrive better and store more honey, but that is superstition. It is as the editor of the *Farmer* says: "The particular style of hive is but part of the subject to be understood. Much more depends on the individual than on the exact shape of the frame to be used." I will add that the movable-comb idea is for the convenience of the bee-keeper in handling the combs, and for those who will never handle the combs, a box-hive is as good as the best hive made.

Having used the Langstroth frame, I will say that I am satisfied, and will not change for any other style. I trusted to the experience of prominent veterans, and find I have made no mistake in doing so.

Decatur, Ind.

For the American Bee Journal.

Introducing Queens.

J. E. POND, JR.

I fully believe that a colony of bees will accept a queen at once if offered them at the entrance of the hive within 24 hours after the old one is removed. I believe also that if such queen is not so offered them within 24 hours, that some days must elapse before it will be accepted. My experiments during the last season have been on a scale sufficiently large to warrant me in that belief, and I think that the theory which I offer in regard to the matter is correct.

In the first instance, it follows from the fact that queens often leave the hive and return again. Now, if a new queen is offered in a natural way (viz: at the entrance of the hive), before the old one is missed, and before queen-cells have been begun, they will accept her, not knowing the difference, and, perhaps, not having realized their loss. If, on the other hand, more than 24 hours elapse, they have missed the old queen and have started queen-cells, and know full well that time enough has not elapsed for a young queen to be produced from them. I do not believe in the notion that each separate colony has a peculiar scent by which its individual members are known to each other. This notion is too much on a par with the old frying-pan and key business in swarming.

I do not suppose that this theory of mine will be accepted by the majority of bee-keepers, as they will claim that I give the bees too much reasoning power. But where, I ask, can we draw the line between instinct and reason?

At any rate whether accepted or not, I trust that it will be the means of starting further inquiry into the matter of introducing queens, and of giving us out of that inquiry a surer plan than any which we now have knowledge of. That we need some method of speedy introduction all will admit; and I trust some such one will soon be discovered.

Foxboro, Mass.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

To all new subscribers who send us \$2 for the Weekly BEE JOURNAL next year, we will send the rest of the numbers of this year free from the time the subscription is received at this office.

SELECTIONS FROM OUR LETTER BOX

About One-Third of a Crop.

This year my crop of honey was short. I obtained 22,000 pounds, being about one-third of a crop. I have 700 colonies with which to begin the winter. L. LINDSLY. ☉
Waterloo, La., Nov. 12, 1884.

Use of Foundation, etc.

I commenced the season with 42 colonies, and increased them to 75 colonies by natural swarming. I obtained about one-third of a crop (1,800 pounds) of comb honey, and I sold it at 18 cents per pound. The prospect in the early part of the season was encouraging, but during basswood bloom the weather was so cold and dry that the bees did not store much surplus. They gathered most of their stores from goldenrod. I notice that some writers for the BEE JOURNAL think that it does not pay to use foundation. I think that it is just the thing for this Northern climate. The honey seasons are so short that it is certainly profitable to use foundation very freely. I have had new colonies draw out the foundation and deposit eggs in it in 30 hours after being hived. During the season I introduced 3 queens on the plan suggested by S. Simmins, and it proved a success.

C. S. HAWKINS. ☉
Sauk Rapids, Minn., Nov. 12, 1884.

Good Yield of Beeswax.

I have to report about 17 tons of extracted honey from 246 colonies, spring count, and an increase of 44 natural swarms. This average of 138 pounds per colony is certainly small in comparison with that of Mr. H. C. Parks, of Riverside, Calif., which is only 20 miles from this place; but I challenge any bee-keeper in the production of beeswax, which amounted to 450 pounds, or nearly 2 pounds to the colony. This season has settled the much-agitated question of ripening the honey by means of ventilation, and exposition to the solar heat in large tanks and glassed troughs. The vastness of the crop made this method impracticable and unnecessary, as most bee-keepers had not help enough (specially skilled) to take out the honey before it was capped in the cells. In my opinion nature does this curing or ripening process not only better, but also more economically, if we consider the result. The low prices for honey in good years, make the business of bee-keeping less profitable than other pursuits well performed. Bee-keepers are here scattered all over the country, but far apart, and should unite, therefore, for two purposes. First, to lower the price of production, by ordering the cans and cases at a certain price from one reliable firm; and, second, by stating the prices of the different

grades of honey, under which they agree not to sell. H. SONTAG. ☉
Cucamonga, Calif., Nov. 4, 1884.

Report from Fairview Apiary.

The present season has proven a very poor one in this locality. No basswood honey has been secured, and but little clover honey. My honey harvest was confined to 16 days on buckwheat, from Aug. 4 to Aug. 20, with the following result: Those colonies run for extracted honey averaged 100 pounds per colony, or 6¼ pounds per day; those run for comb honey, 28½ pounds per colony. All was gathered by black bees. With extracted honey at 10 cents per pound, and comb honey at 15 cents, retail, one will readily see which is the more profitable. Box-hive men have had varying degrees of success, some reporting no increase and no honey; some a large increase but no honey, and some, a little honey. One small apiary of 14 colonies in box-hives produced a surplus of 25 pounds of comb honey; these I have come in possession of, and will see what they will do in frame hives. Not 75 rods from them was another lot of bees in the same kind of hives, and every condition apparently as favorable, but they produced no honey.

WILBER G. FISH. ☉
Ithaca, N. Y., Nov. 14, 1884.

Bee-Keeping in Alabama.

Old fogy bee-keepers, with their log or box-hives, as usual, know all about bees. They say that this year's yield was about an average honey crop, being 20 to 25 pounds per colony. The following is the report of Geo. H. Hoyle, of Mobile, Ala.: He commenced the season with 11 weak colonies, and later obtained a 4-frame nucleus, making 12, which increased to 37 strong colonies, from which he secured 1,941 pounds of honey, 136 pounds of comb honey in one-pound sections, and 1,805 pounds of extracted. He sold it at home at 20 cents and 12½ cents per pound. Many people came to get 50 or 100-pound kegs after the honey was all sold. The 4-frame nucleus was transferred to a 10-frame Langstroth-Simplicity hive, and were given six sheets of foundation. The fine Italian queen being very prolific, the colony soon covered 40 combs, 36 of which were on foundation. It was increased to 2 strong colonies, and gathered 137 pounds of extracted honey, which was sold at 12½ cents per pound, making a profit of about 237 per cent. in honey alone.

A. M. HOYLE.
Morgan, Texas, Nov. 17, 1884.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

Convention Notices.

☞ The Central Illinois Bee-keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

☞ Excursion rates from all points on the Chicago & West Michigan R. R. have been secured for the benefit of those desiring to attend the Western Michigan Bee-keepers' Association, held at Music Hall, in Fremont, Mich., on Nov. 25, 1884. Certificates can be had by applying to Mr. T. M. Cobb, President, Grand Rapids, Mich., or to Mr. Geo. E. Hilton, Secretary, Fremont, Mich. Prominent bee men from abroad are expected, and an interesting time is anticipated.

GEO. E. HILTON, Sec.

☞ The Willamette Valley Bee-keepers' Association will hold its second meeting at La Fayette, Oregon, on the third Tuesday in June, 1885. All who are interested are invited to attend.

E. J. HADLEY, Sec.
F. S. HARDING, Pres.

☞ The annual meeting of the Michigan State Bee-keepers' Association will occur in Lansing, Mich., in the Senate Chamber of the State Capitol, Dec. 10 and 11, 1884, first session beginning at 10 a. m. on Dec. 10. This being the home of Prof. A. J. Cook, and the location of the State Agricultural College, it is expected that this will be the most interesting meeting ever held by this Society. A programme is being prepared, including several very important and interesting papers from Prof. Cook, T. J. Burrill, Dr. Beal, and R. L. Hewett, and several prominent apiarists from other States. A large delegation is expected from Canada. The question-box will be one of the important features. Come prepared to ask and answer questions. Reduced rates on all Michigan railroads, and at hotels in Lansing. The President and Secretary will be at the Hudson House. Notify me as soon as possible how many railroad certificates you will want, and over what road you will go, so I will have time to procure them. A cordial invitation is extended to all. Please come and bring your bee-keeping friends with you.

H. D. CUTTING, Sec.

☞ The Southeastern Michigan Bee-keepers' Association will hold their annual meeting in Adrian, Lenawee Co., Mich., on Dec. 3, 1884, in Plymouth Church Chapel. All bee-keepers are cordially invited to attend, and bring with them anything for exhibition that will be of any use or benefit to bee-keepers. Let all turn out and have a good time.

A. M. GANDER, Sec.
F. W. GILBERT, Pres.

Local Convention Directory.

Time and place of Meeting.

- Dec. 3.—Southeastern Mich., at Adrian, Mich.
A. M. Gander, Sec.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.
- Dec. 12.—Northeastern Kansas, at Hiawatha, Kan.
1885.
- Jan. 6.—Southern Wisconsin, at Janesville, Wis.
J. T. Pomeroy, Sec.
- Jan. 14.—Central Illinois, at Bloomington, Ills.
W. B. Lawrence, Sec.
- June 19.—Willamette Valley, at La Fayette, Oreg.
E. J. Hudley, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWJIAN,

925 West Madison St., CHICAGO, ILL.

Oil-Cloth Covering.

Please inform me through the BEE JOURNAL whether a covering of oil-cloth (or any material impervious to water) over the frames in winter is likely to cause the combs to become moldy. I have been troubled with that some and propose to cover only with sacking as I put my colonies into the cellar.

W. W. O.

St. Paul, Minn.

ANSWER.—Of course, a porous cloth will pass the moisture away from the combs and cluster of bees, while one impervious to moisture would not. In my own experience, I could never discover any harm resulting from a porous covering, and for that reason I use such a one over all colonies which are wintered out-of-doors.

Moving Bees, etc.

1. I have bought some bees in box-hives, and I wish to move them home $2\frac{1}{2}$ miles and put them into the cellar. Which is the best time, a warm or cool day? Now or later? Would it be best to put them right into the cellar from the wagon or leave them in my bee-yard till they can have a flight?

2. On Nov. 11 my bees had a flight, not having flown before for some time; they voided an excrement which spotted white clothes and resembled that voided at the first spring flight. Is it an indication of disease? or is such voiding a cleansing process preparatory for winter?

3. For extracted honey I use pails, the covers of which slip over or outside of them; and I find that in moving the honey, it will leak out from under the cover. How can I remedy it?

4. Is it necessary to wax a well made oak-barrel holding 160 pounds? Can paraffine be used to advantage for waxing?

W. G. FISH.

ANSWERS.—1. On a day when the temperature is warm enough so they can have a thoroughly cleansing flight when you get home with them. Place them a considerable distance apart, in irregular positions, and smoke the bees well back from the entrances before you open them to release them. Do this and give them their flight before you open the hives at the top. I should much prefer that they have this flight before placing them in the cellar.

2. It is both; though it is no sure sign that such accumulation will go on increasing until your bees die with the diarrhoea.

3. I prefer a pail which has a cover whose flange or rim goes inside of the pail. Any of these pails are not intended to ship honey in while it is in the liquid state. When you can turn a pail down on its side, or turn it "up side down," and leave it so for 48 hours, and no leakage occurs, then you have a pail fit to ship liquid honey in.

4. No, I find no need for waxing well made barrels, and it pays to use no other. Waxing costs about the same as the cooperage. I know nothing of the nature of paraffine.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL,
Monday, 10 a. m., Nov. 24, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as 4-lb., 1-lb., and 2-lb. jars, from the retail trade. Prices are low as arrivals exceed the demand. Extracted honey brings 52c. on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15@16c. in the jobbing way. We have several small lots of dark comb honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb. without finding a buyer. Dealers most certainly misled producers by quoting buckwheat and popular comb honey, if they are not more successful than we are in disposing of the same.

BEESWAX.—The demand is slow and arrivals are few. Good yellow brings 26@27c. on arrival.
C. F. MUTH, Freeman & Central Ave.

NEW YORK.

HONEY.—The market is well stocked with honey which is in good demand at the following prices: Fancy white comb in 1-lb. sections, 18@20c.; the same in 2-lb. sections, 16@18c.; fair to good white comb in 1 and 2-lb. sections, 14@16c.; fancy buckwheat comb in 1-lb. sections, 12@13c.; same in 2-lb. sections, 11@11½c.; ordinary buckwheat comb in 2-lb. sections, 9@10c. Extracted, white clover in kegs or small barrels, 6½@8c.

BEESWAX.—Prime yellow, 30@31c.
MCCAUL & HILDRETH, 34 Hudson St.

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY.—There is a good demand for best qualities of comb and extracted, but ordinary sells slowly at low figures. White extracted in cases changed hand at 4½c., and granulated honey of good quality sold for 3½c. For extra choice extracted, 5½c. is readily obtained in a jobbing way. White to extra white comb, 9@10c.; dark to good, 6@8c.; extracted, choice to extra white, 4½@5c.; dark and candied, 3¼@3½c.

BEESWAX.—Wholesale, 24@27c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8c.

BEESWAX.—Firm at 32@32½c. for choice.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.

BEESWAX.—28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2-lb. sections, 13@14c.; extracted, 6½c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, 1-lb. sections, none in the market. They would bring 14c.; 1-lbs., 14@16c.; 2-lbs., 13@14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6@7c.; white clover, 7@8c.; Southern, 5½@6c.

BEESWAX.—None in the market.

CLEMENS, CLOON & Co.

Successors to Jerome Twichell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 15@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-glazed sections sell best.

BEESWAX.—35c.
BLAKE & RIPLEY, 57 Chatham Street.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

New Subscribers for the Monthly for 1885 will have all the numbers for 1884 free that are published after the subscriptions are received at this office.

Make \$20.00 for Christmas.

The publishers of *Rutledge's Monthly* offer twelve valuable rewards in their *Monthly* for December, among which is the following:

We will give \$20.00 to the person telling us which is the middle verse of the New Testament Scriptures (not the Revised Edition) by December 10, 1884. Should two or more correct answers be received, the REWARD will be divided. The money will be forwarded to the winner December 12, 1884. Persons trying for the reward must send 20 cents in silver (no postage stamps taken) with their answer, for which they will receive the January *Monthly*, in which the name and address of the winner of the reward and the correct answer will be published, and in which several more valuable rewards will be offered. Address RUTLEDGE PUBLISHING COMPANY, Easton, Pa.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Domett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6½ inches.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.10.

CLUBBING LIST.

We will supply the *American Bee Journal* one year, and any of the following Books, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

HEDDON'S COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County MICH.

Prices Reduced.

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN }
1861.

Chicago, Ill., December 3, 1884.

VOL. XX.—No. 49.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P. O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is at our risk, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA.

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5ABly HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and snitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. J. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., DECEMBER 3, 1884.

No. 49.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR.

Build up your Home Markets.

This, we verily believe, is the best advice that can be given to apiarists generally. There should be a steady and growing demand for honey in every locality in America, no matter whether it be a large or small place.

The large markets are well supplied with honey, while in the smaller ones it is often a very scarce article. This should not be the case when the honey is produced in the country. Just think of it! The country merchants in all the Western States are continually ordering honey, both comb and extracted, from the wholesale grocers of Chicago, and thus it has to be shipped *twice* when none would be necessary, if every home market were kept well supplied by the producers near it.

Let every honey-producer see to it that all the towns in his immediate vicinity are well supplied with good honey, put up in attractive packages, and this will in a great measure remedy the evil, and keep prices up to a paying basis. The *Indiana Farmer* of last week has the following which is just to the point:

We are strongly impressed with the idea that this is one of the most important subjects now before the bee-keepers of this country, and we feel very much like keeping the sentence standing at the head of our *Apiary Column*, a persistent reminder that in our home markets rests our best success. Our California advices report that large lots of fine honey are being sold there as low as three cents per pound. This is much lower than it can be produced with anything like profit, and shows that something is woefully wrong. There is some remedy for all this, and we are fully

impressed with the idea that the very first step towards remedying the evil is to see that our home markets are fully supplied. There are thousands of people in this grand country of ours who have never eaten such honey as we are able to offer them at the present time, that would become regular consumers, if once induced to make a purchase. This matter is not theoretical with us. Besides we know personally of parties who dispose of good crops of honey at a fair price, among their neighbors, while others do not try to dispose of a pound at home, but seek a large market at a loss to themselves.

The example has been often recorded, how an enterprising bee-keeper has built up a local trade which is not only lucrative, but a steady thing, year after year; and when we think of the saving of freight rates and breakages, does it not pay well to look after the home markets? Just think of it! Five hundred or a thousand Leaflets with the producers name and address on them [would sell tons of honey every year in almost any neighborhood. Try it, and astonish yourselves with the result! The only necessity is to have good honey in attractive packages, and energy enough to push the sale and *make* the market.

☞ We have received a copy of an excellent agricultural work entitled "HOW THE FARM PAYS," published by Peter Henderson & Co., 35 and 37 Cortland Street, New York. It is a volume of over 400 pages, being well bound, extensively illustrated, and nicely printed on good paper, and deserves a position in every well regulated farm-house in the land. All should study it who are endeavoring to make farming a success, as it treats thoroughly and practically of the various important subjects which should engage the earnest attention of every progressive farmer.

☞ The Michigan State Bee-keepers' Association will meet in the Senate Chamber of the State Capitol on December 10 and 11, 1884.

Ignorance About Honey.

The ignorance of the public concerning honey is astonishing, when we consider the efforts being put forth to instruct them concerning it. In the *Prairie Farmer*, Mrs. L. Harrison gives the following illustrations of this ignorance:

A lady called this morning saying that she wanted to buy some comb honey to make a wash for the baby's mouth. The Doctor had told her that she must not buy it at a drug store, but get it in the comb and strain it. This looks as if the Doctor thought the drug-store honey was adulterated. I showed her some extracted honey, telling her it was pure, but she shook her head saying "the Doctor told me to get comb honey and 'strain' it myself."

Yesterday, an Irish woman who has a few colonies of bees called, and said that she could not sell her honey, because the stores were so full of that white stuff in little frames, that is made in Chicago. "Shure, indade, the comb is made and filled with glucose, and then sealed with a hot iron." It appears that the "scientific pleasure" of Prof. W. is widely disseminated. All bee-keepers, and those who have ever worked with wax, know that to thus fill and seal is an impossibility, and yet when this statement was made by a learned professor, it had the run of all the papers.

☞ The *Sugar Bowl and Farm Journal* contains a very complimentary notice of the apiary and business of Dr. Paul L. Viallon at Bayou Goula, La. It says:

Just as you enter Bayou Goula, you observe a home-like cottage, embowered among trees, a croquet ground at the side, and back of this, some large new buildings to themselves. As you enter the apiary grounds you find perfect order and an easy method for the management of those little "stingers" and useful "busy-bodies." Four hundred colonies of bees and 200 nuclei for queens comprise the industrious settlement.

☞ For two subscribers for the Weekly BEE JOURNAL (or 8 for the Monthly) for one year, we will present a Pocket Dictionary, and send it by mail postpaid.

To Indiana Bee-Keepers.

Mr. A. Cox gives the following concerning the Bee and Honey Show at Indianapolis, in the *Indiana Farmer* :

I cannot hold my peace any longer. I am so rejoiced over the success of the bee-keepers' display in the apiary department at our last State Fair that I must say something about it. It was certainly splendid, and I can only attribute the success to the great zeal we bee-keepers have for our industry and to the fact the bee-keepers of Indiana do not let their colonies become queenless. And now that our good time at the Fair is over, I am looking forward to a good time coming, when our next State Bee Keepers' Association meets this winter. We want every bee-keeper to remember it, for we expect a larger attendance than ever before. The lady bee-keepers must come. Our President is a lady, and a very pleasant one too, and she wishes all lady bee-keepers to attend. There is very important business to attend to and it must be looked after. The advance that apiculture has made in this State places Indiana among the foremost as a bee-keeping State. There should be some very important steps taken this winter for its further advancement and it will be to the interest of every bee-keeper in the State, if he can be present, to come. Besides this, I presume our meeting this winter will be largely attended by visitors from other States. There will be ample room and I would say to all to come, for there is work for everyone.

Boone Co.

Wax and Candied Honey.

Mrs. L. Harrison gives the following in the *Prarie Farmer* of last week on the above subject :

Owing to the sickness of myself and family last winter, considerable of honey remained unsold. I find some of the lot candied, and as many persons do not like "sugared" honey, I melt it and sell it as liquid honey. As the quantity which I liquefy at one time is not large, I reduce it in a pan set over a kettle of boiling water, stirring it often so that it will all melt without getting very hot, which would injure both color and flavor. As soon as the wax forms in a cake on top, I pour the honey from under it, through a coffee-strainer into a vessel, while warm, as it can be done so much more readily. This honey is sold in Mason fruit jars, and marketed before it solidifies again. There is great difference in honey, with respect to its granulating; lately I melted some that was very white, and it became solid in a day or two; another quantity remained liquid for weeks.

During the fine weather of this month, I set out this wax from the top of the melted honey, and let the bees clean it off, and also the boxes from which it was taken. The boxes were then put away for another season, free

from stickiness. I was amused lately at the ability of the bees to clean an article soiled with honey. I had the misfortune to spill some extracted honey in the buggy, into which I dropped my veil. When I reached home, I spread the veil out on the gooseberry bushes, thinking it would never be used again. The next day was fine, and toward evening, noticing the veil, I found the honey all gone. The dew of the preceding night had moistened it, and the bees had removed all of it.

The honey from the top, when melted, is very light in color and sells readily. I pour it, while hot, through a coffee-strainer into oiled tin-pans. If there is a sediment, I pour it again into a fresh pan, settle it, and return it again to the melting pan. To have wax settle nicely, it should be kept melted, without heating too hot. The coffee-strainer containing sediment, can be left to drain in a moderate oven; and when the sediment will drain no more wax, it makes a good fire. In order to have cakes of wax free from cracks, cool very slowly. Some wrap flannel around the vessel to keep in the heat a long time.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.50 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

The East Saginaw, Mich., *Courier* says that Mr. John Rey's apiary, consisting of 56 colonies, is at the rear of his residence in that city, and that he has obtained from the bees, 3,392 pounds of comb honey, and has extracted 600 pounds, besides having sold 14 swarms, during the past summer.

The Southeastern Michigan Bee-Keepers' Association will hold their annual meeting in Adrian, Lenawee Co., Mich., on Dec. 3, 1884, in Plymouth Church Chapel. All bee-keepers are cordially invited to attend, and bring with them anything for exhibition that will be of any use or benefit to bee-keepers. Let all turn out and have a good time. □

A. M. GANDER, Sec.

F. W. GILBERT, Pres.

The annual meeting of the Michigan State Bee-Keepers' Association will occur in Lansing, Mich., in the Senate Chamber of the State Capitol, Dec. 10 and 11, 1884, first session beginning at 10 a. m. on Dec. 10. This being the home of Prof. A. J. Cook, and the location of the State Agricultural College, it is expected that this will be the most interesting meeting ever held by this Society. A programme is being prepared, including several very important and interesting papers from Prof. Cook, T. J. Burrill, Dr. Beal, and R. L. Hewett, and several prominent apiarists from other States. A large delegation is expected from Canada. The question-box will be one of the important features. Come prepared to ask and answer questions. Reduced rates on all Michigan railroads, and at hotels in Lansing. The President and Secretary will be at the Hudson House. Notify me as soon as possible how many railroad certificates you will want, and over what road you will go, so I will have time to procure them. A cordial invitation is extended to all. Please come and bring your bee-keeping friends with you.

H. D. CUTTING, Sec.

The sixteenth annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 21, 22 and 23 of January, 1885. The executive committee are determined to maintain the high standing and enviable reputation which the Association has justly gained in the past, and at the coming convention they propose to outdo all former efforts. The meeting will surely be the largest and most interesting ever held in America. No bee-keeper can afford to stay at home. All are invited. All implements of the apiary sent to the Secretary, will be properly arrayed to compare favorably with others on exhibition, and will be disposed of or returned, as the owner directs. Reduced rates for board at hotels.

GEO. W. HOUSE, Sec.

L. C. ROOT, Pres.

CORRESPONDENCE

For the American Bee Journal.

The Pollen Theory.

JAMES HEDDON.

On page 743 Mr. Doolittle writes that a year ago he stated that bees of mature age do not eat pollen, except to form it into chyme for their brood, and further tells us that he has seen nothing since to alter that opinion, and that Dr. Miller's article in a late number of the BEE JOURNAL proves him to be correct. I do not see how the Doctor's statement and experience proves anything of the kind. Mr. Latham, on the same and next page tells us why mature bees do eat pollen, either in the form of bee-bread or floating in the honey, and why they must eat it, if they exercise, to renew the waste of tissue caused by such exercise. One correspondent has suggested that cold, causing the bees to exercise, and this exercising causing a waste of tissue, inducing the consumption of pollen, may be the indirect cause of bee-diarrhoea. The direct cause, however, remains—pollen.

I think that Mr. Latham errs greatly in his judgment as regards which we may call direct, and which indirect causes. When we notice an effect, we call its prime cause, the cause just immediately behind it. We know this cause is an effect of some other cause, and so on infinitely in either direction, making a first cause or last effect, something entirely incomprehensible. He says, "Whisky never caused intoxication when let alone; a prompting thirst induces the victim to imbibe, and inebriation follows." Now, according to Mr. Latham's logic, a drunken man has been made drunk, not by liquor dealers, license law, or whisky, but by a "prompting thirst."

Why do the Prohibitionists desire to obtain power? To make some laws, I suppose. Laws about what? "Prompting thirst?" When they have laws made, what are they going to do with "prompting thirst," should he violate them? I thought that it was highly proper to say that whisky was the prime cause of intoxication that came about by the drinking of it. I thought that the Prohibitionists proposed to stop drunkenness, if possible, by making some laws regarding its cause, intoxicating drinks; and if these laws were not obeyed by those who handle such drink (not prompting thirst), such persons would be compelled to obey them. I cheerfully admit that pollen is no more the prime cause of bee-diarrhoea than whisky is of a whisky drunk.

As my articles upon the subject will show—I have been looking for some cheap, practical system of manipulation that might rid the hive of most of its bee-bread, and see by experiment if we could get along with the rest. I am at that now, but it is

too early to report yet. If the pollen theory be the correct one, then all past efforts to winter bees successfully, by all parties, have been direct experiments according to the philosophy of Mr. Latham's first proposition at the top of the middle column on page 744.

To sum up: if pollen is the cause of bee-diarrhoea, then the removal of combs containing it, and replacing of combs which do not, but contain plenty of oxygenized food, is a sure preventive. It is, further, the only one of which I know. Who knows of any other? As soon as any one does, let him report, and let us see if by his method the cost and labor is lessened. We have twice evidenced that the non-pollen method was a sure preventive. The coming winter will give us a third evidence, or a rebuttal to former evidence. If pollen is a cause at all, it is the prime cause; unless, perchance, breeding in confinement should prove to be the cause. "we will anchor by-and-by."

Can Bees Be Bred to Fixed Types?

G. M. ALVES.

It is common to find in bee-literature the opinion that bees may, by the skill of man, be successfully bred to fixed improved types, as is done with ordinary domestic animals; and although we find so high an authority as Prof. Cook advocating that opinion in a recent number of the BEE JOURNAL, the writer nevertheless insists that such an opinion is held without due regard to practical difficulties, and is founded upon vague and misconceived laws of animal life.

Chief among the practical difficulties is, that the drones cannot be sufficiently controlled. True, if we had no other drones to contend with except our own (a thing scarcely to be expected), we could then do much towards the proper mating of the queens. But even in that case, could we succeed in mating all of our virgin queens with drones from a single selected colony—a thing in practice which we could not hope successfully to constantly do—we would even then have to assume that any one drone from that particular colony was as good as any other.

Would a skillful breeder expect to maintain the fixed type of a breed of hogs by accepting any one boar from a litter to be as suitable for his purpose as any other from the same litter? Those who think that he would, for the reason that they are all of the same blood, know little of the critical acumen of a skillful breeder. Now, if we hold that bees can be bred to a type because hogs can, are we not compelled, from the very nature of our *assumpsit*, to assume parallel laws in both cases?

But there is a broader philosophy underlying this subject, and a better reason why our bees may not, by our skill, be bred to improved fixed types; and that is this: Fixed breeds can

only be maintained by fixed conditions of the animal life. If the surrounding conditions vary, the animal type will ultimately vary in harmony. An investigation of modern thought or an appeal to nature herself, properly directed, will convince any thoughtful mind, of the absoluteness of this law in all animal life.

In our ordinary domestic animals we may change their surrounding conditions, and hence produce different physical types. We may place the hog in such conditions that his shelter and food may be gotten with little exertion to himself, and hence in generations his extremities and other waste parts will relatively diminish, and his butcher meat will relatively increase in harmony with his new conditions. We may, by proper shelter and food, increase the mammary glands of the cow, and hence in generations she will conform physically in harmony to her new conditions. We may further hasten the improvement of our domestic animals by the proper selection of the sires and dams; but how are we to control any of these things in our bees?

We have seen that it would be impracticable to control their mating. The writer respectfully requests Prof. Cook to tell us how we can control their surrounding conditions; and if the conditions cannot be changed, will they not assuredly gravitate in harmony with that inexorable law of animal life, to its surrounding conditions—conditions over which we have little or no control?

Henderson, ♂ Ky.

For the American Bee Journal.

Bees and Flower Colors.

CLARENCE M. WEED.

In a recent article in the BEE JOURNAL I attempted to show that the petals of flowers were for the purpose of attracting insects to carry pollen from one plant to another, so that the seeds would be more perfectly fertilized; and, also, that petals had been evolved from stamens. As stamens are almost universally yellow, it is natural to suppose that the primitive petals were also yellow; and the question arises, "How came these originally yellow petals to assume the many varied hues which they now possess?" A quarter of a century ago this question would hardly have been thought of, to say nothing of an attempt to answer it; but now, thanks to the researches of Darwin, Lubbock, Muller, Wallace and others across the Atlantic, as well as Gray, Beal, and scores of other enthusiastic workers in our own country, we can at least point to a very plausible solution of the question.

These researches have proved not only what has before been stated, that flowers with their colored petals are parts of the plant specially set aside to attract insects, but also that certain colors attract certain insects. Thus dandelions, May-weeds, and other white or yellow flowers are found to be most freely visited by two-

winged flies, while bees and butterflies are most freely attracted to more highly colored ones. Think over the most important bee-plants and see how many of them are pink, purple, blue or lilac in color. True, there are some conspicuous exceptions, as sweet clover (but it will generally be found in such cases that nectar is unusually abundant), attracting the bees without high colors. Nature is very economical with her forces and places none of them where they are not needed.

Besides this evidence of the ability of insects to distinguish colors, we have the conclusive experiments of Sir John Lubbock regarding the color-sense of bees. In these experiments, honey was placed on glass beneath which were slips of yellow, pink and blue paper, and it was found that the bees first selected that over the blue paper, thus proving not only their ability to distinguish colors, but their preference of blue.

But some one will ask, "How and why did the primitive yellow flowers commence to vary?" It is well known to gardeners that when the conditions of a plant are changed, it is likely to vary or sport, as it is called. This is especially true of the highly organized petals where variation is more likely to occur than on the rest of the plant. Chemistry also teaches that the composition of pink and yellow petals differs but little, and that a very slight change in the composition may produce marked differences in color. Hence, variation is very likely to be produced if a seed is carried by the wind, or otherwise, to a new locality.

To illustrate the theory now held by eminent botanists regarding the development of colors in petals, let us suppose a case of a flower of the primitive yellow, varying slightly to a white or pink color. Obviously, it will be more conspicuous than its surrounding non-sportive brethren; and, hence, will receive more visits from bees and other nectar-loving insects. Hence, as has been so often shown by Darwin and others, the seeds will be more perfectly fertilized, and will produce stronger and more thrifty plants. These resulting plants will be likely to have flowers with the original variation more strongly marked, which, in turn, being more conspicuous, will be more freely visited, produce thriftier plants, and so on until the progeny of the original sport will become a well established species.

Nectar or Honey-Dew.

PROF. A. J. COOK.

These terms are very old in our literature, and refer to drops of liquid sweet, often very minute, which are frequently observed on grass and on the foliage or branches of various trees and plants. These drops of nectar have been referred to by writers for the last 2,000 years; and probably were the subject of remark and inquiry as far back as the time of

Aristotle. The first name, nectar, is very appropriate, as the substance is sweet and often very pleasant to the taste. Sometimes it is as light colored as the finest honey, while at other times it is as dark as New Orleans molasses, and, as if to illustrate that Nature has an eye to the fitness of things. The dark nectar is often quite odorous, so much so that when gathered largely, as it is likely to be, by bees, a rank, disagreeable smell will be observed about the apiary in place of the delightful odor usual to the bee-yard.

A few weeks ago, an apiarist being misled by this odor, was very anxious for fear he had, in his apiary, the dreaded malady, "foul brood," which is always characterized by a most disagreeable stench. Have not many readers, during the past summer months, as they have been walking, especially just at the beginning of twilight, perceived a very noticeable odor, which the physicians would liken to slippery elm, but which would remind the farmer boy of the diluted odor of the hog-pen? The cause of such odors is this same nectar. Often it so besmears the leaves of the trees that to grasp them, covers the hands with a sticky, unctuous liquid not entirely pleasant to the touch; not unfrequently the glittering drops may be seen to twinkle on the foliage, or as they fall from it, especially just at the dawn of morning. Sometimes it falls from the leaves, so as to stain the sidewalks or other objects beneath the trees.

The other term, honey-dew, is not so correct; for, though the sweet is well likened to honey, it is in no respect like dew. As is well known, dew collects from vapors in the atmosphere, while the so-called honey-dew never has any such origin, though it is quite impossible to persuade many persons, especially bee-keepers, that such is not the case. Even men of no mean scientific ability have often assented to this false view as to the origin of the nectar.

Occasionally this nectar takes the name "mauna," and grasses from which it is secured have, in recent periodicals, been called "manna grass." Were this term in general use, I should think it a very appropriate name.

The sources of nectar of plants are very various. That secreted by flowers, through the agency of special cells, is best understood, and is without doubt to attract insects to the important work of fertilizing the flowers. Another source of nectar is special extra-floral glands, which are sometimes on the stalk, sometimes on the leaves and sometimes on the peduncles, or flower-stems. The cotton partridge pea show such glands, and afford such secretion. Prof. Trelease suggests that the function or use of such glands and secretion is to insure the presence of ants, wasps, and bees, which will destroy or frighten and drive off insect enemies of the plants. Prof. Trelease was led to this view while studying the cotton plant of the South. Such nectar—that from flow-

ers and extra-floral glands, as also the sugar-laden sap or juices of many trees and plants—is never included in the term honey-dew.

The nectar known as honey-dew is also of diverse origin. As is well known, it comes largely from plant-lice. It may come from special tubes—called nectaries—or, as is more generally the case, from the glandular pores of the abdomen. It is very common to find the leaves of trees infested with aphidæ, or plant-lice, blackened by this nectar, or the fungi which its presence induces. The presence of ants in tree or shrub is almost always a sure indication that the plants were previously attacked by plant-lice. The ants repair to the place for the same nectar. Bees often collect this nectar in considerable quantities. I have often seen this sweet in large drops sufficiently ample to be sampled without difficulty. Of course I sampled it, and have always found it agreeable to the taste. It might not be wise to label honey "Plant-Louse Honey," but I am free to say that some of the best of honey might be thus truthfully labeled. I have found the plant-louse nectar of the larch and elm particularly pleasant in flavor.

The near relatives of plant-lice, bark-lice, also secrete a large amount of nectar. This bark-louse or scale-louse nectar, unlike that from the plant-lice, is dark, of strong odor, and ill-flavored. As scale-lice flourish best in dry seasons, so in years of drought this bark-louse nectar will be most plentiful. The present season, and also the year made memorable by the Chicago fire, were both marked by the great amount of this bark-louse nectar. During the present season, tons of honey have been stored by bees, the source of which was these same bark or scale lice.

While many do not object to the flavor of this honey, it is dark and rank, and as it in many cases was mixed with the clover honey, its presence was a sore misfortune to the bee-keeper. For my own part I would never put such on the market, as I would never use it on my table. As I have often stated, I believe that the cause of the great mortality among the bees in the winter following the Chicago fire was due, in part at least, to this bark-louse honey in the beehives. I think, however, that the flavor of the nectar that season was considerably more rank than it is this summer, possibly owing to its being less mixed with other and better honey.

