The notches in the ſide of each lead are intended to give eaſy paſſage to the water, that, if there ſhould be any foulneſs or ſediment in it, on ſhaking it a little it may all run through, and freſh water be put in its place. But this ſhifting the water need not be done more than once or twice in a winter, as there may be occaſion from the foulneſs; and when this is done, the ſides of the veſſel ſhould be cleaned with a painter's bruſh, and rinſed out again, and the bulbs themſelves waſhed, by pouring water on them at a little diſtance.

At any time when the outer ſkins of the bulbs dry, they are to be peeled off, that they may not occaſion foulneſs in the water; and if any duſt or foul matter be at any time obſerved ſwimming on the ſurface, the method is to fill up the pot or veſſel to the rim, and let it run over: this will carry off that light foulneſs, and the water may afterwards be poured away to the proper ſtandard.

Bulbs of equal bigneſs ſhould be planted together in the ſame pot, that they may all have the ſame benefit of the water. Narciſſus's and hyacinths do well together; as alſo tulips and jonquils, and crocuſes and ſnow-drops.

FLUDD (Robert), a famous philoſopher, born in 1574. He was fellow of the college of phyſicians in London, and became a moſt voluminous writer: he doated greatly on the wonders of chemiſtry; was a zealous brother of the Roſicrucian order; and his books, which are moſtly in Latin, are as dark and myſterious in their language as in their matter. He died in 1637.

FLUID, an appellation given to all bodies whoſe particles eaſily yield to the leaſt partial preſſure, or force impreſſed. For the

Laws and Properties of Fluids. See HYDROSTATICS.

There are various kinds of animalcules to be diſcerned in different fluids by the microſcope. Of many remarkable kinds of theſe, a deſcription is given under the article ANIMALCULE. All of theſe little creatures are eaſily deſtroyed by ſeparating them from their natural element. Naturaliſts have even fallen upon ſhorter methods. A needle-point, dipped in ſpirit of vitriol, and then immerſed into a drop of pepper-water, readily kills all the animalcules; which, though before friſking about with great livelineſs and activity, no ſooner come within the influence of the acid particles, than they ſpread themſelves, and tumble down to all appearance dead. The like may be done by a ſolution of ſalt; only with this difference, that, by the latter application, they ſeem to grow vertiginous, turning round and round till they fall down. Tincture of ſalt of tartar, uſed in the ſame manner, kills them ſtill more readily; yet not ſo, but there will be apparent marks of their being firſt ſick and convulſed. Inks deſtroy them as faſt as ſpirit of vitriol, and human blood produces the ſame effect. Urine, ſack, and ſugar, all deſtroy them, though not ſo faſt; beſides, that there is

ſome

Fluid. some diverſity in their figures and appearances, as they receive their deaths from this poiſon or that. The point of a pin dipped in ſpittle, preſently killed all the kinds of animalcules in puddle-water, as Mr Harris ſuppoſes it will other animalcules of this kind.

All who are acquainted with microſcopic obſervations, know very well, that in winter, in which the beſt glaſſes can diſcover no particle of animated matter, after a few grains of pepper, or a fragment of a plant of almoſt any kind, has been ſome time in it, animals full of life and motion are produced: and thoſe in ſuch numbers, as to equal the fluid itſelf in quantity.—When we ſee a numerous brood of young fiſhes in a pond, we make no doubt of their having owed their origin to the ſpawn, that is, to the eggs of the parents of the ſame ſpecies. What are we then to think of theſe? If we will conſider the progreſs of nature in the inſect tribes in general, and eſpecially in ſuch of them as are moſt analogous to theſe, we ſhall find it leſs difficult to give an account of their origin than might have been imagined.

A ſmall quantity of water taken from any ditch in the ſummer-months, is found to be full of little worms, ſeeming in nothing ſo much as in ſize to differ from the microſcopic animalcules. Nay, water, without theſe, expoſed in open veſſels to the heat of the weather, will be always found to abound with multitudes of them, viſible to the naked eye, and full of life and motion. Theſe we know, by their future changes, are the fly-worms of the different ſpecies of gnats, and multitudes of other fly-ſpecies; and we can eaſily determine, that they have owed their origin only to the eggs of the parent-fly there depoſited. Nay, a cloſer obſervation will at any time give ocular proof of this; as the flies may be ſeen laying their eggs there, and the eggs may be followed through all their changes to the fly again. Why then are we to doubt but that the air abounds with other flies and animalcules as minute as the worms in thoſe fluids; and that theſe laſt are only the fly-worms of the former, which, after a proper time ſpent in that ſtate, will ſuffer changes like thoſe of the larger kinds, and become flies like thoſe to whoſe eggs they owed their origin? *Vid. Reaumur. Hiſt. Inſect.* vol. iv. p. 431.

The differently medicated liquors made by infuſions of different plants, afford a proper matter for the worms of different ſpecies of theſe ſmall flies: and there is no reaſon to doubt, but that among theſe ſome are viviparous, others oviparous; and to this may be, in a great meaſure, owing the different time taken up for the production of theſe inſects in different fluids. Thoſe which are a proper matter for the worms of the viviparous fly, may be ſooneſt found full of them; as, probably, the liquor is no ſooner in a ſtate to afford them proper nouriſhment, than their parents place them there: whereas thoſe produced from the eggs of the little oviparous flies, muſt, after the liquor is in a proper ſtate, and they are depoſited in it in the form of eggs, have a proper time to be hatched, before they can appear alive.

It is eaſy to prove, that the animals we find in theſe vegetable infuſions were brought thither from elſewhere. It is not leſs eaſy to prove, that they could not be in the matter infuſed any more than in the water in which it is infuſed.

Notwithſtanding the fabulous accounts of ſalamanders, it is now well known, that no animal, large or ſmall, can bear the force of fire for any conſiderable time; and, by parity of reaſon, we are not to believe, that any inſect, or embryo inſect, in any ſtate, can bear the heat of boiling water for many minutes. To proceed to inquiries on this foundation: If ſeveral tubes filled with water, with a ſmall quantity of vegetable matter, ſuch as pepper, oak-bark, truffles, &c. in which, after a time, inſects will be diſcovered by the microſcope; and other like tubes be filled with ſimple water boiled, with water and pepper boiled together, and with water with the two other ingredients, all ſeparately boiled in it; when all theſe liquors come to a proper time for the obſervation of the microſcope, all, as well thoſe which have been boiled as thoſe which have not, will be found equally to abound with inſects; and thoſe of the ſame kind, in infuſions of the ſame kind, whether boiled or not boiled. Thoſe in the infuſions which had ſuſtained a heat capable of deſtroying animal-life, muſt therefore not have ſubſiſted either in the water or in the matters put into it, but muſt have been brought thither after the boiling; and it ſeems by no way ſo probably, as by means of ſome little winged inhabitants of the air depoſiting their eggs or worms in theſe fluids.

On this it is natural to aſk, how it comes to paſs, that while we ſee myriads of the progeny of theſe winged inſects in water, we never ſee themſelves? The anſwer is equally eaſy, viz. becauſe we can always place a drop of this water immediately before the focus of the microſcope, and keep it there while we are at leiſure to examine its contents; but that is not the caſe with regard to the air inhabited by the parent flies of theſe worms, which is an immenſe extent in proportion to the water proper for nouriſhing theſe worms; and, conſequently, while the latter are cluſtered together in heaps, the former may be diſperſed and ſcattered. Nor do we want inſtances of this, even in inſects of a larger kind. In many of our gardens, we frequently find veſſels of water filled with worms of the gnat kind, as plentifully, in proportion to their ſize, as thoſe of other fluids are with animalcules. Every cubic inch of water in theſe veſſels contains many hundreds of animals; yet we ſee many cubic inches of air in the garden not affording one of the parent flies.

But neither are we poſitively to declare that the parent flies of theſe animalcules are in all ſtates wholly inviſible to us; if not ſingly to be ſeen, there are ſome ſtrong reaſons to imagine that they may in great cluſters. Every one has ſeen in a clear day, when looking ſtedfaſtly at the ſky, that the air is in many places diſturbed by motions and convolutions in certain ſpots. Theſe cannot be the effects of imagination, or of faults in our eyes, becauſe they appear the ſame to all; and if we conſider what would be the caſe to an eye formed in ſuch a manner as to ſee nothing ſmaller than an ox, on viewing the air on a marſh fully peopled with gnats, we muſt be ſenſible, that the clouds of theſe inſects, though to us diſtinctly enough viſible, would appear to ſuch an eye merely as the moving parcels of air in the former inſtance do to us: and ſurely it is thence no raſh concluſion to infer, that the caſe may be the ſame, and that myriads of flying in-

Fluid, Fluidity.

fects, too small to be singly the objects of our view, yet are to us what the clouds of gnats would be in the former case.

Nervous FLUID. See ANATOMY, p. 761. col. 2.

Elastic FLUIDS. See AEROLOGY, AIR, *Fixed Air*, GAS, VAPOUR, &c.

FLUIDITY, is by Sir Isaac Newton defined to be, that property of bodies by which they yield to any force impressed, and which have their parts very easily moved among one another.

To this definition some have added, that the parts of a fluid are in a continual motion. This opinion is supported by the solution of salts, and the formation of tinctures. If a small bit of saffron is thrown into a phial full of water, a yellow tincture will soon be communicated to the water to a considerable height, though the phial is allowed to remain at rest; which indicates a motion in those parts of the fluid which touch the saffron, by which its colouring matter is carried up.

With regard to water, this can scarce be denied; the constant exhalations from its surface show, that there must be a perpetual motion in its parts from the ascent of the steam through it. In mercury, where insensible evaporation does not take place, it might be doubted; and accordingly the Newtonian philosophers in general have been of opinion, that there are some substances essentially fluid, from the spherical figure of their constituent particles. The congelation of mercury, however, by an extreme degree of cold *, demonstrates that fluidity is not essentially inherent in mercury more than in other bodies.

* See *Congelation.*

That fluids have vacuities in their substance is evident, because they may be made to dissolve certain bodies without sensibly increasing their bulk. For example, water will dissolve a certain quantity of salt; after which it will receive a little sugar, and after that a little alum, without increasing its first dimensions. Here we can scarce suppose any thing else than that the saline particles were interposed between those of the fluid; and as, by the mixture of salt and water, a considerable degree of cold is produced, we may thence easily see why the fluid receives these substances without any increase of bulk. All substances are expanded by heat, and reduced into less dimensions by cold; therefore, if any substance is added to a fluid, which tends to make it cold, the expansion by the bulk of the substance added, will not be so much perceived as if this effect had not happened; and if the quantity added be small, the fluid will contract as much, perhaps more, from the cold produced by the mixture, than it will be expanded from the bulk of the salt. This also may let us know with what these interstices between the particles of the fluid were filled up; namely, the element of fire or heat. The saline particles, upon their solution in the fluid, have occupied these spaces; and now the liquor, being deprived of a quantity of this element equal in bulk to the salt added, feels sensibly colder.

As, therefore, there is scarce any body to be found, but what may become solid by a sufficient degree of cold, and none but what a certain degree of heat will render fluid; the opinion naturally arises, that fire is the cause of fluidity in all bodies, and that this element is the only essentially fluid substance in nature. Hence we may conclude, that those substances which we call *fluids* are not essentially so, but only assume that appearance in consequence of an intimate union with the element of fire; just as gums assume a fluid appearance on being dissolved in spirit of wine, or salts in water.

Fluidity ‖ Flumm erg.

Upon these principles Dr Black mentions fluidity as an effect of heat *. The different degrees of heat which are required to bring different bodies into a state of fluidity, he supposes to depend on some particulars in the mixture and composition of the bodies themselves: which becomes extremely probable, from considering that we change the natural state of bodies in this respect, by certain mixtures; thus, if two metals are compounded, the mixture is usually more fusible than either of them separately. See CHEMISTRY, n° 542.

* See *Chemistry*, n° 115, 117, 119.

It is certain, however, that water becomes warmer by being converted into ice †; which may seem contradictory to this opinion. To this, however, the Doctor replies, that fluidity does not consist in the degree of sensible heat contained in bodies, which will affect the hand or a thermometer; but in a certain quantity which remains in a latent state ‡. This opinion he supports from the great length of time required to melt ice; and to ascertain the degree of heat requisite to keep water in a fluid state, he put five ounces of water into a Florence flask, and converted it into ice by means of a freezing mixture put round the flask. Into another flask of the same kind he put an equal quantity of water cooled down nearly to the freezing point, by mixing it with snow, and then pouring it off. In this he placed a very delicate thermometer; and found, that it acquired heat from the air of the room in which it was placed: seven degrees of heat were gained the first half hour. The ice being exposed to the same degree of heat, namely, the air of a large room without fire, it cannot be doubted that it received heat from the air as fast as the water which was not frozen: but, to prevent all possibility of deception, he put his hand under the flask containing the ice, and found a stream of cold air very sensibly descending from it, even at a considerable distance from the flask; which undeniably proved, that the ice was all that time absorbing heat from the air. Nevertheless, it was not till 11 hours that the ice was half-melted, though in that time it had absorbed so much heat as ought to have raised the thermometer to 140°; and even after it was melted, the temperature of the water was found scarce above the freezing point: so that, as the heat which entered could not be found in the melted ice, he concluded that it remained concealed in the water, as an essential ingredient of its composition. See CONGELATION.

FLUKE, or FLOUNDER, in ichthyology. See PLEURONECTES.

Fluke-Worm. See FASCIOLA.

Fluke of an Anchor, that part of it which fastens in the ground. See ANCHOR.

FLUMMERY, a wholesome sort of jelly made of oat-meal.

The manner of preparing it is as follows. Put three large handfuls of finely ground oat-meal to steep, for 24 hours, in two quarts of fair water: then pour off the clear water, and put two quarts of fresh water to it:

Fluor. it: ſtrain it through a fine hair-ſieve, putting in two ſpoonfuls of orange-flower water and a ſpoonful of ſugar: boil it till it is as thick as a haſty-pudding, ſtirring it continually while it is boiling, that it may be very ſmooth.

FLUOR, in phyſics, a fluid; or, more properly, the ſtate of a body that was before hard or ſolid, but is now reduced by fuſion or fire into a ſtate of fluidity.

Fluor Acid. See CHEMISTRY-*Index*.

Fluor Albus. See MEDICINE-*Index*.

Fluor-Spar, or *Blue-John*, called alſo fluxing ſpars, vitreſcent or glaſs ſpars, are a genus of foſſils compoſed of calcareous earth united with an acid of a peculiar kind, of which an account is given under CHEMISTRY; ſee that article, per Index at *Fluor acid*.

They are little harder than common calcareous ſpars, and do not ſtrike fire with ſteel; nor do they effervesce with acids either before or after calcination. When expoſed to a ſtrong fire, they crack and ſplit in pieces, but do not melt without a violent heat. Engenſtroom informs us, that all of them which he tried melted pretty eaſily before the blow-pipe; but he was obliged to take great care to prevent them from flying away before they were thoroughly heated. Their ſpecific gravity is from 3144 to 3175. Notwithſtanding the difficulty with which they are fuſed by themſelves, however, they melt very readily in conjunction with other earths; running into a corroſive glaſs which diſſolves the ſtrongeſt crucibles, unleſs ſome quartz or fire-clay be mixed in their compoſition. When gradually heated, they give a phoſphoreſcent light; but loſe this property when made red-hot. Thoſe which are coloured, particularly the green ones, give the ſtrongeſt light. They melt eaſily with borax, and next to that with the microcoſmic ſalt, neither of them making any effervesence. They diſſolve in acids when boiling, particularly aqua-regia; and the ſolutions are precipitated by an alkali even though cold, but not ſo completely. M. Magellan informs us, that he has frequently diſſolved them in boiling vitriolic acid in order to get that of fluor in an aerial ſtate. There are three ſpecies.

1. The indurated fluor is ſolid, and of an indeterminate figure, of a dull texture, ſemitranſparent, and full of cracks in the rock. It is of a white colour.

2. Sparry fluor. This has nearly the figure of ſpar; though, on cloſe obſervation, it is found leſs regular; nothing but its gloſſy ſurface giving it the reſemblance of ſpar. It is found of various colours, viz. white, blue, green, pale green, violet, and yellow.

3. The cryſtallized fluor is of four kinds. 1. Having an irregular figure, of a white, blue, or red colour. 2. Cryſtallized in cubes, of a yellow or violet colour. 3. Of a polygonal ſpherical figure, white or blue coloured. 4. Of an octoedral figure, clear and colourleſs.

The principal uſe of fluors is for ſmelting ores, where they act as very powerful fluxes, and on this account are much valued. They are found in various countries, particularly Sweden, and ſome other northern countries of Europe. From this quality of melting eaſily in combination with other earthy matters, they have got the name of *fluors*. "The reſemblance between the coloured fluorsand the compoſitions made of coloured glaſs (ſays Cronſtedt), has perhaps contributed not only to the fluors being reckoned of the ſame value with the coloured quartz cryſtals, by ſuch collectors as only mind colour and figure, but to their alſo obtaining a rank among the precious ſtones in the apothecaries and druggiſts ſhops." M. Fabroni obſerves, that this combination of calcareous earth with the ſparry acid is almoſt always tranſparent: it often cryſtallizes in regular cubes, ſometimes ſingle from one line to two inches in diameter, and ſometimes of an indeterminate figure. They are ſometimes of a blue colour; others are purple like amethyſts; ſome are of a brown colour, others opaque. M. Magellan ſays, that fluors in general have this ſingular property, that on being melted by the flame of the blow-pipe, together with gypſum, the lead reſulting from both is all formed with facets on the outſide; but if melted with terra ponderoſa, its ſurface is quite round or ſpherical. Fluor || Flute.

M. Margraaf has made experiments in order to diſcover the nature of theſe ſtones. He aſcertained the above mentioned diſtinctions between them and the gypſeous ſpars; and therefore infers, that they are not compounded of vitriolic acid with calcareous earth. He obſerved ſingular appearances on mixing them with vitriolic and other acids, and ſubjecting the mixtures to diſtillation.

Eight ounces of the powder of a green fluor being mixed with an equal weight of pure oil of vitriol, and diſtilled together with a graduated heat, yielded, after the watery part of the acid had paſſed, a fine white ſublimate, which aroſe and adhered to the neck of the retort, and even paſſed into the receiver. The firſt parts of this ſublimate which aroſe appeared like butter of antimony; and, like this butter, they melted by the heat of a live coal brought near the neck of the retort: but the parts which aroſe towards the end of the operation, with the greateſt degree of heat, could not be melted by that heat. The retort being broken, a reſiduum was found weighing 12 oz. Hence 4 oz. of oil of vitriol remained united with the ſpar. The bottom of the retort was obſerved to be pierced with holes. Laſtly, the liquor which had paſſed into the receiver and the white ſublimate, had very ſenſibly a ſulphureous ſmell. The ſublimate, triturated a long time in a mortar with hot diſtilled water, diſſolved, and paſſed thro' a filter. To the filtrated liquor ſome fixed alkali being added, a precipitate was formed; which being well waſhed and dried, was readily melted by fire into a maſs reſembling porcelain. The ſame excellent and accurate chemiſt produced the ſame effects upon this ſtone, by ſubſtituting, inſtead of the vitriolic acid, the nitrous, marine, phoſphoric, or the concentrated acetous acids.

Fluor Albus or *Uterinus*, in medicine, a kind of flux incident to women, popularly called the *whites*. See MEDICINE-*Index*.

FLUSHING, an handſome, ſtrong, and conſiderable town of the United Provinces, in Zealand, and in the iſland of Walcheren, with a very good harbour, and a great foreign trade. It was put into the hands of queen Elizabeth for a pledge of their fidelity, and as a ſecurity for the money ſhe advanced. It is one of the three places which Charles V. adviſed Philip II. to preſerve with care. E. Long. 3. 32. N. Lat. 51. 26.

FLUTE, an inſtrument of muſic, the ſimpleſt of all thoſe of the wind kind. It is played on by blowing,

it

Flute. it with the mouth; and the tones or notes are changed by ſtopping and opening the holes diſpoſed for that purpoſe along its ſide.

This is a very ancient inſtrument. It was at firſt called the flute *à bec*, from *bec* an old Gauliſh word ſignifying the beak of a bird or fowl, but more eſpecially of a cock; the term *flute à bec* muſt therefore ſignify the *beaked flute*; which appears very proper, on comparing it with the traverſe or German flute. The word *flute* is derived from *fluta*, the Latin for a lamprey or ſmall eel taken in the Sicilian ſeas, having ſeven holes immediately below the gills on each ſide, the preciſe number of thoſe in the front of the flute.

By Merſennus this inſtrument is called the *fiſtula dulcis, ſeu Anglica*; the loweſt note, according to him, for the treble flute, is *C ſa ut*, and the compaſs of the inſtrument 15 notes. There is, however, a flute known by the name of the *concert flute*, the loweſt note of which is F. Indeed, ever ſince the introduction of the flute into concerts, the loweſt note of the inſtrument, of what ſize ſoever it is, has been called F; when in truth its pitch is determinable only by its correſpondence in reſpect of acuteneſs or gravity with one or other of the chords in the *ſcala maxima* or great ſyſtem.

Beſides the true concert-flute, others of a leſs ſize were ſoon introduced into concerts of violins; in which caſe the method was to write the flute-part in a key correſpondent to its pitch. This practice was introduced in 1710 by one Woodcock, a celebrated performer on this inſtrument, and William Babell organiſt of the church of All-hallows, Bread Street, London. They failed, however, in procuring for the flute a reception into concerts of various inſtruments; for which reaſon, one Thomas Staneſby, a very curious maker of flutes and other inſtruments of the like kind, about the year 1732, adverting to the ſcale of Merſennus, in which the loweſt note was C, invented what he called the *new ſyſtem*; in which, by making the flute of ſuch a ſize as to be a fifth above concert pitch, the loweſt note became *C ſol fa ut*. By this contrivance the neceſſity of tranſpoſing the flute-part was taken away; for a flute of this ſize, adjuſted to the ſyſtem above mentioned, became an octave to the violin. To further this invention of Staneſby, one Lewis Merci, an excellent performer on the flute, publiſhed, about the year 1735, ſix ſolos for this inſtrument, three of which are ſaid to be accommodated to Mr Staneſby's new ſyſtem; but the German flute was now become a favourite inſtrument, and Staneſby's ingenuity failed of its effect.—One great objection indeed lies againſt this inſtrument, which, however, equally affects all perforated pipes; namely, that they are never perfectly in tune, or cannot be made to play all their notes with equal exactneſs. The utmoſt that the makers of them can do is to tune them to ſome one key; as the hautboy to C, the German flute to D, and the Engliſh flute to F; and to effect this truly is a matter of no ſmall difficulty. The Engliſh flutes made by the younger Staneſby came the neareſt of any to perfection; but thoſe of Breſſan, though excellent in their tone, are all too flat in the upper octave. For theſe reaſons ſome are induced to think, that the utmoſt degree of proficiency on any of thoſe inſtruments is not worth the labour of attaining it.

German FLUTE, is an inſtrument entirely different from the common flute. It is not, like that, put into the mouth to be played; but the end is ſtopt with a tompion or plug, and the lower lip is applied to a hole about two inches and a half or three inches diſtant from the end. This inſtrument is uſually about a foot and a half long; rather bigger at the upper end than the lower; and perforated with holes, beſides that for the mouth, the loweſt of which is ſtopped and opened by the little finger's preſſing on a braſs or ſometimes a ſilver key, like thoſe in hautboys, haſſoons, &c. Its ſound is exceeding ſweet and agreeable; and ſerves as a treble in a concert. Flute ‖ Flux.

FLUTE, or FLUYT, is a kind of long veſſel, with flat ribs or floor-timbers, round behind, and ſwelled in the middle; ſerving chiefly for the carrying of proviſions in fleets or ſquadrons of ſhips; though it is often uſed in merchandize. The word *flute*, taken for a ſort of boat or veſſel, is derived, according to Borel, from the ancient *flotte*, a little boat. In the verbal proceſs of the miracles of St Catherine of Sweden, in the 12th century, we read *Unus equum ſuum una cum mercibus magni ponderis introduxit ſuper inſtrumentum de lignis fabricatum, vulgariter dictum fluta*. Upon which the Bollandiſts obſerve, that in ſome copies it is read *flotta*, an inſtrument called by the Latins *ratis*; and that the word *flutta* or *flotta* aroſe from *flotten* or *vlotten*, "to float."

FLUTES, or FLUTINGS, in architecture, are perpendicular channels or cavities cut along the ſhaft of a column or pilaſter. They are ſuppoſed to have been firſt introduced in imitation of the plaits of womens robes; and are therefore called by the Latins *ſtriges* and *rugæ*. The French call them *cannelures*, as being excavations; and we, *flutes* or *flutings*, as bearing ſome reſemblance to the muſical inſtrument ſo called. They are chiefly affected in the Ionic order, in which they had their firſt riſe; though they are alſo uſed in all the richer orders, as the Corinthian and Compoſite; but rarely in the Doric, and ſcarce ever in the Tuſcan.

FLUX, in medicine, an extraordinary iſſue or evacuation of ſome humour. Fluxes are various and variouſly denominated according to their ſeats or the humours thus voided; as a flux of the belly, uterine flux, hepatic flux, ſalival flux, &c. The flux of the belly is of four kinds, which have each their reſpective denominations, viz. the *lientery*, or *fluxus lientericus*; the *cæliac*, or *fluxus chyloſus*; the *diarrhœa*; and the *dyſentery*, or *bloody flux*;—all which are properly treated of in MEDICINE.

FLUX, in hydrography, a regular periodical motion of the ſea, happening twice in 24 hours; wherein the water is raiſed and driven violently againſt the ſhores. The flux or flow is one of the motions of the tide; the other, whereby the water ſinks and retires, is called the reflux or ebb. There is alſo a kind of reſt or ceſſation of about half an hour between the flux and reflux; during which time the water is at its greateſt height, called *high-water*. The flux is made by the motion of the water of the ſea from the equator towards the poles; which, in its progreſs, ſtriking againſt the coaſts in its way, and meeting with oppoſition from them, ſwells, and where it can find paſſage, as in flats, rivers, &c. riſes up and runs into the land. This motion follows, in ſome meaſure, the courſe of the moon;

as

Flux. as it loſes or comes later every day by about three quarters of an hour, or more preciſely, by 48 minutes; and by ſo much is the motion of the moon ſlower than that of the ſun. It is always higheſt and greateſt in full moons, particularly thoſe of the equinoxes. In ſome parts, as at Mount St Michael, it riſes 80 or 90 feet, though in the open ſea it never riſes above a foot or two; and in ſome places, as about the Morea, there is no flux at all. It runs up ſome rivers above 120 miles. Up the river Thames it only goes 80, viz. near to Kingſton in Surry. Above London bridge the water flows four hours and ebbs eight; and below the bridge, flows five hours and ebbs ſeven.

Flux, in metallurgy, is ſometimes uſed ſynonymouſly with *fuſion*. For inſtance, an ore, or other matter, is ſaid to be in liquid flux, when it is completely fuſed.

But the word *flux* is generally uſed to ſignify certain ſaline matters, which facilitates the fuſion of ores, and other matters which are difficultly fuſible in eſſays and reductions of ores. Fixed alkalis, nitre, borax, tartar, and common ſalt, are the ſaline matters of which fluxes are generally compoſed. But the word *flux* is more particularly applied to mixtures of different proportions of only nitre and tartar; and theſe fluxes are called by particular names, according to the proportions of theſe ingredients, as in the following articles.

White Flux, is made with equal parts of nitre and of tartar detonated together, by which they are alkaliſed. The reſiduum of this detonation is an alkali compoſed of the alkalis of the nitre and of the tartar, both which are abſolutely of the ſame nature. As the proportion of nitre in this mixture is more than is ſufficient to conſume entirely all the inflammable matter of the tartar, the alkali remaining after the detonation is perfectly white, and is therefore called *white flux*; and as this alkali is made very quickly, it is alſo called *extemporaneous alkali*. When a ſmall quantity only of white flux is made, as a few ounces for inſtance, ſome nitre always remains undecompoſed, and a little of the inflammable principle of the tartar, which gives a red or even a black colour to ſome part of the flux: but this does not happen when a large quantity of white flux is made; becauſe then the heat is much greater. This ſmall quantity of undecompoſed nitre and tartar which remains in white flux is not hurtful in moſt of the metallic fuſions in which this flux is employed: but if the flux be required perfectly pure, it might eaſily be diſengaged from thoſe extraneous matters by a long and ſtrong calcination, without fuſion. Flux.

Crude Flux. By crude flux is meant the mixture of nitre and tartar in any proportions, without detonation. Thus the mixture of equal parts of the two ſalts uſed in the preparation of the white flux, or the mixture of one part of nitre and two parts of tartar for the preparation of the black flux, are each of them a crude flux before detonation. It has alſo been called *white flux*, from its colour: but this might occaſion it to be confounded with the white flux above deſcribed. The name, therefore, of crude flux is more convenient.

Crude flux is detonated and alkaliſed during the reductions and fuſions in which it is employed; and is then changed into white or black flux, according to the proportions of which it is compoſed. This detonation produces good effects in theſe fuſions and reductions, if the ſwelling and extravaſation of the detonating matters be guarded againſt. Accordingly, crude flux may be employed ſucceſsfully in many operations; as, for inſtance, in the ordinary operation for procuring the regulus of antimony.

Black Flux. Black flux is produced from the mixture of two parts of tartar and one part of nitre detonated together. As the quantity of nitre which enters into the compoſition of this flux is not ſufficient to conſume all the inflammable matter of the tartar, the alkali which remains after the detonation contains much black matter, of the nature of coal, and is therefore called *black flux*.

This flux is deſignedly ſo prepared, that it ſhall contain a certain quantity of inflammable matter; for it is thereby capable, not only of facilitating the fuſion of metallic earths like the white flux, but alſo of reviving theſe metals by its phlogiſton. From this property it is alſo called *reducing flux*; the black flux, therefore, or crude flux made with ſuch proportions of the ingredients as to be convertible into black flux, ought always to be uſed when metallic matters are at once to be fuſed and reduced, or even when deſtructive metals are to be fuſed, as theſe require a continual ſupply of phlogiſton to prevent their calcination.

FLUXIONS;

A Method of calculation which greatly facilitates computations in the higher parts of mathematics. Sir Iſaac Newton and Mr Leibnitz contended for the honour of inventing it. It is probable they had both made progreſs in the ſame diſcovery, unknown to each other, before there was any publication on the ſubject.

In this branch of mathematics, magnitudes of every kind are ſuppoſed generated by motion; a line by the motion of a point, a ſurface by the motion of a line, and a ſolid by the motion of a ſurface. And ſome part of a figure is ſuppoſed generated by an uniform motion; in conſequence of which, the other parts may increaſe uniformly or with an accelerated or retarded motion, or may decreaſe in any of theſe ways; and the computations are made by tracing the comparative velocities with which the parts flow.

Fig. 1. If the parallelogram ABCD be generated by an uniform motion of the line AB toward CD while it moves from FE towards *fe*, while the line BF receives the increment F*f*, and the figure will be increaſed by the parallelogram *Fe*; the line FE in this caſe undergoes no variation. Plate CXCV.

The fluxion of any magnitude at any point is the increment that it would receive in any given time, ſuppoſing it to increaſe uniformly from that point; and as the meaſures will be the ſame, whatever the time be, we are at liberty to ſuppoſe it leſs than any aſſigned time.

The firſt letters in the alphabet are uſed to repreſent.

ſent invariable quantities; the letters x, y, z, variable quantities; and the ſame letters with points over them $\dot{x}$, $\dot{y}$, $\dot{z}$, repreſent their fluxions.

Therefore if AB$=a$, and BF$=x$; Ff, the fluxion of BF, will be $=\dot{x}$, and Fe, the fluxion of AF, $=a\dot{x}$.

If the rectangle be ſuppoſed generated by the uniform motion of FG towards CD, at the ſame time that HG moves uniformly towards AD, the point G keeping always on the diagonal, the lines FG, HG will flow uniformly; for while Bf receives the increment Ff, and HB the increment HK, FG will receive the increment hg, and HG the increment bg, and they will receive equal increments in equal ſucceſſive times. But the parallelogram will flow with an accelerated motion; for while F flows to f, and H to K, it is increaſed by the gnomon KGf; but while F and H flow through the equal ſpaces fm KL, it is increaſed by the gnomon Lgm greater than KGf; conſequently when fluxions of the ſides of a parallelogram are uniform, the fluxion of the parallelogram increaſes continually.

The fluxion of the parallelogram BHGF is the two parallelograms KG and Gf; for though the parameter receives an increment of the gnomon KGf, while its ſides flow to f and K, the part gG is owing to the additional velocity wherewith the parallelogram flows during that time; and therefore is no part of the meaſure of the fluxion, which muſt be computed by ſuppoſing the parameter to flow uniformly as it did at the beginning, without any acceleration.

Therefore if the ſides of a parallelogram be x and y, their fluxions will be $\dot{x}$ $\dot{y}$; and the fluxion of the parallelogram $x\dot{y}+y\dot{x}$; and if $x=y$, that is, if the figure be a ſquare, the fluxion of x^2 will be $2x\dot{x}$.

Fig. 2. Let the triangle ABC be deſcribed by the uniform motion of DE from A towards B, the point E moving in the line DF, ſo as always to touch the lines AC, CB; while D moves from A to F, DE is uniformly increaſed, and the increaſe of the triangle is uniformly accelerated. When DE is in the poſition FC, it is a maximum. As D moves from F to B, the line FC decreaſes, and the triangle increaſes, but with a motion uniformly retarded.

Fig. 3. If the ſemicircle AFB be generated by the uniform motion of CD from A towards B, while C moves from A to G, the line CD will increaſe, but with a retarded motion; the circumference alſo increaſes with a retarded motion, and the circular ſpace increaſes with an accelerated motion, but not uniformly, the degrees of acceleration growing leſs as CD approaches to the poſition GF. When C moves from G to B, it decreaſes with a motion continually accelerated, the circumference increaſes with a motion continually accelerated, and the area increaſes with a motion continually retarded, and more quickly retarded as CD approaches to B.

The fluxion of a quantity which decreaſes is to be conſidered as negative.

When a quantity does not flow uniformly, its fluxion may be repreſented by a variable quantity, or a line of a variable length; the fluxion of ſuch a line is called the *ſecond fluxion of the quantity whoſe fluxion that line is:* and if it be variable, a third fluxion may be deduced from it, and higher orders from theſe in the ſame manner: the ſecond fluxion is repreſented by two points, as $\ddot{x}$.

The increment a quantity receives by flowing for any given time, contains meaſures of all the different orders of fluxions; for if it increaſes uniformly, the whole increment is the firſt fluxion; and it has no ſecond fluxion. If it increaſes with a motion uniformly accelerated, the part of the increment occaſioned by the firſt motion meaſures the firſt fluxion, and the part occaſioned by the acceleration meaſures the ſecond fluxion. If the motion be not only accelerated, but the degree of acceleration continually increaſed, the two firſt fluxions are meaſured as before; and the part of the increment occaſioned by the additional degree of acceleration meaſures the third; and ſo on. Theſe meaſures require to be corrected, and are only mentioned here to illuſtrate the ſubject.

DIRECT METHOD.

Any flowing quantity being given, to find its fluxion.

Rule I. To find the fluxion of any power of a quantity, multiply the fluxion of the root by the exponent of the power, and the product by a power of the ſame root leſs by unity than the given exponent.

The fluxion of x^3 is $3x^2\dot{x}$, of x^n $nx^{n-1}\dot{x}$; for the root of x^n is x, whoſe fluxion is $\dot{x}$; which multiplied by the exponent n, and by a power of x leſs by unity than n, gives the above fluxion.

If x receive the increment $\dot{x}$, it becomes $x+\dot{x}$; raiſe both to the power of n, and x^n becomes $x^n+nx^{n-1}\dot{x}+\frac{n.n-1}{2}x^{n-2}\dot{x}^2+$, &c.; but all the parts of the increment, except the firſt term, are owing to the accelerated increaſe of x^n, and form meaſures of the higher fluxions. The firſt term only meaſures the firſt fluxion; the fluxion of $\overline{a^2+z^2}^{\frac{3}{2}}$ is $\frac{3}{2}\times 2z\dot{z}\times\overline{a^2+z^2}^{\frac{1}{2}}$; for put $x=a^2+z^2$, we have $\dot{x}=2z\dot{z}$; and the fluxion of $x^{\frac{3}{2}}$, which is equal to the propoſed fluent, is $\frac{3}{2}x^{\frac{1}{2}}\dot{x}$; for which ſubſtituting the values of z and x, we have the above fluxion.

Rule II. To find the fluxion of the product of ſeveral variable quantities multiplied together, multiply the fluxion of each by the product of the reſt of the quantities, and the ſum of the products thus ariſing will be the fluxion fought.

Thus the fluxion of xy, is $x\dot{y}+y\dot{x}$; that of xyz, is $xy\dot{z}+x\dot{z}y+\dot{y}zx$; and that of $xyzu$, is $xyz\dot{u}+xyu\dot{z}+xz\dot{u}y+\dot{y}zux$.

Rule III. To find the fluxion of a fraction—From the fluxion of the numerator multiplied by the denominator, ſubtract the fluxion of the denominator multiplied by the numerator, and divide the remainder by the ſquare of the denominator.

Thus, the fluxion of $\frac{x}{y}$ is $\frac{\dot{y}x-x\dot{y}}{y^2}$; that of $\frac{x}{x+y}$, is $\frac{\dot{x}\times x+\dot{x}y-x\dot{x}+\dot{y}\times x}{\overline{x+y}^2}=\frac{\dot{y}x-x\dot{y}}{\overline{x+y}^2}$.

Rule

Rule IV. In complex cases, let the particulars be collected from the simple rules, and combined together.

The fluxion of $\frac{x^2y^2}{z}$ is $\frac{2\dot{x}^2y\dot{y}+2y^2\dot{x}\dot{x}\times z-x^2y^2\dot{z}}{z^2}$; for the fluxion of x^2 is $2x\dot{x}$, and of y^2 is $2y\dot{y}$, by Rule I. and therefore the fluxion of x^2y^2 (by Rule II.) $2x^2y\dot{y}+2y^2x\dot{x}$; from which multiplied by z, (by Rule III.) and subtracting from it the fluxion of the denominator z, multiplied by the numerator, and dividing the whole by the square of the denominator, gives the above fluxion.

Rule V. The second fluxion is derived from the first, in the same manner as the first from the flowing quantity.

Thus the fluxion of x^3, $3x^2\dot{x}$; its second, $6x\dot{x}^2+3x^2\ddot{x}$ (by Rule II.); and so on: but if $\dot{x}$ be invariable, $\ddot{x}=0$, and the second fluxion of $x^3=6x\dot{x}^2$.

Prob. I. *To determine maxima and minima.*

When a quantity increases, its fluxion is positive; when it decreases, it is negative; therefore when it is just betwixt increasing and decreasing, its fluxion is $=0$.

Rule. Find the fluxion, make it $=0$, whence an equation will result that will give an answer to the question.

Examp. To determine the dimensions of a cylindric measure ABCD, (fig. 4.) open at the top, which shall contain a given quantity (of liquor, grain, &c.) under the least internal superficies possible.

Let the diameter $AB=x$, and the altitude $AD=y$; moreover, let p (3,14159, &c.) denote the periphery of the circle whose diameter is unity, and let c be the given content of the cylinder. Then it will be $1:p::x:(px)$ the circumference of the base; which, multiplied by the altitude y, gives pxy for the concave superficies of the cylinder. In like manner, the area of the base, by multiplying the same expression into $\frac{1}{4}$ of the diameter x, will be found $=\frac{px^2}{4}$; which drawn into the altitude y, gives $\frac{px^2y}{4}$ for the solid content of the cylinder; which being made $=c$, the concave surface pxy will be found $=\frac{4c}{x}$, and consequently the whole surface $=\frac{4c}{x}+\frac{px^2}{4}$: Whereof the fluxion, which is $-\frac{4c\dot{x}}{x^2}+\frac{p\dot{x}}{2}$ being put $=0$, we shall get $-8c\times\dot{x}px^3=0$; and therefore $x=2\sqrt[3]{\frac{c}{p}}$ further, because $px^3=8c$, and $px^2y=4c$, it follows, that $x=2y$; whence y is also known, and from which it appears that the diameter of the base must be just double of the altitude.

Fig. 7. To find the longest and shortest ordinates of any curve, DEF, whose equation or the relation which the ordinates bear to the abscissas is known.

Make AC the abscissa x, and CE the ordinate $=y$; take a value y in terms of x, and find its fluxion; which making $=0$, an equation will result whose roots give the value of x when y is a maximum or a minimum.

To determine when it is a maximum and when a minimum, take the value of y, when x is a little more than the root of the equation so found, and it may be perceived whether it increases or decreases.

If the equation has an even number of equal roots, y will be neither a maximum nor minimum when its fluxion is $=0$.

Prob. II. *To draw a tangent to any curve.*

Fig. 5. When the abscissa CS of a curve moves uniformly from A to B, the motion of the curve will be retarded if it be concave, and accelerated if convex towards AB; for a straight line TC is described by an uniform motion, and the fluxion of the curve at any point is the same as the fluxion of the tangent, because it would describe the tangent if it continued to move equally from that point. Now if Ss or Ce be the fluxion of the base, Cd will be the fluxion of the tangent, and de of the ordinate. And because the triangles TSC, Ced, are equiangular, $de:ce::CS:ST$, wherefore,

Rule. Find a fourth proportional to the fluxion of the ordinate valued in terms of the abscissa, the fluxion of the abscissa, and the ordinate, and it determines the line ST, which is called the *semi-tangent*, and TC joined is a tangent to the curve.

Examp. To draw a right line CT, (fig. 6.) to touch a given circle BCA in a point C.

Let CS be perpendicular to the diameter AB, and put $AB=a$, $BS=x$, and $SC=y$: then, by the property of the circle, y^2 $(CS^2)=BS\times AS$ $(=x\times\overline{a-x})=ax-x^2$; whereof the fluxion being taken, in order to determine the ratio of $\dot{x}$ and $\dot{y}$, we get $2y\dot{y}=a\dot{x}-2x\dot{x}$; consequently $\frac{\dot{x}}{\dot{y}}=\frac{2y}{a-2x}=\frac{y}{\frac{1}{2}a-x}$; which multiplied by y, gives $\frac{y\dot{x}}{\dot{y}}=\frac{y^2}{\frac{1}{2}a-x}=$ the subtangent ST. Whence (O being supposed the centre) we have $OS\ (\frac{1}{2}a-x):CS\ (y)::CS\ (y):ST$; which we also know from other principles.

Prob. III. *To determine points of contrary flexure in curves.*

Fig. 7. Supposing C to move uniformly from A to B, the curve DEF will be convex towards AB when the celerity of E increases, and concave when it decreases; therefore at the point where it ceases to be convex and begins to be concave, or the opposite way, the celerity of E will be uniform, that is, CE will have no second fluxion. Therefore,

Rule. Find the second fluxion of the ordinate in terms of the abscissa, and make it $=0$; and from the equation that arises you get a value of the abscissa, which determines the point of contrary flexure.

Ex. Let the nature of the curve ARS be defined by the equation $ay=a^{\frac{1}{2}}x^{\frac{1}{2}}+xx$, (the abscissa AF and the ordinate FG being, as usual, represented by x and y respectively). Then $\dot{y}$, expressing the celerity of the point r, in the line FH, will be equal to $\frac{\frac{1}{2}a^{\frac{1}{2}}x^{-\frac{1}{2}}\dot{x}+2x\dot{x}}{a}$; Whose fluxion, or that of $\frac{1}{2}a^{\frac{1}{2}}x^{-\frac{1}{2}}+2x$ (because a and

and $\dot{x}$ are conſtant) muſt be equal to nothing; that is, $-\frac{1}{2}a^{\frac{1}{2}}x^{-\frac{1}{2}}\dot{x}+2\dot{x}=0$: Whence $a^{\frac{1}{2}}x^{-\frac{1}{2}}=8$, $a^{\frac{1}{2}}=8x^{\frac{1}{2}}$, $64x^3=a^3$, and $x=\frac{1}{4}a=AF$; therefore FG $\left(=\frac{a^{\frac{3}{2}}x^{\frac{1}{2}}+x\dot{x}}{\dot{a}}\right)$ $=\frac{9}{16}a$: From which the poſition of the point G is given.

PROB. IV. *To find the radii of curvature.*

THE curvature of a circle is uniform in every point, that of every other curve continually varying: and it is meaſured at any point by that of a circle whoſe radius is of ſuch a length as to coincide with it in curvature in that point.

All curves that have the ſame tangent have the ſame firſt fluxion, becauſe the fluxion of a curve and its tangent are the ſame. If it moved uniformly on from the point of contact, it would deſcribe the tangent. And the deflection from the tangent is owing to the acceleration or retardation of its motion, which is meaſured by its ſecond fluxion: and conſequently two curves which have not only the ſame tangent, but the ſame curvature at the point of contact, will have both their firſt and ſecond fluxions equal. It is eaſily proven from thence, that the radius of curvature is $=\frac{\dot{z}^3}{-\dot{x}\ddot{y}}$, x, y, and z repreſent the abſciſſa, ordinate, and curve reſpectively.

EXAMP. Let the given curve be the common parabola, whoſe equation is $y=a^{\frac{1}{2}}x^{\frac{1}{2}}$: Then will $\dot{y}=\frac{1}{2}a^{\frac{1}{2}}\dot{x}x^{-\frac{1}{2}}$ $=\frac{a^{\frac{1}{2}}\dot{x}}{2x^{\frac{1}{2}}}$, and (making $\dot{x}$ conſtant) $\ddot{y}=-\frac{1}{4}\times\frac{1}{2}a^{\frac{1}{2}}\dot{x}^2x^{-\frac{3}{2}}=$ $\frac{-a^{\frac{1}{2}}\dot{x}^2}{4x^{\frac{3}{2}}}$: Whence $\dot{z}\left(\sqrt{\dot{x}^2+\dot{y}^2}\right)=\frac{\dot{x}}{2}\sqrt{\frac{4x+a}{x}}$, and the radius of curvature $\left(\frac{\dot{z}^3}{-\dot{x}\ddot{y}}\right)=\frac{\overline{a+4x}^{\frac{3}{2}}}{2\sqrt{a}}$: Which at the vertex, where $x=0$, will be $=\frac{1}{2}a$.

INVERSE METHOD.

From a given fluxion to find a fluent.

THIS is done by tracing back the ſteps of the direct method. The fluxion of x is $\dot{x}$; and therefore the fluent of $\dot{x}$ is x: but as there is no direct method of finding fluents, this branch of the art is imperfect. We can aſſign the fluxion of every fluent; but we cannot aſſign the fluent of a fluxion, unleſs it be ſuch a one as may be produced by ſome rule in the direct method from a known fluent.

GENERAL RULE. Divide by the fluxion of the root, add unity to the exponent of the power, and divide by the exponent ſo increaſed.

For, dividing the fluxion $nx^{n-1}\dot{x}$ by $\dot{x}$ (the fluxion of the root x) it becomes nx^{n-1}; and, adding 1 to the exponent $(n-1)$, we have nx^n; which, divided by n, gives x^n, the true fluent of $nx^{n-1}\dot{x}$.

Hence (by the ſame rule) the

Fluent of $3x^2\dot{x}$ will be $=x^3$;

That of $8x^3\dot{x}=\frac{8x^3}{3}$;

That of $2x^5\dot{x}=\frac{x^6}{3}$;

That of $y^{\frac{1}{2}}\dot{y}=\frac{2}{3}y^{\frac{3}{2}}$.

Sometimes the fluent ſo found requires to be corrected. The fluxion of x is $\dot{x}$, and the fluxion of $a+x$ is alſo $\dot{x}$; becauſe a is invariable, and has therefore no fluxion.

Now when the fluent of $\dot{x}$ is required, it muſt be determined, from the nature of the problem, whether any invariable part, as a, muſt be added to the variable part x.

When fluents cannot be exactly found, they can be approximated by infinite ſeries.

Ex. Let it be required to approximate the fluent of $\frac{\overline{a^2-x^2}^{\frac{1}{2}}\times\dot{x}}{\overline{c^2-x^2}^{\frac{1}{2}}}$ in an infinite ſeries.

The value of $\frac{\overline{a^2-x^2}^{\frac{1}{2}}}{\overline{c^2-x^2}^{\frac{1}{2}}}$, expreſſed in a ſeries, is $\frac{a}{c}+\frac{a}{2c^3}-\frac{1}{2ac}\times x^2+\frac{3a}{8c^5}-\frac{1}{4ac^3}-\frac{1}{8a^3c}\times x^4+\frac{5a}{16c^7}-\frac{3}{16ac^5}$ $\frac{1}{16a^3c^3}$ $\frac{1}{16a^5c}\times x^6+$ &c. Which value being therefore multiplied by $x^n\dot{x}$, and the fluent taken (by the common method) we get $\frac{ax^{n+1}}{n+1\times c}+\frac{a}{2c^3}-\frac{1}{2ac}\times\frac{x^{n+3}}{n+3}+$ $\frac{3a}{8c^5}-\frac{1}{4ac^3}-\frac{1}{8a^3c}\times\frac{x^{n+5}}{n+5}+$ $\frac{5a}{16c^7}-\frac{3}{16ac^5}-\frac{1}{16a^3c^3}-\frac{1}{16a^5c}\times\frac{x^{n+7}}{n+7}+$ &c.

PROB. I. *To find the area of any curve.*

RULE. Multiply the ordinate by the fluxion of the abſciſſa, and the product gives the fluxion of the figure, whoſe fluent is the area of the figure.

EXAMP. 1. Fig. 8. Let the curve ARMH, whoſe arca you will find, be the common parabola. Let u repreſent the area, and $\dot{u}$ its fluxion.

In which caſe the relation of AB (x) and BR (y) being expreſſed by $y^2=ax$ (where a is the parameter) we thence get $y=a^{\frac{1}{2}}x^{\frac{1}{2}}$; and therefore $\dot{u}=RmHB$ $(=y\dot{x})$ $=a^{\frac{1}{2}}x^{\frac{1}{2}}\dot{x}$: whence $u=\frac{2}{3}\times a^{\frac{1}{2}}x^{\frac{3}{2}}=\frac{2}{3}a^{\frac{1}{2}}x^{\frac{1}{2}}\times x=\frac{2}{3}yx$ (becauſe $a^{\frac{1}{2}}x^{\frac{1}{2}}=y$) $=\frac{2}{3}\times AB\times BR$: hence a parabola is $\frac{2}{3}$ of a rectangle of the ſame baſe and altitude.

EXAMP. 2. Let the propoſed curve CSDR (fig. 9.) be of ſuch a nature, that (ſuppoſing AB unity) the ſum of the areas CSTBC and CDGBC anſwering to any two propoſed abſciſſas AT and AG, ſhall be equal to the area CRNBC, whoſe correſponding abſciſſa AN is equal

equal to AT×AG, the product o the measures of the two former abscissas.

First, in order to determine the equation of the curve (which must be known before the area can be found), let the ordinates GD and NR move parallel to themselves towards HF; and then having put GD=y, NR=z, AT=a, AG=s, and AN=u, the fluxion of the area CDGB will be represented by $\dot{y}s$, and that of the area CRNB by $z\dot{u}$: which two expressions must, by the nature of the problem, be equal to each other; because the latter area CRNB exceeds the former CDGB by the area CSTB, which is here considered as a constant quantity: and it is evident, that two expressions, that differ only by a constant quantity, must always have equal fluxions.

Since, therefore, $\dot{y}s$ is $=z\dot{u}$, and $u=as$, by hypothesis, it follows, that $\dot{u}=a\dot{s}$, and that the first equation (by substituting for $\dot{u}$) will become $\dot{y}s=az\dot{s}$, or $\dot{y}=a\frac{z}{s}$, or lastly $\dot{y}s=za\dot{s}$, that is, GD×AG=NR×AN: therefore, GD : NR :: AN : AG; whence it appears, that every ordinate of the curve is reciprocally as its corresponding abscissa.

Now, to find the area of the curve so determined, put AB=1, BC=b, and BG=x: then, since AG $(1+x)$: AB (1) :: BC (b) : GD (y) we have $y=\frac{b}{1+x}$, consequently $\dot{u}\ (=y\dot{x})=\frac{b\dot{x}}{1+x}=b\times\dot{x}-x\dot{x}+x^2\dot{x}-x^3\dot{x}+x^4\dot{x}-$ &c. Whence, BGDC, the area itself will be $=b\times x-\frac{x^2}{2}+\frac{x^3}{3}-\frac{x^4}{4}+\frac{x^5}{5}$, &c. which was to be found.

Hence it appears, that as these areas have the same properties as logarithms, this series gives an easy method of computing logarithms; and the fluent may be found by means of a table of logarithms, without the trouble of an infinite series: and every fluxion whose fluent agrees with any known logarithmic expression, may be found the same way. Hence the fluents of fluxions of the following forms are deduced.

The fluent of $\frac{\dot{x}}{\sqrt{x^2\pm a^2}}$ = hyp. log. of $x+\sqrt{x^2\pm a^2}$;

of $\frac{\dot{x}}{\sqrt{2ax+xx}}$ = hyp. log. $a\times x+\sqrt{2ax+x^2}$;

of $\frac{2a\dot{x}}{a^2-x^2}$ hyp. log. of $\frac{a+x}{a-x}$;

and of $\frac{2a\dot{x}}{x\sqrt{a^2\pm x^2}}$ = hyp. log. $\frac{a-\sqrt{a^2\pm x^2}}{a+\sqrt{a^2\pm x^2}}$

Prob. 2. *To determine the length of curves.*

Fig. 5. Because Cde is a right-angle triangle, Cd^2 = Ce^2 + de^2; wherefore the fluxions of the abscissa and ordinate being taken in the same terms and squared, their sum gives the square of the fluxion of the curve; whose root being extracted, and the fluent taken, gives the length of the curve.

Examp. To find the length of a circle from its tangent. Make the radius AO (fig. 5.) $=a$, the tangent of AC=t, and its secant $=s$, the curve $=z$, and its fluxion $=\dot{z}$; because the triangles OTC, OCS, are similar, OT : OC :: OC :: OS; whence OS $=\frac{a^2}{s}$, and SA $=a-\frac{a^2}{s}=a-\frac{a^2}{\sqrt{a^2+t^2}}$; whose fluxion is $\frac{a^2t\dot{t}}{a^2+t^2\sqrt{\frac{3}{2}}}$; and because the triangles OTC, dCe are similar, TC $(=t)$: TO $(=\sqrt{a^2+t^2})$ :: Ce $=\left(\frac{a^2t\dot{t}}{a^2+t^2\sqrt{\frac{3}{2}}}\right)$: C$d=\frac{a^2\dot{t}}{a^2+t^2}$ = fluxion of the curve. Now by converting this into an infinite series we have the fluxion of the curve $=\dot{t}-\frac{t^2\dot{t}}{a^2}+\frac{t^4\dot{t}}{a^4}-\frac{t^6\dot{t}}{a^6}$, &c. and consequently $z=-\frac{t^3}{3a^2}+\frac{t^5}{5a^4}-\frac{t^7}{7a^6}+\frac{t^9}{9a^8}$, &c. = AR. Where, if (for example's sake) AR be supposed an arch of 30 degrees, and AO (to render the operation more easy) be put = unity, we shall have $t=\sqrt{\frac{1}{3}}=.5773502$ (because $Ob\sqrt{\frac{3}{4}}$: $bR\ (\frac{1}{2})$ :: OA (1) : AT $(t)=\sqrt{\frac{1}{3}}$) Whence,

t^3 $(=t\times t^2=t\times\frac{1}{3})=.1924500$

t^5 $\left(=t^3\times t^2=\frac{t^3}{3}\right)=.0641500$

t^7 $\left(=t^5\times t^2=\frac{t^5}{3}\right)=.0213833$

t^9 $\left(=t^7\times t^2=\frac{t^7}{3}\right)=.0071277$

t^{11} $\left(=t^9\times t^2=\frac{t^9}{3}\right)=.0023759$

t^{13} $\left(=t^{11}\times t^2=\frac{t^{11}}{3}\right)=.0007919$

t^{15} $\left(=t^{13}\times t^2=\frac{t^{13}}{3}\right)=.0002639$

&c.

And therefore AR $=.5773502-\frac{.1934500}{3}+\frac{.0641500}{5}-\frac{.0213833}{7}+\frac{.0091277}{9}-\frac{.0023759}{11}+\frac{.0007919}{13}-\frac{.0002639}{15}+\frac{.0000879}{17}-\frac{.0000293}{19}+\frac{.0000097}{21}-\frac{.0000032}{23}=.5235987$: for the length of an arch of 30 degrees, which multiplied by 6 gives 3.141592+ for the length of the semi-periphery of the circle whose radius is unity.

Other series may be deduced from the versed sine and secant; and these are of use for finding fluents which cannot be expressed in finite terms.

the fluent of $\left\{\begin{array}{l}\frac{\dot{z}v}{\sqrt{2av-v^2}}\\ \frac{\dot{z}v}{\sqrt{a^2-v^2}}\\ \frac{a\dot{z}v}{a^2+v^2}\\ \frac{a\dot{z}v}{v\sqrt{v^2-a^2}}\end{array}\right\}$ is equal to the arch whose $\left\{\begin{array}{l}\text{Versed sine}\\ \text{Right sine}\\ \text{Tangent}\\ \text{Secant}\end{array}\right\}$ is $\frac{v}{a}$, and Radius Unity.

PROB. 3. *To find the contents of a solid.*

LET the surface of the generating plane be multiplied by the space it passes through in any time, the product will give a solid which is the fluxion of the solid required: the surface must therefore be computed in terms of x, which represents the line or axis on which it moves, and by its motion on which the fluxion is to be measured, and the fluent found will give the contents of the solid.

EXAMP. Let it be proposed to find the content of a cone ABC, fig. 10.

Put the given altitude (AD) of the cone $=a$, and the semidiameter (BD) of its base $=b$, the solid $=s$, its fluxion $=\dot{s}$, and the area of a circle, whose radius is unity, $=p$: then the distance (AF) of the circle EG, from the vertex A, being denoted by x, we have, by similar triangles, as $a : b :: x :$ EF $(y) = \frac{bx}{a}$. Whence in this case, $\dot{s}\ (=py^2\dot{x}) = \frac{pb^2x^2\dot{x}}{a^2}$; and consequently $s = \frac{pb^2x^3}{3a^2}$; which, when $x=a$ (=AD) gives $\frac{pb^2a}{3}$ $(=p\times \mathrm{BD}^2\times\frac{1}{3}\mathrm{AD})$ for the content of the whole cone ABC: which appears from hence to be just $\frac{1}{3}$ of a cylinder of the same base and altitude.

PROB. 4. *To compute the surface of any solid body.*

THE fluxion of the surface of the solid is equal to the periphery of the surface, by whose motion the solid is generated, multiplied by its velocity on the edge of the solid, and the computation is made as in the foregoing.

EXAMP. Let it be proposed to determine the convex superficies of a cone ABC, fig. 11.

Then, the semidiameter of the base (BD or CD) being put $=b$, the slanting line or hypothenuse AC$=c$, and FH (parallel to DC) $=y$, AG $=x$, the surface $=z$, its fluxion $=\dot{z}$, and $p=$ the periphery of a circle whose diameter is unity, we shall, from the similarity of the triangles ADC and Hmb, have $b : c :: y$ $(mb : x\ (\mathrm{H}b) = \frac{cy}{b}$: whence $\dot{z}\ (2pyx) = \frac{2pcyy}{b}$; and consequently $z = \frac{pcy^2}{b}$. This, when $y=b$, becomes $=pcb=p\times\mathrm{DC}\times\mathrm{AC}=$ the convex superficies of the whole cone ABC: which therefore is equal to a rectangle under half the circumference of the base and the slanting line.

The method of fluxions is also applied to find the centres of gravities, and oscillation of different bodies; to determine the paths described by projectiles and bodies acted on by central forces, with the laws of centripetal force in different curves, the retardates given to motions performed in resisting medii, the attractions of bodies under different forms, the direction of wind which has the greatest effect on an engine, and to solve many other curious and useful problems.

FLY

Fly.

FLY, in zoology, a large order of insects, the distinguishing characteristic of which is, that their wings are transparent. By this they are distinguished from beetles, butterflies, grasshoppers, &c.

Flies are subdivided into those which have four, and those which have two wings.

Of those with four wings there are several genera or kinds; as the ant, apis, ichneumon, &c. See APIS, FORMICA, &c.

Of those with two wings, there are likewise several kinds, as the gad-fly, gnat, &c. See *GAD-Fly*, &c.

Those who desire a more particular account of the anatomy, generation, structure, and manifold subdivisions of flies, may consult Reaumer's History of Insects, tom. 4. See also ENTOMOLOGY.

House-Fly. See MUSCA.

Pestilential Fly. See ETHIOPIA, n° 11.

FLY, in mechanics, a cross with leaden weights at its ends; or rather, a heavy wheel at right angles, to the axis of a windlass, jack, or the like; by means of which, the force of the power, whatever it is, is not only preserved, but equally distributed in all parts of the revolution of the machine. See MECHANICS.

Flies for Fishing. See *FISHING-Fly.*

Vegetable Fly, a very curious natural production chiefly found in the West Indies. "Excepting that it has no wings, it resembles the drone both in size and colour more than any other British insect. In the month of May it buries itself in the earth, and begins to vegetate. By the latter end of July, the tree is arrived at its full growth, and resembles a coral branch; and is about three inches high, and bears several little pods, which dropping off become worms, and from thence flies, like the British caterpillar."

Such was the account originally given of this extraordinary production. But several boxes of these flies having been sent to Dr Hill for examination, his report was this: "There is in Martinique a fungus of the clavaria kind, different in species from those hitherto known. It produces soboles from its sides; I call it therefore *clavaria sobolifera*. It grows on putrid animal bodies, as our *fungus ex pede equino* from the dead horse's hoof. The cicada is common in Martinique, and in its nympha state, in which the old authors call it *tettigometra*: it buries itself under dead leaves to wait its change; and when the season is unfavourable, many perish. The seeds of the clavaria find a proper bed on this dead insect, and grow. The tettigometra is among the cicadæ in the British museum; the clavaria is just now known. This is the fact, and all the fact; though the untaught inhabitants suppose a fly to vegetate, and though there is a Spanish drawing of the plants growing into a trifoliate tree, and it has been figured with the creature flying with this tree upon its back."

Phil. Tr. for 1763.

The ingenious Mr Edwards has taken notice of this extraordinary production in his Gleanings of Natural History, from which the figures on Plate CXCVI. are taken.

veſſel, whoſe burden is generally from 600 to 1200 tons. It is diſtinguiſhed by a ſtern remarkably high, reſembling a Gothic turret, and by very broad buttocks below.

Fly-Catcher, in zoology. See MUSCICAPA.

Fly-Trap, in botany, a newly diſcovered ſenſitive plant. See *DIONÆA Muſcipula*.

Fly-Tree, in natural hiſtory, a name given by the common people of America to a tree, whoſe leaves, they ſay, at a certain time of the year produce *flies*. On examining theſe leaves about the middle of ſummer, the time at which the flies uſe to be produced, there are found on them a ſort of bags of a tough matter, of about the ſize of a filbert, and of a duſky greeniſh colour. On opening one of theſe bags with a knife, there is uſually found a ſingle full-grown fly, of the gnat kind, and a number of ſmall worms, which in a day or two more have wings and flee away in the form of their parent. The tree is of the mulberry kind, and its leaves are uſually very largely ſtocked with theſe inſect-bags; and the generality of them are found to contain the inſects in their worm-ſtate; when they become winged, they ſoon make their way out. The bags begin to appear when the leaves are young, and afterwards grow with them; but they never rumple the leaf or injure its ſhape. They are of the kind of leaf-galls, and partake in all reſpects, except ſize, of a ſpecies we have frequent on the large maple, or, as it is called, the *ſycamore*.

FLYERS, in architecture, ſuch ſtairs as go ſtraight, and do not wind round, nor have the ſteps made tapering; but the fore and back part of each ſtair and the ends reſpectively parallel to one another: So that if one flight do not carry you to your deſigned height, there is a broad half ſpace; and then you fly again, with ſteps every where of the ſame breadth and length as before.

FLYERS, the performers in a celebrated exhibition among the Mexicans, which was made on certain great feſtivals, and is thus deſcribed by Clavigero in his Hiſtory of that people. "They fought in the woods for an extremely lofty tree, which, after ſtripping it of its branches and bark, they brought to the city, and fixed in the centre of ſome large ſquare. They caſed the point of the tree in a wooden cylinder, which, on account of ſome reſemblance in its ſhape, the Spaniards called a *mortar*. From this cylinder hung four ſtrong ropes, which ſerved to ſupport a ſquare frame. In the ſpace between the cylinder and the frame, they fixed four other thick ropes, which they twiſted as many times round the tree as there were revolutions to be made by the flyers. Theſe ropes were drawn through four holes, made in the middle of the four planks of which the frame conſiſted. The four principal flyers, diſguiſed like eagles, herons, and other birds, mounted the tree with great agility, by means of a rope which was laced about it from the ground up to the frame; from the frame they mounted one at a time ſucceſſively upon the cylinder, and after having danced there a little, they tied themſelves round with the ends of the ropes, which were drawn through the holes of the frame, and launching with a ſpring from it, began their flight with their wings expanded. The action of their bodies put the frame and the cylinder in motion; the frame by its revolutions gradually untwiſted the cords by which the flyers ſwung; ſo that as the ropes lengthened, they made ſo much the greater circles in their flight. Whilſt theſe four were flying, a fifth danced upon the cylinder, beating a little drum, or waving a flag, without the ſmalleſt apprehenſion of the danger he was in of being precipitated from ſuch a height. The others who were upon the frame (there having been 10 or 12 perſons generally who mounted), as ſoon as they ſaw the flyers in their laſt revolution, precipitated themſelves by the ſame ropes, in order to reach the ground at the ſame time amidſt the acclamations of the populace. Thoſe who precipitated themſelves in this manner by the ropes, that they might make a ſtill greater diſplay of their agility, frequently paſſed from one rope to another, at that part where, on account of the little diſtance between them, it was poſſible for them to do ſo. The moſt eſſential point of this performance conſiſted in proportioning ſo juſtly the height of the tree with the length of the ropes, that the flyers ſhould reach the ground with 13 revolutions, to repreſent by ſuch number their century of 52 years, compoſed in the manner we have already mentioned. This celebrated diverſion is ſtill in uſe in that kingdom; but no particular attention is paid to the number of the revolutions or the flyers; as the frame is commonly ſexagonal or octagonal, and the flyers 6 or 8 in number. In ſome places they put a rail round the frame, to prevent accidents which were frequent after the conqueſt; as the Indians became much given to drinking, and uſed to mount the tree when intoxicated with wine or brandy, and were unable to keep their ſtation on ſo great a height, which was uſually 60 feet." See Plate CXCVI.

Flying.

FLYING, the progreſſive motion of a bird, or other winged animal, in the air.

The parts of birds chiefly concerned in flying are the wings and tail: by the firſt, the bird ſuſtains and wafts himſelf along; and by the ſecond, he is aſſiſted in aſcending and deſcending, to keep his body poiſed and upright, and to obviate the vacillations thereof.

It is by the largeneſs and ſtrength of the pectoral muſcles, that birds are ſo well diſpoſed for quick, ſtrong, and continued flying. Theſe muſcles, which in men are ſcarce a 70th part of the muſcles of the body in birds, exceed and outweigh all the other muſcles taken together; upon which Mr Willoughby makes this reflection, that if it be poſſible for man to fly, his wings muſt be ſo contrived and adapted, that he may make uſe of his legs, and not his arms, in managing them.

The tail, Meſſrs Willoughby, Ray, and many others, imagine to be principally employed in ſteering and turning the body in the air, as a rudder: but Borelli has put it beyond all doubt, that this is the leaſt uſe of it, which is chiefly to aſſiſt the bird in its aſcent and deſcent in the air, and to obviate the vacillations of the body and wings: for, as to turning to this or that ſide, it is performed by the wings and inclination of the body, and but very little by the help of the tail. The flying of a bird, in effect, is quite a different thing from the rowing of a veſſel. Birds do not vibrate their wings towards the tail, as oars are ſtruck towards the ſtern,

Flying. ſtern, but waſt them downwards; nor does the tail of the bird cut the air at right angles, as the rudder does the water; but is diſpoſed horizontally, and preſerves the ſame ſituation what way ſoever the bird turns. In effect, as a veſſel is turned about on its centre of gravity to the right, by a briſk application of the oars to the left; ſo a bird, in beating the air with its right wing alone, towards the tail, will turn its fore-part to the left. Thus pigeons changing their courſe to the left, would labour it with their right wing, keeping the other almoſt at reſt. Birds of a long neck alter their courſe by the inclination of their head and neck; which altering the courſe of gravity, the bird will proceed in a new direction.

The manner of FLYING is thus: The bird firſt bends his legs, and ſprings with a violent leap from the ground; then opens and expands the joints of his wings, ſo as to make a right line perpendicular to the ſides of his body: thus the wings, with all the feathers therein, conſtitute one continued lamina. Being now raiſed a little above the horizon, and vibrating the wings with great force and velocity perpendicularly againſt the ſubject air, that fluid reſiſts thoſe ſucceſſions, both from its natural inactivity and elaſticity, by means of which the whole body of the bird is protruded. The reſiſtance the air makes to the withdrawing of the wings, and conſequently the progreſs of the bird, will be ſo much the greater, as the waſt or ſtroke of the fan of the wing is longer: but as the force of the wing is continually diminiſhed by this reſiſtance, when the two forces continue to be *in equilibrio*, the bird will remain ſuſpended in the ſame place; for the bird only aſcends ſo long as the arch of air the wing deſcribes makes a reſiſtance equal to the exceſs of the ſpecific gravity of the bird above the air. If the air, therefore, be ſo rare as to give way with the ſame velocity as it is ſtruck withal, there will be no reſiſtance, and conſequently the bird can never mount. Birds never fly upwards in a perpendicular line, but always in a parabola. In a direct aſcent, the natural and artificial tendency would oppoſe and deſtroy each other, ſo that the progreſs would be very ſlow. In a direct deſcent they would aid one another, ſo that the fall would be too precipitate.

Artificial FLYING, that attempted by men, by the aſſiſtance of mechanics.

The art of flying has been attempted by ſeveral perſons in all ages. The Leucadians, out of ſuperſtition, are reported to have had a cuſtom of precipitating a man from a high cliff into the ſea, firſt fixing feathers, variouſly expanded, round his body, in order to break the fall.

Friar Bacon, who lived near 500 years ago, not only affirms the art of flying poſſible, but aſſures us, that he himſelf knew how to make an engine wherein a man ſitting might be able to convey himſelf through the air like a bird; and further adds, that there was then one who had tried it with ſucceſs. The ſecret conſiſted in a couple of large thin hollow copper-globes, exhauſted of air; which being much lighter than air, would ſuſtain a chair whereon a perſon might ſit. Fa. Franciſco Lana, in his *Prodromo*, propoſes the ſame thing, as his own thought. He computes, that a round veſſel of plate-braſs, 14 feet in diameter, weighing three ounces the ſquare foot, will only weigh 1848 ounces; whereas a quantity of air of the ſame bulk will weigh 2155½d ounces; ſo that the globe will not only be ſuſtained in the air, but will carry with it a weight of 373½d ounces; and by increaſing the bulk of the globe, without increaſing the thickneſs of the metal, he adds, a veſſel might be made to carry a much greater weight.—But the fallacy is obvious: a globe of the dimenſions he deſcribes, Dr Hook ſhows, would not ſuſtain the preſſure of the air, but be cruſhed inwards. Beſides, in whatever ratio the bulk of the globe were increaſed, in the ſame muſt the thickneſs of the metal, and conſequently the weight be increaſed: ſo that there would be no advantage in ſuch augmentation. See AEROSTATION.

Flying ſi Foenus.

The ſame author deſcribes an engine for flying, invented by the Sieur Beſnier, a ſmith of Sable, in the county of Main. *Vid. Philoſoph. Collect.* N° 1.

The philoſophers of king Charles the ſecond's reign were mightily buſied about this art. The famous biſhop Wilkins was ſo confident of ſucceſs in it, that he ſays, he does not queſtion but in future ages it will be as uſual to hear a man call for his wings, when he is going a journey, as it is now to call for his boots.

FLYING-Bridge. See BRIDGE.

FLYING-Fiſh, a name given by the Engliſh writers to ſeveral ſpecies of fiſh, which by means of their long fins, have a method of keeping themſelves out of water a conſiderable time. See EXOCOETUS.

FLYING-Pinion, is part of a clock, having a fly or fan whereby to gather air, and ſo bridle the rapidity of the clock's motion, when the weight deſcends in the ſtriking part.

FO, or FOE; an idol of the Chineſe. He was originally worſhipped in the Indies, and tranſported from thence into China, together with the fables with which the Indian books were filled. He is ſaid to have performed moſt wonderful things, which the Chineſe have deſcribed in ſeveral volumes, and repreſented by cuts.

Sect of Fo. See CHINA, n° 103.

Fo-Kien. See FOKIEN.

FOAL, or *COLT and FILLY*; the young of the horſe kind. The word *colt*, among dealers, is underſtood of the male, as *filly* is of the female. See COLT.

FOCUS, in geometry and conic ſections, is applied to certain points in the parabola, elliplis, and hyperbola, where the rays reflected from all parts of theſe curves concur and meet. See *Conic Sections*.

FOCUS, in optics; a point in which any number of rays, after being reflected or refracted, meet.

FODDER, any kind of meat for horſes or other cattle. In ſome places, hay and ſtraw, mingled together, is peculiarly denominated *fodder*.

FODDER, in the civil law, is uſed for a prerogative that the prince has, to be provided of corn and other meats for his horſes, by the ſubjects, in his warlike expeditions.

FODDER, in mining, a meaſure containing 22 hundred and an half weight, though in London but 20 hundred weight.

FOENUGREEK, in botany. See TRIGONELLA.

FOENUS NAUTICUM. Where money was lent to a merchant, to be employed in a beneficial trade with condition to be repaid, with extraordinary intereſt, in caſe

Foefius || Fog.

case such voyage was safely performed, the agreement was sometimes called *fœnus nauticum*, sometimes *usura maritima*. But as this gave an opening for usurious and gaming contracts, 19 Geo. II. c. 37. enacts, that all money lent on bottomry, or at *respondentia*, on vessels bound to or from the East Indies, shall be expressly lent only upon the ship or merchandise: the lender to have the benefit of salvage, &c. *Blackst. Com.* II. 459. *Mol. de Jur. Mar.* 361.

FOESIUS (Anulus), a very learned and celebrated physician of the faculty of Paris, born at Mentz in 1528. He translated into Latin the whole works of Hippocrates, judiciously correcting the Greek text as he went along; and composed a kind of dictionary to him, intitled, *Oeconomia Hippocratis*. He translated, beside, the Commentaries of Galen upon the second book of Hippocrates; and was the author of some other works. After practising physic a long time with great success and reputation, at Lorrain and other places, he died in 1596.

FOETOR, in medicine, stinking or fetid effluvia arising from the body or any part thereof.

FOETUS, the young of all viviparous animals whilst in the womb, and of oviparous animals before being hatched: the name is transferred by botanists to the *embryos of vegetables*.

Strictly, the name is applied to the young after it is perfectly formed; till which time it is more properly called Embryo. See Anatomy, n° 109, 110.

In the human fœtus are several peculiarities not to be found in the adult; some of them are as follows. 1. The arteries of the navel-string, which are continuations of the hypogastics, are, after the birth, shrivelled up, and form the ligamenta umbilic. infer. 2. The veins of the navel-string are formed by the union of all the venous branches in the placenta, and passing into the abdomen become the falciform ligament of the liver. 3. The lungs, before being inflated with air, are compact and heavy, but after one inspiration they become light, and as it were spongy: and it may be noted here, that the notion of the lungs sinking in water before the child breathes, and of their swimming after the reception of air, are no certain proofs that the child had or had not breathed, much less that it was murdered: for the uninflated lungs become specifically lighter than water as soon as any degree of putrefaction takes place in them; and this soon happens after the death of the child: besides, where the utmost care hath been taken to preserve the child, it hath breathed once or twice, and then died. 6. The thymus gland is very large in the fœtus, but dwindles away in proportion as years advance. 7. The foramen ovale in the heart of a fœtus, is generally closed in an adult.

FOG, or Mist, a meteor, consisting of gross vapours, floating near the surface of the earth.

Mists, according to lord Bacon, are imperfect condensations of the air, consisting of a large proportion of the air, and a small one of the aqueous vapour: and these happen in the winter, about the change of the weather from frost to thaw, or from thaw to frost; but in the summer, and in the spring, from the expansion of the dew.

If the vapours, which are raised plentifully from the earth and waters, either by the solar or subterraneous heat, do at their first entrance into the atmosphere meet with cold enough to condense them to a considerable degree, their specific gravity is by that means increased, and so they will be stopped from ascending; and either return back in form of dew or of drizzling rain, or remain suspended some time in the form of a fog. Vapours may be seen on the high grounds as well as the low, but more especially about marshy places. They are easily dissipated by the wind, as also by the heat of the sun. They continue longest in the lowest grounds, because these places contain most moisture, and are least exposed to the action of the wind.

Hence we may easily conceive, that fogs are only low clouds, or clouds in the lowest region of the air; as clouds are no other than fogs raised on high. See Cloud.

When fogs stink, then the vapours are mixed with sulphureous exhalations, which smell so. Objects viewed through fogs appear larger and more remote than through the common air. Mr Boyle observes, that upon the coast of Coromandel, and most maritime parts of the East Indies, there are, notwithstanding the heat of the climate, annual fogs so thick, as to occasion people of other nations who reside there, and even the more tender sort of the natives, to keep their houses close shut up.

Fogs are commonly pretty strongly electrified, as appears from Mr Cavallo's observations upon them. See Electricity, n° 76.

FOGAGE, in the forest law, is rank grass not eaten up in summer.

FOGLIETA (Oberto or Hubert), a Genoese priest, and one of the most learned writers of the 16th century. He had a share in the disturbances that were raised at Genoa, for which he was banished; and died at Rome in 1581, aged 63. He wrote a history of Genoa in Italian, which is highly esteemed; and many works in Latin.

FOGO, or Fuego. See Fuego.

FOHI. See Fe; and China, n° 7.

FOIBLE, a French term, frequently used also in our language. It literally signifies *weak*; and in that sense is applied to the body of animals and the parts thereof, as *foible* reins, *foible* sight, &c. being derived from the Italian *fievole*, of the Latin *flebilis*, to be "lamented, pitied."

But it is chiefly used with us substantively, to denote a defect or flaw in a person or thing. Thus we say, Every person has his foible; and the great secret consists in hiding it artfully: Princes are gained by flattery, that is their foible: The foible of young people is pleasure; the foible of old men is avarice; the foible of the great and learned is vanity; the foible of women and girls, coquetry, or an affectation of having gallants: You should know the forte and the foible of a man before you employ him: We should not let people perceive that we know their foible.

FOIL, in fencing, denotes a blunt sword, or one that has a button at the end covered with leather, used in learning the art of fencing.

Foil, among glass-grinders, a sheet of tin, with quicksilver, or the like, laid on the back side of a looking-glass, to make it reflect. See Foliating.

Foil, among jewellers, a thin leaf of metal placed under

Fogage || Foil.

Foil
ll
Folard.

under a precious ſtone, in order to make it look tranſparent, and give it an agreeable different colour, either deep or pale: thus, if you want a ſtone to be of a pale colour, put a foil of that colour under it; or if you would have it deep, lay a dark one under it.

Theſe foils are made either of copper, gold, or gold and ſilver together. The copper foils are commonly known by the name of *Nuremberg* or *German foils*; and are prepared as follows: Procure the thinneſt copper-plates you can get: beat theſe plates gently upon a well-poliſhed anvil, with a poliſhed hammer, as thin as poſſible; and placing them between two iron-plates as thin as writing paper, heat them in the fire; then boil the foil in a pipkin, with equal quantities of tartar and ſalt, conſtantly ſtirring them till by boiling they become white; after which, taking them out and drying them, give them another hammering, till they are made fit for your purpoſe: however, care muſt be taken not to give the foils to much heat, for fear of melting; nor muſt they be too long boiled, for fear of attracting too much ſalt.

The manner of poliſhing theſe foils is as follows: Take a plate of the beſt copper, one foot long and about five or ſix inches wide, poliſhed to the greateſt perfection; bend this to a long convex, faſten it upon a half roll, and fix it to a bench or table; then take ſome chalk, waſhed as clean as poſſible, and filtred through a fine linen cloth, till it be as fine as you can make it; and having laid ſome thereof on the roll, and wetted the copper all over, lay your foils on it, and with a poliſhing ſtone and the chalk poliſh your foils till they are as bright as a looking-glaſs; after which they muſt be dried, and laid up ſecure from duſt.

FOKIEN, a province of China in Aſia, commodiouſly ſituated for navigation and commerce, part of it bordering on the ſea, in which they catch large quantities of fiſh, which they ſend ſalted to other parts of the empire. Its ſhores are very uneven, by reaſon of the number and variety of its bays; and there are many forts built thereon to guard the coaſt. The air is hot, but pure and wholeſome.

The mountains are almoſt every where diſpoſed into a kind of amphitheatres, by the labour of the inhabitants, with terraces placed one above another. The fields are watered with rivers and ſprings, which iſſue out of the mountains, and which the huſbandmen conduct in ſuch a manner as to overflow the fields of rice when they pleaſe, becauſe it thrives beſt in watery ground. They make uſe of pipes of bamboe for this purpoſe.

They have all commodities in common with the reſt of China; but more particularly muſk, precious ſtones, quickſilver, ſilk, hempen-cloth, callico, iron, and all ſorts of utenſils wrought to the greateſt perfection. From other countries they have cloves, cinnamon, pepper, ſandal-wood, amber, coral, and many other things. The capital city is Foutcheou Fou; or, as others would have it written, Fucherofu. But as for Fokien, which moſt geographers make the capital, Groſier informs us there is no ſuch place.

FOLARD (Charles), an eminent Frenchman, famous for his ſkill and knowledge in the art military, was born at Avignon in 1669, of a noble family, but not a rich one. He diſcovered an early turn for the ſciences, and a ſtrong paſſion for arms; which laſt was ſo inflamed by reading Cæſar's Commentaries, that he enliſted at 16 years of age. His father got him off, and ſhut him in a monaſtery: but he made his eſcape in about two years after, and entered himſelf a ſecond time in quality of cadet. His inclination for military affairs, and the great pains he took to accompliſh himſelf in that way, recommended him to notice; and he was admitted into the friendſhip of the firſt-rate officers. M. de Vendome, who commanded in Italy in 1720, made him his aid-de-camp, having conceived the higheſt regard for him; and ſoon after ſent him with part of his forces into Lombardy. He was entirely truſted by the commander of that army; and no meaſures were concerted, or ſteps taken, without conſulting him. By purſuing his plans, many places were taken, and advantages gained; and ſuch, in ſhort, were his ſervices, that he had a penſion of 400 livres ſettled upon him, and was honoured with the croſs of St Lewis. He diſtinguiſhed himſelf greatly, Auguſt 15. 1705, at the battle of Caſſano; where he received a wound upon his left hand, which deprived him of the uſe of it ever after. It was at this battle that he conceived the firſt idea of that ſyſtem of columns, which he afterwards prefixed to his Commentaries upon Polybius. The duke of Orleans ſending de Vendome again into Italy in 1706, Folard had orders to throw himſelf into Modena to defend it againſt Eugene: where, tho' he acquitted himſelf with his uſual ſkill, he was very near being aſſaſſinated. The deſcription which he has given of the conduct and character of the governor of this town, may be found in his Treatiſe of the Defence of Places, and deſerves to be read. He received a dangerous wound on the thigh at the battle of Malplaquet, and was ſome time after made priſoner by prince Eugene. Being exchanged in 1711, he was made governor of Bourbourg. In 1714 he went to Malta, to aſſiſt in defending that iſland againſt the Turks. Upon his return to France, he embarked for Sweden, having a paſſionate deſire to ſee Charles XII. He acquired the eſteem and confidence of that famous general, who ſent him to France to negociate the reeſtabliſhment of James II. upon the throne of England; but that project being dropped, he returned to Sweden, followed Charles XII. in his expedition to Norway, and ſerved under him at the ſiege of Frederickſhall, where that prince was killed, Dec. 11. 1718. Folard then returned to France; and made his laſt campaign in 1719, under the duke of Berwick, in quality of colonel. From that time he applied himſelf intenſely to the ſtudy of the art military as far as it could be ſtudied at home; and built his theories upon the foundation of his experience and obſervations on facts. He contracted an intimacy with count Saxe, who, as he then declared, would one day prove a very great general. He was choſen a fellow of the Royal Society at London in 1749; and, in 1751, made a journey to Avignon, where he died in 1752, aged 83 years. He was the author of ſeveral works, the principal of which are, 1. Commentaries upon Polybius, in ſix volumes, 4to. 2. A Book of new Diſcoveries in War. 3. A Treatiſe concerning the Defence of Places, &c in French. Thoſe who would know more of this eminent ſoldier, may conſult a French piece, intitled,

Folard.

olc-lands || olencio.

titled, *Memoires pours ſervir à l'Hiſtoire de M. de Chevalier de Folard. Ratiſbone*, 1753, 12mo.

FOLC-LANDS, (Sax.) copy-hold lands ſo called in the time of the Saxons, as charter-lands were called *boc-lands*, Kitch. 174. *Folkland* was *terra vulgi* or *popularis*; the land of the vulgar people, who had no certain eſtate therein, but held the ſame, under the rents and ſervices accuſtomed or agreed, at the will only of their lord the thane; and it was therefore not put in writing, but accounted *prædium ruſticum et ignobile*. Spelm. of Feuds, *c.* 5.

FOLCMOTE, or FOLKMOTE, (Sax. *Folcgemot*, i. e. *conventus populi*), is compounded of *folk*, *populus*, and *mote*, or *gemote*, *convenire*; and ſignified originally, as Somner in his Saxon Dictionary informs us, a general aſſembly of the people, to conſider of and order matters of the commonwealth. And Sir Henry Spelman ſays, the *folcmote* was a ſort of annual parliament, or convention of the biſhops, thanes, aldermen, and freemen, upon every May-day yearly; where the laymen were ſworn to defend one another and the king, and to preſerve the laws of the kingdom; and then conſulted of the common ſafety. But Dr Brady infers from the laws of the Saxon kings of England, that it was an inferior court, held before the king's *reeve* or ſteward, every month, to do *folk* right, or compoſe ſmaller differences, from whence there lay appeal to the ſuperior courts; *Gloſs.* p. 48. Squire ſeems to think the *folcmote* not diſtinct from the *ſhiremote*, or common general meeting of the county. See his *Angl. Sax. Gov.* 155. *n.*

Manwood mentions *folcmote* as a court holden in London, wherein all the *folk* and people of the city did complain of the mayor and aldermen, for miſgovernment within the ſaid city; and this word is ſtill in uſe among the Londoners, and denotes *celebrem ex tota civitate conventum. Stow's Survey.* According to Kennet, the *folcmote* was a common-council of all the inhabitants of a city, town, or borough, convened often by ſound of bell, to the *Mote Hall*, or *Houſe*; or it was applied to a larger congreſs of all the freemen within a county, called the *ſhire-mote*, where formerly all knights and military tenants did fealty to the king, and elected the annual ſheriff on the 1ſt of October; till this popular election, to avoid tumults and riots, devolved to the king's nomination, anno 1315, 3 Edw. 1. After which the city *folkmote* was ſwallowed up in a ſelect committee or common-council, and the country *folkmote* in the ſheriff's tourn and aſſiſes.

The word *folkmote* was alſo uſed for any kind of popular or public meeting; as of all the tenants at the *court leet*, or *court-baron*, in which ſignification it was of a leſs extent. *Paroch. Antiq.* 120.

FOLENGIO (Theophilus), of Mantua, known alſo by the title of *Merlin Coccaye*, an Italian poet, remarkable for giving to a poem a name which has been adopted ever ſince for all trifling performances of the ſame ſpecies, conſiſting of buffoonry, puns, anagrams, wit without wiſdom, and humour without good ſenſe. His poem was called *The Macaroni*, from an Italian cake of the ſame name, which is ſweet to the taſte, but has not the leaſt alimentary virtue, on the contrary palls the appetite and cloys the ſtomach. Theſe idle poems, however, became the reigning taſte in Italy and in France: they gave birth to macaroni academies; and, reaching England, to macaroni clubs; till, in the end, every thing inſipid, contemptible, and ridiculous, in the character, dreſs, or behaviour, of both men and women, is now ſummed up in the deſpicable appellation of *a macaroni*. Folengio died in 1544.

Folia || Folio.

FOLIA, among botaniſts, particularly ſignify the leaves of plants; thoſe of flowers being expreſſed by the word *petals*. See LEAF.

FOLIAGE, a cluſter or aſſemblage of flowers, leaves, branches, &c.

FOLIAGE, is particularly uſed for the repreſentations of ſuch flowers, leaves, branches, rinds, &c. whether natural or artificial, as are uſed for enrichments on capitals, friezes, pediments, &c.

FOLIATING *of* LOOKING-GLASSES, the ſpreading the plates over, after they are poliſhed, with quickſilver, &c. in order to reflect the image. It is performed thus: A thin blotting paper is ſpread on the table, and ſprinkled with fine chalk; and then a fine lamina or leaf of tin, called *foil*, is laid over the paper; upon this is poured mercury, which is to be diſtributed equally over the leaf with a hare's-foot or cotton: over this is laid a clean paper, and over that the glaſs-plate, which is preſſed down with the right-hand, and the paper drawn gently out with the left: this being done, the plate is covered with a thicker paper, and loaded with a greater weight, that the ſuperfluous mercury may be driven out and the tin adhere more cloſely to the glaſs. When it is dried, the weight is removed, and the looking-glaſs is complete.

Some add an ounce of marcaſite, melted by the fire; and, leſt the mercury ſhould evaporate in ſmoke, they pour it into cold water; and when cooled, ſqueeze through a cloth, or through leather.

Some add a quarter of an ounce of tin and lead to the marcaſite, that the glaſs may dry the ſooner.

FOLIATING *of Globe Looking-glaſſes*, is done as follows: Take five ounces of quickſilver and one ounce of biſmuth; of lead and tin, half an ounce each: firſt put the lead and tin into fuſion, then put in the biſmuth; and when you perceive that in fuſion too, let it ſtand till it is almoſt cold, and pour the quickſilver into it: after this, take the glaſs-globe, which muſt be very clean, and the inſide free from duſt: make a paper-funnel, which put into the hole of the globe, as near the glaſs as you can, ſo that the amalgam, when you pour it in, may not ſplaſh, and cauſe the glaſs to be full of ſpots; pour it in gently, and move it about, ſo that the amalgam may touch every where: if you find the amalgam begin to be curdly and fixed, then hold it over a gentle fire, and it will eaſily flow again; and if you find the amalgam too thin, add a little more lead, tin, and biſmuth to it. The finer and clearer your globe is, the better will the looking-glaſs be.

Dr Shaw obſerves, that this operation has conſiderable advantages, as being performable in the cold; and that it is not attended with the danger of poiſonous fumes from arſenic, or other unwholeſome matters, uſually employed for this purpoſe: beſides, how far it is applicable to the more commodious foliating of the common looking-glaſſes, and other ſpeculums, he thinks, may deſerve to be conſidered.

FOLIO, in merchants books, denotes a page, or rather both the right and left hand pages, theſe being ex-

Folio || Folis.

expreſſed by the ſame figure, and correſponding to each other. See BOOK-KEEPING.

FOLIO, among printers and bookſellers, the largeſt form of books, when each ſheet is ſo printed that it may be bound up in two leaves only.

FOLIS. See FOLLIS.

FOLIUM, or LEAF, in botany. See LEAF.

FOLKES (Martin), an Engliſh antiquary, mathematician, and philoſopher, was born at Weſtminſter about 1690; and was greatly diſtinguiſhed as a member of the Royal Society in London, and of the Academy of Sciences at Paris. He was admitted into the former at 24 years of age; made one of their council two years after; named by Sir Iſaac Newton himſelf as vice-preſident; and, after Sir Hans Sloane, became preſident. There are numerous Memoirs of his in the Philoſophical Tranſactions. Coins, ancient and modern, were a great object with him: and his laſt production was a book upon the Engliſh Silver Coin, from the conqueſt to his own times. He died at London in 1754. Dr Birch had drawn up materials for a life of Mr Folkes, which are preſerved at large in the Anecdotes of Bowyer, p. 562. *et ſeq.*

FOLKESTONE, a town of Kent, between Dover and Hythe, 72 miles from London, appears to have been a very ancient place, from the Roman coins and Britiſh bricks often found in it. Stillingfleet and Tanner take it for the *Lapis Tituli* of Nennius. It was burnt by Earl Godwin, and by the French in the reign of Edward III. It had five churches, now reduced to one. It is a member of the town and port of Dover; and has a weekly market and an annual fair. It is chiefly noted for the multitude of fiſhing-boats that belong to its harbour, which are employed in the ſeaſon in catching mackerel for London; to which they are carried by the mackerel-boats of London and Barking. About Michaelmas, the Folkeſtone-barks, with others from Suſſex, go away to the Suffolk and Norfolk coaſts, to catch herrings for the merchants of Yarmouth and Leoſtoff.—Folkeſtone gives title of *Viſcount* to William Henry Bouverie, whoſe grandfather, Jacob, was ſo created in 1747. It has been obſerved of ſome hills in this neighbourhood, that they have viſibly ſunk and grown lower within memory.

FOLKLAND, and FOLKMOTE. See FOLCLAND.

FOLLICULUS, (from *follis*, "a bag,") a ſpecies of ſeed-veſſel firſt mentioned by Linnæus in his *Delineatio plantæ*, generally conſiſting of one valve, which opens from bottom to top on one ſide, and has no future for faſtening or attaching the ſeeds within it.

FOLLICULI are likewiſe defined by the ſame author to be ſmall glandular veſſels diſtended with air, which appear on the ſurface of ſome plants; as at the root of water-milfoil, and on the leaves of aldrovanda. In the former, the veſſels in queſtion are roundiſh, and furniſhed with an appearance like two horns; in the latter, pot ſhaped, and ſemicircular.

FOLLIS, or FOLIS, anciently ſignified a little bag or purſe; whence it came to be uſed for a ſum of money, and very different ſums were called by that name: thus the ſcholiaſt on the Baſilics, mentions a follis of copper which was worth but the 24th part of the miliarenſis; the gloſſæ nomicæ, quoted by Gronovius and others, one of 125 miliarenſis, and another of 250 denarii, which was the ancient ſeſtertium; and three different ſums of eight, four, and two pound of gold, were each called *follis*. According to the account of the ſcholiaſt, the ounce of ſilver, which contained 5 miliarenſis of 60 in the pound, was worth 120 follis of copper. The gloſſographer, deſcribing a follis of 250 denarii, ſays it was equal to 312 pounds 6 ounces of copper; and as the denarius of that age was the 8th part of an ounce, an ounce of ſilver muſt have been worth 120 ounces of copper; and therefore the ſcholiaſt's follis was an ounce of copper, and equal to the gloſſographer's nummus. But as Conſtantine's copper money weighed a quarter of a Roman ounce, the ſcholiaſt's follis and the gloſſographer's nummus contained four of them, as the ancient nummus contained four aſſes.

Folly || Fong-yang.

FOLLY, according to Mr Locke, conſiſts in the drawing of falſe concluſions from juſt principles; by which it is diſtinguiſhed from madneſs, which draws juſt concluſions from falſe principles.

But this ſeems too confined a definition; *folly*, in its moſt general acceptation, denoting a weakneſs of intellect or apprehenſion, or ſome partial abſurdity in ſentiment or conduct.

FOMAHANT, in aſtronomy, a ſtar of the firſt magnitude in the conſtellation AQUARIUS.

FOMENTATION, in medicine, is a fluid externally applied, uſually as warm as the patient can bear it, and in the following manner. Two flanel cloths are dipped into the heated liquor, one of which is wrung as dry as the neceſſary ſpeed will admit, then immediately applied to the part affected; it lies on until the heat begins to go off, and the other is in readineſs to apply at the inſtant in which the firſt is removed: thus theſe flanels are alternately applied, ſo as to keep the affected part conſtantly ſupplied with them warm. This is continued 15 or 20 minutes, and repeated two or three times a-day.

Every intention of relaxing and ſoothing by fomentations may be anſwered as well by warm water alone as when the whole tribe of emollients are boiled in it; but when diſcutients or antiſeptics are required, ſuch ingredients muſt be called in as are adapted to that end.

The degree of heat ſhould never exceed that of producing a pleaſing ſenſation; great heat produces effects very oppoſite to that intended by the uſe of fomentations.

FONG-YANG, a city of China, in the province of KIANG-*Nan*. It is ſituated on a mountain, which hangs over the yellow river, and incloſes with its walls ſeveral fertile little hills. Its juriſdiction is very extenſive: for it comprehends 18 cities; 5 of which are of the ſecond, and 13 of the third claſs. As this was the birth-place of the emperor Hong-vou, chief of the preceding dynaſty, this prince formed a deſign of rendering it a famous and magnificent city, in order to make it the ſeat of empire. After having expelled the weſtern Tartars, who had taken poſſeſſion of China, he transferred his court hither, and named the city *Fong-yang*; that is to ſay, "The Place of the Eagle's Splendor." His intention, as we have ſaid, was to beautify and enlarge it; but the inequality of the ground, the ſcarcity of freſh water, and above all the vicinity of his father's tomb, made him change his deſign. By the

Fong-yang Fontaine

the unanimous advice of his principal officers, this prince eſtabliſhed his court at NAN-KING, a more beautiful and commodious place. When he had formed this reſolution, a ſtop was put to the intended works: the imperial palace which was to have been incloſed by a triple wall, the walls of the city to which a circumference of nine leagues were aſſigned, and the canals that were begun, all were abandoned; and nothing was finiſhed but three monuments, which ſtill remain. The extent and magnificence of theſe ſufficiently ſhow what the beauty of this city would have been, had the emperor purſued his original deſign. The firſt is the tomb of the father of Hong-vou, to decorate which no expence was ſpared; it is called *Hoan-lin*, or the *Royal Tomb*. The ſecond is a tower built in the middle of the city, which is of an oblong form, and 100 feet high. The third is a magnificent temple erected to the god Fo. At firſt it was only a pagod, to which Hong-vou retired after having loſt his parents, and where he was admitted as an inferior domeſtic; but, having ſoon become weary of this kind of life, he enliſted with the chief of a band of banditti, who had revolted from the Tartars. As he was bold and enterpriſing, the general made choice of him for his ſon-in-law; ſoon after, he was declared his ſucceſſor by the unanimous voice of the troops. The new chief, ſeeing himſelf at the head of a large party, had the preſumption to carry his views to the throne. The Tartars, informed of the progreſs of his arms, ſent a numerous army into the field: but he ſurpriſed and attacked them with ſo much impetuoſity, that they were obliged to fly; and, though they ſeveral times returned to the charge, they were ſtill defeated, and at length driven entirely out of China. As ſoon as he mounted the throne, he cauſed the ſuperb temple which we have mentioned, to be raiſed out of gratitude to the Bonzes, who had received him in his diſtreſs, and aſſigned them a revenue ſufficient for the maintenance of 300 perſons, under a chief of their own ſect, whom he conſtituted a mandarin, with power of governing them, independent of the officers of the city. This pagod was ſupported as long as the preceding dynaſty laſted; but that of the eaſtern Tartars, which ſucceeded, ſuffered it to fall to ruin.

FONG-Choui, the name of a ridiculous ſuperſtition among the Chineſe. See CHINA, n° 105.

FONT, among eccleſiaſtical writers, a large baſon, in which water is kept for the baptizing of infants or other perſons.

FONT, in the art of printing, denotes a complete aſſortment of letters, accents, &c. uſed in printing. See FOUNT.

FONTAINE (John), the celebrated French poet, and one of the firſt rate geniuſes of his age, was born at Chateau Thierri in Champaigne, the 8th of July 1621, of a good extraction. At the age of 19 he entered amongſt the Oratorians, but quitted that order 18 months after. He was 22 years of age before he knew his own talents for poetry; but hearing an ode of Malherbe read, upon the aſſaſſination of Henry IV. he was ſo taken with admiration of it, that the poetical fire, which had before lain dormant within him, ſeemed to be enkindled from that of the other great poet. He applied himſelf to read, to meditate, to repeat, in fine, to imitate, the works of Malherbe. The firſt eſſays of his pen he confined to one of his relations, who made him read the beſt Latin authors, Horace, Virgil, Terence, Quintilian, &c. and then the beſt compoſitions in French and Italian. He applied himſelf likewiſe to the ſtudy of the Greek authors, particularly Plato and Plutarch. Some time afterwards his parents made him marry a daughter of a lieutenant-general, a relation of the great Racine. This young lady, beſides her very great beauty, was remarkable for the delicacy of her wit, and Fontaine never compoſed any work without conſulting her. But as her temper was none of the beſt, to avoid diſſenſion, he ſeparated himſelf from her company as often as he well could. The famous ducheſs of Bouillon, niece to cardinal Mazarine, being exiled to Chateau Thierri, took particular notice of Fontaine. Upon her recal, he followed her to Paris; where, by the intereſt of one of his relations, he got a penſion ſettled upon him. He met with great friends and protectors amongſt the moſt diſtinguiſhed perſons of the court, but madam de la Sabliere was the moſt particular. She took him to live at her houſe; and it was then that Fontaine, diveſted of domeſtic concerns, led a life conformable to his diſpoſition, and cultivated an acquaintance with all the great men of the age. It was his cuſtom, after he was fixed at Paris, to go every year, during the month of September, to his native place of Chateau-Thierri, and pay a viſit to his wife, carrying with him Racine, Deſpreaux, Chapelle, or ſome other celebrated writers. When he has ſometimes gone thither alone by himſelf, he has come away without remembering even to call upon her; but ſeldom omitted ſelling ſome part of his lands, by which means he ſquandered away a conſiderable fortune. After the death of madame de la Sabliere, he was invited into England, particularly by madame Mazarin, and by St Evremond, who promiſed him all the ſweets and comforts of life; but the difficulty of learning the Engliſh language, and the liberality of the duke of Burgundy, prevented his voyage.

Fontaine.

About the end of the year 1692 he fell dangerouſly ill; and, as is cuſtomary upon theſe occaſions in the Romiſh church, he made a general confeſſion of his whole life to P. Poguet, an oratorian; and, before he received the ſacrament, he ſent for the gentlemen of the French academy, and in their preſence declared his ſincere compunction for having compoſed his Tales; a work he could not reflect upon without the greateſt repentance and deteſtation; promiſing, that if it ſhould pleaſe God to reſtore his health, he would employ his talents only in writing upon matters of morality or piety. He ſurvived this illneſs two years, living in the moſt exemplary and edifying manner, and died the 13th of March 1695, being 74 years of age. When they ſtripped his body, they found next his ſkin a hair-ſhirt; which gave room for the following expreſſion of the younger Racine:

Et l'Auteur de Jaconde eſt orme d' un Cilice.

Fontaine's character is remarkable for a ſimplicity, candour, and probity, ſeldom to be met with. He was of an obliging diſpoſition; cultivating a real friendſhip with his brother poets and authors; and, what is very rare, beloved and eſteemed by them all. His converſation was neither gay nor brilliant, eſpecially when he was not among his intimate friends. One

Fontaine, Fontainbleau

day being invited to dinner at a farmer-general's, he eat a great deal, but did not ſpeak. Riſing up from table very early, under pretext of going to the academy, one of the company repreſented to him that it was not yet a proper time: "Well (ſays he), if it is not, I will ſtay a little longer." He had one ſon by his wife in the year 1660. At the age of 14, he put him into the hands of M. de Harley, the firſt preſident, recommending to him his education and fortune. It is ſaid, that having been a long time without ſeeing him, he happened to meet him one day viſiting, without recollecting him again, and mentioned to the company that he thought that young man had a good deal of wit and underſtanding. When they told him it was his own ſon, he anſwered in the moſt tranquil manner, "Ha! truly I am glad on't." An indifference, or rather an abſence of mind, influenced his whole conduct, and rendered him often inſenſible to the inclemency of the weather. Madame de Bouillon going one morning to Verſailles, ſaw him, abſtracted in thought, ſitting in an arbour; returning at night, ſhe found him in the ſame place, and in the ſame attitude, although it was very cold and had rained almoſt the whole day. He carried this ſimplicity ſo far, that he was ſcarce ſenſible of the bad effects ſome of his writings might occaſion, particularly his tales. In a great ſickneſs, his confeſſor exhorting him to prayer and almsdeeds: "As for alms-deeds (replied Fontaine), I am not able, having nothing to give; but they are about publiſhing a new edition of my Tales, and the bookſeller owes me a hundred copies; you ſhall have them to ſell, and diſtribute their amount amongſt the poor." Another time P. Poguet exhorting him to repent of his faults, "If he has committed any (cried the nurſe), I am ſure it is more from ignorance than malice, for he has as much ſimplicity as an infant." One time having compoſed a tale, wherein he made a profane application of thoſe words of the Goſpel, "Lord, five talents thou didſt deliver to me," he dedicated it, by a moſt ingenious prologue, to the celebrated Arnauld, telling him, it was to ſhow to poſterity the great eſteem he had for the learned doctor. He was not ſenſible of the indecency of the dedication, and the profane application of the text, till Boileau and Racine repreſented it to him. He addreſſed another, by a dedication in the ſame manner to the archbiſhop of Paris. His Fables are an immortal work, exceeding every thing in that kind, both ancient and modern, in the opinion of the learned. People of taſte, the oftener they read them, will find continually new beauties and charms, not to be met with elſewhere. The deſcendants of this great poet are exempted in France from all taxes and impoſitions, a privilege which the intendants of Soiſſons to this day think it an honour to confirm to them.

FONTAINBLEAU, a town in the Iſle of France, and in the Gatinois, remarkable for its fine palace, which has been the place where the kings of France uſed to lodge when they went a-hunting. It was firſt embelliſhed by Francis I. and all the ſucceſſive kings have added ſomething thereto; inſomuch that it may now be called the fineſt pleaſure-houſe in the world. It ſtands in the midſt of a foreſt, conſiſting of 26,424 arpents of land, each containing 100 ſquare perches, and each perch 18 feet. E. Long. 2. 33. N. Lat. 40. 22.

Fontaines Fontarabia.

FONTAINES (Peter Francis), a French critic, was born of a good family at Rouen in 1685. At 15, he entered into the ſociety of the Jeſuits; and at 30, quitted it, for the ſake of returning to the world. He was a prieſt, and had a cure in Normandy; but left it, and was, as a man of wit and letters, ſome time with the cardinal d'Auvergne. Having excited ſome attention at Paris by certain critical productions, the Abbé Bignon in 1724 committed to him the *Journal des Sçavans*. He acquitted himſelf well in this department, and was peaceably enjoying the applauſes of the public, when his enemies, whom by critical ſtrictures in his Journal he had made ſuch, formed an accuſation againſt him of a moſt abominable crime, and procured him to be impriſoned. By the credit of powerful friends, he was ſet at liberty in 15 days: the magiſtrate of the police took upon himſelf the trouble of juſtifying him in a letter to the Abbé Bignon; and this letter having been read amidſt his fellow-labourers in the Journal, he was unanimouſly re-eſtabliſhed in his former credit. This happened in 1725. But with whatever repute he might acquit himſelf in this Journal, frequent diſguſts made him frequently abandon it. He laboured mean while in ſome new periodical works, from which he derived his greateſt fame. In 1731, he began one under the title of *Nouvelliſte du Parnaſſe, ou Reflexions ſur les Ouvrages nouveaux:* but only proceeded to two volumes; the work having been ſuppreſſed by authority, from the inceſſant complaints of authors ridiculed therein. About three years after, in 1735, he obtained a new privilege for a periodical production, intitled, *Obſervations ſur les Ecrits Modernes;* which, after continuing to 33 volumes, was ſuppreſſed again in 1743. Yet the year following, 1744, he publiſhed another weekly paper, called, *Jugemens ſur les Ouvrages nouveaux*, and proceeded to 11 volumes: the two laſt being done by other hands. In 1745, he was attacked with a diſorder in the breaſt, which ended in a dropſy that proved fatal in five weeks. "He was (ſays M. Freron) born a ſentimental perſon; a philoſopher in conduct as well as in principle; exempt from ambition; and of a noble firm ſpirit, which would not ſubmit to ſue for preferments or titles. In common converſation he appeared only a common man; but when ſubjects of literature, or any thing out of the ordinary way, were agitated, he diſcovered great force of imagination and wit." Beſides the periodical works mentioned above, he was the author of many others: his biographer gives us no leſs than 17 articles; many of them critical, ſome hiſtorical, and ſome tranſlations from Engliſh writers, chiefly from Pope, Swift, Fielding, &c. The Abbé de la Porte, publiſhed, in 1757, *L'Eſprit de l'Abbé des Fontaines*, in 4 vols 12mo; prefixed to which is the Life of Fontaines, a catalogue of his works, and another catalogue of writings againſt him.

FONTANELLA, in anatomy, imports the quadrangular aperture found betwixt the os frontis and oſſa ſincipitis, in children juſt born; which is alſo called *fons pulſatilis*.

FONTARABIA, a ſea-port town of Spain in Biſcay, and in the territory of Guipuſcoa, ſeated on a peninſula on the ſea-ſhore, and on the river Bidaſſoa. It is ſmall, but well fortified both by nature and art; and has a good harbour, though dry at low-water. It

is

Fontenay || Fontevraud.

is built in the form of an amphitheatre, on the declivity of an hill, and furrounded on the land fide by the high Pyrenean mountains. It is a very important place, being accounted the key of Spain on that fide. W. Long. 1. 43. N. Lat. 43. 23.

FONTENAY, (John Baptift Blain de), a very famous painter of fruit and flowers, was born at Caen in 1654. Louis XIV. gave him a penfion, and an apartment in the galleries of the Louvre; and he was nominated counfellor of the Academy of Painting. His fruit and flowers have all the freſhneſs and beauty of nature; the very dew feems to trickle down their ſtalks, with all the luſtre and tranſparency of the diamond, while the inſects upon them ſeem perfectly alive and animated. This ingenious painter died at Paris in 1715.

FONTENELLE, (Bernard de), a celebrated French author, was born in 1657, and died in 1756, when he was near 100 years old. He diſcharged the truſt of perpetual ſecretary to the Academy of Sciences above 40 years with univerſal applauſe; and his Hiſtory of the Academy of Sciences throws a great light upon their memoirs, which are very obſcure. The eloges which he pronounced on the deceaſed members of the academy, have this peculiar merit, that they excite a reſpect for the ſciences as well as for the author. In his poetical performances, and the Dialogues of the Dead, the ſpirit of Voiture was diſcernible, though more extended and more philoſophical. His Plurality of Worlds, is a work ſingular in its kind: the deſign of which was to preſent that part of philoſophy to view in a gay and pleaſing dreſs. In his more advanced years, he publiſhed comedies, which, though they ſhowed the elegance of Fontenelle, were little fitted for the ſtage; and An Apology for Des Cartes's Vortices. M. de Voltaire, who declares him to have been the moſt univerſal genius the age of Louis XIV. produced, ſays, "We muſt excuſe his comedies, on account of his great age; and his Carteſian opinions, as they were thoſe of his youth, when they were univerſally received all over Europe."

FONTENOY, a town or village of the Auſtrian Netherlands, in the province of Hainault, and on the borders of Flanders; remarkable for a battle fought there between the allies and the French on the firſt of May 1745. The French were commanded by Mareſchal Saxe, and the allies by the Duke of Cumberland. The latter behaved with great bravery; but through the ſuperiority of the numbers of the French army, and likewiſe the ſuperior generalſhip of their commander, the allies were defeated with great ſlaughter. The Britiſh troops behaved with aſtoniſhing intrepidity, as their enemies themſelves owned. It is even ſaid, that the battle was loſt through the cowardice of the Dutch, who failed in their attack on the village of Fontenoy, on which the event of the day depended. E. Long. 2. 20. N. Lat. 50. 35.

FONTENOY, a village of France, in the duchy of Burgundy, remarkable for a bloody battle fought there in 841, between the Germans and the French, in which were killed above 100,000 men: and the Germans were defeated. E. Long. 3. 48. N. Lat. 47. 28.

FONTEVRAUD, or FONTEVAUX (Order of), in eccleſiaſtical hiſtory, a religious order inſtituted by Robert d'Arbriſſel, about the latter end of the 11th century, and taken under the protection of the holy ſee by pope Paſcal II. in 1106, confirmed by a bull in 1113, and inveſted by his ſucceſſors with very extraordinary privileges. The chief of this order is a female, who is appointed to inſpect both the monks and nuns. The order is divided into four provinces, which are thoſe of France, Aquitaine, Auvergne, and Bretagne, in each of which they have ſeveral priories.

Fonticulus || Food.

FONTICULUS, or FONTANELLA, in ſurgery, an iſſue, ſeton, or ſmall ulcer, made in various parts of the body, in order to eliminate the latent corruption out of it.

FONTINALIA, or FONTANALIA, in antiquity, a religious feaſt held among the Romans in honour of the deities who preſided over fountains or ſprings. Varro obſerves, that it was the cuſtom to viſit the wells on thoſe days, and to caſt crowns into fountains. Scaliger, in his conjectures on Varro, takes this not to be a feaſt of fountains in general, as Feſtus inſinuates, but of the fountain which had a temple at Rome, near the Porta Capena, called alſo *Porta Fontinalis*: he adds, that it is of this fountain Cicero ſpeaks in his ſecond book *De legib.* The fontinalia were held on the 13th of October.

FONTINALIS, WATER-MOSS, in botany: A genus of the natural order of muſci, belonging to the cryptogamia claſs of plants. The anthera is hooded; the calyptra, or covering of the anthera, ſeſſile, incloſed in a perichætium or empalement of leaflets different from thoſe of the reſt of the plant. There are four ſpecies, all of them natives of Britain. They grow on the brinks of rivulets, and on the trunks of trees. The moſt remarkable is the antipyretica, with purple ſtalks. The Scandinavians line the inſides of their chimneys with this moſs, to defend them againſt the fire; for, contrary to the nature of all other moſs, this is ſcarcely capable of burning.

FOOD, in the moſt extenſive ſignification of the word, implies whatever aliments are taken into the body, whether ſolid or fluid; but, in common language, it is generally uſed to ſignify only the ſolid part of our aliment.

We are told, that in the firſt ages men lived upon acorns, berries, and ſuch fruits as the earth ſpontaneouſly produces; then they proceeded to eat the fleſh of wild animals taken in hunting: But their numbers decreaſing and mankind multiplying, neceſſity taught them the art of cultivating the ground, to ſow corn, &c. By and by they began to aſſign to each other, by general conſent, portions of land to produce them their ſupply of vegetables; after this, reaſon ſuggeſted the expedient of domeſticating certain animals, both to aſſiſt them in their labours and ſupply them with food. Hogs were the firſt animals of the domeſtic kind that appeared upon their tables; they held it to be ungrateful to devour the beaſts that aſſiſted them in their labours.—When they began to make a free uſe of domeſtic animals, they roaſted them only; boiling was a refinement in cookery which for ages they were ſtrangers to; and fiſh living in an element men were unuſed to, were not eaten till they grew ſomewhat civilized. Menelaus complains, in the Odyſſey, that they had been conſtrained to feed upon them.

The moſt remarkable diſtinction of foods, in a medical view, is into thoſe which are already aſſimilated into

Food. into the animal nature, and such as are not. Of the first kind are animal substances in general; which if not entirely similar, are nearly so, to our nature. The second comprehends vegetables, which are much more difficultly assimilated. But as the nourishment of all animals, even those which live on other animals, can be traced originally to the vegetable kingdom, it is plain, that the principle of all nourishment is in vegetables.

Cullen on the Mat. Med. 1st edit.

Though there is perhaps no vegetable which does not afford nourishment to some species of animals or other; yet, with regard to mankind, a very considerable distinction is to be made. Those vegetables which are of a mild, bland, agreeable taste, are proper nourishment; while those of an acrid, bitter, and nauseous nature, are improper. We use, indeed, several acrid substances as food; but the mild, the bland, and agreeable, are in the largest proportion in almost every vegetable. Such as are very acrid, and at the same time of an aromatic nature, are not used as food, but as spices or condiments, which answer the purposes of medicine rather than any thing else. Sometimes, indeed, acrid and bitter vegetables seem to be admitted as food. Thus celeri and endive are used in common food, though both are substances of considerable acrimony; but it must be observed, that, when we use them, they are previously blanched, which almost totally destroys their acrimony. Or if we employ other acrid substances, we generally, in a great measure, deprive them of their acrimony by boiling. In different countries the same plants grow with different degrees of acrimony. Thus, garlic here seldom enters our food; but in the southern countries, where the plants grow more mild, they are frequently used for that purpose. The plant which furnishes cassada, being very acrimonious, and even poisonous, in its recent state, affords an instance of the necessity of preparing acrid substances even in the hot countries: and there are other plants, such as arum-root, which are so exceedingly acrimonious in their natural state, that they cannot be swallowed with safety; yet, when deprived of that acrimony, will afford good nourishment.

The most remarkable properties of different vegetable substances as food, are taken notice of under their different names; here we shall only compare vegetable foods in general with those of the animal kind.

I. *In the Stomach*, they differ remarkably, in that the vegetables always have a tendency to acidity, while animal food of all kinds tend rather to alkalescency and putrefaction. Some animal foods, indeed, turn manifestly acid before they putrify; and it has been asserted, that some degree of accescency takes place in every kind of animal food before digestion. This accescency of animal food, however, never comes to any morbid degree, but the disease is always on the side of putrescency. The accescency of vegetables is more frequent, and ought to be more attended to, than the alkalescency of animal food; which last, even in weak stomachs, is seldom felt; while accescency greatly affects both the stomach and system.

With regard to their difference of *solution*:—Heaviness, as it is called, is seldom felt from vegetables, except from tough farinaceous paste, or the most viscid substances; while the heaviness of animal food is more frequently noticed, especially when in any great quantity. Difficulty of solution does not depend so much on firmness of texture (as a man, from fish of all kinds, is more oppressed than from firmer substances) as on viscidity; and hence it is more frequent in animal food, especially in the younger animals. Food.

With regard to *mixture*:—There is no instance of difficult mixture in vegetables, except in vegetable oils; while animal foods, from both viscidity and oiliness, especially the fatter meats, are refractory in this respect. Perhaps the difference of animal and vegetable foods might be referred to this head of mixture. For vegetable food continues long in the stomach, giving little stimulus: Now the system is affected in proportion to the extent of this stimulus, which is incomparably greater from the animal viscid oily food, than from the vegetable, firmer, and more aqueous. However, there are certain applications to the stomach, which have a tendency to bring on the cold fit of fever, independent of stimulus, merely by their refrigeration: and this oftener arises from vegetables; as we see, in those hot countries where intermittents prevail, they are oftener induced from a surfeit of vegetable than of animal food. A proof of this is, that when one is recovering of an intermittent, there is nothing more apt to cause a relapse than cold food, especially if taken on those days when the fit should return, and particularly accescent, fermentable vegetables, as salad, melons, cucumbers, &c. *acido dulces*, &c. which, according to Dr Cullen, are the most frequent causes of epidemics; therefore, when an intermittent is to be avoided, we shun vegetable diet, and give animal foods, although their stimulus be greater.

II. *In the Intestines.* When the putrescency of animal food has gone too far, it produces an active stimulus, causing diarrhœa, dysentery, &c. But these effects are but rare: whereas from vegetable food and its acid, which, united with the bile, proves a pretty strong stimulus, they more frequently occur; but, luckily, are of less consequence, if the refrigeration is not very great. In the autumnal season, when there is a tendency to dysentery, if it is observed that eating of fruits brings it on, it is rather to be ascribed to their cooling than stimulating the intestines.

As to *stool*—Wherever neither putrefaction nor acidity has gone a great length, animal food keeps the belly more regular. Vegetable food gives a greater proportion of feculent matter, and, when exsiccated by the stomach and intestines, is more apt to stagnate, and produce slow-belly and costiveness, than animal stimulating food; which, before it comes to the great guts, where stoppage is made, has attained a putrefactive tendency, and gives a proper stimulus: and thus those who are costive from the use of vegetables, when they have recourse to animal food are in this respect better.

III. *In the blood-vessels.* They both give a blood of the same kind, but of different quality. Animal food gives it in greater quantity, being in great part, as the expression is, convertible *in succum et sanguinem*, and of easy digestion; whereas vegetable is more watery, and contains a portion of unconquerable saline matter, which causes it to be thrown out of the body by some excretion. Animal food affords a more dense stimulating elastic blood than vegetable; stretching and causing a greater resistance in the solids, and again exciting their stronger action. It has been supposed, that

accescency

Food

acefcency of vegetable food is carried into the blood-veffels, and there exerts its effects; but the tendency of animal fluids is fo ftrong to alkalefcency, that the exiftence of an acid acrimony in the blood feems very improbable. Animal food alone will foon produce an alkalefcent acrimony; and if a perfon who lives entirely on vegetables were to take no food for a few days, his acrimony would be alkalefcent.

IV. We are next to take notice of the *quantity of nutriment* thefe different foods afford. Nutriment is of two kinds: the firft repairs the waffe of the folid fibres; the other fupplies certain fluids, the chief of which is oil. Now, as animal food is eafier converted, and alfo longer retained in the fyftem, and as it contains a greater proportion of oil, it will afford both kinds of nutriment more copioufly than vegetables.

V. Laftly, *As to the different degrees of perfpirability of thefe foods.* This is not yet properly determined. Sanctorius conftantly fpeaks of mutton as the moft perfpirable of all food, and of vegetables as checking perfpiration. This is a confequence of the different ftimulus thofe foods give to the ftomach, fo that perfons who live on vegetables have not their perfpiration fo fuddenly excited. In time of digeftion, perfpiration is ftopped from whatever food, much more fo from cooling vegetables. Another reafon why vegetables are lefs perfpirable is, becaufe their aqueo-faline juices determine them to go off by urine, while the more perfectly mixed animal food is more equally diffufed over the fyftem, and fo goes off by perfpiration. Hence Sanctorius's accounts may be underftood; for vegetable aliment is not longer retained in the body, but moftly takes the courfe of the kidneys. Both are equally perfpirable in this refpect, viz. that a perfon living on either, returns once a-day to his ufual weight; and if we confider the little nourifhment of vegetables, and the great tendency of animal food to corpulency, we muft allow that vegetable is more quickly perfpired than animal food.

As to the queftion, Whether man was originally defigned for animal or vegetable food, fee the article Carnivorous.

With regard to the effects of thefe foods on men, it muft be obferved, that there are no perfons who live entirely on vegetables. The Pythagoreans themfelves eat milk; and thofe who do fo moftly, as thefe Pythagoreans, are weakly, fickly, and meagre, labouring under a conftant diarrhœa and feveral other diffeafes. None of the hardy, robuft, live on thefe; but chiefly fuch as gain a livelihood by the exertion of their mental faculties, as (in the Eaft Indies) factors and brokers; and this method of life is now confined to the hot climates, where vegetable diet, without inconvenience, may be carried to great excefs. Though it be granted, therefore, that man is intended to live on thefe different foods promifcuoufly, yet the vegetable fhould be in very great proportion. Thus the Laplanders are faid to live entirely on animal food: but this is contradicted by the beft accounts; for Linnæus fays, that befides milk, which they take four, to obviate the bad effects of animal food, they ufe alfo calla, menyanthes, and many other plants, copioufly. So there is no inftance of any nation living entirely either on vegetable or animal food, though there are indeed fome who live particularly on one or other in the greateft proportion. In the cold countries, *e. g.* the inhabitants live chiefly on animal food, on account of the rigour of the feafon, their fmaller perfpiration, and little tendency to putrefaction. Food.

Of more importance, however, is the following than the former queftion, viz. *In what proportion animal and vegetable food ought to be mixed?*

1. *Animal* food certainly gives moft ftrength to the fyftem. It is a known aphorifm of Sanctorius, that *pondus addit robur;* which may be explained from the impletion of the blood-veffels, and giving a proper degree of tenfion for the performance of ftrong ofcillations. Now animal food not only goes a greater way in fupplying fluid, but alfo gives the fluid more denfe and elaftic. The art of giving the utmoft ftrength to the fyftem is beft underftood by thofe who breed fighting cocks. Thefe people raife the cocks to a certain weight, which muft bear a certain proportion to the other parts of the fyftem, and which at the fame time is fo nicely proportioned, as that, on lofing a few ounces of it, their ftrength is very confiderably impaired. Dr Robinfon of Dublin has obferved, that the force and weight of the fyftem ought to be determined by the largenefs of the heart, and its proportion to the fyftem: for a large heart will give large blood-veffels, while at the fame time the vifcera are lefs, particularly the liver; which laft being increafed in fize, a greater quantity of fluid is determined into the cellular texture, and lefs into the fanguineous fyftem. Hence we fee how animal food gives ftrength, by filling the fanguiferous veffels. What pains we now beftow on cocks, the ancients did on the Athletæ, by proper nourifhment bringing them to a great degree of ftrength and agility. It is faid that men were at firft fed on figs, a proof of which we have from their nutritious quality: however, in this refpect they were foon found to fall far fhort of animal food; and thus we fee, that men, in fome meafure, will work in proportion to the quality of their food. The Engliih labour more than the Scots; and wherever men are expofed to hard labour, their food fhould be animal. Animal food, although it gives ftrength, yet loads the body; and Hippocrates long ago obferved, that the athletic habit, by a fmall increafe, was expofed to the greateft hazards. Hence it is only proper for bodily labours, and entirely improper for mental exercifes; for whoever would keep his mind acute and penetrating, will exceed rather on the fide of vegetable food. Even the body is oppreffed with animal food; a full meal always produces dulnefs, lazinefs, and yawning; and hence the feeding of gamefters, whofe mind muft be ready to take advantage, is always performed by avoiding a large quantity of animal food. Farther, with regard to the ftrength of the body, animal food in the firft ftage of life is hardly neceffary to give ftrength: in manhood, when we are expofed to active fcenes, it is more allowable; and even in the decline of life, fome proportion of it is neceffary to keep the body in vigour. There are fome diffeafes which come on in the decay of life, at leaft are aggravated by it; among thefe the moft remarkable is the gout. This, when it is in the fyftem, and does not appear with inflammation in the extremities, has pernicious effects there, attacking the lungs, ftomach, head, &c. Now to determine this to the extremities, a large proportion

Food. of animal food is neceſſary, eſpecially as the perſon is commonly incapable of much exerciſe. Food.

Animal food, although it gives ſtrength, is yet of many hazards to the ſyſtem, as it produces plethora and all its conſequences. As a ſtimulus to the ſtomach and to the whole ſyſtem, it excites fever, urges the circulation, and promotes the perſpiration. The ſyſtem, however, by the repetition of theſe ſtimuli, is ſoon worn out; and a man who has early uſed the athletic diet, is either early carried off by inflammatory diſeaſes, or, if he takes exerciſe ſufficient to render that diet ſalutary, ſuch an accumulation is made of putreſcent fluids, as in his after-life lays a foundation for the moſt inveterate chronic diſtempers. Therefore it is to be queſtioned, whether we ſhould deſire this high degree of bodily ſtrength, with all the inconveniences and dangers attending it. Thoſe who are chiefly employed in mental reſearches, and not expoſed to too much bodily labour, ſhould always avoid an exceſs of animal food. There is a diſeaſe which ſeems to require animal food, viz. the hyderic or hypochoudriac; and which appears to be very much a-kin to the gout, affecting the alimentary canal. All people affected with this diſeaſe are much diſpoſed to acefcency; which ſometimes goes ſo far, that no other vegetable but bread can be taken in, without occaſioning the worſt conſequences. Here then we are obliged to preſcribe an animal diet, even to thoſe of very weak organs; for it generally obviates the ſymptoms. However, ſeveral inſtances of ſcurvy in exceſs have been produced by a long-continued uſe of this diet, which it is always unlucky to be obliged to preſcribe; and when it is abſolutely neceſſary to preſcribe, it ſhould be joined with as much of the vegetable as poſſible, and when a cure is performed we ſhould gradually recur to that again.

2. Next, let us conſider the *vegetable* diet. The chief inconveniency of this is difficulty of aſſimilation; which, however, in the vigorous and exerciſed, will not be liable to occur. In warm climates, the aſſimilation of vegetable aliment is more eaſy, ſo that *there* it may be more uſed, and when joined to exerciſe gives a pretty tolerable degree of ſtrength and vigour; and though the general rule be in favour of *animal* diet, for giving ſtrength, yet there are many inſtances of its being remarkably produced from vegetable. Vegetable diet has this advantage, that it whets the appetite, and that we can hardly ſuffer from a full meal of it. Beſides the diſorders it is liable to produce in the *primæ viæ*, and its falling ſhort to give ſtrength, there ſeem to be no bad conſequences it can produce in the blood-veſſels; for there is no inſtance where its peculiar acrimony was ever carried there, and it is certainly leſs putrifiable than animal food; nor, without the utmoſt indolence, and a ſharp appetite, does it give plethora, or any of its conſequences: ſo that we cannot here but conclude, that a large proportion of vegetable food is uſeful for the generality of mankind.

There is no error in this country more dangerous, or more common, than the neglect of bread: for it is the fulleſt of vegetable aliment, and the beſt corrector of animal food; and, by a large proportion of this alone, its bad conſequences, when uſed in a hypochondriac ſtate, have been obviated. The French apparently have as much animal food on their tables as the Britons; and yet, by a greater uſe of bread and the dried acid fruits, its bad effects are prevented; and therefore bread ſhould be particularly uſed by the Engliſh, as they are ſo voracious of animal food. Vegetable food is not only neceſſary to ſecure health, but long life: and, as we have ſaid, in infancy and youth we ſhould be confined to it moſtly; in manhood, and decay of life, uſe animal food; and, near the end, vegetable again.

There is another queſtion much agitated, viz. *What are the effects of variety in food?* Is it neceſſary and allowable, or univerſally hurtful? Variety of a certain kind ſeems neceſſary; as vegetable and animal foods have their mutual advantages, tending to correct each other. Another variety, which is very proper, is that of liquid and ſolid food, which ſhould be ſo managed as to temper each other: and liquid food, eſpecially of the vegetable kind, is too ready to paſs off before it is properly aſſimilated, while ſolid food makes a long ſtay. But this does not properly belong to the queſtion, whether variety of the ſame kind is neceſſary or proper, as in animal-foods, beef, fiſh, fowl, &c. It doth not appear that there is any inconvenience ariſing from this mixture or difficulty of aſſimilation, provided a moderate quantity be taken. When any inconvenience does ariſe, it probably proceeds from this, that one of the particular ſubſtances in the mixture, when taken by itſelf, would produce the *ſame effects*; and, indeed, it would appear, that this effect is not *heightened* by the mixture, but properly *obviated* by it. There are few exceptions to this, if any, *e. g.* taking a large proportion of acefcent ſubſtances with milk. The coldneſs, &c. acidity, flatulency, &c. may appear; and it is poſſible that the coagulum, from the acefcency of the vegetables, being ſomewhat ſtronger induced, may give occaſion to too long retention in the ſtomach, and to acidity in too great degree. Again, the mixture of fiſh and milk often occaſions inconveniences. The theory of this is difficult, though, from univerſal conſent, it muſt certainly be juſt. Can we ſuppoſe that fiſh gives occaſion to ſuch a coagulum as runnet? If it does ſo, it may produce bad effects. Beſides, fiſhes approach ſomewhat to vegetables, in giving little ſtimulus; and are accuſed of the ſame bad effects as theſe, viz. bringing on the cold fit of fever.

Thus much may be ſaid for variety. But it alſo has its diſadvantages, provoking to gluttony; this, and the art of cookery, making men take in more than they properly can digeſt: and hence, perhaps, very juſtly, phyſicians have univerſally almoſt preferred ſimplicity of diet; for, in ſpite of rules, man's eating will only be meaſured by his appetite, and fatiety is ſooner produced by *one* than by *many* ſubſtances. But this is ſo far from being an argument againſt variety, that it is one for it, as the only way of avoiding a full meal of animal food, and its bad effects, is by preſenting a quantity of vegetables. Another mean of preventing the bad effects of animal-food, is to take a large proportion of liquid; and hence the bad effects of animal-food are leſs felt in Scotland, on account of their drinking much with it, and uſing broths, which are at once excellent correctors of animal-food and preventives of gluttony.

With regard to the differences between ANIMAL FOODS, properly ſo called, the firſt regards their ſolubility,

Food. lity, depending on a lax or firm texture of their different kinds.

I. Solubility of animal food ſeems to deſerve leſs attention than is commonly imagined; for there are many inſtances of perſons of a weak ſtomach incapable of breaking down the texture of vegetables, or even of diſſolving a light pudding, to whom hung beef, or a piece of ham, was very grateful and eaſily digeſted. None of the theories given for the ſolution of animal-food in the human ſtomach ſeem to have explained that proceſs ſufficiently. Long ago has been diſcarded the ſuppoſition of an active corroſive menſtruum there; and alſo the doctrine of trituration, for which, indeed, there ſeems no mechaniſm in the human body; and, till lately, phyſicians commonly agreed with Boerhaave in ſuppoſing nothing more to be neceſſary than a watery menſtruum, moderate heat, and frequent agitation. This will account for ſolution in ſome caſes, but not entirely. Let us try to imitate it out of the body with the ſame circumſtances, and in ten times the time in which the food is diſſolved in the ſtomach we ſhall not be able to bring about the ſame changes. Take the coagulated white of an egg, which almoſt every body can eaſily digeſt, and yet no artifice ſhall be able to diſſolve it. Hence, then, we are led to ſeek another cauſe for ſolution, *viz.* fermentation; a notion, indeed, formerly embraced, but, on the introduction of mechanical philoſophy, induſtriouſly baniſhed, with every other ſuppoſition of that proceſs taking place at all in the animal economy.

Many of the ancients imagined this fermentation to be putrefactive. But this we deny, as an acid is produced; though hence the fermentation might be reckoned the vinous, which, however, ſeems always to be morbid. Neither, indeed, is the fermentation purely acetous, but modified by putreſcence; for Pringle has obſerved, that animal-matters raiſe and even expede the acetous proceſs. The fermentation, then, in the ſtomach is of a mixed nature, between the acetous and putrefactive, mutually modifying each other; though, indeed, in the inteſtines, ſomewhat of the putrefactive ſeems to take place, as may be obſerved from the ſtate of the feces broke down, and from the little diſpoſition of ſuch ſubſtances to be ſo, which are not liable to the putrefactive proceſs, as the firmer parts of vegetables, &c. Upon this view ſolution ſeems to be extremely eaſy, and thoſe ſubſtances to be moſt eaſily broke down which are moſt ſubject to putrefaction. See Anatomy, n° 104. and *Gastric Juice*.

But ſolution alſo depends on other circumſtances, and hence requires a more particular regard.

1. There is a difference of ſolubility with reſpect to the manducation of animal-food, for which bread is extremely neceſſary, in order to keep the more ſlippery parts in the mouth till they be properly comminuted*. From want of proper manducation perſons are ſubject to eructations; and this more frequently from the firm vegetable foods, as apples, almonds, &c. than from the animal, though, indeed, even from animal food, very tendinous, or ſwallowed in unbroken maſſes, ſuch ſometimes occur. Manducation is ſo much connected with ſolution, that ſome, from imperfectly performing that, are obliged to belch up their food, remanducate it, and ſwallow it again before the ſtomach can diſſolve it, or proper nouriſhment be extracted. Another proof of our regard to ſolubility, is our rejecting the firmer parts of animal-food, as bull-beef, and generally carnivorous animals. Food.

2. Its effects with regard to ſolubility ſeem alſo to be the foundation of our choice between *fat* and *lean*, *young* and *old meats*. In the *lean*, although perhaps a ſingle fibre might be ſufficiently tender, yet theſe, when collected in *faſciculi*, are very firm and compact, and of difficult ſolution; whereas in the *fat* there is a greater number of veſſels, a greater quantity of juice, more interpoſition of cellular ſubſtance, and conſequently more ſolubility. Again, in young animals, there is probably the ſame number of fibres as in the older, but theſe more connected: whereas, in the older, the growth depending on the ſeparation of theſe, and the increaſe of veſſels and cellular ſubſtance, the texture is leſs firm and more ſoluble; which qualities, with regard to the ſtomach, are at that time too increaſed, by the increaſed alkaleſcency of the animal. To this alſo may be referred our choice of caſtrated animals, *viz.* on account of their diſpoſition to fatten after the operation.

3. It is with a view to the ſolubility, that we make a choice between meats recently killed, and thoſe which have been kept for ſome time. As ſoon as meat is killed, the putrefactive proceſs begins; which commonly we allow to proceed for a little, as that proceſs is the moſt effectual breaker down of animal matters, and a great aſſiſtance to ſolution. The length of time during which meat ought to be kept, is proportioned to the meat's tendency to undergo the putrid fermentation, and the degree of thoſe circumſtances which favour it: Thus, in the torrid zone, where meat cannot be kept above four or five hours, it is uſed much more recent than in theſe northern climates.

4. *Boiled* or *roaſted* meats create a difference of ſolution. By boiling we extract the juices interpoſed between the fibres, approximate them more to each other, and render them of more difficult ſolubility; which is increaſed too by the extraction of the juices, which are much more alkaleſcent than the fibres: but when we want to avoid the ſtimulus of alkaleſcent food, and the quick ſolution, as in ſome caſes of diſeaſe, the roaſted is not to be choſen. Of roaſted meat it may be aſked, which are more proper, thoſe which are moſt or leaſt roaſted? That which is leaſt done is certainly the moſt ſoluble: even raw meats are more ſoluble than dreſſed, as Dr Cullen was informed by a perſon who from neceſſity was obliged, for ſome time, to eat ſuch. But at the ſame time that meats little done are very ſoluble, they are very alkaleſcent; ſo that, wherever we want to avoid alkaleſcency in the *primæ viæ*, the moſt roaſted meats ſhould be choſen. Thoſe who throw away the broths of boiled meat do very improperly; for, beſides their ſupplying a fluid, from their greater alkaleſcency they increaſe the ſolubility of the meat. Here we ſhall obſerve, that pure blood has been thought inſoluble. Undoubtedly it is very nutritious; and though out of the body, like the white of eggs, it ſeems very inſoluble, yet, like that too, in the body it is commonly eaſily digeſted. Moſes very properly forbad it the Iſraelites, as in warm countries it is highly alkaleſcent; and even here, when it was uſed in great quantity, the ſcurvy was

* See the article Bread.

Food. more frequent: but to a moderate uſe of it, in theſe climates, no ſuch objection takes place. Food.

5. Solubility is varied from another ſource, *viz.* viſcidity of the juice of aliment. Young animals, then, appear more ſoluble than old, not only on account of the compaction and firmneſs of texture in the latter, but alſo their greater viſcidity of juice. And nothing is more common, than to be longer oppreſſed from a full meal of veal, than from the ſame quantity of beef, &c. Upon account, too, of their greater viſcidity of juice, are the tendinous and ligamentous parts of animals longer retained than the purely muſcular, as well as on account of their firmneſs of texture. Even fiſhes, whoſe muſcular parts are exceedingly tender, are, on account of their gluey viſcoſity, longer of ſolution in the ſtomach. And eggs, too, which are exceedingly nouriſhing, have the ſame effect, and cannot be taken in great quantity: For the ſtomach is peculiarly ſenſible to gelatinous ſubſtances; and by this means has nature perhaps taught us, as it were by a ſort of inſtinct, to limit ourſelves in the quantity of ſuch nutritive ſubſtances.

6. With regard to ſolution, we muſt take in the oils of animal food; which, when tolerably pure, are the leaſt putreſcent part of it, and, by diminiſhing the coheſion of the fibres, render them more ſoluble. On this laſt account is the lean of fat meat more eaſily diſſolved than other lean. But when the meat is expoſed to much heat, this oil is ſeparated, leaving the ſolid parts leſs eaſily ſoluble, and becoming itſelf empyreumatic, ranceſcent, and of difficult mixture in the ſtomach. Fried meats, from the reaſons now given, and baked meats, for the ſame, as well as for the tenacity of the paſte, are preparations which diminiſh the ſolubility of the food. From what has been ſaid, the preparation of food by fattening it, and keeping it for ſome time after killed, although it may adminiſter to gluttony, will yet, it muſt be confeſſed, increaſe the ſolution of the food.

II. The ſecond difference of animal-food is with regard to Alkalescency.

Of this we have taken a little notice already under the head of *Solubility*.

1. From their too great alkaleſcency we commonly avoid the carnivorous animals, and the *feræ*; and chooſe rather the granivorous. Some birds, indeed, which live on inſects, are admitted into our food; but no man, without *nauſea*, can live upon theſe alone for any length of time. Fiſhes, too, are an exception to this rule, living almoſt univerſally on each other. But in theſe the alkaleſcency does not proceed ſo far; whether from the viſcidity of their juice, their want of heat, or ſome peculiarity in their œconomy, is not eaſy to determine.

2. Alkaleſcency is determined by difference of age. The older animals are always more alkaleſcent than the young, from their continual progreſs to putrefaction. Homberg always found, in his endeavours to extract an acid from human blood, that more was obtained from the young than from the old animals.

3. A third circumſtance which varies the alkaleſcency of the food, is the wildneſs or tameneſs of the animal; and this again ſeems to depend on its exerciſe. Dr Cullen knew a gentleman who was fond of cats for food: but he always uſed to feed them on vegetable food, and kept them from exerciſe; and in the ſame manner did the Romans rear up their rats, when intended for food. In the ſame way the fleſh of the partridge and the hen ſeems to be much the ſame; only, from its being more on the wing, the one is more alkaleſcent than the other. Again, tame animals are commonly uſed without their blood; whereas the wild are commonly killed in their blood, and upon that account, as well as their greater exerciſe, are more alkaleſcent.

4. The alkaleſcency of food may be determined from the quantity of volatile ſalt it affords. The older the meat is, it is found to give the greater proportion of volatile ſalt.

5. The alkaleſcency of aliment may alſo, in ſome meaſure, be determined from its colour, the younger animals being whiter and leſs alkaleſcent. We alſo take a mark from the colour of the gravy poured out, according to the redneſs of the juices judging of the animal's alkaleſcency.

6. The reliſh of food is found to depend much on its alkaleſcency, as does alſo the ſtimulus it gives and the fever it produces in the ſyſtem. Theſe effects are alſo complicated with the viſcidity of the food, by which means it is longer detained in the ſtomach, and the want of alkaleſcency ſupplied.

Having mentioned animal food as differing in ſolubility and alkaleſcency, which often go together in the ſame ſubject, we come to the third difference, *viz.*

III. Quantity of Nutriment. Which is either abſolute or relative: abſolute with reſpect to the quantity it really contains, ſufficient powers being given to extract it; relative, with reſpect to the aſſimilatory powers of thoſe who uſe it. The abſolute nutriment is of ſome conſequence; but the relative, in the robuſt and healthy, and except in caſes of extraordinary weakneſs, may, without much inconvenience, be diſregarded. In another caſe is the quantity of nouriſhment relative, *viz.* with regard to its *perſpirability*; for if the food is ſoon carried off by the excretions, it is the ſame thing as if it contained a leſs proportion of nouriſhment. For, giving more fluid, that which is longer retained affords moſt; and, for the repair of the ſolids, that retention alſo is of advantage. Now, gelatinous ſubſtances are long retained; and beſides, are themſelves animal ſubſtances diſſolved: ſo that, both abſolutely and relatively, ſuch ſubſtances are nutritious. Of this kind are eggs, ſhell-fiſh, &c. In adults, though it is diſputed whether their ſolids need any repair, yet, at any rate, at this period, fluid is more required; for this purpoſe the alkaleſcent foods are moſt proper, being moſt eaſily diſſolved. They are, at the ſame time, the moſt perſpirable; on one hand that alkaleſcency leading to diſeaſe, while on the other their perſpirability obviates it. Adults, therefore, as writers juſtly obſerve, are better nouriſhed on the alkaleſcent; the young and growing, on gelatinous foods. All this leads to a compariſon of young and old meats; the firſt being more gelatinous, and the laſt more alkaleſcent. This, however, by experience, is not yet properly aſcertained. Mr Geoffroy is the only perſon who has been taken up with the analyſis of foods. See *Memoires de l'Academie*, Jan. 1731 & 1732. His attempt was certainly laudable, and in ſome reſpects uſefully performed; but, in general, his experiments

Food. ments were not sufficiently repeated, nor are indeed sufficiently accurate. He has not been on his guard against the various circumstances which affect meats; the cow-kind liking a moist succulent herbage, which is not to be got in warm climates; while the sheep are fond of a dry food, and thrive best there. Again, some of his experiments seem contradictory. He says, that veal gives more solution than beef, while lamb gives less than mutton, which is much to be doubted. If both he and Sanctorius had examined English beef, the result probably would have been very different as to its perspirability, &c. Besides, Mr Geoffroy has only analysed beef and veal when raw; has made no proper circumstantial comparisons between quadrupeds and birds; and has examined these last along with their bones, and not their muscles, &c. by themselves, as he ought to have done, &c. If a set of experiments of this kind were properly and accurately performed, they might be of great use; but, at present, for the purpose of determining our present subject, we must have recourse to our alkalescency, solubility, &c.

IV. The fourth difference of animal foods is, *The Nature of the Fluids they afford.* The whole of this will be understood from what has been said on alkalescency; the fluid produced being more or less dense and stimulating, in proportion as that prevails.

V. The fifth difference of animal foods is with respect to their

Perspirability. The sum of what can be said on this matter is this, that such foods as promote an accumulation of fluid in our vessels, and dispose to plethora, are the least perspirable, and commonly give most strength; that the more alkalescent foods are the most perspirable, though the viscid and less alkalescent may attain the same property by long retention in the system. The authors on perspirability have determined the perspiration of foods as imperfectly as Mr Geoffroy has done the solubility, and in a few cases only. We must not lay hold on what Sanctorius has said on the perspirability of mutton, because he has not examined in the same way other meats in their perfect state; far less on what Keil says of oysters, as he himself was a valetudinarian, and consequently an unfit subject for such experiments, and probably of a peculiar temperament.