These nectar-secreting bark-lice are very common here, and in many Northern States. Myriads of them are now in our basswoods, maples, hickories, sassafrasses, white ashes, and elm, pumping up the sap and excreting this bitter, odorous sweet. The very atmosphere is tainted, and when the bees can do no better, they accept this nectar of questionable reputation. The bee-keeper must watch for this unsavory nectar, and when it abounds he must see that it is not mixed with the fine grades of honey. By use of the extractor it

will be easy to keep this separate. As this nectar will keep the bees busy gathering in time of no nectar bloom, it will keep the colonies breeding, and as it will be good food for bees during summer, it will do no serious mischief to one who is informed as to its use and abuse.

Lately, I have received several samples of what has been styled "manna grass," by those sending it. It comes from Ohio and Michigan. The grass was speckled with crystals of sugar, much as though it had been dipped in sugar syrup. Placed on the tongue, it seemed as if it might have been sprinkled with granulated sugar. The sweet was very pleasant to the taste.

Upon close examination, I found that the grass was the seat of a thrifty plantation of ergot. Many of the seeds or kernels had the purple-black ergot grains. I gave the ergot to Dr. Grange, our veterinarian, and told him of the coating of sugar, which I supposed must arise from insects, though I could find none of the latter.

Soon after, Dr. Grange kindly referred me to a work on veterinary medicine, where ergot was described and the honeyed secretion given as a characteristic marking of the early stages of this poisonous fungus. In looking up this subject I find that European writers often speak of this nectar from ergot, and of insects collecting it. The ergotized grass, in Quincy, Mich., was thronged with bees, which are reported to have secured excellent honey from it.

Ergot, as is well known, is a fungus much used in medicine. Its use induces spasmodic contraction of the involuntary muscles. When eaten by man, as it is wont to be in ergotized rye, it produces inflammation of the eyes, chills the extremities—probably by contraction of the arterioles—induces swelling of the joints, which is speedily followed by gangrene of the limbs and bowels, and death by convulsions. As Bonjean and others have shown, if the ergot of plants is eaten by cattle and others of the lower animals, disease and death are produced, with much the same symptoms as mark ergot poisoning in man. It is stated that there have been many epidemics in Europe caused by ergot poisoning.

We see, then, that in ergot, Michigan has a most unwelcome visitor, and that there is a very dark side to this ergot picture; but it is pleasant to think that here as in most of Nature's products and life's experiences, the sweet is liberally mixed in with the bitter. I remark, in closing, that in this fungus we have another source of nectar not before noticed in our American literature.

The Willamette Valley Bee-Keepers' Association will hold its second meeting at La Fayette, Oregon, on the third Tuesday in June, 1885. All who are interested are invited to attend.

Continuous Passage-Ways in Hives.

J. E. POND, JR.

I notice that some of our apiarists are endeavoring to establish the claim that bees will not work as well in sections, where they are placed directly on the frames, as they do when a bee-space is used between. This has not been my experience, and I have given the matter a pretty fair test during the last season. I will confess that as one who learned his bee-lore in the first place from Father Langstroth, I was much prejudiced against doing away with a bee-space, and was more than incredulous in regard to the same; in fact I was so prejudiced in favor of the bee-space that it was with great difficulty that I was persuaded to make any tests in regard to it.

However, I was presented with so strong a case both theoretically and practically as to the superiority of a hive provided with continuous passage-ways, and the plan operating the sections on it, that I was induced early in the season to try such a hive. I was so fortunate as to have my colonies all very strong in time to take advantage of fruit bloom, and on its first appearance, I gave sections to 3 colonies of as nearly as possible the same size and strength, one of them being placed in a hive provided with continuous passage-ways, the others being in Langstroth-Simplificities, with an ordinary section-ease. The result was that the colony in the former hive went at once into the sections, and filled and capped nearly all of them (30), while the bees in the other hives did not work up into their sections till apple bloom had almost entirely passed away.

This I did not look upon as a full test, although strongly in favor of the continuous-passage-way method; consequently I was not satisfied, but on the appearance of white clover, I changed the colony in the hive provided with continuous passage-ways with one of the others above mentioned, and strange to say, the evidence was so strong that I was convinced; the colony which did not work well in sections in the Langstroth-Simplicity hive with $\frac{1}{4}$ -inch bee-space, went at once into the sections upon being placed in the hive provided with continuous passage-ways; while the other 2 colonies, one of them being the one which was taken from the hive with continuous passage-ways, spent some four or five days before they did anything in their sections.

I consider the tests which I have described, fairly conclusive; and so much so are they to me, that I should use the continuous passage-ways if I were working for surplus comb honey. No separators were used, yet not a section did I find which could not be glassed; and so little propolis was placed on them, that it was hardly appreciable. I presume if I had a hive and section different in principle from the one of which I am now writing, which I was offering for sale,

and urging as the best to be found, I should not make the above statement; but such is not the case. I have no interest whatever in the sales of any hive or supplies of any kind; but my belief is, however, that the continuous-passage-way idea is the correct one in producing comb honey in sections, and that the continuous passage-way will, ere long, be recognized as the best, and firmly established as one of the great recent improvements.

It stands to reason as a matter of theory, that our bees will use an unobstructed path more freely than they will one which contains various obstacles; when practice is found to be just what theory indicates, a case is made out, and in my experience practice proves just what the theory indicated.

I had no trouble at all with the queen occupying the sections; for the reason, I suppose, that she had plenty of room below, and the bees filled the sections so quickly that she had no chance to get into them, even had she been so disposed.

I have written the above in the interest of apiculture, for I believe it a duty which we all owe each other to make such tests as we can conveniently, and give the results, whatever they may be, for public use. By this means the public will be benefitted, either in one way or the other, as all the experiences of the fraternity when collated become a great chart, whereby we may learn where the deep water lies, and also where the shoals and quicksands may be found.

Large Combs to Prevent Swarms.

G. M. DOOLITTLE.

Some bee-keepers seem to think that large frames of comb used in a hive have a tendency to prevent natural swarming, and for this reason advise resorting to the use of such combs by all those who desire no swarms; but after years of careful experiment, I fail to find that the size of the frame has anything to do with swarming, unless, perchance, some few weak colonies, in the spring, are so slow building up on these large frames, that the honey season is past before they get strong enough to swarm. As such weak colonies are of little value to the apiarist in any event, it has little bearing on the subject one way or the other.

After working several different styles of frames, from the Quinby down to the Gallup, I decided that the Gallup frame gave me all of the advantages which the larger frames did, and some not possessed by them. For this reason I decided on the Gallup frame as the best frame in use, and after years of experience with it, I still hold to the same opinion. While using the larger style of frames, I experimented relative to the effect which each kind had on natural swarming, and became convinced that if the same number of square inches of comb were given each colony, that

there was no difference in the results; while, if the same number of frames were used in a hive, the small frames gave the most swarms.

But here came the trouble in using so many large frames; the bees would have plenty of room in the hive below to store honey, and after once commencing to store honey there, they would crowd the brood nearly all out before they would go into the boxes or sections, and the result would be little or no honey in the sections, with a colony weak in bees to go into winter quarters.

As a part of these experiments were conducted before the honey extractor came into use, I found that by using the large hives, I had nearly all the honey in an unsalable shape; thus the large hive with its few swarms did not yield me one-half as much profit as the smaller hive with its small frames. I now reduced the number of large frames so that six of them represented the same amount of comb space which nine of the small ones did, when I found that after the colonies in each kind of hive were of the same strength, they would produce equal results as to honey and swarms.

After I procured an extractor, I tried emptying the combs as fast as filled in the large hive, so as to give the queen room in which to lay, hoping that thereby I could get a good yield of honey in the sections with but few swarms. At the end of the season I found that I was beaten again; for as long as I extracted from the brood-chamber, no honey was put into the sections, so I decided that there was no sure way of getting a good yield of honey in sections except by a moderate increase, which is the conclusion all arrive at sooner or later.

As the Gallup frame was more to my liking than the unwieldy Quiby or American, I gave the latter up after trying one more experiment, which was to try the two sizes of frames side by side for extracted honey, as it was claimed by some that the small frames could not be worked for extracted honey without more or less swarms. As some advised the use of half combs in the upper story, the saving of time claimed by many in handling the combs while extracting, was found to be a myth, as the loss in the handling of the small frames more than balanced the time gained with the large ones. Hence, the only advantage the large frames could possibly have, was the fact (if such it should prove to be) that they would give no swarms, while the small ones would.

To test the matter, a given number of each was set apart, and before the honey harvest commenced, room was given in the upper story to each in about the same proportion by placing in them empty combs. When these were partly filled, more was put in until some were three tiers high. The result was, that not one swarm issued from either size of frame, and I fully believe that the small frame is just as effectual in preventing swarms as the large one, where both are worked for extracted honey.

Any sized frame can be used upon the non-swarmer plan, when the apiary is worked for extracted honey, provided the upper set of combs is so that the bees have free access to them. However, if thus used, more or less brood will be found in the upper set of combs, especially if the season should prove a poor one. In fact I have had, during the past season, the queen and "all hands" move upstairs so that there was neither brood nor honey in the lower hive. I have tried the perforated zinc to some extent to remedy this, but so far it has not proven satisfactory, on account of its giving the bees a disposition to swarm the same as they do when working for comb honey.

If brood is placed above the zinc, the bees seem to consider it isolated from the main hive or cluster of bees and go to rearing queen-cells on it, from which cause they are almost sure to swarm as soon as the cells are sealed. If no brood is thus used, they swarm from failing to take possession. Perhaps if the frame of brood were taken out just before the cells were sealed, the bees would continue to work and no swarming would result. With a good honey year, and where the extracting is all done at the end of the season, it is of little consequence if the queen does go up-stairs to lay; and by allowing her to do so, swarming is surely prevented in my apiary.

Northern Michigan Convention.

The meeting of the Northern Michigan Bee-keepers' Association was held in Greenville, Mich., on Oct. 6 and 7, 1884. The Association was unfortunate this year in selecting a time for holding its meeting, which proved rainy, but as bee-keepers are not easily discouraged, the meeting was held. Questions both intricate and delicate, specific and scientific, common and proper, and ancient and modern were discussed with untiring zeal and energy, and without fear or favor.

I need hardly say that wintering bees was the most thoroughly discussed. The usual variety of plans and failures was suggested. One fact in this connection is especially worthy of mention: Those familiar with cellar, "clamp," and out-side wintering generally agreed that bees were less liable to dwindle in the spring when wintered on the summer stands, and gave as a reason that the bees know by experience the danger in wintering unprotected in unfavorable weather.

One bee-keeper reported quite satisfactory results by wintering bees on the following plan: 1. The hive entrance to be $\frac{3}{4}$ of an inch high by 10 inches long, and giving plenty of lower ventilation. 2. A large box to hold the hive, so as to give space for 3 or 4 inches of sawdust around the sides, and a couple inches of chaff on the top. The quilts must be clean and free of propolis, so that dampness

may find a ready exit through them and the thin layer of chaff. Sticks are laid crosswise on the frames on top to allow passage for the bees; and the hives are set facing the east to avoid winds blowing into the entrances.

The following plan was given as an experiment: A trench, say 3 feet deep made in sloping ground, to be provided with 50 or 100 feet of small tile laid low enough to carry off water, and to preserve a uniform temperature of fresh air. The lower end of the tile should be covered with wire-cloth to keep out mice, and a large perforated box placed over it to prevent snow from clogging up the same. The trench should be wide enough to allow a single-walled hive to set inside of it, and be boarded up to prevent the sides from caving in. Cleats nailed on the sides will prevent the hives from dropping nearer than 10 inches from the bottom of the trench, thus leaving a sufficiency of room for dead bees below. Place the hives, without bottom-boards, into the trench and cover them well with boards and dry earth. At the upper end of this trench place a ventilator 10 or 12 feet long in an upright position, so as to create a draft and carry off all foul gasses. This ventilator may be made of 1x6 inch strips of boards, and will answer the purpose.

Heddon's "pollen theory" was generally accepted as correct, though a few objected to it. "How is the aggregate strength of bees, and stores reduced during the winter if the bees do not fly?" This question drew out quite a discussion, and was treated in connection with ventilation, and the general opinion expressed was that without proper ventilation dampness will destroy the strongest colony.

Artificial fertilization was discussed and some interesting facts brought out in connection with the spawning of fish. All talk on this subject was purely speculative. The question, "Which pays best at present prices, comb or extracted honey?" was decided in favor of the latter, with more ready sale for the former. At a time when honey was coming in slowly 2 colonies of the same strength were experimented with, empty combs being placed in one hive, and a section-case on the other. The empty combs were gradually filled while the case was untouched.

"What shall we do with our poor grades of extracted honey?" A spirited discussion followed this question. Some favored selling it to the lower class of boarding-houses, mill men, etc., without comment as to quality. Some advised selling it to merchants, and insisting upon their retailing it as poor honey; while others thought that people would be prejudiced against the best honey by using the poor quality. All endorsed the following plan: Sell it to the tobacco manufacturers; for our poorest quality of honey cannot injure their finest "weed." Good extracted honey for table use among bee-men is beginning to be the rule, and not the exception.

A number of apiarists reported a home market for all their honey. Extracting when the combs are two-thirds sealed was considered preferable to Dadant's plan of waiting until the honey season is over. One-pound sections were the smallest exhibited or recommended. Samples of honey produced without separators were entirely satisfactory. Honey-boards are but little used by any of our members.

Mr. Youngman told all about bees evaporating nectar on the wing. His proofs were satisfactory. That Italian bees are best for this country was conceded by all. Mr. Youngman described his plan of securing good queen-cells; but as it was published last year, we will not reproduce it.

A good display of apicultural literature, tools for use in the bee-yard, wired foundation in frames, one and two piece sections, shipping and retailing crates and honey in large and small sections, etc., added to the interest of the occasion.

By request of F. A. Palmer, the next annual picnic will be held at his residence on the last Thursday in May, 1885.

The following were elected as officers for the coming year: President, S. J. Youngman; Secretary, F. A. Palmer; Treasurer, Mr. McBride; first Vice President, L. L. Bissell; second Vice-President, Edwin Hunt; third, Mrs. A. M. Sanders; fourth, J. H. Robertson; fifth, L. S. Benham.

A vote of thanks was tendered Mr. J. E. Gault for the free use of his hall, after which the Convention was adjourned.

In regard to the picnic of this Association, held at Ionia, Mich., on June 19, 1884, I append the following: At the last Convention previous to the one above reported, a motion was carried that a bee-keepers' basket picnic be held during the summer of 1884 at the residence of some active bee-keeper. Miss Bellamy, of Ionia, Mich., being the first to invite the picnic, her request was granted, and a call was issued.

On the morning of the day selected, several teams were in readiness to convey people from the trains to the grounds. Arriving there, we found Miss Bellamy, smoker in hand, busy with her bees, giving all an opportunity to study her methods and profit by her experience. Not a few of us who had made a success in bee-keeping were anxious to know how she was able to report at our last Convention better results than any other person present.

The day was pleasant, though very warm; but before noon 30 or 40 bee-keepers might have been seen in busy groups among the bees, or under the shady trees, while others were seated in the spacious parlors, all intent upon the one object of discussing the mysteries of bee-keeping. The hour of noon arriving, "a go as you please" dinner was in order. Hot tea and coffee was served at the family table, with other refreshments, to all who desired them; while others literally carried out the spirit of the

picnic, by basketing under the lofty shade-trees.

After dinner, all being seated on the grass, a semi-formal meeting was held, and resulted in a vote of thanks to Miss Bellamy and her friends, and in receiving several new members into the Association.

At 2:30 p. m., those coming by rail were obliged to leave for home, being pleased with the people whom we had met, and with the success of our first picnic.

For the American Bee Journal.

Working Against Nature.

DR. G. L. TINKER.

All experience has shown that in any direction the greatest success with bees is to be attained by conforming as nearly as possible to their instinct and nature. As a rule, there is probably no exception to it, yet we find methods recommended every now and then which are not in accordance with the natural impulses and habits of the bees. Such methods may be moderately successful under certain conditions, but there are other conditions sure to arise out of which trouble and, perchance, disease may come.

One of these instances is recorded in a communication in the BEE JOURNAL, by Mr. C. Mitchell, in which he says: "I would like to say, in justice to Mr. Heddon, that I think that the very dry season had a good deal to do with the strange intercourse of some of my swarms, after working on his plan, in trying to rob, and not being properly recognized as strangers." Mr. Heddon will understand the need to perform all work with bees in accordance with their instinct, and has often reverted to this fact. Why he should recommend his plan of controlling after-swarms in view of the other facts which he has set forth, I am at a loss to determine; for it is plainly contrary to nature, and in the practice above quoted, does not appear to have been a safe procedure.

No doubt, in the near future, it will be necessary for many bee-keepers to control increase in some way; but that plan should be the most natural as well as the most profitable one, which I venture to suggest his is not. If primary swarming does not tend to lessen the yield of surplus comb honey, as alleged by Mr. Heddon, and held by myself and many others; and again, if "the largest yields on record have come from colonies which cast not only one, but two and three swarms" as further alleged, it does not appear that there is any need to be in a great hurry to mix up and double up colonies where increase is not desired. Mr. Heddon's logic is opposed to both his theory and practice. If the largest yields on record have come from different practice than that which he so fully recommends, why mix up colonies by moving the old one about the new one to drain it of its bees, prevent it from making any surplus, and run the risk of causing wholesale robbing? We

should say, if a "readily-movable" hive is to be commended for this purpose specially, it is not so invaluable as it might be.

Mr. Heddon's plan of controlling increase, no doubt contemplates obtaining the most surplus; but if we are to believe him, the largest surplus is obtained where swarming is allowed strictly in accordance with the instinct of the bees. Yet the limit to swarming should be to the prevention of all after-swarms; for the chances of a protracted yield of surplus are few and far between. My course has been to cut out queen-cells and return after-swarms, or to cut out all the queen-cells but one, and I doubt if there is a better plan, whether we consider the amount of surplus to be gained as the convenience of the bee-keeper.

As to the increase: It occurs to me that if colonies are to be doubled up, the proper time to do it is in the fall or after the season's operations are completed. With right management there is every reason to believe that it may be done not only with success in wintering, but with advantage and profit during the following season. My experience in doubling up weak colonies in the fall, justifies me in thinking that the uniting of full colonies late in the season will prove the most promising method of reducing undesirable increase.

New Philadelphia, \odot Ohio.

For the American Bee Journal.

Progressive Bee-Keepers' Convention

The bee-keepers of McDonough and adjoining counties met in Bushnell, Ill., on Nov. 20, 1884. The meeting was called to order by Mr. J. G. Norton, who announced its object. Mr. A. W. Fisk, of Bushnell, was appointed chairman. A committee of three was then selected on permanent organization; after a few minutes they presented the following names for office, to be voted on by the Association. President, A. W. Fisk; Vice-President, Samuel H. Moss; Treasurer, Miss Cora Castle; Secretary, J. G. Norton. A constitution and by-laws were then adopted, and after a short discussion it was decided to adopt as a name, "The Progressive Bee-Keepers Association of Western Illinois."

The annual dues were placed at 25 cents per member; ladies to be admitted free. The convention then adjourned to meet at 6 p. m.

The convention was called to order at 6 p. m. with President A. W. Fisk in the chair. Samuel H. Moss gave his report for the season. He said that he commenced the season with 90 colonies, increased them to 130, and then doubled them back to 120. He had taken 2,200 pounds of comb honey, and 1,000 pounds of extracted. His increase of colonies was obtained by natural swarming. He packs the upper stories of the hives with chaff, and leaves upper passages.

Wintering bees was discussed to considerable length. J. M. Hume

uses chaff-hives with chaff over the frames and upper passages.

The President leaves upper passages, and uses porous covering over the frames.

The Secretary uses chaff-packing cases with upper passages and chaff over the frames. T. C. Rundle uses oil-cloth over the frames, and finds no objection to it. Upper passages were discussed at considerable length, but the majority claimed that while bees came to the top of the frames, they did not pass over at all in cold weather, and only moved or changed position when it was warm enough to fly.

The Langstroth hive was considered the best by all present. The association consists of 30 members representing 600 colonies of bees.

Adjourned to meet on the first Thursday in May, 1885, in Bushnell, Ill.

J. G. NORTON, Sec.

A. W. FISK, Pres.

For the American Bee Journal.

How Many Colonies?

W. Z. HUTCHINSON, 68-94.

This practice of indicating by figures, at the end of the writer's signature, the number of colonies owned on the first day of the previous May, and at the present time is, I believe, Dr. C. C. Miller's "baby." It has been somewhat backward in "learning to walk," but its parent ought not despair; slowness of growth is often an indication of longevity.

"What is the object of this plan?" is a pertinent question. Briefly stated, it might be said in reply that it assists the reader in forming an opinion of the value of the writer's assertions, views and conclusions; it gives, to considerable extent, the breadth of the writer's experience; and helps to show how good an authority he is upon the subject with which he may be discussing.

In opposition to the plan, it has been urged that it would not find favor among the owners of small apiaries, that they would not be willing to thus "expose their ignorance," or rather their lack of experience. Those who have urged this objection should remember that there are many subjects connected with bee-keeping upon which one may become excellent authority, and yet never own a large apiary. Especially is this true in regard to purely scientific subjects, requiring close study, careful observation, and faithfully conducted experiments. I believe that Mr. Nutt has never owned a large apiary, but he is excellent authority upon foul brood. Prof. Cook has never managed a large number of colonies, but who is a better authority upon subjects relating to the natural history of the bee? But when John Smith writes: "I have practiced, this season, the Heddon method of preventing after-swarming, and it works like a charm;" or "I have discarded foundation in the brood-frames, as I consider its use in that place unprofitable;" or "I have used the Jones' perforated-zinc

honey-boards this season, and not a queen has passed through them;" or, but why enlarge when we read of such things as these, we would really be glad to know whether the writer is the possessor of two or three colonies, or of two or three hundred colonies.

When a new contributor writes from some cross-roads in Michigan, and his signature is William Jones, we know nothing in regard to him, unless it is disclosed in his communication; but let the name of his post-office be followed by one of those little signs, the use of which was suggested by Mr. Doolittle, and his name followed by the figures indicating the number of colonies kept, and we will know that Mr. Jones lives, for instance, in Eastern Michigan, began the season with 40 colonies, and has increased them to 75; and he is at once given a "local habitation and a name"—an "apicultural standing."

I think that but few, if any bee-keepers are opposed to telling, in this manner, how many colonies they have, but they "forget" to do so.

Rogersville, ♂ Mich.

SELECTIONS FROM OUR LETTER BOX

Denies the Soft Impeachment.

Some have accused me of owning a bee-paper printed in New England; but I wish to say, through the BEE JOURNAL, that I do not now and never did invest one cent in any bee-paper. I have no interest in any of them except in their general welfare. I wish that each one of them had 20,000 subscribers. I think that any one can get enough out of one issue of any of them to pay the cost of one year's subscription. Although there is one printed monthly within six miles of Wenham, I have not seen half a dozen copies of it during the past year. I hope that none will hereafter say that I have any money invested in any publication.

HENRY ALLEY.

Wenham, ♂ Mass., Nov. 21, 1884.

A Peculiar Season.

My report for the past season is rather a poor one. The season has been different from any which I have ever seen. The last winter being a very bad one, the bees which did come through were weak, and it took some time for them to build up; but when white clover bloomed they filled their hives and began to work finely in the sections. It continued only seven days when the bees left the clover for the honey-dew. They commenced on the honey-dew in real earnest, when they should have been working on the white clover; but that lasted only for a short time. After July 1 there was no honey until the last of August, when the bees worked diligently on buckwheat, smart-weed and Spanish-needle. This continued for only a few days, when the flow of honey

ceased, the flowers being in full bloom, the nights were warm, the weather was not dry, and there was a world of bloom ten days after the bees quit work. I had 27 colonies, spring count, increased them to 45, obtained 1,500 pounds of comb honey and sold it at home for 15 and 20 cents per pound. I could sell 5 tons if I had it. There are farmers near me who buy 100 pounds of me for their own use. The largest amount taken from one hive, during the season, was 135 pounds.

D. R. ROSEBROUGH.

Casey, ♂ Ill., Nov. 19, 1884.

Well Satisfied.

This season is said to have been a poor one in this State, but I am satisfied. I bought 2 colonies of Italian bees on May 1, 1884, and managed them in Langstroth hives, as directed in the BEE JOURNAL, and as intelligently as I could. The result is 160 pounds of comb honey per colony, spring count, with from 40 to 60 pounds yet in each brood-chamber. I increased them to 5 colonies, and put them into the cellar on Nov. 18. The bees are in good condition, being well packed, and the cellar is well aired and ventilated, so I confidently expect to meet with success in wintering. I have just the amount of honey which myself and family can conveniently consume.

EZRA J. CRONKLETON.

Dunlap, ♂ Iowa, Nov. 24, 1884.

Light Honey Crop.

The weather has been very nice up to this time, and my bees seem to be in good condition. The honey crop in this part of the country was very light. I had 30 colonies, and increased them to 53. I found 2 swarms, this fall, in the timber, and so I now have 55 colonies. About one-half of my bees are the natives, the rest of them are Italians and hybrids. My crop of honey amounted to about 600 pounds. Although the fall weather has been very nice, with no frost, yet the late fall flowers seemed to dry up and the bees did not appear to gather much honey from them. I use a good, double-walled hive, and 1½-pound sections.

A. GIBSON.

Ponca, ♂ Nebr., Nov. 25, 1884.

An Unfavorable Season.

This has been an unfavorable year for producing honey in this section of the country. Our honey-flow lasted from about June 10 until July 4. I began the season with 20 colonies, increased them to 29, and received 628 pounds of honey, about half of it being extracted and the balance comb honey. I had to feed 300 pounds of honey to my young colonies, or they would not have had enough to supply them during the coming winter. All of my colonies are now in good condition, excepting 3 or 4 which are not very strong, for we have a elder mill near by which ground up millions of bees every day. I winter my bees on the summer stands, and use a large hive 24 inches wide by 13½ inches long and 15 inches high on the inside,

with two division-boards to keep the bees in the middle of the hive during winter; then it is packed with dry leaves behind the division-boards, putting two strips of cotton-cloth over them, and filled with leaves on the top 10 inches high, with a straw mat on top to keep the leaves down, and a roof with an inch hole in both ends so the air can pass through. I also pack leaves outside at the rear from top to bottom; the entrance of the hive is 5 inches long by $\frac{3}{8}$ of an inch deep; an inch hole is about 5 inches above the entrance, and the hives are set facing southward.

HENRY ERBROTD.

La Harpe, Ill., Nov. 23, 1884.

Bee-Keeping in Louisiana.

This year, my yield from 165 colonies, spring count, is 11,800 pounds of extracted honey, and 650 pounds of comb honey in one-pound sections. I increased my apiary, by natural swarming, to 240 colonies. I live on the bank of the Red river, which overflowed twice during this year, and caused me a great loss. The water was 2 feet deep in my bee-yard, and I had to put my hives upon rail pens. Near me there are over 1,000 colonies of bees on a circle whose radius is four miles.

WM. J. DAWSON.

Dixons X Roads, La., Nov. 15, 1884.

Nicest Honey of the Season.

On Nov. 17 I shipped 110 crates of comb honey by freight to Chicago; and on Nov. 22, our consignee wrote as follows: "The honey arrived in good order, and is the nicest lot of honey I have had this season." It was produced without separators.

W. Z. HUTCHINSON, 68-94.

Rogersville, Mich., Nov. 27, 1884.

Bees Flying.

We have had fine weather during the last two days. The butterflies are out again, and the bees are flying everywhere. As we had two light snow storms, and I had my hive entrances opened full width for winter, I had to partly close them this morning. Many bee-keepers have their bees in cellars, and now they are missing a good flight. The honey-flow was cut off very early here, still I obtained 3,000 pounds from 55 colonies, many first swarms having gathered no surplus. I would like to say, in justice to Mr. Heddon, that I think that the very dry season had a good deal to do with the strange intercourse of some of my swarms, after working on his plan, in trying to rob and not being properly recognized as strangers. My bees have bred none since August, and they will be seven months old before replace, which will test the late breeding pretty well. Will Mr. Deadman, of Ontario, please state how many colonies he has at present? His method of wintering bees ought to be attended with success; but his way of feeding will soon be dropped, I think.

C. MITCHELL.

Molesworth, Ont., Nov. 17, 1884.

Bees Ready for Winter.

On Nov. 18, I placed my bees in the cellar, all being in fine condition, and each colony having from 25 to 35 pounds of well sealed honey. Since that time we have had cold, rough weather.

F. M. TAINTOR.

Elm Grove, Mass., Nov. 26, 1884.

An Italianized Apiary.

This has been a very poor season for the apiarist, in this section at least, except he esteems his experience of sufficient value to compensate him for his time, trouble and outlay. There was an abundance of fruit bloom and white clover; but a dearth of nectar in the flowers, all through the season, especially so in the earlier months. I had 17 colonies to commence with in the spring, and I had but 2 natural swarms, and 2 made by division. Some of my bees did so poorly that they had to be fed until Aug. 1, to prevent starvation; since that date they have gathered enough honey to winter on, by taking from the richer ones and helping the poorer. I obtained perhaps 50 pounds of surplus honey from all. While there was no honey being stored, I thought it a good time to Italianize my colonies. I had a tested Italian queen from last season, and this season I reared and successfully introduced 20 young Italian queens. By screening the black drones out, before introducing the young queens, I think that most of them are purely mated. So, if it is an advantage to have young queens in an apiary, I will be favorably equipped in that respect next spring, if I succeed in wintering them.

J. A. BLACK.

Pleasant Mound, Ill., Nov. 24, 1884.

Do Bees Hibernates?

As this subject is now considerably agitating the minds of bee-keepers, I desire to give my experience on the subject. Several winters ago, while in the woods, my foot broke through the earth about half knee-deep. I examined the opening in the ground and in it I found a nest about the size of a gallon crock. In the nest was what people in the West call a prairie grey squirrel, which was hibernating; *i. e.*, it was neither dead nor alive. It was curled up in a circular form and after I would straighten it out it would curl up again. It did not breathe and its heart did not beat. I took it to the house and placed it on the hearth, occasionally turned it around, and in a few moments it came to life, as you might say, and was as lively as anything I have ever seen. Now is this not a perfect example of hibernation? My experience teaches me that it is not natural for bees to hibernate, yet they may go into this condition when compelled to from exposure, and that they will remain in this condition for 48 hours if not exposed to a temperature of 32°; and so I claim that it is not natural for bees to hibernate, but exposure causes them to do so. I have experimented with those chilled or hibernating bees, having taken full colonies into the house and

warmed them just as I did with the squirrel, and this fall, in getting the bees to carry honey from the upper to the lower story of the hive, on the empty combs in the upper story, on a frosty morning, I found small bunches of bees which to all appearances were dead; but after being warmed they would revive, and in every such case of reviving they would show signs of bee-diarrhea; some worse than others, owing to the length of time which they had been chilled. What I am trying to get at is this: Do bees which winter on the inside of a cluster, at a temperature of 80° to 100° above zero, ever have bee-diarrhea? I think not. I am satisfied that the young bees winter in the center of the cluster, and I have found by experiment that the temperature on the outside of the cluster is from 70° to 80° lower than that of the center.

WM. MALONE.

Oakley, Iowa, Nov. 22, 1884.

Keeping Bees on Shares.

Will Mr. Heddon please give his opinion on taking bees on the shares, or on what condition bees are generally let? One man offered me 100 colonies, last spring, on the following conditions: I was to take the 100 colonies and buy 100 new hives complete for \$4 each, for the swarms, and I was to receive half of the honey and half of the swarms; and in the fall he was to take the 100 colonies which he let me have in the spring, half of the honey, and half of the swarms, making the new hives cost me \$8 each. I proposed to take his bees in this way: I was to take the 100 colonies in the spring on the same conditions as above, except that he was to furnish half of the hives and I the other half.

T. W. DOUGHERTY.

Princeton, Ill., Nov. 24, 1884.

Report for 1884.

Last winter, out of 31 colonies I lost one, and from the remaining 30, this season, I have received 800 lbs. of comb honey in one-lb. sections and 200 lbs. of extracted. I had 50 swarms, and I am going to try to winter 35 colonies in my cellar this winter.

JOHN L. DAVIS.

Holt, Mich., Nov. 25, 1884.

Mr. D. A. Jones of Beeton, Ont. has sent us a copy of his Winter Catalogue for 1884. It contains 32 pages, and is well printed.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

Local Convention Directory.

Time and place of Meeting.

- Dec. 3.—Sontbeastern Mich., at Adrian, Mich.
A. M. Gander, Sec.
- Dec. 10, 11.—Michigan State, at Lansing.
H. D. Cutting, Sec., Clinton, Mich.
- Dec. 12.—Northeastern Kansas, at Hiawatha, Kan.
1885.
- Jan. 6.—Southern Wisconsin, at Janesville, Wis.
J. T. Pomeroy, Sec.
- Jan. 14.—Central Illinois, at Bloomington, Ills.
W. B. Lawrence, Sec.
- Jan. 21—23.—Northeastern, at Syracuse, N. Y.
Geo. W. Housse, Sec.
- June 19.—Willamette Valley, at La Fayette, Oreg.
E. J. Hadley, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Bees Acting Strangely.

I close my hives every night and open them about 9 o'clock in the morning, if the day is warm. I notice when I open one of the hives, a few bees rush out and some try to fly, but only get away 2 or 3 feet from the hive when they fall to the ground, appearing to be weak. Please give me some explanation of the above.

(GEO. KLITCH.

Ewing ♀, Ind., Nov. 22, 1884.

ANSWER.—It is caused by your imprisoning your bees. It is not best to close hives at any time, except when they are being moved. Such imprisoning gets up an agitation and heat, and ruins some of the bees, which causes them to "fall to the ground." If the outside air is cold, that would assist in causing them to fall.

Shipping Bees.

Will Mr. Heddon please describe the best method of packing hives of bees for shipment in a stock car?

E. SANDFORD, ♂

Nokomis, Ills., Nov. 19, 1884.

ANSWER.—If they are to be shipped at this time of the year during cold weather, with no brood in the hives, they will not need the same preparations which they would require in May. Much depends upon the style of the hive and frames, and whether or not the frames are wired, how old the combs are and how heavy with

honey. It seems as though this short question demanded too long an answer for this department, if the answer were to be explicit enough to be of much value. I think that this department, in back numbers of the BEE JOURNAL for this year, has something upon this subject.

Is Honey-Dew Poisonous?

But why call it honey-dew? for, according to Prof. Cook, it is neither honey nor dew. After reading all that has been written on honey-dew as being "vile stuff," "vile trash," I am lead to ask a few questions about it. On page 723 Mr. L. E. Webster says of selling honey-dew, that it has occurred to him that there might be some way to prevent such frauds. Of course he has reference to those selling it; but will not the same apply to the bees? for they certainly gather and store it in the boxes with white clover and other honey; and how shall we prevent them, as it is hard to foretell from what a bee will gather its load when it starts in search of sweets, and just where it will deposit its treasure upon its return? If Mr. L. E. Webster, or any one else, can give us a practical rule (not merely theory) by which we can stop the bees from perpetrating such a gigantic fraud on us (this sounds a little harsh), as gathering honey-dew for honey, then, and not till then, can we guarantee our honey pure. Unless these questions can be answered in the affirmative by good authority, would it not be wisdom on our part to say nothing more, as it only tends to injure the sale of honey? On page 643 is the following: "Educate! Educate! is the watch word. Let all think these things over and be wise."

THOMAS GORSUCH, ♂

Gorsuch, Pa., Nov. 18, 1884.

ANSWER.—Prof. Cook tells us that the sweet liquid gathered by our bees, which is ejected by the plant-louse, is not usually bad for bees or man; that much of it makes good honey; but that ejected by the bark-louse is "vile stuff," not considered safe upon which to winter bees, and being disagreeable to the taste. If it is sold to unsuspecting honey-lovers, it will tend to disgust them with bee-keepers and their products, thus working us all a great injury. We must treat the consumer as we would be treated, or he will soon treat us to indifference and consequent failure. It seems that these secretions of the bark-louse, occurring in sufficient quantities and at the right time to attract the bees to it so as to mix it in with our surplus honey, only happens very rarely in any given locality; and when the bees do mix it, I know of no way but to remove the surplus receptacles till such secretion ceases. It happens so rarely that I have never heard of it till this season, and we here have not experienced it. Regarding "educating" the people to eat honey, I look at it in this manner: Honey is a luxury only, and always will be at any price at which we can afford to produce it. All luxuries should have their presence well advertised by

keeping them always in sight, and otherwise urging their sale; but as regards "educating" the people as to the taste and nature of the commodity, is it not a little too old for that?

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL,
Monday, 10 a. m., Dec. 1, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.

BEESWAX.—For fair to yellow, 28@30c.
R. A. BURNETT, 161 South Water St.

NEW YORK.

HONEY.—The market is well stocked with honey which is in good demand at the following prices: Fancy white comb in 1-lb. sections, 18@20c.; the same in 2-lb. sections, 16@18c.; fair to good white comb in 1 and 2-lb. sections, 14@16c.; fancy buckwheat comb in 1-lb. sections, 12@13c.; same in 2-lb. sections, 11@12c.; ordinary buckwheat comb in 2-lb. sections, 9@10c. Extracted, white clover in kegs or small barrels, 6½@8c.

BEESWAX.—Yellow, 30@31c.

MCCAUL & HILDRETH, 34 Hudson St.

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as dime, ¼-lb., 1-lb., and 2-lb. jars, from the retail trade. Prices are low as arrivals exceed the demand. Extracted honey brings 5@9c. on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15@16c. in the jobbing way. We have several small lots of dark comb honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb. without finding a buyer. Dealers most certainly mislead producers by quoting buckwheat and popular comb honey, if they are not more successful than we are in disposing of the same.

BEESWAX.—The demand is slow and arrivals are few. Good yellow brings 26@27c. on arrival.

C. F. MUTH, Freeman & Central Ave.

SAN FRANCISCO.

HONEY.—A moderate trade is doing, mainly in best qualities. There are liberal supplies of extracted and common comb. In a wholesale way choice extracted is not readily salable over 4½c., buyers being privileged to take a single case at 5c. There is some dark extracted on market for which 2½c. would be a full figure to realize. A vessel sailed for Liverpool with 105 barrels and 443 cases. White to extra white comb, 9@10c.; dark to good, 6@8c. Extracted, choice to extra white, 4@5c.; dark and candied, 2½@3½c.

BEESWAX.—Wholesale, 24@27c.

STEARNS & SMITH, 273 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@8½c.

BEESWAX.—Firm at 32@32½c. for choice.

W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.

BEESWAX.—28c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13@14c; extracted, 6½c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, ½-lb. sections, none in the market. They would bring 18c.; 1-lb., 14@16c.; 2-lb., 13@14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6@7c.; white clover, 7@8c.; Southern, 5½@6c.

BEESWAX.—None in the market.

CLEMONS, CLOON & Co.
Successors to Jerome Twichell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-graded sections sell best.

BEESWAX—35c.

BLAKE & RIPLEY, 57 Chatham Street.

Premium for Club of 10 Subscribers.

The book for every farmer is the one entitled "Alleck's Farmer's and Planter's Record and Account Book," in which there is the most systematic, complete and convenient arrangement of headings for every Farm Account and memoranda of all important events which may occur in connection with his business. Every progressive farmer certainly desires to make a success of his occupation, and should adopt every possible means of bringing about that result. He, then, should have a correct knowledge of his entire business, which he can have only by keeping a correct account of every crop produced on his farm, the cost of production of all his live stock and an itemized account of all his expenses. Then at the close of the year, when he takes off his balance sheet, which is admirably arranged in the book above referred to, he will be able to see at a glance whether his farm does or does not pay.

This valuable book contains 166 pages, is nicely printed on writing paper, ruled and bound, and the price is \$3.00. It can be sent by mail for 24 cents extra.

We can supply these books at the publisher's price, or will make a present of one copy for every club of TEN subscribers to the Weekly BEE JOURNAL for one year, with \$20. Four subscribers to the Monthly will count the same as one for the Weekly.

Now is the time to get up Clubs. Who will work for a copy of this valuable book?

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Domett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6 1/2 inches.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

CLUBBING LIST.

We will supply the American Bee Journal one year, and any of the following Books, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

| | Price of both. | Club. |

To all new subscribers who send us \$2 for the Weekly BEE JOURNAL next year, we will send the rest of the numbers of this year free from the time the subscription is received at this office.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows :

- For 50 colonies (120 pages).....\$1 00
- “ 100 colonies (220 pages)..... 1 25
- “ 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

Young Men!—Read This.

THE VOLTAIC BELT CO., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6D1y

ELECTROTYPES

“BOSS” ONE-PIECE SECTIONS.

We have again increased our capacity for making the “BOSS” ONE-PIECE SECTION, and are now ready to fill orders on short notice. We would advise our customers, and especially SUPPLY DEALERS, to

ORDER EARLY,

And not Wait until the Rush Comes.

We will not manufacture Hives and Shipping Crates this season, as we have fixed over all our machinery for making the One-Piece Sections.

J. FORNCROOK & CO.,

49BC1f

Watertown, Wis., Dec. 1, 1883

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

ALFRED H. NEWMAN,
923 West Madison Street. Chicago, Ill.

FLAT-BOTTOM COMB FOUNDATION.

high side-walls, 4 to 16 square feet to the pound. Circulars and samples free **J. VAN DEUSEN & SONS,** Sole Manufacturers, Sprout Brook, Mont. Co., N. Y.

GOLD for the working class. Send 10 cents for postage, and we will mail you free, a royal, valuable box of sample goods that will put you in the way of making more money in a few days, than you ever thought possible at any business. Capital not required. We will start you. You can work all the time or in spare time only. The work is universally adapted to both sexes, young and old. You can easily earn from 50 cents to \$5 every evening. That all who want work may test the business, we make this unparalleled offer; to all who are not well satisfied, we will send \$1 to pay for the trouble of writing us. Full particulars, directions, etc., sent free. Fortunes will be made by those who give their whole time to the work. Great success absolutely sure. Don't delay. Start now. Address **STINSON & CO.,** Portland, Maine. 4A1y

For Bees, Queens.

Honey, Foundation, Hives, Sections, and all Apiary Implements, send for Circular to **FLANAGAN & ILLINSKI,** 1A1y Lock box 995. Belleville, St. Clair Co., Illa.

DUNHAM COMB FOUNDATION MACHINE.

TESTIMONIALS.

Mrs. FRANCES DUNHAM, De Pere, Wis.
Dear Madam:—We have made about 38,000 lbs. of foundation on your mills this year, and the foundation has given universal satisfaction; so much so, that several manufacturers have stopped manufacturing to supply their customers with our foundation. We have also manufactured about 10,000 lbs. of thin foundation on the Vandervort machine for surplus boxes, and it has been equally success, but for brood chamber foundation, yours is still unexcelled.
Yours,
CHAS. DADANT & SON.

Hamilton, Ill., Dec. 10, 1883.

Mrs. FRANCES DUNHAM, De Pere, Wis.
Dear Madam:—I have made over 100,000 lbs. of foundation on one of your machines, and would not now take double the price I paid for it.
Yours very truly,
D. A. JONES.

Beeton, Ont., Dec. 10, 1883.

Mrs. FRANCES DUNHAM:
All prefer the foundation I manufacture on one of your mills, to that made on any other machine I have no difficulty in rolling it from 10 to 12 feet to the pound for sections.
Yours respectfully,
J. G. WHITTEN.

Genoa, Cayuga Co., N. Y., Dec. 12, 1883.

Mrs. FRANCES DUNHAM:
After using one of your foundation mills for the past 3 years, we can't say too much in its favor And for brood foundation, it stands head and shoulders above all.
Yours,
SMITH & SMITH.

Kenton, Ohio, Dec. 29, 1883.

Mrs. FRANCES DUNHAM:
I made all brood on Dunham mill, and that I believed it by far the best for that purpose, and as further proof, instance the testimony of E. Kretchmer, of Coburg, Iowa, and L. C. Root & Bro., of Mohawk, N. Y. Messrs. Root & Bro. have only used brood foundation of me, and in a later communication say: "It (our foundation) gave the best results of any tried." I write this that you may have fair play, which is to me always a jewel. You are at liberty to publish this.
Yours truly,
T. L. VON DORN.

Omaha, Neb., Jan. 18, 1884.

HEDDON'S COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County MICH.

Prices Reduced.

1A1Btf HOOPESTON, ILL.

OLDEST BEE PAPER
IN AMERICA

THE WEEKLY

ESTABLISHED
IN 1861

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., December 10, 1884.

VOL. XX.—No. 50.

THE AMERICAN BEE JOURNAL

PUBLISHED BY
THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is at OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Topics Presented in this Number.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

ADVERTISING RATES.

20 cents-per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will admit about 7 words. ONE INCH will contain TWELVE lines.

Transient Advertisements must be paid for in advance.

Editorial Notices will be inserted at the rate of 50 cents per line.

Time Discounts on advertisements will be made as follows: **On 10 lines** and upward, 3 insertions, 5 ¢ cent.; 6 insertions, 10 ¢ cent.; 9 insertions, 15 ¢ cent.; 12 insertions, 20 ¢ cent.; 26 insertions, 25 ¢ cent.; 52 insertions, 40 ¢ cent.

On 50 lines and upward, 1 time, 5 ¢ cent.; 3 insertions, 10 ¢ cent.; 6 insertions, 15 ¢ cent.; 9 insertions, 20 ¢ cent.; 12 insertions, 25 ¢ cent.; 26 insertions, 30 ¢ cent.; 52 insertions, 50 per cent.

On 100 lines and upward, 1 time, 10 ¢ cent.; 3 insertions, 15 ¢ cent.; 6 insertions, 20 ¢ cent.; 9 insertions, 25 ¢ cent.; 12 insertions, 30 ¢ cent.; 26 insertions, 40 ¢ cent.; 52 insertions, 60 per cent.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

VALUABLE ORIGINAL PATENTS.

BINGHAM & HETHERINGTON UNCAPPING KNIFE.

PATENTED, MAY 20, 1875.

The Original BINGHAM Bee Smoker

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always work!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

- Doctor smoker (wide shield) . . . 3 1/2 inch. . . \$2.00
- Conqueror smoker (wide shield) 3 " . . . 1.75

BOOKS!

Sent by mail, on receipt of price, by THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 25 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., DECEMBER 10, 1884.

No. 50.

ESTABLISHED 1862
THE AMERICAN
BEE JOURNAL
PUBLISHED WEEKLY

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

This being No. 50, two numbers more will close the Volume of the Weekly BEE JOURNAL for 1884. Nearly all of the subscriptions will run out in a few days and we would respectfully request every reader and patron to sit down as soon as this article is read and send us the renewal of his or her subscription for 1885, and thus prevent the loss of a number and the consequent pleasure of the weekly feast it presents.

Phenol—Carbolic Acid.

Mr. A. W. Osburn, of Cuba, West Indies, asks us to reply in the BEE JOURNAL to the following queries:

1. What relation has crystallized carbolic-acid to phenol? We cannot get phenol here.

2. Is it your opinion that crystallized carbolic-acid, cut with alcohol, will cure foul brood after Cheshire's plan? We are trying it, but fear it is not going to do the business.

1. Phenol is a hydrocarbon produced in the distillation of coal-tar, or from the vapor of benzoic acid. Carbolic-acid is obtained from coal-tar, and when pure, is about the same thing as phenol—whether crystallized or in the liquid state.

2. We can see no reason why crystallized carbolic-acid, cut with alcohol, will not be as effectual in the cure of what is erroneously called "foul brood" as phenol. Our "opinion" (asked for by our correspondent) is, however, not worth a straw, because we have never tried it. We would invite Mr. Cheshire to give his "opinion" on the subject. As he has made it a study and experimented largely with the disease and the use of phenol for its eradication, his "opinion"

is of more value than many thousands of those who have never experimented with it.

As there is much interest manifested by Americans on the above subject, we have published Mr. Cheshire's experiments and investigations in pamphlet form—32 pages—and will send it postpaid for 10 cents to any address.

The Charge of Adulteration.

In reference to the article on page 724, concerning Mr. Hunt's honey, and the result of the analysis as there published, Mr. Hunt sends us the following reply:

Centre Point, Iowa.

On page 724 is an article on "Hunting Adulteration." Now, as I so far have been barred from replying to the accusations against my integrity as a bee-keeper, on account of my former reply being slightly flavored with "vituperation," I will again attempt a short answer, and will endeavor to be "as meek as Moses," and obey the injunction, "Love your enemies, and pray for those who despitefully use you," or words to that effect. I have now lain malice aside, and will recite the facts, and then leave it to the reader to determine whether I am guilty or not.

A former article from Mr. Von Dorn was headed, "On a Still Hunt." Now, I trust that Mr. Von Dorn will admit that their "still hunt" commenced about four years ago, with the game located in Omaha, and I being the "still hunter."

As a result of this "hunt," an antipathy sprang up which has since cropped out occasionally. I will pass many little incidents from that time up to last winter, when I attended the Nebraska State Bee-Keepers' Association. Everything there went smoothly until the question came up, "Where shall we get queens?" when a prominent queen-breeder was denounced as a fraud by one present. I remarked that I had transacted business with the party referred to, and had always found him a gentleman in every sense of the word, and felt safe in saying that he was not guilty of the charge preferred against him.

The next move was a "caution" by Mr. Von Dorn in the Nebraska State Journal. In that "caution" he stated that a sample of the honey would

immediately be analyzed, and the result at once published. I would ask why Mr. Von Dorn did not keep good his word and have the result of that analysis published? To the reader it will be fully apparent why he did not, when I say that the result of the analysis was a statement from the Nebraska State Chemist, saying that he had analyzed the honey and found the same to be pure and all right. I would now ask, and not this as good evidence as that of Dr. Arno Behr, who analyzed the honey after it had been brought by Mr. Von Dorn from Omaha to Chicago. Saying nothing for or against either chemist, I think that the one statement of the quality of the honey only balances the other (providing that the last named honey was not tampered with in getting it from the can into the bottle, and then to Chicago); and, I think, before it is admitted that either "looks conclusive," that, perhaps, it would be well to have another reliable chemist analyze another sample from any one of the cans taken promiscuously from the lot which I sold to Mr. Tamblin, and then both sides abide by the result of such analysis. If he says that it is glucose, or any other thing but pure honey, then, Mr. Editor, say that that looks "conclusive," and award a crown to Mr. Von Dorn.

I have no "confession or apology" to offer, and a very small "argument." I have been thinking that if I were to engage in the glucose business, whether I would be foolish enough to put my own name and address on every can sold, when some other name would look just as well around a can of honey, and would go equally as far at a bank.

In conclusion I will say that I am in the bee-business to stay, and have no fears of being driven out by any member of the Nebraska State Bee-Keepers' Association.

F. H. HUNT.

Well, "when doctor's disagree who is to decide?" When two chemists make opposite decisions about an article, given to them for analysis, it is, to say the least, very confusing.

By the following letter from Mr. J. W. Sanders, of Le Grand, Iowa, it will be seen that a third sample is to be analyzed:

Le Grand, Iowa, Dec. 4, 1884.

To-day, in Marshalltown, Iowa, I met with Mr. Tamblin, of Lincoln, Neb., who bought the honey in question from Mr. F. H. Hunt, of Iowa,

and obtained from him, after being properly sealed and stamped by the American Express Company, a bottle of the disputed honey which Mr. Von Dorn claims is adulterated. The sample will immediately be forwarded to a chemist of one of our State institutions for analysis; and that analysis will be sent to the Editor of the BEE JOURNAL, for publication, as soon as obtained from the State chemist, who knows nothing in regard to the disputed honey. Mr. Tamblin is a gentleman, a scholar, and a man of business; and he desires to know by whom he has been wronged. As the chemist of the Nebraska State University analyzed a sample of that honey and pronounced it pure, and the chemist of the Chicago Sugar Refining Company pronounced it impure, he wants to know which is right. Mr. Tamblin says that the bottle of honey brought with him was taken promiscuously from the lot, and without any expectation of having the sample analyzed, but brought it along to show to disinterested parties. I, for one, must say that it has a fine appearance and good flavor. Mr. F. H. Hunt, of Centre Point, Linn County, Iowa, is an extensive bee-keeper, though comparatively a stranger to me, as I have met him but a few times; and he says that he is willing to abide the consequences of a fair test. We, as bee-keepers, are all interested in this affair, and want to have honor given to whom honor is due.

J. W. SANDERS.

The BEE JOURNAL having published the charges of adulteration must, in justice to Mr. Hunt, give him a hearing, for it has no wish to deal out anything but "equal and exact justice" to all; in fact, we invited him to reply, as will be seen on page 724. We shall publish the result of the analysis by the Iowa chemist, and hope that will satisfy all concerned. As that is being done at the request of the merchant who bought the honey of Mr. Hunt, it would appear to be a fair undertaking, and we trust will result in an amicable settlement of the whole matter.

☞ More wild bees have been caught this season in the vicinity of Kingston, Green Lake county, Wis., than ever before.

☞ Small fruits and flies are now gone, the cooler weather excites the appetites for sweets, and if your honey crop is not sold, now is the time to dispose of it. The local market should be looked after first, and no honey sent to distant markets until the local demand is supplied. If there is no local market, make one; if you have never tried, you will be astonished at what can be accomplished by a little push.—*Exch.*

Moving Bees a Short Distance.

A correspondent in the *Kansas Bee-Keeper* gives the following as his experience in "moving bees a short distance":

Moving bees a short distance is a square issue with nature. "Old fogies" will tell you that it can't be "did," because it's contrary to "nature." I have more practical experience in this matter of moving bees a short distance than I care to have. Last May I moved 50 colonies two or three hundred feet, without any perceptible loss of bees. They were moved near my office and honey store-rooms. Well, last summer convinced me that they were too close to the public road, and while I thought that there was no probability of them ever disturbing anybody while passing the road, some people were afraid of them, and this was enough. I determined to move them back out of all danger. I selected a day that was cool in the morning, but warm enough for the bees to fly in the afternoon. Early in the morning the hives were all closed, and borne between two men to their new positions. Of course, the new yard was staked off and made ready beforehand. The hives were all kept closed till late in the evening. Boards were placed in front of the hives, and the bees were not let out till quite late, under which circumstances bees are most likely to mark well their new location, and to this management I attribute my good success. But the next day was the most trying of all. The old yard was cleared of every thing, and changed as much as possible in appearance. Some smothered fires made of wet straw were kept going in the old yard, and changed about where most needed. Well, on the third day I had my bees carrying in "meal" and sweetened water as though nothing had happened. Of course a few straggling bees will go back and look over the old grounds for several days, but this amounts to nothing, as they know how to return home.

Timely Hints.

The *Texas Farm and Ranch* contains the following interesting items:

In selecting the site for your bees, have one where the ground slopes, so that rain will run off freely, and make the hives face south or east, never north.

To raise prices by individual effort, work your home market for all that it is worth, and ship as little as possible to the cities, so as to avoid a glut in the market.

Mr. R. Wilkins, of California, has obtained 100,000 pounds of honey from 1000 colonies of bees. S. T. Miller, of Los Angeles, took 40 tons from 270 colonies and increased them to 370.

See that your hives are high and dry, and not liable to have rains or floods wash in. Place a piece of board to enable any belated or tired bees to crawl up into the entrances, in case

they may miss the alighting board on their return from a fly-out.

Two bee-keepers living in the same locality, both using the same hive (Langstroth) and having the same facilities and advantages, report as follows: A doubled the number of his colonies and took an average of 100 pounds of honey from each. B about doubled his colonies, but did not get ten pounds of honey per hive. The difference was the result of management, care and attention.

Honey for Home Use.

The *Indiana Farmer* remarks thus upon the keeping of bees on farms, for the purpose of producing honey for the use of the farmer's family:

Aside from the hopes for any pecuniary gain, there is a great inducement for the keeping of at least a few colonies of bees. In these times of adulterated sweets, about the only resort is to buy directly from our neighbor or produce our own. Honey is one of the most delicious sweets producible, and can be produced with as little expense and labor as anything, especially so in a small way. People who make a specialty of poultry-raising, bee-keeping, etc., give all the time possible which they think will pay one penny more; yet honey may be produced as chickens are, for home use, with but very little care. The perfectly straight combs sell at a better price but do not affect the flavor of the honey. A partially filled section will bring only half price in the market, but it is just the same honey as fills the section without an empty cell; and with the knowledge of the present day, we are enabled to secure more honey from three or four colonies than our fathers obtained from three times the number.

☞ The *Texas Farm and Ranch* remarks thus concerning the *Cheshire Foul Brood Cure*:

I want particularly to call the attention of my bee-keeping readers to an article in the AMERICAN BEE JOURNAL for October 8, 1884, on "Foul Brood, its Propagation and Cure." It is a paper read before the International Congress of Bee-keepers held in London a few weeks ago, by Frank Cheshire. It is exhaustive, and Mr. Cheshire claims that his cure is absolutely sure. Mr. Newman, the Editor of the AMERICAN BEE JOURNAL, has done the apiarists of America a considerable favor by publishing it, and it has been intimated to me by that gentleman that eminent United States bee-keepers are going to give Mr. Cheshire's cure a thorough test. With this essay in, and the anticipation of the results of these tests and these discussions, the BEE JOURNAL becomes absolutely necessary to bee-keepers; at least it is not safe, not wise to be without it.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

CORRESPONDENCE

For the American Bee Journal.

The Hibernation Theory, etc.

JAMES HEDDON.

I fail to see anything in it yet. I have, I think, had a greater experience and observation in this line than Mr. Clarke. For all this I might be mistaken while he might be correct. It does seem, however, as though I ought to get clear upon the subject, with so clear a writer to expound and explain. I find several weak points in his long essay on page 758, which I cannot let pass. I think that the incorrectness of these points destroys his whole theory.

Mr. Clarke asks for the admission that bees generally do well in trees during winter. This no one can admit and yet tell the truth. So far as my experience and observation go, they usually do worse in trees than in all sorts of hives. Many times they go below the entrance hole instead of above it; and one old bee-hunter has "spun" a theory that all fly-holes should be at the top of hives, for he has found that all those colonies in trees having the fly-holes at the top of the brood-nest, are much the best and longest lived. Many are the instances cited, and some of which I have seen, where the old cracked, split hives with tops all open, or Langstroth hives where the empty surplus boxes were left on, contained the only healthy colonies in the spring. If Mr. Clarke's ideas in favor of lower and against upward ventilation were correct, there would, at this day, be no such evenly balanced bee-keeping armies clamoring for both. That ground has been worked over, both by theory and experiment.

I find in connection with Mr. C.'s hibernation theory, that the hive is to be of such size and so arranged that the bees can regulate the temperature at all times. Now, just imagine the changes of temperature given us by nature, and a cluster of bees regulating the temperature within their walls against these outer changes and hibernating at the same time. Mr. C. quotes my bees which consumed so little, as hibernating. Well, they were very quiet, and so he claims them as within his hibernation theory. Now, I know that I fixed the temperature within their hives, and not they; and I further know that if they had been put out-of-doors upon just such a stand as Mr. C. describes, just as soon as the temperature sank outside, a buzzing would have been heard within, and that would not have been recognized, even by Mr. Clarke, as hibernation. Mr. Clarke's ideas of bees hibernating and controlling the temperature, "fauning" the cold air out and gases down, etc., at the same time, puts me in mind of Widow Bedott's recipe for a good night's

rest, by just taking some of her herb tea every fifteen minutes, all night.

Mr. Clarke wants to know if any one can tell why bees do not need as pure air as a human being. If I believed his theory, I could say, because they hibernate. There are other reasons, no doubt; what they are I do not know, but I do know that I have seen bees come through the winter in a No. 1 condition, or at least with no signs of diarrhoea, where they had been subjected to the most abominable impure atmosphere. I have also seen them have the disease radically with the best of ventilation.

One might as well ascribe the cause of the cholera in Paris to carbonic-acid gas, as the bee-diarrhoea to the same source; when we analyze the excreta of these diseased intestines, we do not find gases, we find pollen. The theory that healthy bees which have been protected in a repository have been made tender, and thus are more likely to dwindle in the spring, is, in my judgment, false. It is based on the principle of good care making the bee tender, and then it cannot stand the cold winds of spring. While that is a true theory, in the light of the lifetime of a species, it is not true regarding the individual bee or colony. If it is, why does Mr. Clarke put this outer box over his out-door hibernating colony? Will it not make them tender, and cause them to dwindle in the spring? Let it be recorded that I call "spring dwindling" the result of a physical weakness brought about by the food diseasing the intestines in a limited degree, not enough to show in the hive, as the bees were able to hold the feces till they could fly and void it where it would not be seen. Where bees do not speck the snow upon their first flight, or if so, only slightly and light-colored, there no spring dwindling will occur.

Spring dwindling is bee-diarrhoea in disguise. When we learn the cause and prevention of this disease, we shall also learn that a good cellar is the cheapest and best place in which to winter bees. Mr. Clarke's theory of the falling of carbonic gas, which is, I presume, the author of the theory of the lower air-shaft, is correctly shown as an error, by Mr. Cornell on page 756. Now, of what value is the shaft if Mr. Cornell's theory is correct, which I had previously learned it to be? Will the air-shaft stand when its uses fail? Does not Mr. Clarke suspect that his hive-stand is awkward and impractical for the use of the specialist? Does he not see that its expense is greater than the enduring and otherwise useful cellar? I cannot see wherein Mr. C. differs from the rest of us, only that he now calls hibernating what, last March, I called a sort of semi-hibernating condition (we hardly disagree upon the word to describe what we both agree to), and that I place this quietude as an effect of bee-diarrhoea preventives, and he, as the prevention itself.

It is certainly interesting to witness the masterly skill which our fellow bee-keeper displays in making the truthful statements of some and the erroneous assertions of others, seem

to prove the most absurd claims which have yet been offered as the cause of our winter losses.

CONTINUOUS PASSAGE-WAYS.

On page 761, Dr. Tinker gives us a lot of assertions which I doubt if there is one-tenth part of the readers who can see any reason in. We want the reason why bees will not glue the sections together if no bee-spaces are allowed. Also, how it is managed to dispatch work while placing cases on top of each other, and not crush any bees. Yes, I did at one time think that these continuous passage-ways might have some advantages, but my experiments relieved my mind from the least doubt. When I asked the Chicago Convention how many believed in the continuous-passage-way system, I could not get one affirmation. I did not think that I was so far "off," but I wanted to be sure. I feel sure that continuous passage-ways do not tend to the building of straight combs; and further, I am quite sure that no race of yellow bees are the fine, straight comb builders that are the brown Germans.

During the past year I made careful experiments upon this very point, and I wish that the Doctor could hear my students talk about it. If I am enthusiastic on this point, the students are "cranky." Come, Doctor, give us the reason why bees violate the old rule laid down by Father Langstroth, that "Bees glue up all spaces too small for them to pass through."

Dowagiac, 9 Mich.

Read before the Maine Convention.

Progress in Bee-Culture.

E. P. CHURCHILL.

I am always interested in anything pertaining to bee-keeping, and ever ready to contribute my mite in the way of promoting our noble cause. As we discuss the different modes of procedure in caring for our bees, let us do so with kind and unselfish motives. I am aware that I shall call out some criticism, but if we all thought alike where would be our thousand improvements of to-day? Who would have believed before comb foundation was tried that such a wonderful result would have followed? But we may go still farther back to the movable frame. If then, any one had told us that he could take a hive all apart and move the bees all about on frames, could discover any defect, and could change frames of comb from hive to hive, I ask, what would he have met? It would have been looked upon with as much doubt as the invention of the mowing machine encountered; but all these ideas have proved to be actual facts. And the question arises, have we reached the upper step of improvement and invention? I feel safe in saying that we have not.

There was at one time a great hindrance to our progress, and that was the different patents. Although we owe our Father Langstroth a score

of thanks for his labor and for his patent, yet it is plain that a few patents were spread over the country which were a hindrance to progressive bee-culture. But happily nearly all of these have gone out of use. How absurd to think of success with a hive without division-boards; with the whole upper story and cover solid; with closed top-bars nearly their whole length, and frames fitting close to stays at their sides, to be ever fastened by the bees, proving, when removed, to be regular bee and queen killers! But says one, "I use such hives and obtain honey." So you may, my friend, and you can get it by using a box-hive or a barrel, or almost anything; and so we can cut our grass with a hand scythe, but how much easier and faster is hay obtained with the mower! Often I have heard the let-alone-plan advised, but after seeing what can be done with correct management, some will venture to try their hands at this.

I call to mind one particular case. I was transferring a colony from a box-hive when a neighbor called and stated that he had a wonderful colony of bees which he had just bought for the small sum of ten dollars, in the old Kidder hive. I asked how many frames there were; he did not know, but guessed it was full, at any rate, it was a big hive, and the party of whom he bought stated that the colony did wonders during the previous season. He thought it was all folly to go to the expense of my arrangement, but the sequel showed him his mistake. While the transferred bees made a splendid return in surplus honey and swarms, his did nothing. I had occasion to visit a party with the improved arrangement, and while there this old neighbor came, too, and looking rather "down in the mouth," asked me to go and see if I could discover the cause of his bees acting as they did. He had just removed them from the cellar, and they appeared to be weak; he also said that they acted strangely during all the previous summer. They would dart around and act as if dissatisfied with their home. I suggested that they might be troubled with moths. "Can you not go and see them?" said he. Have you not opened them? I asked, "Oh no, they would sting me to death." I was in a hurry; however, I went over, and after digging and prying a long time I succeeded in removing the old honey-board, when about as many worms as bees appeared to view. The queen tried hard to locate and start brood in several places in that very large hive, but the moths had driven them every time, and they were reduced to about a pint of bees. I knew, of course, that he could do nothing for them, and the shortest cut seemed to be to fit the hive so as to take the Langstroth frame, which was done, and single division-boards were put in. With care I got comb enough from the old hive to fill two of these frames. They were packed with chaff and cloth, paper and chaff being put over them. I directed him how to manage them, and to his surprise that little nucleus gave him two

swarms and a good amount of surplus honey. He now handles his bees and knows just their condition at all times, and says that "guess work" cannot be depended upon. I give this one case to illustrate the condition of thousands.

It is a positive fact that no occupation will be successful unless properly attended to in all its minor points, and bee-keeping is no exception. Unless one loves the bees and intends to study them and devote some time and expense on them, he may as well give them a severe letting alone; but on the other hand, if he will only make his bees a study, as he does all his other work, he will find much amusement and some profit in it.

At the present time there is great diversity of opinion as to what strains of bees are preferable. One says: "If we want bees to sell, we need the pure Italians; but if for business, the hybrids are just as good; while another says that he wants the long, leather-colored Italians. I thought that an Italian was yellow at any rate, if pure; because we are told that the three yellow bands are a test of purity. Still, the best imported queens are sometimes dark; in fact, I do not believe that all queens from good colonies are perfect any more than that the progeny of other colonies of any kind will be blessed with perfect qualities, every time. I do not believe that we can produce queens whose offspring will be smart workers, etc., if we breed and mate queens from the same colony. And this is my reason for favoring hybrids, or at least one reason. It is a fact that we can do double the amount of extracting from hybrids (or black bees) that we can from Italians, and they are not quite so fond of their younger brothers and sisters, so they will leave the brood-nests and take to the sections a little freer than the Italians. But when we come to the manipulation of the hives, the Italians are far preferable. One will notice this very readily if he has occasion to extract from a variety. He will see also how much more work it is to get the Italians off the combs; besides, he will see hundreds of Italians scattered all about the hive, while with the others, nearly all will be inside. I do not speak of this to condemn the Italians, for I like their gentleness very much, but I intend to keep on the right side of my bees, or in other words, I intend to be master at the start, the same as I would with a horse or any creature which possesses a cross disposition. I do earnestly say, do not drop the Italians, but keep the best, and guard against in-and-in breeding as far as is within your power, and I believe perfection will be reached in time.

I think that the hive which we use has much to do with the disposition of bees. Let us begin on a hive where we cannot pry the case from the frames, and see how the bees will become aroused by the time we lift up a few frames which are adhering to the case which we are lifting. Robbers "smell the rat," and not a few are calling to seek what they may devour,

and perhaps a queen is killed, or a valuable comb or two smashed. By that time the bee-keeper says: "I do not want any more chaff-hives." Now, my idea is, a chaff-hive every time. I believe it is of much account to pack the cover with some coarse material, as hay or chaff, as a shade, and also to keep it warmer in winter; and again, to press down the enameled cloth or quilt which may be over the upper story.

Let the hive be what it may, I prefer one whose frames are level with the top of the hive, so that in removing cases we can press a knife or chisel directly between them and the frames. I want the hive so constructed that when the division-boards are in place, there will be no possible exit for the bees, aside from the entrance, of course

For the American Bee Journal.

"The Apicultural Outlook."

R. J. KENDALL.

On page 756 Mr. Heddon gives us some good thoughts under the above heading, but there is one point in which I differ from him, and that is, the organization idea; which of us is right, I am glad to say, is in a fair way of being tested. For some reasons I would like Mr. Heddon to be right, and on the other hand I would like to be right myself, for other reasons. But let us see. Mr. Heddon, like me, deplors the unsatisfactory condition of the honey market, but adds (probably alluding to my idea that organization would kill the adulteration and better the state of things), "Allow me to predict that organization will not stop this condition of things." That is Mr. Heddon's opinion. Now, when Mr. Heddon speaks on matters relative to the management of bees, I stand silent and do not presume to reply, yet on this subject the opinion of a beginner may be equally as sound as Mr. Heddon's. This, I presume, Mr. Heddon will admit—with slight reservation any way.

Mr. Heddon probably is aware by this time, from his perusal of the *British Bee Journal*, that that paper has been almost continually slapping, directly or indirectly, at American honey, and giving currency to the idea that American honey, as a class of honey, is usually adulterated; in other words, they have the glucose problem over there, more or less; the idea is out that American honey is adulterated with glucose. Whether this is true or not, matters not for the purpose of my argument.

How have the Britishers met the problem? They have organized. A honey company called "The British Honey Company" is just formed, the advertisement, brand or label (The British Isles) are published in the last issues of the above-named bee-paper. The label is a very taking one, and I predict that it will be very popular, and more, in my opinion it is the hardest hit at and will do more to keep American honey out of the market than any thing that the Britishers

have done heretofore. See if it does not. I was born in England, and I know what I am saying—or I think I do.

If Mr. Heddon is right, then this organization of British bee-keepers will affect the sales of American honey (pure or adulterated) very little; if I am right, it will cut them down. Let the event settle it. I know that England cannot produce as much honey as she uses, but whereas the English have been using much honey produced here, they will now get cargoes from Australia and New Zealand, and, perhaps, from Canada, or from some British colony.

This is what the "sharp Alec's" in the shape of American adulterators have done for us. For instance, take myself: I was very seriously contemplating sending my honey to England—honey which I will warrant and swear to be pure honey without the least shadow of adulteration near it; but now I shall wait, and like Rip Van Winkle, when he was asked what he would now do if his wife tumbled into the river, he replied: "Stop and think about it awhile." I believe it would work the same here. Mr. Heddon does not give us any reasons why he makes his prediction, and I only can infer that they are because of his ideas on specialty, and that we have had altogether too much outcry as to adulteration.

Now, I believe in Mr. Heddon's ideas on making the business thoroughly a specialty, and heartily concur in his remarks as to the mistake made by so many supply dealers in trying to induce everybody and his wife to go into the business; but Mr. Heddon must remember that the adulteration cry is not made so much by bee-papers as it is by the thousands of outside periodicals which report cases.

If bee-papers, by talking about adulteration, cause their readers and honey-producers to adulterate by giving them the wrinkle, then, Mr. Heddon, we are a bad lot—and no mistake. No, it is not the *honey-producers* who do the adulterating, it is the middlemen and merchants who buy honey in bulk from the apiarists and then bottle and can it.

Why, a friend of mine who was employed in one of these very houses, and who did not know a queen from a drone, told me how it was done, and gave me the proportions of honey to glucose, etc.; if I remember rightly, it was about 30 per cent. of honey. Yet this same stuff was and is sold as pure honey. It is these fellows that we have to fight, and we have to fight them not around our own homes in the country so much as in cities; and in the cities the people do not know who Heddon or Doolittle is, and if they did, Heddon and Doolittle could not begin to supply those who want honey, so their private labels are lost in the crowd. The fact is, honest though every one of us may be, we are too isolated to be felt. Let us unite, have a common label, organize, and then we can strike effectively at those who are in-

jurging us and taking the bread out of our mouths.

Personally I am not hurt yet, and more, I do not propose to be; but I will say this: If one thing more than another would make me give up producing honey, it would be just this refusal or lack of "git up" on the part of bee-keepers to take advantage of one of the first lessons their colonies teach them—unity of purpose for the common benefit—a lesson which every trades' union in the land emphasizes, and a lesson which is one of the first taught us in our childhood by the story of the Roman father and his sons and the example of the bundle of rods.