As to the effects of Food on the Mind, we have already hinted at them above. It is plain, that delicacy of feeling, liveliness of imagination, quickness of apprehension, and acuteness of judgment, more frequently accompany a weak state of the body. True it is, indeed, that the same state is liable to timidity, fluctuation, and doubt; while the strong have that steadiness of judgment, and firmness of purpose, which are proper for the higher and more active scenes of life. The most valuable state of the mind, however, appears to reside in somewhat less firmness and vigour of body. Vegetable aliment, as never over-distending the vessels or loading the system, never interrupts the stronger motions of the mind; while the heat, fulness, and weight, of animal food, are an enemy to its vigorous efforts. Temperance, then, does not so much consist in the quantity, for that always will be regulated by our appetite, as in the quality, *viz.* a large proportion of vegetable aliment.

A considerable change has now taken place in the articles made use of as food by the ancients, by substituting, instead of what were then used, particularly of the vegetable kind, a number of more bland, agreeable, and nutritive juices. The acorns and nuts of the primitive times have given way to a variety of sweeter farinaceous seeds and roots. To the malvaceous tribe of plants so much used by the Greeks and Romans, hath succeeded the more grateful spinach; and to the blite, the garden orach. The rough borage is supplanted by the acescent sorrel; and asparagus has banished a number of roots recorded by the Roman writers under the name of *bulbs*; but Linnæus is of opinion, that the parsnip has undeservedly usurped the place of the skirret. The bean of the ancients, improperly so called, being the roots as well as other parts of the *nymphæa nelumbo*, or Indian water-lily, is superseded by the kidney-bean. The garden rocket, eaten with and as an antidote against the chilling qualities of the lettuce, is banished by the more agreeable cress and tarragon; the apium by the meliorated celery; the pompion, and others of the cucurbitaceous tribe, by the melon; and the sumach berries, by the fragrant nutmeg. The silphium, or succus Cyrenaicus, which the Romans purchased from Persia and India at a great price, and is thought by some to have been the asafetida of the present time, is no longer used in preference to the alliaceous tribe. Food il Fooshт.

To turn from the vegetable to some of the animal substitutes, we may mention the carp among fishes as having excluded a great number held in high estimation among the Romans. The change of oil for butter; of honey for sugar; of mulsa, or liquors made of wine, water, and honey, for the wines of modern times; and that of the ancient zythus for the present improved malt liquors; not to mention also the *callida* of the Roman taverns, analogous to our tea and coffee.

Food of Plants. See Agriculture, n° 1—6. and Plants; also the article Composts.

FOOL, according to Mr Locke, is a person who makes false conclusions from right principles; whereas a madman, on the contrary, draws right conclusions from wrong principles. See Folly.

Fool-Stones, in botany. See Orchis.

FOOSHT, an island in the Red Sea; situated, according to the observations of Mr Bruce, in N. Lat. 15° 59′ 43″. It is described by him as about five miles in length from north to south, though only *nine* in circumference. It is low and sandy in the southern part, but the north rises in a black hill of inconsiderable height. It is covered with a kind of bent-grass, which never arrives at any great length by reason of want of rain and the constant browzing of the goats. There are great appearances of the black hill having once been a volcano; and near the north cape the ground sounds hollow like the Solfaterra in Italy. There are a vast number of beautiful fish met with upon the coasts, but few fit for eating; and our traveller observed, that the most beautiful were the most noxious when eaten; none, indeed, being salutary food excepting those which resembled the fish of the northern seas. There are many beautiful shell-fish, as the concha veneris, of several colours and sizes; sea-urchins, &c. Spunges are likewise found all along the coast. There are also pearls, but neither large nor of a good water; in consequence of which they sell at no great price. They are produced by a species of bivalve shells. Several

Foot. veral large ſhells, from the fiſh named *biſſer*, are met with upon ſtones of ten or twelve tons weight along the coaſt. They are turned upon their faces and ſunk into the ſtones, as into a paſte, the ſtone being raiſed all about them in ſuch a manner as to cover the edge of the ſhell; "a proof (ſays Mr Bruce) that this ſtone muſt ſome time lately have been ſoft or liquefied: for had it been long ago, the ſun and air would have worn the ſurface of the ſhell; but it ſeems perfectly entire, and is ſet in that hard brown rock as the ſtone of a ring is in a golden chaſing."—The water in this iſland is very good.

The inhabitants of Fooſht are poor fiſhermen of a ſwarthy colour; going naked, excepting only a rag about their waiſt. They have no bread but what they procure in exchange for the fiſh they catch. What they barter in this manner is caled *ſeajan*. But beſides this they catch another ſpecies, which is flat, with a long tail, and the ſkin made uſe of for ſhagreen, of which the handles of knives and ſwords are made. There is a ſmall town on the iſland, conſiſting of about 30 huts, built with faggots of bent graſs or ſpartum, ſupported by a few ſticks, and thatched with graſs of the ſame kind of which they are built.

FOOT, a part of the body of moſt animals whereon the ſtand, walk, &c. See Anatomy, n° 63.

Foot, in the Latin and Greek poetry, a metre or meaſure, compoſed of a certain number of long and ſhort ſyllables.

Theſe feet are commonly reckoned 28: of which ſome are ſimple, as conſiſting of two or three ſyllables, and therefore called *diſſyllabic* or *triſyllabic feet;* others are compound, conſiſting of four ſyllables, and are therefore called *tetraſyllabic feet*.

The diſſyllabic feet are four in number, *viz.* the pyrrhichius, ſpondeus, iambus, and trocheus. See Pyrrhichius, &c.

The triſyllabic feet are eight in number, *viz.* the dactylus, anapæſtus, tribrachys, moloſſus, amphibrachys, amphimacer, bacchius, and antibacchius. See Dactyl, &c.

The tetraſyllabic are in number 16, *viz.* the procleuſmaticus, diſpondeus, choriambus, antiſpaſtus, diiambus, dichoreus, ionicus a majore, ionicus a minore, epitritus primus, epitritus ſecundus, epitritus tertius, epitritus quartus, pæon primus, pæon ſecundus, pæon tertius, and pæon quartus. See Procleusmaticus, &c.

Foot is alſo a long meaſure conſiſting of 12 inches.

Geometricians divide the foot into 10 digits, and the digit into 10 lines.

Foot Halt, the name of a particular diſorder incident to ſheep. It takes its ſource from an inſect, which, when it comes to a certain maturity, reſembles a worm of two, three, or four inches in length. The firſt appearance of the malady is, when the ſheep gives ſigns of being lame, which increaſes to ſo high a degree as to prevent grazing; when, what with want of ſufficient food and pain, the poor animal ſuffers greatly, and lingers till it dies a natural death, if not properly attended to, by extracting the inſect or worm; the ſooner the better, as it is very eaſily performed.

As ſoon as the lameneſs is perceived, let the foot that is lame be examined between the cloſe of the claws, and it will be found that in the ſkin where the cloſe ſeparates is a ſmall hole (not natural), through which the inſect, when yet ſmall, gets its entrance, and by degrees has worked itſelf upwards along the leg, between the outward ſkin and bone, and obtains its largeſt magnitude. Proportionally it finds its nouriſhment, and is left undiſturbed. This worm muſt be extracted by moving the claws backward and forward in contrary directions; and it will not be long before the under part of the worm makes its appearance at the above mentioned ſmall hole, and continuing the ſame operation of moving the claws, the whole worm will work itſelf out; which is better than when at its firſt appearance it ſhould be drawn out with danger of breaking off, and part of it ſhould remain in the ſheep's leg, and by its rotting there may be hurtful. This eaſy and ſimple operation will be found effectual without any other kind of application whatever, nature herſelf curing the channel which the worm had made along the leg. Foot, Foote.

It is obſerved, this malady is in ſome years more prevalent than in others, particularly in wet ſeaſons than in drier; more obſerved to begin in ſpring and autumn than in ſummer and winter; notwithſtanding, what with ſnow, &c. ſheep ſuffer more by the wet in winter than in any of the other ſeaſons (poſſibly it is not then the ſeaſon for this ſort of infect). In high healthy grounds, the ſheep are leſs liable to it than in low marſhy and meadow grounds: from all which circumſtances it may be ſuppoſed, that this inſect, in its firſt ſtate, has for its moſt natural element either the earth, water, or air; and only gets accidentally between the cloſe of the claws of the ſheep, and finds there what is ſufficient for its nouriſhment and ſecurity.

Foot Square, is the ſame meaſure both in breadth and length, containing 144 ſquare or ſuperficial inches.

Cubic or *Solid Foot*, is the ſame meaſure in all the three dimenſions, length, breadth, and depth or thickneſs, containing 1728 cubic inches.

Foot of a Horſe, in the manege, the extremity of the leg, from the coronet to the lower part of the hoof.

Foot-Level, among artificers, an inſtrument that ſerves as a foot-rule, a ſquare, and a level. See Level, Rule, and Square.

FOOTE (Samuel, Eſq;), the modern Ariſtophanes, was born at Truro, in Cornwall; and was deſcended from a very ancient family. His father was member of parliament for Tiverton, in Devonſhire; and enjoyed the poſt of commiſſioner of the prize-office and fine-contract. His mother was heireſs of the Dinely and Goodere families. In conſequence of a fatal miſunderſtanding between her two brothers, Sir John Dinely Goodere, Bart. and Samuel Goodere, Eſq; captain of his majeſty's ſhip the Ruby, which ended in the death of both, a conſiderable part of the Goodere eſtate, which was better than 5000 l. *per annum*, deſcended to Mr Foote.

He was educated at Worceſter college, Oxford, which owed its foundation to Sir Thomas Cookes Winford, Bart. a ſecond couſin of our author's. On leaving the univerſity, he commenced ſtudent of law in the Temple; but as the dryneſs of this ſtudy did not ſuit the livelineſs of his genius, he ſoon relinquiſhed it.

He

Foote. He married a young lady of a good family and some fortune; but their tempers not agreeing, a perfect harmony did not long subsist between them. He now launched into all the fashionable foibles of the age, gaming not excepted; and in a few years spent his whole fortune. His necessities led him to the stage, and he made his first appearance in the character of Othello. He next performed Fondlewife with much more applause; and this, indeed, was ever after one of his capital parts. He attempted Lord Foppington likewise, but prudently gave it up. But as Mr Foote was never a capital actor in the plays of others, his salary was very unequal to his gay and extravagant turn; and he contracted debts which forced him to take refuge within the verge of the court. On this occasion, he relieved his necessities by the following stratagem. Sir Fr—s D—l—l had long been his intimate friend, and had dissipated his fortune by similar extravagance. Lady N-ll-u P—l-t, who was likewise an intimate acquaintance of Foote's, and who was exceeding rich, was fortunately at that time bent upon a matrimonial scheme. Foote strongly recommended to her to consult upon this momentous affair the conjurer in the Old Bailey, whom he represented as a man of surprising skill and penetration. He employed an acquaintance of his own to personate the conjurer; who depicted Sir Fr—s D—l—l at full length; described the time when, the place where, and the dress in which she would see him. The lady was so struck with the coincidence of every circumstance, that she married D—l—l in a few days. For this service Sir Francis settled an annuity upon Foote; and this enabled him once more to emerge from obscurity.

In 1747 he opened the little theatre in the Haymarket, taking upon himself the double character of author and performer; and appeared in a dramatic piece of his own composing, called the *Diversions of the Morning*. This piece consisted of nothing more than the exhibition of several characters well known in real life; whose manner of conversation and expression this author very happily hit off in the diction of his drama, and still more happily represented on the stage, by an exact and most amazing imitation, not only of the manner and tone of voice, but even of the very persons, of those whom he intended to take off. In this performance, a certain physician, Dr L---n, well known for the oddity and singularity of his appearance and conversation, and the celebrated Chevalier Taylor, who was at that time in the height of his popularity, were made objects of Foote's ridicule; the latter, indeed, very deservedly; and, in the concluding part of his speech, under the character of a theatrical director, Mr Foote took off, with great humour and accuracy, the several styles of acting of every principal performer on the English stage. This performance at first met with some opposition from the civil magistrates of Westminster, under the sanction of the act of parliament for limiting the number of playhouses, as well as from the jealousy of one of the managers of Drury-lane playhouse; but the author being patronized by many of the principal nobility, and other persons of distinction, this opposition was over ruled: and having altered the title of his performance, Mr Foote proceeded, without further molestation, to give *Tea in a Morning* to his friends, and represented it through a run of 40 mornings to crowded and splendid audiences.— Foote. The ensuing season he produced another piece of the same kind, which he called *An Auction of Pictures*. In this performance he introduced several new and popular characters; particularly Sir Thomas de Veil, then the acting justice of peace for Westminster, Mr Cock the celebrated auctioneer, and the equally famous orator Henley. This piece also had a very great run. —His *Knights*, which was the produce of the ensuing season, was a performance of somewhat more dramatic regularity: but still, although his plot and characters seemed less immediately personal, it was apparent that he kept some particular real persons strongly in his eye in the performance; and the town took upon themselves to fix them where the resemblance appeared to be the most striking.—Thus Mr Foote continued from time to time to select, for the entertainment of the public, such characters, as well general as individual, as seemed most likely to engage their attention. His dramatic pieces, exclusive of the interlude called *Piety in Pattens*, are as follow: Taste, The Knights, The Author, The Englishman in Paris, The Englishman returned from Paris, The Mayor of Garrat, The Liar, The Patron, The Minor, The Orators, The Commissary, The Devil upon Two Sticks, The Lame Lover, The Maid of Bath, The Nabob, The Cozeners, The Capuchin, The Bankrupt, and an unfinished comedy called The Slanderer.—All these works are only to be ranked among the *petites pieces* of the theatre. In the execution they are somewhat loose, negligent, and unfinished; the plots are often irregular, and the catastrophes not always conclusive: but, with all these deficiencies, they contain more strength of character, more strokes of keen satire, and more touches of temporary humour, than are to be found in the writings of any other modern dramatist. Even the language spoken by his characters, incorrect as it may sometimes seem, will on a closer examination be found entirely dramatical; as it abounds with those natural minutiæ of expression which frequently form the very basis of character, and which render it the truest mirror of the conversation of the times in which he wrote.

In the year 1766, being on a party of pleasure with the late duke of York, lord Mexborough, and Sir Francis Delaval, Mr Foote had the misfortune to break his leg, by a fall from his horse; in consequence of which, he was compelled to undergo an amputation. This accident so sensibly affected the duke, that he made a point of obtaining for Mr Foote a patent for life; whereby he was allowed to perform, at the little theatre in the Haymarket, from the 15th of May to the 15th of September every year.

He now became a greater favourite of the town than ever: his very laughable pieces, with his more laughable performance, constantly filled his house; and his receipts were some seasons almost incredible. Parsimony was never a vice to be ascribed to Mr Foote; his hospitality and generosity were ever conspicuous; he was visited by the first nobility, and he was sometimes honoured even by royal guests.

The attack made upon his character by one of his domestics, whom he had dismissed for misbehaviour, is too well known to be particularized here. Suffice it to say, he was honourably acquitted of that charge: but it is believed by some, that the shock which he received

Foote & Forbes.

ceived from it accelerated his death; others pretend, that his literary altercation with a certain *then* duchefs, or rather her agents, much affected him, and that from that time his health declined. It is probable, however, that his natural volatility of fpirits could fcarcely fail to fupport him againft all impreffions from either of thefe quarters.

Mr Foote, finding his health decline, entered into an agreement with Mr Colman, for his patent of the theatre; according to which, he was to receive from Mr Colman L.1600 *per annum*, befides a ftipulated fum whenever he chofe to perform. Mr Foote made his appearance two or three times in fome of the moft admired characters; but being fuddenly affected with a paralytic ftroke one night whilft upon the ftage, he was compelled to retire. He was adviſed to bathe; and accordingly repaired to Brightelmſtone, where he apparently recovered his former health and fpirits, and was what is called the *fiddle of the company* who reforted to that agreeable place of amufement. A few weeks before his death, he returned to London; but, by the advice of his phyficians, fet out with an intention to fpend the winter at Paris and in the fouth of France. He had got no farther than Dover, when he was fuddenly attacked by another ftroke of the palfy, which in a few hours terminated his exiftence. He died on the 21ft of October 1777, in the 56th year of his age, and was privately interred in the cloifters of Weftminfter abbey.

FOP, probably derived from the *vappa* of Horace, applied in the firft fatire of his firft book to the wild and extravagant Nævius, is ufed among us to denote a perfon who cultivates a regard to adventitious ornament and beauty to excefs.

FORAMEN, in anatomy, a name given to feveral apertures or perforations in divers parts of the body; as, 1. The external and internal foramina of the cranium or fkull. 2. The foramina in the upper and lower jaw. 3. Foramen lachrymale. 4. Foramen membranæ tympani.

Foramen Ovale, an oval aperture or paffage through the heart of a fœtus, which clofes up after birth. It arifes from the coronal vein, near the right auricle, and paffes directly into the left auricle of the heart, ferving for the circulation of the blood in the fœtus, till fuch time as the infant breathes, and the lungs are open; it being generally reckoned one of the temporary parts of the fœtus, wherein it differs from an adult; although almoft all anatomifts, Mr Chefelden excepted, aſſure us, that the foramen ovale has fometimes been found in adults. See Foetus.

FORBES (Patrick), bifhop of Aberdeen, was born in 1654, when the affairs of the church of Scotland were in much confufion; to the fettlement of which he greatly contributed. As chancellor of the univerfity of Aberdeen, he improved that feat of learning by repairing the fabric, augmenting the library, and reviving the profefforfhips. He publifhed a *Commentary on the Revelations*, at London, in 1613; and died in 1635.

Forbes (John), the fon of Patrick, but of much more extenfive learning than his father, was perhaps excelled by none of his age, which will be allowed by thofe who read his *Hiſtorical and Theological Inſtitutes*. He was bifhop of Aberdeen; but was expelled by the Covenanters, and forced to fly beyond fea. He continued in Holland two years; and, upon his return, lived private on his eftate at Corfe, until he died in 1648. An edition of all his works was printed in two vols folio at Amfterdam in 1703.

Forbes (William), a learned bifhop of Edinburgh, born in 1585. His ill-health and the anti-epifcopal difpofition of the Scots, confined him chiefly to a retired life: but when Charles I. in 1633, founded an epifcopal church at Edinburgh, he thought none more worthy to fill the fee than Mr Forbes; who, however, died three months after his confecration, in 1634. Though very able and learned, he publifhed nothing; but wrote a treatife to pacify controverfies, which was printed at London 24 years after his death.

Forbes (Duncan, Efq; of Culloden), was born in the year 1685. In his early life, he was brought up in a family remarkable for hofpitality; which, perhaps, led him afterwards to a freer indulgence in focial pleafures. His natural difpofition inclined him to the army: but, as he foon difcovered a fuperior genius, by the advice of his friends he applied himfelf to letters. He directed his ftudies particularly to the civil law; in which he made a quick progrefs, and in 1709 was admitted an advocate. From 1722 to 1737, he repreſented in parliament the boroughs of Invernefs, Fortrofe, Nairn, and Forres. In 1725, he was made king's advocate; and Lord Prefident of the Court of Seffion in 1737. In the troubles of 1715 and 1745 he efpoufed the royal cauſe; but with fo much prudence and moderation did he conduct himfelf at this delicate conjuncture, that not a whifper was at any time heard to his prejudice. The glory he acquired in advancing the profperity of his country, and in contributing to re-eftablifh peace and order, was the only reward of his fervices. He had even impaired, and almoft ruined, his private fortune in the cauſe of the public; but government did not make him the fmalleft recompenſe. The miniſter, with a meannefs for which it is difficult to account, defired to have a ſtate of his difburfements. He was fo much fhocked at the rudenefs of this treatment, that he left the miniſter without making any reply. Throughout the whole courfe of his life he had a lively fenfe of religion, without the leaft taint of fuperſtition; and his charity was extended to every ſect and denomination of religioniſts indifcriminately. He was well verſed in the Hebrew language; and wrote, in a flowing and oratorial ſtyle, concerning religion natural and revealed, fome important difcoveries in theology and philoſophy, and concerning the fources of incredulity. He died in 1747, in the 62d year of his age; and his works have fince been publifhed in two volumes octavo.

FORCE, in philoſophy, denotes the cauſe of the change in the ſtate of a body, when, being at reſt, it begins to move, or has a motion which is either not uniform or not direct. While a body remains in the ſame ſtate, either of reſt or of uniform and rectilinear motion, the cauſe of its remaining in ſuch a ſtate is in the nature of the body, and it cannot be ſaid that any extrinſic force has acted on it. This internal cauſe or principle is called *inertia*.

Mechanical forces may be reduced to two ſorts; one of a body at reſt, the other of a body in motion.

Force. The force of a body at reſt, is that which we conceive to be in a body lying ſtill on a table, or hanging by a rope, or ſupported by a ſpring, &c and this is called by the names of *preſſure*, *tenſion*, *force*, or *vis mortua*, *ſolicitatio*, *conatus movendi*, *momen*, &c. To this claſs alſo of forces we muſt refer centripetal and centrifugal forces, though they reſide in a body in motion; becauſe theſe forces are homogeneous to weights, preſſures, or tenſions of any kind.

The force of a body in motion is a power reſiding in that body ſo long as it continues its motion; by means of which it is able to remove obſtacles lying in its way; to leſſen, deſtroy, or overcome the force of any other moving body, which meets it in an oppoſite direction; or to ſurmount any dead preſſure or reſiſtance, as tenſion, gravity, friction, &c. for ſome time; but which will be leſſened or deſtroyed by ſuch reſiſtance as leſſens or deſtroys the motion of the body. This is called *moving force*, *vis motrix*, and by ſome late writers *vis viva*, to diſtinguiſh it from the *vis mortua* ſpoken of before; and by theſe appellations, however different, the ſame thing is underſtood by all mathematicians; namely, that power of diſplacing, of withſtanding oppoſite moving forces, or of overcoming any dead reſiſtance, which reſides in a moving body, and which, in whole or in part, continues to accompany it, ſo long as the body moves. See MECHANICS.

We have ſeveral curious as well as uſeful obſervations in Deſagulier's Experimental Philoſophy, concerning the comparative forces of men and horſes, and the beſt way of applying them. A horſe draws with the greateſt advantage when the line of direction is level with his breaſt; in ſuch a ſituation, he is able to draw 200 lb. eight hours a day, walking about two miles and an half an hour. And if the ſame horſe is made to draw 240 lb. he can work but ſix hours a-day, and cannot go quite ſo faſt. On a carriage, indeed, where friction alone is to be overcome, a middling horſe will draw 1000 lb. But the beſt way to try a horſe's force, is by making him draw up out of a well, over a ſingle pulley or roller; and in ſuch a caſe, one horſe with another will draw 200 lb. as already obſerved.

Five men are found to be equal in ſtrength to one horſe, and can, with as much eaſe, puſh round the horizontal beam of a mill, in a walk 40 feet wide; whereas three men will do it in a walk only 19 feet wide.

The worſt way of applying the force of a horſe, is to make him carry or draw up hill: for if the hill be ſteep, three men will do more than a horſe, each man climbing up faſter with a burden of 100 lb. weight, than a horſe that is loaded with 300 lb. a difference which is owing to the poſition of the parts of the human body being better adapted to climb than thoſe of a horſe.

On the other hand, the beſt way of applying the force of a horſe, is an horizontal direction, wherein a man can exert leaſt force: thus a man, weighing 140 lb. and drawing a boat along by means of a rope coming over his ſhoulders, cannot draw above 27 lb. or exert above one-ſeventh part of the force of a horſe employed to the ſame purpoſe.

The very beſt and moſt effectual poſture in a man, is that of rowing; wherein he not only acts with more muſcles at once for overcoming the reſiſtance, than in any other poſition; but as he pulls backwards, the weight of his body aſſiſts by way of lever. See Deſaguliers, Exp. Phil. vol. i. p. 241. where we have ſeveral other obſervations relative to force acquired by certain poſitions of the body, from which that author accounts for moſt feats of ſtrength and activity. See alſo a *Memoire* on this ſubject by M. de la Hire, in Mem. Roy. Acad. Sc. 1629; or in Deſaguliers, Exp. &c. p. 267, &c. who has publiſhed a tranſlation of part of it with remarks. Force, Forcible.

FORCE, in law, ſignifies any unlawful violence offered to things or perſons, and is divided into ſimple and compound. *Simple force* is what is ſo committed, that it has no other crime attending it; as where a perſon by force enters on another's poſſeſſion, without committing any other unlawful act. *Compound force*, is where ſome other violence is committed with ſuch an act which of itſelf alone is criminal; as if one enters by force into another's houſe, and there kills a perſon, or raviſhes a woman. There is likewiſe a force implied in law, as in every treſpaſs, reſcue, or diſſeiſin, and an actual force with weapons, number of perſons, &c.—Any perſon may lawfully enter a tavern, inn, or victualling-houſe; ſo may a landlord his tenant's houſe to view repairs, &c. But if, in theſe caſes, the perſon that enters commits any violence or force, the law will intend that he entered for that purpoſe.

FORCEPS, in ſurgery, &c. a pair of ſciſſars for cutting off, or dividing, the fleſhy membranous parts of the body, as occaſion requires. See SURGERY.

FORCIBLE ENTRY, is a violent and actual entry into houſes or lands; and a forcible detainer, is where one by violence with-holds the poſſeſſion of lands, &c. ſo that the perſon who has a right of entry is barred, or hindered, therefrom.

At common law, any perſon that had a right to enter into lands, &c. might retain poſſeſſion of it by force. But this liberty being abuſed, to the breach of the peace, it was therefore found neceſſary that the ſame ſhould be reſtrained: Though, at this day, he who is wrongfully diſpoſſeſſed of goods may by force retake them. By ſtatute, no perſons ſhall make an entry on any lands or tenements, except where it is given by law, and in a peaceable manner, even tho' they have title of entry, on pain of impriſonment: and where a forcible entry is committed, juſtices of peace are authorized to view the place, and enquire of the force by a jury, ſummoned by the ſheriff of the county; and they may cauſe the tenements, &c. to be reſtored, and impriſon the offenders till they pay a fine. Likewiſe a writ of forcible entry lies, where a perſon ſeiſed of freehold, is by force put out thereof.

Forcible Marriage, of a woman of eſtate, is felony. For by the ſtatute 3 H. 7. c. 2 it is enacted, "That if any perſons ſhall take away any woman having lands or goods, or that is heir-apparent to her anceſtor, by force, and againſt her will, and *marry* or *defile* her; the takers, procurers, abettors, and receivers, of the woman taken away againſt her will, and knowing the ſame, ſhall be deemed principal felons; but as to procurers and acceſſories, they are, before the offence be committed, to be excluded the benefit of clergy, by *Jacob's Law Dict.*

Forcible, Forcing.

39 Eliz. c. 9. The indictment on the ſtatute 3 H. 7, is expreſsly to ſet forth, that the woman taken away had lands or goods, or was heir apparent; and alſo that ſhe was married or defiled, becauſe no other caſe is within the ſtatute; and it ought to allege that the taking was for lucre. It is no excuſe that the woman at firſt was taken away with her conſent: for if ſhe afterwards refuſe to continue with the offender, and be forced againſt her will, ſhe may from that time properly be ſaid to be taken againſt her will; and it is not material whether a woman ſo taken away be at laſt married or defiled with her own conſent or not, if ſhe were under force at the time; the offender being in both caſes equally within the words of the act.

Thoſe perſons who, after the fact, receive the offender, are but acceſſories after the offence, according to the rules of common law; and thoſe that are only privy to the damage, but not parties to the forcible taking away, are not within the act, H. P. C. 119. A man may be indicted for taking away a woman by force in another country; for the continuing of the force in any country, amounts to a forcible taking there. *Ibid.* Taking away any woman-child under the age of 16 years and unmarried, out of the cuſtody and without the conſent of the father or guardian, &c. the offender ſhall ſuffer fine and impriſonment; and if the woman agrees to any contract of matrimony with ſuch perſon, ſhe ſhall forfeit her eſtate during life, to the next of kin to whom the inheritance ſhould deſcend, &c. Stat. 4 & 5. P & M. c. 8. This is a force againſt the parents: and an information will lie for ſeducing a young man or woman from their parents, againſt their conſents, in order to marry them, &c. See MARRIAGE.

FORCING, in gardening, a method of producing ripe fruits from trees before their natural ſeaſon. The method of doing it is this: A wall ſhould be erected ten feet high; a border muſt be marked out on the ſouth ſide of it, of about four feet wide, and ſome ſtakes muſt be faſtened into the ground all along the edge of the border; theſe ſhould be four inches thick. They are intended to reſt the glaſs lights upon, which are to ſlope backwards to the wall, to ſhelter the fruit as there ſhall be occaſion: and there muſt be, at each end, a door to open either way, according as the wind blows. The frame ſhould be made moveable along the wall, that when a tree has been forced one year, the frame may be removed to another, and ſo on, that the trees may each of them be forced only once in three years, at which rate they will laſt a long time. They muſt be always well-grown trees that are choſen for forcing; for young ones are ſoon deſtroyed, and the fruit that is produced from them is never ſo well taſted. The fruits moſt proper for this management are the avant or ſmall white nutmeg, the albemarle, the early newington, and the brown nutmeg peaches; Mr Fairchild's early, and the elruge and newington nectarines; the maſculine apricot, and the may-duke and may cherry. For grapes, the white and black ſweet-water are the propereſt; and of gooſeberries the Dutch white, the Dutch early green, and the walnut gooſeberry; and the large Dutch white and large Dutch red currants.

The dung, before it is put to the wall, ſhould be laid together in a heap for five or ſix days, that it may heat uniformly through; and when thus prepared it muſt be laid four feet thick at the baſe of the wall, and go ſloping up till it is two feet thick at the top. It muſt be laid at leaſt within three or four inches of the top of the wall; and when it ſinks, as it will ſink two or three feet, more dung muſt be laid on; for the firſt heat will do little more than juſt ſwell the bloſſom-buds. The covering the trees with glaſſes is of great ſervice; but they ſhould be taken off to admit the benefit of gentle ſhowers to the trees, and the doors at the ends ſhould be either left entirely open, or one or both of them opened, and a mat hung before them, at once to let the air circulate and keep off the froſts.

Forcing For Jou.

The dung is never to be applied till towards the end of November; and three changes of it will be ſufficient to ripen the cherries, which will be very fine in February. As to the apricots, grapes, nectarines, peaches, and plums, if the weather be milder, the glaſſes are to be opened to let in ſunſhine or gentle ſhowers.

If a row or two of ſcarlet ſtrawberries be planted at the back of the frame, they will ripen in February or the beginning of March; the vines will bloſſom in April, and the grapes will be ripe in June.

It ſhould be carefully obſerved, not to place early and late ripening fruits together, becauſe the heat neceſſary to force the late ones will be of great injury to the early ones after they have fruited.

The maſculine apricot will be ripe in the beginning of April, the early nectarines will be ripe about the ſame time, and the forward ſort of plums by the latter end of that month. Gooſeberries will have fruit fit for tarts in January or February, and will ripen in March; and currants will have ripe fruit in April.

The trees need not be planted ſo diſtant at theſe walls as at others, for they do not ſhoot ſo freely as in the open air; nine feet aſunder is ſufficient. They ſhould be pruned about three weeks before the heat is applied.

FORCING, in the wine trade, a term uſed by the wine-coopers for the fining down wines, and rendering them fit for immediate draught. The principal inconvenience of the common way of fining down the white-wines by iſinglaſs, and the red by whites of eggs, is the ſlowneſs of the operation; theſe ingredients not performing their office in leſs than a week, or ſometimes a fortnight, according as the weather proves favourable, cloudy or clear, windy or calm: this appears to be matter of conſtant obſervation. But the wine-merchant frequently requires a method that ſhall, with certainty, make the wines fit for taſting in a few hours. A method of this kind there is, but it is kept in a few hands a valuable ſecret. Perhaps it depends upon a prudent uſe of a tartarized ſpirit of wine, and the common forcing, as occaſion is, along with gypſum, as the principal; all which are to be well ſtirred about in wine, for half an hour before it is ſuffered to reſt.

FORDOUN (John of), the father of Scottiſh hiſtory, flouriſhed in the reign of Alexander III. towards the end of the 13th century. But of his life there is nothing known with certainty, though there was not a monaſtery that poſſeſſed not copies of his work. The firſt five books of the hiſtory which bears his

Fordwich || Foreign.

his name were written by him: the reſt were fabricated from materials left by him, and from new collections by different perſons. A manuſcript in vellum of this hiſtorian is in the library of the univerſity of Edinburgh.

FORDWICH, a town of Kent, called in the Doomſday-Book "the little Borough of Fordwich," is a member of the port of Sandwich, and was anciently incorporated by the ſtyle of the Barons of the town of Fordwich, but more lately by the name of the mayor, jurats, and commonalty, who enjoy the ſame privileges as the cinque-ports. This place is famous for excellent trouts in its river Stour.

FORDYCE (David), an elegant and learned writer of the preſent age, was profeſſor of philoſophy in the Mariſchal-college, Aberdeen. He was originally deſigned for the miniſtry; to prepare himſelf for which was the whole aim of his ambition, and for a courſe of years the whole purpoſe of his ſtudies. How well he was qualified to appear in that character, appears from his "Theodorus, a dialogue concerning the art of preaching." After having finiſhed this work, he went abroad on his travels, in order to obtain freſh ſtores of knowledge: but after a ſucceſsful tour through ſeveral parts of Europe, he was unfortunately caſt away in a ſtorm on the coaſt of Holland. Beſides the above work, he wrote Dialogues on Education, 8vo, and a Treatiſe of Moral Philoſophy publiſhed in the Preceptor. The third edition of his Theodorus was publiſhed in London, after his untimely death, by his brother the Rev. Mr James Fordyce, an eminent diſſenting miniſter, in 1755.

FORE, applied to a ſhip, denotes all that part of a ſhip's frame and machinery which lies near the ſtem.

Fore and aft is uſed for the whole ſhip's length, or from end to end.

FORECASTLE *of a Ship*, that part where the foremaſt ſtands. It is divided from the reſt by a bulkhead.

FOREIGN, ſomething extraneous, or that comes from abroad. The word is formed from the Latin *foras*, "doors;" or *foris*, "out of doors;" or *forum*, "market," &c.

Foreign miniſter, foreign prince, foreign goods, &c. are thoſe belonging to other nations. See Minister, &c.

Foreign to the purpoſe, ſignifies a thing remote or impertinent.

Foreign, in the Engliſh law, is uſed in various ſignifications Thus,

Foreign Attachment, is an attachment of the goods of foreigners found within a city or liberty, for the ſatisfaction of ſome citizen to whom the foreigner is indebted; or it ſignifies an attachment of a foreigner's money in the hands of another perſon.

Foreign Kingdom, a kingdom under the dominion of a foreign prince.

At the inſtance of an ambaſſador or conſul, any offender againſt the laws here may be ſent for hither from a foreign kingdom to which he hath fled. And, where a ſtranger of Holland, or any foreign country, buys goods at London, for inſtance, and there gives a note under his hand for payment, and then goes away privately into Holland; in that caſe, the ſeller may have a certificate from the lord mayor, on the proof of the ſale and delivery of ſuch goods, whereupon a proceſs will be executed on the party in Holland.

Foreign || Foreland.

Foreign Oppoſer, or *Appoſer*, an officer in the exchequer that oppoſes or makes a charge on all ſheriffs, &c. of their green wax; that is to ſay, fines, iſſues, amerciaments, recognizances, &c.

Foreign Plea, ſignifies an objection to the judge of the court, by refuſing him as incompetent, becauſe the matter in queſtion is not within his juriſdiction.

Foreign Seamen, ſerving two years on board Britiſh ſhips, whether of war, trade, or privateers, during the time of war, ſhall be deemed natural-born ſubjects.

FOREIGNER, the natural-born ſubject to ſome foreign prince.

Foreigners, though made denizens, or naturalized, are diſabled to bear any office in government, to be of the privy-council, or members of parliament, &c. This is by the acts of the ſettlement of the crown. Such perſons as are not freemen of a city or corporation, are alſo called *foreigners*, to diſtinguiſh them from the members of the ſame.

FOREJUDGER, in law, ſignifies a judgment whereby one is deprived or put by a thing in queſtion.

To be *forejudged the court*, is where an officer or attorney of any court is expelled the ſame for malpractice, or for not appearing to an action on a bill filed againſt him, &c. And where an attorney of the common-pleas is ſued, the plaintiff's attorney delivers the bill to one of the criers of the court, who calls the attorney defendant, and ſolemnly proclaims aloud, that, if he does not appear thereto, he will be forejudged: likewiſe a rule is given by the ſecondary for his appearance: and if the attorney appears not in four days, then the clerk of the warrants ſtrikes ſuch an attorney off the roll of attorneys; after which he becomes liable to be arreſted like any other perſon: but where an attorney is forejudged, he may be reſtored on clearing himſelf from his contumacy, and making ſatisfaction to the plaintiff, &c.

FORELAND, or Foreness, in navigation, a point of land jutting out into the ſea.

North Foreland, in the iſle of Thanet, Kent, of which it is the N. E. point, is the promontory aſcertained by act of parliament to be the moſt ſouthern part of the port of London, which is thereby extended N. in a right line to the point called the Naſe on the coaſt of Eſſex, and forms that properly called the Mouth of the Thames. A ſea mark was erected here by the Trinity-Houſe corporation at the public expence, which is a round brick-tower, near 80 feet high. The ſea gains ſo much upon the land here by the winds at S. W. that within the memory of ſome that are living above 30 acres of land have been loſt in one place. All veſſels that paſs on the ſouth-ſide of this head-land are ſaid to enter the Channel, which is the name for the narrow ſea between England and France; and all the towns or harbours between London and this place, whether on the Kentiſh or Eſſex ſhore, are called members of the port of London.

South Foreland, in Kent, a head of land forming the eaſt point of the Kentiſh ſhore; and called *South*, in reſpect to its bearing from the other Foreland, which is about ſix miles to the north. Its ſituation

Fore locks || Foreſt.

is of great ſecurity to the Downs, the road between both, which would be a very dangerous road for ſhips, did not this point break the ſea off, that would otherwiſe come rolling up from the weſt to the Flats or bank of ſands, which for three leagues together and at about a league or a league and a half from the ſhore run parallel with it, and are dry at low water; ſo that theſe two capes breaking all the force of the ſea on the S. E. and S. W. make the Downs accounted a good road, except when the wind blows exceſſive hard from S. E. E. by N. or E. N. E. when ſhips in the Downs are driven from their anchors, and often run a-ſhore, or are forced on the ſands, or into Sandwich bay or Ramſgate pier.

FORE-LOCKS, in the ſea-language, little flat wedges made with iron, uſed at the ends of bolts, to keep them from flying out of their holes.

FORE-MAST of a SHIP, a large round piece of timber, placed in her fore-part or fore-caſtle, and carrying the fore-ſail and fore-top-ſail yards. Its length is uſually $\frac{8}{9}$ of the main-maſt, and the fore-top-gallant-maſt is $\frac{1}{2}$ the length of the fore-top.

FOREMAST-Men, are thoſe on board a ſhip that take in the top-ſails, ſling the yards, furl the ſails, bowſe, trice, and take their turn at the helm, &c.

FOREST, in geography, a huge wood; or, a large extent of ground covered with trees. The word is formed of the Latin *foreſta*, which firſt occurs in the capitulars of Charlemagne, and which itſelf is derived from the German *froſt*, ſignifying the ſame thing. Spelman derives it from the Latin *foris reſtat*, by reaſon foreſts are out of towns. Others derive *foreſta* from *feris*, q. d. *Foreſta, quoad ſit tuta ſtatio ferarum*, as being a ſafe ſtation or abode for wild beaſts.

The Caledonian and Hereynian foreſts are famous in hiſtory. The firſt was a celebrated retreat of the ancient Picts and Scots: The latter anciently occupied the greateſt part of Europe; particularly Germany, Poland, Hungary, &c. In Cæſar's time it extended from the borders of Alſatia and Switzerland to Tranſylvania; and was computed 60 days journey long, and 9 broad: ſome parts or cantons thereof are ſtill remaining.

The ancients adored foreſts, and imagined a great part of their gods to reſide therein: temples were frequently built in the thickeſt foreſts; the gloom and ſilence whereof naturally inſpire ſentiments of devotion, and turn mens thoughts within themſelves.

For the like reaſon, the Druids made foreſts the place of their reſidence, performed their ſacrifices, inſtructed their youth, and gave laws therein.

FOREST, in law, is defined, by Manwood, a certain territory of woody grounds and fruitful paſtures, privileged for wild beaſts and fowls of foreſt, chaſe, and warren, to reſt and abide under the protection of the king, for his princely delight; bounded with unremoveable marks and meres, either known by matter of record or preſcription; repleniſhed with wild beaſts of venery or chaſe, with great coverts of vert for the ſaid beaſts; for preſervation and continuance whereof, the vert and veniſon, there are certain particular laws, privileges, and officers.

Foreſts are of ſuch antiquity in England, that, excepting the New-Foreſt in Hampſhire, erected by William the Conqueror, and Hampton Court, erected by Henry VIII. it is ſaid, that there is no record or hiſtory which makes any certain mention of their erection, though they are mentioned by ſeveral writers and in ſeveral of our laws and ſtatutes. Ancient hiſtorians tell us, "that New-foreſt was raiſed by the deſtruction of 22 pariſh-churches, and many villages, chapels, and manors, for the ſpace of 30 miles together, which was attended with divers judgments on the poſterity of William I. who erected it: for William Rufus was there ſhot with an arrow, and before him Richard the brother of Henry I.; and Henry nephew to Robert, the eldeſt ſon of the Conqueror, did hang by the hair of the head in the boughs of the foreſt, like unto Abſalom." *Blount.* Foreſt.

Beſides the New-foreſt, there are 68 other foreſts in England, 13 chaſes, and more than 700 parks: the four principal foreſts are New-foreſt on the ſea, Shirewood-foreſt on the Trent, Dean-foreſt on the Severn, and Windſor-foreſt on the Thames.

A foreſt in the hands of a ſubject is properly the ſame thing with a CHASE; being ſubject to the common law, and not to the foreſt-laws. But a chaſe differs from a foreſt, in that it is not incloſed; and likewiſe, that a man may have a chaſe in another man's ground as well as his own; being indeed the liberty of keeping beaſts of chaſe, or royal game therein, protected even from the owner of the land, with a power of hunting them thereon. See PARK.

The manner of erecting a foreſt is thus: Certain commiſſioners are appointed under the great ſeal, who view the ground intended for a foreſt, and fence it round: this commiſſion being returned into chancery, the king cauſeth it to be proclaimed throughout the county where the land lieth, that it is a foreſt; and prohibits all perſons from hunting there, without his leave. Though the king may erect a foreſt on his own ground and waſte, he may not do it on the ground of other perſons without their conſent; and agreements with them for that purpoſe ought to be confirmed by parliament.

A foreſt, ſtrictly taken, cannot be in the hands of any but the king; for no perſon but the king has power to grant a commiſſion to be juſtice in eyre of the foreſt: yet, if he grants a foreſt to a ſubject, and that on requeſt made in the chancery, that ſubject and his heirs ſhall have juſtices of the foreſt, in which caſe the ſubject has a foreſt in law.

A ſecond property of a foreſt is, the courts thereof. See *FOREST-Courts, infra.*

A third property is the officers belonging to it, as the juſtices, warden, verderer, foreſter, agiſtor, regarder, keeper, bailiff, beadle, &c. See the articles AGISTOR, BAILIFF, FORESTER, &c.

By the laws of the foreſt, the receivers of treſpaſſes in hunting, or killing of the deer, if they know them to be the king's property, are principal treſpaſſers. Likewiſe, if a treſpaſs be committed in a foreſt, and the treſpaſſer dies, after his death, it may be puniſhed in the life-time of the heir, contrary to common law. Our Norman kings puniſhed ſuch as killed deer in any of their foreſts with great ſeverity; alſo in various manners; as by hanging, loſs of limbs, gelding, and putting out eyes. By *magna charta de foreſta*, it is ordained, that no perſon ſhall loſe life or member for killing the king's deer in foreſts, but ſhall be fined; and

Foreſt. if the offender has nothing to pay the fine, he ſhall be impriſoned a year and a day, and then be delivered, if he can give ſecurity not to offend for the future, &c. 9 *Hen. III. c.* 1.

Before this ſtatute, it was felony to hunt the king's deer; and by a late act, perſons armed and diſguiſed, appearing in any foreſt, &c. if they hunt, kill, or ſteal any deer, &c. are guilty of felony. 9. *Geo. I. c.* 22.

He who has any licence to hunt in a foreſt or chace, &c. is to take care that he does not exceed his authority; otherwiſe he ſhall be deemed a treſpaſſer from the beginning, and be puniſhed for that fact, as if he had no licence. See further, the articles GAME, and *Game-Law*.

Beaſts of the foreſt are, the hart, hind, buck, doe, boar, wolf, fox, hare, &c. The ſeaſons for hunting whereof are as follow, *viz.* that of the hart and buck begins at the feaſt of St John Baptiſt, and ends at Holy-rood day; of the hind and doe, begins at Holy-rood, and continues till Candlemas; of the boar, from Chriſtmas to Candlemas; of the fox begins at Chriſtmas, and continues till Lady-day; of the hare at Michaelmas, and laſts till Candlemas.

FOREST-Courts, courts inſtituted for the government of the king's foreſts in different parts of the kingdom, and for the puniſhment of all injuries done to the king's deer or veniſon, to the vert or greenſwerd, and to the covert in which ſuch deer are lodged. Theſe are the courts of ATTACHMENTS, of REGARD, of SWEINMOTE, and of JUSTICE-SEAT. 1. The court of attachments, woodmote, or forty-days court, is to be held before the verderors of the foreſt once in every forty days; and is inſtituted to inquire into all offenders againſt vert and veniſon: who may be attached by their bodies, if taken with the mainour (or *mainœuvre, à manu*) that is, in the very act of killing veniſon, or ſtealing wood, or in the preparing ſo to do, or by freſh and immediate purſuit after the act is done; elſe they muſt be attached by their goods. And in this forty-days court the foreſters or keepers are to bring in the attachments, or preſentments *de viridi et venatione*; and the verderors are to receive the ſame, and to enrol them, and to certify them under their ſeals to the court of juſtice-ſeat or ſweinmote: for this court can only inquire of, but not convict, offenders. 2. The court of regard, or ſurvey of dogs, is to be holden every third year for the lawing or expeditation of maſtiffs; which is done by cutting off the claws of the fore-feet, to prevent them from running after deer. No other dogs but maſtiffs are to be thus lawed or expeditated, for none other were permitted to be kept within the precincts of the foreſt; it being ſuppoſed that the keeping of theſe, and theſe only, was neceſſary for the defence of a man's houſe. 3. The court of ſweinmote is to be holden before the verderors, as judges, by the ſteward of the ſweinmote, thrice in every year; the ſweins or freeholders within the foreſt compoſing the jury. The principal juriſdiction of this court is, firſt, to inquire into the oppreſſions and grievances committed by the officers of the foreſt; "*de ſuper-oneratione foreſtariorum, et aliorum miniſtrorum foreſtæ; et de eorum oppreſſionibus populo regis illatis:*" and, ſecondly, to receive and try preſentments certified from the court of attachments againſt offences in vert and veniſon. And this court may not only inquire, but convict alſo; which conviction ſhall be certified to the court of juſtice-ſeat under the ſeals of the jury, for this court cannot proceed to judgment. But the principal court is, 4. The court of juſtice-ſeat, which is held before the chief juſtice in eyre, or chief itinerant judge, *capitalis juſtitiarius in itinere*, or his deputy; to hear and determine all treſpaſſes within the foreſt, and all claims of franchiſes, liberties, and privileges, and all pleas and cauſes whatſoever therein ariſing. It may alſo proceed to try preſentments in the inferior courts of the foreſts, and to give judgment upon conviction of the ſweinmote. And the chief juſtice may therefore, after preſentment made or indictment found, but not before, iſſue his warrant to the officers of the foreſt to apprehend the offenders. It may be held every third year; and 40 days notice ought to be given of its ſitting. This court may fine and impriſon for offences within the foreſt, it being a court of record: and therefore a writ of error lies from hence to the court of king's-bench, to rectify and redreſs any mal-adminiſtrations of juſtice; or the chief juſtice in eyre may adjourn any matter of law into the court of king's-bench.

Blackſt. Comment.

FOREST-Laws, are peculiar laws different from the common law of England. Before the making of *Charta de Foreſta*, in the time of king John and his ſon Henry III. confirmed in parliament by 9 Henry III. offences committed therein were puniſhed at the pleaſure of the king in the ſevereſt manner. By this charter, many foreſts were diſafforeſted and ſtripped of their oppreſſive privileges, and regulations were made for the government of thoſe that remained; particularly, killing the king's deer was made no longer a capital offence, but only puniſhed by fine, impriſonment, or abjuration of the realm: yet even in the charter there were ſome grievous articles, which the clemency of later princes have ſince by ſtatute thought fit to alter *per aſſiſas foreſtæ*. And to this day, in treſpaſſes relating to the foreſt, *voluntas reputabitur pro facto*; ſo that if a man be taken hunting a deer, he may be arreſted as if he had taken a deer.

FOREST-Towns, in geography, certain towns of Suabia in Germany, lying along the Rhine, and the confines of Switzerland, and ſubject to the houſe of Auſtria. Their names are *Rhineſeld, Seckingen, Laufenburg*, and *Waldſhut*.

FORE-STAFF, an inſtrument uſed at ſea for taking the altitudes of heavenly bodies. The fore-ſtaff, called alſo *croſs-ſtaff*, takes its denomination hence, that the obſerver, in uſing it, turns his face towards the object; in contradiſtinction to the back-ſtaff, where he turns his back to the object. Foreſt, Fore-ſtaff.

The fore or croſs ſtaff, repreſented in Plate CXCV. conſiſts of a ſtraight ſquare ſtaff, A B, graduated like a line of tangents and four croſſes or vanes, F F, E E, D D, C C, which ſlide thereon. The firſt and ſhorteſt of theſe vanes, F F, is called the *ten croſs*, or *vane*, and belongs to that ſide of the inſtrument whereon the diviſions begin at three degrees and end at ten. The next longer vane, E E, is called the *thirty croſs*, belonging to that ſide of the ſtaff wherein the diviſions begin at ten degrees and end at thirty, called the *thirty ſcale*. The next vane, D D, is called the *ſixty croſs*, and belongs to the ſide where the diviſions begin at twenty degrees and end at ſixty. The laſt and longeſt, C C, called the *ninety-croſs*, belongs to the ſide whereon the diviſions begin at thirty degrees and end at ninety.

Fore ſtaff || Foreſter.

The great uſe of this inſtrument is to take the height of the ſun and ſtars, or the diſtance of two ſtars: and the ten, thirty, ſixty, or ninety croſſes, are to be uſed according as the altitude is greater or leſs; that is, if the altitude be leſs than ten degrees, the ten croſs is to be uſed; if above ten, but leſs than thirty, the thirty croſs is to be uſed, &c. *Note*, For altitudes greater than thirty degrees, this inſtrument is not ſo convenient as a quadrant or ſemicircle.

To obſerve an altitude by this inſtrument.—Apply the flat end of the ſtaff to your eye, and look at the upper end of the croſs for the centre of the ſun or ſtar, and at the lower end for the horizon. If you ſee the ſky inſtead of the horizon, ſlide the croſs a little nearer the eye; and if you ſee the ſea inſtead of the horizon, ſlide the croſs farther from the eye: and thus continue moving till you ſee exactly the ſun or ſtar's centre by the top of the croſs, and the horizon by the bottom thereof. Then the degrees and minutes, cut by the inner edge of the croſs upon the ſide of the ſtaff peculiar to the croſs you uſe, give the altitude of the ſun or ſtar.

If it be the meridian altitude you want, continue your obſervation as long as you find the altitude increaſe, ſtill moving the croſs nearer to the eye. By ſubtracting the meridian altitude thus found from 90 degrees, you will have the zenith diſtance. To work accurately, an allowance muſt be made for the height of the eye above the ſurface of the ſea, viz. for one Engliſh foot, 1 minute; for 5 feet, $2\frac{1}{2}$; for 10 feet, $3\frac{1}{2}$; for 20 feet, 5; for 40 feet, 7, &c. Theſe minutes ſubtracted from the altitude obſerved, and added to the zenith diſtance obſerved, give the true altitude and zenith diſtance.

To obſerve the diſtance of two ſtars, or the moon's diſtance from a ſtar, by the fore-ſtaff.—Apply the inſtrument to the eye, and looking to both ends of the croſs, move it nearer or farther from the eye till you ſee the two ſtars, the one on the one end and the other on the other end of the croſs; then the degrees and minutes cut by the croſs on the ſide proper to the vane in uſe give the ſtars diſtance.

FORESTALLER, a perſon who is guilty of foreſtalling. See the next article.

FORESTALLING, in law, buying or bargaining for any corn, cattle, victuals, or merchandiſe, in the way as they come to fairs or markets to be ſold, before they get thither, with an intent to ſell the ſame again at a higher price.

The puniſhment for this offence, upon conviction at the quarter-ſeſſions by two or more witneſſes, is, for the firſt time, two months impriſonment and the loſs of the goods, or the value; for the ſecond offence, the offender ſhall be impriſoned ſix months, and loſe double the value of the goods; for the third offence, he ſhall ſuffer impriſonment during the king's pleaſure, forfeit all his goods and chattels, and ſtand on the pillory: but the ſtatute does not extend to maltſters buying barley, or to badgers licenſed.

FORESTER, a ſworn officer of the foreſt, appointed by the king's letters-patent, to walk the foreſt at all hours, and watch over the vert and veniſon; alſo to make attachments and true preſentments of all treſpaſſes committed within the foreſt.

If a man comes into a foreſt in the night, a foreſter cannot lawfully beat him before he makes ſome reſiſtance; but in caſe ſuch a perſon reſiſts the foreſter, he may juſtify a battery. And a foreſter ſhall not be queſtioned for killing a treſpaſſer that, after the peace cried to him, will not ſurrender himſelf, if it be not done on any former malice; though, where treſpaſſers in a foreſt, &c. do kill a perſon that oppoſes them, it is murder in all, becauſe they were engaged in an unlawful act, and therefore malice is implied to the perſon killed.

Fore-thought Forfar.

FORETHOUGHT-FELONY, in Scots law, ſignifies premeditated murder. See MURDER.

FORFAR, a parliament-town of Scotland, and capital of the county of that name, ſituated in N. Lat. 56. 25. W. Long. 2. 32. This town, with Dundee, Cupar, Perth, and St Andrew's, jointly ſend one member to the Britiſh parliament. It ſtands in the great valley of Strathmore that runs from Perth north eaſt to the ſea, almoſt in a ſtraight line, about 50 miles long and betwixt four and five miles broad, bordered on either ſide by hills, riſing gently on the ſouth ſide, and on the north by the famous Grampians, a little more elevated.

Though hiſtory is ſilent as to the etymology of the name *Forfar*, yet we are ſure it is of very ancient date, and that in the days of old it was the reſidence of royal majeſty. Here Malcom Canmore, a wiſe and magnanimous prince, held his firſt parliament in 1057. The ruins of his palace are ſtill to be ſeen on the top of an artificial mount of a circular form, reſting upon a baſe of about three acres of ground, and riſing 50 feet high above the level of the circumambient plain. A wall of ſtone of a great thickneſs, ſo ſtrongly cemented with run-lime that it is ſcarce poſſible to break the cement with the ſtroke of a hammer, environed the place; and a moat of at leaſt 20 feet broad, and in ſome parts a great deal more, and 12 feet deep, encompaſſed the whole. Adjoining to this is a field of about ſix acres of ground called the *Queen's Manor*, ſurrounded in thoſe days with a large ſheet of water, and acceſſible only by boats. In clearing away ſome of the rubbiſh of the palace a few years ago, a tea-kettle of a conical figure, and a bunch of barbed arrows, were found in the ruins. A pit of about 18 feet deep, very prettily built of hewn ſtone, with a human body in a ſtate of extreme putrefaction, was alſo diſcovered. The lake of Forfar, ſtretching two miles in length from eaſt to weſt, and half a mile in breadth, and covering the palace on the north, afforded not only a plentiful ſupply of water for every purpoſe, but alſo added to the ſtrength of the place. This lake abounds with trout, pike, perch, and eel. Of late years it has been greatly reduced by draining; to which the immenſe quantity of fine marle at the bottom was the principal inducement. This excellent manure is found here in large ſtrata from two to ſix and eight feet deep, and generally below moſs ten feet deep.

This lake has proved fatal to many of the human race; but particularly and deſervedly ſo to the murderers of Malcom II. who having fled after perpetrating the bloody deed at the caſtle of Glammis, about five miles diſtant, in the year 1036, miſſed their way, owing to a deep fall of ſnow, and wandered in the fields for ſome time, till at laſt they came upon the ice on the lake, which not being firm, ſuddenly gave way under them, and they all periſhed. When the thaw

Forfar. came, their bodies were found; and being diſcovered to be the murderers of the king, they were all hung on gibbets on the ſides of the highways.

Within this lake were formerly two iſlands raiſed by art, with buildings on each; to which Margaret, Malcom Canmore's queen, retired after the deceaſe of her huſband. Part of the ruins of theſe edifices are ſtill to be ſeen. To this queen, tradition ſays, we owe the cuſtom of the grace-drink; ſhe having eſtabliſhed it as a rule at her table, that whoever ſtaid till grace was ſaid was rewarded with a bumper.

From this time we have little or no accounts of Forfar till the middle of the 17th century, except an act paſſed in the 13th parliament of James VI. 21ſt July 1593, in the following words: "Our ſoveraine Lorde, underſtanding that be acte and ordinance maid anent obſervation of the Sabbath-daie within this realme, the mercatte-daie of the burgh of Forfare, being the head burgh of the ſchire, quhilk was Sundaie, is taken from them; and his hieneſſe not willing that they in onie waies ſuld be prejudged hereby, therefore his hieneſſe, with adviſe of the eſtaites of this preſent parliament, alteris and changis thein ſaid mercatte-daie from Sundaie to Fridaie, and willis the ſamen Fridaie oukly to be their mercatte daie to them in all tymes hercafter; and the ſamin to ſtande with the like priviledges and freedomes as the Sundaie did of before." Whether this change took place, or how long it continued, is uncertain; but the market-day is preſently held on Saturday, and has been ſo paſt memory of man.

During the uſurpation of Oliver Cromwell, a detachment of his forces, after ſacking Dundee, came to Forfar and burnt all the public records of the place; and the only charter the town now has is one granted by Charles II. after his reſtoration, confirming all its ancient rights and privileges.

As an evidence of the ignorance and barbarity of the times, it appears from the records of the trials kept in the charter-cheſt of Forfar, that nine perſons were condemned and burnt here for witchcraft betwixt the years 1650 and 1662. Theſe innocent people were all tried by a ſpecial commiſſion from the lords of the privy-council at Edinburgh; and although the commiſſion expreſsly diſcharged torturing them on purpoſe to extort a confeſſion of their guilt, yet, as it was then thought meritorious to obtain confeſſion of guilt by whatever means, many inhuman cruelties were exerciſed upon the unfortunate objects; particularly, an iron boot was drawn upon one of their legs, and a wedge driven with great force between it and the leg. Another inſtrument, ſtill carefully preſerved here, was likewiſe uſed, and is called the *witch-bridle*. It is made of iron, in the ſhape of a dog's collar, with two pikes on the inſide, about four inches diſtant and two and a half long. Theſe pikes were put into the mouth, and the collar afterwards buckled ſtrait on the back of the head, to which was affixed an iron chain, whereby the condemned perſons were led to the place of execution called the *Play-field*, about a quarter of a mile to the northward of the town.

The inhabitants of Forfar are a hoſpitable, free, and generous ſet of people: they are at leaſt doubled in number within theſe 30 years, being now about 3300: the houſes have alſo increaſed more in proportion, beſides being vaſtly improved. The church here has juſt been rebuilt on an elegant and extenſive plan calculated to contain 2000 hearers. Forfar, Forfeiture.

Forfar Shire, a county of Scotland, of which Forfar is the capital. Including Angus, Glenila, Gleneſk, and Glenpraſſin, it extends 29 miles from eaſt to weſt, and 16 where broadeſt, though in ſome places the breadth does not exceed five miles. On the north it is divided from the Brae of Mar by a ridge of the Binchinin mountains; it is bounded on the ſouth by the Frith of Tay and the Britiſh ocean, on the eaſt by Mearns, and on the weſt by Perthſhire. Part of the Grampian mountains runs through this county, which is agreeably diverſified with hill and dale. It produces lead and iron in abundance, together with quarries of freeſtone and ſlate, with which the inhabitants drive a conſiderable traffic. The county is well watered with lakes, rivers, rivulets, and fountains, ſhaded with large foreſts, roughened with brown mountains, and waved with green hills interſperſed with fields and meadows, and adorned with fine ſeats and plantations. Their heaths and woods abound with hart, hind, roebuck, and moor-game; their ſtreams are ſtocked with trout and ſalmon. Their hills are covered with flocks of ſheep, and their fields afford plentiful harveſts of wheat and all ſorts of grain. The mountains to the weſt and north are inhabited by Highlanders: but the Lowlanders poſſeſs the towns and champaign country, and are remarkable for their politeneſs and hoſpitality.

FORFEITURE, originally ſignifies a tranſgreſſion, or offence againſt ſome penal law. The word is formed of the baſe Latin *foriſfactura*: whence *forfaitura* and *forfaicture*, and the French *forfait*. *Foriſfactura* comes of *foriſfacere*; which, according to Iſidore, ſignifies to "hurt or offend," *facere contra rationem*; and which is not improbably derived of *foris* "out," and *facere*, "to do," q. d. an action out of rule, or contrary to the rules. Borel will have *forfait* derived from the uſing of force or violence: Lubineau in his gloſſary will have *foriſfacta* properly to ſignify a mulct or amend, not a *forfeit*; which latter he derives from the baſe Britiſh *forfed*, "a penalty."

But, with us, it is now more frequently uſed for the effect of ſuch tranſgreſſion; or the loſing ſome right, privilege, eſtate, honour, office, or effects, in conſequence thereof; than for the tranſgreſſion itſelf.

Forfeiture differs from *confiſcation*, in that the former is more general; while confiſcation is particularly applied to ſuch things as become forfeited to the king's exchequer; and goods confiſcated are ſaid to be ſuch as nobody claims.

Forfeitures may be either in *civil* or *criminal* caſes.

I. With reſpect to the firſt, a man that hath an eſtate for life or years, may forfeit it many ways, as well as by treaſon or felony; ſuch as alienation, claiming a greater eſtate than he hath, or affirming the reverſion to be in a ſtranger, &c. When a tenant in tail makes leaſes not warranted by the ſtatute; a copyholder commits waſte, refuſes to pay his rent, or do ſuit of court; and where an eſtate is granted upon condition, on non-performance thereof, &c. they will make a forfeiture.

Entry for a forfeiture ought to be by him who is next in reverſion, or remainder, after the eſtate forfeited. As if tenant for life or years commits a forfeiture, he who has the immediate reverſion or remainder ought:

Forfeiture. ought to enter; though he has the fee, or only an eſtate-tail.

II. Forfeiture in criminal caſes is twofold; of real, and perſonal eſtates.

1. As to real eſtates, by ATTAINDER in high-treaſon, a man forfeits to the king all his lands and tenements of inheritance, whether fee-ſimple or fee-tail; and all his rights of entry on lands and tenements, which he had at the time of the offence committed, or at any time afterwards, to be for ever veſted in the crown; and alſo the profits of all lands and tenements, which he had in his own right for life or years, ſo long as ſuch intereſt ſhall ſubſiſt. This forfeiture relates backwards to the time of the treaſon committed; ſo as to avoid all intermediate ſales and incumbrances, but not thoſe before the fact: and therefore a wife's jointure is not forfeitable for the treaſon of her huſband; becauſe ſettled upon her previous to the treaſon committed. But her dower is forfeited, by the expreſs proviſion of ſtatute 5 and 6 Edw. VI. c. 11. And yet the huſband ſhall be tenant by the curteſy of the wife's lands, if the wife be attainted of treaſon: for that is not prohibited by the ſtatute. But, though after attainder the forfeiture relates back to the time of the treaſon committed, yet it does not take effect unleſs an attainder be had, of which it is one of the fruits; and therefore, if a traitor dies before judgment pronounced, or is killed in open rebellion, or is hanged by martial law, it works no forfeiture of his lands: for he never was attainted of treaſon. But if the chief juſtice of the king's bench (the ſupreme coroner of all England) in perſon, upon the view of the body of him killed in open rebellion, records it and returns the record into his own court, both lands and goods ſhall be forfeited.

Plowd. Comment.

The natural juſtice of forfeiture or confiſcation of property, for treaſon, is founded on this conſideration: That he who hath thus violated the fundamental principles of government, and broken his part of the original contract between king and people, hath abandoned his connections with ſociety, and hath no longer any right to thoſe advantages which before belonged to him purely as a member of the community; among which *ſocial* advantages, the right of transferring or tranſmitting property to others is one of the chief. Such forfeitures, moreover, whereby his poſterity muſt ſuffer as well as himſelf, will help to reſtrain a man, not only by the ſenſe of his duty, and dread of perſonal puniſhment, but alſo by his paſſions and natural affections; and will intereſt every dependent and relation he has to keep him from offending: according to that beautiful ſentiment of Cicero, "*nec vero me fugit quam ſit acerbum, parentum ſcelera filiorum pœnis lui: ſed hoc præclare legibus comparatum eſt, ut caritas liberorum amiciores parentes reipublicæ redderet.*" And therefore Aulus Caſcellius, a Roman lawyer in the time of the triumvirate, uſed to boaſt that he had two reaſons for deſpiſing the power of the tyrants; his old age and his want of children: for children are pledges to the prince of the father's obedience. Yet many nations have thought, that this poſthumous puniſhment favours of hardſhip to the innocent; eſpecially for crimes that do not ſtrike at the very root and foundation of ſociety, as treaſon againſt the government expreſsly does. And therefore, although confiſcations were very frequent in the times of the earlier emperors, yet Arcadius and Honorius, in every other inſtance but that of treaſon, thought it more juſt, *ibi eſſe pœnam, ubi et noxa eſt*; and ordered, that "*peccata ſuos teneant auctores, nec ulterius progrediatur metus, quam reperiatur delictum:*" and Juſtinian alſo made a law to reſtrain the puniſhment of relations; which directs the forfeiture to go, except in the caſe of *crimen majeſtatis*, to the next of kin to the delinquent. On the other hand, the Macedonian laws extended even the capital puniſhment of treaſon, not only to the children, but to all the relations of the delinquent: and of courſe their eſtates muſt be alſo forfeited, as no man was left to inherit them. And in Germany, by the famous golden bull (copied almoſt *verbatim* from Juſtinian's code), the lives of the ſons of ſuch as conſpire to kill an elector are ſpared, as it is expreſſed, by the emperor's *particular bounty*. But they are deprived of all their effects and rights of ſucceſſion, and are rendered incapable of any honour eccleſiaſtical and civil: to the end that, being always poor and neceſſitous, they may for ever be accompanied by the infamy of their father; may languiſh in continual indigence; and may find (ſays this mercileſs edict) their puniſhment in living, and their relief in dying."

Forfeiture

In England, forfeiture of lands and tenements to the crown for treaſon is by no means derived from the feodal policy, but was antecedent to the eſtabliſhment of that ſyſtem in this iſland; being tranſmitted from our Saxon anceſtors, and forming a part of the ancient Scandinavian conſtitution. But in certain treaſons relating to the coin (which ſeem rather a ſpecies of the *crimen falſi* than the *crimen læſæ majeſtatis*), it is provided by ſome of the modern ſtatutes which conſtitute the offence, that it ſhall work no forfeiture of lands, ſave only for the life of the offenders; and by all, that it ſhall not deprive the wife of her dower. And, in order to aboliſh ſuch hereditary puniſhment entirely, it was enacted by ſtatute 7 Ann. c. 21. that, after the deceaſe of the late pretender, no attainder for treaſon ſhould extend to the diſinheriting of any heir, nor to the prejudice of any perſon, other than the traitor himſelf. By which the law of forfeitures for high treaſon would by this time have been at an end, had not a ſubſequent ſtatute intervened to give them a longer duration. The hiſtory of this matter is ſomewhat ſingular, and worthy obſervation. At the time of the union, the crime of treaſon in Scotland was, by the Scots law, in many reſpects different from that of treaſon in England; and particularly in its conſequence of forfeitures of entailed eſtates, which was more peculiarly Engliſh: yet it ſeemed neceſſary, that a crime ſo nearly affecting government ſhould, both in its eſſence and conſequences, be put upon the ſame footing in both parts of the united kingdoms. In new-modelling theſe laws, the Scots nation and the Engliſh houſe of commons ſtruggled hard, partly to maintain, and partly to acquire, a total immunity from forfeiture and corruption of blood: which the houſe of lords as firmly reſiſted. At length a compromiſe was agreed to, which is eſtabliſhed by this ſtatute, *viz.* that the ſame crimes, and no other, ſhould be treaſon in Scotland that are ſo in England; and that the Engliſh forfeitures and corruption of blood ſhould take place in Scotland till the death of the then pretender, and then ceaſe throughout the whole of Great Britain: the lords artfully propoſing this temporary clauſe, in hopes (it

orfeiture is ſaid) that the prudence of ſucceeding parliaments would make it perpetual. This has partly been done by the ſtatute 17 Geo. II. c. 39. (made in the year preceding the late rebellion), the operation of theſe indemnifying clauſes being thereby ſtill farther ſuſpended till the death of the ſons of the pretender.

In petit treaſon and felony, the offender alſo forfeits all his chattel intereſts abſolutely, and the profits of all freehold eſtates during life; and after his death all his lands and tenements in fee ſimple (but not thoſe in tail) to the crown, for a very ſhort period of time: for the king ſhall have them for a year and a day, and may commit therein what waſte he pleaſes; which is called the king's *year*, *day*, and *waſte*. Formerly the king had only a liberty of committing waſte on the lands of felons, by pulling down their houſes, extirpating their gardens, ploughing their meadows, and cutting down their woods. And a puniſhment of a ſimilar ſpirit appears to have obtained in the oriental countries, from the decrees of Nebuchadnezzar and Cyrus in the books of Daniel and Ezra; which, beſides the pain of death inflicted on the delinquents there ſpecified, ordain, "that their houſes ſhall be made a dunghill." But this tending greatly to the prejudice of the public, it was agreed in the reign of Henry I. in England, that the king ſhould have the profits of the land for one year and a day in lieu of the deſtruction he was otherwiſe at liberty to commit: and therefore *magna charta* provides, that the king ſhall only hold ſuch lands for a year and a day, and then reſtore them to the lord of the fee, without any mention made of waſte. But the ſtatute 17 Edw. II. *de prerogativa regis*, ſeems to ſuppoſe, that the king ſhall have his year, day, *and* waſte; and not the year and day *inſtead of* waſte: which Sir Edward Coke (and the author of the Mirror before him) very juſtly look upon as an encroachment, though a very ancient one, of the royal prerogative. This year, day, and waſte, are now uſually compounded for; but otherwiſe they regularly belong to the crown; and after their expiration the land would naturally have deſcended to the heir (as in gavelkind tenure it ſtill does), did not its feodal quality intercept ſuch deſcent, and give it by way of eſcheat to the lord. Theſe forfeitures for felony do alſo ariſe only upon attainder; and therefore a *felo de ſe* forfeits no lands of inheritance or freehold, for he never is attainted as a felon. They likewiſe relate back to the time the offence was committed as well as forfeitures for treaſon, ſo as to avoid all intermediate charges and conveyances. This may be hard upon ſuch as have unwarily engaged with the offender: but the cruelty and reproach muſt lie on the part, not of the law, but of the criminal; who has thus knowingly and diſhoneſtly involved others in his own calamities.

2. The forfeiture of goods and chattels accrues in every one of the high kinds of offence; in high treaſon, or miſpriſon thereof, petit treaſon, felonies of all ſorts whether clergyable or not, ſelf-murder or felony *de ſe*, petty larceny, ſtanding mute, &c. For flight alſo, on an accuſation of treaſon, felony, or even petit larceny, whether the party be found guilty or acquitted, if the jury find the flight, the party ſhall forfeit his goods and chattels: for the very flight is an offence, carrying with it a ſtrong preſumption of guilt, and is at leaſt an endeavour to elude and ſtifle the courſe of juſtice preſcribed by the law. But the jury very ſeldom find the flight: forfeiture being looked upon, ſince the vaſt increaſe of perſonal property of late years, as too large a penalty for an offence to which a man is prompted by the natural love of liberty. Forfeiture ‖ Forficula.

There is a remarkable difference or two between the forfeiture of lands and of goods and chattels. (1.) Lands are forfeited upon *attainder*, and not before: goods and chattels are forfeited by *conviction*. Becauſe in many of the caſes where goods are forfeited, there never is any attainder; which happens only where judgment of death or outlawry is given: therefore, in thoſe caſes, the forfeiture muſt be upon conviction, or not at all; and, being neceſſarily upon conviction in thoſe, it is ſo ordered in all other caſes, for the law loves uniformity. (2.) The forfeiture of lands has relation to the time the fact was committed, ſo as to avoid all ſubſequent ſales and incumbrances: but the forfeiture of goods and chattels has no relation backwards; ſo that thoſe only which a man has at the time of conviction ſhall be forfeited. Therefore a traitor or felon may *bona fide* ſell any of his chattels, real or perſonal, for the ſuſtenance of himſelf and family between the fact and conviction: for perſonal property is of ſo fluctuating a nature, that it paſſes through many hands in a ſhort time; and no buyer could be ſafe, if he were liable to return the goods which he had fairly bought, provided any of the prior vendors had committed a treaſon or felony. Yet if they be colluſively and not *bona fide* parted with, merely to defraud the crown, the law (and particularly the ſtatute 13 Eliz. c. 5.) will reach them; for they are all the while truly and ſubſtantially the goods of the offender: and as he, if acquitted, might recover them himſelf, as not parted with for a good conſideration; ſo, in caſe he happens to be convicted, the law will recover them for the king.

FORFEX, in Roman antiquity, was a way of drawing up an army in the form of a pair of ſheers. It was intended to receive the *cuneus* or wedge, if the enemy ſhould make uſe of that figure. For when the forfex opened to admit the wedge, they had an opportunity of defeating their deſign, and cutting them in pieces.

FORFICULA, the EAR-WIG, in zoology, a genus of inſects belonging to the order of coleoptera. The antennæ are briſtly; the elytra are dimidiated; the wings are covered; and the tail is forked. There are two ſpecies, *viz.* the auricularia, or common ear-wig, with the tops of the elytra white; and the minor, with teſtaceous and unſpotted elytra.—This genus of inſects is one of the beſt known, the forceps at the extremity of their abdomen forming a very diſtinctive character. It is this ſeeming weapon that has occaſioned thoſe inſects to be called *forficulæ* in Latin; and the formidable name of *ear-wigs* has been given them in Engliſh, from a notion that the inſect frequently introduces itſelf into the ears, cauſing great pain, and even death. Mr Barbut, however, aſſures us, that the forceps which the ear-wig carries at his tail, and with which he ſeems provided for his defence, is not ſo formidable as it at firſt appears, being deſtitute of ſtrength ſufficient to produce the leaſt ſenſible impreſſion. The larva of the ear-wig differs very little from the perfect inſect.

Ear-

Forge. Ear-wigs are very miſchievous vermin in gardens, eſpecially where carnations are preſerved; for they are ſo fond of theſe flowers, that if care is not taken to prevent them, they will entirely deſtroy them, by eating off the ſweet part at the bottom of the petals or leaves. To prevent which, moſt people have ſtands erected, which have a baſon of earth or lead round each ſupporter, which is conſtantly kept filled with water. Others hang the hollow claws of crabs and lobſters upon ſticks in divers parts of the garden into which thoſe vermin get; and by often ſearching them, you will deſtroy them without much trouble, which will be of great ſervice to your wall-fruit, for theſe are great deſtroyers alſo of all ſoft fruits.

FORGE, properly ſignifies a little furnace, wherein ſmiths and other artificers of iron or ſteel, &c. heat their metals red-hot, in order to ſoften them and render them more malleable and manageable on the anvil.

An ordinary forge is nothing but a pair of bellows, the nozzle of which is directed upon a ſmooth area, on which coals are placed. The nozzle of a pair of bellows may be alſo directed to the bottom of any furnace, to excite the combuſtion of the coals placed there, by which a kind of forge is formed. In laboratories, there is generally a ſmall furnace conſiſting of one cylindrical piece, open at top, which has at its lower ſide a hole for receiving the nozzle of a double bellows. This kind of forge-furnace is very convenient for fuſions, as the operation is quickly performed, and with few coals. In its lower part, two inches above the hole for receiving the nozzle of the bellows, may be placed an iron-plate of the ſame diameter, ſupported upon two horizontal bars, and pierced near its circumference with four holes diametrically oppoſite to each other. By this diſpoſition, the wind of the bellows, puſhed forcibly under this plate, enters at theſe four holes; and thus the heat of the fire is equally diſtributed, and the crucible in the furnace is equally ſurrounded by it. This contrivance is uſed in the forge-furnaces for melting copper, with this difference only, that theſe furnaces are ſquare, which is a matter of no conſequence.

As the wind of bellows ſtrongly and rapidly excites the action of the fire, a forge is very convenient when a great heat is to be applied quickly: but it is not ſuitable when the heat is to be gradually increaſed.

The forge, or blaſt of bellows, is uſed in ſeveral operations in ſmall; as to fuſe ſalts, metals, ores, &c. It is alſo much uſed in works in the great, which require ſtrong heat, without much management; and chiefly in the ſmelting of ores, and fuſion of metallic matters.

FORGE is alſo uſed for a large furnace, wherein iron-ore, taken out of the mine, is melted down: or it is more properly applied to another kind of furnace, wherein the iron-ore, melted down and ſeparated in a former furnace, and then caſt into ſows and pigs, is heated and fuſed over again, and beaten afterwards with large hammers, and thus rendered more ſoft, pure, ductile, and fit for uſe.

FORGE, in the train of artillery, is generally called a *travelling forge*, and may not be improperly called a portable ſmith's ſhop: at this forge all manner of ſmith's work is made, and it can be uſed upon a march as well as in camp. Formerly they were very ill contrived, with 2 wheels only, and wooden ſupporters to prop the forge for working when in the park. Of late years they are made with 4 wheels, which anſwers their purpoſe much better. Forge || Forgery

FORGE for red-hot Balls, is a place where the balls are made red-hot before they are fired off: it is built about five or ſix feet below the ſurface of the ground, of ſtrong brick-work, and an iron grate, upon which the balls are laid, with a very large fire under them.

FORGER, in law, one guilty of FORGERY.

FORGERY (from the French *forger*, i. e. *accudere*, *fabricare*, "to beat on an anvil, forge, or form,") may be defined at common law, to be "the fraudulent making or alteration of a writing to the prejudice of another man's right:" for which the offender may ſuffer fine, impriſonment, and pillory. And alſo, by a variety of ſtatutes, a more ſevere puniſhment is inflicted on the offender in many particular caſes, which are ſo multiplied of late as almoſt to become general. We ſhall mention the principal inſtances.

By ſtatute 5 Eliz. c. 14. to forge or make, or knowingly to publiſh or give in evidence, any forged deed, court-roll, or will, with intent to affect the right of real property, either freehold or copyhold, is puniſhed by a forfeiture to the party grieved of double coſts and damages; by ſtanding in the pillory, and having both his ears cut off, and his noſtrils ſlit, and ſeared; by forfeiture to the crown of the profits of his lands, and by perpetual impriſonment. For any forgery relating to a term of years or annuity, bond, obligation, acquittance, releaſe, or diſcharge of any debt or demand of any perſonal chattels, the ſame forfeiture is given to the party grieved; and on the offender is inflicted the pillory, loſs of one of his ears, and half a year's impriſonment: the ſecond offence, in both caſes, being felony without benefit of clergy.

Beſides this general act, a multitude of others, ſince the revolution (when paper-credit was firſt eſtabliſhed), have inflicted capital puniſhment on the forging, altering, or uttering as true when forged, of any bank bills or notes, or other ſecurities; of bills of credit iſſued from the exchequer; of ſouth-ſea bonds, &c.; of lottery tickets or orders; of army or navy debentures; of Eaſt India bonds; of writings under ſeal of the London or royal-exchange aſſurance; of the hand of the receiver of the pre-fines, or of the accountant-general and certain other officers of the court of chancery; of a letter of attorney or other power to receive or transfer ſtock or annuities; and on the perſonating a proprietor thereof, to receive or transfer ſuch annuities, ſtock, or dividends: alſo on the perſonating, or procuring to be perſonated, any ſeaman or other perſon, intitled to wages or other naval emoluments, or any of his perſonal repreſentatives; and the taking, or procuring to be taken, any falſe oath in order to obtain a probate or letters of adminiſtration, in order to receive ſuch payments; and the forging, or procuring to be forged, and likewiſe the uttering or publiſhing, as true, of any counterfeited ſeaman's will or power: to which may be added, though not ſtrictly reducible to this head, the counterfeiting of Mediterranean paſſes, under the hands of the lords of the admiralty, to protect one from the piratical ſtates of Barbary; the forging or imitating of any ſtamps to defraud the public revenue: and the forging of any marriage regiſter or licence: all which are, by diſtinct acts of parliament,

Forging liament, made felonies without benefit of clergy. By ſtatutes 13 Geo. III. c. 52. & 59. forging or counterfeiting any ſtamp or mark to denote the ſtandard of gold and ſilver plate, and certain other offences of the like tendency, are puniſhed with tranſportation for 14 years. By ſtatute 12 Geo. III. c. 48. certain frauds on the ſtamp-duties, therein deſcribed, principally by uſing the ſame ſtamps more than once, are made ſingle felony, and liable to tranſportation for ſeven years. And the ſame puniſhment is inflicted by ſtatute 13 Geo. III. c. 38. on ſuch as counterfeit the common ſeal of the corporation for manufacturing plate-glaſs (thereby erected), or knowingly demand money of the company by virtue of any writing under ſuch counterfeit ſeal.

There are alſo two other general laws, with regard to forgery; the one 2 Geo. II. c. 25. whereby the firſt offence in forging or procuring to be forged, acting or aſſiſting therein, or uttering or publiſhing as true, any forged deed, will, bond, writing obligatory, bill of exchange, promiſſory note, indorſement or aſſignment thereof, or any acquittance or receipt for money or goods, with intention to defraud any perſon (or corporation), is made felony without benefit of clergy. And by ſtatute 7 Geo. II. c. 22. it is equally penal to forge, or cauſe to be forged, or utter as true, a counterfeit acceptance of a bill of exchange, or the number of any accountable receipt for any note, bill, or any other ſecurity for money, or any warrant or order for the payment of money, or delivery of goods. So that, through the number of theſe general and ſpecial proviſions, there is now hardly a caſe poſſible to be conceived, wherein forgery, that tends to defraud, whether in the name of a real or fictitious perſon, is not made a capital crime.

FORGING, in law, the act of FORGERY.

FORGING, in ſmithery, the beating or hammering iron on the anvil, after having firſt made it red-hot in the forge, in order to extend it into various forms, and faſhion it into works. See FORGE.

There are two ways of forging and hammering iron. One is by the force of the hand, in which there are uſually ſeveral perſons employed, one of them turning the iron and hammering likewiſe, and the reſt only hammering. The other way is by the force of a water-mill, which raiſes and works ſeveral huge hammers beyond the force of man; under the ſtrokes whereof the workmen preſent large lumps or pieces of iron, which are ſuſtained at one end by the anvils, and at the other by iron-chains faſtened to the cieling of the forge. See MILL.

This laſt way of forging is only uſed in the largeſt works, as anchors for ſhips, &c. which uſually weigh ſeveral thouſand pounds. For the lighter works, a ſingle man ſerves to hold, heat, and turn with one hand, while he hammers with the other.

Each purpoſe the work is deſigned for requires its proper heat; for if it be too cold, it will not feel the weight of the hammer, as the ſmiths call it when it will not batter under the hammer; and if it be too hot, it will read-ſear, that is, break or crack under the hammer.

The ſeveral degrees of heat the ſmiths give their irons, are, firſt, a blood-red heat; ſecondly, a white-flame-heat; and, thirdly, a ſparkling or welding heat.

FORISFAMILIATION, in law. When a child, upon receiving a portion from his father, or otherwiſe, renounces his legal title to any further ſhare of his father's ſucceſſion, he is ſaid to be *foriſfamiliated*. Foriſfamiliation || Form.

FORK, a well-known inſtrument, conſiſting of a handle and blade, divided at the end into two or more points or prongs.

The *pitch-fork* is a large utenſil of this conſtruction, employed in hay-making, &c.

The *table-fork*, an inſtrument now ſo indiſpenſable, did not come into uſe in England till the reign of James I. as we learn from a remarkable paſſage in Coryat. The reader will probably ſmile at the ſolemn manner in which this important diſcovery or innovation is related: "Here I will mention a thing that might have been ſpoken of before in diſcourſe of the firſt Italian towns. I obſerved a cuſtom in all thoſe Italian cities and townes through the which I paſſed, that is not uſed in any other country that I ſaw in my travels, neither do I thinke that any other nation of Chriſtendome doth uſe it, but only Italy. The Italian and alſo moſt ſtrangers that are commonant in Italy, doe always at their meals uſe a little forke when they eat their meate; for while with their knife which they hold in one hand they cut the meate out of the diſh, they faſten the fork which they hold in the other hand upon the ſame diſh, ſo that whatſoever he be that ſitting in the company of any others at meale ſhould unadviſedly touch the diſh of meat with his fingers from which all the table doe cut, he will give occaſion of offence unto the company as having tranſgreſſed the lawes of good manners, in ſo much that for his error he ſhall be at leaſt brow-beaten if not reprehended in wordes. This form of feeding I underſtand is generally uſed in all parts of Italy, their forkes for the moſt part being made of yronn, ſteele, and ſome of ſilver, but thoſe are uſed only by gentlemen. The reaſon of this their curioſity is, becauſe the Italian cannot by any means indure to have his diſh touched with fingers, ſeeing all mens fingers are not alike cleane. Hereupon I myſelf thought good to imitate the Italian faſhion by this forked cutting of meate, not only while I was in Italy, but alſo in Germany, and often times in England ſince I came home: being once quipped for that frequently uſing my forke, by a certain learned gentleman a familiar friend of mine, Mr Lawrence Whitaker; who in his merry humour doubted not to call me a table *Furcifer*, only for uſing a forke at feeding, but for no other cauſe."

FORLI, an ancient and conſiderable town of Italy, and capital of a territory of the ſame name, in Romagna, with a biſhop's ſee. The public ſtructures are very handſome; and it is ſeated in a fertile, healthy, and pleaſant country, 10 miles ſouth-eaſt of Faenza, and 45 north-eaſt of Florence. E. Long. 12. 1. N. Lat. 44. 28.

FORLORN-HOPE, in the military art, ſignifies men detached from ſeveral regiments, or otherwiſe appointed, to make the firſt attack in day of battle; or, at a ſiege, to ſtorm the counterſcarp, mount the breach, or the like. They are ſo called from the great danger they are unavoidably expoſed to; but the word is old, and begins to be obſolete.

FORM, in phyſics, denotes the manner of being peculiar to each body; or that which conſtitutes it ſuch

Form. a particular body, and diſtinguiſhes it from every other.

Mr Harris uſes the term *form* likewiſe in another ſenſe, as an efficient animating principle; to which he ſuppoſes Ovid to refer in the firſt lines of his Metamorphoſis,

In nova fert animus mutatas dicere formas
Corpora——

Theſe animating forms are of themſelves no objects either of the ear or of the eye; but their nature or character is underſtood in this, that were they never to exert their proper energies on their proper ſubjects, the marble on which the ſculptor exerciſes his art would remain for ever ſhapeleſs, and the harp from which the harper calls forth ſounds would remain for ever ſilent.

Thus, alſo, the animating form of a natural body is neither its organization nor its figure, nor any other of thoſe inferior forms which make up the ſyſtem of its viſible qualities; but it is the power, which is yet able to produce, preſerve, and employ theſe. It is the power, which firſt moves, and then conducts that latent proceſs, by which the acorn becomes an oak, and the embryo becomes a man; by which digeſtion is performed in plants and animals, and, which departing, the body ceaſes to live, and its members putrefy; and by which every being produces another like itſelf, and every ſpecies is continued. In animals, it is that higher faculty, which, by employing the organs of ſenſe, peculiar to them as animals, diſtinguiſhes them as ſenſitive beings from vegetables; and it is alſo that more noble faculty, which by its own divine vigour, unaſſiſted perhaps with organs, makes and denominates him a being intellective and rational. So that Mr Harris reckons two ſorts of forms, thoſe which are paſſive elements, and thoſe which are efficient cauſes. And all of them agree in this, that they give to every being its peculiar and diſtinctive character: and on the whole he concludes, that form appears in part to be an element, and in part an efficient cauſe, *i. e.* a cauſe which aſſociates the conſtituent elements of natural ſubſtance, and which employs them, when aſſociated, according to their various and peculiar characters.

The philoſophers generally allow two principles of bodies: *matter*, as the common baſis or ſubſtratum of all; and *form*, as that which ſpecifies and diſtinguiſhes each; and which, added to a quantity of common matter, determines or denominates it this or that; wood, or fire, or aſhes, &c.

Subſtantial forms ſeem to have been firſt broached by the followers of Ariſtotle, who thought matter, under different modes or modifications, not ſufficient to conſtitute different bodies; but that ſomething ſubſtantial was neceſſary to ſet them at a greater diſtance: and thus introduced ſubſtantial forms, on the footing of ſouls, which ſpecify and diſtinguiſh animals. What led to this erroneous notion was the circumſtances of life and death: For obſerving, that, as ſoon as the ſoul was departed out of a man, all motion, reſpiration, nutrition, &c immediately ceaſed, they concluded, that all theſe functions depended on the ſoul, and conſequently that the ſoul was the form of the animal body, or that which conſtituted it ſuch: that the ſoul was a ſubſtance, independent of matter, no body doubted; and hence the forms of other bodies were concluded equally ſubſtantial. But to this it is anſwered, that though the ſoul be that by which a man is man, and conſequently is the form of the human body, as human; yet it does not follow, that it is properly the form of this body of ours, as it is a body; nor of the ſeveral parts thereof, conſidered as diſtinct from each other: For thoſe ſeveral parts have their proper forms ſo cloſely connected with their matter, that it remains inſeparable therefrom long after the ſoul has quitted the body: thus, fleſh has the form of fleſh, bone of bone, &c. long after the ſoul is removed as well as before. The truth is, the body does not become incapable of performing its accuſtomed functions becauſe the ſoul has deſerted it; but the ſoul takes its leave, becauſe the body is not in a condition to perform its functions. Form.

The ancient and modern corpuſcular philoſophers, therefore, with the Carteſians, exclude the notion of ſubſtantial forms; and ſhow, by many arguments, that the form is only the modus or manner of the body it is inherent in. And as there are only three primary modes of matter, viz, figure, reſt, or motion, with two others ariſing therefrom, viz. magnitude and ſituation, the form of all bodies they hold to conſiſt therein; and ſuppoſe the variations theſe modes are capable of, ſufficient to preſent all the variety obſervable in bodies.

Forms are uſually diſtinguiſhed into *eſſential* and *accidental*.

Eſſential. Though the five modes above mentioned, generally taken, be adventitious; yet to this or that body, *e. gr.* to fire or water, they are eſſential: thus, it is *accidental* to iron, to have this or that magnitude, figure, or ſituation, ſince it might exiſt in different ones; yet to a knife or hammer, the figure, magnitude, and poſition of parts, which conſtitute it a hammer or knife, are eſſential; and they cannot exiſt or be conceived without them. Hence it is inferred, that though there be no ſubſtantial, there are eſſential, forms, whereby the ſeveral ſpecies of bodies become what they are, and are diſtinguiſhed from all others.

Accidental forms, are thoſe really inherent in bodies, but in ſuch manner as that the body may exiſt in all its perfection without them. Such is whiteneſs in a wall, heat in water, a figure of a man in wax, &c.

Form is alſo uſed, in a moral ſenſe, for the manner of being or doing a thing according to rules: thus we ſay, a form of government, a form of argument, &c.

Form, in law, the rules eſtabliſhed and requiſite to be obſerved in legal proceedings.—The formal part of the law, or method of proceeding, cannot be altered but by parliament; for if once theſe outworks were demoliſhed, there would be an inlet to all manner of innovation in the body of the law itſelf.

Form, in carpentery, is uſed to denote the long ſeats or benches in the choirs of churches or in ſchools, for the prieſts, prebends, religious, or ſcholars, to ſit on. Du Cange takes the name to be derived from hence, that the backs of the ſeats were anciently enriched with figures of painting and ſculpture, called in Latin *formæ et typi*. In the life of St William of Roſchild, we meet with *forma* as ſignifying a ſeat for an eccleſiaſtic, or religious, in a choir; and in that of St

Lupi-

Form || Forman.

Lupicin, we have formula in the ſame ſenſe. In the rule of the monaſtery of St Cæſarea, the nun who preſides over the choir is called *primiceria, vel formari.*

At ſchools, the word *form* is frequently applied to what is otherwiſe termed a *claſs.* See CLASS.

FORM alſo denotes the external appearance or ſurface of a body, or the diſpoſition of its parts, as to the length, breadth, and thickneſs.

FORM is alſo uſed among mechanics, for a ſort of mould whereon any thing is faſhioned or wrought.

Printer's FORM, an aſſemblage of letters, words, and lines, ranged in order, and ſo diſpoſed into pages by the compoſitor; from which, by means of ink and a preſs, the printed ſheets are drawn.

Every form is incloſed in an iron-chaſe, wherein it is firmly locked by a number of pieces of wood; ſome long and narrow, and others of the form of wedges. There are two forms required for every ſheet, one for each ſide; and each form conſiſts of more or fewer pages according to the ſize of the book.

Hatter's FORM, is a large block or piece of wood, of a cylindrical figure; the top thereof rounded, and the bottom quite flat. Its uſe is, to mould or faſhion the crown of the hat, after the matter thereof has been beaten and fulled.

Paper-maker's FORM, is the frame or mould wherein the ſheets are faſhioned. See PAPER.

FORMA PAUPERIS, in law, is when a perſon has juſt cauſe of ſuit, but is ſo poor that he cannot defray the uſual charges of ſuing at law or in equity; in which caſe, on making oath that he is not worth L.5 in the world, on all his debts being paid, and producing a certificate from ſome lawyer that he has good cauſe of ſuit, the judge will admit him to ſue in *forma pauperis;* that is, without paying any fee to counſellors, attorneys, or clerk: the ſtatute 11 Hen. VII. c. 12. having enacted, that counſel and attorneys, &c. ſhall be aſſigned to ſuch poor perſons *gratis.* Where it appears that any pauper has ſold or contracted for the benefit of his ſuit whilſt it is depending in court, ſuch cauſe ſhall be thenceforth totally diſmiſſed; and a perſon ſuing *in forma pauperis*, ſhall not have a new trial granted him, but is to acquieſce in the judgment of the court.

FORMAL, ſomething belonging to or conſtituting the form of a thing. See FORM.

FORMALITY, the quality of a form, or formula; or that which conſtitutes and denominates them ſuch.

FORMALITY, as defined in the ſchools, is any manner wherein a thing is conceived; or a manner in any object, importing a relation to the underſtanding, whereby it may be diſtinguiſhed from another object. Thus, animality and rationality are formalities. The Scottiſts make great uſe of formalities, in oppoſition to the virtualities of the Thomiſts.

FORMALITIES, in matters of law, are frequently uſed for the formulas themſelves, or the rules preſcribed for judiciary proceedings. In contracts of ſtrict law, all the formalities muſt be ſtrictly obſerved: an omiſſion of the leaſt formality may ruin the whole convention.

The term is alſo uſed for a certain order, or decorum to be obſerved.

FORMAN (Andrew), archbiſhop of St Andrew's, earl of Pittenweem, and of Cottingham in England, one of the lords of the regency appointed by the ſtates during the minority of king James V. of Scotland, legate a-latere, primate of all the kingdom of Scotland, and archbiſhop of Bourges in France, was deſcended from the family of the Formans of Hutton in the ſhire of Berwick, and is conſidered to have been one of the beſt ſtateſmen of the age in which he lived. He was employed in 1501, along with Robert Blackader archbiſhop of Glaſgow and Patrick earl of Bothwell, to negociate a match between Ja. IV. of Scotland and Margaret eldeſt daughter of Hen. VII. of England; which next year was ratified by the Scottiſh ambaſſadors. He was afterwards frequently employed as Scots ambaſſador to Rome, England, and France, upon the moſt important occaſions. In 1514 he was tranſlated from the ſee of Moray, to which he had been appointed in 1502, to that of St Andrew's. During the time of his poſſeſſing the former, he was employed as mediator betwixt Pope Julius II. and Louis XII. of France, who were at that time at variance; and he happily ſucceeded in conciliating the difference. Having taken leave of the Pope, he paſſed through France on his return home, where he was kindly received by the king and queen, who beſtowed upon him the biſhopric of Bourges in France, which annually brought him in 400 tons of wine, 10,000 franks of gold, and other ſmaller articles. Beſides all this, he was moſt liberally rewarded by Pope Julius; who promoted him to the archbiſhopric of St Andrew's, as has been already mentioned; conferred on him the two rich abbeys of Dunfermline and Aberbrothic; and made him his legate a-latere. At that time, however, there were two other candidates for the archiepiſcopal ſee. The learned Gavin Douglas biſhop of Dunkeld having been nominated by the queen, had actually taken poſſeſſion of it; but John Hepburn, a bold and factious man, having been preferred by the monks, drove out the officers of Gavin Douglas, and placed a ſtrong garriſon in the caſtle. So great was the power of this man, that when Forman was nominated by the Pope, no perſon could be found who durſt proclaim the bulls for his election. At laſt lord Home, at that time the moſt powerful nobleman in Scotland, was induced, by large promiſes, beſides ſome gifts of great conſequence, among which was the donation of the abbacy of Coldingham to his youngeſt brother David, to undertake the taſk. It was executed at Edinburgh and St Andrew's; to which places lord Home's brother went with 10,000 men; though the doing of it, contrary to Forman's inclination, proved a ſource of much trouble to that nobleman afterwards. The quarrel betwixt Hepburn and Forman, however, was at laſt terminated by the latter ſurrendering the biſhopric of Moray, as well as ſome years revenue of the archbiſhopric itſelf; paying Hepburn alſo 3000 French crowns annually out of his eccleſiaſtical revenues. On the appointment of the duke of Albany to the regency, Hepburn endeavoured to undermine the primate's credit with that nobleman, by repreſenting him as one who had in a manner collected all the money in the country, and who conſequently might endanger the tranquillity of the kingdom. Theſe inſinuations, however, were but little regarded by the regent; and Forman had the good fortune afterwards to make up a

Formans.

Formation || Formiæ.

difference between him and the nobility, which was likely to be attended with much bloodſhed. In 1517 the archbiſhop was appointed by the ſtates one of the lords of the regency, on occaſion of the duke of Albany's going to France. We have already mentioned his embaſſy to Pope Julius II. In M'Kenzie's lives we are informed that in the collection of the Letters of the Scottiſh Kings from the year 1505 till the year 1626, in the lawyers library, there is a letter from that pope to king James IV. wherein he not only highly commends Forman, but likewiſe promiſes that at the firſt creation of cardinals he ſhould be made one. This letter is dated the 6th of May 1511: but the pope died before he had an opportunity of performing his promiſe. In the ſame collection there is a letter from the duke of Albany to Leo X. Julius's ſucceſſor, wherein he preſſes the pope to advance him to the dignity of a cardinal promiſed him by his predeceſſor, and to continue him his legate a-latere. Archbiſhop Forman died in 1521, and was buried at Dunfermline. Dempſter ſays that he wrote a book againſt Luther, a book concerning the Stoic Philoſophy, and a Collection out of the Decretals.

FORMATION, in philoſophy, an act whereby ſomething is formed or produced.—For the formation of the fœtus in the womb, ſee ANATOMY, nº 109, 110.

Formation of Stones. See STONE.

Formation of Metals and Minerals. See METAL and MINERAL.

FORMATION, in grammar, ſignifies the manner of forming one word from another: thus *accountantſh'p* is formed from *accountant*, and this laſt from *account*.

FORMEDON, in law, (breve *de forma donationis*), a writ that lies for a perſon who has a right to lands or tenements, by virtue of any entail, ariſing from the ſtatute of Weſtm. 2 Ch. II.

This writ is of three kinds, viz. a deſcender, remainder, and reverter. Formedon in *deſcender*, lies where a tenant in tail infeoffs a ſtranger, or is diſſeiſed and dies, and the heir may bring this writ to recover the lands. Formedon in *remainder*, lies where a man gives lands, &c. to a perſon in tail, and, for default of iſſue of his body, the remainder to another in tail: here if the tenant in tail die without iſſue, and a ſtranger abates and enters into the land, he in remainder ſhall have this writ. Formedon in *reverter*, lies where lands are entailed on certain perſons and their iſſue, with remainder over for want of iſſue; and, on that remainder failing, then to revert to the donor and his heirs: in this caſe, if the tenant in tail dies without iſſue, and alſo he in remainder, the donor and his heirs, to whom the reverſion returns, may have this writ for the recovery of the eſtate, though the ſame be alienated, &c.

FORMIÆ, or FORMIA, (anc. geog.), a maritime town of the Adjected or New Latium, to the ſouth-eaſt of Cajeta; built by the Lacedæmonians, (Strabo;) called originally *Hormiæ*, on account of its commodious harbour. An ancient municipium. *Formiani*, the people; who were admitted to the liberty of the city the very year in which Alexandria was built; but not to the right of ſuffrage till a long time after the ſecond Punic war, (Livy). *Formiæ* at this day lies in ruins, near a place now called *Mola*.

FORMICA, or the ANT, in zoology; a genus of inſects belonging to the order of hymenoptera, the characters of which are theſe: There is a ſmall ſcale betwixt the breaſt and belly; and the joint is ſo deep, that the animal appears as if it were almoſt cut thro' the body. The females, and the neuters or working ants which have no ſexual characteriſtics, are furniſhed with a hidden ſting; and both the males and females have wings, but the neuters have none. There are 18 ſpecies, moſt of them diſtinguiſhed by their colours. Formica. Plate CXCVI.

Theſe inſects keep together in companies like the bees, and maintain a ſort of republic. Their neſt is not exactly ſquare, but longer one way than the other; and in it there are a ſort of paths, which lead to different magazines. Some of the ants are employed in making the ground firm, by mixing it with a ſort of glue, for fear it ſhould crumble and fall down upon them. They may be ſometimes ſeen to gather ſeveral twigs, which ſerve them for raſters, which they place over the paths, to ſupport the covering; they lay others acroſs them, and upon them ruſhes, weeds, and dried graſs, which they heap up into a double declivity, which ſerves to turn off the water from their magazines. Some of theſe ſerve to lay up their proviſions in, and in others they lay their eggs.

As for the proviſions, they lay up every thing that is fit for them to eat; and you may often ſee one loaded with pippin or grain of fruit, another with a dead fly, and ſeveral together with the carcaſe of a may-bug or other inſect. If they meet with any they cannot bring away, they eat it upon the ſpot, or at leaſt ſo much of it as may reduce it to a bulk ſmall enough for them to carry. They do not run about where they pleaſe, at all adventures: for ſome of them are ſent abroad to make diſcoveries; and if they bring back news that they have met with a pear, or a ſugar-loaf, or a pot of ſweetmeats, they will run from the bottom of the garden, as high as the third ſtory of a houſe, to come at it. They all follow each other in the ſame path, without wandering to the right or the left; but in the fields they are more at their liberty, and are allowed to run about in ſearch of game. There is a ſort of green fly *, that does a great deal of miſchief among the flowers, and which curls up the leaves of peach and pear trees: and theſe are ſurrounded with a ſort of glue, or honey, which the ants hunt after very greedily; for they touch neither the plant nor the flies themſelves. Next to this, their greateſt paſſion is to lay up hoards of wheat and other corn; and for fear the corn ſhould ſprout by the moiſture of the ſubterraneous cells, they gnaw off the end which would produce the blade. The ants are often ſeen puſhing along grains of wheat or barley much larger than themſelves. It is remarkable, that if one ant meets another that is loaded, it always gives way to let it paſs freely; or will help it if it be overburdened.

* The *Aphis.*

The ant lays eggs in the manner of the common flies; and from theſe eggs are hatched the larvæ, a ſort of ſmall maggots or worms without legs: theſe are ſharp at one end and blunt at the other; and are white, but ſo tranſparent that the inteſtines are ſeen through the ſkin. Theſe, after a ſhort time, change into large white aureliæ or chryſalids, which are what are uſually called *ants eggs*. That end which is to be the tail is the

Formica. the largeſt, and that which is the head is ſomewhat tranſparent. The ants move theſe about at pleaſure with their forceps. It is well known, that when a neſt of theſe creatures is diſturbed, and the aureliæ ſcattered about, the ants are at infinite pains to get together all that are unhurt, and make a neſt for them again: nay, any ants will do this, and thoſe of one neſt will often take care of the aureliæ of another. Formica.

The care theſe creatures take of their offspring is remarkable. Whenever a hill is diſturbed, all the ants are found buſied in conſulting the ſafety, not of themſelves, but of the eggs or thoſe larger bodies incloſing the maggot or young ant; they carry theſe down any way ſo as to get them out of ſight, and will do this over and over as often as they are diſturbed. They carry away the eggs and vermicles together in their confuſion; but, as ſoon as the danger is over, they carefully ſeparate them, and place each ſort in parcels by themſelves under ſhelter of different kinds, and at various depths, according to the different degrees of warmth and coverture the different ſtates require. In the warm ſeaſon of the year, they every morning bring up the *eggs*, as they are uſually called, to the ſurface, or nearly ſo; and from ten in the forenoon to five in the afternoon or thereabouts, all theſe will be found juſt under the ſurface: and if the hills be examined toward eight in the evening, they will be found to have carried them all down; and if rainy weather be coming on, it will be neceſſary to dig a foot deep or more, in order to find them. All human precautions have not hitherto been able to ſupply that degree of warmth and minute attention which the ants put in practice to forward the inſtant of their laſt metamorphoſis. The inſect, iſſuing forth to a new life, tears its white tranſparent veil; it is then a real ant, deſtitute of wings, if it has no ſex; winged, if it be male or female, always to be known by a ſmall erect ſcale placed on the thread which connects the body and thorax. Ants tranſact their amours in the air. The males, who are much ſmaller, ſeldom frequent the common habitation: but the females much larger, repair to it to depoſit their eggs, which is all the labour they undergo; the winter's cold deſtroys them. As to the males, it is uncertain whether they fall victims to the ſeverity of winter, or are made over to the rage of the labouring ants. Theſe laſt paſs the winter in a torpid ſtate, as ſome other inſects do, till ſpring reſtores them to their wonted activity: they have therefore no ſtores for winter, no conſumption of proviſions. What are commonly ſold in markets for ant's eggs are grubs newly hatched, of which pheaſants, nightingales, and partridges, are very fond. The chief enemies to ants are the formica-leo, magpies, and ſome other birds and beaſts.

In the hotter countries, as Italy, Spain, and the Weſt Indies, ants are the greateſt peſt of the fields. Trees, which they are ſaid to injure greatly, may be preſerved from them by encompaſſing the ſtem, for four fingers breadth, with a roll of wool, newly pulled from the ſheep's belly; or by laying ſaw-duſt all round the ſtump of it. Some anoint the tree with tar, which has the ſame effect. But whatever harm they may do in paſture-lands, by making up hills for their habitation and impairing or drying up the graſs, their damaging fruit-trees appears to be an unjuſt reproach. On the contrary, in Switzerland they are made ſubſervient to the deſtruction of caterpillars. This is done by hanging a pouch filled with ants upon a tree; and they, making their eſcape through an aperture contrived on purpoſe, run over the tree without being able to reach down to the ground, becauſe care has been previouſly taken to beſmear the foot of the tree with wet clay or ſoft pitch; in conſequence of which, compelled by hunger, they fall upon the caterpillars and devour them. People pretend to ſay, that ants, taken inwardly, give a ſpring to the urinary ducts and to the organs of generation. The red colour which they communicate to blue paper, when cruſhed upon it, proves that they contain an acid (ſee CHEMISTRY, n° 907.)

The large, black, winged ants of America, to avoid the great rains which fall there at particular ſeaſons, make to themſelves large neſts on trees, with a covered way for them to go up and down on the lee-ſide of the tree. Theſe neſts are roundiſh on the outſide, made of light brown earth, plaſtered ſmooth. They are larger than a buſhel; and in the inſide are many ſinuous caverns or lodgings communicating with one another. See Plate CXCVI. A, The ants neſt; B, The tubular paſſage, made of the ſame materials.

As to thoſe inſects called *white ants*, which abound in Africa and the Eaſt Indies, they belong to a different genus; for which ſee the article TERMES.

FORMICA-Leo, the *Ant-lion*, in zoology, an inſect ſo called from its devouring great numbers of ants. It is the caterpillar or worm of a fly much reſembling the libellæ or dragon-flies; and feeds chiefly upon ants, from which property it derives its name.

It is ſomewhat of the nature of the ſpider in its way of taking its prey, its manner of ſpinning, and the figure and ſoftneſs of its body. It has, in its general figure, ſomewhat of the appearance of the millepes or wood-louſe, ſo that ſome have miſtaken it at firſt ſight for that animal. It is of a dirty greyiſh colour, marked with ſome black ſpots; and theſe are alſo compoſed of many points when viewed with a microſcope, which make it reſemble a hedge-hog or porcupine. Its body is compoſed of ſeveral rings, and has thence a wrinkled look. It has ſix legs, four are joined to the breaſt, and the other two to a longer part, which may be taken for its neck. Its head is ſmall and flat, and it has two remarkable horns: theſe are about a ſixth part of an inch long, and as thick as a hair: they are hard, hollow, and hooked at the end like the claws of a cat. At the origin of each of theſe horns, it has a clear and bright black eye, which ſees very diſtinctly, and gives the creature notice to eſcape on ſight of the ſmalleſt object.—This creature is not able to hunt after its prey, nor to deſtroy large inſects; it can only draw into its ſnares ſuch as come near its habitation, and of theſe very few are ſuch as he can manage: all the winged kind are able to eſcape by flight; and the beetle kinds, and others that have hard ſhells upon their bodies, are of no uſe to him, as his horns cannot pierce them. The ſmallneſs of the ant, and the want of wings in the neuters, make them the deſtined prey of this devourer. The manner in which he catches his prey is as follows.

He uſually encamps under an old wall, that he may be ſheltered from the injuries of the weather; and he always chooſes a place where the ſoil is compoſed of a fine dry ſand. In this he makes a pit of the ſhape of

Formica. a funnel, or an inverted hollow cone. If he intends the pit to be but ſmall, he thruſts down his hinder part into the ſand, and by degrees plunges himſelf backward into it; and when he has got to a certain depth, he toſſes out the looſe ſand which has run down with his head, artfully throwing it off beyond the edges of his pit. Thus he lies at the bottom of a ſmall hollow, which is wideſt at the top, and comes ſloping down to his body.

But if he is to make a larger pit, more pains are required to bring it to perfection. He firſt traces, in the ſurface of the ſand, a large circle, which is the erected baſe or mouth of the pit he is to make in form of an inverted cone. He then buries himſelf in the ſand near the edge of this circle, and carefully throws up the ſand above him, with his head toſſing it out beyond the circumference of the circle. Thus he continues his work, running down backwards in a ſpiral line all the way, and carefully throwing off the ſand from above him, till he is come to the place of his reſt, which is the point or reverted apex of the hollow cone he has formed by his paſſage. The length of his neck, and the flatneſs of his head, gives him a power of uſing the whole as a ſpade, and throwing off the ſand with great eaſe; and his ſtrength in this part is ſo great, that he is able to throw off a quantity of it to ſix inches diſtance. This is a power he exerts oftener, however, in throwing away the remains of the animals he has fed upon, that his den may not become frightful to others of the ſame ſpecies, by ſeeing their fellow carcaſes about it.

When he has finiſhed his pit, he buries himſelf at the bottom of it among the ſand, leaving no part above ground but the tips of his two horns, which he expands to the two ſides of the pit. In this condition he lies and waits for his prey, and never comes up afterwards. When an ant, or any other ſuch creature, chances to walk over the edges of his pit, its ſteps throw down a little of the ſand, which naturally running down to the bottom of the pit, gives the enemy notice of his prey; he then toſſes up the ſand which covers his head, to bury the ant, and bring him down with its returning force to the bottom; and as one ſuch attempt cannot be ſufficient to prevent the ant's eſcape, he throws more and more ſand upon him, till he by degrees brings him down. All the endeavours of the ant to eſcape, when once it is within the verge of the pit, are in vain; for, as it attempts to climb, the ſand runs away from under its feet, and it ſinks the lower for every attempt. This motion of the ſand alſo informs the enemy where it is, and directs him to throw up more ſand in the right place; which it does, till the poor ant falls to the bottom between its horns. It then plunges the points deep into the ant's body; and having ſucked all the juice out of the prey, it throws out the empty ſkin as far from the hole as it can. This done, it mounts up the edges of its pit, and if it has ſuffered any injury, repairs it with great care, and immediately buries itſelf again in the centre, to wait for another meal. The horns of this creature are its only organs for receiving nouriſhment; it never brings any animal which it has ſeized near to its head, but always holds it at the tip of the horns. They therefore plainly ſerve as ſyringes, to draw into its ſtomach the juices of the bodies of the inſects it feeds upon: neither is there any mouth or trunk, or any other organ to be diſcovered about its head, which could ſerve to the purpoſe of eating; the head ſeeming only intended for throwing away the ſand in forming the pit. The horns of this animal being ſo neceſſary to its life, nature has provided for the reſtoring them in caſe of accidents; and, if cut off, they are found to grow again. Formica.

The food this creature procures by its pit can be but little; and as it has no power of catching its prey any other way, its motion being only backwards, and that ſlowly, and by ſmall ſpaces at a time, ſome people have believed its catching now and then an ant by this means was rather for diverſion than hunger. But tho' the formica-leo will live a long time without food, and even paſs through all its changes when ſhut up in a box, yet it is always ready to eat when food is offered it; it always appears ſtarved and ſmall when kept thus; and if a fly is given it in this hungry ſtate, it will ſo ſuck out all its juices, that the ſhell remaining may be rubbed to powder between the fingers, while the body of the creature that has ſucked it appears remarkably ſwelled and diſtended; ſo that it is plain that the juices of the prey are conveyed into the body of the creature; though it is not eaſy to ſee by what means, the horns not appearing to have any perforation.

When the formica leo has lived a proper time in this ſtate, it leaves its pit, and is only ſeen drawing lines and traces on the ſurface of the ſand. After this it buries itſelf under the ſurface; and there incloſes itſelf in a fine web, in which it is to paſs its transformation into the winged ſtate. This caſe is made of a ſort of ſilk which the creature ſpins in the manner of the ſpider, and of a quantity of the grains of ſand cemented together by a glutinous humour which flows from its pores. This caſe, however, would be too harſh and coarſe for the body of the creature, and therefore it ſerves only for the outer covering to defend it from injuries; the creature ſpinning one of pure and incomparably fine ſilk, of a beautiful pearl colour, within it, which covers its whole body.

When the creature has lain ſome time in this caſe, it throws off its outer ſkin, with the eyes, the horns, and every other part neceſſary to its life before, and becomes an oblong nymph, in which a careful eye may trace the form of the fly into which it is to be transformed. There may be ſeen, through its tranſparent covering, new eyes, new horns, wings, and all the other parts of the animal in its perfect ſtate. This nymph makes its way about half out of the ſhell, and remains in this condition, but without farther life or motion, till the perfect fly makes its way out at a ſlit in the back. In this laſt ſtate it much reſembles the libellæ or dragon-flies common about our waters. The male couples with the female in this ſtate only; and M. Poupart, to whom the world is obliged for this curious deſcription, is of opinion that the females lay only one egg; but this is very different from the courſe of nature in the other animals of the ſame claſs.

When this inſect forms its pit in a bed of pure ſand, it is made and repaired with great eaſe; but where it meets with other ſubſtances among the ſand, the labour becomes greatly the more embarraſſing. If, for inſtance, when the creature has half formed its pit, and then comes to a ſtone of ſome moderate ſize, it does not deſert the work for this, but goes on, intending to

Forming, Formoſa. remove that impediment at laſt. When the pit is finiſhed, the creature crawls backward up the ſide of the place where the ſtone is, and getting its backſide under it, takes great pains and time to get it on a true poiſe, and then begins to crawl backward with it up the edge to the top of the pit, to get it out of the way. It is a very common thing to ſee a formica-leo in this manner labouring at a ſtone four times as big as its own body; and as it can only move backward, and the poiſe is hard to keep, eſpecially up a ſlope of ſuch crumbly matter as ſand, which moulders away from under its feet, and neceſſarily alters the poſition of its body, the ſtone very frequently falls down when near the verge, and then it is ſure to roll to the bottom. In this caſe the animal attacks it again in the ſame way, and often is not diſcouraged by five or ſix miſcarriages of this kind; but, after all, attempts again, and at length gets it over the verge of the place. When it has done this, it does not leave it there, leſt it ſhould roll in again; but is always at the pains of puſhing it farther on, till it has removed it to a neceſſary diſtance from the edge of the pit.

The common formica-leo moves only backward; but Mr. Rouet has obſerved a ſpecies which moves forward in the common way of other animals, and makes no pit of this kind to entrap its prey, but ſeizes other inſects by force.

FORMING is uſed for the act of giving being or birth to any thing.

The word is alſo ſimply uſed for giving the figure to any thing. The potter forms his veſſels as he pleaſes. Geometry teaches how to form all kinds of figures.

It is likewiſe uſed for the producing of a thing: thus, the lineaments of the face began to be formed.

Forming of a Siege, is the making lines of circumvallation to fortify the camp, and diſpoſing things for the attack of a place in form.

They alſo ſay, to form a ſquadron or battalion; meaning, to range the ſoldiers in form of a ſquadron, &c.

Forming the Line, is drawing up infantry, cavalry, and artillery, into line of battle. See LINE.

FORMING is alſo uſed in grammar, in ſpeaking of certain tenſes of verbs, which are made from others by a change of certain letters. The preſent tenſe is formed from the infinitive. Compound and derivative words alſo, and even all that have any etymology, are ſaid to be formed.

FORMOSA, an iſland in the Pacific Ocean, between 119° and 122° of E Long. and 22° and 25° N. Lat. about 100 miles eaſt of Canton in China. It is ſubject to the Chineſe; who, however, notwithſtanding its vicinity, did not know of its exiſtence until the year 1430. It is about 85 leagues in length, and 25 in breadth. A long chain of mountains, which runs from north to ſouth, divides it into two parts, the eaſtern and weſtern. The Dutch formed an eſtabliſhment in the weſtern part in 1634, and built the fort of Zealand, which ſecured to them the principal port of the iſland; but they were driven from thence in 1659 or 1661 by a celebrated Chineſe pirate, who made himſelf maſter of all the weſtern part, which afterwards ſubmitted in 1682 to the authority of Kang-he emperor of China.

This weſtern part of Formoſa is divided into three diſtinct governments, all ſubordinate to the governor of TAI-OUAN, the capital of the iſland, who is himſelf ſubject to the viceroy of the province of FOKIEN. Formoſa.

This iſland preſents extenſive and fertile plains, watered by a great number of rivulets that fall from the eaſtern mountains. Its air is pure and wholeſome; and the earth produces in abundance corn, rice, and the greater part of other grains. Moſt of the Indian fruits are found here, ſuch as oranges, bananas, pine-apples, guavas, papaws, cocoa-nuts; and part of thoſe of Europe, particularly peaches, apricots, figs, raiſins, cheſnuts, pomegranates, water-melons, &c. Tobacco, ſugar, pepper, camphire, and cinnamon, are alſo common. Horſes, ſheep, and goats, are very rare in this iſland: there are even few hogs, although theſe animals abound in China. Domeſtic poultry, ſuch as fowls, geeſe, and ducks, are exceedingly plenty; pheaſants alſo are ſometimes ſeen; and monkeys and ſtags have multiplied ſo much, that they wander through the country in large flocks.

The inhabitants of Formoſa rear a great number of oxen, which they uſe for riding, from a want of horſes and mules. They accuſtom them early to this kind of ſervice, and by daily exerciſe train them to go as well and as expeditiouſly as the beſt horſes. Theſe oxen are furniſhed with a bridle, ſaddle, and crupper. A Chineſe looks as big and proud when mounted in this manner, as if he were carried by the fineſt Barbary courſer.

Wholeſome water fit for drinking is the only thing wanting in the iſland of Formoſa. It is very extraordinary, that every kind of water in it is a deadly poiſon to ſtrangers, for which no remedy has hitherto been found. "One of the governor's ſervants," ſays Father de Mailla, "whom I had in my train (a ſtrong and robuſt man), truſting too much to the force of his conſtitution, would not believe what had been told him concerning this water: he drank ſome of it; and died in leſs than five days, after every medicine and antidote had been adminiſtered without ſucceſs. There is none but the water of the capital which can be drunk: the mandarins of the place therefore always took care to tranſport a ſufficiency of it in carts for our uſe." Our author adds, that at the bottom of a mountain a league diſtant from Fong-kan-hien, there is a ſpring that produces a ſtream, the water of which is of a whitiſh blue colour, and ſo noxious, that no one can approach it.

There are few mulberry-trees in Formoſa, conſequently little ſilk is made in the country. Numerous manufactures, however, would ſoon be introduced into it, were the Chineſe permitted indiſcriminately to tranſport themſelves thither, and to form eſtabliſhments in the iſland. Thoſe who go to it muſt be protected by paſſports from the Chineſe mandarins, and theſe paſſports are ſold at a dear rate; ſecurities are beſides required. This is not all: when they arrive, money muſt be given to the mandarins who are appointed to examine thoſe who enter or quit the iſland, and who generally diſcharge this duty with the moſt rigid ſeverity. If they give no preſent, or offer only a trifle, they meet with little mercy; and are ſure to be ſent back, whatever paſſport they may have. The Chineſe, through policy, connive at theſe exactions, to prevent

too

Formosa too great a number of people from emigrating to this island, which is rendered a place of great importance by its proximity to China. They fear, and with great reason (especially since Tartar emperors have been on the throne), that if any revolt should happen in Formosa, its influence might spread, and occasion great disturbance in the whole empire. On this account, the Tartars keep a garrison there of 10,000 men; which they take care to change every three years, or even oftener if they judge it necessary.

Besides the capital, the Chinese have also two other cities, and some villages, where they inhabit alone; for they do not permit the Indians, who are their subjects, to live among them; they suffer none to remain but those who are either their slaves or domestics. These Indians are united into 45 villages; 36 of which lie to the north, and 9 towards the south. The northern villages are very populous, and the houses are built almost after the Chinese manner. The habitations of the southern islanders are only heaps of huts or cottages of earth. In these huts they have neither chairs, benches, tables, beds, nor any piece of furniture; the middle part is occupied by a kind of hearth or chimney, raised two feet high, and constructed of earth, upon which they dress their victuals. Their ordinary food is rice, other small grain, and the game which they catch by coursing or kill with their arms. These islanders run with such surprising swiftness, that they can almost outstrip the fleetest greyhound. The Chinese attribute this agility to the precaution they take of confining their knees and reins by a close bandage until the age of 14 or 15. Their favourite arms are lances, which they dart to the distance of 60 or 80 feet with the greatest dexterity and precision. They use bows and arrows, and can kill a pheasant on wing with as much certainty as an European sportsman could with a fusee. These people are very dirty in their manner of eating. They have neither plates, dishes, nor spoons, nor even the small sticks used in China. Whatever they dress is placed on a plain board or mat, and they make use of their fingers for conveying it to their mouths. They eat flesh half raw; and provided it has been only presented to the fire, it appears to them excellent. Their beds are formed of fresh-gathered leaves. They go almost naked, and wear only a piece of cloth which hangs from their girdle to their knees. Those among them who, according to the judgment of the chiefs of the village, have borne away the prize for agility in running or dexterity in the chase, obtain the honourable privilege of making on their skin, by a very painful operation, several fantastical figures of flowers, trees, and animals. All have the right of blackening their teeth, and of wearing ornaments of bracelets and crowns made of shells and crystal.

The islanders who inhabit the northern part, where the climate is something colder, clothe themselves with the skins of the stags which they kill in hunting. They make a kind of dress of them without sleeves, that pretty much resembles a dalmatic, or vestment worn at the altar by the Roman clergy. They wear on their heads caps in the form of a cylinder, made of palm-leaves, and ornamented with several crowns placed one above another, on the top of which they fix plumes composed of the feathers of a cock or pheasant

The marriage ceremonies of the inhabitants of Formosa approach near to the simple laws of nature. They neither purchase, as in China, the women whom they espouse, nor does interest ever preside over their unions. Fathers and mothers are scarcely ever consulted. If a young man has a mind to marry, and has fixed his affection on a young girl, he appears for several days following near the place where she lives with a musical instrument in his hand. If the young woman is satisfied with the figure of her gallant, she comes forth and joins him: they then agree, and settle the marriage-contract. After this they give notice to their parents, who prepare a wedding-dinner, which is always given in the house where the young woman resides, and where the bridegroom remains without returning again to his father. The young man afterwards considers the house of his father-in-law as his own. He becomes the whole support of it, and he has no farther connection with that of his father; like married women in Europe, who generally quit their paternal home in order to live with their husbands. These islanders therefore seldom offer up vows for obtaining male children: they prefer daughters, because they procure them sons-in-law, who become the supports of their old age. Formosa

Although the Formosans are entirely subjected to the Chinese, they still preserve some remains of their ancient government. Each village chooses three or four old men from among these who have the greatest reputation for probity. By this choice they become the rulers and judges of the rest of the hamlet. They have the power of finally determining all differences; and if any one should refuse to abide by their judgement, he would be immediately banished from the village, without hopes of ever being able to re-enter it, and none of the inhabitants would afterwards dare to receive him.

The natives pay in grain the tribute imposed on them by the Chinese. To regulate every thing that concerns the laying on and collecting of this impost, government have established a Chinese in every village, who is obliged to learn the language, and act as interpreter to the mandarins. These interpreters are most cruel extortioners to the miserable people, whom they ought rather to protect: they are such insatiable leeches, that they can scarcely ever be satisfied. This daily and domestic tyranny has already caused the defection of three villages in the southern part of the island, where formerly there were twelve. The inhabitants of these villages revolted, expelled their interpreters, refused to pay tribute any longer to the Chinese, and have united themselves to the independent nation in the eastern part of the island.

It was in the island of Formosa that John Struys affirms to have seen with his own eyes a man who had a tail more than a foot in length, covered with red hair, and greatly resembling that of an ox. This man with a tail said, that his deformity, if it was one, proceeded from the climate, and that all those of the southern part of the island were born with tails like his.—But John Struys is the only author who attests the existence of this extraordinary race of men; no other writer who has spoken of Formosa makes the least mention of them. Another circumstance, no less singular, and which appears to be little better authenticated,

Formoſa. ticated, is, that in this iſland women are not permitted to bring forth children before they are 35, although they are at liberty to marry long before that age. Rechteren* thus expreſſes himſelf concerning this ſtrange cuſtom:

* Dutch Eaſt India Company Voyages, vol v. p. 96.

"When women are firſt married, they bring no children into the world; they muſt, before that is permitted, have attained the age of 35 or 37. When they are big with child, their prieſteſſes pay them a viſit, and tread on their bellies with their feet, if it be neceſſary, and make them miſcarry, with perhaps greater pains than they would have in being brought to bed. It would be not only a ſhame, but an enormous crime, to bring forth a child before the term preſcribed. I have ſeen ſome females who had already deſtroyed the fruit of their womb 15 or 16 times, and who were big for the 17th when it was lawful for them to bring forth a living child."

To our deſcription of Formoſa we ſhall add the following account of the dreadful diſaſter that lately befel this unhappy iſland. The details were conveyed by a letter from Peking, addreſſed to M. Bertin, and dated the 14th of July 1782.

'The waters of the ocean have well nigh deprived China of one of its moſt valuable maritime poſſeſſions. The iſland of Tay-ouan, known in Europe by the name of Formoſa, has been almoſt ſwallowed up by them. It has been reported here, that part of the mountain which divides the iſland has ſunk and diſappeared; that the reſt has been overturned; and that the greater part of the inhabitants have periſhed. Such have been for ſome days the popular reports in this capital. Government, however, has put a ſtop to them, by informing the public of the real truth; ſuch as it is has been announced to the emperor by the officers who have this ſmall portion of his territories under their juriſdiction. I cannot do better than tranſcribe what they have written. The diſpatches of the Chineſe officers, addreſſed to the emperor, run thus:

"Beehen, governor-general of the provinces of Fokien and Tche-Kyang-ya, viceroy of Fokien, and others, make known to your majeſty the diſaſter that has lately befallen the iſland of Tay-ouan. Monha-hon, and other principal officers of this iſland, have acquainted us, that on the 21ſt of the fourth moon (May 22d, 1782), a moſt furious wind, accompanied with heavy rain and a ſwell of the ſea greater than ever remembered, had kept them under continual apprehenſion of being ſwallowed up by the waves, or buried in the bowels of the earth, from the hour of *yn* until the hour *ouei* (A). This dreadful tempeſt ſeemed to blow at the ſame time from the four cardinal points of the compaſs, and continued with equal violence during the above mentioned time. The buildings where the tribunals were held, the public granaries, the barracks, ſalt-warehouſes, and works, have been totally deſtroyed, and every thing they contained is loſt: warehouſes and work-ſhops, as well as private houſes, for the moſt part, preſent nothing but ruins and heaps of rubbiſh. Of 27 ſhips of war which were in the harbour 12 have diſappeared; two others have been daſhed to pieces, and 10 are ſhattered in ſuch a manner that they are rendered entirely unfit for ſervice; other ſmaller veſſels of different ſizes, above 100 in number, have ſhared the ſame fate; eighty have been ſwallowed up; five others, which had juſt taken in a lading of rice for Fokien, have ſunk, and their cargoes, which amounted to 100,000 buſhels, are wholly loſt. With regard to other veſſels, whether ſmall or great, which had not entered the harbour, 10 or 12 of the largeſt are reckoned to have been ſwallowed up; thoſe of inferior ſize, as well as a prodigious number of barks, boats, and other ſmall veſſels of different kinds, have diſappeared, without leaving the leaſt piece of wreck behind them. As the whole iſland has been covered with water, the proviſions have been either ſwept away or ſpoilt, ſo as to render them prejudicial to the health of thoſe who uſe them in their preſent ſtate. The crops are entirely loſt. When we ſhall have been informed of particulars, we ſhall not fail to give your majeſty the earlieſt intelligence of them.—After having received this letter from Mon-ha-hon, and the other principal officers reſiding at Tay-ouan, I employed the utmoſt diligence to give every aſſiſtance in my power to this unfortunate iſland; and I ordered the travelling commiſſary, and Trey-ouer, general of the province, to get particular information of the number of thoſe who have periſhed, of the houſes deſtroyed, and of the quantity of ſalt and other proviſions that has been loſt: I have likewiſe enjoined them to rebuild with the utmoſt expedition the tribunals, granaries, and other public edifices; to diſpatch proper perſons to ſearch for the veſſels and ſhips that have diſappeared; to repair thoſe which are not altogether unfit for ſervice, and to ſend immediately to the neighbouring countries for ſalt and other neceſſary proviſions; but above all, to aſcertain in the moſt accurate manner the different loſſes ſuſtained by the inhabitants, and the preciſe number of people that have periſhed, in order that I may be able to give the fulleſt information to your majeſty."

Formoſa.

'The emperor of China cauſed a particular detail of theſe loſſes to be publiſhed, together with the following letter:

"Tchang-yu, &c. Tchem-hoei-Thon-Tſong-tou of Fokien, and others, have informed me of the diſmal event that hath taken place in the iſland of Tay-ouan, which is a diſtrict of the province of Fokien. They have written to me, that on the 21ſt of the fourth moon. [Here the emperor repeats what is contained in the preceding letter, and continues thus]: I command Tſong-tou to get the beſt information he can of the different loſſes ſuſtained by the inhabitants of the iſland, and to tranſmit the particulars to me, in order that I may give them every aſſiſtance to repair them. My intention is, that all the houſes which have been thrown down ſhall be rebuilt entirely at my expence; that thoſe be repaired which are only damaged; and that proviſions, and every thing which the people ſtand in immediate want of, be ſupplied them. I ſhould feel much pain, were even one among them to be neglected: I therefore recommend the utmoſt diligence

(A) The hours of the Chineſe are double ours: the hour *yn* begins at three in the morning and ends at five; *ouei* begins at three in the afternoon and ends at five.

Formula || Fornication.

ligence and ſtricteſt inquiry, as I am deſirous that none of my ſubjects ſhould entertain the leaſt doubt of the tender affection which I have for them; and that they ſhould know that they are all under my eyes, and that I myſelf will provide for their wants. With regard to my ſhips of war, tribunals, and public edifices, let them be reſtored to their former ſtate with money taken from the public treaſury, and let the general account of the whole expence be laid before me."

The miſſionary who ſent this account farther ſays, From theſe letters it evidently appears, that this diſaſter happened in conſequence of an earthquake; but he adds, that the volcano which occaſioned it muſt be at a prodigious depth below the ſea. He does not pretend to give an explanation of it; he is contented with obſerving, that the ſame ſcene ſeems to have paſſed at the iſland of Formoſa as at Lima and Liſbon.

FORMULA, or FORMULARY, a rule or model, or certain terms preſcribed or decreed by authority, for the form and manner of an act, inſtrument, proceeding, or the like.

FORMULA, in church-hiſtory and theology, ſignifies a profeſſion of faith.

FORMULA, in medicine, imports the conſtitution of medicines, either ſimple or compound, both with reſpect to their preſcription and conſiſtence.

FORMULARY, a writing, containing the form or formula of an oath, declaration, atteſtation, or abjuration, &c. to be made on certain occaſions.

There are alſo formularies of devotion, of prayers, &c. Liturgies are formularies of the public ſervice in moſt churches.

FORNACALIA, or FORNICALIA, in Roman antiquity, a feſtival inſtituted by Numa, in honour of Fornax, the goddeſs of ovens; wherein certain cakes were made, and offered in ſacrifice before the ovens.

FORNICATION (*Fornicatio*, from the *fornices* in Rome, where the lewd women proſtituted themſelves for money), is whoredom, or the act of incontinency, between ſingle perſons; for if either of the parties is married, it is *adultery*. Formerly court-leets had power to inquire of and puniſh fornication and adultery; in which courts the king had a fine aſſeſſed on the offenders, as appears by the book of Domeſday.

In the year 1650, when the ruling powers found it for their intereſt to put on the ſemblance of a very extraordinary ſtrictneſs and purity of morals, not only inceſt and wilful adultery were made capital crimes, but alſo the repeated act of keeping a brothel, or committing fornication, were (upon a ſecond conviction) made felony without benefit of clergy. But, at the reſtoration, when men, from an abhorrence of the hypocriſy of the late times, fell into a contrary extreme of licentiouſneſs, it was not thought proper to renew a law of ſuch unfaſhionable rigour. And theſe offences have been ever ſince left to the feeble coercion of the ſpiritual court, according to the rules of the canon law; a law which has treated the offence of incontinence, nay, even adultery itſelf, with a great degree of tenderneſs and lenity; owing perhaps to the conſtrained celibacy of its firſt compilers. The temporal courts therefore take no cogniſance even of the crime of adultery otherwiſe than as a private injury. See ADULTERY.

The evils of fornication, which too many wiſh to conſider as no ſin, may be judged of from the following particulars. Fornication.

1. The malignity and moral quality of each crime is not to be eſtimated by the particular effect of one offence, or of one perſon's offending, but by the general tendency and conſequence of crimes of the ſame nature. In the preſent caſe, let the libertine conſider and ſay, what would be the conſequence, if the ſame licentiouſneſs in which he indulges were univerſal? or what ſhould hinder its becoming univerſal, if it be innocent or allowable in him?

2. Fornication ſuppoſes proſtitution; and by proſtitution the victims of it are brought to almoſt certain miſery. It is no ſmall quantity of miſery in the aggregate, which, between want, diſeaſe, and inſult, is ſuffered by thoſe outcaſts of human ſociety who infeſt populous cities; the whole of which is a general conſequence of fornication, and to the increaſe and continuance of which every act and inſtance of fornication contributes.

3. Fornication produces habits of ungovernable lewdneſs, which introduce the more aggravated crimes of ſeduction, adultery, violation, &c. The criminal indulgences between the ſexes prepare an eaſy admiſſion for every ſin that ſeeks it: they are, in low life, uſually the firſt ſtage in mens progreſs to the moſt deſperate villanies; and in high life, to that lamented diſſoluteneſs of principle, which manifeſts itſelf in a proſligacy of public conduct, and a contempt of the obligations of religion and moral probity.

4. Fornication perpetuates a diſeaſe, which may be accounted one of the foreſt maladies of human nature, and the effects of which are ſaid to viſit the conſtitution of even diſtant generations.

The paſſion being natural, proves that it was intended to be gratified; but under what reſtrictions, or whether without any, muſt be collected from different conſiderations.

In the Scriptures, fornication is abſolutely and peremptorily condemned. 'Out of the heart proceed evil thoughts, murders, adulteries, fornication, theſts, falſe witneſs, blaſphemies; theſe are the things which defile a man.' Theſe are Chriſt's own words; and one word from him upon the ſubject is final. The apoſtles are more full upon this topic. One well-known paſſage in the Epiſtle to the Hebrews may ſtand in the place of all others; becauſe, admitting the authority by which the apoſtles of Chriſt ſpake and wrote, it is deciſive. 'Marriage and the bed undefiled is honourable amongſt all men, but whoremongers and adulterers God will judge;' which was a great deal to ſay, at a time when it was not agreed even amongſt philoſophers that fornication was a crime.

Upon this ſubject Mr Paley adds the following obſervations*.

* *Moral and Political Philoſophy*, p. 246.

"The Scriptures give no ſanction to thoſe auſterities which have been ſince impoſed upon the world under the name of Chriſt's religion, as the celibacy of the clergy, the praiſe of perpetual virginity, the *prohibitio concubitus cum gravida uxore;* but with a juſt knowledge of, and regard to the condition and intereſt of the human ſpecies, have provided in the marriage of one man with one woman an adequate gratification for the propenſities of their nature, and have reſtrained them to that gratification.

"The

Fornication || Forres.

"The avowed toleration, and in some countries the licensing, taxing, and regulating of public brothels, has appeared to the people an authorizing of fornication, and has contributed, with other causes, so far to vitiate the public opinion, that there is no practice of which the immorality is so little thought of or acknowledged, although there are few in which it can more plainly be made out. The legislators who have patronized receptacles of prostitution ought to have foreseen this effect, as well as considered, that whatever facilitates fornication, diminishes marriages. And as to the usual apology for this relaxed discipline, the danger of greater enormities if access to prostitutes were too strictly watched and prohibited; it will be time enough to look to that, after the laws and the magistrates have done their utmost. The greatest vigilance of both will do no more, than oppose some bounds and some difficulties to this intercourse. And after all, these pretended fears are without foundation in experience. The men are in all respects the most virtuous in countries where the women are most chaste.

"If fornication be criminal, all those incentives which lead to it are accessaries to the crime; as lascivious conversation, whether expressed in obscene or disguised under modest phrases; also wanton songs, pictures, books; the writing, publishing, and circulating of which, whether out of frolic or for some pitiful profit, is productive of so extensive a mischief from so mean a temptation, that few crimes within the reach of private wickedness have more to answer for, or less to plead in their excuse.

"Indecent conversation, and by parity of reason all the rest, are forbidden by St Paul, Eph. iv. 29. 'Let no corrupt communication proceed out of your mouth;' and again, Col. iii. 8. 'Put filthy communication out of your mouth.'

"The invitation or voluntary admission of impure thoughts, or the suffering them to get possession of the imagination, falls within the same description, and is condemned by Christ, Matt. v. 28. 'Whosoever looketh on a woman to lust after her, hath committed adultery with her already in his heart.' Christ, by thus enjoining a regulation of the thought, strikes at the root of the evil."

FORNIX, in anatomy, is part of the corpus callosum in the brain; so called, because of a distant resemblance it hath to the arches of ancient vaults when viewed in a particular manner.

FORRAGE, in the military art, denotes hay, oats, barley, wheat, grass, clover, &c. brought into the camp by the troopers, for the sustenance of their horses.

It is the business of the quarter-master general to appoint the method of forrage, and post proper guards for the security of the foragers.

FORRES, a parliament town of Scotland in the county of Murray, classing with Inverness, Fortrose, and Nairn. It is a small well-built town, pleasantly situated on an eminence near the river Findhorn. The country about it has a cheerful appearance, having a few gentlemens seats, with some plantations about them. On a hill west of the town are the remains of a castle; and a melancholy view of a number of sand-hills, that now cover that tract of land which was formerly the estate of a Mr Cowben in the parish of Dyke. This inundation was occasioned by the influx of the sea and the violence of the wind. It had been the custom to pull up the bent, a long spiry grass near the shore, for litter for horses, by which means the sand was loosened, and gave way to the violence of the sea and wind, which carried it over several thousand acres of land. The people having been prevented from pulling up any more of the grass, the progress of the sand is now nearly stopped, and the sea has retired; but the wind has blown some of the sand from the hills over Colonel Grant's land, and destroyed near 100 acres. A sand-bank, which is all dry at low-water, runs out from this place for several miles into the Murray-Firth. Some of the land, which has been long forsaken by the water, is now beginning to be useful again, and is turned into grazing land. At Forres, coarse linen and sewing thread are made. About a mile from the town, on the left-hand side of the road, is a remarkable obelisk, said to be the most stately monument of the Gothic kind to be seen in Europe. It has been the subject of many able pens; but totally overlooked by Dr Johnson, who says, "At Forres we found good accommodation, but nothing worthy of particular remark."—It is thus described by Mr Cordiner, in a letter to Mr Pennant: "In the first division, underneath the Gothic ornaments at the top, are nine horses with their riders, marching forth in order: in the next is a line of warriors on foot, brandishing their weapons, and appear to be shouting for the battle. The import of the attitudes in the third division is very dubious, their expression indefinite. The figures which form a square in the middle of the column are pretty complex but distinct; four serjeants with their halberts guard a company, under which are placed several human heads, which have belonged to the dead bodies piled up at the left of the division: one appears in the character of executioner severing the head from another body; behind him are three trumpeters sounding their trumpets, and before him two pair of combatants fighting with sword and target. A troop of horse next appears, put to flight by infantry, whose first line have bows and arrows; the three following, swords and targets. In the lowermost division now visible, the horses seem to be seized by the victorious party, their riders beheaded, and the head of their chief hung in chains or placed in a frame; the others being thrown together beside the dead bodies under an arched cover. The greatest part of the other side of the obelisk, occupied by a sumptuous cross, is covered over with an uniform figure, elaborately raised, and interwoven with great mathematical exactness. Under the cross are two august personages, with some attendants, much obliterated, but evidently in an attitude of reconciliation; and if the monument was erected in memory of the peace concluded between Malcolm and Canute, upon the final retreat of the Danes, these large figures may represent the reconciled monarchs. On the edge below the fretwork are some rows of figures joined hand-in-hand, which may also imply the new degree of confidence and security which took place, after the feuds were composed, which are characterized on the front of the pillar. But to whatever particular transaction it may allude, it can hardly be imagined, that in so early an age of the arts in Scotland as it must have been raised, so elaborate a performance would have been undertaken but in consequence of an event

Forres.

Forſkohlea of the moſt general importance; it is therefore ſurpriſing, that no diſtinct traditions of it arrived at the era when letters were known. The height of this monument (called *King Sueno's ſtone*) above the ground is 23 feet; beſides 12 or 15 feet under ground. Its breadth is 3 feet 10 inches by 1 foot 3 inches in thickneſs."

Vitrified Forts.

FORSKOHLEA, in botany: A genus of the pentagynia order, belonging to the decandria claſs of plants. The calyx is pentaphyllous, and longer than the corolla. There are ten petals ſpatulated, *i. e.* roundiſh before, with a linear baſe.

FORSTERA, in botany: A genus of the triandria order, belonging to the gynandria claſs of plants. The perianthium is double; the exterior one beneath three-leaved; the interior one above, and ſix-cleft; the corolla tubular.

FORT, in the military art, a ſmall fortified place, environed on all ſides with a moat, rampart, and parapet. Its uſe is to ſecure ſome high ground, or the paſſage of a river, to make good an advantageous poſt, to defend the lines and quarters of a ſiege, &c.

Forts are made of different figures and extents, according as the ground requires. Some are fortified with baſtions, others with demi-baſtions. Some again are in form of a ſquare, others of a pentagon. A fort differs from a citadel, as this laſt is built to command ſome town.

Vitrified Forts, a very ſingular kind of ſtructures found in the highlands and northern parts of Scotland, in which the walls have the appearance of being melted into a ſolid maſs, ſo as to reſemble the lava of a volcano, for which indeed they have been taken by ſeveral perſons who have viſited them.

Theſe walls were taken notice of by Mr Williams an engineer, who wrote a treatiſe upon the ſubject, and was the firſt who ſuppoſed them to be the works of art; other naturaliſts having attributed them to a volcanic origin. Theſe works are commonly ſituated on the tops of ſmall hills, commanding an extenſive view of the adjacent valley or low country. The area on the ſummit, varying, as is ſuppoſed, according to the number of cattle the proprietor had to protect, or the dependents he was obliged to accommodate, is ſurrounded with an high and ſtrong wall, of which the ſtones are melted, moſt of them entirely; while others, in which the fuſion has not been ſo complete, are ſunk in the vitrified matter in ſuch a manner as to be quite incloſed with it; and in ſome places the fuſion has been ſo perfect, that the ruins appear like maſſes of coarſe glaſs. Mr Williams has not only abſolutely determined the walls in queſtion to be the works of art, but has even hazarded a conjecture as to the manner in which they were conſtructed, and which, according to him, was as follows. Two parallel dikes of earth or ſod being raiſed, in the direction of the intended wall, with a ſpace between them ſufficient for its thickneſs, the fuel was put in, and ſet on fire. The ſtones beſt adapted for the purpoſe, called the *plum-pudding ſtone*, are every where to be found in the neighbourhood. Theſe were laid on the fuel, and when melted, were kept by the frame of earth from running off; and by repeating the operation, the wall was raiſed to a ſufficient height. This opinion of the ſtones being thrown in without any order, is thought to be confirmed by the circumſtance of there not being any where a large one to be ſeen, nor a ſtone laid in any particular direction, nor one piece which has not in ſome degree been affected by the fire. Mr Williams mentions a fact tending to confirm his hypotheſis, viz. of a brick kiln ſituated on the declivity of an eminence, ſo as to be expoſed to the wind, which happening to riſe briſkly one time when the kiln was burning, ſo increaſed the heat, that the bricks were melted, and ran, like a lava, for a conſiderable way down the hill.

The opinion of Mr Williams has been embraced by ſeveral other authors; particularly Mr Freebairn and Dr Anderſon, the latter having publiſhed two treatiſes upon theſe buildings in the Archæologia. In the ſame work, however, we meet with a paper by the Hon. Daines Barrington, in which the author expreſſes quite different ſentiments. He obſerves, that Mr Williams, and the other antiquaries, who ſuppoſe the walls in queſtion to be the works of art, imagine that the reaſon of their being conſtructed in this manner was the ignorance of cement, which in theſe remote ages prevailed in Scotland: but with reſpect to this circumſtance, he ſays, that if one ſide of the wall only was heated, and that to any conſiderable height, the matter in fuſion would in all likelihood drop down to the bottom, without operating as any cement to the looſe ſtones thrown in amongſt it. This circumſtance of the walls being vitrified only on one ſide, is indeed remarkable, and takes place in moſt of the forts of this kind to be met with at preſent: but with regard to it, Mr Barrington obſerves, that he himſelf has been twice in the Highlands of Scotland, and has found very few hills of any height which were cloathed with wood; the trouble therefore of carrying it up to the top of ſuch a mountain would be very conſiderable. But to this it might eaſily be replied, that we cannot by any means argue from the preſent ſtate of the hills in the Highlands to their ſtate in a very remote period of antiquity. At that time, it is neither impoſſible nor in the leaſt improbable, that moſt of the hills in Scotland were overgrown with wood; or at any rate, there undoubtedly was plenty of peat, which is ſtill uſed as fuel in Scotland, and which affords ſuch a ſtrong heat as to be advantageouſly employed in ſmelting iron*, as we are informed by M. Magellan. A third particular mentioned by Mr Williams is, that theſe incloſures were intended as places of defence; and in ſupport of this opinion alleges, that there are dried wells found within moſt of them. But on this Mr Barrington obſerves, that ſhelter from the weather was alſo neceſſary "upon the top of a bleak Scotch hill, whilſt whiſky (or a ſuccedaneum for it) would be often in greater requeſt than the bare element of water." This objection, however, as well as the laſt, is evidently very frivolous; for theſe buildings might have roofs as well as any other; and whatever neceſſity there might be for whiſky occaſionally, water was certainly an indiſpenſable requiſite.

* See the article *Iron*.

Mr Barrington having thus given his reaſons for diſſenting from the opinion of Mr Williams and the antiquaries juſt mentioned, proceeds to ſtate his own. He tells us, that having travelled for 21 years the moſt mountainous circuit in Wales, he has frequently obſerved incloſures of dry ſtones, particu-

ified rts.

larly a long tract in the western part of Merionethshire, called in the language of the country *Dussryn*, i. e. *the vale*. On first viewing these small inclosures made with walls of thick stones, he was at a loss to imagine how it could be worth while to construct such strong fences for so inconsiderable a piece of ground as they inclosed: but, on examining the adjacent country, he found it almost entirely covered with stones of a similar kind; and, of consequence, the smaller the space to be cleared, the less expensive would be the removal. "For the same reason (says he), such dry walls are often of a great thickness, and sometimes the corners of the inclosures are filled with stones to a great width, this being the only possible means of procuring pasture." To a practice of the same kind our author would ascribe the origin of the works in question: but the objection occurs very strongly, that the walls in Scotland are vitrified, and it is not to be supposed that such trouble would be taken with fences made in such a fortuitous manner. This objection, our author owns, would indeed be unanswerable, on the supposition that the vitrification was made on purpose to strengthen the walls of the fortress; "but (says he) may not the vitrification have been occasioned by volcanoes, or by what are called *bloomeries*? The same effect may be produced likewise on dry walls of stone by lightning passing along them. The loose stones in either case would not be rejected because they were glassy, and would be piled up in the fence of the inclosure; as the great point upon these occasions is to clear the ground, and remove the incumbering stones to the smallest distance. One of the advocates for the designed and not fortuitous vitrification, says, that the pieces he had procured did not resemble what is called *lava*. But every volcano is not necessarily an Etna or a Vesuvius; and consequently the matter disgorged from the crater must perpetually vary both in substance and form. Vitrified masses, larger or smaller, will likewise be produced by the same means. It may be contended indeed, that pasture thus procured, by clearing the ground, would be more convenient at the bottom or on the sides, than on the top of the hill: but to this I answer, that in rocky countries you must get what pittance you can of soil, and often it will happen that the only detached and removeable stones are on the summit. When such inclosures have been made, they became very convenient for putting cattle into; and hence perhaps some of the wells which Mr Williams hath mentioned."

Our author concludes his dissertation on this subject by observing, that if vitrification answered the purpose of cement, it is very extraordinary that the ancient inhabitants of Scotland did not apply it to the houses or huts in which they constantly lived, but reserved this troublesome and expensive process merely for a fortification, which might not perhaps be used in half a century against an enemy. On this it is almost superfluous to observe, that in the ages of barbarity and bloodshed, in which these inclosures, whether natural or artificial, were supposed to be used as fortresses, war was so frequent, that a defence against an enemy might seem to be necessary every day, instead of once in half a century. Before we proceed further in the argument, however, it will be necessary to give some account of the situation and appearance of these fortresses. Vitrified Forts.

According to Mr Cardonnel, the largest of them is situated on the hill of Knockfarril, to the south of the valley of Strathpesser, two miles west from Dingwall in Rossshire. The inclosure is 120 feet long and 40 broad within the walls; strengthened on the outside with works at each end. A range of habitations seem to have been erected against, or under, the shade of the outward wall; of which those on the south-side seem to have been higher and larger than those on the north. There are two wells in the middle, which, on being cleared out, filled with water. On the skirts of the hill to the south are many detached buildings; which, from the stratum of dung found on removing the ruins, appear plainly to have been used for securing the cattle. This place seems to have been anciently of consequence, and the residence of some powerful chief, from a road which leads through the hills to the north-west sea. To the east of the works are a number of vitrified ruins, extending for a considerable way along the ridge of the hill. The end next the fort seems to have joined the outer wall, and consisted either of two parallel walls, closed above, with a passage between them under cover, or a high wall broad enough to walk on. In this wall there is the vestige of a break about the middle, over which a bridge has been laid, to be drawn up or removed as occasion might require.

The fort next in consequence to that of Knockfarril is situated on the hill of Craig-Phadrick near Inverness, "which (says Mr Cardonnel) has this peculiar circumstance, that there appears to have been two vitrified walls quite round the area. The inner one seems to have been very high and strong; the outer wall but low: probably the space between was intended for securing their cattle, as there are no remains of dry-stone buildings, such as are found near the rest. Several parts of this outer wall appear quite entire, sticking to the firm bare rock, where it was first run. The area within the inner wall is near 80 paces long, and 27 broad." Of this we have an account† by Alexander Fraser-Tytler, Esq; professor of civil history in the university of Edinburgh, who visited it in the year 1782. The hill itself is a small conical eminence, forming the eastern extremity of that ridge of mountains which bounds Loch-Ness on the north-west side. It is situated about a mile to the north of Inverness, and is accessible on two different quarters, viz. the west and south-east; the former affording entrance by a narrow level ridge joining the hills on Loch-Ness, and the latter by an easy ascent from the high ground above Inverness. On approaching the hill from the west, we first meet with a road cut through the rock from the bottom to the top, in most places 10 feet broad and nearly as deep; winding, for about 70 feet, with an easy serpentine direction, by which we gain an ascent over a steep rock otherwise quite inaccessible from that quarter. This road, in our author's opinion, is undoubtedly the work of art, and the vitrified matter on the top is the only thing which indicates the effect of fire; there being neither an appearance of pumice stone, lava, nor basaltes about the hill otherwise. There is indeed plenty of plum-pudding stone; which

† *Edin. Phil. Transact.* Vol. II. class ii. art. II.

Vitrified Forts.

which ſome have ſuppoſed to be of the nature of volcanic tuſa: but this opinion is rejected by our author as erroneous. "But the circumſtance (ſays he) which in my apprehenſion evinces, in the moſt ſatisfactory manner, that theſe appearances of the effect of fire on the ſummit of this hill are not the operation of nature but of art, is the regular order and diſpoſition of thoſe materials, the form of the ground, and the various traces of ſkill and contrivance which are yet diſcernible, though conſiderably defaced either by external violence or the obliterating hand of time." To inveſtigate this matter regularly, he begins with the winding road already mentioned, and which is evidently cut through the rock for the purpoſe of gaining an eaſy aſcent from the level ridge to the ſummit, which would otherwiſe have been impracticable. In aſcending by this road, there appears, towards the middle, on the right hand, a ſmall platform overhanging the paſſage, and inclining by a very gentle declivity to the very edge of the rock. Four enormous ſtones are placed upon the platform, and on the edge and extremity of it, which have evidently been guided by art into that poſition; it being impoſſible that they could have reſted there, had they been rolled down from the higher parts. The obvious reaſon for placing them in ſuch a poſition has been, that on an alarm of danger they might be projected into the path below, which could be done by the efforts of a very few men; and when this was done, the paſſage would be entirely obſtructed, or at leaſt rendered ſo difficult that it could be defended by a few againſt any number of aſſailants. Some other large ſtones are placed on an eminence to the left, probably with a view to block up an hollow channel, by which an enemy might have attempted to aſcend. When we come to the top of the hill, a few feet below the rampart which crowns the whole, there appears an outward wall, approaching on the ſides of the hill ſo near the upper rampart, as to have only a trench of 10 or 12 feet wide between them. This outward wall is in ſome places ſo low as to be almoſt level with the rock, though in other places it riſes to the height of two or three feet; but even where loweſt, it may be traced by a line of vitrified matter ſticking faſt to the rock all along, and nearly of the ſame breadth, which is about nine feet. The remains of this wall are ſtrongly vitrified, except in one place on the north ſide, where, for about 70 yards, the rampart is formed only of dry ſtones and earth. At the eaſt ſide, where the hill is more acceſſible, there is a prodigious mound of vitrified matter, extending itſelf to the thickneſs of above 40 feet. At the ſouth-eaſt corner, and adjoining to this immenſe mound, is an outwork, conſiſting of two ſemicircular vitrified walls, with a narrow paſs cut through them in the middle: which appears to have been another, and perhaps the principal, entry to the fort.

The inner wall, ſurrounding the ſummit of the hill, incloſes an oblong level area of about 75 yards long and 30 broad, rounded at each of the ends like the outward wall. It is of conſiderable height, and nearly of the ſame thickneſs with the outward one.—It has ſome appearance of having been defended with four turrets or baſtions: but the traces are ſo imperfect, that Mr Tytler does not lay much ſtreſs on his obſervations in this reſpect; a number of ſmall tumuli of earth, with a ſtone in the centre, were more diſcernible. On the eaſt-ſide a portion of the internal ſpace appears ſeparated from the reſt by two ranges of ſtones fixed ſtrongly in the earth, and forming a right-angled parallelogram. "This ſeparation (ſays our author) is immediately diſcernible by the eye, from this circumſtance, that the whole of the incloſed ſummit has been moſt careſully cleared from ſtones, of which there is not one to be ſeen, unleſs thoſe that form this diviſion, and the ſingle one in the middle of the circle of tumuli above mentioned. What has been the deſign of this ſeparated ſpace, it is difficult to conjecture. It might perhaps have marked the reſidence of thoſe of a higher rank, or ſerved as a temple for the purpoſes of devotion." On the eaſt end of the large area on the ſummit is a well of about ſix feet in diameter, which has probably been ſunk very deep in the rock, though now it is filled up with rubbiſh to within a yard of the top.

Vitrified Forts.

The other fortified hills mentioned by Mr Cardonnel are thoſe of Dun-Evan in the ſhire of Nairn; Tordun caſtle, near Fort Auguſtus; and another on the weſt ſide of Gleneves in Lochaber, three miles to the ſouth of Fort William. The Caſtle-hill of Finhaven, in the county of Angus, has likewiſe ſome conſiderable ruins of the ſame kind.

Dun-Evan and the hill of Finhaven have likewiſe been viſited by Mr Tytler, who gives an account of them in the paper already quoted; of which the following is an abſtract. "On the ſummit of the hill of Dun-Evan, whoſe name implies that it had been originally a place of defence, are the remains of two walls ſurrounding an oblong ſpace like that of Craig-Phadrick already deſcribed, but ſomewhat ſmaller in ſize. [Mr Cardonnel ſays that it is about 70 paces long and 30 broad]. There are likewiſe the traces of a well in the incloſed area; and at the eaſt end are the remains of a prodigious maſs of building, much more extenſive than that on Craig-Phadrick." Here, however, our author could not perceive any marks of fire; and Mr Williams owns that the vitrified ruins here are more waſted than on Knockfarril or Craig-Phadrick. But with regard to the vitrifications here, our author is inclined to ſuppoſe Mr Williams to have been entirely in a miſtake. On the Caſtle-hill of Finhaven, however, the vitrified remains are very viſible all round the ſummit, which is cleared of ſtones and levelled, unleſs at one end, where there is a great hollow ſpace ſeparated from the reſt of the area, and probably deſtined exclusively for the keeping of cattle. The incloſed area is about 140 yards long and upwards of 40 broad.

Beſides theſe fortifications, the hill of Noth affords a remarkable appearance of the ſame kind: of which Mr Cordiner gives the following deſcription, not from his own obſervation, but thoſe of a gentleman of credit who viſited the place. "On the top of the hill there is an oblong hollow, as I could gueſs, of about an Engliſh acre, covered with a fine ſward of graſs: in the middle toward the eaſt end of this hollow is a large and deep well. The hollow is ſurrounded on all ſides with a thick rampart of ſtones. On three ſides of this rampart, from 8 to 12 feet thick, is one compact body of ſtones and minerals which have been in a ſtate of fuſion, reſembling a mixture of ſtone and

trified orts.

iron-ore, all vitrified, calcined, and incorporated. On the north side, the rampart consists of broken pieces of rock, which have the appearance of having been torn to pieces by some extraordinary violence. If the calcined compact wall exists under them, it is not at present visible."

Such are the descriptions of the most remarkable of these curious fortifications, which of late seem to have engaged the attention of the learned in a considerable degree. We have already taken notice, that by some they are supposed to be the works of art, by others the productions of a volcano. Mr Cardonnel adopts the opinion of Mr Williams as the most probable, both with respect to their use and manner of construction. Mr Tytler takes notice of the remarkable difference of opinion among those who have viewed the places in question. "It is curious to remark (says he) how the same appearances, to different observers, lead to the most opposite opinions and conclusions. The two gentlemen above-mentioned (Mr Williams and Dr Anderson), seem not to have entertained the smallest doubt, that the vitrified materials on the tops of these hills were the vestiges of works of art, and the remains of structures reared for the purposes of security and defence. The bishop of Derry, when on a tour to the north of Scotland, visited the hill of Craig-Phadrick near Inverness, and expressed his opinion, that the mounds of vitrified matter were not the remains of any artificial work, but the traces of an ancient volcano. In the Phil. Trans. of the Royal Society of London for 1777, Part II. n° 20. is an account of *Creek Fatcrick*, there termed *a Volcanic hill near Inverness*, in a letter from Thomas West, Esq; to Mr Law, F. R. S. in which the writer does not hesitate to pronounce this hill an extinguished volcano: and having sent specimens of the burnt matter for the inspection of the Royal Society, the secretary subjoins a note to the paper, intimating, that these specimens having been examined by some of the members well acquainted with volcanic productions, were by them judged to be real lava. Such was likewise the opinion of the late Andrew Crosbie, Esq; who, in an account which he gave to the Philosophical Society of Edinburgh in 1780, offered some very curious conjectures with regard to the process of nature, by which he supposed the whole of this hill to have been thrown up from the bottom of the sea by the operation of intestine fire.

Mr Tytler agrees with these who think the vitrified structures to be artificial works; but he differs from Mr Williams and others, who think that they were vitrified on purpose for cementing the materials together. His reason for this is, that the number of forts that show marks of vitrification is inconsiderable when compared with those that do not. He therefore considers the vitrification as accidental; and that it must have been accomplished in the following manner. In the rude state in which we must suppose Scotland to have been in early times, it is very probable that their buildings, both for habitation and defence, would be frequently constructed of loose stones of an irregular shape; of which, by themselves, it would scarce be possible to fabricate a wall of any tolerable strength. Hence it became necessary to use wood as well as stone in their construction. This kind of building then, in our author's opinion, was begun by raising a double row of palisades or strong stakes in the form of the intended structure, in the same way as in that ancient mode of building described by Palladio under the name of *riempiuta a cassa*, or coffer-work. These stakes were probably warped across by boughs of trees laid very closely together, so as to form two fences running parallel to each other at the distance of some feet, and so close as to confine all the materials of whatever size that were thrown in between them. Into this intermediate space Mr Tytler supposes were thrown boughs and trunks of trees, earth and stones of all sizes, large or small as they could quarry or collect them. Very little care would be necessary in the disposition of these materials, as the outward fence would keep the mound in form. In this way it is easy to conceive that a very strong bulwark might be reared with great dispatch; which, joined to the natural advantage of a very inaccessible situation, and that improved by artful contrivances for increasing the difficulty of access, would form a structure capable of answering every purpose of security or defence. The most formidable attack against such a building would be fire, which would no doubt be always attempted, and often with success, by an enemy who undertook the siege. If the besiegers prevailed in gaining an approach to the ramparts, and, surrounding the external wall, set fire to it in several places, the conflagration must speedily have become universal, and the effect may be easily imagined. If there happened to be any wind at the time to increase the heat, the stony parts could not fail to come into fusion; and as the wood burnt away, sinking by their own weight into a solid mass, there would remain a wreck of vitrified matter tracking the spot where the ancient rampart had stood; irregular, and of unequal height, from the fortuitous and unequal distribution of the stony materials of which it had been composed. This conjecture appears very probable from their appearance at this day. They do not seem to have ever been much higher than they are at present, as the fragments that have fallen from them, even where the wall is lowest, are very inconsiderable. The durable nature of the materials would prevent them from suffering any changes by time; though, from the gradual increase of the soil, they must in some places have lost considerably of their apparent height, and in others been quite covered. Mr Williams, in making a cut through the ramparts at Knockfarril, found in many places the vitrified matter covered with peat-moss half a foot thick.

Vitrified Forts.

In confirmation of this opinion, our author likewise urges, that in the fortification on Craig Phadrick, a large portion of the outward rampart bears no marks of vitrification. The reason of this seems to be, that the steepness of the hill on that side renders a low fence of stones and turf sufficient; and no wood had probably been employed in its construction. "It appears therefore highly probable (concludes our author), that the effect of fire upon these hill-fortifications has been entirely accidental; or, to speak more properly, that fire has been employed, not in the construction, but towards the demolition of such buildings: and for the latter purpose it would certainly prove much more efficacious than for the former. It is much to be doubted, whether it would be at all possible, even in the present

Vitrified Forts.

ſent day, by the utmoſt combination of labour and of ſkill, to ſurround a large ſpace of ground with a double rampart of ſtones compacted by fire, of ſuch height and ſolidity as to anſwer any purpoſe of ſecurity or defence againſt an enemy. Any ſtructure of this kind muſt have been irregular, low, fragile, eaſily ſcaled, and quite inſecure; a much weaker rampart, in ſhort, than a ſimple wall of turf or wooden palliſade. The veſtiges yet remaining, as I have already obſerved, give no room to ſuppoſe that the vitrified mound has ever been much more entire than it is at preſent. The effect of fire upon ſtructures reared in the manner I have ſuppoſed them to have been, will account moſt perfectly for their preſent appearance. It was from neceſſity that the builders of theſe fortifications betook themſelves to a mode of ſtructure ſo liable to be deſtroyed by fire. In thoſe parts where ſtones could be eaſily quarried, of ſuch ſize and form as to rear a rampart by themſelves of ſufficient ſtrength and ſolidity, there was no occaſion to employ wood or turf in its conſtruction; and it was therefore proof againſt all aſſaults by fire. Such are the ramparts which appear on the hill of Dun-Jardel, Dun-Evan, and many others, on which there is not the ſmalleſt appearance of vitrification. But on Craig Phadrick, and the other hills above deſcribed, where, from the nature of the rock, the ſtones could be procured only in irregular and generally ſmall fragments, it was neceſſary to employ ſome ſuch mode of conſtruction as I have ſuppoſed; and theſe ramparts, though ſolid and well calculated for defence againſt every attack by force or ſtratagem, were not proof againſt an aſſault by fire."

Mr Cordiner is of opinion, that the vitrifications in queſtion cannot have been the works of art, and ridicules the contrary hypotheſis; though without adducing any argument againſt it. The Hill of Noth is by him ſuppoſed to have been a volcano. He deſcribes it as "a moſt majeſtic mountain, in general brown, with moſs and heath, interſperſed with bare rock, in many places crumbling down. The higheſt part of it is a circular hill, whoſe verdure, as well as height, diſtinguiſhes it from the reſt of the mountain. This is called the *Top of Noth;* and bears the ſtrongeſt reſemblance to every deſcription of a volcanic mount. At the diſtance of many miles, one can diſtinguiſh thoſe ridges which are the boundaries of the crater, indicating the hollow in the top." The gentleman from whom Mr Cordiner received the account of the vitrifications on the ſummit, informs us, that on firſt ſeeing ſpecimens of them, he imagined that they had been pieces of ſtone calcined by the burning down of a caſtle; as he had found ſomething very like them on the caſtle-hill at Cullen, in parts where the ſward of graſs was broken: but on reaching the top, and viewing the appearances on it already deſcribed, he altered his opinion. "That men hardly beſet (ſays he) might climb up with ſome proviſions to this as a place of refuge, is probable: but that, on a barren mountain-top, far from cultivated ground, half a day's journey from the plain; that there, in any period of ſociety, man ſhould have been tempted to build that amazing rampart, is not to be imagined: they have found it a natural and extenſive fortreſs, and in critical circumſtances have made uſe of it accordingly. That it has been occupied as a place of ſtrength and of refuge, is very evident; for, ſome hundred yards down lower on the hill, there are the remains of another rampart or wall, conſiſting of looſe ſtones piled together without any cement, carried quite round the hill. This laſt has been built for an additional defence to thoſe who made their abode on the top. The top of Noth, for two-thirds downwards, is covered with a green ſward; below that, it is brown with heath: this is the very reverſe of the adjacent mountains; and the greater verdure of the upper part I imputed to a new ſoil created by the aſhes of the volcano. The opening, called a *well*, I ſuppoſe to have been the lateſt crater. About a mile ſouth, down towards the lower grounds of the *Cabrock*, there is a very pretty regular green hill, which I aſcribe to a later eruption than thoſe which may have formed the contiguous hills now covered with heath. There is an extraordinary luxuriant ſpring of water ruſhes out at once from the ſide of the hill of Noth; which is likewiſe ſome confirmation of the opinion that a volcano has ſome time exiſted there, which has occaſioned great hollows and reſervoirs of water in the heart of the mountain. And the wild irregularities of nature through all the Cabrock, the hideous and ſtrange projection of rocks from the ſides of the hills, would ſeem to indicate ſome vaſt convulſions which the earth muſt have ſuffered in theſe parts.

"The traces of ancient volcanoes (ſays Mr Cordiner) are far from being unfrequent in Scotland. The hill of Finhaven is one inſtance; and not only abundant in this ſpecies of lava, but with *tarras*, or the *pulvis puteolanus*, an *amalgama*, as Condamine calls it, of calcined ſtones mixed with ſcorias and iron-ruſt reduced to powder. The hill of Beregonium, near Dunſtaffage caſtle, is another, yielding vaſt quantities of pumices or ſcoria of different kinds; many of which are of the ſame ſpecies with thoſe of the volcanic Iceland. The noble aſſemblage of baſaltic columns at Staffa, thoſe in the Iſle of Sky, and the rock Humble, are but ſo many evidences of the ancient volcanoes of this country. And finally, the immenſe ſtratum of pumex vitreus or Iceland agate, on the hill of Dun-ſuin in Arran, is the laſt proof I ſhall bring in ſupport of the queſtion."

On this diſpute we can only obſerve, that whatever ſide we embrace, the difficulties ſeem to be very great, nay almoſt inſurmountable. When we conſider the great thickneſs of the walls on the top of Noth, from 8 to 12 feet, and the vaſt mound of vitrified matter, no leſs than 40 feet in breadth, mentioned by Mr Tytler, we can ſcarce conceive it poſſible that leſs than a volcanic fire could be able to form them. We may eaſily allow, that, in the way this gentleman mentions, there might be conſiderable vitrifications formed; but that ſuch immenſe maſſes ſhould be brought into perfect fuſion by the ſmall quantity of fuel which could be put round them in paliſades, or intermixed with the materials themſelves, will be incredible to every one acquainted with the extreme difficulty with which ſtones of any magnitude are brought into complete fuſion. We ſee even in the inſides of furnaces, though ſometimes built of no more unfuſible materials than common brick, no ſuch effects follow. There is a ſlight vitrification indeed, but it ſcarce ever penetrates to the depth of an inch or two, though very violent fires are kept

Vitrified Forts.

kept up for a much longer time than we could ſuppoſe the wood ſurrounding thoſe walls to require for its being conſumed. In conflagrations, where houſes are conſumed, which are the only ſimilar examples we have, no ſuch effect is perceived. Even in the great fire at London in 1666, where ſo many buildings were deſtroyed, we do not hear of their walls being vitrified, though the materials of many of them were undoubtedly as fuſible as the rocks and ſtones of Craig-Phadrick, or the Top of Noth. If, on the other hand, we reject this, and adhere to the volcanic hypotheſis, our difficulties are equally great. For where ſhall we find in any other part of the world an example of volcanoes ejecting lava in the form of walls incloſing a regular area? This would be attributing ſuch a ſingularity to the volcanoes of Scotland as the moſt extravagant imagination cannot admit. We muſt therefore conclude, that though theſe ruins are certainly the works of art, we have not yet ſufficient data to decide the queſtion with reſpect to their conſtruction, but that the ſubject requires a farther inveſtigation.

In the paper already quoted, Mr Tytler obſerves, that "theſe ancient fortifications preſent a more curious and intereſting object of ſpeculation, than thoſe uncertain and indeed fruitleſs conjectures as to the mode in which they have been reared." This, he juſtly obſerves, muſt have been before the uſe of mortar was known; for as the country abounded in limeſtone, and the builders certainly would exert all their powers in giving them a proper degree of ſtrength, it would undoubtedly have been uſed. Hence we are led to aſcribe to theſe a very conſiderable degree of antiquity; for as the Britons were taught the uſe of mortar by the Romans, it is probable that we muſt date the origin of the ſtructures in queſtion before the time of the invaſion of that people, or at leaſt ſoon after it: ſo that we muſt look upon them to be more than 1650 years old; but how far beyond that period we are to ſearch for their origin, does not appear. "All that we can conclude with certainty (ſays our author) is, that they belong to a period of extreme barbariſm. They muſt have been conſtructed by a people ſcarcely removed from the ſtate of ſavages, who lived under no impreſſion of fixed or regulated property in land; whoſe only appropriated goods were their cattle; and whoſe ſole ſecurity, in a life of conſtant depredation, was the retreat to the ſummits of thoſe hills of difficult acceſs, which they had fortified in the beſt manner they could. As the ſpace incloſed was incapable of containing a great number of men, eſpecially if occupied in part by cattle, it is preſumable, that theſe retreats were formed chiefly for the ſecurity of the women and children of the canton and of their herds. They could be defended by a few men, while the reſt of the tribe were engaged with their enemies in the field."

Our author concludes his diſſertation with a conjecture, which indeed ſeems well ſupported, that the forts in queſtion were conſtructed, not only before the Roman invaſion, but before the introduction of the rites of the Druids into Britain; as "there appears no probability that the inhabitants either lived under ſuch a government as we know to have prevailed under the influence of the Druids, or had any acquaintance with thoſe arts which it is certain they cultivated."

FORTALICE, in Scots law, ſignified anciently a ſmall place of ſtrength, originally built for the defence of the country; and which on that account was formerly reckoned *inter regalia*, and did not go along with the lands upon which it was ſituated without a ſpecial grant from the crown. Now, fortalices are carried by a general grant of the lands; and the word is become ſynonymous with manor-place, meſſuage, &c. Fortalice Forth.

FORTESCUE (Sir John), lord chief juſtice of the king's bench, and lord high chancellor of England, in the reign of king Henry VI. was deſcended from the ancient family of Forteſcue, in the county of Devon. He ſtudied the municipal laws of England in Lincoln's Inn, of which he was made one of the governors in the fourth and ſeventh years of the reign of king Henry VI. In 1430 he was called to the degree of a ſerjeant at law, and in 1441 was conſtituted the king's ſerjeant. The following year he was made lord chief juſtice of the king's bench; in which honourable ſtation he continued till near the end of that king's reign, who ſhowed him many particular marks of his favour, and advanced him to the poſt of lord high chancellor of England. During the reign of king Edward IV. he followed the fortunes of the houſe of Lancaſter, and was many years in exile with queen Margaret and prince Edward her ſon. At length, they having a proſpect of retrieving their deſperate fortunes, the queen and prince returned to England, and Sir John Forteſcue, with many others, accompanied them: but ſoon after the deciſive battle of Tewkſbury, he was thrown into priſon and attainted, with other Lancaſtrians; but found means to procure his pardon from Edward IV. He wrote, 1. A learned commentary on the politic laws of England, for the uſe of prince Edward; to one edition of which Mr Selden wrote notes. 2. The difference between an abſolute and limited monarchy, as it more particularly regards the Engliſh conſtitution (which was publiſhed, with ſome remarks, by John Forteſcue, afterwards lord Forteſcue, in 8vo, in 1714; and a ſecond edition was publiſhed, with amendments, in 1719): And ſeveral works, which ſtill remain in manuſcript. He died near 90 years of age; and was buried in the pariſh church of Ebburton, where a monument was erected to his memory, in 1677, by one of his deſcendants.

FORTH, one of the moſt noble and commodious rivers in Scotland. It takes its riſe near the bottom of Lomond hills; and running from weſt to eaſt, receives in its paſſage many conſiderable ſtreams, deriving their waters from the eminences in the midland counties of North Britain. Between Stirling and Alloa, the Forth winds in a moſt beautiful and ſurpriſing manner; ſo that, though it is but four miles by land, it is 24 by water between thoſe two places. Below Alloa the river expands itſelf to a great breadth between the counties of Lothian and Fife, till at Queen's-ferry it is contracted by promontories ſhooting into it from both coaſts; ſo that, from being four or five there it is not above two miles broad. In the middle of the channel lies a ſmall iſland called *Inchgarvy*, which has a ſpring of freſh water: upon the iſland there is an ancient fort, which has been lately repaired; and if there were either forts or blockhouſes on the oppoſite promontories, that part of the river which lies between Alloa and Queens-ferry would be as ſecure and conve-

Forth.

nient a harbour as could be desired. A little below this, near the north shore, lies Inchcomb, on which are the remains of an ancient monastery of considerable extent; and opposite to Leith stands the island of Inchkeith, formerly fortified, but now in ruins. Below Queens-ferry the north and south shores receding, the body of the water gradually enlarges till it becomes two or three leagues broad, affording several safe harbours on both sides, and excellent roads throughout, unembarrassed with latent rocks, shoals, or sands; and allowing secure anchorage to the largest ships within a league of the coast in almost any part of the Frith, and to vessels of a smaller size within a mile or less. The Firth, or (as it is commonly written) the *Frith*, of Forth, is, at the mouth of it, from North Berwick to Fifeness, full five leagues broad; having the little island of May (on which there is a light-house, and there might also be a fort) in the middle of it, and to the west of this the rocky island of Bass; notwithstanding which, the largest fleet may enter and sail up it many miles with the utmost facility and in the greatest safety. In 1781, Admiral Parker's fleet lay some weeks opposite to Edinburgh, accompanied by 500 sail of merchantmen, the whole in full view of the city and castle.

The Forth was known to the ancients by the name of *Bodotria*, or (as Ptolemy calls it) *Boderia*, and has been ever famous for the number of its havens: some of which are, indeed, in their present condition, scarce worthy of that name. It is navigable for merchantmen as high as Alloa, 50 miles from the sea; and for coasters as far as Stirling, 24 miles further by water, though only four by land in a direct line, as already observed. The tide flows only a full mile above Stirling to a place called *Craigforth*, where the proprietor intercepts the passage of the salmon by a cruive or weir, very injurious to the large tract of country, which stretches as far as Lomond westward. The river from Stirling to the bridge of Aberfoil, at the entrance into the West Highlands, is only passable for man or horse at few places, and these in dry seasons. It glides gently through a dead flat, from Gartmore eastward; "and on these accounts (says Mr Knox*) it might be made navigable for barges, at a trifling expence to the proprietors of the lands, an improvement much wanted in a rich, extensive, and populous valley, without market towns, coal and lime. Supposing this work to be executed, of which there is some probability, the whole extent of navigation on the Forth, will, including all its windings, exceed 200 miles, through a coast of nearly 100 miles; fertile, populous, industrious; and from Stirling eastward, almost lined with towns, anciently the seats of commerce and navigation, till they were ruined by the English depredations; in which miserable state some of them still remain, while others begin to resume the appearance of business. The principal object of these towns was the fisheries, which they prosecuted with great vigour as far as Iceland, till the time of the Union, from which period the eastern fisheries gradually dwindled away; and the poor fishermen, unable to subsist themselves upon air and water, took up the trade of smuggling; but so soon as the fishery laws shall be amended, the salt duties abolished, and an adequate bounty extended to boats as well as busses, these people will readily fall into the track of their ancestors, live by honest industry, and add new vigour to our naval strength. Many of the ports are nearly choaked up, others want repairs, which neither the individuals nor the corporations of those decayed places can accomplish. Though the harbours on the Forth are in general small, the depth of water might be made sufficient for vessels of 200 tons burden, which fully answers the purposes of their coasting and Baltic trade; but to obtain this, or even a less depth of water, an aid of 50,000 l. would be requisite."

Forth.

By this river and the Clyde, Scotland is almost divided into two parts. The Forth falls into the east sea below Edinburgh, and has an easy communication with the whole eastern coast of Great Britain; with France, Ostend, Holland, Hamburgh, Prussia, Dantzic, Russia, Sweden, Denmark, Norway, and Greenland. The Clyde falls into the Atlantic ocean below Glasgow, and communicates with the western coast of Great Britain; with Ireland, the south of France, Portugal, Spain, the Mediterranean, America, and the West Indies. These two rivers, thus falling in opposite directions into the two seas which environ our island, and the neck of land between them amounting scarcely to 24 miles, gave rise to the idea of a junction, so as to open a communication across the kingdom, and thereby cut off the long dangerous navigation by the Land's End and the Pentland Frith: an object of vast utility, and which has lately been happily accomplished. See the article CANAL.

* *View of the British Empire*, vol. ii. p. 518.

FORTIFICATION;

THE art of fortifying a town, or other place; or of putting them in such a posture of defence, that every one of its parts defends, and is defended by, some other parts, by means of ramparts, parapets, moats, and other bulwarks; to the end that a small number of men within may be able to defend themselves for a considerable time against the assaults of a numerous army without, so that the enemy in attacking them must of necessity suffer great loss.

The origin and rise of fortification is undoubtedly owing to the degeneracy of mankind. In the first ages of the world, men were dispersed up and down the countries in separate families, as we are told in the histories of the Jews and Scythians, who wandered from one place to another, for the sake of finding pasture for their cattle. These families became in time so numerous as to form large communities, which settled all together in a place; from whence villages and towns had their origin and rise: but they found it was necessary, for the common security, to surround those towns with walls and ditches, to prevent all violences *from their neighbours, and sudden surprises*. This was sufficient for some time, till offensive weapons were invented, and conquering became a fashion. Then walls

with

with loop-holes were made at proper diſtances, in order to ſcreen the defenders againſt the arrows of the aſſailants: but finding that, as ſoon as the enemy got once cloſe to the walls, they could from no part be diſcovered or repulſed; for this reaſon they added ſquare towers at proper diſtances from each other, ſo that every part of the wall might be defended by the adjacent ſides of the towers. However, this manner of incloſing of towns was found to be imperfect, becauſe there remained ſtill one of the faces of the towers which fronted the field that could not be ſeen from any other part, and therefore could not be defended. To remedy this, they made the towers round inſtead of ſquare, imagining this figure to be the ſtrongeſt to reſiſt the battering engines, as likewiſe to be better defended from the other parts of the wall.

Notwithſtanding the ſuperiority of this method above the former, there remained yet a part of theſe towers unſeen and incapable of being defended; which made them change the figure of the towers again; that is, they made them ſquare as before; but, inſtead of preſenting a face to the field as formerly, they preſented an angle; by this means they effectually found out ſuch a diſpoſition of their works, that no part could be attacked without being ſeen or defended by ſome other part.

This laſt method was in uſe a long while; and would in all probability have continued to this day, if gunpowder had not been found out: but the violence of the guns and mortars ſoon convinced the world, that ſuch towers and walls were but a weak defence againſt theſe thundering engines; and beſides, as the nature of the attack was entirely changed, it was alſo neceſſary to change that of fortifying likewiſe.

From that time ramparts were added to the walls, the towers enlarged into baſtions, and all ſorts of outworks have been added, ſuch as ravelins, counterguards, horn and crown works, and others of the like nature, in order to render the defence in ſome meaſure equivalent to the attack.

Notwithſtanding all the improvements which have been made in the art of fortifying ſince the invention of gun-powder, that of attacking is ſtill ſuperior to it: engineers have tried in vain to render the advantages of a fortification equal to thoſe of the attack; the ſuperiority of the beſiegers fire, together with the greater number of men, obliges generally, ſooner or later, the beſieged to ſubmit.

The greateſt improvement made in the art of attacking happened in the year 1697, when M. Vauban made firſt uſe of ricochet-firing at the ſiege of Ath, whereby the beſieged placed behind the parapets were as much expoſed to the fire of the beſiegers as if there had been none; whereas, before, they had been ſecure as long as the parapet was not demoliſhed: and the worſt is, that there can be no remedy found to prevent this enfilading, without falling into inconveniencies almoſt as bad as thoſe which we endeavour to avoid.

Fortification is either regular or irregular. *Regular* fortification, is that built in a regular polygon, the ſides and angles of which are all equal, being commonly about a muſket-ſhot from each other. *Irregular* fortification, on the contrary, is that where the ſides and angles are not uniform, equidiſtant, or equal; which is owing to the irregularity of the ground, valleys, rivers, hills, and the like. Vauban's Method.

Sect. I. *Of Regular Fortification.*

Although authors agree as to the general form in the preſent manner of fortifying, yet they moſtly differ in particular conſtructions of the parts. As it would be both needleſs and ſuperfluous to treat of all the different methods hitherto propoſed, we ſhall content ourſelves with explaining thoſe only which are moſt eſteemed by the beſt judges, and have been moſtly put in practice.

Conſtruction of M. Vauban's Method.

This method is divided into little, mean, and great; the *little* is chiefly uſed in the conſtruction of citadels, the *mean* in that of all ſorts of towns, and the *great* in particular caſes only.

We ſhall give the conſtruction of the mean, as being moſt uſeful; and refer the reader to the table hereafter, for thoſe dimenſions which are different in theſe ſeveral fortifications. Plate CXCVII.

Inſcribe in a circle a polygon of as many ſides as the fortification is deſigned to have fronts; let AB be one of the ſides of half an hexagon, which biſect by the perpendicular CD; divide half AC of it into nine equal parts, and one of theſe into ten others; then theſe diviſions will ſerve as a ſcale to conſtruct all the parts of the fortification, and each of them is ſuppoſed to be a toiſe or fathom, that is, ſix French feet; and therefore the whole ſide AB is ſuppoſed to be 180 toiſes.

As the dividing a line into ſo many equal parts is troubleſome and tedious; it is more convenient to have a ſcale of equal parts by which the works may be conſtructed.

If therefore, in this caſe, the radius is taken equal to 180 toiſes, and the circle deſcribed with that radius being divided into ſix equal parts, or the radius being carried ſix times round, you will have an hexagon inſcribed; AB being biſected by the perpendicular CD as before, ſet off 30 toiſes from C to D, and draw the indefinite lines ADG, BDF; in which take the parts AE, BH, each equal to 50 toiſes; from the centre E deſcribe an arc through the point H, meeting AD in G, and from the centre H deſcribe an arc through the point E, meeting BD in F; or which is the ſame, make each of the lines EG, HF, equal to the diſtance EH; then the lines joining the points A, E, F, G, H, B, will be the principal or outline of the front.

If the ſame conſtruction be performed on the other ſides of the polygon, you will have the principal or outline of the whole fortification.

If, with a radius of 20 toiſes, there be deſcribed circular arcs, from the angular points B, A, M, T, and lines are drawn from the oppoſite angles E, H, &c. ſo as to touch theſe arcs, their parts *a b*, *b c*, &c. together with theſe arcs, will repreſent the outline of the ditch.

Definitions.

1. The part FEALN, is called the baſtion.
2. AE, AL, the faces of the baſtion.
3. EF, LN, the flanks.
4. FG, the curtain.

Of Orillons.

Plate CXCVII.

5. FN, the gorge of the baſtion.

6. AG, BF, the lines of defence.

7. AB, the exterior ſide of the polygon.

8. CD, the perpendicular.

9. Any line which divides a work into two equal parts, is called the capital of that work.

10. *a b c*, the counterſcarp of the ditch.

11. A, M, the flanked angles.

12. H, E, L, the angles of the ſhoulder, or ſhoulder only.

13. G, F, N, the angles of the flank.

14. Any angle whoſe point turns from the place is called a *faliant angle*, ſuch as A, M: and any angle whoſe point turns towards the place, *re-entering angle*, ſuch as *b*, F, N.

15. If there be drawn two lines parallel to the principal or outline, the one at 3 toiſes diſtance, and the other at 8 from it; then the ſpace *y x* included between the principal one and that fartheſt diſtant, is called the *rampart*.

And the ſpace *x x*, contained by the principal line, and that near to it, and which is generally ſtained black, is called the *parapet*.

16. There is a fine line drawn within four feet of the parapet, which expreſſes a ſtep called *banquette*.

Of Ravelins.

Plate CXCVII.

N. B. All works have a parapet of three toiſes thick, and a rampart of 8 to 10, beſides their ſlopes. The rampart is elevated more or leſs above the level of the place, from 10 to 20 feet, according to the nature of the ground and the particular conſtructions of engineers.

The parapet is a part of the rampart elevated from 6 to 7½ feet above the reſt, in order to cover the troops which are drawn up there from the fire of the enemy in a ſiege; and the banquette is two or three feet higher than the rampart, or about four feet lower than the parapet; ſo that when the troops ſtand upon it, they may juſt be able to fire over the parapet.

17. The body of the place, is all that which is contained within this firſt rampart: for which reaſon, it is often ſaid to conſtruct the body of the place; which means properly, the conſtruction of the baſtions and curtains.

18. All the works which are conſtructed beyond the ditch before the body of the place are called *outworks*.

TABLE.

	Forts.						Little Fortif.				Mean.		Great.	
Side of Polyg.	80	90	100	110	120	130	140	150	160	170	180	190	200	260
Perpendicul.	10	11	12½	14	15	16	20	21	23	25	30	31	25	22
Faces baſt.	22	25	28	30	33	35	40	42	45	47	50	53	55	60
Cap. of ravel.	25	28	30	35	38	40	45	50	50	52	55	55	60	50

In the firſt vertical column are the numbers expreſſing the lengths of the exterior ſides from 80 to 260. In the ſecond, the perpendiculars anſwering to theſe ſides. In the third, the lengths of the faces of baſtions; and in the fourth, the lengths of the capitals of the ravelins.

The forts are moſtly, if not always, ſquares: for which reaſon, the perpendiculars are made one-eighth of the exterior ſides; becauſe if they were more, the gorges of the baſtions would become too narrow.

The little fortification is chiefly deſigned for citadels, and are commonly pentagons; the perpendiculars are made one-ſeventh of the exterior ſide: the mean is uſed in all kinds of fortifications from an hexagon upwards to any number of ſides: and the great is ſeldom uſed but in an irregular fortification, where there are ſome ſides that cannot be made leſs without much expence; or in a town which lies near a great river, where the ſide next the river is made from 200 to 260 toiſes; and as that ſide is leſs expoſed to be attacked than any other, the perpendicular is made ſhorter, which ſaves much expence.

The faces of the baſtions are all ⅓ths of the exterior ſides, or nearly ſo, becauſe the fractions are neglected.

It may be obſerved in general, that in all ſquares the perpendicular is ⅛th of the exterior ſide, and all pentagons ⅐th, and in all the reſt upward ⅙th.

1. *Conſtruction of Orillons and retired Flanks.*

Describe the front MPQRST as before, and divide the flank into three equal parts, of which ſuppoſe S *r* to be one: from the oppoſite flanked angle M draw a line M *r*, in which take the part *m r* of 5 toiſes; take likewiſe R *n* in the line of defence M R, produced, equal to 5 toiſes, and join *n m*, upon which as a baſe deſcribe the equilateral triangle *n p m*, and from the angle *p*, oppoſite to the baſe as centre, is deſcribed the circular flank *n m*.

And if S *r* be biſected by the perpendicular 1, 2, and another be erected upon the face S T, at S; the interſection 2 of theſe two perpendiculars will be the centre of the arc which forms the orillon.

The orillons are very uſeful in covering the retired flanks, which cannot be ſeen but directly in the front; and as theſe orillons are round, they cannot be ſo eaſily deſtroyed as they would be if they were of any other figure.

2. *Conſtruction of Ravelins or Half-moons.*

Fig. 2. Set off 55 toiſes, from the re-entering angle O of the counterſcarp, on the capital O L or on the perpendicular produced, and from the point L draw lines to the ſhoulders A B; whoſe parts L M, L N, terminated by the counterſcarp, will be the faces, and M O, O N, the ſemi-gorges of the ravelin required.

This is Mr Vauban's method of conſtructing ravelins, according to ſome authors: and others will have the faces of the ravelin to terminate on thoſe of the baſtions within 3 toiſes of the ſhoulders; which ſeems to be the beſt way, for theſe ravelins cover the flanks much better than the others.

The ditch before the ravelin is 12 toiſes, its counterſcarp

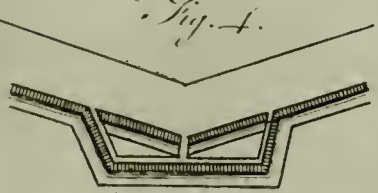

Fig. 5.

J. Bell, Prin. Mad. Sculptor fecit.

Of Tenailles. Plate CXCVII.

scarp parallel to the faces of the ravelins; and is made in a circular arc, before the saliant angle; as likewise all ditches are in general.

When the ravelins are made with flanks, as in fig. 3. the faces should terminate on those of the bastions, at least 5 toises from the shoulders.

The flanks are made by setting off 10 toises from the extremities of the faces, from *f* to *b*, and from *m* to *l*; and from the points *b*, *l*, the flanks *b k*, *l p*, are drawn parallel to the capital LO of the ravelin.

There are sometimes redoubts made in the ravelin, such as in fig. 2 which is done by setting off 16 toises from the extremities of the faces on the semi-gorges from N to *b*, and from M to *a*; and from the points *b*, *a*, the faces are drawn parallel to those of the ravelin: the ditch before the redoubt is 6 toises, and its counterscarp parallel to the faces.

3. *Construction of Tenailles.*

A tenaille is a work made in the ditch before the curtains, the parapet of which is only 2 or 3 feet higher than the level ground of the ravelin. There are three different sorts: the first are those as in fig. 4. which are made in the direction of the lines of defence, leaving a passage of 3 toises between their extremities and the flanks of the bastions, as likewise another of 2 in the middle for a bridge of communication to the ravelin.

The second sort are those as in fig. 5. Their faces are in the lines of defence, and 16 toises long, besides the passage of 3 toises between them and the flanks of the bastions; their flanks are found by describing arcs from one shoulder of the tenaille as centre through the other, on which are set off 10 toises for the flanks desired.

And the third sort are those as in fig. 6. Their faces are 16 toises, as in the second sort, and the flanks are parallel to those of the bastions.

The use in general of tenailles, is to defend the bottom of the ditch by a grazing fire, as likewise the level ground of the ravelin, and especially the ditch before the redoubt within the ravelin, which can be defended from no where else so well as from them.

The first sort do not defend the ditch so well as the others, as being too oblique a defence, but as they are not subject to be enfiladed, M. Vauban has generally preferred them in the fortifying of places, as may be seen in the citadel of Lille, at Landau, New-Brisac, and in a great many other places.

The second sort defend the ditch much better than the first, and add a low flank to those of the bastions; but as these flanks are liable to be enfiladed, they have not been much put in practice. This defect might however be remedied, by making them so as to be covered by the extremities of the parapets of the opposite ravelins, or by some other work.

As to the third sort, they have the same advantage as the second, and are likewise liable to the same objections; for which reason, they may be used with the same precautions which have been mentioned in the second.

Tenailles are esteemed so necessary, that there is hardly any place fortified without them: and it is not without reason. For when the ditch is dry, the part behind the tenailles serves as a place of arms, from which the troops may sally, destroy the works of the enemy in the ditch, oppose their descent, and retire with safety; and the communication from the body of the place to the ravelin becomes easy and secure: which is a great advantage; for by that means the ravelin may be a much better defence, as it can be supplied with troops and necessaries at any time. And if the ditch is wet, they serve as harbours for boats, which may carry out armed men to oppose the passage over the ditch whenever they please; and the communication from the tenailles to the ravelin, becomes likewise much easier than it would be without them.

Of Lunettes, &c. Plate CXCVII.

4. *Construction of Lunettes.*

Fig. 7. Lunettes are placed on both sides of the ravelin, such as B, to increase the strength of a place: they are constructed, by bisecting the faces of the ravelin with the perpendicular LN; on which is set off 30 toises from the counterscarp of the ditch. for one of its faces; the other face, PN, is found by making the semi-gorge TP of 25 toises; the ditch before the lunettes is 12 toises, the parapet 3, and the rampart 8; as in the ravelin.

There is sometimes another work made to cover the saliant angle of the ravelin, such as A, called *bonnet*, whose faces are parallel to those of the ravelin, and when produced bisect those of the lunettes; the ditch before it is 10 toises.

There are likewise lunettes, such as D in fig. 8. whose faces are drawn perpendicular to those of the ravelin, within a third part from the saliant angle; and their semi gorges are only 20 toises.

These kind of works may make a good defence, and cost no very great expence; for as they are so near the ravelin, the communication with it is very easy, and one cannot well be maintained till they are all three taken.

5. *Construction of Tenaillons.*

Fig. 9. Produce the faces of the ravelin beyond the counterscarp of the ditch, at a distance MN of 30 toises, and take on the counterscarp of the great ditch 15 toises from the re-entering angle *p* to *q*, and draw N*q*; then *q*NM*p* will be the tenailles required; its ditch is 12 toises, that is, the same as that of the ravelin. Sometimes there is made a retired battery in the front of the tenaillons, as in B; this battery is 10 toises from the front to which it is parallel, and 15 toises long.

There are commonly retrenchments made in the tenaillons, such as O; their parapets are parallel to the fronts MN, and bisect the side *q* N; the ditch before this retrenchment is 3 toises: and there is a banquette before the parapet next to the ditch of about 8 feet, called *berm*; which serves to prevent the earth of the parapet (which seldom has any revetment) from falling into the ditch.

It is to be observed, that the ravelin, before which tenaillons are constructed, must have its saliant angle much greater than the former construction makes them; otherwise the saliant angles of the tenaillons become too acute; for which reason we made the capital of

this

Of Counter-guards, &c.

this ravelin 45 toiſes, and the faces terminate within 3 toiſes of the ſhoulders.

6. Conſtruction of Counterguards.

Plate CXCVII.

Fig. 10, 11. When the counterguard is placed before the ravelin, ſet off 40 toiſes on the capital of the ravelin from the faliant angle A to the faliant angle B, of the counterguard; and 10 from C to D, on the counterſcarp of the ditch.

When the counterguard is before the baſtion, ſuch as in fig. 2. its faliant angle F is 50 toiſes from the faliant angle E of the baſtion, and the breadth near the ditch of the ravelin 10 toiſes as before.

The ditch before the counterguards is 12 toiſes, and its counterſcarp parallel to the faces.

Counterguards are made before the ravelin on ſome particular occaſions only; but are frequently conſtructed before the baſtions, as covering the flanks wonderfully well. Some authors, as Mr Blondel and Mr Coehorn, will have them much narrower than they are here.

7. Conſtruction of Hornworks.

Fig. 12. Produce the capital of the ravelin beyond the faliant angle A, at a diſtance AB of about 80 toiſes; draw DBE at right angles to AB; in which take BD, BE, each equal to 55 toiſes; and on the exterior ſide DE, trace a front of a polygon in the ſame manner as that of the body of the place, making the perpendicular BF 10 toiſes, and the faces 30.

The branches D *a*, E *b*, of the hornwork, when produced, terminate on the faces of the baſtions, within 5 toiſes of the ſhoulders. The ditch of the hornwork is 12 toiſes, and its counterſcarp parallel to the branches; and in the front terminates at the ſhoulders, in the ſame manner as the great ditch before the baſtions.

The capital of the ravelin before the front of the hornwork is 35 toiſes, and the faces terminate on the ſhoulders, or rather 2 or 3 toiſes beyond them: and the ditch before the ravelin is 8 toiſes.

There are ſometimes retrenchments made within the hornwork, ſuch as S, S; which are conſtructed by erecting perpendiculars to the faces of the ravelins, within 25 toiſes of their extremities. This retrenchment, like all others, has a parapet turfed only with a berm of 8 feet before it; as likewiſe a ditch from 3 to 5 toiſes broad.

Fig. 13. When a hornwork is made before the baſtion, the diſtance D L of the front from the faliant angle of the baſtion is 100 toiſes, and the branches terminate on the faces of the adjacent ravelins within 5 toiſes from their extremities; all the reſt is the ſame as before.

8. Conſtruction of Crown-works.

Plate CXCVIII.

From the faliant angle, A (fig. 1.) of the ravelin, as a centre, deſcribe an arc of a circle with a radius of about 120 toiſes, cutting the capital of the ravelin produced at C; from the point C, ſet off the cords CB, CF, each of them equal to 110 toiſes; and on each of which, as an exterior ſide, conſtruct a front of a polygon of the ſame dimenſions as in the hornwork; that is, the perpendicular ſhould be 18 toiſes, the faces 30, and the branches terminate on the faces of the baſtions within 25 toiſes of the ſhoulders.

The ditch is 12 toiſes, the capital of the ravelin 35, and its ditch 8; that is, the ſame as in the hornwork.

Sometimes the crownwork is made before the baſtion, as in fig. 2. The arc is deſcribed from the faliant angle A of the baſtion, with a radius of 120 toiſes, as before; and the branches terminate on the faces of the adjacent ravelins within 25 toiſes of their extremities: the reſt of the dimenſions and conſtructions are the ſame as before.

Hornworks, as well as crownworks, are never made but when a large ſpot of ground falls beyond the fortification, which might be advantageous to an enemy in a ſiege, or to cover ſome gate or entrance into a town.

Of Covert-ways, &c.

Plate CXCVII

9. Conſtruction of Covert-ways and Glacis.

Although we have not hitherto mentioned the covert-way, nevertheleſs all fortifications whatſoever have one; for they are eſteemed to be one of the moſt eſſential parts of a modern fortification; and it is certain, the taking the covert-way, when it is in a good condition and well defended, is generally the moſt bloody action of the ſiege.

After having conſtructed the body of the place, and all the outworks which are thought neceſſary, lines are drawn parallel to the outmoſt counterſcarp of the ditches, at 6 toiſes diſtant from it; and the ſpace *m n*, *m n*, included between that line and the counterſcarp, will be the covert-way required.

Fig. 3. There is in every re-entering angle of the counterſcarp a place of arms, *m*; which is found by ſetting off 20 toiſes from the re-entering angle *a*, on both ſides from *a* to *b*, and from *a* to *c*; and from the points *b*, *c*, as centres, ares are deſcribed with a radius of 25 toiſes, ſo as to interſect each other in *d*; then the lines drawn from this interſection to the points *b*, *c*, will be the faces of the places of arms.

If lines are drawn, parallel to the lines which terminate the covert way, and the places of arms, at 20 toiſes diſtant from them, the ſpace *x*, *x*, *x*, between theſe lines and thoſe which terminate the covert-way, will be the glacis.

At the extremities of the places of arms, are traverſes made, ſuch as *v*, *v*, which ſerve to incloſe them; theſe traverſes are 3 toiſes thick, and as long as the covert-way is broad; and a paſſage is cut in the glacis round them, of about 6 or 8 feet, in order to have a free communication with the reſt of the covert-way.

There are alſo traverſes of the ſame dimenſions before every faliant angle of the baſtion and outworks, and are in the ſame direction as the faces of thoſe works produced; and the thickneſs lies at the ſame ſide as the parapets.

The paſſages round theſe laſt traverſes are likewiſe from 6 to 8 feet wide.

In each place of arms are two ſally ports *z z*, which are 10 or 12 feet wide, for the troops to ſally out; in time of a ſiege they are ſhut up, with barriers or gates.

10. Conſtruction of Arrows and Detached Redoubts.

An arrow is a work made before the faliant angles of the glacis, ſuch as A, fig. 3. It is compoſed of a

Fig. 1.

Fig. 2.

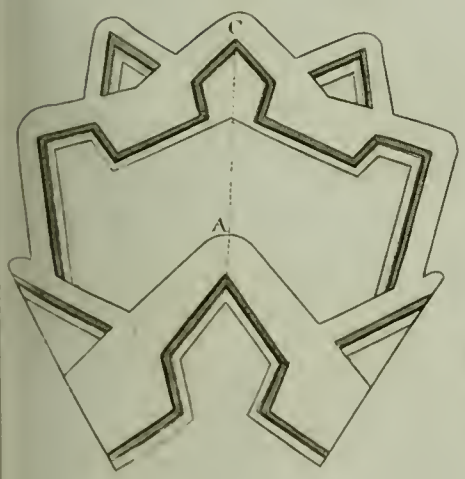

Fig. 3.

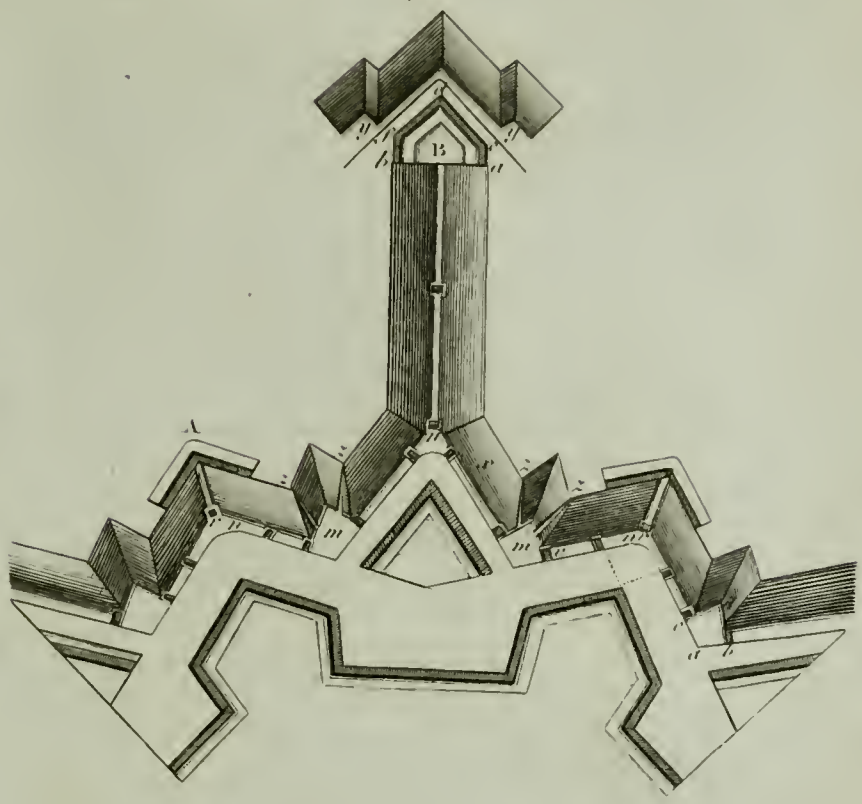

Fig. 4.

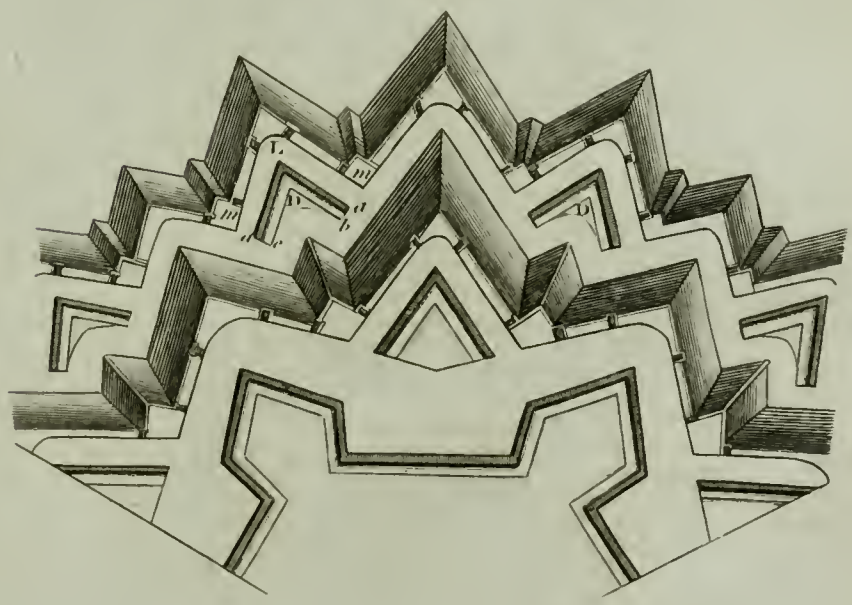

J. Bell's Prin. Mat. Sculptor fecit.

Of Covert-ways, &c.

Plate CXCVIII.

parapet of 3 toiſes thick. and 40 long; and the ditch before it 5 toiſes, terminating in a ſlope at both ends. The communication from the covert way into theſe arrows is 4 or 5 toiſes wide; and there is a traverſe, *r*, at the entrance, of 3 toiſes thick, with a paſſage of 6 or 8 feet round it.

A detached redoubt is a kind of work much like a ravelin, with flanks placed beyond the glacis; ſuch as B: they are made in order to occupy ſome ſpot of ground which might be advantageous to the beſiegers; likewiſe to oblige the enemy to open their trenches farther off than they would do otherwiſe.

Their diſtance from the covert-way ought not to exceed 120 toiſes, that it may be defended by muſket-ſhot from thence.

The gorge *a b* is 40 toiſes; the flanks *a c*, *b f*, which are perpendicular to the gorge, 10; and the faces *c d*, *f d*, 30: the ditch before it is 6 toiſes, ending in ſlopes at both ends; the covert-way 4; the branches of the covert-way are 42 toiſes long, or thereabouts; the faces of the places of arms *y*, *y*, which are perpendicular to the branches, 10; and the other, which is parallel to them, 14.

The communication from the covert-way into the redoubt, is 5 or 6 toiſes wide; and there is a traverſe made juſt at the entrance, and another in the middle when it is pretty long. The parapets of this communication terminate in a ſlope or glacis.

If theſe redoubts are above 50 toiſes diſtant from the covert-way, the beſiegers carry their trenches round, and enter through the gorge; by which the troops that are in them are made priſoners of war, if they do not retire betimes; to prevent which, ſome other outworks ſhould be made to ſupport them.

11. *Conſtruction of Second Ditches and Covert-ways.*

Fig. 4. When the ground is low, and water to be found, there is often a ditch about 10 or 12 toiſes made round the glacis; and oppoſite to the places of arms are conſtructed lunettes, beyond the ditch: ſuch as D, whoſe breadth on the counterſcarp of the ditch is 10 toiſes, from *b* to *a*, and from *c* to *d*; and the faces *a* L, *d* L, are parallel to thoſe of the places of arms; the ditch before them is from 8 to 10 toiſes wide.

The ſecond covert-way is 4 toiſes, the ſemi-gorges of the places of arms, *m*, about 15, and the faces perpendicular to the counterſcarp; the ſecond glacis is from 15 to 18 toiſes broad.

This ſecond covert-way has traverſes every where, in the ſame manner as the firſt.

12. *Conſtruction of Profiles.*

Of Profiles.

Plate CXCVIII.

A PROFILE is the repreſentation of a vertical ſection of a work; it ſerves to ſhow thoſe dimenſions which cannot be repreſented in plans, and is neceſſary in the building of a fortification. Profiles are generally conſtructed upon a ſcale of 30 feet to an inch. It would be endleſs to deſcribe all their particular dimenſions; we ſhall therefore lay down the principal rules only, given by M. Vauban, on this ſubject.

1. Every work ought to be at leaſt 6 feet higher than that before it, ſo that it may command thoſe before it; that is, that the garriſon may fire from all the works at the ſame time, with great and ſmall arms, at the beſiegers in their approaches. Notwithſtanding this ſpecious pretence, there are ſeveral authors who object againſt it. For, ſay they, if you can diſcover the enemy from all the works, they can diſcover, by the ſame reaſon, all the works from their batteries; ſo that they may deſtroy them without being obliged to change their ſituation, and thereby diſmount all the guns of the place before they come near it.

But if all the works were of the ſame height, thoſe within cannot be deſtroyed, till ſuch time as thoſe before them are taken: guns might be placed in the covert-way and outworks to obſtruct the enemy's approach; and when they come near the place, they might be tranſported into the inner-works: and as the body of the place would be much lower, the expence would be conſiderably diminiſhed.

But when works are low, they are eaſily enfiladed by the ricochet batteries, which is a kind of firing with a ſmall quantity of powder, by giving the gun an elevation of 10 or 12 degrees: this might however be partly prevented, by making the parapets near the ſaliant angles, for the ſpace of 8 toiſes on each ſide, 5 or 6 feet higher than the reſt of the works.

2. The covert-way ſhould be lower than the level ground, otherwiſe the body of the place muſt be raiſed very high, eſpecially where there are ſeveral outworks: this is to be underſtood only when the works exceed each other in height, otherwiſe it need not be below the level.

3. The baſes of all inward ſlopes of earth ſhould be at leaſt equal to the height, if not more.

4. The baſes of all outward ſlopes of earth, two-thirds of their heights.

5. The ſlopes of all walls or revetments ſhould be one-fifth of their height; or one-ſixth might perhaps be ſufficient: the height of a wall is eſtimated from the bottom of the ditch, and not from the beginning of its foundation.

6. The ſlopes of all parapets and traverſes are one-ſixth of their breadth; that is, 3 feet towards the field; or the inſide, where the banquettes ſhould be 3 feet higher than the outſide.

7. When the revetment of a rampart goes quite up to the top, 4 feet of the upper part is a vertical wall of 3 feet thick, with a ſquare ſtone at the top of it projecting 6 inches; and a circular one below, or where the ſlope begins, of 8 or 10 inches diameter: they go quite round the rampart, and the circular projection is called the *cordon*.

Where the ſtraight part of the wall ends and the ſlope begins, the wall is always made 5 feet thick; and the counterforts or buttreſſes reach no higher than that place.

8. When the rampart is partly walled and partly turfed, then one-fifth of the height which is turfed muſt be added to 5 feet, to get the thickneſs of the wall above.

And having the thickneſs of any wall above, by adding one-fifth of its height from the bottom of the ditch, the ſum will be the thickneſs of the wall at the bottom; but if a ſixth part is only taken for the ſlope, then a ſixth part muſt be added.

For inſtance, ſuppoſe a rampart of 30 feet high from the bottom of the ditch, and that 10 of which are to be turfed; then the fifth part of 10, which is 2, added

to

Of Irregular Fortification.

Plate CXCIX.

to 5, gives 7 for the wall above; and as this wall is 20 feet high, the fifth of which is 4, and 4 added to the thickneſs 7 above, gives 11 for the thickneſs near the foundation.

Fig. 1. Repreſents, in military perſpective, the profiles of the body of a place, the ravelin and covert-way; which gives a clear idea of what is meant by a profile, and from which thoſe of all other works may be eaſily conceived.

Sect. II. *Of Irregular Fortification.*

The moſt eſſential principle in fortification conſiſts in making all the fronts of a place equally ſtrong, ſo that the enemy may find no advantage in attacking either of the ſides. This can happen no otherwiſe in a regular fortification ſituated in a plain or even ground: but as there are but few places which are not irregular either in their works or ſituations, and the nature of the ground may be ſuch as makes it impracticable to build them regular without too great expence; it is ſo much the more neceſſary to ſhow in what conſiſts the ſtrength or weakneſs of a town irregularly fortified, ſo that the weakeſt part may be made ſtronger by additional outworks; as likewiſe, if ſuch a place is to be attacked, to know which is the ſtrongeſt or weakeſt part.

1. *Conſtruction of an irregular place ſituated in an open country.*

If the place to be fortified is an old town incloſed by a wall or rampart, as it moſt frequently happens, the engineer is to conſider well all the different circumſtances of the figure, ſituation, and nature of the ground; and to regulate his plan accordingly, ſo as to avoid the diſadvantages, and gain all the advantages poſſible: he ſhould examine, whether by cutting off ſome parts of the old wall or rampart, and taking in ſome ground, the place can be reduced into a regular figure, or nearly ſo; for if that can be done without increaſing the expence conſiderably, it ſhould by no means be omitted. Old towns have often towers placed from diſtance to diſtance, as Douay. Tournay, and many other places, which are generally made uſe of, and mended when it may be done. If there is a rampart without baſtions or towers, it muſt be well conſidered whether baſtions may not be added, or if it is not better to make only ſome outworks: if the ditch about this rampart is not too wide and deep, it would be advantageous to make detached baſtions; otherwiſe ravelins and counterguards muſt be conſtructed. Special care muſt be taken to make all the ſides of the polygon as nearly equal as poſſible, and that the length of the lines of defence do not exceed the reach of muſket-ſhot; but if that cannot be done, thoſe ſides which are on the narroweſt part ſhould be made the longeſt.

If it ſhould happen that ſome of the ſides are inacceſſible or of very difficult approach, either on account of ſome precipice marſhy ground, or inundation, they may be made much longer than the others which are of eaſy acceſs, and the flanks need not be ſo large as the reſt; by doing ſo, there will be ſome expences ſaved, which may be uſed in making the other ſides ſtronger by adding more outworks.

There are few ſituations but what are more advantageous in ſome parts than in others; it is therefore the buſineſs of an engineer to diſtinguiſh them, and to render thoſe ſides ſtrong by art which are not ſo by nature.

If the ſituation is low and watery, lunettes or tenaillons, and ſuch other ſmall outworks, ſhould be conſtructed; becauſe they are not of any great expence, and may make a very good defence. But if one ſide of the place only is low, and running water is to be had, a ſecond ditch and covert-way with lunettes may be made, by obſerving, that if the firſt glacis is made to ſlope, ſo as to become even with the level of the water in the ſecond ditch; or if the water can be ſwelled by means of dykes or ſluices, ſo as to overflow the beſt part of the firſt glacis, it ſhould be done: for by ſo doing theſe works will be able to make a very good defence, ſince the beſiegers will find it a difficult matter to lodge themſelves upon this glacis; which cannot be done but within a few toiſes of the firſt covert-way, where the beſieged are ready to receive them, and to deſtroy their works with great advantage; whereas the enemy cannot ſupport their workmen but from the ſecond covert-way, which is too far off to be of any great ſervice to them.

But if the ſituation is of a dry nature, without any water about it, caponiers ſhould be made in the great ditch, from the curtains to the ravelin, and batteries raiſed in the entrance of the ditch before the ravelin, whoſe parapet muſt ſlope off into a glacis ſo as to afford no cover for the enemy behind them. Arrows and detached redoubts are likewiſe very proper to be uſed in ſuch a caſe; and ſometimes horn or crown works, if it ſhould be thought convenient: but theſe works ſhould never be conſtructed without an abſolute neceſſity, either to occupy a ſpot of ground which might be advantageous to the enemy, or to cover ſome gate or entrance into the town; for they are of great expence, and their defence ſeems not to be anſwerable to it.

Moſt of the places in Flanders are fortified with hornworks, ſuch as Ipres, Tournay, Lille, and others.

If the place to be fortified is new, and the ſituation will not admit of a regular conſtruction, particular care muſt be taken in chooſing ſuch a ſpot of ground as is moſt advantageous, and leaſt liable to any diſadvantages either in the building or in the maintaining of it. All hills or riſing grounds ſhould be avoided, which might command any part of the works; marſhy grounds, becauſe ſuch ſituations are unwholeſome; or lakes and ſtanding waters for the ſame reaſon, excepting a lake is or may be made navigable. Good water ſhould be had either within the place or near it, for it is abſolutely neceſſary for men and cattle; the air ſhould be wholeſome; otherwiſe the continual ſickneſs that may reign in ſuch a place might prevent people to come and live in it, and the garriſon would not be in a condition to defend themſelves as they ought to do. In ſhort, all the different circumſtances attending ſuch an undertaking ſhould be maturely conſidered before a reſolution is taken to fortify any place.

When a ſituation is fixed upon, the next thing to be conſidered is, the bigneſs of the town and the number of its outworks; which muſt abſolutely depend upon the conſequence ſuch a place is of to a nation. If it is only to guard a paſs or entrance into a country, it need not be ſo large: but if it is to be a place either to promote

Fig. 1.

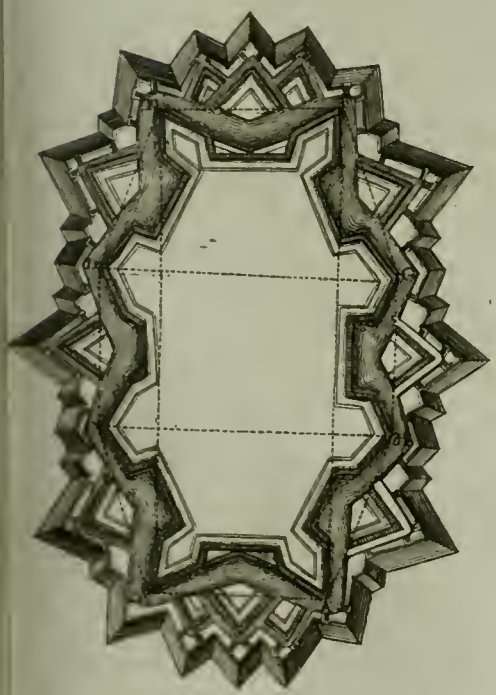

Fig. 3.

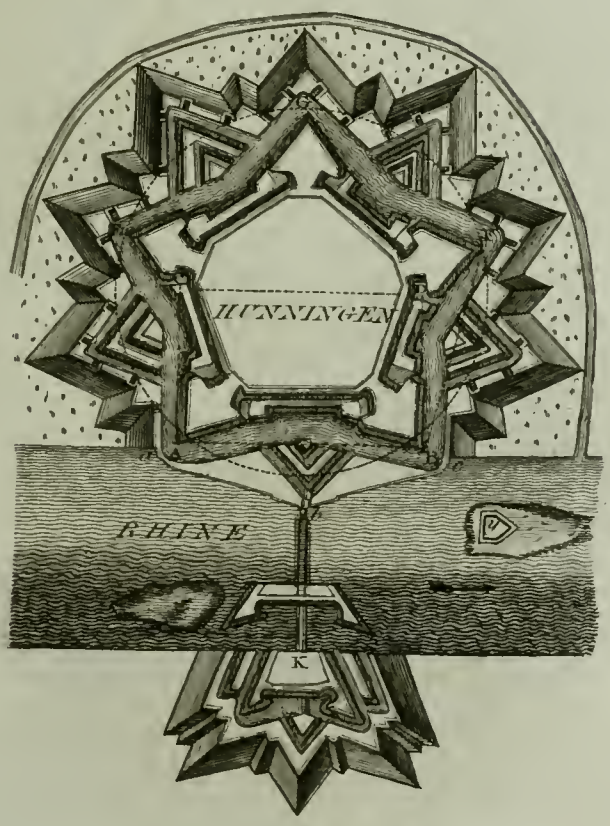

J. Bell Prin. Math. Sculptor fecit.

Of Irregular Fortification.

Plate CXCIX.

promote or to protect trade, it should be large and commodious; the streets should be wide, and the buildings regular and convenient. As to what regards the fortification, its construction should depend on the nature of the situation, and the number of works, on the funds or expence a prince or a nation will be at; which, however, ought to be according to the benefit arising from such a place: for as such undertakings are of very great expence, an engineer cannot be too sparing in his works; on the contrary, the greatest economy should be used both in regard to the number of works and to their construction. The body of the place may have (A) revetments quite up to the top, or only in part, and the rest turfed; but as to the outworks, they should have half revetments, or they may be made with turf only; as being not so necessary to prevent the place from being surprised, which may nevertheless make a good defence.

Fig. 2. is the plan of an octagon, one half of which is similar and equal to the other half; it being supposed, that the situation would not admit of fortification quite regular. The exterior sides are each 180 toises, and the works are constructed according to our method: but because the sides AB, EF, are weaker than the rest, as has been proved before, we have added tenailles, redoubts in the ravelins, and lunettes, to render them nearly equal in strength with the others; and if counter-guards were made before the bastions A and B, it would effectually secure that front. Instead of lunettes, any other works may be made, as may be thought convenient and according to the nature of the ground. If it should be judged necessary to add other outworks to the ravelins all round the place, care must be taken to add likewise more to the fronts AB, EF, in order to render the advantages and disadvantages of attacking on either side equal.

2. *Construction of an irregular place situated on a hill or rock.*

In the construction of such places, care must be taken that no neighbouring hill commands any part of the works. The town should always be built on the highest part; but if it should be thought more convenient to place it lower, then the upper part must be fortified with a fort. The situation should be made level as near as possible, by removing the earth from some places to fill up others; and if it cannot well be levelled without extraordinary expence, works must be made on the highest part, so as to command and protect the lower. The works ought to occupy all the upper part of the hill; but if it should be too extensive to be all inclosed, or so irregular as not to be fortified without great inconvenience, the parts which fall without should be fortified with some detached works, and a communication with the place must be made either above or under ground. There should be no cavity or hollow roads within cannon-shot round about the place, where the enemy might be able to approach under cover. If there should happen to be a spring near the top of the hill, it should be inclosed in the fortification; or if that cannot be done, by some work or other: for there is nothing more necessary, and at the same time scarcer, in such situations, than water; for which reason there cannot be too much care in providing it: several cisterns are to be made to receive the rain-water, and to preserve it; wells should be dug likewise, though ever so deep, the water of which will serve for common use.

Of Irregular Fortification.

Plate CXCIX.

Places built on hills or rocks should never be large; for their use is generally to guard passes or inlets into a country, and are seldom useful in traffic; and it is a difficult matter to provide for a large garrison in such situations, neither should any such place be built without some very material reasons: but when it is absolutely necessary, great care and precaution should be taken to render the works as perfect as the situation will admit of, and at the same time to be as frugal in the expence as possible.

3. *Construction of irregular fortifications situated near rivers, lakes, or the sea.*

As the intent of building these kind of places is chiefly to facilitate and protect trade, they are of more importance than any other kind, especially in maritime countries, where the principal strength and power depends on them: for which reason, we shall treat of this construction more largely than of any other.

The first thing to be considered is their situation, which ought to be such as to afford a good harbour for shipping, or a safe and easy entrance in stormy weather; but as it is hardly possible to find any where ships may go in and lie secure with all winds, care should be taken to make them safe to enter with those winds which are most dangerous: but it is not sufficient that the harbour is safe against stormy weather, they should likewise be so against an enemy both by land and water; for it often happens, that ships are destroyed where it was imagined they were secure, which is of too great consequence not to be provided against; for which reason, forts or batteries must be built in the most convenient places, to prevent the enemy's ships from coming too near, so as to be able to cannonade those in the harbour, or sling shells amongst them; and if there is any danger of an enemy's approach by land, high ramparts and edifices must be built, so as to cover them.

When a river is pretty large, and it is not convenient for making a harbour without great expence, the ships may ride along the shore; which, for that reason, must be made accessible for ships of burden: this may be done by advancing the quay into the river if the water is too shallow, or by digging the river sufficiently deep for that purpose.

And to prevent an enemy from coming up the river, forts must be built on both sides, especially when there are any turnings or windings. Antwerp is such a place: for the Scheld is sufficiently deep to carry ships of great burden, which may come quite near the town-wall; and several forts are built below it on both sides, so that it would not be an easy matter for an enemy to come up the river.

When the river is but small, so that no ships of bur-

(A) Revetments are chiefly made to prevent a place from being surprised: outworks do not want to be made so; the taking them by surprise is of no great consequence, except in a siege, when other cautions are used to prevent it.

Of Irregular Fortification.

Plate CXCIX.

den can come through it, it is sufficient to make it run through some of the works, where proper landing-places are contrived, from whence the goods may be carried in to the place; as at Sarrelouis, where a hornwork is built beyond the Sarre, in the gorge of which the goods are landed.

If the breadth of the river does not exceed 200 yards, it commonly passes through the middle of the town, and proper quays are made on each side; in such a case, the fortification is so contrived, as that the river passes through the curtain, in order to have a bastion on each side to defend the coming in and going out.

When M. Vauban fortified near rivers, he made always the exterior side near the water much longer than any of the others; such as Hunninghen on the Rhine, and Sarrelouis on the Sarre; but for what reason he fortified these places in that manner, has not been told by any author.

But it is plain that the sides which terminate at the river are the weakest; because the besiegers trenches being secured by the river, they may draw most of their troops off, and act therefore with more vigour and strength on the other side: besides, as the strength of a side increases in proportion as the angle of the polygon is greater, by making the side next the river longer, the angles at its extremities become wider, and consequently the adjacent sides stronger.

There are other advantages, besides those mentioned already, which arise from the lengthening that side: for if the river is pretty deep so as not to be fordable, that side is not liable to be attacked; and by increasing its length, the capacity of the place increases much more in proportion to the expence, than if more sides were made; the centre of the place will be likewise nearer the river, which makes it more convenient for transporting the goods from the water-side to any part of the town.

Fig. 3. To illustrate this method of M. Vauban's, we shall give the plan of Hunninghen: this place was built for the sake of having a bridge over the Rhine, for which reason he made it only a pentagon; the side AB next to the river is 200 toises, and each of the others but 180.

About the space *abc*, which lies before the front AB, is a stone wall; and the passages *x x* are shut up with sluices, to retain the water in the ditches in dry seasons: and to prevent an enemy from destroying the sluice near the point *c*, whereby the water would run out and leave the ditches dry, the redoubt *y* was built in the little island hard by, in order to cover that sluice; without which precaution the place might be insulted from the river side, where the water is shallow in dry seasons.

Of Irregular Fortification.

Plate CXCIX.

The hornwork K beyond the Rhine was built to cover the bridge; but as this work cannot be well defended cross the river, the hornwork H was made to support the other.

Before finishing the description of this plan, we shall shew how to find the long side AB.

After having inscribed the two sides GE, GF, in a circle, draw the diameter CD, so as to be equally distant from the line joining the points E F that is parallel to it. On this diameter set off 100 toises on each side of the centre; from these points draw two indefinite perpendiculars to the diameter; then if from the points E F, as centres, two arcs are described with a radius of 180 toises, their intersections A and B, with the said perpendiculars, will determine the long side AB, as likewise the other two FB and EA. In like manner may be found the long or short side of any polygon whatsoever.

When a place near a river is to be fortified for the safety of commerce, particular care should be taken in leaving a good space between the houses and the water-side, to have a key or landing place for goods brought by water; it should also be contrived to have proper places for ships and boats to lie secure in stormy weather, and in time of a siege; and as water-carriage is very advantageous for transporting goods from one place to another, as likewise for bringing the necessary materials, not only for building the fortifications, but also the place itself, the expences will be lessened considerably when this convenience can be had; for which reason, places should never be built any where else but near rivers, lakes, or the sea; excepting in extraordinary cases, where it cannot be avoided.

F O R

Fortin or Fortitude.

FORTIN, FORTELET, or *Field-fort*, a sconce or little fort, whose flanked angles are generally 120 fathoms distant from one another.

The extent and figure of fortins are different, according to the situation and nature of the ground; some of them having whole bastions, and others demi-bastions. They are made use of only for a time, either to defend the lines of circumvallation, or to guard some passage or dangerous post.

FORTISSIMO, in music, sometimes denoted by FFF, or *fff*, signifies, to sing or play very loud or strong.

FORTITUDE, a virtue or quality of the mind, generally considered as the same with COURAGE; tho' in a more accurate sense they seem to be distinguishable. Courage may be a virtue or a vice, according to circumstances; *fortitude* is always a virtue: we speak

F O R

of desperate courage, but not of desperate fortitude. A contempt or neglect of danger, without regard to consequences, may be called *courage*; and this some brutes have as well as we: in them it is the effect of natural instinct chiefly; in man it depends partly on habit, partly on strength of nerves, and partly on want of consideration. But fortitude is the virtue of a rational and considerate mind, and is founded in a sense of honour and a regard to duty. There may be courage in fighting a duel, though that folly is more frequently the effect of cowardice: there may be courage in an act of piracy or robbery; but there can be no fortitude in perpetrating a crime. Fortitude implies a love of equity and of public good; for, as Plato and Cicero observe, courage exerted for a selfish purpose, or without a regard to justice, ought to be called audacity rather than fortitude.

Fortitude

Fortitude, Fortuna.

This virtue takes different names, according as it acts in oppoſition to different ſorts of evil; but ſome of thoſe names are applied with conſiderable latitude. With reſpect to danger in general, fortitude may be termed *intrepidity;* with reſpect to the dangers of war, *valour;* with reſpect to pain of body or diſtreſs of mind, *patience;* with reſpect to labour, *activity;* with reſpect to injury, *forbearance;* with reſpect to our condition in general, *magnanimity.*

Fortitude is very becoming in both ſexes; but courage is not ſo ſuitable to the female character: for in women, on ordinary occaſions of danger, a certain degree of timidity is not unſeemly, becauſe it betokens gentleneſs of diſpoſition. Yet from thoſe of very high rank, from a queen or an empreſs, courage in emergencies of great public danger would be expected, and the want of it blamed; we ſhould overlook the ſex, and conſider the duties of the ſtation. In general, however, maſculine boldneſs in a woman is diſagreeable; the term *virago* conveys an offenſive idea. The female warriors of antiquity, whether real or fabulous, Camilla, Thaleſtris, and the whole community of AMAZONS, were unamiable perſonages. But female courage exerted in defence of a child, a huſband, or a near relation, would be true fortitude, and deſerve the higheſt encomiums.

The motives to fortitude are many and powerful. This virtue tends greatly to the happineſs of the individual, by giving compoſure and preſence of mind, and keeping the other paſſions in due ſubordination. To public good it is eſſential; for without it, the independence and liberty of nations would be impoſſible. It gives to a character that elevation which poets, orators, and hiſtorians, have in all ages vied with one another to celebrate. Nothing ſo effectually inſpires it as rational piety; the fear of God is the beſt ſecurity againſt every other fear. A true eſtimate of human life; its ſhortneſs and uncertainty; the numberleſs evils and temptations to which by a long continuance in this world we muſt unavoidably be expoſed; ought by no means to diſcourage or to throw any gloom on our future proſpects: they ſhould teach us, that many things are more formidable than death; and that nothing is loſt, but much gained, when, by the appointment of Providence, a well-ſpent life is brought to a concluſion.

Let it be conſidered too, that puſillanimity and fearfulneſs can never avail us any thing. On the contrary, they debaſe our nature, poiſon all our comforts, and make us deſpicable in the eyes of others; they darken our reaſon, diſconcert our ſchemes, enfeeble our efforts, extinguiſh our hopes, and add tenfold poignancy to all the evils of life. In battle, the brave ſoldier is in leſs danger than the coward; in leſs danger even of death and wounds, becauſe better prepared to defend himſelf; in far leſs danger of infelicity; and has before him the animating hope of victory and honour. So in life, the man of true fortitude is in leſs danger of diſappointment than others are, becauſe his underſtanding is clear, and his mind diſencumbered; he is prepared to meet calamity without the fear of ſinking under it; and he has before him the near proſpect of another life, in which they who piouſly bear the evils of this will obtain a glorious reward.

FORTUNA, a goddeſs worſhipped with great devotion by the ancient Greeks and Romans; who believed her to preſide over human affairs, and to diſtribute wealth and honour at her pleaſure. See FORTUNE. Fortunate, Fortune.

FORTUNATE-ISLANDS, in ancient geography, certain iſlands (concerning the ſituation of which authors are not agreed) famous for the golden apples of the HESPERIDES.—The common opinion is, that they are the *CANARY Iſlands.*

FORTUNE (Τυχη), a name which among the ancients ſeems to have denoted a principle of fortuity, whereby things came to paſs, without being neceſſitated thereto: but what and whence that principle is, they do not ſeem to have ever preciſely thought. Hence their philoſophers are often intimating, that men only framed the phantom *Fortune* to hide their ignorance; and that they call *Fortune* whatever befals a man without his knowing for what purpoſe. Hence Juvenal (ſat. x. ver. 366.) affirms, they were men who made a deity of Fortune.

Nullum numen abeſt, ſi ſit prudentia; ſed te
Nos facimus, Fortuna, deam, cœloque locamus.

The ingenious Mr Spence gives another reading of this paſſage:

Nullum numen habes, ſi ſit prudentia; ſed te
Nos facimus, Fortuna, deam cœloque locamus.

This reading, he thinks, agrees beſt with the context: Juvenal ſays, ver. 356. that the two things we ſhould pray for are good health and good ſenſe; that we might be the authors of our own happineſs if we pleaſed, ver 363; that virtue is the only way to true happineſs, ver. 364; that if we ourſelves are prudent, Fortune has no power over us; and that, in truth, ſhe is no goddeſs at all, and has only uſurped a ſeat in heaven from the folly of mankind, ver. 366. Fortune was not conſidered as a deity by the old Romans, but was made ſo by the devotion and folly of the vulgar; and Mr Spence ſays, that he has ſeen an ancient gem, in which Cybele, the mother of the gods, is repreſented as turning away her head from Fortune, in an attitude of diſowning and rejecting her; (Polymetis, p. 150, 154. &c.)

According to the opinion of the heathens, therefore, fortune in reality was only the arrival of things in a ſudden and unexpected manner, without any apparent cauſe or reaſon: ſo that the philoſophical ſenſe of the word coincides with what is vulgarly called *chance.*

But in religion it had a farther force; altars and temples in great numbers were conſecrated to this Fortune, as a deity. This intimates, that the heathens had perſonified, and even deified, their chance; and conceived her as a ſort of goddeſs, who diſpoſed of the fate of men at her pleaſure. Hence that invocation of Horace, *O diva, gratum quæ regis Antium,* in the 35th ode of the firſt book, where he recommends Auguſtus, then preparing for a viſit to Britain, to her protection. From theſe different ſentiments it may be inferred, that the ancients at one time took Fortune for a peremptory cauſe, bent upon doing good to ſome, and perſecuting others; and ſometimes for a blind inconſtant cauſe, without any view or determination at all.

If then the word *fortune* had no certain idea in the mouth of thoſe who erected altars to her, much leſs can it be aſcertained what it denotes in the mind o

Fortune || Forum.

those who now use the word in their writings. They who would substitute the name *Providence* in lieu of that of *Fortune*, cannot give any tolerable sense to half the phrases wherein the word occurs.

Horace paints the goddess, preceded by Necessity, holding nails and wedges in her hands, with a crampiron, and melted lead to fasten it; rarely accompanied with Fidelity, unless when she abandons a family; for in that case Fidelity never fails to depart with her, as well as friends.

She is disrespectfully spoken of by most of the Roman writers, and represented as blind, inconstant, unjust, and delighting in mischief, (*Ovid. ad Liv* ver. 52. ver. 374. *Hor.* lib. i. od. 34. ver. 26. lib. iii. od. 29. ver. 51. *Statius*, Theb. xii. ver. 505.) However, they had a good as well as a bad Fortune, a constant and inconstant Fortune; the latter of which was represented with wings, and a wheel by her, (*Hor.* lib. iii. od. 29. ver. 56.) Juvenal alludes to a statue of Fortune, which exhibited her under a very good character, as the patroness of the poor infants that were exposed by their parents in the streets, (*Sat.* vi. ver. 605.)

The painters represent her in a woman's habit, with a bandage before her eyes, to show that she acts without discernment; and standing on a wheel, to express her instability. The Romans, says Lactantius, represented her with a cornucopia, and the helm of a ship, to show that she distributes riches, and directs the affairs of the world. In effect, it is with such characters that we see her represented on so many medals, with the inscriptions, FORTVNA AVG. FORTVNA REDVX. FORTVNÆ AVG. or REDVCIS, &c. Sometimes she is seen pointing at a globe before her feet, with a sceptre in one hand, and holding the cornucopia in the other.

The Romans had a virile as well as a muliebrian Fortune, for the objects of their adoration: the *Fortuna virilis* was honoured by the men, and the *Fortuna muliebris* by the women. They honoured Fortune also under a variety of other appellations.

The Romans derived the worship of Fortune from the Greeks, under the reign of Servius Tullius, who dedicated the first temple to her in the public market. Nero also built a temple to Fortune. The Fortune worshipped at Antium was probably of the most exalted character of any among the Romans; if we may judge by the account which Horace gives us of the great solemn processions that were made to her, (*Hor.* lib. i. od. 35. ver. 22.) But the most celebrated temple of Fortune was at Præneste. Statius speaks of several Fortunes there, and calls them the *Præneſtinæ sorores*, (Lib. i. Sylv. iii. ver. 80.)

Fortune-Tellers. Persons pretending to tell fortunes are to be punished with a year's imprisonment, and standing four times on the pillory. Stat. 9 Geo. II. c. 5.

FORTY-DAYS *Court*, the court of *attachment* or *woodmote*, held before the verderors of the forest once every forty days, to inquire concerning all offenders against vert and venison. See ATTACHMENT.

FORUM, in Roman antiquity, a public standing place within the city of Rome, where causes were judicially tried, and orations delivered to the people.

FORUM was also used for a place of traffic, answering to our market-place. These were generally called *fora venalia*; in contradistinction to the former, which were called *fora civilia*. Forum.

The *fora civilia* were public courts of justice, very magnificent in themselves, and surrounded with porticos and stately edifices; of these there were six very remarkable: 1. *Forum Romanum*. 2. *Julianum*. 3 *Augustum*. 4. *Palladium*. 5. *Forum Trajani*. 6. *Forum Salustii*. The *Forum Romanum* was the most noted, and is often called simply *Forum*, by way of eminence. Here was the pleading place called *Rostra*, the *Comitium*, the sanctuary of *Saturn*, temple of *Castor*, &c. See ROSTRA, COMITIUM, &c.

The *fora venalia*, or market-places, were very numerous. The chief of them were the *forum boarium* for oxen or beef; *suarium* for swine; *pistorium* for bread; *cupedinarium* for dainties; *olitorium* for garden stuff.

The Grecian Ἀγοραὶ exactly correspond with the Roman *fora*, being places where courts and markets were held. At Athens they had many *fora*, but the chief of them were the *old* and the *new*.

Forum Indicere, was the act of the prætor appointing the place in Rome where causes were to be tried. *Agere forum* denoted the bringing on causes out of Rome, in a Roman province (Cicero, Suetonius); the same with *agere conventum* (Florus).

The term *forum* added to a proper name, denoted some market town or borough; as,

Forum Allieni, a place mentioned only by Tacitus; and, from what he says of it, thought to be *Ferrara*, capital of the duchy of that name in Italy. E. Long. 12. 5. N. Lat. 44. 46.

Forum Appii (Cicero, Luke); a town of the Volsci, in Latium, on the Via Appia, a little beyond the Tres Tabernæ; set down in the Jerusalem Itinerary as situated near the river Nymphæus: now entirely extinct.

Forum Cornelii, a town of the Cispadana, built by Sylla: Now *Imola*, a city in the Romania, and territory of the pope. E. Long. 12. 12. N. Lat. 44. 30.

Forum Domitii, a town of Gallia Narbonensis: probably built by Ahenobarbus Domitius, who commanded in those parts: Now *Frontignan*, or *Frontigniac*, in Languedoc, near the Mediterranean. E. Long. 3. 30. N. Lat. 43. 30.

Forum Fulvii, a town of Liguria, furnamed *Valentinum*; from which it is conjectured that it is now *Valenza*, in the duchy of Milan; which is confirmed by Peutinger's distances. E. Long. 9°. N. Lat 45°.

Forum Gallorum, a small town of the Cispadana, on the Via Æmilia, eight miles from Mutina, beyond the river Scultenna. Here Antony defeated Pansa, and was in his turn defeated by Hirtius: Now *Castelfranco*, in the territory of Bologna.—Another *Forum Gallorum*, a town of the Vascones in the Hither Spain: Now *Gurrea*, a small town of Arragon.

Forum Julium. There are several towns of this name; as a *Forum Julium*, of Gallia Narbonensis; or *Forojulium*: Now *Frejus*, or *Frejules*, in Provence, at the mouth of the Argens. *Forum Julium Carnorum*, to the north of Aquileia, in the Transpadana: Now *Cividal di Friuli*, formerly *Cividal d'Austria*, in the territory of Venice.

Forum Jutuntorum, a town of the Insubres, in the Transpadana: Now *Crema*, capital of the Cremasco;

Forum ‖ Foſſe.

in the territory of Venice. E. Long. 10. 15. N. Lat. 45. 20.

Forum Livii, a town of the Semanones, in the Ciſpadana: Now *Forli*, in Romania. E. Long. 12. 45. N. Lat 44. 25.

Forum Seguſianorum, ſituated on the eaſt ſide of the Liger, in Gallia Celtica: Now *Feurs*, on the Loire, in the Lionnois, capital of the territory of Forez. E. Long. 4. 15. N. Lat. 45. 44.

Forum Tiberii, a town of the Pagus Tigurinus, in Belgica, on the left or ſouth ſide of the Rhine: Now *Kayſerſtull*; literally the tribunal of Tiberius, which he held there when commander in the Rhetian war.

Forum Vulcani (Strabo); the *Campi Phlegraei* of Pliny: a place in Campania, encompaſſed with rocky eminences, near Puteoli, and diſtant from it two miles towards Naples, emitting ſmoke, and in ſome places flame, like a large extenſive furnace, and yielding ſelphur: Now called *Solfatara*, in the Terra di Lavoro.

FORUM, is alſo uſed, among caſuiſts, &c. for juriſdiction; thus they ſay, *In foro legis*, &c.

FOSS, or FOSSE, in fortification, &c. a ditch or moat. The word is French, formed of the Latin participle *foſſum*, of the verb *fodio* "I dig."

FOSS, *Foſſa*, in anatomy, a kind of cavity in a bone, with a large aperture, but no exit or perforation. When the aperture is very narrow, it is called a *ſinus*.

FOSS is particularly uſed for the cavity or denture in the back part of the neck.

FOSSA MAGNA, or NAVICULARIS, is an oblong cavity, forming the inſide of the *pudendum muliebre*, and which preſents itſelf upon opening the labia; and in the middle whereof are the *caruncule myrtiformes*. See ANATOMY, p. 470.

FOSSA, in our ancient cuſtoms, was a ditch full of water, where women committing felony were drowned; as men were hanged: *Nam et ipſi in omnibus tenementis ſuis omnem ab antiquo legalem habuere juſtitiam, videlicet ferrum, foſſam, furcas, et ſimilia.* In another ſenſe it is taken for a grave, as appears by theſe old verſes:

Hic jacent in foſſa Bede venerabilis oſſa;
Hic eſt ſepultus, qui bis erat hic cathedratus.

Foss-Way was anciently one of the four great Roman high-ways of England: ſo called, according to Cambden, becauſe it was ditched on both ſides, which was the Roman method of making highways.

FOSSARII, in antiquity, a kind of officers in the eaſtern church, whoſe buſineſs was to inter the dead.

Ciaconius relates, that Conſtantine created 950 foſſaries, whom he took out of the divers colleges or companies of tradeſmen: he adds, that they were exempted from taxes, ſervices, burdenſome offices, &c.

F. Goar, in his notes on the Greek Euchologion, inſinuates that the foſſarii were eſtabliſhed in the times of the apoſtles; and that the young men, who carried off the body of Ananias, and thoſe perſons full of the fear of God, who interred St Stephen, were of the number.

St Jerom aſſures us, that the rank of foſſarii held the firſt place among the clerks; but he is to be underſtood of thoſe clerks only who had the direction and intendance of the interment of the devout.

FOSSE, the Roman military-way in South Britain, begins at Totneſs, and paſſes through Exeter, Ivelcheſter, Shepton-Mallet, Bath, Cirenceſter, Leiceſter, the Vale of Belvoir, Newark, Lincoln, to Barton upon the Humber, being ſtill viſible in ſeveral parts, tho' of 1400 years ſtanding. It had the name from the foſſes or ditches made by the ſides of it. Foſſil.

FOSSIL, in natural hiſtory, denotes, in general, every thing dug out of the earth, whether they be natives thereof, as metals, ſtones, ſalts, earths, and other minerals; or extraneous, repoſited in the bowels of the earth by ſome extraordinary means, as earthquakes, the deluge, &c. See METAL, STONE, &c. Plates CC & CCI.

Native foſſils, according to Dr Hill, are ſubſtances found either buried in the earth, or lying on its ſurface, of a plain ſimple ſtructure, and ſhowing no ſigns of containing veſſels or circulating juices. Theſe are ſubdivided by the ſame author, 1. Into foſſils naturally and eſſentially ſimple. Of theſe, ſome are neither inflammable nor ſoluble in water; as ſimple earths, tales, fibrariæ, gypſum, ſelenitæ, cryſtal, and ſpars: others, though uninflammable, are ſoluble in water; as all the ſimple ſalts: and others, on the contrary, are inflammable, but not ſoluble in water; as ſulphur, auripigmentum, zarnich, amber, ambergreaſe, gagates, aſphaltum, ampelites, lithanthrax, naphtha, and piſſaſphalta. 2. The ſecond general ſubdiviſion of foſſiis comprehends all ſuch as are naturally compound, but unmetallic. Of theſe, ſome are neither inflammable, nor ſoluble in water; as compound earths, ſtones, ſeptariæ, ſiderochita, ſemipellucid gems, &c. others are ſoluble in water, but not inflammable; as all the metallic ſalts: and, laſtly, ſome are inflammable, but not ſoluble in water; as the marcaſites, pyritæ, and phlogonia. 3. The third, and laſt, general diviſion of foſſils comprehends all the metallic ones; which are bodies naturally hard, remarkably heavy, and fuſible in fire. Of theſe, ſome are perfectly metallic, as being malleable when pure; ſuch are gold, lead, ſilver, copper, iron, and tin: others are imperfectly metallic, as not being malleable even in their pureſt ſtate; ſuch are antimony, biſmuth, cobalt, zinc, and quickſilver or mercury. Of all which ſubſtances, the reader will find a particular deſcription under their reſpective heads.

Extraneous foſſils are bodies of the vegetable or animal kingdoms accidentally buried in the earth. Of the vegetable kingdom, there are principally three kinds, trees or parts of them, herbaceous plants, and corals; and of the animal kingdom there are four kinds, ſeaſhells, the teeth or bony palates and bones of fiſhes, complete-fiſhes, and the bones of land-animals. See BONES, TREE, WOOD, PLANT, SHELL, &c.

Theſe adventitious or *extraneous* foſſils, thus found buried in great abundance in divers parts of the earth, have employed the curioſity of ſeveral of our lateſt naturaliſts, who have each their ſeveral ſyſtem to account for the ſurpriſing appearances of petrefied ſeafiſhes, in places far remote from the ſea, and on the tops of mountains; ſhells in the middle of quarries of ſtone; and of elephants teeth, and bones of divers animals, peculiar to the ſouthern climates, and plants only growing in the eaſt, found foſſile in our northern and weſtern parts.

Some will have theſe ſhells, &c. to be real ſtones, and

Foſſil, Foſter.

and ſtone plants, formed after the uſual manner of o ther figured ſtones; of which opinion is the learned Dr Liſter.

Another opinion is, that theſe foſſil ſhells, with all their foreign bodies found within the earth, as bones, trees, plants, &c. were buried therein at the time of the univerſal deluge; and that, having been penetrated either by the bituminous matter abounding chiefly in watery places, or by the ſalts of the earth, they have been preſerved entire, and ſometimes petrefied.

Others think, that thoſe ſhells, found at the tops of the higheſt mountains, could never have been carried thither by the waters, even of the deluge; inaſmuch as moſt of theſe aquatic animals, on account of the weight of their ſhells, always remain at the bottom of the water, and never move but cloſe along the ground. They imagine, that a year's continuance of the waters of the deluge, intermixed with the ſalt waters of the ſea, upon the ſurface of the earth, might well give occaſion to the production of ſhells of diverſe kinds in different climates; and that the univerſal ſaltneſs of the water was the real cauſe of their reſemblance to the ſea-ſhells, as the lakes formed daily by the retention of rain or ſpring water produce different kinds.

Others think, that the waters of the ſea, and the rivers, with thoſe which fell from heaven, turned the whole ſurface of the earth upſide down; after the ſame manner as the waters of the Loire, and other rivers, which roll in a ſandy bottom, overturn all their ſands, and even the earth itſelf, in their ſwellings and inundations; and that in this general ſubverſion, the ſhells came to be interred here, fiſhes there, trees there, &c. See Deluge.

Dr Woodward, in his Natural Hiſtory of the Earth, purſuing and improving the hypotheſis of Dr Burnet, maintains the whole maſs of earth, with every thing belonging thereto, to have been ſo broken and diſſolved at the time of the deluge, that a new earth was then formed on the boſom of the water, conſiſting of different ſtrata, or beds of terreſtrial matter, ranged over each other uſually according to the order of their ſpecific gravities. By this means, plants, animals, and eſpecially fiſhes and ſhells, not yet diſſolved among the reſt, remained mixed and blended among the mineral and foſſil matters; which preſerved them, or at leaſt aſſumed and retained their figures and impreſſions either indentedly, or in relievo.

See more on this ſubject under the article Earth, *paſſim*. See alſo Petrifactions and Strata.

Foſſile Pitch. See Petroleum.

FOSTER (Dr James), a moſt diſtinguiſhed and popular diſſenting miniſter, born at Exeter in 1697. He began to preach in 1718; and ſtrong diſputes ariſing ſoon after, among the diſſenters, concerning the Trinity and ſubſcription to teſts, his judgment determining him to the obnoxious opinions, the clamour grew loud againſt him, and occaſioned more than one removal. His talents were hid among obſcure country congregations, until 1724; when he was choſen to ſucceed Dr Gale in Barbican, where he laboured as paſtor above 20 years. The Sunday evening-lecture, begun in the Old Jury meeting-houſe in 1728, and which he conducted with ſuch uncommon applauſe for more than 20 years, indiſputably ſhowed his abilities as a preacher. Perſons of all perſuaſions and ranks in life flocked to hear him: and Mr Pope has honoured him with a commendatory couplet in his ſatires; which, however, his commentator laboured to deſtroy the intention of by a frivolous note. In 1746, he attended the unhappy lord Kilmarnock, at his execution on Tower-hill; an office which thoſe who lived with him imagined made too deep an impreſſion on his ſympathizing ſpirit, as his vivacity abated from that time. He died in 1753; after having publiſhed ſeveral valuable compoſitions and ſermons; particularly, 1. A Defence of Chriſtianity, againſt Tindal's Chriſtianity as old as the Creation. 2. An Eſſay on Fundamentals. 3. Four volumes of Sermons. 4. Diſcourſes on Natural Religion and Social Virtue, in 4to.

Foſter || Fothergill.

Foster (Samuel), an ingenious Engliſh mathematician of the laſt century, and aſtronomical profeſſor in Greſham college, was one of that learned aſſociation which met for cultivating the new philoſophy during the political confuſions, and which Charles II. eſtabliſhed into the Royal Society. Mr Foſter, however, died in 1652, before this incorporation took place; but wrote a number of mathematical and aſtronomical treatiſes, too many to particularize. There were two other mathematical ſtudents of this name; William Foſter, a diſciple of Mr Oughtred, who taught in London; and Mark Foſter, author of a treatiſe on trigonometry, who lived later than the former two.

FOTHER, or Fodder, is a weight of lead, containing eight pigs, and every pig one and twenty ſtone and a half; ſo that it is about a ton or common cart-load. Among the plumbers in London, it is nineteen hundred and a half; and at the mines it is two and twenty hundred and a half. The word is of Teutonic origin, from *fuder*.

FOTHERGILL (Dr George), was born in Weſtmoreland in 1705, where his family had been long ſeated on a competent eſtate that had deſcended regularly for ſeveral generations. After an academical education in Queen's college, Oxford, of which he became a fellow, he was, in 1751, elected principal of St Edmund's-hall, and preſented to the vicarage of Brumley in Hampſhire. Having been long afflicted with an aſthma, he died in 1760. He was the author of a collection of much eſteemed ſermons, in 2 vols 8vo. The firſt volume conſiſts of occaſional diſcourſes, publiſhed by himſelf; the ſecond printed from his MSS.

Fothergill (Dr John), a late eminent phyſician, ſon of John and Margaret, quakers, was born in 1712, at Carr End in Yorkſhire, where his father, who had been a brewer at Knareſborough (after having travelled from one end of America to the other), lived retired on a ſmall eſtate which he cultivated. The Doctor was the ſecond of five children (four ſons and a daughter), and received his education under the care of his grandfather Thomas Hough, a perſon of fortune in Cheſhire (which gave him a predilection for that county), and at Sedburg in Yorkſhire. He afterwards ſerved his time to one Mr Bartlett an apothecary at Bradford. From thence he removed to London, and became a pupil of Dr (afterwards Sir Edward) Wilmot, at St Thomas's Hoſpital. He then went to the univerſity of Edinburgh to ſtudy phyſic, and took his doctor's degree there. From Edinburgh he went to Leyden; whence, after a ſhort ſtay, he returned to London, and began to practiſe about the year 1740, in

Fothergill in a houſe in White-hart Court, Lombard-ſtreet, where he reſided during the greateſt part of his life, and acquired moſt of his fortune. In 1746, he was admitted a licentiate of the college of phyſicians in London; and in 1754 a fellow of that of Edinburgh, to which he was a conſiderable benefactor. He afterwards became a member of the Royal Medical Society at Paris, and a member both of the Royal and Antiquarian Societies. He continued his practice with uninterrupted ſucceſs till within the laſt two years of his life, when the illneſs which he had brought on himſelf by unremitted attention, obliged him to give up a conſiderable part of it. Beſides his application to medical ſcience, he had imbibed an early taſte for natural hiſtory, improved by his friend Peter Collinſon, and employed himſelf on coquillage and ſmaller objects of botany. He was for many years a valuable contributor to the Gentleman's Magazine; where his obſervations on the weather and diſeaſes were begun in April 1751, and diſcontinued in the beginning of 1756, being diſappointed in his views of exciting other experienced phyſicians in different parts to imitate the example. He had very extenſive practice, but he did not add to his art any great or various improvements. His pamphlet on the ulcerous ſore throat is, on every account, the beſt of his publications; but owes much of its merit to the information of the late Dr Letherland. It was firſt printed in 1748, on the re-appearance of that fatal diſorder which in 1739 had carried off the two only ſons of Mr Pelham. In 1762 Dr Fothergill purchaſed an eſtate at Upton in Eſſex; and formed a botanic garden there, the ſecond in Europe: Kew is the firſt. In 1766 he began regularly to withdraw, from Midſummer to Michaelmas, from the exceſſive fatigue of his profeſſion, to Lee Hall, near Middlewich, in Cheſhire; which, though he only rented it by the year, he had ſpared no expence to improve. He took no fees during this receſs, but attended to preſcribe gratis at an inn at Middlewich once a-week. In 1767, after he found himſelf obliged to relax his attention to buſineſs, he removed from his houſe in the city, to reſide in Harpur-ſtreet, Red-Lion Square. Some time before his death he had been induſtrious to contrive a method of generating and preſerving ice in the Weſt-Indies. He was the patron of Sidney Parkinſon, and drew up the preface prefixed to his account of the voyage to the South Seas. At his expence alſo was made and printed an entire new tranſlation of the whole Bible, from the Hebrew and Greek originals, by Anthony Purver, a quaker, in two volumes, 1764. folio, and alſo, in 1780, an edition of biſhop Percy's "Key to the New Teſtament," adapted to the uſe of a ſeminary of young Quakers, at Acworth, near Leeds in Yorkſhire, founded in 1778 by the Society, who purchaſed, by a ſubſcription in which Dr Fothergill ſtood foremoſt, the houſe and an eſtate of thirty acres which the Foundling Hoſpital held there, but which they found inconvenient for their purpoſe on account of diſtance. The Doctor himſelf firſt projected this on the plan of a ſmaller inſtitution of the ſame kind at Gilderſomes. He alſo endowed it handſomely by his will. It now contains above 300 children of both ſexes, who are cloathed and inſtructed. Among the other beneficent ſchemes ſuggeſted by Dr Fothergill were thoſe of bringing fiſh to London by land carriage, which, though it did not in every reſpect ſucceed, tended to deſtroy a ſuppoſed combination; and of rendering bread much cheaper, though equally wholeſome, to the poor, by making it with one part of potatoes and three parts of houſehold flour. But his public benefactions, his encouragements of ſcience, the inſtances of his attention to the health, the police, the convenience of the metropolis, &c. we cannot pretend to ſpecify. The fortune which Dr Fothergill had acquired was immenſe; and, taking all things together, the houſe and moveables in Harpur-ſtreet, the property in Eſſex, and the eſtate in Cheſhire (which he held on a leaſe), and his ready money, amounted to L.80,000. His buſineſs when he was in full practice was calculated at near L. 7000 per annum. In the influenza of 1775 and 1776, he is ſaid to have had 60 patients on his liſt daily, and his profit was eſtimated at L. 8000 per annum. Fothergill, Fothergilla.

The diſorder which haſtened his death was a ſcirrhus of the proſtata, and an obſtruction in the bladder (in which were found after his death two quarts of water), which had been gradually coming on him for ſix years paſt, occaſioned by a delicacy, which made him unwilling to alight from his carriage; and when, after his temporary recovery from it the year before he died, he ſubmitted to uſe relief in his carriage, it was too late. He died at his houſe in Harpur-ſtreet, December 26. 1780; and his remains were interred, January 5. in the Quakers burying ground at Winchmore-hill, whither they were accompanied by more than 70 coaches and poſt-chaiſes, notwithſtanding the intention of the executors to have the funeral private. The Doctor by his will appointed, that his ſhells, and other pieces of natural hiſtory, ſhould be offered to the late Dr Hunter at L. 500 under the valuation he ordered to be taken of them. Accordingly Dr Hunter bought them for L. 1200. The drawings and collections in natural hiſtory were alſo to be offered to Mr (now Sir Joſeph) Banks at a valuation. His Engliſh portraits and prints, which had been collected by Mr John Nickolls of Ware, and purchaſed by him for 80 guineas, were bought for 200 guineas by Mr Thane. His books were ſold by auction, April 30. 1781, and the eight following days. His houſe and garden at Upton, in which 15 men were conſtantly employed, were valued at L. 10,000. He ſpared no expence to augment this as well as his other collections. He had an ingenious artiſt qualified to collect for him at the Cape of Good Hope, and another on the Alps, and employed for ſeveral years before his death a painter in natural hiſtory at Leeds.

Dr Fothergill's character was excellent. A tranſaction, indeed, with regard to one Dr Leeds, gave occaſion to ſome of his enemies to blame him; but how unjuſtly, has been abundantly ſhown by his biographers Dr Elliott and Dr Lettſome. Beſides the pamphlet already mentioned, Dr Fothergill wrote a conſiderable number of Tracts, which are now collected into one volume 8vo, by Dr Elliott. He ſometimes wrote in the newſpapers, and is ſaid to have been the author of more than 100 letters in the Gazeteer concerning the New Pavement.

FOTHERGILLA, in botany: A genus of the digynia order, belonging to the polyandria claſs of plants. The

Fothering || Foul. The calyx is lobed, moſt entire; there is no corolla; the germen bifid; the capſule bilocular; and the cells two-valved; the ſeeds ſolitary and bony.

FOTHERING, a peculiar method of endeavouring to ſtop a leak in the bottom of a ſhip while ſhe is afloat, either under ſail or at anchor. It is uſually performed in the following manner: A baſket is filled with aſhes, cinders, and chopped rope-yarns, and looſely covered with a piece of canvas; to this is faſtened a long pole, by which it is plunged repeatedly in the water, as cloſe as poſſible to the place where the lake is conjectured to lie. The oakum or chopped rope-yarns being thus gradually ſhaken through the twigs, or over the top of the baſket, are frequently ſucked into the hole along with the water, ſo that the leak becomes immediately choaked; and the future entrance of the water is thereby prevented.

FOTHERINGAY, a town of Northamptonſhire, about four miles from Staneford, ſituated on the river Avon or Nen, and conſiſting of one ſtreet. Edward duke of York in the reign of Henry V. founded and endowed a fine collegiate church here, in which he was interred. At the Diſſolution the college and the choir were pulled down, and the bodies of the founder and his family left expoſed till queen Elizabeth's time, who ordered them to be interred, and the preſent monuments to be erected. On the north ſide of the church is a free ſchool, founded by Henry VII. or Edward VI. endowed with L.20 *per annum* for a maſter, payable out of the exchequer by the receiver of the county. The bridge over the river here was firſt built by queen Elizabeth, 1573, of timber, with three pillars upon the foundation. Daniel, firſt earl of Nottingham, and the other truſtees for William Saville, marquis of Halifax, rebuilt it, in 1722, of freeſtone from King's Cliffe. On the ſouth-eaſt ſide of the Cliffe ſtood the caſtle; which was of great antiquity and conſiderable ſtrength. Mary queen of Scots, who had been in the cuſtody of Sir Amias Powlet here, was tried and beheaded in the hall; and her ſon afterwards, forgiving and even taking into favour her greateſt enemy Cecil, only took the childiſh revenge of beating down the caſtle; which he ſo completely demoliſhed, that no more than the earthworks now remain. Within the firſt work is a farm-houſe with ſome carved ſtones wrought into it, and at the ſouth-weſt corner of the inner trench are ſome maſſes of ſtone-walls. Sir Robert Cotton carried the wainſcot of the hall to Connington.

FOU-TCHEOU, a city of China, in the province of Fo-KIEN. It carries on a conſiderable trade; but is chiefly remarkable for the magnificence of its principal bridge, which has more than 100 arches, conſtructed of white ſtone, and ornamented with a double baluſtrade throughout. This city is the reſidence of a viceroy, and has under its juriſdiction nine cities of the third claſs.

FOUGADE, or FOUGASSE, in the art of war, a little mine, about 8 or 10 feet wide, and 10 or 12 deep, dug under ſome work or poſt, which is in danger of falling into the enemy's hands; and charged with ſacks of powder, covered with ſtones, earth, and whatever elſe can make great deſtruction. It is ſet on fire like other mines, with a faucciſſe. See MINE.

FOUL, or FOULE, in the ſea-language, is uſed when a ſhip has been long untrimmed, ſo that the graſs-weeds, or barnacles, grow to her ſides under water. A rope is alſo foul when it is either tangled in itſelf, or hindered by another, ſo that it cannot run or be over-hawled. Foul || Foundation.

FOUL imports, alſo, the running of one ſhip againſt another. This happens ſometimes by the violence of the wind, and ſometimes by the careleſſneſs of the people on board, to ſhips in the ſame convoy, and to ſhips in port by means of others coming in. The damages occaſioned by running foul, are of the nature of thoſe in which both parties muſt bear a ſhare. They are uſually made half to fall upon the ſufferer, and half upon the veſſel which did the injury: but in caſes where it is evidently the fault of the maſter of the veſſel, he alone is to bear the damage.

Foul-Water. A ſhip is ſaid to make foul-water, when, being under ſail, ſhe comes into ſuch ſhoal-water, that though her keel do not touch the ground, yet it comes ſo near it, that the motion of the water under her raiſes the mud from the bottom.

FOUL is alſo a diſeaſe in cattle, proceeding from blood, and a wateriſh rheum that falls down into the legs, and makes them ſwell.

FOUL or *Pimpled Face.* See *GUTTA Roſacea.*

FOULA, or *Foul Iſland*, one of the Shetland iſles, lying between ſix and ſeven leagues weſt from the main land. It is about three miles long, narrow, and full of rough, ſteep, and bare rocks; one of which is ſo large, and runs up to ſuch an height, that it may be clearly ſeen from Orkney. This, therefore, may be reckoned with the greateſt probability to be the Thule of Tacitus, whatever might be the Thule of the Phenicians and Greeks. It has ſcarce any paſturage, and but very little arable land; but that, however ſmall in extent, is very fertile, out of the produce of which, with fowl and fiſh, the poor inhabitants ſubſiſt. They have nothing that can be called a port; and the only commodities they have are ſtock-fiſh, train-oil, and feathers.

FOUMART, in zoology, a ſpecies of MUSTELA.

FOUNDATION, in architecture, is that part of a building which is under-ground. See ARCHITECTURE, n° 96 *et ſeq.* and n° 130, &c.

Palladio allows a ſixth part of the height of the whole building for the hollowing or under-digging; unleſs there be cellars under ground, in which caſe he would have it ſomewhat lower.

FOUNDATION, denotes alſo a donation or legacy, either in money or lands, for the maintenance and ſupport of ſome community, hoſpital, ſchool, &c.

The king only can found a college, but there may be a college in reputation founded by others. If it cannot appear by inquiſition who it was that founded a church or college, it ſhall be intended that it was the king, who has power to found a new church, &c. The king may found and erect an hoſpital, and give a name to the houſe upon the inheritance of another, or licenſe another perſon to do it upon his own lands; and the words *fundo*, *ereo*, &c. are not neceſſary in every foundation, either of a college or hoſpital, made by the king; but it is ſufficient if there be words equivalent: the incorporation of a college or hoſpital is the very foundation; but he who endows it with lands is the founder; and to the erection of an hoſpital, nothing more is requiſite but the incorporation and foundation. *Jacob's Law Dict.*

Perſons

Founder, Foundery. Perſons ſeiſed of eſtates in fee-ſimple, may erect and found hoſpitals for the poor by deed enrolled in chancery, &c. which ſhall be incorporated, and ſubject to ſuch viſitors as the founder ſhall appoint, &c. ſtat. 39 Eliz. c. 5.

FOUNDER, in a general ſenſe, the perſon who lays a foundation, or endows a church, ſchool, religious houſe, or other charitable inſtitution. See FOUNDATION.

FOUNDER, alſo implies an artiſt who caſts metals, in various forms, for different uſes, as guns, bells, ſtatues, printing-characters, candleſticks, buckles, &c. whence they are denominated gun-founders, bell-founders, figure-founders, letter-founders, founders of ſmall works, &c. See FOUNDERY.

FOUNDER, in the ſea language: A ſhip is ſaid to founder, when by an extraordinary leak, or by a great ſea breaking in upon her, ſhe is ſo filled with water, that ſhe cannot be freed of it; ſo that ſhe can neither veer nor ſteer, but lie like a log; and not being able to ſwim long, will at laſt ſink.

FOUNDERED, in farriery. See there, § xli.

FOUNDERY, or FOUNDRY, the art of caſting all ſorts of metals into different forms. It likewiſe ſignifies the work-houſe or ſmelting-hut wherein theſe operations are performed.

Foundery of Small Works, or Caſting in Sand. The ſand uſed for caſting ſmall-works is at firſt of a pretty ſoft, yellowiſh, and clammy nature: but it being neceſſary to ſtrew charcoal-duſt in the mould, it at length becomes of a quite black colour. This ſand is worked over and over, on a board, with a roller, and a ſort of knife; being placed over a trough to receive it, after it is by theſe means ſufficiently prepared.

This done, they take a wooden board of a length and breadth proportional to the things to be caſt, and putting a ledge round it, they fill it with ſand, a little moiſtened, to make it duly cohere. Then they take either wood or metal models of what they intend to caſt, and apply them ſo to the mould, and preſs them into the ſand, as to leave their impreſſion there. Along the middle of the mould is laid half a ſmall braſs cylinder, as the chief canal for the metal to run through, when melted, into the models or patterns: and from this chief canal are placed ſeveral others, which extend to each model or pattern placed in the frame. After this frame is finiſhed, they take out the patterns, by firſt looſening them all round, that the ſand may not give way.

Then they proceed to work the other half of the mould with the ſame patterns in juſt ſuch another frame; only that it has pins, which, entering into holes that correſpond to it in the other, make the two cavities of the pattern fall exactly on each other.

The frame, thus moulded, is carried to the melter; who, after extending the chief canal of the counterpart, and adding the croſs canals to the ſeveral models in both, and ſtrewing mill-duſt over them, dries them in a kind of oven for that purpoſe.

Both parts of the mould being dry, they are joined together by means of the pins; and to prevent their giving way, by reaſon of the melted metal paſſing thro' the chief cylindrical canal, they are ſcrewed or wedged up like a kind of preſs.

While the moulds are thus preparing, the metal is ſuſing in a crucible of a ſize proportionate to the quantity of metal intended to be caſt. Foundery.

When the moulds are coolish, the frames are unſcrewed, or unwedged, and the caſt work taken out of the ſand, which ſand is worked over again for other caſtings.

Foundery of Statues. The caſting of ſtatues depends on the due preparation of the pit, the core, the wax, the outer mould, the inferior furnace to melt off the wax, and the upper to fuſe the metal. The pit is a hole dug in a dry place ſomething deeper than the intended figure, and made according to the prominence of certain parts thereof. The inſide of the pit is commonly lined with ſtone, or brick; or, when the figure is very large, they ſometimes work on the ground, and raiſe a proper fence to reſiſt the impulſion of the melted metal.

The inner mould, or core, is a rude maſs to which is given the intended attitude and contours. It is raiſed on an iron grate, ſtrong enough to ſuſtain it, and is ſtrengthened within by ſeveral bars of iron. It is generally made either of potter's clay, mixed with hair and horſe-dung; or of plaſter of Paris mixed with brick-duſt. The uſe of the core is to ſupport the wax, the ſhell, and leſſen the weight of the metal. The iron bars and the core are taken out of the braſs figure through an aperture left in it for that purpoſe, which is ſoldered up afterwards. It is neceſſary to leave ſome of the iron bars of the core, that contribute to the ſteadineſs of the projecting part, within the braſs figure.

The wax is a repreſentation of the intended ſtatue. If it be a piece of ſculpture, the wax ſhould be all of the ſculptor's own hand, who uſually forms it on the core: Though it may be wrought ſeparately in cavities, moulded on a model, and afterwards arranged on the ribs of iron over the grate; filling the vacant ſpace in the middle with liquid plaſter and brick-duſt, whereby the inner core is proportioned as the ſculptor carries on the wax.

When the wax, which is the intended thickneſs of the metal, is finiſhed, they fill ſmall waxen tubes perpendicular to it from top to bottom, to ſerve both as canals for the conveyance of the metal to all parts of the work; and as vent-holes, to give paſſage to the air, which would otherwiſe occaſion great diſorder when the hot metal came to encompaſs it.

The work being brought thus far, muſt be covered with its ſhell, which is a kind of cruſt laid over the wax, and which being of a ſoft matter, eaſily receives the impreſſion of every part, which is afterwards communicated to the metal upon its taking the place of the wax, between the ſhell and the mould. The matter of this outer mould is varied according as different layers are applied. The firſt is generally a compoſition of clay, and old white crucibles well ground and ſifted, and mixed up with water to the conſiſtence of a colour fit for painting: accordingly they apply it with a pencil, laying it ſeven or eight times over, and letting it dry between whiles. For the ſecond impreſſion, they add horſe-dung and natural earth to the former compoſition. The third impreſſion is only horſe-dung and earth. Laſtly, the ſhell is finiſhed by laying on ſeveral more impreſſions of this laſt matter, made very thick with the hand.

The ſhell, thus finiſhed, is ſecured by ſeveral iron

Foundery. girths, bound round it, at about half a foot diſtance from each other, and faſtened at the bottom to the grate under the ſtatue, and at top to a circle of iron where they all terminate.

If the ſtatue be ſo big that it would not be eaſy to move the moulds with ſafety, they muſt be wrought on the ſpot where it is to be caſt. This is performed two ways: in the firſt, a ſquare hole is dug under ground, much bigger than the mould to be made therein, and its inſide lined with walls of free-ſtone or brick. At the bottom is made a hole of the ſame materials, with a kind of furnace, having its aperture outwards: in this is a fire made to dry the mould, and afterwards melt the wax. Over this furnace is placed the grate, and upon this the mould, &c. formed as above. Laſtly, at one of the edges of the ſquare pit, is made another large furnace to melt the metal. In the other way, it is ſufficient to work the mould above ground, but with the like precaution of a furnace and grate underneath. When finiſhed, four walls are to be run around it, and by the ſide thereof a maſſive made for a melting-furnace. For the reſt the method is the ſame in both. The mould being finiſhed, and incloſed as deſcribed, whether under ground or above it, a moderate fire is lighted in the furnace under it, and the whole covered with planks, that the wax may melt gently down, and run out at pipes contrived for that purpoſe, at the foot of the mould, which are afterwards exactly cloſed with earth, ſo ſoon as the wax is carried off. This done, the hole is filled up with bricks thrown in at random, and the fire in the furnace augmented, till ſuch time as both the bricks and mould become red hot. After this, the fire being extinguiſhed, and every thing cold again, they take out the bricks, and fill up their place with earth moiſtened, and a little beaten to the top of the mould, in order to make it the more firm and ſteady. Theſe preparatory meaſures being duly taken, there remains nothing but to melt the metal, and run it into the mould. This is the office of the furnace above deſcribed, which is commonly made in the form of an oven with three apertures, one to put in the wood, another for a vent, and a third to run the metal out at. From this laſt aperture, which is kept very cloſe, while the metal is in fuſion, a ſmall tube is laid, whereby the melted metal is conveyed into a large earthen baſon, over the mould, into the bottom of which all the big branches of the jets, or calls, which are to convey the metal into all the parts of the mould, are inſerted.

Theſe calls or jets are all terminated with a kind of plugs, which are kept cloſe, that, upon opening the furnace, the braſs, which guſhes out with violence, may not enter any of them, till the baſon be full enough of matter to run into them all at once. Upon which occaſion they pull out the plugs, which are long iron rods with a head at one end, capable of filling the whole diameter of each tube. The whole of the furnace is opened with a long piece of iron fitted at the end of each pole, and the mould filled in an inſtant. This completes the work in relation to the caſting part; the reſt being the ſculptor's or carver's buſineſs, who, taking the figure out of the mould and earth wherewith it is encompaſſed, ſaws off the jets with which it appears covered over, and repairs it with chiſſels, gravers, puncheons, &c.

Foundery of Bells. The metal, it is to be obſerved, is different for bells from what it is for ſtatues; there being no tin in the ſtatue-metal: but there is a fifth, and ſometimes more, in the bell-metal. Foundery.

The dimenſions of the core and the wax for bells, if a ring of bells eſpecially, are not left to chance, but muſt be meaſured on a ſcale, or diapaſon, which gives the height, aperture, and thickneſs, neceſſary for the ſeveral tones required.

It is on the wax that the ſeveral mouldings and other ornaments and inſcriptions, to be repreſented in relievo on the outſide of the bell, are formed. The clapper or tongue is not properly a part of the bell, but is furniſhed from other hands. In Europe, it is uſually of iron, with a large knob at the extreme; and is ſuſpended in the middle of the bell. In China, it is only a huge wooden mallet, ſtruck by force of arm againſt the bell; whence they can have but little of that conſonancy ſo much admired in ſome of our rings of bells. The Chineſe have an extraordinary way of increaſing the ſound of their bells; viz. by leaving a hole under the cannon; which our bell founders would reckon a defect.

The proportions of our bells differ very much from thoſe of the Chineſe. In ours, the modern proportions are, to make the diameter 15 times the thickneſs of the brim, and the height 12 times. The parts of a bell are, 1. The ſounding bow, terminated by an inferior circle, which grows thinner and thinner, 2. The brim or that part of a bell whereon the clapper ſtrikes, and which is thicker than the reſt. 3. The outward ſinking of the middle of the bell, or the point under which it grows wider to the brim. 4. The waiſt or furniture, and the part that grows wider and thicker quite to the brim. 5. The upper vaſe, or that part which is above the waiſt. 6. The pallet which ſupports the ſtaple of the clapper within. 7. The bent and hollowed branches of metal uniting with the cannons, to receive the iron keys, whereby the bell is hung up to the beam, which is its ſupport and counterpoiſe, when rung out.

The buſineſs of bell-foundery is reducible to three particulars. 1. The proportion of a bell. 2. The forming of the mould. And, 3. The melting of the metal. There are two kinds of proportions, viz. the ſimple and the relative; the former are thoſe proportions only that are between the ſeveral parts of a bell to render it ſonorous; the relative proportions eſtabliſh a requiſite harmony between ſeveral bells.

The method of forming the profile of a bell, previous to its being caſt, in which the proportion of the ſeveral parts may be ſeen, is as follows: the thickneſs of the brim, C1 (Plate CXCV.) is the foundation of every other meaſure, and is divided into three equal parts. Firſt, draw the line HD, which repreſents the diameter of the bell; biſect it in F and erect the perpendicular F f; let D F and H F be alſo biſected in E and G, and two other perpendiculars E e, G a, be erected at E and G: G E will be the diameter of the top or upper vaſe, *i. e.* the diameter of the top will be half that of the bell; and it will, therefore, be the diameter of a bell which will ſound an octave to the other. Divide the diameter of the bell or the line HD into 15 equal parts, and one of theſe will give C1 the thickneſs of the brim; divide again each of

theſe

Foundery

these 15 equal parts into three other equal parts, and then form a ſcale. From this ſcale take 12 of the larger diviſions or $\frac{2}{3}$ of the whole ſcale in the compaſs, and ſetting one leg in D deſcribe an arc to cut the line E e in N; draw N D, and divide this line into 12 equal parts; at the point 1 erect the perpendicular 1 C = 10, and C t will be the thickneſs of the brim = $\frac{1}{15}$ of the diameter: draw the line C D: biſect D N; and at the point of biſection 6 erect the perpendicular 6 K = $1\frac{1}{2}$ of the larger diviſions on the ſcale. With an opening of the compaſs equal to twice the length of the ſcale or 30 brims, ſetting one leg in N, deſcribe an arc of a circle, and with the ſame leg in K and the ſame opening deſcribe another arc to interſect the former: on this point of interſection as a centre, and with a radius equal to 30 brims, deſcribe the arc N K; in 6 K produced take K B = $\frac{1}{7}$ of the larger meaſure of the ſcale or $\frac{1}{7}$ of the brim, and on the ſame centre with the radius $30\frac{1}{7}$ brims deſcribe an arc A B parallel to N K. For the arc BC, take 12 diviſions of the ſcale or 12 brims in the compaſs; find a centre, and from that centre, with this opening, deſcribe the arc BC, in the ſame manner as N K or A B were deſcribed. There are various ways of deſcribing the arc K p; ſome deſcribe it on a centre at the diſtance of nine brims from the points p and K; others, as it is done in the figure, on a centre at the diſtance only of ſeven brims from thoſe points. But it is neceſſary firſt to find the point p, and to determine the rounding of the bell p 1. For this purpoſe, on the point C as a centre, and with the radius C 1, deſcribe the arc 1 p n; biſect the part 1, 2 of the line D n, and erecting the perpendicular p m, this perpendicular will cut the arc 1 p n in m, which terminates the rounding 1 p. Some founders make the bendings K a third of a brim lower than the middle of the line D N; others make the part C 1 D more acute, and inſtead of making C 1 perpendicular to DN at 1, draw it $\frac{1}{3}$th of a brim higher, making it ſtill equal to one brim; ſo that the line 1 D is longer than the brim C 1. In order to trace out the top-part N *a*, take in the compaſs eight diviſions of the ſcale or eight brims, and on the points N and D as centres, deſcribe arcs to interſect each other in 8: on this point 8, with a radius of eight brims, deſcribe the arc N b; this arc will be the exterior curve of the top or crown: on the ſame point 8 as a centre, and with a radius equal to $7\frac{1}{3}$ brims, deſcribe the arc A e, and this will be the interior curve of the crown, and its whole thickneſs will be one third of the brim. As the point 8 does not fall in the axis of the bell, a centre M may be found in the axis by deſcribing, with the interval of eight brims on the centres D and H, arcs which will interſect in M; and this point may be made the centre of the inner and outer curves of the crown as before. The thickneſs of the cap which ſtrengthens the crown at Q is about one-third of the thickneſs of the brim; and the hollow branches or ears about one-fixth of the diameter of the bell. The height of the bell is in proportion to its diameter as 12 to 15, or in the proportion of the fundamental ſound to its third major: whence it follows, that the ſound of a bell is principally compoſed of the ſound of its extremity or brim, as a fundamental of the ſound of the crown which is an octave to it, and of that of the height which is a third.

The particulars neceſſary for making the mould of a bell are, 1. The earth: the moſt coheſive is the beſt; it muſt be well ground and ſifted, to prevent any chinks. 2. Brick-ſtone; which muſt be uſed for the mine, mould, or core, and for the furnace. 3. Horſe-dung, hair, and hemp, mixed with the earth, to render the cement more binding. 4. The wax for inſcriptions, coats of arms, &c. 5. The tallow equally mixed with the wax, in order to put a ſlight lay of it upon the outer mould, before any letters are applied to it. 6. The coals to dry the mould. Foundery.

For making the mould, they have a ſcaffold conſiſting of four boards, ranged upon treſſels. Upon this they carry the earth, gruſsly diluted, to mix it with horſe-dung, beating the whole with a large ſpatula.

The compaſſes of conſtruction is the chief inſtrument for making the mould, which conſiſt of two different legs joined by a third piece. And laſt of all, the founders ſhelves, on which are the engravings of the letters, cartridges, coats of arms, &c.

They firſt dig a hole of a ſufficient depth to contain the mould of the bell, together with the caſe or cannon, under ground; and about ſix inches lower than the terreplain, where the work is performed. The hole muſt be wide enough for a free paſſage between the mould and walls of the hole, or between one mould and another, when ſeveral bells are to be caſt. At the centre of the hole is a ſtake erected, that is ſtrongly faſtened in the ground. This ſupports an iron peg, on which the pivot of the ſecond branch of the compaſſes turns. The ſtake is encompaſſed with a ſolid brick-work, perfectly round, about half a foot high, and of the propoſed bell's diameter. This they call a *mill-ſtone*. The parts of the mould are, the core, the model of the bell, and the ſhell. When the outer ſurface of the core is formed, they begin to raiſe the core, which is made of bricks that are laid in courſes of equal height upon a lay of plain earth. At the laying of each brick, they bring near it the branch of the compaſſes, on which the curve of the core is ſhaped, ſo as that there may remain between it and the curve the diſtance of a line, to be afterwards filled up with layers of cement. The work is continued to the top, only leaving an opening for the coals to bake the core. This work is covered with a layer of cement, made of earth and horſe-dung; on which they move the compaſſes of conſtruction, to make it of an even ſmoothneſs every where.

The firſt layer being finiſhed, they put the fire to the core, by filling it half with coals, through an opening that is kept ſhut, during the baking, with a cake of earth that has been ſeparately baked. The firſt fire conſumes the ſtake, and the fire is left in the core half or ſometimes a whole day: the firſt layer being thoroughly dry, they cover it with a ſecond, third, and fourth; each being ſmoothed by the board of the compaſſes, and thoroughly dried before they proceed to another.

The core being completed, they take the compaſſes to pieces, with intent to cut off the thickneſs of the model, and the compaſſes are immediately put in their place to begin a ſecond piece of the mould. It conſiſts of a mixture of earth and hair, applied with the hand on the core, in ſeveral cakes that cloſe together. This work is finiſhed by ſeveral layers of a thinner cement of the ſame matter, ſmoothed by the compaſſes,

Foundery and thoroughly dried before another is laid on. The firſt layer of the model is a mixture of wax and greaſe ſpread over the whole. After which are applied the inſcriptions, coats of arms, &c. beſmeared with a pencil dipped in a veſſel of wax in a chafing-diſh: this is done for every letter. Before the ſhell is begun, the compaſſes are taken to pieces, to cut off all the wood that fills the place of the thickneſs to be given to the ſhell.

The firſt layer is the ſame earth with the reſt, ſifted very fine; whilſt it is tempering in water, it is mixed with cow's hair to make it cohere. The whole being a thin cullis, is gently poured on the model, that fills exactly all the ſinuoſities of the figures, &c. and this is repeated till the whole is two lines thick over the model. When this layer is thoroughly dried, they cover it with a ſecond of the ſame matter, but ſomewhat thicker; when this ſecond layer becomes of ſome conſiſtence, they apply the compaſſes again, and light a fire in the core, ſo as to melt off the wax of the inſcriptions, &c.

After this, they go on with other layers of the ſhell, by means of the compaſſes. Here they add to the cow's hair a quantity of hemp, ſpread upon the layers, and afterwards ſmoothed by the board of the compaſſes. The thickneſs of the ſhell comes to four or five inches lower than the mill ſtone before obſerved, and ſurrounds it quite cloſe, which prevents the extravaſation of the metal. The wax ſhould be taken out before the melting of the metal.

The ear of the bell requires a ſeparate work, which is done during the drying of the ſeveral incruſtations of the cement. It has ſeven rings: the ſeventh is called the *bridge*, and unites the others, being a perpendicular ſupport to ſtrengthen the curves. It has an aperture at the top, to admit a large iron peg, bent at the bottom; and this is introduced into two holes in the beam, faſtened with two ſtrong iron keys. There are models made of the rings, with maſſes of beaten earth, that are dried in the fire, in order to have the hollow of them. Theſe rings are gently preſſed upon a layer of earth and cow's hair, one half of its depth; and then taken out, without breaking the mould. This operation is repeated 12 times for 12 half-moulds, that two and two united may make the hollows of the ſix rings: the ſame they do for the hollow of the bridge, and bake them all, to unite them together.

Upon the open place left for the coals to be put in, are placed the rings that conſtitute the ear. They firſt put into this open place the iron-ring to ſupport the clapper of the bell; then they make a round cake of clay, to fill up the diameter of the thickneſs of the core. This cake, after baking, is clapped upon the opening, and ſoldered with a thin mortar ſpread over it, which binds the cover cloſe to the core.

The hollow of the model is filled with an earth, ſufficiently moiſt to fix on the place, which is ſtrewed at ſeveral times upon the cover of the core; and they beat it gently with a peſtle, to a proper height; and a workman ſmooths the earth at top with a wooden trowel dipped in water.

Upon this cover, to be taken off afterwards, they aſſemble the hollows of the rings. When every thing is in its proper place, they ſtrengthen the outſide of the hollows with mortar, in order to bind them with the bridge, and keep them ſteady at the bottom, by means of a cake of the ſame mortar, which fills up the whole aperture of the ſhell. This they let dry, that it may be removed without breaking. To make room for the metal, they pull off the hollows of the rings, through which the metal is to paſs, before it enters into the vacuity of the mould. The ſhell being unloaded of its ear, they range under the milliſtone five or ſix pieces of wood, about two feet long, and thick enough to reach almoſt the lower part of the ſhell; between theſe and the mould, they drive in wooden wedges with a mallet, to ſhake the ſhell of the model whereon it reſts, ſo as to be pulled up and got out of the pit. Foundery.

When this and the wax are removed, they break the model and the layer of earth, through which the metal muſt run, from the hollow of the rings, between the ſhell and the core. They ſmoke the inſide of the ſhell, by burning ſtraw under it, that helps to ſmooth the ſurface of the bell. Then they put the ſhell in the place, ſo as to leave the ſame interval between that and the core; and before the hollows of the rings or the cap are put on again, they add two vents, that are united to the rings, and to each other, by a maſs of baked cement. After which they put on this maſs of the cap, the rings, and the vent, over the ſhell, and ſolder it with thin cement, which is dried gradually by covering it with burning coals. Then they fill up the pit with earth, beating it ſtrongly all the time round the mould.

The furnace has a place for the fire, and another for the metal. The fire-place has a large chimney with a ſpacious aſh-hole. The furnace which contains the metal is vaulted, whoſe bottom is made of earth, rammed down; the reſt is built with brick. It has four apertures; the firſt, through which the flame revibrates; the ſecond is cloſed with a ſtopple that is opened for the metal to run; the others are to ſeparate the droſs or ſcoriæ of the metal by wooden rakes: through theſe laſt apertures paſſes the thick ſmoke. The ground of the furnace is built ſloping, for the metal to run down.

Foundery of Great Guns and Mortar-Pieces. The method of caſting theſe pieces is little different from that of bells: they are run maſſy, without any core, being determined by the hollow of the ſhell; and they are afterwards bored with a ſteel trepan, that is worked either by horſes or a water-mill.

For the metal, parts, proportions, &c. of theſe pieces, ſee Gunnery.