In Yorkshire where I was born, certain judicious men were described as being men "who save through the vent hole, but let their money go out by the bung hole"—and this is a very expressive way of putting the policy which we bee-keepers are now carrying out. We strive hard and rack our brains to get in an extra pound of honey, but when we let the big, city honey-houses manipulate and retail it, we are surely letting our money go out at the bung hole of our honey barrel with a vengeance. They will soon not be satisfied with the "bung hole," but will knock in the barrel head itself.

Mr. Heddon may term this a "lament" if he desires—I call it a word in season. "Fore warned should be fore armed," and I say to you, fellow bee-keepers, you must move in this matter, your vital interests demand it, and unless you do, you will regret it. "Now is the accepted time, and now is the day of salvation."

Country Gentleman.

Timely Hints for the Apiary.

J. SINGLETON.

Winter is a time of comparative leisure to the bee-keeper as well as to the farmer, and should be improved by both in laying plans for another campaign when the season opens. The question of primary importance at the present season is: In what shape shall I have my honey crop put up, in order to realize the greatest returns from it? Those who have had several years' experience in the improved manner of bee-keeping, and have made a business of it, will by this time, no doubt, have solved the question for themselves; but to a majority of those who keep bees merely as a secondary matter, and who have but few colonies, it is still an open question. Looking over the files of the different bee-papers, we find about as many advocates for producing comb honey as we do for extracted, as a matter of profit. For a few colonies, no doubt, in my mind, comb honey will be as profitable, considering the less time and attention needed to care for the crop and the bees during the time of gathering; but for an apiary of 75 to 200 colonies or more, if one has abundant help, I

consider that extracted honey will bring the greatest returns.

Now is the time for each apiarist to decide for himself, taking into consideration local variations in market. In some parts little extracted honey can be sold, and that at a low figure. In such a case, comb honey will, of course, be found the most profitable. Every honey-producer should cultivate his home market, and by supplying only *pure* honey, put up in attractive, clean tin pails or glass jars with labels, on which is printed the name of the apiarist as a guaranty of its purity, a fair local trade can usually be worked up without paying any profits to middlemen, or loss in transit and storage. I have usually had no difficulty in selling all my honey within a radius of a few miles of home, long before the next year's crop came in.

If the decision be in favor of producing comb honey, see to it that there is enough wide frames for holding the sections, giving room for at least 100 or 150 pounds per colony, as it is better to have more frames on hand than we expect to need; it often saves a great deal of trouble hunting up and emptying frames of sections not quite completed, from other colonies. In producing comb honey the question arises as to the size of sections, whether the ½-pounds, 1-pounds or 2-pounds. No doubt a greater weight of honey will be stored, under the same circumstances, in the large sections than in the small ones; but in most instances the large ones can only be sold at a reduction of several cents per pound, while the smaller ones are always salable, and command the highest price.

If comb honey is to be the object, a full supply of wide frames and sections should be on hand in good time, also foundation for starters, which I prefer to use almost as large as the sections, within ¼ inch of sides and bottoms. If the foundation is made thin, 10 or 12 feet to a pound, the bees will work it out so there will be no "fish-bone" in the honey, and no difference can be perceived between that and comb made altogether by the bees, while the use of full-sized pieces of foundation will insure straight combs and facilitate the work of the bees, inducing them to occupy the sections more readily than the small bits used some years ago.

If extracted honey is to be produced, have on hand a full supply of clean frames with good straight combs or foundation ready for immediate use when the season opens. Often it is not convenient in the busy season to extract as quickly as combs are taken off the hives, and a good supply of empty combs in reserve, or frames and foundation is very convenient, as the full combs can be put away for "a more convenient season," and good straight combs evenly drawn out are a "handy thing to have a good stock of" when well secured from moths and other depredators. Have ready, also, a good extractor of right size to fit the frames in use in the apiary. Also have an uncapping knife and waxed barrels, or better

still, tin cans or pails for storing and retailing the honey when it is obtained. It is not wise to wait until a thing is actually needed before obtaining it, as time and money are often lost in the vexatious delays of transportation, etc.

It is conceded by most who have tried it, that from one third to one-half more weight of honey can be obtained by extracting than in the form of comb honey; and in time, those who deal honestly with their customers, and supply only the pure product of the flowers, in good and attractive shape, with the guaranty of their own name and location attached, will build up a business in that way, which, I think, will overcome the prejudice of customers, and establish extracted honey on a par with comb honey as to price.

Making Cushions.

WARREN PEIRCE.

The article in a late number of the BEE JOURNAL by G. M. Doolittle, on "Preparing bees for winter," was read with much interest, and his directions for preparing a winter feed were marked for future use. If in return I can save him or any other apiarist some extra labor in making sacks for cushions like those he describes first, I shall be glad to do so.

Instead of using the long strip 72 by 4½ inches, and sewing the eight seams to set it together, just make a plain sack as described in the second place, only have it 4 inches larger each way than required when filled. Now take hold of the cloth each side of the corner, equally distant from the edges and fold the corner crosswise of the sack and stitch across far enough from the corner so the seam will be just 4 inches long. Fold and stitch each corner in this manner, and the same result is accomplished with only half the sewing.

Garrettsville, 3 O.

Rural New Yorker.

Reversible Frames.

PROF. A. J. COOK.

For some years a few of our most successful bee-keepers have been praising reversible frames. Mr. O. J. Hetherington, one of our most skillful Michigan bee-keepers, told me, some years ago, that the old style of the Quinby hive—one of the Huber style of hives—was superior on this very ground, that it permitted turning the frame upside down at will. Our people are very conservative, and it often takes years to introduce even a good feature in our practice; so, while many whispers of the value of the reversible frame have been heard, these, until within a year, have met for the most part, deaf ears. During the past year this subject has come prominently before the bee-keeping public, and reversible frames have

been tried by a large number of our most intelligent bee-keepers, who, in nearly every case, have only words of praise for the arrangement.

The advantages secured by reversible frames are these: 1. The combs are fastened to all four sides of the frame, instead of just to the top-bar and the upper part of the end-bars, as is generally the case. Combs thus fastened are firmly held, and will never fall out, no matter how well loaded with honey, while being handled. Such thorough fastening is also very desirable in case the bees are to be shipped. Nothing can be more disastrous to bees which are being transported from one region to another, than to have a comb full of honey break out of the frame. Of course, if we use wired foundation, the above point in favor of reversible frame has no force; combs on wires never fall out of the frames. But, as desirable and excellent as wired combs are, comparatively few apiarists are yet using them. To such, reversible frames, enabling the bee-keeper to force the bees to form a firm attachment of the comb to the frame, would be a valuable acquisition.

2. By the use of reversible frames, bees can be induced to work in the surplus chamber, when otherwise this seems impossible, as every bee-keeper knows that the bees always place some honey (often very little) above the brood. From this rim of honey the brood, by the time the honey harvest opens, is built clear to the bottom-bar of the frame. If at this time the frames are turned bottom upward, there will be no honey above the brood, and the bees, true to their instinct, will instantly rush to the sections and give us the delectable white clover and basswood honey in the surplus receptacles—just where it is desired.

To use these frames, we have only to take them out of the hive and turn them bottom side up. This will be done when we wish our combs firmly attached to the bottom-bars; also at the beginning of the honey harvest, when we wish to send the bees *en masse* into the surplus chamber, that our beautiful white sections may be speedily filled with more beautiful and whiter honey.

There are three ways of making these reversible frames: The frames may be made to stand up on the bottom-board, like the old Quinby frame and the Bingham frame, or they may have a projection from the center of the end-bar, resting on an iron support fastened to the side of the hive, midway from top to bottom; or, a strap of iron three-fourths of an inch longer than one-half the length of the end-bar, and of the same size, may have one end screwed to the center of the end-bar of the frame, and be bent over at right angles one-half inch from the other end. A hole is made through the iron in the middle just below the angle, large enough to receive a small wire nail. Now, by simply removing this nail and turning this iron, the supports may be changed from what was the top-bar to the bottom-bar, and the frame reversed.

The wire nail is pushed into a hole previously made in the ends of the top and bottom bars of the frame, and, of course, holds the iron securely so it cannot turn till the nail is removed. I have used all three styles with success.

Agricultural College, 2 Mich.

For the American Bee Journal.

Western Michigan Convention.

The bee-keepers of Western Michigan met on Nov. 25, 1884, in Music Hall at Fremont, Mich. The President, Thos. M. Cobb, being absent, Mr. Balch, of Kalamazoo, presided over the meeting. The minutes of the last meeting, and the Treasurer's report being called for, they were read and accepted.

This being the annual meeting, the election of officers then took place, and resulted as follows: President, George E. Hilton, of Fremont, Mich.; Secretary, F. S. Covey, Coopersville, Mich.; Vice-Presidents: For Kent county, Thos. M. Cobb, Grand Rapids; Ottawa, Martin Pelow, Holland; Newaygo, A. M. Alton, Newaygo; Oceana, John Dolph, Hesperia; Muskegon, G. C. Young, Ravenna.

The meeting then assumed the social form, the most of the members relating their experiences and reporting their successes for the past year, which was usually good. The matter of sending delegates to the National Convention to be held at Detroit in 1885, was brought up, and the convention decided to send two, Mr. George E. Hilton and Mr. F. S. Covey.

The time for adjournment having arrived, Mr. Hilton invited as many as could, to meet at his house in the evening for a good time, and to look at his model apiary, which is indeed a fine sight. The convention then adjourned to meet on the first Tuesday in May, 1885, at Fremont, Mich.

Lewiston Journal.

Bee-Keeping in Maine.

X. Y. Z.

On a beautiful August day, when the goldenrods were just coming into bloom, and the bees were rolling the pellets of pollen upon their tibial extremities, and thrusting their tongues into every nectar laden chalice for the stored-up sweets of the orange-colored blossoms, it was my pleasure to enjoy a chat in the extensive apiary of Mr. J. B. Mason, of Mechanic Falls, who is one of the best informed bee-keepers in Maine. Mr. Mason has been long a close student of the economy of the hive and its occupants.

Moreover, Mr. Mason has had the advantage of wide observation among some of the most practical and scientific bee-keepers in New England, which, coupled with his diligent and close application of the principles of bee-keeping gleaned by reading the bee-literature of the country, and

possessing withal quick intuitive perception, these combined with his many years of experience in handling bees, make him master of the business.

"The bee interest in Maine," says Mr. Mason, "has increased quite fast during the last decade. And this right in the face of discouraging seasons and consequent failure from short honey crops. The Western development of apiculture has been wonderful within the last fifteen years. Tons of honey are now yearly produced by single apiaries cared for by individuals who make this their only business, and who often realize a fortune from it."

"Maine caught the fever somewhat, soon after the introduction of the Italian bee into this country some twenty years ago. About that time Mr. Langstroth brought forth and perfected his frame hive which was a boon to bee-keepers, and opened up a new phase in the business, revealing new possibilities in the rearing and breeding of bees, which two decades of wonderful progress have failed to fathom or exhaust."

"All over the West and portions of the South, and in California, and laterally spreading into portions of New England, were men, and women, too, who made a specialty of rearing queen-bees and sending them to all parts of the country by mail. In warmer latitudes, with longer seasons, the new method of caring for and handling bees grew into a profitable business, and to many became a congenial pursuit. At this time Maine's bee-keepers were struggling along with their bees in box-hives, depending upon the brimstone pit at the close of the honey season for a supply of the sweets of the hive, thus killing the goose to obtain the golden egg."

"But the bee-keepers of Maine soon caught inspiration from the Western 'buzz,' and notwithstanding the drawback of short summers and long, hard winters, they have become so well schooled in the intricate and wonderful processes of bee-life, that to-day the business is one of considerable magnitude, and I cannot but think that the day is not far distant when Maine farmers will as constantly supply their tables with the pure sweets of the hive, as they now do from the golden product of the dairy."

For the American Bee Journal.

Causes of Loss in Winter.

S. J. YOUNGMAN.

I would say to the bee-keepers in the North, do not despair of yet solving the difficult problem of wintering bees, while such men as Messrs. Heddon, Clarke, and a host of others are so deeply interested, and are striving with each other, both by hard study and costly experiments, to see who shall be the first to say "Eureka." I would frankly say that I think Mr. Clarke's theory has but few friends, but all must admit that his plan has advantages for ventilating the hive.

My observations have led me to believe that bees do not winter as well in trees as they do in hives; as I have had them die out in log-gums which were 8 feet in length, and at the same time do well in movable-frame hives. I have also cut trees, and have known others to, which contained combs with honey; but the bees had hibernated to such an extent that they had failed to awaken.

I think that Mr. Heddon made a true statement when he said: "This question of wintering is not one of cellars, ventilation, pieces of lath, sticks, quilts and cushions over the combs; what kills our bees is diarrhoea." I agree with Mr. Heddon this far; but what is the cause of this disease? I cannot believe that pollen is the first cause of this worst-of-all diseases which bees are heir to. I am convinced that bees having all the necessary conditions to winter well, do not breed as when ordinarily prepared for winter by the well informed bee-keepers of the present day; but anything which may threaten the welfare of the colony, whether a loss of numbers, a diseased condition, or anything which threatens the extinction of the colony, will cause it to commence brood-rearing at once; and if pollen is at hand, they will, of course, use it, and this will certainly aggravate the condition in which we find them when diarrhoea first makes its appearance.

I have seen bees affected with this disease at all times of the year, in fall, winter, spring, and in mid-summer; in the fall when flights were quite frequent and no brood-rearing going on at the time. On June 18, 1884, I received, at this place, a carload of bees from Louisiana, which had been confined to their hives for over eight days, and upon having a chance for a fly, many of them showed unmistakable signs of bee-diarrhoea. This, of course, was not caused by brood-rearing.

Now, I find some locations which are nearly, if not quite, exempt from this disease, as it ordinarily makes its appearance in colonies of bees. I find that in dry, sandy locations where fall bloom is scanty and the honey sources are from raspberry, clover, basswood and purple fire-weed, there is no trouble of this nature; on the other hand, where there is an abundance of fall bloom, such as buckwheat, motherwort, corn and different varieties of wild asters, the trouble commences early, and many in such localities lose all the bees that they may have; whether they are on the summer stands, packed in chaff in double-walled hives, in cellars, or in clamps, the result is the same.

As far as Michigan is concerned, apiaries in the southern and middle parts seem to be more affected with this disease, or condition of things, than the northern part. Bees are kept successfully at Petoskey, which is as far north as I have known them to have been kept in this State. I know, personally, that there are wild bees as far north as Roscommon county, and that two of the most successful bee-keepers of Michigan live far north of

Bay City, in the interior of the State, on an elevated location, the soil being of a sandy nature, and willow-herb, called by some purple fire-weed, and goldenrod being their chief sources of fall honey; and from whom one of our most prominent bee-keepers living in the southern part of the State, has twice purchased bees, after losing her own by diarrhoea. I refer to "Cyula Linswik," who smiles quite audibly at Mr. Clarke's long, winter nap, and Mr. Heddon's pollen idea; and well she may, as she has never met with any serious losses. Thanks to the plants which gives her a pure, healthy article of honey—"it cannot be excelled"—and her admirable method of packing and ventilating the hives.

I would say in conclusion that it will be utterly impossible to winter bees successfully in low, moist localities, unless the early honey is left in the hive, the extractors used with caution, and combs of white clover or basswood honey laid aside to be given back to the bees in early fall in place of the "vile stuff" which they sometimes gather; but perhaps the surest way of all is to extract all the honey in early fall and feed up with a good article of sugar syrup, and thus not run any chances of not having the necessary requirements for them to winter safely.

Cato, Mich., Dec. 1, 1884.

For the American Bee Journal.

Returning First-Swarms, etc.

FAYETTE LEE.

For me this is the hardest part of bee-keeping. I do it in three ways, viz: 1. Return the swarm after removing all queen-cells, then turn the hive half way around. 2. Hive the swarm in a new hive placed beside the old one, and in three days put the combs from the old hive into the new one. 3. Kill the old queen, and in eight days cut out all of the queen-cells except one. With second-swarms, this season, I waited till I heard the queens peep, when I would open the hive and cut out the queen-cells and let out one of the queens, so as to be sure that there were two queens in the hive at one time. In this way I had only two second-swarms out of 48 swarms. Sometimes the young queen will lead off a swarm, if the cells are all cut out; but if two young queens are free, there will be a fight, when one will be killed, and no swarm will be led off. This has been my experience. I want to make 80 section-cases to be placed on Langstroth hives, and I want to make the best kind. What is that kind?

Cokato, Minn., Nov. 30, 1884.

[Your question is very indefinite. Are the "cases" to be filled with one-pound sections or larger? Do you wish to use separators, or not? Do you want cases to use over the frames, or in the brood-chamber? You should particularize or the question cannot be answered satisfactorily.—ED.]

For the American Bee Journal.

Winter Queen-Rearing in Cuba, etc.

A. W. OSBURN.

As many have written me regarding the rearing of queens here in winter, and shipping them North in early spring, I take this way of answering, as it is quite impossible to give personal answers to each letter that I receive. In the first place, the thing is impossible; for after Oct. 15 there are no drones to speak of. There are a few, and it is barely possible that after Oct. 15 until Feb. 15, we might get one queen in 15 mated; but you see that it would never pay as a business.

Now, in relation to Cuban bee-keeping: What I know of it is, that the management of bees for surplus is so different from that in the North, that whether it shall finally prove a success or not, depends upon judicious management. As you know, the surplus season comes here in the winter; and although it does not freeze, the flowers bloom, and the bees gather honey. Yet it is winter; it is winter time, and it is winter with the bees. Although they are in a tropical climate, their nature is not materially changed. They kill off their drones, the queens lay sparingly, they seal up every crack in their hives, they are cross and hard to handle, and when disturbed are liable to ball their queen, and everything goes to show the close observer that they are preparing for a season of rest; if not to "hibernate," to suspend all, or nearly all operations until the next spring.

But the long, cold winter of the North does not come with the severity that it does in New York or Michigan; but instead, a temperate, cool, fall weather, during which there is plenty of honey to gather, yet the colonies are not strong like they would be in May or June, and, of course, the amount of honey cannot be gathered, as the days are short, and the nights are cool, thus making it hard to properly evaporate honey. All conditions seem to be unfavorable to great success, or to securing a large honey yield at a season of the year when, to my mind, nature had designed that the honey-bee should be asleep. Our surplus season is near at hand now, and were it the first of June, instead of December, large results could be expected, for the honey is here, but the workers are few, and the time of the year is against them.

For the first six or eight months that I was here, I was told, by the native bee-keepers, great stories about Cuban bee-keeping, and the honey resources at all times of the year; but I have not found their statements "to pan out" worth a cent. From July 1 to Nov. 1 we had four months of honey dearth, when the bees did not make a living. I will not say that the business will not be made a success finally, but I will say this: I know that there is much to learn about the winter management of bees, in order to make them profitable at this unseasonable time of the year.

I will report further when I have had more experience. Our efforts during this winter will be to secure all the honey we can, instead of increase, as we were doing last winter.

Cuba, West Indies, Nov. 27, 1884.

Prairie Farmer.

A Familiar Talk About Bees.

MRS. L. HARRISON.

A sprightly, energetic, old lady called to me to have a talk about bees. She said: "My old man is so square, he never wants to change, wants to do just as his father did. When we begun house-keeping, his father gave us a swarm of bees in a 'gum,' and said to me, now Liddy be sure and salt these bees on Washington's birthday, or they will do no good, and if Jesse should die, rap on the hive and tell the bees about it."

As the bees were given to me to "salt," I took an interest in them, and I wanted Jesse to get some patent hives. But he said, "father never spent one cent for his bees, except to buy a quarter's worth of brimstun in the fall, and I'm not going to, either. He melted the brimstun, and then he dipped some dry sticks in it; then he dug a hole in the ground, made a fire with these sticks, and set a 'gum' over it. In a few minutes the bees had all dropped into the fire; he hefted all the gums, and all that he thought was too light to winter, he smothered. Mother strained the combs, and when she could not get any more honey, soaked them in water and made metheglin. At last she boiled the comb, and made wax, and always had a cake of it, to put with the taller, when she made dips. I tell you Liddy, the old way is the best; never had any one burnt up with the pesky kerosene in those good old days, and we had plenty of honey for our buckwheat cakes, with only 25 cents spent for brimstun."

One day Jesse was away and the bees swarmed, and I put them into a gum, that Jesse always said was too small—not high enough. It was a very large swarm, and the bees could not all get in; so I bored some holes in the top, and put on some starch boxes. When I was fixing the boxes, the hired man said, "Let me cut some holes in the ends of them, and tack pieces of glass over them, so you can look in and see what they are at." There was a splendid flow of honey just then, and the boxes were soon filled, and I removed them, and put a large glass dish in their place and covered it up dark and close. When it was filled, I showed it to Jesse, and told him I was going to take it to the fair. So I did, and it took the blue ribbon. I was so pleased that I staid around the honey exhibit, and I found other bee-keepers did too, like flies around a sugar barrel. A bee-keeper (who did not know I brought it) said, "That honey in the glass dish should not have drawn the premium; it looks pretty, but it is not in marketable shape." And then he pointed

out to me little boxes that he called sections, and showed me how nicely they could be handled; also a Langstroth hive.

I was delighted, and spoke right out in meetin', "Jesse do come and see this hive." He looked at it leisurely and said, "What do you want me to see it for, our hives are good enough; you can bore all the holes you want to, and turn glass ware over them." Jesse is so sot, I knew it was no use to argue the matter further, and concluded to buy some hives and say nothing about them.

When the owner of the hive came around again, I asked him the price of his hive, and he handed me a printed list. I saw lives in the "flat," and they were cheaper than the other; I did not know what this meant, so I said, "Why are these flat hives the cheapest? O! you mean hives in the flat; they are the pieces of a hive all ready to nail together. When they are shipped more of them can be put into a car in this way, and more can be hauled in a wagon. I told him that I wanted to buy six hives all ready to put bees in, and could I have them the last of next May?" I did not want to ask Jesse to drive nails, and I told the man he need not be afraid he would not get his pay, because Jesse wouldn't buy the hives, for I was going to save the premium money that I got on my honey, and add the turkey money to it, and also what I get from poultry and eggs during the winter.

For the American Bee Journal.

Wax and Comb Foundation.

HOWARD U. ACKERMAN.

The increasing demand for wax, caused principally by the large quantity used annually in making comb foundation, has naturally increased the price of this useful commodity, and, of course, that of comb foundation as well, until the price of comb foundation has reached so high a figure that many bee keepers are debating whether they can afford to use it during the coming season.

There certainly is a point, beyond which the use of foundation will cease to be profitable to the average apiarist; but whether that price has yet been reached, can best be decided by bee-keepers whose experience covers a greater length of time than my own. I mean by that, the use of full sheets of comb foundation, both in the brood-chamber and sections, for we could not well dispense with the use of comb foundation for starters, at any price; although it would be so much more desirable to use full sheets, especially in the brood-chamber, for by no other means can we secure such nice, straight, all-worker combs.

I think that it has been demonstrated that practical American apiarists cannot produce wax in any great quantity, even at the price at which it is now selling. Of course they can produce some wax, which would

otherwise go to waste, and in a year's time it amounts to thousands of pounds in the aggregate. But what I mean is, they cannot run an apiary exclusively for wax and make nearly so great a profit with wax at thirty-five cents per pound, as they can by running for honey and selling it at ten cents per pound. Am I not right?

Now, what should be done about this state of affairs? We must have comb foundation, and that, too, at a reasonable price, and, therefore, we must have wax which we confess we are unable to produce in sufficient quantities to meet the demand, even at the price which we all consider too high when we have to buy it. I think that the most reasonable thing to do is to look elsewhere, outside of our own country, for our future wax supply; for I am convinced that it can be produced in Europe at a much less cost than American bee-keepers can afford to produce it; and that we can import it at a much less cost than the present market price of wax.

If there is a duty on wax, I think the bee-keepers of this country should petition Congress to abolish that duty without delay.

I have often noticed that supply dealers announce in the bee-papers, that if the supply of wax was not equal to the demand, or if prices continued to advance, they would be compelled to import it. I do not know whether they have done so, but if they have, I should judge, not in sufficient quantities to affect the market here.

The value of the annual yield of honey in the whole empire of Russia is not far from \$4,000,000, or about 18,000 tons. To this must be added nearly 5,000 tons of wax worth \$2,000,000. This is about all consumed in Russia, the exports being very small.

Russia annually produces nearly 5 pounds of wax to every 18 pounds of honey. If American bee-keepers could do this, or even half as well, it is safe to say that we would have all the wax which we should require for comb foundation, or for other purposes, and yet have some to spare. It will also be seen that 5,000 tons of wax is valued at \$2,000,000 (20 cents per pound), or from 5 to 10 cents less than the market value of wax here; and that 18,000 tons of honey is valued at \$4,000,000, or a fraction over 11 cents per pound, and, as I suppose, this is comb honey. Who will doubt that Russian bee-keepers can produce both wax and honey at a less price than we can?

I should think that wax could be imported at a cost over the first price of not more than 5 or 6 cents, thus making the cost of it, delivered here, about 25 or 26 cents per pound, and, as it could be worked up into comb foundation for from 15 to 20 cents per pound, the foundation made from it could be sold from 40 to 50 cents per pound, a price at which every one could afford to buy in as large quantities as his necessities demanded. If it can be accomplished at the figures which I have given, it will be a boon to many bee-keepers.

North Indianapolis, © Ind.

SELECTIONS FROM OUR LETTER BOX

Small Honey Crop.

Our honey crop was small, being only about two-thirds of the average. Our principal source was the poplar; while it lasted, which was for three weeks, all the strong colonies stored from 30 to 100 pounds of honey, which I extracted. I had 26 colonies in the spring, and increased them to 54. I give them no attention, owing to sickness in my family, and the death of my father and my wife. I obtained 1,000 pounds of honey, mostly extracted.

J. A. P. FANCHER.

Fancher's Mills, © Tenn.

A Poor Season.

We have had a poor season here in Northeastern Kansas. The weather was too cool most of the time for the secretion of honey. I have increased 15 colonies to 23, and have secured 150 pounds of surplus comb honey. New colonies were built up by a liberal use of comb foundation, and the surplus honey is mostly in an unfinished condition, not being capped over, and has a rank taste. The colonies have reared no brood since Sept. 1, and consequently are weak in bees, and none are very heavy with honey, but I think that they have enough to last until they are set out in the spring, when those which need honey will be fed. I shall put them into the cellar as soon as the weather turns cold.

L. C. CLARK.

Granada, © Kans., Nov. 25, 1884.

Is Dodder a Destructive Plant?

Let me sound "a note of warning" in regard to that plant called "dodder," which was illustrated on page 755. I found a description and cut of this plant in a book called "Rays from the Realms of Nature," by Rev. James Neil, M. A. The cut is very similar to the one given in the BEE JOURNAL, and after speaking of other parasitic plants, he describes dodder as follows: "Another deadly English parasite is the curious "*Cuscuta*" or "dodder." It appears in the form of long filaments which attach themselves by means of suckers, to the stems of certain plants, around which they twine in a tangled mesh. They are at times as terrible a visitation as a flight of locusts, destroying whole crops of lucern clover and flax." Now, I am anxious to have new honey-producing plants introduced, but I think that we should know all about them, both the good and the bad qualities. The article on page 755, speaks of it being destructive to alfalfa only, but the above quotation says that it is also destructive to clover and flax, two of our very important crops. Let us leave it in California, if we cannot push it into the Pacific; we do not want it any nearer to us.

F. D. MITCHEL.

Paris, Ont., Dec. 1, 1884.

Bee-Keeping in Texas.

As far as I can ascertain, bees have done very poorly here this season. They swarmed but little, and stored very little surplus honey. I have recently purchased 9 colonies, which I have been Italianizing. I have kept bees on a small scale for 20 years, in Maine, and I think that I shall now go into bee-culture quite extensively. Texas honey is very inferior compared with Maine honey. I do not think that one-half of the colonies have honey enough to winter on. I have my doubts about this section being very good for bees, but the people say that in some years much honey is produced, although the last two years have been very poor ones. Bee-keepers lose many bees in the winter; some say that the bees freeze, while others attribute it to other causes. Here they have winds from the north in the winter, which they call "Northers." These winds make it very chilly, and they come so suddenly, that such may be the cause of the loss of many colonies. I would like to hear from some practical bee-keeper in Texas, what care is given their bees in winter, etc.

F. S. HARDING, Pres.

☞ There are a few general rules which beginners should adhere to closely in the handling of bees, first among which is in regard to the use of smoke. If they fail to do this, as many do, they should not grumble at the result. If in after time one prefers to take the chances of being stung, rather than to go to the bother of lighting up the smoker, he only chooses what he considers the least of two evils, trouble or pain.—*Exch.*

☞ Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

☞ To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as arc answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares — therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Keeping Bees on Shares.

Will Mr. Heddon please give his opinion on taking bees on the shares, or on what condition bees are generally let? One man offered me 100 colonies, last spring, on the following conditions: I was to take the 100 colonies and buy 100 new hives complete for \$4 each, for the swarms, and I was to receive half of the honey and half of the swarms; and in the fall he was to take the 100 colonies which he let me have in the spring, half of the honey, and half of the swarms, making the new hives cost me \$8 each. I proposed to take his bees in this way: I was to take the 100 colonies in the spring on the same conditions as above, except that he was to furnish half of the hives and I the other half. T. W. DOUGHERTY, Princeton, ♂ Ill., Nov. 24, 1884.

ANSWER.—Perhaps I can do no better than to repeat what I wrote on this subject in last year's BEE JOURNAL, and then Mr. D. can judge which of his two terms I consider the correct one: The "Bees on Shares" question, is one that I have studied considerably. In answering the above, I do so with a prejudice in favor of the laborer vs. the capitalist. a principle herein involved, though on ever so small a scale. Here are two facts:

1. Bees are to some considerable extent a risky property; their life and the amount of their stores being an unknown quantity. One should have a larger per cent. of income from such property by three or four fold, than from a good, safe real estate mortgage.

2. On the other hand, the laborer should have an average income in advance of the "going wages." All this can be realized from the manipulation of bees, provided the bees are in proper hives, in a good location, and the work done by a faithful and learned man, and directed by experience and tact.

I will lay down the following terms as those which seem to me the nearest to being just, and the best adapted to both parties:

The one owning the bees shall furnish the place to establish the apiary. He shall furnish all the fix-

tures in every respect. The laborer shall furnish himself, nothing more.

"The laziest tramp can turn and mend,
And be a man 'for a' that."

The capitalist furnishes bees, apiary, tools, new hives for increase, comb foundation for surplus and brood departments, in full sheets; sections, shipping crates and everything, including his riper experience (which, it is supposable, he possesses). He shall have the diction of the general plan of management, while the renter does all the work, and is dictator of the detail manipulation. The division shall be as follows: Each party shall have one-half of the surplus honey, and when it is sold, each one shall pay one-half of the cost of sections, shipping crates and surplus comb foundation that is sold with that season's crop. The capitalist shall have diction over the whole crop, merely dividing the money for the same, unless the laborer give security for the payment of his half of the sections, foundation and crates, when the honey may be divided, and each sell his own as he chooses. The bees should be managed for securing the greatest amount of surplus possible, and discouraged from swarming, all that such management tends to do, but when they do swarm, they are to be hived and managed as are the old colonies. The increase belongs to the apiary, always; and any system that gives a share of the increase to the laborer, will defeat itself, and prove in the end damaging to both parties. The old system of half the honey and half the increase, and the lessee or laborer furnish everything, is illy adapted to modern apiculture, and would give the capitalist "the lion's share." Of course the surplus from the increase is divided equally, the same as that from the old colonies. All the reasons for settling on the above terms as the nearest just and best, all around, are too many for this department.

Convention Notices.

The annual meeting of the Michigan State Bee-Keepers' Association will occur in Lansing, Mich., in the Senate Chamber of the State Capitol, Dec. 10 and 11, 1884, first session beginning at 10 a. m. on Dec. 10. This being the home of Prof. A. J. Cook, and the location of the State Agricultural College, it is expected that this will be the most interesting meeting ever held by this Society. A programme is being prepared, including several very important and interesting papers from Prof. Cook, T. J. Burrill, Dr. Beal, and R. L. Hewett, and several prominent apiarists from other States. A large delegation is expected from Canada. The question-box will be one of the important features. Come prepared to ask and answer questions. Reduced rates on all Michigan railroads, and at hotels in Lansing. The President and Secretary will be at the Hudson House. Notify me as soon as possible how many railroad certificates you will want, and over what road you will go,

so I will have time to procure them. A cordial invitation is extended to all. Please come and bring your bee-keeping friends with you.

H. D. CUTTING, Sec.

The sixteenth annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 21, 22 and 23 of January, 1885. The executive committee are determined to maintain the high standing and enviable reputation which the Association has justly gained in the past, and at the coming convention they propose to outdo all former efforts. The meeting will surely be the largest and most interesting ever held in America. No bee-keeper can afford to stay at home. All are invited. All implements of the apiary sent to the Secretary, will be properly arrayed to compare favorably with others on exhibition, and will be disposed of or returned, as the owner directs. Reduced rates for board at hotels.

GEO. W. HOUSE, Sec.

L. C. ROOT, Pres.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

The annual meeting of the Northeastern Kansas Bee-Keepers' Association will be held in the Court House at Hiawatha, Kans., on Friday, Dec. 12, 1884. An invitation is extended to every one interested in bee-culture.

L. C. CLARK, Sec.

The Hancock County, O., Bee-Keepers' Association meets in the Court House at Findlay, Ohio, at 10 a. m., on Saturday, Dec. 13, 1884.

SAM'L. H. BOLTON, Sec.

P. A. RIEGLE, Pres.

The regular annual meeting of the Indiana State Bee-Keepers' Association will be held on Thursday and Friday, Jan. 22 and 23, 1885. The meetings will be conducted in the rooms of the State Board of Agriculture, on the corner of Tennessee and Market Streets, in Indianapolis, Ind. It is proposed to make this the most important and interesting meeting of bee-keepers ever held in the State. An extensive programme, including all questions of importance to bee-keepers, is being prepared and will be soon sent out to bee-keepers throughout the State. Prominent apiarists from neighboring States have been invited to assist and presumably many of them will be in attendance during the meeting. These gatherings are of vast importance, especially to beginners, and all those at all interested in this important industry should make it a point to attend this meeting.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

- \$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.
- \$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows :

- For 50 colonies (120 pages).....\$1 00
- “ 100 colonies (220 pages)..... 1 25
- “ 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide - awake honey producers should get the Leaflets “Why eat Honey” (only 50 cents per 100), or else the pamphlets on “Honey as Food and Medicine,” and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for “Honey as Food and Medicine” are as follows :

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, “Presented by,” etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of “Honey as Food and Medicine” to every one who buys a package of honey, will sell almost any quantity of it.

Our rates for two or more copies of the book, “Bees and Honey,” may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased “to sell again.” The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

To all new subscribers who send us \$2 for the Weekly BEE JOURNAL next year, we will send the rest of the numbers of this year free from the time the subscription is received at this office.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a.m., Dec. 8, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour :

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15¢@16¢ is the best price obtainable for a fancy article of comb-honey in frames. Some lots bring from 14 to 15¢ when in good order. Stock of comb-honey is not large at present. Extracted, 7¢@8¢ for new.

BEESWAX.—For fair to yellow, 28¢@30¢.
K. A. BURNETT, 161 South Water St.

NEW YORK.

HONEY.—The market is well stocked with honey which is in good demand at the following prices: Fancy white comb in 1-lb. sections, 18¢@20¢; the same in 2-lb. sections, 14¢@15¢; fair to good white comb in 1 and 2-lb. sections, 12¢@13¢; fancy buckwheat comb in 1-lb. sections, 12¢@13¢; same in 2-lb. sections, 11¢@12¢; ordinary buckwheat comb in 2-lb. sections, 9¢@10¢. Extracted, white clover in kegs or small barrels, 6½¢@8¢.

BEESWAX.—Prime yellow, 30¢@31¢.
MCCAUL & HILDRETH, 34 Hudson St.

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as dime, ¼-lb., 1-lb., and 2-lb. jars, from the retail trade. Prices are low as arrivals exceed the demand. Extracted honey brings 5¢@6¢ on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15¢@16¢ in the jobbing way. We have several small lots of dark comb-honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb, without finding a buyer. Dealers most certainly mislead producers by quoting buckwheat and popular comb-honey, if they are not more successful than we are in disposing of the same.

BEESWAX.—The demand is slow and arrivals are few. Good yellow brings 26¢@27¢ on arrival.
C. F. MUTH, Freeman & Central Ave.

SAN FRANCISCO.

HONEY.—Demand is not active, and is confined almost wholly to best qualities. Prices remain unchanged. A vessel having 383,545 pounds on board sailed for Liverpool, England, this week. White to extra white comb, 9¢@10¢; dark to good, 6¢@8¢. Extracted, choice to extra white, 4¢@5¢; dark and caudied, 2½¢@3½¢.

BEESWAX.—Wholesale, 24¢@27¢.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12¢@14¢ per lb., and strained and extracted 6¢@6½¢.

BEESWAX.—Firm at 32¢@32½¢ for choice.
W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at 15¢, with an occasional sale at 16¢; 1½ and 2-lb. sections, best white, 14¢; dark and second quality, rather slow at 12 to 14¢. For extracted there is no demand.

BEESWAX.—28¢.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13¢@14¢; extracted, 6½¢.
GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, ½-lb. sections, none in the market. They would bring 18¢; 1-lbs., 14¢@16¢; 2-lbs., 13¢@14¢. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10¢. Extracted, California, 6¢@7¢; white clover, 7¢@8¢; Southern, 5½¢@6¢.

BEESWAX.—None in the market.
CLEMONS, CLOON & Co.
Successors to Jerome Twichell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18¢@20¢; 2-lb., 16¢@18¢. Extracted, 8¢@9¢. Unglazed sections sell best.

BEESWAX.—35¢.
BLAKE & RIPLEY, 57 Chatham Street.

Premium for Club of 10 Subscribers.

The book for every farmer is the one entitled "Affleck's Farmer's and Planter's Record and Account Book," in which there is the most systematic, complete and convenient arrangement of headings for every Farm Account and memoranda of all important events which may occur in connection with his business. Every progressive farmer certainly desires to make a success of his occupation, and should adopt every possible means of bringing about that result. He, then, should have a correct knowledge of his entire business, which he can have only by keeping a correct account of every crop produced on his farm, the cost of production of all his live stock and an itemized account of all his expenses. Then at the close of the year, when he takes off his balance sheet, which is admirably arranged in the book above referred to, he will be able to see at a glance whether his farm does or does not pay.

This valuable book contains 166 pages, is nicely printed on writing paper, ruled and bound, and the price is \$3.00. It can be sent by mail for 24 cents extra.

We can supply these books at the publisher's price, or will make a present of one copy for every club of TEN subscribers to the Weekly BEE JOURNAL for one year, with \$20. Four subscribers to the Monthly will count the same as one for the Weekly.

Now is the time to get up Clubs. Who will work for a copy of this valuable book?

The new Monthly for January will be issued next week, and the many sample copies already ordered will then be sent. We send samples free to all who wish them, or desire to get up Clubs. Now is the time to work for the Cash premiums we offer. A large club for the Monthly can be gotten up in almost every locality.

Supply dealers who wish their advertisements to appear in the January number of the Monthly BEE JOURNAL should send the copy to this office immediately. It will have a large circulation among those who now take no bee paper, as sample copies, in addition to its regular subscribers.

For two subscribers for the Weekly BEE JOURNAL (or 8 for the Monthly) for one year, we will present a Pocket Dictionary, and send it by mail postpaid.

DRAKE & SMITH,
Successors to A. E. Maonm, Bristol, Vermont,
MANUFACTURERS OF
BEE-KEEPERS' SUPPLIES,
Hives, Sections, Shipping Crates, &c.

White Poplar Sections a specialty in quality and accuracy. Send for Illustrated Catalogue and Price List. 50A12T

SEND FOR IT.

We have just issued a new four-page circular that will interest any bee-keeper. Send your name on a postal card for it. 44Atf HENRY ALLEY, Wenham, Mass. Canadian Farmer.

A Christmas Present.

To every person who sends us one NEW subscription, (besides his own renewal), for one year, for the Weekly BEE JOURNAL, or 4 NEW Monthly subscribers, for a year, we will send as a present, by mail, postpaid, a copy of "Mistletoe Memories, or What the Poets say about Christmas."

It comprises a collection of poems selected from the writings of H. W. Longfellow, J. G. Whittier, Thomas Hood, Alfred Domett, Chas. Mackay, Sir Walter Scott, Jennie Joy, and others. The whole bound in Banner shape, with rich silk fringe and tassels. For presentation, this art souvenir is vastly superior to a mere Christmas card, as it combines the advantages of both art and literature. Size, 4 by 6 1/2 inches.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Bee-Keepers' Badges at Fairs.

We have some ELEGANT RIBBON BADGES, having a rosette and gold Bee, for bee-keepers' use at Fairs, Conventions, etc. Price 50 cents each, by mail, postpaid.

Address, **THOMAS G. NEWMAN,**
925 West Madison St., CHICAGO, ILL.

SYSTEMATIC AND CONVENIENT.

DAVIS' PATENT HONEY CARRIAGE,
REVOLVING COMB-HANGER,
Tool Box and Recording Desk Combined.
Price, complete, only \$18.00.
For sale by **ALFRED H. NEWMAN,**
923 West Madison Street, CHICAGO, ILL.

Dadant's Foundation Factory, wholesale and retail. See Advertisement in another column.

"BOSS" ONE-PIECE SECTIONS.

READ THIS.

A word of explanation in regard to the infringement suit on the One-Piece Section, we deem necessary at this time.

I commenced suit against A. I. Root, in the United States Circuit Court, for the Northern district of Ohio; Stanley Matthews presiding. He decided that the patent was void for want of novelty. I have taken an appeal to the United States Supreme Court at Washington, which will decide the case, and its decision will be final. If it goes against me I will submit, but if decided in my favor, I shall expect all who have infringed will pay me damages from date of the patent.

Some unprincipled parties are advertising that the Courts have decided that the patent is void. This is not the case, as it is before the United States Supreme Court at Washington, at the present time. When that Court gives its opinion it will be final, and until it does, any one infringing will be liable for damages, if the United States Supreme Court sustains the patent.

PRICES OF SECTIONS.

| | |
|--|--------|
| One-lb. Sections in lots of 500 to 4,000 | \$5.00 |
| Ditto Ditto 5,000 to 10,000 | 4.75 |
| Ditto Ditto 10,000 to 25,000 | 4.50 |
| Ditto Ditto 25,000 to 50,000 | 4.25 |
| Ditto Ditto 100,000 or more | 4.00 |

The one-lb. Section is 17 inches long. For any sizes between 17 and 20 inches in length, add 5 per cent. For any sizes between 20 and 24 inches, add 10 per cent. Add the above per centage to the price of one-lb. Sections in the same quantity.

BY B. J. KENDALL, M. D.

A TREATISE giving an index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

1868. 1884.
HEDDON'S
COLUMN.

WAX ON SHARES,

For Comb Foundation for 1885.

Why not send me your Wax
NOW

to be made into the best Given Foundation on shares, or at a low cash price per pound for making, during the less-hurried winter months.

If you have no wax, perhaps your store-keepers have, and it will pay you to buy and ship to me.

Write and get my present low terms. I pay highest market price in
CASH FOR WAX.

Apiary for Sale.

I offer for sale one of the best apiaries and very choicest location in Southern Michigan.

No other bees kept in the field. House, barn and honey-house, good cellar, cistern, and two wells; high-board fence all on 1/2 acre of ground in a small village, 6 miles from here, on this M. C. R. R. Depot, freight, express and telegraph offices, saw-mill, store and blacksmith shop only 25 rods distant.

Here we have three surplus honey crops: First, from white clover; second, from basswood; third, from myriads of fall flowers.

I will give my purchaser a splendid opportunity to gain a good home, and choice honey location. I will sell with it any number of colonies of bees and apiarian fixtures wanted, the outfit being either for comb or extracted honey as desired; or I will sell only the home and permanent fixtures, and furnish a large number of colonies on shares till the purchaser thus gains stock of his own. Hives and fixtures of my latest improved patterns. Write me for prices, terms, etc.

HIVES IN THE FLAT,

OR MADE UP COMPLETE,

Either for Comb or Extracted Honey, cheaper than many can procure material at home. Write for special prices in quantity, and state the number wanted.

Address,

JAMES HEDDON,
DOWAGIAC, Cass County MICH.

Prices Reduced.

Owing to a decline in the price of Beeswax there will, hereafter, be a reduction of **5 cents per pound** on all orders for Comb Foundation.

OLDEST BEE PAPER
IN AMERICA

ESTABLISHED
IN 1861

THE WEEKLY

BEE JOURNAL

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN
1861.

Chicago, Ill., December 17, 1884.

VOL. XX.—No. 51.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time.

Club Rates for the Weekly are: \$3.80 for two copies to the same or different post-offices; \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money, sent as above described, is at our risk, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar; or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

ADVERTISING RATES.

20 cents per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will admit about 7 words. ONE INCH will contain TWELVE lines.

Transient Advertisements must be paid for in advance.

Editorial Notices will be inserted at the rate of 50 cents per line.

Time Discounts on advertisements will be made as follows: On 10 lines and upward, 3 insertions, 5 ¢ cent.; 6 insertions, 10 ¢ cent.; 9 insertions, 15 ¢ cent.; 12 insertions, 20 ¢ cent.; 26 insertions, 25 ¢ cent.; 52 insertions, 40 ¢ cent.

On 50 lines and upward, 1 time, 5 ¢ cent.; 3 insertions, 10 ¢ cent.; 6 insertions, 15 ¢ cent.; 9 insertions, 20 ¢ cent.; 12 insertions, 25 ¢ cent.; 26 insertions, 30 ¢ cent.; 52 insertions, 50 ¢ cent.

On 100 lines and upward, 1 time, 10 ¢ cent.; 3 insertions, 15 ¢ cent.; 6 insertions, 20 ¢ cent.; 9 insertions, 25 ¢ cent.; 12 insertions, 30 ¢ cent.; 26 insertions, 40 ¢ cent.; 52 insertions, 60 ¢ cent.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe.—Weekly, 50 cents; Monthly, 10 cents. To Australia.—Weekly, \$1; Monthly, 20 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable Manual of the Apiary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

- Doctor smoker (wide shield) .3 1/2 inch. \$2.00
- Conqueror smoker (wide shield) 3 " " 1.75
- Large smoker (wide shield) 2 1/2 " " 1.50

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects: Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quitting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.55; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the English or German edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey! by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANOSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY AILEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either English or German.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote. Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Emerson Binders, made especially for the BEE JOURNAL, and lettered in gold on the back. 75c. for the Weekly; or for the Monthly, 50c. They cannot be sent by mail to Canada.

Constitution and By-Laws, for local Associations, \$2 per 100. The name of the Association printed in the blanks 50c. extra.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, 10c. each, or \$8 per 100.

Poulterer's Guide, for treating diseases of Poultry, etc., by C. J. WARD. Price 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., DECEMBER 17, 1884.

No. 51.

THE AMERICAN BEE JOURNAL

Published every Wednesday, by

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

This being No. 51, one number more will close the Volume of the Weekly BEE JOURNAL for 1884. Nearly all of the subscriptions will run out in a few days and we would respectfully request such readers and patrons to sit down as soon as this article is read and send us the renewal of his or her subscription for 1885, and thus prevent the loss of a number and the consequent pleasure of the weekly feast it presents.

The Elements of Success.

The *Prairie Farmer* well says that "if a person would reach the very highest success in horticulture, he must love trees and plants. Must love to look at them, to inquire into their wants and requirements, and to administer to their wants as living things. If a man loves a tree for its beauty, for its shade, for its fruit, and for its company, and loves to study varieties of fruits and habits of plants and trees, then he has the first rudimentary qualifications of a tree and fruit raiser, and may enter on work with assurance of success."

The same rule will apply to apiculture. A person who would succeed, should love the bees and their products; must love to look at them, ascertain their requirements, and administer to their wants. No others can expect to succeed. Though it is not essential that a person should enjoy the eating of honey, it is still desirable that such should be the case—for some human stomachs will not endure its sweetness. In such cases, however, a glass of sweet milk drunk after eating the honey will usually cause a pleasant condition of

the system generally, and add to the health of the person using it.

If one loves the honey-bee for its docility and beauty, for its pleasant hum and sporting flight, for its industry and work, for its architectural skill and indomitable energy, then the first-principles of a bee-keeper presents themselves, and such may safely proceed, expecting ultimate success.

In this, as in all other departments of business, it is only the careful and practical that may hope to succeed. Nature has provided the health-giving delicious nectar in myriads of beautiful flowers, which deck forest, field and garden, and developed the bees to gather this abundant sweetness and store it in quantities far exceeding their wants—providing an opportunity for man to step in and second the efforts of Nature and the bees, and utilize the surplus honey for his pleasure and sustenance.

Bees and flowers are so closely allied, so dependent the one on the other, that we may well love both. What is there in all the Creation so soul-inspiring as a cultivated garden of Nature's flowers of variegated hues and heavenly grandeur? None but the unfortunate or despondent can fail to enjoy Nature in her garb of beauty, decked by the bounteous hand of Deity!

To produce a garden of living gorgeousness, we may all aspire and long enjoy its gratifying results. We may as well become enthusiasts upon bees and flowers, for apiculture and horticulture go hand-in-hand.

Before Vennor died, he had completed the manuscript of his almanac for 1885, which has just been issued. In his general forecast he says: "We are in a moist period, which will continue for two years, extending over the northern and middle States and Canada." The fall of 1884, he predicted, would be very open. He also predicted an unusually green Christmas and a mild New Year.

We have received 10 large quarto volumes of the "Tenth Census of the United States," and shall publish in the BEE JOURNAL for next week, the statistics therein given on honey and wax for all the States and Territories. The census gives no statistics on bees—or at least we have not been able, so far, to find any. We will give a thorough examination and report them, if any are found. The Secretary of the Interior has our thanks for forwarding these volumes, which our visitors can examine at their pleasure, if they so request. Their weight is about 75 pounds, and they were received by mail.

The next issue of the Weekly BEE JOURNAL is No. 52, and concludes the Volume for 1884. On account of the great labor on the Indexes, it will be *two days later than usual*. Our subscribers will please take due notice, and not expect it before that time.

Catalogues for 1885.—We have received the following:

Drake & Smith, Bristol, Vt.
C. W. Costellow, Waterborough, Me.
J. E. Pryor, Dexter, Iowa.
C. M. Goodspeed, Thorn Hill, N. Y.
T. A. Pool, Greensburg, Ind.

We have received a copy of the Greenwood, Neb., *Hawkeye* which contains the following notice of the "Greenwood Apiary" owned by Mr. M. L. Trester:

The apiary is situated in the west part of the town, and has an admirable location. The proprietor has 206 colonies of Italian and hybrid bees. He has erected a large and commodious extracting establishment, and has a yearly capacity of 20,000 pounds of extracted honey. The honey is of the finest and best, is strictly pure and free from adulterations. The proprietor keeps on hand at all times plenty of good, pure honey, which can be had at reasonable rates. The apiary has been visited by some of the leading bee-men of the State, and all say unhesitatingly that Greenwood takes the cake from them all.

ALFILLARILLA, OR FILAREE, A California Honey-Plant.

Our California correspondent, W. A. Pryal, writes us as follows concerning this honey-plant:

The alfillarilla is an *Erodium*, and two species grow in California, viz: *E. circularium* and *E. muschatum*; they

Its growth is rapid, and by the first of December many of the plants may be found in bloom, and if the season continues favorable, they will be a foot or more in height by the middle of February. Damp and cold weather retard its growth and prevent its

belong to or are a form of "erane's-bill." The seed-pods, seed and parts thereof are quite odd, very much like those of the geranium. The early fall rains which usually commence early in October are just sufficient to start the sharp-pointed and spiral-tailed seed of the filaree, as it is commonly called, into existence. The genial sunny weather which follows these showers, and which weather is considered the finest California can boast of, causes the plant to spring up at once into vigorous life, as if by magic.

blooming for some weeks beyond its usual time. On cultivated soil it grows very rank; while on hill and pasture lands it rarely attains the height of four inches, and it is of a trailing habit, while that on fertile soil is tall and robust. From my observations I believe that the honey from *Erodium muschatum* has not that "rankish" taste as has *Erodium circularium*, but the former is more "musky." The engraving, Fig. 1, shows the general form of the plant; Fig. 2, part of the flower stalk, showing flowers, seed-pods, and the seed

ready to fall to the ground; and Fig. 3, a leaf.

ITS HONEY QUALITIES.—Honey obtained from these plants candies shortly after being taken from the combs. Its chief value is that its greatest flow of honey comes at a time when honey is much needed for stimulating the queen to greater exertions in laying. The flow of honey is enormous while it lasts, and the bees soon fill the lower part of the hive with it. Its time of blooming, to any consequence, is about Feb. 15, or a little later, and often so continues until the latter part of April. Like all California honey gathered during the winter months and early spring, it is of a pretty dark color.

AS FOOD FOR STOCK.—It is one of our "best weeds," for such it is, though not a noxious one, as it is easy to eradicate. Horses, cattle and swine are quite fond of it. Its fattening qualities appear to be excellent. Milk obtained from cows which have grazed on pastures where *Erodium muschatum* grows, has a musky flavor—so much so that many people are loth to drink it.

The plants withstand our severest winters, and possibly may be introduced into other States. It is our earliest honey source, and all honey gathered from it is consumed by the bees in brood-rearing, so whatever bad qualities it has are not detrimental to the apiarist.

Besides the names which I have mentioned, it has other common names among our people, the principal one being "pin-weed," and by referring to the engraving, one can perceive why it is so called. It grows everywhere, in the highway, the garden, back door-yard, in the valley and on the hill-top, on high, dry and low ground.

The regular annual meeting of the Indiana State Bee-Keepers' Association will be held on Thursday and Friday, Jan. 22 and 23, 1885. The meetings will be conducted in the rooms of the State Board of Agriculture, on the corner of Tennessee and Market Streets, in Indianapolis, Ind. It is proposed to make this the most important and interesting meeting of bee-keepers ever held in the State. An extensive programme, including all questions of importance to bee-keepers, is being prepared and will be soon sent out to bee-keepers throughout the State. Prominent apiarists from neighboring States have been invited to assist and presumably many of them will be in attendance during the meeting. These gatherings are of vast importance, especially to beginners, and all those at all interested in this important industry should make it a point to attend this meeting.

FRANK L. DOUGHERTY, Sec.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

Bee-Keeping in India.

Bee-keeping in India, which appears to be one of the lost arts, has now found a champion in Mr. John Douglas, of the Indian Telegraph Department, says the London *Post*. Apiculture may yet become a happy resource to the indigent population of India, both as adding another article to their dietary and as eking out their scanty means. In some districts wild honey is said to be eagerly sought after by the native population as an article of food, an offering to the gods, and a soothing syrup for fractious infancy.

The first question for Indian apiculturists is the domestication of the great tiger honey-fly. The choicest honey is produced by this ferocious insect with a villainous sting, named in different parts of the country Bhowara, Bhanwar, Bhaur, and great tiger honey-fly; but the most worthless sort is obtained from an amiable little insect about a quarter of the size of a common house-fly, which offers no objection to being observed, possibly aware that the intruder will obtain very inadequate compensation for his trouble. This species usually builds low down near the ground, under stones or in the clefts of trees; its nest is sought after by children, who eat up honey, comb, and grub on the spot, the bee meantime accepting the situation with true Asiatic philosophy.

Far different is the fate of him who ventures to disturb the Bhowara bee, which attacks the traveler on the slightest provocation, and very often strikes on the principle that prevention is better than cure. A swarm of these bees have been known to put a regiment of cavalry to flight, and innumerable are the instances in which man and beast have fallen victims to their unrelenting animosity. They build their nests on ledges of rock in steep and inaccessible places, and to obtain their honey, which is said to rival in flavor the celebrated honey of Mount Hymettus, the native hunter has to exercise much caution and dexterity.

The hunter of these bees waits for a dark night, and starts forth after 9 p. m. Having selected the spot he intends to rifle, he prepares to reach it either from above or below, according as seems most feasible; should he ascend he does so by means of a ladder; should he decide to descend, a number of thin, green bamboos are spliced together with fibre and let down over the face of the precipice. One end is fastened to a tree or stake driven into the ground, and over this the brother-in-law of the descending man keeps watch. This particular relative is chosen as being the least likely to favor foul play, since on him, in case of accident, would devolve the care of the widow and children. The man takes down with him a basket, a knife, and a bunch of dried grass, to which he sets fire on arriving opposite the nests. The bees, aroused by the

glare, desert the combs in thousands, but they are too stupefied by the smoke to do anything but buzz aimlessly about, alighting on the rocks and branches, and even on the person of the hunter himself, without attempting to sting. The comb is cut away and dropped into the basket, which, when full, is pulled up by those above. Some of the hunters who draw honey in the daytime rub themselves with the juice of a plant the aroma of which bees cannot endure; for these insects have very sensitive organs of smell, and it would appear that the capricious likes and dislikes they show for different persons depend on their olfactory nerves. It is well known that some people can handle bees with impunity, while others dare not venture within 50 yards of them. The acuteness of this one organ is, however, counterbalanced by their total deafness.

Since Virgil wrote the Fourth *Georgic*, his recommendation has been followed not to have the hives too near the dwelling house, lest the presence of man should disturb the bees' peace of mind; but the Kashmir peasant builds his hives actually in his house, and with the best possible results. Round, tubular cavities are left in the walls, extending right through from the inside to the outer air. They are lined with mortar worked up with the down of thistles. The ends of the tubes are closed with platters of red earthenware, the outer platter having a circular hole in its centre to enable the bees to pass in and out. When the time for taking the honey arrives, the house-father removes the inner platter, and lighting a wisp of straw blows the smoke into the hive; this causes the bees to rush precipitately towards the outlet, and enables the man to cut away the comb with a knife. Enough is left hanging round the further end of the hive to encourage the swarm to return and begin their labors again.

In "Moorcraft's Travels" we find his observations on bee-culture in the Himalayas as follows:

"In most villages of the northern range of the Himalayas, bees are kept, and honey, the produce of the wild or domesticated bee, is an article of sale. It is commonly sold in the bazaar at from four to six seers for a rupee, and, although, not much thicker than syrup, is of a flavor equal to Narbonne and less cloying to the stomach. There is no great demand for wax, otherwise this might also be plentifully supplied. At present the comb, after the honey is compressed, is thrown away. The domestic bee is known by the name of mahru, mohri, and mari. It is not much above half the size of that of Europe, but it is very industrious and mild tempered. The wild bee is termed bhaonra, a name by which the people of the plains designate the humble-bee, but is not half the bulk of that insect, though larger than the domestic bee of Europe. It is of a darker color generally, and has longer and broader wings. Its temper is irascible, and sting, venomous. It commonly builds

its nest under projecting ledges of rock, overhanging, steep, mural precipices, in a situation almost inaccessible to bears and men. The hive contains a large quantity of both wax and honey. The latter, if gathered before the month of Bhadra, is fully equal to that of the domestic bee, but in that and the following months is said to produce intoxication followed by stupefaction. The effect is with some probability ascribed to the bees working on the flower of a species of aconite, which is in bloom in Bhadra and Asharh, and which, growing high up the mountain, is beyond the flight of the domestic bee."

That the virtues of the honey depend on the particular pasturage the bee has found, is well known, and every school boy has read in Xenophon of the deleterious effects the honey of Trebizond had on the soldiers during the retreat of the Ten Thousand. Narbonne honey owes its peculiar excellence to the rosemary plant, and the best honey years in India are when the strobilanthes is in bloom. There are many species in this genus, and they flower once in seven or ten years, about the month of May. Immediately the flowers wither and fall off, the plant itself dies, a new crop afterwards springing up from the seed. This flower has a strong and sweet scent, and whenever it is in bloom colonies of bees migrate from all parts of the country to feast on the honey and to rear their young. At such times honey becomes plentiful and cheap, and is of the finest flavor.

☞ The sixteenth annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 21, 22 and 23 of January, 1885. The executive committee are determined to maintain the high standing and enviable reputation which the Association has justly gained in the past, and at the coming convention they propose to outdo all former efforts. The meeting will surely be the largest and most interesting ever held in America. No bee-keeper can afford to stay at home. All are invited. All implements of the apary sent to the Secretary, will be properly arrayed to compare favorably with others on exhibition, and will be disposed of or returned, as the owner directs. Reduced rates for board at hotels.

GEO. W. HOUSE, Sec.
L. C. ROOT, Pres.

☞ To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the *Monthly BEE JOURNAL* for one year at \$1.25 for the two.

CORRESPONDENCE

For the American Bee Journal.

Hibernation.—In Rhyme.

WM. F. CLARKE.

Rest,—busy little workers all,—
Through winter's dreary hours ;
Into a peaceful torpor fall,
And hoard your latent powers.

Your domicile is not a sieve
With air-drafts coursing through—
In such a house I could not live,
Neither, my pets, can you.

You are not buried in a pit.
A cellar, or a clamp ;
Never by ray of sunshine lit,—
Cheerless, and foul, and damp.

Your dwelling is a chaff-packed room
Raised above toads and mice,
Meant for a home, and not a tomb,
Propolized tight and nice.

A column of heaven's purest air
Beneath your cozy nest,
Your native instincts will prepare
To suit your moods of rest.

Whene'er Jack Frost relents his grip,
And there's a thawing day,
Rouse up ! a little honey sip,
And have a spell of play.

Dance on th' alighting-board a jig,
Or pirouette on high ;
No need to wallow, like a pig,
When you can have a fly !

Don't eat a bit of pollen, dears,
While you are on the frolic,
For, if you do, James Heddon fears
You'll die of bilious colic !

Your play-spell over, tightly hug
And cluster close together,
Then each can sleep, " snug as a bug,"
All through the coldest weather.

Soon blust'ring March will shake you up,
And whisper loud of spring :
Your master, then, a little cup
Of sweet, will to you bring.

The queen, her sleepy head will scratch,
And take the hint to lay,
Then you must seek the willow-patch
Upon the first fine day.

With catkin pollen feed the brood
And nurse them up to strength,
Till nectar from the maple-wood,
Rewards your search at length.

Then, as the hive grows populous
With vigorous young bees,
Each of you, without " muss or fuss,"
Depart this life in peace.

Your course complete—your work well
done—

Die without pain or fear :
And thus your history will run,
" ESCAPED THE DIARRHŒA ! "

Speedside, Ont.

The Union Bee-Keepers' Association of Western Iowa will meet in Stuart, Iowa, at 10 a. m. on Saturday, Dec. 27, 1884. All who are interested are invited to attend.

M. E. DARBY, Sec.

The Willamette Valley Bee-Keepers' Association will hold its second meeting at La Fayette, Oregon, on the third Tuesday in June, 1885. All who are interested are invited to attend.

Few Uncapped Sections in the Fall.

G. M. DOOLITTLE, 40—80.

How to manage our bees so as to secure the greatest yield of comb honey, is a question of great importance to all those who are engaged in producing such honey for market, hence we often have articles on this topic giving us instruction regarding it. But comb honey is of little value unless thoroughly sealed or capped over; and from the reports which I get telling of *much* unsealed honey, it would seem that, "How to manage our bees so as to have few uncapped sections in the fall," is a question of nearly as much importance as the first; yet it is one about which very little is said in print.

For years I was troubled by having from $\frac{1}{4}$ to $\frac{1}{2}$ of the combs in the sections not fully sealed at the close of the honey harvest, which were only salable at a reduced price; but of late I have very few of such even in a poor season. After experimenting for a year or two regarding the matter, I became convinced that the cause of the trouble was in giving the bees too many sections, and especially conducive to this was the plan of tiering-up sections late in the season. How often have I, years ago, spoiled a promise of an abundant yield of comb honey by tiering-up four or five days before the honey harvest closed!

To tier-up sections profitably requires considerable tact, and especially do we want a thorough knowledge of the honey resources of the field which we occupy. I think that there is too much injudicious talk in some of our bee-papers regarding our not allowing the bees under any circumstances to cluster on the outside of the hive, the idea being generally conveyed that when bees thus cluster out they need more room.

Now, it depends upon when this clustering out occurs, whether more room is needed or not; and hence I said "injudicious talk." If the clustering out occurs at the commencement, or in the height of the honey harvest, then more room should be given; while if at the latter part of the honey harvest, or in a time of honey dearth, no more room is needed; for more room at this time results in one case in many unfinished sections, and in the other to an absolute waste of time used in enlarging the hive. To illustrate: During the past season we had a day and a half of good honey secretion, a little past the middle of the basswood bloom. As, at this time, I had on each live section room of only about 20 pounds capacity, the bees began to be crowded out; and hoping that the weather might yet be favorable for a week or more, I spread the sections on a few hives by placing some empty ones between those nearly full, giving at most only about 35 pounds capacity, while when all is favorable, I use 60 pounds capacity. The result was that the bees immediately took possession of the empty sections, while

the weather turned unfavorable again, and when the season was over, I got no more than 5 to 10 pounds of capped honey from these hives, while those not touched gave 20 pounds of nice, capped honey. In this case the bad weather was the cause, for the spreading was seasonable, but in former years I had been the cause by spreading or tiering-up but a few days before the honey harvest closed.

Again, after the basswood bloom had failed, there came on a very hot spell when not a bit of honey was to be obtained, and the result was that the fronts of my hives were black with bees. According to the advice above alluded to, I should have given more room, and if the bees then persisted in clustering out, I must take my smoker and smoke each colony until they all went in and staid there. Nonsense! At such times the bees are doing just as much for the benefit of the apiarist, hanging on the outside of the hive, as anywhere.

But to return. My plan of operation to secure all capped sections is as follows: When the bees show, by building little bits of comb here and there about the hive, that they are ready for the sections, I put on sections to the amount of about 20 pounds, and leave them thus until the bees are well at work in them, when they are spread apart and about 10 pounds more of room given them. When this room is fully occupied, I give room at the sides of the hive of about 15 pounds capacity; and were I using the tiering-up plan I should have my surplus arrangement so arranged that at this time I could raise up about one-half of the sections already on, putting empty sections under them instead of raising up the whole 30 pounds, thus giving them more room, a little at a time, as the bees have need.

By the time the bees fully occupy the 15 pounds of room given at the sides, the first 20 pounds given them is ready to come off; and when this is taken off, the partly filled sections at the sides are raised by cases and put in the places of those which have been taken off, while empty sections are given at the sides, for from 15 to 30 pounds according to the size of the colony. Thus I keep taking off and putting on sections, taking the full from the top and putting the empty sections at the sides, until the season begins to draw toward its close, when as fast as those partially filled sections are taken from the sides to replace the full ones taken from the top, the side-spaces are closed up till all are on top. Then as fast as the sections are finished there, the top-space is contracted till only the original 20-pound space remains. In this way the bees are given all the space they really need, while the chance for many uncapped sections in the fall is quite small.

By a little study the tiering-up plan can be made to conform to the above, and worked on the same principle. I think that any plan which requires the tiering-up of from 30 to 40 pounds capacity, or the spreading out of the same number of pounds at one time,

is a wrong policy to adopt; while the giving of a small amount of surplus room as needed, seems to me to be a wise course to pursue. I now use a section $5\frac{3}{8} \times 3\frac{1}{2} \times 2$ inches, outside measure, and find that while it works to the best advantage in my hives, it also sells for fully as good a price in all of our Eastern markets as does the $4\frac{1}{2} \times 4\frac{1}{4}$ or one-pound section of honey.

Home-Made Honey-Extractor.

E. A. THOMAS.

While visiting a friend of mine in Massachusetts, I had the opportunity of seeing and testing his new honey-extractor, which, for rapidity and ease of manipulation I have never seen equaled. My friend is an excellent machinist, and made this extractor himself. While recognizing the fact that the cost of the machine will prevent its coming into general use, I am inclined to believe that it would be desirable for those who run their apiaries for extracted honey, and have considerable extracting to do. The following is a description of it, as near as I can give it:

The can, which is made of block-tin all in one piece, is 3 feet and 4 inches high and 23 inches in diameter; there is a space of 12 inches under the comb-basket, giving a storing capacity of about 200 pounds. The comb-basket is 18 inches deep and $14\frac{1}{2}$ inches square, and is attached to a shaft running in a standard in the centre of the can. The bearing is so arranged that no honey can get to it, and can, therefore, be kept well oiled. A reversible basket can be used if the operator so desires. Now I am coming to the part wherein it differs from all other extractors which I have ever seen. On the lower end of the shaft to which the basket is attached, is a beveled gear running in a corresponding one on a horizontal shaft extending from the centre under the can, to the circumference. Here, again, is another set of beveled gears, carrying the motion to an upright shaft running in boxes outside of the can. The upper end of this is geared to a 6-inch gear attached to the side of the can which has a handle for turning. The small gears are $1\frac{1}{2}$ inches in diameter, and the shafts are $\frac{5}{8}$ of an inch.

From the above description the reader will perceive that there is nothing on the top of the can over the comb-basket to interfere with the putting in and taking out of combs, or the removal of the basket for cleaning; also that the turning-wheel is upright, which gives a much easier and more natural movement than the round and round motion of a horizontal wheel. Perhaps the reader may think this is of but little consequence, but let him turn the extractor all day, as some have to do, and I think he will change his mind.

Notwithstanding the fact that the extractor is geared up so much, it is easier to run than any I ever saw.

This is due in part to the well-fitting bearings and the accuracy of construction. The whole machine is well and solidly built, and there is no shake whatever to the comb-basket. Only a slow motion of the turning-wheel is required to throw out the honey, and the comb-basket can be revolved very rapidly, if necessary, with an extra exertion on the part of the operator.

Another good thing about it is the rapidity with which it can be taken apart and put together. The comb-basket can be taken to pieces, every thing taken out, and all put together again in less than a minute.

Rural New Yorker.

The Hunting of Bee-Trees.

PROF. A. J. COOK.

I am requested to give directions for finding the haunts of bees in the forests. I gladly do this, though unless one wishes to hunt bees for the pleasure, only, it is a non-paying business. The time spent in finding the bees, the usual condition of the colony with crooked combs, and little honey, and the trouble to secure the bees, honey, and combs in such a state that they will be of value, together with the fact that the owner of the tree does not like to have his trees disturbed, even though he may give his consent, make this business as a business anything but desirable.

To understand bee-hunting, we have only to remember that bees like sweets, and are sure to find and to sip them; and that the bees, as soon as full, will circle about, as if to mark the locality, and then dart off straight toward the tree or hive where they are to store the nectar.

In late fall after bees have ceased to gather honey, we may soon attract them by burning an old piece of honey-comb; at other times they may be taken from the flowers. To "line" bees one should have a small box without a bottom, and with a movable glass top. This box should be six inches each way, and on one side there should be a shelf within, three or four inches wide on which a piece of comb may be laid. With this box and a bottle of water sweetened with honey, or sugar, one is prepared for operations. When a bee is discovered in the woods on a flower, the box is placed over it, and as soon as the bee commences to sip the sweet liquid which was turned into the empty cells of a comb previously fastened to the shelf in the box, the cover should be removed. The bee will soon fly, and must be watched carefully. After a few circles, each circle bending toward its home, the bee will dart off in that direction. Soon it will return with others, and as soon as the line is made certain, the hunter can go a few rods to one side and find another line, and of course where these lines meet will be the tree. If in the region of a bee keeper, one must be careful or the lines will take him to some one's hives, and his time will be lost. If no bees are found on

the flowers, then the bees can be attracted to the sweets in the box by burning the comb as suggested above.

When once found, it is better to climb up and cut the bees out rather than to fell the tree, if this is possible. A little smoke and the jarring will so frighten the bees that the danger from stings is very slight. It takes some experience to line bees quickly; but old bee-hunters will find bee-trees in a surprisingly short time. Agricultural College, ♀ Mich.

Queen-Excluding Honey-Boards.

W. Z. HUTCHINSON, 68—94.

Of late, quite a number of inquiries have come to me asking for information in regard to the Heddon skeleton or slat honey-board; and from the tone of many of them, it is evident that the writers regard this honey-board as queen-excluding. Such is not the case; Mr. Heddon has never claimed that they are. He says that they *discourage*, but do not *prevent* the queen from entering the surplus department; and so far as my experience goes, Mr. Heddon is correct.

Whether a queen-excluding honey-board is needed, depends upon the size and shape of the brood-nest, and the method of management. With a large brood apartment, and especially one which approaches a cube in shape, there is less inducement to the queen to invade the surplus department than with a flattened or small brood-nest. The advantages of a small, flat brood-nest are, that it is kept so full of brood that there is little room in it for honey, and the surplus department is brought so near the centre of the brood-nest that nearly all the honey is stored in the surplus department and sold for at least twice as much per pound as sugar will cost to feed the bees for winter. Sugar is a safer food for winter than honey; and it is *hoped* that these small brood-nests will be free from pollen upon the approach of winter.