Letter-Foundery, or *Caſting of Printing-Letters.*

In the buſineſs of cutting, caſting, &c. letters for printing, the letter-cutter muſt be provided with a vice, hand-vice, hammers, and files of all ſorts for watch-makers uſe; as alſo gravers and ſculpters of all ſorts, and an oil-ſtone, &c. ſuitable and ſizeable to the ſeveral letters to be cut: a flat gage made of box to hold a rod of ſteel, or the body of a mould, &c. exactly perpendicular to the flat of the uſing file: a ſliding-gage whoſe uſe is to meaſure and ſet off diſtances between the ſhoulder and the tooth, and to mark it off from the end, or from the edge of the work: a face-gage, which is a ſquare notch cut with a file into the edge of a thin plate of ſteel, iron, or braſs, of the thickneſs of a piece of common tin, whoſe uſe is to proportion the face of each ſort of letter, viz. long letters, aſcending,

Foundery.

cending letters, and ſhort letters. So there muſt be three gages, and the gage for the long letters is the length of the whole body ſuppoſed to be divided into 42 equal parts. The gage for the aſcending letters Roman and Italic are $\frac{5}{7}$, or 30 parts of 42, and 33 parts for the Engliſh face. The gage for the ſhort letters is $\frac{3}{7}$, or 18 parts of 42 of the whole body for the Roman and Italic, and 22 parts for the Engliſh face.

The Italic and other ſtanding gages are to meaſure the ſcope of the Italic ſtems, by applying the top and bottom of the gage to the top and bottom lines of the letters; and the other ſide of the gage to the ſtem; for when the letter complies with theſe three ſides of the gage, that letter has its true ſhape.

The next care of the letter-cutter is to prepare good ſteel punches, well tempered, and quite free from all veins of iron; on the face of which he draws or marks the exact ſhape of the letter with pen and ink if the letter be large, or with a ſmooth blunted point of a needle if it be ſmall; and then with ſizeable and proper ſhaped and pointed gravers and ſculpters, digs or ſculps out the ſteel between the ſtrokes or marks he made on the face of the punch, and leaves the marks ſtanding on the face. Having well ſhaped the inſide ſtrokes of his letter, he deepens the hollows with the ſame tools; for if a letter be not deep in proportion to its width, it will, when uſed at preſs, print black, and be good for nothing. This work is generally regulated by the depth of the counter-punch. Then he works the outſide with proper files till it be fit for the matrice.

But before we proceed to the ſinking and juſtifying of the matrices, we muſt provide a mould to juſtify them by, of which you have a draught in Plate CXCV. fig. 1. 2.

Every mould is compoſed of an upper and an under part. The under part is delineated in fig. 1. The upper part is marked fig. 2. and is in all reſpects made like the under part, excepting the ſtool behind, and the bow or ſpring alſo behind; and excepting a ſmall roundiſh wire between the body and carriage, near the break, where the under part hath a ſmall rounding groove made in the body. This wire, or rather half-wire, in the upper part makes the nick in the ſhank of the letter, when part of it is received into the groove in the under part. Theſe two parts are ſo exactly fitted and gaged into one another (*viz.* the male-gage marked *c* in fig. 2. into the female marked *g* in fig. 1. that when the upper part of the mould is properly placed on, and in the under part of the mould, both together make the entire mould, and may be ſlid backwards for uſe ſo far, till the edge of either of the bodies on the middle of either carriage comes juſt to the edge of the female gages cut in each carriage: and they may be ſlid forward ſo far, till the bodies on either carriage touch each other: and the ſliding of theſe two parts of the mould backwards makes the ſhank of the letter thicker, becauſe the bodies in each part ſtand wider aſunder; and the ſliding them forwards makes the ſhank of the letter thinner, becauſe the bodies on each part of the mould ſtand cloſer together. The parts of the mould are as follow: *viz.* a, The carriage. b, The body. c, The male gage. d e, The mouth-piece. f i, The regiſter. g, The female gage. h, The hag. *a a a a*, The bottom plate. *b b b*, The wood on which the bottom plate lies. *c c c*, The mouth. *d d*, The throat, *e d d*, The pallat. *f*, The nick. *g g*, The ſtool. *h h*, The ſpring or bow.

Then the mould muſt be juſtified: and firſt the founder juſtifies the body, by caſting about 20 proofs or ſamples of letters; which are ſet up in a compoſing ſtick, with all their nicks towards the right hand; and then by comparing theſe with the pattern letters, ſet up in the ſame manner, he finds the exact meaſure of the body to be caſt. He alſo tries if the two ſides of the body are parallel, or that the body be no bigger at the head than at the foot, by taking half the number of his proofs and turning them with their heads to the feet of the other half; and if then the heads and the feet be found exactly even upon each other, and neither to drive out nor get in, the two ſides may be pronounced parallel. He farther tries whether the two ſides of the thickneſs of the letter be parallel, by firſt ſetting his proofs in the compoſing ſtick with their nicks upwards, and then turning one half with their heads to the feet of the other half; and if the heads and feet lie exactly upon each other, and neither drive out nor get in, the two ſides of the thickneſs are parallel.

The mould thus juſtified, the next buſineſs is to prepare the matrices. A matrice is a piece of braſs or copper of about an inch and a half long, and of a thickneſs in proportion to the ſize of the letter it is to contain. In this metal is ſunk the face of the letter intended to be caſt, by ſtriking the letter punch about the depth of an n. After this the ſides and face of the matrice muſt be juſtified and cleared with files of all bunchings made by ſinking the punch.

Every thing thus prepared, it is brought to the furnace; which is built of brick upright, with four ſquare ſides, and a ſtone on the top, in which ſtone is a wide round hole for the pan to ſtand in. A foundery of any conſequence has ſeveral of theſe furnaces in it.

As to the metal of which the types are to be caſt, this, in extenſive founderies, is always prepared in large quantities; but caſt into ſmall bars, of about 20 pounds weight, to be delivered out to the workmen as occaſion requires. In the letter foundery which has been long carried on with reputation under the direction of Dr Alex. Wilſon and ſons at Glaſgow, we are informed, that a ſtock of metal is made up at two different times of the year, ſufficient to ſerve the caſters at the furnace for ſix months each time. For this purpoſe, a large furnace is built under a ſhade, furniſhed with a wheel vent, in order the more equally to heat the ſides of a ſtrong pot of caſt-iron, which holds when full 15 hundred weight of the metal. The fire being kindled below, the bars of lead are let ſoftly down into the pot, and their fuſion promoted by throwing in ſome pitch and tallow, which ſoon inflame. An outer chimney, which is built ſo as to project about a foot over the fartheſt lip of the pot, catches hold of the flame by a ſtrong draught, and makes it act very powerfully in melting lead; whilſt it ſerves at the ſame time to convey away all the fumes, &c. from the workmen, to whom this laborious part of the buſineſs is committed. When the lead is thoroughly melted, a due proportion of the regulus of antimony and other ingredients are put in, and ſome more tallow is inflamed to make the whole incorporate ſooner. The workmen now having mixed the contents of the pot very thoroughly

Foundery. roughly by ſtirring long with a large iron ladle, next proceed to draw the metal off into the ſmall troughs of caſt-iron, which are ranged to the number of fourſcore upon a level platform faced with ſtone, built towards the right hand. In the courſe of a day 15 hundred weight of metal can be eaſily prepared in this manner; and the operation is continued for as many days as are neceſſary to prepare a ſtock of metal of all the various degrees of hardneſs. After this, the whole is diſpoſed into preſſes according to its quality, to be delivered out occaſionally to the workmen.

The founder muſt now be provided with a ladle, which differs nothing from other iron ladles but in its ſize; and he is provided always with ladles of ſeveral ſizes, which he uſes according to the ſize of the letters he is to caſt. Before the caſter begins to caſt, he muſt kindle his fire in the furnace to melt the metal in the pan. Therefore he takes the pan out of the hole in the ſtone, and there lays in coals and kindles them; and, when they are well kindled, he ſets the pan in again, and puts in metal into it to melt: if it be a ſmall-bodied letter he caſts, or a thin letter of great bodies, his metal muſt be very hot; nay ſometimes red-hot, to make the letter come. Then having choſen a ladle than will hold about ſo much as the letter and break is, he lays it at the ſtoking-hole, where the flame burſts out, to heat. Then he ties a thin leather, cut with its narrow end againſt the face to the leather groove of the matrice, by whipping a brown thread twice about the leather-groove, and faſtening the thread with a knot. Then he puts both halves of the mould together, and puts the matrice into the matrice-cheek, and places the foot of the matrice on the ſtool of the mould, and the broad end of the leather upon the wood of the upper half of the mould, but not tight up, leſt it might hinder the foot of the matrice from ſinking cloſe down upon the ſtool in a train of work. Then laying a little roſin on the upper wood of the mould, and having his caſting-ladle hot, he with the boiling ſide of it melts the roſin: and, when it is yet melted, preſſes the broad end of the leather hard down on the wood, and ſo faſtens it to the wood; all this is the preparation.

Now he comes to caſting. Wherefore, placing the under half of the mould in his left hand, with the hook or hag forward, he clutches the ends of its wood between the lower part of the ball of his thumb and his three hind fingers; then he lays the upper half of the mould upon the under half, ſo that the male gages may fall into the female gages, and at the ſame time the foot of the matrice places itſelf upon the ſtool; and, claſping his left-hand thumb ſtrong over the upper half of the mould, he nimbly catches hold of the bow or ſpring with his right-hand fingers at the top of it, and his thumb under it, and places the point of it againſt the middle of the notch in the backſide of the matrice, preſſing it as well forwards towards the mould, as downwards by the ſhoulder of the notch cloſe upon the ſtool, while at the ſame time with his hinder fingers, as aforeſaid, he draws the under half of the mould towards the ball of his thumb, and thruſts by the ball of his thumb the upper part towards his fingers, that both the regiſters of the mould may preſs againſt both ſides of the matrice, and his thumb and fingers preſs both halves of the mould cloſe together.

Then he takes the handle of his ladle in his right hand, and with the boll of it gives a ſtroke, two or three, outwards upon the ſurface of the melted metal, to ſcum or clear it from the film or duſt that may ſwim upon it; then takes up the ladle full of metal, and having his mould, as aforeſaid, in his left hand, he a little twiſts the left ſide of his body from the furnace, and brings the geat of his ladle (full of metal) to the mouth of the mould, and twiſts the upper part of his right hand towards him to turn the metal into it, while at the ſame moment of time he jilts the mould in his left hand forwards, to receive the metal with a ſtrong ſhake (as it is called), not only into the body of the mould, but while the metal is yet hot running, ſwift and ſtrongly, into the very face of the matrice, to receive its perfect form there, as well as in the ſhank. Foundery.

Then he takes the upper half of the mould off the under half, by placing his right-hand thumb on the end of the wood next his left-hand thumb, and his two middle-fingers at the other end of the wood; and finding the letter and break lie in the under half of the mould (as moſt commonly by reaſon of its weight it does), he throws or toſſes the letter, break and all, upon a ſheet of waſte paper laid for that purpoſe on the bench, juſt a little beyond his left hand, and is then ready to caſt another letter as before; and alſo, the whole number that is to be caſt with that matrice. A workman will ordinarily caſt about three thouſand of theſe letters in a day.

When the caſters at the furnace have got a ſufficient number of types upon the tables, a ſet of boys come and nimbly break away the jets from them: the jets are thrown into the pots, and the types are carried away in parcels to other boys, who paſs them ſwiftly under their fingers, defended by leather, upon ſmooth flat ſtones, in order to poliſh their broad-ſides. This is a very dexterous operation, and is a remarkable inſtance of what may be effected by the power of habit and long practice; for theſe boys, in turning up the other ſide of the type, do it ſo quickly by a mere touch of the fingers of the left hand, as not to require the leaſt perceptible intermiſſion in the motion of the right hand upon the ſtone. The types, thus finely ſmoothed and flattened on the broad-ſides, are next carried to another ſet of boys, who ſit at a ſquare table, two on each ſide, and there are ranged up on long rulers or ſticks, fitted with a ſmall projection, to hinder them from ſliding off backwards. When theſe ſticks are ſo filled, they are placed, two and two, upon a ſet of wooden pins fixed into the wall, near the dreſſer, ſometimes to the amount of an hundred, in order to undergo the finiſhing operations. This workman, who is always the moſt expert and ſkilful in all the different branches carried on at the foundery, begins by taking one of theſe ſticks, and, with a peculiar addreſs, ſlides the whole column of types off upon the dreſſing-ſtick: this is made of well-ſeaſoned mahogany, and furniſhed with two end-pieces of ſteel, a little lower than the body of the types, one of which is moveable, ſo as to approach the other by means of a long ſcrew-pin, inſerted in the end of the ſtick. The types are put into this ſtick with their faces next to the back or projection; and after they are adjuſted to one another ſo as to ſtand even, they are then bound up, by ſcrewing home the moveable end-piece. It is here where the great

Foundery.

great and requiſite accuracy of the moulds comes to be perceived; for in this caſe the whole column, ſo bound up, lies flat and true upon the ſtick, the two extreme types being quite parallel, and the whole has the appearance of one ſolid continuous plate of metal. The leaſt inaccuracy in the exact parallelifm of the individual type, when multiplied ſo many times, would render it impoſſible to bind them up in this manner, by diſpoſing them to riſe or ſpring from the ſtick by the ſmalleſt preſſure from the ſcrew. Now, when lying ſo conveniently with the narrow edges uppermoſt, which cannot poſſibly be ſmoothed in the manner before mentioned by the ſtones, the workman does this more effectually by ſcraping the ſurface of the column with a thick-edged but ſharp razor, which at every ſtroke brings on a very fine ſmooth ſkin, like to poliſhed ſilver; and thus he proceeds till in about half a minute he comes to the farther end of the ſtick. The other edges of the types are next turned upwards, and poliſhed in the ſame manner. It is whilſt the types thus lie in the dreſſing-ſtick that the operation of bearding or barbing is performed, which is effected by running a plane, faced with ſteel, along the ſhoulder of the body next to the face, which takes more or leſs off the corner, as occaſion may require. Whilſt in the dreſſing-ſtick they are alſo grooved, which is a very material operation. In order to underſtand this, it muſt be remembered, that when the types are firſt broken off from the jets, ſome ſuperfluous metal always remains, which would make them bear very unequally againſt the paper whilſt under the printing-preſs, and effectually mar the impreſſion. That all theſe inequalities may, therefore, be taken away, and that the bearings of every type may be regulated by the ſhoulders imparted to them all alike from the mould, the workman or dreſſer proceeds in the following manner. The types being ſcrewed up in the ſtick, as before mentioned, with the jet-end outermoſt, and projecting beyond the wood about one-eighth of an inch, the ſtick is put into an open preſs, ſo as to preſent the jet-end uppermoſt, and then every thing is made faſt by driving a long wedge, which bears upon a ſlip of wood, which lies cloſe to the types the whole length: then a plough or plane is applied, which is ſo conſtructed as to embrace the projecting part of the types betwixt its long ſides, which are made of poliſhed iron. When the plane is thus applied, the ſteel cutter bearing upon that part between the ſhoulders of the types, where the inequalities lie, the dreſſer dexterouſly glides it along, and by this means ſtrips off every irregular part that comes in the way, and ſo makes an uniform groove the whole length, and leaves the two ſhoulders ſtanding; by which means every type becomes preciſely like to another, as to the height againſt paper. The types being now finiſhed, the ſtick is taken out of the preſs, and the whole column replaced upon the other ſtick; and after the whole are ſo dreſſed, he proceeds to pick out the bad letters, previous to putting them up into pages and papers. In doing this he takes the ſtick into his left hand, and turning the faces near to the light, he examines them carefully, and whenever an imperfect or damaged letter occurs, he nimbly plucks it out with a ſharp bodkin, which he holds in the right hand for that purpoſe. Thoſe letters which, from their form, project over the body of the type, and which cannot on this account be rubbed on the ſtones, are ſcraped on the broad-ſides with a knife or file, and ſome of the metal next the face pared away with a penknife, in order to allow the type to come cloſe to any other. This operation is called *kerning*.

Fount, Fountain.

The excellence of printing types conſiſts not only in the due performance of all the operations above deſcribed, but alſo in the hardneſs of the metal, form, and fine proportion of the character, and in the exact bearing and ranging of the letters in relation to one another.

FOUNT, or FONT, among printers, &c. a ſet or quantity of characters or letters of each kind, caſt by a letter-founder, and ſorted.—We ſay, a founder has caſt a fount of pica, of engliſh, of pearl, &c. meaning that he has caſt a ſet of characters of theſe kinds.

A complete fount does not only include the running letters, but alſo large and ſmall capitals, ſingle letters, double letters, points, commas, lines, and numeral characters.

Founts are large or ſmall, according to the demand of the printer, who orders them by the hundred weight, or by ſheets. When the printer orders a fount of 500, he means that the fount ſhould weigh 500 lb. When he demands a fount of 10 ſheets, it is underſtood, that with that fount he ſhall be able to compoſe 10 ſheets, or 20 forms, without being obliged to diſtribute. The founder takes his meaſures accordingly; he reckons 120 pounds for a ſheet, including the quadrates, &c. or 60 pounds for a form, which is half a ſheet: not that the ſheet always weighs 120 pounds, or the form 60 pounds; on the contrary, it varies according to the ſize of the form; beſides, it is always ſuppoſed that there are letters left in the caſes.

The letter-founders have a kind of liſt, or tariff, whereby they regulate their founts: the occaſion thereof is, that ſome letters being in much more uſe, and oftener repeated than others, their cells or caſes, ſhould be better filled and ſtored than thoſe of the letters which do not return ſo frequently. Thus the *o* and *i*, for inſtance, are always in greater quantity than the *k* or *z*.

This difference will be beſt perceived from a proportional compariſon of thoſe letters with themſelves, or ſome others. Suppoſe a fount of 100,000 characters, which is a common fount; here the *a* ſhould have 5000, the *c* 3000, the *e* 11,000, the *i* 6000, the *m* 3000, the *k* only 30, and the *x*, *y*, and *z*, not many more. But this is only to be underſtood of the letters of the lower caſe; thoſe of the upper having other proportions, which it would be, here, too long to inſiſt on.

FOUNTAIN, a ſpring or ſource of water riſing out of the earth. Among the ancients, fountains were generally eſteemed as ſacred; but ſome were held to be ſo in a more particular manner. The good effects received from cold baths gave ſprings and rivers this high reputation; for the ſalutary influence was ſuppoſed to proceed from ſome preſiding deity. Particular reaſons might occaſion ſome to be held in greater veneration than others. It was cuſtomary to throw little pieces of money into thoſe ſprings, lakes, or rivers, which were eſteemed ſacred, to render the preſiding divinities propitious; as the touch of a naked body

Fountain. dy was supposed to pollute their hallowed waters. For the phenomena, theory, and origin, of fountains or springs, see SPRING.

Artificial Fountain, called also a *jet d'eau*, is a contrivance by which water is violently spouted upwards. See HYDRAULICS.

Boiling Fountain. See ICELAND.

Fountain-Tree, a very extraordinary vegetable growing in one of the Canary islands, and likewise said to exist in some other places, which distils water from its leaves in such plenty as to answer all the purposes of the inhabitants who live near it. Of this tree we have the following account in Glasse's history of the Canary islands.—"There are only three fountains of water in the whole island of Hierro, wherein the fountain-tree grows. One of these fountains is called *Aref*, which, in the language of the ancient inhabitants, signifies *river*; a name, however, which does not seem to have been given it on account of its yielding much water, for in that respect it hardly deserves the name of a fountain. More to the northward is another called *Hapio*; and in the middle of the island is a spring, yielding a stream about the thickness of a man's finger. This last was discovered in the year 1565, and is called the *fountain of Anton. Hernandez*. On account of the scarcity of water, the sheep, goats, and swine, here do not drink in the summer, but are taught to dig up the roots of fern, and chew them to quench their thirst. The great cattle are watered at those fountains, and at a place where water distils from the leaves of a tree. Many writers have made mention of this famous tree, some in such a manner as to make it appear miraculous: others again deny the existence of any such tree; among whom is Father Feyjoo, a modern Spanish author, in his Theatro Critico. But he, and those who agree with him in this matter, are as much mistaken as those who would make it appear to be miraculous. This is the only island of all the Canaries which I have not been in; but I have failed with natives of Hierro, who, when questioned about the existence of this tree, answered in the affirmative.

"The author of the *History of the discovery and conquest* has given us a particular account of it, which I shall here relate at large.

'The district in which this tree stands is called *Tigulate*; near to which, and in the cliff or steep rocky ascent that surrounds the whole island, is a narrow gutter or gulley, which commences at the sea, and continues to the summit of the cliff, where it joins or coincides with a valley, which is terminated by the steep front of a rock. On the top of this rock grows a tree, called in the language of the ancient inhabitants, *Garse*, "Sacred or Holy Tree," which for many years has been preserved sound, entire, and fresh. Its leaves constantly distil such a quantity of water as is sufficient to furnish drink to every living creature in Hierro; nature having provided this remedy for the drought of the island. It is situated about a league and a half from the sea. Nobody knows of what species it is, only that it is called *Til*. It is distinct from other trees, and stands by itself; the circumference of the trunk is about 12 spans, the diameter four, and in height from the ground to the top of the highest branch, 40 spans: the circumference of all the branches together is 120 feet. The branches are thick and extended; the lowest commence about the height of an ell from the ground. Its fruit resembles the acorn, and tastes something like the kernel of a pine-apple, but is softer and more aromatic. The leaves of this tree resemble those of the laurel, but are larger, wider, and more curved; they come forth in a perpetual succession, so that the tree always remains green. Near to it grows a thorn which fastens on many of its branches, and interweaves with them; and at a small distance from the garse are some beech-trees, bresos, and thorns. On the north side of the trunk are two large tanks or cisterns, of rough stone, or rather one cistern divided, each half being 20 feet square, and 16 spans in depth. One of these contains water for the drinking of the inhabitants; and the other that which they use for their cattle, washing, and such-like purposes. Every morning, near this part of the island, a cloud or mist arises from the sea, which the south and easterly winds force against the fore-mentioned steep cliff; so that the cloud having no vent but by the gutter, gradually ascends it, and from thence advances slowly to the extremity of the valley, whence it is stopped and checked by the front of the rock which terminates the valley, and then rests upon the thick leaves and wide-spreading branches of the tree, from whence it distils in drops during the remainder of the day, until it is at length exhausted, in the same manner that we see water drip from the leaves of trees after a heavy shower of rain. This distillation is not peculiar to the garse or til; for the bresos, which grow near it, likewise drop water; but their leaves being but few and narrow, the quantity is so trifling, that though the natives save some of it, yet they make little or no account of any but what distils from the til, which, together with the water of some fountains, and what is saved in the winter season, is sufficient to serve them and their flocks. This tree yields most water in those years when the Levant or easterly winds have prevailed for a continuance; for, by these winds only the clouds or mists are drawn hither from the sea. A person lives on the spot near which this tree grows, who is appointed by the council to take care of it and its water; and is allowed a house to live in, with a certain salary. He every day distributes to each family of the district seven pots or vessels full of water, besides what he gives to the principal people of the island.'

"Whether the tree which yields water at this present time be the same as that mentioned in the above description, I cannot pretend to determine: but it is probable there has been a succession of them; for Pliny, describing the Fortunate island, says, 'In the mountains of Ombrion are trees resembling the plant ferula, from which water may be procured by pressure. What comes from the black kind is bitter, but that which the white yields is sweet and potable."

Trees yielding water are not peculiar to the island of Hierro; for travellers inform us of one of the same kind on the island of St Thomas, in the bight or gulph of Guiney. In Cockburn's voyages we find the following account of a dropping tree, near the mountains of Vera Paz, in America.

"On the morning of the fourth day, we came out on a large plain, where were great numbers of fine deer, and in the middle stood a tree of unusual size, spreading its branches over a vast compass of ground.

Fountain ‖ Fourmont.

Curiosity led us up to it. We had perceived, at some distance off, the ground about it to be wet; at which we began to be somewhat surprised, as well knowing there had no rain fallen for near six months past, according to the certain course of the season in that latitude: that it was impossible to be occasioned by the fall of dew on the tree, we were convinced, by the sun's having power to exhale away all moisture of that nature a few minutes after its rising. At last, to our great amazement as well as joy, we saw water dropping, or as it were distilling, fast from the end of every leaf of this wonderful (nor had it been amiss if I had said *miraculous*) tree; at least it was so with respect to us, who had been labouring four days through extreme heat, without receiving the least moisture, and were now almost expiring for the want of it

"We could not help looking on this as liquor sent from heaven to comfort us under great extremity. We catched what we could of it in our hands, and drank very plentifully of it; and liked it so well, that we could hardly prevail with ourselves to give over. A matter of this nature could not but incite us to make the strictest observations concerning it; and accordingly we staid under the tree near three hours, and found we could not fathom its body in five times. We observed the soil where it grew to be very strong; and upon the nicest inquiry we could afterwards make, both of the natives of the country and the Spanish inhabitants, we could not learn there was any such tree known throughout New Spain, nor perhaps all America over: but I do not relate this as a prodigy in nature, because I am not philosopher enough to ascribe any natural cause for it; the learned may perhaps give substantial reasons in nature for what appeared to us a great and marvellous secret."

FOUQUIERES (James), an eminent painter, was born at Antwerp in 1580, and received his chief instructions from Velvet Brughel. He applied himself to the study of landscapes, and went to Italy to improve himself in colouring; and succeeded so happily, that his works are said to be nearly equal to those of Titian.—He was engaged and much caressed at the court of the elector Palatine, and afterwards spent several years of his life in France; where his works met with universal approbation, and he was proportionably well paid for his paintings. Yet by some misconduct he sunk into poverty, and died in the house of an inconsiderable painter in 1659. He had resided for several years at Rome and Venice, where he acquired that excellent style of colouring and design for which he is so deservedly distinguished.

FOURCHEE, or FOURCHY, in heraldry, an appellation given to a cross forked at the ends. See HERALDRY.

FOURMONT (Stephen), professor of the Arabic and Chinese languages, and one of the most learned men of his time, was born at Herbelai, a village four leagues from Paris, in 1683. He studied in Mazarine college, and afterwards in the Seminary of Thirty-three. He was at length professor of Arabic in the Royal College, and was made a member of the Academy of Inscriptions. In 1738 he was chosen a member of the Royal Society in London, and of that of Berlin in 1741. He was often consulted by the duke of Orleans, first prince of the blood; who had a particular esteem for him, and made him one of his secretaries. He wrote a great number of books; the most considerable of those which have been printed are, 1. The Roots of the Latin Tongue, in verse. 2. Critical Reflections on the Histories of ancient Nations, 2 vols 4to. 3. *Meditationes Sinicæ*, folio. 4. A Chinese Grammar, in Latin, folio. 5. Several Dissertations printed in the Memoirs of the Academy of Inscriptions, &c. He died at Paris in 1745.

Fourness.

He ought not to be confounded with *Michael Fourmont*, his youngest brother; who took orders, was professor of the Syriac language in the Royal College, and a member of the Academy of Inscriptions. He died in 1746.

FOURNESS, in Loynsdale, Lancashire, is a track, between the Kent, Leven, and Dudden Sands, which runs north parallel with the west sides of Cumberland and Westmoreland; and on the south runs out into the sea as a promontory. Here, as Mr Camden expresses it, "the sea, as if enraged at it, lashes it more furiously, and in high tides has even devoured the shore, and made three large bays; *viz* Kentsand, into which the river Ken empties itself; Levensand and Duddensand, between which the land projects in such a manner that it has its name thence; Forenes and Foreland, signifying the same with us as *promontorium anterius* in Latin." Bishop Gibson, however, derives the name of *Fourness*, or *Furness*, from the numerous furnaces that were there anciently, the rents and services of which (called *bloomsmithy rents*) are still paid. This whole tract, except on the coast, rises in high hills and vast piles of rocks called *Furness-Fells*; among which the Britans found a secure retreat, trusting to these natural fortresses, though nothing was inaccessible to the victorious Saxons: for we find the Britans settled here 228 years after the arrival of the Saxons; because at that time Egfrid king of Northumberland gave St Cuthbert the land called *Carthmell*, and all the Britans in it, as is related in his life. In these mountainous parts are found quarries of a fine durable blue slate to cover buildings with, which are made use of in many other parts of the kingdom. Here are several cotton mills lately erected; and if fuel for fire were more plentiful, the trade of this country would much increase: but there being no coals nearer than Wigan or Whitehaven, and the coast-duties high, firing is rather scarce, the country people using only turf or peat, and that begins to be more scarce than formerly. In the mosses of Fourness much fir is found, but more oak: the trunks in general lie with their heads to the east, the high winds having been from the west. High Fourness has ever had great quantities of sheep, which browse upon the hollies left in great numbers for them; and produces charcoal for melting iron-ore, and oak-bark for tanners use, in great abundance. The forests abounded with deer and wild boars, and the *legh* or *scose*, or large stags, whose horns are frequently found underground here. The low or plain part of Fourness, which is so called to distinguish it from the woody or mountainous part, produces all sorts of grain, but principally oats, whereof the bread eaten in this country is generally made; and there are found here veins of a very rich iron-ore, which is not only melted and wrought here, but great quantities are exported to other parts to mix with poorer ores. The three sands

above mentioned are very dangerous to travellers by the tides and the many quickſands. There is a guide on horſeback appointed to Kent or Lancaſter ſand at 10 l. *per ann.* to Leven at 6 l. *per ann.* out of the public revenue; but to Dudden, which are moſt dangerous, none; and it is no uncommon thing for perſons to paſs over in parties of 100 at a time like caravans, under the direction of the carriers, who go to or fro every day. The ſands are leſs dangerous than formerly, being more uſed and better known, and travellers never going without the carriers or guides. "Furnis abbey up in the mountains," was begun at Tulket in Amounderneſs 1124, by Stephen earl of Boulogne, afterwards king of England, for the monks of Savigni in France, and three years after removed to this valley, then called *Bekangeſgill*, or "the vale of nightſhade." It was of the Ciſtertian order, endowed with above 800 l. *per ann.* Out of the monks of this abbey, Mr Camden informs us, the biſhops of the Iſle of Man, which lies overagainſt it, uſed to be choſen by ancient cuſtom; it being as it were the mother of many monaſteries in Man and Ireland. Some ruins, and part of the foſſe which ſurrounded the monaſtery, are ſtill to be ſeen at Tulket. The remains at Fourneſs breathe that plain ſimplicity of the Ciſtertian abbeys; the chapter-houſe was the only piece of elegant Gothic about it, and its roof has lately fallen in. Part of the painted glaſs from the eaſt window, repreſenting the crucifixion, &c. is preſerved at Winder-mere church in Bowlneſs, Weſtmoreland. The church (except the north ſide of the nave), the chapter-houſe, refectory, &c. remain, only unroofed.

FOURTH REDUNDANT, in muſic. See INTERVAL.

FOWEY, or FOY, a town of Cornwall in England, 240 miles from London, with a commodious haven on the Channel. It is a populous place, extending above one mile on the eaſt ſide of a river of its own name; and has a great ſhare in the fiſhing trade, eſpecially pilchards. It roſe ſo much formerly by naval wars and piracies, that in the reign of Edward III. its ſhips refuſing to ſtrike when required as they ſailed by Rye and Winchelſea, were attacked by the ſhips of thoſe ports, but defeated them; whereupon they bore their arms mixed with the arms of thoſe two cinque-ports, which gave riſe to the name of the "Gallants of Fowey." And we learn from Camden, that this town quartered a part of the arms of every one of the cinque-ports with their own; intimating, that they had at times triumphed over them all: and indeed once they were ſo powerful, that they took ſeveral of the French men of war. In the reign of Edward III. they reſcued certain ſhips of Rye from diſtreſs, for which this town was made a member of the cinque-ports. Edward IV. favoured Fowey ſo much, that when the French threatened to come up the river to burn it, he cauſed two towers, the ruins of which are yet viſible, to be built at the public charge for its ſecurity: but he was afterwards ſo diſguſted with the inhabitants for attacking the French after a truce proclaimed with Louis XI. that he took away all their ſhips and naval ſtores, together with a chain drawn acroſs the river between the two forts above mentioned, which was carried to Dartmouth. It is ſaid they were ſo inſolent, that they cut off the ears of the king's purſuivants; for which ſome lives were forfeited as well as eſtates. The corporation conſiſts of a mayor, recorder, 8 aldermen, a town-clerk, and 2 aſſiſtants. The market is Saturday, the fairs May-day and Sept. 10. Here are a fine old church, a free-ſchool, and an hoſpital. The toll of the market and fairs, and keyage of the harbour, were veſted in the corporation on the payment of a fee-farm rent of about 40s. It does not appear to have ſent members to parliament before the 13th of Queen Elizabeth. Here is a coinage for the tin; of which a great quantity is dug in the country to the north and weſt of it. The river Foy, or Foath, is very broad and deep here, and was formerly navigable as high as Leſtwithiel. W. Long. 5°. N. Lat. 50. 27.

FOWL, among zoologiſts, denotes the larger ſorts of birds, whether domeſtic or wild: ſuch as geeſe, pheaſants, partridges, turkey, ducks, &c.

Tame fowl make a neceſſary part of the ſtock of a country farm. See the article POULTRY.

Fowls are again diſtinguiſhed into two kinds, *viz.* *land* and *water* fowl, theſe laſt being ſo called from their living much in and about water: alſo into thoſe which are accounted *game*, and thoſe which are not. See the article GAME.

FOWLING, the art of catching birds by means of bird-lime, decoys, and other devices, or the killing of them by the gun. See *BIRD-Catching*, *BIRD-Lime*, DECOY, SHOOTING, and the names of the different birds in the order of the alphabet.

FOWLING, is alſo uſed for the purſuing and taking birds with hawks, more properly called FALCONRY or HAWKING. See theſe articles.

FOWLING-Piece, a light gun for ſhooting birds. That piece is always reckoned beſt which has the longeſt barrel, from 5½ to 6 feet, with a moderate bore; though every fowler ſhould have them of different ſizes, ſuitable to the game he deſigns to kill. The barrel ſhould be well poliſhed and ſmooth within, and the bore of an equal bigneſs from one end to the other; which may be proved, by putting in a piece of paſteboard, cut of the exact roundneſs of the top: for if this goes down without ſtops or ſlipping, you may conclude the bore good. The bridge-pan muſt be ſomewhat above the touch-hole, and ought to have a notch to let down a little powder: this will prevent the piece from recoiling, which it would otherwiſe be apt to do. As to the locks, chooſe ſuch as are well filed with true work, whoſe ſprings muſt be neither too ſtrong nor too weak. The hammer ought to be well hardened, and pliable to go down to the pan with a quick motion.

FOX, in zoology. See CANIS.

The fox is a great nuiſance to the huſbandman, by taking away and deſtroying his lambs, geeſe, poultry, &c. The common way to catch him is by gins; which being baited, and a train made by drawing raw fleſh acroſs in his uſual paths or haunts to the gin, it proves an inducement to bring him to the place of deſtruction.

The fox is alſo a beaſt of chace, and is taken with grehounds, tarriers, &c. See the article HUNTING.

FOX (John), the martyrologiſt, was born at Boſton in Lincolnſhire in the year 1517. At the age of 16 he was entered a ſtudent of Brazen-noſe college in Oxford; and in 1543 he proceeded maſter of arts, and was choſen fellow of Magdalen college. He diſcovered an early genius for poetry, and wrote ſeveral Latin comedies,

Fox. the ſubjects taken from ſcripture, which his ſon aſſures us were written in an elegant ſtyle. Forſaking the muſes, he now applied himſelf with uncommon aſſiduity to the ſtudy of divinity, particularly church-hiſtory; and, diſcovering a premature propenſity to the doctrine of reformation, he was expelled the college as an heretic. His diſtreſs on this occaſion was very great; but it was not long before he found an aſylum in the houſe of Sir Thomas Lucy of Warwickſhire, who employed him as a tutor to his children. Here he married the daughter of a citizen of Coventry. Sir Thomas's children being now grown up, after reſiding a ſhort time with his wife's father, he came to London; where finding no immediate means of ſubſiſtence, he was reduced to the utmoſt degree of want; but was at length (as his ſon relates) miraculouſly relieved in the following manner: As he was one day ſitting in St Paul's church, emaciated with hunger, a ſtranger accoſted him familiarly, and, bidding him be of good cheer, put a ſum of money into his hand; telling him at the ſame time, that in a few days new hopes were at hand. He was ſoon after taken into the family of the ducheſs of Richmond, as tutor to the earl of Surrey's children, who, when their father was ſent to the tower, were committed to her care. In this family he lived, at Ryegate in Surrey, during the latter part of the reign of Henry VIII. the entire reign of Edward VI. and part of that of queen Mary: but at length, perſecuted by his implacable enemy biſhop Gardiner, he was obliged to ſeek refuge abroad. Baſil in Switzerland was the place of his retreat, where he ſubſiſted by correcting the preſs. On the death of queen Mary he returned to England; where he was graciouſly received by his former pupil the duke of Norfolk, who retained him in his family as long as he lived, and bequeathed him a penſion at his death. Mr ſecretary Cecil alſo obtained for him the rectory of Shipton near Saliſbury; and we are aſſured that he might have had conſiderable church-preferment, had it not been for his unwillingneſs to ſubſcribe to the canons. He died in the year 1587, in the 70th year of his age; and was buried in the chancel of St Giles's, Cripplegate. He was a man of great induſtry, and conſiderable learning; a zealous, but not a violent reformer; a nonconformiſt, but not an enemy to the church of England. He left two ſons; one of which was bred a divine, the other a phyſician. He wrote many pieces: but his principal work is, the Acts and Monuments of the Church, &c. commonly called *Fox's Book of Martyrs*. His facts are not always to be depended on, and he often loſes his temper; which, conſidering the ſubject, is not much to be wondered at.

FOX (George), the founder of the ſect of Engliſh Quakers, was a ſhoemaker in Nottingham. The accounts of thoſe times tell us, that as he wrought at his trade, he uſed to meditate much on the ſcriptures: which, with his ſolitary courſe of life, improving his natural melancholy, he began at length to fancy himſelf inſpired; and in conſequence thereof ſet up for a preacher.

He propoſed but few articles of faith; inſiſting chiefly on moral virtue, mutual charity, the love of God, and a deep attention to the inward motions and ſecret operations of the ſpirit: he required a plain ſimple worſhip, and a religion without ceremonies, making it a principal point to wait in profound ſilence the directions of the Holy Spirit. Fox met with much rough treatment for his zeal, was often impriſoned, and ſeveral times in danger of being knocked on the head. But all diſcouragements notwithſtanding, his ſect prevailed much, and many conſiderable men were drawn over to them; among whom were Barclay and Penn. He died in 1681. His followers were called *Quakers*, in deriſion of ſome unuſual ſhakings and convulſions with which they were ſeized at their firſt meetings. See the article Quakers. Fox.

Fox-Glove, in botany. See Digitalis.

Fox-Iſlands, the name of a group of iſlands, 16 in number, ſituated between the eaſtern coaſt of Kamtſchatka and the weſtern coaſt of the continent of America. Each iſland has a particular name; but the general name *Fox-iſlands* is given to the whole group, on account of the great number of black, grey, and red foxes with which they abound. The dreſs of the inhabitants conſiſts of a cap and a fur coat, which reaches down to the knee. Some of them wear common caps of a party-coloured bird-ſkin, upon which they leave part of the wings and tail. On the fore part of their hunting and fiſhing-caps, they place a ſmall board like a ſkreen, adorned with the jaw-bones of ſea-bears, and ornamented with glaſs-beads, which they receive in barter from the Ruſſians. At their feſtivals and dancing parties they uſe a much more ſhowy ſort of caps. They feed upon the fleſh of all ſorts of ſea-animals, and generally eat it raw. But if at any time they chooſe to dreſs their victuals, they make uſe of a hollow ſtone; having placed the fiſh or fleſh therein, they cover it with another, and cloſe the interſtices with lime or clay. They then lay it horizontally upon two ſtones, and light a fire under it. The proviſion intended for keeping is dried without ſalt in the open air. Their weapons conſiſt of bows, arrows, and darts; and for defence they uſe wooden ſhields.—The moſt perfect equality reigns among theſe iſlanders. They have neither chiefs nor ſuperiors, neither laws nor puniſhments. They live together in families, and ſocieties of ſeveral families united, which form what they call a *race*, who, in caſe of an attack or defence, mutually help and ſupport each other. The inhabitants of the ſame iſland always pretend to be of the ſame race; and every perſon looks upon his iſland as a poſſeſſion, the property of which is common to all the individuals of the ſame ſociety. Feaſts are very common among them, and more particularly when the inhabitants of one iſland are viſited by thoſe of the others. The men of the village meet their gueſts beating drums, and preceded by the women, who ſing and dance. At the concluſion of the dance, the hoſts ſerve up their beſt proviſions, and invite their gueſts to partake of the feaſt. They feed their children when very young with the coarſeſt fleſh, and for the moſt part raw. If an infant cries, the mother immediately carries it to the ſea-ſide, and whether it be ſummer or winter, holds it naked in the water until it is quiet. This cuſtom is ſo far from doing the children any harm, that it hardens them againſt the cold, and they accordingly go barefooted through the winter without the leaſt inconvenience. They ſeldom heat their dwellings; but when they are deſirous of warming themſelves, they light a bundle of hay, and ſtand

Fracaſtor, Fraches.

over it; or elſe they ſet fire to train-oil, which they pour into a hollow ſtone. They have a good ſhare of plain natural ſenſe, but are rather ſlow of underſtanding. They ſeem cold and indifferent in moſt of their actions; but let an injury, or even a ſuſpicion only, rouſe them from this phlegmatic ſtate, and they become inflexible and furious, taking the moſt violent revenge without any regard to the conſequences. The leaſt affliction prompts them to ſuicide; the apprehenſion of even an uncertain evil often leads them to deſpair; and they put an end to their days with great apparent inſenſibility.

FRACASTOR (Jerome), a moſt eminent Italian poet and phyſician, was born at Verona in the year 1482. Two ſingularities are related of him in his infancy: one is, that his lips adhered ſo cloſely to each other when he came into the world, that a chirurgeon was obliged to divide them with his inciſion-knife; the other, that his mother was killed with lightning, while he, though in her arms at the very moment, eſcaped unhurt. Fracaſtor was of parts ſo exquiſite, and made ſo wonderful a progreſs in every thing he undertook, that he became eminently ſkilled not only in the belles lettres, but in all arts and ſciences. He was a poet, a philoſopher, a phyſician, an aſtronomer, a mathematician, and what not? He was a man of vaſt conſequence in his time; as appears from pope Paul III.'s making uſe of his authority to remove the council of Trent to Bologne, under the pretext of a contagious diſtemper, which, as Fracaſtor depoſed, made it no longer ſafe to continue at Trent. He was intimately acquainted with cardinal Bembus, Julius Scaliger, and all the great men of his time. He died of an apoplexy at Caſi near Verona, in 1553: and in 1559, the town of Verona erected a ſtatue in honour of him.

He was the author of many performances, both as a poet and as a phyſician; yet never man was more diſintereſted in both theſe capacities than he: evidently ſo as a phyſician, for he practiſed without fees; and as a poet, whoſe uſual reward is glory, nothing could be more indifferent. It is owing to this indifference, that we have ſo little of his poetry, in compariſon of what he wrote; and that, among other compoſitions, his Odes and Epigrams, which were read in manuſcript with infinite admiration, yet, never paſſing the preſs, were loſt. What we have now of his, are the three books of "Siphilis, or of the French diſeaſe;" a book of Miſcellaneous Poems; and two books of his poem, intitled, *Joſeph*, which he began at the latter end of his life, but did not live to finiſh. And theſe works, it is ſaid, would have periſhed with the reſt, if his friends had not taken care to preſerve and communicate copies of them: For Fracaſtor, writing merely for amuſement, never troubled himſelf in the leaſt about what became of his works after they once got out of his hands. Fracaſtor compoſed alſo a poem, called *Alcon, ſive de cura canum venaticorum*. His poems as well as his other works are written all in Latin. His medical pieces are, *De Sympathia & Antipathia*,—*De contagione & contagioſis morbis*,—*De cauſis criticorum dierum*,—*De vini temperatura*, &c. His works have been printed ſeparately and collectively. The beſt edition of them is that of Padua 1735, in 2 vols 4to.

FRACHES, in the glaſs trade, are the flat iron pans into which the glaſs veſſels already formed are put when in the tower over the working furnace, and by means of which they are drawn out through the leers, that they may be taken gradually from the fire, and cool by degrees. Fraction

Fragaria.

FRACTION, in arithmetic and algebra, a part or diviſion of an unit or integer; or a number which ſtands to an unit in the relation of a part to its whole. The word literally imports a broken number.

Fractions are uſually divided into decimal, ſexageſimal, and vulgar. See Algebra and Arithmetic.

FRACTURE, in ſurgery, a rupture of a bone or a ſolution of continuity in a bone when it is cruſhed or broken by ſome external cauſe. See Surgery.

FRÆNUM, or Frenum, *Bridle*, in anatomy, a name given to divers ligaments, from their office in retaining and curbing the motions of the parts they are fitted to.

Frænum Linguæ, or *Bridle of the Tongue*; a membranous ligament, which ties the tongue to the os hyoides, larynx, fauces, and lower parts of the mouth. In ſome ſubjects the *frænum* runs the whole length of the tongue to the very tip; in which caſes, if it were not cut, it would take away all poſſibility of ſpeech. See *Tongue-Tied*.

Frænum Penis, a ſlender ligament, whereby the prepuce is tied to the lower part of the glans of the penis. Nature varies in the make of this part; it being ſo ſhort in ſome, that unleſs divided it would not admit of perfect erection. There is alſo a kind of little *frænum*, faſtened to the lower part of the clitoris.

FRAGA, a ſtrong town with a handſome caſtle in the kingdom of Arragon in Spain. It is ſtrong by ſituation among the mountains; having the river Cinca before it, whoſe high banks are difficult of acceſs; and at its back a hill, which cannot eaſily be approached with large cannon. Alphonſo VII. king of Arragon, and the firſt of that name of Caſtile, was killed by the Moors in 1134, when he beſieged this town. E. Long. 0. 23. N. Lat. 41. 28.

FRAGARIA, the Strawberry: A genus of the polygynia order, belonging to the icoſandria claſs of plants; and in the natural method ranking under the 35th order, *Senticoſæ*. The calyx is decemfid; the petals five; the receptacle of the ſeeds ovate, in the form of a berry, and deciduous. There is but one ſpecies, *viz.* the veſca, or cultivated ſtrawberry. The principal varieties are, 1. The ſylveſtris, or wood-ſtrawberry, with oval ſawed leaves, and ſmall round fruit. 2. The Virginian ſcarlet, or Virginia ſtrawberry, with oblong oval ſawed leaves, and a roundiſh ſcarlet-coloured fruit. 3. The moſchata, or hautboy, or muſky ſtrawberry, having oval, lanceolate, rough leaves, and large pale-red fruit. 4. The Chiloenſis, or Chili ſtrawberry, with large, oval, thick, hairy leaves, large flowers, and very large firm fruit. 5. The Alpina, Alpine, or monthly ſtrawberry, having ſmall oval leaves, ſmall flowers, and moderate-ſized, oblong, pointed fruit.

All theſe varieties are hardy, low, perennials, durable in root, but the leaves and fruit-ſtalks are renewed annually in ſpring. They flower in May and June, and their fruit comes to perfection in June, July, and Auguſt; the Alpine kind continuing till the beginning of winter. They all proſper in any common garden ſoil, producing abundant crops annually without

Fraguier Frame.

ont much trouble. They increaſe exceedingly every ſummer, both by off-ſets or ſuckers from the ſides of the plants, and by the runners or ſtrings, all of which rooting and forming plants at every joint, each of which ſeparately planted bears a few fruit the following year, and bear in great perfection the ſecond ſummer. Thoſe of the Alpine kind will even bear fruit the ſame year that they are formed. All the ſorts are commonly cultivated in kitchen-gardens, in beds or borders of common earth, in rows lengthwiſe 15 or 18 inches diſtance; the plants the ſame diſtance from one another in each row. Patches of the different ſorts diſpoſed here and there in the fronts of the different compartments of the pleaſure-ground, will appear ornamental both in their flowers and fruit, and make an agreeable variety.

Strawberries, eaten either alone, or with ſugar and milk, are univerſally eſteemed a moſt delicious fruit. They are grateful, cooling, ſubacid, and juicy. Tho' taken in large quantities, they ſeldom diſagree. They promote perſpiration, impart a violet ſmell to the urine, and diſſolve the tartareous incruſtations on the teeth. People afflicted with the gout or ſtone have found relief by uſing them very largely; and Hoffman ſays, he has known conſumptive people cured by them. The bark of the root is aſtringent.—Sheep and goats eat the plant; cows are not fond of it; horſes and ſwine refuſe it.

FRAGUIER (Glaude Francis), a polite and learned French writer, born at Paris, of a noble family, in 1666. He was educated under the Jeſuits, and was even admitted into the order, though he afterwards quitted it; and being thus at liberty to follow his inclinations, he ſoon after aſſiſted the Abbè Bignon in conducting the *Journal de Scavans*, having all the qualifications for ſuch a work. His works conſiſt of Latin poems, and a great number of very excellent diſſertations. He died in 1728.

FRAIL, a baſket made of ruſhes or the like, in which are packed up figs, raiſins, &c. It ſignifies alſo a certain quantity of raiſins, about 75 pounds.

FRAISE, in fortification, a kind of defence, conſiſting of pointed ſtakes, ſix or ſeven feet long, driven parallel to the horizon into the retrenchments of a camp, a half-moon, or the like, to prevent any approach or ſcalade.

Fraiſes differ from paliſades chiefly in this, that the latter ſtand perpendicular to the horizon, and the former jet out parallel to the horizon, or nearly ſo, being uſually made a little ſloping, or with the points hanging down. Fraiſes are chiefly uſed in retrenchments and other works thrown up of earth; ſometimes they are found under the parapet of a rampart, ſerving inſtead of the cordon of ſtone uſed in ſtone-works.

To FRAISE *a Battalion*, is to line the muſqueteers round with pikes, that in caſe they ſhould be charged with a body of horſe, the pikes being preſented, may cover the muſqueteers from the ſhock, and ſerve as a barricade.

FRAME, in joinery, a kind of caſe, wherein a thing is ſet or incloſed, or even ſupported; as a window-frame, a picture-frame, &c.

FRAME is alſo a machine uſed in divers arts; as,

FRAME, among printers, is the ſtand which ſupports the caſes. See CASE.

FRAME, among founders, a kind of ledge incloſing a board; which, being filled with wetted ſand, ſerves as a mould to caſt their works in. See FOUNDERY. Frame in France.

FRAME is more particularly uſed for a ſort of loom, whereon artificers ſtretch their linens, ſilks, ſtuffs, &c. to be embroidered, quilted, or the like.

FRAME, among painters, a kind of ſquare, conſiſting of four long ſlips of wood joined together, whoſe intermediate ſpace is divided by threads into ſeveral little ſquares like a net; and hence ſometimes called *reticula*. It ſerves to reduce figures from great to ſmall; or, on the contrary, to augment their ſize from ſmall to great.

FRAMLINGHAM, a town of Suſſex, 88 miles from London. It is a large old place, with a caſtle, ſuppoſed to have been built by ſome of the firſt kings of the Eaſt-Angles; the walls, yet ſtanding, are 44 feet high, 8 thick, with 13 towers 14 feet above them, 2 of which are watch-towers. To this caſtle the princeſs, afterwards Queen Mary I. retired, when the Lady Jane Grey was her competitor for the crown. The town is pleaſantly ſituated, though but indifferently built, upon a clay-hill, in a fruitful ſoil and a healthy air, near the ſource of the river Ore, by ſome called Winckel, which runs through it to Orford. It has a ſpacious place for the market on Saturday; and a large ſtately church built all of black flint, with a ſteeple 100 feet high; two good almſhouſes; and a free-ſchool.

FRANC. See FRANK.

FRANCE, a large kingdom of Europe, ſituated between 5° W. and 7° E. Long. and between 43° and 51° N. Lat. being bounded by the Engliſh channel and the Auſtrian Netherlands on the north; by Germany, Switzerland, Savoy, and Piedmont, in Italy, on the eaſt; by the Mediterranean ſea, and the Pyrenean mountains, which ſeparate it from Spain, on the ſouth; and by the bay of Biſcay on the weſt.

The kingdom of France was originally poſſeſſed by the *Celtes* or *Gauls*. They were a very warlike people, and often checked the progreſs of the Roman arms: nor did they yield till the time of Julius Cæſar, who totally ſubdued their country, and reduced it to the form of a Roman province*. The Romans continued in quiet poſſeſſion of Gaul, as long as their empire retained its ſtrength, and they were in a condition to repreſs the incurſions of the German nations, whom even in the zenith of their power they had not been able to ſubdue. But in the reign of the emperor Valerian, the ancient Roman valour and diſcipline had begun to decline, and the ſame care was not taken to defend the provinces as formerly. The barbarous nations, therefore, began to make much more frequent incurſions; and among the reſt the *Franks*, a German nation, inhabiting the banks of the Rhine, proved particularly troubleſome. Their origin is variouſly accounted for; but the moſt probable ſuppoſition is, that about the time of the emperor Gordian, the people inhabiting the banks of the lower Rhine entered into a confederacy with thoſe who dwelt on the Weſer, and both together aſſumed the name of *Franks* or *Freeman*. Their firſt irruption, we are told by Valeſius, happened in the year 254, the ſecond of Valerian's reign. At this time they were but few in number; and were repulſed by Aurelian, afterwards emperor.

1 Firſt ſubdued by Julius Cæſar.

* See *Gaul*.

2 Invaded by the Franks.

Not

France. Not discouraged by this check, they returned two years after in far greater numbers; but were again defeated by Gallienus, whom Valerian had chosen for his partner in the empire. Others, however, continued to pour in from their native country in such multitudes, that Gallienus, no longer able to drive them out by force of arms, made advantageous proposals to one of their chiefs, whom he engaged to defend the frontiers against his countrymen as well as other invaders.

This expedient did not long answer the purpose. In 260 the Franks, taking advantage of the defeat and captivity of Valerian in Persia, broke into Gaul, and afterwards into Italy, committing every where dreadful ravages. Five years afterwards they invaded Spain; which they possessed, or rather plundered, for the space of 12 years: nor could they be driven out of Gaul till the year 275, when the emperor Probus not only gave them a total overthrow in that country, but pursued them into their own, where he built several forts to keep them in awe. This intimidated them so much, that nine of their kings submitted to the emperor, and promised an annual tribute.—They continued quiet till the year 287; when, in conjunction with the Saxon pirates, they plundered the coasts of Gaul, carrying off an immense booty. To revenge this insult, the emperor Maximian entered the country of the Franks the following year, where he committed such ravages that two of their kings submitted to him; and to many of the common people who chose to remain in Gaul, he allowed lands in the neighbourhood of Treves and Cambray.

The restless disposition of the Franks, however, did not allow them to remain long in quiet. About the year 293, they made themselves masters of Batavia and part of Flanders; but were entirely defeated, and forced to surrender at discretion, by Constantius the father of Constantine the Great, who transplanted them into Gaul. Their countrymen in Germany continued quiet till the year 306, when they renewed their depredations; but being overcome by Constantine the Great, two of their kings were taken prisoners, and thrown to the wild beasts in the shows exhibited on that occasion.

All these victories, however, as well as many others said to have been gained by the Romans, were not sufficient to prevent the incursions of this restless and turbulent nation; insomuch that, in the year 355, they had made themselves masters of 40 cities in the province of Gaul. Soon after, they were totally defeated by the emperor Julian, and again by count Theodosius, father to the emperor of that name; but, in the year 388, they ravaged the province with more fury than ever, and cut off a whole Roman army that was sent against them. As the western empire was at this time in a very low state, they for some time found more interruption from other barbarians than from the Romans, till their progress was checked by Aetius.

3 Pharamond the first king. When the war with Aetius broke out, the Franks were governed by one *Pharamond*, the first of their kings of whom we have any distinct account. He is supposed to have reigned from the year 417 or 418, to 428; and is thought by archbishop Usher to have been killed in the war with Aetius. By some he is supposed to have compiled the Salic Laws, with the assistance of four sages named *Wisegast*, *Losegast*, *Widegast*, and *Salegast*. But Valesius is of opinion that the Franks had no written laws till the time of Clovis. France.

4 Clodio. Pharamond was succeeded by his son Clodio, who likewise carried on a war against the Romans. He is said to have received a terrible overthrow from Aetius near the city of Lens; notwithstanding which, he advanced to Cambray, and made himself master of that city, where for some time he took up his residence. After this he extended his conquests as far as the river Somme, and destroyed the cities of Treves and Cologne, Tournay and Amiens. He died in the year 448, and was succeeded by Merovæus.

5 Merovæus. Authors are not agreed whether the new king was brother, or son, or any relation at all, to Clodio. It seems probable indeed, that he was of a different family; as from him the first race of French kings were styled *Merovingian*. He was honoured and respected by his people, but did not greatly enlarge the boundaries of his kingdom. He died in 458.

6 Childeric. Merovæus was succeeded by his son Childeric; who being no longer kept in awe by Aetius, made war on the Romans, and extended his conquests as far as the river Loire. He is said to have taken the city of Paris after a siege of five years, according to some, and of ten, according to others. The Roman power was now totally destroyed in Italy; and therefore *Clodoveus*, *Clovis*, or *Louis*, for his name is differently written, who succeeded Childeric, set himself about making an entire conquest of Gaul. Part of the province was still retained by a Roman named *Syagrius*, who probably had become sovereign of the country on the downfal of the western empire in 476. He was defeated and taken prisoner by Clovis, who afterwards caused him to be beheaded, and soon after totally reduced his dominions.

7 French monarchy established by Clovis. Thus was the French monarchy established by Clovis in the year 487. He now possessed all the country lying between the Rhine and the Loire; which, though a very extensive dominion, was yet considerably inferior to what it is at present.

Clovis had been educated in the Pagan religion, and continued in that profession till the 30th year of his age; notwithstanding which he allowed his subjects full liberty of conscience. Having married, however, Clotilda, daughter of the duke of Burgundy, this princess, who was a zealous Christian, used all her influence with her husband to persuade him to embrace her religion. For some time he continued to waver; but happening to gain a battle, where, being in great danger, he had invoked the god of Clotilda and the Christians, he afterwards gave such a favourable ear to the discourses of Remigius bishop of Rheims, that he soon declared himself a convert, and was baptised in the year 496. His acknowledgment of the truths of the gospel was not followed by any amendment of life: on the contrary, he employed the remainder of his life in the aggrandisement of himself and extension of his dominions by the most abominable treachery, fraud, and violence. In his attacks on Armorica he proved unsuccessful. The inhabitants of this country, which comprehended the maritime part of ancient Gaul lying between the rivers Seine and Loire, had united for their defence; and though abandoned by the Romans,

France. mans, made a powerful defence againſt the barbarians who aſſaulted them on all ſides. Clovis, finding them too powerful to be ſubdued by force, propoſed an union with his people, which they readily accepted, and this the more eaſily on account of his profeſſing the Chriſtain religion. Thus the Chriſtianity of Clovis in ſeveral inſtances proved ſubſervient to the purpoſes of his ambition, and his power became gradually very formidable. The Burgundians at this time poſſeſſed all the country from the foreſt of Voſges to the ſea of Marſeilles, under Gondebaud the uncle of Clotilda; who to ſecure his own authority, had put to death two of his brothers, one of whom was the father of the French queen. The third brother, *Godageſil*, whom he had ſpared and allowed to poſſeſs the principality of Geneva, conſpired with Clovis to drive him from his dominions. A war having commenced between the French and Burgundian monarchs, the latter was deſerted in a battle by Godageſil, and obliged to fly to Avignon, leaving his antagoniſt maſter of the cities of Lyons and Vienna. The victor next laid ſiege to Avignon; but it was defended with ſuch vigour, that Clovis at laſt thought proper to accept of a ſum of money and an annual tribute from Gondebaud; who was likewiſe obliged to cede to Godageſil the city of Vienne, and ſeveral other places taken during the war.

Gondebaud no ſooner found himſelf at liberty from his enemies, than he aſſembled a powerful army; with which he advanced towards Vienne, where Godageſil himſelf reſided at that time. The place was garriſoned by 5000 Franks, and might have made conſiderable reſiſtance; but Gondebaud being admitted through the ſubterraneous paſſage of an aqueduct, maſſacred moſt of the Franks, ſent the reſt priſoners to the king of the Viſigoths, and put Godageſil to death. This was quickly followed by the ſubmiſſion of all the other places which had owned the authority of Godageſil: and Gondebaud, now thinking himſelf able to reſiſt the power of Clovis, ſent a meſſage to inform him, that he muſt no longer expect the promiſed tribute; and though Clovis was very much mortified with this defection, he found himſelf obliged for the preſent to put up with the injury, and accept of the alliance and military ſervice of the king of Burgundy.

His next expedition was againſt the Viſigoths, who poſſeſſed conſiderable territories on both ſides of the Pyrenean mountains. His motives for this undertaking were expreſſed in the following ſpeech to his nobility when aſſembled in the city of Paris, which he conſidered as the capital of his dominions. "It is with concern (ſaid the religious monarch) that I ſuffer the Arians to poſſeſs the moſt fertile part of Gaul; let us, with the aid of God, march againſt them; and having conquered them, annex their kingdom to our dominions." The nobility approved of the ſcheme; and Clovis marched againſt a prince for whom he had but lately profeſſed the greateſt regard, vowing to erect a church in honour of the holy apoſtles, if he ſucceeded in his enterpriſe. Alaric the king of the Viſigoths was a young man deſtitute of military experience, though perſonally brave. He did not therefore heſitate at engaging his antagoniſt; but, unable to contend with the veteran troops of Clovis, his army was utterly defeated on the banks of the Clain, 10 miles ſouth of Poictiers, in the year 507. Alaric, perceiving the ruin of his troops, ruſhed againſt Clovis in perſon, by whom he was killed, and the remainder of the army purſued for ſome time with great ſlaughter. After this victory the province of Aquitain ſubmitted, and Clovis eſtabliſhed his winter quarters at Bourdeaux. Tholouſe ſurrendered next ſpring; and the royal treaſures of the Viſigoths were tranſported to Paris. Angouleme was next reduced, and the city of Arles inveſted. But here the victorious career of Clovis was ſtopped by Theodoric king of the Oſtrogoths, who had overturned the dominion of Odoacer in Italy. He had married Adolfleda the ſiſter of Clovis, but had alſo given his own daughter in marriage to the king of the Viſigoths, and had endeavoured, as much as was in his power, to preſerve a good underſtanding between the two ſovereigns. Finding this impoſſible, however, and that no bounds could be ſet to the ambition of Clovis, he ſent one of his generals with a powerful army againſt him; by whom the French monarch was defeated with the loſs of 30,000 men. By this misfortune Clovis was obliged to raiſe the ſiege of Arles with precipitation: however, the Franks ſtill retained the greateſt part of their conqueſts, and the province of Aquitain was indiſſolubly annexed to their empire. France.

8 Is honoured with the title of *Roman Conſul*.

In 509, Clovis had the title of Roman conſul; by which means the people of Rome were inſenſibly led to pay a peculiar regard to the French monarchs: and Clovis was now ſuppoſed to be inveſted with a juſt title to all his conqueſts in whatever manner they had been acquired. He was ſolemnly inveſted with his new dignity in the church of St Martin in the city of Tours; after which he entered the cathedral clothed in a purple tunic and mantle, the badges of his office.

Clovis now proceeded to augment his power by the murder of his kinſmen the princes of the Merovingian race. Among thoſe who periſhed on this occaſion were Sigibert king of Cologne, with his ſon Cloderic, Cararic, another prince whoſe dominions have not been accurately pointed out by hiſtorians; Ranacaire, who governed the preſent dioceſe of Cambray; and Renomer king of the territory of Maine. All theſe murders, however, were expiated, according to the views of the clergy of thoſe times, by the great zeal he expreſſed in the cauſe of Chriſtianity, and his liberality to the church.

Clovis died in the year 511, after having reformed and publiſhed the Salic laws: a few lines of which, debarring women from inheriting any part of the Salic lands, have been extended ſo far as to deprive the females of the royal family of France of their right of ſucceſſion to the throne of that kingdom.

9 His dominions divided among his children

Clovis was buried in the church of St Peter and St Paul, now Genevieve, in the city of Paris, where his tomb is ſtill to be ſeen. His dominions were divided among his four ſons. Thieri, or Theodoric, the eldeſt, had the eaſtern part of the empire; and, from his making the city of Metz his capital, is commonly called the *king of Metz*. Clodomir, the eldeſt ſon by Clotilda, had the kingdom of Orleans; Childebert, and Clotaire, who were both infants, had the kingdoms of Paris and Soiſſons, under the tutelage of their mother. The prudence of Clotida kept matters quiet in all the parts of the empire for eight years; but about

France. about the year 520, a numerous fleet of Danes arrived at the mouth of the Meuſe; and their king Cochiliac, having landed his forces, began to deſtroy the country with fire and ſword. Againſt him Thieri ſent his ſon Theodobert, who defeated the Daniſh army and navy, and killed their king, forcing the reſt to retire with precipitation.

In 522, Hermanfroi king of Thuringia, having deſtroyed one of his brethren named *Berthaire*, and ſeized on his dominions, applied to Thieri for aſſiſtance againſt his other brother Balderic, whom he intended to treat in the ſame manner. In this infamous enterpriſe Thieri embarked, on condition that he ſhould have one half of Balderic's dominions: but after the unhappy prince was overcome and killed in battle, Hermanfroi ſeized all his dominions. Thieri had no opportunity of revenging himſelf till the year 531; when perceiving the power of the Oſtrogoths, whom he much dreaded, to be conſiderably leſſened by the death of king Theodric, he engaged his brother Clotaire to aſſiſt him; and they accordingly entered Thuringia with two powerful armies. They joined their forces as ſoon as they had paſſed the Rhine, and were quickly after reinforced by a conſiderable body of troops under the command of Theodobert. The allies attacked the army of Hermanfroi, which was advantageouſly poſted; and having totally defeated it, he was forced to fly from place to place in diſguiſe. Soon after this the capital was taken, and Hermanfroi himſelf being invited to a conference by Thieri, was treacherouſly murdered; after which his extenſive dominions became feudatory to Thieri.

In the mean time, Clotilda had excited her children to make war on the Burgundians, in order to revenge the death of her father Chilperic, whom Gondebaud king of Burgundy had cauſed to be murdered. Gondebaud was now dead, and had left his dominions to his ſons Sigiſmund and Godemar. Sigiſmund's forces were quickly defeated; and he himſelf was ſoon after delivered up by his own ſubjects to Clodomir, who cauſed him to be thrown into a pit, where he periſhed miſerably. By his death Godemar became ſole maſter of Burgundy. Clodomir marched againſt him, and defeated him; but purſuing his victory too eagerly, was ſurrounded by his enemies and ſlain. After the reduction of Thuringia, however, Childebert and Clotaire entered the kingdom of Burgundy at the head of a powerful army, and in 534 completed the conqueſt of it; in which, according to ſome, Godemar was killed; according to others, he retired into Spain, and from thence into Africa.

10 Clotaire becomes ſole monarch.

In 560 Clotaire became ſole monarch of France. He had murdered the ſons of Clodomir, who was killed in Burgundy as above related. Thieri and his children were dead, as was alſo Childebert; ſo that Clotaire was ſole heir to all the dominions of Clovis. He had five ſons; and the eldeſt of them, named *Chramnes*, had ſome time before rebelled againſt his father in Auvergne. As long as Childebert lived, he ſupported the young prince; but on his death, Chramnes was obliged to implore his father's clemency. He was at this time pardoned; but he ſoon began to cabal afreſh, and engaged the count of Bretagne to aſſiſt him in another rebellion. The Bretons, however, were defeated, and Chramnes determined to make his eſcape; but perceiving that his wife and children were ſurrounded by his father's troops, he attempted to reſcue them. In this attempt he was taken priſoner, and with his family was thruſt into a thatched cottage near the field of battle; of which the king was no ſooner informed, than he commanded the cottage to be ſet on fire, and all that were in it periſhed in the flames. France.

11 The empire again divided.

Clotaire did not long ſurvive this cruel execution of his ſon, but died in 562; and after his death the French empire was divided among his four remaining ſons, Caribert, Gontran, Sigebert, and Chilperic.—The old king made no diviſion of his dominions before he died, which perhaps cauſed the young princes to fall out ſooner than they would otherwiſe have done. After his death, however, they divided the kingdom by lot; when Caribert, the eldeſt, had the kingdom of Paris; Gontran, the ſecond, had Orleans; Sigibert had Metz (or the kingdom of Auſtraſia); and Chilperic had Soiſſons. Provence and Aquitaine were poſſeſſed by all of them in common. The peace of the empire was firſt diſturbed in 563 by an invaſion of the Abares; a barbarous nation, ſaid to be the remains of the Huns. They entered Thuringia, which belonged to the dominions of Sigebert; but by him they were totally defeated, and obliged to repaſs the Elbe with precipitation. Sigebert purſued them cloſe, but readily concluded a peace with them on their firſt propoſals. To this he was induced, by hearing that his brother Chilperic had invaded his dominions, and taken Rheims and ſome other places in the neighbourhood. Againſt him, therefore, Sigebert marched with his victorious army, made himſelf maſter of Soiſſons his capital, and of the perſon of his eldeſt ſon Theodobert. He then defeated Chilperic in battle; and not only recovered the place which he had ſeized, but conquered the greater part of his dominions: nevertheleſs, on the mediation of the other two brothers, Sigebert abandoned all his conqueſts, ſet Theodobert at liberty, and thus reſtored peace to the empire.

Soon after this, Sigebert married Brunehaut daughter to Athanagilde king of the Viſigoths in Spain; and in a little time after the marriage, died Caribert king of Paris, whoſe dominions were divided among his three brethren. In 567 Chilperic married Galſwintha, Brunehaut's eldeſt ſiſter, whom he did not obtain without ſome difficulty. Before her arrival, he diſmiſſed his miſtreſs called *Fredegonde*; a woman of great abilities and firmneſs of mind, but ambitious to the higheſt degree, and capable of committing the blackeſt crimes in order to gratify her ambition. The queen, who brought with her immenſe treaſures from Spain, and made it her whole ſtudy to pleaſe the king, was for ſome time entirely acceptable. By degrees, however, Chilperic ſuffered Fredegonde to appear again at court, and was ſuſpected of having renewed his intercourſe with her; which gave ſuch umbrage to the queen, that ſhe deſired leave to return to her own country, promiſing to leave behind her all the wealth ſhe had brought. The king, knowing that this would render him extremely odious, found means to diſſipate his wife's ſuſpicions, and ſoon after cauſed her to be privately ſtrangled, upon which he publicly married Fredegonde.

12 Infamous conduct of Chilperic.

Such an atrocious action could not fail of exciting the greateſt indignation againſt Chilperic. His domi-

France. nions were immediately invaded by Sigebert and Gontran, who conquered the greateſt part of them; after which they ſuddenly made peace, Chilperic conſenting that Brunehaut ſhould enjoy thoſe places which on his marriage he had beſtowed upon Galſwintha, viz. Bourdeaux, Limoges, Cahors, Bigorre, and the town of Bearn, now called *Leſcar*.

The French princes, however, did not long continue at peace among themſelves. A war quickly enſued, in which Gontran and Chilperic allied themſelves againſt Sigebert. The latter prevailed; and having forced Gontran to a ſeparate peace, ſeemed determined to make Chilperic pay dear for his repeated perfidy and infamous conduct; when he was aſſaſſinated by a contrivance of Fredegonde, who thus ſaved herſelf and Chilperic from the moſt imminent danger. Immediately on his death, Brunehaut fell into the hands of Chilperic; but Gondebaud, one of Sigebert's beſt generals, made his eſcape into Auſtraſia with Childebert, the only ſon of Sigebert, an infant of about five years of age, who was immediately proclaimed king in room of his father. In a ſhort time, however, Meroveus, eldeſt ſon to Chilperic, fell in love with Brunehaut, and married her without acquainting his father. Chilperic, on this news, immediately went to Rouen, where Meroveus and his conſort were; and having ſeized them, ſent Brunehaut and her two daughters to Metz, and carried Meroveus to Soiſſons. Soon after, one of his generals being defeated by Gontran, who eſpouſed Brunehaut's cauſe, Chilperic, in a fit of rage, cauſed Meroveus to be ſhaved and confined in a monaſtery. From hence he found means to make his eſcape, and with great difficulty arrived in Auſtraſia, where Brunehaut would gladly have protected him: but the jealouſy of the nobles was ſo ſtrong, that he was forced to leave that country; and being betrayed into the hands of his father's forces, was murdered at the inſtigation of Fredegonde, as was generally believed.

13 Sigebert aſſaſſinated;

The French empire was at this time divided between Gontran king of Orleans, called alſo king of Burgundy, Chilperic king of Soiſſons, and Childebert king of Auſtraſia. Chilperic found his affairs in a very diſagreeable ſituation. In 579, he had a diſpute with Varoc count of Bretagne, who refuſed to do him homage. Chilperic diſpatched a body of troops againſt him; who were defeated, and he was then forced to ſubmit to a diſhonourable peace. His brother and nephew lived in ſtrict union, and had no reaſon to be very well pleaſed with him. His own ſubjects, being oppreſſed with heavy taxes, were miſerably poor and diſcontented. His ſon Clovis, by a former queen named *Andovera*, hated Fredegonde, and made no ſecret of his averſion. To add to his embarraſſment, the ſeaſons were for a long time ſo unfavourable, that the country was threatened with famine and peſtilence at the ſame time. The king and queen were both attacked by an epidemic diſeaſe which then raged. They recovered: but their three ſons, Clodobert, Samſon, and Dagobert, died; after which the ſight of Clovis became ſo diſagreeable to Fredegonde that ſhe cauſed him to be murdered, and likewiſe his mother Andovera, leſt Chilperic's affection for her ſhould return after the tragical death of her ſon.

14 nd likeiſe Chilperic.

In 583 Chilperic himſelf was murdered by ſome unknown aſſaſſins, when his dominions were on the point of being conquered by Gontran and Childebert, who had entered into a league for that purpoſe. After his death Fredegonde implored the protection of Gontran for herſelf and her infant ſon Clotaire; which he very readily granted, and obliged Childebert to put an end to the war. He found himſelf, however, greatly difficulted to keep Fredegonde and Brunehaut in awe; for theſe two princeſſes having been long rivals and implacable enemies, were continually plotting the deſtruction of each other. This, however, he accompliſhed, by favouring ſometimes Brunehaut and ſometimes Fredegonde; ſo that, during his life, neither of them durſt undertake any thing againſt the other. France.

15 Death of Gontran;

On the 28th of March 593, died Gontran, having lived upwards of 60, and reigned 32 years. Childebert ſucceeded to the kingdom without oppoſition, but did not long enjoy it; he himſelf dying in the year 596, and his queen ſhortly after. His dominions were divided between his two ſons Theodobert and Thierri; the firſt of whom was declared king of Auſtraſia, and the latter king of Burgundy. As Theodobert was only in the 11th year of his age, and Thierri in his 10th, Brunehaut governed both kingdoms with an abſolute ſway. Fredegonde, however, took care not to let ſlip ſuch a favourable opportunity as was offered her by the death of Childebert, and therefore made herſelf miſtreſs of Paris and ſome other places on the Seine.

16 And Fredegonde.

Upon this Brunehaut ſent againſt her the beſt part of the forces in Auſtraſia, who were totally defeated; but Fredegonde died before ſhe had time to improve her victory, leaving her ſon Clotaire heir to all her dominions.

For ſome time Brunehaut preſerved her kingdom in peace; but in the end her own ambition proved her ruin. Inſtead of inſtructing Theodobert in what was neceſſary for a prince to know, ſhe took care rather to keep him in ignorance, and even ſuffered him to marry a young and handſome ſlave of his father's. The new queen was poſſeſſed of a great deal of affability and good-nature; by which means ſhe in a ſhort time gained the affection of her huſband ſo much, that he readily conſented to the baniſhment of Brunehaut. Upon this diſgrace ſhe fled to Thierri king of Burgundy, in the year 599. By him ſhe was very kindly received; and inſtead of exciting jealouſies or miſunderſtandings between the two brothers, ſhe engaged Thierri to attempt the recovery of Paris and the other places which had been wreſted from their family by Fredegonde, procuring at the ſame time a conſiderable body of auxiliaries from the Viſigoths. This meaſure was ſo acceptable to Theodobert, that he likewiſe raiſed a numerous army, and invaded Clotaire's dominions in conjunction with his brother. A battle enſued, in which the forces of Clotaire were totally defeated, and himſelf obliged ſoon after to ſue for peace; which was not granted, but on condition of his yielding up the beſt part of his dominions.

17 Brunehaut baniſhed.

This treaty was concluded in the year 600; but three years afterwards, it was broken by Clotaire. He was again attacked by the two brothers, and the war carried on with great vigour till the next ſpring. At this time Thierri having forced Landri, Clotaire's general, to a battle, gave him a total overthrow, in which the king's infant ſon Merovæus, whom he had ſent along with Landri, was maſſacred; to gratify, as Clotaire

France. taire pretended, the malice of Brunehaut. After this victory, Thierri marched directly to Paris; fully bent on the deſtruction of his couſin, which now ſeemed inevitable. This, however, was prevented by Theodobert; who no ſooner heard of the victory gained by Thierri, than he became jealous of his ſucceſs, and offered Clotaire ſuch terms of peace as he gladly accepted. The latter having then nothing to fear on the ſide of Auſtraſia, quickly compelled Thierri to liſten to terms of accommodation alſo.

This behaviour of Theodobert greatly provoked his brother; and his reſentment was highly inflamed by Brunehaut, who never forgot her diſgrace in being baniſhed from his court. A war was therefore commenced between the two brothers in 605; but it was ſo highly diſapproved of by the nobility, that Thierri found himſelf obliged to put an end to it. The tranquillity which now took place was again diſturbed in 607, by Theodobert's ſending an embaſſy to demand ſome part of Childebert's dominions which had been added, by the will of that monarch, to thoſe of Burgundy. The nobility of both kingdoms were ſo much averſe to war, that they conſtrained their kings to conſent to a conference attended by an equal number of troops; but Theodobert, by a ſcandalous breach of his faith, brought double the number, and compelled his brother to ſubmit to what terms he pleaſed. This piece of treachery inſtantly brought on a war; for Thierri was bent on revenge, and his nobility no longer oppoſed him. It was neceſſary, however, to ſecure Clotaire by a negociation; and accordingly a promiſe was made of reſtoring thoſe parts of his dominions which had formerly been taken from him, provided he would remain quiet. This treaty being finiſhed, Thierri entered Theodobert's dominions, defeated him in two battles, took him priſoner, uſed him with the utmoſt indignity; and having cauſed an infant ſon of his to be put to death, ſent him to his grandmother Brunehaut. By her orders he was firſt ſhaved and confined in a monaſtery; but afterwards, fearing leſt he ſhould make his eſcape, ſhe cauſed him to be put to death.—Clotaire, in the mean time, thought that the beſt method of making Thierri keep his word was to ſeize on thoſe places which he had promiſed to reſtore to him, before his return from the war with Theodobert. This he accordingly did; and Thierri no ſooner heard of his having done ſo, than he ſent him a meſſage requiring him to withdraw his forces, and, in caſe of his refuſal, declared war. Clotaire was prepared for this; and accordingly aſſembled all the forces in his dominions, in order to give him a proper reception. But before Thierri could reach his enemies, he was ſeized with a dyſentery; of which he died in the year 612, having lived 26 years, and reigned 17.

18 Death of Thierri.

On the death of Thierri, Brunehaut immediately cauſed his eldeſt ſon, named *Sigiſbert*, then in the 10th year of his age, to be proclaimed king. It is probable that ſhe intended to have governed in his name with an abſolute ſway; but Clotaire did not give her time to diſcover her intentions. Having great intelligence in Auſtraſia and Burgundy, and knowing that the nobility in both kingdoms were diſaffected to Brunehaut, he declared war againſt her; and ſhe being betrayed by her generals, fell into the hands of her enemies. Clotaire gave her up to the nobles; who generally hated her, and who uſed her in the moſt cruel manner. After having led her about the camp, expoſed to the inſults of all who had the meanneſs to inſult her, ſhe was tied by the leg and arm to the tail of an untamed horſe, which, ſetting off at full ſpeed, quickly daſhed out her brains. After this her mangled body was reduced to aſhes, which were afterwards interred in the abbey of St Martin at Autun. France.

19 Brunehaut put to a cruel death

Thus in the year 613, Clotaire became ſole monarch of France; and quietly enjoyed his kingdom till his death, which happened in 628. He was ſucceeded by Dagobert; who proved a great and powerful prince, and raiſed the kingdom of France to a high degree of ſplendor. Dagobert was ſucceeded by his ſons Sigebert and Clovis; the former of whom had the kingdom of Auſtraſia, and the latter that of Burgundy. Both the kings were minors at the time of their acceſſion to the throne, which gave an opportunity to the mayors of the palace (the higheſt officers under the crown) to uſurp the whole authority. Sigebert died in 640, after a ſhort reign of one year; leaving behind him an infant ſon named *Dagobert*, whom he ſtrongly recommended to the care of Grimoalde his mayor of the palace. The miniſter cauſed Dagobert to be immediately proclaimed king, but did not long ſuffer him to enjoy that honour. He had not the cruelty, however, to put him to death; but ſent him to a monaſtery in one of the Weſtern iſlands of Scotland; and then, giving out that he was dead, advanced his own ſon Childebert to the throne. Childebert was expelled by Clovis king of Burgundy; who placed on the throne Childeric, the ſecond ſon of Sigebert. Clovis died ſoon after the revolution, and was ſucceeded in his dominions by his ſon Clotaire; who died in a ſhort time, without iſſue. He was ſucceeded by his brother Childeric; who, after a ſhort reign, was murdered with his queen, at that time big with child, and an infant ſon named *Dagobert*; though another, named *Daniel*, had the good luck to eſcape.

20 Miſerable ſituation of France.

The affairs of the French were now in the moſt deplorable ſituation. The princes of the Merovingian race had been for ſome time entirely deprived of their power by their officers called *mayors of the palace*. In Auſtraſia the adminiſtration had been totally engroſſed by Pepin and his ſon Grimaulde; while Archambaud and Ebroin did the ſame in Neuſtria and Burgundy. On the reunion of Neuſtria and Burgundy to the reſt of the French dominions, this miniſter ruled with ſuch a deſpotic ſway, that the nobility of Auſtraſia were provoked to a revolt; electing for their dukes two chiefs named *Martin* and *Pepin*. The forces of the confederates, however, were defeated by Ebroin; and Martin having ſurrendered on a promiſe of ſafety, was treacherouſly put to death. Pepin loſt no time in recruiting his ſhattered forces; but before he had any occaſion to try his fortune a ſecond time in the field of battle, the aſſaſſination of Ebroin delivered him from all apprehenſions from that quarter. After his death Pepin carried every thing before him, overthrew the royal army under the command of the new miniſter Bertaire; and, having got poſſeſſion of the capital, cauſed himſelf to be declared mayor of the palace; in which ſtation he continued to govern with an abſolute ſway during the remainder of his life.

Pepin (who had got the ſurname of *Heriſtal* from his

France

his palace on the Meuse) died in the year 714, having enjoyed unlimited power for 26 years. He appointed his grandson Theudobalde, then only six years of age, to succeed him in his post of mayor of the palace. This happened during the reign of Dagobert already mentioned; but this prince had too much spirit to suffer himself to be deprived of his authority by an infant. The adherents of the young mayor were defeated in battle, and this defeat was soon followed by his death.

21 Exploits of Charles Martel.

Charles, however, the illegitimate son of Pepin, was now raised to the dignity of duke by the Austrasians, and by his great qualities seemed every way worthy of that honour. The murder of Dagobert freed him from a powerful opponent; and the young king Chilperic, who after Dagobert's death was brought from a cloyster to the throne, could by no means cope with such an experienced antagonist. On the 19th of March 717, Charles had the good fortune to surprise the royal camp as he passed through the forest of Arden; and soon after a battle ensued, in which the king's forces were entirely defeated. On this Chilperic entered into an alliance with Eudes duke of Aquitaine, whose friendship he purchased by the final cession of all the country which Eudes had seized for himself. Charles, however, having placed on the throne another of the royal family named *Clotaire*, advanced against Chilperic and his associate, whom he entirely defeated near Soissons. After this disaster, Eudes, despairing of success, delivered up Chilperic into the hands of his antagonist; after having stipulated for himself the same terms which had been formerly granted him by the captive monarch.

Charles now advanced to the summit of power, treated Chilperic with great respect; and, on the death of Clotaire, caused him to be proclaimed king of Austrasia; by which, however, his own power was not in the least diminished: and from this time the authority of the kings of France became merely nominal; and so inactive and indolent were they accounted, that historians have bestowed upon them the epithet of *faineans*, i. e. "lazy or idle." Charles, however, had still one competitor to contend with. This was Rainfroy, who had been appointed mayor of the palace; and who made such a vigorous resistance, that Charles was obliged to allow him the peaceable possession of the country of Anjou. No sooner, however, had Charles thus set himself at liberty from domestic enemies, than he was threatened with destruction from foreign nations. The Suevians, Frisons, and Alemanni, were successively encountered and defeated. Eudes also, who had perfidiously broken the treaties to which he had bound himself, was twice repulsed; after which Charles invaded Aquitain, and obliged the treacherous duke to hearken to reason. This was scarce accomplished, when he found himself engaged with a more formidable enemy than any he had yet encountered. The Saracens, having over-run great part of Asia, now turned their victorious arms westward, and threatened Europe with total subjection. Spain had already received the yoke; and having passed the Pyrenees, they next invaded France, appearing in vast numbers under the walls of Thoulouse. Here they were encountered and defeated by Eudes; but this proved only a partial check. The barbarians once more passing the Pyrenees, entered France with such a powerful army, that Eudes was no longer able to resist. He encountered them indeed with his accustomed valour; but being forced to yield to superior power, he solicited the protection and assistance of Charles. On this occasion the latter, on account of his valour and personal strength, acquired the name of *Martel*, i. e. "the hammer," alluding to the violence of the strokes he bestowed on his enemies*. Three hundred and seventy-five thousand of the Infidels, among whom was the commander Abderahman himself, are said to have perished in the battle; notwithstanding which they soon made another irruption: but in this they were attended with no better success, being again defeated by Charles; who by so many victories established his power on the most solid foundation. Having again defeated the Frisons, and with his own hand killed their duke, he assumed the sovereignty of the dominions of Eudes after his decease, reserving to himself the claim of homage, which he ought to have yielded to Thierri his lawful sovereign. At last his fame grew so great, that he was chosen by pope Gregory III. for his protector. He offered to shake off the yoke of the Greek emperor, and to invest Charles with the dignity of Roman consul; sending him at the same time the keys of the tomb of St Peter; but while this negociation was going on successfully, the pope, the emperor, and Charles Martel himself died. After his death, which happened in the year 741, his dominions were divided among his three sons, Carloman, Pepin, and Grippon, according to the disposition he had made in his life-time. By this Carloman, the eldest, had Austrasia; Pepin, the second, Neustria and Burgundy; while Grippon, the third, had only some lands assigned him in France; by which he was so much displeased, that the tranquillity of the empire was soon disturbed. With the assistance of his mother Sonnechilde he seized on the city of Laon, where he endured a violent siege. In the end, however, he was obliged to submit; Sonnechilde was put into a monastery, and Grippon imprisoned in a castle at Arden. The two brothers, having thus freed themselves from their domestic enemy, continued to govern the empire with uninterrupted harmony; but their tranquillity was soon disturbed by the intrigues of Sonnechilde. That enterprising and ambitious woman had negociated a marriage between Odilon duke of Bavaria and Hiltrude the sister of the two princes. This was no sooner accomplished than Odilon, instigated by Sonnechilde, and alarmed at the growing power of the two princes, entered into an alliance with Theodobald duke of the Alemanni and Theodoric duke of the Saxons; who having assembled a formidable army, advanced directly against the princes. They posted themselves in an advantageous manner, with the river Lech in their front; but Carloman and Pepin, passing the river at different fords in the night-time, attacked the camp of the allies with great vigour. The engagement continued doubtful for five hours; but at last the entrenchments were forced on all sides, the Bavarians and Saxons entirely routed, and the vanquished dukes obliged to submit to the clemency of the victors. During their absence on this expedition, Hunalde, whom Charles Martel had appointed duke of Aquitain, having likewise entered into a confederacy with Odilon, passed the Loire, ravaged the open country, and burnt the magnificent cathedral of the city of Chartres. The two princes, however, having returned with their victorious

* See *Artillery*, n° 174.

22 France divided among the sons of Charles.

France. torious army, Hunalde found himſelf obliged to retreat: and even this availed him but little; for the Franks entering the duchy of Aquitain, committed ſuch devaſtations, that Hunalde in deſpair reſigned his dominions to his ſon, and retired into a convent. This event was ſoon followed by a ſimilar reſignation of Carloman, notwithſtanding the uninterrupted ſucceſs he had met with. He ſuddenly took the reſolution of retiring into a convent, and perſiſted in his deſign, notwithſtanding the intreaties of Pepin, who, to appearance at leaſt, did all he could to diſſuade him.

23 Pepin becomes ſole maſter of the kingdom.

By the reſignation of Carloman, which happened in the year 746, Pepin was left ſole maſter of France; and in this exalted ſtation he acquitted himſelf in ſuch a manner as has juſtly rendered his name famous to poſterity. One of the firſt acts of his new adminiſtration was to releaſe his brother Grippon from priſon: but that treacherous prince had no ſooner regained his liberty, than he again excited the Saxons to take up arms. His enterpriſe, however, proved unſucceſsful; the Saxons were defeated, their duke Theodoric taken, and his ſubjects obliged to ſubmit to the will of the conqueror; who upon this occaſion cauſed them make a profeſſion of the Chriſtian religion. Grippon then fled to Hiltrude, his half-ſiſter, whoſe huſband Odilon was now dead, and had left an infant ſon named *Taſſilon*. He met with a favourable reception from her; but, with his uſual treachery, ſeized both her and her ſon by the aſſiſtance of an army of malcontent Franks, whom he had perſuaded to join him. His next ſtep was to aſſume the ſovereignty and title of duke of Bavaria: but being driven from the throne by Pepin, he was obliged to implore his clemency, which was once more granted. All theſe misfortunes, however, were not yet ſufficient to cure Grippon of his turbulence and ambition: He once more endeavoured to excite diſturbances in the court of Pepin; but being finally detected and baffled, he was obliged to take refuge in Aquitain.

24 Aſſumes the title of king.

Pepin having now ſubdued all his foes both foreign and domeſtic, began to think of aſſuming the title of *king*, after having ſo long enjoyed the regal power. His wiſhes in this reſpect were quite agreeable to thoſe of the nation in general. The nobility, however, were bound by an oath of allegiance to Childeric the nominal monarch at that time; and this oath could not be diſpenſed with but by the authority of the pope. Ambaſſadors for this purpoſe were therefore diſpatched both from Pepin and the nobility to pope Zachary, the reigning pontiff. His holineſs replied, that it was lawful to tranſfer the regal dignity from hands incapable of maintaining it to thoſe who had ſo ſucceſsfully preſerved it; and that the nation might unite in the ſame perſon the authority and title of *king*. On this the unfortunate Childeric was degraded from his dignity, ſhaved, and confined in a monaſtery for life; Pepin aſſumed the title of *king of France*, and the line of Clovis was finally ſet aſide.

This revolution took place in the year 751. The attention of the new monarch was firſt claimed by a revolt of the Saxons; but they were ſoon reduced to ſubjection, and obliged to pay an additional tribute: and during his expedition againſt them, the king had the ſatisfaction of getting rid of his reſtleſs and treacherous competitor Grippon. This turbulent prince, having ſoon become weary of reſiding at the court of Aquitain, determined to eſcape from thence, and put himſelf under the protection of Aſtolphus king of the Lombards; but he was killed in attempting to force a paſs on the confines of Italy. Pepin in the mean time continued to puſh his good fortune. The ſubmiſſion of the Saxons was ſoon followed by the reduction of Brittany; and that by the recovery of Narbonne from the Infidels. His next exploit was the protection of pope Stephen III. againſt Aſtolphus the king of the Lombards, who had ſeized on the exarchate of Ravenna, and inſiſted on being acknowledged king of Rome. The pope, unable to contend with ſuch a powerful rival, haſted to croſs the Alps and implore the protection of Pepin, who received him with all the reſpect due to his character. He was lodged in the abbey of St Dennis, and attended by the king in perſon during a dangerous ſickneſs with which he was ſeized. On his recovery Stephen ſolemnly placed the diadem on the head of his benefactor, beſtowed the regal unction on his ſons Charles and Carloman, and conferred on the three princes the title of *patrician of Rome*. In return for theſe honours Pepin accompanied the pontiff into Italy at the head of a powerful army. Aſtolphus, unable to withſtand ſuch a powerful antagoniſt, ſhut himſelf up in Pavia, where he was cloſely beſieged by the Franks, and obliged to renounce all pretenſions to the ſovereignty of Rome, as well as to reſtore the city and exarchate of Ravenna, and ſwear to the obſervance of the treaty. No ſooner was Pepin gone, however, than Aſtolphus broke the treaty he had juſt ratified with ſuch ſolemnity. The pope was again reduced to diſtreſs, and again applied to Pepin. He now ſent him a pompous epiſtle in the ſtyle and character of St Peter himſelf; which ſo much inflamed the zeal of Pepin, that he inſtantly ſet out for Italy, and compelled Aſtolphus a ſecond time to ſubmit to his terms, which were now rendered more ſevere by the impoſition of an annual tribute. Pepin next made a tour to Rome; but finding that his preſence there gave great uneaſineſs both to the Greeks and to the pope himſelf, he thought proper to finiſh his viſit in a ſhort time. Soon after his return Aſtolphus died, and his dominions were uſurped by his general Didier; who, however, obtained the papal ſanction for what he had done, and was recogniſed as lawful ſovereign of the Lombards in the year 756.

Pepin returned to France in triumph; but the peace of his dominions was ſoon diſturbed by the revolt of the Saxons, who always bore the French yoke with the utmoſt impatience. Their preſent attempts, however, proved equally unſucceſsful with thoſe they had formerly made; being obliged to ſubmit and purchaſe their pardon not only by a renewal of their tribute, but by an additional ſupply of 300 horſe. But while the king was abſent on this expedition, Vaifar duke of Aquitain took the opportunity of ravaging Burgundy, where he carried his devaſtations as far as Chalons. Pepin ſoon returned, and entering the dominions of Vaifar, committed ſimilar devaſtations, and would probably have reduced the whole territory of Aquitain, had he not been interrupted by the hoſtile preparations of his nephew Taſſilon the duke of Bavaria. The king, however, contented himſelf at preſent with ſecuring his frontiers by a chain of poſts, againſt any inva-

France. invaſion; after which he reſumed his enterpriſe on the dominions of Vaiſar. The latter at firſt attempted to impede the progreſs of his antagoniſt by burning and laying waſte the country; but finding this to no purpoſe, he determined to try his fortune in an engagement. Victory declared in favour of Pepin; but he refuſed to grant a peace upon any terms. The French monarch advanced to the banks of the Garonne; while Vaiſar was abandoned by his ally the duke of Bavaria, and even by his own ſubjects. In this diſtreſs he retired with a band of faithful followers into the country of Saintonge, where he defended himſelf as long as poſſible, but was at laſt deprived both of his crown and life by the victor.

Thus the duchy of Aquitain was once more annexed to the crown of France; but Pepin had ſcarce time to indulge himſelf with a view of his new conqueſt when he was ſeized with a ſlow fever, which put an
25 Death of Pepin. end to his life in the year 768, the 54th of his age, and 17th of his reign. He was of a ſhort ſtature, whence he had the ſurname of *Le Bref*, or *the Short*; but his great actions juſtly intitled him to the character of an hero; though under the ſucceeding reign his own fame ſeemed to have been entirely forgot, and on his tomb was only inſcribed, "Here lies the father of Charlemagne."

26 Succeeded by his two ſons. Pepin was ſucceeded in his authority by his two ſons Charles and Carloman; to whom with his dying breath he bequeathed his dominions. They continued to reign jointly for ſome time; but the active and enterpriſing ſpirit of Charles gave ſuch umbrage to the weak and jealous Carloman, that he regarded him with envy, and was on the point of coming to an open rupture with him, when he himſelf was taken off by death, and thus the tranquillity of the empire was preſerved.

The firſt military enterpriſe of Charles was againſt Hunalde, the old duke of Aquitain; who leaving the monaſtery where he had reſided upwards of 20 years, aſſumed the royal title, and was joyfully received by his ſubjects, already weary of the French yoke. Charles took the field with the utmoſt expedition, and with difficulty prevailed upon his brother Carloman, who was then alive, to join him with his forces. But the junction was ſcarce effected, when Carloman withdrew his forces again, and left his brother to carry on the war in the beſt manner he could. Charles, though thus deſerted, did not heſitate at engaging the enemy; and having overthrown them in a great battle, Hunalde was obliged to fly to the territories of Lupus duke of Gaſcony. Charles quickly ſent an embaſſy demanding the fugitive prince; and Lupus, not daring to diſobey the orders of ſuch a powerful monarch, yielded up the unfortunate Hunalde, who was inſtantly caſt into priſon, from which, however, he afterwards made his eſcape.

27 Reign of Charles the Great. The death of Carloman, which happened in the year 771, left Charles ſole maſter of France; but the revolt of the Saxons involved him in a ſeries of wars from which he did not extricate himſelf for 33 years. Theſe had long been tributaries to the French, but frequently revolted; and now, when freed from the terror of Pepin's arms, thought they had a right to ſhake off the yoke altogether. Charles entered their country with a powerful army; and having defeated them in a number of ſmall engagements, advanced towards Ereſbourg near Paderborn, where they had their capital poſt, and where was the image of their god Irminſul, repreſented as a man completely armed, and ſtanding on a column. The Saxons made an obſtinate defence, but were at laſt obliged to ſubmit; and Charles employed his army three days in demoliſhing the monuments of idolatry in this place; which ſo much diſheartened the whole nation, that for the preſent they ſubmitted to ſuch terms as he pleaſed to impoſe; and which were rendered eaſier than they probably would have been, by the news which Charles now received from Italy. He had concluded a marriage with the daughter of Didier king of the Lombards; but this had been diſſolved by the Pope, who reproached the Lombards with the firſt ſtain of the leproſy. Thus all friendſhip was diſſolved betwixt Didier and Charles; and as the Lombard monarchs ſeem to have had a kind of natural enmity towards the popes, it is not ſurpriſing that it ſhould now break out with uncommon fury. Didier having ſeized and frighted to death Pope Stephen IV. uſed his utmoſt endeavours to reduce his ſucceſſor Adrian I. to a ſtate of entire dependance on himſelf. Adrian applied to the French monarch, the uſual reſource of the pontiffs in thoſe days. Charles was very willing to grant the neceſſary aſſiſtance, but the nobility were averſe to an Italian war: ſo that he was obliged to act with great circumſpection. Several embaſſies were therefore ſent to Didier, entreating him to reſtore to the pope thoſe places which he had taken from him, and at laſt even offering him a large ſum of money if he would do ſo; but this propoſal being rejected, he obtained the conſent of his nobility to make war on the Lombards. Didier diſpoſed his troops in ſuch a manner, that the officers of Charles are ſaid to have been unanimouſly of opinion that it would be impoſſible to force a paſſage. This, however, was accompliſhed, either through the ſuperior ſkill of Charles, according to ſome hiſtorians, or a panic which ſeized the Lombard ſoldiers, according to others; after which, Didier, with the old duke of Aquitain, who had eſcaped from his priſon, and taken refuge at his court, ſhut themſelves up in Pavia. Adalgiſe, the only ſon of the Lombard monarch, with the widow and children of Carloman, fled to Verona. That city was immediately inveſted by the conqueror, and in a ſhort time obliged to ſubmit. Adalgiſe had the good luck to eſcape to Conſtantinople, but we are not informed what became of Carloman's widow and children. Charles, after paying a ſhort viſit to Rome, returned to the ſiege of Pavia. The place was vigorouſly defended, until famine and peſtilence obliged the inhabitants to implore the clemency of Charles. Hunalde fell a ſacrifice to his own obſtinacy in oppoſing the intention of the people; Didier was taken priſoner and carried into France; but we are not informed of his fate afterwards. His kingdom, however, was totally diſſolved, and Charles was crowned king of Lombardy at Milan in the year 774.

Having received the oaths of allegiance from his new ſubjects, Charles ſet out for Saxony, the inhabitants of which had again revolted, and recovered Ereſbourg their capital. The king ſoon recovered this important poſt; but a detachment of his army being cut off, and new troubles ariſing in Italy, he was obliged

France. ged to accept of the propofals of the Saxons, though their fincerity was very doubtful. Having therefore only ſtrengthened the fortifications of Ereſbourg, and left a ſufficient garriſon in the place, he ſet out for Italy, which was all in commotion through the intrigues of the emperor of the Eaſt, and Adalgiſe the ſon of Didier. The preſence of Charles reſtored tranquillity in that quarter; but in the mean time, the Saxons having taken Ereſbourg and deſtroyed the fortifications, threatened to annihilate the French power in that quarter. On the king's return, he found them employed in the ſiege of Sigebourg. His ſudden arrival ſtruck the barbarians with ſuch terror, that they inſtantly ſued for peace; which the king once more granted, but took care to ſecure their obedience by a chain of forts along the river Lippe, and repairing the fortifications of Ereſbourg. An aſſembly of the Saxon chiefs was held at Paderborn; and a promiſe was made, that the nation ſhould embrace the Chriſtian religion: after which the king ſet out on an expedition to Spain in the year 778.

This new enterpriſe was undertaken at the requeſt of Ibunala, the Mooriſh ſovereign of Saragoſſa, who had been driven from his territory. He was reſtored, however, by the proweſs of Charles, who reduced the cities of Pampluna and Saragoſſa. He reduced alſo the city of Barcelona, and the kingdoms of Navarre and Arragon; but on his return, he met with a ſevere check from the Gaſcons, who attacked and defeated the rear-guard of his army with great ſlaughter as they paſſed the Pyrenean mountains. This engagement, which ſeems to imply ſome defect in the prudence or military ſkill of Charles, has been much celebrated among romance writers, on account of the death of Roland a famous warrior.

Next year, 779, he paid a viſit to Italy with his two ſons Carloman and Louis. Having paſſed the winter at Pavia, he entered Rome next ſpring amidſt the acclamations of the inhabitants. Here, in the 39th year of his age, he divided his dominions in preſence of the pope betwixt his two ſons Carloman and Louis. The former, who now took the name of Pepin, had Lombardy; the latter Aquitain. Having then received the ſubmiſſion of Taſſilon duke of Bavaria, he ſet out for Saxony, where he took a moſt ſevere revenge on the people of that country for the many treacheries they had been guilty of. The preſent revolt was chiefly owing to a chief named Witikind, who had twice before fled from the victorious arms of Charles, and taken refuge at the court of Denmark. Returning from thence in the king's abſence, he rouſed his countrymen to action, while the generals of Charles, diſagreeing among themſelves, neglected to take the proper methods for repelling the enemy. In conſequence of this, they were entirely defeated on the banks of the Weſer in the year 782. Charles arrived in time to prevent the total deſtruction of his people, and directly penetrated into the heart of the country. Witikind, unable to reſiſt his antagoniſt, once more fled into Denmark; but 4500 of his followers periſhed at once by the hands of the executioner. An univerſal inſurrection was the conſequence of this unheard-of cruelty; and though during three years the French monarch was conſtantly ſucceſsful in the field, he found it impoſſible by any force whatever to ſubdue the ſpirit of the people. At laſt therefore he was obliged to have recourſe to negociation. Witikind and ſeveral other chiefs were invited to an interview; where Charles repreſented to them in ſuch ſtrong colours the ruin which muſt neceſſarily enſue to their country by perſiſting obſtinately in oppoſition to him, that they were induced not only to perſuade their countrymen finally to ſubmit, but to embrace the Chriſtian religion. France.

Charles having thus brought his affairs in Saxony to an happy concluſion, turned his arms againſt Taſſilon duke of Bavaria, who had underhand ſupported the Saxons in their revolt. Having entered his country with a powerful army in the year 787, he made ſuch rapid advances, that the total deſtruction of Taſſilon ſeemed inevitable. Charles had advanced as far as the river Lech, when Taſſilon privately entered his camp, and threw himſelf at his feet. The king had compaſſion on his faithleſs kinſman on ſeeing him in this abject poſture; but no ſooner did the traitor find himſelf at liberty, than he ſtirred up the Hunns, the Greek emperor, and the fugitive Adalgiſe, againſt the king. He fomented alſo the diſcontents of the factious nobles of Aquitain and Lombardy; but his ſubjects, fearing leaſt theſe intrigues ſhould involve them in deſtruction, made a diſcovery of the whole to Charles. Taſſilon, ignorant of this, entered the diet at Ingelheim, not ſuſpecting any danger, but was inſtantly arreſted by order of the French monarch. Being brought to a trial, the proofs of his guilt were ſo apparent, that he was condemned to loſe his head: the puniſhment, however, was afterwards mitigated to perpetual confinement in a monaſtery, and the duchy of Bavaria was annexed to the dominions of Charles.

The Hunns and other enemies of the French monarch continued to proſecute their enterpriſes without regarding the fate of their aſſociate Taſſilon. Their attempts, however, only ſerved to enhance the fame of Charles. He defeated the Hunns in Bavaria, and the Greek emperor in Italy; obliging the latter to renounce for ever the fortune of Adalgiſe. The Hunns, not diſheartened by their defeat, continuing to infeſt the French dominions, Charles entered their country at the head of a formidable army; and having forced their entrenchments, penetrated as far as Raal on the Danube, but was compelled by an epidemic diſtemper to retire before he had finiſhed his conqueſt. He was no ſooner returned to his own dominions, than he had the mortification to be informed, that his eldeſt ſon Pepin had conſpired againſt his ſovereignty and life. The plot was diſcovered by a prieſt who had accidentally fallen aſleep in a church where the conſpirators were aſſembled. Being awakened by their voices, he overheard them conſulting on the proper meaſures for completing their purpoſe; on which he inſtantly ſet out for the palace, and ſummoned the monarch from his bed to inform him of the guilt of his ſon. Pepin was ſeized, but had his life ſpared, tho' condemned to expiate his offences by ſpending the remainder of his days in a monaſtery.

Charles was no ſooner freed from this danger than he was again called to arms by a revolt of the Saxons on the one hand, while a formidable invaſion of the Moors diſtreſſed him on the other; the Hunns at the ſame time renewing their depredations on his dominions.

France. nions. The king did not at preſent make war againſt the Moors; probably foreſeeing that they would be called off by their Chriſtian enemies in Spain. This accordingly happened; the victories of Alonſo the Chaſte obliged them to leave France; after which Charles marched in perſon to attack the Saxons and Hunns. The former conſented again to receive the Chriſtian religion, but were likewiſe obliged to deliver up a third part of their army to be diſpoſed of at the king's pleaſure; but the Hunns defended themſelves with incredible vigour. Though often defeated, their love of liberty was altogether invincible; ſo that the war was not terminated but by the death of the king, and an almoſt total deſtruction of the people: only one tribe could be induced to acknowledge the authority of the French monarch.

Theſe exploits were finiſhed betwixt the years 793 and 798; after which Charles invaded and ſubdued the iſland of Majorca and Minorca; which the diſſenſions of the Mooriſh chiefs gave him an opportunity of doing. The ſatisfaction he felt from this new conqueſt, however, was ſoon damped by the troubles which broke out in Italy. After the death of pope Adrian, his nephew aſpired to the papal dignity; but a prieſt named Leo being preferred, the diſappointed candidate determined on revenge. He managed matters ſo well, that his deſigns were concealed for four years. At laſt, on the day of a proceſſion, a furious aſſault was made on the perſon of Leo. The unfortunate pontiff was left for dead on the ground; but having with difficulty recovered, and made his eſcape to the Vatican, he was protected by the duke of Spoleto, at that time general of the French forces. His cauſe was warmly eſpouſed by Charles, who invited him to his camp at Paderborn in Weſtphalia; whence he diſpatched him with a numerous guard to Rome, promiſing ſoon after to viſit that metropolis, and redreſs all grievances. His attention for the preſent, however, was called by the deſcents of the Normans on the maritime provinces of his dominions; ſo that he was obliged to defer the promiſed aſſiſtance for ſome time longer. Having conſtructed forts at the mouths of moſt of the navigable rivers, and further provided for the defence of his territories, by inſtituting a regular militia, and appointing proper ſquadrons to cruiſe againſt the invaders, he ſet out for the fourth and laſt time on a journey to Rome. Here he was received with the higheſt poſſible honours. Leo was allowed to clear himſelf by oath of the crimes laid to his charge by his enemies, while his accuſers were ſent into exile. On the feſtival of Chriſtmas, in the year 800, after Charles had made his appearance in the cathedral of St Peter, and aſſiſted devoutly at maſs, the pope ſuddenly put a crown on his head; and the place inſtantly reſounded with acclamations of "Long life to Charles the Auguſt, crowned by the hand of GOD! Long life and victory to the great and pacific emperor of the Romans!" His body was then conſecrated and anointed with royal unction; and after being conducted to a throne, he was treated with all the reſpect uſually paid to the ancient Cæſars; from this time alſo being honoured with the title of *Charlemagne*, or *Charles the Great*. In private converſation, however, he uſually proteſted, that he was ignorant of the pope's intention at this time; and that, had he known it, he would have diſappointed him by his abſence: but theſe proteſtations were not generally believed; and the care he took to have his new title acknowledged by the eaſtern emperors, evidently ſhowed how fond he was of it.

28 He crowned n pero- o. he weſt

Charles, now raiſed to the ſupreme dignity in the weſt, propoſed to unite in himſelf the whole power of the firſt Roman emperors, by marrying Irene the empreſs of the eaſt. But in this he was diſappointed by the marriage of that princeſs by Nicephorus; however, the latter acknowledged his new dignity of Auguſtus, and the boundaries of the two empires were amicably ſettled. Charles was further gratified by the reſpect paid him by the great Haroun Al-Raſhid, caliph of the Saracens, who yielded to him the ſacred city of Jeruſalem, and holy ſepulchre there. But in the mean time his empire was threatened with the invaſion of a very formidable enemy, whom even the power of Charles would have found it hard to reſiſt. Theſe were the Normans, at this time under the government of Godfrey a celebrated warrior, and who by their adventurous ſpirit, and ſkill in maritime affairs, threatened all the weſtern coaſts of Europe with deſolation. From motives of mutual convenience a tranſitory peace was eſtabliſhed, and Charles made uſe of this interval to ſettle the final diſtribution of his dominions. Aquitain and Gaſcony, with the Spaniſh march, were aſſigned to his ſon Louis; Pepin had Italy confirmed to him; and to this was added the greateſt part of Bavaria, with the country now poſſeſſed by the Griſons. Charles the eldeſt had Neuſtria, Auſtraſia, and Thuringia. The donation was ſuppoſed to be rendered more authentic by the ſanction of the pope. This diviſion, however, had ſcarce taken place, when the princes were all obliged to defend their dominions by force of arms. Louis and Pepin were attacked by the Saracens, and Charles by the Sclavonians. All theſe enemies were defeated; but while Charles hoped to ſpend the ſhort remainder of his life in tranquillity, he was once more called forth to martial exertions by the hoſtile behaviour of Godfrey the Norman leader. Charles ſent him a meſſage of defiance, which was returned in the ſame ſtyle by Godfrey: but the former, by artfully fomenting diviſions among the northern powers, prevented for a while the threatened danger; but, theſe diſturbances being quelled, the Normans renewed their depredations, and Charles was obliged to face them in the field. An engagement, however, was prevented by the death of Godfrey, who was aſſaſſinated by a private ſoldier; on which the Norman army retreated, and the dominions of the emperor ſtill remained free from theſe invaders. Still the latter days of Charles were embittered by domeſtic misfortunes. His favourite daughter Rotrude died, as did alſo Pepin king of Italy; and theſe misfortunes were ſoon followed by the death of his eldeſt ſon Charles. The emperor then thought proper to aſſociate his only ſurviving ſon Louis with him in the government; which was formally done at Aix-la-Chapelle. Charles himſelf ſurvived this tranſaction only a few months: his death happened on the 27th of January 814; in the 71ſt year of his age, and 47th of his reign.

29 Death of Charles the Great.

30 Extent of his territories.

By the martial atchievements of this hero, the French monarchy was raiſed to its utmoſt pitch of ſplendor. He had added the province of Aquitain to the territories of his anceſtors; he had confined the inhabitants

France. bitants of Brittany to the ſhores of the ocean, and obliged them to ſubmit to a diſgraceful tribute. He had reduced under his dominion all that part of Spain which extends from the Pyrenees to the river Ebro, and includes the kingdoms of Rouſſillon, Navarre, Arragon, and Catalonia. He poſſeſſed Italy from the Alps to the borders of Calabria; but the duchy of Beneventum, including moſt of the preſent kingdom of Naples, eſcaped the yoke after a tranſitory ſubmiſſion. Beſides theſe extenſive countries, Charles added to his territories the whole of Germany and Pannonia; ſo that the French now had the juriſdiction of all the country from eaſt and weſt, from the Ebro in Spain to the Viſtula; and from north to ſouth, from the duchy of Beneventum to the river Eyder, the boundary between Germany and the dominions of Denmark. In acquiring theſe extenſive dominions Charles had been guilty of horrid and repeated maſſacres; for which, however, he had been in ſome meaſure excuſable by the barbarity and rebellious diſpoſition of the people with whom he had to deal, upon whom no mild meaſures would probably have had any effect. His eſtabliſhing of ſchools throughout the conquered provinces, ſhowed alſo his inclination to govern his ſubjects in peace, and to take proper ſteps for their civilization; though indeed many parts of his private conduct ſhowed no ſmall inclination to cruelty; particularly the fate of the ſons of Carloman, of whom no account could ever be obtained. His advice to his ſon Louis indeed was excellent; exhorting him to conſider his people as his children; to be very mild and gentle in his adminiſtration, but firm in the execution of juſtice; to reward merit; promote his nobles gradually; chooſe miniſters deliberately, but not remove them capriciouſly or without ſufficient reaſon. All theſe prudent maxims,

31 Decline of his empire

however, were not ſufficient to enable Louis to govern dominions ſo extenſive, and people ſo turbulent as he had to deal with. At the time of the deceaſe of his father this prince was about 36 years of age, and had married Ermengarde, daughter of the count of Heſbai of the dioceſe of Liege, by whom he had three ſons, Lothaire, Pepin, and Louis. Lothaire, the eldeſt, was aſſociated with himſelf in the empire, and the two youngeſt were entruſted with the governments of Aquitain and Bavaria. Every one of the princes proved unfaithful to their father, as well as enemies to one another. The death of Ermengarde, and the marriage of the emperor with Judith a princeſs of Bavaria, artful but accompliſhed, proved the firſt ſource of calamity to the empire. In the year 823, Charles, the emperor's youngeſt ſon was born; and his pretenſions became in time more fatal to the public tranquillity than the ambition and diſobedience of all the reſt. Various parts of the Imperial dominions were likewiſe aſſaulted by foreign enemies. The inhabitants of Brittany and Navarre revolted; the Moors invaded Catalonia; while the ambition of Judith produced a war amongſt the brothers themſelves.

32 Civil wars among the ſons of Louis the Gentle.

Charles at firſt had been appointed ſovereign of that part of Germany bounded by the rivers Danube, the Maine, the Neckar, and the Rhine; the country of the Griſons and Burgundy, comprehending Geneva and the Swiſs cantons: but this was oppoſed by the three elder ſons. Pepin and Louis advanced with the united forces of Aquitaine and Bavaria, while the Imperial forces deſerted their ſtandard and joined the malcontents. The emperor was taken priſoner, and the empreſs retired to a monaſtery. Lothaire, the eldeſt of the young princes, to whom the reſt found themſelves obliged to ſubmit, was the perſon who retained the emperor in his poſſeſſion; but, notwithſtanding his breach of duty, his heart was touched with remorſe on account of the crimes he had committed. Dreading the reproach of the world at large, and being threatened with the cenſures of the church, he threw himſelf at his father's feet, and begged pardon for his guilt, conſenting to relinquiſh the authority he had unjuſtly uſurped. Thus Louis was reeſtabliſhed in his authority by the diet of the empire which had met to depoſe him. His firſt ſtep was to recal his empreſs from the monaſtery to which ſhe had retired; but this princeſs, implacable in her reſentment, now proſecuted Lothaire to ſuch a degree, that he was obliged to join his two brothers Pepin and Louis in a confederacy againſt their father. The old emperor thought to check this rebellious diſpoſition by revoking his grant of Aquitain to Pepin, and conferring it on his youngeſt ſon Charles, then only nine years of age; but pope Gregory IV. conferred the Imperial dignity itſelf on Lothaire, depoſing the unhappy monarch, and again ſending the empreſs to a nunnery in the foreſt of Arden. The unnatural behaviour of his ſons, however, once more excited the compaſſion of his ſubjects. Dreux, the biſhop of Mentz, uſed his intereſt with Louis king of Bavaria to arm his ſubjects in defence of his father and ſovereign. In this enterpriſe the Bavarian monarch was joined by the French and Saxons; ſo that the aged emperor was once more reſtored, the empreſs releaſed from her nunnery, and Charles from his priſon, in the year 833. France.

The ambition of Judith now ſet matters once more in a flame. Taking advantage of the affection her huſband bore her, ſhe perſuaded him to inveſt her ſon Charles with the ſovereignty of Neuſtria as well as the dominions formerly aſſigned him. This was productive of great diſcontents on the part of Lothaire and Pepin; but their power was now too much broken to be able to accompliſh any thing by force of arms. The death of Pepin, which happened ſoon after, produced a new diviſion of the empire. The claims of young Pepin and Charles, ſons of the deceaſed prince, were entirely diſregarded, and his French dominions divided between the two brothers Charles and Lothaire, the latter being named guardian to his infant nephew. This enraged Louis of Bavaria, whoſe intereſt was entirely neglected in the partition, to ſuch a degree, that he again revolted; but the unexpected appearance, with the hoſtile preparations of the Saxons, obliged him to ſubmit and aſk pardon for his offences. Still, however, the ambition of the empreſs kept matters in a continual ferment, and the empire was again threatened with all the calamities of civil war; but before theſe took place, the emperor died, in 841, after a moſt unfortunate reign of 27 years.

Louis was eminent for the mildneſs of his manners and peaceful virtues, which procured him the title of *Le Debonnaire*, or "the gentle:" but ſuch was the turbulence and exceſſive barbarity of the age in which he lived, that all his virtues, inſtead of procuring him reſpect

France. respect and esteem, were productive only of contempt and rebellion from those whom both duty and nature ought to have rendered the most submissive and obedient.

The decease of the emperor was followed by a civil war among his sons. The united forces of Lothaire and his nephew Pepin were defeated by those of Charles and Louis in a very bloody battle in the plains of Fontenoy, where 100,000 Franks perished, in the year 842. This victory, however, bloody as it was, did not decide the fortune of the war. The conquerors having, through motives of interest or jealousy, retired each into their own dominions, Lothaire found means not only to recruit his shattered forces, but pressed the other two princes so vigorously, that they were glad to consent to a new partition of the empire. By this Lothaire was allowed to possess the whole of Italy, with the whole tract of country between the rivers Rhone and Rhine, as well as that between the Meuse and Scheld. Charles had Aquitain, with the country lying between the Loire and the Meuse; while Louis had Bavaria, with the rest of Germany, from whence he was distinguished by the appellation of *Louis the German*.

33 Division of the empire.

By this partition, Germany and France were disjoined in such a manner as never afterwards to be united under one head. That part of France which was allowed to Lothaire, was from him called *Lotharingia*, and now *Lorrain*, by a gradual corruption of the word. The sovereignty, however, which that prince had pursued at the expence of every filial duty, and purchased at so much blood, afforded him now but little satisfaction. Disgusted with the cares and anxieties of his situation, he sought relief in a monastery in the year 855. On his retreat from the throne, he allotted to his eldest son Louis II. the sovereignty of Italy; to his second son Lothaire the territory of Lorrain, with the title of king; and to his youngest son Charles, surnamed the *Bald*, Provence, Dauphiny, and part of the kingdom of Burgundy; so that he may be considered as properly the king of France. From the year 845 to 857 the provinces subjected to his jurisdiction had been infested by the annual depredations of the Normans, from whom Charles was at last fain to purchase peace at a greater expence than might have carried on a successful war. The people of Brittany had also revolted; and though obliged by the appearance of Charles himself, at the head of a powerful army, to return to their allegiance, they no sooner perceived him again embarrassed by the incursions of the Normans, than they threw off the yoke, and under the conduct of their duke Louis subdued the neighbouring diocese of Rennes; after which exploit Louis assumed the title of king, which he transmitted to his son Herispee. By him Charles was totally defeated; and his subjects, perceiving the weakness of their monarch, put themselves under the protection of Louis the German. His ambition prompted him to give a ready ear to the proposal; and therefore, taking the opportunity of Charles's absence in repelling an invasion of the Danes, he marched with a formidable army into France, and was solemnly crowned by the archbishop of Sens in the year 857. Being too confident of success, however, and fancying himself already established on the throne, he was persuaded to dismiss his German forces; which he had no sooner done, than Charles marched against him with an army, and Louis abandoned his new kingdom as easily as he had obtained it. France.

34 Lothaire resigns.

35 Reign of Charles the Bald.

Notwithstanding this success, the kingdom of Charles continued still in a very tottering situation. The Normans harassed him in one quarter, and the king of Brittany in another. He marched against the latter in the year 860; but had the misfortune to receive a total defeat after an engagement which lasted two days. The victory was chiefly owing to a noted warrior named Robert le Fort, or the Strong, who commanded the Bretons; but Charles found means to gain him over to his party by investing him with the title of Duke of France, including the country which lies between the rivers Seine and Loire.

For some time the abilities of Robert continued to support the tottering throne of Charles; but his difficulties returned on the death of that hero, who was killed in repelling an invasion of the Danes. Some amends was indeed made for his loss by the death of the king of Lorrain in the year 869; by which event the territories of Charles were augmented by the cities of Lyons, Vienne, Toul, Besançon, Verdun, Cambray, Viviers, and Urez, together with the territories of Hainault, Zealand, and Holland. Cologne, Utrecht, Treves, Mentz, Strasburgh, with the rest of the territories of Lothaire, were assigned to Louis the German.

All this time the Normans still continued their incursions to such a degree, that Solomon king of Brittany was persuaded to join his forces to those of Charles, in order to repel the common enemy. The event proved unfortunate to the Normans; for their principal leaders were besieged in Angiers, and obliged to purchase leave to depart by relinquishing all the spoil they had taken. Charles thus freed from a formidable enemy, began to aspire to the imperial crown, which about this time became vacant by the death of Louis. This belonged of right to Louis the German; but Charles, having instantly assembled a powerful army, marched with it into Italy before Louis could be apprised of his designs; and being favourably received at Rome, the Imperial crown was put upon his head without any hesitation by the Pope, in the year 873. Louis, enraged at his disappointment, discharged his fury on the defenceless country of Champagne; and though the approach of Charles obliged him for the present to retire, yet he continued his preparations with such vigour, that Charles would in all probability have found him a very formidable adversary, had he not been taken off by death in the year 877. Charles was no sooner informed of his brother's decease, than he invaded the dominions of his son Louis, who possessed Franconia, Thuringia, the Lower Lorraine, with some other territories in that quarter. The enterprise, however, proved unsuccessful. Charles, though superior in numbers, was defeated with great slaughter, and had scarce time to reunite his scattered forces, when he was informed that the Normans had invaded his territories, laid waste part of the country, and taken possession of the city of Rouen. So many disasters affected him in such a manner that he fell dangerously ill, and was scarce recovered of his sickness when he found himself called into Italy to the assistance of the Pope against

France. the Saracens, whoſe invaſions were encouraged by the dukes of Beneventum and the Greek emperor. Charles paſſed into Italy with only a few followers; but when he came to Pavia, at which place the pontiff had appointed to meet him, was informed that Carloman king of Bavaria, and ſon of Louis the German, was already in Italy with a powerful army, and laid claim to the imperial title in virtue of his father's right. Charles prepared to oppoſe him by force of arms; but his generals conſpired againſt him, and the ſoldiers declared their reſolution not to paſs the Alps. On this he was obliged to retire to France, at the very moment that Carloman, dreading his power, prepared to return to Germany. This was the laſt of Charles's enterpriſes.

36 He is poiſoned. His journey brought on a return of his indiſpoſition, which was rendered fatal through the treachery of a Jewiſh phyſician named Zedechias, who adminiſtered poiſon to him under pretence of curing his malady. He expired in a miſerable cottage upon mount Cenis in the 54th year of his age, and 38th of his reign over the kingdom of France.

37 Reign of Louis the Stammerer. The ambition of Charles had been productive of much diſtreſs both to himſelf and to his ſubjects. His ſon Louis, ſurnamed, from a defect in his ſpeech, *the Stammerer*, was of a quite different diſpoſition; but his feeble adminiſtration was ill calculated to retrieve matters in their preſent ſituation. He died on the 10th of April 879, while on a march to ſuppreſs ſome inſurrections in Burgundy. He left his queen Adelaide pregnant; who ſome time after his deceaſe was delivered of a ſon, named *Charles*. After his death followed an interregnum; during which a faction was formed for ſetting aſide the children of Louis the Stammerer, in favour of the German princes, ſons to Louis the brother of Charles the Bald. This ſcheme, however, proved abortive; and the two ſons of the late king, Louis and Carloman, were crowned kings of France. Another kingdom was at that time erected by an aſſembly of the ſtates, namely, the kingdom of Provence, which conſiſted of the countries now called *Lyonnois*, *Savoy*, *Dauphiny*, *Franche Comte*, and part of the duchy of Burgundy; and this kingdom was given to duke Boſon, brother-in-law to Charles the Bald. In 881, both kings of France died; Louis, as was ſuſpected, by poiſon; and Carloman of a wound he received accidentally while hunting. This produced a ſecond interregnum; which ended with the calling in of Charles the Groſs, emperor of Germany. His reign was more unfortunate than that of any of his predeceſſors. The Normans, to whom he had given leave to ſettle in Frieſland, ſailed up the Seine with a fleet of 700 ſhips, and laid ſiege to Paris. Charles, unable to force them to abandon their undertaking, prevailed on them to depart by a large ſum of money. But as the king could not advance the money at once, he allowed them to remain in the neighbourhood of Paris during the winter; and they in return plundered the country, thus amaſſing vaſt wealth beſides the ſum which Charles had promiſed. After this ignominious tranſaction Charles returned to Germany, in a very declining ſtate of health both as to body and mind. Here he quarrelled with his empreſs; and being abandoned by all his friends, he was depoſed, and reduced to ſuch diſtreſs, that he would not even have had bread to eat, had not he been ſupplied by the archbiſhop of Mentz, out of a principle of charity. France.

On the depoſition of Charles the Groſs, Eudes count of Paris was choſen king by the nobility during the minority of Charles the ſon of Adelaide, afterwards named *Charles the Simple*. He defeated the Normans, and repreſſed the power of the nobility; on which account a faction was formed in favour of Charles, who was ſent for, with his mother, from England. Eudes did not enter into a civil war; but peaceably reſigned the greateſt part of the kingdom to him, and conſented to do homage for the reſt. He died ſoon after this agreement, in the year 898.

During the reign of Charles the Simple, the French government declined. By the introduction of fiefs, thoſe noblemen who had got into the poſſeſſion of governments, having theſe confirmed to them and their heirs for ever, became in a manner independent ſovereigns: and as theſe great lords had others under them, and they in like manner had others under them, and even theſe again had their vaſſals; inſtead of the eaſy and equal government which prevailed before, a vaſt number of inſupportable little tyrannies were erected. The Normans, too, ravaged the country in the moſt terrible manner, and deſolated ſome of the fineſt provinces in France. At laſt Charles ceded to Rollo, the king or captain of theſe barbarians, the duchy of Neuſtria; who thereupon became Chriſtian, changed his own name to *Robert*, and that of his principality to *Normandy*.

During the remainder of the reign of Charles the Simple, and the entire reigns of Louis IV. ſurnamed the *Stranger*, Lothaire, and Louis V. the power of the Carlovingian race continually declined; till at laſt they were ſupplanted by Hugh Capet, who had been created duke of France by Lothaire. This revolution happened in the year 987, and was brought about much in the ſame manner as the former one had been by Pepin. He proved an active and prudent monarch, and poſſeſſed ſuch other qualities as were requiſite for keeping his tumultuous ſubjects in awe. He died on the 24th of October 997, leaving his dominions in perfect quiet to his ſon Robert.

38 Family of Charles the Great ſupplanted by Hugh Capet.

39 Robert. The new king inherited the good qualities of his father. In his reign the kingdom was enlarged by the death of Henry duke of Burgundy, the king's uncle, to whom he fell heir. This new acceſſion of territory, however, was not obtained without a war of ſeveral years continuance on account of ſome pretenders to the ſovereignty of that duchy; and had it not been for the aſſiſtance of the duke of Normandy, it is doubtful whether the king would have ſucceeded.—As Robert was of opinion, that peace and tranquillity were preferable to wide extended dominions with a precarious tenure, he refuſed the kingdom of Italy and the imperial crown of Germany, both which were offered him. He died on the 20th of July 1030; having reigned 33 years, and lived 60.

40 Henry I. Robert was ſucceeded by his eldeſt ſon Henry I. who in the beginning of his reign met with great oppoſition from his mother. She had always hated him; and preferred his younger brother Robert, in whoſe favour ſhe now raiſed an inſurrection. By the aſſiſtance of Robert duke of Normandy, however, Henry overcame

France. came all his enemies, and eſtabliſhed himſelf firmly upon the throne. In return for this, he ſupported William, Robert's natural ſon, and afterwards king of England, in the poſſeſſion of the duchy of Normandy. Afterwards, however, growing jealous of his power, he not only ſupported the pretenders to the duchy of Normandy ſecretly, but invaded that country himſelf in their favour. This enterprize proved unſucceſsful, and Henry was obliged to make peace: but no ſincere reconciliation ever followed; for the king retained a deep ſenſe of the diſgrace he had met with, and the duke never forgave him for invading his dominions. The treaty between them, therefore, was quickly broken; and Henry once more invaded Normandy with two armies, one commanded by himſelf, and the other by his brother. The firſt was haraſſed by continual ſkirmiſhes, and the laſt totally defeated; after which Henry was obliged to agree to ſuch terms as the duke thought proper: but the rancour between them never ceaſed, and was in reality the cauſe of that implacable averſion which for a long ſeries of years produced perpetual quarrels between the kings of France and thoſe of the Norman race in England.

41 Philip. Henry died in 1059, not without a ſuſpicion of being poiſoned; and was ſucceeded by his eldeſt ſon Philip, at that time in the eighth year of his age. Baldwin earl of Flanders was appointed his guardian; and died in the year 1066, about the time that William of Normandy became king of England. After the death of his tutor, Philip began to ſhow a very inſincere, haughty, and oppreſſive diſpoſition. He engaged in a war with William the Conqueror, and ſupported his ſon Robert in his rebellion againſt him*. But after the death of William, he aſſiſted Robert's brothers againſt him; by which means he was forced to conſent to a partition of his dominions.

* See *England*, n° 89.

In 1092, king Philip being wearied of his queen Bertha, procured a divorce from her under pretence of conſanguinity, and afterwards demanded in marriage Emma daughter to Roger count of Calabria. The treaty of marriage was concluded; and the princeſs was ſent over, richly adorned with jewels, and with a large portion in ready money: but the king, inſtead of eſpouſing her, retained her fortune, and diſmiſſed the princeſs herſelf, carrying off from her huſband the counteſs of Anjou, who was eſteemed the handſomeſt woman in France. With her he was ſo deeply enamoured, that not ſatisfied with the illegal poſſeſſion of her perſon, he procured a divorce between her and her huſband, and prevailed upon ſome Norman biſhops to ſolemnize his own marriage with her. The whole of theſe tranſactions, however, were ſo ſcandalous, that the pope having cauſed them to be reviſed in a council at Autun, in the year 1094, pronounced ſentence of excommunication againſt Philip in caſe he did not part with the counteſs. On his repentance, the cenſure was taken off; but as the king paid no regard to his promiſes, he was, in 1095, excommunicated a ſecond time. He again profeſſed repentance, and was abſolved; but ſoon after, living with the counteſs of Anjou as formerly, he was excommunicated a third time. This conduct, ſo unworthy of a prince, expoſed him to the contempt of the people. Too many of the nobility followed his example, and at the ſame time deſpiſed his authority; not only making war upon each other, but ſpoiling and robbing his ſubjects with impunity. France.

In the year 1110, Philip prevailed on the court of Rome to have his affair reviewed in an aſſembly at Poictiers; where, notwithſtanding his utmoſt efforts, ſentence of excommunication was a fourth time pronounced againſt him. Ye, in ſpite of all theſe ſentences, as queen Bertha was dead, and the count of Anjou offered, for a large ſum of money, to give whatever aſſiſtance was requiſite for procuring a diſpenſation, Philip at laſt prevailed, and the counteſs was proclaimed queen of France. But though the king's domeſtic affairs were now in ſome meaſure quieted, his negligence in government had thrown the affairs of the nation into the greateſt diſorder. He therefore aſſociated with him in the government his eldeſt ſon Louis. This prince was the very reverſe of his father; and by his activity and reſolution, keeping conſtantly in the field with a conſiderable body of forces, he reduced the rebellious nobility to ſubjection, and, according to the beſt hiſtorians, at this time ſaved the ſtate from being utterly ſubverted.

For theſe ſervices the queen looked upon the young prince with ſo jealous an eye, and gave him ſo much diſturbance, that he found it neceſſary to retire for ſome time into England; where he was received by king Henry I. with the greateſt kindneſs. He had not been long at court, before Henry received, by an expreſs, a letter from Philip; telling him, that, for certain important reaſons, he ſhould be glad if he cloſely confined his ſon, or even diſpatched him altogether. The king of England, however, inſtead of complying with this infamous requeſt, ſhowed the letter to Louis, and ſent him home with all imaginable marks of reſpect. Immediately on his return, he demanded juſtice; but the queen procured poiſon to be given him, which operated ſo violently that his life was deſpaired of. A ſtranger, however, undertook the cure, and ſucceeded; only a paleneſs remained in the prince's face ever afterwards, though he grew ſo fat that he was ſurnamed *the Groſs*.

On his recovery, the prince was on the point of revenging his quarrel by force of arms; but his father having cauſed the queen to make the moſt humble ſubmiſſions to him, his reſentment was at length appeaſed, and a perfect reconciliation took place.

Nothing memorable happened in the reign of king Philip after this reconciliation. He died in the year 1108, and was ſucceeded by his ſon Louis the Groſs. The firſt years of his reign were diſturbed by inſurrections of his lords in different places of the kingdom; and theſe inſurrections were the more troubleſome, as they were ſecretly fomented by Henry I. of England, that by weakening the power of France his duchy of Normandy might be the more ſecure. This quickly brought on a war; in which Henry was defeated, and his ſon William obliged to do homage to Louis for the duchy of Normandy. As the kings of England and France, however, were rivals, and exceedingly jealous of each other, the latter eſpouſed the cauſe of William the ſon of Robert duke of Normandy, whom Henry had unjuſtly deprived of that duchy. This brought on a new war; in which Louis, receiving a great defeat from Henry, was obliged to make peace upon ſuch terms as his antagoniſt thought proper. 42 Louis the Groſs.

France. proper. The tranquillity, however, was but of ſhort duration. Louis renewed his intrigues in favour of William, and endeavoured to form a confederacy againſt Henry; but the latter found means not only to diſſipate this confederacy, but to prevail upon Henry V. emperor of Germany to invade France with the whole ſtrength of the empire on one ſide, while he prepared to attack it on the other. But Louis having collected an army of 200,000 men, both of them thought proper to deſiſt. Upon this the king of France would have marched into Normandy, in order to put William in poſſeſſion of that duchy. His great vaſſals, however, told him they would do no ſuch thing; that they had aſſembled in order to defend the territories of France from the invaſion of a foreign prince, and not to enlarge his power by deſtroying that balance which aroſe from the king of England's poſſeſſion of Normandy, and which they reckoned neceſſary for their own ſafety. This was followed by a peace with Henry: which, as both monarchs had now ſeen the extent of each other's power, was made on pretty equal terms, and kept during the life of Louis, who died in 1137, leaving the kingdom to his ſon Louis VII.

43 Louis VII. a weak prince. The young king was not endowed with any of thoſe qualities which conſtitute a great monarch. From the ſuperſtition common to the age in which he lived, he undertook an expedition into the Holy Land, from whence he returned without glory. In this expedition he took his queen Eleanor along with him; but was ſo much offended with her gallantries during her ſtay there, as well as her behaviour afterwards, that he divorced her, and returned the duchy of Guienne which he received with her as a portion. Six weeks after this ſhe married Henry duke of Normandy, count of Anjou and Maine, and heir-apparent to the crown of England. This marriage was a very great mortification to Louis; and procured him the ſirname of *the Young*, on account of the folly of his conduct. When Henry aſcended the throne of England, ſome wars were carried on between him and Louis, with little advantage on either ſide: at laſt, however, a perfect reconciliation took place; and Louis took a voyage to England, in order to viſit the ſhrine of St Thomas of Canterbury. On his return he was ſtruck with an apoplexy; and though he recovered for that time, yet he continued ever after paralytic on the right ſide. After having languiſhed for about a year under this malady, he died on the 18th of September 1180, leaving the kingdom to his ſon Philip.

44 Philip the Great. This prince, ſurnamed *The Gift of God*, *The Magnanimous*, and *The Conqueror*, during his lifetime; and, as if all theſe titles had fallen ſhort of his merit, ſtyled *Auguſtus* after his death,—is reckoned one of the greateſt princes that ever ſat on the throne of France, or any other.—It doth not, however, appear that theſe titles were altogether well founded. In the beginning of his reign he was oppoſed by a ſtrong faction excited by his mother. Them indeed he repreſſed with a vigour and ſpirit which did him honour; but his taking part with the children of Henry II. of England in their unnatural conteſts with their father, and his treacherous combination with John to ſeize his brother's kingdom when he was detained in priſon by the emperor of Germany, muſt be indelible ſtains in his character, and for ever exclude him from the title of *Magnanimous*. As to military ſkill and perſonal valour, he was evidently inferior to Richard I. of England; nor can his recovering of the provinces held by the Engliſh in France, from ſuch a mean and daſtardly prince as king John, intitle him with any juſtice to the ſurname of *Conqueror*. In politics he was evidently the dupe of the Pope, who made uſe of him to intimidate John into a ſubmiſſion, by promiſing him the kingdom of England, which he never meant that he ſhould enjoy. An account of theſe tranſactions, which are the principal ones of this reign, is given under the article ENGLAND, n° 121——141. France.

45 Reign of Louis IX. Philip died in 1223, and was ſucceeded by his ſon Louis VIII. and he, in 1226, by Louis IX. afterwards ſtyled *St Louis*. This prince was certainly poſſeſſed of many good qualities, but deeply tinctured with the ſuperſtition of the times. This induced him to engage in two croiſades. The firſt was againſt the Saracens in Egypt: in which he was taken priſoner by the Infidels, and treated with great cruelty; but at laſt obtained his ranſom, on condition of paying a million of pieces of gold, and ſurrendering the city of Damietta. He no ſooner regained his liberty, than he entered Syria with a view of doing ſomething worthy of his rank and character. From this expedition he was obliged to return ſooner than he intended, by the news of the deceaſe of his mother queen Blanch, whom he had appointed regent in his abſence, and who had managed the national affairs with the greateſt prudence. The king, however, found many diſorders in the kingdom upon his return; and theſe he ſet himſelf to reform with the utmoſt diligence. Having ſucceeded in this, he yielded to Henry III. of England, the Limouſin, Querci, Perigord, and ſome other places; in conſideration of Henry and his ſon prince Edward their renouncing, in the fulleſt manner, all pretenſions to Normandy and the other provinces of France which the Engliſh had formerly poſſeſſed.

The reputation of this monarch for candour and juſtice was ſo great, that the barons of England, as well as king Henry III. conſented to make him umpire of the differences which ſubſiſted between them. But though he decided this matter very juſtly, his deciſion was not productive of any good effect. At laſt the king, having ſettled every thing relating to his kingdom in a proper manner, ſet out on another croiſade for Africa; where he died of the plague, on the 25th of Auguſt 1270.

46 Philip the Hardy. Notwithſtanding the misfortunes of Louis, his ſucceſſor Philip, ſurnamed *the Hardy*, continued the war againſt the Infidels with great vigour. Being reinforced by his uncle Charles king of Sicily, he brought the war to a more fortunate concluſion than his predeceſſor had been likely to do. The Saracens were defeated in two engagements, and the king of Tunis obliged to ſue for peace; offering at the ſame time to double the tribute he formerly paid to the crown of Sicily; to reimburſe the expences of the war; and to permit the Chriſtian religion to be freely propagated throughout his dominions. Having accompliſhed this, the two princes ſet ſail for Europe; but the ſeeds of the diſtemper which had infected the army in Africa not being eradicated, broke forth on their arrival in Sicily, and raged for ſome time with great violence.

Beſides

France. Beſides a vaſt number of common people, the king's brother John, his queen Iſabella, with his brother and ſiſter-in-law the king and queen of Navarre, and his uncle and aunt the count and counteſs of Poictiers, periſhed by this dreadful malady.

On his return to France, Philip took poſſeſſion of the counties of Provence and Thouloufe; married his ſecond ſon, though then very young, to the only daughter of the king of Navarre; while he himſelf eſpouſed Mary the daughter of the duke of Brabant, reckoned one of the moſt beautiful princeſſes of the age. He ſteadily enforced the regulations of his predeceſſor, who had prohibited the barons from making private wars upon one another; procured the friendſhip of Edward I. of England by ceding to him the county of Agenois; and entered into a war with Spain in order to ſupport the pretenſions of his nephews, the Infants de la Cerda, to the throne of Caſtile.

The events of this war were of no great importance; and the king's attention was quickly called off from them by the death of his eldeſt ſon Louis at the age of twelve years. This diſaſtrous event happened in the year 1275, not without a ſuſpicion of poiſon; and the young queen, Mary, was accuſed by a ſurgeon named La Broſſe as guilty of his death. Philip gave ſome credit to the accuſation; but having applied to a nun, who pretended to be inſpired, for full ſatisfaction, her anſwer proved fatal to La Broſſe. The queen being cleared by this pretended propheteſs, La Broſſe was accuſed of a treaſonable correſpondence with the king of Caſtile, and condemned to death. The manner of his trial and execution, however, were ſuch, that the tide of popular favour was turned; La Broſſe was by the voice of the people declared to be innocent, and the king and queen themſelves loudly condemned. During theſe unfavourable circumſtances, the Sicilians, over whom Charles of Anjou had eſtabliſhed his authority, inſtigated by John of Procida, a noble exile, came to a reſolution of freeing themſelves at once from the French yoke by a general maſſacre. This cruel reſolution was accordingly put in execution; and the French, to the number of 8000, murdered in one night; after which Peter of Arragon ſailed to the iſland, where he was received by the inhabitants as their king and ſaviour. Charles was ſenſibly affected by this misfortune; and having laid ſiege to Meſſina, ſailed directly to Marſeilles, where he obtained a powerful reinforcement. But during his abſence on this occaſion, his ſon, to whom he had entruſted the care of the ſiege, having raſhly ventured an engagement with the Spaniſh fleet, was entirely defeated and taken priſoner; which ſo much affected the father that he died of grief, and Sicily was inſeparably attached to the houſe of Arragon.

47 ench affacred Sicily.

The misfortunes of Charles were followed by others equally great to Philip himſelf. Pope Martin IV. in the warmth of his zeal for the cauſe of the duke of Anjou, had excommunicated Pedro king of Arragon, and beſtowed his kingdom on Charles of Valois, a younger ſon of the king of France. In attempting to defend himſelf againſt the execution of this unjuſt ſentence, Pedro was mortally wounded; but, ſoon after, the French fleet being defeated by that of Arragon, the king was ſo much affected by the misfortune that he fell ſick. His diſeaſe was augmented by the heat of the climate and the fatigues of war; ſo that, quite worn out with grief and infirmities, he expired at Perpignan in the 41ſt year of his age, and 16th of his reign. France.

48 Reign of Philip the Fair.

By the death of Philip the Hardy the French crown devolved on his ſecond ſon, called alſo Philip, and from the beauty of his perſon ſurnamed *the Fair*; who had eſpouſed the princeſs of Navarre, and at the time of his acceſſion was in his 17th year. By the marriage with this princeſs he had obtained the counties of Champagne and Brie; yet with all this increaſe of power he found himſelf unable to ſupport the war in which his predeceſſor had engaged. For this reaſon he thought proper to abandon the intereſt of the Infants de la Cerda, and ſettle the differences with Caſtile. The treaty was concluded by the mediation of Edward I. of England; at whoſe interceſſion Charles the Lame, ſon to the duke of Anjou already mentioned, was releaſed from his captivity; Edward himſelf paying part of his ranſom. On this Charles conſented to renounce his claim on Sicily; and Philip himſelf promiſed that his kinſman, Philip of Valois, ſhould renounce all pretenſions to the crown of Arragon. In return for this generoſity, the latter obtained the eldeſt daughter of Charles, with the territories of Anjou and Maine as a dowry.

The tranquillity procured by this treaty, however, was ſoon interrupted by differences with Edward the promoter of it; pope Boniface VIII. and Guy de Dampier, count of Flanders. The difference with England took place by a mere accident. A Norman and an Engliſh veſſel having met off the coaſt of Bayonne, and having both occaſion for water, the crews met and quarrelled at the ſame ſpring. A Norman was killed in the ſquabble by his own weapon, with which he aſſaulted an Engliſhman, as the latter pretended: but however the matter was, complaints were made by the Normans to Philip; who, without giving himſelf much trouble to inquire into the merits of the cauſe, inſtantly allowed them to redreſs their ſuppoſed injuries. On this a kind of piratical war commenced between the two nations, in which the two ſovereigns for ſome time took no active part; though other nations interfered; the Iriſh and Dutch ſeamen ſiding with the Engliſh, and thoſe of Flanders and Genoa with the French. Thus the powers on both ſides were gradually augmented, till at laſt the affair became ſo ſerious, that in one engagement 15,000 French are ſaid to have periſhed. Philip, alarmed at ſuch a carnage, ſummoned the king of England as his vaſſal to attend; and, on his refuſal, declared his eſtates in France to be forfeited. After a number of negociations, Philip declared that he would be ſatisfied with the nominal ceſſion of the province of Guienne, which he engaged inſtantly to reſtore to the king of England as ſoon as it ſhould be put into his hands. Edward complied with his demand: but no ſooner had the French monarch obtained poſſeſſion of that country, than he perſiſted in the forfeiture of the Engliſh poſſeſſions in France; which treacherous proceeding inſtantly produced a war betwixt the two nations. Edward, that he might the better defend himſelf againſt ſuch a formidable adverſary, concluded a treaty with the emperor Adolphus, together with the counts of Brittany, Holland, Bar, Juliers, Gueldres, and Flanders; 49 Difference with England.

France. ders; while Philip ſtrengthened himſelf by an alliance with John Baliol of Scotland; and this laid the foundation of that ſtrict union which took place between France and Scotland for two centuries. During this war the French made a deſcent on the coaſt of England, and deſtroyed the town of Dover; while Edward, in revenge, landed in Gaſcony with an army of 50,000 men. No great exploits, however, were performed with this mighty armament; and both parties finding themſelves pretty equally matched, conſented to a ſuſpenſion of arms for two years; during which a peace was finally concluded by the mediation of pope

50 Peace concluded. Boniface VIII. Guienne was reſtored; Edward eſpouſed Margaret the ſiſter of Philip; while his daughter Iſabella was given in marriage to the prince of Wales.

Both Philip and Edward behaved to the allies whom they had engaged in their cauſe with equal perfidy. Baliol was abandoned by Philip to the reſentment of Edward; while Guy, earl of Flanders, was left equally expoſed to the reſentment of Philip.

51 Difference with Pope Boniface. The reconciliation betwixt the French and Engliſh monarchs was ſoon followed by a difference with pope Boniface, whom they had appointed mediator between them. Senſible of his aſſuming diſpoſition, however, they had inſerted in the reference made to him, that he was choſen as a private man, and not as the ſucceſſor of St Peter. The haughty pontiff, however, ſoon ſhowed, that he was not by any means to be treated as a private perſon, and a conteſt with Philip quickly enſued. Boniface began with forbidding the clergy to grant the king any ſubſidies without firſt obtaining the conſent of the Holy See, under the pain of excommunication. Philip revenged himſelf by prohibiting any eccleſiaſtics from ſending money out of the kingdom without his leave; and by protecting the Colonnas, who were the implacable enemies of Boniface. By this his holineſs was ſo much irritated that he ſent a moſt abuſive letter to Philip; after which he ſummoned the clergy of France to a council at Rome; which Philip retaliated, by ſeizing the temporalities of thoſe who obeyed the ſummons, and recalling his brother Charles of Valois, who had the title of the *pope's general*. Senſible, however, of the danger that attended this conteſt, he diſpatched two emiſſaries, under pretence of conciliating the differences, to levy ſuch a body of troops as might execute his hoſtile purpoſes againſt the holy father. With theſe he ſuddenly inveſted the pope in his native city of Anegnia; and while the bull was preparing for the excommunication of Philip, and releaſing his ſubjects from their obedience, the Pope himſelf was obliged to ſurrender priſoner to the troops of the prince whom he deſigned to anathematize.

Though Boniface had been at this time delivered up to the troops of Philip through the treachery of the people of Anegnia, yet he was no ſooner taken priſoner and brought to diſtreſs, than they reſcued him from his guards and conveyed him to Rome, where he

52 Death of Boniface. ſoon after died of grief and ſhame. His ſucceſſor Benedict revoked the excommunication of Boniface, and attempted to regain the allegiance of Philip by gentle means: but, before this could be effected, he himſelf was cut off by death, not without ſtrong ſuſpicions of poiſon. After his deceaſe Philip offered to procure the papal chair for Bertrand archbiſhop of Bourdeaux, France. provided he would condemn the memory of Boniface, reſtore the honours and eſtates of the Colonnas which had been forfeited, allow him, for five years, the tenths of the clergy of France, and comply with a requeſt which at that time it was not proper to divulge.

Bertrand having complied with the terms propoſed by the king, aſcended the papal throne by the name of *Clement V.* but narrowly eſcaped being killed on his return from the cathedral of Lyons, by the falling of a wall which had been overloaded by the number of people who came to ſee the proceſſion; by which accident the duke of Brittany was killed, and the king and count of Valois conſiderably bruiſed. The new

55 The pope fixes his r ſidence a Avignon pope fixed his reſidence at Avignon, where he punctually complied with all the conditions of the treaty, except that of condemning the conduct of Boniface, which he abſolutely refuſed to do; and, inſtead of doing ſo, vindicated with much ſolemnity, after having inquired into the matter, or pretended to do ſo. The other condition, which Philip had at firſt concealed, was diſcovered by the death of the emperor Albert of Auſtria; after which event he deſired Clement to aſſiſt him in placing his brother Charles of Valois on the Imperial throne. But his holineſs, apprehenſive of the danger which might accrue to himſelf from being ſurrounded with the powerful relations of Philip, urged the diet to proceed inſtantly to an election; recommending to them Henry of Luxemburg as a proper perſon to fill the Imperial throne. In this ſcheme he ſucceeded ſo well, that the election was over before Philip could arrive at Avignon; and the only conſolation the French monarch could obtain for his diſappointment was the poſſeſſion of the city of Lyons, which had hitherto maintained an independency under its archbiſhop; but was now perſuaded to ſubmit to the authority of Philip.

54 Expeditio of Philip againſt th earl of Flanders. In the mean time Guy, earl of Flanders, being abandoned by his ally Edward king of England, was obliged to throw himſelf on the mercy of the French monarch, who had ſent his brother, Charles of Valois, with a powerful army to invade his dominions. From the latter indeed he had obtained a promiſe, that if he could not, within a year, compoſe the differences ſubſiſting between him and Philip, he ſhould be at liberty to retire, and purſue what meaſures he pleaſed. But Philip, in order to gratify the reſentment which his queen entertained againſt the captive prince, detained him, with two of his ſons, in cloſe confinement; while he himſelf entering Flanders in triumph, was every where received as ſovereign of the country; and at his departure appointed John de Chatillon, a relation of the queen, to govern thoſe newly acquired territories.

The new governor took care to repair the fortifications. which had been ſuffered to decay by reaſon of the aſſiduous application of the Flemings to trade; but being of a very haughty and tyrannical diſpoſition, and the poverty of the times not allowing his maſter to keep regular garriſons, an inſurrection quickly took place. This would have been effectually quelled by the diligence of the magiſtrates, had not Chatillon unluckily entered Bruges, and publicly diſplayed two hogſheads of ropes, which he threatened to employ in the execution of the inhabitants. On this they flew

to

ance.

to arms, maſſacred 1500 French; Chatillon himſelf being obliged to eſcape their fury by ſwimming over the town ditch. The inſurgents now, daily gathering ſtrength, ſoon amounted to an army of 60,000 men, who laid ſiege to Courtray. Here they were raſhly attacked in their trenches by the count d'Artois, who met with the reward of his temerity, being cut off with 20,000 of his troops. Philip determined on revenge; though the raiſing another army obliged him to debaſe the coin of the kingdom. Thus, however, he was enabled to enter Flanders with ſuch a force as would probably have ſubdued the whole country, had not Edward artfully communicated to the queen of France, as a ſecret, a feigned correſpondence between the French nobility and the court of Rome; by which falſe intelligence the king was induced to abandon the enterprife without performing any thing worthy of the armament he had fitted out. The war was continued for ſome time longer; but the attempts of Philip were conſtantly defeated by the ſteady valour of the Flemings; and the only recompence Philip obtained for all his trouble and expence was the city of Courtray.

54 ulſion e hts plars.

The other remarkable tranſactions of this reign were the expulſion and confiſcation of the eſtates of the Templars, who at that time enjoyed immenſe poſſeſſions in France. The confiſcations took place without any form of trial, and upwards of 50 of them were put to death in a cruel manner. The grand-maſter, with three of his principal officers, were burnt by a ſlow fire in the preſence of the king himſelf. The whole body of theſe unfortunate knights had been accuſed of the moſt groſs and abominable ſenſualities. The particulars were revealed, or pretended to be ſo, by two criminals who received their pardon for the diſcoveries they made; and theſe diſcoveries were confirmed by the confeſſion of the Templars themſelves. But this confeſſion was afterwards retracted, as being extorted from them by the fear of abſolute deſtruction; and thoſe who ſuffered, maintained their purity to the laſt: and on the whole, it was believed that Philip conſulted his avarice rather than his juſtice by this cruel execution. The latter part of his life was embittered by domeſtic misfortunes. His three daughters-in-law, Margaret daughter of the duke, and Jean and Blanch, of the count of Burgundy, who had married his three ſons Louis, Philip, and Charles, were accuſed of infidelity to their huſbands. After a ſevere examination, Margaret and Blanch were condemned to perpetual impriſonment; in which ſituation Margaret was afterwards ſtrangled by order of her huſband Louis. Their paramours, Philip and Walter de Launay, two brothers, were flayed alive, and afterwards hung upon a gibbet, with an uſher of the chamber, who had been their confident. The uneaſineſs of mind which Philip ſuffered on this account is ſuppoſed to have impaired his health, and he died of a conſumption in the year 1395, the 47th of his age, and 30th of his reign.

55 n of is the terous.

On the acceſſion of Louis, ſurnamed the *Boiſterous* on account of his violent temper, he found his treaſury ſo much exhauſted, that he was obliged to delay for ſome time the ceremony of his coronation with his new queen Clemence, daughter of the king of Hungary. Finding the kingdom otherwiſe in a very diſtracted ſtate, he applied himſelf very diligently to appeaſe the diſcontents of his ſubjects, and conciliate their affection by every means in his power. In this he was aſſiſted by his uncle Charles of Valois, on whom he at length entirely devolved the government of the kingdom. This regent, however, behaved with ſuch cruelty as is ſuppoſed to have proved fatal to the king himſelf; for having put to death a nobleman named *Enguerrand de Poitier de Marigni*, who enjoyed the confidence of the late king, this cruelty was ſo much reſented, that his friends were thought to have adminiſtered poiſon to the king; who expired ſuddenly after drinking a glaſs of cold water, in the 26th year of his age, and ſecond of his reign. Immediately after his death, Charles prepared to diſpute the ſovereignty with the brothers of the late ſovereign. Philip count of Poictou, the eldeſt brother, was at that time at Rome aſſiſting in the election of a new pope; and it was not until a month after the death of his brother that he was able to put an end to the intrigues which took place on that occaſion: but on his arrival in France, the throne was aſſigned to him by the unanimous voice of the people. His proſpects, however, were for a ſhort time clouded by the queen-dowager Clemence being delivered of a ſon, who has been inrolled among the kings of France under the name of *John I.* His death in three weeks ſecured the throne to Philip; who, on account of the tallneſs of his ſtature was ſurnamed the *Long*. His conduct proved ſuperior to that of his predeceſſor, who had unſucceſsfully attempted to ſubdue the Flemings, and had even ſuffered himſelf to be duped by their count; but Philip, by his vigorous behaviour, ſo reduced them, that they compelled their ſovereign to conſent to a peace upon honourable terms. He ſummoned Edward II. of England to do homage for his poſſeſſions in France; but that monarch, finding himſelf involved in difficulties, which rendered the viſit inconvenient, ſent excuſes to Philip, which he was pleaſed to accept. As the French monarch had formerly taken the croſs during the lifetime of his father, he now propoſed to put his vow in execution; but was diſſuaded from this by the pope himſelf, at whoſe inſtance he ſent an army into Italy to put an end to the contending factions of the Guelphs and Gibelines, who for ſo long time filled that country with blood and ſlaughter. The event proved unfortunate; and the diſgrace was rendered more mortifying by a contagious diſtemper, which ſwept off many thouſands of French ſubjects. This was ſuppoſed by the ſuperſtitious people of thoſe times to be occaſioned by the Jews, who had conſpired with the Saracens to poiſon the ſprings; and that the execution of the project was committed to ſome lepers who lived by themſelves in hoſpitals richly endowed. On this a perſecution was inſtantly commenced againſt theſe unfortunate men, and great numbers of them were burnt alive; while the Jews in general were abandoned to the rage of the populace, who inſulted their perſons, and plundered their houſes without remorſe.

France.

56 Reign of Philip the Long.

57 Unfortunate expedition into Italy.

The remaining part of the reign of Philip was ſpent in attempting to regulate the internal concerns of his kingdom. A deſign had been formed by his predeceſſors of eſtabliſhing a certain ſtandard for the coin, weights, and meaſures, throughout France: and this was adopted by Philip; who, in order to carry it more effectually into execution, purchaſed from the counts of Valois, Clermont, and Bourbon, their right of coinage,

France. coinage within their own dominions. But notwithſtanding all his endeavours for this purpoſe, he never could bring the ſcheme to bear; nor indeed could he in any degree conciliate the affection of his ſubjects. He died of a fever and dyſentery in the year 1322, the 28th of his age, and 6th of his reign.

58 Reign of Charles the Fair. By the death of Philip, the crown of France devolved on his brother Charles IV. who had obtained the ſurname of *Fair*. After ſettling ſome diſputes with the duke of Burgundy, his next ſtep was to diſſolve his marriage with Blanch, who ſtill continued in priſon, and to eſpouſe Mary the daughter of Henry emperor of Germany. This marriage was contracted with a view to the imperial crown itſelf, which had been ſo long ſeparated from that of France; and in 1325 an opportunity offered for Charles to gratify his ambition. At that time the Imperial dignity was diſputed between Louis of Bavaria and Frederic of Auſtria; the latter of whom had been taken priſoner in a battle with Louis. But pope John, who entertained an implacable hatred againſt Louis, fulminated the ſentence of excommunication againſt him, intruſting the execution of it to Leopold the brother of Ferdinand. The king of France was induced to embark in the ſame cauſe, by a promiſe of the ſpoils of Bavaria; while Frederic himſelf conſented to relinquiſh his pretenſions to the empire which he had ſo unſucceſsfully maintained. Louis, however, by inſtantly releaſing his priſoner, and diſmiſſing him in an honourable manner, engaged his friendſhip, and diſarmed his moſt formidable antagoniſt. But the pope was not to be ſo diſappointed. A conſiderable ſum of money induced Leopold to perſevere in his hoſtilities, while it was determined that a new council of electors ſhould be held in order to transfer the Imperial crown to Charles. In purſuit of this viſionary ſcheme the king of France ſet out for the frontiers of Germany with a ſplendid army; but ſoon found that there was no poſſibility of accompliſhing his wiſhes. Leopold alone, from motives of intereſt, remained his friend; the reſt ſhowed the greateſt indifference; and even his brother-in-law the king of Bohemia abſented himſelf from the diet; while in a ſhort time the death of the queen put an end to all connections with that crown.

On the deceaſe of Mary, Charles eſpouſed Joanna daughter to the count of Evreux: and in order to avert the calamities to be feared from an infant ſucceſſion, he entered into an alliance with Robert king of Scotland; by which it was provided, that ſhould either of the ſovereigns die without an heir apparent, the ſtates of the kingdom ſhould fill the vacant throne, and the ſurvivor of the two kings ſhould with his whole force ſupport the legality of the nomination againſt any other competitor: though even this proved inſufficient to avert the danger which now threatened the kingdom, as ſhall be explained in the ſequel.

59 Candidates for the regency and kingdom on the death of Charles. Charles died in the year 1328, in the 34th year of his age, leaving his queen pregnant; and as the ſucceſſion depended on the fruit of the queen's pregnancy, a regent in the mean time was neceſſary; and two candidates inſtantly appeared for this important poſt, urging at the ſame time their right to the crown as well as to the regency. Theſe were, Philip de Valois, couſin-german to the deceaſed king; the other, Edward III. king of England, who aſpired to the throne in right of his mother, and the nephew of Charles the Fair. His pretenſions, however, were eaſily ſet aſide, and Philip was confirmed in the regency; from which he ſoon after ſtepped into the throne, on the queen being delivered of a daughter; from which circumſtance he acquired the ſurname of *Fortunate*. But though the pretenſions of Edward, both to the regency and crown, were unanimouſly rejected by the people, it was ſtill impoſſible for Philip to think of the claims of ſuch a formidable rival without uneaſineſs. He therefore ſummoned the Engliſh monarch to do homage for his poſſeſſions in France; and, upon his not anſwering his ſummons, forfeited them, and ſeized his revenues. This at laſt induced Edward to croſs the ſea and pay his homage; which Philip conſented to receive in any form, upon condition of a proper explanation being afterwards given: but as this was ſtudiouſly delayed after the return of the king of England, the province of Guienne was again ſeized by the French monarch. Edward, unwilling to loſe his continental dominions, or involve himſelf in a war for the ſake of a mere ceremony, ſent over a formal deed, by which he acknowledged that he owed liege homage to France. Thus the flame was ſmothered for the preſent; and would perhaps have been entirely extinguiſhed, had it not been for the intrigues of Robert of Artois, brother-in-law to the king of France himſelf, who had been expelled his country, and had taken refuge in England. By him he was perſuaded to renew his pretenſions to the crown of France, which of neceſſity produced a war.

60 Diſputes with Edward III. of England.

For ſome time, indeed, neither party made any open declaration of hoſtility; but as both monarchs were poſſeſſed of great prudence and ſagacity, they ſoon penetrated each other's deſigns. Philip, under pretence of taking the croſs, began to make prodigious armaments, ſtrengthening himſelf at the ſame time by alliances on every ſide; while Edward, determining to renew his claim to the crown of France, projected the conqueſt of Scotland. This, however, he could not accompliſh; and in the mean time Philip, in order to favour the Scots, with whom he was in alliance, ſuffered his ſubjects to make irruptions into Guienne.

61 Edward's unſucceſsful expedition. In 1337, the war broke out openly. Philip having detached a ſquadron of his fleet againſt the Infidels, employed the reſt, conſiſting chiefly of Genoeſe veſſels, againſt the Engliſh. As in this war it was of great importance which ſide was taken by the Flemings, theſe people were courted by both parties. Louis count of Flanders declared for Philip, but his ſubjects were more inclined to king Edward. James Arteville a brewer, the moſt able and artful man in the country, governed them at that time as much as if he had been their prince; and the advantages ariſing from the Engliſh commerce determining him in favour of Edward, that prince, at his requeſt, embarked for Sluys with a numerous army. Here he arrived in 1338; and on his firſt landing, it was reſolved that the German princes in alliance with him ſhould act againſt France. But for this a pretence was wanting. The vaſſals of the empire could not act by Edward's orders, or even as his allies, without directions from the emperor, and he was in league with France. This difficulty, however, was ſoon overcome: the French had made themſelves maſters of Cambray, and the emperor reſolved

France. that it ſhould be retaken. With this view he created Edward *Vicar General of the Empire;* an empty title, but which ſeemed to give him a right of commanding the ſervices of the princes of Germany. The Flemings, who were vaſſals of France, likewiſe pretended ſcruples at invading the territories of their liege lord. To quiet theſe, Edward, by the advice of Arteville, aſſumed the title of *King of France;* and by virtue of this right challenged their aſſiſtance for dethroning Philip de Valois, the uſurper of his kingdom. This ſtep, which he feared would beget endleſs animoſities and jealouſies, he did not take without heſitation; and, according to Mr Hume, from this time we may date the commencement of that great animoſity which the Engliſh have always borne to the French.

Edward's firſt attempt was upon the city of Cambray, to which he laid ſiege; but in a ſhort time he was prevailed upon by Robert d'Artois to raiſe the ſiege and march into Picardy. This country he entered with an army of near 50,000 men, compoſed moſtly of foreigners. Philip came within ſight of him with an army of near 100,000, compoſed chiefly of native ſubjects; and it was daily expected that a battle would enſue. But the Engliſh monarch was averſe to engage againſt ſo great a ſuperiority; and Philip thought it ſufficient if he eluded the attacks of his enemy, without running any unneceſſary hazard. The two armies faced each other for ſeveral days; mutual defiances were ſent; and Edward at laſt retired into Flanders, and diſperſed his army.

Such was the fruitleſs, and almoſt ridiculous concluſion of Edward's firſt expedition, which had plunged him into the greateſt difficulties. He had contracted near L. 300,000 of debt; he had anticipated all his revenue; he had pawned every thing of value which belonged either to himſelf or his queen; nay, he was obliged in ſome meaſure even to pawn himſelf to his creditors, by deſiring their permiſſion to go over to England in order to procure ſupply, and by promiſing on his word of honour to return in perſon if he did not remit their money. On his arrival in England, however, he procured a large ſupply, ſufficient to enable him to make all the neceſſary preparations for a new invaſion; and ſo certain were the Engliſh that France would now be conquered, that the parliament, before Edward's departure, proteſted that they owed him no obedience as king of France, but that the two kingdoms muſt remain for ever diſtinct and independent.

62 His ſecond expedition. The king of England ſet out on his ſecond expedition with a fleet of 240 veſſels. Philip had prepared a fleet of 400 veſſels, manned with 40,000 men; which he ſtationed off Sluys, in order to intercept him in his paſſage. The two fleets met on the 13th of June 1340; but the Engliſh, either by the ſuperior abilities of Edward, or the greater dexterity of his ſeamen, gained the wind of the enemy, and had the ſun in their backs; and with theſe advantages began the action. The battle was fierce and bloody: the Engliſh archers, whoſe force and addreſs were now much celebrated, galled the French on their approach; and when the ſhips grappled together, the example of the king and the nobility who were with him ſo animated the ſeamen and ſoldiers, that they maintained every where a ſuperiority over the enemy. The Flemings obſerving the battle, hurried out of their ports, and brought a reinforcement to the Engliſh; which coming unexpectedly, had a greater effect than in proportion to its power and numbers. Two hundred and thirty ſhips were taken; and 30,000 Frenchmen were killed, with two of their admirals: the loſs of the Engliſh was inconſiderable, compared to the greatneſs and importance of the victory. None of Philip's courtiers, it is ſaid, dared to inform him of the event; till his fool or jeſter gave him a hint, by which he diſcovered the loſs he had ſuſtained.

63 The French entirely defeated at ſea.

After this great victory, Edward landed his forces, and laid ſiege to Tournay. Philip marched to its relief with a very numerous army; but acted with ſo much caution, that Edward found himſelf in a manner blocked up in his camp: and the counteſs dowager of Hainault, ſiſter to Philip, mother-in-law to Edward, and ſiſter-in-law to Robert d'Artois, coming out of a convent, to which ſhe had retired, interpoſed with ſo much ſpirit and addreſs, that ſhe engaged all parties to agree to a truce for a year, and might perhaps have brought about a peace if ſhe had ſurvived.

64 Edward invited into France a third time. In 1341, however, Edward's ambition was once more excited by the invitation of the count de Mountfort, who had poſſeſſed himſelf of the province of Brittany, and applied to Edward to ſecond his claims. An offer of this kind entirely coincided with Edward's moſt ſanguine deſires. He was happy in the promiſed aſſiſtance of Mountfort, an active and valiant prince, cloſely united to him by intereſt, and thus opening to him an entrance into the heart of France. Theſe flattering proſpects, however, were for a while damped by the impriſonment of Mountfort; whoſe aims being diſcovered, he was beſieged in the city of Nantz and taken. But Jane of Flanders his wife ſoon made up for the loſs of her huſband. This lady courageouſly undertook to ſupport the falling fortunes of her family. She aſſembled the inhabitants of Rennes, where ſhe then reſided; and carrying her infant ſon in her arms, deplored her misfortunes, and attempted to inſpire the citizens with an affection for her cauſe. The inhabitants of Nantz inſtantly eſpouſed her intereſts, and all the other fortreſſes of Brittany embraced the ſame reſolution. The king of England was appriſed of her efforts; and was intreated to ſend her ſuccours with all poſſible expedition to the town of Hennebone, in which place ſhe reſolved to ſuſtain the attacks of the enemy. Charles de Blois, Philip's general, anxious to make himſelf maſter of ſo important a fortreſs as Hennebone, and ſtill more to take the counteſs a priſoner, ſat down before the place with a large army, and conducted the ſiege with indefatigable induſtry. The defence was no leſs vigorous: ſeveral ſallies were made by the garriſon, in which the counteſs herſelf was ſtill the moſt active, and led on to the aſſault. Obſerving one day that their whole army had quitted the camp to join in a general ſtorm, ſhe ſallied out by a poſtern at the head of 300 horſe, ſet fire to the enemies tents and baggage, put their ſuttlers and ſervants to the ſword, and occaſioned ſuch an alarm, that the French deſiſted from the aſſault, in order to cut off her communication with the town. Thus intercepted, ſhe retired to Auray, where ſhe continued five or ſix days; then returning at the head of 500 horſe, ſhe fought her way through one quarter of the French camp, and returned to her faithful citizens in triumph. But the beſiegers had at length

France. length made several breaches in the walls; and it was apprehended that a general assault, which was hourly expected, would be fatal. A capitulation was therefore proposed, and a conference was already begun, when the countess, who had mounted on a high tower, and was looking towards the sea with great impatience, descried some ships at a distance. She immediately exclaimed that succours were arrived, and forbid any further capitulation. She was not disappointed in her wishes; the fleet she discerned carried a body of English gentlemen, with 6000 archers, whom Edward had prepared for the relief of Hennebone, but who had been long detained by contrary winds. They entered the harbour under the conduct of Sir Walter Manny, one of the most valiant commanders of his time. This relief served to keep up the declining spirits of the Bretons until the time appointed by the late truce with Edward was expired, on which he was at liberty to renew the war in greater form.

The succours under Sir Walter Manny were quickly followed by a more considerable reinforcement commanded by Robert of Artois, who made himself master of the city of Vannes soon after his arrival: but the Bretons soon recovered the city, and Robert was compelled to relinquish his prize after receiving a mortal wound. Edward himself, eager to revenge the death of his ally, soon landed at Morbian near Vannes with an army of 12,000 men. With this small number he undertook at once the siege of Vannes, Nantz, and Rennes: but by dividing his forces, he failed in every enterprise, and gave an opportunity to John duke of Normandy, the king of France's eldest son, to invest him in his camp. In this situation his provisions soon began to fail; and Edward, notwithstanding all his valour, would have been obliged to surrender, had he not, by a train of artful negociations, induced Philip to relinquish the advantage he had obtained, and consent to a truce of three years. This was accomplished by the mediation of the court of Rome; and the French monarch was soon made sensible of the partiality of that court, and the imprudence of the step he himself had taken. Edward soon found a pretence to renew the war, from the execution of some nobles of Brittany, who, he said, were partisans of Mountfort, and chose to look upon their punishment as an infraction of the treaty.

Philip now endeavoured to secure himself against the power of his rival by alliances, and by purchasing the city of Montpelier from the king of Majorca: but in the mean time, the English, under the command of the earl of Darby, had invaded Guienne, twice defeated the French army commanded by the Count de Lisle, and made themselves masters of a great number of towns. Philip, by reason of the exhausted state of his treasury, was for some time incapable of making any opposition. To recruit his finances, he was obliged to lay a duty on salt; which gave such offence to his subjects as had almost excited a rebellion. When these discontents were assuaged, however, he soon raised an army of 100,000 men, whose courage was further raised by the presence of the dukes of Normandy and Burgundy. The English general was therefore compelled to stand upon the defensive. One fortress after another was surrendered to the French; till at length nothing appeared but a total extinction of the power of England upon the continent. In this situation, France. Edward resolved to bring relief in person to his distressed subjects and allies; and accordingly embarked in 1346 at Southampton, on board a fleet of near 1000 sail, of all dimensions. He carried with him, besides all the chief nobility of England, his eldest son the prince of Wales (afterwards surnamed the *Black Prince*); a youth of about 15 years old, and already remarkable both for understanding and valour above his age. His army consisted of 4000 men at arms, 10,000 archers, 10,000 Welsh infantry, and 6000 Irish; all which he landed safely at La Hogue, a port in Normandy, which country he determined to make the seat of the war.

65 He lands with an army in Normandy.

The intelligence of Edward's landing, and the devastation caused by his troops, who dispersed themselves over the whole face of the country, soon spread universal consternation through the French court. The rich city of Caen was taken and plundered by the English without mercy; the villages and towns, even up to Paris, shared the same fate; and the French had no other resource but by breaking down their bridges, to attempt putting a stop to the invader's career. In the mean time, Philip was not idle in making preparations to repress the enemy. He had stationed one of his generals, Godemar de Faye, with an army on the opposite side of the river Somme, over which Edward was to pass; while he himself, at the head of 120,000 fighting men, advanced to give the English battle. Edward, thus unexpectedly exposed to the danger of being inclosed and starved in an enemy's country, published a reward to any that should bring him intelligence of a passage over the river Somme. This was discovered by a peasant of the country named Gobin Agace; and Edward had just time to get his whole army over the river, when Philip appeared in his rear. Of the battle that ensued, in which the French were overthrown with great slaughter, an account is given under the article CRESSY.

66 Calais taken.

Edward next laid siege to Calais, which was then defended by John di Vienne, an experienced commander, and supplied with every thing necessary for defence. It was at length taken, after a twelvemonth's siege, the defendants having been reduced to the last extremity by famine and fatigue; for the consequences of which, see the article CALAIS.

From the very beginning of this unfortunate war, Philip had invariably showed himself desirous of peace, and the victory of Cressy rendered him still more so. Edward also, notwithstanding his successes, was unable to support the expences of the war any longer. The mediation of the court of Rome was therefore readily accepted, and a truce for three years concluded. At the same time, Philip met with some recompence for the losses he had sustained, by the acquisition of Dauphiny, which has ever since given the title of *Dauphin* to the eldest son of the king of France. It was obtained by the resignation of Humbert prince of Dauphiny; who, being disappointed in his hopes of marrying Joan, daughter of the duke of Bourbon, gave up his territories to Charles the grandson of Philip, who had married that lady; himself retiring into a convent. Soon after this event, the king himself, who had been some time a widower, was married to Blanch, the daughter of Philip count of Evreux, and Jane queen of Navarre; and his son

France.

son John to the countess of Boulogne. But the happiness occasioned by these marriages was soon interrupted by the death of the king; who expired in the year 1350, the 57th of his age, and 23d of his reign.

67 Death of king Philip.

On the death of Philip, his eldest son John took possession of the kingdom; but scarcely was he seated on the throne, when he disgusted his nobility by an unseasonable act of severity. Robert de Brienne, count of Eu and Guisnes, had been taken prisoner by the king of England at Caen; and under pretence of negociating his ransom, had passed several times between France and England; but being accused of a treasonable correspondence with Edward, he was by order of his sovereign suddenly arrested, condemned, and beheaded, without any form of trial. At his death, it is said, that he confessed his treasonable practices; but this has not been authenticated by any historian of credit. Having been constable of France, the sword, the badge of his office, was delivered to Charles de la Carda: but his fate was equally unfortunate with that of his predecessor, being soon after assassinated by Charles king of Navarre, surnamed *The Wicked*. This prince, celebrated for his personal qualifications, but detested for his crimes, was the son-in-law of John himself. He had demanded the duchy of Angouleme of the king; but as the latter had thought proper to bestow it upon Carda, he had taken the effectual method of revenging himself by assassinating his rival. John did not fail to show a proper resentment; but such was the weakness of his government, that the king of Navarre set him at defiance, and would not even condescend to the ceremony of asking pardon until John had sent him his second son as an hostage for his personal security. To these offences the king of Navarre added another still more atrocious, viz. that of aspiring to the crown of France itself; to which he pretended a right derived from his mother, being grandson by the female side to Louis the Boisterous. But his more immediate demands were the countries of Champagne and Brie. To obviate all difficulties on this head, however, John bestowed the duchy of Normandy on his eldest son Charles; and commanded him to seize the estates of the king of Navarre. On this the latter soon made his appearance at Paris; but John found himself obliged to appease his murmurs at the expence of no less than 100,000 crowns.

68 Infamous conduct of the king of Navarre.

All this time the truce with England had been very ill observed on both sides; the French had possessed themselves of the port of St Jean d'Angeli; and the English had surprised the town of Guisnes. The rival houses of Mountfort and Blois still continued their animosities; while Edward continued to threaten war. The king of Navarre went on with his intrigues; and even the dauphin was drawn into a confederacy against his father. John, however, being informed of their machinations, found means to defeat them effectually. The dauphin was reclaimed by pointing out to him the impropriety of his conduct, and the disadvantage which must unavoidably accrue to himself from the connections which he had formed.

69 He is taken and confined.

The king of Navarre was invited, with his principal adherents, to an entertainment, where they were unexpectedly arrested; the former being sent prisoner to Chateau Gaillard, and several of the most obnoxious of the latter put to death. The rest of the conspirators, instead of being dismayed by this check, immediately showed themselves in open rebellion; and finding themselves unable, without farther assistance, to gain their point, they without delay invited over Edward from England.

France.

70 France again invaded by Edward.

That warlike and enterprising monarch had never lost sight of the object he had originally embraced; and on the expiration of the truce had sent his son, prince of Wales, and, from the colour of his armour, surnamed the *Black Prince*, with a fleet towards the coast of France. Young Edward had with this fleet entered the mouth of the river Garonne, burnt the towns and villages of Languedoc, and retired with the plunder into the country of Guienne. Edward himself, who had likewise passed over to the continent, wasted the country as far as St Omer; but the French king, notwithstanding all these provocations, determined to avoid a battle, and therefore prohibited his general, the constable of Bourbon, from coming to an engagement though his army was much superior to that of the prince of Wales. With the flower of his troops, however, he pursued Edward from St Omer to Hesdin, where he defied him to a pitched battle; but the latter, without minding his bravadoes, continued his march to Calais, from whence he embarked for England. After his departure, John called an assembly of the states at Paris, where he explained the distressed situation of his finances, and showed so fully the necessity of assisting him in the defence of the kingdom, that they consented to maintain an army of 30,000 men during the war. To supply the other exigencies of government, they revived the duty on salt, and added a variety of other imposts; but at the same time appointed a committee of their own number to take care that the money was solely appropriated to the public service.

The satisfaction which John received from these grants, and the suppression of some disturbances which happened about this time, was soon overcast by the news that the prince of Wales had marched with an army of 12,000 men from Bourdeaux; and, after ravaging the Agenois, Quercy, and the Limousin, had entered the province of Berry. The young warrior had penetrated into the heart of France with this trifling body of forces, in hopes of joining the duke of Lancaster in Guienne. But he soon found that his scheme was impracticable: the country before him was too well guarded to permit his advancing further; and all the bridges behind were broken down, which effectually barred a retreat. In this embarrassing situation, his perplexity was increased, by being informed, that the king of France was actually marching at the head of 60,000 men to intercept him. He at first thought of retreating: but soon finding it impossible, he determined calmly to await the approach of the enemy; and, notwithstanding the disparity of forces, to commit all to the hazard of a battle.

71 Battle of Poictiers.

It was at a place called *Maupertuis*, near Poictiers, that both armies came in sight of each other. The French king might very easily have starved the English into any terms he thought proper to impose; but such was the impatient valour of the French nobility, and such their certainty of success, that it might have been equally fatal to attempt repressing their ardour to engage. In the mean time, while both armies were

France. drawn out, and expecting the signal to begin, they were stopped by the appearance of the cardinal of Perigord, who attempted to be a mediator between them. However, John, who made himself sure of victory, would listen to no other terms than the restitution of Calais; with which the Black Prince refusing to comply, the onset was deferred till the next morning, for which both sides waited in anxious suspence.

During this interval, the young prince strengthened his post by new entrenchments; and placed 300 men in ambush, with as many archers, who were commanded to attack the enemy in flank during the heat of the engagement. Having taken these precautions, he ranged his army in three divisions; the van was commanded by the earl of Warwick, the rear by the earls of Salisbury and Suffolk, and the main body by himself. In like manner, the king of France arranged his forces in three divisions; the first commanded by the duke of Orleans; the second by the Dauphin, attended by his younger brothers; while he himself led up the main body, seconded by his youngest and favourite son, then about 14 years of age. As the English were to be attacked only by marching up a long narrow lane, the French suffered greatly from their archers, who were posted on each side, behind the hedges. Nor were they in a better situation upon emerging from this danger, being met by the Black Prince himself at the head of a chosen body of troops, who made a furious onset upon their forces, already in great disorder. A dreadful overthrow ensued: those who were as yet in the lane recoiled upon their own forces; while the English troops who had been placed in ambush, took that opportunity to increase the confusion, and confirm the victory. The dauphin and the duke of Orleans were among the first that fled. The king of France himself made the utmost efforts to retrieve, by his valour, what his rashness had forfeited: but his single courage was unable to stop that consternation which had now become general through his army; and his cavalry soon flying, he found himself exposed to the enemy's fury. At length, spent with fatigue, and despairing of success, he thought of yielding himself a prisoner; and frequently cried out, that he was ready to deliver himself to his cousin the prince of Wales. The honour of taking him, however, was reserved for a much more ignoble hand; he was seized by Dennis de Morbec, a knight of Arras, who had been obliged to fly his country for murder.

72 French defeated.

73 King John taken prisoner.

In April following, the prince conducted his royal prisoner through London, attended by an infinite concourse of people of all ranks and stations. His modesty upon this occasion was very remarkable: the king of France was clad in royal apparel, and mounted on a white steed distinguished by its size and beauty; while the prince himself rode by his side upon a mean little horse, and in very plain attire.

74 Miserable situation of France.

This dreadful defeat, which happened in the year 1356, almost entirely ruined the French affairs; and the miseries which ensued from this cause were greatly augmented by intestine commotions. The dauphin, who had now assumed the government, was altogether unable to govern a turbulent and seditious people at such a crisis. An assembly of the states, which he called, took the opportunity to limit the power of the prince, impeach the former ministers, and demand the liberty of the king of Navarre; the treasurer of the crown was murdered by one Marcel, a partizan of that worthless prince, who had filled the city of Paris with confusion by his intrigues. The assassin whom Marcel employed was dragged, by order of the dauphin, from an altar where he had taken refuge, and instantly put to death. The bishop of Paris resented the indignity done to the church; and Marcel avenged the fate of his adherent by murdering both the mareschals, who had seized him in the presence of the dauphin; and so near him, that his clothes were stained with their blood. The prince indignantly asked him, if he was to be involved in the same destruction? when Marcel affected to provide for his safety by putting upon him a blue hood, the badge of the adherents of Navarre. The public disorders were now also augmented by the escape of the king of Navarre from confinement; and though the dauphin was even assured that he had administered a dose of poison to him, he was obliged still to pay him some appearance of regard. A scheme was even formed by the chiefs of the sedition to change the government, to vest all the power in the commons, and leave the king no more than an empty title; but though this was favourably received by the city of Paris, it was entirely rejected by the other cities of the kingdom. The dauphin was likewise recognised as regent by the states general, and the inhabitants of Picardy and Champagne took up arms in his cause.

75 The king of Navarre escapes from prison.

In this disastrous state of affairs, the miseries of the people were heightened by a new and unexpected evil. The peasants, who had been all along oppressed by the nobles, were now treated in such a manner, that they rose in great numbers to revenge themselves; the castles of the nobility were razed to the ground, their wives and daughters ravished, and themselves put to the most cruel torments. At last they were obliged to arm in their own defence. The duke of Orleans cut off 10,000 of them in the neighbourhood of Paris; 12,000 were massacred by the king of Navarre; 9000, who had laid siege to the town of Meaux, where the dauphiness and three other ladies of the first rank resided, were routed and pursued with dreadful slaughter by an officer in the service of Edward. Amidst these confusions, Marcel, the seditious leader already mentioned, perished in a tumult of his own raising; and the most virtuous and prudent people of the nation supported the pretensions of the dauphin. His most dangerous enemy was the king of Navarre, who had allured to his standard numbers of those Norman and English adventurers who had followed Edward into France, and there been left to seek their fortunes; where they associated themselves under the name of the *Companions*. By such a formidable competitor the dauphin was reduced almost to the last extremity, when his hopes were revived by an unexpected proposal from his rival, of peace upon equitable and moderate terms. Historians in general have ascribed this to the natural levity of the king of Navarre; but some have been of opinion that he acted from prudential motives, and that he justly supposed it would be more easy to deal with the dauphin, who was his own kinsman, and humbled by so many misfortunes, than with an haughty and imperious conqueror like Edward.

76 Insurrections and tumult of the peasants.

77 Peace between the dauphin and king of Navarre.

On the expiration of the truce in 1359, Edward again set sail for France, and anchored before Calais with

with a fleet of 1100 ſail, aſſumed the title of *king of France*, and augmented his army to 100,000 men. The dauphin, finding himſelf unable to withſtand ſo great a power, was obliged to act on the defenſive; chooſing the city of Paris for his ſtation, and allowing the Engliſh to ravage all the open country. Thus they were allowed to penetrate through Picardy into Champagne; but the city of Rheims, where Edward deſigned to have been crowned king of France, baffled their utmoſt efforts. From Champagne, therefore, which was already laid waſte, the Engliſh monarch marched into Burgundy; pillaging Tonnere, Gaillon, and Avalon. Burgundy was ſaved by the payment of 100,000 merks, and a like ſum was paid for Nivernois. At laſt, after a long and deſtructive march, Edward arrived at the gates of Paris; but the prudence of the dauphin and citizens of that metropolis had rendered it impregnable to the attacks of famine as well as the aſſaults of an army. Thus the war went on till the year 1360, when the king of England was inclined to peace, as is ſaid, by a dreadful tempeſt, to which his army was expoſed while encamped in the fields round Chartres. His conduct, however, may more reaſonably be derived from other motives. Notwithſtanding all the victories he had gained, the French nation ſhowed not the leaſt favour to his claim of ſucceſſion; the king of Navarre was a dangerous rival, and the caution of the dauphin in avoiding an engagement deprived him of the advantages he might expect from his valour and military ſkill. Thus conferences for a peace were opened at Bretigny in the Chartraine; and it was at laſt concluded on the following conditions, *viz.* That king John ſhould pay for his ranſom, at different periods, three millions of crowns of gold (about a million and an half of our money); Edward ſhould for ever renounce all claim to the kingdom of France; and ſhould remain poſſeſſed of the territories of Poictou, Xaintonge, l'Agenois, Perigord, the Limouſin, Quercy, Rouvergne, l'Angoumois, and other diſtricts in that quarter, together with Calais, Guiſnes, Montreuil, and the county of Ponthieu on the other ſide of France. Some other ſtipulations were made in favour of the allies of England, as a ſecurity for the execution of theſe conditions.

Upon John's return to his dominions, he found himſelf very ill able to ratify thoſe terms of peace that had been juſt concluded. He was without finances, at the head of an exhauſted ſtate; his ſoldiers without diſcipline, and his peaſants without ſubordination. Theſe had riſen in great numbers; and one of the chiefs of their banditti aſſumed the title of *The Friend of God and the Terror of Man*. A citizen of Sens, named *John Gouge*, alſo got himſelf, by means of his robberies, to be acknowledged king; and he ſoon cauſed as many calamities by his devaſtations, as the real king had brought on by his misfortunes. Such was the ſtate of that wretched kingdom upon the return of its captive monarch: and yet ſuch was his abſurdity, that he immediately prepared for a croiſade into the Holy Land, before he was well replaced on the throne. Had his exhauſted ſubjects been able to equip him for this chimerical project, it is probable he would have gone through with it; but their miſeries were ſuch, that they were even too poor to pay his ranſom. This was a breach of treaty that John would not ſubmit to; and he was heard to expreſs himſelf in a very noble manner upon the occaſion: "Though (ſays he) good faith ſhould be baniſhed from the reſt of the earth, yet ſhe ought ſtill to retain her habitation in the breaſt of kings." In conſequence of this declaration, he actually returned to England once more; and yielded himſelf a priſoner, ſince he could not be honourably free. It is ſaid by ſome, that his paſſion for the countefs of Saliſbury was the real cauſe of his journey: but we want at this time the foundations for ſuch an injurious report. He was lodged in the Savoy, the palace where he had reſided during his captivity; and ſoon after he cloſed a long and unfortunate reign, by his death, which happened in the year 1384, about the 56th year of his age.

France.

81 Dies, and is ſucceeded by Charles the Wiſe.

Charles, ſurnamed *the Wiſe*, ſucceeded his father on the throne of France; and this monarch, merely by the force of a finely conducted policy, and even tho' ſuffering ſome defeats, reſtored his country once more to tranquillity and power. He quelled and diſſipated a ſet of banditti, who had aſſociated themſelves under the name of *Companions*, and who had long been a terror to the peaceable inhabitants. He had them inrolled into a body, and led them into the kingdom of Caſtile againſt Peter, ſurnamed *the Cruel*, whom his ſubjects had dethroned, and who, by means of an alliance with the Engliſh, endeavoured to get himſelf reinſtated upon the throne. In conſequence of theſe alliances, the Engliſh and French again came to an engagement; their armies on the one ſide commanded by the Black Prince; on the other, by Henry of Tranſtamarre, and Bertrand du Gueſclin, one of the moſt conſummate generals and accompliſhed characters of the age in which he lived. However, the uſual good fortune of the Engliſh prince prevailed; the French loſt above 20,000 men, while only four knights and 40 private men on the ſide of the Engliſh were ſlain.

82 Bad ſucceſs of the Engliſh.

Nevertheleſs, theſe victories were attended with very few good effects. The Engliſh, by their frequent levies, had been quite exhauſted, and were unable to continue an army in the field. Charles, on the other hand, cautiouſly forbore coming to any deciſive engagement; but was contented to let his enemies waſte their ſtrength in attempts to plunder a fortified country. When they were retired, he then was ſure to ſally forth; and poſſeſs himſelf of ſuch places as they were not ſtrong enough to defend. He firſt fell upon Ponthieu; the citizens of Abbeville opened their gates to him; thoſe of St Valois, Rue, and Crotoy, imitated the example; and the whole country was, in a little time, reduced to total ſubmiſſion. The ſouthern provinces were, in the ſame manner, invaded by his generals with equal ſucceſs: while the Black Prince, deſtitute of ſupplies from England, and waſted by a cruel and conſumptive diſorder, was obliged to return to his native country, leaving his affairs in the ſouth of France in a deſperate condition.

In this exigence, the reſentment of the king of England was excited to the utmoſt pitch; and he ſeemed reſolved to take ſignal vengeance on his enemies of the continent. But the fortunate occaſion was now elapſed; and all his ſucceeding deſigns were marked with ill ſucceſs. The earl of Pembroke and his whole army were intercepted at ſea, and taken priſoners by Henry king of Caſtile. Sir Robert Knolles, one of his

France. his generals on the continent, at the head of 30,000 men, was defeated by Bertrand du Guefclin; while the duke of Lancaſter, at the head of 25,000 men, had the mortification of ſeeing his troops diminiſhed one half by flying parties, without ever coming to a battle.

At laſt, the Engliſh affairs were totally ruined by the death of the Black Prince and king Edward. On receiving this news, the armies of Charles attacked the Engliſh on all ſides. One, under the command of the duke of Burgundy, entered Artois; another entered Auvergne, under the command of the duke of Berry; that which acted in Guienne was commanded by the duke of Anjou; and the forces in Bretagne were under the conſtable Gueſelin: the king himſelf had a powerful body of troops, that he might be able to repair any accident which ſhould happen through the chance of war. The conſtable joined the duke of Burgundy, who found it difficult to oppoſe Sir Thomas Felton and the Seneſchal of Bourdeaux. Soon after his arrival, the conſtable attacked and defeated them, making both the commanders priſoners of war. This victory was ſo well purſued, that, at the cloſe of the campaign 1377, Bayonne and Bourdeaux, with the diſtricts about them, and the fortreſs of Calais with its dependencies, were all the places left to England on the continent.

Thus Charles eſtabliſhed once more the houſe of Valois on the throne of France, but did not long live to
83 Death of Charles; enjoy his good fortune. He died in the year 1379, at the age of 44, of the conſequences of poiſon formerly given him by the king of Navarre, as has already been mentioned. The immediate operation of this poiſon had been ſuſpended by the ſkill of a phyſician ſent by the emperor Charles IV. He opened an iſſue in his arm, the running of which preſerved his life; but the phyſician declared, that whenever it ſhould dry, up the conſequence would be fatal. Not long before his death, Charles had commenced a proceſs againſt the king of Navarre for this crime. Several of the aſſociates of the latter ſuffered on this occaſion, and the king himſelf was deprived of his poſſeſſions in Normandy, as well as his lordſhip of Montpelier, which had been given him in lieu of the counties of Champagne and Brie, and the duchy of Burgundy which he
84 And of the king of Navarre. had claimed. He did not long ſurvive the death of the French monarch whom he deſtroyed. His death was ſingular and very terrible; for having been afflicted with the leproſy, he had been obliged to make uſe of ſome bandages dipped in ſulphur and afterwards ſteeped in brandy. Theſe took fire by the careleſſneſs of a page, and the unfortunate prince was burnt to death.

85 Reign of Charles VI. Charles V. was ſucceeded by his ſon Charles VI. ſurnamed the *Well-beloved*, who at the time of his acceſſion to the throne was only 12 years of age. The duke of Anjou, eldeſt brother to the late king, had been appointed guardian during the minority of the prince; but he being totally unfit for the office, and diſtinguiſhed only for his rapacity and ambition, readily reſigned his charge to the dukes of Burgundy and Bourbon, the former uncle to the king by his father's ſide, the latter by his mother's. None of theſe tutors, however, proved faithful to the truſt repoſed in them. The duke of Anjou ſeized the plate and treaſures of the late king, in order to ſupport his ambitious enterprizes. At that time Joan, infamous for her profligacy, reigned in Naples. She had appointed one Charles Durazzo, who was her relation, to ſucceed her in the throne; but the inhuman wretch murdered his benefactreſs, who with her laſt breath revoked her grant of the kingdom to him, and beſtowed it upon the duke of Anjou. His influence at the French court enabled him to waſte the treaſures of the kingdom in ſupport of his pretenſions; though he proved ultimately unſucceſsful, his forces being conſtantly defeated, and his deſigns fruſtrated by the ſuperior ſkill of his adverſary. The duke of Burgundy, inſtead of inſtructing his pupil in the ways of virtue, indulged him in every kind of vicious pleaſure, hoping thereby to gain his favour afterwards. The citizens of Paris, oppreſſed by taxes, broke out into tumults, and were quelled with difficulty; while the mal-adminiſtration of Philip the duke of Burgundy ſoon involved the nation
86 Flanders invaded. in hoſtilities with the Flemings. Philip invaded their country at the head of an army of 80,000 men, along with whom was the young king, accompanied by the principal nobility of France. The firſt operations of war were favourable to the Flemings; but they were at length totally defeated on the banks of the river Lis, where their leader, with 25,000 of his followers, periſhed. This victory was followed by the ſubmiſſion of the whole country; but the ſatisfaction of the king at this event was diſturbed by new ſeditions and revolts in the city of Paris, and other great towns of the kingdom. His return, however, at the head of a victorious army, ſoon reduced them to their duty, and ſeveral of the revolted cities were ſeverely puniſhed; at the ſame time that the death of the duke of Anjou having freed him from the immediate dependence on his tutors, he aſſumed the reins of government into his own hands in the year 1384.

The genius which Charles began to diſplay in his early years, raiſed the hopes of the nation; but theſe were ſoon overcaſt, and greater misfortunes than ever were now about to enſue. The young king, whoſe marriage began to be a ſubject of attention to the council, refuſed to comply with the forms in uſe among his predeceſſors, and inſiſted upon ſeeing the
87 Marries Iſabella daughter of the duke of Bavaria. perſon deſigned for his conſort. An interview was accordingly contrived betwixt him and Iſabella daughter to the duke of Bavaria; where he fell in love with that princeſs, and afterwards married her. His adminiſtration was for ſome time prudent and vigorous. He conciliated the affections of his people by reſtoring their privileges, puniſhing their oppreſſors, and relieving them from the taxes which had been impoſed in his minority. He reduced the Flemings to ſubmit to the authority of his uncle the duke of Burgundy; detached 15,000 archers and 1500 men at arms to aſſiſt the Scots in their incurſions into England; and in 1385 fitted out a prodigious armament againſt England. A vaſt fleet was aſſembled in the harbour of Sluys, and a very numerous army in the neighbourhood. According to ſome writers, the armament conſiſted of 1200 ſhips, 20,000 foot differently armed, 20,000 cavalry, and 20,000 croſs-bow men. There was beſides a vaſt wooden edifice or floating town, which was contrived for the protection of the ſoldiers when landed: but all theſe preparations were at laſt

rance. brought to nothing through the obſtinacy of the duke of Berry; who, having been originally againſt this meaſure, carried on his part of the armament ſo ſlowly, that he did not arrive at Sluys till the middle of September, when the ſeaſon was ſo far advanced, that no invaſion was practicable. A ſtorm that happened ſoon after, drove the greateſt part of the fleet on ſhore, and beat the wooden edifice all to pieces; the remains of which the king beſtowed on the duke of Burgundy, to whom he gave alſo the port of Sluys, which was then very commodious, and of the utmoſt importance.

The deſtruction of the French fleet was only a prelude to calamities of a more extraordinary nature. The Sieur de Craon, a profligate nobleman, had been entruſted by the court of France with a conſiderable ſum of money for the ſupport of the duke of Anjou, at the time he was reduced to diſtreſs by his Italian expedition. This money he had diſſipated at Venice; but, by the credit of the duke of Orleans, the king's brother, he had obtained his pardon, and returned to court. Here he attempted to gratify his private reſentment by the aſſaſſination of Oliver Cliſſon the conſtable, whom he ſuſpected of having promoted his diſgrace. This veteran hero was attacked, on his return from the hotel de St Pol, by a band of 20 ruffians, againſt whom he defended himſelf with wonderful intrepidity, when at laſt he fell, after receiving more than 50 wounds. Happily, however, he recovered notwithſtanding his being mangled in this manner; while the aſſaſſin, to ſcreen himſelf from vengeance, fled for protection to the duke of Brittany. The king demanded the aſſaſſin to be given up to him in chains; but the duke anſwered, that he knew nothing of him: to which the king giving no credit, marched with all his forces into his territories. When the army arrived at Mans, the king was ſeized with a ſlow fever; but could not be prevailed upon to reſt or take phyſic. On
88 ized lunatic the 5th of Auguſt 1391, having marched all day in the heat of the ſun, a miſerable, ragged, wild-looking fellow, darted from behind a tree, and laying hold of the briddle of his horſe, cried out, "Stop! where are you going, king? You are betrayed;" and immediately withdrew again into the wood. The king paſſed on, not a little diſturbed; and ſoon after one of the pages, who rode behind and carried his lance, overcome with heat, fell aſleep, and let it fall upon the helmet which was carried by the other. The king, hearing the noiſe, looked about; and perceiving the page lifting the lance, killed him immediately: then riding furiouſly with his ſword drawn, he ſtruck on every ſide of him, and at every perſon, till he broke his ſword; upon which one of his gentlemen leaped up behind him and held his arm. He fell ſoon after, and lay as if he had been dead; ſo that being taken up and bound in a waggon, he was carried back to Mans, where he lay two days in a lethargy, after which he came a little to himſelf, and expreſſed great concern at the blood he had ſhed in his delirium. The people, who had expreſſed the greateſt concern for his diſtemper, were equally rejoiced at the news of his recovery; but unfortunately it was ſoon diſcovered, that he no longer poſſeſſed that ſtrength of judgment and underſtanding for which he had formerly been remarkable. Hence a regency became indiſpenſably neceſſary; and the competition for it brought to light the characters of the queen and duke of Orleans, which had not hitherto been diſplayed to public view. The former of theſe was a moſt beautiful and accompliſhed princeſs; but vindictive, violent, and intriguing; inſenſible to natural affection, but eaſily acceſſible to flattery, and ready to yield to every impulſe of lawleſs paſſion. The duke of Orleans was equally remarkable for his perſonal accompliſhments, and had married Valentina daughter of the duke of Milan; but his engagements with that princeſs did not prevent him from engaging in a number of licentious amours, and among the reſt, as was ſuppoſed, with his ſiſter-in law Iſabella. During the king's illneſs he openly aſpired at the regency; but his pretenſions were over-ruled by the ſtates, the adminiſtration of affairs being for the preſent conferred on the duke of Burgundy. In a few months indeed the health and underſtanding of the king ſeemed to be ſufficiently reſtored; but in the year 1393 it was again diſturbed by an accident no leſs extraordinary than the former had been. An entertainment had been given in honour of the marriage of one of the queen's attendants. At this ſix maſques entered the apartment, diſguiſed like ſatyrs, in linen clothes covered with roſin, and while warm ſtuck over with down. Theſe were the king and five of his lords. The ducheſs of Berri paid attention to the king though ſhe did not know him, and engaged in converſation with him. In the mean time the duke of Orleans, ignorant of the conſequence, out of diverſion ran a lighted torch againſt one of them. His whole dreſs was inſtantly in a flame, and the fire was from him communicated to all the reſt. The maſques, notwithſtanding the dreadful ſituation they were in, called out, "Save the king; ſave the king!" On which the ducheſs of Berri, recollecting that it muſt be him with whom ſhe had engaged in converſation, wrapped him in her cloak, and preſerved him from farther danger. Only one of the reſt eſcaped by jumping into a ciſtern of water; the other four periſhed in the flames. The terror which the king underwent by this accident inſtantly occaſioned a relapſe; and he continued delirious at intervals as long as he lived. During this ſtate of inſanity he was intractable by every perſon except Valentina ducheſs of Orleans; who ſeemed to have as great an influence over him as her huſband the duke had over the mind of the queen. So great was the power indeed which ſhe had over the king in this deplorable ſtate, that in thoſe ſuperſtitious times it was ſuppoſed by many to be the effect of magic. Others, with more probability, aſcribed it to her ſuperior charms as a woman; and this idea inſtantly produced her a number of enemies among her own ſex. The ducheſs of Burgundy, particularly, by her hatred, and the quarrel between the two ladies, ſoon extended itſelf to their huſbands. Amidſt their diſſenſions, however, they did not entirely neglect the adminiſtration of public affairs; they ſtrove to conciliate the affection of the parliament by preſerving the rights of the commons inviolate; and they endeavoured to check an inordinate paſſion for gaming, which began to appear about this time, and to ſubſtitute manly and martial exerciſes in its place.

France.

89 Diſturbances about a regency.

90 An accident occaſions a relapſe in the king.

During the intervals of his reaſon, Charles frequently aſſumed the government into his own hands; and as the war ſtill continued with England, though in

France

91 Interview between the kings of France and England.

a languid manner, the French monarch, in one of thefe lucid intervals, had an interview with Richard king of England, in order to put an end to hoftilities, of which both were equally weary. Still, however, their claims were fo difficult to be adjufted, that they could do no more than conclude a truce for 25 years; during which fpace it was hoped that a lafting peace might take place. Richard gave up Cherburg to Charles, and Breft to the duke of Brittany: a marriage was alfo concluded betwixt the king of England and Ifabella the daughter of Charles, though the latter was then only feven years of age; but by reafon of the tender age of the princefs, this marriage was never confummated.

92 Unhappy fate of the fuccours fent to the Hungarians.

During this unfortunate reign, France was ftill farther weakened by the fuccours fent to the Hungarians againft the Turks. On this fatal expedition upwards of 1000 of the braveft and moft experienced knights were fent under the conduct of John count of Nevers, eldeft fon of the duke of Burgundy; the count of Eu conftable of France; John de Vienne admiral of France; and the count of Marche, a prince of the blood royal; together with De Courcy, one of the beft and moft experienced captains in Chriftendom. The prudent counfels of this veteran, however, were not obeyed by the youthful warriors by whom he was accompanied. Attacking the enemy therefore rafhly, and while heated with wine, they were all either killed or taken prifoners. Notwithftanding this difafter, however, affiftance was fent in the year 1400 to Wanceflaus emperor of Germany; and the duke of Orleans, who commanded the army on this occafion, acquitted himfelf fo well that he acquired the duchy of Luxemburg for himfelf, and left his ally fatisfied: but while the friendfhip of France was thus courted by foreign powers, the kingdom itfelf was in the moft miferable fituation. The king's diftemper feemed daily to gain ground; while the difcordant intereffs of the contending parties kept the whole nation in a ferment. The

93 Violent commotions in France.

moft violent animofity took place betwixt the dukes of Orleans and Burgundy. The former, by means of his own intereft with the queen, and the afcendancy his ducheff had over the king, for fome time got the better of his rival, and was made lieutenant-general and governor of the kingdom; but having prefumed on his power to levy new impofts on the people, and oppreffing alfo the churchmen, whom in that fuperftitious age he ought by all means to have let alone, he was deprived of his authority, and obliged to yield to the duke of Burgundy. For fome time, however, thefe powerful rivals were kept within fome bounds by the mediation of the duke of Bourbon, who feems to have been the only grandee who maintained a pure and unfpotted character; but by his death in 1404, the unhappy nation was left totally expofed to their relentlefs fury. In 1405, the queen and duke of Orleans again feized the adminiftration; but were foon deprived of it by the unanimous voice of the people. During this period Charles and his children were neglected and abandoned to diftrefs; but they were relieved by the duke of Burgundy on his obtaining the regency; and Ifabella, with the duke of Orleans, was obliged to retire from Milan. A fudden return of the king's reafon and underftanding for a much longer time than ufual, now deprived both parties of their power; and the adminiftration was veffed in the queen and a council compofed of princes of the blood.

France

The two rival dukes, thus prohibited from interfering in public affairs, exercifed themfelves in committing hoftilities againft the Engliffh, with whom the truce had been lately concluded. They were encouraged to this infraction of the treaty by the unfettled fituation of the affairs of Henry IV.: but their attempts proving unfuccefsful, the truce was renewed after obtaining reftoration of the princefs, who had been married to Richard II. as has been already mentioned. The failure of their enterprifes produced a new fcene of difcord betwixt the dukes, who mutually threw the blame upon each other. By the intreaties of the duke of Berri they were apparently reconciled; but the duke of Burgundy pretended friendfhip only in order to take the more fignal vengeance. To this he was now further inflamed by jealoufy. Having hired a band of ruffians to execute his bloody purpofe, the duke was one evening attacked by eighteen of them while attended only by two pages. A Norman gentleman whom the duke had deprived of an employment, headed the affaffins, and in perfon attacked the duke. At the firft blow he cut off his hand, at the fecond he ftruck him from his mule, and at the third put an end to his life. His wife Valentina was fo concerned at his death, that fhe died foon after. The duke of Burgundy efcaped to Flanders; and the whole nation was rent into two factions, called the *Burgundians* and *Armagnacs;* the latter being the title of the party of the duke of Orleans, from Armagnac the father-in-law of that prince. A dreadful confufion enfued: the duke of Burgundy foon returned to France, and extorted a pardon from the unhappy king, who was now no longer able to refift him: and we may have fome notion of the ftate of the kingdom in general from being told, that 2000 people perifhed in one tumult in the capital. The king himfelf was alternately the prifoner of each party, and alternately transferred the power from the one to the other as he happened to fall into their hands. This therefore was thought by Henry V. of England a favourable opportunity to recover from France thofe grants that had been formerly given up by treaty. But previoufly, to give his intended expedition the appearence of juftice, he fent over ambaffadors to Paris, offering a perpetual peace and alliance, on condition of being put in poffeffion of all thofe provinces which had been ravifhed from the Engliffh during fome former reigns, and of efpoufing Catharine, the French king's daughter, in marriage, with a fuitable dowry. Though the French court was at that time extremely averfe to war, yet the exorbitance of thefe demands could not be complied with; and Henry very probably made them in hopes of a denial. He therefore affembled a great fleet and army at Southampton; and having allured all the military men of the kingdom to attend him, from the hopes of conqueft, he put to fea, and landed at Harfleur, at the head of an army of 6000 men at arms, and 24,000 foot, moftly archers.

94 Duke of Orleans affaffinated.

95 Invafion of Henry V. of England.

His firft operations were upon Harfleur; which being preffed hard, promifed at a certain day to furrender, unlefs relieved before that time. The day arriving, and the garrifon, unmindful of their engagement, ftill refolving to defend the place, Henry ordered an

affault

France. assault to be made, took the town by storm, and put all the garrison to the sword. From thence, the victor advanced farther into the country, which had been already rendered desolate by factions, and which he now totally laid waste. But although the enemy made a feeble resistance, yet the climate seemed to fight against the English; a contagious dysentery carrying off three parts of Henry's army. In this situation he had recourse to an expedient common enough in that barbarous age, to inspire his troops with confidence in their general. He challenged the dauphin, who commanded in the French army, to single combat, offering to stake his pretensions on the event. This challenge, as might naturally be expected, was rejected; and the French, though disagreeing internally, at last seemed to unite at the appearance of the common danger. A numerous army of 14,000 men at arms, and 40,000 foot, was by this time assembled under the command of count Albert, and was now placed to intercept Henry's weakened forces on their return. The English monarch, when it was too late, began to repent of his rash inroad into a country where disease and a powerful army every where threatened destruction; he therefore thought of retiring into Calais. In this retreat, which was at once both painful and dangerous, Henry took every precaution to inspire his troops with patience and perseverance; and showed them in his own person the brightest example of fortitude and resignation. He was continually harassed on his march by flying parties of the enemy; and whenever he attempted to pass the river Somme, across which his march lay, he saw troops on the other side ready to oppose his passage. However, he was so fortunate as to seize by surprise a passage near St Quintin, which had not been sufficiently guarded; and there he safely carried over his army.

But the enemy was still resolved to intercept his retreat: and after he had passed the small river of Tertrois at Blangi, he was surprised to observe from the heights the whole French army drawn up in the plains
96 Battle of Agincourt. of Agincourt; and so posted, that it was impossible for him to proceed on his march, without coming to an engagement. A battle accordingly took place, in which the English gained a victory, the most remarkable perhaps of any recorded in history; an account of which is given under the article AGINCOURT.

This victory, gained on the 25th of October 1415, was however attended with no immediate effects. Henry still continued to retreat, after the battle of Agincourt, out of the kingdom; and carried his prisoners to Calais, and from thence to England. In
97 Henry and again in Normandy. 1517, he once more landed an army of 25,000 men in Normandy; and prepared to strike a decisive blow for the crown of France, to which the English monarchs had long made pretensions. That wretched country was now in a most deplorable situation. The whole kingdom appeared as one vast theatre of crimes, murders, injustice, and devastation. The duke of Orleans was assassinated by the duke of Burgundy; and the duke of Burgundy, in his turn, fell by the treachery of the dauphin. At the same time, the duke's son, desirous of revenging his father's death, entered into a secret treaty with the English; and a league was immediately concluded at Arras, between Henry and the young duke of Burgundy, in which the king promised to revenge the murder of the late duke; and the son seemed to insist upon no further stipulations. Henry, therefore, proceeded in his conquests without much opposition from any quarter. Several towns and provinces submitted on his approach; the city of Rouen was besieged and taken; Pontoise and Gisors he soon became master of. He even threatened Paris by the terror of his power, and obliged the court to remove to Troye. It was at this city that the duke of Burgundy, who had taken upon him the protection of the French king, met Henry in order to ratify that treaty which was formerly begun, and by which the crown of France was to be transferred to a stranger. The imbecility into which Charles had fallen, made him passive in this remarkable treaty; and Henry dictated the terms throughout the whole negociation. The principal articles of this treaty were, That Henry should espouse the princess Catharine; that king Charles should enjoy the title and dignity of king for life; but that Henry should be declared heir to the crown, and should be intrusted with the present administration of the government; that France and England should for ever be united under one king, but should still retain their respective laws and privileges; that Henry should unite his arms with those of king Charles and the duke of Burgundy, to depress and subdue the dauphin and his partisans. France.

98 He marries the princess Catharine. It was not long after this treaty, that Henry married the princess Catharine; after which he carried his father-in-law to Paris, and took a formal possession of that capital. There he obtained, from the estates of the kingdom, a ratification of the late compact; and then turned his arms with success against the adherents of the dauphin; who, in the mean time, wandered about a stranger in his own patrimony, and to his enemies successes only opposed fruitless expostulations.

Henry's supplies were not provided in such plenty as to enable him to carry on the war, without returning in person to prevail upon his parliament for fresh succours; and, upon his arrival in England, though he found his subjects highly pleased with the splendor of his conquests, yet they seemed somewhat doubtful as to the advantage of them. A treaty, which in its consequences was likely to transfer the seat of empire from England, was not much relished by the parliament. They therefore, upon various pretences, refused him a supply equal to his exigencies or his demands; but he was resolved on pursuing his schemes; and, joining to the supplies granted at home, the contributions levied on the conquered provinces, he was able once more to assemble an army of 28,000 men, and with these he landed safely at Calais.

In the mean time, the dauphin, a prince of great prudence and activity, omitted no opportunity of repairing his ruined situation, and to take the advantage of Henry's absence from France. He prevailed upon the regent of Scotland to send him a body of 8000 men from that kingdom; and with these, and some few forces of his own, he attacked the duke of Clarence, who commanded the troops in Henry's absence, and gained a complete victory.

This was the first action which turned the tide of success against the English. But it was of short duration: for Henry soon after appearing with a consider-

France. able army, the dauphin fled at his approach; while many of the places, which held out for the dauphin in the neighbourhood of Paris, surrendered to the conqueror. In this manner, while Henry was every where victorious, he fixed his residence at Paris; and while Charles had a small court, he was attended with a very magnificent one. On Whitsunday 1421, the two kings and their two queens with crowns on their heads dined together in public; Charles receiving apparent homage, but Henry commanding with absolute authority.

In the mean time, the dauphin was chased beyond the Loire, and almost totally dispossessed of all the northern provinces. He was even pursued into the south, by the united arms of the English and Burgundians, and threatened with total destruction. In this exigence, he found it necessary to spin out the war, and to evade all hazardous actions with a rival who had been long accustomed to victory. His prudence was every where remarkable; and, after a train of long persecutions from fortune, he found her at length willing to declare in his favour, by the death of the king of England.

99 Death of Henry and Charles. Charles VI. died a short time after; and Charles VII. succeeded his father to a nominal throne. Nothing could be more deplorable than the situation of that monarch on assuming his title to the crown. The English were masters of almost all France; and Henry VI. though yet but an infant, was solemnly invested with regal power by legates from Paris. The duke of Bedford was at the head of a numerous army, in the heart of the kingdom, ready to oppose every insurrection; while the duke of Burgundy, who had entered into a firm confederacy with him, still remained stedfast, and seconded his claims. Yet, notwithstanding these favourable appearances, Charles found means to break

100 Desperate situation of Charles VII. the leagues formed against him, and to bring back his subjects to their natural interests and their duty. However, his first attempts were totally destitute of success. Wherever he endeavoured to face the enemy he was overthrown, and he could scarcely rely on the friends next his person. His authority was insulted even by his own servants; advantage after advantage was gained against him; and a battle fought near Verneuil, in which he was totally defeated by the duke of Bedford, seemed to render his affairs altogether desperate. But from the impossibility of the English keeping the field without new supplies, Bedford was obliged to retire into England; and in the mean time, his vigilant enemy began to recover from his late consternation. Dumois, one of his generals, at the head of 1000 men, compelled the earl of Warwick to raise the siege of Montargis; and this advantage, slight as it was, began to make the French suppose that the English were not invincible.

101 The French affairs retrieved by the Maid of Orleans. But they soon had still greater reason to triumph in their change of fortune, and a new revolution was produced by means apparently the most unlikely to be attended with success. In the village of Domremi, near Vaucouleurs, on the borders of Lorrain, there lived a country-girl, about 27 years of age, called *Joan de Arc*. This girl had been a servant at a small inn; and in that humble station had submitted to those hardy employments which fit the body for the fatigues of war. She was of an irreproachable life, and had hitherto testified none of those enterprizing qualities France. which displayed themselves soon after. She contentedly fulfilled the duties of her situation, and was remarkable only for her modesty and love of religion. But the miseries of her country seemed to have been one of the greatest objects of her compassion and regard. Her mind, inflamed by these objects, and brooding with melancholy stedfastness upon them, began to feel several impulses, which she was willing to mistake for the inspirations of heaven. Convinced of the reality of her own admonitions, she had recourse to one Baudricourt, governor of Vaucouleurs, and informed him of her destination by heaven to free her native country of its fierce invaders. Baudricourt treated her at first with neglect: but her importunities at length prevailed; and willing to make a trial of her pretensions, he gave her some attendants, who conducted her to the court, which at that time resided at Chinon.

The French court were probably sensible of the weakness of her pretensions; but they were willing to make use of every artifice to support their declining fortunes. It was therefore given out, that Joan was actually inspired; that she had been able to discover the king among the number of his courtiers, although he had laid aside all the distinctions of his authority; that she had told him some secrets, which were only known to himself; and that she had demanded, and minutely described, a sword in the church of St Catharine de Fierbois, which she had never seen. In this manner, the minds of the vulgar being prepared for her appearance, she was armed cap-à-pee, and shown in that martial dress to the people. She was then brought before the doctors of the university; and they, tinctured with the credulity of the times, or willing to second the imposture, declared that she had actually received her commission from above.

When the preparations for her mission were completely blazoned, the next aim was to send her against the enemy. The English were at that time besieging the city of Orleans, the last resource of Charles, and every thing promised them a speedy surrender. Joan undertook to raise the siege; and to render herself still more remarkable, girded herself with the miraculous sword, of which she before had such extraordinary notices. Thus equipped, she ordered all the soldiers to confess themselves before they set out; she displayed in her hand a consecrated banner, and assured the troops of certain success. Such confidence on her side soon raised the spirits of the French army; and even the English, who pretended to despise her efforts, felt themselves secretly influenced with the terrors of her mission. A supply of provisions was to be conveyed into the town; Joan, at the head of some French troops, covered the embarkation, and entered Orleans at the head of the convoy which she had safely protected. While she was leading her troops along, a dead silence and astonishment reigned among the English; and they regarded with religious awe that temerity, which they thought nothing but supernatural assistance could inspire. But they were soon rouzed from their state of amazement by a sally from the town; Joan led on the besieged, bearing the sacred standard in her hand, encouraging them with her words and actions, bringing them to the trenches, and overpowering the besie-

gers

France. gers in their own redoubts. In the attack of one of the forts, ſhe was wounded in the neck with an arrow; but inſtantly pulling out the weapon with her own hands, and getting the wound quickly dreſſed, ſhe haſtened back to head the troops, and to plant her victorious banner on the ramparts of the enemy. Theſe ſucceſſes continuing, the Engliſh found that it was impoſſible to reſiſt troops animated by ſuch ſuperior energy; and Suffolk, who conducted the attack, thinking that it might prove extremely dangerous to remain any longer in the preſence of ſuch a courageous and victorious enemy, raiſed the ſiege, and retreated with all imaginable precaution.

From being attacked, the French now in turn became the aggreſſors. Charles formed a body of 6000 men, and ſent them to beſiege Jergeau, whither the Engliſh, commanded by the earl of Suffolk, had retired, with a detachment of his army. The city was taken; Suffolk yielded himſelf a priſoner; and Joan marched into the place in triumph at the head of the army. A battle was ſoon after fought near Patay, where the Engliſh were worſted, as before; and the generals Scales and Talbot were taken priſoners.

The raiſing of the ſiege of Orleans was one part of the maid's promiſe to the king of France; the crowning him at Rheims was the other. She now declared that it was time to complete that ceremony; and Charles, in purſuance of her advice, ſet out for Rheims at the head of 12,000 men. The towns thro' which he paſſed opened their gates to receive him; and Rheims ſent him a deputation, with its keys, upon his approach. The ceremony of his coronation was there performed with the utmoſt ſolemnity; and the *Maid of Orleans* (for ſo ſhe was now called) ſeeing the completion of her miſſion, deſired leave to retire, alleging, that ſhe had now accompliſhed the end of her calling. But her ſervices had been ſo great, that the king could not think of parting with her; he preſſed her to ſtay ſo earneſtly, that ſhe at length complied with his requeſt.

A tide of ſucceſſes followed the performance of this ſolemnity; Laon, Soiſſons, Chateau-Thierri, Provins, and many other fortreſſes in that neighbourhood, ſubmitted to him on the firſt ſummons. On the other hand, the Engliſh, diſcomfited and diſpirited, fled on every quarter; not knowing whether to aſcribe their misfortunes to the power of ſorcery or to a celeſtial influence; but equally terrified at either. They now found themſelves deprived of the conqueſts they had gained, in the ſame manner as the French had formerly ſubmitted to their power. Their own diviſions, both abroad and at home, unfitted them entirely for carrying on the war; and the duke of Bedford, notwithſtanding all his prudence, ſaw himſelf diveſted of his ſtrong-holds in the country, without being able to ſtop the enemy's progreſs. In order, therefore, to revive the declining ſtate of his affairs, he reſolved to

102 Henry VI. of England crowned king of France. have Henry crowned king at Paris, knowing that the natives would be allured to obedience by the ſplendor of the ceremony. In 1430, Henry was accordingly crowned, all the vaſſals that ſtill continued under the Engliſh power ſwearing fealty and homage. But it was now too late for the ceremonies of a coronation to give a turn to the affairs of the Engliſh; the generality of the kingdom had declared againſt them, and the remainder only waited a convenient opportunity to follow the example. France.

An accident enſued ſoon after, which, though it promiſed to promote the Engliſh cauſe in France, in the end ſerved to render it odious, and conduced to the total evacuation of that country. The duke of Burgundy, at the head of a powerful army, had laid ſiege to Compeign; and the Maid of Orleans had thrown herſelf into the place, contrary to the wiſhes of the governor, who did not deſire the company of one whoſe authority would be greater than his own. The garriſon, however, were rejoiced at her appearance, and believed themſelves invincible under her protection. But their joy was of ſhort duration; for Joan having the day after her arrival headed a ſally, and twice driven the enemy from their intrenchments, ſhe was at laſt obliged to retire, placing herſelf in the rear, to protect the retreat of her forces. But in the end attempting to follow her troops into the city, ſhe found the gates ſhut, and the bridge drawn up by order of the governor, who is ſaid to have long wiſhed for an opportunity of delivering her up to the enemy. 103 Maid of Orleans taken priſoner,

Nothing could exceed the joy of the beſiegers, in having taken a perſon who had been ſo long a terror to their arms. The ſervice of Te Deum was publicly celebrated on this occaſion; and it was hoped, that the capture of this extraordinary perſon would reſtore the Engliſh to their former victories and ſucceſſes. The duke of Bedford was no ſooner informed of her being taken, than he purchaſed her of the count Vendome, who had made her his priſoner, and ordered her to be committed to cloſe confinement. The credulity of both nations was at that time ſo great, that nothing was too abſurd to gain belief that coincided with their paſſions. As Joan but a little before, from her ſucceſſes, was regarded as a ſaint, ſhe was now, upon her captivity, conſidered as a ſorcereſs, forſaken by the dæmon who had granted her a fallacious and temporary aſſiſtance. Accordingly it was reſolved in council to ſend her to Rouen to be tried for witchcraft: and the biſhop of Beauvais, a man wholly devoted to the Engliſh intereſt, preſented a petition againſt her for that purpoſe. The univerſity of Paris was ſo mean as to join in the ſame requeſt. Several prelates, among whom the cardinal of Wincheſter was the only Engliſhman, were appointed as her judges. They held their court in Rouen, where Henry then reſided; and the Maid, clothed in her former military apparel, but loaded with irons, was produced before this tribunal. Her behaviour there noway diſgraced her former gallantry; ſhe betrayed neither weakneſs nor womaniſh ſubmiſſion; but appealed to God and the pope for the truth of her former revelations. In the iſſue, ſhe was found guilty of hereſy and witchcraft; and ſentenced to be burnt alive, the common puniſhment for ſuch offences.

But previous to the infliction of this dreadful ſentence upon her, they were reſolved to make her abjure her former errors; and at length ſo far prevailed upon her, by terror and rigorous treatment, that her ſpirits were entirely broken by the hardſhips ſhe was obliged to ſuffer. Her former viſionary dreams began to vaniſh, and a gloomy diſtruſt to take place of her late inſpirations. She publicly declared herſelf willing to recant, and promiſed never more to give way to the

France. vain deluſions which had hitherto miſled her, and impoſed on the people. This was what her oppreſſors deſired; and willing to ſhow ſome appearance of mercy, they changed her ſentence into perpetual impriſonment, and to be fed during life on bread and water. But the rage of her enemies was not yet ſatiated. Suſpecting that the female dreſs, which ſhe had conſented to wear, was diſagreeable to her, they purpoſely placed in her apartment a ſuit of mens apparel, and watched for the effect of their temptation upon her. Their cruel artifices prevailed. Joan, ſtruck with the ſight of a dreſs in which ſhe had gained ſo much glory, immediately threw off her penitent's robes, and put on the forbidden garment. Her enemies caught her equipped in this manner; and her imprudence was conſidered as a relapſe into her former tranſgreſſions.

104 And cruelly put to death. No recantation would ſuffice, and no pardon would be granted. She was condemned to be burnt alive in the market-place of Rouen; and this infamous ſentence was accordingly executed with moſt brutal ſeverity.

One of the firſt misfortunes which the Engliſh felt after this puniſhment, was the defection of the duke of Burgundy; who had for ſome time ſeen the error of his conduct, and wiſhed to break an unnatural connection, that only ſerved to involve his country in ruin. A treaty was therefore begun and concluded between him and Charles, in which the former agreed to aſſiſt him in driving the Engliſh out of France. This was a mortal blow to their cauſe; and ſuch was its effects upon the populace of London when they were informed of it, that they killed ſeveral of the duke of Burgundy's ſubjects, who happened to be among them at the time. It might perhaps alſo have haſtened the duke of Bedford's death, who died at Rouen a few days after the treaty was concluded; and the earl of Cambridge was appointed his ſucceſſor to the regency of France.

105 Affairs of the Engliſh totally ruined. From this period, the Engliſh affairs became totally irretrievable. The city of Paris returned once more to a ſenſe of its duty. Lord Willoughby, who commanded it for the Engliſh, was contented to ſtipulate for the ſafe retreat of his troops to Normandy. Thus ground was continually, though ſlowly, gained by the French; and notwithſtanding their fields were laid waſte, and their towns depopulated, yet they found protection from the weakneſs and diviſions of the Engliſh. At length both parties began to grow weary of a war, which, though carried on but feebly, was yet a burden greater than either could ſupport. But the terms of peace inſiſted upon by both were ſo wide of each other, that no hopes of an accommodation could quickly be expected. A truce, therefore, for twenty-two months, was concluded in 1443, which left every thing on the preſent footing between the parties. No ſooner was this agreed upon, than Charles employed himſelf with great induſtry and judgment in repairing thoſe numberleſs ills to which his kingdom, from the continuance of wars both foreign and domeſtic, had ſo long been expoſed. He eſtabliſhed diſcipline among his troops, and juſtice among his governors. He revived agriculture, and repreſſed faction. Thus being prepared once more for taking the field, he took the firſt favourable occaſion of breaking the truce; and Normandy was at the ſame time invaded by four powerful armies; one commanded by Charles himſelf, a ſecond by the duke of Brittany, a third by the count of Alençon, and a fourth by the count Dunois. Every place opened its gates almoſt as ſoon as the French appeared before them. Rouen was the only one that promiſed to hold out a ſiege; but the inhabitants clamoured ſo loud for a ſurrender, that the duke of Somerſet, who commanded the garriſon, was obliged to capitulate. The battle, or rather the ſkirmiſh, of Fourmingi, was the laſt ſtand which the Engliſh made in defence of their French dominions. However, they were put to the rout, and above a thouſand were ſlain. All Normandy and Guienne, that had ſo long acknowledged ſubjection to England, were loſt in the ſpace of a year; and the Engliſh ſaw themſelves entirely diſpoſſeſſed of a country which for above three centuries they had conſidered as annexed to their native dominions. Calais alone remained of all their conqueſts; and this was but a ſmall compenſation for the blood and treaſure which had been laviſhed in that country, and only ſerved to gratify ambition with a tranſient applauſe. France.

Thus, in the year 1450, the power of the Engliſh in France was entirely deſtroyed; and Charles deſervedly obtained the ſurname of *Victorious*, on account of the vigour he had ſhown in driving out the invaders of his country. His ſatisfaction, however, was now greatly diminiſhed by domeſtic misfortunes. The dauphin, forgetting the allegiance and filial duty he owed to his father, had already impeded his conqueſts by his ſeditious intrigues. He had uſed every endeavour to thwart the deſigns of his miniſters, and it was ſuppoſed that he had deſtroyed Agnes Soreille his father's favourite miſtreſs by poiſon. He had married Charlotte daughter to the duke of Savoy; which Charles had reſented by a declaration of war againſt the duke, but had been perſuaded to recall it in order to proſecute the war againſt Guienne, which made part of the dominions of the Engliſh. At laſt, weary of the diſobedience of his ſon, he commanded him to be arreſted; but Louis, informed of his deſign, withdrew to Franche Comte, and afterwards to Brabant; of which the duke of Burgundy (at this time ſovereign of the country) was no ſooner appriſed, than he ordered him to be ſupplied with every neceſſary, and treated with all imaginable reſpect. He refuſed to ſee him, however, until he ſhould obtain the approbation of his father; on which Louis, having in vain attempted to draw the duke into a participation of his crimes, employed himſelf in ſowing diſſenſion betwixt his benefactor and his ſon the count of Charolois, at the very time that he himſelf was receiving a penſion of 12,000 crowns annually from the father. Thus he at laſt deſtroyed the domeſtic peace of his benefactor, while his unnatural behaviour created continual ſuſpicions in the mind of his father. Charles was repeatedly informed that his own domeſtics, along with his undutiful ſon, were in a conſpiracy againſt his life. The miſerable monarch, therefore, in continual fear of being poiſoned, and having none in whom he could repoſe any confidence, obſtinately refuſed for ſome days to take any nouriſhment; and when at laſt prevailed upon by the importunities of his attendants to do ſo, his ſtomach had become incapable of receiving food, ſo that he died for want of ſuſtenance in the year 1461. His body, neglected by his unnatural ſon, was interred at the expence

106 Domeſtic misfortune and death Charles.

France pence of Tannegui de Chaſtel, who had been his faithful companion.

107 Reign of Louis XI.

On the death of Charles, his ſon Louis ſucceeded to the throne, to which he had ſo long aſpired. He was reckoned one of the greateſt politicians that ever exiſted; though his character was not on that account the more amiable; on the contrary, there are few princes whoſe hiſtory appears in a more deteſtable light. So deſtitute was he of natural affection, that he did not even attempt to conceal his joy at his father's death. He pretended much friendſhip for the count of Charolois, ſon to the duke of Burgundy, on account of the protection he had received at his father's court; and even conferred upon him a penſion of 12,000 crowns annually: but all this ſhow of affection ſoon degenerated into a mortal averſion on both ſides. Some differences which took place between the courts of France and Caſtile produced an interview betwixt the two monarchs, Louis, and Henry ſurnamed the *Impotent*. They met at Mauleon on the confines of Navarre: but their negociations came to nothing, and they parted with a mutual contempt of each other; Henry deſpiſing the mean and ſordid appearance of Louis, as he in his turn did the gaudy magnificence of Henry. In his negociations with the duke of Burgundy, Louis proved more ſucceſsful; perſuading him to reſtore ſome towns on the river Somme, which had been ceded by Charles VII. and by the poſſeſſion of which the duke was in effect maſter of Picardy. This ceſſion was oppoſed by the count of Charolois; but Louis, by corrupting John de Croy the duke's miniſter, obtained his end; and for the ſum of 400,000 crowns the cities were delivered to him. By this tranſaction he effectually enſured the hatred of Charolois: and even in that very tranſaction the duplicity of Louis was eminently diſplayed; for though he had agreed to retain in thoſe towns the officers appointed by the duke, he was no ſooner in poſſeſſion of them than he diſplaced them all, and nominated others in their ſtead.

108 Formidable confederacy againſt him.

The duchy of Brittany was at this time governed by Francis, a weak but generous prince, and whoſe defect of capacity was ſupplied by the abilities of his miniſters. Him Louis inſulted in the moſt grievous manner; and as Francis found himſelf unable to oppoſe ſuch a powerful adverſary alone, he joined in a cloſe alliance with the duke of Burgundy and the count of Charolois; the latter having been grievouſly offended with Louis, and even accuſed him of attempting his life. The conſpiracy was joined by ſeveral of the principal French nobility, who had been oppreſſed by the king; and though the ſecret was confided to upwards of 500 perſons, not one of them ever divulged it. Louis finding matters become very critical, marched with an army towards the capital, which the count of Charolois already inſulted. A battle enſued, in which both princes exerted themſelves to the utmoſt, though their valour was but ill ſeconded by the bravery of their troops. About 1500 periſhed on each ſide; but the count of Charolois remained maſter of the field of battle. Louis, however, after this engagement, entered the capital; where he endeavoured, by every kind of conceſſion he could think of, to conciliate the affection of his ſubjects; in which he ſucceeded ſo well, that though the army of inſurgents was ſoon augmented to more than 100,000 men, they were unable to make themſelves maſters of the city. At laſt a treaty was ſet on foot betwixt Louis and the count of Charolois; by which the latter obtained the towns which had been formerly ceded, with the diſtricts of Boulogne, Guiſne, Peronne, Mondidior, and Roye, as a perpetual inheritance for himſelf. By granting favours to the other confederates, the league was broken; and the moment that Louis found himſelf freed from danger, he proteſted againſt the whole treaty in preſence of ſome confidential members of parliament, as contrary to the intereſts of the crown; and therefore waited the firſt favourable opportunity to cruſh one by one thoſe who had been ready by their united efforts to deſtroy himſelf. The duke of Bourbon, one of the moſt able of the confederates, was gained over, by beſtowing upon him in marriage Jane the natural daughter of Louis himſelf, with the dowry of Uſſon in Auvergne; together with Moras, Beaurepaire, and Cormillon in Dauphiny; while, by the diſcontents betwixt the dukes of Brittany and Normandy, he was enabled to ſecure the neutrality of the former, and to recover from the latter ſome territories which he had unwillingly ceded to him.

France. 109 Peace concluded. 110 Treachery of Louis.

In 1467, Philip duke of Burgundy, from his amiable qualities ſurnamed *The Good*, died, and left his dominions to his ſon Charles count of Charolois. That fiery and impetuous prince, jealous of the growing power of France, and an implacable enemy of Louis, had entered into a ſecret treaty with Francis; but Louis had driven the Bretons from the poſts they occupied in Normandy before the duke of Burgundy could paſs the Somme. The king, however, alarmed at the power of the confederates, concluded a peace with Brittany; and, confiding in his talents for negociation, determined to have a perſonal interview with the duke of Burgundy.

111 Louis impriſoned by Charles.

This memorable interview took place in the year 1468; and Peronne, a city of Picardy, but belonging to the duke of Burgundy, was appointed as the place of rendezvous. To this place the politic Louis repaired with a ſlender train, and attended only by Cardinal Balue, the duke of Bourbon, and the count de St Pol, conſtable of France; ſeemingly without reflecting that he was entering an hoſtile city, where he might be confined for any length of time, or treated at the pleaſure of the duke, who was his mortal enemy. Indeed he had not long been in the place when he began to ſee the error of his conduct; and by the daily concourſe of Burgundian lords and other perſons of rank, who were his avowed enemies, he became alarmed for his perſonal ſafety. His fear now ſuggeſted to him a worſe meaſure than even the former; and he requeſted apartments in the caſtle, where it was in the power of his rival in a moment to make him a cloſe priſoner. This event accordingly took place, and that through the arts and machinations of Louis himſelf. His deſign had been from the beginning to keep the duke of Burgundy conſtantly employed in domeſtic wars. For this purpoſe he had, before his interview with Charles, excited the inhabitants of Liege, who were ſubject to the duke of Burgundy, to revolt. It is moſt probable, that he did not imagine the effects of this treachery would ſo ſoon begin to appear. At the very time, however, that Louis was

in

France. in the caſtle of Peronne, the people of Liege revolted, ſeized the biſhop and governor; and having maſſacred great numbers of the adherents of Charles, retired with the priſoners they had made to the capital. Charles was ſoon informed of this maſſacre, with the additional circumſtance, that the ambaſſadors of Louis were ſeen animating the inſurgents to their work of deſtruction. He then flew into a tranſport of rage; commanded the gates of the caſtle to be ſhut and ſtrictly guarded; denouncing the ſevereſt vengeance on the perfidious monarch who had ſo often deceived him. Louis, however, though greatly, and no doubt very juſtly, alarmed, did not neglect to take the proper methods for ſecuring himſelf. He diſtributed large ſums of money among thoſe officers to whom he imagined the duke was moſt inclined to pay any regard, and by ſplendid promiſes and preſents endeavoured to allay the reſentment of his other enemies. At laſt the reſentment of Charles having ſubſided, he entered into a treaty with the king, and concluded it upon much the ſame terms as thoſe which had been agreed upon before. His reſentment, however, ſtill manifeſted itſelf ſo far, that he inſiſted upon Louis being preſent at the puniſhment he inflicted upon the inhabitants of Liege for the maſſacre they had committed, and of which we have already taken notice. This was agreed to: the two princes formed the ſiege of the city in conjunction; and, notwithſtanding the obſtinate defence of the people, it was at laſt taken by ſtorm, and the inhabitants maſſacred. It was not long, however, before the new alliance was diſſolved. A confederacy againſt Louis, whom neither promiſes nor treaties could bind, was formed betwixt his own brother the duke of Normandy and the duke of Burgundy; but before their meaſures were ripe for execution, Louis had already commenced hoſtilities. The duke of Burgundy, as a peer of France, was ſummoned to parliament; and on his refuſal, the conſtable St Pol made himſelf maſter of St Quintin. Several other cities were ſoon after reduced; and Baldwin, the natural brother of Charles, corrupted by Louis, deſerted his cauſe; and the haughty ſpirit of the duke was thus at laſt obliged to condeſcend to ſolicit a peace. This, however, was of no long duration. Charles, encouraged by the ſucceſs of Edward IV. of England his brother-in-law, began once more to league againſt Louis with the dukes of Brittany and of Guienne; the latter being the king's brother, formerly duke of Normandy, but who had exchanged that duchy for the territory of Guienne. But while the affairs of the confederates ſeemed to be in a proſperous way, their proſpects were ſuddenly overcaſt by the death of the duke of Guienne, which was univerſally ſuppoſed to have been occaſioned by poiſon, and Louis was as univerſally looked upon as the author. The abbot of St Joan d'Angeli was fixed upon as the immediate perpetrator of the deed: but on the day appointed for his trial he was found ſtrangled in his cell; and this alſo was with great probability ſuppoſed to have been the deed of Louis, who after the death of his brother inſtantly ſeized on the territory of Guienne, and annexed it to the dominions of France.

112 A treaty between Louis and Charles.

By this unheard of conduct of the French monarch, Charles was exaſperated to ſuch a degree, that he vowed the moſt dreadful vengeance againſt the unhappy people of France, and threatened to ſacrifice to the memory of the duke of Guienne every one who now fell into his hands. The citizens of Nelle were maſſacred without diſtinction of ſex or age; Beauvis reſiſted his attacks; after which Charles wreaked his fury on other places. Having entered the country of Caux, he reduced the cities of Eu and St Valery, burnt Longueville, and waſted the whole country as far as Rouen. Louis, on the other hand, ſteady and conſtant in his deſigns, determined to diſſolve the league between the duke of Brittany and Edward IV. of England. Accordingly he encamped with his army on the frontiers of Brittany; while the duke, not meeting with the aſſiſtance promiſed by Edward, was obliged to conſent to a truce for a year; and the duke of Burgundy himſelf was obliged to follow his example, having committed ſuch devaſtations as deprived him of all means of ſubſiſtence in the country, ſo that he could neither advance nor retreat. In a very little time, however, he again began to conſpire with the king of England againſt Louis, and a powerful invaſion was determined upon. Edward was to croſs the ſea with an army of 10,000 men, while Charles aſſembled all his forces to join him. The former was alſo to ſet up a claim to the crown of France, and at leaſt to obtain the provinces of Normandy and Guienne; the duke was to have Champagne with ſome adjacent diſtricts; to free his dominions from homage; and neither party was to make peace without the conſent of the other. It was ſuppoſed that the duke of Brittany would naturally accede to the confederacy; and the count de St Pol, conſtable of France, had engaged to deliver up the town of St Quintin and others which he occupied on the river Somme. Louis, however, ſtill had the good fortune to avoid the ſtorm. Charles, inſtead of advancing to the aſſiſtance of Edward, who had entered France at the head of 15,000 archers and 1500 men at arms, laid ſiege to the city of Nuiz on the Rhine; while the conſtable St Pol, inſtead of delivering up the towns as he had promiſed, deceived his allies, and enabled Louis to diſſolve a confederacy, which, had it been vigorouſly maintained, might have involved him in the greateſt difficulties. To procure the departure of Edward, however, he was obliged to conſent to a tribute of 75,000 crowns, as well as to ſettle on the king himſelf 50,000 crowns for life; betrothing alſo the dauphin to the eldeſt daughter of the king of England. The duke of Burgundy exclaimed loudly againſt this treaty: but Edward perſiſted in his reſolution; and it was accordingly executed at a place called *Pecquigny*, near Amiens; but in ſuch a manner as ſhowed the little confidence the two ſovereigns repoſed in each other. A grated barrier was erected in the middle of the bridge of Pecquigny, between the barriers of which only a man's arm could paſs: the two princes appeared on the oppoſite ſides of it; and having conferred privately, and confirmed the treaty between them, parted with many proteſtations of friendſhip; in which, probably, neither party was very ſincere. A power was reſerved by Edward, for the duke of Burgundy to accede to the treaty; but the latter haughtily replied, that he was able to ſupport himſelf without the aſſiſtance of England; and that he would make no peace with Louis till three months after the return of Edward to his own country.

France. 113 Furious invaſion of France by Charles of Burgundy.

114 Invaſion of Edward of England.

115 Louis agrees to pay an annual penſion to Edward.

country. To this reſolution he adhered; but no ſooner was the term expired, than he concluded a truce with Louis for nine years. The ſtipulations publicly agreed upon betwixt theſe two princes conſiſted only in ſome articles for the mutual advantage of their ſubjects; but privately they had ſigned others of a different nature. The conſtable St Pol having rendered himſelf obnoxious to all parties by his complicated treachery, fled to Mons in Hainault; but the duke of Burgundy had already conſented to deliver him up on condition of receiving his eſtates and moveables as the price of his treachery.

Thus was Louis, without any other remarkable qualification than the mere arts of falſehood and duplicity, got rid of all his enemies except the duke of Burgundy, whoſe growing power rendered him a conſtant object of jealouſy and terror. His own imprudence and raſhneſs, however, ſoon proved his ruin. Having raſhly engaged in a war with the Swiſs, he was defeated in the firſt engagement with that martial nation, with the loſs of his military cheſt and baggage, with his plate and jewels, ſuppoſed to be the richeſt in Europe. His diſappointment on this occaſion was ſo great, that he was ſeized with a ſevere ſickneſs, from which he had hardly recovered when he reſumed his mad ſcheme of conquering the Swiſs. Another battle enſued; in which, after an obſtinate diſpute, Charles was defeated with the loſs of 18,000 men, himſelf eſcaping with great difficulty. This diſaſter was followed by the defection of moſt of his allies: the duke of Lorrain recovered the city of Nancy and great part of his dominions which Charles had ſeized; while the latter, overwhelmed with ſhame and diſappointment, ſpent his time in ſolitude and inactivity. From this he was at laſt roufed by the misfortunes which fell upon him in ſuch quick ſucceſſion. He now inveſted the city of Nancy; and in this, as well as in every other inſtance, he acted againſt the advice of his beſt officers; and the conſequences were ſtill more fatal than before. The duke of Lorrain advanced with a ſtrong body of Germans to the relief of the city, while Charles had ſcarcely 4000 men to oppoſe him. His troops were therefore eaſily defeated, and himſelf, notwithſtanding the moſt heroic efforts of valour, hurried away in the crowd. The count de Campobaſſo, an Italian nobleman in whom he put a great deal of confidence, but who was in reality a traitor, had deſerted with about 80 men in the beginning of the engagement. He left 12 or 15 men about the duke's perſon, with ſtrict orders to aſſaſſinate him in the tumult; and this order they punctually complied with; the body of Charles being found two days after the battle, pierced with three wounds.

The news of Charles's death was received with the moſt unfeigned joy by Louis, whoſe ſole object now was to unite the territories of the duke of Burgundy to his own. This might be done in two ways; one by a match betwixt the dauphin and Mary the heireſs of Burgundy; the other, by marrying her to the duke of Angouleme, a prince of the royal blood of France, and on whom Mary had ſhown ſome inclination to beſtow herſelf. The king, however, to whom duplicity and falſehood ſeem to have been abſolutely neceſſary, choſe a third method, more agreeable to his character. The match with the dauphin was attended with ſuch circumſtances as rendered it evidently impracticable. The diſparity of age was very great, the dauphin being only eight years old, and the princeſs twenty; the Flemings were beſides very much averſe from ſubmitting to a prince whoſe powerful reſources would enable him to oppreſs their liberties: but, notwithſtanding theſe inſurmountable difficulties, Louis choſe to inſiſt upon the match, at the ſame time that he endeavoured to make himſelf maſter of her dominions by force of arms. He addreſſed circular letters to the principal cities of Burgundy; repreſenting, that the duchy had been given by king John to the male heirs of his ſon Philip; and that now, when theſe were extinct by the death of Charles, the territory reverted of courſe to the crown. To render this argument more effectual, he corrupted the governors of ſome towns, ſeduced the inhabitants of others to riſe againſt their governors; whilſt he himſelf, at the head of an army, prepared to enforce obedience from thoſe who could not be worked upon by other methods. Thus the province of Burgundy was entirely reduced; but Flanders could not be brought under ſubjection either by fair means, force, or fraud. In his conduct for this purpoſe, indeed, Louis diſplayed the moſt deteſtable as well as the meaneſt treachery and falſehood. To render Mary odious to her ſubjects, he negociated with her miniſters, and prevailed upon them to diſcloſe to him ſome of the moſt important ſtate ſecrets; after which he communicated their letters to the ſtates of Flanders. This double treachery, however, did not at preſent anſwer his purpoſe. The two miniſters whom he had betrayed were indeed put to death without mercy, and that even in the preſence of their ſovereign: but Mary herſelf was thus induced to beſtow herſelf upon the emperor Maximilian; and Louis had the mortification to find that all his arts had contributed only to aggrandize a rival power, whom he had already ſufficient cauſe to dread. To remedy this overſight, he entered into an alliance with Edward IV. of England, whom he had inſpired with a jealouſy of his brother Clarence, in order to prevent a match betwixt that nobleman and the princeſs Mary, which had alſo been in agitation. Thus a peace was concluded between the two monarchs, to continue during the life of each, and for a year after.

The marriage of Mary with Maximilian effectually ſecured the independence of Flanders; while the return of the prince of Orange to the party of that princeſs extended the flames of war once more to the cities of Burgundy. The French were on the point of being totally expelled from that country, when Maximilian unexpectedly made propoſals of peace. A truce was on this concluded between the two princes; but without any term limited for its duration, or without any conditions ſtipulated in favour of the Burgundians; ſo that the whole country was quickly after reduced by Louis.

119 Tyranny and cruelty of Louis.

The king now, freed from the apprehenſion of foreign enemies, turned his vindictive diſpoſition againſt his own ſubjects; over whom, under pretence of former rebellions, he exerciſed the moſt inſupportable tyranny. The principal victim to his ſanguinary diſpoſition on this occaſion was James d'Armagnac duke of Nemours, one of the firſt noblemen in the kingdom, but who had formerly appeared a zealous confederate againſt

France. against him in the league in which Edward and Charles were concerned. The unfortunate nobleman, knowing that vengeance was determined against him, fled to a fortreſs named *Carlat*, ſituated among the mountains of Auvergne. Here he was beſieged by the Seigneur de Beaujeu, who had married Anne the daughter of Louis. The place, however, was almoſt impregnable to any force; ſo that his enemies were obliged to make the moſt ſolemn promiſes of ſafety in order to induce him to ſurrender himſelf. By theſe he was at laſt perſuaded to truſt himſelf in the hands of the faithleſs tyrant; who no ſooner had him in his power than he ſhut him up in the Baſtile in an iron cage, and reprimanded the judges becauſe they had releaſed him from this cloſe confinement during the time of his examination. The judges reluctantly condemned him to be beheaded: but the king's cruelty extended beyond the ſentence; and he ordered the two young ſons of the duke, though yet in early childhood, to be placed directly under the ſcaffold, that they might be covered with the blood of their father. Four thouſand perſons are ſuppoſed to have periſhed upon this occaſion without any form of trial: and were it not for the concurrent teſtimony of the hiſtorians of that age, the inhumanities and barbarities of this monarch are ſcarce to be credited. By theſe he broke the ſpirits of the French nobility, and gradually extended the power of the crown beyond all bounds; ſo that at laſt it was limited only by the ſovereign's pleaſure. Amidſt all the perfidy and cruelty, however, for which this monarch is ſo juſtly to be deteſted, we may on ſome occaſions remark a kind of magnanimity and generoſity, which we cannot but applaud. An inſtance of this was his ſupporting the houſe of Medici againſt pope Sextus, whom he obliged to deſiſt from his attacks, and to recall his ſentence which he had fulminated againſt them.

120 Burgundy unſucceſsfully invaded by Maximilian.

In 1479, the emperor Maximilian, who had lightly abandoned the duchy of Burgundy when he might have reduced it, now renewed his claims when it was no longer in his power to enforce them. After a variety of actions of leſſer note, and the deſtruction of cities on both ſides, a deciſive battle was fought at Guinegate. Here the Flemings were routed; but as the French purſued with too great ardour, the infantry of the enemy rallied, and the battle was renewed with great ſlaughter on both ſides. A more deciſive advantage was afterwards gained by the capture of 80 Flemiſh veſſels, which induced that commercial people to think of peace. In the mean time, however, Louis, after a life ſpent in continual deceit, hypocriſy, and cruelty, received warning of his approaching end by a fit of apoplexy with which he was ſeized in the year 1480. He lay ſpeechleſs and motionleſs for two days; after which he recovered in ſome degree, but never completely regained his health and ſtrength. His illneſs, however, neither prevented him from purſuing the ſchemes of his ambition, nor from uſing the ſame methods as before to attain them. He ſeized, without any pretence, the eſtates of the duke of Bourbon, the only nobleman in the kingdom whoſe power could give him any cauſe of ſuſpicion; yet, notwithſtanding his aſſiduity for the intereſt of the dauphin, he kept him a kind of priſoner in the caſtle of Amboiſe, permitting none but his own ſervants, or perſons of the meaneſt rank, to have acceſs to him. He baniſhed his own conſort, the mother of the dauphin, to Savoy, and endeavoured to inſpire the prince with averſion towards her. By the death of Charles, the titular king of Naples, and the laſt of the ſecond houſe of Anjou, he became maſter of the county of Provence; but his ſatisfaction on this occaſion was marred by a ſecond ſtroke of apoplexy. Still, however, he revived, and, with his recovery, again began to purſue his ambitious intrigues. The death of Mary of Burgundy, who periſhed by a fall from her horſe, inſpired him with new views; and he betrothed his ſon to the infant daughter of the emperor. Thus he offended Edward IV. of England, whoſe eldeſt daughter Elizabeth had been previouſly contracted to the dauphin; and a war would have undoubtedly enſued, had it not been for the death of the king of England. This was followed in no long time after by that of Louis himſelf, who had in vain exhauſted the ſkill of the phyſician, and wearied the clerical order with prayers and proceſſions to avert the impending ſtroke. He expired in the year 1483, after a reign of 23 years; during which he was deteſted by his ſubjects, whom he had continually oppreſſed; and equally dreaded and hated by his neighbours, whom he had conſtantly deceived; notwithſtanding which he obtained the title of *Moſt Chriſtian* from his holineſs, which his ſucceſſors have ever after retained.

Franc

121 Death of Louis X

Notwithſtanding the dark character of this prince, it is undoubtedly to be allowed, that he laid the foundations of the future greatneſs of France. By his arts he deprived the common people of their liberty, depreſſed the power of the nobility, eſtabliſhed a ſtanding army, and even induced the ſtates to render many taxes perpetual, which formerly were only temporary, in order to ſupport the army which was to keep themſelves in ſlavery. From this time the people were accuſtomed to ſubmit entirely to the voice of their ſovereign as their only legiſlator; and being always obedient in matters of the greateſt conſequence, they cheerfully contributed whatever ſums were required to fulfil the king's pleaſure.

122 Reign of Cha. VI

Charles VIII. who ſucceeded his father Louis XI. in 1483, was only 14 years of age at the time of his father's death: but though he might, even at that age, have aſcended the throne without any material violation of the laws of France, yet it was judged neceſſary to have a regent on account of the king's delicacy of conſtitution and want of education. Three competitors appeared as candidates for this important truſt, *viz.* John duke of Bourbon, a prince of the blood, and who had, till the age of 60, maintained the moſt unblemiſhed character; Louis duke of Orleans, preſumptive heir to the crown, but who from his being only 20 years old himſelf, ſeemed incapacitated on that account from undertaking ſuch an important office: the third competitor was Anne, the eldeſt daughter of Louis, to whom the latter had in the laſt moments of his life committed the charge of the kingdom, with the title of governeſs. The claim of this lady was ſupported by the aſſembly of the ſtates-general at Tours; and though ſhe was only entered into the 22d year of her age, it appears that the office could not have been more properly beſtowed. Being married to Peter of Bourbon, ſire of Beaujeu, her

123 Regent the La Beauje

France

her present title was *the Lady of Beaujeu*; but she appears to have acted entirely independent of her husband, who was but of a moderate capacity, and indeed had been recommended to her by Louis on account of his slender abilities, left by any other match the house of Bourbon should be too much aggrandized. Her first step was to ingratiate herself with the people by some popular acts; among which one was to punish the instruments of her father's cruelties. One of these, named Olivier le Dain, who, from the station of a barber, had raised himself to the confidence and favour of the king, and had distinguished himself by the invention of new modes of torture, was publicly hanged. Another, named Jean Doyac, who by continual acts of violence and rapacity had oppressed the people, was condemned, after being whipped in all the open places or squares of Paris, to have one of his ears cut off, and his tongue pierced with a hot iron; after which he was conveyed to his native city of Montferrand, where he was again whipped, and his other ear cut off; after which his estates, as well as those of Olivier, were confiscated. Jacques Coitier, the physician of Louis, who had availed himself of the terror of death with which the king was strongly influenced, to extort great sums of money from him, was ordered to answer for the immense wealth he had acquired; but he averted the danger by paying a fine of 50,000 crowns.

Thus the lady de Beaujeu gained the affection of the people at large; and was equally successful in gaining over those who were averse to her government. The duke of Bourbon was made constable, an office which he had long desired; but the duke of Orleans behaved in such a manner as to exclude all hopes of favour. Incensed at the determination of a trifling dispute at tennis against him, by the lady Beaujeu, he exclaimed, that whoever had decided it in that manner "was a liar if a man, or a strumpet if a woman." After this furious declaration he fled to the castle of Beaujency, where, however, he was soon forced to surrender. He then applied to Henry VII. of England, who had newly ascended the throne of England; but that prince, naturally slow and cautious, did not pay much attention to his proposals; on which he next made his application to the court of Brittany. Here he was received with great marks of esteem, and began to entertain hopes of marrying the daughter of the duke; but being looked upon with a jealous eye by the nobility, they entered into secret negociations with Anne, and even solicited her to invade the country. In these negociations, however, they stipulated that only a certain number of troops should enter the province, and that no fortified place should remain in the hands of the French; which conditions were indeed agreed to by the regent, though she determined to keep them no longer than it answered her purpose. In pursuance of this resolution, Brittany was invaded at once by four armies, each of them superior to the stipulated number, who quickly made themselves masters of the most important places in the country; while the troops of the duke retired in disgust, leaving them to pursue their conquests as they pleased. Finding at last, however, that the entire subjection of their country was determined upon, the nobility began to exert themselves in defence of it; and, inflamed by the enthusiasm of liberty, they raised an army of 60,000 men. By these the French were compelled to abandon the siege of Nantz: but this proved only a transient gleam of success. Anne persevered in her design of completing the conquest of the country, and the state of Europe at that time favoured the design. Of all the European states, England alone was then capable of affording any effectual assistance; and the slow caution of Henry prevented him from giving the assistance which for his own interest he ought to have done. Thus the Bretons were left to defend themselves the best way they could; and having ventured a battle, they were entirely defeated, and most of their leaders taken prisoners. A small body of English, under the command of lord Woodville, who assisted them, were entirely cut in pieces. The duke soon after died by a fall from his horse, leaving his dominions to his daughter Anne, at that time only 13 years of age. A marriage was negociated betwixt this princess and Maximilian king of the Romans, who had been married to Mary of Burgundy; but by reason of the poverty of that prince it was never completed. The lady Beaujeu, then, finding that the absolute conquest of Brittany would still be a difficult matter, determined to conclude a marriage betwixt the young king of France and the duchess, though the former had already been married to Margaret of Austria, the daughter of Maximilian. This marriage indeed had not been consummated by reason of the tender age of the princess; but she had been sent to Paris for her education, and had for several years been treated as queen of France. In 1491, however, Margaret was sent back to her father: Anne of Brittany for a long time refused to violate the engagements into which she had entered; but at last, finding herself distressed on all sides, and incapable of resisting the numerous forces of France with which she was pressed, she reluctantly consented to the match, and the nuptials were celebrated the same year at Langeais in Touraine.

France.

126 Marriage between the king of France and duchess of Brittany.

Maximilian, whose poverty had prevented him from giving any assistance to his bride, or even from coming to see her, enraged at the double disgrace he had suffered, began, when too late, to think of revenge. France was now threatened with an invasion from the united forces of Austria, Spain, and England. But this formidable confederacy was soon dissipated. Henry, whose natural avarice had prevented him from giving the necessary assistance, was bought off with money: the immediate payment of 745,000 crowns, and the promise of 25,000 annually ever after, persuaded him to retire into his own country. Ferdinand king of Spain had the counties of Roussillon and Cerdagne restored to him; while Maximilian was gratified by the cession of part of Artois, which had been acquired by Louis XI.

124 Duke of Orleans flies to Brittany.

125 That country invaded by the French.

The young king of France agreed to these terms the more readily, that he was impatient to undertake an expedition into Italy, in order to conquer the kingdom of Naples, to which he claimed a right. Most of his counsellors were against the expedition; but the king was inflexible, even though Ferdinand king of Naples offered to do homage for his kingdom, and pay him a tribute of 50,000 crowns a-year. He appointed Peter duke of Bourbon regent in his absence; after which he set out on his expedition with very few

127 His expedition into Italy, and surprising success.

France. troops and very little money. By the way he fell ill of the ſmall-pox, but in a ſhort time recovered, and entering Italy with only 6000 horſe and 12,000 foot, he was attended with the moſt ſurpriſing ſucceſs, traverſing the whole country in ſix weeks, and becoming maſter of the kingdom of Naples in leſs than a fortnight. Such extraordinary good fortune ſeemed miraculous; and he was reckoned an inſtrument raiſed up by God to deſtroy the execrable tyrants with which Italy was at that time infeſted. Had Charles made uſe of this prepoſſeſſion in his favour, and acted up to the character generally given him, he might have raiſed his name as high as any hero of antiquity. His behaviour, however, was of a very different nature. He amuſed himſelf with feaſts and ſhows; and leaving his power in the hands of favourites, they abandoned it to whoever would purchaſe titles, places, or authority, at the rates they impoſed; and the whole force he propoſed to leave in his new conquered dominions amounted to no more than 4000 men.

But while Charles was thus loſing his time, a league was concluded againſt him at Venice; into which entered the pope, the emperor Maximilian, the archduke Philip, Ludowic Sforza, and the Venetians. The confederates aſſembled an army of 40,000 men, commanded by Francis marquis of Mantua; and they waited for the king in the valley of Farnova, in the duchy of Parma, into which he deſcended with 9000 men. On the 6th of July 1495 he attacked the allies; and, notwithſtanding their great ſuperiority, defeated them, with the loſs of only 80 of his own men. Thus he got ſafe to France; but his Italian dominions were loſt almoſt as ſoon as he departed. Some ſchemes were
128 propoſed for recovering theſe conqueſts; but they were
His death. never put in execution, and the king died of an apoplexy in 1498.

The premature death of this monarch, in the 28th year of his age, was ſuppoſed to have been owing to his irregular life, and particularly his attachment to women; which had for ſome time impaired his health, and brought on evident ſymptoms of his approaching diſſolution. At laſt he relinquiſhed his irregularities, and retired with the queen to the caſtle of Amboiſe. Here in paſſing through a low door he ſtruck his head with violence againſt the top. No unfavourable ſymptom appeared at the time; but ſoon afterwards, as he converſed with his confeſſor, and avowed his deſign of obſerving the nuptial fidelity he owed to the queen, he ſuddenly fell backward in a fit of apoplexy. He recovered his voice three times, and uttered ſome expreſſions of devotion; but inſtantly relapſed, and in a ſhort time expired, notwithſtanding every aſſiſtance that could be given. He was greatly celebrated for his ſweet temper and agreeable diſpoſition, which procured him the ſurnames of the *Affable* and *Courteous*. Two of his domeſtics are ſaid to have died of grief after his death, and his widow abandoned herſelf to the moſt pungent ſorrow for *two days*.

By the death of Charles VIII. the throne of France paſſed from the direct line of the houſe of Valois, and Louis duke of Orleans ſucceeded to the throne. At the time of his acceſſion he was in his 36th year, and had long been taught prudence in the ſchool of adverſity. During the adminiſtration of the Lady Beaujeu, he had been, as we have already obſerved, conſtantly in diſgrace; and after his connections with the duke of Brittany, had ſpent a very conſiderable time France. in priſon; and though afterwards ſet at liberty by Charles, he had never poſſeſſed any ſhare of that monarch's confidence or favour. Towards the concluſion of that reign, he fell under the diſpleaſure of the queen; and had afterwards continued at his caſtle of Blois till he was called from thence to the poſſeſſion of the kingdom. He had been married in early life, and againſt his will, to Jane the youngeſt daughter of Louis XI. a princeſs of an amiable diſpoſition, but deformed in her perſon, and ſuppoſed to be incapable of bearing children. Afterwards he entertained thoughts of having this matriage diſſolved, and was ſuppoſed to poſſeſs the affection of the ducheſs of Brittany before ſhe became queen of France. After the death of her huſband, that princeſs retired to Brittany, where ſhe pretended to aſſume an independent ſovereignty; but Louis having got his marriage with Jane diſſolved by Pope Alexander VI. quickly after made propoſals to the queen-dowager, which on her part were accepted without heſitation; though it was ſtipulated, that if ſhe ſhould have two ſons, the younger ſhould inherit the duchy of Brittany.

As Louis, while duke of Orleans, had ſome pretenſions to the kingdom of Naples, he inſtantly ſet about realizing them by conqueſt. On his acceſſion, he found matters in that country much more favourable to his deſigns than formerly. The pope, Alexander VI. was very much in his intereſts, from the hopes of getting his ſon Cæſar Borgia provided for: he had conciliated the friendſhip of the Venetians by promiſing them a part of the Milaneſe; he concluded a truce with the archduke Philip; and renewed his alliances with the crowns of England, Scotland, and Denmark. 129
He then entered Italy with an army of 20,000 men; Expedition
and being aſſiſted by the Venetians, quickly conquered of Louis
one part of the duchy, while they conquered the other, XII. into
the duke himſelf being obliged to fly with his family Italy.
to Inſpruck. He then attacked Ferdinand of Spain with three armies at once, two to act by land, and one by ſea; but none of theſe performing any thing remarkable, he was obliged to evacuate the kingdom of Naples in 1504.

In 1506, the people of Genoa revolted; drove out the nobility; choſe eight tribunes; and declared Paul Nuova, a ſilk-dyer, their duke: after which, they expelled the French governor, and reduced a great part of the Riviera. This occaſioned Louis's return into Italy; where, in 1507, he obliged the Genoeſe to ſurrender at diſcretion: and, in 1508, entered into the league of Cambray, with the other princes who at that time wanted to reduce the overgrown power of the Venetians. Pope Julius II. who had been the firſt contriver of this league, very ſoon repented of it; and declared, that if the Venetians would reſtore the cities of Faenza and Rimini, which had been unjuſtly taken from him, he would be contented. This was refuſed; and in 1509, the forces of the republic received ſuch an entire defeat from Louis, that they agreed to reſtore not only the two cities demanded by pope Julius, but whatever elſe the allies required.

The pope now, inſtead of executing his treaties with his allies, made war on the king of France without the leaſt provocation. Louis called an aſſembly of his clergy; where it was determined, that in ſome caſes it was lawful to make war upon the pope; upon which

France. the king declared war againſt him, and committed the care of his army to the Marſhall de Trivulce. He ſoon obliged the pope to retire into Ravenna; and in 1511, Gaſton de Foix, duke of Nemours, gained a great victory at Ravenna, but was himſelf killed in the engagement. After his death the army diſbanded for want of pay; and the French affairs in Italy, and every where elſe, fell into great confuſion. They recovered the duchy of Milan, and loſt it again in a few weeks. Henry VIII. of England invaded France, and took Terruenne and Tournay; and the Swiſs invaded Burgundy with an army of 25,000 men. In this deſperate ſituation of affairs the queen died, and Louis put an end to the oppoſition of his moſt dangerous enemies by negociating marriages. To Ferdinand of Spain he offered his ſecond daughter for either of his grandſons, Charles or Ferdinand; and to renounce, in favour of that marriage, his claims on Milan and Genoa.

130 His marriage with the princeſs Mary of England, and death.

This propoſal was accepted; and Louis himſelf married the princeſs Mary, ſiſter to Henry VIII. of England. This marriage he did not long ſurvive, but died on the 2d of January 1514; and was ſucceeded by Francis I. count of Angouleſme, and duke of Bretagne and Valois.

131 Francis I. invades Italy.

The new king was no ſooner ſeated on the throne, than he reſolved on an expedition into Italy. In this he was at firſt ſucceſsful, defeating the Swiſs at Marignano, and reducing the duchy of Milan. In 1518, the emperor Maximilian dying, Francis was very ambitious of being his ſucceſſor, and thereby reſtoring to France ſuch a ſplendid title, which had been ſo long loſt. But Maximilian, before his death, had exerted himſelf ſo much in favour of Charles V. of Spain, that Francis found it impoſſible to ſucceed; and from that time an irreconcileable hatred took place between the two monarchs. In 1521, this ill-will produced a war; which, however, might perhaps have been terminated, if Francis could have been prevailed upon to reſtore the town of Fontarabia, which had been taken by his admiral Bonivet: but this being refuſed, hoſtilities were renewed with greater vigour than ever; nor were they concluded till France was brought to the very brink of deſtruction. The war was continued with various ſucceſs till the year 1524; when Francis having invaded Italy, and laid ſiege to Pavia, he was utterly defeated before that city, and taken priſoner on the 24th of February.

132 Defeated and taken priſoner.

This diſaſter threw the whole kingdom into the utmoſt confuſion. The Flemiſh troops made continual inroads; many thouſand boors aſſembled in Alſace, in order to make an invaſion from that quarter; Henry VIII. had aſſembled a great army, and threatened the kingdom on that ſide alſo; and a party was formed in the kingdom, in order to diſpoſſeſs the ducheſs of the regency, and confer it upon the duke de Vendoſme. This prince, however, who, after the conſtable, was the head of the Houſe of Bourbon, went on purpoſe to Lyons, where he aſſured the regent that he had no view but for her ſervice, and that of his country; upon which ſhe formed a council of the ableſt men of the kingdom, and of this ſhe made him preſident. The famous Andrew Doria ſailed with the French galleys to take on board the remains of the French troops under the duke of Alva, whom he landed ſafely in France. Thoſe who eſcaped out of the Milaneſe alſo made their way back again as well as they could. Henry VIII. under the influence of cardinal Wolſey, reſolved not to oppreſs the oppreſſed: he therefore aſſured the regent that ſhe had nothing to fear from him; and at the ſame time adviſed her not to conſent to any treaty by which France was to be diſmembered. To the emperor, however, he uſed another language. He told him, that the time was now come when this puiſſant monarchy lay at their mercy; and therefore, that ſo favourable an opportunity ſhould not be let ſlip: that, for his part, he ſhould be content with Normandy, Guienne, and Gaſcony, and hoped the empire would make no ſcruple of owning him king of France: adding, that he expected the emperor would make a right uſe of his victory, by entering Guienne in perſon; in which caſe he was ready to bear half the expences of the war. He foreſaw what fell out: the emperor was alarmed at theſe conditions, and did not care to have him for a neighbour; for which reaſon he agreed to a truce with the regent for ſix months. In Picardy the Flemings were repulſed; and the count de Guiſe, with the duke of Lorrain, had the good fortune, with a handful of troops, to defeat and cut to pieces the German peaſants. France.

133 Francis I. carried to Madrid, where he ſigns a diſadvantageous treaty;

In the mean time, Francis was detained in captivity in Italy: but being wearied of his confinement in that country, and the princes of Italy beginning to cabal for his deliverance, he was carried to Madrid; where, on the 14th of January 1525, he ſigned a treaty, the principal articles of which were, That he ſhould reſign to the emperor the duchy of Burgundy in full ſovereignty; that he ſhould deſiſt from the homage which the emperor owed him for Artois and Flanders; that he ſhould renounce all claim to Naples, Milan, Aſti, Tournay, Liſle, and Heſdin, &c.; that he ſhould perſuade Henry d'Albret to reſign the kingdom of Navarre to the emperor, or at leaſt ſhould give him no aſſiſtance; that within 40 days he ſhould reſtore the duke of Bourbon and all his party to their eſtates; that he ſhould pay the king of England 500,000 crowns which the emperor owed him; that when the emperor went to Italy to receive the Imperial crown, he ſhould lend him 12 galleys, four large ſhips, and a land-army, or inſtead of it 200,000 crowns.

All theſe articles the king of France promiſed on the word and honour of a prince to execute; or, in caſe of non-performance, to return priſoner into Spain. But, notwithſtanding theſe profeſſions, Francis had already proteſted before certain notaries and witneſſes in whom he could truſt, that the treaty he was about to ſign was againſt his will, and therefore null and void. On the 21ſt of February, the emperor thought fit to releaſe him from his priſon, in which he had been cloſely confined ever ſince his arrival in Spain; and after receiving the ſtrongeſt aſſurances from his own mouth, that he would literally fulfil the terms of the treaty, ſent him under a ſtrong gaurd to the frontiers, where he was exchanged for his two eldeſt ſons, who were to remain as hoſtages for his fidelity.

134 And breaks it.

When the king returned to his dominions, his firſt care was to get himſelf abſolved by the Pope from the oaths he had taken; after which he entered into a league with the pontiff, the Venetians, the duke of Milan, and the king of England, for preſerving the peace of Italy. In the month of June, he publicly re-

France. received remonſtrances from the ſtates of Burgundy; in which they told him, without ceremony, that by the treaty of Madrid he had done what he had no right to do, in breach of the laws and his coronation-oath; adding, that if he perſiſted in his reſolution of throwing them under a foreign yoke, they muſt appeal to the General States of the kingdom. At theſe remonſtrances the viceroy of Naples and the Spaniſh miniſters were preſent. They perceived the end which the king aimed at, and therefore expoſtulated with him in pretty warm terms. At laſt the viceroy told him, that he had now nothing left but to keep his royal word in returning to the caſtle of Madrid, as his predeceſſor John had done in a like caſe. To this the king replied, that king John acted rightly; that he returned to a king who had treated him like a king; but that at Madrid he had received ſuch uſage as would have been unbecoming to a gentleman: that he had often declared to the emperor's miniſters, that the terms they extorted from him were unjuſt and impracticable: but that he was ſtill willing to do all that was fit and reaſonable; and to ranſom his ſons at the rate of two millions of gold, in lieu of the duchy of Burgundy.

Hitherto the treaty for the tranquillity of Italy had been kept ſecret, in hopes that ſome mitigation of the treaty of Madrid would have been obtained; but now it was judged expedient to publiſh it, though the viceroy of Naples and the Spaniſh lords were ſtill at the French court; and the emperor was to be admitted into it, provided he accepted the king's offer of two millions for the releaſe of his children, and left the duke of Milan and other Italian princes in quiet poſſeſſion of their dominions. It is the common misfortune of all leagues, that the powers who enter into them keep only their own particular intereſts in view, and thus defeat the general intention of the confederacy. This was the caſe here. The king's great point was to obtain his children upon the terms he had propoſed; and he was deſirous of knowing what hopes there were of that, before he acted againſt the monarch who had them in his power. Thus the duke of Milan and the Pope were both ſacrificed. The former was obliged to ſurrender to the duke of Bourbon, and the latter was ſurpriſed by the Colonnas; both of which diſaſters would have been prevented if the French ſuccours had entered Italy in time. See ITALY.

According to an agreement which had been made between Francis and Henry, their ambaſſadors went into Spain, attended each of them by a herald, in order to ſummon the emperor to accept the terms which had been offered him; or, in caſe of refuſal, to declare war. It ſeems the emperor's anſwer was foreſeen in the court of France; and therefore the king had previouſly called together an aſſembly of the notables; that is, perſons of the ſeveral ranks of his people in whom he could confide. To them he propoſed the great queſtion, Whether he was bound to perform the treaty of Madrid? or, Whether, if he did not perform it, he was obliged in honour to return to Spain? To both theſe queſtions, the aſſembly anſwered in the negative: they ſaid, that Burgundy was united to the crown of France, and that he could not ſeparate it by his own authority; that his perſon alſo was the property of the public, of which therefore he could not diſpoſe; but for the two millions, which they looked upon as a juſt equivalent, they undertook that it ſhould France. be raiſed for his ſervice. When the ambaſſadors delivered their propoſitions, Charles treated the Engliſh herald with reſpect, and the French one with contempt; which produced a challenge from Francis to the emperor*. All differences, however, were at laſt * See *Duel.* adjuſted; and a treaty was concluded at Cambray, on 135 Treaty of the 5th of Auguſt 1528. By this treaty, inſtead of Cambray. the poſſeſſion, the emperor contented himſelf with reſerving his rights to the duchy of Burgundy, and the two millions of crowns already mentioned. Of theſe he was to receive 1,200,000 in ready money: the prince's lands in Flanders belonging to the houſe of Bourbon were to be delivered up; theſe were valued at 400,000 more: and the remaining 400,000 were to be paid by France in diſcharge of the emperor's debt to England. Francis was likewiſe to diſcharge the penalty of 500,000 crowns which the emperor had incurred, by not marrying his niece the princeſs Mary of England; and to releaſe a rich *fleur de lys* which had been many years before pawned by the houſe of Burgundy for 50,000 crowns. The town and caſtle of Heſdin were alſo yielded; together with the ſovereignty of Flanders and Artois, and all the king's pretenſions in Italy. As for the allies of France, they were abandoned to the emperor's mercy, without the leaſt ſtipulation in their favour; and Francis himſelf proteſted againſt the validity of the treaty before he ratified it, as did alſo his attorney-general before he regiſtered it in parliament; but both of them with the greateſt ſecrecy imaginable.

Nothing farther of much conſequence happened during the remainder of the reign of Francis I. The war was ſoon renewed with Charles, who made an invaſion into France, but with very bad ſucceſs; nor was peace fully eſtabliſhed but by the death of Francis, which 136 happened on the 3d of March, 1547. He was ſuc- Francis dies ceeded by his ſon Henry II. who aſcended the throne and is ſucthat very day on which he was 29 years of age. In ceeded by the beginning of his reign, an inſurrection happened Henry II. in Guienne, owing to the oppreſſive conduct of the officers who levied the ſalt tax. The king diſpatched againſt the inſurgents two bodies of troops; one commanded by the duke of Aumale ſon to the duke of Guiſe, the other by the conſtable. The firſt behaved with the greateſt moderation, and brought back the people to their duty without making many examples: the other behaved with the utmoſt haughtineſs and cruelty; and though the king afterwards remitted many of his puniſhments, yet from that time the conſtable became odious to the people, while the family of Guiſe were highly reſpected.

In 1548, the king began to execute the edicts which 137 had been made againſt the Proteſtants with the ut- Henry perſecutes the moſt ſeverity; and, thinking even the clergy too mild Proteſtants. in the proſecution of hereſy, erected for that purpoſe a chamber compoſed of members of the parliament of Paris. At the queen's coronation, which happened this year, he cauſed a number of Proteſtants to be burned, and was himſelf preſent at the ſpectacle. He was, however, ſo much ſhocked, that he could never forget it; but complained, as long as he lived, that, at certain times, it appeared before his eyes, and troubled his underſtanding.

In 1549, a peace being concluded with England, the king

France.

138 Advantageous treaty with England.

king purchaſed Boulogne from the latter, for the ſum of 400,000 crowns; one half to be paid on the day of reſtitution, and the other a few months after. Scotland was included in the treaty, and the Engliſh reſtored ſome places they had taken there. This was the moſt advantageous peace that France had hitherto made with England; the vaſt arrears which were due to that crown being in effect remitted; and the penſion which looked ſo like tribute, not being mentioned, was in fact extinguiſhed. The earl of Warwick himſelf, who had concluded the peace, was ſo ſenſible of the diſgrace ſuffered by his nation on this occaſion, that he pretended to be ſick, in order to avoid ſetting his hand to ſuch a ſcandalous bargain.

This year, an edict was made to reſtrain the extravagant remittances which the clergy had been in uſe of making to the court of Rome, and for correcting ſome other abuſes committed by the papal notaries. With this edict Pope Julius III. was highly diſpleaſed; and the following year (1550), war was declared by the king of France againſt the pope and the emperor. The pretence was, that Henry protected Octavio Farneſe duke of Parma, whom the pope was deſirous of depriving of his dominions. In this war the king was threatened with the cenſures of the church, more eſpecially when it was known that he had entered into an alliance with the Turks, and a Turkiſh fleet entered the Mediterranean, where they threatened the Iſle of Gozo, and made deſcents upon Sicily. Henry, however, ſtrongly denied any ſuch connection, and inſiſted that the emperor had given them ſufficient provocation: but, be this as it will, the emperor ſoon found himſelf in ſuch danger from theſe new enemies, that he could not ſupport the pope as he intended, who on that account was obliged to ſue for peace. After this, the king continued the war againſt the emperor with ſucceſs; reducing the cities of Toul, Verdun, and Metz. He then entered the country of Alſace, and reduced all the fortreſſes between Hagenau and Wiſſenburg. He failed, however, in his attempt on Straſburgh: and was ſoon after obliged by the German princes and the Swiſs to deſiſt from farther conqueſts on that ſide. This war continued with very little interruption, and as little ſucceſs on the part of the French, till the year 1557, when a peace was concluded; and ſoon after, the king was killed at a tournament by one count de Montgomery, who was reckoned one of the ſtrongeſt knights in France, and who had done all he could to avoid this encounter with the king.

139 Henry's ſucceſs againſt the emperor.

140 He is killed at a tournament.

The reign of his ſucceſſor Francis II. was remarkable only for the perſecution of the Proteſtants; which became ſo grievous, that they were obliged to take up arms in their own defence. This occaſioned ſeveral civil wars, the firſt of which commenced in the reign of Charles IX. who ſucceeded to the throne in 1560. This firſt war continued till the year 1562, when a peace was concluded, by which the Proteſtants were to have a free pardon, and liberty of conſcience. In 1565, the war broke out anew, and was continued with very little interruption till 1569, when peace was again concluded upon very advantageous terms for the Proteſtants. After this, king Charles, who had now taken the government into his hands, careſſed the Proteſtants in an extraordinary manner. He invited to court the admiral Coligni, who was the head of the Proteſtant party; and cajoled him ſo, that he was lulled into a perfect ſecurity, notwithſtanding the many warnings given him by his friends, that the king's fair ſpeeches were by no means to be truſted: but he had ſoon reaſon to repent his confidence. On the 22d of Auguſt 1571, as he was walking from the court to his lodgings, he received a ſhot from a window, which carried away the ſecond finger of his right hand, and wounded him grievouſly in the left arm. This he himſelf aſcribed to the malice of the duke of Guiſe, the head of the Catholic party. After dinner, however, the king went to pay him a viſit, and amongſt others made him this compliment; "You have received the wound, but it is I who ſuffer;" deſiring at the ſame time, that he would order his friends to quarter about his houſe, and promiſing to hinder the Catholics from entering that quarter after it was dark. This ſatisfied the admiral of the king's ſincerity; and hindered him from complying with the deſires of his friends, who would have carried him away, and who were ſtrong enough to have forced a paſſage out of Paris if they had attempted it.

141 Civil wars with the Proteſtants.

In the evening, the queen-mother, Katharine de Medicis, held a cabinet-council to fix the execution of the maſſacre of the Proteſtants, which had been long meditated. The perſons of which this council was compoſed, were, Henry duke of Anjou, the king's brother; Gonzagua duke of Nevers; Henry of Angouleſme, grand prior of France, and baſtard brother of the king; the marſhal de Tavannes; and Albert de Gondi, count de Rhetz. The direction of the whole was given to the duke of Guiſe, to whom the adminiſtration had been entirely confided during the former reign. The guards were appointed to be in arms, and the city-officers were to diſpoſe the militia to execute the king's orders, of which the ſignal was the ringing of a bell near the Louvre. Some ſay, that when the hour approached, which was that of midnight, the king grew undetermined: that he expreſſed his horror at ſhedding ſo much blood, eſpecially conſidering that the people whom he was going to deſtroy were his ſubjects, who had come to the capital at his command, and in confidence of his word; and particularly the admiral, whom he had detained ſo lately by his careſſes. The queen-mother, however, reproached him with his cowardice, and repreſented to him the great danger he was in from the Proteſtants; which at laſt induced him to conſent. According to others, however, the king himſelf urged on the maſſacre; and when it was propoſed to him to take off only a few of the heads, he cried out, "If any are to die, let there not be one left to reproach me with breach of faith."

142 Dreadful maſſacre of the Proteſtants.

As ſoon as the ſignal was given, a body of Swiſs troops, of the Catholic religion, headed by the duke of Guiſe, the chevalier d'Angouleſme, accompanied by many perſons of quality, attacked the admiral's houſe. Having forced open the doors, the foremoſt of the aſſaſſins ruſhed into his apartment; and one of them aſked if he was Coligni? To this he anſwered that he was; adding, "Young man, reſpect theſe grey hairs:" to which the aſſaſſin replied by running him through the body with his ſword. The duke of Guiſe and the chevalier, growing impatient below ſtairs, cried out to

France

know if the buſineſs was done: and being told that it was, commanded that the body ſhould be thrown out at the window. As ſoon as it fell on the ground, the chevalier, or (as ſome ſay) the duke of Guiſe, wiping the blood off the face, kicked it with his foot. The body was then abandoned to the fury of the populace; who, after a ſeries of indignities, dragged it to the common gallows, to which they chained it by the feet, the head being cut off and carried to the queen-mother; who, it is ſaid, cauſed it to be embalmed and ſent to Rome. The king himſelf went to ſee the body hang upon the gibbet; where a fire being kindled under it, part was burnt, and the reſt ſcorched. In the Louvre the gentlemen belonging to the king of Navarre and the prince of Condé were murdered under the king's eye. Two of them wounded, and purſued by the aſſaſſins, fled into the bed-chamber of the queen of Navarre, and jumped upon her bed, beſeeching her to ſave their lives; and as ſhe went to aſk this favour of the queen-mother, two more, under the like circumſtances, ruſhed into the room, and threw themſelves at her feet. The queen-mother came to the window to enjoy theſe dreadful ſcenes; and the king, ſeeing the Proteſtants who lodged on the other ſide of the river, flying for their lives, called for his long gun, and fired upon them. In the ſpace of three or four days, many thouſands were deſtroyed in the city of Paris, by the moſt cruel deaths which malice itſelf could invent. Peter Ramus, profeſſor of philoſophy and mathematics, after being robbed of all he had, his belly being firſt ripped open, was thrown out of a window. This ſo much affected Denis Lambin the king's profeſſor, that, though a zealous Catholic, he died of terror. The firſt two days, the king denied it was done by his orders, and threw the whole blame on the houſe of Guiſe: but, on the 28th of Auguſt, he went to the parliament, avowed it, was complimented upon it, and directed a proceſs againſt the admiral, by which he was ſtigmatized as a traitor. Two innocent gentlemen ſuffered as his accomplices in a pretended plot againſt the life of the king, in order to ſet the crown on the head of the prince of Condé. They were executed by torch-light; and the king and the queen-mother (with the king of Navarre and the prince of Condé by force) were ſpectators of this horrid fact; and they alſo aſſiſted at the jubilee to thank God for the execution of ſuch an infamous deſign.

This maſſacre was not confined to the city of Paris alone. On the eve of St Bartholomew, orders had been ſent to the governors of provinces to fall upon the Proteſtants themſelves, and to let looſe the people upon them: and though an edict was publiſhed before the end of the week, aſſuring them of the king's protection, and that he by no means deſigned to exterminate them becauſe of their religion, yet private orders were ſent, of a nature directly contrary; in conſequence of which, the maſſacre, or (as, in alluſion to the Sicilian veſpers*, it was now ſtyled) the *Matins of Paris*, were repeated in Meaux, Orleans, Troyes, Angers, Tholouſe, Rouen, and Lyons; ſo that in the ſpace of two months 30,000 Proteſtants were butchered. The next year Rochelle, the only ſtrong fortreſs which the Proteſtants held in France, was beſieged, but was not taken without the loſs of 24,000 of the Catholics who beſieged it. After this a pacification enſued on terms favourable to the Proteſtants, but to which they never truſted.

*See Sicily

This year the duke of Anjou was elected king of Poland, and ſoon after ſet out to take poſſeſſion of his new kingdom. The king accompanied him to the frontiers of the kingdom; but during the journey was ſeized with a ſlow fever, which from the beginning had a very dangerous appearance. He lingered for ſome time under the moſt terrible agonies both of body and mind; and at laſt died on the 30th of May 1572, having lived 24 years, and reigned 13. It is ſaid, that after the dreadful maſſacre abovementioned, this prince had a fierceneſs in his looks and a colour in his cheeks which he never had before. He ſlept little, and never ſound. He waked frequently in agonies, and had ſoft muſic to compoſe him again to reſt. 143 Death of Charles I.

During the firſt years of the reign of Henry III. who ſucceeded his brother Charles, the war with the Proteſtants was carried on with indifferent ſucceſs on the part of the Catholics. In 1575, a peace was concluded, called by way of eminence the *Edict of Pacification*. It conſiſted of no fewer than 63 articles; the ſubſtance of which was, that liberty of conſcience, and the public exerciſe of religion, were granted to the reformed, without any other reſtriction than that they ſhould not preach within two leagues of Paris or any other part where the court was: Party chambers were erected in every parliament, to conſiſt of equal numbers of Catholics and Proteſtants, before whom all judgments were to be tried: The judgments againſt the admiral, and, in general, all who had fallen in the war or been executed, were reverſed; and eight cautionary towns were given to the Proteſtants. 144 Henry III.

This edict gave occaſion to the Guiſes to form an aſſociation in defence, as was pretended, of the Catholic religion, afterwards known by the name of the *Catholic League*. In this league, though the king was mentioned with reſpect, he could not help ſeeing that it ſtruck at the very root of his authority: for, as the Proteſtants had already their chiefs, ſo the Catholics were, for the future, to depend entirely upon the chief of the league; and were, by the very words of it, to execute whatever he commanded, for the good of the cauſe, againſt any, without exception of perſons. The king, to avoid the bad effects of this, by the advice of his council declared himſelf head of the league; and of conſequence recommenced the war againſt the Proteſtants, which was not extinguiſhed as long as he lived. 145 Catholic league formed.

The faction of the duke of Guiſe, in the mean time, took a reſolution of ſupporting Charles cardinal of Bourbon, a weak old man, as preſumptive heir of the crown. In 1584 they entered into a league with Spain, and took up arms againſt the king: and tho' peace was concluded the ſame year, yet in 1587 they again proceeded to ſuch extremities, that the king was forced to fly from Paris. Another reconciliation was ſoon after effected; but it is generally believed that the king from this time reſolved on the deſtruction of Guiſe. Accordingly, finding that this nobleman ſtill behaved towards him with his uſual inſolence, the king cauſed him to be ſtabbed, as he was coming into his preſence, by his guards, on the 23d of December 1587. The king himſelf did not long ſurvive him; being ſtabbed by one James Clement, a Jacobine

France.

cobine monk, on the first of August 1588. His wound at first was not thought mortal: but his frequent swooning quickly discovered his danger; and he died next morning, in the 39th year of his age, and 16th of his reign.

Before the king's death, he nominated Henry Bourbon king of Navarre for his successor on the throne of France; but as he was a Protestant, or at least one who greatly favoured their cause, he was at first owned by very few except those of the Protestant party. He met with the most violent opposition from the members of the Catholic league; and was often reduced to such straits, that he went to people's houses under colour of visits, when in reality he had not a dinner in his own. By his activity and perseverance, however, he was at last acknowledged throughout the whole kingdom, to which his abjuration of the Protestant religion contributed not a little. As the king of Spain had laid claim to the crown of France, Henry no sooner found himself in a fair way of being firmly seated on the throne, than he formally declared war against that kingdom; in which he at last proved successful, and in 1597 entered upon the quiet possession of his kingdom.

147
enry IV.