With an ordinary eight-frame, Langstroth hived filled with combs, the queen has so seldom left the brood-nest when working for comb honey, that I should not care for a queen-excluding honey-board were it not for the swarms. Let a swarm be hived upon empty combs, and the queen will not go into the sections; but let it be hived upon empty frames, and let there be foundation or comb in the sections, and the queen will make a brood-nest of the surplus department; she will also do so if the brood-frames are filled with foundation, and the sections with comb. In working for extracted honey, the queen is *quite* likely to take up her field of labor in the surplus department.

I am strongly in favor of having the brood occupy one part of the hive, and the honey another, to a greater extent than has yet been generally accomplished; and to secure this result, I know of no better plan than to use a queen-excluding honey-board.

The objections to the perforated zinc for a queen-excluding honey-board are, first, its cost; second, its lack of rigidity. When first put on it does very well; but, of course, the bees stick it down and connect it by means of brace-combs, with the frames below, and when it is removed it is liable to be bent or kinked so that when again placed upon the hive the bee-spaces above and below the zinc are not perfect. Where the space becomes too small, the bees stick the zinc fast with propolis; where the space is too small, they build brace-combs.

To make the Heddon honey-board queen-excluding, I have placed the slats five-thirty-seconds of an inch apart, and such boards are a success; but the difficulty is in adjusting the spaces to a nicety, and keeping the slats in place. To overcome this difficulty, I have, during the past season, used honey-boards of perforated wood. Their construction is as follows: Take lumber $\frac{1}{4}$ -inch thick, cut it into lengths as long as the hive, and of such width that three pieces will cover the top of the hive. With a saw of such thickness that it will cut a kerf five-thirty-seconds of an inch in width, cut slots into these pieces of wood, something after the manner of the perforated zinc. I make the slots about 3 inches in length, one inch apart, and they "break joints" as do the perforation in the zinc. A frame of $\frac{5}{8}$ -inch stuff as large as the top of the hive, has the inner corners of the end-pieces rabbeted on one side, and into these rabbets are placed the perforated pieces, where they are fastened with brads. This gives a honey-board with a raised rim of about $\frac{3}{8}$ of an inch around its edge, which allows a bee-space below the sections. Such a honey-board always preserves the bee-spaces perfectly, and, as yet, no queen has passed through them.

The perforation in a zinc honey-board need to be a trifle smaller, to restrain the queen, than in one $\frac{1}{4}$ of an inch thick.

After using queen-excluding honey-boards for two years, I am unable to see that they lessen, or in any manner affect the amount of surplus honey secured.

Rogersville, 6 Mich.

For the American Bee Journal.

That New Zealand Comb Foundation

G. ELLIOTT.

In the BEE JOURNAL for Sept. 3, 1884, there is a letter from "Another New Zealand Bee Keeper," and an article copied from the *New Zealand and Australian Bee Journal* about our New Zealand comb foundation made by Mr. Hopkins; and as "Another New Zealand bee-keeper" wishes to inform the readers of the BEE JOURNAL that Dr. Dalziel had no grounds for getting the foundation analyzed, allow me to give my account of it, as it was chiefly through me that the Doctor acted as he did.

Dr. Dalziel showed me some samples of comb foundation which he had received from Chicago, and these looked so very different compared with the foundation which we were getting from Mr. Hopkins. The color was the same as that of the beeswax which I had always obtained from my own bees; the foundation of the cell-walls was deep, thick and soft; the sheet was more pliable without breaking; and, in fact, it was in every way such a superior article that it looked as if, with its use, there would be none of the trouble which I, and all the bee-keepers to whom I had spoken on the subject, had had with Mr. Hopkins's foundation, which was so brittle, and sagged so much after being put into the hive that I considered the best thing that I could do would be either to get my foundation from America or possess a machine and make my own.

With this view, I inquired from a traveler of Messrs. Porter & Co., importing ironmongers, whether they had any American bee-appliances. He said that they had on hand a honey-extractor, a machine for making comb foundation, and wax to be used with the machine, and he believed that there were some other implements among them. I said that a foundation machine was what I wanted, chiefly, but I would use my own beeswax. He said that the wax which they had was much cheaper, as it was a composition largely used in America, but it was not pure beeswax. As he did not have these articles on his list, he did not know the prices, so I asked him to inquire and then let me know.

A short time afterwards I saw him again, and he told me the price of the extractor and foundation machine, but said that they had no more wax, as it had all been sold and gone to the Thames. I asked him who had bought it, and he said, "I think that it was Mr. Hopkins." He said that it had been a sample lot sent over with the machines.

A few days after the above interview, as Dr. Dalziel was going into Auckland, I asked him to call at Porter's and look at the extractor and foundation machines for me, to make what inquiry he could about the composition wax, its price, etc., as the traveler's statement might, perhaps, account for the difference in the two specimens of foundation. I believe when the Doctor made the inquiry about the wax, the employes at first said that they had never had any wax; but when he informed them of what the traveler had told me, they said that they remembered that such a parcel did once pass through their hands, but they could not remember anything very definite about it. One of them promised to examine the books and ascertain all he could about it, but if it was a sample lot, it was very likely that there would not be any entry of it.

I afterwards saw the letter which the Doctor received, stating that no record of the parcel could be found; and we thought that, considering the possible truth of the traveler's state-

ment, and the evident difference in the two lots of foundation, that there were good grounds for suspecting the purity of Mr. Hopkins's comb foundation. We agreed to have it analyzed by Mr. Pond, of Auckland, and forward the report to the *New Zealand Bee Journal* whatever the report might be.

Auckland, N. Zealand, Nov. 8, 1884.

[The foregoing explanation is given in the BEE JOURNAL as requested, because it has twice decided (see pages 155 and 571) that the sample of beeswax sent here from New Zealand was a "pure article."

The trouble, no doubt, came from the blundering of the traveling salesman of the importers, who called the foundation mill "a machine for making artificial comb." Either he did not know what he was talking about, or the importers had obtained some "paraffine," and in saying that "spurious wax" or "paraffine" was "a composition largely used in America" in the manufacture of comb foundation, he was very far from the truth. We are informed that an Ohio manufacturer has been using some as an experiment, and that is about all that can be said about it. Now let the matter rest.—Ed.]

For the American Bee Journal.

Whom Can We Believe?

JOSHUA BULL.

I believe that I have carefully read every article that has appeared in the BEE JOURNAL for over a year, especially every thing bearing upon the vexed question of wintering bees; and I find so much diversity of opinions, and apparently conflicting theories advocated by those who claim to be experts in bee-keeping, that it is enough to confuse and bewilder those who have had no experience in the business. How are we to decide whether it is best to give our bees honey or sugar for winter food, upward or downward ventilation, to place them in the cellar, in a repository, or to leave them on the summer stands? One says, "Remove the bottom-board and place the hive upon a tray of dry sawdust;" while another recommends a perpendicular column of air underneath the hive. Now, with all this diversity of teaching, with so many different theories urged upon us, how are we to know whom to believe? Why, it seems to me that this wintering problem is about as far from being settled as the question of an "open sea around the North Pole!"

Are bees deficient in instinct? I was quite surprised when reading Mr. Heddon's statement, on page 501, where he said, "I have found that the judgment of man knew better than their own instincts what was best for

bees." Again, on page 550, he says that "Dame Nature either forgot to endow them with it, or did not care for their failure, or herself made a failure; for they do not at all times succeed any better than the tender plant against the drouth, the beautiful shrub against the frost of winter, the sparrow against the hawk, the minnow against the shark, etc." Now, with all due respect for Mr. H., I wish to be allowed to express my objection to his assertions, for therein appears to be a grave charge against the Creator, in that Mr. H. accuses Him of indifference about his works, or of failure to accomplish what He intended.

Let us examine this matter a little before we accept it. Mr. H. may be fully convinced in his own mind that he knows better than the bees what they need; but has he demonstrated it sufficiently clear to convince others that such is really a fact? We, of course, leave every one to be his own judge about that; but in regard to the reasons which he offers in support of his assertion, that bees are deficient in instinct, I wish to say: 1. I am not aware that plants and shrubs have any instinct at all, or any powers of volition whatever, and, therefore, can see no similitude in the comparison; and so far as the sparrow, minnows, etc., are concerned, when they are pursued, overtaken and devoured by predatory animals stronger than themselves, it is no indication that they are deficient in instinctive knowledge for self-preservation, but only that they are compelled to succumb to powers greater than their own; simply the weaker is overcome by the stronger. I believe, and, no doubt, Mr. H. will concur with me in this, that if the sparrow, minnow, and all others of the weaker creatures of creation could only receive such assistance as would enable them to carry out their instinctive impulses for self-preservation, that they would never allow themselves to fall a prey to the destroyer; and, no doubt, this principle will hold good with bees as well as with anything else. Therefore, it is clear to my mind that in order to secure the best results, we should not try to controvert or in any way interrupt the plans which the bees devise for their own preservation; but when we can render them such assistance as will enable them to consummate those plans, then, and not till then, do I believe that this wintering difficulty will be successfully overcome. I am slow to believe that instinct ever leads astray or guides in the wrong direction.

"And reason raise o'er instinct as you can,
In this 'tis God directs, in that 'tis man."

THE TREE-TRUNK PRINCIPLE.—It is not in my nature to accept any theory or believe any statement simply because some certain person has said it is so, unless that person can produce some evidence or argument which will appeal to my understanding or in some way accord with my own experience; but I am quite inclined to think that Messrs. Wm. F. Clarke and A. H. Dutton are leading off in the right direction on this win-

tering question; and as a reason for this belief, allow me to give a little item of my own experience.

Some 35 or 40 years ago, when I was a mere lad, my father set me to work to make a bee-hive on the following plan: A box-hive 26 inches high by 16x12 inches, and in the lower part of this box-hive were fixed three honey drawers on each side, 6x6x12 inches, thus leaving an open space between them of about 4x12 inches, and 18 inches high. Over these drawers was placed a floor or bottom-board with a slot or passage-way 1x12 inches in the centre, and above this was the brood-chamber, 16x12x8 inches, then a top board or cover was put on and nailed down tight, and a door upon the back side to exclude light from the drawers and to make all snug, completed the hive. (I write this from memory, and the dimensions may not be exactly correct, but I think that they are nearly so; the principle is the same anyhow.)

A swarm of bees was put into this hive, and the whole thing was put upon a bench about 14 inches high, with blocks placed under each corner of the hive to raise it about $\frac{3}{4}$ of an inch, and there it stood just in that position during summer and winter. The bees filled it with comb clear down to the bottom of the hive; but in winter they would all cluster in this upper chamber, thus leaving an air-space below them, 12x4 and 18 inches high, except what space the comb occupied. In this condition they lived 15 years in succession without once being winter-killed.

When Mr. Clarke announced his new theory, it at once recalled to my mind the above-mentioned facts, and I felt quite inclined to believe that his idea might be correct, and, if it does not entirely solve the difficulty, it may prove to be a very important principle, and, therefore, a step in the right direction.

Seymour, Wis., Dec. 6, 1884.

For the American Bee Journal.

First Queen by Mail from Jerusalem.

ANDREW H. DIVEN.

I would say to the bee-keepers generally, that on June 23, 1884, I received a Palestine queen from Philip T. Baldensperger, of Jerusalem, Palestine, direct by mail, the cage being post-marked at Jerusalem on May 28, 1884.

The queen came through in good condition, no evidence of having suffered from confinement. About one-half of her attendant bees were dead. She began laying in less than a week after her arrival, and is now in winter quarters with a full colony of Palestines. Mr. B. and myself think that this is the first queen sent direct by mail from Palestine to the United States. If we are correct, we modestly ask that it be so placed on record; if we are in error, we invite correction.

Mr. Baldensperger wrote me as follows on Aug. 6, 1884, dated Jerusalem: "I am very glad to know that

the first queen mailed from Palestine to the United States arrived safely, and that she began to lay, too. It is a great satisfaction to know that the confinement of 26 days did not injure her. In the *British Bee Journal* of Sept. 1, 1884, is a notice of an American queen which crossed the Atlantic, and the correspondent says, "Probably this is the first queen which crossed the Atlantic." I think that he refers to the "golden queens" as being the first; for Messrs. Benton, D. A. Jones and others occasionally mailed queens from Syria and Cyprus to England first, and after some rest they were sent on to America; but the queen which I sent you went through from Bethlehem via Jerusalem to the United States in 26 days."

The cage in which the queen came, I send to be placed in the Museum.

Seneca, Pa., Dec. 9, 1884.

[The cage is placed in the Museum, as requested.—ED.]

Home Farm.

To Beginners—Manipulation.

J. E. POND, JR.

I have been asked why some one of experience does not write a chapter upon manipulation. I presume the reason is that no one has thought that there was any necessity for so doing, as it was supposed that every one knew just how to do this simple work; the question having been asked, leads me to think that an article on the subject might prove of some interest to the novice if to no one else.

In the first place, it should be well understood that a colony of bees should not be examined or manipulated unless for a purpose. The promiscuous opening of hives, pulling out the combs and disturbing the cluster in the spring, or the busy worker in warm weather, has worked much harm, and the novice will do far better in his work when his apiary becomes so large that he cannot subject his colonies to a daily overhauling.

Again, colonies should not be examined at all save to perform some actually needed work, (such for instance as an introduction of a queen or something of the kind), except in pleasant weather, and when it is warm enough for the bees to fly safely. The beginner who has it all to learn in the way of practical work in the apiary may, however, take some particular colony and experiment with that alone, by opening and examining it until he gains that confidence and expertness which comes from practice alone; for this is a part of his apprenticeship, but it should be discontinued as soon as he is able to perform the work expertly.

To examine a colony, the first thing to be done is to blow a little smoke in at the entrance, and, by the way, at no other time save when using smoke should one stand in front of his hives—all operations should be performed from the rear. In using smoke there is no necessity of blowing in a large amount, the smallest

whiff is just as good as though the bees were suffocated with volumes of it.

After blowing in the smoke, the operator proceeds to the rear of the hive, and waits a moment till the bees are filled with honey, then he will proceed to take off the cover of the hive and lay it to one side; the next thing is to remove the covering mat from the frames; this, as well as all motions made around a bee-hive, should be done slowly and deliberately. Bees seem to detest any quick motions, and will resent them with a sting, when otherwise they would be as amiable as you please. After removing the mat, the center frames on one side or the other should be crowded together a little to give room to remove the outside frame. As soon as sufficient space is formed, the outside frame should be carefully taken out, examined for any desired purpose, and then carefully stood up beside the hive, or, what is better, carefully set into an empty hive or a light box made for that especial purpose.

After the first frame is removed, all subsequent manipulation comes easy enough, for all there is to be done is to take out the next frame, examine and replace it in the position occupied by the first one, and so on till all the frames are looked over, when the first frame can be set in the place of the last one taken out. In case, by reason of any inequalities or bulges in the face, it does not fit right, these inequalities may be shaved off with a sharp knife, or the frames may be set again in their original position. As the first method is much the easier, the apiarist should take care to see that each comb is interchangeable, not only with every other comb in the hive, but with every other comb in the whole apiary. This will be the means of simplifying his work, and making it easier to perform than it otherwise would be. Time is money, and every step taken to save time in an apiary is one in the right direction, and will be well appreciated on a day with the temperature at 100 F. or more, and fifty colonies to examine before night.

The manipulating of a colony is the simplest work of the apiary as it is purely mechanical and manual, and can be easily learned by practice. To know when and why to manipulate is a far more serious undertaking, and one that requires a vast amount of experience and study to fully learn, but when learned, it comprises the larger portion of what is required to make an expert apiarist.

Foxboro, ♂ Mass.

For the American Bee Journal.

To the Bee-Keepers of Indiana.

I want to talk with all the bee-keepers of Indiana. Bee-keepers, the time is set for our annual convention on Jan. 22, 1885. How many will be present? For almost one year the executive committee of the State Association have spent much time in the way of talk and correspondence in the

interest of our Society. At the State Fair we had a glimpse of our reward, a beginning of what we hope will be a grand success in the near future. All those who are sorely afflicted with remorse that they did not help us out at the Fair, can now have a chance to redeem themselves by coming and bringing as many as they can to the State meeting.

We hope that the week of heat and dust that we spent at the Fair in making the acquaintance of bee-keepers, and in making bee-keepers acquainted was not time spent fruitlessly. There is no reason why the Bee-Keepers' Society should not be, I will not say one of the largest, but the largest society which meets in the Agricultural rooms during this winter. We have the numbers and talent to make it the finest organization that will assemble in this city this winter.

I was surprised to meet so many women bee-keepers at the Fair—women who represent from 10 to 50 colonies; women who had the stamina to make a success of whatever they turned brain or hand to. Now, sister bee-keepers, assert your rights, overcome every difficulty and present yourselves at the State meeting. Let it be a meeting long to be remembered. If you have not learned all about bee-keeping, you can learn more in two days at a meeting of this kind than in a whole month of reading, for you will not only hear of the successes but of the failures of bee-keepers. On the other hand, if you think you have learned all, come and impart your knowledge to others. This meeting will be an important one. There will be many matters of interest brought before the Society in which we wish to have the voice of as many bee-keepers as possible.

Mrs. C. ROBBINS, *Pres.*

For the American Bee Journal.

International Bee-Keepers' Congress.

J. P. H. BROWN.

With this I send a call for an International Congress of Bee-Keepers to be held on the World's Exposition Grounds at New Orleans, La., on Feb. 24, 25 and 26, 1885. The time selected seems to suit the majority of bee-keepers the best. This has been ascertained by much correspondence. The Exposition offers a large hall and space for exhibits free of charge. Rates of board and quarters for bee-keepers attending the Congress will be made known through the BEE JOURNAL as soon as possible.

It is likely that the Exposition will withhold all apiarian exhibits until the week of the Congress. The prospects for a large attendance are very flattering. I hope that honey-producers will come well prepared to fully tackle the question of the disposal of the honey product. The question of honey-production, and all the methods and schemes for securing the greatest surplus have been most thoroughly ventilated by our bee-conventions, and now it is time to consider the subject of the disposition of the pro-

duct to the best advantage for the producer.

I appeal to the bee-keepers of America to send representatives to this Congress. In this matter no section or country should be known, but wherever intelligent apiculture is practiced, its interests should be represented.

Aside from the Congress, the sight of the foreign exhibits will alone be worth all the expense of the trip. So, fellow bee-keepers, lay aside your cares and labors for a week or two—strain a point—you have only got one life to live in this world—pack your valise and go.

Augusta, ♂ Ga., Dec. 9, 1884.

For the American Bee Journal.

The International Congress.

It is proposed to hold an International Bee-Keepers' Congress on the World's Exposition Grounds at New Orleans, La., Feb. 24, 25 and 26, 1885. An interesting programme of subjects of great importance to every bee-keeper in America will be presented and discussed. The disposition of our honey product, with a view to secure better prices will be fully considered. At the same time there will be an Exhibit of Bees and Apian Supplies. Fuller particulars will be given hereafter. At the time selected, the Exposition will be at its best, and excursion rates low. The bee-keepers of our country should lay aside business for a week or two, and make every exertion to attend this Convention. Come prepared with facts and statistics, and ideas arranged, to take part in its deliberations.

Bee-Hive Ventilation.

J. F. LATHAM.

On page 756, Mr. S. Corneil, in attempting a criticism of the ideas advanced by some of the correspondents of the BEE JOURNAL respecting the ventilation of bee-hives, including myself in the number, writes: "I notice that some of the contributors are in error in regard to the carbonic-acid gas produced by the respiration of a cluster of bees."

"These writers seem to think that because carbonic acid gas is more than half as heavy again as air, it falls to the bottom of the hive, and provisions should be made for getting rid of it at that point."

As only that portion of his comments which touches my statements, is subject to my notice, in answer I feel like saying that I think I am not

"in error" if the paragraph on page 342 embodying my ideas of bee-hive ventilation is called in question.

As a compound of liquids on being shaken up will re-arrange themselves in the order of their identity, so will an equilibrium be sought by air of different degrees of temperature. This operation of natural laws is most sublimely illustrated by the phenomena which culminate in our thunder-showers. The lower strata of the earth's atmosphere is rarefied by heat from the sun's rays, and ascends until an equilibrium is produced by its mingling with the upper, cold strata of the cloud regions; the colder air rushing in and supplying its place. The noxious gases from the earth's surface, diffused in those warm, humid accumulations, are re-arranged when the gases with which they are mingled assume their distinctive positions or characteristics, and the charm of nature is dissolved in the refreshing rainfall; while the noxious elements vent their "fiery spume" in the lightning's flash and the thunder's roll; "dissolving" to again unite with the surrounding elements, and again perform the eternal rounds of collection and diffusion as per the universal laboratory of the universe.

Aside from the electrical display wherein does not that grand exhibition of nature's process of purification faithfully illustrate the more humble process by which the domiciles of our generous workers of the apiary may be freed from the noxious gas incidental to the surroundings of all animate life in domesticity? especially such surroundings as the compulsory confinement which bees wintered in our Northern climate must necessarily be subjected to.

I do not claim that lower ventilation is the only outlet desirable or needed to free the bee-hive from the foul accumulations emanating from the exhalations of its inmates; whether respiratory or by transpiration, I would not have a reservoir of impure air in the lower portions of the brood-nest. Let us see: The paragraph alluded to in Mr. Cornell's critique, reads as follows: "When in a semi-dormant state the denizens of the hive require but little oxygen to support life or neutralize any harmful effects resulting from the accumulation of carbonic-acid gas in their surroundings." If there is anything in that sentence unrealistic or inapplicable to a cluster of bees in winter repose, I have been, as yet, unable to discover it. The next sentence reads: "As this gas, when occupying space in quantities detrimental to animal life, moves earthward, it is easy to comprehend how readily the inside of a bee-hive may be freed from its bad effects by proper downward ventilation, accompanied by an imperceptible upward ventilation, *i. e.*, an upward ventilation not strong enough to produce a rapid current of cold air through or around the cluster."

I did not intend to advance the idea that the gaseous accumulations would sink to the bottom of the hive and roll out! But, by giving the proper ventilation at the entrance, and a

slight ventilation over the brood-nest, a gentle circulation of pure air inside of the hive would be continuous. Such an arrangement, if I am correct, would be consistent with natural laws governing the circulation of aerial fluids, *i. e.*, as the air becomes warmed and vitiated by the bees, pure, cold air from the outside would pass in at the entrance, and a portion of the impure air in the lower portion of the brood-chamber would pass out at the same opening; thus forming a gentle flow of continuous supply and exhaust.

On opening the outside entrance to a lighted and heated room on a frosty winter evening, the process of aerial circulation may be readily observed by a person standing outside, as the heated, humid air rushes through the upper portion of the door-way, sparkling, into the freezing atmosphere, and the cold air from without moves in to fill its place through the lower portion of the door-way. Right here is the germ contained in Mr. Clarke's "Ariadnean clew:" the basis of hibernation, or hibernal requirements.

This, I think, sufficiently elucidates the import of the criticized paragraph; and if I construe the language of Mr. Cornell's critique correctly, his illustration as fully delineates its meaning as I have done. But enough. "Too much dispute puts truth to flight."
Cumberland, ♀ Maine, Dec. 8, 1884.

Local Convention Directory.

Time and place of Meeting.

- Dec. 27.—Unlon, at Stuart, Iowa, M. E. Darby, Sec.
1885.
Jan. 6.—Southern Wisconsin, at Janesville, Wis. J. T. Pomeroy, Sec.
Jan. 14.—Central Illinois, at Bloomington, Ills. W. B. Lawrence, Sec.
Jan. 20, 21.—N. W. Illinois, at Freeport, Ills. Jonathan Stewart, Sec.
Jan. 21—23.—Northeastern, at Syracuse, N. Y. Geo. W. House, Sec.
Jan. 22, 23.—Indiana State, at Indianapolis, Ind. Frank L. Dougherty, Sec.
Feb. 24, 26.—International, at New Orleans, La.
May 28.—N. Mich. Picnic, near McBride, Mich. F. A. Palmer, Sec.
June 19.—Willamette Valley, at La Fayette, Oreg. E. J. Hadley, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The eighth annual meeting of the Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will be held in Temperance Hall, at Freeport, Ill., on Jan. 20 and 21, 1885.

JONATHAN STEWART, Sec.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

What and How.

ANSWERS BY

James Heddon, Dowagiac, Mich.

Rules for this Department.

1. Give your name and post-office address.
2. Be brief, and to the point.
3. Send no simple questions, such as are answered in the bee-books.
4. Ask only such questions as are of general interest.
5. This department is not intended for advertising any one's wares—therefore questions concerning the manufacture of goods for sale are not appropriate.
6. Direct all questions to the editor—

THOS. G. NEWMAN,

925 West Madison St., CHICAGO, ILL.

Sundry Queries.

If I scarify or uncap the honey over the brood, will the bees carry it into the section-boxes? and will the queen lay eggs in the cells from which the honey was taken?

O. P. CRITTENDEN.

Reading, ♀ Mich., Dec. 7, 1884.

ANSWER.—Yes if you do it at a time when the bees are crowding the brood department with brood; but if on the other hand it is during a time when the honey-flow is excessive, and the bees are inclined to load down the brood-combs with honey, they will recap the scarified cells. You will find the German bees more inclined to carry up the honey than Italians of any strain, I think.

Bees Uneasy.

I have two colonies in the cellar under my kitchen; one is an Italian colony and the other is a colony of blacks. The former is very uneasy; the latter, very quiet. The temperature is about 40° above zero. Would the noise in the kitchen disturb them?

O. MCINNES.

London, Ont., Dec. 1, 1884.

ANSWER.—It has been demonstrated that bees will winter nicely with an anarchy of noise over their heads all winter. It is also quite probable that while such noise is not a cause of bee-diarrhoea, it often is an aggravation to the cause. It seems to me that such is true in your case, for while each colony is subjected alike to noise, temperature, ventilation and humidity, one is very quiet while the other is uneasy. Again we have proof that the wrong condition is within the hive.

Honey-Boards, Section-Cases, etc.

1. Of what advantage is the slat or skeleton honey-board between the brood-frames and section cases? Would the bees not enter the sections more readily if the honey-board were dispensed with and the cases placed directly upon the body of the hive?

2. Where the cases set flat upon the hives, without beveled edges on either to keep them in place, is there not

danger of the cases blowing off? What objection is there to beveled edges or projections, or one or the other, to keep hives and cases together, and to prevent rain from driving in?

3. Will winter feeding disturb the bees so as to induce breeding or cause uneasiness or excitement resulting in bee-diarrhea? J. W. GORDON.

Brighton, Ont., Dec. 5, 1884.

ANSWERS.—1. When I devised that honey-board I knew that such a board between the brood-chamber and the surplus comb-honey department was a thing of great convenience, and that between the brood-chamber and surplus extracting frames, almost a necessity. I was not sure, however, that the board would not sometimes somewhat deter the bees from entering the sections, and this is one of the reasons why I constructed it so that the cases fit the hive as perfectly without the honey-board as with it. Years of experiment on a large scale have demonstrated to others and to myself that the board has not the least tendency to dissuade the bees from entering the surplus department as soon as the heat and nectar will admit of their entering such department with any other arrangement. The advantages of the slat, sink honey-board are these: 1. It keeps all the brace-combs below it and away from the sections, keeping them clear of these dripping bits of comb. 2. It thus greatly facilitates the easy and speedy removal or adjusting of the surplus arrangements. 3. When running for extracted honey no bits of comb ever rest the frames at their bottoms, thus destroying their rest at their tops, which makes a host of trouble. 4. It tends to keep the queen in the lower apartment. 5. If reversed in the fall, and covered with cloth, it gives a bee-passage over the combs, prevents the cloth from being gummed, and forms a bottom to the case or super holding the absorbing material, so the same may be put off or on without any danger of scattering the contents. 6. It is a protection against robber bees when removing surplus departments.

2. No, there is no danger whatever of the cases blowing off, nor of the rain beating in, where the hives and cases are properly managed (I never have any trouble from either); and if you allow of any such bevel or projections, it greatly increases the difficulty of quickly adjusting them, as it spoils a perfect "lateral movement"—the best of all movements with which to adjust one section or story of a hive to another. It is not only a damage but an extra expense, and entirely uncalled for.

3. Sometimes it will. If you are feeding bees with pure, cane sugar syrup, which are occupying combs containing no bee-bread, I will warrant that no breeding nor bee-diarrhea will result.

The Monthly BEE JOURNAL for a year and the pamphlet "Bees and Honey," will both be sent for \$1.

SELECTIONS FROM OUR LETTER BOX

Boards in Front of Entrances.

In referring to my proposed plan of wintering, given on page 743, Mr. Chas. Mitchell says that I should "tack each board at the top edge against each hive, or the snow will freeze to them and keep melting on the ground so that in two or three days the boards will be leaning back and form a complete 'shoot' to catch fresh snow and fill the entrances." In reply I would say that these leaning boards used to keep the snow and wind from the entrances of the hives, rest on the bottom-board of the hive and not on the ground as he supposes; hence they are never drawn back as he speaks of; or at least, after using them for two years, I have never seen one do so. G. M. DOOLITTLE 40-80
Borodino, © N. Y., Dec. 8, 1884.

Is Honey-Dew Poisonous?

Will Dr. Tinker please say whether honey-dew is poisonous or not? Will it cause death or insanity? G.

[I have had no experience with the so-called honey-dew, and know little of it, except what has appeared in the bee-papers. If reference is had to any properties that the bees may convey to it, I should say that it would affect a person no different than other sweets usually stored by the bees.—DR. TINKER.]

Hives Packed in Sawdust.

On May 1, 1884, I bought 7 colonies of bees in box-hives, transferred them to Quinby's improved hive, and increased them to 11 colonies. I have taken from the same 420 pounds of comb honey in one-pound sections, 264 pounds of it being white clover, and the balance gathered from golden-rod and buckwheat. My bees are on the summer stands packed in sawdust, with 6 inches of the same on top, with upper and lower ventilation, and with 40 pounds of honey and bees by weight of frames. I allowed 10 pounds for bees and frames.

C. R. HANCOCK.
Chatham, Ont., Dec. 4, 1884.

Honey-Flora of Middle Tennessee.

The following is a list of the honey-producing plants, and the dates of their blooming in succession, in Middle Tennessee, 36° north latitude: During the latter part of February, white elm, alder and maple; March 1, box-elder; April 10, peach, pear and service; April 15, beech and sugar-tree; April 18, red-bud or Judas-tree; May 5, wild-cherry, raspberry and strawberry; May 10, poplar (the best of all); May 15, white clover and black locust; June 1, persimmon, black-gum and motherwort; June 5,

orchard-grass (for pollen); June 12, yellow or shittim wood; June 20, linden or basswood; June 25, chestnut and sour-wood; July 1, melilot clover, catnip and motherwort; July 25, spider-plant; August 1, sumac and prickly-ash; August 10, heart's-ease; Sept. 1, goldenrod, flea-mint, ironweed, boneset and asters.

D. S. ENGLAND.
Sparta, © Tenn., Dec. 6, 1884.

Report of the Buckhorn Apiary.

In the fall of 1883 I put 78 colonies into my bee-cellar, and all came out alive last spring. During the past season they have increased to 137 colonies by natural swarming, and I have them all in the cellar again in good condition. I have obtained 2,000 lbs. of comb honey and 2,000 lbs. of extracted honey, and I have about half of it left. F. A. GIBSON.
Racine, © Wis., Dec. 10, 1884.

That Adulterated Honey.

Concerning the article of Mr. Hunt, on page 787 of last week's JOURNAL, we have the following from Mr. Von Dorn:

OMAHA, Neb., Dec. 6, 1884.—In reply to Mr. Hunt's article: 1. I know of no one who wishes him to go out of the bee-business. It is the adulteration business we are after, and we do not propose to let it up either.

2. He may have all the legal proof he needs as to the identity of the honey; I have it.

3. It is presumable that the Chicago Sugar Refining Company (one of the largest glucose works in the United States) knows what glucose is, and how to detect it. Prof. Nicholson, the chemist at the Nebraska State University, says: "I find neither starch nor paraffine, and believe (italics mine) the article to be pure strained honey." He believes; the Refining Company knows. Paraffine in honey is good; no wonder he believes. I proposed to have proof one way or the other before I told the public what it was.

4. I neither know nor care now who that queen-breeder was. It is of no importance to this case. If it was I who made any remarks, I presume I can furnish satisfactory proof in support of them.

5. I have no personal ill-will in the least, and if he can convince me that I am in the wrong, I will do more to right him than I have to hunt him down. T. L. VON DORN.

The readers of the BEE JOURNAL are not interested in a personal controversy, and with the exception of the result of the third analysis (if offered for publication) this article will close this subject in our columns. All we desire is to get at the facts of the case, and these, so far, are contradictory, and, therefore, unsatisfactory. What the next will be we do not know.

The Bee Journal for 1885.

Premiums, \$25.00 in Cash.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

All former offers of Premiums are now withdrawn.

The price of the Weekly BEE JOURNAL for 1885 is \$2.00 for one copy; \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

We have decided to publish the Monthly BEE JOURNAL for next year of the same size and shape as the Weekly, (which contains about the same amount of reading matter as the present Monthly,) at 50 cents a year; two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each. The time has been extended on all portions of next year, which have been paid for at the rate of \$1.00.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Apiary Register—New Edition.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it. The prices will hereafter be as follows:

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 25
 " 200 colonies (420 pages)..... 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

The new Monthly for January will be issued this week, and the many sample copies already ordered will then be sent. We send samples free to all who wish them, or desire to get up Clubs. Now is the time to work for the Cash premiums we offer. A large club for the Monthly can be gotten up in almost every locality.

Create a Local Honey Market.

Now is the time to create Honey Markets in every village, town and city. Wide-awake honey producers should get the Leaflets "Why eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully all over the territory they can supply with honey, and the result will be a demand that will readily take all of their crops at remunerative prices. The prices for "Honey as Food and Medicine" are as follows:

Single copy 5 cts.; per doz., 40 cts.; per hundred, \$2.50. 500 will be sent postpaid for \$10.00; or 1000 for \$15.00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Premium for Club of 10 Subscribers.

The book for every farmer is the one entitled "Afleck's Farmer's and Planter's Record and Account Book," in which there is the most systematic, complete and convenient arrangement of headings for every Farm Account and memoranda of all important events which may occur in connection with his business. Every progressive farmer certainly desires to make a success of his occupation, and should adopt every possible means of bringing about that result. He, then, should have a correct knowledge of his entire business, which he can have only by keeping a correct account of every crop produced on his farm, the cost of production of all his live stock and an itemized account of all his expenses. Then at the close of the year, when he takes off his balance sheet, which is admirably arranged in the book above referred to, he will be able to see at a glance whether his farm does or does not pay.

This valuable book contains 166 pages, is nicely printed on writing paper, ruled and bound, and the price is \$3.00. It can be sent by mail for 24 cents extra.

We can supply these books at the publisher's price, or will make a present of one copy for every club of TEN subscribers to the Weekly BEE JOURNAL for one year, with \$20. Four subscribers to the Monthly will count the same as one for the Weekly.

Now is the time to get up Clubs. Who will work for a copy of this valuable book?

For two subscribers for the Weekly BEE JOURNAL (or 8 for the Monthly) for one year, we will present a Pocket Dictionary, and send it by mail postpaid.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
 Monday, 10 a. m., Dec. 15, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

CHICAGO.

HONEY.—Comb honey has been taken with freedom by the trade this week, but 15@16c. is the best price obtainable for a fancy article of comb honey in frames. Some lots bring from 14 to 15c. when in good order. Stock of comb honey is not large at present. Extracted, 7@8c. for new.
 BEESWAX.—For fair to yellow, 28@30c.
 R. A. BURNETT, 161 South Water St.

NEW YORK.

HONEY.—The market is well stocked with honey which is in good demand at the following prices: Fancy white comb in 1-lb. sections, 18@20c.; the same in 2-lb. sections, 16@18c.; fair to good white comb in 1 and 2-lb. sections, 14@16c.; fancy buckwheat comb in 1-lb. sections, 12@13c.; same in 2-lb. sections, 11@12c.; ordinary buckwheat comb in 2-lb. sections, 9@10c. Extracted, white clover in kegs or small barrels, 6½@8c.
 BEESWAX.—Prime yellow, 30@31c.
 MCCAUL & HILDRETH, 34 Hudson St.

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as dime, ½-lb., 1-lb., and 2-lb. jars, from the retail trade. Prices are low as arrivals exceed the demand. Extracted honey brings 5@6c. on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15@16c. in the jobbing way. We have several small lots of dark comb honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb. without finding a buyer. Dealers must certainly mislead producers by quoting buckwheat and popular comb honey, if they are not more successful than we are in disposing of the same.
 BEESWAX.—The demand is slow and arrivals are few. Good yellow brings 26@27c. on arrival.
 C. F. MUTH, Freeman & Central Ave.

SAN FRANCISCO.

HONEY.—Stocks of combs are larger and include some of choice quality. Supplies of extracted are liberal, and prices are fully as much in buyers' favor, as at any time during the season.
 White to extra white comb, 9@10c.; dark to good, 4@5c. Extracted, choice to extra white, 3½@4½c.; dark and candied, 3@3½c.
 BEESWAX.—Wholesale, 24@27c.
 STARNES & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c per lb., and strained and extracted 6@6½c.
 BEESWAX.—Firm at 32@32½c. for choice.
 W. T. ANDERSON & Co., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. Whilst the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.
 BEESWAX.—28c.
 A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13@14c; extracted, 6½c.
 GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, ½-lb. sections, none in the market. They would bring 18c.; 1-lbs., 14@16c.; 2-lbs., 13@14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6@7c.; white clover, 7@8c.; Southern, 5½@6c.
 BEESWAX.—None in the market.
 CLEMENS, CLOON & Co.
 Successors to Jerome Twitchell.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Un-bleached sections sell best.
 BEESWAX.—35c.
 BLAKE & RIPLEY, 57 Chatham Street.

Convention Hand-Book.

It is a nice Pocket Companion for bee-keepers. It is beautifully printed on toned paper, and bound in cloth—price 50 cents.

We have had some bound in Russia leather, with colored edges—price 60 cents.

☞ We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Young Men!—Read This.

THE VOLTAIC BELT Co., of Marshall, Mich., offer to send their celebrated ELECTRO-VOLTAIC BELT and other ELECTRIC APPLIANCES on trial for thirty days, to men (young or old) afflicted with nervous debility, loss of vitality and manhood, and all kindred troubles. Also for rheumatism, neuralgia, paralysis, and many other diseases. Complete restoration to health, vigor and manhood guaranteed. No risk is incurred, as thirty days trial is allowed. Write them at once for illustrated pamphlet free. 6D1y

"BOSS" ONE-PIECE SECTIONS.

READ THIS.

A word of explanation in regard to the infringement suit on the One-Piece Section, we deem necessary at this time.

I commenced suit against A. I. Root, in the United States Circuit Court, for the Northern district of Ohio; Stanley Matthews presiding. He decided that the patent was void for want of novelty. I have taken an appeal to the United States Supreme Court at Washington, which will decide the case, and its decision will be final. If it goes against me I will submit, but if decided in my favor, I shall expect all who have infringed will pay me damages from date of the patent.

Some unprincipled parties are advertising that the Courts have decided that the patent is void. This is not the case, as it is before the United States Supreme Court at Washington, at the present time. When that Court gives its opinion it will be final, and until it does, any one infringing will be liable for damages, if the United States Supreme Court sustains the patent.

PRICES OF SECTIONS.

| | | |
|---------------------------------|----------|-----------------------|
| One-lb. Sections in lots of 500 | to 4,000 | \$5.00 |
| Ditto | Ditto | 5,000 to 10,000 4.75 |
| Ditto | Ditto | 10,000 to 25,000 4.50 |
| Ditto | Ditto | 25,000 to 50,000 4.25 |
| Ditto | Ditto | 100,000 or more 4.00 |

The one-lb. Section is 17 inches long. For any sizes between 17 and 20 inches in length, add 5 per cent. For any sizes between 20 and 24 inches, add 10 per cent. Add the above per centage to the price of one-lb. Sections in the same quantity.

J. FORNCROOK & CO.,

50A1Bctf Watertown, Wis., Dec. 1, 1884.

A NEW BEE-VEIL.

There are five cross bars united by a rivet through their center at the top. These bars are buttoned on to studs on the neck-band. The bars are of best light spring steel; the neck-band of best hard spring brass; the cover is of handsome light material. It is very easily put together, no trouble to put on or take off, and folds compactly in a paper box 6x7 inches by one inch deep. There would be no discomfort in wearing it either day or night, and the protection against Mosquitoes, Flies, Bees, Gnats, etc., is perfect. The weight of the entire Veil being only five ounces. Price, by Mail or Express, \$1.00.

OLDEST BEE PAPER IN AMERICA

THE WEEKLY BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED TO THE INTERESTS OF HONEY PRODUCERS.

ESTABLISHED IN 1861. Chicago, Ill., December 24, 1884. VOL. XX.—No. 52.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR,

925 WEST MADISON-STREET, CHICAGO, ILL.

Weekly, \$2 a year; Monthly, 50 cents.

Entered at the P.O. as Second-Class matter.

TO CORRESPONDENTS.

The Subscription Price of the Weekly BEE JOURNAL is \$2.00 a year; and of the Monthly, 50 cents a year in advance. New Subscriptions can begin at any time. Single Copies, five cents each.

Club Rates for the Weekly are: \$3.80 for two copies (to the same or different post-offices); \$5.50 for three copies; \$7.20 for four copies; and for five or more copies, \$1.75 each.

Club Rates for the Monthly are: two copies (to the same or different post-offices) for 90 cents; three copies for \$1.30; four copies for \$1.70; five copies for \$2.00; more than five copies for 40 cents each.

Sending Money.—Remit by Express, Post Office Order, Postal Note, or Bank Draft on New York or Chicago. If neither of these can be obtained, Register your Letter, affixing stamps both for postage and registry, and take a receipt for it; or send it by Express. Money sent as above described, is AT OUR RISK, otherwise, it is not. Do not send checks on local banks, which cost us 25 cents each, at the banks here, to get them cashed.

Silver should never be sent in Letters. It will either be stolen, or lost by wearing holes in the envelope.

Postage Stamps of any denomination may be sent for fractions of a dollar: or where Money Orders, cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given in two weeks after sending the money, write to us, for something must be wrong about it. Do not wait for months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This gives a continual statement of account.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

ADVERTISING RATES.

20 cents per line of space, each insertion.

For either the Weekly or Monthly Editions.

A line of this type will admit about 7 words. ONE INCH will contain TWELVE lines.

Transient Advertisements must be paid for in advance.

Editorial Notices will be inserted at the rate of 50 cents per line.

Time Discounts on advertisements will be made as follows: **On 10 lines** and upward, 3 insertions, 5 ¢ cent.; 6 insertions, 10 ¢ cent.; 9 insertions, 15 ¢ cent.; 12 insertions, 20 ¢ cent.; 26 insertions, 25 ¢ cent.; 52 insertions, 40 ¢ cent.

On 50 lines and upward, 1 time, 5 ¢ cent.; 3 insertions, 10 ¢ cent.; 6 insertions, 15 ¢ cent.; 9 insertions, 20 ¢ cent.; 12 insertions, 25 ¢ cent.; 26 insertions, 30 ¢ cent.; 52 insertions, 50 ¢ cent.

On 100 lines and upward, 1 time, 10 ¢ cent.; 3 insertions, 15 ¢ cent.; 6 insertions, 20 ¢ cent.; 9 insertions, 25 ¢ cent.; 12 insertions, 30 ¢ cent.; 26 insertions, 40 ¢ cent.; 52 insertions, 60 ¢ cent.

TO CORRESPONDENTS.

Advertisements for the next Weekly BEE JOURNAL must reach this office by the Saturday of the previous week.

Books for Bee-Keepers.—For prices and descriptions of bee-books, see the second page of this paper.

All Papers are Stopped at the expiration of the time paid for, unless requested to be continued.

When writing to this office on Business, correspondents must not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either part of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They both may be sent in one envelope, but on separate pieces of paper.

Always give the name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

Emerson Binders, made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents each. They cannot be sent by mail to Canada.

To Canadians.—We take Canadian money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 10 cents.
To Australia—Weekly, \$1; Monthly, 20 cents.
George Neighbour & Sons, London, England, are our authorized agents for Europe.

Our rates for two or more copies of the book, "Bees and Honey," may be found on the Book List on the second page of this paper. Also wholesale rates on all books where they are purchased "to sell again." The time for reading up will soon be here, and in anticipation of this, we now have a very large stock of books on hand, and can fill orders for them in any quantity, on receipt of orders.

DADANT'S FOUNDATION

is attested by hundreds of the most practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenness and neatness of any that is made. It is kept for sale by Messrs.

and UNSOLICITED TESTIMONIALS from as many bee-keepers in 1888.

We guarantee every inch of our Foundation equal to sample in every respect.

CHAS. DADANT & SON,

5AB1y HAMILTON, Hancock Co., ILL.

VALUABLE ORIGINAL PATENTS.

Prof. Cook, in his valuable *Manual of the Apiary*, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that one Mr. Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, which they never go out or fail to blow smoke up or down or sideways, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors, and only legal makers, and have had over 45,000 in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over 3,000, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make will have met the advanced wants of the most advanced bee-keepers in Europe and America.

Prices, by mail, post-paid.

On dozen or half-dozen lots of one kind, we allow 25 per cent. discount, and prepay postage. Special rates on larger quantities, given upon application.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN.—It is "fully up with the times," in all the various improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey-bee, and at the same time produce the most honey in its best and most attractive condition. It embraces the following subjects:—Ancient History of Bees and Honey—Locating an Apiary—Transferring—Feeding—Swarming—Dividing—Extracting—Queen Rearing—Introducing Queens—Italianizing—Bee Pasturage a Necessity—Quieting and Handling Bees—The Management of Bees and Honey at Fairs—Marketing Honey, etc. 220 profusely-illustrated pages. Price, bound in cloth, \$1.00; 2 copies for \$1.80; 3 copies for \$2.50; 5 for \$4.00; 10 for \$7.50. Paper covers, 75 cents; 2 copies for \$1.40; 3 copies for \$2.00; 5 for \$3.00; 10 for \$5.00.

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, ruled and printed, and is so arranged that a mere glance will give its complete history. Strongly bound in full leather. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25; for 200 colonies, \$1.50.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc. Also, Honey as Medicine, with many valuable recipes. It is intended for consumers, and should be liberally scattered to help in creating a demand for honey. Price, for either the *English or German* edition, 5 cents—one dozen, 40 cents—100 for \$2.50—500 for \$10.00—1,000 for \$15.00.—If 100 or more are ordered, we will print the bee-keeper's card (free of cost) on the cover.

Bee-Keepers' Convention Hand Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for the guidance of officers and members of Local Conventions—Model Constitution and By-Laws for a Local Society—Programme for a Convention, with Subjects for discussion—List of Premium for Fairs, etc. Bound in cloth, and suitable for the pocket. Price, 50 cents.

Why Eat Honey? by THOMAS G. NEWMAN.—This Leaflet is intended for distribution in the Bee-Keeper's own locality, in order to create a Local Market. Price, 50 cents per 100; 500 copies for \$2.25; 1,000 copies for \$4.00. When 200 or more are ordered at one time, we will print the honey-producer's name and address FREE, at the bottom.

Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and Instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. This is a chapter from "Bees and Honey." Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey." Price 5c.

Bee Pasturage a Necessity, by THOMAS G. NEWMAN.—Progressive views on this important subject; suggesting what and how to plant.—A chapter from "Bees and Honey." 26 engravings. Price, 10c.

Bees in Winter, by THOMAS G. NEWMAN.—Describing Chaff-packing, Cellars and Bee-Houses. A chapter from "Bees and Honey." Price 5c.

Bienen Kultur, by THOMAS G. NEWMAN.—In the German language. Price, in paper covers, 40 cents, or \$3 per doz.

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—It is elegantly illustrated, and fully up with the times on every subject that interests the bee-keeper. It is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, \$1.25.

Quinby's New Bee-Keeping, by L. C. ROOT.—Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, \$1.50.

A B C of Bee-Culture, by A. I. ROOT.—Embraces everything pertaining to the care of the Honey-Bee, and is valuable to the more advanced bee-keeper, as well as the beginner. Cloth, \$1.25; paper, \$1.

Blessed Bees, by JOHN ALLEN.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Price, 75c.

The Hive and Honey-Bee, by REV. L. L. LANGSTROTH.—This is the work of a master, and will always remain a standard. Price, \$2.00.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, \$2.00; in paper covers, \$1.50.

Queen-Rearing, by HENRY ALLEY.—A full and detailed account of 23 years experience in rearing Queen Bees. The cheapest, easiest and best way of rearing. Price, \$1.

Bee-Keepers' Text Book, by A. J. KING.—A new edition, revised and enlarged. Price, \$1.00, bound in cloth.

Extracted Honey; Harvesting, Handling and Marketing.—By CHAS. DADANT & SON.—Details their management. Price, 15c.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—Gives his views on the management of bees. Price, 10c.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the late Samuel Wagner. Price, 15c.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50c.

The Hive I Use, by G. M. DOOLITTLE.—Details his management of bees. Price 5c.

Foul Brood, by A. R. KOHNKE.—Its origin and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic.—Contains over 1,000,000 industrial facts, calculations, processes, trade secrets, legal items, business forms, etc. Price, \$2.50.

Kendall's Horse Book.—No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, 25c., in either *English or German*.

Food Adulteration.—What we eat and should not eat. This book should be in every family. Price, 50c.

Scribner's Lumber and Log Book.—Gives measurement of all kinds of lumber, logs and planks; wages, rent, etc. Price, 35c.

Fisher's Grain Tables.—For casting up the price of grain, produce and hay; wood measurer, ready reckoner, tables for plowing, etc. Price, 40c.

Hand-Book of Health, by Dr. Foote.—Rules for eating, drinking, sleeping, bathing, working, dressing, etc. Price, 25c.

Weekly Bee Journal,

DEVOTED TO THE INTERESTS OF THE PRODUCERS OF HONEY.

VOL. XX.

CHICAGO, ILL., DECEMBER 24, 1884.

No. 52.

THOMAS G. NEWMAN,
EDITOR AND PROPRIETOR.

VOLUME XX ENDED.

With this number—the fifty-second for 1884—ends the 20th Volume of the Weekly BEE JOURNAL.

Nearly all of the subscriptions run out with this issue, and we would respectfully request such readers and patrons to sit down as soon as this article is read and send us the renewal of his or her subscription for 1885, and thus prevent the loss of a number and the consequent pleasure of the weekly feast it presents.

We are grateful for past favors, and we confidently look for an increased support by progressive bee-keepers everywhere, in order to enable the BEE JOURNAL to retain the proud position of being *the best*, as well as the oldest bee-paper on the American Continent. The BEE JOURNAL and its able corps of correspondents have contributed their full share in all the advance-steps of modern improvements in bee-culture, and it has kept its readers fully posted in the development of every one of such, as fast as they have attained a foot-hold.

We will close the present Volume by wishing all our readers

**A MERRY CHRISTMAS
AND A HAPPY NEW YEAR.**

Every subscriber is kindly invited to obtain a *new* subscriber to send with his renewal. Please notice the premiums offered for clubs, on another page.

Honey and Beeswax.

It will be interesting to put this Table on record; though we do not think it complete, by any means. As proof of this assertion, we have only to compare the third and fourth lines, where we find Arkansas to have produced about double the amount of honey credited to California. It also gives North Carolina credit for 50 per cent. more than Michigan, and more than Illinois or Iowa. The fact is, it is so manifestly incorrect that it is useless.

From an investment of \$2.00, every subscriber to the Weekly BEE JOURNAL for 1885, will receive fifty-two dividends.

To the copious indexes found in this number of the BEE JOURNAL we point with pride. Those who bind the volume or use the Emerson Binder, will find it of untold value.

At the World's Exposition, let it be understood, says Dr. Brown, that "all exhibits of colonies of bees and bee manipulations will *only be during the week of the Convention*. Supplies can be exhibited any time during the Exposition."

The long winter evenings will be well occupied by reading bee literature. When renewing your subscription, it will be well to get some good bee-books. See our list of books on the second page and select what you need. Do not forget to send for a Binder in which to file your JOURNAL and thus have the full benefit of it during the whole year.

We had about concluded that the *Kansas Bee-Keeper* had ceased to exist, as it had not been published since September. We now learn that the cause was the illness of both of its editors, Messrs. Scovell and Pond.—They now propose to issue it weekly and thus make amends for lost time.

As there are fifty-three Wednesdays in this year, and as we are behind with this number, with two legal holidays for the employes before us, the next issue of the Weekly BEE JOURNAL, for January 7, will be mailed on the previous Saturday, and after that, it will be mailed, as usual, every Tuesday.

Please notice the change of the club rate for the *Apiculturist*, as noted on the last page of this paper.

To Canadian subscribers let us say that we have made arrangements so that we can supply the *Farmer's Advocate* of London, Ont., and the Monthly BEE JOURNAL for one year at \$1.25 for the two.

CORRESPONDENCE

For the American Bee Journal

Keeping Bees on Shares, etc.

CHAS. DADANT & SON.

In reply to the question asked by Mr. T. W. Dougherty, on page 796, which Mr. Heddon answers, allow us to give a report of the different ways in which we do it, and which give satisfaction to all parties.

There are three ways in which we take and give bees on shares, and there are often also three persons involved in the transactions, the owner of the bees, the owner of the location, and the bee-tender or bee-keeper. The bee-keeper who takes bees on shares, usually has some of his own, and it is, therefore, preferable to put them on the premises of a third party. The rule is to give the owner of the bees two-fifths of the surplus, the apiarist gets two-fifths, and the land owner one-fifth. In the bargain it is understood that the latter is to furnish room for the empty hives, boxes, extractors, honey, etc., and board the apiarist and his horses, while at work.

The only risks of loss to be incurred are, that of winter or the absence of a crop. These risks should be incurred by the owner of the bees; that is, he must stand the winter loss, and the expense of feeding the bees if necessary. On the other hand, the apiarist must put the bees in winter quarters as safely as possible, and if there is a crop he must keep enough surplus honey to feed the bees until the next crop. If there is no crop, he must do the work of feeding if needed.

As for the increase of bees: All depends on the manner of it. If swarming by division is intended, the terms depend on the quality of the hives, the amount of comb foundation used, and the more or less purity of the race of bees employed. If natural swarming is the only source of increase, then the increase belongs to the owner of the bees, provided he pays for hiving the swarms; otherwise the apiarist has a right to one-half of the increase, but he must furnish hives, comb foundation, etc., for his share. The price which we pay for hiving swarms is 75 cents per swarm. It would be unreasonable and bad policy to request the apiarist to hive the swarms free of charge, for swarming is a tedious job, and takes much valuable time. Besides, an apiarist who tends three or four apiaries cannot be expected to hive all the swarms. It becomes the part of the location owner.

Our method, therefore, is as follows: When a man lets bees to an apiarist on the apiarist's land, the owner of the bees gets two-fifths, and the apiarist three-fifths; the owner pays 75 cents for each swarm hived, and furnishes hives, etc., to suit himself, and the swarms are his; or if he

pays nothing, each of them gets half of the swarms, and each furnishes his own hives, foundation, etc.

When a man lets bees to a land-owner, and tends the bees himself, he gives one-fifth and pays 75 cents per swarm.

When a man lets bees to an apiarist on a third man's land, he gives the apiarist two-fifths, the land-owner one-fifth, and pays 75 cents for the swarms hived. If the apiarist pays 75 cents, then he gets half of the natural increase.

DOES BEE-KEEPING PAY?

One more word. Messrs. Doolittle and Heddon claim that bee-keeping does not pay because honey is too cheap, or something to that effect. The great trouble is that they want a man to try a living with 100 to 200 colonies of bees. We say and prove by facts, that a man can keep from 400 to 700 colonies of bees, and keep them properly. Of course additional help is needed during the honey harvest, the hives and implements must be ready before spring, and the colonies must be in running order to start with. We also say and prove by our own experience that extracted honey can be produced at 6 cents per pound and pay its producer. The production of honey has not yet been and cannot be overdone, for the consumption increases as fast as the production, and honey will always be the highest priced of all sweets.

Mr. D. W. McDaniel, of this city, has done the greater part of the work on some 450 colonies of bees for us this summer, and was not busy more than half of the time either.

Hamilton, Ill., Dec. 12, 1884.

For the American Bee Journal.

Honey as a Staple Article.

H. U. ACKERMAN.

The following from the Indianapolis *Evening News* of Dec. 10, 1884, I should like to have published in the BEE JOURNAL, believing that it will be appreciated. After fighting, for months, the "Prof. Wiley scientific pleasantries" (lie), it is quite refreshing for a bee-keeper to read in a newspaper an article like this, speaking a good word for his pursuit, and I would suggest that bee-keepers generally send a copy of the BEE JOURNAL containing it, to their local papers requesting them to copy it:

HONEY A SUBSTITUTE FOR BUTTER.

"Times are bad and likely to be worse," said a prominent member of the Franklin Institute to a reporter yesterday afternoon. "Butter is becoming scarcer and dearer every year and it will be beyond the reach of poor people this winter. Unless poor people who are out of work find a substitute that is cheaper than butter, they will have to eat their bread dry. They will not eat butterine or oleomargarine; they would turn up their noses at that, if they were starving."

"What can they use, then?"

"I do not know; but if some enterprising man would take hold of the honey question, I believe he would make a fortune."

"Honey?"

"Yes, sir; honey. There is an opinion going around that honey is a luxury. There never was a bigger mistake made. If it does not make much muscle, it gives warmth to the whole system, arouses all the nervous energies and gives vigor to all the vital functions. I can talk about honey because I know about it. I know that most children would rather eat bread and honey than bread and butter, and that a pound of honey will go as far as two of butter. Besides, honey will keep forever and never get sour or rancid like butter does. Then look how much cheaper it is. Honey can be bought at 15 cents and 20 cents a pound, and a fair profit made by the retailer. Butter is seldom less than 40 cents, and this winter it will reach 55 cents a pound. Of course I am only speaking of the best kind of honey. Buckwheat honey, which has a slight flavor, can be retailed at a profit at \$1 for 8 pounds. Bnt, Lor' bless you, the people would not eat that. Only the best is good enough for them."

"Could enough honey be brought into the market to substitute it for butter?"

"Well, that is not exactly the question. It is not likely that honey will supersede butter altogether; but just now, when wages are low and butter is getting higher and higher every day, it would be a good thing if people knew that they could buy a good substitute, if it is only a temporary one. What is wanted to make it a paying one is the introduction of the barrel trade. If retail dealers would take their honey in barrels and sell it in small quantities at the rate of about 15 cents a pound, they could make a large profit. You know working people look twice at a quarter before they spend it on what they think is a luxury. But if they thought they could buy 5 or 10 cents worth at a time, they would be glad of it, and they would soon learn that honey is cheaper and preferable to butter. In the winter honey candies and becomes hard enough to cut with a knife and spread like butter, so it can be used in the same way. If a demand for pure honey arose, a hundred barrels could be brought into the city every week all the year round, or a hundred dozen if the demand increased."

"How about adulteration?"

"The principal adulteration is glucose, but it is not difficult to detect. Honey mixed with glucose will not candy at the lowest temperature, whereas pure honey candies very freely. The best way to keep honey is in those five-pound Mason jars. If it candies, so much the better. A little heat will soon liquify it, if that is desired. If people generally knew what a nutritious, wholesome food honey is, it would not be long before the bee-keepers would have all they can do to keep up the supply."

North Indianapolis, Ind.

For the American Bee Journal.

Bee-Keeping in 1884.

JNO. A. THORNTON, 54-73.

During the past spring my bees were in pretty fair condition, and all except 4 were good colonies. The 4 were weak, and I did not secure any thing at all from them, so I really did not count them as colonies. I obtained 3,200 pounds of honey from the 50 colonies, 1,800 pounds of which was comb honey in one-pound sections (800 pounds of this being clover and basswood honey, and the balance from Spanish-needle and smart-weed); and 1,400 pounds of extracted honey, being mostly of fall honey.

There was some of the bark-louse honey gathered early in the spring, but not enough to amount to much. The flow from clover did not last until July 1; basswood lasted only three days, and then the bees did not gather much from it; so I had to feed some to get the weaker colonies strong enough to gather the fall honey crop, which commenced about Aug. 26 and continued for 6 or 8 days, when it ceased and there was no more gathered; so the bees did not have very much time to gather much surplus, but secured enough to winter on, and nearly all of them stored some surplus; none of them filled a two-story, Langstroth-Simplicity hive.

Honey sells slowly here now, and is not much in demand; 13 and 15 cents is the most I can get for comb honey in one-pound sections; for extracted, 10 cents per pound at retail; and then most of the people seem to think this too high, and will buy only a few pounds at a time.

The black bees did not secure any surplus at all in this neighborhood, but the majority of them stored enough to winter on. Some of my neighbors, who have black bees, seem to think that they are a poor investment, and are killing them for what honey there is in their hives. The Italian bees produced by far the most honey this year. In 1883 I had some colonies of hybrids, each of which stored 275 pounds of honey, being 50 or 60 pounds more than any full colony of Italians gathered; but this year none of them gathered as much, and they did not fill sections as full as the Italian colonies did. I cannot see wherein hybrids are so much superior to the Italians, as some beekeepers claim them to be; they are hard to handle, and will not stick to the combs; and worse yet, they are more likely to sting; but I consider them far superior to the blacks.

Some may think that I have poor colonies to breed from, but this is not so, for the queens are from the best imported and home-bred queens, and only the best are allowed to become laying queens. Some colonies of hybrids are as gentle to handle as some Italians, during a honey-flow; but when the flow ceases, look out! for if they cannot sting you, they will follow you for a long while; and then they are worse robbers than any others.

Yesterday and the day before were nice days, and the bees were out in full force, having a good "fly." I have never tried to winter bees any where else except on the summer stands, and I have had good success. In the fall of 1882, 23 colonies were prepared, and all wintered without loss; in the fall of 1883, 54 colonies were left on the summer stands and came out all right. The way they were prepared was with straw packed around them and tied with strings on 3 sides, with covers made of shingles, and the fronts of the hives were not covered, and faced the south; three half-inch sticks were put crosswise of the frames on top, with covers made of muslin, painted, which is almost the same as oil-cloth. This is the best cover I ever tried for summer use, but I do not like it for winter use. I use the 10-frame, Langstroth-Simplicity hive.

I asked a bee-keeper, who has black bees, how many colonies he had, and this is the way he answered me: "Well, I do not know, but I can count them. There are 3 under the cedar; one of them the moths ate up; 3 under the big pine, is 5; 2 under the box-alder, is 7; 2 under the little cedar, is 9; 2 by the fence, is 11; 2 under the little pine, is 13; 1 over in the corner, is 14; and one in a log, is 15; and one more is 16. Now, I will give you 4 colonies for enough honey to winter the rest on. Four have starved, I killed 6, and got about 6 lbs. of honey, and I would like to winter the rest and try them another year."

But I did not bargain for the 4 colonies, as I did not like the investment. Lima, +o Ill., Dec. 5, 1884.

For the American Bee Journal.

Wintering Bees, Swarm-Catcher, etc.

R. GRADEN.

I have procured several colonies of bees at different times, and always lost them in various ways, still I would not give up, as I have quite a liking for bees. Every time that I lost bees I examined the contents of the hive to ascertain, if possible, the cause; yet I had the courage to try again.

After 3 or 4 years of losing bees, I decided upon a course by which I would not lose them in any of the former ways; so I proceeded to a neighbor who kept some bees in box-hives, and who never pays any attention to them except when they swarm, when he takes an old box of any kind, or an old nail-keg or cheese-box, and makes a hole in it large enough to admit of a fist, and then with the aid of a 20-foot pole he manages to dump the bees into it, sets them up against the fence, and does nothing more to them until the next swarming season, should they be fortunate enough to winter. I told my neighbor that I wanted to get another swarm of bees, the first that should issue, as it was then about July 10, 1882, and he should put them into a good box-hive, which he did about the last of July.

I took my bees home and cared for them, and they did well, and before cold weather set in, they filled the box-hive and a small cap holding about 8 pounds of honey. I prepared them as I had decided upon, and they wintered safely.

On May 21 and 22, 1883, snow fell to the depth of 2 inches, but on May 23, the weather cleared up, the snow thawed, and about 2 p. m. my bees swarmed. I hived the swarm and it did well, and on May 31, a second-swarm issued, and on June 3, a third-swarm issued. I increased them to 7 colonies, 5 good and 2 small ones. When cold weather came I prepared 6 colonies as I did the one of the previous year, and one I carried into the cellar, but it died with the diarrhoea about the middle of January 1884. The 6 which were left on the summer stands, wintered safely, but on examination of the weakest, I found that it had exhausted its stores, and the queen and a cluster of bees the size of a small hen's egg, was all that was left in the hive. I immediately fed them sugar syrup, and left them to themselves, as I had no other frames which would fit that hive. They have increased to a fair-sized colony, but this year they produced neither surplus honey nor swarms.

I have increased my apiary to 13 colonies, and have them prepared for winter on the summer stands; and besides what honey was consumed in a large family, I have left about 150 pounds of comb honey in one-pound sections.

In the BEE JOURNAL I have seen descriptions of different kinds of swarm-catchers, but I use one which I think is far ahead of any which has been described. The following is my manner of hiving bees and a description of my swarm-catcher: When I hive bees, I put the hive on the summer stand, where it is to remain, and place two small $\frac{1}{2}$ -inch blocks under its front. Then I take a planed board about one foot wide by 2 feet in length, and place it in a slanting position, so that when I pour the bees upon it, they will slide down in front of the hive. I have a light box made of $\frac{1}{2}$ -inch lumber, which is about 8 inches square and 14 inches deep, and which has five one-inch holes bored on each side. I then put a light, stout pole through the hole in the centre of one of the sides, and let it run through the box and secure it on the opposite side. The pole may be left any length that is desired. I also use a second pole which has a hook in one end.

As soon as a swarm has clustered, I hold one side of the box against the cluster, and with the pole which has the hook, I shake or jar lightly whatever they may be clustered on, and it is surprising to see how quickly they will all be in the box. I have hived a large swarm in this manner in less than five minutes.

After carrying the box of bees to the hive, turn the open end of the box on the slanting board before the hive, and the bees will roll or slide easily to the hive entrance. If some of the bees still adhere to the box, give it a

sudden jerk and the remaining bees will immediately roll out. If the work is done rightly, I think it is the quickest and best method of hiving bees, as there is no smashing of bees, no trees to climb, and the bees can be carried as far as desired. A bee-keeper, to whom I described my swarm-catcher, and whom I induced to try it, told me that if the box were put up among the flying bees as soon as the swarm issues, in nine cases out of ten, they would cluster in it.

Taylor Centre, Mich.

For the American Bee Journal.

Honey Production and Consumption.

WM. CAMM.

I wish that Mr. Heddon would turn his attention to economics for a year or so before he writes another article such as that on page 756, in which he advises us to cease condemning and exposing adulterations. Indeed, it would be well if all of us would remember that we cannot, as a class, have the world all to ourselves; but we must share the fortunes and the fate of all other classes.

Economics should be considered under three divisions or heads, viz: production, distribution, and consumption. Bee-keepers have an immunity in the first division which no other class, unless it be fishermen, can be said to enjoy; but in the division of distribution, they have a privilege which other classes have not, only in some places; while in the third division, consumption, they meet a drawback which neutralizes every advantage that they otherwise possess.

We produce only that we may consume. To increase consumption is to encourage production; to limit consumption, discourages production. We have, like every other class, done all we could to increase the production of honey; we have done something to induce others to consume; but we have done nothing to enable others to buy. I have not yet sold a pound of honey in a city market, but have done all I could to develop the local market in the country and town about me, and I have found that my best customers were not the wealthy with plenty to spend, but the working men and women, whose consumption was limited by their wages, or their ability to buy; and I have naturally asked myself how it was that those whose labor moved the world, were forced to stint themselves in buying what is usually considered a luxury, but which, when healthfulness is considered, may be regarded as a necessity.

To-day there are tens of thousands out of employment; and, on account of their enforced idleness, unable to obtain even the necessities of life, to say nothing of luxuries; but in looking over the division of production, I find nothing lacking; there is the labor, and here is the land; and all wealth is produced by the application of labor to land. Our warehouses and granaries are so full that

superficial thinkers are crying out over-production. There can be no such thing as over-production, though relative over-production there may be, and now is. Some men have labored, some have not; and those who have been idle have no products to exchange with those who have worked; hence those who have produced honey, or corn, or pork, say that there is too much produced; while those who get no remunerative employment say not enough is produced, and that bread and meat are beyond their reach; while such a luxury as honey they dare not think of. Consumption being thus limited, production becomes profitless because exchange is forestalled. Now, where is the trouble?

After all our boasting it is clear that we could not attain to half the population per square mile which China has supported for centuries, so bad are our laws of distribution that thousands and tens of thousands are forced into want and suffering while ware-rooms and elevators are crammed.

I have just taken my last honey to market; it went to grocerymen almost under the shadow of a woolen factory; the last two crates went to a man to whom I have never sold before, and who whistled when I named the price. Behind us stood a factory woman, and the grocer, lifting a section and turning it before her, "How pretty!" The woman looked at it longingly, and in a soliloquizing voice, as though her thoughts reverted regretfully to her children, "O! how nice!" But she did not buy. My wife wanted some blankets which I could not afford to buy. Here was producer and consumer face to face, but there was a barrier between them. What was that barrier? She wanted honey, and though she made blankets, she could not afford it; I wanted blankets, and produced honey, but could not exchange. Why? Our landlords wanted neither honey nor blankets, but money, and we had to raise that before we could supply our own necessities.

I have long ago learned why our system of distribution was so bad. Dealing in a local market, and often directly with the consumers, my own neighbors, with whose circumstances I was more or less acquainted, I saw that it was the price that productive labor had to pay to non-productive ownership that constituted the barrier between producer and consumer, and which rises as fast as we approximate those conditions which we are all striving to gain. Carlyle has put it well: "A widow is gathering nettles for her children's dinner; a perfumed seignior, delicately longing on an *Eil de Bœuf*, hath an alchemy whereby he will extract from her the third nettle, and call it rent."

To eliminate the unearned increment, rent, is the task before us. It is easy to do where once the evil is pointed out, but I am glad that bee-keepers cannot do it by themselves, but join with every other producing class to effect the reform. I wish that every periodical would devote a rea-

sonable space to economics. Until we do something in this direction, we are only beating our brains against a wall. I have more trouble and anxiety in disposing of my honey than I have in producing it. Should I succeed in getting a competency, or something more, I must use it in preying upon others as I am now preyed upon. I shall continue to condemn adulteration and fraud, and I desire no knowledge which is not as good for my neighbor as for myself; but I shall hereafter devote more time to the removal of the evil which robs me and every worker in the human "hive" of more than half of what my labor produces.

Murrayville, Ill., Dec. 13, 1884.

For the American Bee Journal.

Rearing and Introducing Queens.

C. W. DAYTON, 114.

As I am a stickler for business-queens, and believe the best if not the only practical method for the honey-producer to obtain them, is by the swarming-impulse, early in the season, I begin building up a few colonies in order to obtain early queen-cells. Soon after I find the first capped queen-cell, I divide an ordinarily populous colony by inserting a division-board near the centre of the brood-nest, which causes queen-cells to be built on the part not containing the queen. This colony I use as a queen-nursery.

As the first swarms issue, I hive them on empty combs in hives on the old stands, and after taking the queen-cells from the combs in the old hives, I put them into the cellar for a couple of days, after which I unite as much of them as is advisable, with the swarms, and use what is left where it is most needed. I fasten the queen-cells into cages which I tie in bundles and place (with the cells pointing downward) under the enameled cloth of the nursery-colony, after withdrawing the division-board. This prepares the nursery-colony to accept an unfertile queen, though it contains a laying one.

The cages which I use are made of one piece of wire-cloth, and are $1\frac{1}{2}$ inches long by 1 inch square, and have a piece of wood for a stopper, to the inside of which is fastened, by means of a tack, a small amount of the "Good" candy.

Knowing the age of the queen-cells in each bundle, from a slate hanging in a corresponding position on the outside of the hive, I know just when and where to look for queens. As the queens hatch, I remove the empty cells and put 3 or 4 young bees into each cage. In the evening, when the queens are 7 days old, and having at my side a hive large enough to hold one standard frame, I open the nursery-hive as quietly as possible, using just enough smoke to quiet the bees, and no more; then I lift a frame of brood with adhering bees (without the queen) and set it edgewise on the alighting-board, and lean it against the hive. I then draw the stopper

from a cage containing an unexcited queen, and allow her to walk at her leisure out on the comb amongst the bees; the main point being free her without her knowing it.