The king's first care was to put an end to the religious disputes which had so long distracted the kingdom. For this purpose, he granted the famous edict, dated at Nantes, April 13. 1598. It re-established, in a most solid and effectual manner, all the favours that had ever been granted to the reformed by other princes; adding some which had not been thought of before, particularly the allowing them a free admission to all employments of trust, profit, and honour; the establishing chambers in which the members of the two religions were equal; and the permitting their children to be educated without constraint in any of the universities. Soon after, he concluded peace with Spain upon very advantageous terms. This gave him an opportunity of restoring order and justice throughout his dominions; of repairing all the ravages occasioned by the civil war; and abolishing all those innovations which had been made, either to the prejudice of the prerogatives of the crown or the welfare of the people. His schemes of reformation, indeed, he intended to have carried beyond the boundaries of France. If we may believe the duke of Sully, he had in view no less a design than the new-modelling of all Europe. He imagined that the European powers might be formed into a kind of Christian republic, by rendering them as nearly as possible of equal strength; and that this republic might be maintained in perpetual peace, by bringing all their differences to be decided before a senate of wise, disinterested, and able judges: and then he thought it would be no difficult matter to overturn the Ottoman empire. The number of these powers was to be 15; *viz.* the Papacy; the empire of Germany; France; Spain; Hungary; Great Britain; Bohemia; Lombardy; Poland; Sweden; Denmark; the republic of Venice; the States-General; the Swiss Cantons; and the Italian commonwealth, which was to comprehend the states of Florence, Genoa, Lucca, Modena, Parma, Mantua, and Monaco. In order to render the states equal, the empire was to be given to the duke of Bavaria; the kingdom of Naples to the pope; that of Sicily to the Venetians; Milan to the duke of Savoy, who, by this acquisition, was to become king of Lombardy; the Austrian Low Countries were to be added to the Dutch republic; Franche Compte, Alsace, and the country of Trent, were to be given to the Swiss. With a view, it is now thought, of executing this grand project, but under pretence of reducing the exorbitant power of the house of Austria, Henry made immense preparations both by sea and land; but if he really had such a design, he was prevented by death from attempting to execute it. He was stabbed in his coach by one Ravilliac, on the 12th of May 1608.

He is murdered.

On the death of Henry IV. the queen-mother assumed the regency. Ravilliac was executed, after suffering horrid tortures. It is said that he made a confession, which was so written by the person who took it down, that not one word of it could ever be read, and thus his instigators and accomplices could never be discovered. The regency, during the minority of Louis XIII. was only remarkable for cabals and intrigues of the courtiers. In 1617, the king assumed the government himself, banished the queen-mother to Blois, caused her favourite marshal d'Ancre to be killed, and chose for his minister the famous cardinal Richlieu. In 1620, a new war broke out between the Catholics and Protestants, which was carried on with the greatest fury on both sides; and we may judge of the spirit which actuated both parties, by what happened at Negrepliffe, a town in Quercy. This place was besieged by the king's troops, and it was resolved to make an example of the inhabitants. The latter, however, absolutely refused to surrender upon any terms. They defended themselves, therefore, most desperately; and the city being at last taken by storm, they were all massacred, without respect of rank, sex, or age, except ten men. When these were brought into the king's presence, he told them they did not deserve mercy: they answered, that they would not receive it; that the only favour they asked, was to be hanged on trees in their own gardens; which was granted, and the place reduced to ashes. Both parties soon became weary of such a destructive war; and a peace was concluded in 1621, by which the edict of Nantes was confirmed. This treaty, however, was of no long duration. A new war broke out which lasted till the year 1628, when the edict of Nantes was again confirmed; only the Protestants were deprived of all their cautionary towns, and consequently of the power of defending themselves in time to come. This put an end to the civil wars on account of religion in France. Historians say, that in these wars above a million of men lost their lives; that 150,000,000 livres were spent in carrying them on; and that 9 cities, 400 villages, 2000 churches, 2000 monasteries, and 10,000 houses, were burnt or otherwise destroyed during their continuance. The next year, the king was attacked with a slow fever which nothing could allay, an extreme depression of spirits, and prodigious swelling in his stomach and belly. The year after, however, he recovered, to the great disappointment of his mother, who had been in hopes of regaining her power. She was arrested; but found means to escape into Flanders, where she remained during the rest of this reign. Richlieu, by a masterly train of politics, though himself was next to an enthusiast for popery, supported the

France

Protestants of Germany and Gustavus Adolphus against the house of Austria; and after quelling all the rebellions and conspiracies which had been formed against him in France, he died some months before Louis XIII. in 1643.

152 Louis XIV

Louis XIV. surnamed *le Grand*, succeeded to the throne when he was only five years of age. During his minority, the kingdom was torn in pieces under the administration of his mother Anne of Austria, by the factions of the great, and the divisions between the court and parliament, for the most trifling causes, and upon the most despicable principles. The prince of Condé flamed like a blazing star; sometimes a patriot, sometimes a courtier, and sometimes a rebel. He was opposed by the celebrated Turenne, who from a Protestant had turned Papist. The nation of France was involved at once in civil and domestic wars; but the queen-mother having made choice of cardinal Mazarine for her first minister, he found means to turn the arms even of Cromwell against the Spaniards, and to divide the domestic enemies of the court so effectually among themselves, that when Louis assumed the reins of government into his own hands, he found himself the most absolute monarch that had ever sat upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domestic administration of his affairs into the hands of Colbert, who formed new systems for the glory, commerce, and manufactures of France, all which he carried to a surprising height. The king himself, ignorant and vain, was blind to every patriotic duty of a king, promoting the interests of his subjects only that they might the better answer the purposes of his greatness: and by his ambition he embroiled himself with all his neighbours, and wantonly rendered Germany a dismal scene of devastation. By his impolitic and unjust revocation of the edict of Nantes in the year 1685, with the dragooning* the protestants that followed it, he obliged them to take shelter in England, Holland, and different parts of Germany, where they established the silk manufactories, to the great prejudice of their own country. He was so blinded by flattery, that he arrogated to himself the divine honours paid to the pagan emperors of Rome. He made and broke treaties for his convenience: and in the end he raised against himself a confederacy of almost all the other princes of Europe; at the head of which was king William III. of England. He was so well served, that he made head for some years against this alliance; and France seemed to have attained the highest pitch of military glory, under the conduct of those renowned generals Condé and Turenne. (See United Provinces.) At length, having provoked the English by his repeated infidelities, their arms under the duke of Marlborough, and those of the Austrians under prince Eugene, rendered the latter part of Louis's life as miserable as the beginning of it was splendid. His reign, from the year 1702 to 1711, was one continued series of defeats and calamities; and he had the mortification of seeing those places taken from him, which, in the former part of his reign, were acquired at the expence of many thousand lives. (See Britain, n° 342, &c.)—Just as he was reduced, old as he was, to the desperate resolution of collecting his people and dying at their head, he was saved by the English Tory ministry deserting the cause, withdrawing from their allies, and concluding the peace of Utrecht in 1713. See Britain, n° 371, &c.

* See *Dragooning*.

The last years of Louis XIV. were also embittered by domestic calamities; which, added to those he had already endured of a public nature, impressed him with a deep melancholy. He had been for some time afflicted with a fistula; which, though successfully cut, ever afterwards affected his health. The year before the peace, his only son, the duke of Burgundy, died, together with the duchess and their eldest son; and the only remaining child was left at the point of death. The king himself survived till the month of September 1715; but on the 14th of that month expired, leaving the kingdom to his great-grandson Louis, then a minor.

153 Louis X

By the last will of Louis he had devolved the regency, during the minority of the young king, upon a council, at the head of which was the duke of Orleans. That nobleman, however, disgusted with a disposition which gave him only a casting vote, appealed to the parliament of Paris, who set aside the will of the late king, and declared him sole regent. His first acts were extremely popular, and gave the most favourable ideas of his government and character. He restored to the parliament the right which had been taken from them of remonstrating against the edicts of the crown, and compelled those who had enriched themselves during the calamities of the former reign to restore their wealth. He also took every method to efface the calamities occasioned by the unsuccessful wars in which his predecessor had engaged; promoted commerce and agriculture; and, by a close alliance with Great Britain and the United Provinces, seemed to lay the foundation of a lasting tranquillity. This happy prospect, however, was soon overcast by the intrigues of Alberoni the Spanish minister, who had formed a design of recovering Sardinia from the emperor, Sicily from the duke of Savoy, and of establishing the Pretender on the throne of Britain. To accomplish these purposes, he negociated with the Ottoman Porte, Peter the Great of Russia, and Charles XII. of Sweden; the Turks intending to resume the war against the emperor; the two latter to invade Great Britain. But as long as the duke of Orleans retained the administration of France, he found it impossible to bring his schemes to bear. To remove him, therefore, he fomented divisions in the kingdom. An insurrection took place in Brittany; and Alberoni sent small parties in disguise into the country, in order to support the insurgents, and even laid plots to seize the regent himself. All of a sudden, however, the Spanish minister found himself disappointed in every one of his schemes. His partisans in France were put to death; the king of Sweden was killed at Frederickshall in Norway; the Czar, intent on making new regulations, could not be persuaded to make war upon Britain; and the Turks refused to engage in a war with the emperor, from whom they had lately suffered so much. The cardinal, nevertheless, continued his intrigues; which quickly produced a war betwixt Spain on the one part, and France and Britain on the other. The Spaniards, unable to resist the union of two such formidable powers, were soon reduced to the necessity of suing for peace; and the terms were dictated

154 Administration of the duke of Orleans

France. tated by the regent of France; and of these the dismission of Alberoni the Spanish minister was one. A double marriage was now set on foot: the duke of Orleans gave his own daughter, Mademoiselle Montpensier, to Don Lewis prince of Asturias, while the infanta of Spain was betrothed to her cousin the king of France. From this time the house of Bourbon continued united; both princes being convinced, that it was their interest not to waste their strength in wars against each other.

155 Destructive project of John Law.

The spirit of conquest having now in a great measure subsided, and that of commerce taken place throughout the world in general, France became the scene of as remarkable a project in the commercial way as ever was known in any country. One John Law, a Scotsman, having been obliged to fly from his own country for murder, laid the plan of a company which might by its notes pay off the debt of the nation, and reimburse itself by the profits. Law had wandered through various parts of Europe, and had successively endeavoured to engross the attention of various courts. The proposal was made to Victor Amadeus king of Sicily; but he dismissed Law with a reply, that "he was not rich enough to ruin himself:" but in France it was looked upon in a more favourable light; the nation being at this time involved in a debt of 200 millions, and the regent, as well as the people in general, very fond of embarking in new schemes. The bank, thus established, proceeded at first with some degree of caution; but having by degrees extended their credit to more than 80 times their real stock, they soon became unable to answer the demands made upon them; so that the company was dissolved the very same year in which it had been instituted. The confusion into which the kingdom was thrown by this fatal scheme, required the utmost exertions of the regent to put a stop to it; and scarcely was this accomplished when the king, in 1723, took the government into his own hands. The duke then became minister; but did not long enjoy this post. His irregularities had broken his constitution, and brought on a number of maladies, under which he in a short time sunk, and was succeeded in his administration by the duke of Bourbon Conde. The king, as we have already remarked, had been married, when very young, to the infanta of Spain, though by reason of his tender years the marriage had never been completed. The princess, however, had been brought to Paris, and for some time treated as queen of France; but as Louis grew up, it was easy to see that he had contracted an inveterate hatred against the intended partner of his bed. The minister, therefore, at last consented that the princess should be sent back; an affront so much resented by the queen her mother, that it had almost produced a war betwixt the two nations.

156 The king takes the government into his own hands.

157 The Infanta of Spain sent back.

The dissolution of the marriage of Louis was the last act of Conde's administration; and the procuring of a new match was the first act of his successor Cardinal Fleury. The princess pitched upon was the daughter of Stanislaus Leszinski, king of Poland, who had been deposed by Charles XII. of Sweden. The princess was destitute of personal charms, but of an amiable disposition; and though it is probable that she never possessed the love of her husband, her excellent qualities could not but extort his esteem; and the birth of a prince soon after their marriage removed all the fears of the people concerning the succession.

158 Marriage with the daughter of Stanislaus king of Poland.

Cardinal Fleury continued the pacific schemes pursued by his predecessors; though they were somewhat interrupted by the war which took place in the year 1733. Notwithstanding the connection betwixt that monarch and the French nation, however, Fleury was so parsimonious in his assistance, that only 1500 soldiers were sent to relieve Dantzic, where Stanislaus himself resided, and who at that time was besieged by the Russians. This pitiful reinforcement was soon overwhelmed by a multitude of Russians; and Stanislaus was at last obliged to renounce all thoughts of the crown of Poland, though he was permitted to retain the title of king: and that this title might not be merely nominal, the king of France consented to bestow upon him the duchies of Bar and Lorrain; so that, after the death of Stanislaus, these territories were indissolubly united to the dominions of France. Fleury steadily pursued his pacific plans, and the disputes between Spain and England in 1737 very little affected the peace of that kingdom; and it must be remembered to his praise, that instead of fomenting the quarrels betwixt the neighbouring potentates, he laboured incessantly to keep them at peace. He reconciled the Genoese and Corsicans, who were at war; and his mediation was accepted by the Ottoman Porte, who at that time carried on a successful war with the emperor of Germany, but made peace with him at the intercession of the cardinal. All his endeavours to preserve the general peace, however, proved at last ineffectual. The death of the emperor Charles VI. in 1740, the last prince of the house of Austria, set all Europe in a flame. The emperor's eldest daughter, Maria Theresa, claimed the Austrian succession, which comprehended the kingdoms of Hungary and Bohemia, the duchy of Silesia, Austrian Suabia, Upper and Lower Austria, Styria, Carinthia, Carniola; the four forest towns; Burgaw; Brisgaw; the Low Countries; Friuli; Tyrol; the duchy of Milan; and the duchies of Parma and Placentia. Among the many competitors who pretended a right to share, or wholly to inherit, these extensive dominions, the king of France was one. But as he wished not to awaken the jealousy of the European princes by preferring directly his own pretensions, he chose rather to support those of Frederic III. who laid claim to the duchy of Silesia. This brought on the war of 1740; and of which an account is given under the articles BRITAIN and PRUSSIA. It was terminated in 1748 by the treaty of Aix-la-Chapelle; but to this Louis, who secretly meditated a severe vengeance against Britain, only consented, that he might have time to recruit his fleet and put himself somewhat more upon an equality with that formidable power. But while he meditated great exploits of this kind, the internal tranquillity of the kingdom was disturbed by violent disputes betwixt the clergy and parliaments of France. In the reign of Louis XIV. there had been violent contests betwixt the Jansenists and Jesuits concerning free-will and other obscure points of theology; and the opinions of the Jansenists had been declared heretical by the celebrated papal bull named *Unigenitus*; the reception of which was enforced by the king, in opposition to the parliaments, the archbishop of Paris, and the body of the

159 Disputes betwixt the parliaments and clergy.

France. people. The archbishop, with 15 other prelates, protested against it as an infringement of the rights of the Gallican church, of the laws of the realm, and an insult on the rights of the people themselves. The duke of Orleans favoured the bull by inducing the bishops to submit to it; but at the same time stopped a persecution which was going on against its opponents. Thus matters passed over till the conclusion of the peace; a short time after which the jealousy of the clergy was awakened by an attempt of the minister of state to inquire into the wealth of individuals of their order. To prevent this, they revived the contest about the bull Unigenitus; and it was resolved, that confessional notes should be obtained of dying persons; that these notes should be signed by priests who maintained the authority of the bull; and that, without such notes, no person could obtain a viaticum, or extreme unction. On this occasion the new archbishop of Paris, and the parliament of that city, took opposite sides; the latter imprisoning such of the clergy as refused to administer the sacraments excepting in the circumstances above mentioned. Other parliaments followed the example of that of Paris; and a war was instantly kindled betwixt the civil and ecclesiastical departments of the state. In this dispute the king interfered, forbad the parliaments to take cognizance of ecclesiastical proceedings, and commanded them to suspend all prosecutions relative to the refusal of the sacraments: but instead of acquiescing, the parliament presented new remonstrances, refused to attend any other business, and resolved that they could not obey this injunction without violating their duty as well as their oath. They cited the bishop of Orleans before their tribunal, and ordered all writings, in which its jurisdiction was disputed, to be burnt by the executioner. By the assistance of the military, they enforced the administration of the sacraments to the sick, and ceased to distribute that justice to the subject for which they had been originally instituted. The king, enraged at their obstinacy, arrested and imprisoned four of the members who had been most obstinate, and banished the remainder to Bourges, Poictiers, and Auvergne; while, to prevent any impediment from taking place in the administration of justice by their absence, he issued letters patent, by which a royal chamber for the prosecution of civil and criminal suits was instituted. The counsellors refused to plead before these new courts; and the king, finding at last that the whole nation was about to fall into a state of anarchy, thought proper to recall the parliament. The banished members entered Paris amidst the acclamations of the inhabitants; and the archbishop, who still continued to encourage the priests in refusing the sacraments, was banished to his seat at Conflans; the bishops of Orleans and Troyes were in like manner banished, and a calm for the present restored to the kingdom.

160 Parliament of Paris banished.

161 New disputes betwixt the king and parliament.

The tranquillity thus established was of no long duration. In the year 1756, the parliament again fell under the displeasure of the king by their imprudent persecution of those who adhered to the bull Unigenitus. They proceeded so far in this opposition as to refuse to register certain taxes absolutely necessary for the carrying on of the war. By this Louis was so provoked, that he suppressed the fourth and fifth chambers of inquests, the members of which had distinguished themselves by their opposition to his will. He commanded the bull Unigenitus to be respected, and prohibited the secular judges from ordering the administration of the sacraments. On this 15 counsellors of the great chamber resigned their offices, and 124 members of the different parliaments followed their example; and the most grievous discontents took place throughout the kingdom. An attempt was made by a fanatic, named *Damien*, to assassinate him; and the king was actually wounded, though slightly, between the ribs, in the presence of his son and in the midst of his guards. The assassin was put to the most exquisite tortures; in the midst of which he persisted, in the most obstinate manner, to declare that he had no intention to kill the king; but that his design was only to wound him, that God might touch his heart, and incline him to restore peace to his dominions, &c. These expressions, which undoubtedly indicated insanity, had no effect on his merciless judges, who consigned him to one of the most horrid deaths the ingenuity or cruelty of man could invent. This attempt, however, seems to have had some effect upon the king, as he soon after banished the archbishop of Paris, who had been recalled, and accommodated matters with his parliament once more. France.

162 Family compact between France and Spain established.

The unfortunate event of the war of 1755 had brought the nation to the brink of ruin, when Louis implored the assistance of Spain; and on this occasion the celebrated *Family Compact* was signed; by which, with the single exception of the American trade, the subjects of France and Spain are naturalized in both kingdoms, and the enemy of the one sovereign is invariably to be looked upon as the enemy of the other. At that time, however, the assistance of Spain availed very little; both powers were reduced to the lowest ebb, and the arms of Britain were triumphant in every quarter of the globe. See the article BRITAIN.

163 Expulsion of the Jesuits.

The peace concluded at Paris in the year 1763, though it freed the nation from a most destructive and bloody war, did not restore its internal tranquillity. The parliament, eager to pursue the victory they had formerly gained over their religious enemies, now directed their efforts against the Jesuits, who had obtained and enforced the bull Unigenitus. That once powerful order, however, was now on the brink of destruction. A general detestation of its members had taken place throughout the whole world. A conspiracy formed by them against the king of Portugal, and from which he narrowly escaped, had roused the indignation of Europe, and this was still farther inflamed by some fraudulent practices of which they had been guilty in France. Le Valette, the chief of their missionaries at Martinico, had, ever since the peace of Aix-la Chapelle, carried on a very extensive commerce, insomuch that he even aspired at monopolizing the whole West India trade when the war with Britian commenced in 1755. Leonay and Gouffic, merchants at Marseilles, in expectation of receiving merchandize to the value of two millions from him, had accepted of bills drawn by the Jesuits to the amount of a million and an half. Unhappily they were disappointed by the vast number of captures made by the British; in consequence of which they were obliged to apply to the Society of Jesuits at large: but they, either ignorant of their true interest, or too slow in giving assist-

France.

ance, suffered the merchants to stop payment; and thus not only to bring ruin upon themselves, but to involve, as is usual in such cases, a great many others in the same calamity. Their creditors demanded indemnification from the society at large; and on their refusal to satisfy them, brought their cause before the parliament of Paris. That body, eager to revenge themselves on such powerful adversaries, carried on the most violent persecutions every where against them. In the course of these, the volume containing the constitution and government of the order itself was appealed to, and produced in open court. It then appeared, that the order of Jesuits formed a distinct body in the state, submitting implicitly to their chief, who alone was absolute over their lives and fortunes. It was likewise discovered that they had, after a former expulsion, been admitted into the kingdom upon conditions which they had never fulfilled; and to which their chief had obstinately refused to subscribe; consequently that their existence at that time in the nation was merely the effect of toleration. The event was, that the writings of the Jesuits were pronounced to contain doctrines subversive of all civil government, and injurious to the security of the sacred persons of sovereigns; the attempt of Damien against the king was attributed to them, and every thing seemed to prognosticate their speedy dissolution. In this critical moment, however, the king interfered, and by his royal mandate suspended all proceedings against them for a year; a plan of accommodation was drawn up, and submitted to the pope and general of the order: but the latter, by his ill-timed haughtiness, entirely overthrew the hope of reconciliation. The king withdrew his protection, and the parliament redoubled their efforts against them. The bulls, briefs, constitutions, and other regulations of the Society, were determined to be encroachments on authority, and abuses of government; the Society itself was finally dissolved, and its members declared incapable of holding any clerical or municipal offices; their colleges were seized; their effects confiscated; and the order annihilated ever since.

164 Contentions betwixt the king and his parliaments.

The parliament, having gained this victory, next made an attempt to set bounds to the power of the king himself. They now refused to register an edict which Louis had issued for the continuance of some taxes which should have ended with the war, and likewise to conform to another by which the king was enabled to redeem his debts at an inadequate price. The court attempted to get the edicts registered by force, but the parliaments every where seemed inclined to resist to the last. In 1766, the parliament of Brittany refused the crown a gift of 700,000 livres; in consequence of which they were singled out to bear the weight of royal vengeance: but while matters were on the point of coming to extremities, the king thought proper to drop the process altogether, and to publish a general amnesty. The parliaments, however, now affected to despise the royal clemency; which exasperated the king to such a degree, that he ordered the counsellors of the parliament of Brittany (who had refused to resume the functions of which he deprived them) to be included in the list of those who were to be drafted for militia; and those upon whom the lot fell were immediately obliged to join their respective regiments; the rest being employed in forming the city-guard. The parliament of Paris remonstrated so freely upon this conduct of the king, that they also fell under his censure; and Louis in the most explicit manner declared, that he would suffer no earthly power to interfere with his will; and the parliaments were for the present intimidated into submission.

France.

The interval of domestic tranquillity which now took place, was employed by the king in humbling the pride of the pope, who refused to recal a brief he had published against the duke of Parma. On this the French monarch reclaimed the territories of Avignon and Venaissin; and while the pontiff denounced his unavailing censures against him, the marquis de Rochecouart, with a single regiment of soldiers, drove out the troops of the pope, and took possession of the territories in question.

165 Island of Corsica reduced.

A more formidable opposition was made by the natives of the small island of Corsica; the sovereignty of which had been transferred to France by the Genoese its former masters, on condition that Louis should reinstate them in the possession of the island of Capraia, which the Corsicans had lately reduced. These islanders defended themselves with the most desperate intrepidity; and it was not till after two campaigns, in which several thousands of the bravest troops of France were lost, that they could be brought under subjection.

166 Distressed state of the nation.

The satisfaction which this unimportant conquest might afford to Louis, was clouded by the distress of the nation at large. The East India Company had totally failed, and most of the capital commercial houses in the kingdom were involved in the same calamity. The minister, the duc de Choiseuil, by one desperate stroke, reduced the interest of the funds to one half, and at the same time took away the benefit of the survivorship in the tontines, by which the national credit was greatly affected; the altercation betwixt the king and his parliaments revived, and the dissensions became worse than ever. The duc de Choiseuil attempted in vain to conciliate the differences; his efforts tended only to bring misfortunes upon himself, and in 1771 he was banished by the king, who suspected him of favouring the popular party too much; and this was soon after followed by the banishment of the whole parliament of Paris, and that by the banishment of a number of others; new parliaments being every where chosen in place of those who had been expelled. The people were by no means disposed to pay the same regard to these new parliaments that they had done to the old ones; but every appearance of opposition was at last silenced by the absolute authority of the king. In the midst of this plenitude of power, however, which he had so ardently desired, his health daily declined, and the period of his days was evidently at no great distance. As he had all along indulged himself in sensual pleasures to the greatest excess, so now they proved the immediate means of his destruction. His favourite mistress, Madame de Pompadour, who for a long time governed him with an absolute sway, had long since been dead, and the king had for some time been equally enslaved by the charms of Madame du Barre. At last even her beauty proved insufficient to excite desire; and a succession of mistresses became necessary to rouse the languid appetites of the king. One

France. of these, who was infected with the small-pox, communicated the disease to the king; who in a short time died of it, notwithstanding all the assistance that could be given him by the physicians.

167 Death of Louis XV.

168 Reign of Louis XVI.

The new king Louis XVI. grandson to the former, ascended the throne in the year 1774, in the 20th year of his age; and to secure himself against the disease which had proved fatal to his predecessor, submitted to inoculation, with several others of the royal family. Their quick and easy recovery contributed much to extend that practice throughout the kingdom, and to remove the prejudices which had been entertained against it.

The king had no sooner regained his health, than he applied himself diligently to extinguish the differences which had taken place betwixt his predecessor and the people. He removed those from their employments who had given cause of complaint by their arbitrary and oppressive conduct; and he conciliated the affection of his subjects by removing the new parliaments and recalling the old ones.

But though the prudence of Louis had suggested to him these compliances, he endeavoured still to preserve pure and entire the royal authority. He explained his intentions by a speech in the great chamber of parliament. "The step that he had taken to ensure the tranquillity and happiness of his subjects, ought not (he observed) to invalidate his own authority; and he hoped, from the zeal and attachment of the present assembly, an example of submission to the rest of his subjects. Their repeated resistance to the commands of his grandfather had compelled that monarch to maintain his prerogative by their banishment; and they were now recalled, in the expectation that they would quietly exercise their functions, and display their gratitude by their obedience." He concluded with declaring, "That it was his desire to bury in oblivion all past grievances; that he should ever behold with extreme disapprobation whatever might tend to create divisions and disturb the general tranquillity; and that his chancellor would read his ordinance to the assembly, from which they might be assured he would not suffer the smallest deviation to be made." That ordinance was conceived in the most explicit terms, and was immediately registered by the king's command. The articles of it limited within very narrow bounds the pretensions of the parliament of Paris: The members were forbidden to look upon themselves as one body with the other parliaments of the kingdom, or to take any step, or assume any title, that might tend towards, or imply, such an union: They were enjoined never to relinquish the administration of public justice, except in cases of absolute necessity, for which the first president was to be responsible to the king; and it was added, that on their disobedience the Grand Council might replace the parliament, without any new edict for the purpose. They were still however permitted to enjoy the right of remonstrating before the registering of any edicts or letters patent which they might conceive injurious to the welfare of the people, provided they preserved in their representations the respect due to the throne. But these remonstrances were not to be repeated; and the parliament, if they proved ineffectual, were to register the edict objected to within a month at farthest from the first day of its being published. They were forbidden to issue any arrets which might excite trouble, or in any manner retard the execution of the king's ordinances; and they were assured by the king himself, at the conclusion of this code for their future conduct, that as long as they adhered to the bounds prescribed, they might depend upon his countenance and protection. In short, the terms on which Louis consented to re-establish the parliaments were such, that they were reduced to mere cyphers, and the word of the king still continued to be the only law in the kingdom. The archbishop of Paris, who had likewise presumed to raise some commotions with regard to the bull Unigenitus, was obliged to submit; and severely threatened if he should afterwards interfere in such a cause. France.

The final conquest of the Corsicans, who, provoked by the oppression of their governors, had once more attempted to regain their former liberty, was the first event of importance which took place after this restoration of tranquillity: but the kingdom was yet filled with disorder from other causes. A scarcity of corn 1775. happening to take place just at the time that some regulations had been made by M. Turgot the new financier, the populace rose in great bodies, and committed such outrages, that a military force became absolutely necessary to quell them; and it was not till upwards of 500 of these miserable wretches were destroyed that they could be reduced. The king, however, by his prudent and vigorous conduct on this occasion, soon put a stop to all riots, and eminently displayed his clemency as well as prudence in the methods he took for the restoration of the public tranquillity.

169 Humane edict in favour of deserters.

The humanity of Louis was next shown in an edict which he caused to be registered in parliament, abolishing the sentencing the deserters from his army in future to work as slaves on the public roads, instead of punishing them as formerly with death; and with equal attention to the general welfare of his subjects, he seized the moment of peace to fulfil those promises of economy which on his accession he had given to his people. Various regulations took place in consequence; particularly the

170 Suppression of the Musquetaires.

suppression of the Musquetaires and some other corps, which being adapted more to the parade of guarding the royal person than any real military service, were supported at a great expence, without any adequate return of benefit to the state.

Particular attention was also paid to the state of the marine; and the appointment of M. de Sartine in 1776 to that department did honour to the penetration of the sovereign. That minister, fruitful in resources, and unwearied in his application, was incessantly engaged in augmenting the naval strength of his country; and the various preparations that filled the ports and docks created no small uneasiness to the British court.

171 Appointment of M. Necker to the direction of the finances.

The next appointment made by the king was equally happy, and in one respect singular and unprecedented. M. Turgot, though possessed of integrity and industry, had not been able to command the public confidence. On his retreat, M. Clugny, intendant-general of Bourdeaux, had been elevated to the vacant post: but he dying in a very short space, M. Taboureau des Reaux was appointed his successor; and the king soon after associated with him in the management of the

the finances M. Necker, by birth a Swifs, and by religion a Proteſtant. That gentleman, in the preceding reign, had been choſen to adjuſt ſome differences between the Eaſt India company and the crown; and had diſcharged his truſt in a manner which gained the approbation of both parties. Poſſeſſed of diſtinguiſhed abilities, his appointment would have excited no ſurpriſe, had it not been contrary to the conſtant policy of France, which had carefully excluded the aliens of her country and faith from the control of her revenue. It now ſtood forward as a new inſtance of enlargement of mind and liberality of ſentiment; and will to poſterity mark the prominent features of the reign of Louis XVI.

172 e French vately ſt the A- ricans in ir conteſt th Bri- n;

Although the French monarch was of a pacific diſpoſition, and not deſtitute of generoſity of ſentiment; yet his own and the public exultation had been openly and conſtantly proportioned to the ſucceſs of the Americans in their conteſt with Britain: the princes of the blood and the chief nobility were eager to embark in ſupport of the cauſe of freedom; and the prudence of the king and his moſt confidential miniſters alone reſtrained their ardour. The fatal events of the former war were ſtill impreſſed on the mind of Louis; and he could not readily conſent to expoſe his infant marine in a conteſt with a nation who had ſo frequently aſſerted the dominion of the ſeas, and ſo lately broken the united ſtrength of the houſe of Bourbon. At the ſame time, he was ſenſible that the opportunity of humbling thoſe haughty iſlanders ſhould not be entirely neglected, and that ſome advantages ſhould be taken of the preſent commotions in America. Two agents from the United States, Silas Deane and Dr Benjamin Franklin, had ſucceſſively arrived at Paris; and though all audience was denied them in a public capacity, ſtill they were privately encouraged to hope that France only waited the proper opportunity to vindicate in arms the independence of America. In the mean while, the American cruizers were hoſpitably received into the French ports; artillery and all kinds of warlike ſtores were freely ſold or liberally granted to the diſtreſs of the coloniſts; and French officers and engineers, with the connivance of government, entered into their ſervice.

Some changes were about this time introduced into the different departments of ſtate. The conduct of M. Necker in the finances had been attended with univerſal approbation; and M. Taboureau des Reaux, his colleague, had reſigned his ſituation, but ſtill retained the dignity of counſellor of ſtate. To afford full ſcope to the genius of M. Necker, Louis determined no longer to clog him with an aſſociate; but, with the title of Director-general of the Finances, ſubmitted to him the entire management of the funds and revenue of France. In the enſuing year, the count de St Germains, ſecretary at war, died; and the prince de Montbarey, who had already filled an inferior ſituation in that department, was now appointed to ſucceed him.

In the mean time, Louis's negociations with foreign courts were not neglected. He concluded a new treaty of alliance with Switzerland; vigilantly obſerved the motions of the different princes of Germany on the death of the elector of Bavaria; and when cloſely queſtioned by the Engliſh ambaſſador Lord Stormont, reſpecting the various warlike preparations which were diligently continued through the kingdom, he replied, That at a time when the ſeas were covered with Engliſh fleets and American cruizers, and when ſuch armies were ſent to the New World as had never before appeared there, it became prudent for him alſo to arm for the ſecurity of the colonies and the protection of the commerce of France. The king was not ignorant at the ſame time, that the remonſtrances of Great Britain, and the importunities of the agents of the United States, would ſoon compel him to adopt ſome deciſive line of conduct. This was haſtened by a new event diſaſtrous to Britain; the failure of general Burgoyne's expedition, and the capture of his army. The news of that event was received at Paris with unbounded exultation. M. Sartine, the marine ſuperintendant, was eager to meaſure the naval ſtrength of France with that of Great Britain; the queen, who had long ſeconded the applications of the American agents, now eſpouſed their cauſe with freſh ardour; and the pacific inclinations of Louis being overborne by the ſuggeſtions of his miniſters and the influence of his queen, it was at length determined openly to acknowledge the independence of the United States.

173 An! at laſt openly acknowledge the independence of the United States.

Dr Franklin and Silas Deane, who had hitherto acted as private agents, were now acknowledged as public ambaſſadors from thoſe ſtates to the court of Verſailles; and a treaty of amity and commerce was ſigned between the two powers in the month of February 1778. The duke of Noailles, ambaſſador to the court of London, was in the month of March inſtructed to acquaint that court with the above treaty. At the ſame time he declared, that the contracting parties had paid great attention not to ſtipulate any excluſive advantages in favour of France, and that the United States had reſerved the liberty of treating with every nation whatever on the ſame footing of equality and reciprocity. But this ſtipulation was treated by the Britiſh with contempt; and the recal of Lord Stormont, their ambaſſador at Verſailles, was the ſignal for the commencement of hoſtilities.—The events produced by this war are related under the articles AMERICA, BRITAIN, and INDOSTAN. Here our chief buſineſs is with domeſtic tranſactions, the meaſures of the cabinet, and the internal economy of the ſtate.

In the year 1780, new changes in the French miniſtry took place. M. Bertin had reſigned the office of ſecretary of ſtate; the prince de Montbarey had retired from the poſt of ſecretary at war, and was ſucceeded by the marquis de Segur. But the moſt important removal was that of M. Sartine, who had for ſeveral years preſided over the marine department, and whoſe unwearied application and ability had raiſed the naval power of France to a height that aſtoniſhed Europe: but his colleagues in the cabinet loudly accuſed a profuſion, which would have diverted into one channel the whole reſources of the kingdom; and his retreat opened a road to the ambition of the marquis de Caſtries, who was appointed to ſupply his place.

174 Removal of M. de Sartine.

This year, the king fixed on the anniverſary of his birth-day to render it memorable by a new inſtance of humanity; and he aboliſhed for ever the inhuman cuſtom of *putting the queſtion*, as it was called, by torture; a cuſtom which had been ſo eſtabliſhed by the practice of ages, that it ſeemed to be an inſeparable part of the

France. the conſtitution of the courts of juſtice in France. At the ſame time, to defray the charges of war, he continued to diminiſh his own expenditure; and ſacrificing his magnificence to the eaſe of his ſubjects, diſmiſſed at once above 400 officers belonging to his court.

175 Diſmiſſion of M. Necker. Unhappily, however, the popular diſcontents were excited next year by the diſmiſſion of their favourite miniſter M. Necker. He had conceived the arduous but popular project of ſupporting a war by loans without taxes; and the rigid economy which he had introduced into all the departments of the royal houſehold, and the various reſources that preſented themſelves to his fertile genius, had ſupported him amidſt the difficulties that attended this ſyſtem. But his auſterity of temper had not rendered him equally acceptable to the ſovereign and his ſubjects; and the repeated reforms he had recommended were repreſented as inconſiſtent with the dignity of the crown: he was therefore in 1781 diſmiſſed from his office of comptroller-general; and M. Joli de Fleuri, counſellor of ſtate, was appointed to that important department. The defeat of the count de Graſſe happened next year, and impreſſed the kingdom with general grief and conſternation. Immenſe preparations were, however, made for the operations of 1783; and in conjunction with the courts of Madrid and the Hague, Louis was determined this year to make the moſt powerful efforts to bring the war to a concluſion. But in the midſt of theſe preparations,

176 Peace concluded. the voice of peace was again heard; and Louis was induced to liſten to the proffered mediation of the two firſt protentates in Europe, the emperor of Germany and the empreſs of Ruſſia. The count de Vergennes, who ſtill occupied the poſt of ſecretary of foreign affairs, was appointed to treat with Mr Fitzherbert the Britiſh miniſter at Bruſſels, but who had lately proceeded to Paris to conduct this important negociation. The way was already ſmoothed for the reſtoration of the public tranquillity, by proviſional articles ſigned at the concluſion of the laſt year between the States of America and Great Britain, and which were to conſtitute a treaty of peace finally to be concluded when that between France and Great Britain took place. Preliminary articles were accordingly agreed upon and ſigned at Verſailles: theſe were ſoon after ſucceeded by a definitive treaty; and France, throughout her extenſive dominions, beheld peace once more eſtabliſhed. Though the late war had been attended by the moſt brilliant ſucceſs, and the independence of America ſeemed to ſtrike deep at the ſource of her rival's power, yet France herſelf had not been entirely free from inconvenience. The retreat of M. Necker had, as we have already obſerved, diminiſhed the public confidence; three different perſons who had ſince tranſiently occupied his poſt, increaſed the jealouſies of

177 Of the Caiſſe d'Eſcompe. the people; and the failure of the celebrated Caiſſe d'Eſcompte completed the univerſal conſternation.

That bank had been eſtabliſhed in the year 1776. The plan of it was formed by a company of private adventurers, and its capital was fixed at L.500,000 Sterling. The profeſſed deſign of the Company was to diſcount bills at ſhort dates, at the rate of four *per cent. per annum*: but as this intereſt could never be an equivalent for the capital ſunk by the proprietors, they were entruſted with the additional power of iſſuing notes to the amount of their capital, which, as they were capable at any time of being converted into ſpecie, might be often voluntarily taken by their cuſtomers from mere convenience. The reputation of the bank ſoon cauſed its ſtock to fell above par; and its credit was ſtill at the higheſt, when to the aſtoniſhment of the nation it ſuddenly ſtopped payment on the 2d of October 1783. The cauſe aſſigned was an uncommon ſcarcity of ſpecie: But the public ſuſpected that the failure aroſe from a loan ſecretly made to government; and what confirmed the ſuſpicion was, that government about the ſame time ſtopped payment of the bills drawn upon them by their army in America.

Whatever was the cauſe of this event, the king was prevailed on to extend his protection to the company. By four ſucceſſive edicts the banks in Paris were ordered to receive the notes of the Caiſſe d'Eſcompte as currency; and a lottery with a ſtock of one million Sterling, redeemable in eight years, being eſtabliſhed, the tickets were made purchaſable in notes of the Caiſſe d'Eſcompte. By theſe expedients the public confidence in that bank was revived, its buſineſs increaſed, and its ſtock roſe to above double the original ſubſcription; the bills from America were at the ſame time put in a train of payment, and public credit was reſtored throughout the kingdom. Some compenſation alſo for the expences that had been incurred during the late war, was drawn from a treaty with the United States of America. Theſe engaged to reimburſe France in the ſum of 18 million of livres, which had been advanced in the hour of their diſtreſs; and Louis conſented to receive the money, as more convenient to the States, in the ſpace of 12 years, by 12 equal and annual payments.

The general peace was ſoon after followed by a particular treaty between France and Holland, which was effected with great addreſs by the Count de Vergennes. It included all the principles which can ſerve to cement in the cloſeſt union diſtinct nations under diſtinct governments; and by which they may mutually participate, in peace or in war, of good or of evil; and in all caſes adminiſter the moſt perfect aid, counſel, and ſuccour to each other. It alſo preſcribed, if their united good offices for the preſervation of peace ſhould prove ineffectual, the aſſiſtance they were to afford each other by ſea and land. France was to furniſh Holland with 10,000 effective infantry, 2000 cavalry, with 12 ſhips of the line and 6 frigates. Their High Mightineſſes, on the other ſide, in caſe of a marine war, or that France ſhould be attacked by ſea, were to contribute to her defence ſix ſhips of the line and three frigates; and in caſe of an attack on the territory of France, the States-general were to have the option of furniſhing their land contingent either in money or troops, at the eſtimate of 5000 infantry and 1000 cavalry. Further, if the ſtipulated ſuccours ſhould be inſufficient for the defence of the party attacked, or for procuring a proper peace, they engaged to aſſiſt each other with all their forces, if neceſſary; it being however agreed that the contingent of troops to be furniſhed by the States-general ſhould not exceed 20,000 infantry and 4000 cavalry. It was further added, that neither of the contracting powers ſhould diſarm, or make or receive propoſals of peace or truce, without the conſent of the other: they promiſed alſo not to contract any future alliance or engagement whatever,

178 Treary between France Holland

ever, directly or indirectly, contrary to the present treaty; and on any treaties or negociations being proposed which might prove detrimental to their joint interest, they pledged their faith to give notice to each other of such proposals as soon as made.

Thus was Holland now converted into the firm ally of that power against whose encroaching spirit she had formerly armed the most powerful kingdoms of Europe; while France having asserted the independence of America against Great Britain, and having converted an ancient and formidable foe into an useful friend, seemed to have attained an influence over the nations of the earth that she had never before been possessed of.

But however exalted her present situation might appear, the seeds of future commotion were already apparent to an attentive observer. The applause that had attended the parliament of Paris in their struggles with the late king might be considered as the first dawn of freedom; the language of that assembly had boldly inculcated to their countrymen their natural rights, and taught them to look with a less enraptured eye on the lustre that encompassed the throne. The war in America had contributed to enlarge the political ideas of the French: they had on that occasion stood forth as the champions of liberty, in opposition to regal power; and the officers, who had acted on that conspicuous theatre, accustomed to think and speak without restraint, on their return imparted to the provinces of France the flame of freedom which had been kindled in the wilds of America. From that moment the French, instead of silently acquiescing under the edicts of their sovereign, canvassed each action with bold and rigid impartiality; while the attachment of the army, which has ever been considered as the sole foundation of despotism, gave way to the noble enthusiasm of liberty.

We have already noticed the public dissatisfaction that had attended the dismission of M. Necker; his transient successor, M. de Fleury, had retired from the management of the finances in 1783, and the more transient administration of M. d'Ormesson had expired in the same year that gave it birth. On his retreat, M. de Calonne, who had successively filled with acknowledged reputation the office of intendant of Mentz, and afterwards of the provinces of Flanders and Artois, was nominated to the post of comptroller-general. This gentleman, flexible and insinuating, eloquent in conversation and polished in his manners, fertile in resources and liberal in the disposal of the public money, soon rendered himself acceptable to the sovereign. But he did not enter upon his new and arduous station favoured by the breath of popularity: he was reported to be more able than consistent, and not to have tempered the ardour of his spirit by the severity of deep research; and the people, amidst repeated loans, regretted that severe simplicity which had characterised the administration of M. Necker.

It was the bold and judicious measures of Calonne, however, that restored credit to the Caisse d'Escompte, which had stopped payment a few weeks before his accession. His next measure, in 1784, the establishment of the Caisse d'Amortissement or sinking fund, was intitled to a still higher degree of applause. The plan of that fund was simple and moderate: It was to pay annually by government, into the hands of a board set apart for that purpose, the entire interest of the national debts, whether in stock or annuities, together with an additional sum of L.120,000. The annuities that would be extinguished every year were estimated at L.50,000; and in that proportion, the sum set apart for the redemption of the national debt would annually increase. The operation of this new fund was limited to the term of 25 years; and during that term the annual receipt of the Caisse d'Amortissement is declared unalterable, and incapable of being diverted to any other object. France.

The principal measure of the next year was the establishment of a new East India Company, the constitutions of which have been already detailed in a preceding volume of this work, under the article COMPANY; see Vol. V. p. 247, 248: A measure not equally commendable with the preceding, and which did not fail to excite violent complaints. The time, however, was now approaching, when the necessities of the state would compel him to measures still more unpopular, and destined to undergo a severer scrutiny. Although peace had been re-established throughout Europe for three years, yet the finances of France seemed scarce affected by this interval of tranquillity, and it was found requisite to close every year with a loan. The public expenditure of 1785 might probably seem to sanction this measure. It had been thought proper to fortify Cherbourg upon a large and magnificent scale; the claim of the emperor to the navigation of the Scheldt, had obliged the French to increase their land forces, either to form a respectable neutrality, or to assist effectually their Dutch allies; and the marquis de Castries, fond of war and profuse in his designs, had not suffered the navy, which M. Sartine had surrendered into his hands, to decline during the interval of peace. The treaty of commerce concluded in the year 1785 with Great Britain was a new source of discontent. Though regarded by the English manufacturers as far from advantageous, it excited in France still louder murmurs. It was represented as likely to extinguish those infant establishments, which were yet unable to vie with the manufactures of England that had attained to maturity; and the market that it held out for the wines and oils of France was passed over in silence, while the distress of the artisan was painted in the most striking colours. But when the edict for registering the loan at the conclusion of the last year, and which amounted to the sum of three millions three hundred and thirty thousand pounds, was presented to the parliament of Paris, the murmurs of the people, through the remonstrances of that assembly, assumed a more legal and formidable aspect. The king however signified to the select deputation that were commissioned to convey to him their remonstrances, that he expected to be obeyed without farther delay. The ceremony of the registering accordingly took place on the next day; but it was accompanied with a resolution, importing, "that public economy was the only genuine source of abundant revenue, the only means of providing for the necessities of the state, and restoring that credit which borrowing had reduced to the brink of ruin."

The king was no sooner informed of this step, than he commanded the attendance of the grand deputation of parliament; when he erased from their records the

France. the reſolution that had been adopted; and obſerved, that though it was his pleaſure that the parliament ſhould communicate, by its reſpectful repreſentations, whatever might concern the good of the public, yet he never would allow them ſo far to abuſe his clemency as to erect themſelves into the cenſors of his government. At the ſame time, more ſtrongly to mark his diſpleaſure at their expoſtulations, he ſuperſeded one of their officers, who had appeared moſt active in forwarding the obnoxious reſolution.

M. de Calonne, however, though gratified by the approbation of his ſovereign, could not but feel himſelf deeply mortified by the oppoſition of the parliament. His atempts to conciliate that aſſembly had proved ineffectual; and he experienced their inflexible averſion at the critical juncture when their acquieſcence might have proved of the moſt eſſential ſervice. An anxious inquiry into the ſtate of the public finances had convinced him that the expenditure by far exceeded the revenue. In this ſituation, to impoſe new taxes was impracticable; to continue the method of borrowing was ruinous; to have recourſe only to economical reforms, would be found wholly inadequate; and he heſitated not to declare, that it would be impoſſible to place the finances on a ſolid baſis, but by the reformation of whatever was vicious in the conſtitution of the ſtate.

To give weight to this reform, M de Calonne was ſenſible that ſomething more was neceſſary than the royal authority; he perceived that the parliament was neither a fit inſtrument for introducing a new order into public affairs. nor would ſubmit to be a paſſive machine for ſanctioning the plans of a miniſter, even if thoſe plans were the emanations of perfect wiſdom. Though originally a body of lawyers, indebted for their appointments to the king, there was not an attribute of genuine legiſlative aſſembly but what they ſeemed deſirous to engroſs to themſelves; and they had been ſupported in their pretenſions by the plaudits of the people, who were ſenſible that there was no other body in the nation that could plead their cauſe againſt royal or miniſterial oppreſſion. To ſuppreſs, therefore, the only power of control that remained, and to render the government more arbitrary, was deemed too perilous a meaſure: yet to leave the parliament in the full poſſeſſion of their influence, an influence that the miniſter was convinced would be exerted againſt him, was at once to render his whole ſyſtem abortive.

In this dilemma, the only expedient that ſuggeſted itſelf was to have recourſe to ſome other aſſembly, more dignified and ſolemn in its character, and which ſhould in a greater degree conſiſt of members from the various orders of the ſtate and the different provinces of the kingdom. This promiſed to be a popular meaſure; it implied a deference to the people at large, and might be expected to prove highly acceptable. But the true and legitimate aſſembly of the nation, the ſtates-general, had not met ſince the year 1614; nor could the miniſter flatter himſelf with the hope of obtaining the royal aſſent to a meeting which a deſpotic ſovereign could not but regard with ſecret jealouſy.

181 Aſſembly of the Notables. Another aſſembly had occaſionally been ſubſtituted in the room of the ſtates-general: this was diſtinguiſhed by the title of the *Notables*; and conſiſted of a number of perſons from all parts of the kingdom, chiefly ſelected from the higher orders of the ſtate, and nominated by the king himſelf. This aſſembly had been convened by Henry IV. again by Louis XIII. and was now once more ſummoned by the authority of the preſent monarch. France.

The writs for calling them together were dated on the 29th of December 1786; and they were addreſſed to ſeven princes of the blood, nine dukes and peers of France, eight field-mareſchals, twenty-two nobles, eight counſellors of ſtate, four maſters of requeſts, eleven archbiſhops and biſhops, thirty-ſeven of the heads of the law, twelve deputies of the *pays d'etats*, the lieutenant civil, and twenty-five magiſtrates of the different towns of the kingdom. The number of members was 144; and the 29th of January 1787 was the period appointed for their meeting.

Upon the arrival of the Notables at Paris, however, the miniſter found himſelf yet unprepared to ſubmit his ſyſtem to their inſpection, and poſtponed the opening of the council to the 7th of February. A ſecond delay to the 14th of the ſame month was occaſioned by the indiſpoſition of M. de Calonne himſelf, and that of the count de Vergennes preſident of the council of finance and firſt ſecretary of ſtate; and a third procraſtination was the neceſſary reſult of the death of the count on the day previous to that fixed for the opening of the meeting. He was ſucceeded in the department of foreign affairs by the count de Montmorin, a nobleman of unblemiſhed character. But his loſs at this critical juncture was ſeverely felt by M. de Calonne; he alone, of all the miniſters, having entered with warmth and ſincerity into the plans of the comptroller-general. The chevalier de Miromeſnil, keeper of the ſeals, was avowedly the rival and enemy of that ſtateſman. The mareſchal de Caſtries, ſecretary for the marine department, was perſonally attached to M. Necker; and the baron de Breteuil, ſecretary for the houſehold, was the creature of the queen, and deeply engaged in what was called the Auſtrian ſyſtem.

182 Splendid project of M de Calonne. It was under theſe difficulties that M. de Calonne, on the 22d of February, firſt met the aſſembly of the Notables, and opened his long expected plan. He began by ſtating, that the public expenditure had for centuries paſt exceeded the revenue, and that a very conſiderable deficiency had of courſe exiſted; that the Miſſiſſippi ſcheme of 1720 had by no means, as might have been expected, reſtored the balance; and that under the economical adminiſtration of cardinal Fleury the deficit ſtill exiſted; that the progreſs of this derangement under the laſt reign had been extreme; the deficiency amounting to three millions ſterling at the appointment of the abbé Terray; who, however, reduced it to one million ſix hundred and ſeventy-five thouſand pounds; it decreaſed a little under the ſhort adminiſtrations that followed, but roſe again in conſequence of the war, under the adminiſtration of M. Necker; and at his own acceſſion to office, it was three millions three hundred and thirty thouſand pounds.

In order to remedy this growing evil, M. Calonne recommended a territorial impoſt, in the nature of the England land-tax, from which no rank or order of men were to be exempted; and an enquiry into the poſſeſſions

France. poſſeſſions of the clergy, which hitherto had been deemed ſacred from their proportion of the public burdens: the various branches of internal taxation were alſo to undergo a ſtrict examination; and a conſiderable reſource was preſented in mortgaging the demeſne lands of the crown.

The very neceſſity for theſe reforms was combated with a degree of boldneſs and force of reaſoning that could not fail of deeply impreſſing the aſſembly; and inſtead of meeting with a ready acquieſcence, the comptroller-general was now launched into the boundleſs ocean of political controverſy. M. Necker, previous to his retirement, had publiſhed his Compte rendu au Roi, in which France was repreſented as poſſeſſing a clear ſurplus of 425,000 pounds ſterling: this performance had been read with avidity, and probably contributed to eſtrange from the author the royal countenance; but the credit of it was ably vindicated by M. de Brienne archbiſhop of Thouloufe.

183 Oppoſed by Mirabeau and the biſhop of Thouloufe:

M. de Calonne met with a ſtill more formidable adverſary in the count de Mirabeau. This extraordinary man, reſtleſs in his diſpoſition, licentious in his morals, but bold, penetrating, and enterpriſing, had occaſionally viſited every court in Europe. He had been admitted at one time to the confidence of the miniſter; and had been directed, though in no oſtenſible character, to obſerve at Berlin the diſpoſition of the ſucceſſor of the great Frederic: in this capacity he was frequently expoſed to neglect and diſappointment; his letters were often left unanſwered; diſguſt ſucceeded to admiration; and he who had entered the Pruſſian court the intimate friend, returned to Paris the avowed enemy, of M. de Calonne: While the archbiſhop arraigned the underſtanding, the count impeached the integrity, of the comptroller-general.

The eloquence of M. de Calonne, however, might have ſucceſsfully vindicated his ſyſtem and reputation againſt the calculations of Brienne, and the invectives of Mirabeau; but he could not ſupport himſelf againſt the influence of the three great bodies of the nation.

184 And by the principal nobility, clergy, and magiſtrates.

The ancient nobility and the clergy had ever been free from all public aſſeſſments; and had the evil gone no farther, it might have been ſtill perhaps borne with patience; but through the ſhameful cuſtom of ſelling patents of nobility, ſuch crowds of new nobleſſe ſtarted up, that every province in the kingdom was filled with them. The firſt object with thoſe who had acquired fortunes rapidly, was to purchaſe a patent; which, beſides gratifying their vanity, afforded an exemption to them and their poſterity from contributing proportionably to the exigencies of the ſtate; the magiſtracies likewiſe throughout the kingdom enjoyed their ſhare of theſe exemptions; ſo that the whole weight of the taxes fell on thoſe who were leaſt able to bear them.

The miniſter's deſign, then, of equalizing the public burdens, and by rendering the taxes general diminiſhing the load borne by the lower and moſt uſeful claſſes of people, though undoubtedly great and patriotic, at once united againſt him the nobility, the clergy, and the magiſtracy; and the event was ſuch as might be expected: the intrigues of thoſe three bodies raiſed againſt him ſo loud a clamour, that finding it impoſſible to ſtem the torrent, he not only reſigned his place on the 12th of April, but ſoon after retired to England from the ſtorm of perſecution. France.

185 Upon which M. de Calonne reſigns.

In the midſt of theſe tranſactions at home, Louis's attention was alſo called to the ſtate of affairs in the republic of Holland, his new and cloſe ally. The prince of Orange had been ſtripped of all authority by the ariſtocratic party; and, retiring from the Hague, maintained the ſhadow of a court at Nimeguen. His brother-in-law, however, the new king of Pruſſia, exerted his endeavours to promote the intereſts of the ſtadtholder; and having offered, in concert with France, to undertake the arduous taſk of compoſing the differences which diſtracted the republic, the propoſal was received with apparent cordiality by the court of Verſailles. At the ſame time it could ſcarce be expected that France would become the inſtrument of reſtoring the prince of Orange to that ſhare of power which he had before occupied, and thus abandon one of the longeſt and moſt favourite objects of her policy, the eſtabliſhing a ſupreme and permanent controul in the affairs of Holland. In fact, the conditions which were framed by the Louveſtein faction, as the baſis of reconciliation, were ſuch as plainly indicated their deſign to reduce the influence and authority of the ſtadtholder within very narrow limits. On his renouncing his right of filling up the occaſional vacancies in the town ſenates, he was to be reſtored to the nominal office of captain-general: but he was to be reſtrained from marching the troops into or out of any province, without leave from the reſpective provinces concerned; and he was alſo to ſubſcribe to a reſolution paſſed ſome time before by the ſenate of Amſterdam, that the command ſhould at all times be revocable at the pleaſure of the ſtates. Had the prince acquieſced in theſe preliminaries, France would have completely attained the object of her long negociations, and by means of the Louveſtein faction have acquired the aſcendency that ſhe had repeatedly ſought in the councils of Holland. But under the difficulties that ſurrounded him, the prince of Orange was admirably ſupported and aſſiſted by the genius, the ſpirit, and the abilities of his conſort: ſhe firmly rejected every meaſure tending to abridge any rights that had been attached to the office of ſtadtholder; and M. de Rayneval, the French negociator, having in vain endeavoured to overcome her reſolution, broke off the correſpondence between the Hague and Nimeguen, and returned to Paris about the middle of January 1787.

186 Diſturbances in Holland.

The events that enſued will be found detailed under a ſubſequent article. It is only neceſſary to obſerve in this place, that the republican party were totally diſappointed in their hopes from France. The court of Verſailles had indeed long truſted to the natural ſtrength of the republican party, and had been aſſiduous during the whole ſummer in endeavouring to ſecond them by every ſpecies of ſuccours that could be privately afforded. Crowds of French officers arrived daily in Holland; and either received commiſſions in the ſervice of the ſtates, or acted as volunteers in their troops. Several hundreds of tried and experienced ſoldiers were ſelected from different regiments; and being furniſhed with money for their journey, and aſſurances of future favour, were diſpatched in ſmall parties to join the troops, and help to diſcipline the

187 Attempts of the French to ſupport the republican party.

France. burghers and volunteers. A conſiderable corps of engineers were alſo directed to proceed ſilently and in diſguiſe towards Amſterdam, and to aſſiſt in ſtrengthening the works of that city. Theſe aids, which might have proved effectual had the conteſt been confined to the ſtates of Holland and the ſtadtholder, were overwhelmed in the rapid invaſion of the Pruſſians; and the court of Berlin had taken its meaſures with ſo much celerity, and the ſituation of the republicans was already become ſo deſperate, that it was doubtful whether their affairs could be reſtored by any aſſiſtance that France was capable of immediately adminiſtering. Yet on Great Britain ſitting out a ſtrong ſquadron of men of war at Portſmouth to give confidence to the operations of the king of Pruſſia, the court of Verſailles alſo ſent orders to equip 16 ſail of the line at Breſt, and recalled a ſmall ſquadron which had been commiſſioned on a ſummer's cruiſe on the coaſt of Portugal. But in theſe preparations Louis ſeemed rather to regard his own dignity, than to be actuated by any hopes of effectually relieving his allies. All oppoſition in Holland might be already conſidered as extinguiſhed. The ſtates aſſembled at the Hague had officially notified to the court of Verſailles, that the diſputes between them and the ſtadtholder were now happily terminated; and as the circumſtances which gave occaſion for their application to that court no longer exiſted, ſo the ſuccours which they had then requeſted would now be unneceſſary.

Under theſe circumſtances, France could only with to extricate herſelf from her preſent difficulty with honour. She therefore readily liſtened to a memorial from the Britiſh miniſter at Paris; who propoſed, in order to preſerve the good underſtanding between the two crowns, that all warlike preparations ſhould be diſcontinued, and that the naveys of both kingdoms ſhould be again reduced to the footing of a peace eſtabliſhment. This was gladly acceded to by the court of Verſailles; and that harmony which had been tranſiently interrupted between the two nations was reſtored.

188 Domeſtic concerns of France.

Though the French king could not but ſenſibly feel the mortification of thus relinquiſhing the aſcendeney which he had attained in the councils of Holland, the ſtate of his own domeſtic concerns and the internal ſituation of his kingdom furniſhed matter for more ſerious reflection. The diſmiſſion of M. de Calonne had left France without a miniſter, and almoſt without a ſyſtem; and though the king bore the oppoſition of the Notables with admirable temper, yet the diſappointment that he had experienced ſunk deep into his mind. Without obtaining any relief for his moſt urgent neceſſities, he perceived too late that he had opened a path to the reſtoration of the ancient conſtitution of France, which had been undermined by the crafty Louis XI. and had been nearly extinguiſhed by the daring and ſanguinary counſels of Richlieu under Louis XIII. The Notables had indeed demeaned themſelves with reſpect and moderation, but at the ſame time they had not been deficient in firmneſs.

189 Aſſembly of the Notables diſſolved.

The appointment of the archbiſhop of Thouloufe, the vigorous adverſary of M. de Calonne, to the office of comptroller-general, probably contributed to preſerve the appearance of good humour in that aſſembly; yet the propoſed territorial impoſt, or general land tax, which was an object ſo ardently coveted by the court, was rejected. Louis, therefore, deprived of any farther hope of rendering the convention ſubſervient to his embarraſſments, determined to diſſolve the aſſembly; which he accordingly did, with a very moderate and conciliatory ſpeech to the members on their diſmiſſion. France.

190 Refuſal of the parliament to regiſter the new taxes.

Thus diſappointed of the advantage which he had flattered himſelf he would have drawn from the acquieſcence of the Notables, the king was obliged now to recur to the uſual mode of raiſing money by the royal edicts; among the meaſures propoſed for which purpoſe were the doubling of the poll-tax, the re-eſtabliſhment of the third twentieth, and a ſtamp-duty. But the whole was ſtrongly diſapproved by the parliament of Paris; and that aſſembly, in the moſt poſitive terms, refuſed to regiſter the edict. Louis was obliged to apply, as the laſt reſort, to his abſolute authority; and, by holding what is called *a bed of juſtice*, compelled them to inroll the impoſt.

The parliament, though defeated, were far from ſubdued; and on the day after the king had held his bed of juſtice, they entered a formal proteſt againſt the edict; declaring, "that it had been regiſtered againſt their approbation and conſent, by the king's expreſs command; that it neither ought nor ſhould have any force; and that the firſt perſon who ſhould preſume to attempt to carry it into execution, ſhould be adjudged a traitor, and condemned to the galleys." This ſpirited declaration left the king no other alternative, than either proceeding to extremities in ſupport of his authority, or relinquiſhing for ever after the power of raiſing money upon any occaſion without the conſent of the parliament. Painful as every appearance of violence muſt have proved to the mild diſpoſition of Louis, he could not conſent to ſurrender, without a ſtruggle, that authority which had been ſo long exerciſed by his predeceſſors. Since the commencement of the preſent diſcontents, the capital had been gradually filled with conſiderable bodies of troops; and about a week after the parliament had entered the proteſt, an officer of the French guards, with a party of ſoldiers, went at break of day to the houſe of each individual member, to ſignify to him the king's command, that he ſhould immediately get into his carriage, and proceed to Troyes, a city of Champagne, about 70 miles from Paris, without writing or ſpeaking to any perſon out of his own houſe before his departure.

191 The members baniſhed.

Theſe orders were ſerved at the ſame inſtant; and before the citizens of Paris were acquainted with the tranſaction, their magiſtrates were already on the road to their place of baniſhment.

Previous to their removal, however, they had preſented a remonſtrance on the late meaſures of government, and the alarming ſtate of public affairs. In ſtating their opinions on taxes, they declared, that neither the parliaments, nor any other authority, excepting that of the three eſtates of the kingdom collectively aſſembled, could warrant the laying of any permanent tax upon the people; and they ſtrongly enforced the renewal of thoſe national aſſemblies, which had rendered the reign of Charlemagne ſo great and illuſtrious.

This requiſition of the parliaments to re-eſtabliſh the

France

the national council, or ſtates-general, was the more honourable, as the former aſſemblies muſt have ſunk under the influence of the latter, and returned to their original condition of mere regiſters and courts of law. The confidence and attachment of the people of conſequence roſe in proportion to this inſtance of diſintereſtedneſs; their murmurs were openly expreſſed in the ſtreets of the capital, and the general diſſatisfaction was augmented by the ſtop that was put to public buſineſs by the exile of the parliament.

The cabinet at the ſame time was apparently weak, diſunited, and fluctuating; and continual changes took place in every department of the ſtate. Louis, averſe to rigorous counſels, wiſhed to allay the growing diſcontent by every conceſſion that was conſiſtent with his dignity; but it was generally believed, that the queen ſtrongly diſſuaded him from any ſtep that might tend to the diminution of the royal authority. The influence of that princeſs in the cabinet was undoubtedly great: but the popularity which once had accompanied her was no more; and ſome imputations of private levity, which had been rumoured through the capital, were far from rendering her acceptable to the majority of the people; while the count d'Artois, the king's brother, who had expreſſed himſelf in the moſt unguarded terms againſt the conduct of the parliament, ſtood expoſed to all the conſequences of popular hatred.

Nor was it only in the capital that the flame of liberty once more burſt forth; it blazed with equal ſtrength in the provincial parliaments. Among various inſtances of this nature, the parliament of Grenoble paſſed a decree againſt *lettres de cachet*, the moſt odious engine of arbitrary power; and declared the execution of them within their juriſdiction, by any perſon, and under whatever authority, to be a capital crime.

The king had endeavoured to ſoothe the Pariſians by new regulations of economy, and by continual retrenchments in his houſehold: but theſe inſtances of attention, which once would have been received with the loudeſt acclamations, were now diſregarded under their affliction for the abſence of their parliament. His majeſty, therefore, in order to regain the affections of his ſubjects, conſented to reſtore that aſſembly; abandoning at the ſame time the ſtamp-duty and the territorial impoſt, which had been the ſources of diſpute. Theſe meaſures were, however, inſufficient to eſtabliſh harmony between the court and the parliament. The neceſſities of the ſtate ſtill continued; nor could the deficiency of the revenue be ſupplied but by extraordinary reſources, or a long courſe of rigid frugality. About the middle of November 1787, in a full meeting of the parliament, attended by all the princes of the blood and the peers of France, the king entered the aſſembly, and propoſed two edicts for their approbation: one was for a new loan of 450 millions, near 19 millions ſterling: the other was for the re-eſtabliſhment of the Proteſtants in all their ancient civil rights; a meaſure which had long been warmly recommended by the parliament, and which was probably now introduced to procure a better reception to the loan.

192 Recalled.

On this occaſion, the king delivered himſelf in a ſpeech of uncommon length, filled with profeſſions of regard for the people, but at the ſame time ſtrongly expreſſive of the obedience he expected to his edicts. Louis probably imagined, that the dread of that baniſhment from which the members had been ſo lately recalled, would have enſured the acquieſcence of the aſſembly; but no ſooner was permiſſion announced for every member to deliver his ſentiment, than he was convinced that their ſpirits remained totally unſubdued. An animated debate took place, and was continued for nine hours; when the king, wearied by perpetual oppoſition, and chagrined at ſome freedoms uſed in their debates, ſuddenly roſe, and commanded the edict to be regiſtered without further delay. This meaſure was moſt unexpectedly oppoſed by the duke of Orleans, firſt prince of the blood; who, conſidering it as an infringement of the rights of parliament, proteſted againſt the whole proceedings of the day as being thereby null and void. Though Louis could not conceal his aſtoniſhment and diſpleaſure at this deciſive ſtep, he contented himſelf with repeating his orders; and immediately after, quitting the aſſembly, retired to Verſailles. On the king's departure, the parliament confirmed the proteſt of the duke of Orleans; and declared, that as their deliberations had been interrupted, they conſidered the whole buſineſs of that day as of no effect.

193 Oppoſe the edict for a loan.

It was not to be ſuppoſed that Louis would ſuffer ſo bold an attack on his power with impunity. Accordingly a letter was next day delivered to the duke of Orleans, commanding him to retire to Villars Cotterel, one of his ſeats about 15 leagues from Paris, and to receive no company there except his own family; at the ſame time the Abbé Sabatiere and M. Freteau, both members of the parliament, and who had diſtinguiſhed themſelves in the debate, were ſeized under the authority of lettres de cachet, and conveyed, the firſt to the caſtle of Mont St Michel in Normandy, the laſt to a priſon in Picardy. This act of deſpotiſm did not fail immediately to rouſe the feelings of the parliament. On the following day they waited on the king, and expreſſed their aſtoniſhment and concern that a prince of the blood royal had been exiled, and two of their members impriſoned, for having declared in his preſence what their duty and conſciences dictated, and at a time when his majeſty had announced that he came to take the ſenſe of the aſſembly by a plurality of voices. The anſwer of the king was reſerved, forbidding, and unſatisfactory; and tended to increaſe the reſentment of the parliament. At the ſame time, it did not prevent them from attending to the exigencies of the ſtate; and convinced of the emergency, they conſented to regiſter the loan for 450 millions of livres, which had been the ſource of this unfortunate difference. This conceſſion contributed to ſoften the mind of the king, and the ſentence of the two magiſtrates was in conſequence changed from impriſonment to exile; M Freteau being ſent to one of his country-ſeats, and the Abbé Sabatiere to a convent of Benedictines.

194 Duke of Orleans and two members baniſhed.

195 Strong remonſtrances of the parliament.

The parliament however was not to be ſoothed by that meaſure to give up the points againſt which they had originally remonſtrated. In a petition conceived with freedom, and couched in the moſt animated language, they boldly reprobated the late acts of arbitrary violence, and demanded the entire liberation of the perſons againſt whom they had been exerted. We have already noticed the fluctuating counſels of the court of

France.

Verſailles; and that Louis, as often as he was left to purſue his own inclinations, adopted meaſures of reconciliation. On the preſent occaſion, in the beginning of the year 1788, he recalled the duke of Orleans to court, who ſoon after obtained leave to retire to England; and he permitted the return of the abbé Sabatiere and M. Freteau to the capital.

196 Duke of Orleans recalled.

The parliament however had not confined their demands to the liberation of thoſe gentlemen; but had alſo echoed the remonſtrances of the parliament of Grenoble, and had loudly inveighed againſt the execution of *lettres de cachet*. Theſe repeated remonſtrances, mingled with perſonal reflections, ſeconded moſt probably the ſuggeſtions of the queen, and Louis was once more inſtigated to meaſures of ſeverity. Meſſ. d'Eſpremevil and Monſambert, whoſe bold and pointed harangues had preſſed moſt cloſely on the royal dignity, were doomed to experience its immediate reſentment. While a body of armed troops ſurrounded the hotel in which the parliament were convened, Colonel Degout entered the aſſembly, and ſecured the perſons of the obnoxious members, who were inſtantly conducted to different priſons. This new inſtance of arbitrary violence occaſioned a remonſtrance from parliament, which in boldneſs far exceeded all the former repreſentations of that aſſembly. They declared they were now more ſtrongly confirmed, by every proceeding, of the entire innovation which was aimed at in the conſtitution. "But, ſire," added they, "the French nation will never adopt the deſpotic meaſures to which you are adviſed, and whoſe effects alarm the moſt faithful of your magiſtrates: we ſhall not repeat all the unfortunate circumſtances which afflict us; we ſhall only repreſent to you with reſpectful firmneſs, that the fundamental laws of the kingdom *muſt* not be trampled upon, and that *your authority can only be eſteemed ſo long as it is tempered with juſtice.*"

197 New remonſtrances.

Language ſo pointed and deciſive, and which aſſerted the controlling power of the laws above the regal authority, could not fail of ſeriouſly alarming the king; and with a view to diminiſh the influence of parliament, it was determined again to convene the Notables. Accordingly, about the beginning of May, Louis appeared in that aſſembly; and after complaining of the exceſſes in which the parliament of Paris had indulged themſelves, and which had drawn down his reluctant indignation on a few of the members, he declared his reſolution, inſtead of annihilating them as a body, to recal them to their duty and obedience by a ſalutary reform. M. de la Moignon, as keeper of the ſeals, then explained his majeſty's pleaſure to eſtabliſh a *cour pleniere* or ſupreme aſſembly, to be compoſed of princes of the blood, peers of the realm, great officers of the crown, the clergy, mareſchals of France, governors of provinces, knights of different orders, a deputation of one member from every parliament, and two members from the chambers of council, and to be ſummoned as often as the public emergency, in the royal opinion, ſhould render it requiſite.

198 Aſſembly of the Notables.

If the aſſembly of the Notables liſtened in ſilent deference to the project of their ſovereign, the parliament of Paris received it with every ſymptom of averſion. That body ſtrongly proteſted againſt the eſtabliſhment of any other tribunal; and declared their final reſolution not to aſſiſt at any deliberations in the ſupreme aſſembly which his majeſty prepared to inſtitute. A more unexpected mortification occurred to the king in the oppoſition of ſeveral peers of the realm: theſe expreſſed their regret at beholding the fundamental principles of the conſtitution violated; and while they were laviſh in their profeſſions of attachment to the perſon of their ſovereign, concluded with apologizing for not entering on thoſe functions aſſigned them in the plenary court, as being inconſiſtent with the true intereſts of his majeſty, which were inſeparable from thoſe of the nation.

199 Oppoſition to the king's propoſals.

France.

The flame quickly ſpread throughout the more diſtant provinces; at Rennes in Brittany, and Grenoble in Dauphiné, the people broke out into acts of the moſt daring outrage. In the latter city ſeveral hundreds of the inhabitants periſhed in a conflict with the military; they yet maintained their ground againſt the regulars; and the commanding officer, at the intreaties of the firſt preſident, readily withdrew his troops from a conteſt into which he had entered with reluctance. The different parliaments of the kingdom at the ſame time expreſſed their feelings in the moſt glowing language; and ſtrongly urged the neceſſity of calling together the ſtates-general, the lawful council of the kingdom, as the only means of reſtoring the public tranquillity.

Louis now plainly ſaw, that a compliance with the public wiſhes for the re-eſtabliſhment of the ſtates-general was abſolutely neceſſary, in order to avoid the calamities of a civil war which impended upon his refuſal. In that event he muſt have expected to have encountered the majority of the people, animated by the exhortations and example of their magiſtrates: the peers of the realm had expreſſed the ſtrongeſt diſapprobation of his meaſures; nor could he even depend any longer on the ſupport of the princes of his blood; but what afforded moſt ſerious matter of alarm was the ſpirit lately diſplayed among the military, who, during the diſturbances in the provinces, had reluctantly been brought to draw their ſwords againſt their countrymen; and many of whoſe officers, ſo recently engaged in eſtabliſhing the freedom of America, publicly declared their abhorrence of deſpotiſm.

It was not, however, till after many a painful ſtruggle that Louis could reſolve to reſtore an aſſembly, whoſe influence muſt naturally overſhadow that of the crown, and whoſe juriſdiction would confine within narrow limits the boundleſs power he had inherited from his predeceſſor. In the two preceding reigns, the ſtates-general had been wholly diſcontinued; and though the queen-regent, during the troubles which attended the minority of Louis XIV. frequently expreſſed her intention of calling them together, ſhe was conſtantly diſſuaded by the repreſentations of Mazarin. It is probable that the preſent monarch ſtill flattered himſelf with the hope of being able to allure the members of that aſſembly to the ſide of the court; and having employed them to eſtabliſh ſome degree of regularity in the finances, and to curb the ſpirit of the parliaments, that he would again have diſmiſſed them to obſcurity.

Under theſe impreſſions an arret was iſſued in Auguſt, fixing the meeting of the ſtates general to the firſt of May in the enſuing year; and every ſtep was taken to ſecure the favourable opinion of the public during

200 Arret for ſummoning the ſtates-general.

France. during the interval. New arrangements took place in the adminiſtration; and M. Necker, whom the confidence of the people had long followed, was again introduced into the management of the finances: the torture, which by a former edict had been reſtricted in part, was now entirely aboliſhed; every perſon accuſed was allowed the aſſiſtance of counſel, and permitted to avail himſelf of any point of law; and it was decreed, that in future ſentence of death ſhould not be paſſed on any perſon, unleſs the party accuſed ſhould be pronounced guilty by a majority at leaſt of three judges.

The time appointed for the convention of the ſtates-general was now approaching; and the means of aſſembling them formed a matter of difficult deliberation in the cabinet. The laſt meeting, in 1614, had been convened by application to the bailiwicks. But this mode was liable to ſeveral ſtrong objections; the bailiwicks had been increaſed in number and juriſdiction, ſeveral provinces having ſince that period been united to France; and the numbers and quality of the members were no leſs an object of ſerious attention: it was not till the cloſe of the year, therefore, that the propoſal of M. Necker was adopted, which fixed the number of deputies at 1000 and upwards, and ordained that the repreſentatives of the third eſtate or commons ſhould equal in number thoſe of the nobility and clergy united.

The eyes of all Europe were now turned on the ſtates-general; but the moment of that aſſembly's meeting was far from auſpicious: The minds of the French had long been agitated by various rumours; the unanimity that had been expected from the different orders of the ſtates was extinguiſhed by the jarring pretenſions of each; and their mutual jealouſies were attributed by the ſuſpicions of the people to the intrigues of the court, who were ſuppoſed already to repent of the haſty aſſent which had been extorted. A dearth that pervaded the kingdom increaſed the general diſcontent; and the people, preſſed by hunger, and inflamed by reſentment, were ripe for revolt. The ſovereign alſo, equally impatient of the obſtacles he continually encountered, could not conceal his chagrin; while the influence of the queen in the cabinet was again eſtabliſhed, and was attended by the immediate removal of M. Necker. The diſmiſſion of that miniſter, ſo long the favourite of the public, was the ſignal of open inſurrection: the Pariſians aſſembled in myriads; the guards refuſed to oppoſe and ſtain their arms with the blood of their fellow-citizens; the count d'Artois and the moſt obnoxious of the nobility thought themſelves happy in eluding by flight the fury of the inſurgents; and in a moment a revolution was accompliſhed, the moſt remarkable perhaps of any recorded in hiſtory.

201 Inſurrections and revolution.

But that we may not take up room with an imperfect or dubious narration, we muſt defer giving any detail of particulars till ſome future opportunity, when the tide of innovation and reform now prevailing in that kingdom ſhall have ſubſided, and the government in one ſhape or another have attained a footing that promiſes to be durable. The objects of the revolution are many and arduous: and it is impoſſible to ſay, whether we may have yet to record their entire conſummation; or to recount a new train of events tending to ſhake the novel fabric, and to reſtore the puiſſance and the ſplendor of *royalty*, though the ſceptre of *deſpotiſm* ſhould be ſwayed no more. In ſhort, it is wiſhed to have an opportunity, not only of detailing the progreſs, but of ſurveying the final iſſue, of the event in queſtion. Such an opportunity may perhaps be afforded by the time we arrive at the article REVOLUTION, where there will be occaſion to advert to the principal events which under that denomination have formed eras in the hiſtory of different nations, and when of courſe this great era in the annals of France will claim a ſhare of attention proportioned to its magnitude and importance. France.

The air in France is pure, healthy, and temperate. The kingdom is ſo happily ſeated in the middle of the temperate zone, that ſome make it equal to Italy, with regard to the delightfulneſs of the landſcapes, and the fertility of the ſoil: however, it is certainly much more healthful. The ſoil produces corn, wine, oil, and flax, in great abundance; and they have very large manufactures of linen, woollen, ſilk, and lace. They have a foreign trade to Spain, Italy, Turkey, and to the Eaſt and Weſt Indies. They themſelves reckon that the number of the inhabitants is 20,000,000. The kingdom is watered by a great number of rivers; of which the four principal are, the Loire, the Seine, the Rhone, and the Garonne or Gironde. The monarchy was abſolute before the late revolution; and the ſubjects were extremely devoted to their prince even under the greateſt acts of oppreſſion. The parliaments, for a long ſeries of years paſt, had little or no ſhare in the government; and their buſineſs was confined to the paſſing and regiſtering the arrets or laws which the king was pleaſed to ſend them: however, they did not always pay a blind obedience to the king, and we have had frequent inſtances of their making a noble ſtand. In civil cauſes theſe parliaments were the laſt reſort, provided the court did not interpoſe. That of Paris was the moſt conſiderable, where the king uſed often to come in perſon to ſee his royal acts recorded. It conſiſted of the dukes and peers of France (when dukes and peers exiſted), beſides the ordinary members, who purchaſed their places; and they only took cognizance of cauſes belonging to the crown. The revenues of the crown aroſe from the taille or land-tax, and the aids which proceed from the cuſtoms and duties on all merchandize, except ſalt, the tax upon which commodity is called the *gabelles**: beſides theſe, there were other taxes; as, the capitation or poll-tax; the tenths of all eſtates, offices, and employments; beſides the 15th penny, from which neither the nobility nor clergy were exempted. Add to theſe, the tenths and free-gifts of the clergy, who were allowed to tax themſelves; and, laſtly, crown-rents, fines, and forfeitures, which brought in a conſiderable ſum. All theſe are ſaid to have amounted to 15,000,000 Sterling a-year. But the king had other reſources and ways of raiſing money, whenever neceſſity obliged him. The army, in time of peace, is ſaid to conſiſt of 200,000 men, and in time of war of 400,000; among whom are many Swiſs, Germans, Scots, Iriſh, Swedes, and Danes. There was till lately no religion allowed in France but the Roman Catholic, ever ſince the revocation of the edict of Nantz in 1685; though they are not ſo devoted to the pope as other nations of that communion, Now aboliſhed.

* See *Gabelle*.

ner

France || Franchiſe.

nor had they ever any inquiſition among them. The Roman Catholic is ſtill the eſtabliſhed religion; but with ample toleration to the Proteſtants, who are now even not excluded from places of the higheſt truſt in the ſtate.

Iſle of France, a province of France, ſo called, becauſe it was formerly bounded by the river Seine, Marne, Oiſe, Aiſne, and Ourque. It comprehends, beſides Paris, the Beauvoſis, the Valois, the county of Senlis, the Vexin, the Hurepois, the Gatinois, the Multien, the Goele, and the Mantois. Paris is the capital.

FRANCESCA (Peter), an eminent Florentine painter of night-pieces and battles, was employed to paint the Vatican. He alſo painted portraits, and wrote on arithmetic and geometry. He died in 1458.

FRANCFORT *on the Main*, an Imperial and Hanſeatic town of Franconia in Germany, where the emperors were formerly elected. It is a handſome, ſtrong, and rich place, and has a great deal of commerce. Here the golden bull is preſerved, which is the original of the fundamental laws of the empire. It is ſeated in a fine fertile plain; and well fortified with a double ditch, baſtions, redoubts, and ravelins. The ſtreets are remarkably wide, and the houſes handſomely built. It has great conveniency for carrying on an extenſive trade with the other parts of Germany, by means of the navigable river which runs throughout it. The ſuburbs is called *Saxon-hauſen*, and joined to the town by a ſtone bridge built over the Main. E. Long. 8. 40. N. Lat 49. 55.

Francfort, on the Oder, a rich and handſome town of Germany, in the middle Marche of Brandenburg, formerly imperial, but now ſubject to the king of Pruſſia. E. Long. 15. 0. N. Lat. 52. 20.

FRANCHE-COMPTE, a province of France, bounded on the ſouth and weſt by Champagne and Burgundy; on the north by Lorrain; and to the eaſt by the earldom of Mumplegard, and Switzerland. It is in length from north to ſouth about 30 leagues; in breadth about 20. It is partly flat and partly hilly. The flat country is fruitful in grain, wine, hemp, and paſture; and the hilly country abounds in cattle, producing alſo ſome wine and corn, copper, lead, iron, and ſilver ores, mineral waters, and quarries of ſtone, marble, and alabaſter.

FRANCHISE, in law. *Franchiſe* and *liberty* are uſed as ſynonymous terms; and their definition is, "a royal privilege, or branch of the king's prerogative, ſubſiſting in the hands of a ſubject." Being therefore derived from the crown, they muſt ariſe from the king's grant; or, in ſome caſes, may be held by preſcription, which, as has been frequently ſaid, preſuppoſes a grant. The kinds of them are various, and almoſt infinite. We ſhall here briefly touch upon ſome of the principal; premiſing only, that they may be veſted in either natural perſons or bodies-politic; in one man, or in many: but the ſame identical franchiſe, that has before been granted to one, cannot be beſtowed on another, for that would prejudice the former grant.

To be a county-palatine, is a franchiſe veſted in a number of perſons. It is likewiſe a franchiſe for a number of perſons to be incorporated and ſubſiſt as a body-politic; with a power to maintain perpetual ſucceſſion, and do other corporate acts: and each individual member of ſuch corporation is alſo ſaid to have a franchiſe or freedom. Other franchiſes are, to hold a court-leet: to have a manor or lordſhip; or, at leaſt, to have a lordſhip paramount: to have waifs, wrecks, eſtrays, treaſure-trove, royal fiſh, forfeitures, and deodands: to have a court of one's own, or liberty of holding pleas and trying cauſes: to have the cognizance of pleas; which is a ſtill greater liberty, being an excluſive right, ſo that no other court ſhall try cauſes ariſing within that juriſdiction: to have a bailiwick, or liberty exempt from the ſheriff of the county; wherein the grantee only, and his officers, are to execute all proceſs: to have a fair or market; with the right of taking toll, either there or at any other public places, as at bridges, wharfs, or the like; which tolls muſt have a reaſonable cauſe of commencement (as in conſideration of repairs, or the like), elſe the franchiſe is illegal and void: or laſtly, to have a foreſt, chaſe, park, warren, or fiſhery, endowed with privileges of royalty. See CHASE, FOREST, &c.

Franchiſe || Francis.

FRANCHISE is alſo uſed for an aſylum or ſanctuary, where people are ſecure of their perſons, &c. Churches and monaſteries in Spain are franchiſes for criminals; ſo were they anciently in England, till they were abuſed to ſuch a degree that there was a neceſſity for aboliſhing the cuſtom. One of the moſt remarkable capitulars made by Charlemagne in his palace of Heriſtal, in 779, was that relating to the franchiſes of churches. The right of franchiſe was held ſo ſacred, that even the leſs religious kings obſerved it to a degree of ſcrupulouſneſs; but to ſuch exceſs in time was it carried, that Charlemagne reſolved to reduce it. Accordingly he forbad any proviſion being carried to criminals retired into churches for refuge.

Franchiſe of Quarters, is a certain ſpace or diſtrict at Rome, wherein are the houſes of the ambaſſadors of the princes of Europe; and where ſuch as retire cannot be arreſted or ſeized by the ſoirri or ſerjeants, nor proſecuted at law. The people of Rome look on this as an old uſurpation and a ſcandalous privilege, which ambaſſadors, out of a jealouſy of their power, carried to a great length in the 15th century, by enlarging inſenſibly the dependencies of their palaces or houſes, within which the right of franchiſe was anciently confined. Several of the popes, Julius III. Pius XIV. Gregory XIII. and Sixtus V. publiſhed bulls and ordinances againſt this abuſe; which had reſcued ſo conſiderable a part of the city from their authority, and rendered it a retreat for the moſt abandoned perſons. At length Innocent XI. expreſsly refuſed to receive any more ambaſſadors but ſuch as would make a formal renunciation of the franchiſe of quarters.

FRANCIA (Franceſco), a celebrated Bologneſe painter, born in 1450. He was firſt a goldſmith or jeweller, afterwards a graver of coins and medals; but applying at laſt to painting, obtained great reputation by his works, particularly by a piece of St Sebaſtian, whom he had drawn bound to a tree with his hands tied over his head. He pined himſelf into a conſumption, by deſpairing to equal Raphael; and died in 1518.

FRANCIS I. king of France, the rival of the emperor Charles V. and the reſtorer of learning and politeneſs in France. See (*Hiſtory* of) FRANCE.

FRANCIS (Philip), a very ingenious writer, of Iriſh ex-

Franciscans.

extraction, if not born in that kingdom. His father was a dignified clergyman in Ireland, being dean of some cathedral; and our author, his son, was also bred to the church, and had a doctor's degree conferred on him. He was more distinguished as a translator than as an original writer. His versions of Horace and Demosthenes have been justly valued: the former is accompanied with notes, and is perhaps as complete and useful a work of its kind as hath yet appeared. He was also a considerable political writer; and in the beginning of the present reign is supposed to have been employed by the government: for which service, he was promoted to the rectory of Barrow in Suffolk, and to the chaplainship of Chelsea hospital. He was also the author of two tragedies, Eugenia, and Constantia; but, as a dramatic writer, not very successful. He died at Bath in March 1773; leaving a son, who was then one of the supreme council at Bengal.

FRANCISCANS, in ecclesiastical history, are religious of the order of St Francis, founded by him in the year 1209. Francis was the son of a merchant of Assisi, in the province of Umbria, who, having led a dissolute life, was reclaimed by a fit of sickness, and afterwards fell into an extravagant kind of devotion, that looked less like religion than alienation of mind. Soon after this, viz. in the year 1208, hearing the passage repeated, Matt. x. 9, 10. in which Christ addresses his apostles, *Provide neither gold, nor silver*, &c. he was led to consider a voluntary and absolute poverty as the essence of the gospel, and to prescribe this poverty as a sacred rule both to himself and to the few that followed him. This new society, which appeared to Innocent III. extremely adapted to the present state of the church, and proper to restore its declining credit, was solemnly approved and confirmed by Honorius III. in 1223, and had made a considerable progress before the death of its founder in 1226. Francis, through an excessive humility, would not suffer the monks of his order to be called *fratres*, i. e. brethren or friars, but *fraterculi*, i. e. little brethren, or friars-minor, by which denomination they still continue to be distinguished. They are also called *grey friars*, on account of the colour of their clothing, and *cordeliers*, &c. The Franciscans and Dominicans were zealous and active friends to the papal hierarchy, and, in return, were distinguished by peculiar privileges and honourable employments. The Franciscans, in particular, were invested with the treasure of ample and extensive indulgences; the distribution of which was committed to them by the popes, as a means of subsistence, and a rich indemnification for their voluntary poverty. In consequence of this grant, the rule of the founder, which absolutely prohibited both personal and collective property, so that neither the individual nor the community were to possess either fund, revenue, or any worldly goods, was considered as too strict and severe, and dispensed with soon after his death. In 1231, Gregory IX. published an interpretation of this rule, mitigating its rigour; which was farther confirmed by Innocent IV. in 1245, and by Alexander IV. in 1247. These milder alterations were zealously opposed by a branch of the Franciscans called the *spiritual*; and their complaints were regarded by Nicolas III. who, in 1279, published a famous constitution, confirming the rule of St Francis, and containing an elaborate explication of the maxims it recommended, and the duties it prescribed. In 1287, Matthew of Aqua Sparta, being elected general of the order, discouraged the ancient discipline of the Franciscans, and indulged his monks in abandoning even the appearance of poverty; and this conduct inflamed the indignation of the spiritual or austerer Franciscans; so that from the year 1290, seditions and schisms arose in an order that had been so famous for its pretended disinterestedness and humility. Such was the enthusiastic frenzy of the Franciscans, that they impiously maintained, that the founder of their order was a second Christ, in all respects similar to the first; and that their institution and discipline were the true gospel of Jesus. Accordingly, Albizi, a Franciscan of Pisa, published a book in 1383, with the applause of his order, intitled, The Book of the Conformities of St Francis with Jesus Christ. In the beginning of this century, the whole Franciscan order was divided into two parties; the one, embracing the severe discipline and absolute poverty of St Francis, were called *spirituals*; and the other, who insisted on mitigating the austere injunctions of their founder, were denominated *brethren of the community*. These wore long, loose, and good habits, with large hoods; the former were clad in a strait, coarse, and short dress, pretending that this dress was enjoined by St Francis, and that no power on earth had a right to alter it. Neither the moderation of Clement V. nor the violence of John XXII. could appease the tumult occasioned by these two parties: however, their rage subsided from the year 1329. In 1368 these two parties were formed into two large bodies, comprehending the whole Franciscan order, which subsist to this day; viz. the *conventual brethren*, and the *brethren of the observance* or *observation*, from whom sprung the capuchins and recollects. The general opinion is, that the Franciscans came into England in the year 1224, and had their first house at Canterbury, and their second at London; but there is no certain account of their being here till king Henry VII. built two or three houses for them. At the dissolution of the monasteries, the conventual Franciscans had about 55 houses, which were under seven custodies or wardenships; viz. those of London, York, Cambridge, Bristol, Oxford, Newcastle, and Worcester.

FRANCONIA, a circle of the German empire, lying between Bohemia on the east, and the Electorate of Mentz on the west. Its capital is Nuremburg; and from this country the Franks, who conquered and gave name to the kingdom of France, are said to have come.

FRANGULA, in botany. See RHAMNUS.

FRANK LANGUAGE, *Lingua Franca*, a kind of jargon spoken on the Mediterranean, and particularly throughout the coasts and ports of the Levant, composed of Italian, Spanish, French, vulgar Greek, and other languages.

FRANK, or *Franc*, an ancient coin, either of gold or silver, struck and current in France. The value of the gold franc was something more than that of the gold crown; the silver franc was a third of the gold one: this coin has been long out of use, tho' the term is still retained as the name of a money of account; in which sense it is equivalent to the livre, or 20 sols.

FRANK,

Frank. FRANK, or *Franc*, meaning literally *free* from charges and impoſitions, or exempt from public taxes, has various ſignifications in the ancient Engliſh cuſtoms.

FRANK Almoigne, (libera eleemoſyna), or "free alms;" a tenure of a ſpiritual nature, whereby a religious corporation, aggregate or ſole, holdeth lands of the donor to them and their ſucceſſors for ever. The ſervice which they were bound to render for theſe lands was not certainly defined: but only in general to pray for the ſouls of the donor and his heirs, dead or alive; and therefore they did no fealty (which is incident to all other ſervices but this), becauſe this divine ſervice was of a higher and more exalted nature. This is the tenure by which almoſt all the ancient monaſteries and religious houſes held their lands; and by which the parochial clergy, and very many eccleſiaſtical and eleemoſynary foundations, hold them at this day; the nature of the ſervice being upon the reformation altered, and made conformable to the purer doctrines of the church of England. It was an old Saxon tenure; and continued under the Norman revolution, through the great reſpect that was ſhown to religion and religious men in ancient times. This is alſo the reaſon that tenants in frankalmoign were diſcharged of all other ſervices except the *trinoda neceſſitas*, of repairing the highways, building caſtles, and repelling invaſions; juſt as the druids, among the ancient Britons, had *omnium rerum immunitatem*. And even at preſent, this is a tenure of a very different nature from all others; being not in the leaſt feodal, but merely ſpiritual. For, if the ſervice be neglected, the law gives no remedy by diſtreſs, or otherwiſe, to the lord of whom the lands are holden; but merely a complaint to the ordinary or viſitor to correct it.

FRANK-Chace is defined to be a liberty of free chace, whereby perſons that have lands within the compaſs of the ſame, are prohibited to cut down any wood, &c. out of the view of the foreſter.

FRANK-Fee, ſignifies the ſame thing as holding lands and tenements in fee-ſimple; that is, to any perſon and his heirs, and not by ſuch ſervice as is required by ancient demeſne, but is pleaded at common law. See FEE.

FRANK-Law, a word applied to the free and common law of the land, or the benefit a perſon has by it.

He that for any offence loſeth this frank-law, incurs theſe inconveniences, viz. He may not be permitted to ſerve on juries, nor uſed as an evidence to the truth; and if he has any thing to do in the king's court, he muſt not approach it in perſon, but appoint his attorney; his lands, goods, and chattels, ſhall be ſeized into the king's hands; and his lands be eſtreated, his trees rooted up, and his body committed to cuſtody.

FRANK-Marriage, in law, is where tenements are given by one man to another, together with a wife, who is the daughter or couſin to the donor, to hold in frank-marriage. By ſuch gift, though nothing but the word *frank-marriage* is expreſſed, the donees ſhall have the tenements to them, and the heirs of their two bodies begotten; that is, they are tenants in ſpecial tail. For this one word, *frankmarriage*, denotes, *ex vi termini*, not only an inheritance, like the word *frank-almoigne*, but likewiſe limits that inheritance; ſupplying, not only words of deſcent, but of procreation alſo. Such donees in frank-marriage are liable to no ſervice but fealty; for a rent reſerved therein is void until the fourth degree of conſanguinity be paſt between the iſſues of the donor and donee. Frank.

FRANK-Pledge, in law, ſignifies a pledge or ſurety for the behaviour of freemen.

According to the ancient cuſtom of England, for the preſervation of the public peace, every free-born man, at the age of fourteen, except religious perſons, clerks, knights, and their eldeſt ſons, was obliged to give ſecurity for his truth and behaviour towards the king and his ſubjects, or elſe be impriſoned. Accordingly, a certain number of neighbours became interchangeably bound for each other, to ſee each perſon of their pledge forthcoming at all times, or to anſwer for the offence of any one gone away: ſo that whenever any perſon offended, it was preſently inquired in what pledge he was, and there the perſons bound either produced the offender in 31 days, or made ſatisfaction for his offence.

FRANK-Tenement. See TENURE.

FRANKED LETTERS. The privilege of letters coming free of poſtage to and from members of parliament was claimed by the houſe of commons in 1660, when the firſt legal ſettlement of the preſent poſt-office was made; but afterwards dropped, upon a private aſſurance from the crown, that this privilege ſhould be allowed the members. And accordingly a warrant was conſtantly iſſued to the poſtmaſter-general, directing the allowance thereof to the extent of two ounces in weight: till at length it was expreſsly confirmed by 4 Geo. III. *c.* 24. which adds many new regulations, rendered neceſſary by the great abuſes crept into the practice of franking; whereby the annual amount of franked letters had increaſed from L. 23,600 in the year 1715, to L. 170,700 in the year 1763. Further regulations have ſince taken place; in particular, franks muſt be dated (the month written at length), and put into the office the ſame day; notwithſtanding which, the revenue ſtill loſes by this privilege above L. 80,000 *per annum*.

FRANKEN (Franciſcus), commonly called *Old Frank*, a famous Flemiſh painter, ſuppoſed to have been born about the year 1544; but tho' his works are well known, very few of the circumſtances of his life have been tranſmitted to poſterity. This maſter painted hiſtorical ſubjects from the Old and New Teſtaments; and was remarkable for introducing a great number of figures into his compoſitions, which he had the addreſs to group very diſtinctly. Vandyck often commended his works, and thought them worthy of a place in any collection.

FRANKEN (Franciſcus), diſtinguiſhed by the name of *Young Frank*, was the ſon of the former, born in the year 1580. He was inſtructed by his father; whoſe ſtyle he adopted ſo cloſely, that their works are frequently miſtaken. When he found himſelf ſufficiently ſkilled at home, he travelled into Italy for improvement in colouring; and, on his return, his works were much coveted. The moſt capital performance of this painter are, a ſcriptural performance in the church of Notre-dame at Antwerp; and an excellent picture, in a ſmall ſize, of Solomon's idolatry. Young Frank died in 1642.

Frankendal || Franklin.

FRANKENDAL, a ſtrong town of Germany, in the dominions of the Elector Palatine. It was taken by the Spaniards in 1623, by the Swedes in 1632, and burnt by the French in 1688. E. Long. 8. 29. N. Lat. 49. 28.

FRANKENIA, in botany: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quinquefid, and funnel-ſhaped; the petals five; the ſtigma ſexpartite; the capſule unilocular and trivalvular.

FRANKINCENSE. See INCENSE.

FRANKLIN (Thomas), D. D. chaplain in ordinary to his majeſty, was the ſon of Richard Franklin, well known as the printer of an anti-miniſterial paper called *The Craſtſman*; in the conduct of which he received great aſſiſtance from Lord Bolingbroke, Mr Pulteney, and other excellent writers, who then oppoſed Sir Robert Walpole's meaſures. By the advice of the ſecond of theſe gentlemen, young Franklin was devoted to the church, with a promiſe of being provided for by the patriot; who afterwards forgot his undertaking, and then entirely neglected him. He was educated at Weſtminſter-ſchool; from whence he went to the univerſity of Cambridge, where he became fellow of Trinity college, and was ſome time Greek profeſſor. In Dec. 1758, he was inſtituted vicar of Ware and Thundridge; which, with the lecture-ſhip of St Paul, Covent-Garden, and a chapel in Queen-ſtreet, were all the preferments he held till he obtained the rectory of Braſted in Kent. This gentleman was poſſeſſed of no inconſiderable ſhare of learning and poetical abilities, and was long a favourite in the literary world. His tranſlations of Phalaris, Sophocles, and Lucian, equally evince his learning and his genius, as they are not more diſtinguiſhed for fidelity in the verſion, than congeniality with the ſpirit of the admirable originals. Dr Franklin, like Mr Foote, ſuffered a tranſlation from the French to be printed in his name; but the Creſſes and Electra are ſuppoſed to be all that were really by him. It was a tranſlation of Voltaire's works, to which alſo Dr Smollet's name appears. His own dramatic compoſitions, of which the principal are the tragedies of The Earl of Warwick and Matilda, are univerſally known, and deſervedly eſteemed by the public; ſo that his death, which happened March 15. 1784, may be conſidered as a loſs to the republic of letters.

FRANKLIN (Dr Benjamin), one of the moſt celebrated philoſophers and politicians of the preſent age, was born at Boſton in North America in the year 1706. His father was a tallow-chandler; whoſe houſe he quitted before the age of 14, in order to go to Philadelphia, where he was introduced to the only printer eſtabliſhed in that city. This perſon, being ſtruck with his appearance and manner, took him into his houſe, and inſtructed him in his art; and Franklin, by his diſpoſition, genius, and diligence, ſoon deſerved and increaſed the favourable opinion that had been entertained of him by his maſter. Nor was he leſs agreeable to thoſe who viſited the printing-houſe out of curioſity: for the typographical art being then almoſt unknown in thoſe parts, great numbers were attracted by the myſtery; and were ſo well pleaſed with the ſkill, activity, and communicative manner of our young operator, that they ſeldom went away without leaving him ſome marks of their liberality.—Here he ſoon began to manifeſt that love of learning and thirſt after knowledge for which he was ſo remarkable: and as it was difficult to procure books from England, young Franklin entered into a ſociety with ſome others of his own age; among whom it was agreed, that they ſhould bring ſuch books as they had into one place, in order to form a common library. This reſource, however, was found ſo defective, that the ſociety, at Franklin's perſuaſion, reſolved to contribute a ſmall ſum monthly towards the purchaſe of books for their uſe from London. Thus their ſtock began to increaſe rapidly; and the inhabitants of Philadelphia, being deſirous of having a ſhare in their literary knowledge, propoſed that the books ſhould be ſent out on paying a ſmall ſum for the indulgence. Thus in a few years the ſociety became rich, and poſſeſſed more books than were perhaps to be found in all the other colonies; the collection was advanced into a public library; and the other colonies, ſenſible of the advantages reſulting from thence, began to form ſimilar plans; whence originated the libraries at Boſton, New York, Charleſtown, &c. that of Philadelphia being now inferior to none in Europe.

Franklin.

Mr Franklin, notwithſtanding all the advantages he could derive from his ſituation in Philadelphia, was not yet ſatisfied. He came over to England therefore in the year 1724 or 1725; and worked as a journeyman printer with one Mr Watts. By him he was greatly eſteemed; and treated with ſuch kindneſs, that it was always remembered with gratitude by our philoſopher. Mr Watts often predicted that his young American compoſitor would one day make a conſiderable figure in the world; and he lived to ſee his prediction fulfilled with regard to his philoſophical diſcoveries, though not as to the part he acted in political matters.

Having ſtaid ſome time in London, Mr Franklin returned to Philadelphia, where he perſuaded the printer with whom he formerly reſided to ſet up a newſpaper; which was attended with ſuch benefit, that his maſter admitted him as a partner in the buſineſs, and gave him his daughter in marriage. Having thus eſtabliſhed himſelf as a printer, and acquired ſome fortune, Mr Franklin was left at liberty to follow the natural bent of his genius. Being much addicted to the ſtudy of natural philoſophy, and the diſcovery of the Leyden experiment in electricity having rendered that ſcience an object of general curioſity, Mr Franklin applied himſelf to it, and ſoon began to diſtinguiſh himſelf eminently in that way. He is particularly remarkable for being the firſt who thought of ſecuring buildings from lightning; and he is generally thought to have been the inventor of the electrical kite, though ſome aſcribe this invention to another. His theory of poſitive and negative electricity has alſo received the ſanction of public approbation; though, when rigorouſly inveſtigated, it does not ſeem capable of ſupporting itſelf *. His theories were at firſt oppoſed by the members of the Royal Society in London; but in 1755, when he returned to that city, they voted him the gold medal which is annually given to the perſon who preſents a memoir on the moſt curious and intereſting ſubject. He was likewiſe admitted a member of

* See *Electricity*, Sect. v. and vi.

Franklin. the Society, and had the degree of doctor of laws conferred upon him by one of the univerſities: but at this time, by reaſon of the war which broke out between Britain and France, he returned to America, and began to take a ſhare in the public affairs of that country.

Having planned the different poſts through the continent of America, he was made poſtmaſter-general for that country; but as in the ſubſequent diſputes he took always the popular ſide, he was afterwards removed from that employment. In the year 1767, he was examined before the houſe of commons concerning the ſtamp-act. In 1773, having been appointed agent for the province of Penſylvania, he came over to England at the time when the diſputes between Great Britain and America were on the point of coming to extremities; when he attracted the public attention by a letter on the duel betwixt Mr Whatley and Mr Temple concerning the publication of governor Hutchinſon's letters. On the 29th January next year, he was examined before the privy-council on a petition he had preſented long before as agent for Maſſachuſets Bay againſt Mr Hutchinſon: but this petition being diſagreeable to miniſtry, was precipitately rejected, and Dr Franklin was ſoon after removed from his office of poſtmaſter-general for America. He was now looked upon by government with ſuch a jealous eye, that ſome thoughts were entertained of having him arreſted as a fomenter of rebellion. The Doctor, however, being on his guard, departed for America in the beginning of the year 1775 with ſuch privacy, that he had left England before it was ſuſpected that he entertained any deſign of quitting it. Being named one of the delegates to the continental congreſs, he had a principal ſhare in bringing about the revolution and declaration of independency on the part of the colonies. In 1776 he was deputed by congreſs to Canada, to negociate with the people in that country, and to perſuade them to throw off the Britiſh yoke; but the Canadians had been ſo much diſguſted with the hot-headed zeal of the New Englanders, who had burnt ſome of their chapels, that they refuſed to liſten to the propoſals, though enforced by all the arguments Dr Franklin could make uſe of. On his return to Philadelphia, congreſs, ſenſible how much he was eſteemed in France, ſent him thither to put a finiſhing hand to the private negociations of Mr Silas Deane; and this important commiſſion was readily accepted by the Doctor, though then in the 71ſt year of his age. The event is well known; a treaty of alliance and commerce was ſigned between France and America; and M. le Roi aſſerts, that the Doctor had a great ſhare in the tranſaction, by ſtrongly adviſing M. Maurepas not to loſe a ſingle moment, if he wiſhed to ſecure the friendſhip of America, and to detach it from the mother-country. He likewiſe informs us, that no man could be more rejoiced than Dr Franklin was on the day that the Britiſh ambaſſador, Lord Stormont, quitted Paris on account of the rupture betwixt the two nations. In 1777 he was regularly appointed plenipotentiary from Congreſs to the French court; but obtained leave of diſmiſſion in 1780. Having at laſt ſeen the full accompliſhment of his wiſhes by the concluſion of the peace in 1783, which gave independency to America, he became deſirous of reviſiting his native country. He therefore requeſted to be recalled; and, after repeated ſolicitations, Mr Jefferſon was appointed in his room. On the arrival of his ſucceſſor, he repaired to Havre de Grace, and croſſing the Channel, landed at Newport in the Iſle of Wight; and, after a favourable paſſage, arrived ſafe at Philadelphia in the month of September 1785. He was received amidſt the acclamations of a vaſt multitude who flocked from all parts to ſee him, and who conducted him in triumph to his own houſe. In a few days he was viſited by the members of the congreſs and the principal inhabitants of Philadelphia. He was afterwards twice choſen preſident of the aſſembly of Philadelphia; but his increaſing infirmities obliged him to aſk permiſſion to retire, and to ſpend the remainder of his life in tranquillity; which was granted. Franklin

During the greateſt part of his lifetime the Doctor had been very healthy. In the year 1735, indeed, he was attacked by a pleuriſy, which ended in a ſuppuration of the left lobe of the lungs, ſo that he was almoſt ſuffocated by the quantity of matter thrown up. But from this, as well as from another attack of the ſame kind afterwards, he recovered ſo completely, that his breathing was not affected afterwards in the leaſt. As he advanced in years, however, he became ſubject to fits of the gout, to which in the year 1782 a nephritic colic was ſuperadded. From this time he became ſubject to the ſtone as well as the gout, and for the laſt twelve months of his life theſe complaints almoſt entirely confined him to his bed. Notwithſtanding his diſtreſſed ſituation, however, neither his mental abilities nor his natural cheerfulneſs ever forſook him. His memory was very tenacious to the very laſt; and he ſeemed to be an exception to the general rule, that at a certain period of life the organs which are ſubſervient to memory become callous; a remarkable inſtance of which is, that he learned to ſpeak French after he had attained the age of 70. About 16 days before his death, he was ſeized with a feveriſh diſorder; which, about the third or fourth day, was attended with a pain in the left breaſt. This became at laſt very acute, and was accompanied with a cough and laborious breathing. Thus he continued for five days, when the painful ſymptoms ceaſed at once, and his family began to flatter themſelves with hopes of his recovery. But a new impoſthume had now taken place in the lungs; which ſuddenly breaking as the others had done, he was unable to expectorate the matter fully. Hence an oppreſſion of the organs of reſpiration and a lethargic diſpoſition came on; which gradually increaſing, he expired on the 17th of April 1790, about 11 at night.—He left one ſon, governor William Franklin, a zealous loyaliſt, who now reſides at London; and a daughter, married to Mr William Bache merchant in Philadelphia. This lady was his greateſt favourite, and waited upon him during his laſt illneſs. Three days before he died, he begged that his bed might be made, that he might die in a decent manner; to which Mrs Bache anſwered, that ſhe hoped he would recover and live many years longer: but he replied, "I hope not."

With regard to the character of Dr Franklin, he was ſaid to be ſententious but not fluent in ſociety; rather inclined to liſten than to talk; an informing rather than a pleaſing companion; very impatient, however, of interruption; ſo that he would frequently mention the cuſtom

Franks || Fraserburgh.

of the Indians, who keep ſilence for ſome time before they anſwer a queſtion which they have heard with attention. With regard to religion, he was a firm believer in the Scriptures; and his ſentiments on death may be gathered from a letter written about 35 years ago to Miſs Hubbard on the death of her father-in-law Mr John Franklin. "We are ſpirits (ſays he): That bodies ſhould be lent us while they can afford us pleaſure, aſſiſt us in acquiring knowledge, or doing good to our fellow creatures, is a kind and benevolent act of God. When they become unfit for theſe purpoſes, and afford us pain inſtead of pleaſure; inſtead of an aid they become an incumbrance, and anſwer none of the intentions for which they were given: it is then equally kind and benevolent, that a way is provided by which we may get rid of them. Death is that way.—Our friend and we are invited abroad on a party of pleaſure that is to laſt for ever. His carriage was firſt ready, and he is gone before us; we could not all conveniently ſtart together; and why ſhould you and I be grieved at this, ſince we are ſoon to follow, and know where to find him?" The Doctor was author of many tracts on electricity, and other branches of natural philoſophy, as well as on politics and miſcellaneous ſubjects.

FRANKS, Francs, Frankis, or Franquis, a name which the Turks, Arabs, Greeks, &c. give to all the people of the weſtern parts of Europe. The appellation is commonly ſuppoſed to have had its riſe in Aſia, at the time of the croiſades; when the French made the moſt conſiderable figure among the croiſées: from which time the Turks, Saracens, Greeks, Abyſſinians, &c. uſed it as a common term for all the Chriſtians of Europe; and called Europe itſelf *Frankiſtan*. The Arabs and Mahometans, ſays M. d'Herbelot, apply the term *Franks* not only to the French (to whom the name originally belonged), but alſo to the Latins and Europeans in general.

But F. Goar, in his notes on Condinus, cap. 5. n. 43. furniſhes another origin of the appellation *Franks*, of greater antiquity than the former. He obſerves, that the Greeks at firſt confined the name to the *Franci*, *i. e.* the German nations, who had ſettled themſelves in France or Gaul; but afterwards they gave the ſame name to the Apulians and Calabrians, after they had been conquered by the Normans; and at length the name was farther extended to all the Latins.

In this ſenſe is the word uſed by ſeveral Greek writers; as Comnenus, &c. who, to diſtinguiſh the French, call them the *weſtern Franks*. Du Cange adds, that about the time of Charlemagne, they diſtinguiſhed eaſtern France, weſtern France, Latin or Roman France, and German France, which was the ancient France, afterwards called *Francouia*.

FRASCATI, or Frescati. See Frescati.

FRASERSBURGH, a ſmall ſea port town in the county of Aberdeen, ſituated in a cheap and populous country, on the point of land called *Kinnaird's Head*, which is the ſouthern extremity of the Murray firth. It has a ſmall good harbour, made and kept up at a conſiderable expence by the proprietor and the town, and well adapted for building of ſmall veſſels. According to the tide, there are 11 to 15 feet water within the harbour, and 20 feet immediately without at ſpring-tides: without is a tolerable road for ſhipping, in a bay nearly a league in length and half a league in depth, with good anchorage in a ſandy bottom. Veſſels of about 200 tons burden enter the harbour at preſent. Fraſerſburgh contains about 1000 inhabitants, and is well ſituated for trade with the eaſt coaſt of Europe. The town has lately advanced conſiderably, and requires only encouragement to render it a port of ſome conſequence on the coaſt of Scotland. At preſent it carries on a ſmall trade to the eaſt ſea, ſeveral manufactories are forming in its neighbourhood, and the port is well adapted for building of ſmall veſſels.

Fraternal, Fraternity.

FRATERNAL, ſomething belonging to the relation of brother.

Fraternal Affection is the love and attachment ſubſiſting among, or due to one another by, children of the ſame family.

Though all mankind ſprung from the ſame head, and are bound to cultivate a mutual good-will to each other; yet this duty is not ſo obvious and ſtriking as that which is incumbent on thoſe who belong to the ſame family. Nothing can approach nearer to ſelf-love than fraternal affection: and there is but a ſhort remove from our own concerns and happineſs, to theirs who come from the ſame ſtock, and are partakers of the ſame blood. Nothing, therefore, can be more horrible than diſcord and animoſity among members ſo allied; and nothing ſo beautiful as harmony and love.

This relation is formed by nature, not by choice; and though it has many things in common with, yet it is prior to, the obligations of friendſhip: conſequently nature and reaſon dictate that there ſhould be a peculiar affection between brethren. We are not obliged, however, to make a brother or ſiſter an intimate or boſom friend in preference to one who is not akin. Diverſity of temper, and want of ſuitable qualifications, may render it unſafe and improper But where friendſhip and fraternity meet in the ſame perſons, ſuch a conjunction adds a luſtre to the relation.

Among brethren, an hearty benevolence, an ardent concern for each other's welfare, a readineſs to ſerve and promote it, are the peculiar offices of this relation; and though friends are to have their ſhare, yet the claim of kindred is firſt and ordinarily ſtrongeſt. "Neceſſaria præſidia vitæ debentur iis maxime (ſays Cicero), quos ante dixi (*i. e.* propinquis); vita autem, victuſque communis, conciliia, ſermones, &c. in amicitiis vigent maxime." *De Officiis*.

FRATERNITY, brotherhood, the relation or union of brothers, friends, partners, aſſociates, &c.

Fraternity, in a civil ſenſe, is uſed for a guild, aſſociation, or ſociety of perſons, united into a body, for ſome common intereſt or advantage. See Company and Guild.

Fraternity, in the Roman Catholic countries, ſignifies a ſociety for the improvement of devotion. Of theſe there are ſeveral ſorts; as, 1. The fraternity of the roſary, founded by St Dominic. It is divided into two branches, called the *common roſary*, and the *perpetual roſary*; the former of whom are obliged to confeſs and communicate every firſt Sunday in the month, and the latter to repeat the roſary continually. 2 The fraternity of the ſcapulary, whom the bleſſed Virgin, according to the ſabbatine bull of pope John XXII. has promiſed to deliver out of hell the firſt Sunday after their death. 3. The fraternity of St Francis's gir-

Fratres || Fratricelli.

dle are clothed with a ſack of a grey colour, which they tie with a cord; and in proceſſions walk bare-footed, carrying in their hands a wooden croſs. 4. That of St Auſtin's leathern girdle, comprehends a great many devotees. Italy, Spain, and Portugal, are the countries where one ſees the greateſt number of theſe fraternities, ſome of which aſſume the name of *arch-fraternities*. Pope Clement VII. inſtituted the arch-fraternity of charity, which diſtributes bread every Sunday among the poor, and gives portions to 40 poor girls on the feaſt of St Jerom their patron. The fraternity of death, buries ſuch dead as are abandoned by their relations, and cauſes maſſes to be celebrated for them.

FRATRES ARVALES. See ARVALES.

FRATRIAGE, the partition among brothers, or coheirs, coming to the ſame inheritance or ſucceſſion.

FRATRICELLI, in eccleſiaſtical hiſtory, an enthuſiaſtic ſect of Franciſcans, which roſe in Italy, and particularly in the marquiſate of Ancona, about the year 1294. The word is an Italian diminutive, ſignifying *fraterculi*, or "little brothers;" and was here uſed as a term of deriſion, as they were moſt of them apoſtate monks, whom the Italians call *fratelli*, or *fratricelli*. For this reaſon the term *fratricelli*, as a nick-name, was given to many other ſects, as the Cathariſts, the Waldenſes, &c. however different in their opinions and in their conduct. But this denomination applied to the auſtere part of the Franciſcans was conſidered as honourable. See FRANCISCANS.

The founders were P. Maurato, and P. de Foſſombroni, who having obtained of pope Celeſtin V. a permiſſion to live in ſolitude, after the manner of hermits, and to obſerve the rule of St Francis in all its rigour, ſeveral idle vagabond monks joined them, who, living after their own fancies, and making all perfection to conſiſt in poverty, were ſoon condemned by pope Boniface VIII. and his ſucceſſor, and the inquiſitors ordered to proceed againſt them as heretics: which commiſſion they executed with their uſual barbarity. Upon this, retiring into Sicily, Peter John Oliva de Serignan had no ſooner publiſhed his Comment on the Apocalypſe, than they adopted his errors. They held the Romiſh church to be Babylon, and propoſed to eſtabliſh another far more perfect one: they maintained, that the rule of St Francis was the evangelical rule obſerved by Jeſus Chriſt and his apoſtles. They foretold the reformation of the church, and the reſtoration of the true goſpel of Chriſt, by the genuine followers of St Francis, and declared their aſſent to almoſt all the doctrines which were publiſhed under the name of the abbot Joachim, in the "Introduction to the everlaſting Goſpel," a book publiſhed in 1250, and explained by one of the ſpiritual friars whoſe name was Gerhard. Among other enormities inculcated in this book, it is pretended that St Francis was the angel mentioned in Rev. xiv. 6. and had promulgated to the world the true and everlaſting goſpel of God; that the goſpel of Chriſt was to be abrogated in 1260, and to give place to this new and everlaſting goſpel, which was to be ſubſtituted in its room; and that the miniſters of this great reformation were to be humble and bare-footed friars, deſtitute of all worldly employments. Some ſay they even elected a pope of their church; at leaſt they appointed a general, with ſuperiors, and built monaſteries, &c. Beſide the opinions of Oliva, they held, that the ſacraments of the church were invalid; becauſe thoſe who adminiſtered them, had no longer any power or juriſdiction. They were condemned afreſh by pope John XXII. in conſequence of whoſe cruelty they regarded him as the true anti-chriſt; but ſeveral of them returning into Germany, were ſheltered by Lewis, duke of Bavaria, the emperor.

Fratricide || Fraxinus.

There are authentic records, from which it appears, that no leſs than 2000 perſons were burnt by the inquiſition, from the year 1318 to the time of Innocent VI. for their inflexible attachment to the poverty of St Francis. The ſeverities againſt them were again revived towards the cloſe of the 15th century by pope Nicolas V. and his ſucceſſors. However, all the perſecutions which this ſect endured were not ſufficient to extinguiſh it; for it ſubſiſted until the times of the reformation in Germany, when its remaining votaries adopted the cauſe and embraced the doctrine and diſcipline of Luther. And this has led Popiſh writers to charge the Fratricelli with many enormities, ſome of which are recounted by M. Bayle, art. *Fratricelli*.

The Fratricelli had divers other denominations: they were called *fratricelli*, according to ſome, becauſe they lived in community, in imitation of the primitive Chriſtians, or rather through the humility of the founder of the Franciſcan order, to which the Fratricelli originally belonged; *dulcini*, from one of their doctors; *Bizochi*, *Beguins*, and *Beghardi*.

FRATRICIDE, the crime of murdering one's brother. See PARRICIDE.

FRAUD, in law, ſignifies deceit in grants, or conveyances of lands, &c. or in bargains and ſales of goods, &c. to the damage of another perſon.

A fraudulent conveyance of lands or goods to deceive creditors, as to creditors is void in law. And a fraudulent conveyance in order to defraud purchaſers, is alſo to ſuch purchaſers void: and the perſons juſtifying or putting off ſuch grants as good, ſhall forfeit a year's value of the lands, and the full value of the goods and chattels, and likewiſe ſhall be impriſoned. See CHEATING.

FRAUSTADT, a town of Sileſia, on the frontiers of Poland, remarkable for a battle gained by the Swedes over the Saxons in 1706. E. Long. 15. 50. N. Lat. 51. 45.

FRAXINELLA, in botany. See DICTAMNUS.—It is remarkable of this odorous plant, that, when in full bleſſom, the air which ſurrounds it in a ſtill night, may be inflamed by the approach of a lighted candle. Dr Watſon doubts whether this inflammability proceeds from an inflammable air which is exhaled by the plant, or from ſome of the finer parts of the eſſential oil of the plant being diſſolved in the common atmoſpherical air. The latter is the moſt probable ſuppoſition; for were it the pure inflammable air, as Mr Cavallo obſerves, it would, on account of its ſmall ſpecific gravity, leave the plant as ſoon as it was produced. Common air acquires the property of becoming inflammable, by being tranſmitted through ſeveral eſſential oils.

FRAXINUS, the ASH: A genus of the diœcia order, belonging to the polygamia claſs of plants; and in the natural method ranking under the 44th order,

Fray ‖ Freats.

Sepiaria. There is no hermaphrodite calyx, or it is quadripartite; and there is either no corolla, or it is tetrapetalous: there are two ſtamina; one piſtil; one lanceolated ſeed; and the piſtil of the female is lanceolated. There are ſix ſpecies; of which the moſt uſeful is the common aſh, which is ſo well known, that it needs no deſcription. If a wood of theſe trees is rightly managed, it will turn greatly to the advantage of the owner: for, by the underwood, which will be fit to cut every eight or ten years, there will be a continual income, more than ſufficient to pay the rent of the ground and all other charges; and ſtill there will be a ſtock preſerved for timber, which in a few years will be worth 40s. or 50s. per tree. This tree flouriſhes beſt in groves, but grows very well in rich ſoil in open fields. It bears tranſplanting and lopping. In the north of Lancaſhire they lop the tops of theſe trees to feed the cattle in autumn when the graſs is on the decline; the cattle peeling off the bark as food. The wood hath the ſingular property of being nearly as good when young as when old. It is hard and tough, and is much uſed to make the tools employed in huſbandry. The aſhes of the wood afford very good potaſh. The bark is uſed in tanning calf-ſkin. A ſlight infuſion of it appears of a pale yellowiſh colour when viewed betwixt the eye and the light; but when looked down upon, or placed betwixt the eye and an opake object, appears blue. This blueneſs is deſtroyed by the addition of an acid, but recovered by alkalies. The ſeeds are acrid and bitter. In the church-yard of Lochaber in Scotland, Dr Walker meaſured the trunk of a dead aſh tree, which at five feet from the ſurface of the ground was 58 feet in circumference.—Horſes, cows, ſheep, and goats eat it; but it ſpoils the milk of cows, ſo that it ſhould not be planted in dairy farms.

FRAY literally ſignifies to fret; as cloth or ſtuff does by rubbing, or over-much wearing.

Among hunters a deer is ſaid to fray his head, when he rubs it againſt a tree, to cauſe the ſkins of his new horns to come off.

FREA, or FRIGGA, the wife of Odin, was, next to him, the moſt revered divinity among the Heathen Saxons, Danes, and other northern nations. As Odin was believed to be the father, Frea was eſteemed the mother of all the other gods. In the moſt ancient times, Frea was the ſame with the goddeſs Herthus, or Earth, who was ſo devoutly worſhipped by the Angli and other German nations. But when Odin, the conqueror of the north, uſurped the honours due only to the true Odin, his wife Frea uſurped thoſe which had been formerly paid to mother Earth. She was worſhipped as the goddeſs of love and pleaſure, who beſtowed on her votaries a variety of delights, particularly happy marriages and eaſy child-births. To Frea the ſixth day of the week was conſecrated, which ſtill bears her name.

FREAM, a name given by farmers to ploughed lands worn out of heart, and laid fallow till it recover.

FREATS, or FREITS, a term uſed in Scotland for *ill omens*, and ſometimes denoting accidents ſupernaturally unlucky. King James VI. in his *Dæmonologie*, *MS. pen. Edit.* B. I. *ch.* IIII. *p.* 13. "But I pray you forget not likeways to tell what are the Devill's rudimentis? E. His rudimentis I call firſt in generall all that quhilk is called vulgairelie the virtu of woode, herbe, and ſtaine; quhilk is uſed by unlawfull charmis without natural cauſis. As lykeways all kynd of prattiques, *freitis, or uther lyk extraordinair actions, quhilk cannot abyde the trew twicke of naturall raiſon.*" It occurs again in the ſame ſenſe in *p.* 14. *marg. note;* and in *p.* 41. ſpeaking of *Sorcerers:* "And in generall that naime was gevin thaime for uſing of ſic chairmis and *freitis*, as that craft teachis thaime." Freckles ‖ Frede ick.

FRECKLES, LENTIGINES, ſpots of a yellowiſh colour, of the bigneſs of a lentile-ſeed, ſcattered over the face, neck, and hands. Freckles are either natural, or proceeding accidentally from the jaundice or the action of the ſun upon the part. Heat, or a ſudden change of the weather, will often cauſe the ſkin to appear of a darker colour than natural; and thereby produce what is called *tan*, *ſunburn*, and *morphew*, which ſeem to differ only in degree; and uſually diſappear in winter.

Perſons of a fine complexion, and ſuch whoſe hair is red, are the moſt ſubject to freckles, eſpecially in thoſe parts which they expoſe to the air.

To remove freckles, put juice of lemons in a glaſs-vial, and, mixing it with ſugar and borax finely powdered, let it digeſt eight days, and then uſe it. Homberg propoſes bullock's gall mixed with alum, and, after the alum has precipitated, expoſed three or four months to the ſun in a cloſe vial, as one of the beſt remedies known for the removing of freckles.

FREDBERG, a rich, ſtrong, and fine town of Germany, in Miſnia, remarkable for its mines, and for being the burying place of the princes of the houſe of Saxony. It is a delightful place, ſeated on the river Multa. E. Long. 13. 40. N. Lat. 51. 2.

FREDERICA, a town of North America, in Georgia, ſeated at the mouth of the river Alatamaha, lately built and fortified by general Oglethorpe. The iſland it ſtands upon is called *St Simons's;* and is about 13 miles in length, and 4 in breadth. W. Long. 81. 35. N. Lat. 31. 0.

FREDERICK II. the Great, of Pruſſia, one of the greateſt warriors the preſent age has produced, was the ſon of Frederick-William then hereditary prince of Brandenburg, and Maria Dorothea a princeſs of the houſe of Brunſwick. He was born in 1712, the year before his father Frederick I. mounted the throne of Pruſſia. The latter was ſo far from being a patron of literature, that he regarded nothing but what related to the military art; and moſt of his generals, whatever their merits in their own line might be, ſcarce knew how to ſign their names. So great indeed was the ignorance of the monarch himſelf, that he baniſhed from his dominions a philoſopher of the name of *Wolf*, merely becauſe he maintained the doctrine of pre-eſtabliſhed harmony; upon which a theologian named *Lange* aſſerted, that on ſuch principles his majeſty's grenadiers were not culpable when they deſerted, it being only the neceſſary conſequence of the impulſe their machine had received from their Creator. His ſon was of a diſpoſition the very reverſe of his father. Being put from his birth under the care of Val de Recoule a French lady of great merit and underſtanding, he acquired, in his early years, not only a taſte for literature in general, but a predilection for the French language, which was not obliterated throughout his whole life.

Frederick. It is not to be ſuppoſed that a prince of the diſpoſition above mentioned, would ſuffer his ſon to be long engaged in literary purſuits. At ſeven years of age, young Frederick was taken out of the hands of Madame de Recoule, and put under the care of military tutors. General Count de Finkeſtein, an old warrior, was appointed his governor; his ſub-governor was Colonel de Kalkſtein, an officer renowned for his courage and experience; he was taught mathematics and fortification by Major Senning; Han de Jendun, a Frenchman, inſtructed him in other branches of knowledge; and a cadet of the name of *Kenzel*, taught him his exerciſe. At eight years of age he was furniſhed with a ſmall arſenal ſtored with all ſorts of arms proportioned to his age and ſtrength, of which his father left him abſolute maſter. In a ſhort time he was named captain and chief of the corps of cadets; and the young prince performed every day, in miniature, with his little ſoldiers, all the evolutions with which his father exerciſed his giants. At laſt he received the command of a company in his father's regiment famous throughout all Europe, and which was compoſed of men of whom ſcarce one was ſhort of ſeven French feet.

Born, however, with a taſte for the arts, he devoted to their cultivation every moment he could eſcape the vigilance of his guardians. He was more particularly fond of poetry and muſic, and when he could find a moment's leiſure, he read French authors, or played on the flute; but his father, as often as he ſurpriſed him playing or reading, broke his flute and threw his books into the fire. The prince, chagrined at ſuch injurious treatment, and having a great deſire to viſit Germany, England, France, and Italy, deſired permiſſion to travel. This, however, his father would not allow, but permitted him to accompany himſelf in the little journeys he made from time to time into Germany; and, in 1728, took him to Dreſden to ſee the king of Poland. By theſe little expeditions the deſire of the prince to viſit other countries was only the more inflamed, ſo that at laſt he formed a deſign of ſetting out without his father's knowledge. The deſign was intruſted to two of the prince's young friends named *Kat* and *Keit;* money was borrowed for the occaſion, and the day of their departure fixed, when unluckily the whole project was diſcovered. The old king, implacable in his reſentment, and conſidering his ſon as a deſerter, determined to put him to death. He was ſhut up in the fortreſs of Cuſtrin; and it was with the utmoſt difficulty that the count de Seckendorf, ſent for the purpoſe by the emperor Charles VI. was able to alter the king's reſolution. Certain vengeance, however, was determined on both the intended aſſociates in Frederick's journey. Keit eſcaped the danger by flying into Holland; but Kat had not that good fortune. The king firſt directed that he ſhould be tried by a court-martial; but as they, contrary to his expectation, only ſentenced the criminal to perpetual impriſonment, the revengeful monarch by an unheard of exerciſe of the royal prerogative cauſed him to be beheaded. The execution was performed under the windows of the prince royal, whoſe head was held towards the ſcaffold by four grenadiers; but no ſooner did he approach the window and ſee his friend in the hands of the executioner, than he ſtretched out his arms towards him, crying out "Kat! Kat!" and inſtantly fainted away. During the remainder of his life he conſidered capital puniſhments with a great degree of horror, and they were rare throughout the Pruſſian dominions while he continued to reign. When the emperor had ſucceeded in preventing the execution of Frederick, the king remarked, that "Auſtria would one day ſee what a ſerpent ſhe had nouriſhed in her boſom." The royal priſoner remained a year at Cuſtrin; during which time his father wiſhed that he ſhould learn the maxims of government and finance. For this purpoſe M. de Munchow, preſident of the chamber of domains and finances, was ordered to make him aſſiſt at all their aſſemblies, to conſider him as a ſimple counſellor, to treat him as ſuch, and make him work like others. The young counſellor, however, though he aſſiſted at their meetings, did not trouble himſelf with reading acts or copying decrees. Inſtead of this, he amuſed himſelf ſometimes with reading French pamphlets, and at others with drawing caricaturas of the preſident or members of the aſſembly. M. Munchow himſelf was likewiſe very favourable to the prince at this time, by furniſhing him books and other articles of amuſement, notwithſtanding the expreſs prohibition of his father: though in this he certainly ran a great riſk; for the old king, who ſet but a very light value on human life, would undoubtedly have put him to death had he received intelligence of his complaiſance. Frederick

Frederick, after paſſing the time above mentioned in confinement, was recalled to Berlin, on pretence of being preſent at the celebration of his eldeſt ſiſter's marriage with the hereditary prince of Bareith; but the true reaſon was, that the king had now prepared a match for the prince himſelf. This was the princeſs Elizabeth Chriſtina of Brunſwick, niece to the empreſs. Frederick, who was not only totally indifferent to the fair ſex in general, but particularly prejudiced againſt this princeſs, made ſome objections; his father, however, overcame all obſtacles with "his uſual arguments (ſays the author of the life of Frederick), viz. his cane, and a few kicks."

The coldneſs which Frederick at this time ſhowed for the fair ſex, appears not to have been natural; for as early as the year 1723, though then only in the 11th year of his age, he is ſaid to have fallen in love with the princeſs Anne, daughter of George II. Even at this early period he entered into vows to refuſe every other but her for his conſort; nor were theſe ever broken, as far as depended on himſelf. The marriage perhaps would have taken place, had it not been for ſome differences which aroſe between the courts of Pruſſia and Hanover about a few acres of meadow-land, and two or three Hanoverians enliſted by the Pruſſian recruiters. It is ſuppoſed alſo, that it was intended at one time to marry him to Maria Thereſa of Auſtria; but, as in that caſe it would have been neceſſary to change his religion, Frederick derived from thence a plauſible pretence for refuſing the match. The princeſs whom he eſpouſed had a large ſhare of beauty; and, what was ſtill better, an excellent heart: but Frederick is ſaid to have ſuffered ſo much in his former amours, that certain natural and inſurmountable impediments remained to the completing of his marriage with any woman. Scarcely therefore was he in bed with his young ſpouſe, when a cry of *Fire!* was raiſed by his friends.

Frederick. friends. Frederick got up to ſee where the conflagration was: but finding it to be a falſe alarm, he ſent meſſengers to compoſe the princeſs; but neither that night, nor any other, did he think proper to diſturb her reſt.

On occaſion of this marriage, Frederick received from his father the county of Rupin. He reſided in the capital of this county, named alſo *Rupin*, for ſome time; but afterwards choſe Rheinſberg for his place of abode. This is a little town built in the ſands, on the confines of Mecklenburg, and at that time containing only 1000 inhabitants; but it was ſoon greatly improved by Frederick. Having put over the great gate of the caſtle, however, the following inſcription, FREDERICO TRANQUILLITATEM COLENTI, his father was diſpleaſed with it, and therefore hurried him from his peaceful retreat into the noiſe and tumult of war. At this time the ſucceſſion to the crown of Poland had kindled a general war throughout Europe, and the king of Pruſſia was to ſend 10,000 auxiliaries to the imperial army, then commanded by prince Eugene. The king conducted his troops in perſon, and reſolved to take this opportunity of giving his ſon an idea of war. At this time, however, he learnt but little; and only ſaw, as he himſelf expreſſes it, the ſhadow of the great Eugene. That conſummate general, nevertheleſs, did not overlook his merit; but predicted that he would one day be a great captain. Frederick having gone to reconnoitre the lines at Philipſburg, in his return through a very open wood, was expoſed to the cannon of the lines, which thundered inceſſantly. The balls broke a number of branches on every ſide of him: notwithſtanding which, he never cauſed his horſe move quicker; nor did his hand which held the bridle ever alter its motion even for a moment. He continued to converſe quietly with the generals who attended him, and never ſhowed the ſmalleſt ſign of apprehenſion. Being one night at ſupper with field-marſhal Grumkow, the converſation turned on the young prince Eugene who died on the Rhine; and he was aſked whether that prince would ever have become a great man? Frederick decided in the negative, on account of young Eugene's not having known at any period of his life how to chooſe a friend who dared to tell him the truth.

During this campaign the health of the old king was ſo much impaired, that he was obliged to leave the army; and Frederick, on his return, was for ſome time intruſted with ſigning all the orders in his father's name. On the king's recovery the prince was ſent to Stetten, under the care of the prince of Deſſau, that he might ſee the fortifications of that town. He was afterwards permitted to go to Konigſberg to ſee the unfortunate Staniſlaus, who had taken refuge in that place, and who was no leſs remarkable for his philoſophy and conſtancy than for his misfortunes. With him Frederick remained for ſome weeks, and contracted a friendſhip which was not diſſolved but by the death of Staniſlaus. At laſt he was allowed to return to his peaceful manſion at Rheinſberg, where he remained till the death of his father. In this place his time was occupied alternately by the ſtudy of the ſciences, the cultivation of the arts, and the pleaſures of friendſhip. Philoſophy, hiſtory, politics, the military art, poetry and muſic, agreeably ſucceeded each other, and had each its ſtated period. The prince paſſed the greateſt part of the day in his library; and the remainder in the ſociety of a ſelect company of agreeable and learned men. The principal of theſe were Chaſot, a French officer; Kayſerling, a gentleman of Courland, on whom the prince beſtowed the name of *Cæſarion*; Jordan, a French refugee; and Knobelſdorf, director of the buildings and gardens; but who could converſe on all the arts of deſigning with as much taſte as judgement.—In theſe meetings, gaiety generally preſided; there were generals to ſpeak of war, muſicians to form concerts, and excellent painters to decorate the apartments. Whilſt Knobelſdorf was executing landſcapes and laying out the gardens, Peſne was immortalizing himſelf by his cielings, and du Buiſſon by his pictures of flowers. The two Grauns compoſed excellent muſic, or directed the orcheſtra; and Benda, one of the firſt violins of Europe, accompanied the prince who played extremely well on the flute. The morning was uſually dedicated to ſtudy; gaiety and agreeable converſation prevailed at every repaſt; and every evening there was a little concert.—In this retreat Frederick conceived that ardent paſſion for military glory and the aggrandiſement of his kingdom for which he became at laſt ſo remarkable; and here he is ſuppoſed to have formed the moſt ſublime and daring projects. He was fired with a deſire of imitating the celebrated heroes of antiquity, of whom he read in the ancient authors, and for which he ſet apart ſome hours every day. Amongſt the works which he read almoſt every year, were Herodotus, Thucydides, Xenophon, Plutarch, Tacitus, Salluſt, Livy, Quintus Curtius, Cornelius Nepos, Valerius Maximus, Polybius, Cæſar, Vegetius, &c. He never ſpoke but with enthuſiaſm of the great warriors of Greece and Rome; and when ſeated on the throne, thought he could never diſtinguiſh an able ſoldier in a more honourable manner than by conferring on him a Roman ſurname. Hence he diſtinguiſhed, by the name of *Quintus Icilius*, M. Guichard who had written ſome treatiſes on the military art of the ancients; giving him at the ſame time a free battalion. This name of *Quintus Icilius* was retained by M. Guichard as long as he lived.

Frederick.

In his purſuit of glory Frederick found that it was not improper to cultivate the friendſhip of celebrated poets, philoſophers, and others of the literary claſs; for which purpoſe he flattered, commended, and complimented all the moſt celebrated literati of Europe at that time. "The philoſophers (ſays the author of his life) anſwered him as a mad lover writes to his miſtreſs. They wrote to him that he was a great poet, a great philoſopher, the *Solomon* of the north. All theſe hyperboles were printed; and Solomon was not ſorry for it, though he had too much underſtanding to believe in them. Wolf, Rollin, Graveſande, Maupertuis, Algarotti, Voltaire, were honoured with his correſpondence. The laſt eſpecially, accuſtomed to offer up incenſe to the idol of the day were it tranſported from the dunghil to the altar, did not fail to exalt as the firſt man of the univerſe. a prince who was in expectancy of the throne, and who aſſured him that he was the greateſt philoſopher of the age and the firſt poet in the world."

That Frederick might keep up his character with the literati, or perhaps from a real predilection for his principles,

Frederick. principles, he patroniſed the Apology of Wolf, and had his principal treatiſes tranſlated into French. He even prevailed upon his father to relax a little in favour of that philoſopher. A commiſſion of reformed and Lutheran theologians was appointed in 1736, to examine into the tenets of that unfortunate philoſopher. Wolf was declared innocent, and a letter was ſent to him at Marpourg containing an invitation to return; but the philoſopher did not think proper to make his appearance till the year 1740, when his protector was ſeated on the throne.

During his reſidence at Rheinſberg, Frederick compoſed his refutation of the principles of Machiavel, under the title of *Anti Machiavel*; of which he ſent the manuſcript to Voltaire to correct, and to get printed.

The old king, now almoſt worn out with infirmity, ſaw with regret the predilection his ſon entertained for men of letters; and, in his peeviſh fits, often threatened the whole ſociety with confinement in the fortreſs of Spandau. Theſe threats frequently occaſioned a violent alarm among the joyous company at Rheinſberg, which it required all the eloquence of Frederick to quiet. Their apprehenſions on this account, however, were ſoon removed. At the commencement of the year 1740, the king's diſorder increaſed to a great degree, and in the month of May his caſe became deſperate. He lived, however, till the 31ſt of that month, when he expired, and left the throne to his ſon Frederick II.

The acquiſition of a kingdom did not abate Frederick's paſſion for literature, though to this he was now obliged to ſuperadd the qualities and labours of a great king. A conſideration of his tranſactions in this character falls under the article PRUSSIA, to which we refer: theſe, indeed, ſo totally engroſſed the remaining part of his life, that little more remains to be ſaid under this article, than to relate ſome anecdotes by which we may be in ſome meaſure able to trace the character of this great and ſingular perſonage.

It has already been mentioned, that in the early part of his life, Frederick had conceived a great inclination to travel. This paſſion ſeems not to have been extinguiſhed by the ſplendor of his new ſituation; for having, ſoon after his acceſſion, gone into Pruſſia and Weſtphalia to receive the homage of the inhabitants, he formed a reſolution of proceeding *incognito* as far as Paris. Being diſcovered at Straſbourg, however, he laid aſide the deſign of proceeding to Paris, and went to ſee his ſtates in Lower Germany. Here he wrote the celebrated Voltaire, that he ſhould come *incognito* to viſit him at Bruſſels; but being ſeized with an indiſpoſition in the little palace of Meuſe, two leagues from Cleves, he wrote again to that philoſopher, informing him that he expected he ſhould make the firſt advances. The following curious account is given by him of his reception, &c. "The only guard I found at the gate was one ſoldier. The privy-counſellor, Bamboret, was cooling his heels in the court: he had large ruffles of dirty linen; a hat full of holes; and an old magiſterial peruke, one end of which deſcended as low as his pockets, and the other ſcarcely reached his ſhoulder. I was conducted into his majeſty's apartment, where there was nothing but bare walls. I perceived in a cabinet, by the glimmering of a taper, a truckle bed, two feet and an half wide, on which lay a little man muffled up in a night-gown of coarſe blue cloth. This was the king, in a ſtrong perſpiration, and even trembling under a wretched blanket in a violent fit of the ague. I bowed to him; and began by feeling his pulſe, as if I had been his firſt phyſician. The fit over, he dreſſed himſelf and ſat down to table. Algarotti, Kayſerling, Maupertuis, the king's miniſter to the States General, and myſelf, were of the party; where we converſed profoundly on the immortality of the ſoul, on liberty, and the androgynes of Plato." Frederic

This rigid economy, and contempt of every luxury with regard to his own perſon, was maintained by Frederick as long as he lived. The following account, taken likewiſe from Voltaire, will give an idea of his manner of living. "He roſe at five in the morning in ſummer, and ſix in winter. A lacquey came to light his fire, and dreſs and ſhave him; and indeed he almoſt wholly dreſſed himſelf. His room was not inelegant. A rich baluſtrade of ſilver, ornamented with little cupids, ſeemed to encloſe an alcove bed, the curtains of which were viſible; but behind them, inſtead of a bed, there was a library: the king ſlept on a truckle bed with a ſlight mattreſs concealed behind a ſcreen. Marcus Aurelius and Julian, thoſe apoſtles of Stoiciſm, did not ſleep in a more homely manner. At ſeven his prime miniſter arrived with a great bundle of papers under his arm. This prime miniſter was no other than a clerk who had formerly been a ſoldier and valet de chambre. To him the ſecretaries ſent all their diſpatches, and he brought extracts of them, to which the king wrote anſwers in two words on the margin: and thus the affairs of the whole kingdom were expedited in an hour. Towards eleven the king put on his boots, reviewed his regiment of guards in the garden, and at the ſame hour the colonels were following his example in their reſpective provinces. The princes his brothers, the general officers, and one or two chamberlains, dined at his table; which was as good as it could be in a country where there is neither game, tolerable butcher's meat, nor a pullet, and where the very wheat is brought from Magdebourg. After the repaſt he retired alone into his cabinet, where he made verſes till five or ſix o'clock. Then came a young man named D'Arget, formerly ſecretary to Valory the French envoy, who read to him. A little concert began at ſeven, in which the king played on the flute with as much ſkill as the firſt performer; and pieces of his compoſition were frequently executed. Supper was ſerved in a little hall, the ſingular and ſtriking ornament of which was a picture the deſign of which he had given to Peſne, one of our beſt colouriſts. It was a fine picture of Priapus. Theſe repaſts were not in general the leſs philoſophic on that account. Never did men converſe in any part of the world with ſo much liberty reſpecting all the ſuperſtitions of mankind, and never were they treated with more pleaſantry and contempt. God was reſpected; but none of thoſe who had deceived men in his name were ſpared. Neither women nor prieſts ever entered the palace. In a word, Frederick lived without a court, without counſel, and without religious worſhip."