If a queen should get excited when released (a thing which they seldom do when handled rightly), I immediately re-cage her and try another. Having released one that performs satisfactorily, and having placed the comb in the little hive, I put it as far from any other hive as is possible and convenient. The vacancy in the nursery-hive may be filled with frames of brood taken from colonies which are able to spare them. If the whole of the next day following the one on which the queens were introduced should be pleasant, and there are plenty of drones flying, by evening about one-half of the queens should bear evidence of fertilization, when they may be taken out and another unfertilized queen may generally be easily introduced.

If I have no immediate use for laying-queens, I put them into cages which may be laid on the brood-frames of any colony in the apiary, for future use, and where I have kept them 65 days very successfully. The bees, after being used in the nuclei, may be disposed of at the entrance of the hive from which they were taken, and the brood may be used in building up weak colonies.

Through an accidental discovery in the spring of 1883, I have been led to practice, for the last two seasons, the method as here described; but since the appearance of the article by S. Simmins, on page 456, it has been with greatly increased success as well as pleasure. By this method I have several times introduced unfertile queens in the forenoon, and found them depositing eggs by the evening of the next day. I have also had two queens fertilized from one nucleus in 48 hours.

My experience with this method during the past season covers the introduction (without loss) of 67 unfertile queens, 2 of which proved to be imperfectly developed, 1 was lost in mating, and 2 nuclei absconded after the queens had been laying several days. The others are now in colonies. Bradford, ζ Iowa, Dec. 12, 1884.

For the American Bee Journal.

Western Maine Convention.

L. F. ABBOTT.

The third quarterly session of the Western Maine Bee-Keepers' Association was held on Nov. 25 and 26, 1884, at Mechanic Falls, Me. The attendance was good, and a lively interest was manifested in all the discussions. The Association now has a membership of about fifty.

The main topics discussed were methods of wintering bees, including wintering bees in chaff-hives, on summer stands, and in single-walled hives in the cellar. The comparative merits of Italian and black bees were briefly discussed.

The first session convened at 1 p. m., on Nov. 25, 1884. The topic of

wintering bees in chaff-hives was introduced by the reading of an essay by Mr. E. P. Churchill, of North Auburn. Some points in the essay called out an animated discussion which continued till evening. The experience of the members present extended over a period of time ranging from two to forty years.

The evening session was devoted to the discussion of wintering bees in the cellar. When proper conditions had been observed, cellar-wintering had been quite uniformly successful.

Mr. Pike, of Livermore Falls, had for 15 years followed the practice of placing his hives in the cellar. He had never lost a colony by that method when the hives contained sufficient stores.

Mr. J. B. Mason, of Mechanic Falls, had, for 7 years, wintered bees in chaff-hives, and had not lost a colony. Chaff-hives are now generally adopted by the bee-keepers of Maine.

Mr. Hatch, of Minot, had kept bees for 40 years, and had used the Kidder hive which was constructed somewhat on the double-walled plan. He thought that the chaff-hive was an improvement on the Kidder hive in that respect.

Mr. Mason now has some 30 colonies of bees wintering in the cellar. His practice has been to winter a part of his bees out-of-doors and a part in the cellar. When placed in the cellar the hives were raised a half-inch from the bottom-boards, when these were loose; or the entrances left open when the bottom-boards were fast. The bees were crowded upon 5 or 6 frames and division-boards placed on each side. On the top a quilt was placed, tacked on half-inch strips of wood, to allow the bees a passage over the frames. His cellar now maintains a temperature of 45° above zero. This he considered the right temperature, and in that condition the bees remained quiet. As the temperature of the cellar went down, the bees became uneasy. The remedy was to raise the temperature by artificial heat if necessary.

L. F. Abbott, of Lewiston, had wintered bees with uniform success, until last winter. His bees had consumed, having been ascertained by careful test, from 8½ to 22½ pounds of honey per colony, and were wintered in the cellar. Ventilation was given by means of a tube conducting air from the outside.

The decision of those who had wintered bees under the snow seemed mainly to condemn the practice of allowing the snow to remain drifted over the hives long at a time, especially during the months when the snow was likely to become dampened by its thawing.

At the evening session an essay was read, sent in by Mr. Addition, of Dexter, President of the State Bee-Keepers' Association. The subject being mainly relative to preparation of bees for winter. One point was to extract early enough in the fall so that the bees could be fed successfully all the field-gathered stores, and syrup of granulated sugar.

Another point was the merits of the Italian bee over the common black bee. The discussions of this latter subject was left over until the following forenoon.

Mr. Hutchinson favored the Italian bees because they were better to handle. Black queens were hard to find, and when black colonies were smoked, the bees came out and filled the air, and made an uproar generally.

Julius Fuller, of Oxford, said that from his experience, the Italians would go to the fields better and do less loitering about the hive-entrances than the blacks.

Mr. Churchill had conflicting opinions concerning the two races of bees, but from his experience and observation, he thought the Italians preferable. When we come to handling the bees, the Italians clutter out on the frames like a scared toad; but when you touch the blacks you have reversible bees at once.

Remarks were made by Messrs. Mason, Abbott, Welcome, and others. A communication was read from the editor of the *American Apiculturist*, referring to the formation of an association of bee-keepers for the New England States.

A resolution was adopted at the opening session of the convention constituting Mr. J. E. Pond, Jr., of Foxboro, Mass., an honorary member.

Action was taken at the closing session changing the meetings of the Association from quarterly to semi-annual, to be held on the first Tuesday and Wednesday in May, and in September. The next meeting will be at Mechanic Falls in May, 1885.

The International Congress.

It is proposed to hold an International Bee-Keepers' Congress on the World's Exposition Grounds at New Orleans, La., Feb. 24, 25 and 26, 1885. An interesting programme of subjects of great importance to every bee-keeper in America will be presented and discussed. The disposition of our honey product, with a view to secure better prices will be fully considered. At the same time there will be an Exhibit of Bees and Apian Supplies. Fuller particulars will be given hereafter. At the time selected, the Exposition will be at its best, and excursion rates low. The bee-keepers of our country should lay aside business for a week or two, and make every exertion to attend this Convention. Come prepared with facts and statistics, and ideas arranged, to take part in its deliberations.

Dr. N. P. Allen, Smith's Grove, Ky.
W. Williamson, Lexington, Ky.
Dr. O. M. Blanton, Greenville, Miss.
P. L. Viallon, Bayou Goula, La.
Judge W. H. Andrews, McKinney, Tex.
W. S. Hart, New Smyrna, Florida.
S. C. Boylston, Charleston, S. C.
Dr. J. P. H. Brown, Augusta, Ga.
H. C. Austin, Austin's Springs, Tenn.
R. C. Taylor, Wilmington, N. C.
J. W. Porter, Charlottesville, Va.
S. Valentine, Hagerstown, Md.

To the Bee-Keepers of the Northwest

At the last meeting of the Northwestern Bee-Keepers' Society, a special committee was appointed as follows:

T. G. Newman, Chicago, Ills., Pres.
T. L. Von Dorn, Omaha, Neb., Sec.
Rev. O. Clute, Iowa City, Iowa.
Jas. A. Nelson, Wyandotte, Kan.
Prof. A. J. Cook, Lansing, Mich.
Dr. G. L. Tinker, New Philadelphia, Ohio.
A. Fahnestock, La Porte, Ind.
C. H. Green, Berlin, Wis.
D. G. Parker, St. Joseph, Mo.
C. F. Greening, Grand Meadow, Minn.,

for the purpose of securing, by legislation in the several States of the Northwest, laws for the suppression of foul brood, and for securing statistical reports of apiarian products. After consultation with Gen. C. F. Manderson, of Omaha, a Nebraska senator, I am convinced that a petition or petitions asking to have our products included in the crop reports of the Department of Agriculture will meet with a ready response and prompt action at the hands of Congress. Senator Manderson said that he would be pleased to serve the bee-keepers in the matter, and had no doubt as to the result.

I would, therefore, earnestly request the bee-keepers of the United States to advise me at once, by postal, as to their desires in the matter, that I may forward their views to Washington. Their full views upon all the subjects contained in this article are urged, giving in detail all that they may think necessary to be mentioned in the petition, or in the laws for the suppression of foul brood. My own ideas upon the subject of petition are these:

We, the undersigned petitioners, bee-keepers of the United States, do respectfully request of your Honorable Body, that crop reports of apiarian products may be included in the reports of the Department of Agriculture: we would further ask that such reports should state the number of colonies of bees in the various States and Territories upon the first day of June of each year; and that upon the first day of August and upon the first day of Oct. of each year, there shall be made a report giving as nearly as possible the number of pounds of comb and extracted honey produced in the several States and Territories, together with a statement as to the source from which it was derived. The October report is to contain, also, the probable production of beeswax.

It will also be in order to support this petition with an argument as to its desirability, which should go with it. These are only my own crude ideas. Let me hear from all.

The matter of foul brood is entirely a State matter. As it is altogether probable that a cure for this dread disease is now possible, I imagine that we will not need any death-penalty laws on the subject; but I imagine that we shall need well-drawn laws in every State to suppress it. The specialist will hardly need a law, at any rate, not on this side the Rockies; but what will we say, if the

disease can be carried in the honey which is just now being sent to us from portions of California, the bees of which, by good authority, are much affected with foul brood. Leaving this source of danger out of the question, there yet remains that large class of shiftless bee-keepers, who either do not know or do not care about it, and hence the necessity of sound law.

I should be pleased if those who can will send me drafts of the law as they think it *should be*.

T. L. VON DORN, Sec. Spec. Com.
820 S. Ave., Omaha, Neb.

For the American Bee Journal.

Tuscarawas County, O., Convention.

The bee-keepers of Tuscarawas County, O., met at New Philadelphia, O., on Oct. 21, 1884. The meeting was called to order by the President, A. A. Fradenburg, after which he delivered an opening address to the convention, confining himself mainly to the cultivation of honey-plants. In his remarks he stated that he believed that it would pay to cultivate plants for honey alone.

Many subjects were brought up, and different views concerning them were advanced. Never before was there such an interest taken in beetur in old Tuscarawas county as there is at the present time.

The number of colonies of bees represented was 173, spring count, and 267 fall count, and the number of pounds of honey taken was 5,216.

That which may most interest bee-keepers in general was a discussion of open cider-mills and their effect on the bees. After the discussion, Messrs. Swinehart and Williams were appointed to draw up a petition to be presented to our State legislature, asking that all open cider-mills be so enclosed as to exclude all bees. The following is the petition:

To the General Assembly of the State of Ohio:—

HONORABLE SIRS: *Whereas*, Bee-culture is now a standard occupation in our State, there being a large number of both men and women engaged in it as a means of subsistence; and

Whereas, There are many cider-mills, or places where cider is made, in close proximity to our bees; and

Whereas, Our bees are, as it were, enticed by the cider to the place of making; and that many thousands are drowned and crushed, during the making of the cider, to such an extent that many colonies are almost depopulated; and that in the fall, when they have ceased rearing bees, and thus go into winter quarters in reduced numbers, greatly increasing the mortality among them; and

Whereas, Much cider is carried away by the bees and stored in the combs of the hives, which, when eaten during cold weather, produces dysentery or bee-diarrhoea, which destroys more bees than all other things combined, and sometimes almost depopulating whole apiaries.

Therefore, We, the bee-keepers of the State of Ohio, do petition and

earnestly request that you protect us in our cultivation of bees and production of honey, by the passage of such a law as will require all persons engaged in the making of cider to enclose their mills so as to exclude bees.

It was decided, after much discussion, that the best manner to get the above petition before the Legislature, was to have every bee-keeper to copy it and get the bee-keepers of his neighborhood to sign it, and that all be sent to some one person who will present all to the Assembly. Mr. A. A. Fradenburg, of Port Washington, O., will receive the petitions.

We would like all interested in this matter to give their views on this question, and also their efforts in bringing about the desired result.

GEO. F. WILLIAMS, Sec.
A. A. FRADENBURG, Pres.

For the American Bee Journal.

Getting Statistics—Peculiar Season.

J. W. MARGRAVE.

We have had the most peculiar season, so far as honey is concerned, that I ever saw. I wintered my bees mainly in a clamp, took them out on April 1, and found 7 out of 45 colonies dead, and a majority of the others badly affected with bee-diarrhoea. I had 12 colonies on the summer stands, one of which was dead, but there was not much diarrhoea among the others. In the spring they dwindled down to 38 colonies by May 10, and many of the remaining colonies were reduced to a mere handful.

It was cold and wet during fruit-bloom, and they only got honey enough to keep brood-rearing going well until in June, when they began to swarm; and by dividing, together with natural swarming, I increased them to 66 colonies. I secured no surplus honey until Aug. 18, when the bees began to show signs of activity, and for five or six days gathered honey very rapidly. I was on the point of extracting a barrel or two of honey, but on Aug. 24 we had an intensely hot day, and nearly all of the bees lay out on the outside of the hives, and just then our honey season ended.

I extracted none at all, and doubled them back from 66 to 53 colonies, and left them out on the summer stands, with $\frac{1}{2}$ -story on the top of the hives filled with forest leaves; how many I shall lose in wintering, I will be able to report about May 1, 1885.

In regard to getting statistical reports, I would say that I think it can be done better through the assessors of the different townships than by any other way. In our county we now get a pretty fair report in this way, but we do not get the increase for the preceding year, only the number of colonies and the amount of honey and beeswax. Now, if we could get the blanks so printed as to show the increase of colonies as well as the number of colonies lost in wintering (and by a little effort this might be done), what more would we need?

SELECTIONS FROM OUR LETTER BOX

A Good Report.

I use the Langstroth-Simplicity hive, and my bees are the common or brown German. I commenced the season with 18 colonies, 6 of which were very weak, and I lost one colony by being robbed while I was away from home. I have increased my apiary to 32 colonies, and my crop is 2,150 pounds of comb honey in one-pound sections, 75 per cent of which is white honey. How is that for a poor honey season?

A. KRONEMYER.

Hudsonville, Mich., Dec. 14, 1884.

Bee-Keeping in Wyoming Territory.

I am pleased with the bold stand you have taken against adulteration. That humbug cry of honey adulteration greatly retards the use of honey for food. One of my neighbors, a wealthy cattle and sheep owner, told me the other day, in a very wise (?) and emphatic manner, that all honey put on the market now-a-days, is artificial, made from sugar and glucose, and that he had seen the combs made in large quantities by machinery in a "factory" right in the great city of Chicago. It was useless for me to endeavor to explain the matter to him, or to argue him out of such absurd ideas, and I had to "grin and bear it." My honey-bees have wintered well and stored nice, white surplus honey from the wild prairie and mountain flowers during the three years that I have had them. They are the first and only honey-bees ever brought to Wyoming Territory. This is a wonderful region, where flowers sometimes blossom ten thousand feet above the sea-level, and the great mountains rear their caps of snow above the clouds, and where bears, mountain-lions, elk, deer, antelopes

and mountain-sheep abound; also gold, silver, copper, iron, coal, asbestos, sulphur, soda, and even petroleum are found. This is also the particular region where the celebrated Wyoming moss-agates are found, which are considered the most beautiful in the world; and the different ores, fossils, crystals, petrifications, etc., in all their peculiar forms and colors, are interesting to all lovers of nature.

G. G. MEAD.

Rawlins, Wyo., Dec. 5, 1884.

Bee-Exhibit at the World's Fair.

I am authorized to say that the time of the exhibit of colonies of bees at the World's Fair at New Orleans, La., will be during the week of the Bee-Keepers' Congress, and not as given in the published Premium List.

J. P. H. BROWN, M. D.

Augusta, Ga., Dec. 11, 1884.

Profiting by Mistakes.

I had 5 colonies of bees, spring count, and I have taken about 125 pounds of comb honey and 75 pounds of extracted honey. My bees were weak, and the spring being so cold and wet, with high winds, they had no chance to work. No swarms issued until Aug. 6, when our fall bloom commenced, which was very good; but wishing to rear some queens, to supersede some that I had, I did not get as much out of the bloom as I might. I increased my apiary to 10 colonies, and they were put into winter quarters in pretty good condition. On looking back I can see my many mistakes, but I hope to be able to rectify them during another year.

W. STOUT.

Delaware City, Del., Dec. 10, 1884.

What is the Duty on Cuban Honey?

I see by the text of the new commercial treaty with Spain, that eggs, honey, wax, etc., from Cuba and Porto Rico, are to be admitted into the United States free of duty. It seems to me that if this treaty is ratified, it will tend to materially lower the price of honey in the United States, as I understand that some honey is imported from Cuba now under a duty of about 20 cents per gallon. Will some one who knows, please say through the BEE JOURNAL what honey is worth in Cuba? What kinds they produce mostly, comb or extracted? and in what quantities?

A. F. ROBSON.

Italy Hollow, N. Y., Dec. 12, 1884.

Getting Sections Completely Filled.

I attended the late convention of the Michigan State Bee-Keepers' Association and exhibited a few samples of sections filled with honey, in which the foundation had been fastened at both ends, and one could hardly tell which was top or bottom, except by the cells. Now, I would like to have every bee-keeper try this plan. Cut the foundation $\frac{1}{2}$ inch longer than the section and fasten at both ends. It will make a sort of brace, and the bees seem to take to such sections

sooner than when they are only half filled. The weight of the bees does not pull down the foundation as they sometimes do when the sections are only half filled. I tried about 100 of them during the past summer, without separators, and I crated 90 of them in crates holding 32 $4\frac{1}{4} \times 4\frac{1}{4}$ sections, and they weighed 36 lbs. to the crate. If the foundation is fastened in this way, there is no up or down and the sections can be placed in the hives on either end and will not need to be reversed in order to get the bottoms attached. The bees will build them solid all around. I am going to fasten all my foundation at both ends after this, for I know that it is a good way to get sections completely filled. I do not claim this for the 2-lb. sections, for I have not tried them yet, but I will do so next season. Of course by this plan a little more foundation will be used, but one will get it all back again in nice, well-filled sections.

JOHN REV.

E. Saginaw, Mich. Dec. 15, 1884.

Pollen the Cause of Bee-Diarrhoea.

When the question, "Is pollen the cause of bee-diarrhoea?" is asked, I would answer, yes, and the pollen which causes the trouble is found in the honey. I have lost no bees since I discovered that some honey contains pollen. I am satisfied, from past experience, that the "pollen theory" is correct, and the pollen is found principally in the honey.

CHAS. HARROLD, 14-36.

Hamburg, Iowa, Dec. 13, 1884.

Hives Packed for Winter.

I have six colonies in Langstroth hives packed with cloth above the brood-chamber, and the upper story filled with dry oak-leaves. The hives are set one foot apart, the spaces between them at their backs are filled in with straw, and a board roof is over all. I will tell you in the spring how they wintered.

W. R. ELWOOD,

Lindley, Mo., Dec. 13, 1884.

Light Honey Crop.

The honey crop in this country is light. Populous colonies have produced an average of 40 pounds of extracted honey or 20 pounds of comb honey per colony. Those colonies which swarmed and also their swarms have hardly made a living. Extracted honey sells for about the same as good molasses—5 cents per lb.; and comb honey in sections sells at 10 cts. per lb.

FRANK THAVILLE,

Forest City, Ark., Dec. 10, 1884.

Many Swarms Absconded.

I secured about 800 lbs. of extracted honey from heart's-ease which is worth 12 cents per pound, and I have paid out about \$60 for various kinds of supplies, and a great deal more for experience. The increase was made by division. The season was a very poor one, and the bees stopped working a full month before frost came, while last year they stored honey rap-

idly until frost appeared. A great many swarms absconded in this vicinity, many of which will starve, as there are few trees left along the streams large enough to contain a winter supply of honey for a colony of bees.

DAVID M. IMLAY, 15—39.
Seward, α Nebr., Dec. 15, 1884.

Pollen not Harmful.

I have 129 colonies of bees in good condition for wintering on the summer stands in double-walled hives packed with tow. I have not lost a single colony in wintering in these hives since 1881. I have no trouble with spring dwindling or bee-diarthæa. I wintered my bees on honey and all the pollen that I could give them, and they have come out all right, nice and bright every spring; so the "pollen theory" is all wrong to me. As I wish to change from the one-pound, $4\frac{1}{4} \times 4\frac{1}{4} \times 2$ -inch section, to a one-pound $1\frac{1}{2}$ inches wide, what must be the size of the latter?

A. KOEPPEN.

Flint, \odot Mich., Dec. 14, 1884.

[About $4\frac{1}{2} \times 4\frac{1}{2}$ inches.—Ed.]

Reply to Mr. Kendall.

In reply to Mr. Kendall's just and friendly criticisms on page 790, I will say that I feel his inferior rather than his superior upon the subject of organization as an antidote for adulteration. I take no issue with him, if he means an organization of producers for the purpose of working against the practice of adulteration, for while they were at this work, they might work against over-stocking the honey markets by inducing every one to keep bees. I do not think that the practice of adulteration hurts us because of the *quality* of the mixed goods, but by the addition of *quantity*, especially when put on an already over-stocked market. I have little fears of adulteration, for our introduction of small packages has closed nearly all the re-packing honey houses, and I claim that such are the laws of specialty that no producer can make it pay to adulterate. He had better put his capital, muscle and thought into straight-forward production; better in a dollar-and-cent point of view. The reason why I thought that organization would do us only harm, was because I expected that organization, while it discouraged the increase of 1-lb. of mixed honey, would foster the increase of 3-lbs. of the pure article, whose every pound we just as much dread; and the reporters of papers would go away and say: "The bee-keepers, themselves, declare that the markets are loaded with bogus honey; they say that comb honey is not exempt." If Mr. Kendall means for us to have a producers' convention, a meeting of men who hold the same views as he and I, one that will do its work in the interests of producers who now exist, not only regarding our interests in the adulteration matter, but the over-production matter as well, I am very much in favor of such a meeting. I should

rejoice to once attend a meeting that I thought came to more than it cost. Let us hear from Dr. C. C. Miller on this subject. Who are conventions for, and whom have they benefited?

JAMES HEDDON, 400—460
Dowagiac, ρ Mich.

Too Hasty a Conclusion.

In Mr. Youngman's article, on page 793, is a paragraph which requires correction. It was not "Cyula," but myself, who took positive grounds in discussing the wintering problem. Being a stranger, and making but a short call, it is not surprising that Mr. Youngman's memory should be somewhat at fault. That I "smiled audibly" at either of the theories mentioned, must be only Mr. Youngman's graphic way of representing that I did insist upon my "absurd" little theory, viz: That bees will surely winter well when properly prepared and packed on their summer stands in good season; meaning, of course, by properly prepared and packed, according to my own method, which after all does not differ materially from that employed by hundreds of others. Some of our bee-keeping friends know how little encouragement my sister gives me, when I undertake to maintain that we have proven that we can winter bees successfully.

NELLIE LINSWIK.

Poor Season, but not Discouraged.

The past season has been the poorest one for honey secretion in this locality that I have experienced anywhere since being in the bee-business. I began with 24 colonies in the spring, and a part of those were light, yet during April and May, I got them into good working condition; but when June came, with all its abundant bloom, it was a time of perfect starvation to the bees throughout this neighborhood, and many of the colonies died. During July they secured enough honey to start brood-rearing, and during August the most of them stored enough for winter use. From Aug. 15 to Aug. 24, I never saw such a rush for the boxes as the bees made, but two days later all was at a standstill, and the consequence was that my surplus boxes were left about half-filled. I left them on the hive, still hoping that we would get another flow of honey in Sept., but no more was stored than what they required, so I was obliged to take off the cases with 100 lbs. of finished comb honey, and 75 lbs. of extracted. My increase was 6 swarms by natural swarming and 5 by division, and 2 nuclei with my breeding queens in them. I have received poor pay this season, but I am not discouraged, for the harvest will come. I have put 31 colonies into winter quarters, some of them being very light and weighing only 16 to 18 pounds, *i. e.* of bees and stores. All are sleeping quietly now, but whether they will all wake up in the spring is yet to be seen. I have 16 colonies in the cellar and the balance outside.

ROBT. CORBETT.
Manhattan, δ Kans., Dec. 9, 1884.

Convention Notices.

The seventh annual meeting of the Nebraska State Bee-Keepers' Association will be held at Tecumseh, Neb., on Wednesday, Thursday and Friday, Jan. 14, 15 and 16, 1885; the first session beginning at 3 p. m. on the 14th. Notices will be posted in the Tecumseh depots, stating the hall in which the meeting will be held. The meeting has been appointed this time in the southeastern part of the State, expecting that Iowa, Missouri and Kansas will be well represented. We already have the promise of several prominent bee-keepers of other States to be present. Please notify me immediately, at Lincoln, Nebr., what route you wish to take to get there, and I will send you a Railroad certificate, entitling you to reduced rates. Do not neglect this.

M. L. TRESTER, Sec.

A meeting of bee-keepers will be held at Rock Elm Center, Wis., on Wednesday, Dec. 31, 1884, for the purpose of organizing a bee-keepers' society. All who are interested are invited to be present.

A. C. SANFORD.

The Mahoning Valley Bee-Keepers' Association will hold its next meeting in the Town Hall at Newton Falls, O., on the third Thursday in January, 1885. The meeting will be instructive as well as interesting.

E. W. TURNER, Sec.
L. CARSON, Pres.

The Champlain Valley Bee-Keepers' Association will meet at the Addison House in Middlebury, Vt., on Thursday, January 8, 1885.

J. E. CRANE, Sec.

Premium for Club of 10 Subscribers.

The book for every farmer is the one entitled "Affleck's Farmer's and Planter's Record and Account Book," in which there is the most systematic, complete and convenient arrangement of headings for every Farm Account and memoranda of all important events which may occur in connection with his business. Every progressive farmer certainly desires to make a success of his occupation, and should adopt every possible means of bringing about that result. He, then, should have a correct knowledge of his entire business, which he can have only by keeping a correct account of every crop produced on his farm, the cost of production of all his live stock and an itemized account of all his expenses. Then at the close of the year, when he takes off his balance sheet, which is admirably arranged in the book above referred to, he will be able to see at a glance whether his farm does or does not pay.

This valuable book contains 166 pages, is nicely printed on writing paper, ruled and bound, and the price is \$3.00. It can be sent by mail for 24 cents extra.

We can supply these books at the publisher's price, or will make a present of one copy for every club of TEN subscribers to the Weekly BEE JOURNAL for one year, with \$20. Four subscribers to the Monthly will count the same as one for the Weekly.

Now is the time to get up Clubs. Who will work for a copy of this valuable book.

Convention Notices.

The sixteenth annual convention of the Northeastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 21, 22 and 23 of January, 1885. The executive committee are determined to maintain the high standing and enviable reputation which the Association has justly gained in the past, and at the coming convention they propose to outdo all former efforts. The meeting will surely be the largest and most interesting ever held in America. No bee-keeper can afford to stay at home. All are invited. All implements of the apiary sent to the Secretary, will be properly arrayed to compare favorably with others on exhibition, and will be disposed of or returned, as the owner directs. Reduced rates for board at hotels.

GEO. W. HOUSE, Sec.

L. C. ROOT, Pres.

The regular annual meeting of the Indiana State Bee-Keepers' Association will be held on Thursday and Friday, Jan. 22 and 23, 1885. The meetings will be conducted in the rooms of the State Board of Agriculture, on the corner of Tennessee and Market Streets, in Indianapolis, Ind. It is proposed to make this the most important and interesting meeting of bee-keepers ever held in the State. An extensive programme, including all questions of importance to bee-keepers, is being prepared and will be soon sent out to bee-keepers throughout the State. Prominent apiarists from neighboring States have been invited to assist and presumably many of them will be in attendance during the meeting. These gatherings are of vast importance, especially to beginners, and all those at all interested in this important industry should make it a point to attend this meeting.

FRANK L. DOUGHERTY, Sec.

The eighth annual meeting of the Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will be held in Temperance Hall, at Freeport, Ill., on Jan. 20 and 21, 1885.

JONATHAN STEWART, Sec.

The Central Illinois Bee-Keepers' Association will hold its next annual meeting in Bloomington, Ill., on the second Wednesday in January, 1885, at 9 a. m.

W. B. LAWRENCE, Sec.

The Willamette Valley Bee-Keepers' Association will hold its second meeting at La Fayette, Oregon, on the third Tuesday in June, 1885. All who are interested are invited to attend.

E. J. HADLEY, Sec.

F. S. HARDING, Pres.

The Union Bee-Keepers' Association of Western Iowa will meet in Stuart, Iowa, at 10 a. m. on Saturday, Dec. 27, 1884. All who are interested are invited to attend.

M. E. DARBY, Sec.

The Bee Journal for 1885.

To increase the number of readers of the BEE JOURNAL, we believe, will aid progressive bee-culture and help to elevate the pursuit. We, therefore, offer the following

CASH PREMIUMS FOR CLUBS.

\$10.00 for the largest club received at this office before Feb. 1, 1885 (either of the Weekly, Monthly, or both); one Weekly counts same as 4 Monthlies.

\$5.00 for the second largest; \$4.00 for the third; \$3.00 for the fourth; \$2.00 for the fifth; and \$1.00 for the sixth largest club.

Subscriptions for two or more years for one person, will count the same as each year for a different person.

Phenol for curing Foul Brood.

As there is much interest manifested by Americans on the above subject, we have published Mr. Cheshire's experiments and investigations in pamphlet form—32 pages—and will send it postpaid for 10 cents to any address.

For two subscribers for the Weekly BEE JOURNAL (or 8 for the Monthly) for one year, we will present a Pocket Dictionary, and send it by mail postpaid.

Dr. J. P. H. Brown, Augusta, Ga., writes thus concerning our "Bee-Keepers' Convention Hand-Book": "I have examined it, and find it most superbly gotten up. You have embodied in it all the gist of the Parliamentary Manuals of Jefferson, Cushing and Mell. Aside from the information it contains, no bee-keeper can afford to do without it for a memorandum book."

For \$2.75 we will supply the Weekly BEE JOURNAL one year, and Dzierzon's Rational Bee-Keeping, in paper covers; or the Monthly BEE JOURNAL and the book for \$1.75. Or, bound in cloth, with Weekly, \$3.00; with the Monthly, \$2.00.

We will send sample copies free to all who wish them, or desire to get up Clubs. Now is the time to work for the Cash premiums we offer. A large club for the Monthly can be gotten up in almost every locality.

We can supply photographs of Rev. L. L. Langstroth, the Baron of Berlepsch, or Dzierzon, at 25 cts. each.

Honey and Beeswax Market.

OFFICE OF THE AMERICAN BEE JOURNAL, }
Monday, 10 a. m., Dec. 22, 1884. }

The following are the latest quotations for honey and beeswax received up to this hour:

NEW YORK.

HONEY.—Our market is well supplied with comb honey, with an unsatisfactory demand for it, even at the following low prices:

Fancy white comb in 1-lb. sections, 16@18c.; the same in 2-lb. sections, 14@16c.; fair to good white comb in 1 and 2-lb. sections, 13@15c.; fancy buckwheat comb in 1-lb. sections, 10@11c.; same in 2-lb. sections, 9@9½c.; ordinary grades of buckwheat comb honey, in 1 and 2-pound sections, 9@9½c. Extracted, white clover, in kegs or small barrels, 8@8½c.; buckwheat, in ditto, 6@7.

BEEWAX.—Prime yellow, 31@32c.

MCCAUL & HILDRETH, 34 Hudson St.

BOSTON.

HONEY.—We quote best white in 1-lb. sections, 18@20c.; 2-lb., 16@18c. Extracted, 8@9c. Unglassed sections sell best. Our market is quiet and we are obliged to shade our prices in order to make sales. We have a large stock and cannot advise any more shipments this season.

BEEWAX—35c.

BLAKE & RIPLEY, 57 Chatbam Street.

CHICAGO.

HONEY.—The sales of comb honey are very light at present, and prices little better than nominal. The stock of that produced in the Middle States is not large, compared with the past two seasons. But then we did not have the Pacific slope pouring it in like the east, as they are doing at present, and which can be bought by the case at 12 to 14c. per pound—in combs of 2-lbs. well filled and pure white in appearance. A large percentage of the trade buy it in preference to our Mississippi Valley at the same price. I quote 1-lb. frames, well filled and pure white, at 16c. A little off in color, etc., 14@15c. Extracted, weak, 6@8c.

BEEWAX.—For fair to slow, 28@30c.

R. A. BURNETT, 161 South Water St.

CINCINNATI.

HONEY.—There is an unsatisfactory demand for extracted honey from manufacturers, while there is a fair inquiry for small packages of clover honey such as dimes, ½-lb., 1-lb., and 2-lb. jars, from the retail trade. In fact, as arrivals exceed the demand. Extracted honey brings 5@6c. on arrival; choice white comb honey is in fair demand and sells best in 1-lb. sections. It brings 15 @16c. in the jobbing way. We have several small lots of dark comb honey from parties in Illinois, and offered it as low as 10 and 11 cents per lb, without finding a buyer. Dealers most certainly misled producers by quoting buckwheat and popular comb honey, if they are not more successful than we are in disposing of the same.

BEEWAX.—The demand is slow and arrivals are few. Good yellow brings 26@27c. on arrival.

C. F. MUTH, Freeman & Central Ave.

SAN FRANCISCO.

HONEY.—There is a moderate local trade and large orders are being filled for shipment. Stocks are on the decrease and the market has a firmer tone. We caution apiarists against using old or second-hand cases or tins, as such can never be handled to advantage and cause extra expense and trouble. Tins in cases should always have a strong partition between them.

White to extra white comb, 9@10c.; dark to good, 4@8c. Extracted, choice to extra white, 4½@4¾c.; dark and candied, 3½@3¾c.

BEEWAX.—Wholesale, 25@30c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY.—Steady; demand and supply both small. Comb, 12@14c. per lb., and strained and extracted 5½@6c.

BEEWAX.—Firm at 32@32½c. for choice.

W. T. ANDERSON & CO., 104 N. 3d Street.

CLEVELAND.

HONEY.—Honey is in a little better demand at a little lower price than our former quotations. While the market is still full, we are enabled to place extra lots of strictly white one-lb. sections at about 15c., with an occasional sale at 16c.; 1½ and 2-lb. sections, best white, 14c.; dark and second quality, rather slow at 12 to 14c. For extracted there is no demand.

BEEWAX.—28c.

A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY.—We quote comb honey in 2 lb. sections, 13@14c.; extracted, 6½c.

GEO. W. MEADE & Co., 213 Market.

KANSAS CITY.

HONEY.—The market is quiet and unchanged, with good demand and liberal receipts. Comb, 5-lb. sections, none in the market. They would bring 18c.; 1-lb., 14@16c.; 2-lbs., 13@14c. The above figures are for choice stock in regular shipping crates. Dark or large combs in rough crates sell slowly at 9 to 10c. Extracted, California, 6@7c.; white clover, 7@8c.; Southern, 5½@6c.

BEEWAX.—None in the market.

CLEMENS, CLOON & Co.

"BOSS" ONE-PIECE SECTIONS.

READ THIS.

A word of explanation in regard to the infringement suit on the One-Piece Section, we deem necessary at this time.

I commenced suit against A. I. Root, in the United States Circuit Court, for the Northern district of Ohio; Stanley Matthews presiding. He decided that the patent was void for want of novelty. I have taken an appeal to the United States Supreme Court at Washington, which will decide the case, and its decision will be final. If it goes against me I will submit, but if decided in my favor, I shall expect all who have infringed will pay me damages from date of the patent.

Some unprincipled parties are advertising that the Courts have decided that the patent is void. This is not the case, as it is before the United States Supreme Court at Washington, at the present time. When that Court gives its opinion it will be final, and until it does, any one infringing will be liable for damages, if the United States Supreme Court sustains the patent.

PRICES OF SECTIONS.

| | |
|--|--------|
| One-lb. Sections in lots of 500 to 4,000 | \$5.00 |
| Ditto Ditto 5,000 to 10,000 | 4.75 |
| Ditto Ditto 10,000 to 25,000 | 4.50 |
| Ditto Ditto 25,000 to 50,000 | 4.25 |
| Ditto Ditto 100,000 or more | 4.00 |

The one-lb. Section is 17 inches long. For any sizes between 17 and 20 inches in length, add 5 per cent. For any sizes between 20 and 24 inches, add 10 per cent. Add the above per centage to the price of one-lb. Sections in the same quantity.