As Frederick had eſpouſed his princeſs entirely contrary to his inclination, it was imagined that on his acceſſion to the throne he would embrace the opportunity of ſetting himſelf free from engagements ſo diſagree-

able

Frederick. able to himſelf. The queen was not without ſuſpicions of this kind, inſomuch that ſhe was on the point of fainting away when he made his firſt viſit to her. To the ſurpriſe of all parties, however, he made her a very affectionate ſpeech, apologizing for his indifference, and inviting her to participate with him the throne of which ſhe was ſo worthy. In the firſt year of his reign he reſtored the academy of ſciences at Berlin which had been founded in 1700; but he ſoon became diſguſted with its members, whom he endeavoured at all times to ridicule rather than encourage. His war with the queen of Hungary, however, which took place almoſt immediately after his acceſſion, for ſome time prevented him from taking ſuch an active part in literary matters as he was naturally inclined to do. After the peace, being at liberty to follow his inclination, he gave full ſcope to his paſſion for literature; and in the interval betwixt the concluſion of the firſt war and beginning of that of 1756, he compoſed moſt of the works which are now aſcribed to him. At this time he wrote his *Hiſtory of my own Time*, afterwards announced among his poſthumous works. In writing hiſtory he acquired a taſte for hiſtorians; and juſtly gave the preference to the ancients, the moſt celebrated of whoſe works he peruſed every year. Voltaire was his principal literary correſpondent, whom he invited to reſide with him. Afraid of loſing his liberty, however, that philoſopher heſitated, excuſed himſelf, and entered into pecuniary treaties, firſt for himſelf, and afterwards for his niece Madam Dennis, whom he wiſhed to accompany him. At laſt he was determined by ſeeing a poem from Frederick to M. D'Arnaud, in which the latter was compared to the riſing, and Voltaire to the ſetting, ſun. By this Voltaire was ſo much piqued, that he ſet out for Berlin without delay, and arrived there in June 1750. He was received in the moſt magnificent and affectionate manner, and for ſome time his ſituation was very agreeable; but the diſputes and rivalſhip which took place betwixt him and Maupertuis ſoon threw every thing into confuſion. In theſe the king interfered in ſuch a manner as was certainly below his dignity; and he often exerciſed himſelf in making a jeſt of the other men of letters in a way exceedingly diſguſting, and which induced many of them to leave him. The ſquabbles with Voltaire were ſometimes very diverting; an account of ſome of which is given under the article VOLTAIRE. They ended at laſt in a final quarrel with that wit, and his departure from the kingdom. The reſtleſs diſpoſition of Frederick ſhowed itſelf after his departure, by his attempts to provoke the literati who remained at his court to quarrel with him as Voltaire had been accuſtomed to do. But they were of too paſſive a diſpoſition to gratify him in this reſpect, chooſing rather to ſuffer the moſt mortifying ſtrokes of raillery, or to leave the kingdom altogether, than to contend with him. This proved ſo uneaſy to the king, that he one day exclaimed, "Shall we have no more quarrels then?" The breaking out of the war in 1756, however, put a ſtop to this diverſion, and afforded him as many enemies as he could wiſh. The exploits he performed during the ſeven years which this unequal conteſt laſted, are almoſt incredible *; and it is amazing how the fortitude and reſolution of any perſon could enable him to ſuſtain the difficulties which during this period he had to encounter. In one fatal moment, indeed, even the Frederick. reſolution of Frederick was on the point of giving way. This happened after the battle of Colin, when his affairs ſeemed altogether deſperate, before they were retrieved by the victory at Roſbach. At this time he wrote to his ſiſter at Bareith, that he was on the point of putting an end to his own life; but as this reſolution did not extinguiſh in him the love of glory, he wiſhed to have it ſaid that he made verſes on the brink of the grave. With this view he wrote a long poetical epiſtle to the marquis d'Argens, in which he communicated to him his deſign, and bade him farewell.

Happily, at laſt, the king's affairs took a better turn, and ſuch deſperate thoughts were laid aſide. His conſtitution, however, was irreparably injured by the exceſſive fatigues he had ſuſtained. Soon after the concluſion of the peace, his body began to bend, and his head to incline to the right ſide: by degrees he became very infirm; he was tormented with the gout, and ſubject to frequent indigeſtions. All his diſtempers, however, were borne with invincible patience; and, till a very ſhort time before his death, he never ceaſed to attend his reviews, or viſit the different provinces of his dominions. He has been known to review his troops, and gallop through all the ranks, as if he felt no pain, notwithſtanding that an abſceſs which had broken out upon him, and approached to a ſuppuration, frequently, upon ſuch occaſions, touched the ſaddle. In Auguſt 1785 he impaired his health ſtill farther by aſſiſting at a review, where he was expoſed without even a cloak to a heavy rain for four or five hours. On his return to Potzdam he was ſeized with a fever; and, for the firſt time, became unable to aſſiſt at the military exerciſes of Potzdam, which take place in September. His malady, however, did not prevent him from dictating the diſpoſition of theſe exerciſes during the three days they laſted, and he always gave the word in preſence of his generals and the foreigners of diſtinction then at Potzdam. About the end of autumn the fever left him, but was ſucceeded by a violent cough; and he continued free from the gout which had uſually attacked him at this ſeaſon. He was greatly weakened by the cough, which prevented him from ſleeping; but this did not in the leaſt interrupt him in the execution of buſineſs. Every morning, at four or five o'clock, he ordered the three cabinet ſecretaries to enter his apartment, where he dictated anſwers to their papers. It was not till after the diſpatch of all his affairs that he ſaw a ſurgeon, or ſometimes a phyſician, though he had a bad opinion of the phyſicians in general, whom he conſulted on his diſtemper. In the evening he amuſed himſelf from five to eight with ſome of his ſociety; and after that hour he paſſed the remainder of the time before he went to reſt, in hearing ſome ancient authors read to him; and thus he continued to employ himſelf till the very day before he died. On the 17th and 18th of May 1786, he was unable to aſſiſt at the ordinary reviews, but ſtill he hoped to be preſent at thoſe of Sileſia. He ſeveral times attempted to mount his horſe to go to the parade at Potzdam; but finding his powers inſufficient, he was obliged to return, after having proceeded a few paces. He made other attempts, but with as little ſucceſs; and at laſt his diſorder terminated in a dropſy. Being now no longer able to remain in bed, he ſat day and night in

* See Preſſia.

Frederick an arm chair with ſprings which could be moved at pleaſure. For near a month before his death the ſwelling of his feet gave him violent pain, ſo that he wiſhed an inciſion to be made; but the ſurgeon refuſed to perform the operation, ſuſpecting that it might haſten his death. Nature, however, accompliſhed his deſires; his right leg opened, and diſcharged ſuch a quantity of matter, that he was greatly relieved; and thoſe unacquainted with the medical art began to entertain hopes of his recovery. The phyſicians, however, were of a very different opinion; and the event juſtified their apprehenſions. On the 16th of Auguſt 1786 his throat began to rattle violently, and his attendants expected every moment that he would breathe his laſt. In this ſituation his three ſecretaries entered the room for the diſpatch of buſineſs as uſual. Even then Frederick made an effort to collect his force, giving them a ſign to wait, as if he would ſpeak with them in a ſhort time. This, however, was the laſt he could make: for he ſoon after fell into a ſtupor; though from this he recovered ſo far as to be able to ſpeak. In the evening he aſked what o'clock it was? and on being anſwered that it was nine, he ſaid, "Well then, I am going to reſt." His reſpiration and voice became gradually more feeble; and he expired on Thurſday at 19 minutes after two in the morning, without any convulſion or ſymptom of pain.

This great monarch was of the middle ſize, had large blue eyes and a piercing look. He ſpoke German incorrectly, and in a very rough manner; but talked French very fluently, and his voice was then mild and agreeable. His conſtitution was naturally feeble, but he had greatly improved it by his activity and laborious life. He had the art of relieving every one from that embarraſſment which frequently occurred in accoſting ſuch a celebrated monarch; and it ſeems probable that he himſelf conſidered on what he ſhould ſay to any illuſtrious perſon who happened to come to his court. His univerſal knowledge enabled him to converſe on all ſubjects; and thus he talked of war with military men, of verſes with the poet, of agriculture with the farmer, juriſprudence with the lawyer, commerce with the merchant, and politics with the Engliſhman. He had a very retentive memory; was fond of ſolitude and gardening; and likewiſe took great pleaſure in dogs, of which animals he conſtantly kept a number about him, giving them little balls covered with leather to play with. In company, he was fond of aſking queſtions and jeſting; in which laſt he proceeded ſuch lengths as undoubtedly were unbecoming in a ſuperior towards his inferiors, who would not have failed to reſent ſuch jokes from perſons more on an equality with them. In military affairs he was exceſſively ſevere, not to ſay cruel; of which the following anecdote may ſerve as an inſtance. In the firſt war of Sileſia, wiſhing to make ſome alterations in his camp during the night, he forbade every perſon, under pain of death, to keep, after a certain hour, a fire or other light in his tent. He himſelf went the rounds; and in paſſing the tent of a captain Zietern he perceived a light. Entering the tent, he found the captain ſealing a letter to his wife, for whom he had a great affection. "What are you doing there? (ſays the king:) Do you not know the order?" The captain fell on his knees and aſked pardon, but did not attempt to make any excuſe. "Sit down (ſays Frederick), and add a few words I am going to dictate to you." Zietern obeyed; and the king dictated, "To-morrow I ſhall periſh on a ſcaffold." The unfortunate man wrote them, and next day was executed. In matters of domeſtic legiſlation, he was more arbitrary than juſt; of which we have a notable example in the famous caſe of Arnold the miller. The man had refuſed to pay the rent of the mill he poſſeſſed, on pretence that the ſtream which turned it had been diverted into a fiſh-pond. This was evidently a frivolous excuſe; becauſe the water which ran into the pond alſo ran out of it into the ſame channel as before, ſo that nothing could be loſt except what evaporated from the ſurface of the fiſh-pond. The judges therefore gave ſentence againſt the miller; but the king not only reverſed their ſentence, but diſgraced them. For this he was celebrated through all the news-papers in Europe; and yet he was in the wrong, and afterwards even acknowledged himſelf to have been ſo: but, notwithſtanding he knew his error, he not only made no reparation to the parties he had injured, but allowed them to lie in priſon at Spandau all his lifetime, ſo that they were not releaſed till the commencement of the preſent reign. He entertained certain and almoſt unaccountable prejudices againſt certain places and perſons, which neither conduct nor merit could eradicate. One of theſe unfortunate places was Weſtphalia, on which he never conferred any bounty: and one day a native of that country, a man of great merit, being propoſed to him for a place, he refuſed, ſaying, "He is a Weſtphalian; he is good for nothing." Voltaire accuſes him of ingratitude to the Count de Seckendorf; who, as we have already ſeen, ſaved his life, and againſt whom he afterwards conceived the moſt implacable hatred. His indifference towards thoſe who afforded him the moſt eſſential ſervice, was evident: when a robuſt butcher prevented him from falling, horſe and all, over a precipice, where both would have undoubtedly been killed; the king, ſenſible of the aſſiſtance that had been afforded him, turned about, and ſaying, "Thank you, friend," rode off without ever inquiring farther about the perſon who had juſt preſerved him from deſtruction.

Frederick, Frederickſburg.

With regard to the literary merits of this monarch, we certainly cannot pronounce them extraordinary. Voltaire boaſts of having corrected his works, and others of having furniſhed him with materials for his hiſtory. He has been accuſed of borrowing whole hemiſtichs of poetry from Voltaire, Boileau, Rouſſeau, and others; nor does the charge appear to be at all void of foundation. Such of his verſes as appear to have undergone no correction, are very indifferent, nor indeed can we pronounce any of his poetic works to be of the firſt rate. In the former part of his life he entertained a great partiality for the French learning and language; but as he advanced in years, he entirely loſt this predilection, and inclined much more to favour the Engliſh and Germans. Towards the end of his life, indeed, he affected a contempt for the French, without whom it is ſaid he would ſcarce ever have made any figure except in the military line.

FREDERICKSBURG, a fort and colony of Brandenburg, on the gold-coaſt of Guinea, in Africa, near Cape Three-points, and about 75 miles from Cape

Frederickshall. Free-Stone.

Cape Coaſt. It mounts 46 pieces of cannon on four batteries; and formerly belonged to the Pruſſians, but is now ſubject to Denmark. W. Long. 1. 15. N. Lat. 4. 30.

FREDERICKSHALL, or FREDERICKSTADT, a ſtrong town of Norway, in the prefecture of Agerhuys, where Charles XII. king of Sweden was killed by a muſket-ball in 1718, when he was beſieging this town. It is ſeated on the coaſt of the Catagate, in E. Long. 10. 45. N. Lat. 59. 2.

FREDERICKSODE, a town of Denmark, in Jutland, taken by the Swedes in 1657, but now ſubject to Denmark. It is ſeated near the ſea, in E. Long. 10. 0. N. Lat. 55. 42.

FREDERICKSTADT, a town of Denmark, in South Jutland, built in 1621. It is ſeated on the river Eyder, in E. Long. 9. 23. N. Lat. 55. 32.

FREDERICKSTADT, a town of Norway, in the province of Agerhuys, ſeated on a bay of the ſea, near the frontiers of Sweden, in E. Long. 11. 6. N. Lat. 59. 12.

FREE, in a general ſenſe, is uſed in oppoſition to whatever is conſtrained or neceſſitated. When applied to things endowed with underſtanding, it more peculiarly relates to the liberty of the will.

FREE-Bench, ſignifies that eſtate in copy-hold which the wife, being eſpouſed a virgin, has after the deceaſe of her huſband for her dower, according to the cuſtom of the manor.

In regard to this free-bench, different manors have different cuſtoms: and in the manor of eaſt and weſt Enbourne in the county of Berks, and in other parts of England, there is a cuſtom, that when a copyhold tenant dies, the widow ſhall have her free-bench in all the deceaſed huſband's lands, *dum ſola & caſta fuerit*, "whilſt ſhe lives ſingle and chaſte;" but if ſhe is found to be guilty of incontinency, ſhe ſhall forfeit her eſtate. Nevertheleſs, upon her coming into the court of the manor riding backwards on a black ram, with his tail in her hand, rehearſing a certain form of words, the ſteward is bound by cuſtom to reſtore her to her free-bench. The words are,

Here I am,
Riding on a black Ram,
Like a whore as I am;
And for my crincum crancum
Have loſt my bincum bancum,
And for my tail's game
Have done this worldly ſhame:
Therefore, pray Mr Steward, let me have my land again.

FREE or *Imperial Cities* in Germany, are thoſe not ſubject to any particular prince; but governed, like republics, by their own magiſtrates.

There were free cities, *(liberæ civitates)*, even under the ancient Roman empire: ſuch were thoſe to whom the emperor, by the advice or conſent of the ſenate, gave the privilege of appointing their own magiſtrates, and governing themſelves by their own laws. See CITY.

FREE Fiſhery. See *Free* FISHERY.

FREE Warren. See WARREN.

FREE-Maſon. See MASON.

FREE-Stone, a whitiſh ſtone, dug up in many parts of Britain, that works like alabaſter, but is more hard and durable; being of excellent uſe in building, &c. It is a kind of the grit ſtone, but finer ſanded and ſmoother; and is called *free*, from its being of ſuch a conſtitution as to cut freely in any direction. Free-Stone || Freehold.

The qualities of the ſeveral kinds of free-ſtones uſed in the different parts of Europe are very different. They all agree in this general property indeed, that they are ſofter while in the quarry, than when they have been ſome time expoſed to the air: but even this general property differs greatly in degree. They have a ſort of grey free-ſtone in uſe at Paris (of which we do not yet ſeem to have met with any in this country), which has the abovementioned quality in ſo great a degree, that the expence of working it is in a great meaſure ſaved.

This ſtone lies every-where on the ſouth-ſide of the river Seine, and is of a coarſe and large grit. It is ſo ſoft when newly taken out of the ſtrata, that they faſhion it very conveniently with a ſort of broad ax, and form as many ſtones for building in this manner in an hour, as an equal number of our people do in a day or two. Though this ſtone is as ſoft as dry clay when firſt taken up, it is found to harden ſo conſiderably in the air, that it becomes more than equal to our ordinary free-ſtone.

Our Portland ſtone of the fineſt kind, which is white, and of a cloſe grit, is very fit for hewing and carving; but it will neither reſiſt water nor fire, which is a very ſingular inſtance in ſo denſe a ſtone; while the free-ſtone of Kent, which is leſs beautiful to the eye, and is of a greyiſh colour, and conſiderably cloſe, though of a larger grain, reſiſts the air and water very well. The free-ſtone of Derbyſhire, on the other hand, is ſo brittle as to be unfit for any fine working; and ſo coarſe and open in its texture, that it lets water through: yet it bears the fire extremely well, and is fit for ovens, hearths, &c.

FREEBOOTER, or FLIBUSTER, a name given to the pirates who ſcour the American ſeas, particularly ſuch as make war againſt the Spaniards. See BUCANEER.

FREEDOM, in general, the ſtate or quality of being free. See LIBERTY.

FREEDOM of a Corporation, the right of enjoying all the privileges and immunities belonging to it. See CORPORATION.

The freedom of cities, and other corporations, is regularly obtained by ſerving an apprenticeſhip; but it is alſo purchaſed with money, and ſometimes conferred by way of compliment.

FREEDOM of Conſcience. See TOLERATION.

FREEDOM of the Will, that power or faculty of the mind, whereby it is capable of acting or not acting, chooſing or rejecting whatever it judges proper †. Of this every man muſt be ſenſible, who finds in himſelf a power to begin or forbear, continue or end ſeveral actions, barely by a thought or preference of the mind. † See *Metaphyſics*.

FREEHOLD, FRANK TENEMENT, (*liberum tenementum*), is land, or tenement, which a man holds in *fee-ſimple*, *fee-tail*, or for term of life. See FEE and TAIL.

Freehold is of two kinds, in *deed* and in *law*.

The firſt is the real poſſeſſion of land or tene-

Freehold & Freezing.

ment in fee, fee-tail, or for life: the other is the right a man has to ſuch land or tenement before his entry or ſeizure.

A freehold, by the common law, cannot commence *in futuro*; but it muſt take effect preſently, either in poſſeſſion, reverſion, or remainder. Whatever is part of the freehold goes to the heir; and things fixed thereto may not be taken in diſtreſs for rent, or in execution, &c. No man ſhall be diſſeiſed of his freehold by ſtat. Magna Charta, cap. 29. but by judgment of his peers, or according to the laws of the land: nor ſhall any diſtrain freeholders to anſwer for their freehold, in any thing concerning the ſame, without the king's writ. Freehold eſtates, of certain value, are required by ſtatutes to qualify jurors, electors of the knights of the ſhire in parliament, &c.

FREEHOLD is likewiſe extended to ſuch offices as a man holds in fee, or for life.

FREEHOLD is alſo ſometimes taken in oppoſition to villenage.

Lambard obſerves, that land, in the Saxons time, was diſtinguiſhed into *bockland*, i. e. holden by book or writing; and *folkland*, held without writing. The former, he ſays, was held on far better condition, and by the better ſort of tenants, as noblemen and gentlemen; being ſuch as we now call *freehold*: the latter was moſtly in poſſeſſion of peaſants; being the ſame with what we now call *at the will of the lord*.

In the ancient laws of Scotland, freeholders are called *milites*, "knights." In Reg. Judicial. it is expreſſed, that he who holds land upon an execution of a ſtatute merchant, until he hath ſatisfied the debt, *tenet ut liberum tenementum ſibi et aſſignatis ſuis*; and the ſame of a tenant *per eligit*: the meaning of which ſeems to be, not that ſuch tenants are freeholders, but as freeholders for the time, till they have received profits to the value of their debt.

FREETHINKER. See DEIST.

FREEZE, FRIEZE, or *Frize*, in commerce. See FRIZE.

FREEZE, in architecture, that part of the entablature of columns, between the architrave and corniche.

The freeze is properly a large flat face, or member, ſeparating the architrave from the corniche.

The ancients called it *zoophorus*, (ζωοφορος) becauſe it was uſually enriched with figures of animals; and our denomination *freeze* has a like origin, being formed of the Latin *phrygio*, "an embroiderer," becauſe it is commonly adorned with ſculptures in baſſo-relievo, imitating embroidery.

FREEZING, in philoſophy, the ſame with congelation. See CONGELATION, FROST, and ICE.

FREEZING Rain, or *Raining Ice*, a very uncommon kind of ſhower, which fell in the weſt of England, in December 1672; whereof we have divers accounts in the Philoſophical Tranſactions.

This rain, as ſoon as it touched any thing above ground, as a bough or the like, immediately ſettled into ice; and by multiplying and enlarging the icicles, broke all down with its weight. The rain that fell on the ſnow immediately froze into ice, without ſinking in the ſnow at all.

It made an incredible deſtruction of trees, beyond any thing in all hiſtory. "Had it concluded with ſome guſt of wind (ſays a gentleman on the ſpot), it might have been of terrible conſequence. I weighed the ſprig of an aſh tree, of juſt three-quarters of a pound; the ice on which weighed 16 pounds. Some were frighted with the noiſe in the air; till they diſcerned it was the clatter of icy boughs, daſhed againſt each other." Dr Beale obſerves, that there was no conſiderable froſt obſerved on the ground during the whole; whence he concludes, that a froſt may be very intenſe and dangerous on the tops of ſome hills and plains; while in other places it keeps at two, three, or four feet diſtance above the ground, rivers, lakes, &c. and may wander about very furious in ſome places, and remiſs in others not far off. The froſt was followed by glowing heats, and a wonderful forwardneſs of flowers and fruits.

Freight & Freinthemius.

FREIGHT, in navigation and commerce, the hire of a ſhip, or a part thereof, for the conveyance and carriage of goods from one port or place to another; or the ſum agreed on between the owner and the merchant, for the hire and uſe of a veſſel. See *Maritime Laws*.

FREIND (John), a moſt learned Engliſh phyſician and writer in the 18th century, was born at Croton, Northamptonſhire, in 1675. In 1696, he publiſhed, in conjunction with Mr P. Foulkes, an edition of two Greek orations, one of Æſchines againſt Cteſiphon, and the other of Demoſthenes *de Coronâ*, with a new Latin verſion. In 1699, he wrote a letter to Dr Sloane concerning an *Hydrocephalus*, publiſhed in the Philoſophical Tranſactions; and another letter in Latin to the ſame gentleman, *De ſpaſmis rarior. hiſtoria*, printed in the ſame Tranſactions. In 1703, his *Emmenalogia* appeared; which gained him great reputation. In 1704, he was choſen profeſſor of chemiſtry in the univerſity of Oxford. In 1705, he attended the earl of Peterborough to Spain, as phyſician to the army there; and upon his return in 1707, publiſhed an account of the earl's expedition and conduct. In 1709, he publiſhed his Chemical Lectures. In 1712, he attended the duke of Ormond in Flanders, as his phyſician. In 1716, he was admitted a fellow of the college of phyſicians in London. This year he publiſhed the firſt and third books of Hippocrates *De morbis popularibus*, with a Commentary on Fevers, written by himſelf. He ſat a member for the borough of Launceſton in Cornwall in 1722, where he diſtinguiſhed himſelf by his oppoſition to the adminiſtration. March 1722, he was committed to the tower on a charge of high-treaſon: and while he was under confinement, he wrote a Latin epiſtle to Dr Mead, *De quibuſdam variolarum generibus*; and began his Hiſtory of Phyſic, the firſt part of which was publiſhed in 1725, and the ſecond in 1726. Upon the acceſſion of George II. to the throne, he was appointed phyſician in ordinary to the queen, who ſhowed the utmoſt regard and eſteem for him. He died at London in 1728. His works were publiſhed together in Latin at London, 1733, in folio, and dedicated to the queen.

FREINSHEMIUS, a learned and elegant author, born at Ulm in 1608. He made Supplements to Livy, Tacitus, and Q. Curtius, in 60 books, printed at Straſburg in 1654. He wrote likewiſe Notes upon Q. Curtius, Florus, Tacitus, and ſome other Latin authors; and died in 1660.

FREITS.

FREITS. See FREATS.

FRENCH, in general, ſomething belonging to France: thus we ſay, the French language, French cuſtoms, polity, &c,

The French language, as it now ſtands, is no original or mother language, but a medley of ſeveral. Thoſe that prevail moſt, and which are, as it were, the baſis thereof, are, 1. The Celtic; whether that were a particular language itſelf, or whether it were only a dialect of the Gothic, as ſpoke in the weſt and north. 2. The Latin, which the Romans carried with them into Gaul, when they made the conqueſt thereof. And, 3. The Teutonic, or that dialect of the Teutonic ſpoke by the Franks, when they paſſed the Rhine, and eſtabliſhed themſelves in Gaul. Of theſe three languages, in the ſpace of about thirteen hundred years, was the preſent French formed, ſuch as it is now found. Its progreſs was very ſlow; and both the Italian and Spaniſh were regular languages long before the French.

Paſquier obſerves, it was under Philip de Valois, that the French tongue firſt began to be poliſhed; and that, in the regiſter of the chamber of accounts of that time, there is a purity ſeen almoſt equal to that of the preſent age. However, the French was ſtill a very imperfect language till the reign of Francis I. the cuſtom of ſpeaking Latin at the bar, and of writing the public acts and inſtruments of the courts of juſtice in that language, had made them overlook the French, their own language. Add, that the preceding ages had been remarkable for their ingorance, which was owing, in good meaſure, to the long and calamitous wars which France had been engaged in: whence the French nobleſſe deemed it a kind of merit not to know any thing; and the generals regarded little whether or no they wrote and talked politely, provided they could but fight well.

But Francis I. who was the reſtorer of learning, and the father of the learned, changed the face of things; and after his time, Henry Stevens printed his book, *De la Precellence du Langage François*. The change was become very conſpicuous at the end of the 16th century; and under Henry IV. Amyot, Coeffeteau, and Malherbe, contributed towards bringing it to its perfection; which the Cardinal De Richelieu completed, by the eſtabliſhment of the French academy; an aſſembly, wherein the moſt diſtinguiſhed perſons of the church, the ſword, and the gown, have been members. Nor did the long reign of Louis XIV. contribute a little to the improvement of the language: the perſonal qualities of that prince, and his taſte for the fine arts, and that of the princes of the blood, rendered his court the politeſt in Europe. Wit and magnificence ſeemed to vie; and his generals might have diſputed with the Greeks, Romans, &c. the glory of writing well, if they could not that of fighting. From court, the elegance and purity of the language ſoon ſpread itſelf into the provinces; and now there is ſcarce any body there who does not write and ſpeak good French.

One of the characters of the French language is, to be natural and eaſy. The words are ranged in it much in the ſame order as the ideas in our minds; in which it differs exceedingly from the Greek and Latin, where the inverſion of the natural order of words is reputed a beauty. Indeed the Hebrew ſurpaſſes even the French in this point; but then it comes ſhort of it in copiouſneſs and variety. French, Freſcati.

It muſt be added, however, that as to the analogy of grammar, and the ſimplicity wherewith the moods of verbs are formed, the Engliſh has the advantage not only over the French, but over all the known languages in the world; but then the turns, the expreſſions, and the idioms, of the Engliſh, are ſometimes ſo quaint and extraordinary, that it loſes a good deal of the advantage which its grammatical ſimplicity gives it over the reſt.

The French has but few compound words; wherein it differs widely from the Greek, High Dutch, and Engliſh. This the French authors own a great diſadvantage in their language; the Greek and Dutch deriving a great part of their force and energy from the compoſition of words, and frequently expreſſing that in one ſounding word, which the French cannot expreſs but by a periphraſis. The diminutives in the French are as few as the compounds; the greateſt part of thoſe remaining in uſe having loſt their diminutive ſignification; but what diſtinguiſh the French moſt, are its juſtneſs, purity, accuracy, and flexibility.

French is the moſt univerſal and extenſive language in Europe. The policy of ſtates and courts has rendered it neceſſary for the miniſters of princes, and their officers, &c. and the taſte of arts and ſciences has had the ſame effect with regard to the learned. In Germany, and elſewhere, the princeſſes and perſons of diſtinction value themſelves on underſtanding French; and in ſeveral courts of Europe, French is almoſt as much known as the language of the country.

FRESCATI, or FRASCATI, a ſmall town, ſituated on the brow of a hill, about twelve miles to the eaſtward of Rome. It derives its name from the coolneſs of the air, and *freſh* verdure of the fields around. It is built on the ruins of the ancient Tuſculum; and the Tuſculan villa where Cicero wrote his famous queſtions is at a place now called *Grotta Ferrata*, about two miles diſtant. E. Long. 11. 43. N. Lat. 41. 48. There is a very fine proſpect from this town into the neighbouring country, which abounds with the ſeats of cardinals and other nobility. It is the ſee of a biſhop, who is one of the ſix ſenior cardinals, and is ſurrounded by ſome of the moſt beautiful villas in Italy; the principal of which are the villa Aldrobandini, belonging to prince Pamfili; the villa Taberna, belonging to prince Borgheſe; and villa Ludoviſi, to the family of Colonna. The villa Aldobrandini, called alſo *Belvedere* from its beautiful proſpect, is the moſt remarkable, on account of its fine ſituation, extenſive gardens, airy terraces, its grottos, caſcades, and waterworks. Over a ſaloon, near the grand caſcade, is the following inſcription:

Huc ego migravi muſis comitatus Apollo;
Hic Delphi, hic Helicon, hic mihi Delos erit.

The walls are adorned with a repreſentation of Apollo and the muſes; and ſome of that god's adventures are painted in freſco by Domenichino. The villa Taberna is one of the fineſt and beſt furniſhed of any in the neighbourhood of Rome. From this you aſcend thro' gardens to Monte Dracone, anothe palace on a more lofty ſituation, belonging alſo to that prince, and deriving its name from the arms of his family. From hence

Fresco. hence you may see Rome, and the whole extent of the plain: it has a noble ascent, with a broad paved walk; and among other curiosities there is a hall adorned with the pictures of a vast number of eminent men for learning and arms. The gardens, laid out by Vignola, contain three miles in compass; and have many delightful walks, with curious water-works. Near this place are the monks of Camaldoli and the capuchins; and higher up are ruins of the ancient Tusculum. Ascending towards the plain, two miles on the right-hand, you find the famous abbey of Grotta Ferrata, belonging to the monks of St Basil, and situated on the ruins of Cicero's house. The virgin Mary of the great altar is an ancient Greek picture; in the chapel the pictures of St Nilus and St Bartholomew the abbot, are by Annibal Caracci; and all the paintings in fresco of this chapel are by Domenichino. Villa Ludovisia has a charming walk going up to it, where you see the ruins of Lucullus's palace. The house is small; but the gardens are large, embellished with a great variety of walks and fountains, and a beautiful cascade.

FRESCO, a method of painting in relievo on walls, so as to endure the weather. It is performed with water-colours on fresh plaster, or on a wall laid with mortar not yet dry. This sort of painting has a great advantage by its incorporating with the mortar, and drying along with it, becomes very durable. The Italians, from whom we borrow the term, call it *fresco*; because it is frequently used for walls, alcoves, and other buildings in the *open air*. Vitruvius, lib. vii. cap. 4. calls it *udo tectorio*.

Painting in fresco is very ancient, having been practised in the earliest ages of Greece and Rome. It is chiefly performed on walls and vaults, newly plastered with lime and sand; but the plaster is only to be laid, in proportion as the painting goes on; no more being to be done at once than the painter can dispatch in a day, while it dries. Before he begins to paint, a cartoon or design is usually made on paper, to be calked, and transferred to the wall, about half an hour after the plaster is applied.

The ancients painted on stucco; and we may remark in Vitruvius what infinite care they took in making the incrustation or plastering of their buildings to render them beautiful and lasting; though the modern painters find a plaster made of lime and sand preferable to it; both as it does not dry so hastily, and as being a little brownish, it is fitter to lay colours on, than a ground so white as stucco.

In this kind of painting, all the compound and artificial colours, and almost all the minerals, are set aside, and scarce any things used but earths; which are capable of preserving their colour, defending it from the burning of the lime, and resisting its salt, which Vitruvius calls its bitterness.

For the work to come out in all its beauty, the colours must be laid on quick, while the plaster is yet moist; nor should they ever be retouched, dry, with colours mixed up with the white of an egg, or size, or gum, as some workmen do; because such colours grow blackish; nor do any preserve themselves, but only such as were laid on hastily at first.

The colours used are white made of lime flaked long before, and white marble dust; ochre, both red and yellow; verditer; lapis lazuli; smalt; black chalk, &c. All which are only ground, and worked up with water; and most of them grow brighter and brighter as the fresco dries.

The brushes and pencils for this work ought to be long and soft, otherwise they will rake and raise the painting. The colours should be full, and flowing from the brush; and the design perfect: for in this work you cannot alter or add upon any colour.

FRESH-WATER, is that not tinctured or impregnated with salt or saline particles, enough to be discoverable by the sense. Such generally is that of springs, rains, wells, lakes, &c.

The dulcifying or making of salt water fresh is a secret that has been long sought with great attention. For an account of the principal attempts that have been made with this view, see *Sea-Water*.

Fresh Wind signifies strong, but not violent; hence when the gale increases, it is said to freshen.

FRESHES, in sea-language, denotes the impetuosity of an ebb-tide, increased by heavy rains, and flowing out into the sea, often discolouring it to a considerable distance, and forming a line that separates the two colours, and which may be distinctly perceived for a great length along the coast.

Freshes, a local term signifying annual inundations, from the rivers being swollen by the melted snows and other fresh waters from the uplands, as is the Nile, &c. from periodical or tropical rains. As a sailor's term, it is opposed to marine or salt-water floodings, tides, &c. The word is of common use in America, where the inundations so called are of great service. They bring down the soil to the intervals below, and form a fine mould, producing corn, grain, and herbage, in the most luxuriant plenty. They also afford another benefit, in regard to many rivers in America, *viz.* in equalizing the surface of the stream (where rapid falls, or cascades, obstruct the navigation), so that rafts of timber and other gross produce are then floated down to the sea-ports in great quantities.

FRESNOY (Charles Alphonse du), an excellent poet and painter, was born at Paris in 1611. He was instructed there by Perrier and Simon Vouet in painting: but he did not long adhere to Vouet's manner of colouring; for as soon as he fixed himself at Rome, he made the works of Titian the models for his imitation. He was, however, more celebrated as a poet than as a painter; and gave more attention to the theory than to the practice of the pencil. Accordingly, he is better known by his incomparable poem *De arte graphica*, than by his performances on the canvas: and on this poem he bestowed so much pains, that he died in 1665, before it was published. It was printed afterward with a French prose translation and notes by M. de Piles; and was translated into English by Mr Dryden, who prefixed to it an original preface containing a parallel between painting and poetry.

FRET, or Frette, in architecture, a kind of knot or ornament, consisting of two lists or small fillets variously interlaced or interwoven, and running at parallel distances equal to their breadth.

Fret, in heraldry, a bearing composed of six bars, crossed and variously interlaced. Some call it the *true-lover's knot*. See Heraldry.

Fret,

Fret
Friburg

FRET, in muſic, ſignifies a kind of ſtop on ſome inſtruments, particularly baſs-viols and lutes. Frets conſiſt of ſtrings tied round the neck of the inſtrument, at certain diſtances, within which ſuch and ſuch notes are to be found.

Fret-Work, that adorned with frets. It is ſometimes uſed to fill up and enrich flat empty ſpaces; but it is moſtly practiſed in roofs, which are fretted over with plaſter work.

FRETTS, in mineralogy, a term uſed by our miners to expreſs the worn ſide of the banks of the rivers in mine-countries, where they ſearch for the ſhoad ſtones or grewts waſhed down from the hills, in order from thence to trace out the running of the ſhoad up to the mine.

FRETTS, *Freats*, or *Freits*. See FREATS.

FRIABLE, among naturaliſts, an appellation given to bodies that are eaſily crumbled to pieces: ſuch are pumice and all calcined ſtones.

FRIAR, or FRIER, by the Latins called *frater*, the Italians *fra*, and the French *frere*, that is, *brother*: a term common to the monks of all orders; founded on this, that there is a kind of fraternity or brotherhood preſumed between the ſeveral religious perſons of the ſame convent or monaſtery.

Friars are generally diſtinguiſhed into theſe four principal branches, *viz.* 1. Minors, grey friars, or franciſcans. 2. Auguſtines. 3. Dominicans, or black friars. 4. White friars or carmelites. From theſe four the reſt of the orders deſcend. See FRANCISCANS, AUGUSTINES, &c.

FRIAR, in a more peculiar ſenſe, is reſtrained to ſuch monks as are not prieſts; for thoſe in orders are uſually dignified with the appellation of *father*.

Friars Obſervant (*fratres obſervantes*), were a branch of the Franciſcans; thus called, becauſe not combined together in any cloyſter, convent, or corporation, as the conventuals are; but only agreed among themſelves to obſerve the rules of their order, and that more ſtrictly than the conventuals did, from whom they ſeparated themſelves out of a ſingularity of zeal, living in certain places of their own chooſing.

FRIBURG, a large town of Germany, and capital of Briſgaw; remarkable for the ſteeple of the great church, which, next to that of Straſburg, is the fineſt in Germany; and for its univerſity. The inhabitants are famous for poliſhing cryſtal and precious ſtones. It has been ſeveral times taken and retaken; particularly by the French in 1744, who demoliſhed the fortifications. It is ſeated on the river Triſer, ten miles eaſt of Briſach, and 30 ſouth of Straſburgh. E. Long. 7. 57. N. Lat. 48. 4.

FRIBURG, a town of Swiſſerland, and capital of the canton of the ſame name, ſeated on the river Sane, in E. Long. 7. 5. N. Lat. 46. 50. Its ſituation is moſt ſingular and picturеſque: "It ſtands partly in a ſmall plain, partly on bold acclivities on a ridge of rugged rocks, half encircled by the river Sane; and is ſo entirely concealed by the circumjacent hills, that the traveller ſcarcely catches the ſmalleſt glimpſe, until he burſts upon a view of the whole town from the overhanging eminence. The fortifications, which conſiſt of high ſtone-walls and towers, incloſe a circumference of about four miles; within which ſpace the eye comprehends a ſingular mixture of houſes, rocks, thickets, and meadows, varying inſtantly from wild to agreeable, from the buſtle of a town to the ſolitude of the deepeſt retirement. The Sane winds in ſuch a ſerpentine manner as to form in its courſe, within the ſpace of two miles, five obtuſe angles, between which the intervening parts of the current are parallel to each other. On all ſides the deſcent to the town is extremely ſteep: in one place the ſtreets even paſs over the roofs of the houſes. Many of the edifices are raiſed in regular gradation like the ſeats of an amphitheatre; and many overhang the edge of a precipice in ſuch a manner, that on looking down, a weak head would be apt to turn giddy. But the moſt extraordinary point of view is from the Pont-neuf. To the north-weſt, part of the town ſtands boldly on the ſides and the piked back of an abrupt ridge; and from eaſt to weſt a ſemicircle of high perpendicular rocks is ſeen, whoſe baſe is waſhed and undermined by the winding Sane, and whoſe tops and ſides are thinly ſcattered with ſhrubs and underwood. On the higheſt point of the rocks, and on the very edge of the precipice, appears, half-hanging in the air, the gate of the town called *Bourguillon*: a ſtranger ſtanding on the bridge would compare it to Laputa, or the Flying Iſland in Gulliver's Travels; and would not conceive it to be acceſſible but by means of a cord and pulleys. The houſes, conſtructed with a grey ſand-ſtone, are neat and well built; and the public edifices, particularly the cathedral, are extremely elegant. The inhabitants are Roman Catholics, as are thoſe of the whole canton. The biſhop of Lauſanne, called here the biſhop of Friburg, reſides in this city. He is appointed by the pope, uſually at the recommendation of the French court; and his revenues, including a ſmall penſion from France, and from the abbey of Hauterive, of which he was abbot, amount to about L. 400 *per annum*. His dioceſe extends over the whole canton, and part of that of Soleure. In all his acts and deeds he ſigns himſelf biſhop and count of Lauſanne, and prince of the German empire. The ſovereign power reſides in the great council of two hundred; compriſing the two advoyers, the chancellor, the grand fautier, the ſenate or little council of twenty-four, the ſixty, from which body are choſen the bannerets and principal magiſtrates, and the remaining hundred and twelve members, who are ſimply denominated burghers."

Tra- Switz. II. 6.

FRIBURG (the canton of), and one of the 13 republics of Switzerland. It is ſurrounded on all ſides by the canton of Bern. The land is fertile in corn, fruits, and paſtures; and it is ſaid the canton can ſend 18,000 men into the field. This canton is entirely catholic.

FRICASSEE, a diſh or meſs haſtily dreſſed in a frying-pan, and ſeaſoned with butter, oil, or the like. The word is French, formed of the Latin *frixatura*, "frying." Others will have fricaſſee formed in imitation of the noiſe made by butter, or other fat, when melted in the pan. We ſay a fricaſſee of pullets, of rabbits, of tench, of tripe, of frogs, of eggs, of peas, &c.

FRICENTI, an epiſcopal town of Italy, in the kingdom of Naples, and in the farther principato, near the river Tripalto, in E. Long. 14. 13. N. Lat. 40. 59.

FRICTION, the act of rubbing or grating the ſurface of one body againſt that of another, called

Friburg
Friction.

Friction. also *attrition*. The phenomena arising upon the friction of divers bodies, under different circumstances, are very numerous and considerable. Mr Hawksbee gives us a number of experiments of this kind; particularly of the attrition or friction of glass, under various circumstances, the result of which was, that it yielded light and became electrical. All bodies by friction are brought to conceive heat; many of them to emit light; particularly a cat's back, sugar, beaten sulphur, mercury, sea-water, gold, copper, &c. but, above all, diamonds, which, when briskly rubbed against glass, gold, or the like, yield a light equal to that of a live coal when blowed by the bellows. See ELECTRICS and ELECTRICITY.

FRICTION, in mechanics, denotes the resistance a moving body meets with from the surface on which it moves. Friction arises from the roughness or asperity of the surface of the body moved on, and that of the body moving: for such surfaces consisting alternately of eminences and cavities, either the eminences of the one must be raised over those of the other, or they must be both broke and worn off; but neither can happen without motion, nor can motion be produced without a force impressed. Hence, the force applied to move the body is either wholly or partly spent on this effect; and consequently there arises a resistance or friction, which will be greater, *cæteris paribus*, as the eminences are the greater and the substance the harder: and as the body, by continual friction, becomes more and more polished, the friction diminishes. See MECHANICS.

FRICTION, in medicine and surgery, denotes the act of rubbing a diseased part with oils, unguents, or other matters, in order to ease, relieve, and cure it. Frictions are much used of late in venereal cases. They prefer the applying of mercury externally by way of friction, to that of giving it internally, to raise a salivation.

There are also frictions with the flesh-brush, a linen cloth, or the hand only. These frictions are a sort of exercise which contributes greatly to health; as they excite and stir up the natural warmth, divert defluxions, promote perspiration, open the pores of the skin, and carry off stagnant humours.

The flesh-brush (Dr Cheyne observes) is an exercise extremely useful for promoting a full and free perspiration and circulation. Every body knows the effect of currying horses; that it makes them sleek, gay, lively, and active; so as even to be judged equivalent to half the feeding. This it can no otherwise effect, but by assisting nature to throw off the recrements of the juices, which stop the free circulation, and, by constant friction, irritation, and stimulation, to bring the blood and spirits to the parts most distant from the seat of heat and motion; and so plump up the superficial muscles. And the same effect it would have in other creatures, and man himself, if managed in the same manner, and with the same care and regularity. Persons, therefore, of weak nerves and sedentary lives, would do well to supply the want of other exercise with spending half an hour, morning and night, in currying and rubbing their whole body, especially their limbs, with a flesh-brush. But this means of health is most advantageously used when the *primæ viæ* are most empty.

FRIDAY, the sixth day of the week; so named of *Freya*, a Saxon deity. By the Romans it was called *dies Veneris*. See FREA.

Good FRIDAY. See *GOOD-Friday*.

FRIDBURG, an imperial town of Germany, in Wetteravia. It is seated on a mountain, in E. Long. 8. 50. N. Lat. 50. 14. It was formerly much more considerable than at present.

FRIDSTOL, mentioned, in our ancient writers, among the immunities granted to churches, signifies a seat, chair, or place of peace and security, where criminals might find safety and protection: of these there were many in England; but the most famous were that at Beverly, and that in St Peter's church at York, granted by charter of king Henry I.

FRIENDLY ISLANDS, a cluster of islands in the Pacific Ocean, so named by Captain Cook in the year 1773, on account of the friendship which appeared to subsist among the inhabitants, and from their courteous behaviour to strangers. Abel Jansen Tasman, an eminent Dutch navigator, first touched here in 1643, and gave names to the principal islands. Captain Cook laboriously explored the whole cluster, which he found to consist of more than 60. The three islands which Tasman saw he named *New Amsterdam*, *Rotterdam*, and *Middleburgh*. The first is the largest, and extends about 21 miles from east to west, and about 13 from north to south. These islands are inhabited by a race of Indians, who cultivate the earth with great industry. The island of Amsterdam is intersected by straight and pleasant roads, with fruit-trees on each side, which provide shade from the scorching heat of the sun. The chief islands are Annamooka, Tangataboo (the residence of the sovereign and the chiefs), Lefooga, and Eooa. Lefooga is about 7 miles long, and in some places not above two or three broad. It is in many respects superior to Annamooka. The plantations are both more numerous and more extensive; and inclosed by fences which, running parallel to each other, form fine spacious public roads, which would appear beautiful in countries where rural conveniences have been carried to the greatest perfection. They are, in general, highly cultivated, and well-stocked with the several roots and fruits which these islands produce; and Captain Cook endeavoured to add to their number by planting Indian corn, and the seeds of melons, pumpkins, and the like. Eooa, when viewed from the ship at anchor, formed one of the most beautiful prospects in nature, and very different from the others of the Friendly Isles; which being low and perfectly level, exhibit nothing to the eye but the trees which cover them: whereas here, the land rising gently to a considerable height, presents us with an extensive prospect, where groves of trees are only interspersed at irregular distances, in beautiful disorder, and all the rest is covered with grass, except near the shores, where it is entirely covered with fruit and other trees; amongst which are the habitations of the natives. In order to have a view of as great a part of the island as possible, Captain Cook and some of his officers walked up to the highest point of the island. From this place they had a view of almost the whole island, which consisted of beautiful meadows of prodigious extent, adorned with tufts of trees, and intermixed with plantations. 'While I was surveying this delightful

prospect (says Captain Cook), I could not help flattering myself with the pleasing idea that some future navigator may, from the same station, behold these meadows stocked with cattle, brought to these islands by the ships of England; and that the completion of this single benevolent purpose, independent of all other considerations, would sufficiently mark to posterity, that our voyages had not been useless to the general interests of humanity. 'The next morning', says our benevolent commander, 'I planted a pine-apple, and sowed the seeds of melons and other vegetables in Taoofa's plantation. I had indeed some encouragement to flatter myself that my endeavours of this kind also would not be fruitless; as I had this day a dish of turnips served up at my dinner, which was the produce of seeds I left here in my former voyage.'

The natives of these islands seldom exceed the common stature; but are very strong and well made, especially as to their limbs. They are generally broad about the shoulders; and though the muscular disposition of the men, which seems a consequence of much action, rather conveys the appearance of strength than of beauty, there are several to be seen who are really handsome. The women are not so much distinguished from the men by their features as by their general form, which is for the most part destitute of that strong fleshy firmness that appears in the latter. Tho' the features of some are so delicate, as not only to be a true index of their sex, but to lay claim to a considerable share of beauty and expression, for the bodies and limbs of most of the females are well proportioned; and some absolutely perfect models of a beautiful figure. But the most remarkable distinction in the women, is the uncommon smallness and delicacy of their fingers, which may be put in competition with the finest in Europe. The general colour is a cast deeper than the copper brown; but several of the men and women have a true olive complexion; and some of the last are even a great deal fairer. Their countenances very remarkably express the abundant mildness or good-nature which they possess: and are entirely free from that savage keenness which marks nations in a barbarous state. They are frank, cheerful, and good-natured.

There are, upon the whole, few natural defects or deformities to be found amongst these people. The most common is the tetter or ring-worm, that seems to affect almost one half of them, and leaves whitish serpentine marks every where behind it; but this is of less consequence than another which is very frequent, and appears on every part of the body. Captain Cook had the mortification to learn that all the care he took, when he first visited these islands, to prevent the venereal disease from being communicated to the inhabitants, had proved ineffectual. What is extraordinary, they do not seem to regard it much; and as there appeared few signs of its destroying effects, probably the climate, and the way of living of these people, greatly abate its virulence. There are two other complaints frequent amongst them; one of which is an indolent firm swelling, that affects the legs and arms, and increases them to an extraordinary size in their whole length. The other is a tumor of the same sort in the testicles, which sometimes exceeds the size of the two fists. But in other respects they may be considered as uncommonly healthy.

Their hair is in general straight, thick, and strong, though a few have it bushy or frizzled. The natural colour is black; but the greatest part of the men, and some of the women, have it stained of a brown or purple colour, and a few of an orange cast. They wear it variously cut. Some have it cut off on one side of the head only; others have it entirely cut off except a single lock; the women in general wear it short. The men have their beards cut short; and both men and women strip the hair from the arm-pits. The men are stained from about the middle of the belly to about half-way down the thighs with a deep blue colour. The women have only a few small lines or spots thus imprinted on the inside of their hands. Their kings, as a mark of distinction, are exempted from this custom.

The men are all circumcised, or rather supercised, as the operation consists in cutting off only a small piece of the foreskin at the upper part; which by that means is rendered incapable ever after of covering the glans. This is all they aim at, as they say the operation is practised from a notion of cleanliness.

The dress of both men and women are the same; and consists of a piece of cloth or matting (but mostly the former) about two yards wide and two and a half long; at least so long as to go once and a half round the waist, to which it is confined by a girdle or cord. It is double before, and hangs down like a petticoat, as low as the middle of the leg. The upper part of the garment above the girdle is plaited into several folds; so that, when unfolded, there is cloth sufficient to draw up and wrap round the shoulders; which is very seldom done. The inferior sort are satisfied with small pieces; and very often wear nothing but a covering made of leaves of plants, or the maro, which is a narrow piece of cloth or matting like a sash. This they pass between the thighs and wrap round the waist; but the use of it is chiefly confined to the men. The ornaments worn by both sexes are necklaces, made of the fruit of the pandanus, and various sweet-smelling flowers, which go under the general name of *lukulla*. Others are composed of small shells, the wing and leg bones of birds, shark's teeth, and other things; all which hang loose upon the breast; rings of tortoise shells on the fingers; and a number of these joined together as bracelets on the wrists. The lobes of the ears (though most frequently only one) are sometimes perforated with two holes, in which they wear cylindrical bits of ivory about three inches long.

Cleanliness induces them to bathe in the ponds, which seem to serve for no other purpose. They are sensible that salt water hurts their skin; and when necessity obliges them to bathe in the sea, they commonly have some cocoa-nut shells filled with fresh water poured over them to wash it off. People of superior rank use cocoa-nut oil, which improves the appearance of the skin very much.

The employment of the women is of the easy kind, and, for the most part, such as may be executed in the house. The manufacturing their cloth is wholly consigned to their care; as is also that of their mats, which are esteemed both for their texture and their beauty. There are many other articles of less note that employ the spare time of their females; as combs, of which they make vast numbers, and little baskets with small beads; but

Friendly Iſlands

but all finiſhed with ſuch neatneſs and taſte in the diſpoſition of the various parts, that a ſtranger cannot help admiring their aſſiduity and dexterity.

The province allotted to the men, as might be expected, is far more laborious and extenſive than that of the women. Agriculture, architecture, boat-building, fiſhing, and other things that relate to navigation, are the objects of their care. Cultivated roots and fruits being their principal ſupport, this requires their conſtant attention to agriculture, which they purſue very diligently, and ſeem to have brought almoſt to as great perfection as circumſtances will permit. In planting the plaintains and yams, they obſerve ſo much exactneſs, that, which ever way you look, the rows preſent themſelves regular and complete. The cocoa-nut and bread fruit trees are ſcattered about without any order, and ſeem to give them no trouble after they have attained a certain height.

The houſes of the lower people are poor huts, and very ſmall; thoſe of the better ſort are larger and more comfortable. The dimenſions of one of a middling ſize are about 30 feet long, 20 broad, and 12 high. Their houſe is, properly ſpeaking, a thatched roof or ſhed, ſupported by poſts and rafters, diſpoſed in a very judicious manner. The floor is raiſed with earth ſmoothed, and covered with ſtrong thick matting, and kept very clean. A thick ſtrong mat, about two and a half or three feet broad, bent into the form of a ſemicircle, and ſet upon its edge, with the ends touching the ſide of the houſe, in ſhape reſembling the fender of a fire hearth, incloſes a ſpace for the maſter and miſtreſs of the family to ſleep in. The reſt of the family ſleep upon the floor, wherever they pleaſe to lie down; the unmarried men and women apart from each other: Or if the family be large, there are ſmall huts adjoining, to which the ſervants retire in the night; ſo that privacy is as much obſerved here as one could expect. The clothes that they wear in the day ſerve for their covering in the night. Their whole furniture conſiſts of a bowl or two, in which they make kava; a few gourds; cocoa-nut ſhells; and ſome ſmall wooden ſtools, which ſerve them for pillows.

They diſplay much ingenuity in the building of their canoes, as well as in the navigating them.

The only tools which they uſe to conſtruct them, which are very dexterouſly made, are hatchets, or rather thick adzes, of a ſmooth black ſtone that abounds at Toofoa; augres, made of ſhark's teeth, fixed on ſmall handles, and raſps of a rough ſkin of a fiſh, faſtened on flat pieces of wood, thinner on one ſide, which alſo have handles. The cordage is made from the fibres of the cocoa-nut huſk, which, though not more than nine or ten inches long, they plait, about the ſize of a quill, or leſs, to any length that they pleaſe, and roll it up in balls, from which the larger ropes are made by twiſting ſeveral of theſe together. The lines that they fiſh with are as ſtrong and even as the beſt cord we make, reſembling it almoſt in every reſpect. Their other fiſhing implements are large and ſmall hooks made of pearl-ſhell. Their weapons are clubs of different ſorts (in the ornamenting of which they ſpend much time), ſpears, and darts. They have alſo bows and arrows; but theſe ſeemed to be deſigned only for amuſement, ſuch as ſhooting at birds, and not for military purpoſes. The ſtools are about two feet long, but only four or five inches high, and near four broad, bending downward in the middle, with four ſtrong legs, and circular feet; the whole made of one piece of black or brown wood, neatly poliſhed, and ſometimes inlaid with bits of ivory.

Friendly Iſlands.

Yams, plantains, and cocoa-nuts, compoſe the greateſt part of their vegetable diet. Of their animal food, the chief articles are, hogs, fowls, fiſh, and all ſorts of ſhell fiſh; but the lower people eat rats. The two firſt vegetable articles, with bread-fruit, are what may be called the baſis of their food, at different times of the year, with fiſh and ſhell-fiſh; for hogs, fowls, and turtle, ſeem only to be occaſional dainties, reſerved for their chiefs. Their food is generally dreſſed by baking, and they have the art of making, from different kinds of fruit, ſeveral diſhes which moſt of us eſteemed very good. The generality of them lay their victuals upon the firſt leaf they meet with, however dirty it may be; but when food is ſerved up to the chiefs, it is commonly laid upon green plantain leaves. The women are not excluded from eating with the men; but there are certain ranks or orders amongſt them that can neither eat nor drink together. This diſtinction begins with the king; but where it ends could not be learnt. They ſeem to have no ſet time for meals. They go to bed as ſoon as it is dark, and riſe with the dawn in the morning.

Their private diverſions are chiefly ſinging, dancing, and muſic, performed by the women. The dancing of the men has a thouſand different motions with the hands, to which we are entire ſtrangers; and they are performed with an eaſe and grace which are not to be deſcribed but by thoſe who have ſeen them.

Whether their marriages be made laſting by any kind of ſolemn contract, our voyagers could not determine with preciſion; but it appeared that the bulk of the people ſatisfied themſelves with one wife. The chiefs, however, have commonly ſeveral women; tho' it appeared as if one only was looked upon as the miſtreſs of the family.

When any perſon of conſequence dies, his body is waſhed and decorated by ſome woman or women, who are appointed on the occaſion; and theſe women are not, by their cuſtoms, to touch any food with their hands for many months afterwards; and it is remarkable, that the length of the time they are thus proſcribed, is the greater in proportion to the rank of the chief whom they had waſhed.

The concern of theſe people for the dead is moſt extraordinary. They beat their teeth with ſtones, ſtrike a ſhark's tooth into the head until the blood flows in ſtreams, and thruſt ſpears into the inner part of the thigh, into their ſides below the arm-pits, and through the cheeks into the mouth. All theſe operations convey an idea of ſuch rigorous diſcipline, as muſt require either an uncommon degree of affection, or the groſſeſt ſuperſtition to exact. It ſhould be obſerved, however, that the more painful operations are only practiſed on account of the death of thoſe moſt nearly connected.

Their long and general mourning proves, that they conſider death as a very great evil. And this is confirmed by a very odd cuſtom which they practiſe to avert it. They ſuppoſe that the Deity will accept

Friendly Islands.

of the little finger, as a sort of sacrifice efficacious enough to procure the recovery of their health. They cut it off with one of their stone hatchets. There appeared scarcely one in ten of them who was not thus mutilated in one or both hands. According to Captain King, it is common also for the inferior people to cut off a joint of their little finger on account of the sickness of the chiefs to whom they belong.

They seem to have little conception of future punishment. They believe, however, that they are justly punished upon earth; and consequently use every method to render their divinities propitious. The Supreme Author of all things they call *Kallafootonga*; who, they say, is a female residing in the sky, and directing the thunder, wind, rain, and in general all the changes of weather. They believe that when she is angry with them, the productions of the earth are blasted; that many things are destroyed by lightning; and that they themselves are afflicted with sickness and death as well as their hogs and other animals. When this anger abates, they suppose that every thing is restored to its natural order. They also admit a plurality of deities, though all inferior to *Kallafootonga*. They have less absurd sentiments about the immateriality and the immortality of the soul. They call it *life*, the living principle; or, what is more agreeable to their notions of it, *Otooa*; that is, a divinity or invisible being.

Of the nature of their government no more is known than the general outline. According to the information received, the power of the king is unlimited, and the life and property of the subject are at his disposal; and instances enough were seen to prove that the lower order of people have no property, nor safety for their persons, but at the will of the chiefs to whom they respectively belong. When any one wants to speak with the king or chief, he advances and sits down before him with his legs across; which is a posture to which they are so much accustomed, that any other mode of sitting is disagreeable to them. To speak to the king standing would be accounted here as a striking mark of rudeness.

Though some of the more potent chiefs may vie with the king in point of actual possessions, they fall very short in rank and in certain marks of respect, which the collective body have agreed to pay the monarch. It is a particular privilege annexed to his sovereignty, not to be punctured nor circumcised, as all his subjects are. Whenever he walks out, every one whom he meets must sit down till he has passed. No one is allowed to be over his head; on the contrary all must come under his feet; for there cannot be a greater outward mark of submission than that which is paid to the sovereign and other great people of these islands by their inferiors. The method is this; the person who is to pay obeisance squats down before the chief, and bows the head to the sole of his foot; which, when he sits, is so placed that it cannot easily be come at; and having tapped or touched it with the under and upper side of the fingers of both hands, he rises up and retires. The hands, after this application of them to the chief's feet, are in some cases rendered useless for a time; for, until they be washed, they must not touch any kind of food. When the hands are in this state, they call it *taboo rema*. *Taboo*, in general, signifies "forbidden," and *rema* is their word for "hand." Their great men are fond of a singular piece of luxury; which is, to have women sit beside them all night, and beat on different parts of their body until they go to sleep; after which they relax a little of their labour, unless they appear likely to awake; in which case they redouble their drumming until they are again fast asleep.

Friendship.

FRIENDSHIP may be defined, a mutual attachment subsisting between two persons; and arising, not merely from the general principle of benevolence, from emotions of gratitude for favours received, from views of interest, nor from instinctive affection or animal passion, but from an opinion entertained by each of them, that the other is adorned with some amiable or respectable qualities. 1 Definition of friendship.

The object of the general principle of benevolence is *mankind*, not any particular individual. Gratitude regards the person from whom he who feels its emotions has received a favour, whether that person be a virtuous or a vicious, a respectable or a contemtible, character: it prompts the person obliged to make a suitable return to his benefactor, but not to enter into any particular intimacy with him, merely on account of the favours which he has received. Many connections are formed, and dignified with the name of *friendship*, upon no other principle but the sordid hope which one or perhaps each of the parties entertains of accomplishing some selfish purpose through the assistance of the other: but such a connection is so base in its nature, and so transitory in its duration, as to render it unnecessary for us to spend time in demonstrating it to be unworthy of the name of friendship. The instinctive affection which a parent entertains for his child, as well as that which the child feels for his parent, seem intended by nature to form an union between the persons thus related to each other: but the union between parents and children, when supported by no other principle but instinct, is different from friendship; it extends no farther than to cause the parent to provide for his child during his helpless years, and the child to look up to his parent for protection and support. We need not mention that appetite which is the foundation of love, and is the provision which nature has made for the continuation of our species. This appetite alone, and unassisted by some nobler principle, cannot give rise to any connection worthy of an honourable name. 2 Illustration of the above definition.

After excluding these principles, we can refer the origin of friendship only to "an opinion entertained by each of the parties between whom it subsists, that the other is adorned with some amiable or respectable qualities." A connection founded on different principles we cannot honour with the name of friendship; but that which flows from this pure source must be noble and virtuous. When two persons of virtue and abilities contemplate each the other's character and conduct, they cannot but view them with complacency and esteem. Habits and actions displaying prudence, fortitude, moderation, integrity, benevolence, and piety, naturally command the approbation of the impartial spectator, and even affect him with delight. But as we are disposed to revisit a landscape the beauties of which we have contemplated with rapture, and read with frequent delight a poem in which genius has

Friendſhip. faithfully delineated ſome of the moſt enchanting ſcenes or the moſt intereſting events in nature; ſo we alſo become deſirous to enjoy frequent opportunities of contemplating a character diſtinguiſhed for eminent abilities and illuſtrious virtues. The ſociety of ſuch a perſon is preferred to his who is diſgraced by the oppoſite qualities. Hence, whenever men of truly reſpectable characters enjoy opportunities of mutual intercourſe, an attachment naturally takes place between them; entirely diſintereſted, and founded ſolely on the approbation with which the one cannot avoid regarding the conduct of the other. The eſteem which the one is thus induced to entertain for the other will lead them to ſeek frequent opportunities of enjoying each other's ſociety, mutually to aſk and liſten to advice, to truſt their moſt ſecret and important purpoſes to each other's confidence, and to be no leſs concerned each of them for the other's intereſt and honour than for his own. This, and this alone, is genuine friendſhip; founded on virtue, and on that approbation which virtue never fails to command: it is a natural conſequence of intercourſe between virtuous men. Where it is once eſtabliſhed, it cannot die, while thoſe virtues to which it owes its origin continue to adorn the perſons between whom it ſubſiſts.

3 Circumſtances favourable to the riſe and continuance of friendſhip.

But, perhaps, ſuch a pure and ſublime attachment can ſcarce be expected to exiſt among beings of ſo mixed and imperfect a character as mankind. The wiſe man of the ancient Stoics, or the Chriſtian who faithfully obeys the precepts and follows the ſteps of his Saviour, might be capable of it; but, unfortunately, humanity never reaches ſuch perfection. Virtue and vice are ſo blended together in every human character, that while none is ſo worthleſs as to excite no other ſentiment but abhorrence, there is ſcarce any ſo uniformly virtuous as to command unvaried eſteem or admiration. Even the pureſt and moſt diſintereſted of thoſe friendſhips which prevail among men, owe their origin to other meaner principles, as well as to that which has been mentioned as the principle of genuine friendſhip. There are certain circumſtances favourable, and others adverſe, to the formation and continuance of friendſhip. Theſe, making amends, as it were, for the imperfection of human virtue and human knowledge, lead men to overlook each other's faults and follies, and to unite in the bonds of friendſhip; a friendſhip which, though leſs ſolid, leſs generous, and leſs laſting, than that which we have above deſcribed, is yet attended with effects favourable to the happineſs of individuals, and to the intereſts of ſociety in general.

Equality of age is favourable to friendſhip. Infancy, manhood, and old age, differ ſo conſiderably from each other in their views, paſſions, and purſuits, that the *man* will ſeldom be diſpoſed to aſſociate with the *boy* or the *youth*, in preference to one who has had equal experience in the world with himſelf; and the *old man* will generally wiſh for the company of ſome ancient friend with whom he may ſpeak of "the days of former years."

They who cultivate the *ſame trade or profeſſion*, enjoy opportunities favourable to the formation of friendſhip. Being engaged among the ſame objects, and acquiring ſkill in the ſame arts, their knowledge, their ſentiments, and habits, are nearly the ſame: they cannot avoid frequent intercourſe with each other; they naturally enter into each other's prejudices and views, and therefore cannot but take pleaſure in each other's converſation and ſociety. Phyſicians, lawyers, and divines, form each of them a diſtinct body; and the members of each of thoſe bodies aſſociate with one another more readily than with men of a different profeſſion. It is related by Swift or Addiſon, that, in the beginning of the preſent century, there was a particular coffee-houſe in London which clergymen uſed to frequent, and that a ſon of the church ſcarce ever ventured to ſhow his head in any other. In the days of Dryden, poets, and all who pretended to poetical genius or taſte, reſorted to *Will's*, as to another Parnaſſus, to ſip cups of coffee, and now and then perhaps to drink of ſome more inſpiring liquor, inſtead of the waters of the fountain Hippocrene. Friendſhip

Equality of rank and fortune is alſo favourable to friendſhip. Seldom will a man of fortune be able to gain the ſincere friendſhip of any of his dependants. Though he treat them with the moſt obliging condeſcenſion, and load them with favours; yet ſtill, either the ſenſe of dependence, or reſentment for imaginary injuries, or impatience of the debt of gratitude, or ſome other ſimilar reaſon, will be likely to prevent them from regarding him with cordial affection. Servants are but rarely faithful even to the moſt indulgent maſter: Shakeſpeare's old Adam is a very amiable, but a very uncommon character. Indeed you may as ſoon expect to find the virtues and the generous courage of the chevalier Bayard among our military men of the preſent age, as to find an old Adam among the preſent race of ſervants. It is no leſs vain for the poor man to hope to acquire a ſincere friend among his ſuperiors in rank and fortune. The ſuperior is generally diſpoſed to exact ſuch profound deference, ſuch gratitude, ſuch reſpect, even from the inferior whom he admits into his intimacy, that the equal amicable intercourſe of friendſhip can ſcarce ever take place between them. Among the letters of the younger Pliny, we are pleaſed to find many monuments of the goodneſs of his heart. A number of his epiſtles addreſſed to friends in meaner circumſtances, appear to have been accompanied with very conſiderable preſents, which by his opulence he was well enabled to beſtow. But he takes care to let thoſe humble friends know the weight of the obligations which he conferred, and the vaſtneſs of the debt of gratitude which they owed to him, in ſuch plain, nay even indelicate terms, that though they might receive his favours with gratitude and regard him as their benefactor, yet they could never regard him as a man with whom they might cultivate the free eaſy intercourſe of friendſhip. Some one or other of the Greek writers mentions a ſingular inſtance of cordial friendſhip ſubſiſting between two perſons in unequal circumſtances. One of them dying before the other, and leaving a wife and daughter to whom he had no fortune nor even means of ſubſiſtence to bequeath, enjoined his rich friend, in his will, to take the charge of them on himſelf, and to ſupport them in a liberal manner: nor did he intreat this from his humanity, but demanded it from his friendſhip. He had made a ſure proviſion for his family. His rich friend delayed not to comply with his dying injunction. He readily took upon himſelf the charge of the wife and daughter of his deceaſed friend, treated them with kindneſs, and at laſt divided his whole fortune equally

Friendſhip. equally between his own only daughter and the child of his friend. This is an agreeable inſtance of the power of friendſhip: but ſuch inſtances are not to be expected to occur frequently in ordinary life, any more than the ſtoic virtue of Cato, or the modeſt piety of a Nelſon.

Similarity of taſte and temper will generally be found favourable to friendſhip. Two peeviſh men, indeed, will not long endure each other's company with much ſatisfaction; but two perſons of mild, humane diſpoſitions will naturally take delight in each other's ſociety and converſation. They who are charmed with the buſtle of a gay and active life, avoid the haunts of the indolent and contemplative, and join hand in hand to climb the heights of ambition, or tread the round of amuſement and diſſipation. Thoſe whom taſte leads to cultivate the elegant objects of literature amid the ſweets of a rural retirement, to wander thro' the grove, or recline on the brink of ſome romantic rill, and peruſe the pages of one of thoſe geniuſes who have ſhown themſelves able to enlighten the underſtanding, and to kindle the glow of generous ſentiment in the breaſt;—thoſe children of taſte frequently aſſociate in their elegant purſuits. We are pleaſed to read the correſpondence of Pliny and Tacitus, of Locke and Molineux, of Swift and Pope. We rejoice to find, that notwithſtanding the rivalry of learning and genius, taſte and philoſophy have a natural tendency to promote benevolence and friendſhip among their votaries. The buſtle of the world muſt be acknowledged to be generally unfavourable to friendſhip. When the heart is occupied with the ſordid objects of ambition, or avarice, or gay diſſipation, there is no room left for the pure and generous ſentiments of friendſhip. Intereſts often interfere, competitions and jealouſies ariſe, fatal to all the ſweets of ſocial intercourſe. It is in an active life that virtue ſhines with the moſt brilliant luſtre; but ſeldom, alas! does pure virtue appear in the ſcenes of active life. How beautifully does the character of Atticus ſhine amid the characters of his illuſtrious cotemporaries! *ut Luna inter minores ignes!* Sylla, Cæſar, Cicero, Brutus, Antony, and Auguſtus, were eminent for their abilities and virtues; but being engaged in the buſtling purſuits of ambition, they ſeem to have been ſtrangers to the calm and elegant happineſs which Atticus enjoyed. Though thoſe of them who were cotemporaries could not avoid perceiving and admiring each other's merits, yet never did cordial friendſhip ſubſiſt between them. Even Cicero who could ſo well define the duties and deſcribe the happineſs of friendſhip, yet appears to have but ſeldom enjoyed its delights. But Atticus, who conſtantly declined entering the ſcenes of public life, experienced ſuch happineſs in a private condition, as muſt have been more than an ample reward to him for ſhunning all the ſplendid purſuits of ambition. He was the diſintereſted friend of all thoſe eminent men, and enjoyed their eſteem and friendſhip. So upright was his character, ſo amiable his manners, that they who were mortal enemies to each other, yet agreed in cultivating at the ſame time the friendſhip of Atticus. None of them appear to have hated him on account of his attachment to their enemies: and while he was the friend of Cicero and Octavius, he was at the ſame time the protector of the wife of Antony. Perhaps the virtue of ſuch a character may be regarded as problematical. It may be alleged, that while ſuch inveterate diſſenſions aroſe among his friends, the neutrality which he preſerved was inconſiſtent with integrity. He has indeed been raſhly branded by ſome writers as an avaricious time-ſerving man. But no evidence appears to juſtify their aſſertions; on the contrary, the moſt reſpectable teſtimony, the niceſt ſcrutiny, exhibit his character in thoſe amiable colours in which we have choſen to view it. Atticus is indeed no ordinary character. The general principles of human nature, and the examples which moſt frequently occur in the world, naturally ſuggeſt a ſuſpicion, that had he been a man of genuine integrity, he muſt have obſerved a different tenor of conduct. But there is one circumſtance which tends to ſtrengthen conſiderably the reſpectable teſtimony of his cotemporaries in his behalf. In Cato, in Epictetus, in the philoſopher who, while ſuffering under all the violence of an acute diſtemper, maintained to Pompey that pain was no evil, we have inſtances of the tenets of philoſophy oppoſing and repreſſing the principles of nature. We know how often religious enthuſiaſm has produced the ſame effects. But Atticus was the votary of the mild and elegant philoſophy of Epicurus; which, though there appears to have been a palpable inconſiſtency between its principles and the ſuperſtructure raiſed upon them, was yet in its general tendency not unfriendly to virtue, and recommended to its votaries that calm and innocent mode of life which Atticus cultivated. There is no ſmall reſemblance between the character of Atticus and that of Epicurus, the founder of this philoſophy. The ſame tenets ſeem to have produced the ſame effects on both; and we will venture to pronounce ſo high an encomium on the Epicurean philoſophy, as to aſſert, that it chiefly contributed to form the character of this amiable Roman.

4. Sex. We know not if we may venture to affirm, that friendſhips are moſt naturally contracted among perſons of the ſame ſex. We believe they often are. If ſimilarity of taſte, of ſentiments, of manners, be favourable to friendſhip, this cannot but happen. The diſtinction which nature has eſtabliſhed between the two ſexes, the new diſtinctions which are introduced by the different views with which their education is conducted, and the different duties which they are called to perform in life, have all a tendency to diſpoſe men and women to enter into habits of intimacy with perſons of their own ſex rather than with the other. Young girls have their peculiar amuſements, as boys have theirs: they knit and ſew together, conſult each other concerning their dreſs, and aſſociate at their idle hours. Young men, in the ſame manner, prefer the ſociety of their equals of the ſame ſex till ſuch time as their hearts begin to feel the impulſe of a new paſſion. This ſoft paſſion, indeed, cauſes the youth to prefer the company of his favourite maid to that of his deareſt companion; and it perhaps cauſes the virgin to view her female companions with a jealous eye, while ſhe fears that their charms may win the heart of the youth whoſe fond regard ſhe herſelf wiſhes to engage. But the fears, the jealouſies, the timidity, nay even the fondneſs of love, are incompatible with friendſhip. Though the lover and his miſtreſs be dear to each other, yet the free confidence of

Friendſhip

friendſhip cannot take place between them. They dare not yet venture to truſt to each other all the ſecrets of their hearts. But if their mutual wiſhes be crowned by marriage; then, indeed, as their intereſts become the ſame, if the tranſports of love are not ſucceeded by the calm delights and the free confidence of friendſhip, they muſt be unhappy. The marriage ſtate is peculiarly favourable to friendſhip. Perſons whoſe relations to each other are more remote, will often find circumſtances concurring to induce them to cultivate a friendly intercourſe with each other. But here indifference is almoſt impoſſible. It is abſolutely requiſite, in order that they may not render each other miſerable, that the huſband and the wife be united in the bonds of friendſhip. This ſeems even to be one of the great laws of nature, by means of which proviſion is made for the happineſs and the preſervation of ſociety. But though the wife and the huſband be particularly attached to each other by the ties of friendſhip no leſs than by thoſe of love, yet their mutual affection will not detach them from the reſt of the world; their relations to the ſociety around them will ſtill remain; the huſband will ſtill cultivate the intimacy of thoſe of his own ſex, and the wife will ſtill chooſe female in preference to male friends. Upon even a ſuperficial view of life, we find reaſon to declare without heſitation, that acquaintance and intimacy moſt naturally take place among perſons of the ſame ſex. The huſband and the wife are more than friends; they are *one bone and one fleſh*. It has been ſometimes ſlightly inſinuated, and ſometimes more openly aſſerted, by people who have but carelefsly viewed the phenomena of ſocial life, or have been diſpoſed to cavil againſt the fair ſex, that women are incapable of ſincerity or conſtancy in friendſhip with each other. But it ſeems unneceſſary to offer a ſerious refutation of this cavil. Neither is the general character of the female ſex ſo inferior to that of the male, nor are their circumſtances ſo very different from ours, as to render them totally incapable of thoſe virtues which are neceſſary to eſtabliſh and ſupport mutual friendſhip. They are in general poſſeſſed of more exquiſite ſenſibility, nicer delicacy of taſte, and a juſter ſenſe of propriety, than we: nor are they deſtitute of generoſity, fidelity, and firmneſs. But ſuch qualities are peculiarly favourable to friendſhip: they communicate a certain charm to the manners of the perſon who is adorned with them; they render the heart ſuſceptible of generous diſintereſted attachment; and they elevate the ſoul above levity, inſincerity, and meanneſs. Competitions and jealouſies muſt no doubt ariſe now and then even among the moſt amiable of the female ſex, as well as among us. Theſe will preclude or deſtroy friendſhip. But the rivalry of beauty, of dreſs, of faſhion, is not oftener fatal to friendſhip among the fair ſex, than the conteſts of pride, avarice, vanity, and ambition, among their haughty lords. If friendſhip be ranked among the virtues, it is not leſs a female than a male virtue.

5 Relations of conſanguinity.

The delightful intercourſe and intimacy of friendſhip may be naturally expected to ſubſiſt not only between the huſband and the wife, but among all who are connected by any of the relations of conſanguinity. The power of inſtinct does not always continue to unite the parent and the child. Its offices are of a temporary nature; but when theſe are performed, it ceaſes to operate. During the infancy, the childhood, and even the youth, of his ſon or daughter, the parent watches over them with fond affection, and labours with anxious aſſiduity to promote their welfare, for no other reaſon but becauſe the yearnings of paternal affection draw him towards them. But as they advance farther in life, and become able to care for themſelves, it has been ſo ordered by the wiſdom of nature, that the attachment of the parent almoſt dies away, unleſs the grateful affection and the merit of his children afford him reaſon to rejoice over them and bleſs them. How ſhocking, how miſerable, the condition of that family, whoſe members are not united by the mutual eſteem and confidence of friendſhip! where the parent views his children with jealouſy, ſhame, indignation, or ſorrow; and the children anxiouſly avoid the ſociety of their parents! Their intereſts are ſo nearly connected; they have ſo many occaſions for acting in concert, and muſt live ſo long together; that we may almoſt venture to affirm, that the parent and the child, like the huſband and the wife, muſt be either friends or enemies. But the ties of nature, the influence of habit, ſentiments, and circumſtances, all concur to form between them the ſacred connection of friendſhip. Brothers and ſiſters, the children of the ſame parents, and for a while members of the ſame family, may be expected to regard each other through life with kindneſs and eſteem; and theſe we would rather chooſe to attribute to a rational attachment, founded on certain principles, than to a blind inſtinctive affection.

Theſe are a few of the diſtinctions and relations in ſociety which appear moſt favourable to friendſhip.—Were we to deſcend to minuter particulars, we might enumerate all the varieties of taſte, of temper, and of circumſtances, by which mankind are diſtinguiſhed from one another, and diſtributed into particular claſſes. But this would be too tedious, and does not appear neceſſary.

6 Laws of friendſhi

As friendſhip is an attachment which takes place between certain human characters when placed in certain circumſtances, there muſt therefore be laws for ſupporting the attachment and regulating the intercourſe of friendſhip. Mutual eſteem is the baſis on which true friendſhip is eſtabliſhed; and the intercourſe of friendſhip ought ſurely to be connected in ſuch a manner that this foundation be not injured. Friendſhip muſt diminiſh neither our benevolence nor prudence: it muſt not ſeduce us from an honeſt attention to our private intereſt, nor contract our ſocial affections.

Sincerity may be conſidered as the firſt law of friendſhip. Artifice and hypocriſy are inimical to all ſocial intercourſe. Between the deceitful and the honeſt, friendſhip can never ſubſiſt. For a while, the one may impoſe on the other; unſuſpicious integrity may not be able to ſee through the maſk under which the hideous features of ſelfiſh cunning are veiled; but the deceitful friend muſt ever be a ſtranger to the delightful ſentiments of genuine friendſhip. To enjoy theſe, your virtues muſt be ſincere, your affection for the perſon whom you call your friend unfeigned: in communicating to each other your ſentiments, in offering and liſtening to mutual advice, in joining to proſecute the ſame deſigns, or ſhare in the ſame amuſements, candid

candid ſincerity muſt ſtill be obſerved between you. Attempt not to perſuade each other, that your mutual affection is more ardent, or your mutual eſteem more profound, than it really is. If the ſentiments or opinions which the one expreſſes appear to the other improper or ill founded, let not a falſe delicacy prevent him from declaring his reaſons againſt them; let him not applaud where, if he were ſincere, he muſt blame. Join not even your friend in an undertaking which you ſecretly diſlike, or an amuſement inſufferably diſagreeable to you. You cannot, conſiſtently with ſincerity and candour: and you will ſoon begin to think the bleſſings of friendſhip too dear, when bought at the price of ſuch ſacrifices.

But though ſincerity is to be faithfully obſerved in the intercourſe of friendſhip; yet the harſhneſs of contradiction muſt be carefully avoided. Thoſe obliging manners which are ſo agreeable in an acquaintance or caſual companion, are ſtill more ſo in a friend. If they are neceſſary to recommend the advantages of ſocial intercourſe in general to the members of ſociety, they are no leſs neceſſary to communicate a charm to the intercourſe of friendſhip. People often think themſelves intitled to behave to thoſe whom they call their friends, and whoſe intereſts they profeſs to regard as their own, with harſhneſs, negligence, and indiſcreet familiarity; but nothing can be more fatal to friendſhip. It is a well known maxim, eſtabliſhed by general and uniform experience, that *too much familiarity occaſions mutual contempt*. And indeed how can it be otherwiſe? Mild obliging manners are underſtood as the natural and genuine expreſſions of kindneſs and affection: boiſterous rudeneſs, petulance, and neglect, are naturally conſidered as expreſſive of oppoſite ſentiments. But if friendſhip aſſume the tone, the carriage, and the language of enmity or indifference, it muſt ſoon loſe all its native charms and advantages. Let the friend, as well as the caſual companion, when he finds reaſon to diſapprove of the ſentiments and conduct, or to diſſent from the opinions of his friend, expreſs himſelf in the gentleſt terms, with honeſty and ſincerity, but without careleſſneſs or harſhneſs. Let no frequency of intercourſe nor union of intereſts ever tempt to careleſs or contemptuous familiarity. Stiff and unmeaning ceremony may be baniſhed; but eaſe, and delicacy, and reſpectful deference, and obliging attention, muſt ſupply its room. Much of the unhappineſs of the marriage ſtate, and much of the mutual uneaſineſs which ariſes among thoſe who are related by the endearing ties of conſanguinity, is occaſioned by the parties who are thus cloſely connected, thinking it unneceſſary to obſerve the ordinary rules of good breeding in their mutual intercourſe. Even kindneſs puts on a diſguſting garb, and aſſumes an harſh aſpect. But mutual kindneſs cannot there long ſubſiſt. Home, which ought to be a ſanctuary to ſhelter from the anxieties and ills of life, a little paradiſe where thoſe pure and innocent pleaſures might be enjoyed which afford the moſt genuine happineſs, and which are not to be taſted in the buſtle of the buſy and the diſſipation of the gay world;—home thus becomes a place of torment, which is never entered but with pain and unwillingneſs; and from which the ſon, the daughter, the huſband, and the wife, eagerly ſeize every opportunity to eſcape.

Mutual confidence is the very ſoul of friendſhip. If friendſhip be rightly defined to be a mutual affection founded on mutual eſteem, thoſe who are united in the bonds of friendſhip cannot but repoſe mutual confidence in each other. Am I conſcious of none but generous worthy ſentiments, and none but upright honeſt intentions? I readily diſcloſe all the ſecrets of my ſoul to him whom I regard as capable only of ſimilar deſigns and ſimilar ſentiments. But it may be aſked, how far the confidence of friendſhip ought to be carried? Muſt I reveal to my friend all my ſentiments, opinions, and deſigns? Muſt I communicate to one friend the ſecrets which have been intruſted to me by another? Or muſt I rather obſerve the moſt ſuſpicious caution in my intercourſe with my friends, remembering that he who is now my friend may one day become my enemy? It ſeems moſt prudent to obſerve a medium between ſuſpicious caution and unlimited confidence. Were human virtue perfect, and were there no inſtances of friends ever becoming enemies, thoſe who regard each other with friendly affection might very reaſonably be required to ſet no bounds to their mutual confidence. But as this is far from being the caſe, different meaſures are to be obſerved. Contract no friendſhips, if you think it neceſſary to treat a friend with the ſame reſerve as an enemy. Yet venture not to diſcloſe to your friend all the fooliſh or evil deſigns which the wantonneſs of imagination may ſeduce you to form. When you feel the emotions of pride, of vanity, or of any evil paſſion, if you are able to repreſs them by the ſtrength of reaſon and conſcience, it ſeems unneceſſary for you to tell the ſtruggle, or to boaſt of the victory. If, at any former period of life, you have been ſo unfortunate as to commit actions which you cannot now recollect without ſhame and contrition, there can be no reaſon why you may not, as far as poſſible, bury the remembrance of them in your own breaſt. In ſhort, not to become tedious by deſcending to minute particulars, the laws of friendſhip do not require friends to unboſom themſelves to each other any farther than is neceſſary—to give them juſt ideas of each other's character and temper,—to enable them to be ſerviceable to each other in the proſecution of honeſt deſigns,—and to afford each of them proper opportunities of exciting the other to virtue and wiſdom, and of interpoſing his influence to preſerve him from vice and folly. Whatever is neceſſary for any of theſe purpoſes ought to be mutually communicated; whatever is not, may be concealed without violating the laws of friendſhip. As mutual eſteem is the foundation of friendſhip, and as human friendſhips are not always laſting, you ought not to pour into the ear of your friend all the impertinences which you may happen to conceive, nor even all the projects which may float in your imagination: but as much of the felicity of friendſhip ariſes from the mutual confidence to which it affords room, call not any man your friend in whoſe preſence you find it proper to obſerve the ſame ſuſpicious caution as if he were your enemy. The ancients, who talked of friendſhip with enthuſiaſm as one of the moſt elevated among the virtues, required ſtill a cloſer union and a more diſintereſted attachment among friends than we dare venture to inſiſt upon. The mutual duties which they have deſcribed as incumbent on friends, appear ſome-

what

Friendſhip. what extravagant. Among other things, ſome of them have gone ſo far as to require a degree of mutual confidence which would ſoon deſtroy all confidence, and could not fail to counteract all the purpoſes of friendſhip: they have required one friend to communicate to another, not only all his own thoughts and purpoſes, but even thoſe ſecrets which have been confided to his honour by any other friend. But the evil conſequences which would reſult are eaſily to be foreſeen. Perhaps, like Atticus, you enjoy the friendſhip of men who are mutual enemies; and by communicating the ſecrets of the one to the other, you will then become the betrayer of both. Or, though not abſolutely enemies, yet thoſe who are *your* friends may happen not to be in habits of friendſhip with each other; and they may then perhaps not ſcruple to divulge thoſe ſecrets of one another which you have imprudently blabbed to them. Indeed, might we ſuppoſe all mankind abſolutely faultleſs, and not liable to moral imperfection, we need not fear theſe bad conſequences from unbounded confidence in our friends. But friendſhip would in ſuch a ſtate of ſociety be unknown; juſt as in the golden age of the poets there are ſuppoſed to have been no diſtinctions of property. We cannot here forbear dropping an obſervation, which will readily be acknowledged as juſt by all who have any tolerable knowledge of the morality of the philoſophers of ancient Greece. All their doctrines and precepts appear calculated for a different order of beings than mankind. They glanced careleſsly at the phenomena of the moral world; and gleaning a few facts, immediately ſet themſelves to erect ſyſtems: From theſe, however wild and theoretical, they then pretended to deduce laws for the regulation of human conduct; and their rules are generally ſuch as might be expected from the means which they appear to have employed in order to arrive at them. An apology has however been offered for ſome of them, which, in our opinion, could occur only to ſuperficial obſervers of human life. It has been alleged in behalf of the Stoics, that their ſyſtem indeed required more exalted virtue than human nature is capable of attaining; but that, notwithſtanding this, it could not fail to produce the happieſt effects on the manners and ſentiments of its votaries. Inſtances, too, have been produced in ſupport of this aſſertion; a Cato, an Epictetus, an Antoninus. When we contemplate a model of perfection beyond what we can hope to reach, ſay the advocates of the Stoic philoſophy, though we deſpair of attaining, yet we are prompted to aſpire after it. Now, the moſt natural way of reaſoning here ſeems to lead to a very different concluſion. If an object is ſet before me which I muſt not hope to obtain, I am unwilling to waſte my time and exhauſt my vigour in the purſuit of it: bid me aſcend an inacceſſible height, I view the vale below with new fondneſs. Philoſophy, as well as ſuperſtition and enthuſiaſm, might in a few inſtances triumph over the principles of nature; but was it always equally powerful? Were all the diſciples of Zeno Catos or Epictetuſes? Have all the monks and anchorites of the Romiſh church been holy as the founders of their orders? No: the Greek philoſophers who infeſted Rome, and taught thoſe *ſchimſical* doctrines which we hear frequently dignified with the name of *ſublime*, were ſingularly corrupted and licentious in their manners. If thoſe of the *regular* clergy of the church of Rome have been always more pure, they have been cruelly calumniated. Aſk, then, only what I am capable of performing: if you demand what is above my ſtrength, I ſit ſtill in indolence. In its general tendency, the Stoic philoſophy was favourable rather to vice than to virtue. Friendſh

But we have not yet exhauſted all the duties of friendſhip. We have inculcated ſincerity, and mutual reſpect and obligingneſs of manners; we have alſo endeavoured to aſcertain, what degree of mutual confidence ought to take place between friends. But an important queſtion ſtill remains to be conſidered: how far is an *union of intereſts* to take place between friends? Am I to ſtudy the intereſt of my friend in preference to my own? May I lawfully injure others, in order to ſerve him? Here, too, we muſt conſider the circumſtances and the ſtrength of human nature; and let us beware of impoſing burdens too heavy to be borne. The greater and more perfect the union which reigns in ſociety, the greater will be its ſtrength and happineſs; the cloſer the union of friends, the more advantages will each of them derive from their union. Where other ties beſides thoſe of friendſhip concur to unite two individuals, their intereſts will be more cloſely conjoined than if they were connected by the ties of friendſhip alone. The order of nature ſeems here to be,—the huſband and wife—the parent and child—brothers and ſiſters, the offſpring of the ſame parents—friends, connected by the ties of friendſhip alone. And, if we may preſume to gueſs at the intentions of the Author of nature from what we behold in his works and read in his word, the cloſeſt union in ſociety ought to be that between the huſband and the wife; their intereſts are altogether the ſame; they ought mutually to forego convenience and gratification for each other's ſake. The intereſts of parents and children are ſomewhat leſs cloſely connected; much is due from the one to the other, but ſomewhat leſs than in the former relation; their intereſts may ſometimes be ſeparate, but never ought to be oppoſite. Next come brethren, and other more diſtant relations; and next, the friend. In theſe caſes, where we ſuppoſe the attachment of friendſhip to operate together with the ties of nature, we perceive that intereſts are variouſly united, and various duties are due; ſcarce in any of them does it appear that the intereſts of two can become entirely one. Still leſs can that be expected to happen, where the ties of friendſhip act not in concert with thoſe of nature. We give up, therefore, all thoſe romantic notions, which ſome have ſo earneſtly inſiſted on, of requiring the friend to conſider his friend as himſelf. We cannot expect any two individuals to poſſeſs preciſely the ſame degree of knowledge, to entertain exactly the ſame ſentiments, or to ſtand in circumſtances preciſely ſimilar. But till this happen, the intereſts of two can never be preciſely the ſame. And we will not, therefore, require the friend actually to prefer his friend to himſelf; nay, we will even allow him to prefer himſelf to his friend; convinced that ſuch is the deſign of nature, and that by preſuming to counteract the principles of nature we ſhall be able to ſerve no uſeful purpoſe. But as far as the firſt principles of human action and the inſtitutions of ſociety permit, we may reaſonably require of friends, that they mutually endea-

vour

ndſhip. your to contribute each to the other's intereſt. You will not deſert your own family, nor neglect what is abſolutely neceſſary for your own preſervation, in order that you may ſerve a friend. It is not requiſite that you be either a Damon or a Pythias. Away with what is romantic; but ſcruple not to ſubmit to what is natural and reaſonable. When your friend needs your direction and advice, freely and honeſtly give it: does he need more than advice; your active exertions in his behalf? the laws of friendſhip require you not to refuſe them. Is it neceſſary for him to receive ſtill more ſubſtantial aſſiſtance? You may even be expected to aid him with your fortune. But remember, that even the amiable principle of benevolence muſt be ſubject to the directions of prudence: if incapable of taking care of ourſelves, we cannot be expected to contribute to the good of others: ſociety would not be favourable to the happineſs of the human race, if every individual ſtudied the general intereſt ſo far as to neglect his own. We are not born to be citizens of the world; but Europeans, Britons, Engliſhmen or Scotchmen. Let every one, then, ſeek the intereſt and happineſs of his friends with whom he is connected by the laws of friendſhip alone, in ſubordination to his own particular intereſt and happineſs, and to the intereſt and happineſs of thoſe with whom he is connected by the ties of nature and the general inſtitutions of ſociety. Engage not in the ſervice of your friend, nor laviſh your fortune in his behalf, if by that means you are likely to injure either yourſelf or your family. Still leſs will you think it requiſite to carry your friendſhip to ſuch romantic exceſs as to commit crimes in the ſervice of your friend. The ancients, whoſe ideas of the nature and duties of friendſhip were romantic and extravagant, have, ſome of them, required that a friend ſhould heſitate at no action, however atrociouſly wicked, by which he can be uſeful to his friend. Have I been guilty of theft or murder, or any other heinous violation of the laws of morality or the inſtitutions of ſociety: when I am brought to juſtice for my crime, if you, being my friend, are appointed to ſit as my judge, the laws of friendſhip, ſay thoſe admirable maſters of morality, require that you pronounce me innocent, though convinced of my guilt. But we need not declaim againſt the abſurdity of enjoining ſuch baſe deeds as duties of friendſhip. The idea of a connection, the laws of which are inimical to the order of ſociety, muſt ſtrike with horror every perſon who thinks of it. Such a connection is the union of a knot of villains, conſpiring againſt the peace, nay even the exiſtence of ſociety.

7 eral of the ntages friend-

Such we apprehend to be the nature of rational friendſhip; ſuch the circumſtances in the order of nature and of ſociety which are moſt favourable to this union; and ſuch the duties, by the performance of which it may be maintained. When founded on theſe principles, and regulated by theſe laws, friendſhip is truly virtuous, and cannot but be highly beneficial to the individuals between whom it ſubſiſts, and to the intereſt of ſociety in general. How delightful to have ſome perſon of an amiable and virtuous character in whom you can confide; who will join with you in the proſecution of virtuous deſigns, or will be ready to call you back when you heedleſsly ſtray into the paths of vice and folly! who will adminiſter to you honeſt, upright advice; will rejoice in your proſperity, will glory over your virtues, and will be ready to conſole and relieve you when ſinking under the preſſure of diſtreſs! Muſt not your connection with ſuch a perſon be favourable to your virtue, your intereſt, and your happineſs? When we ſurvey any ſublime or beauteous ſcene in nature, we wiſh for ſome perſon of congenial taſte and feelings to participate with us in the noble enjoyment which the proſpect affords: when we read any fine piece of compoſition, the pleaſure which we receive from it is more exquiſite if others join with us in applauding it. The landſcape which we have often ſurveyed, the poem which we have often read, pleaſe us anew, with all the charms of novelty, when we have an opportunity of pointing out their beauties to ſome perſon to whom they have been hitherto unknown. Friendſhip communicates new charms and a more delicate reliſh to all our moſt refined and elegant pleaſures. It enlivens our joys, it ſoothes and alleviates our ſorrows. What Cicero has ſaid of polite letters and philoſophy, may be with ſtill ſtronger propriety ſaid of friendſhip. In every condition of life the influence of virtuous friendſhip is favourable to our welfare and our happineſs: in proſperity, in adverſity; in the ſilence and tranquillity of retirement, as well as amid the hurry of buſineſs; in the boſom of your family, and when ſurrounded by your neareſt connections, no leſs than when removed to a ſtrange country. Indeed, whatever advantages ſociety beſtows above what are to be enjoyed in a ſavage ſtate, not leſs numerous nor leſs important are thoſe which we may derive from uniting in the bonds of friendſhip, rather than living in a ſtate of enmity or indifference. Friendſhip.

8 Miſtakes in forming friendſhips, and conſequent inconſtancy.

But though friendſhip, when founded on mutual eſteem, and regulated by the laws of prudence, benevolence, and honeſty, be productive of ſo many happy effects; yet many inſtances occur in the world, in which connections dignified with the name of friendſhip are unfavourable both to the virtue and the happineſs of thoſe between whom they ſubſiſt. When men aſſociate from views of convenience; when their union is haſtily formed without a knowledge of each other's temper and character; when they are drawn together by accident, as when they happen to agree in the purſuits of the ſame intereſts or pleaſures; when the young and the gay reſort together to the haunts of diſſipation, and the covetous and ambitious find it convenient to toil in concert for riches and power: on all ſuch occaſions, the connection which is formed and dignified with the name of friendſhip is unworthy of that honourable appellation. It is not virtuous; it is productive of no happy effects, and is quickly diſſolved. He, therefore, who is not incapable of virtuous friendſhip, and is deſirous of enjoying its advantages, muſt carefully conſider the nature of the connection which he wiſhes to form, gain a thorough acquaintance with the character of the perſon whoſe eſteem and affection he wiſhes to acquire, and attend to thoſe rules by the obſervance of which true friendſhip may be maintained.

9 Relation illuſtrating the power of friendſhip over the human heart.

Many inſtances are related, which ſhow what power it is poſſible for friendſhip to acquire over the human heart. We need not here repeat the well-known ſtory of Damon and Pythias, whoſe generous friendſhip afforded a ſpectacle which ſoftened even the ſavage heart of

Friendſhip. of Dionyſius. It is known to every ſchool-boy; and, after the affected narrative of Valerius Maximus, has been ſtudiouſly detailed and commented on by almoſt every ſucceeding ſtory-teller or moraliſt. Addiſon, in one of his Spectators, gives a beautiful little relation, we know not upon what authority, which finely illuſtrates the power both of friendſhip and love. Two male negroes, in one of our Weſt India iſlands, nearly of the ſame age, and eminent among their fellows in ſlavery for gracefulneſs of figure, ſtrength, agility, and dexterity, were alſo diſtinguiſhed for their mutual friendſhip and for their common attachment to a young female negro, who was generally eſteemed the moſt beautiful of her complexion in the whole iſland. The young female appeared to be equally pleaſed with both her lovers; and was willing to accept either of them for a huſband, provided they could agree between themſelves which of them ſhould yield to the pretenſions of the other. But here lay the difficulty; for while neither would treacherouſly ſupplant, neither of them was willing to yield to his friend. The two youths, therefore, long ſuffered the ſevereſt affliction, while their hearts were torn between love and friendſhip. At length, when they were no longer able to endure the agony of ſuch a conteſt, being ſtill unable to repreſs their paſſion for their lovely countrywoman, and incapable of violating the laws of friendſhip,—on a certain day, they both, in company with the object of their ill-fated love, retired into a wood adjoining to the ſcene of their labours. There, after fondly embracing the maid, calling her by a thouſand endearing names, and lamenting their own unhappy fate, they ſtabbed a knife into her breaſt; which, while ſtill reeking with her blood, was by each of them in his turn plunged into his own. Her cries reached the people who were at work in the next field: ſome of them haſtening to the ſpot, found her expiring, and the two youths already dead beſide her.

We have introduced this little narrative as a ſtriking inſtance of the noble effects which naturally reſult from genuine friendſhip. Here we ſee it ſuperior to the force of the moſt violent of paſſions. Had the elevated ſouls of thoſe negro youths been refined and enlightened by culture and education in the principles of morality and true religion, we may reaſonably ſuppoſe that their friendſhip would have triumphed over their love, without prompting them to the raſh and deſperate deed which they committed.

10 Friendſhip not inconſiſtent with the ſpirit of Chriſtianity.

Friendſhip, thus amiable in its character, thus beneficial in its influence and effects, the theme of unbounded panegyric to the philoſophers and moraliſts of every age, has been ſaid by ſome reſpectable modern writers to be inconſiſtent with the ſpirit of that holy religion which we profeſs, and which we regard as the revelation of heaven. General benevolence is frequently inculcated through the goſpel: Jeſus often earneſtly intreated his diſciples, "to love one another;" and directed them in what manner to diſplay their mutual love, by telling them, that "whatſoever things they could reaſonably wiſh to receive from others, the ſame ought they to do them." The writers of the epiſtles often enlarge on the topics of charity and brotherly love. But private friendſhip is no where recommended in the code of Chriſtianity. Nay, it is ſo inconſiſtent with that univerſal benevolence which the goſpel enjoins, that where the one is recommended and enforced, the other may be underſtood to be tacitly forbidden. But can that religion be true, or can it be favourable to the happineſs of its votaries, which is inimical, nay, which is even not friendly to virtuous friendſhip? Such are the ſuggeſtions of Lord Shafteſbury and Soame Jenyns on this head. Friendſ

We muſt grant them, that the ſyſtem of morals or religion which diſcourages a connection ſo noble in its origin, ſo amiable in its character, and ſo beneficial in its influence, as virtuous friendſhip, is rather unfavourable to the happineſs and virtue of its votaries. But we muſt conſider the genius of Chriſtianity with more careful attention, before we ſuffer ourſelves to be perſuaded that friendſhip is inconſiſtent with it. Univerſal benevolence is, indeed, inculcated in the goſpel: we are required to love our neighbours as ourſelves: and our Saviour ſeems to inſinuate, in the ſtory of the humane Samaritan, that we ought to regard as neighbours all our brethren of the human race, however ſeparated from us by any of the diſtinctions of ſociety. But it would be unfair to conclude from this, that the great Author of the goſpel meant to aboliſh the order of ſocial life, or to oppoſe the ties of nature. Theſe may ſtill be reſpected, though the laws of this benevolence be obeyed. The parent is not required to deſert his child, in order that he may aſſiſt or relieve his neighbour; nor the child to leave his parent to periſh under the infirmities of old age, while he haſtes to lend aſſiſtance to a ſtranger. The goſpel was not intended to diſſolve communities, or to abrogate the diſtinctions of rank. In Jeſus the end of the ceremonial law was accompliſhed: by him, therefore, that burden of types and ceremonies with which the Jews had been loaded was taken away. But be who aboliſhed the ceremonial law declared, that the obligations of the moral law ſhould be more permanent than heaven or earth: The duties which it enjoined were ſtill to be religiouſly diſcharged: The precepts of the goſpel were to illuſtrate and enforce, not to contradict, the inſtitutions of the moral law. The relative duties of parents and children were ſtill to be performed; though men were directed not to confine all their ſentiments of benevolence to domeſtic relations. Jeſus, in his conduct, did not ſet himſelf to oppoſe the order of ſociety. In various parts of the New Teſtament all the ſocial duties are defined and enforced; the mutual duties of parents and children, of huſbands and wives, and of maſters and ſervants. The ſubmiſſion of all the members of a community to that power which is veſted with the authority of the whole, is alſo ſtrictly enjoined in the goſpel. Jeſus, when in his laſt moments he recommended his mother to the protection of his beloved diſciple, choſe to aſk *him* to conſider *her* as a parent; and directed *her* to expect from *him* the reſpect and kindneſs of a ſon. Theſe facts and obſervations teach us in what ſenſe to underſtand that univerſal benevolence which is inculcated in the goſpel. Though we are to love all mankind; yet it is not neceſſary that all the individuals of the human race ſhare our affection alike. Were we powerful, and wiſe, and benevolent, as the Deity; ſuch extenſive benevolence might be required of us: But our ſphere of action and obſervation is narrow; we cannot extend our acquaintance or influence beyond a very limited circle. Were we to endeavour

Friendſhip

deavour to be equally uſeful to all mankind, we ſhould become incapable of being uſeful to any individual. We cannot become citizens of the world in the ſenſe in which ſome philoſophers have affected to call themſelves ſuch, without becoming outcaſts from every particular ſociety. A ſon, a brother, a countryman, a ſtranger, lie around you, each in circumſtances of extreme diſtreſs; you pity their misfortunes, and would gladly adminiſter relief: but ſuch is your benevolence, that you feel preciſely the ſame degree of compaſſion for each of them; you cannot determine to whom you ſhould firſt ſtretch out an helping hand; and you therefore ſtand like that venerable aſs of the ſchoolmen, whoſe tantalizing ſituation between two bundles of hay has been ſo long celebrated and lamented by metaphyſicians; and ſuffer ſon, and brother, and countryman, and ſtranger, to periſh, without relieving any of them by your kind offices. It is therefore the deſign of the goſpel, that we ſhould ſubmit to the laws of nature, and comply with the inſtitutions of ſociety. Firſt, attend to ſelf-preſervation; next, perform the duties of a wife or huſband,—a parent,—a child,—a brother,—a citizen,—an individual of the human race. You will do well, indeed, to regard all mankind with benevolence; but your benevolence will be unavailing to the objects of it, if you overlook the diſtinctions of nature and thoſe inſtitutions which ſupport the union of ſocial life.

But if the ſpirit of Chriſtianity be not inimical to the inſtitutions and relations of ſociety, neither can it be unfavourable to friendſhip. If that benevolence which the goſpel enjoins, admit of any modifications, why not of that particular modification which conſtitutes private friendſhip? It is not, indeed, directly enjoined; but neither is it forbidden. It is perfectly conſiſtent with the general tendency and ſpirit of the goſpel ſyſtem: being favourable to the intereſts of ſociety, it cannot but be agreeable to our holy religion.

But it is recommended by no direct precept, ſay thoſe who would repreſent Chriſtianity as inimical to it; while it has been the favourite theme of the philoſophers and moraliſts of the heathen world.

But why ſhould friendſhip be recommended by means different from thoſe which the goſpel employs for the purpoſe? Make yourſelf well acquainted with that admirable ſyſtem which you ſo earneſtly oppoſe; you will find that even the duties of private friendſhip are better explained and more powerfully enforced in the goſpel, than by all the heathen philoſophers and poets from Heſiod to Plutarch. The goſpel makes a diſtinction between the virtuous and the vicious; it repreſents one character as more amiable and reſpectable than another. As it diſtinguiſhes between virtue and vice, between piety and impiety; ſo its great object is to deter us from vice, and to encourage us to the practice of virtue. It cannot be ſuppoſed, then, that the goſpel will direct us to aſſociate indifferently with virtuous and profligate characters. It does not. It directs us to ſeek improvement, by aſſociating with thoſe whom we have reaſon to eſteem. It directs thoſe who are incorrigibly wicked to be expelled from ſociety. What is this but to command us to enter into habits of intimacy wherever there is ground for mutual eſteem? But this is the only baſis of genuine friendſhip. When all the means which lead to a certain end are laid before you, and when you are particularly directed by ſome high authority to employ thoſe means; though the end which you thus attain be not pointed out, yet the commanding you to employ ſuch a ſeries of means, is evidently the ſame as if you were directed to accompliſh the purpoſe to which they tend. Thus, though the precepts of Chriſtianity do not directly enjoin private friendſhip; yet they have a direct tendency to form thoſe exalted characters who alone are capable of true friendſhip; they inculcate thoſe virtues which naturally give riſe to this generous attachment, and are abſolutely neceſſary to ſupport it where it is formed; they inculcate benevolence by the moſt effectual motives, and admit of modifications of that benevolence, correſpondent to the relations and inſtitutions of ſociety: And therefore they may be conſidered in as ſtrong and direct terms, as if it had been expreſsly ſaid, "Cultivate private friendſhip." Beſides, friendſhip is rather an *accident* of ſociety, a natural conſequence of our character as moral and ſocial beings, than a relation to be regulated and defined by inſtitutions. Friendſhip.

This union, ſo natural between virtuous perſons, has been countenanced by the example of the Author of our religion; to whoſe life, no leſs than to his doctrines and precepts, we will do well to look for a ſtandard by which we may regulate our conduct. We allude to two remarkable inſtances which occur in the evangelical hiſtory; and with the recital of which, as ſtated in all their ſtriking circumſtances by a very elegant writer *, we ſhall conclude the preſent article. Friendſhip countenanced by our Saviour's example.

" The evangeliſt, in relating the miracle which Chriſt performed at Bethany by reſtoring a perſon to life who had lain ſome days in the grave, introduces his narrative by emphatically obſerving, that 'Jeſus loved Lazarus;' intimating, it ſhould ſeem, that the ſentiments which Chriſt entertained of Lazarus were a diſtinct and peculiar ſpecies of that general benevolence with which he was actuated towards all mankind. Agreeably to this explication of the ſacred hiſtorian's meaning, when the ſiſters of Lazarus ſent to acquaint Jeſus with the ſtate in which their brother lay, they did not even mention his name; but, pointing him out by a more honourable and equally notorious deſignation, the terms of their meſſage were, 'Behold! he whom thou loveſt is ſick!' Accordingly, when he informs his diſciples of the notice he had thus received, his expreſſion is, 'Our friend Lazarus ſleepeth.' Now that Chriſt did not upon this occaſion uſe the word *friend* in its looſe undiſtinguiſhed acceptation, but in a reſtrained and ſtrictly appropriated ſenſe, is not only manifeſt from this plain account of the fact itſelf, but appears farther evident from the ſequel. For as he was advancing to the grave, accompanied with the relations of the deceaſed, he diſcovered the ſame emotions of grief as ſwelled the boſoms of thoſe with whom Lazarus had been moſt intimately connected; and ſympathizing with their common ſorrow, he melted into tears. This circumſtance was too remarkable to eſcape particular obſervation: and it drew from the ſpectators, what one ſhould think it muſt neceſſarily draw from every reader, this natural and obvious reflection, 'Behold! how he loved him!'

" But in the concluding cataſtrophe of our Saviour's life, he gave a ſtill more deciſive proof that ſentiments

* W. Melmoth, Eſq; in the concluding note to his *Tranſlation of Cicero's Lælius.*

Friendſhip, Friesland.

of the ſtrongeſt perſonal attachment and friendſhip were not unworthy of being admitted into his ſacred boſom: they were too deeply, indeed, impreſſed, to be extinguiſhed even by the moſt excruciating torments. In thoſe dreadful moments, obſerving among the afflicted witneſſes of his painful and ignominious ſufferings, that faithful follower who is deſcribed by the hiſtorian as 'the diſciple whom he loved;' he diſtinguiſhed him by the moſt convincing inſtance of ſuperior confidence, eſteem, and affection, that ever was exhibited to the admiration of mankind. For, under circumſtances of the moſt agonizing torments, when it might be thought impoſſible for human nature to retain any other ſenſibility but that of its own inexpreſſible ſufferings, he recommended to the care and protection of this his tried and approved friend, in terms of peculiar regard and endearment, the moſt tender and ſacred object of his private affections. But no language can repreſent this pathetic and affecting ſcene with a force and energy equal to the ſublime ſimplicity of the Evangeliſt's own narrative: 'Now there ſtood by the croſs of Jeſus, his mother and his mother's ſiſter, and Mary Magdalene. When Jeſus ſaw his mother and the diſciple (ſtanding) by, whom he loved; he ſaith to his mother, Behold thy ſon! then he ſaith to the diſciple, Behold thy mother! And from that hour that diſciple took her to his own home.'

"It may ſafely be aſſerted, that among all thoſe memorable examples of friendſhip, which have been celebrated with the higheſt encomiums by the ancients, there cannot be produced a ſingle inſtance in which the moſt diſtinguiſhing features of exalted amity are ſo ſtrongly diſplayed as in the foregoing relation. The only one, perhaps, that bears even a faint ſimilitude to it, is that famous tranſaction † recorded by a Greek author, which paſſed between Eudamidas and Aretheus. But when the very different circumſtances attending the reſpective examples are duly conſidered, it muſt be acknowledged, that the former riſes as much above the latter in the proof it exhibits of ſublime friendſhip, as it does in the dignity of the characters concerned.

† Already recited in this article, p. 468, col. 2.

"Upon the whole, then, it appears, that the divine Founder of the Chriſtian religion, as well by his own example as by the ſpirit of his moral doctrine, has not only encouraged but conſecrated friendſhip."

FRIESLAND, one of the united provinces of the Low Countries. It is bounded on the eaſt by the river Lauvers, which parts it from the lordſhip of Groningen, on the ſouth by Overyſſel, on the weſt by the Zuider-Zee, and on the north by the German ocean. It is 30 miles from north to ſouth, and 28 from eaſt to weſt. The land is very fertile in corn and paſture; the horſes are large, and the cows and ſheep prolific. It is divided into three parts; Weſtergo to the weſt, Oſtergo to the eaſt, and Sevenwalden to the ſouth. The iſlands of Sheling, Ameland, and other ſmall ones, are dependent on this province. The principal towns are Leuwarden the capital, Franeker, Dockum, Harlingen, and Staveren.

FRIESLAND (Eaſt), a province of Germany, in the circle of Weſtphalia, lying near the German ocean. It is bounded on the ſouth by the biſhopric of Munſter, on the eaſt by the county of Oldenburg, on the weſt by the province of Groningen, and on the north by the ſea, being about 50 miles in length, and 30 in breadth. It belongs to Pruſſia, and was formerly called the *county of Embden*. It is a very fertile country, and feeds a great number of cattle; but it was greatly damaged by an inundation in 1717, and the repair of the dykes coſt an immenſe ſum. The principal towns are Norden, Leer, Eſſens, Whitmunde, and Auriek. Embden was an imperial city, and the principal place in the country; but now belongs alſo to the king of Pruſſia, who bought it of the Dutch.

Frigo ‖ Fright

FRIGATE, in ſea affairs, a ſhip of war, uſually of two decks, light built, deſigned for ſwift ſailing. When it hath but one deck, and conſequently is of a ſmaller ſize, they call her a light frigate.

Frigates mount from 20 to 44 guns, and are eſteemed excellent cruiſers. The name was formerly known only in the Mediterranean, and applied to a long kind of veſſel navigated in that ſea with ſails and oars. The Engliſh were the firſt who appeared on the ocean with theſe ſhips, and equipped them for war as well as for commerce.

Frigate-Built, denotes the diſpoſition of the decks of ſuch merchant ſhips as have a deſcent of four or five ſteps from the quarter-deck and fore-caſtle into the waiſt, in contradiſtinction to thoſe whoſe decks are on a continued line for the whole length of the ſhip, which are called *galley-built*.

FRIGATOON, a Venetian veſſel, commonly uſed in the Adriatic, built with a ſquare ſtern, and without any fore-maſt, having only a main-maſt, mizen-maſt, and bow-ſprit.

FRIGHT, or TERROR, a ſudden and violent degree of fear. See FEAR.

Sudden fear is frequently productive of very remarkable effects upon the human ſyſtem. Of this many inſtances occur in medical writings.—In general, the effects of terror are a contraction of the ſmall veſſels and a repulſion of the blood in the large and internal ones; hence proceed a ſuppreſſion of perſpiration, a general oppreſſion, trembling, and anguiſh of the heart, and lungs overcharged with blood.

Frights often occaſion incurable diſeaſes, as epilepſy, ſtupor, madneſs, &c. In acute diſeaſes, they have evidently killed many, by the agitation into which they have thrown the ſpirits, already too much diſordered. We have alſo accounts of perſons abſolutely killed by terrors when in perfect health at the time of receiving the ſhock from them: people ordered to be executed, but with private orders for a reprieve, have expired at the block without a wound.—Out of many inſtances of the fatal effects of fear recorded in writers, the following is ſelected as one of the moſt ſingular. "George Grochantzy, a Polander, who had inliſted as a ſoldier in the ſervice of the king of Pruſſia, deſerted during the laſt war. A ſmall party was ſent in purſuit of him; and when he leaſt expected it, they ſurpriſed him ſinging and dancing among a company of peaſants, who were got together in an inn and were making merry. This event, ſo ſudden and unforeſeen, and at the ſame time ſo dreadful in its conſequences, ſtruck him in ſuch a manner, that, giving a great cry, he became at once altogether ſtupid and inſenſible, and was ſeized without the leaſt reſiſtance. They carried him away to Glocau, where he was brought before the council of war, and received ſentence as

a

Fright. a deſerter. He ſuffered himſelf to be led and diſpoſed of at the will of thoſe about him, without uttering a word, or giving the leaſt ſign that he knew what had happened or would happen to him. He remained immoveable as a ſtatue wherever he was placed, and was wholly paſſive with reſpect to all that was done to him or about him. During all the time that he was in cuſtody, he neither eat, nor drank, nor ſlept, nor had any evacuation. Some of his comrades were ſent to ſee him; after that he was viſited by ſome officers of his corps and by ſome prieſts; but he ſtill continued in the ſame ſtate, without diſcovering the leaſt ſigns of ſenſibility. Promiſes, intreaties, and threatenings, were equally ineffectual. The phyſicians who were conſulted upon his caſe were of opinion, that he was in a ſtate of hopeleſs idiocy. It was at firſt ſuſpected, that thoſe appearances were feigned; but theſe ſuſpicions neceſſarily gave way, when it was known that he took no ſuſtenance, and that the involuntary functions of nature were in great meaſure ſuſpended. After ſome time they knocked off his fetters, and left him at liberty to go whither he would. He received his liberty with the ſame inſenſibility that he had ſhowed upon other occaſions: he remained fixed and immoveable; his eyes turned wildly here and there without taking cognizance of any object, and the muſcles of his face were fallen and fixed like thoſe of a dead body. Being left to himſelf, he paſſed 20 days in this condition, without eating, drinking, or any evacuation, and died on the 20th day. He had been ſometimes heard to fetch deep ſighs; and once he ruſhed with great violence on a ſoldier, who had a mug of liquor in his hand, forced the mug from him, and having drank the liquor with great eagerneſs, let the mug drop to the ground."

When a perſon is affected with terror, the principal endeavour ſhould be to reſtore the circulation to its due order, to promote perſpiration, and to allay the agitation of the patient. For theſe purpoſes he may drink a little warm liquor, as camomile-tea, &c. the feet and legs may be put into warm water, the legs rubbed, and the camomile-tea repeated every ſix or eight minutes; and when the ſkin is warm, and there is a tendency to perſpiration, ſleep may be promoted by a gentle opiate.

But frights have been known not only to cauſe, but alſo to cure, diſeaſes. Mr Boyle * mentions agues, gout, and ſciatica, cured by this means.

* Works, Air p. 82, &c.

To turn from the ſerious to the ludicrous effects of fear, the following inſtance of the latter ſort, quoted from a French author by Mr Andrews in his volume of Anecdotes, ſhows upon what ſlight occaſions this paſſion may be ſometimes excited in a very high degree, even in perſons the moſt unlikely to entertain ſuch a gueſt. "Charles Guſtavus (the ſucceſſor of Chriſtina of Sweden) was beſieging Prague, when a boor of moſt extraordinary viſage deſired admittance to his tent; and being allowed entrance, offered, by way of amuſing the king, to devour a whole hog of one hundred weight in his preſence. The old general Konigſmarc, who ſtood by the king's ſide, and who, ſoldier as he was, had not got rid of the prejudices of his childhood, hinted to his royal maſter that the peaſant ought to be burnt as a ſorcerer. 'Sir,' ſaid the fellow, irritated at the remark, 'if your majeſty will but make that old gentleman take off his ſword and his ſpurs, I will eat him immediately before I begin the hog.' General Konigſmarc (who had, at the head of a body of Swedes, performed wonders againſt the Auſtrians, and who was looked upon as one of the braveſt men of the age) could not ſtand this propoſal, eſpecially as it was accompanied by a moſt hideous and preternatural expanſion of the frightful peaſant's jaws. Without uttering a word, the veteran ſuddenly turned round, ran out of the court, and thought not himſelf ſafe until he had arrived at his quarters; where he remained above 24 hours locked up ſecurely, before he had got rid of the panic which had ſo ſeverely affected him."

Fright || Frilaz'n.

Fear (Dr Beattie † obſerves) ſhould not riſe higher than to make us attentive and cautious; when it gains an aſcendency in the mind, it becomes an inſupportable tyranny, and renders life a burden. The object of fear is evil; and to be exempt from fear, or at leaſt not enſlaved to it, gives dignity to our nature, and invigorates all our faculties. Yet there are evils which we ought to fear. Thoſe that ariſe from ourſelves, or which it is in our power to prevent, it would be madneſs to deſpiſe, and audacity not to guard againſt. External evils, which we cannot prevent, or could not avoid without a breach of duty, it is manly and honourable to bear with fortitude. Inſenſibility to danger is not fortitude, no more than the incapacity of feeling pain can be called patience; and to expoſe ourſelves unneceſſarily to evil is worſe than folly, and very blameable preſumption. It is commonly called fool-hardineſs; that is, ſuch a degree of hardineſs or boldneſs as none but fools are capable of. See the article FORTITUDE.

† *Elements of Moral Science.*

FRIGID *(frigidus)*, in a general ſenſe, denotes the quality of being cold. It is frequently applied to a jejune ſtyle, that is unanimated by any ornaments, and conſequently without any force or vigour.

FRIGID Zone. See ZONE.

FRIGIDITY, in medicine, the ſame with IMPOTENCE.

FRIGORIFIC, in phyſiology, ſmall particles of matter, which, according to Gaſſendus and others, being actually and eſſentially cold, and penetrating other bodies, produce in them that quality which we call *cold*. See COLD.

FRILAZIN, the name of a claſs or rank of people among the Anglo-Saxons, conſiſting of thoſe who had been ſlaves, but had either purchaſed, or by ſome other means obtained, their liberty. Though theſe were in reality free men, they were not conſidered as of the ſame rank and dignity with theſe who had been born free, but were ſtill in a more ignoble and dependent condition, either on their former maſters or on ſome new patrons. This cuſtom the Anglo-Saxons ſeem to have derived from their anceſtors in Germany, among whom thoſe who had been made free did not differ much in point of dignity or importance in the ſtate from thoſe who continued in ſervitude. This diſtinction between thoſe who have been made free and thoſe who enjoy freedom by deſcent from a long race of free men, ſtill prevails in many parts of Germany; and particularly in the original ſeats of the Anglo-Saxons. Many of the inhabitants of towns and cities in England, in this period, ſeem to have been of this claſs of men,

Frill. Fringilla.

who were in a kind of middle ſtate between ſlaves and freemen.

FRILL, in falconry. When a hawk trembles or ſhivers, they ſay ſhe frills.

Plate CCIII

FRINGILLA, in ornithology, a genus belonging to the order of paſſeres. The bill is conical, ſtraight, and ſharp-pointed. There are no leſs than 108 ſpecies comprehended under this genus, diſtinguiſhed principally by varieties in their colour. The following are the moſt noted.

1. The *carduelis*, or GOLDFINCH, with the quill-feathers red forwards, and the outermoſt without any ſpots; the two outermoſt are white in the middle, as the reſt are at the point. The young bird before it moults is grey on the head; and hence it is termed by the bird-catchers a *grey-pate*. There is a variety of goldfinches called by the London bird-catchers a *cheverel*, from the manner in which it concludes its jerk. It is diſtinguiſhed from the common ſort by a white ſtreak, or by two, ſometimes three, white ſpots under the throat. Their note is very ſweet; and they are much eſteemed on that account, as well as for their great docility. Towards winter, they aſſemble in flocks; and feed on ſeeds of different kinds, particularly thoſe of the thiſtle. It is fond of orchards, and frequently builds in an apple or pear-tree: its neſt is very elegantly formed of fine moſs, liverworts, and bents, on the outſide; lined firſt with wool and hair, and then with the goſſin or cotton of the ſallow. It lays five white eggs, marked with deep purple ſpots on the upper end; and has two broods in the year. When kept in cages, they are commonly fed much on hemp-ſeed, which they eat freely, but which is ſaid to make them grow black, and loſe both their red and yellow. The goldfinch is a long-lived bird, often attaining the age of 20 years.—This ſpecies is plenty throughout Europe; it is alſo met with both in Aſia and Africa, but leſs common.

2. The *cælebs*, or CHAFFINCH, hath black limbs, and the wings white on both ſides; the three firſt feathers of the tail are without ſpots, but two of the chief are obliquely ſpotted. It has its name from its delighting in chaff. This ſpecies entertains us agreeably with its ſong very early in the year, but towards the latter end of ſummer aſſumes a chirping note: both ſexes continue with us the whole year. What is very ſingular in Sweden, the females quit that country in September, migrating in flocks into Holland, leaving their mates behind: in the ſpring they return. In Hampſhire Mr White has obſerved ſomething of this kind; vaſt flocks of females with ſcarcely any males among them. Their neſt is almoſt as elegantly conſtructed as that of the goldfinch, and of much the ſame materials, only the inſide has the addition of ſome large feathers. They lay four or five eggs of a dull white colour, tinged and ſpotted with deep purple. They are caught in plenty in flight-time; but their neſts are rarely found, though they build in hedges and trees of all ſorts. They make their neſts of moſs and wool, or any thing they can gather up; and have young ones thrice a-year. They are ſeldom bred from the neſt, as being a bird not apt to learn another's ſong, nor to whiſtle; ſo that it is beſt to leave the old ones to bring them up. The Eſſex finches are generally allowed to be the beſt ſort, both for length of ſong and variety, ending with ſeveral notes that are very pretty. It is an hardy bird, and will live almoſt upon any ſeeds, none coming amiſs to him. He is ſeldom ſubject to diſeaſe, but will be very louſy if not ſprinkled with wine two or three times a-month. Fringilla

3. The *montifringilla*, or BRAMBLING, has a yellow bill tipt with black; the head, hind part of the neck, and back, are black; the throat, fore part of the neck, and breaſt, pale rufous orange; lower part of the breaſt and belly white; the quill feathers brown, with yellowiſh edges; the tail a little forked; the legs grey. This ſpecies migrates into England at certain ſeaſons, but does not build here. It is frequently found among chaffinches, and ſometimes comes in vaſt flocks. They are alſo ſeen at certain times in vaſt clouds in France, inſomuch that the ground has been quite covered with their dung, and more than 600 dozen were killed each night. They are ſaid to be particularly fond of beech maſt, but will alſo eat ſeeds of various other kinds. Their fleſh is eaten by many, but is apt to prove bitter. They are ſaid to breed about Luxemburg, making the neſt on the tall fir-trees, compoſed of long moſs without, and lined with wool and feathers within: the eggs are four or five in number, yelloviſh, and ſpotted; and the young are fledged at the end of May. This ſpecies is found more or leſs throughout Europe; and is common in the pine foreſts of Ruſſia and Siberia, but thoſe of the laſt are darker in colour and leſs in ſize.

4. The *domeſtica*, or SPARROW, hath the prime feathers of the wings and tail brown, the body variegated with grey and black, and a ſingle white ſtreak on the wings. Theſe well-known birds are proverbially ſalacious, and have three broods in a year. They are every where common about our houſes, where they build in every place they can find admittance; under the roof, corner of the brick-work, or in holes of the wall. They make a ſlovenly neſt; generally a little hay ill put together, but lined well with feathers; where they lay five or ſix eggs of a reddiſh white colour ſpotted with brown. They will ſometimes build in the neigbouring trees, in which caſe they take more pains with the neſt: and not unfrequently they expel the martins from theirs, to ſave the trouble of conſtructing one of their own. The ſparrow, from frequenting only habitations and parts adjacent, may be ſaid to be chiefly fed from human induſtry; for in ſpite of every precaution, it will partake with the pigeons, poultry, &c. in the food thrown out to them, grain of all kinds being moſt agreeable to its taſte; though it will eat refuſe from the kitchen of moſt kinds. It is a familiar but crafty bird, and will not ſo eaſily come into a ſnare as many others. In autumn they often collect into flocks, and rooſt in numbers on the neighbouring trees, when they may be ſhot by dozens, or of night caught in great numbers by a bat fowling-net. The fleſh is accounted tolerable by many. The ſparrow has no ſong, only a chirp or two frequently repeated, and far from agreeable. This ſpecies is ſpread every where throughout Europe; and is alſo met with in Egypt, Senegal, Syria, and other parts of Africa and Aſia.

5. The *ſpinus*, or SISKIN, hath the prime feathers of the wings yellow in the middle, and the four firſt chief tail-feathers without ſpots; but they are yellow at the baſe,

Fringilla. baſe, and black at the points. Mr Willoughby tells us, that this is a ſong-bird: that in Suſſex it is called the *barley-bird*, becauſe it comes to them in barley-ſeed time. We are informed that it viſits theſe iſlands at very uncertain times, like the groſs beak, &c. It is to be met with in the bird-ſhops in London; and being rather a ſcarce bird, ſells at a higher price than the merit of its ſong deſerves: it is known there by the name of the *aberdavine*. It is a very tame and docile ſpecies; and is often kept and paired with the canary-bird, with which it breeds freely. The bird-catchers have a notion of its coming out of Ruſſia. Dr Kramer informs us, that this bird conceals its neſt with great art; and though there are infinite numbers of young birds in the woods on the banks of the Danube, which ſeem juſt to have taken flight, yet no one could diſcover it.

6. The *linota*, or LINNET, has the bottom of the breaſt of a fine blood-red, which heightens as the ſpring advances. Theſe birds are much eſteemed for their ſong. They feed on ſeeds of different kinds, which they peel before they eat; the ſeed of the linum or flax is their favourite food; from whence the name of the linnet tribe. They breed among furze and white thorn: the outſide of their neſt is made with moſs and bents, and lined with wool and hair. They lay five whitiſh eggs, ſpotted like thoſe of the goldfinch.

7. The *cannabina*, or GREATER RED-POLE, is rather leſs than the common linnet, and has a blood-coloured ſpot on the forehead, and the breaſt of the male is tinged with a fine roſe-colour. It is a common fraud in the bird-ſhops in London, when a male-bird is diſtinguiſhed from the female by a red-breaſt, as in the caſe of this bird, to ſtain or paint the feathers, ſo that the deceit is not eaſily diſcovered, without at leaſt cloſe inſpection. Theſe birds are frequent on our ſea-coaſts; and are often taken in flight-time near London: it is a familiar bird; and is cheerful in five minutes after it is caught.

8. The *linaria*, or LESSER RED-POLE, is about half the ſize of the laſt, and a rich ſpot of purpliſh red on the forehead: the breaſt is of the ſame colour, but leſs bright. The female is leſs lively in colour; has no red on the breaſt; and the ſpot on the forehead is of a ſaffron hue. This ſpecies is common enough in England; and lays four or five eggs of a pale bluiſh green, thickly ſprinkled near the blunt end with ſmall reddiſh ſpots. Mr Pennant mentions an inſtance of this bird being ſo tenacious of her neſt, as to ſuffer herſelf to be taken off by the hand; and that when releaſed ſhe would not forſake it. This ſpecies is known about London by the name of *ſtone redpole*. Linnæus, Kramer, and others, mention its being very fond of the ſeeds of alder. Whole flocks of them, mixed with the ſiſkin, frequent places where alders grow, for the ſake of picking the catkins: they generally hang like the titmouſe, with the back downwards; and in this ſtate are ſo intent on their work, that they may be entangled one after another by dozens, by means of a twig ſmeared with birdlime faſtened to the end of a fiſhing rod or other long pole. This ſpecies ſeems to be in plenty throughout Europe, from the extreme parts of Ruſſia on the one hand to Italy on the other. Is very common in Greenland, and was alſo met with by our late voyagers at Aoonalaſhka. In America it is likewiſe well known. Hence it ſeems to be a bird common to the whole of the northern part of the globe without exception. Fringilla.

9. The *montium*, or TWITE, is about the ſize of a linnet. It has the feathers of the upper part of the body duſky; thoſe on the head edged with aſh-colour, the others with browniſh red: the rump is pale crimſon; the wings and tail are duſky, the tips of the greater coverts and ſecondaries whitiſh; the legs pale brown. The female wants the red mark on the rump. Twites are taken in the flight-ſeaſon near London along with other linnets. It is probable that the name has been taken from their twittering note, having no muſic in it; and indeed the bird-catchers will tell at ſome diſtance whether there be any twites mixed among linnets merely from this circumſtance. The twite is ſuppoſed to breed in the more northern parts of our iſland.

10. The *amandava*, or AMADUVADE BIRD, is about the ſize of a wren. The colour of the bill is of a dull red; all the upper parts are brown, with a mixture of red; the under the ſame, but paler, the middle of the belly darkeſt; all the feathers of the upper wing-coverts, breaſt, and ſides, have a ſpot of white at the tip; the quills are of a grey brown; the tail is black; and the legs are of a pale yelloviſh white. It inhabits Bengal, Java, Malacca, and other parts of Aſia.

11. The *Senegala*, or SENEGAL FINCH, is a ſpecies very little bigger than a wren. The bill is reddiſh, edged all round with brown; and beneath the under mandible a line of brown quite to the tip; the ſame alſo is ſeen on the ridge of the upper mandible: the upper parts of the body are of a vinaceous red colour; the lower parts, with the thighs and under tail-coverts, of a greeniſh brown; the hind part of the head and neck, the back, ſcapulars, and wing-coverts, are brown; the tail is black; and the legs are pale grey. It inhabits Bengal; and, with the former ſpecies, feeds on millet. This affords the natives an eaſy method of catching them: they have no more to do than to ſupport a large hollowed gourd, the bottom uppermoſt, on a ſtick, with a ſtring leading to ſome covered place, and ſtrewing under it ſome millet; the little birds, haſtening in numbers to pick it up, are caught beneath the trap, by the ſtick being pulled away by the obſerver at a diſtance. The females are ſaid to ſing nearly as well as the males. They are familiar birds; and when once uſed to the climate, will frequently live five or ſix years in a cage. They have been bred in Holland by the fanciers of birds.

12. The *canaria*, or CANARY-BIRD, hath a whitiſh body and bill, with the prime feathers of the wings and tail greeniſh. It was originally peculiar to thoſe iſles to which it owes its name; the ſame that were known to the ancients by the addition of the *Fortunate*. Though the ancients celebrate the iſle of Canaria for the multitude of birds, they have not mentioned any in particular. It is probable, then, that our ſpecies was not introduced into Europe till after the ſecond diſcovery of theſe iſles, which was between the 13th and 14th centuries. We are uncertain when it firſt made its appearance in this quarter of the globe. Belon, who wrote in 1555, is ſilent in reſpect to theſe birds: Geſner is the firſt who mentions them; and Aldrovand

Frippery ll Frit.

drovand ſpeaks of them as rarities, obſerving that they were very dear on account of the difficulty attending the bringing them from ſo diſtant a country, and that they were purchaſed by people of rank alone. They are ſtill found on the ſame ſpot to which we were firſt indebted for the production of ſuch charming ſongſters; but they are now become ſo numerous in our own country, that we are under no neceſſity of croſſing the ocean for them.—The Canary-bird will prove fertile with the ſiſkin and goldfinch; but in this caſe the produce, for the moſt part, proves ſterile: the pairs ſucceed beſt when the hen-bird is the Canary, and the cock of the oppoſite ſpecies. It will alſo prove prolific with the linnet, yellow-hammer, chaffinch, and even the houſe ſparrow; but the male Canary-bird will not aſſimilate with the female of theſe birds; the hen muſt be ever of the Canary ſpecies, and the young of theſe moſtly prove male birds.—This bird is ſaid by ſome to live 10 or 15 years; by others, as far as 18.

FRIPPERY, a French term ſometimes uſed in our language to ſignify the trade or traffic of old ſecond-hand clothes and goods. The word is alſo uſed for the place where ſuch ſort of commerce is carried on, and even for the commodities themſelves. The company of frippiers, or fripperers, at Paris, are a regular corporation, of an ancient ſtanding, and make a conſiderable figure in that city.

FRISII, Friſii, Friſiones, and Friſones, (anc. geog.), a people of Germany, ſo called either from their ardent love of freedom, or from the freſh and unbroken lands they occupied, contradiſtinguiſhed from the old lands. Tacitus divides them, from their extent of power and territory, into the Majores, ſituated on the coaſt betwen the Rhine and the Ems; and into the Minores, occupying the parts about the lakes lying between the channels of the Rhine.

FRIT, or Fritt, in the glaſs manufacture, is the matter or ingredients whereof glaſs is to be made, when they have been calcined or baked in a furnace.

A ſalt drawn from the aſhes of the plant kali or from fern, or other plants mixed with ſand or flint, and baked together, makes an opaque maſs called by glaſs-men *frit*; probably from the Italian *fritture*, to fry; or becauſe the frit, when melted, runs into lumps, like fritters, called by the Italians *fritelli*.

Frit, by the ancients, was called *ammonitrum*, of αμμος, *ſand*, and νιτρον, *nitre*; under which name it is deſcribed by Pliny thus: Fine ſand from the Volturnian ſea, mixed with three times the quantity of nitre, and melted, makes a maſs called *ammonitrum*; which being rebaked makes pure glaſs.

Frit, Neri obſerves, is only the calx of the materials which make glaſs; which though they might be melted, and glaſs be made, without thus calcining them, yet it would take up much more time. This calcining, or making of frit, ſerves to mix and incorporate the materials together, and to evaporate all the ſuperfluous humidity. The frit, once made, is readily fuſed, and turned into glaſs.

There are three kinds of frits. The firſt, cryſtal frit, or that for cryſtal metal, is made with ſalt of pulverine and ſand. The ſecond, and ordinary frit, is made of the bare aſhes of pulverine or barilla, without extracting the ſalt from them. This makes the ordinary white or cryſtal metal. The third is frit for green glaſſes, made of common aſhes, without any preparation. This laſt frit will require ten or twelve hours baking.

Frith ll Frizing.

The materials in each are to be finely powdered, waſhed, and ſearced; then equally mixed, and frequently ſtirred together in the melting pot. For the reſt ſee Glass, and Crystal.

FRITH, in its moſt uſual acceptation, ſignifies the mouth or opening of a river into the ſea; ſuch are the Frith of Forth or of Edinburgh, the Frith of Clyde, Moray Frith, &c.

FRITILLARIA, fritillary: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 10th order, *Coronariæ*. The corolla is hexapetalous and campanulated, with a nectariferous cavity above the heel in each petal; the ſtamina are as long as the corolla. There are five ſpecies, all of them bulbous-rooted flowery perennials, producing annual ſtalks from about one foot to a yard or more high, terminated by large, bell-ſhaped, liliaceous flowers, of a great variety of colours. They are all propagated by offſets, which they furniſh abundantly from the ſides of their roots, and which may be ſeparated every ſecond or third year; they are hardy plants, and will thrive in any of the common borders.

FRIULI, a province of Italy, ſubject to Venice, and bounded by Carinthia in Germany on the north, by Carniola on the eaſt, by the Gulph of Venice on the ſouth, and by the Belluneſe and Feltrin on the weſt.

FRIZE, or Frieze, in architecture, a part of the entablature of columns, more uſually written and pronounced *freeze*. See Freeze.

Frize, or Freeze, in commerce, a kind of woollen cloth or ſtuff for winter wear, being frized or knapt on one ſide; whence, in all probability, it derives its name.

Of frizes, ſome are croſſed, others not croſſed: the former are chiefly of Engliſh manufacture, the latter of Iriſh.

FRIZING of Cloth, a term in the woollen manufactory, applied to the forming of the nap of cloth or ſtuff into a number of little hard burrs or prominences, covering almoſt the whole ground thereof.

Some cloths are only frized on the back ſide, as black cloths; others on the right ſide, as coloured and mixed cloths, rateens, bays, friezes, &c.

Frizing may be performed two ways. One with the hand, that is, by means of two workmen, who conduct a kind of plank that ſerves for a frizing inſtrument. The other way is by a mill, worked either by water or a horſe, or ſometimes by men. This latter is eſteemed the better way of frizing, by reaſon the motion being uniform and regular, the little knobs of the frizing are formed more equably and regularly. The ſtructure of this uſeful machine is as follows:

The three principal parts are the frizer or criſper, the frizing table, and the drawer or beam. The two firſt are two equal planks or boards, each about 10 feet long and 15 inches broad; differing only in this, that the frizing-table is lined or covered with a kind of coarſe woollen ſtuff, of a rough ſturdy nap; and the frizer is incruſtated with a kind of cement compoſed of glue, gum-arabic, and a yellow ſand, with a little aqua-vitæ, or urine. The beam, or drawer, thus cal-

ed,

Frizing ll Frobiſher.

ed, becauſe it draws the ſtuff from between the frizer and the frizing-table, is a wooden rolier, beſet all over with little, fine, ſhort points or ends of wire, like thoſe of cards uſed in carding of wool.

The diſpoſition and uſe of the machine is thus. The table ſtands immoveable, and bears or ſuſtains the cloth to be frized, which is laid with that ſide uppermoſt on which the nap is to be raiſed: over the table is placed the frizer, at ſuch a diſtance from it as to give room for the ſtuff to be paſſed between them: ſo that the frizer, having a very ſlow ſemicircular motion, meeting the long hairs or naps of the cloth, twiſts, and rolls them into little knobs or burrs; while, at the ſame time, the drawer, which is continually turning, draws away the ſtuff from under the frizer, and winds it over its own points.

All that the workman has to do while the machine is a-going, is to ſtretch the ſtuff on the table as faſt as the drawer takes it off, and from time to time to take off the fluff from the points of the drawer.

The deſign of having the frizing-table lined with ſtuff of a ſhort, ſtiff, ſtubby nap, is that it may detain the cloth between the table and the frizer long enough for the grain to be formed, that the drawer may not take it away too readily, which muſt otherwiſe be the caſe, as it is not held by any thing at the other end. It were unneceſſary to ſay any thing particular of the manner of frizing ſtuffs with the hand, it being the aim of the workmen to imitate, as near as they can with their wooden inſtrument, the ſlow, equable, and circular motion of the machine: it needs only be added, that their frizer is but about two feet long and one broad; and that to form the nap more eaſily, they moiſten the ſurface of the ſtuff lightly, with water mingled with whites of eggs or honey.

FROBENIUS (John), a famous and learned printer in the 16th century, was born at Hamelburgh in Franconia, and ſettled at Baſil. He had before ſtudied in that univerſity, where he acquired the reputation of being uncommonly learned; and now ſetting up a printing-houſe in that city, was the firſt of the German printers who brought that admirable art to any degree of perfection. Being a man of great probity and piety, as well as ſkill, he was particularly choice in the authors he printed; and would never, for the ſake of profit, ſuffer libels, or any thing that might hurt the reputation of another, to go through his preſs. The great character of this printer was the principal motive which induced Eraſmus to reſide at Baſil, in order to have his own works printed by him. A great number of valuable authors were printed by Frobenius, with great care and accuracy; among which were the works of St Jerome, Auguſtine, and Eraſmus. He deſigned to have printed the Greek Fathers; but died in 1527, before he could execute his deſign. Eraſmus wrote his epitaph in Greek and Latin.

John Frobenius left a ſon, named *Jerome Frobenius*, and a daughter married to Nicholas Epiſcopius; who, joining in partnerſhip, continued Frobenius's printing-houſe with reputation, and printed correct editions of the Greek Fathers.

FROBISHER, or FORBISHER (Sir Martin), an excellent navigator and ſea-officer in the 16th century, was born near Doncaſter in Yorkſhire, and was from his youth brought up to navigation. He was the firſt Engliſhman who attempted to find a north-weſt paſſage to China, and in 1576 he ſailed with two barks and a pinnace in order to attempt that paſſage. In this voyage he diſcovered a cape, to which he gave the name of *Queen Elizabeth's Foreland*, and the next day diſcovered a ſtrait to which he gave his own name. This voyage proving unſucceſsful, he attempted the ſame paſſage in 1577; but diſcovering ſome ore in an iſland, and his commiſſion directing him in this voyage only to ſearch for ore, and to leave the farther diſcovery of the north-weſt to another time, he returned to England. He ſailed again, with 15 ſhips and a great number of adventurers, to form a ſettlement: but being obſtructed by the ice, and driven out to ſea by a violent ſtorm, they, after encountering many difficulties, returned home, without making any ſettlement, but brought a large quantity of ore.—He afterwards commanded the Aid in Sir Francis Drake's expedition to the Weſt Indies, in which St Domingo in Hiſpaniola, Carthagena, and Santa Juſtina, in Florida, were taken and ſacked. In 1588, he bravely exerted himſelf in defence of his country againſt the Spaniſh armada, when he commanded the Triumph, one of the largeſt ſhips in that ſervice; and, as a reward for his diſtinguiſhed bravery, received the honour of knighthood from the lord high-admiral at ſea. He afterwards commanded a ſquadron which was ordered to cruiſe on the Spaniſh coaſt; and in 1592 took two valuable ſhips and a rich carrack. In 1594 he was ſent to the aſſiſtance of Henry IV. king of France againſt a body of the Leaguers and Spaniards, who had ſtrongly entrenched themſelves at Croyzon near Breſt; but in an aſſault upon that fort, on the 7th of November, Sir Martin was unfortunately wounded with a ball, of which he died ſoon after he had brought back the fleet to Plymouth, and was buried in that town.

Frobiſher ll Frog.

FROBISHER's Straits, lie a little to the northward of Cape Farewell in Weſt Greenland, and were diſcovered by Sir Martin Frobiſher. W. Long. 48. 16. N. Lat. 63. 12.

FRODSHAM, a town of Cheſhire in England, 162 miles from London, is noted for its ancient caſtle. It has a ſtone-bridge over the river Weaver near its conflux with the Merſey, and a harbour for ſhips of good burden. By the late inland navigation, it has communication with the rivers Dee, Ribble, Ouſe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaſter, Weſtmoreland, Stafford, Warwick, Leiceſter, Oxford, Worceſter, &c.

FROG, in zoology. See RANA.

Bull-FROG. See RANA.

FROG-Fiſh of Surinam, a very ſingular animal, of which a figure is given by Mr Edwards, *Hiſt. of Birds*, Vol. I. There is no ſpecimen in the Britiſh muſeum, nor in any private collection, except that of Dr Fothergill. It was brought from Surinam in South America.—Frogs, both in Aſia and Africa, according to Merian, change gradually from fiſhes to frogs, as thoſe in Europe; but after many years revert again into fiſhes, though the manner of their change has never been inveſtigated. In Surinam theſe fiſhes are called *jakjés*. They are cartilaginous, of a ſubſtance like our

Frome, Frondescentia.

muſtela, and exquiſite food: they are formed with regular vertebræ, and ſmall bones all over the body divided into equal parts; are firſt darkiſh, and then grey: their ſcales make a beautiful appearance. Whether this animal is, in its perfect ſtate, a ſpecies of frog with a tail, or a kind of water-lizard, Mr Edwards does not pretend to determine; but obſerves, that when its ſize is conſidered, if it ſhould be deemed a tadpole at firſt produced from ſpawn, and in its progreſs towards a frog, ſuch an animal, when full grown, if it bears the ſame proportion to its tadpole as thoſe in Europe do, muſt be of enormous ſize; for our full grown frogs exceed the tadpoles at leaſt 50 times. See a reduced figure on Plate CCIII.

FROME, a river that riſes from ſeveral ſprings in the Weſtern parts of Dorſetſhire in England, the principal of which is near Everſhot; and directing its courſe almoſt due weſt, paſſes under Frampton-bridge, waſhes the town of Dorcheſter, and falls into a bay of the Engliſh Channel called *Poolhaven*, near Wareham.

Frome-Selwood, a town of Somerſetſhire in England, 105 miles from London. It is the chief town of this part of the country, which was anciently one great foreſt called *Selwoodſhire*; and in the latter end of the laſt century, in thoſe called *Frome-Woodlands*, there was a conſiderable gang of money-coiners or clippers, of whom many were taken and executed, and their covert laid open. Though the town is bigger than ſome cities, yet it has only one church; but it has ſix or ſeven meeting-houſes of Proteſtant diſſenters. The inhabitants are reckoned about 13,000, whoſe chief manufactory is broad-cloth. About 50 years ago, more wire cards for carding the wool for the ſpinners were made at this place than in all England beſides, which was for the moſt part ſupplied with them from hence; for here were no leſs than 20 maſter card-makers, one of whom employed 400 men, women, and children, in that manufactory at one time; ſo that even children of 7 or 8 years of age could earn half-a-crown a-week. The river here, which abounds with trout, eels, &c. riſes in the woodlands; and runs under its ſtone-bridge towards Bath, on the eaſt ſide of which it falls into the Avon. This town has been a long time noted for its fine beer, which they keep to a great age, and is generally preferred by the gentry to the wines of France and Portugal. It was governed formerly by a bailiff, and now by two conſtables of the hundreds of Frome, choſen at the court-leet of the lord of the manor.

FRONDESCENTIA, from *frons*, "a leaf;" the preciſe time of the year and month in which each ſpecies of plants unfolds its firſt leaves.

All plants produce new leaves every year; but all do not renew them at the ſame time. Among woody plants, the elder, and moſt of the honey-ſuckles; among perennial herbs, crocus and tulip, are the firſt that puſh or expand their leaves. The time of ſowing the ſeeds decides with reſpect to annuals. The oak and aſh are conſtantly the lateſt in puſhing their leaves: the greateſt number unfold them in ſpring; the moſſes and firs in winter. Theſe ſtriking differences with reſpect to ſo capital a circumſtance in plants as that of unfolding their leaves, ſeem to indicate that each ſpecies of plants has a temperature proper or peculiar to itſelf, and requires a certain degree of heat to extricate the leaves from their buds, and produce the appearance in queſtion.

Front || Frontin

This temperature, however, is not ſo fixed or conſtant as it may appear to a ſuperficial obſerver. Among plants of the ſame ſpecies, there are ſome more early than others; whether that circumſtance depends, as it moſt commonly does, on the nature of the plants, or is owing to differences in heat, expoſure, and ſoil. In general, it may be aſſumed, that ſmall and young trees are always earlier than larger or old ones.

The puſhing of the leaves is likewiſe accelerated or retarded according to the temperature of the ſeaſon; that is, according as the ſun is ſooner or later in diſpenſing that certain degree of heat which is ſuitable to each ſpecies.

FRONT, the forehead, or that part of the face above the eyebrows. The word is formed of the Latin *frons;* and that from the Greek φρονεῖν "to think, perceive;" of φρὴν *mens*, "the mind, thought." Martinius, to make out this etymology, obſerves, that from the forehead of a perſon we perceive what he is, what he is capable of, and what he thinks of.

FRONT is alſo uſed where ſeveral perſons or things are ranged ſide by ſide, and ſhow their front or foreparts.

FRONT, in architecture, denotes the principal face or ſide of a building, or that preſented to their chief aſpect or view.

FRONTAL, in architecture, a little fronton or pediment, ſometimes placed over a ſmall door or window.

FRONTAL, *Frontlet*, or *Brow-band*, is alſo uſed in ſpeaking of the Jewiſh ceremonies. This frontal conſiſts of four ſeveral pieces of vellum, on each whereof is written ſome text of ſcripture. They are all laid on a piece of a black calf's leather with thongs to tie it by. The Jews apply the leather with the vellum on their foreheads in the ſynagogue, and tie it round the head with the thongs.

FRONTIER, the border, confine, or extreme, of a kingdom or province, which the enemies find in front when they would enter the ſame. Thus we ſay, a frontier town, frontier province, &c. Frontiers were anciently called *marches*.

The word is derived from the French *frontiere*, and that from the Latin *frontaria;* as being a kind of front oppoſed to the enemy. Skinner derives *frontier* from *front;* inaſmuch as the frontier is the exterior and moſt advanced part of a ſtate, as the front is that of the face of a man.

FRONTIGNIAC WINE, is ſo called from a town of Languedoc in France, ſituated 16 miles ſouth-weſt of Montpelier, remarkable for producing it.

FRONTINUS (Sextus Julius), an ancient Roman writer, was of conſular dignity, and flouriſhed under the emperors Veſpaſian, Titus, Domitian, Nerva, and Trajan. He commanded the Roman armies in Britain; was made city-prætor when Veſpaſian and Titus were conſuls; and Nerva made him curator of the aqueducts, which occaſioned his writing *De aquæductibus urbis Romæ*. He wrote four books upon the Greek and Roman art of war; a piece *De re agraria*, and another *De limitibus*. Theſe have been often ſeparately

Frontiſpiece ‖ Froſt.

ly reprinted; but were all collected together in a neat edition at Amſterdam in 1661, with notes by Robertus Keuchenius. He died under Trajan.

FRONTISPIECE, in architecture, the principal face of a fine building. The word is formed of the Latin *frontiſpicium*, q. d. *frontis hominis inſpectio*.—Hence alſo, by a figure, we ſay, the frontiſpiece of a book; meaning an ornament with an engraven title on the firſt page.

FRONTLET. See FRONTAL.

FRONTO (Marcus Cornelius), was choſen for his eloquence to inſtruct the emperors Marcus Aurelius and Lucius Verus in rhetoric; in recompence of which he was promoted to the conſulate, and a ſtatue was erected to his honour. He taught Marcus Aurelius not only eloquence, but the duty of kings, and excellent morals. Some ſay he wrote againſt the Chriſtians. A ſect was formed of thoſe who looked upon him as a model of perfect eloquence, and theſe were called *Frontoniani*. The Civilians, whoſe names were *Fronto*, mentioned in the pandects, were probably deſcended from him.

FROST, in phyſiology, ſuch a ſtate of the atmoſphere as occaſions the congelation or freezing of water and other fluids. See CONGELATION.

Under the articles COLD, CONGELATION, EVAPORATION, FLUIDITY, &c. it is ſhown, that water and other fluids are capable of containing the element of fire or heat in two very different ſtates. In the one, they ſeem to imbibe the fire in ſuch a manner, that it eludes all the methods by which we are accuſtomed to obſerve it, either by our ſenſation of feeling, or the thermometer; in the other, it manifeſts itſelf obviouſly to our ſenſes, either by the touch, the thermometer, or the emiſſion of light.

In the firſt of theſe ſtates, we call the body *cold*; and are apt to ſay that this coldneſs is occaſioned by the *abſence* of heat. But this manner of expreſſing ourſelves is certainly improper; for even thoſe fluids which are coldeſt to the touch contain a vaſt deal of heat. Thus vapour, which is colder to the touch than the water from which it was raiſed, contains an immenſe quantity of fire, even more than ſufficient to heat it red hot. The like may be ſaid of common ſalt, and ſnow, or ice. If a quantity of each of theſe ſubſtances is ſeparately reduced to the degree of 28 or 30 of Fahrenheit's thermometer, upon mixing them together, the heat which would have raiſed the thermometer to the degree above mentioned, now enters into the ſubſtance of them in ſuch a manner that the mercury falls down to 0.—Here an exceſſive degree of cold is produced, and yet we are ſure that the ſubſtances contain the very ſame quantity of heat that they formerly did: nay, they will even ſeem exceedingly cold, when they moſt certainly contain a great deal more heat than they originally did; for they abſorb it from all bodies around them; and if a ſmall veſſel full of water is put in the middle of ſuch a mixture, it will in a ſhort time be full of ice.

It appears, therefore, that our ſenſes, even when aſſiſted by thermometers, can only judge of the ſtate in which the element of fire is with relation to the bodies around us, without regard to the quantity contained in them. Thus, if heat flows from any part of our body into any ſubſtance actually in contact with it, the ſenſation of cold is excited, and we call that ſubſtance *cold*; but if it flows from any ſubſtance into our body, the ſenſation of heat is excited, and we call that ſubſtance *hot*, without regard to the abſolute quantity contained in either caſe. See HEAT. Froſt.

Of all known ſubſtances, the atmoſphere either abſorbs or throws out heat with the moſt remarkable facility: and in one or other of theſe ſtates it always is with reſpect to the ſurface of the earth, and ſuch bodies as are placed on or near it; for theſe, properly ſpeaking, have no temperature of their own, but are entirely regulated by that of the atmoſphere.—When the air has been for ſome time abſorbing the heat from terreſtrial bodies, a froſt muſt be the undoubted conſequence, for the ſame reaſon that water freezes in a veſſel put into a freezing mixture; and were this abſorption to continue for a length of time, the whole earth would be converted into a frozen maſs. There are, however, certain powers in nature, by which this effect is always prevented; and the moſt violent froſt we can imagine, muſt always as it were defeat its own purpoſes, and end in a thaw. To underſtand this ſubject, we muſt obſerve,

1. In that ſtate of the atmoſphere which we denominate froſt, there is a moſt intimate union between the air and the water it contains; and therefore froſty weather, except in very high latitudes, is generally clear.

2. When ſuch an union takes place, either in winter or ſummer, we obſerve the atmoſphere alſo inclined to abſorb heat, and conſequently to froſt. Thus in clear ſettled weather, even in ſummer, though the day may be exceſſively hot by reaſon of the continued ſunſhine, yet the mornings and evenings are remarkably cold, and ſometimes even diſagreeably ſo.

3. The air being therefore always ready in the time of froſt, or in clear weather, to abſorb heat from every ſubſtance which comes into contact with it, it follows that it muſt alſo abſorb part of that which belongs to the vapours contained in it.

4. Though vapour is capable of becoming much colder than water without being frozen, yet by a continued abſorption it muſt at laſt part with its latent heat, *i. e.* that which eſſentially conſtitutes it vapour; and without which it is no longer vapour, but water or ice. No ſooner, therefore, does the froſt arrive at a certain pitch, than the vapours, every where diſperſed through the air, give out their latent heat: the atmoſphere then becomes clouded; the froſt either totally goes off, or becomes milder by reaſon of the great quantity of heat diſcharged into the air; and the vapours deſcend in rain, hail, or ſnow, according to the particular diſpoſition of the atmoſphere at the time.

5. Even in the polar regions, where it may be thought that the froſt muſt increaſe beyond meaſure, there are alſo natural means for preventing its running to extremes. The principal cauſe here is, the mixture of a great quantity of vapours from the more temperate regions of the globe with the air in thoſe dreary climates. It is well known, that aqueous vapour always flies from a warm to a colder place. For this reaſon, the vapours raiſed by the ſun in the more temperate regions of the earth, muſt continually travel northward and ſouthward in great quantities. Thus

Froſt. they furniſh materials for thoſe immenſe quantities of ſnow and ice which are to be found in the neighbourhood of the poles, and which we cannot imagine the weak influence of the ſun in theſe parts capable of raiſing. It is impoſſible that a quantity of vapour can be mixed with froſty air, without communicating a great deal of heat to it; and thus there are often thaws of conſiderable duration even in thoſe climates where, from the little influence of the ſun, we ſhould ſuppoſe the froſt would be perpetual.

6. We may now account with ſome probability for the uncertain duration of froſts. In this country they are ſeldom of a long continuance; becauſe the vapours raiſed from the ſea with which our iſland is ſurrounded, perpetually mix with the air over the iſland, and prevent a long duration of the froſt. For the ſame reaſon, froſts are never of ſuch long duration in maritime places on the continent as in the inland ones. There is nothing, however, more uncertain than the motion of the vapours with which the air is conſtantly filled; and therefore it is impoſſible to prognoſticate the duration of a froſt with any degree of certainty. In general, we may always be certain, that if a quantity of vapour is accumulated in any place, no intenſe froſt can ſubſiſt in that place for any length of time; and by whatever cauſes the vapours are driven from place to place, by the ſame cauſes the froſts are regulated throughout the whole world. See THAW, VAPOUR, &c.

The effects of froſt in ſeveral different countries, are enumerated under the article CONGELATION. In the northern parts of the world, even ſolid bodies are liable to be affected by froſt. Timber is often apparently frozen, and rendered exceedingly difficult to ſaw. Marle, chalk, and other leſs ſolid terreſtrial concretions, will be ſhattered by ſtrong and durable froſts. Metals are contracted by froſt: thus, an iron tube, 12 feet long, upon being expoſed to the air in a froſty night, loſt two lines of its length. On the contrary, froſt ſwells or dilates water near one-tenth of its bulk. Mr Boyle made ſeveral experiments with metalline veſſels, exceedingly thick and ſtrong; which being filled with water, cloſe ſtopped, and expoſed to the cold, burſt by the expanſion of the frozen fluid within them. Trees are frequently deſtroyed by froſt, as if burnt up by the moſt exceſſive heat; and in very ſtrong froſts, walnut-trees, aſhes, and even oaks, are ſometimes ſplit and cleft, ſo as to be ſeen through, and this with a terrible noiſe, like the exploſion of fire-arms.

Froſt naturally proceeds from the upper parts of bodies downwards: but how deep it will reach in earth or water, is not eaſily known; becauſe this depth may vary with the degree of coldneſs in the air, by a longer or ſhorter duration of the froſt, the texture of the earth, the nature of the juices wherewith it is impregnated, the conſtitution of its more internal parts as to heat and cold, the nature of its effluvia, &c. Mr Boyle, in order to aſcertain this depth, after four nights of hard froſt, dug in an orchard, where the ground was level and bare, and found the froſt had ſcarce reached three inches and a half, and in a garden nearer the houſe only two inches below the ſurface. Nine or ten ſucceſſive froſty nights froze the bare ground in the garden ſix inches and a half deep; and in the orchard, where a wall ſheltered it from the ſouth ſun, to the depth of eight inches and a half. He alſo dug in an orchard, near a wall, about a week afterwards, and found the froſt to have penetrated to the depth of 14 inches. In a garden at Moſcow, the froſt in a hard ſeaſon only penetrates to two feet: and the utmoſt effect that Captain James mentions the cold to have had upon the ground of Charlton iſland, was to freeze it to 10 feet deep: whence may appear the different degrees of cold of that iſland and Ruſſia. And as to the freezing of water at the abovementioned iſland, the Captain tells us, it does not naturally congeal above the depth of ſix feet, the reſt being by accident. Water alſo, expoſed to the cold air in large veſſels, always freezes firſt at the upper ſurface, the ice gradually increaſing and thickening downwards: for which reaſon, frogs retire in froſty weather to the bottom of ditches; and it is ſaid, that ſhoals of fiſh retire in winter to thoſe depths of the ſea and rivers, where they are not to be found in ſummer. Water, like the earth, ſeems not diſpoſed to receive any very intenſe degree of cold at a conſiderable depth or diſtance from the air. The vaſt maſſes of ice found in the northern ſeas being only many flakes and fragments, which, ſliding under each other, are, by the congelation of the intercepted water, cemented together.

Froſt.

In cold countries, the froſt often proves fatal to mankind; not only producing gangrenes, but even death itſelf. Thoſe who die of it have their hands and feet firſt ſeized, till they grow paſt feeling it; after which the reſt of their bodies is ſo invaded, that they are taken with a drowſineſs, which if indulged, they awake no more, but die inſenſibly. But there is another way whereby it proves mortal, *viz.* by freezing the abdomen and viſcera, which on diſſection are found to be mortified and black.

The great power of froſt on vegetables is a thing ſufficiently known; but the differences between the froſts of a ſevere winter, and thoſe which happen in the ſpring mornings, in their effects on plants and trees, were never perfectly explained, till by Meſſ. Du Hamel and Buffon in the Memoirs of the Paris Academy.

The froſts of ſevere winters are much more terrible than thoſe of the ſpring, as they bring on a privation of all the products of the tenderer part of the vegetable world; but then they are not frequent, ſuch winters happening perhaps but once in an age; and the froſts of the ſpring are in reality greater injuries to us than theſe, as they are every year repeated.

In regard to trees, the great difference is this, that the froſts of ſevere winters affect even their wood, their trunks and large branches; whereas thoſe of the ſpring have only power to hurt the buds.

The winter froſts happening at a time when moſt of the trees in our woods and gardens have neither leaves, flowers, nor fruits upon them, and have their buds ſo hard as to be proof againſt ſlight injuries of weather, eſpecially if the preceding ſummer has not been too wet; in this ſtate, if there are no unlucky circumſtances attending, the generality of trees bear moderate winters very well; but hard froſts, which happen late in

Froſt. in the winter, cauſe very great injuries even to thoſe trees which they do not utterly deſtroy. Theſe are, 1. Long cracks following the direction of the fibres. 2. Parcels of dead wood incloſed round with wood yet in a living ſtate. And, 3. That diſtemperature which the foreſters call the *double blea*, which is a perfect circle of blea, or ſoft white wood, which, when the tree is afterwards felled, is found covered by a circle of hard and ſolid wood. Froſt.

The opinions of authors about the expoſition of trees to the different quarters, have been very different, and moſt of them grounded on no rational foundation. Many are of opinion that the effects of froſt are moſt violently felt on thoſe trees which are expoſed to the north; and others think the ſouth or the weſt the moſt ſtrongly affected by them. There is no doubt but the north expoſure is ſubject to the greateſt cold. It does not, however, follow from this, that the injury muſt be always greateſt on the trees expoſed to the north in froſts: on the contrary, there are abundant proofs that it is on the ſouth ſide that trees are generally more injured by froſt: and it is plain from repeated experiments, that there are particular accidents, under which a more moderate froſt may do more injury to vegetables, than the moſt ſevere one which happens to them under more favourable circumſtances.

It is plain from the accounts of the injuries trees received by the froſts in 1709, that the greateſt of all were owing to repeated falſe thaws, ſucceeded by repeated new froſts. But the froſts of the ſpring-ſeaſon furniſh abundantly more numerous examples of this truth; and ſome experiments made by the Count de Buffon, at large in his own woods, prove inconteſtably, that it is not the ſevereſt cold or moſt fixed froſt that does the greateſt injury to vegetables.

This is an obſervation directly oppoſite to the common opinion; yet is not the leſs true, nor is it any way diſcordant to reaſon. We find by a number of experiments, that humidity is the thing that makes froſt fatal to vegetables; and therefore every thing that can occaſion humidity in them, expoſes them to theſe injuries, and every thing that can prevent or take off an over proportion of humidity in them, every thing that can dry them though with ever ſo increaſed a cold, muſt prevent or preſerve them from thoſe injuries. Numerous experiments and obſervations tend to prove this. It is well known that vegetables always feel the froſt very deſperately in low places where there are fogs. The plants which ſtand by a river ſide are frequently found deſtroyed by the ſpring and autumnal froſts, while thoſe of the ſame ſpecies, which ſtand in a drier place, ſuffer little or perhaps not at all by them; and the low and wet parts of foreſts are well known to produce worſe wood than the high and drier. The coppice wood in wet and low parts of common woods, though it puſh out more vigorouſly at firſt than that of other places, yet never comes to ſo good a growth; for the froſt of the ſpring killing theſe early top-ſhoots, obliges the lower part of the trees to throw out lateral branches: and the ſame thing happens in a greater or leſſer degree to the coppice wood that grows under cover of larger trees in great foreſts; for here the vapours not being carried off either by the ſun or wind, ſtagnate and freeze, and in the ſame manner deſtroy the young ſhoots, as the fogs of marſhy places. It is a general obſervation alſo, that the froſt is never hurtful to the late ſhoots of the vine, or to the flower-buds of trees, except when it follows heavy dews, or a long rainy ſeaſon, and then it never fails to do great miſchief, though it be ever ſo ſlight.

The froſt is always obſerved to be more miſchievous in its conſequences on newly cultivated ground than in other places; and this is becauſe the vapours which continually ariſe from the earth, find an eaſier paſſage from thoſe places than from others. Trees alſo which have been newly cut, ſuffer more than others by the ſpring froſts, which is owing to their ſhooting out more vigorouſly.

Froſts alſo do more damage on light and ſandy grounds, than on the tougher and firmer ſoils, ſuppoſing both equally dry; and this ſeems partly owing to their being more early in their productions, and partly to their lax texture ſuffering a greater quantity of vapours to tranſpire.

It alſo has been frequently obſerved, that the ſide-ſhoots of trees are more ſubject to periſh by the ſpring froſts than thoſe from the top; and M. Buffon, who examined into this with great accuracy, always found the effects of the ſpring froſts much greater near the ground than elſewhere. The ſhoots within a foot of the ground quickly periſhed by them; thoſe which ſtood at two or three feet high, bore them much better; and thoſe at four feet and upwards frequently remained wholly unhurt, while the lower ones were entirely deſtroyed.

There is a ſeries of obſervations, which have proved beyond all doubt, that it is not the hard froſts which ſo much hurt plants, as thoſe froſts, though leſs ſevere, which happen when they are full of moiſture; and this clearly explains the account of all the great damages done by the ſevere froſts being on the ſouth ſide of the trees which are affected by them, though that ſide has been plainly all the while leſs cold than the north. Great damage is alſo done to the weſtern ſides of trees and plantations, when after a rain with a weſt wind the wind turns about to the north at ſun-ſet, as is frequently the caſe in ſpring, or when an eaſt wind blows upon a thick fog before ſun-riſing.

Hoar-Froſt, a cold moiſt vapour, that is drawn up a little way into the air, and in the night falls again on the earth, where it is congealed into icy cryſtals of various figures. Hoar-froſt, therefore, is nothing but dew turned into ice by the coldneſs of the air.

Melioration of Aromatic Spirits by Froſt. Mr Baumé obſerves, that aromatic ſpirituous waters have leſs ſcent when newly diſtilled than after they have been kept about ſix months: and he found that the good effects of age was produced in a ſhort time by means of cold; and that, by plunging quart-bottles of the liquor into a mixture of pounded ice and ſea-ſalt, the ſpirit, after having ſuffered for ſix or eight hours the cold hence reſulting, proves as grateful as that which hath been kept many years. Simple waters alſo, after having been frozen, prove far more agreeable than they were before. Geoffroy takes notice of this melioration by froſt; *Hiſt. Acad.* 1713.

Melioration of Landly Froſt. See AGRICULTURE, n° 137.

FROTH.

Froth || Fructeſcentia.

FROTH, a white light ſubſtance, formed on the ſurface of fluids by vehement agitation, conſiſting of little ſpherules or globules.

Froth-Spit, or *Cuckow-Spit*, a name given to a white froth, or ſpume, very common in the ſpring and firſt months of ſummer, on the leaves of certain plants, particularly on thoſe of the common white field-lychnis or catch-fly, thence called by ſome *ſpatling poppy*.

All writers on vegetables have taken notice of this froth, though few have underſtood the cauſe or origin of it till of late. It is formed by a little leaping animal, called by ſome the *flea graſs-hopper*, by applying its anus cloſe to the leaf, and diſcharging thereon a ſmall drop of a white viſcous fluid, which, containing ſome air in it, is ſoon elevated into a ſmall bubble: before this is well formed, it depoſits ſuch another drop; and ſo on, till it is every way overwhelmed with a quantity of theſe bubbles, which form the white froth which we ſee. Within this ſpume it is ſeen to acquire four tubercles on its back, wherein the wings are incloſed: theſe burſting, from a reptile it becomes a winged animal: and thus, rendered perfect, it flies to meet its mate, and propagate its kind. It has an oblong, obtuſe body, and a large head with ſmall eyes. The external wings, for it has four, are of a duſky brown colour, marked with two white ſpots: the head is black. It is a ſpecies of CICADA.

FROWDE (Philip), an Engliſh poet, was the ſon of a gentleman who had been poſt-maſter in the reign of queen Anne. He was ſent to the univerſity of Oxford, where he had the honour of being diſtinguiſhed by Addiſon, who took him under his protection. While he remained there, he became the author of ſeveral pieces of poetry, ſome of which in Latin were pure and elegant enough to intitle them to a place in the *Muſæ Anglicanæ*. He likewiſe wrote two tragedies: The Fall of Saguntum, dedicated to Sir Robert Walpole; and Philotas, addreſſed to the earl of Cheſterfield. He died at his lodgings at Cecil-ſtreet in the Strand, in 1738, and in the London Daily-Poſt had the following character given him: "Though the elegance of Mr Frowde's writings has recommended him to the general public eſteem, the politeneſs of his genius is the leaſt amiable part of his character; for he eſteemed the talents of wit and learning only as they were conducive to the excitement and practice of honour and humanity. Therefore, with a ſoul cheerful, benevolent, and virtuous, he was in converſation genteelly delightful, in friendſhip punctually ſincere, in death Chriſtianly reſigned. No man could live more beloved, no private man could die more lamented." A fine eloge! and we have no reaſon to doubt the truth of it.

FRUCTESCENTIA, (from *fructus*, "fruit,") comprehends the preciſe time in which, after the fall of the flowers, the fruits arrive at maturity, and diſperſe their ſeeds.

In general, plants which flower in ſpring, ripen their fruits in ſummer, as rye; thoſe which flower in ſummer, have their fruits ripe in autumn, as the vine; the fruit of autumnal flowers ripens in winter, or the following ſpring, if kept in a ſtove or otherwiſe defended from exceſſive froſts. Theſe froſts, ſays M. Adanſon, are frequently ſo pernicious and violent as to deſtroy the greateſt part of the perennial plants of Virginia and Miſſiſſippi, that are cultivated in France, even before they have exhibited their fruit. The plants which flower during our winter, ſuch as thoſe of the Cape of Good Hope, ripen their fruit in ſpring in our ſtoves.

Fructiferous || Fruit.

FRUCTIFEROUS, ſignifies properly any thing that produces fruit.

FRUCTIFICATION OF PLANTS, is defined by Linnæus to be the temporary part of a vegetable appropriated to generation, terminating the old vegetable, and beginning the new. It conſiſts of the following ſeven parts; *viz.* the calyx, corolla, ſtamen, piſtillum, pericarpium, ſemen or ſeed, and receptaculum. See BOTANY, p. 446.

FRUIT, in its general ſenſe, includes whatever the earth produces for the nouriſhment and ſupport of animals; as herbs, grain, pulſe, hay, corn, flax, and every thing expreſſed by the Latins under the name *fruges*.

FRUIT, in natural hiſtory, denotes the laſt production of a tree or plant, for the propagation or multiplication of its kind; in which ſenſe fruit includes all kinds of ſeeds, with their furniture, &c.

FRUIT, in botany, is properly that part of a plant wherein the ſeed is contained; called by the Latins *fructus*; and by the Greeks καρπός. The fruit in the Linnæan ſyſtem is one of the parts of fructification, and is diſtinguiſhed into three parts, viz. the pericarpium, ſeed, and receptacle or *receptaculum ſeminum*. See BOTANY.

Colours Extracted from FRUITS. See the article *Colour-Making*, n° 36.

*Bread-*FRUIT. See BREAD.

FRUITS, with regard to commerce, are diſtinguiſhed into *recent* or *freſh*, and *dry*.

Recent FRUITS, are thoſe ſold juſt as they are gathered from the tree, without any farther preparation; as are moſt of the productions or our gardens and orchards, ſold by the fruiterers.

Dry FRUITS, are thoſe dried in the ſun, or by the fire, with other ingredients ſometimes added to them to make them keep; imported chiefly from beyond ſea, and ſold by the grocers. Such are raiſins, currants, figs, capers, olives, cloves, nutmegs, pepper, and other ſpices; which ſee under their reſpective articles.

Under the denomination of *dry fruits* are alſo frequently included apples, pears, almonds, filberds, &c.

Fruit-Flies, a name given by gardeners and others to a ſort of ſmall black flies found in vaſt numbers among fruit-trees, in the ſpring ſeaſon, and ſuppoſed to do great injury to them. Mr Lewenhoek preſerved ſome of theſe flies for his microſcopical obſervations. He found that they did not live longer than a day or two, but that the females during this time laid a great number of longiſh eggs. The gardeners who ſuppoſe that theſe flies wound the leaves of the trees, are miſtaken: it is true that they feed on their juices; but they have no inſtruments wherewith they can extract theſe for themſelves: they feed on ſuch as are naturally extravaſated; and when there is not a ſufficient quantity of theſe for their purpoſe, they haunt the places to which the pucerons reſort, and feed on the juices which theſe little creatures extravaſate by means of the holes they bore in the leaves with their trunks.

Fruit-Stones. The miſchiefs ariſing from the cuſtom which many people have of ſwallowing the ſtones

of

of plums and other fruit are very great. The Philoſophical Tranſactions give an account of a woman who ſuffered violent pains in her bowels for 30 years, returning once in a month or leſs. At length, a ſtrong purge being given her, the occaſion of all theſe complaints was driven down from the bowels to the anus; where it gave a ſenſation of diſtenſion and ſtoppage, producing a continual deſire of going to ſtool, but without voiding any thing. On the aſſiſtance of a careful hand in this caſe, there was taken out with a forceps a ball of an oval figure, of about ten drachms in weight, and meaſuring five inches in circumference. This had cauſed all the violent fits of pain which ſhe had ſuffered for ſo many years; and, after voiding it, ſhe became perfectly well. The ball extracted looked like a ſtone, and felt very hard, but it ſwam in water. On cutting it through with a knife, there was found in the centre of it a plum-ſtone; round which, ſeveral coats of this hard and tough matter had gathered. Another inſtance given in the ſame papers is of a man, who, dying of an incurable colic which had tormented him many years, and baffled the effects of medicines, was opened after death; and in his bowels was found a ball ſimilar to that above mentioned; but ſomewhat larger, being ſix inches in circumference, and weighing an ounce and an half. In the centre of this, as of the other, there was found the ſtone of a common plum, and the coats were of the ſame nature with thoſe of the former.

Theſe and ſeveral other inſtances mentioned in the ſame place, ſufficiently ſhow the folly of that common opinion that the ſtones of fruits are wholeſome. For though by nature the guts are ſo defended by their proper mucus, that people very ſeldom ſuffer by things of this kind; yet if we conſider the various circumvolutions of the guts, their valves and cells, and at the ſame time conſider the hair of the ſkins of animals we feed on, the wool or down on herbs and fruit, and the fibres, veſſels, and nerves of plants, which are not altered by the ſtomach; it will appear a wonder that inſtances of this ſort of miſchief are not much more common. Cherry-ſtones, ſwallowed in great quantities, have occaſioned the death of many people: and there have been inſtances even of the ſeeds of ſtrawberries collecting into a lump in the guts, and cauſing violent diſorders, which could not be cured without great difficulty.

Fruit-Trees. With regard to theſe it may be obſerved, 1. That the cutting and pruning them when young, ſcrimp their bearing, though it contributes to the richneſs and flavour of the fruit, as well as to the beauty of the tree. 2. That kernel-fruit trees come later to bear than ſtone-fruit trees: the time required by the firſt, before they come to any fit age for bearing, being one with another five years; but when they do begin, they bear in greater plenty than ſtone-fruit. 3. That ſtone-fruit, figs, and grapes, commonly bear conſiderably in three or four years, and bear full crops the fifth and ſixth years; and hold it for many years, if well ordered. 4. That fruit trees in the ſame neighbourhood will ripen a fortnight ſooner in ſome grounds than in others of a different temperature. 5. That in the ſame country, hot or cold ſummers ſet conſiderably forwards, or put backwards, the ſame fruit. 6. That the fruit on wall-trees generally ripen before thoſe on ſtandards, and thoſe on ſtandards before thoſe on dwarfs. 7. That the fruit of all wall trees planted in the ſouth and eaſt quarters, commonly ripen about the ſame time, only thoſe in the ſouth rather earlier than thoſe in the eaſt; thoſe in the weſt are later by eight or ten days; and thoſe in the north, by 15 or 20. For the planting, pruning, grafting, &c. of fruit-trees, ſee the articles PLANTING, TRANSPLANTING, PRUNING, GRAFTING, ORCHARD, NURSERY, &c.

Fruitery || Frutex.

FRUITERY, a place for the keeping of fruit, a fruit-houſe, or fruit-loft.

A fruitery ſhould be inacceſſible to any thing of moiſture; and ſhould be as much as poſſible ſo, even to froſt.

FRUMENTACEOUS, a term applied by botaniſts to all ſuch plants as have a conformity with wheat, in reſpect of their fruits, leaves, ears, or the like.

FRUMENTARII, a kind of ſoldiers or archers under the weſtern empire.

The firſt time we read of theſe officers is in the reign of the emperor Adrian, who made uſe of them to inform himſelf of whatever paſſed. They did not make any particular corps diſtinct from the reſt of the forces, but there was a certain number of them in each legion. It is ſuppoſed, that they were at firſt a number of young perſons, diſpoſed by Auguſtus throughout the provinces, particularly on all the grand roads, to acquaint the emperor, with all expedition, of every thing that happened.

Afterwards they were incorporated into the troops themſelves, where they ſtill retained their ancient name. As their principal office was the giving intelligence, they were often joined with the curioſi, with whom they agreed in this part of their office.

Their name of *frumentarii* is derived from their being alſo a ſort of purveyors to the armies, cities, &c. collecting all the corn from the ſeveral provinces to furniſh the commonwealth.

FRUMENTATION, in Roman antiquity, a largeſs of corn beſtowed on the people. This practice of giving corn to the people was very ancient among the Romans, and frequently uſed to ſoothe the turbulent humour of the populace. At firſt the number of thoſe to whom this largeſs was given was indeterminate, till Auguſtus fixed it at 200,000.

FRUSH, or RUNNING-THRUSH. See FARRIERY, Sect. xliv.

FRUSTUM, in mathematics, a part of ſome ſolid body ſeparated from the reſt.

The fruſtum of a cone is the part that remains, when the top is cut off by a plane parallel to the baſe; and is otherwiſe called a *truncated cone*. See *Conic Sections*.

The fruſtum of a pyramid is alſo what remains after the top is cut off by a plane parallel to its baſe.

The fruſtum of a globe or ſphere is any part thereof cut off by a plane, the ſolid contents of which may be found by this rule: To three times the ſquare of the ſemidiameter of the baſe add the ſquare of its height; then multiply that ſum by the height, and this product multiplied by .5236 gives the ſolidity of the fruſtum.

FRUTEX, a SHRUB. Shrubs, according to Linnæus, make a branch of the ſeventh family in the vegetable

Fry
Fucinus.

getable kingdom; and are diſtinguiſhed from trees, in that they come up without buds. But this diſtinction is not univerſal, though it be generally juſt with regard to thoſe of Europe. Nature hath made no abſolute diſtinction between trees and ſhrubs. *Frutex*, in its general acceptation, is a plant whoſe trunk is perennial, gemmiparous, woody, dividing and ſubdividing into a great number of branches. In ſhort, it is the epitome of a tree, exemplified in the roſe-buſh.

FRY, in zoology, ſignifies the ſpawn, or rather young, of fiſh.

FRYTH (John), a martyr to the Proteſtant religion in the reign of Henry VIII. He was the ſon of an inn-keeper at Seven-oaks in Kent; and educated in the king's college, Cambridge, where he took the degree of bachelor of arts. Thence he removed to Oxford, and was made a junior canon of Wolſey's college. He had not been long in this univerſity before he became acquainted with William Tyndale, a zealous Lutheran, with whom he converſed frequently on the abuſes in religion. Fryth became a convert to Lutheraniſm, and publicly avowed his opinions. He was apprehended, examined by the commiſſary, and confined to his college. At length having obtained his liberty, in 1528 he went over to Germany, where he continued about two years; and then returned to England, more than ever determined in his religious ſentiments. Finding at that time but few aſſociates, he wandered about from place to place, till at laſt he was taken up at Reading as a vagrant, and ſet in the ſtocks, where he remained till he was near expiring for want of ſuſtenance. He was at length relieved by the humanity of Leonard Cox, a ſchoolmaſter; who finding him a man of letters, procured his enlargement, and adminiſtered to his neceſſities. Fryth now ſet out for London, where, with more zeal than prudence, he began to make proſelytes; but was ſoon apprehended by order of the chancellor Sir Thomas Moore, and ſent priſoner to the Tower. Refuſing to recant his opinions, he was condemned to the flames, and accordingly burnt in Smithfield, on the 4th of July 1533. He left ſeveral works behind him, which were printed in folio in 1573.

FUAGE, in old Engliſh writers, a tax of 12d. for every fire, levied in the time of Edward III.

FUCINUS LACUS (anc. geog), a lake of Italy in the country of the Marſi. Now *Lago di Celano*, from a cognominal citadel, lying in the ſouth of the Abruzzo Ultra, in the kingdom of Naples, near the Apennine. This lake was under the protection of a god of the ſame denomination, whoſe temple ſtood on its banks. According to the teſtimony of ancient authors, it was ſubject to extraordinary riſings and decreaſings. The actual circumference is 47 miles: the breadth in the wideſt part is 10, in the narroweſt 4; its depth 12 feet upon an average. But all theſe have varied prodigiouſly. Two miles up the plain, behind Avezzano, the fragments of boats, ſhells, and other marks of its ancient extent, have been caſually diſcovered: and, on the contrary, there are people who remember when it did not flow nearer than within two miles of Avezzano. An immenſe tract of excellent land is loſt at every increaſe of its level. All round this noble piece of water riſes a circle of grand mountains, ſome of them the higheſt in Italy, if we except the Alps, and many of them covered with ſnow; and at the foot of them are numerous villages, with rich and well cultivated farms. The environs of the lake, Mr Swinburn deſcribes as all well incloſed, and the ſides of the hills as covered with fine woods; its waters abound with fiſh of various kinds, and thither repair at ſtated ſeaſons innumerable flights of wild-fowl. As the ſwelling of the lake was attended with incredible damage, the Marſi had often petitioned the ſenate to drain it: Julius Cæſar would have attempted it, had he lived longer. His ſucceſſors were averſe to the project; till Claudius, who delighted in expenſive difficult enterprizes, undertook it. During the ſpace of 11 years he employed 30,000 men in digging a paſſage through the mountain; and when every thing was ready for letting off the water, exhibited a ſuperb naval ſpectacle on the lake. A great number of condemned criminals were obliged to act the parts of Rhodians and Sicilians in ſeparate fleets, to engage in earneſt, and to deſtroy one another for the entertainment of the court and the multitude of ſpectators that covered the hills: A line of well-armed veſſels and rafts loaded with ſoldiers ſurrounded the ſcene of action, in order to prevent any of the wretches from eſcaping; but it was with great difficulty and many threats that they could be brought to an engagement. When this ſavage diverſion was ended, the operations for opening the emiſſary or outlet commenced, and the emperor was very near being ſwept away and drowned by the ſudden ruſhing of the waters towards his vent. However, either through the ignorance or negligence of the engineers, the work did not anſwer as was expected, and Claudius did not live long enough to have the faults amended: Nero abandoned the ſcheme through envy. Hadrian is ſaid to have let off the waters of the Fucinus; but none now eſcape except through hidden channels formed by nature, which are probably ſubject to be obſtructed, and thus occaſion a ſuperabundance of water in the lake, till ſome unknown cauſe removes the obſtructions and again gives free paſſage.

Fucinus
Fucus

Sir William Hamilton, who viſited the Fucinus in 1785, ſays, "it is the moſt beautiful lake he ever ſaw, and would be complete if the neighbouring mountains were better wooded." It furniſhes abundance of fiſh, though not of the beſt quality. There are a few large trout, but moſtly tench, barbel, and dace. In the ſhallow water on the borders of the lake, he ſaw thouſands of water-ſnakes purſuing and preying upon a little kind of fiſh like our thornbacks, but much better armed; though their defenſive weapons ſeemed to avail them but little againſt ſuch ravenous foes. Claudius's emiſſary he deſcribes as ſtill entire, though filled up with earth and rubbiſh in many parts. He went into it with torches as far as he could. It is a covered underground canal three miles long, and part of it cut through a hard rock; and other parts ſupported by maſon work, with wells to give light. Hadrian is ſaid to have let off the waters of the lake: and our author is of opinion, that if the canal were cleared and repaired, it would ſtill anſwer that purpoſe, and thereby reſtore a great deal of rich land fit for cultivation.

FUCUS, a name given by the ancients to certain dyes and paints. By this name they called a purple ſea-plant uſed by them to dye woollen and linen things

Fucus. of that colour. The dye was very beautiful, but not laſting; for it ſoon began to change, and in time went wholly off. This is the account Theophraſtus gives of it.

The women of thoſe times alſo uſed ſomething called *fucus*, to ſtain their cheeks red; and many have ſuppoſed, from the ſame word expreſſing both, that the ſame ſubſtance was uſed on both occaſions. But this, on a ſtrict inquiry, proves not to be the caſe. The Greeks called every thing *fucus*, that would ſtain or paint the fleſh. But this peculiar ſubſtance uſed by the women to paint their cheeks was diſtinguiſhed from the others by the name of *rizion* among the more correct writers, and was indeed a root brought from Syria into Greece. The Latins, in imitation of the Greek name, called this root *radicula*, and Pliny very erroneouſly confounds the plant with the *radix lunaria*, or *ſtruthion* of the Greeks.

The word *fucus* was in thoſe times become ſuch an univerſal name for paint, that the Greeks and Romans had a *fucus metallicus*, which was the ceruſs uſed for painting the neck and arms white; after which they uſed the *purpuriſſum*, or red fucus of the *rizium*, to give the colour to the cheeks. In after-times they alſo uſed a peculiar *fucus* or paint for the purpoſe, prepared of the *Creta argentaria*, or ſilver-chalk, and ſome of the rich purple dyes that were in uſe at that time: and this ſeems to have been very little different from our roſe-pink; a colour commonly ſold at the colour-ſhops, and uſed on like occaſions.

Fucus, in the Linnæan ſyſtem of botany, is a genus of the order of algæ, belonging to the cryptogamia claſs of plants. The moſt remarkable ſpecies are,

1. The ſerratus, ſerrated fucus, or ſea-wrack. This is frequent at all ſeaſons of the year upon the rocks at low-water mark, but produces its ſeeds in July and Auguſt. It conſiſts of a flat, radical, and dichotomous leaf, about two feet long; the branches half an inch wide, ſerrated on the edges with dents of unequal ſize, and at unequal diſtances, having a flat ſtalk or rib divided like the leaf, and running in the middle of it through all its various ramifications. A ſmall ſpecies of coralline called by Linnæus *Sertularia pumila*, frequently creeps along the leaf. All the ſpecies of fucus afford a quantity of impure alkaline ſalt; but this much leſs than ſome others, eight ounces of the aſhes yielding only three of fixed ſalt. The Dutch cover their crabs and lobſters with this fucus to keep them alive and moiſt; and prefer it to any other, as being deſtitute of thoſe mucous veſicles with which ſome of the reſt abound, and which would ſooner ferment and become putrid.

2. The veſiculoſus, bladder fucus, common ſea-wrack, or ſea-ware. It grows in great abundance on the ſea-rocks about low-water mark; producing its fructifications in July and Auguſt. It has the ſame habit, colour, and ſubſtance as the foregoing; but differs from it in the following reſpects: The edges of the leaf have no ſerratures, but are quite entire. In the diſc or ſurface are immerſed hollow, ſpherical, or oval air-bladders, hairy within, growing generally in pairs, but often ſingle in the angles of the branches, which are moſt probably air-bladders deſtined to buoy up the plant in the water. Laſtly, on the ſummits or extreme ſegments of the leaves, appear tumid veſicles about three quarters of an inch long, ſometimes oval and in pairs, ſometimes ſingle and bifid, with a clear viſcid mucus interſperſed with downy hairs.—This ſpecies is an excellent manure for land; for which purpoſe it is often applied in the maritime parts of Scotland and other countries. In the iſlands of Jura and Skye it frequently ſerves as a winter-food for cattle, which regularly come down to the ſhores at the receſs of the tides to ſeek for it. And ſometimes even the ſtags have been obſerved, after a ſtorm, to deſcend from the mountains to the ſea-ſides to feed upon this plant. Fucus.

Linnæus informs us, that the inhabitants of Gothland in Sweden boil this fucus in water, and mixing therewith a little coarſe meal or flour, feed their hogs with it; for which reaſon they call the plant *ſwintang*. And in Scania, he ſays, the poor people cover their cottages with it, and ſometimes uſe it for fuel.

In Jura, and ſome other of the Hebrides, the inhabitants dry their cheeſes without ſalt, by covering them with the aſhes of this plant; which abounds with ſuch quantity of ſalts, that from five ounces of the aſhes may be procured two ounces and a half of fixed alkaline ſalts, that is, half of their whole weight.

But the moſt beneficial uſe to which the fucus veſiculoſus is applied, in the way of economy, is in making pot-aſh or kelp, a work much practiſed in the Weſtern Iſles. There is great difference in the goodneſs and price of this commodity, and much care and ſkill required in properly making it. That is eſteemed the beſt which is hardeſt, fineſt grain'd, and free from ſand or earth. The price of kelp in Jura is 3l. 10s. *per* ton, and about 40 or 50 tons are exported annually from that iſland. So great a value is ſet upon this fucus by the inhabitants of that place, that they have ſometimes thought it worth their while to roll fragments of rocks and huge ſtones into the ſea, in order to invite the growth of it.

Its virtues in the medical way have been much celebrated by Dr Ruſſel, in his Diſſertation concerning the uſe of Sea-water in the Diſeaſes of the Glands. He found the ſaponaceous liquor or mucus in the veſicles of this plant to be an excellent reſolvent, extremely ſerviceable in diſperſing all ſcorbutic and ſcrophulous ſwellings of the glands. He recommends the patient to rub the tumor with theſe veſicles bruiſed in his hand, till the mucus has thoroughly penetrated the part, and afterwards to waſh with ſea-water. Or otherwiſe, to gather two pounds of the tumid veſicles, in the month of July, when they are full of mucus, and infuſe them in a quart of ſea-water, in a glaſs-veſſel, for the ſpace of 15 days, when the liquor will have acquired nearly the conſiſtence of honey. Then ſtrain it off through a linen cloth, and rub this liquor with the hand, as before, three or four times a-day, upon any hard or ſcrophulous ſwellings, waſhing the parts afterwards with ſea-water, and nothing can be more efficacious to diſperſe them. Even ſcirrhoſities, he ſays, in womens breaſts, have been diſpelled by this treatment. The ſame author, by calcining the plant in the open air, made a very black ſalt powder, which he called *vegetable æthiops*; a medicine much in uſe as a reſolvent and deobſtruent, and recommended

Fucus. also as an excellent dentrifice, to correct the ſcorbutic laxity of the gums, and take off the foulneſs of the teeth.

3. The plicatus, matted or Indian-graſs fucus, grows on the ſea-ſhores in many places both of Scotland and England. It is generally about three or four, but ſometimes ſix, inches long. Its colour, after being expoſed to the ſun and air, is yellowiſh, or auburn; its ſubſtance pellucid, tough, and horny, ſo as to bear a ſtrong reſemblance to what the anglers call *Indian graſs*, that is, the tendrils iſſuing from the ovary of the dog-fiſh.

4. The palmatus, palmated or ſweet fucus, commonly called *dulſe* or *dilſe*. This grows plentifully on the ſea-coaſts of Scotland, and the adjoining iſlands. Its ſubſtance is membranaceous, thin, and pellucid; the colour red, ſometimes green with a little mixture of red; its length generally about five or ſix inches, but varies from three inches to a foot; its manner of growth fan-ſhaped, or gradually dilated from the baſe upwards. Its diviſions are extremely various. The inhabitants both of Scotland and England take pleaſure in eating this plant, without expecting any medical virtues from it. The inhabitants of the Archipelago alſo are fond of it, as we learn from Steller. They ſometimes eat it raw, but eſteem it moſt when added to ragouts, ogliios, &c. to which it gives a red colour; and, diſſolving, renders them thick and gelatinous. In the Iſle of Skye it is ſometimes uſed in fevers to promote a ſweat, being boiled in water with the addition of a little butter. In this manner it alſo frequently purges. The dried leaves, infuſed in water, exhale the ſcent of violets.

5. The eſculentus, eatable fucus, or bladder-locks, commonly called *tangle* in Scotland, is likewiſe a native of the Britiſh ſhores. It is commonly about four feet long, and ſeven or eight inches wide; but is ſometimes found three yards or more in length, and a foot in width. Small ſpecimens are not above a cubit long, and two inches broad. The ſubſtance is thin, membranaceous, and pellucid; the colour green or olive. The root conſiſts of tough cartilaginous fibres. The ſtalk is about ſix inches long and half an inch wide, nearly ſquare, and pinnated in the middle between the root and origin of the leaf, with ten or a dozen pair of thick, cartilaginous, oval-obtuſe, foliaceous ligaments, each about two inches long, and crowded together. The leaf is of an oval-lanceolate, or long elliptic form, ſimple and undivided, waved on the edges, and widely ribbed in the middle from bottom to top, the ſtalk running through its whole length, and ſtanding out on both ſides of the leaf. This fucus is eaten in the north both by men and cattle. Its proper ſeaſon is in the month of September, when it is in greateſt perfection. The membranous part is rejected, and the ſtalk only is eaten. It is recommended in the diſorder called *pica*, to ſtrengthen the ſtomach and reſtore the appetite.

6. The ſaccharinus, ſweet fucus, or ſea-belt, is very common on the ſea-coaſt. The ſubſtance of this is cartilaginous and leathern; and the leaf is quite ribleſs. By theſe characters it is diſtinguiſhed from the preceding, to which it is nearly allied. It conſiſts only of one ſimple, linear, elliptic leaf, of a tawney green colour, about five feet long and three inches wide in its full-grown ſtate; but varies ſo exceedingly as to be found from a foot to four yards in length. The ordinary length of the ſtalk is two inches, but it varies even to a foot. The root is compoſed of branched fibres, which adhere to the ſtones like claws. This plant is often infeſted with the ſertularia ciliata. The inhabitants of Iceland make a kind of pottage of this fucus; boiling it in milk, and eating it with a ſpoon. They alſo ſoak it in freſh water, dry it in the ſun, and then lay it up in wooden veſſels, where in a ſhort time it is covered with a white efflorescence of ſea-ſalt, which has a ſweet taſte like ſugar. This they eat with butter; but if taken in too great a quantity, the ſalt is apt to irritate the bowels and bring on a purging. Their cattle feed and get fat upon this plant, both in its recent and dry ſtate; but their fleſh acquires a bad flavour. It is ſometimes eaten by the common people on the coaſt of England, being boiled as a pot-herb. Fucus.

7. The ciliatus, ciliated or ligulated fucus, is found on the ſhores of Iona and other places, but is not common. The colour of this is red, the ſubſtance membranous and pellucid, without rib or nerve; the ordinary height of the whole plant about four or five inches. It is variable in its appearance, according to the different ſtages of its growth. This fucus is eaten by the Scots and Iriſh promiſcuouſly with the fucus palmatus or dilſe.

8. The prolifer, or proliferous fucus, is found on the ſhores of the weſtern coaſt, adhering to ſhells and ſtones. The colour is red; the ſubſtance membranaceous, but tough, and ſomewhat cartilaginous, without rib or nerve, though thicker in the middle than at the edges. The whole length of the plant is about four or five inches, the breadth of each leaf about a quarter of an inch. The growth of this fucus, when examined with attention, appears to be extremely ſingular and wonderful. It takes its origin either from a ſimple, entire, narrow, elliptic leaf, about an inch and a half long; or from a dilated forked one, of the ſame length. Near the extremity of the elliptic leaf, or the points of the forked one (but out of the ſurface, and not the edge), ariſes one or more elliptic or forked leaves, which produce other ſimilar ones, in the ſame manner, near the ſummits; and ſo on continually one or more leaves from near the ends of each other, in a proliferous and dichotomous order, to the top of the plant; which in the manner of its growth reſembles in a good meaſure the cactus opuntia, or flat-leaved Indian fig. Sometimes two or three leaves, or more, grow out of the middle of the diſc of another leaf; but this is not the common order of their growth. The fructifications are red, ſpherical, rough warts, leſs than the ſmalleſt pin's head, ſcattered without order on the ſurface of the leaves. Theſe warts, when highly magnified, appear to be the curled rudiments of young leaves; which in due time either drop off and form new plants, or continue on and germinate upon the parent. This plant is very much infeſted with the ſluſtra piloſa, the mandrepora verrucaria, and other corallines, which make it appear as if covered with white ſcabs.

9. The pinnatifidus, jagged fucus, or pepper-dilſe, is frequent on ſea-rocks which are covered by the tides, both on the eaſtern and weſtern coaſts. It is of a yellow olive-colour, often tinged with red. The ſubſtance is cartilaginous, but yet tender and tranſparent; the height about two or three inches. This fu-

Fucus. cus has a hot taſte in the mouth, and is therefore called *pepper-diſſe* by the people in Scotland, who frequently eat it as a ſalad in the ſame manner they do the fucus palmatus.

10. The plocamium, or pectinated fucus, is frequent on the ſea-rocks, and in baſins of water left by the receſs of the tides. Its natural colour is a moſt beautiful bright red or purple, but is often variegated with white or yellow. Its ſubſtance is cartilaginous, but extremely thin, delicate, and tranſparent; its height commonly about three or four inches. The ſtalk is compreſſed, about half a line in diameter, erect, but waved in its growth, and divided almoſt from the baſe into many widely expanded branches. Theſe primary branches are very long, alternate, exactly like the ſtalk, and ſubdivided into alternate ſecondary branches, which are again frequently compounded in like manner, and theſe diviſions decorated with ſubulated teeth growing in alternate rows, curiouſly pectinated or finely toothed on the upper ſide like a comb, the ſmalleſt of theſe teeth ſcarcely viſible to the naked eye. The fructifications are minute ſpherical capſules, or ſmooth dark-red globules, ſcattered without order on the ſides of the branches; generally ſeſſile, but ſome few of them ſupported on ſhort peduncles. This fucus, on account of its elegant colours and fine diviſions, is the ſpecies moſt admired by the ladies who are fond of pictures and mimic landſcapes compoſed of marine vegetables.

11. The filum, thread-fucus, or ſea-laces, is found on the ſea-rocks, and waving under the water like long ſtrings, frequent on many parts of the coaſt. The ſubſtance of this is opaque and cartilaginous, but not difficult to be broken. The colour, when recent, a dull olive-green; when dry, fuſcous, or nearly black; and when expoſed for ſome time on the ſhores to the ſun and air, it becomes yellow, ſtraw-coloured, or white. It conſiſts only of a ſimple, unbranched, naked, cylindrical ſtalk, three or four yards long, more or leſs, from the ſize of a large fiddle-ſtring to that of a thick whip-cord; ſmalleſt at the baſe and ſummit; ſmooth on the outſide, full of mucus within; often twiſted, and always intercepted by numerous tranſverſe diaphragms, viſible when the plant is held between the eye and the light. The fructifications have not yet been diſcovered; but from the tranſverſe ſepta in its ſtructure, it is reaſonable to ſuppoſe this plant to belong rather to the genus of conferva than that of fucus. The ſtalks, ſkinned when half dry and twiſted, acquire ſo conſiderable a degree of ſtrength and toughneſs, that we are informed the Highlanders ſometimes uſe them for the ſame intentions as Indian graſs.

12. The giganteus, or gigantic fucus, is a native of the Straits Le Maire; and grows on rocky ground, which in thoſe countries is diſtinguiſhed from ſand or ooze by the enormous length of the ſea-weeds that grow upon it. The leaves are four feet long, and ſome of the ſtalks, though not thicker than a man's thumb, are 120. Sir Joſeph Banks and Dr Solander ſounded over ſome of them which were 84 feet long; and as they made a very acute angle with the bottom, they were thought to be at leaſt one half longer.

FUEGO, or Fogo, one of the Cape de Verd iſlands, in the Atlantic ocean. It is much higher than any of the reſt; and ſeems, at ſea, to be one ſingle mountain, though on the ſides there are deep valleys. There is a volcano at the top, which burns continually, and may be ſeen a great way off at ſea. It vomits a great deal of fire and ſmoke, and throws out huge pieces of rock to a vaſt height; and ſometimes torrents of melted matter run down the ſides. The Portugueſe, who firſt inhabited it, brought negro ſlaves with them, and a ſtock of cows, horſes, and hogs; but the chief inhabitants now are blacks, of the Romiſh religion. W. Long. 24. 47. N. Lat. 15. 20.

Fuel

Fugue

FUEL, whatever is proper to burn or make a fire; as wood, turf, peat, bituminous earths, coal, &c.

FUEN-HOA, a city of China, in the province of PE-TCHELI, celebrated for its extent and the number of its inhabitants, as well as for the beauty of its ſtreets and triumphal arches. It is ſituated near the great wall, amidſt mountains; and has under its juriſdiction, beſides two cities of the ſecond and eight of the third claſs, a great number of fortreſſes, which bar the entrance of China againſt the Tartars.

FUGALIA, in Roman antiquity, a feaſt ſuppoſed by ſome to be the ſame with the *refugium*, held on the 24th of February, in memory of the expulſion of the kings and the aboliſhing of monarchical government. Others again diſtinguiſh the fugalia from the regifuge. And others think, that the fugalia was the ſame with the *poplifugia*, or the feaſt of Fugia, the goddeſs of joy, occaſioned by the rout of an enemy, which was the reaſon the people abandoned themſelves to riot and debauchery.

FUGITIVE, a perſon obliged to fly his country, or remove from a place where he had ſome abode or eſtabliſhment, on account of his crimes, debts, or other occaſions.

Fugitive Pieces, among the learned, denote thoſe little compoſitions which are printed on looſe ſheets or half ſheets; thus called, becauſe eaſily loſt and ſoon forgot.

FUGUE, in muſic, (from the Latin *fuga*, "a chaſe:") A piece of muſic, ſometimes longer and ſometimes ſhorter, in which, agreeable to the rules of harmony and modulation, the compoſer treats a ſubject; or, in other words, what expreſſes the capital thought or ſentiment of the piece, in cauſing it to paſs ſucceſſively and alternately from one part to another.

Theſe are the principal rules of the fugue; of which ſome are peculiar to itſelf, and others common to it with what the French call *imitation*.

1. The ſubject proceeds from the tonic to the dominant, or from the dominant to the tonic, in riſing or deſcending.

2. Every fugue finds its reſponſe in the part immediately following that which commenced.

3. That reſponſe ought to reſume the ſubject in the interval of a fourth or fifth above or below the key, and to purſue it as exactly as the laws of harmony will admit; proceeding from the dominant to the tonic when the ſubject is introduced from the tonic to the dominant, and moving in a contrary direction when the ſubject is introduced from the dominant to the tonic. One part may likewiſe reſume the ſame ſubject in the octave or uniſon of the preceding; but in that caſe, it is a repetition rather than a real reſponſe.

4. As the octave is divided into two unequal parts, of which the one contains four gradations aſcending from the tonic to the dominant, and the other only

Fugue. three in continuing the aſcent from the dominant to the tonic; this renders it neceſſary to have ſome regard to this change in the expreſſion of the ſubject, and to make ſome alterations in the reſponſe, that we may not quit the chords that are eſſential to the mode. It is a different caſe when the compoſer intends to alter the modulation; for there the exactneſs of the reſponſe itſelf, when taken in a different tone, produces the alteration proper for this change.

5. It is neceſſary that the fugue ſhould be planned in ſuch a manner, that the reſponſe may commence before the cloſe of the firſt air, ſo that both the one and the other may be in part heard at the ſame time; that, by this anticipation, the ſubject may be as it were connected with itſelf, and that the art of the compoſer may diſcover itſelf in this concourſe. It is abſolute mockery, inſtead of a fugue, to impoſe upon the hearers the ſame air, merely tranſpoſed from one key to another, without any other reſtraint than an accompaniment afterwards formed at pleaſure. This deſerves at beſt no better name than what the French call *imitation*. See IMITATION.

Beſides theſe rules, which are fundamental, there are others which, though preſcribed by taſte alone, are not leſs eſſential. Fugues, in general, render muſic more noiſy than agreeable; it is for this reaſon that they are more agreeable in the chorus than any where elſe. Now, as their chief merit conſiſts in fixing the ear on the principal air or ſubject, which for this reaſon is made to paſs inceſſantly from part to part, and from mode to mode, the compoſer ought to exert his care in preſerving that air always diſtinct; or to prevent it from being abſorbed in, or confounded with, the other parts. To produce this effect, there are two different ways: one in the movement, which muſt be inceſſantly contraſted with itſelf; ſo that, if the procedure of the fugue be accelerated, the other parts more gravely and with protracted notes; or, on the contrary, if the motion of the fugue be ſlow and ſolemn, the accompaniments muſt have more and quicker buſineſs. The other method is to extend the harmony, by removing the parts at a greater diſtance one from the other; leſt the others, too nearly approximated to that which contains the ſubject, ſhould be confounded with it, and prevent it from being diſtinguiſhed with ſufficient clearneſs; ſo that what would be an imperfection any where elſe, becomes here a beauty.

The unity of melody ſhould be preſerved: this is the great and general rule, which muſt frequently be practiſed by different means. The chords muſt be choſen, and the intervals, ſo that one particular ſound may produce the chief effect: this can only reſult from the unity of the melody. It will ſometimes be neceſſary to employ voices and inſtruments of different kinds, that the part which ought to prevail may be moſt eaſily diſtinguiſhed: this again ſhows the neceſſity of preſerving the unity of the melody. Another object of attention, no leſs neceſſary, is, in the different connections of modulation which are introduced by the procedure and progreſs of the fugue, to cauſe all theſe modulations to correſpond at the ſame time in all the parts, to connect the whole in its progreſs by an exact conformity of modes; leſt, if one part be in one mode, and another in another, the general harmony ſhould be in none at all, and for that reaſon ſhould no longer be able to produce ſimple effects upon the ear, nor ſimple ideas in the mind; which is another reaſon for preſerving unity of melody. In a word, in every fugue the confuſion of melodies and modulations is at once what a compoſer has moſt to fear, and will find the greateſt difficulty in avoiding; and as this kind of muſic never produces a pleaſure above mediocrity, one may ſay that a fine fugue is, though the maſterpiece of an excellent harmoniſt, ungrateful to his toil. Fulcrum ‖ Fulham.

There are ſtill ſeveral other kinds of fugues; ſuch as the perpetual fugue *, the double fugue, the inverted fugue. * See *Cano.*

The inverted fugue is a manner of compoſition, in which the flying part proceeds in a contrary direction to the other fugue, which had been formerly fixed in the ſame piece of muſic. Thus, when the firſt fugitive part is heard in aſcending from the tonic to the dominant, or from the dominant to the tonic, the counter fugue ought to be heard in deſcending from the dominant to the tonic, or from the tonic to the dominant, and *vice verſa*. Its other rules are exactly like thoſe of the common fugue.

FULCRUM, in mechanics, the prop or ſupport by which a lever is ſuſtained.

FULDE, a conſiderable town of Germany, in the circle of the upper Rhine, and in the Buchow, with a celebrated abbey; whoſe abbot is primate of the abbeys of the empire, perpetual chancellor of the emperor, and ſovereign of a ſmall territory lying between Heſſe, Franconia, and Thuringia. It is ſeated on the river Fulde, 55 miles ſouth of Caſſel, and 58 north-eaſt of Francfort. E. Long. 9. 53. N. Lat. 50. 40.

FULGORA, in zoology, a genus of inſects belonging to the order of hemiptera; the characters of which are theſe: The front, or fore-part of the head, is drawn extended and empty; the antennæ are ſeated below the eyes, having two articulations, whereof the exterior is larger, and of a globular form; the roſtrum is inflected, or bent inwards under the body; and the feet are made for walking. There are nine ſpecies, the moſt remarkable of which is the candelaria, or lantern-fly. The head and thorax are generally of a ruddy brown; and the ground colour of the elytra is freſh green, but quaintly figured with ſpots of a yellowiſh clay colour, ſometimes pale, at other ſeaſons of a deeper hue. The wings are of a deep and beautiful yellow, with a broad band of gloſſy black bordering the extremities. The tarſi of the feet are compoſed of three articulations, and are of a paler colour than the legs and thighs, which are brown. When the inſect is on the wing, the waving of the elytra (whoſe thinneſs renders the ſpots thereon tranſparent), aſſiſted by the luminous quality peculiar to the tribe, and the golden yellow of the under wings, bordered with black, occaſion, in Mr Barbut's opinion, the flaſhes they dart around in the night, and create images beyond probability in the minds of perſons too ready to credit hyperboles. It is an inhabitant of China.

FULHAM, a village of Middleſex, four miles from London. The Danes in 869 wintered at this place till they retired to the continent. It was in the Conqueror's time held of the king by the canons of St Paul's; and there is an ancient houſe here, which is moated about, and belongs to the ſee of London, whoſe biſhop has a palace here, and the demeſne has belong-

Fulica. ed to that dioceſe from 1067. From this place to Putney there is a wooden bridge over the Thames, where not only horſes, coaches, and all carriages, but even foot-paſſengers, pay toll. The church here is both a rectory and a vicarage.

FULICA, the GALLINULE and COOT, in ornithology; a genus of birds of the order of grallæ. It has a convex bill, with the upper mandible fornicated over the lower at the edge; the lower mandible is gibbous behind the tip. The forehead is bald; and the feet have four toes, ſubpinnated. There are 25 ſpecies; 18 of which belong to the gallinule diviſion, diſtinguiſhed by having the toes furniſhed with broad ſcalloped membranes; and 7 comprehend the coots which have the toes divided to their origin. The following ſpecies are among the moſt noted.

1. The *chloropus*, or COMMON GALLINULE, is in length about 14 inches, and has a bald forehead and broad flat toes. It gets its food on graſſy banks, and borders near freſh waters, and in the very waters if they be weedy. It builds upon low trees and ſhrubs by the water-ſide; breeding twice or thrice in a ſummer; and, when the young are grown up, drives them away to ſhift for themſelves. They lay ſeven eggs of a dirty white, thinly ſpotted with ruſt-colour. This bird ſtrikes with its bill like a hen, and in the ſpring has a ſhrill call. In flying, it hangs down its legs; in running, it often flirts up its tail, and ſhows the white feathers. We may obſerve, that the bottoms of its toes are ſo very flat and broad (to enable it to ſwim), that it ſeems to be the bird which connects the cloven-footed aquatics with the next tribe, *viz.* the ſin toed. It is pretty common on the continent, though in ſome parts more ſcarce than in others. It is alſo an inhabitant of America, from New York to Carolina; and is recorded as a native of Jamaica and other iſlands in the Weſt Indies. It is ſaid to feed on plants and ſmall fiſh; and the fleſh is for the moſt part pretty good.

2. The *porphyrio*, or PURPLE GALLINULE, is about the ſize of a fowl, or 17 inches in length. The bill is an inch and a half long, and of a deep red colour. The forehead is bare and red; the head and hind part of the neck are gloſſy violet; the legs are very ſtout, and of the colour of the bill. This bird is more or leſs common in all the warmer parts of the globe. On the coaſts of Barbary they abound, as well as in ſome of the iſlands of the Mediterranean. In Sicily they are bred in plenty, and kept for their beauty; but whether indigenous there, is uncertain. It is frequently met with in various parts of the ſouth of Ruſſia and weſtern parts of Siberia, among reedy places; in the neighbourhood of the Caſpian Sea it is not uncommon; but in the cultivated rice-grounds of Ghilar in Perſia it is in great plenty and high plumage. The female makes the neſt among the reeds in the middle of March; lays three or four eggs, and ſits from three to four weeks. That it is common in China, the paper-hangings from thence will every where teſtify. It is alſo met with in the Eaſt Indies, the iſlands of Java, Madagaſcar, and many others. Our late navigators ſaw them at Tongataboo in vaſt numbers, as well as in the iſland of Tanna and other parts. It is alſo common in the ſouthern parts of America. In reſpect to its manners, it is a very docile bird, being eaſily tamed, and feeding with the poultry, ſcratching the ground with the foot as the cock and hen. It will feed on many things, ſuch as fruit, roots of plants, and grain; but will eat fiſh with avidity, dipping them into the water before it ſwallows them. It will frequently ſtand on one leg, and lift the food to its mouth with the other like a parrot. A pair of theſe kept in an aviary in France, made a neſt of ſmall ſticks mixed with a quantity of ſtraw, and laid ſix white eggs, perfectly round; but the hen was careleſs of them, and they came to nothing. The fleſh is ſaid to be exquiſite in taſte. Fulica || Fu'k.

3. The *atra*, or COMMON COOT, hath a bald forehead, a black body, and lobated toes; and is about 15 inches in length. They frequent lakes and ſtill rivers; making their neſt among the ruſhes, with graſs, reeds, &c. floating on the water, ſo as to riſe and fall with it. They lay five or ſix large eggs, of a dirty whitiſh hue, ſprinkled over with minute deep ruſt-coloured ſpots; and it is ſaid, that ſometimes they will lay 14 or more eggs. The young when juſt hatched are very deformed, and the head mixed with a red coarſe down. In winter they often repair to the ſea, and the channel near Southampton is ſometimes obſerved almoſt covered with them. They are often brought to that market, where they are expoſed to ſale without their feathers, and ſcalded like pigs. This ſpecies is not ſo numerous as might be expected; for we find that vaſt numbers fall a prey while young to the buzzards, which frequent the marſhes. Their food is ſmall fiſh and water-inſects; but they will ſometimes eat the roots of the bulruſh, and with it feed the young; they are ſaid likewiſe to eat grain. This ſpecies is ſuppoſed to extend throughout the old continent, and perhaps the new alſo. Authors record it as inhabiting Greenland, Sweden, Norway, Ruſſia, Siberia, Perſia, and China, and many of the intermediate parts. It is alſo met with in Jamaica, Carolina, and other parts of North America. The Indians about Niagara dreſs the ſkins of theſe birds, and uſe them for pouches. They are called in Carolina *fluſterers*.

4. The *aterrima*, or GREATER COOT, is of a larger ſize than the laſt, and its plumage is blacker. This ſpecies is ſaid to be found in Lancaſhire and Scotland: but is more plentiful on the continent, being found in Ruſſia and the weſtern part of Siberia very common; and is alſo in plenty at Sologne and the neighbouring parts, where they call it *judelle*. The people eat this bird on maigre days, and its fleſh is much eſteemed.

FULIGINOUS, whatever proceeds from a thick ſooty ſmoke, ſuch as litharge and lamp-black.

FULIGNO, a city of Italy, in the pope's territories, 10 miles north of Spoletto.

FULIGO, in natural hiſtory, a ſpecies of pumice-ſtone. See PUMICE.

FULK (William), a learned and eminent divine of the church of England, in the 16th century. He was patroniſed by the earl of Leiceſter, who in 1571 preſented him to the living of Warley in Eſſex, and ſoon after to that of Diddington in Suffolk. He attended Leiceſter, when he went ambaſſador to France; and on his return was made maſter of Pembroke-hall, and Margaret profeſſor of divinity at Cambridge. His works are very numerous, levelled chiefly at the Papiſts; the moſt conſiderable of them is his Comment on the Rhemiſh Teſtament. He died in 1589.

FULLER,

Fuller.

FULLER (Nicholas), prebendary of Salisbury, and a learned English critic; who published in 1617 *Miscellanea Theologica* in four books, and afterward two more of *Miscellanea Sacra*. He died in 1623; and there are some MSS of his remaining in the Bodleian library that show his great skill in Hebrew and philology.

Fuller (Dr Thomas), a learned English divine, was born at Alvinckle, near Oundle, in Northamptonshire, about the year 1608, and studied at Cambridge. He was chosen minister of St Bennet's there; and at about 23 years of age, his merit procured him a fellowship in Sidney-college, and a prebend in Salisbury cathedral. He was soon after presented to the rectory of Broad Windsor in Dorsetshire; and afterwards was made lecturer of the Savoy in London: but upon the pressing of the covenant, he retired to Oxford; and soon after accompanied Sir Ralph Hopton as his chaplain in the army, which he attended in their marches from place to place. After the death of king Charles I. he obtained the living of Waltham-abbey, and was appointed lecturer of St Clement's; and shortly after removed to the lecture of St Bride's, Fleet-street. Upon the restoration, he recovered his prebend in the cathedral of Salisbury, was appointed chaplain extraordinary to his majesty, and created doctor of divinity. It is said, his memory was so amazingly tenacious and comprehensive, that he could make use of a sermon *verbatim* if he once heard it. He once undertook, in passing to and from Temple-bar to the Poultry, to tell at his return every sign as it stood in order on both sides of the way, repeating them either backwards or forwards; and this task he actually performed. He wrote, 1. A History of the Holy War. 2. The Church-history of Britain, in folio. 3. Andronicus, or the Unfortunate Politician, in 8vo. 4. A Pisgah-sight of Palestine. 5. A History of English Worthies; and other works. He died in August 1661; and was interred in the chancel of Cranford church, in Middlesex, whither his body was attended by at least 200 of his brethren of the ministry.

FULLER; a workman employed in the woollen manufactories to mill or scour cloths, serges, and other stuffs, in order to render them more thick, compact, and durable. See Fulling.

* See *Clay*, n° 4.

Fuller's Earth, in natural history, a species of clay*, of a greyish ash-coloured brown, in all degrees from very pale to almost black, and it has generally something of a greenish cast. It is very hard and firm, of a compact texture, of a rough and somewhat dusty surface that adheres slightly to the tongue. It is very soft to the touch, not staining the hands, nor breaking easily between the fingers. It has a little harshness between the teeth, and melts freely in the mouth. Thrown into water, it makes no ebullition or hissing; but swells gradually in bulk, and falls into a fine soft powder. It makes no effervescence with aquafortis.

The greatest quantity and the finest earth of this kind in the world, is dug in the pits at Wavedon, near Woburn in Bedfordshire. The strata in these pits lie thus: From the surface to the depth of six feet, there are several layers or beds of sand, all reddish, but some lighter coloured than others. Under these there is a thin stratum of a sand-stone, which they break through, and then there is the fuller's earth. The upper stratum of this is about a foot thick: the workmen call it *cledge*, and throw it aside as useless; being commonly fouled with the sand which originally covered it, and which insinuates itself a good way into it. After this, they come to the fine fuller's earth for sale, which lies to the depth of eight feet more. The matter of this is divided into several layers, there being commonly about a foot and an half between one horizontal fissure and another. Of these several layers, the upper half, where the earth breaks itself, is tinged red; which seems to be owing to the running of the water upon it from among the sands above; some of which are probably of a ferruginous nature, or have ferruginous matter among them. This reddish fuller's earth the workmen call *crop*; and between the cledge and this there is a thin stratum of matter, of less than an inch, which in taste, colour, and external appearance, resembles the terra Japonica of the shops. The lower half of the strata of fuller's earth they call *wall-earth*. This is untinged with the red colour of the other, and seems the most proper for fulling. Under the fuller's earth there is a stratum of white and coarse stone about two feet thick. They seldom dig thro' this; but if they do, they find more strata of sand.

This earth is of great use in scouring cloths, stuffs, &c. imbibing all the grease and oil used in preparing, dressing, &c. of the wool; for which reason it is made a contraband commodity, and is not to be exported under the penalty of 1 s. for every pound weight. See Fulling.

Fuller's Weed, or *Teazle*. See Dipsacus.

FULLERY, a place where cloths, &c. are fulled. See the next article.

FULLING, the art or act of cleansing, scouring, and pressing cloths, stuffs, and stockings, to render them stronger, closer, and firmer: called also *milling*. Pliny (*lib.* vii. cap. 56.) assures, that one Nicias, the son of Hermias, was the first inventor of the art of fulling: and it appears by an inscription, quoted by Sir G. Wheeler, in his Travels thro' Greece; that this same Nicias was a governor in Greece in the time of the Romans.

The fulling of cloths and other stuffs is performed by a kind of water-mill, thence called a *fulling* or *scouring mill*.

These mills, excepting in what relates to the mill-stones and hopper, are much the same with corn mills: and there are even some which serve indifferently for either use; corn being ground, and cloths fulled, by the motion of the same wheel. Whence, in some places, particularly in France, the fullers are called *millers*; as grinding corn and milling stuffs at the same time.

The principal parts of the fulling-mill are, The wheel, with its trundle; which gives motion to the tree or spindle, whose teeth communicate it to the pestles or stampers, which are hereby raised and made to fall alternately according as its teeth catch on or quit a kind of latch in the middle of each pestle. The pestles and troughs are of wood; each trough having at least two, sometimes three pestles, at the discretion of the master, or according to the force of the stream of water. In these troughs are laid the cloths, stuffs, &c. intended to be fulled: then, letting the current of water fall on the wheel, the pestles are successively let fall thereon, and by their weight and velocity stamp and press the stuffs very strongly, which by this means become thickened and condensed. In the course of the

the operation, they ſometimes make uſe of urine, ſometimes of fuller's earth, and ſnmetimes of ſoap. To prepare the ſtuffs to receive the firſt impreſſions of the peſtle, they are uſually laid in urine; then in fuller's earth and water; and, laſtly, in ſoap diſſolved in hot water. Soap alone would do very well; but this is expenſive: though fuller's earth, in the way of our dreſſing, is ſcarce inferior thereto; but then it muſt be well cleared of all ſtones and grittineſſes, which are apt to make holes in the ſtuff. As to urine, it is certainly prejudicial, and ought to be entirely diſcarded; not ſo much on account of its ill ſmell, as of its ſharpneſs and ſaltneſs, which qualities are apt to render the ſtuffs dry and harſh.

The true method of fulling with ſoap is delivered by Monſ. Colinet, in an authentic memoir on that ſubject, ſupported by experiments made by order of the marquis de Louvois, then ſuperintendant of the arts and manufactories of France; the ſubſtance of which we ſhall her ſubjoin.

Method of Fulling Cloths and Woollen Stuffs with Soap.—A coloured cloth, of about 45 ells, is to be laid in the uſual manner in the trough of a fulling-mill; without firſt ſoaking it in water, as is commonly practiſed in many places. To full this trough of cloth, 15 pounds of ſoap are required; one-half of which is to be melted in two pails of river or ſpring water, made as hot as the hand can well bear it. This ſolution is to be poured by little and little upon the cloth, in proportion as it is laid in the trough: and thus it is to be fulled for at leaſt two hours; after which, it is to be taken out and ſtretched. This done, the cloth is immediately returned into the ſame trough, without any new ſoap, and there fulled two hours more. Then taking it out, they wring it well, to expreſs all the greaſe and filth. After the ſecond fulling, the remainder of the ſoap is diſſolved as in the former, and caſt four different times on the cloth; remembering to take out the cloth every two hours, to ſtretch it, and undo the plaits and wrinkles it has acquired in the trough. When they perceive it ſufficiently fulled, and brought to the quality and thickneſs required, they ſcour it for good in hot water, keeping it in the trough till it be quite clean. As to white cloths; in regard theſe full more eaſily and in leſs time than coloured ones, a third part of the ſoap may be ſpared.

Fulling of Stockings, Caps, &c. ſhould be performed ſomewhat differently; viz. either with the feet or the hands; or a kind of rack, or wooden machine, either armed with teeth of the ſame matter, or elſe horſes or bullocks teeth. The ingredients made uſe of herein are, urine, green ſoap, white ſoap, and fuller's earth. But the urine alſo is reckoned prejudicial here. Woven ſtockings, &c. ſhould be fulled with ſoap alone: for thoſe that are knit, earth may be uſed with the ſoap. Indeed it is frequent to full theſe kinds of works with the mill, after the uſual manner of cloth, &c. But that is too coarſe and violent a manner, and apt to damage the work unleſs it be very ſtrong.

FULMAR, in ornithology. See Procellaria.

Fulmar, or *Foumart*. See Mustela.

FULMINATING, ſomething that thunders or reſembles thunder.

Fulminating Gold, Silver, Copper, Quickſilver, &c. See Chemistry *Index* at *Fulminating*.

FULMINATION, in chemiſtry, the ſame with detonation. See Detonation and Nitre. Fulmination

Fulmination, in the Romiſh canon law, a ſentence of a biſhop, official, or other eccleſiaſtic appointed by the pope, by which it is decreed that ſome bull ſent from the pope ſhall be executed. Funambulus.

FUMARIA, fumitory: A genus of the pentandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 24th order, *Corydales*. The calyx is diphyllous; the corolla ringent; and there are two membranaceous filaments, each of which has three antheræ. There are a number of different ſpecies; all of them low, ſhrubby, and deciduous and evergreen plants, growing from two to ſix or ſeven feet high, adorned with ſmall ſimple leaves, and papilionaceous flowers of different colours. The moſt remarkable is the officinalis, or common fumitory; which grows naturally in ſhady cultivated grounds, and produces ſpikes of purpliſh flowers in May and June. It is very juicy, of a bitter taſte, without any remarkable ſmell.—The medical effects of this herb are, to ſtrengthen the tone of the bowels, gently looſen the belly, and promote the urinary and other natural ſecretions. It is principally recommended in melancholic, ſcorbutic, and cutaneous diſorders, for opening obſtructions of the viſcera, attenuating and promoting the evacuation of viſcid juices. Frederic Hoffman had a very great opinion of it as a purifier of the blood; and aſſures us, that in this intention ſcarce any plant exceeds it. Cows and ſheep eat the plant; goats are not fond of it; horſes and ſwine refuſe it.

FUMIGATION, in chemiſtry, a kind of calcination, when metals or other hard bodies are corroded or ſoftened by receiving certain fumes for that purpoſe.

Fumigation, in medicine. By the ſubtile fumes that are inſpired as well as inhaled into our bodies, much benefit or prejudice is produced, according to the nature of the matter, and the conſtitution into which it is received; as is evident from the palſies produced among workers in lead-mines, &c. and the benefits received in many caſes when the air is impregnated with ſalutary materials. Catarrhs and catarrhous coughs are relieved by fumes received with the breath; and, by the ſame method, expectoration is aſſiſted in humoural aſthmas; and even ulcers in the lungs are ſaid to have been healed by this method. The advantage of mercurial fumigations in the cure of venereal ulcers is known to every practitioner.

FUMITORY, in botany. See Fumaria.

FUNAMBULUS, among the Romans, was what we call a *rope-dancer*, and the Greeks *ſchœnobates*. See *Rope-Dancer*.

There was a funambulus, it ſeems, who performed at the time when the Hecyra of Terence was acted; and the poet complains, that the ſpectacle prevented the people from attending to his comedy. *Ita populus ſtudio ſtupidus in* funambulo, *animum occuparat*.

At Rome, the funambuli firſt appeared under the conſulate of Sulpicius Pœticus and Licinius Stolo, who were the firſt introducers of the ſcenic repreſentations. It is added, that they were firſt exhibited in the iſland of the Tyber, and that the cenſors Meſſala and Caſſius afterwards promoted them to the theatre.

In the *Floralia*, or *ludi Florales*, held under Galba, there

Funchal Fund.

there were funambulatory elephants, as we are informed by Suetonius. Nero alſo ſhowed the like, in honour of his mother Agrippina. Vopiſcus relates the ſame of the time of Carinus and Numerianus.

FUNCHAL, an epiſcopal town of Madeira, in an iſland of the Atlantic Ocean, over-againſt the coaſt of Morocco. It is large, ſtrong, handſome, and populous, with fine churches. The principal trade conſiſts in ſweetmeats and wines. It belongs to the Portugueſe; and is ſeated in a fertile valley, at the foot of a mountain from whence ſeveral ſtreams proceed. W. Long. 14. 30. N. Lat. 31. 30.

FUNCTION, the act of fulfilling the duties of any employment.

Function, being alſo applied to the actions of the body, is by phyſicians divided into vital, animal, and natural. The *vital* functions are thoſe neceſſary to life, and without which the individual cannot ſubſiſt; as the motion of the heart, lungs, &c. The *natural* functions are ſuch as it cannot ſubſiſt any conſiderable time without; as the digeſtion of the aliment, and its converſion into blood. Under *animal* functions are included the ſenſes of touching, taſting, &c. memory, judgment, and voluntary motion; without any or all of which an animal may live, but not very comfortably.

The animal-functions perform the motion of the body by the action of the muſcles; and this action conſiſts chiefly in the ſhortening the fleſhy fibres, which is called *contraction*, the principal agents of which are the arteries and nerves diſtributed in the fleſhy fibres.

All parts of the body have their own functions, or actions, peculiar to themſelves. Life conſiſts in the *exerciſe* of theſe functions, and health in the *free* and *ready* exerciſe of them.

FUND, in general, ſignifies any ſum of money appropriated for a particular purpoſe. Thus, that part of the national revenue which is ſet aſide for the payment of the national debt, is called the *ſinking fund*. But, when we ſpeak of *the funds*, we generally mean the large ſums which have been lent to government, and conſtitute the national debt; and for which the lenders, or their aſſignees, receive intereſt from revenues allotted for that purpoſe. The term *ſtock* is uſed in the ſame ſenſe, and is alſo applied to the ſums which form the capital of the bank of England, the Eaſt India and South-Sea companies; the proprietors of which are intitled to a ſhare of the profits of the reſpective companies.

The practice of funding was introduced by the Venetians and Genoeſe in the 16th century, and has been adopted ſince by moſt of the nations in Europe. Princes had often borrowed money, in former times, to ſupply their exigencies, and ſometimes mortgaged their territories in ſecurity: but theſe loans were generally extorted, and their payment was always precarious; for it depended on the good faith and ſucceſs of the borrower, and never became a regular burden on poſterity. The origin of funds is derived from the peculiar manners and circumſtances of modern Europe. Since the invention of gun-powder, and the progreſs of commerce, the military occupation has become a diſtinct employment in the hands of mercenaries; the apparatus of war is attended with more expence; and the deciſion of national quarrels has often been determined by command of money rather than by national bravery. Ambitious princes have therefore borrowed money, in order to carry on their projects with more vigour. Weaker ſtates have been compelled, in ſelf-defence, to apply to the ſame reſource; the wealth introduced by commerce has afforded the means; the regularity of adminiſtration, eſtabliſhed in conſequence of the progreſs of civility, has increaſed the confidence of individuals in the public ſecurity; the complicated ſyſtem of modern policy has extended the ſcenes of war, and prolonged their duration; and the colonies eſtabliſhed by the mercantile nations have rendered them vulnerable in more points, and increaſed the expence of defending them. Fund

When a greater ſum has been required for the annual expence than could eaſily be ſupplied by annual taxes, the government have propoſed terms, to their own ſubjects, or foreigners, for obtaining an advance of money, by mortgaging the revenue of future years for their indemnification. This mortgage may either be for a limited period, or perpetual. If the ſum allotted annually for the benefit of thoſe who advance the money, be conſiderably greater than the intereſts of the ſums advanced, they may agree to accept of ſuch allowance, for a limited time, as a full equivalent. Thus, they may either agree for the caſual produce of the revenue aſſigned; or a fixed annuity for a greater or leſs number of years; or a life-annuity to themſelves or nominees; or an annuity for two or more lives; or an annuity, with the benefit of ſurvivorſhip, called a *tontine*, in which ſcheme, the whole ſum to which the original annuitants were intitled continues to be diſtributed among the ſurvivors.

The eſtabliſhment of the funds was introduced in Britain at the revolution; and has ſince been gradually enlarged, and carried to an amazing extent. The various methods above mentioned have been uſed in their turns, but perpetual annuities have been granted for the greateſt part; and, even when the money was originally advanced on other conditions, the lenders have been ſometimes induced, by ſubſequent offers, to accept of perpetual annuities, inſtead of the former terms. The debt for which perpetual annuities are granted, is called the *redeemable debt*, and the other is called the *irredeemable debt*. Although the debts thus contracted by government are ſeldom paid for a long term of years; yet any creditor of the public may obtain money for what is due him when he pleaſes, by transferring his property in the funds to another; and regular methods are appointed for tranſacting theſe transfers in an eaſy manner. By means of this, the ſtocks become a kind of circulating capital; and have the ſame effect, in ſome reſpects, as the circulating money in the nation. When a ſtockholder transfers his ſhare, he may ſometimes be able to obtain a greater price than the original value, and at other times be obliged to accept of a leſs one. The value of the funds depends on the proportion between the intereſt they bear, and the benefit which may be obtained by applying the money to other purpoſes. It is influenced by the plenty or ſcarcity of money, and by the quantity of the public debt; and it is impaired by any event which threatens the ſafety, or weakens the credit, of the government.

The

Funds. The buſineſs of ſtock-jobbing is founded on the variation of the prices of ſtock. Perſons poſſeſſed of real property may buy or ſell ſtock, according to their notion that the value is likely to riſe or fall, in expectation of making profit by the difference of price. And a practice has taken place among perſons who often poſſeſs no property in the funds, to contract for the ſale of ſtock againſt a future day, at a price now agreed on. For inſtance: A agrees to ſell B 1000 l. of bank-ſtock, to be transferred, in 20 days, for 1200 l. A has, in fact, no ſuch ſtock; but, if the price of bank ſtock, on the day appointed for the transfer, ſhould be only 118 *per cent.* A may purchaſe as much as will enable him to fulfil his bargain for 1180 l. and thus gains 20 l. by the tranſaction; on the contrary, if the price of bank-ſtock be 125 *per cent.* he will loſe 50 l. The buſineſs is generally ſettled without any actual purchaſe or transfer of ſtock, by A paying to B, or receiving from him, the difference between the current price of the ſtock on the day appointed and the price bargained for.

This practice, which is really nothing elſe than a wager concerning the price of ſtock, is contrary to law; yet it is carried on to a great extent. In the language of Exchange-alley, where matters of this kind are tranſacted, the buyer is called a *bull*, and the ſeller a *bear*. As neither party can be compelled by law to implement theſe bargains, their ſenſe of honour, and the diſgrace and loſs of future credit, which attend a breach of contract, are the principles by which the buſineſs is ſupported. When a perſon declines to pay his loſs, he is called a *lame duck*, and dare never afterwards appear in the Alley. This opprobrious appellation, however, is not beſtowed on thoſe whoſe failure is owing to want of ability, providing they make the ſame ſurrender of their property voluntarily, which the law would have exacted if the debt had been intitled to its ſanction.

The intereſt or dividend on the ſtock is paid half-yearly; and the purchaſer has the benefit of the intereſt due on the ſtock he buys, from the laſt term to the time of purchaſe. Therefore the prices of the ſtocks riſe gradually, *cæteris paribus*, from term to term, and fall at the term when the intereſt is paid. In comparing the prices of the different ſtocks, it is neceſſary to advert to the term when the laſt intereſt was paid; and, allowance being made for this circumſtance, the prices of all the government ſtocks, which bear intereſt at the ſame rate, muſt be nearly the ſame, as they all depend on the ſame ſecurity.

When a loan is propoſed, ſuch terms muſt be offered to the lenders, as may render the tranſaction beneficial; and this is now regulated by the prices of the old ſtocks. If the ſtocks, which bear intereſt at 4 *per cent.* ſell at par, or rather above, the government may expect to borrow money at that rate; but, if theſe ſtocks are under par, the government muſt either grant a higher intereſt, or ſome other advantage to the lenders, in compenſation for the difference. For this purpoſe, beſides the perpetual annuity, another annuity has ſometimes been granted for life, or for a term of years. Lotteries have frequently been employed to facilitate the loan, by intitling the ſubſcribers to a certain number of tickets, for which no higher price is charged than the exact value diſtributed in prizes, tho' their market price is generally 2 l. or 3 l. higher. Sometimes an abatement of a certain proportion of the capital has been granted, and a lender intitled to hold 100 l. ſtock, though in reality he advanced no more perhaps than 95 l. Funds.

It belongs to the Chancellor of the Exchequer to propoſe the terms of the loan in parliament; and he generally makes a previous agreement with ſome wealthy merchants, who are willing to advance the money on the terms propoſed. The ſubſcribers to the loan depoſit a certain part of the ſum ſubſcribed; and are bound to pay the reſt by inſtalments, or ſtated proportions, on appointed days, under pain of forfeiting what they have depoſited. For this they are intitled, perhaps, not only to hold their ſhare in the capital, but to an annuity for 10 years, and to the right of receiving a certain number of lottery-tickets on advantageous terms. They may ſell their capital to one perſon, their annuity to a ſecond, and their right to the tickets to a third. The value of all theſe intereſts together is called *omnium*; and, in order to obtain a ready ſubſcription, it ought to amount to 102 l. or upwards, on 100 l. of capital. This difference is called the *bonus* to the ſubſcribers.

The capital advanced to the public, in the form of transferable ſtocks, and bearing intereſt from taxes appropriated for that purpoſe, is called the *funded debt*. Beſides, there is generally a conſiderable ſum due by government, which is not diſpoſed of in that manner, and therefore is diſtinguiſhed by the appellation of the *unfunded debt*. This may ariſe from any ſort of national expence, for which no proviſion has been made, or for which the proviſion has proved inſufficient. The chief branches are,

1ſt, *Exchequer Bills*. Theſe are iſſued from the exchequer, generally by appointment of parliament, and ſometimes without ſuch appointment, when exigencies require. They bear intereſt from the time when iſſued, and are taken in by the bank of England, which promotes their circulation.

2d, *Navy-Bills*. The ſums annually granted for the navy have always fallen ſhort of what that ſervice required. To ſupply that deficiency, the admiralty iſſues bills in payment of victuals, ſtores, and the like, which bear intereſt ſix months after the time iſſued. The debt of the navy thus contracted is diſcharged, from time to time, by parliament.

In time of war, the public expences, ſince the revolution, have always been much greater than the annual revenue; and large ſums have conſequently been borrowed. In time of peace, the revenue exceeds the expence, and part of the public debts have frequently been paid off. But, though there have been more years of peace than of war ſince the funds were eſtabliſhed, the debts contracted during each war have much exceeded the payments during the ſubſequent peace. This will appear by the following abſtract of the progreſs of the national debt.

Debt at peace of Ryſwich. 1697	L. 21,515,472
Debt at the beginning of war 1701	16,394,701
Diſcharged during peace 1697 to 1701	5,121,071
Debt at peace of Utrecht 1714, including value of annuities afterwards ſubſcribed to South-Sea ſtock	55,282,978
Contracted in war 1701 to 1714	38,888,277

Fundamental || Fundamental.

Debt at beginning of war 1740, including L. 1,000,000 charged on civil list - - -	L.47,954,623
Diſcharged during peace 1714 to 1739	7,328,355
Debt at peace of Aix la-Chapelle, 1748	79,193,313
Contracted during war 1740 to 1748	31,238,690
Debt at beginning of war 1756	73,289,673
Paid off during peace 1748 to 1756	5,903,640
Debt funded at the peace 1763, including L. 9,839,597 then owing, which was funded in the ſubſequent years	133,957,270
Beſides this, there was about L.6,000,000 of debt paid off, without ever being funded.	
Funded debt, 1775 -	125,000,000
Paid off during peace 1763 to 1775, beſides unfunded debt above mentioned	8,959,270
Funded debt at the peace 1783	211,363,254

FUNDAMENT, in anatomy, the loweſt part of the inteſtinum rectum, called by anatomiſts the *anus*. See ANATOMY, n° 93.

FUNDAMENTAL, in general, ſomething that ſerves as a baſe or foundation for another.

FUNDAMENTAL, in muſic. A *fundamental ſound* is that which forms the loweſt note of the CHORD, and from whence are deduced the harmonical relations of the reſt; or, which ſerves for a key to the tone*. The *fundamental baſs* is that which ſerves for a foundation to the harmony. A *fundamental chord* is that whoſe baſs is fundamental, and in which the ſounds are ranged in the ſame order as when they are generated, according to the experiment ſo often repeated by M. d'Alembert, in his Preliminary Diſcourſe and Elements of Muſic †. But as this order removes the parts to an extreme diſtance one from the other, they muſt be approximated by combinations or inverſions; but if the baſs remains the ſame, the chord does not for this reaſon ceaſe to bear the name of *fundamental*. Such an example is this chord, *ut mi ſol*, included in the interval of a fifth: whereas, in the order of its generation, *ut ſol mi*, it includes a tenth, and even a ſeventeenth; ſince the fundamental *ut* is not the fifth of *ſol*, but the octave of that fifth.

* See *Tonic.*

† See *Muſic.*

FUNDAMENTAL Baſs. This part in muſic is, according to Rouſſeau, and indeed according to all authors who have proceeded upon M. Rameau's experiment, in its primary idea, that baſs which is formed by the fundamental notes of every perfect chord that conſtitutes the harmony of the piece; ſo that under each chord it cauſes to be heard, or underſtood, the fundamental ſound of that particular chord; that is to ſay, the ſound from whence it is derived by the rules of harmony. From whence we may ſee, that the fundamental baſs can have no other contexture than that of a regular and fundamental ſucceſſion, without which the procedure of the upper parts would be illegitimate.

To underſtand this well, it is neceſſary to be known, that, according to the ſyſtem of Rameau, which Rouſſeau has followed in his Dictionary, every chord, tho' compoſed of ſeveral ſounds, can only have one which is its fundamental, *viz.* that which produces this chord, and which is its baſs according to the direct and natural order. Now, the baſs which prevails under all the other parts, does not always expreſs the fundamental ſounds of the chords: for amongſt all the ſounds which form a chord, the compoſer is at liberty to transfer to the baſs that which he thinks preferable; regard being had to the procedure of that baſs, to the beauty of the melody, and above all to the expreſſion, as may afterwards be explained. In this caſe the real fundamental ſound, inſtead of retaining its natural ſtation, which is in the baſs, will either be transferred to ſome of the other parts, or perhaps even entirely ſuppreſſed, and ſuch a chord is called an *inverted* chord. Fundamental.

In reality, ſays Rameau, a chord inverted does not differ from the chord in its direct and natural order from which it was produced: but as theſe ſounds form different combinations, theſe combinations have long been taken for fundamental chords; different names have been given them, (which may be ſeen at the word ACCORD, in Rouſſeau's Dictionary). Theſe names, by the perſons who beſtowed them, were thought to create and ſanctify their diſtinctions; as if a difference in names could really produce a difference in the ſpecies.

M. Rameau in his Treatiſe of Harmony has ſhown, and M d'Alembert in his Elements of Muſic has ſtill more clearly evinced, that many of theſe pretendedly different chords were no more than inverſions of one ſingle chord. Thus the chord of the ſixth is no more than the perfect chord of the third transferred to the baſs; by adding a fifth, we ſhall have the chord of the ſixth and fourth. Here there are three combinations of a chord, which only conſiſts of three ſounds; thoſe which contain four ſounds are ſuſceptible of four combinations, ſince each of theſe ſounds may be transferred to the baſs. But in adding beneath this another baſs which, under all the combinations of one and the ſame chord, always preſents the fundamental ſound; it is evident, that conſonant chords are reduced to the number three, and the number of diſſonant chords to four. Add to this all the chords by ſuppoſition, which may likewiſe be reduced to the ſame fundamentals, and you will find harmony brought to a degree of ſimplicity in which no perſon could ever hope to ſee it whilſt its rules remained in that ſtate of confuſion where M. Rameau found them. It is certainly, as that author obſerves, an aſtoniſhing occurrence, that the practice of this art could be carried ſo far as it really was, without knowing its foundation; and that all the rules were ſo exactly found, without having diſcovered the principle on which they depended.

After having ſhown what is the fundamental baſs beneath the chords, let us now ſpeak of its procedure, and of the manner in which it connects theſe chords among themſelves. Upon this point the precepts of the art may be reduced to the ſix following rules.

1. The fundamental baſs ought never to ſound any other notes than thoſe of the ſeries or tone in which the compoſer finds himſelf, or at leaſt thoſe of the ſeries or tone to which he chooſes to make a tranſition. This of all the rules for the fundamental baſs is the firſt and moſt indiſpenſable.

2. By the ſecond, its procedure ought to be ſo implicitly ſubjected to the laws of modulation, as never to ſuffer the idea of a former mode to be loſt till that of a ſubſequent one can be legitimately aſſumed; that is to ſay, that the fundamental baſs ought never to be devious,

2

Fundamental. vious, or ſuffer us to be one moment at a loſs in what mode we are.

3. By the third, it is ſubjected to the connection of chords and the preparation of diſſonances: a manœuvre which, as we ſhall afterwards ſee, is nothing elſe but a method of producing this connection, and which of conſequence is only neceſſary when the connection cannot ſubſiſt without it. See CONNECTION, PREPARATION.

4. By the fourth, it is neceſſitated, after every diſſonance, to purſue that career which the reſolution of the diſſonance indiſpenſably preſcribes. See RESOLUTION.

5. By the fifth, which is nothing elſe but a conſequence of the former, the fundamental baſs ought only to move by conſonant intervals; except alone in the operation of a broken cadence, or after a chord of the ſeventh diminiſhed, where it riſes diatonically. Every other motion of the fundamental baſs is illegimate.

6. By the ſixth, in ſhort, the fundamental baſs or harmony ought not to be ſyncopated; but to diſtinguiſh the bars and the times which they contain, by changes of chords properly marked with cadences; in ſuch a manner, for inſtance, that the diſſonances which ought to be prepared may find their preparation in the imperfect time, but chiefly that all the repoſes may happen in the perfect time. This ſixth rule admits of an infinite number of exceptions; but the compoſer ought however to be attentive to it, if he would form a muſic in which the movements are properly marked, and in which the bars may end gracefully.

Wherever theſe rules are obſerved, the harmony ſhall be regular and without fault: this, however, will not hinder the muſic from being deteſtable. See COMPOSITION.

A word of illuſtration on the fifth rule may not be uſeleſs. Whatever turn may be given to a fundamental baſs, if it is properly formed, one of theſe alternatives muſt always be found: either perfect chords moving by conſonant interyals, without which theſe chords would have no connection; or, diſſonant chords in operations of cadence: in every other caſe, the diſſonance can neither be properly placed nor properly reſolved.

From thence it follows, that the fundamental baſs cannot move regularly but in one of theſe three manners. 1ſt, To riſe or deſcend by a third or by a ſixth. 2dly, By a fourth or a fifth. 3dly, To riſe diatonically by means of the diſſonance which forms the connection, or by a licence upon a perfect chord. With reſpect to a diatonic deſcent, it is a motion abſolutely prohibited to the fundamental baſs; or, at moſt, merely tolerated in caſes where two perfect chords are in ſucceſſion, divided by a cloſe expreſſed or underſtood. This rule has no other exception: and it is from not diſcerning the foundation of certain tranſitions, that M. Rameau has cauſed the fundamental baſs to deſcend diatonically under chords of the ſeventh; an operation which is impracticable in legitimate harmony. See CADENCE, DISSONANCE.

The fundamental baſs, which they add for no other reaſon than to ſerve as a proof of the harmony, muſt be retrenched in execution, and often in practice it would have a very bad effect; for it is, as M. Rameau very properly obſerves, intended for the judgment, and not for the ear. It would at leaſt produce a monotony extremely nauſeous by frequent returns of the ſame chord, which they diſguiſe and vary more agreeably by combining it in different manners upon the continued baſs, without reckoning upon the different inverſions of harmony, which furniſh a thouſand means of adding new beauties to the muſic and new energy to the expreſſion. See CHORD, INVERSION. Fundamental

But it will be objected, If the fundamental baſs is not uſeful in compoſing good muſic, if it muſt even be retrenched in practice, what good purpoſe, then, can it ſerve? We anſwer, that, in the firſt place, it ſerves for a rule to ſcholars, upon which they may learn to form a regular harmony, and to give to all the parts ſuch a diatonic and elementary procedure as is preſcribed them by that fundamental baſs. It does more, as we have already ſaid: it proves whether a harmony already formed be juſt and regular; for all harmony which cannot be ſubjected to the teſt of a fundamental baſs, muſt according to all rules be bad. Finally, it ſerves for the inveſtigation of a continued baſs under a given air: though, in reality, he who cannot directly form a continued baſs, will ſcarcely be able to form a fundamental baſs, which is better; and much leſs ſtill will he be able to transform that fundamental baſs into a legitimate continued baſs. Theſe which follow are, however, the principal rules which M. Rameau preſcribes for finding the fundamental baſs of a given air.

1. To aſcertain with preciſion the mode in which the compoſer begins, and thoſe through which he paſſes. There are alſo rules for inveſtigating the modes; but ſo long, ſo vague, ſo incomplete, that with reſpect to this, the ear may be formed long before the rules are acquired; and the dunce who ſhould try to uſe them, would gain no improvement but the habit of proceeding always note by note, without even knowing where he is.

2. To try in ſucceſſion under each note the principal chords of the mode, beginning by thoſe which are moſt analogous, and paſſing even to the moſt remote, when the compoſer ſees himſelf under a neceſſity of doing ſo.

3. To conſider whether the chord choſen can ſuit the upper part in what precedes and in what follows, by a juſt fundamental ſucceſſion: and when this is impracticable, to return the way he came.

4. Not to change the note of the fundamental baſs till after having exhauſted all the notes which are allowed in ſucceſſion in the upper part, and which can enter into its chord; or till ſome ſyncopated note in the air may be ſuſceptible of two or a greater number of notes in the baſs, to prepare the diſſonance which may be afterwards reſolved according to rule.

5. To ſtudy the intertexture of the phraſes; the poſſible ſucceſſion of cadences, whether full or avoided; and above all, the pauſes which for ordinary return at the end of every four, or of every two bars, ſo that they may always fall upon perfect and regular cadences.

6. In ſhort, to obſerve all the rules formerly given for the compoſition of the fundamental baſs.—Theſe are the principal obſervations to be made for finding one under any given air; for there are ſometimes ſeve-

Fundi
ll
Funeral.

ral different ones which may be inveſtigated. But, whatever may be ſaid to the contrary, if the air has accent and character, there is only one juſt fundamental baſs which can be adapted to it.

After having given a ſummary explication of the manner in which a fundamental baſs ſhould be compoſed, it ſhould remain to ſuggeſt the means of tranſforming it into a continued baſs; and this would be eaſy, if it were only neceſſary to regard the diatonic procedure and the agreeable air of this baſs. But let us not imagine that the baſs, which is the guide and ſupport of the harmony, the ſoul, and as it were the interpreter, of the air, ſhould be limited to rules ſo ſimple: there are others which depend upon principles more certain and more radical; fruitful, but latent principles, which have been felt by every artiſt of genius, without having been detected by any one. Rouſſeau hopes, that in his letter upon French muſic he inſinuated this principle. For thoſe who underſtand him, he imagines he has ſaid enough concerning it, and can never ſay enough of it for thoſe who do not. See *Rouſſeau's Miſcellanies*, Vol. II. p. 1.

He does not here mention the ingenious ſyſtem by M. Serre of Geneva, nor his double fundamental baſs; becauſe the principles which, with a ſagacity meritorious of praiſe, he had half detected, have afterwards been unfolded by M. Tartini, in a work of which Rouſſeau has given an account in his article SYSTEM.

FUNDI (anc. geog.), a town of Latium, on the Via Appia, near Cajeta; enjoying all the privileges of Roman citizens, except the right of ſuffrage and of magiſtracy. Now *Fondi;* a city of Naples, on the confines of the pope's dominions. E. Long. 14. 20. N. Lat. 41. 35.

FUNDY-BAY, a bay ſeated between New-England and Acadia or New Scotland, in which there is an excellent fiſhery.

FUNEN, or FIONIA, a conſiderable iſland in Denmark, ſeated on the Baltic ſea, and ſeparated from Jutland by a ſtrait called the *Leſſer Belt*, and from the iſland of Zealand by another called the *Great Belt*. It is fertile in wheat and barley; and abounds in cattle, horſes, game of all ſorts, and fiſh. Odenſee is the capital town.

FUNERAL RITES, ceremonies accompanying the interment or burial of any perſon. The word is formed of the Latin *funus*: and that of *funalia*, on account of the torches (which were *funes cera circumdati*) uſed in the funerals of the Romans; though others derive *funus* from the Greek φονος, *death* or *ſlaughter*.

Theſe rites differed among the ancients according to the different genius and religion of each country.

The firſt people who ſeem to have paid any particular reſpect to their dead, were the Egyptians, the poſterity of Ham. The firſt cultivators of idolatrous worſhip and ſuperſtition after the flood; they were alſo the firſt who aſſerted the immortality of the ſoul, its migration into all kinds of animals in earth, air, and ſea, and its return to the human body; which they ſuppoſed to be within the term of 3000 years: Hence proceeded their very great care in embalming of their dead bodies, and their being at ſuch vaſt expences, as they were, in building proper repoſitories for them; for they were more ſolicitous about their graves than their houſes: This gave birth to thoſe wonders of the world, the pyramids, which were built for the burial of their kings, with ſuch vaſt charges, and almoſt incredible magnificence. See PYRAMID. Funeral.

Whenever a perſon died among the *Egyptians*, his parents and friends put on mournful habits, and abſtained from all banquets and entertainments. This mourning laſted from 40 to 70 days, during which time they embalmed the body. See EMBALMING.

When this ceremony was finiſhed, the embalmed body was reſtored to the friends, who placed it in a kind of open cheſt, which was preſerved either in their houſes, or in the ſepulchres of their anceſtors. But before the dead were allowed to be depoſited in the tomb, they underwent a ſolemn judgement, which extended even to their kings. Of this remarkable cuſtom we have a particular account in the firſt book of Diodorus Siculus. "Thoſe who prepare to bury a relation, give notice of the day intended for the ceremony to the judges, and to all the friends of the deceaſed; informing them, that the body will paſs over the lake of that diſtrict to which the dead belonged: when, on the judges aſſembled, to the number of more than 40, and ranging themſelves in a ſemicircle on the farther ſide of the lake, the veſſel is ſet afloat, which thoſe who ſuperintend the funeral have prepared for this purpoſe. This veſſel is managed by a pilot, called in the Egyptian language Charon; and hence they ſay, that Orpheus, travelling in old times into Egypt, and ſeeing this ceremony, formed his fable of the infernal regions, partly from what he ſaw, and partly from invention. The veſſel being launched on the lake before the coffin which contains the body is put on board, the law permits all, who are ſo inclined, to produce an accuſation againſt it. If any one ſteps forth, and proves that the deceaſed has led an evil life, the judges pronounce ſentence, and the body is precluded from burial; but if the accuſer is convicted of injuſtice in his charge, he falls himſelf under a conſiderable penalty. When no accuſer appears, or when the accuſer is proved to be an unfair one, the relations, who are aſſembled, change their expreſſions of ſorrow into encomiums on the dead: yet do not, like the Greeks, ſpeak in honour of his family, becauſe they conſider all Egyptians as equally well-born; but they ſet forth the education and manners of his youth, his piety and juſtice in maturer life, his moderation, and every virtue by which he was diſtinguiſhed; and they ſupplicate the infernal deities to receive him as an aſſociate among the bleſt. The multitude join their acclamations of applauſe in this celebration of the dead, whom they conſider as going to paſs an eternity among the juſt below." Such is the deſcription which Diodorus gives of this funeral judicature, to which even the kings of Egypt were ſubject. The ſame author aſſerts, that many ſovereigns had been thus judicially deprived of the honours of burial by the indignation of their people: and that the terrors of ſuch a fate had the moſt ſalutary influence on the virtue of their kings.

The funeral rites among the *Hebrews* were ſolemn and magnificent. When any perſon was dead, his relations and friends rent their cloaths; which cuſtom is but faintly imitated by the modern Jews, who only cut off a bit of their garment, in token of affliction. It was uſual to bend the dead perſon's thumb into the hand, and faſten it in that poſture with a ſtring; be-

Funeral.

cauſe the thumb then having the figure of the name of God, they thought the devil would not dare to approach it. When they came to the burying-place, they made a ſpeech to the dead in the following terms: "Bleſſed be God, who has formed thee, fed thee, maintained thee, and taken away thy life. O dead! he knows your numbers, and ſhall one day reſtore your life, &c." Then they ſpoke the elogium, or funeral oration, of the deceaſed; after which they ſaid a prayer, called the *righteouſneſs of judgment*; then turning the face of the deceaſed towards heaven, they called out, "Go in peace."

Among the ancient *Greeks* it was uſual ſometimes before the interment, to put a piece of money into the mouth of the deceaſed, which was thought to be Charon's fare for waſting the departed ſoul over the infernal river. This ceremony was not uſed in thoſe countries which were ſuppoſed to be ſituated in the neighbourhood of the infernal regions, and to lead thither by a ready and direct road. The corpſe was likewiſe furniſhed with a cake, compoſed of flour, honey, &c. which was deſigned to appeaſe the fury of Cerberus the door-keeper of hell, and to procure the ghoſt a ſafe and quiet entrance. During the time the corpſe continued in the houſe, there ſtood before the door a veſſel of water: the deſign of which was, that thoſe concerned about the body might purify themſelves by waſhing; it being the opinion of the Greeks, as well as of the Jews, that pollution was contracted by touching a dead body.

The ceremonies by which they expreſſed their ſorrow for the death of their friends were various; but it ſeems to have been a conſtant rule to recede as much as poſſible in habit and behaviour from their ordinary cuſtoms. For this reaſon they abſtained from banquets and entertainments; they diveſted themſelves of all ornaments; they tore, cut off, or ſhaved their hair, which they caſt into the funeral pile, to be conſumed with the body of their deceaſed friend. Sometimes they threw themſelves on the ground, and rolled in the duſt, or covered their head with aſhes; they beat their breaſts, and even tore their fleſh with their nails, upon the loſs of a perſon they much lamented. When perſons of rank, ſuch as public magiſtrates or great generals, died, the whole city put on a face of mourning; all public meetings were intermitted; the ſchools, baths, ſhops, temples, and all places of concourſe, were ſhut up.

After interment followed the *epulæ* or feaſts, at which the company uſed to appear crowned; when they ſpoke in praiſe of the dead, ſo far as they could go with truth, it being eſteemed a notorious wickedneſs to lie upon ſuch an occaſion. And not only at thoſe feaſts, but even before the company departed from the ſepulchre, they were ſometimes entertained with a panegyric upon the dead perſon.

The Grecian ſoldiers, who died in war, had not only their tombs adorned with inſcriptions ſhowing their names, parentage, and exploits, but were alſo honoured with an oration in their praiſe. Particularly the cuſtom among the Athenians in the interment of their ſoldiers was as follows, namely, "They uſed to place the bodies of their dead in tents three days before the funeral, that all perſons might have opportunity to find out their relations, and pay their laſt reſpects to them. Upon the fourth day, a coffin of cypreſs was ſent from every tribe, to convey the bones of their own relations; after which went a covered hearſe, in memory of thoſe whoſe bodies could not be found. All theſe, accompanied with the whole body of the people, were carried to the public burying place, called *Ceramicus*, and there interred. One oration was ſpoken in commendation of them all, and their monuments adorned with pillars, inſcriptions, and all other ornaments uſual about the tombs of the moſt honourable perſons. The oration was pronounced by the fathers of the deceaſed perſons, who had behaved themſelves moſt valiantly. Thus, after the famous battle at Marathon, the fathers of Callimachus and Cynægyrus were appointed to make the funeral oration. And upon the return of the day, upon which the ſolemnity was firſt held, the ſame oration was conſtantly repeated every year."

Interring or laying the dead in the ground, ſeems to have been the moſt ancient practice among the Greeks; though burning came afterwards to be generally uſed among them. It was cuſtomary to throw into the funeral pile thoſe garments the deceaſed uſually wore. The pile was lighted by one of the deceaſed's neareſt relations or friends, who made prayers and vows to the winds to aſſiſt the flames, that the body might quickly be reduced to aſhes; and during the time the pile was burning, the dead perſon's friends ſtood by it, pouring libations of wine, and calling upon the deceaſed.

The funeral rites among the *ancient Romans* were very numerous. The deceaſed was kept ſeven days; and every day waſhed with hot water, and ſometimes with oil, that, in caſe he were only in a ſlumber, he might be thus waked; and every now and then his friends meeting, made a horrible outcry or ſhout, with the ſame view; which laſt action they called *conclamatio*. The third conclamation was on the ſeventh day; when, if no ſigns of life appeared, the defunct was dreſſed and embalmed by the pollinctores; placed in a bed near the door, with his face and heels towards the ſtreet; and the outſide of the gate, if the deceaſed were of condition, was garniſhed with cypreſs boughs. In the courſe of theſe ſeven days, an altar was raiſed near his bed ſide, called *acerra*; on which his friends every day offered incenſe; and the libitinarii provided things for the funeral.

On the ſeventh day a crier was ſent about the city, to invite the people to the ſolemnization of the funeral in theſe words: *Exequias L. Tit. L. filii, quibus eſt commodum ire, jam tempus eſt. Olus* (i. e. *ille*) *ex ædibus efertur*. The people being aſſembled, the laſt conclamation ended, and the bed was covered with purple: a trumpeter marched forth, followed by old women called *præficæ*, ſinging ſongs in praiſe of the deceaſed: laſtly, the bed followed, borne by the next relations; and if the perſon were of quality and office, the waxen images of all his predeceſſors were carried before him on poles. The bed was followed by his children, kindred, &c. *atrati*, or in mourning: from which act of following the corpſe, theſe funeral rites were called *exequiæ*. The body thus brought to the roſtra, the next of kin, *laudabat defunctum pro roſtris*, made a funeral oration in his praiſe and that of his anceſtors. This done, the body was carried to the *pyra*, or funeral pile, and there burnt: his friends firſt cutting off a finger, to be buried

Funeral. ried with a second solemnity. The body consumed, the ashes were gathered; and the priest sprinkling the company thrice with clean water, the eldest of the *præfiæ* crying aloud, *ilicet*, dismissed the people, who took their leave of the deceased in this form, *Vale, vale, vale: nos te ordine quo natura permiserit, sequemur.*—The ashes, inclosed in an urn, were laid in the sepulchre or tomb.

The *ancient Christians* testified their abhorrence of the Pagan custom of burning the dead; and always deposited the body entire in the ground: and it was usual to bestow the honour of embalming upon the martyrs at least, if not upon others. They prepared the body for burial, by washing it with water, and dressing it in a funeral attire. The exportation or carrying forth of the body was performed by near relations, or persons of such dignity as the circumstances of the deceased required. Psalmody, or singing of psalms, was the great ceremony used in all funeral processions among the ancient Christians.

In the *Romish church*, when a person is dead, they wash the body, and put a crucifix in its hand. At its feet stands a vessel full of holy water, and a sprinkler, that they who come in may sprinkle both themselves and the deceased. In the mean time some priest stands by the corpse, and prays for the deceased till it is laid in the earth. In the funeral procession, the exorcist walks first, carrying the holy water; next the cross-bearer, afterwards the rest of the clergy, and last of all the officiating priest. They all sing the *miserere*, and some other psalms; and at the end of each psalm a *requiem*. We learn from Alet's ritual, that the faces of deceased laymen must be turned towards the altar, when they are placed in the church; and those of the clergy, towards the people. The corpse is placed in the church surrounded with lighted tapers: after the office for the dead, mass is said; then the officiating priest sprinkles the corpse thrice with holy water, and as often throws incense on it. The body being laid in the grave, the friends and relations of the deceased sprinkle the grave with holy water.

The funeral ceremonies of the *Greek church* are much the same with those of the Latin. It needs only be observed, that, after the funeral service, they kiss the crucifix, and salute the mouth and forehead of the deceased: after which each of the company eats a bit of bread and drinks a glass of wine in the church, wishing the soul a good repose, and the afflicted family all consolation.

Funeral-Games, a part of the ceremony of the ancient funerals.

It was customary for persons of quality, among the ancient Greeks and Romans, to institute games, with all sorts of exercises, to render the death of their friends more remarkable. This practice was generally received, and is frequently mentioned by ancient writers. Patroclus's funeral games take up the greatest part of one of Homer's Iliads; and Agamemnon's ghost is introduced by the same poet, telling the ghost of Achilles, that he had been a spectator at a great number of such solemnities.

The celebration of these games among the Greeks mostly consisted of horse-races; the prizes were of different sorts and value, according to the quality and magnificence of the person that celebrated them. The garlands given to victors on this occasion were usually of parsley, which was thought to have some particular relation to the dead. Fu

Those games, among the Romans, consisted chiefly of processions; and sometimes of mortal combats of gladiators around the funeral pile. They, as well as the Greeks, had also a custom, though very ancient, of cutting the throats of a number of captives before the pile, as victims to appease the manes of the deceased. Cæsar relates, that the Gauls had this custom.

The funeral games were abolished by the emperor Claudius.

Funeral Oration, a discourse pronounced in praise of a person deceased, at the ceremony of his funeral.

This custom is very ancient. In the latter part of the account above given of the Egyptian ceremonies of interment, may be perceived the first rudiments of funeral orations, and what was the subject of them, which were afterwards moulded into a more polite and regular form by other nations, who adopted this custom. Nor can we omit remarking, that those funeral solemnities were attended not only with orations in praise of the deceased, but with prayers for him; which prayers, it seems, were made by one who personated the deceased: an entire form of one of them is preserved by Porphyry, and perhaps it may in some measure gratify the reader's curiosity to recite it from him. "When (says he) they (the Egyptians) embalm their deceased nobles, they privately take out the entrails, and lay them up in an ark or chest: moreover, among other things which they do in favour of the deceased, lifting up the ark or chest to the sun, they invoke him; one of the *Libitinarii* making a prayer for the deceased, which Euphantus has translated out of the Egyptian language, and is as follows:—O lord, the sun, and all the gods who give life to men, receive me, and admit me into the society of the immortal ones; for as long as I lived in this world, I religiously worshipped the gods whom my parents showed me, and have always honoured those who begat my body: nor have I killed any man, nor have I defrauded any of what has been committed to my trust, nor have I done any thing which is inexpiable. Indeed, whilst I was alive, if I have sinned either by eating or drinking any thing which was not lawful; not through myself have I sinned, but through these, showing the ark and chest where the entrails were. And having thus spoke, he casts it into the river, but the rest of the body he embalms as pure."

The Grecians received the seeds of superstition and idolatrous worship from the Egyptians, through the coming of Cecrops, Cadmus, Danaus, and Erechtheus, into Greece; and among other customs transplanted from Egypt, were the solemnities used at the burial of the dead. Of these, an encomium on the deceased always formed a part, as particularly noticed under the preceding article.

From the Egyptians and Grecians, especially from the latter, the Romans received many of their laws and customs, as well as much of their polytheism and idolatrous worship. It is well known, that the custom of making funeral orations in praise of the dead obtained among them; and the manner in which their funeral services were performed has been already described.

scribed. The corpse being brought into their great oratory, called the *Rostra*, the next of the kin *laudabat defuncum pro rostris*, that is, made a funeral oration, in the commendation principally of the party deceased, but touching the worthy acts also of those his predecessors whose images were there present. The account given by Dr Kennet is in these words: "In all the funerals of note, especially in the public or indictive, the corpse was first brought with a vast train of followers into the Forum; here one of the nearest relations ascended the rostra, and obliged the audience with an oration in praise of the deceased. If none of the kindred undertook the office, it was discharged by some of the most eminent persons in the city for learning and eloquence, as Appian reports of the funeral of Sylla. And Pliny the younger reckons it as the last addition to the happiness of a very great man, that he had the honour to be praised at his funeral by the most eloquent Tacitus, then consul; which is agreeable to Quintilian's account of this matter, *Nam et funebres*, &c. For the funeral orations (says he) depend very often on some public office, and by order of senate are many times given in charge to the magistrates to be performed by themselves in person. The invention of this custom is generally attributed to Valerius Poplicola, soon after the expulsion of the regal family. Plutarch tells us, that honouring his colleague's obsequies with a funeral oration, it so pleased the Romans, that it became customary for the best men to celebrate the funerals of great persons with speeches in their commendations." Thus Julius Cæsar, according to custom, made an oration in the rostra, in praise of his wife Cornelia, and his aunt Julia, when dead; wherein he showed, that his aunt's descent, by her mother's side, was from kings, and by her father's from the gods. Plutarch says, that "he approved of the law of the Romans, which ordered suitable praises to be given to women as well as to men, after death." Though by what he says in another place, it seems that the old Roman law was, that funeral orations should be made only for the elder women; and therefore he says, that Cæsar was the first that made one upon his own wife, it not being then usual to take notice of younger women in that way: but by that action he gained much favour from the populace, who afterwards looked upon him, and loved him as a very mild and good man. The reason why such a law was made in favour of the women, Livy tells us, was this, That when there was such a scarcity of money in the public treasury, that the sum agreed upon to give the Gauls to break up the siege of the city and capital could not be raised, the women collected among themselves and made it up; who hereupon had not only thanks given them, but this additional honour, that after death, they should be solemnly praised as well as the men: which looks as if, before this time, only the men had those funeral orations made for them.

This custom of the Romans very early obtained among the Christians. Some of their funeral sermons or orations are now extant, as that of Eusebius on Constantine; and those of Nazianzen on Basil and Cæsarius: and of Ambrose on Valentinian, Theodosius, and others. Gregory, the brother of Basil, made τριακοστιον λογον, a funeral oration, for Melitius bishop of Antioch: in which orations, they not only praised the dead, but addressed themselves to them, which seems to have introduced the custom of praying to departed saints. Now these orations were usually made before the bodies of the deceased were committed to the ground; which custom has been more or less continued ever since, to this day. Funeral, Fungi.

Thus it appears, that those rites and ceremonies among the heathens, which have been delivered from one people to another, are what have given birth to

Funeral Sermons and Orations among Christians. Though this practice is considerably improved, and cleared of many things which would smell too rank of paganism, and is thrown into a method which, perhaps, may be of some service to Christianity; yet, notwithstanding this new dress, its original may very easily be discerned. The method in which the characters of deceased persons are given in our funeral sermons, is very much the same with that observed in those pagan orations; where first an account is given of the parentage of the deceased, then of his education; after that, we hear of his conduct in riper years: then his many virtues are reckoned up, with his generous, noble, and excellent performances.—Nor let the practice be condemned because of its rise and original; for why may not the custom of heathens, if just and laudable in themselves, and no ways pernicious to Christianity in their consequences, be followed by Christians? Only, since we are come into this practice, there is one thing we should take care to follow them in; and that is, not to make those sermons or orations for every one; but for those only whose characters are distinguished, who have been eminently useful in the world, and in the church of Christ. The old heathens honoured those alone with this part of the funeral solemnity, who were men of probity and justice, renowned for their wisdom and knowledge, or famous for warlike exploits: This, as Cicero* informs us, being part of the law for burials, which directs, that the praises only of honourable persons shall be mentioned in the oration. It would be much more agreeable, therefore, if our funeral discourses were not so common, and if the characters given of the deceased were more just; devoid of that fulsom flattery with which they too often abound.

* *De Leg.* l. 2.

FUNGI (from σφογγος, *fungus*), the name of the 4th order of the 24th class of vegetables, in the Linnæan system; comprehending all those which are of the mushroom kind, and which in Tournefort constitute the 2d, 3d, 4th, 5th, 6th, 7th, and 8th, genera of the first section in the class xvii. This order in Linnæus contains 10 genera. See AGARICUS, BOLETUS, CLAVARIA, LYCOPERDON, &c.

FUNGI, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus. See BOTANY, p. 470.

The ancients called fungi *children of the earth*, meaning, no doubt, to indicate the obscurity of their origin. The moderns have likewise been at a loss in what rank to place them; some referring them to the animal, some to the vegetable, and others to the mineral kingdom.

Messrs Wilck and Münchausen have not scrupled to rank these bodies in the number of animal productions; because, when fragments of them or their seeds were macerated in water, these gentlemen perceived a quantity of animalcules discharged, which they supposed capable

Fungi. capable of being changed into the ſame ſubſtance. It was the ancient opinion, that beef could produce bees; but it was reſerved for Meſſrs Wilck and Munchauſen to ſuppoſe, that bees could produce beef. Wilck aſſerts, that fungi conſiſt of innumerable cavities, each inhabited by a polype; and he does not heſitate to aſcribe the formation of them to their inhabitants, in the ſame way as it has been ſaid that the coral, the lichen, and the mucor, were formed. Hedwig has lately ſhown how ill founded this opinion is with reſpect to the lichen; and M. Durande has demonſtrated its falſity with regard to the corallines. "Indeed (ſays M. Bonnet, talking of the animality of fungi) nothing but the rage for paradox could induce any one to publiſh ſuch a fable; and I regret that poſterity will be able to reproach our times with it. Obſervation and experiment ſhould enable us to overcome the prejudices of modern philoſophy; now, that thoſe of the ancient have diſappeared and are forgotten."

It cannot be denied that the muſhroom is one of the moſt periſhable of all plants, and it is therefore the moſt favourable for the generation of inſects. Conſidering the quickneſs of its growth, it muſt be furniſhed with the power of copious abſorption; the extremity of its veſſels muſt be more dilated than in other plants. Its root ſeems, in many caſes, to be merely intended for its ſupport; for ſome ſpecies grow upon ſtones or moveable ſand, from which it is impoſſible that they can draw much nouriſhment. We muſt therefore ſuppoſe, that it is chiefly by the ſtalk that they abſorb. Theſe ſtalks grow in a moiſt and tainted air, in which float multitudes of eggs, ſo ſmall, that the very inſects they produce are with difficulty ſeen by the microſcope. Theſe eggs may be compared to the particles of the Byſſus, 100,000 of which, as M. Gleditſch ſays, are not equal to the fourth of a grain. May we not ſuppoſe, that a quantity of ſuch eggs are abſorbed by the veſſels of the fungus, that they remain there, without any change, till the plant begins to decay? Beſides, the eggs may be only depoſited on the ſurface of the plant, or they may exiſt in the water into which they are thrown for examination. Do not we ſee that ſuch eggs, diſperſed through the air, are hatched in vinegar, in paſte, &c. and wherever they find a convenient nidus for their developement? Can it be ſurpriſing then, that the corruption of the muſhroom ſhould make the water capable of diſcloſing certain beings that are really foreign to both?

It is not more eaſy to acquieſce in the opinions of thoſe naturaliſts who place the fungi in the mineral kingdom, becauſe they are found growing on porous ſtones, thence called *Lapides Fungarii;* which, however, muſt be covered with a little earth, and be watered with tepid water, in order to favour the growth. Such muſhrooms are no more the produce of the ſtone, than the lichen is of the rock to which it adheres, or the moſs of the tree on which it is found. We have only to obſerve the growth of muſhrooms, to be convinced, that this happens by developement, and not by addition or combination of parts as in minerals. The opinion of Boccone, who attributed them to an unctuous matter performing the function of ſeed, and acquiring extenſion by appoſition of ſimilar parts; and that of Moriſon, who conceived that they grew ſpontaneouſly out of the earth by a certain mixture of ſalt and ſulphur, joined with oils from the dung of quadrupeds; have now no longer any adherents. Fungi are produced, they live, they grow, by developement; they are expoſed to thoſe viciſſitudes natural to the different periods of life which characteriſe living ſubſtances; they periſh and die. They extract, by the extremity of their veſſels, the juices with which they are nouriſhed; they elaborate and aſſimilate them to their own ſubſtance. They are, therefore, organized and living beings, and conſequently belong to the vegetable kingdom. But whether they are real plants, or only the production of plants, is ſtill a matter in diſpute with the ableſt naturaliſts. F

Some ancient authors have pretended to diſcover the ſeed of muſhrooms; but the opinion was never generally received. Petronius, when he is laughing at the ridiculous magnificence of his hero Trimalcio, relates, that he had written to the Indies for the ſeed of the morelle.

Theſe productions were generally attributed to the ſuperfluous humidity of rotten wood, or other putrid ſubſtances. The opinion took its riſe from obſerving that they grew moſt copiouſly in rainy weather. Such was the opinion of Tragus, of Bauhin, and even of Columna, who, talking of the peziza, ſays, that its ſubſtance was more ſolid and harder, becauſe it did not originate from rotten wood, but from the *pituita* of the earth. It is not ſurpriſing that, in times when the want of experiment and obſervation made people believe that inſects could be generated by putrefaction, we ſhould find the opinion general, that fungi owed their origin to the putreſcence of bodies, or to a viſcous humour analogous to putridity.

Malpighi could not ſatisfy himſelf as to the exiſtence of ſeeds which other botaniſts had pretended to diſcover. He only ſays, that theſe plants muſt have them, or that they perpetuate themſelves and ſhoot by fragments. Micheli, among the moderns, appears to have employed himſelf moſt ſucceſsfully on this ſubject. He imagined, that he not only ſaw the ſeeds, but even the ſtamina, as well as the little tranſparent bodies deſtined to favour the diſſemination and the fecundation of theſe ſeeds. Before this author, Liſter thought he perceived ſeeds in the *Fungus peroſus craſſus magnus* of John Bauhin: the little round bodies that are found in the peziæ and helvellæ, at that time, paſſed for ſeeds; which did not appear at all probable to Marſigli, conſidering that the eye, when aſſiſted with the very beſt microſcopes, could perceive nothing ſimilar in much larger fungi. Indeed theſe bodies may be the capſules or covers of the ſeeds, if they are not the ſeeds themſelves. However this may be, Marſigli, obſerving that fungi were often without roots or branches, and that they wanted flowers and ſeeds, the means which nature employs for the production of perfect plants, thought himſelf warranted in doubting whether theſe beings could be ranked in the number of vegetables.

The doubts of Marſigli prompted him to obſerve the formation of fungi. Their matrix he called *Situs:* he imagined they grew in places where they met with an unctuous matter, compoſed of an oil mixed with nitrous ſalt, which, by fermentation, produced heat and moiſture, and inſinuated itſelf between the fibres of wood; that is, he imagined them the production of a viſcous and putreſcent humour. Lanciſi, in like manner, conſidered

Fungi. sidered fungi as owing their exiſtence to the putrefaction of vegetables, and ſuppoſed them a diſeaſe in the plant; but he imagined, "that the fibres of the tree were neceſſary to their production," as is the caſe in the formation of galls; he compared them to the warts and other excreſcences of the human body. He added, that ſuch fungous vegetable tumors muſt neceſſarily aſſume various forms and figures, from the fluids which diſtend the tubes and veſſels relaxed by putreſcence, from the ductility of the fibres and their direction, and from the action of the air.

This opinion has been refuted by the celebrated naturaliſt M. de Juſſieu, in the Memoirs of the Academy of Sciences for the year 1728. He maintains, that the fungi have a great analogy with the lichen, which is allowed to be a vegetable; that, like the lichen, they are diveſted of ſtalk, branches, and leaves: that, like it, they grow and are nouriſhed upon the trunks of trees, on pieces of rotten wood, and on all ſorts of putrid vegetables; that they reſemble the lichen too in the rapidity of their growth, and the facility with which many of them may be dried and reſtored to their former figure, upon being immerſed in water; and, laſtly, that there is a great ſimilarity in the manner in which their ſeeds are produced. He affirms, that only the warts and excreſcences which grow on animal bodies, and the knots and other tumors that are to be found on trees, can be compared with one another; for they are compoſed equally of the ſolid and liquid ſubſtance of the plant or animal on which they grow; whereas, the matter of the fungi is not only quite diſtinct from that of the plants on which they are found, but often entirely ſimilar to the ſubſtance of thoſe that ſpring immediately from the earth.

The organization, ſays M. de Juſſieu, which diſtinguiſhes plants and other productions of nature, is viſible in the fungi; and the particular organization of each ſpecies is conſtant at all times and in all places; a circumſtance which could not happen if there were not an animal reproduction of ſpecies, and conſequently a multiplication and propagation by ſeed. This is not, he ſays, an imaginary ſuppoſition; for the ſeeds may be felt like meal upon muſhrooms with gills, eſpecially when they begin to decay; they may be ſeen with a magnifying glaſs, in thoſe that have gills with black margins: and, laſtly, ſays he, botaniſts can have no doubt that fungi are a diſtinct claſs of plants, becauſe, by comparing the obſervations made in different countries with the figures and deſcriptions of ſuch as have been engraven, the ſame genera and the ſame ſpecies are every where found.

Notwithſtanding this refutation by M. de Juſſieu, another naturaliſt, M de Necker, has lately maintained, in his work intitled *Mycitologia*, That the fungi ought to be excluded from the three kingdoms of nature, and be conſidered as intermediate beings. He has obſerved, like Marſigli, the matrix of the fungi: and has ſubſtituted the word *carchi* (initium faciens) inſtead of *ſitus*; imagining that the rudiment of the fungus cannot exiſt beyond that point in which the developement of the filaments or fibrous roots is perceived. He allows, that fungi are nouriſhed and grow like vegetables; but he thinks that they differ very much from them in reſpect of their origin, ſtructure, nutrition, and rapidity of growth. He ſays, that the various veſ- Fungi.

ſels which compoſe the organization of vegetables are not to be found in the fungi, and that they ſeem entirely compoſed of cellular ſubſtance and bark; ſo that this ſimple organization is nothing more than an aggregation of veſſels endowed with a common nature, that ſuck up the moiſture in the manner of a ſponge; with this difference, that the moiſture is aſſimilated into a part of the fungus. Laſtly, That the fructification, the only eſſential part of a vegetable, and which diſtinguiſhes it from all other organized bodies, being wanting, fungi cannot be conſidered as plants. This he thinks confirmed by the conſtant obſervation of thoſe people who gather the morelle and the muſhroom, and who never find them in the ſame ſpots where they had formerly grown. As the generation of fungi, ſays M. Necker, is always performed when the parenchymatous or cellular ſubſtance has changed its nature, form, and function, we muſt conclude that it is the degeneration of that part which produces theſe bodies.

But if fungi were owing merely to the degeneration of plants, they would be ſtill better intitled to conſtitute a new kingdom. They would then be a decompoſition, not a new formation or new bodies. Beſides, we cannot deny, that in thoſe bodies which form the limit between the animal and vegetable kingdoms, the organization becomes ſimple, as the organs deſtined for nutrition are multiplied; but, as the laſt in the claſs of inſects belongs to the animal kingdom, fungi ought, notwithſtanding the ſimplicity of their organization, ſtill to belong to the vegetable kingdom. The parenchymatous or cellular ſubſtance, which, as Mr Bonnet ſays, is univerſally extended, embraces the whole fibrous ſyſtem, and becomes the principal inſtrument of growth, muſt naturally be more abundant in theſe productions; and this accounts for the rapidity of their enlargement. Beſides, growth, whether ſlow or rapid, never was employed to determine the preſence or abſence of the vegetable or animal character. The *draba verna*, which in a few weeks ſhoots, puts forth its leaves, its flowers, and fruit, is not leſs a plant than the palm. The inſect that exiſts but for a day, is as much an animal as the elephant that lives for centuries. As to the ſeeds of the fungi, it is probable that nature meant to withdraw from our eyes the diſſemination of theſe plants, by making the ſeeds almoſt imperceptible; and it is likewiſe probable, that naturaliſts have ſeen nothing but their capſules. Since, however, from the imperfection of our ſenſes, we are unable to perceive theſe ſeeds, ought we to infer that they do not exiſt? Are we authorized to conclude this, becauſe we do not find muſhrooms where we have found them a year before? Undoubtedly not; for the greater part of plants require a particular ſoil, and the ſame mould that this year will foſter a rare plant, will next year allow it to periſh. Neither are we at liberty to deny the exiſtence of theſe ſeeds, becauſe thoſe bodies which have been called their ſeeds, and the fragments or cuttings of the plants themſelves, have not produced others of the ſame ſpecies. Nature ſeems to have reſerved for herſelf the care of diſſeminating certain plants: It is in vain, for inſtance, that the botaniſt ſows the duſt found in the capſules of the orchis, which every one allows to be the ſeed. But, after all, what are thoſe parts in the fungi caſually obſerved by

Fungi || Furca.

naturaliſts, and which they have taken for the parts of fructification? Theſe are quite diſtinct from the other parts; and whatever may be their uſe, they cannot have been formed by a prolongation of the cellular ſubſtance, or of the fibres of the tree on which the fungus grows: they are, therefore, owing, like flower and fruit, to the proper organization of the plant. Theſe plants, therefore, have a particular exiſtence, independent of their putrefying nidus. The gills of certain fungi, which differ eſſentially from the reſt of the plant in their conformation, would be ſufficient to authorize this latter opinion. But can putrefaction create an organic ſubſtance?

Nature undoubtedly diſſeminates through the air, and over the ſurface of the earth, innumerable ſeeds of fungi, as well as eggs of inſects. The plant and the animal are excluded, when the nidus or the temperature is favourable for their developement. No fortuitous concourſe, either of atoms or fluids, could produce bodies ſo exquiſitely and ſo regularly organized. It is ſufficient to throw one's eyes on the beautiful plates which Schæffer has publiſhed of them, and compare them, by the glaſs, with the warts and other excreſcences of animals, to be convinced that they have not the ſame origin. The function of the cellular ſubſtance in vegetables muſt be greatly ſuperior to that in animals, if it could produce any thing but deformities.

The greater part of fungi exhibit a configuration much too regular, conſtant, and uniform, to be the effect of chance or putrefaction. As this form is preſerved the ſame in all places where fungi have been found, it follows, that they contain in themſelves the principles of their reproduction. They reſemble the miſletoe, and other paraſitic plants, which are perfectly diſtinct from the trees on which they grow. The fungi, therefore, are organized and living ſubſtances, or true plants. If the manner of their production is unknown, that of ſome inſects is ſo too.

FUNGIBLES, in Scots law, are ſuch things as are eſtimated by number, weight, or meaſure; as, coin, butter, ale, &c.

FUNGITÆ, in natural hiſtory, a kind of foſſile coral, of a conic figure, though ſometimes flatted and ſtriated longitudinally.

FUNGUS, in ſurgery, denotes any ſpongy excreſcence. See SURGERY.

FUNNEL *of a* CHIMNEY, the ſhaft or ſmalleſt part of the waſte, where it is gathered into its leaſt dimenſions.

Palladio directs, that the funnels of chimneys be carried through the roof four or five feet at leaſt, that they may carry the ſmoke clear from the houſe into the air. See the article CHIMNEY.

He alſo adviſes, that chamber chimneys be not made narrower than 10 or 11 inches, nor broader than 15: for if too narrow, the ſmoke will not be able to make its way; and, if too wide, the wind will drive it back into the room.

FUR, or FURR, in commerce. See FURR.

FURBISHER, a perſon who furbiſhes, poliſhes, or cleans arms, as guns, ſwords, piſtols, &c.; which is chiefly performed with emery. See the article EMERY.

FURCA, in antiquity, a piece of timber reſembling a fork, uſed by the Romans as an inſtrument of puniſhment.

The puniſhment of the furca was of three kinds: the firſt only ignominious, when a maſter, for ſmall offences, forced a ſervant to carry a furca on his ſhoulders about the city. The ſecond was penal, when the party was led about the circus, or other place, with the furca about his neck, and whipped all the way. The third was capital, when the malefactor having his head faſtened on the furca, was whipped to death.

Furche || Furies.

FURCHE', in heraldry, a croſs forked at the ends.

FURETIERE (Antony), an ingenious and learned Frenchman, was born at Paris in 1620; and after a liberal education became eminent in the civil and canon law. He was firſt an advocate in the parliament; and afterwards taking orders, was preſented with the abbey of Chalivoy, and the priory of Chuines. Many works of literature recommended him to the public: but what he is chiefly known by and valued for, is his Univerſal Dictionary of the French Tongue, in which he explains the terms of art in all ſciences. He had not, however, the pleaſure of ſeeing this uſeful work publiſhed before his death; which happened in 1688. He was of the French academy; and the diſputes and quarrels which he had with certain members of it made a great noiſe in the world.

FURIA, in zoology, a genus of inſects belonging to the order of vermes zoophyta. There is but one ſpecies, viz. the infernalis. This has a linear ſmooth body ciliated on each ſide, with reflexed feelers preſſed to its body. In Finland, Bothnia, and the northern provinces of Sweden, it was not unfrequently that people were ſeized with a pungent pain, confined to a point, in the hand or other expoſed part of the body, which preſently increaſed to a moſt excruciating degree, and hath ſometimes been ſuddenly fatal. This diſorder was more particularly obſerved in Finland, eſpecially about boggy and marſhy places, and always in autumn. At length it was diſcovered that this pain inſtantly ſucceeded ſomewhat that dropped out of the air, and in a moment penetrated and buried itſelf in the fleſh. The Finlanders had tried variety of applications to no purpoſe, until at length a poultice of curds or cheeſe was found the moſt effectual in eaſing the pain: and the event confirmed that the inſect was allured by this application to leave the fleſh; as, on its removal, this worm, no longer than the ſixth of an inch, was found in it, and thus the cauſe of this painful diſeaſe explained. But by what means this creature is raiſed into the air, is as yet unknown.

FURIES, in Pagan antiquity, certain goddeſſes whoſe office it was to puniſh the guilty after death. They were three in number: Alecto, Megæra, and Tiſiphone; who were deſcribed with ſnakes inſtead of hair, and eyes like lightning, carrying iron chains and whips in one hand, and in the other flaming torches; the latter to diſcover, and the former to puniſh, the guilty: and they were ſuppoſed to be conſtantly hovering over ſuch perſons as had been guilty of any enormous crime.

Mythologiſts ſuppoſe, that Tiſiphone puniſhed the crimes which ſprang from hatred or anger; Megæra, thoſe from envy: and Alecto, thoſe from an inſatiable purſuit after riches and pleaſure. They were worſhipped at Caſina in Arcadia, and at Carmia in Peloponneſus. They had a temple at Athens near the Areopagus,

Furius
||
Furnace.

gus, and their prieſts were choſen from amongſt the judges of that court. At Telphuſia, a city in Arcadia, a black ewe was ſacrificed to them.

FURIUS (Bibaculus), a Latin poet who flouriſhed about 103 B. C. He wrote annals in verſe, of which Macrobius recites ſome fragments. Suetonius alſo relates ſome verſes of his on Valerius Cato, in his Illuſtrious Grammarians.

FURLING, in the ſea language, ſignifies the wrapping up and binding any ſail cloſe to the yard; which is done by hawling upon the clew-lines, buntlines, &c. which wraps the ſail cloſe together, and being bound faſt to the yard the ſail is furled.

FURLONG, a long meaſure, equal to one eighth of a mile, or 40 poles.

It is alſo uſed in ſome law-books for the eighth part of an acre.

FURLOUGH, in the military language, a licence granted by an officer to a ſoldier, to be abſent for ſome time from his duty.

FURNACE, an utenſil or veſſel proper to contain fire, or to raiſe and maintain a vehement fire in, whether of coal or wood.—Of theſe there are a great variety, according to the different uſes to which they are applied.

In all furnaces the principal things to be attended to are, 1. To confine the heat as much as poſſible to the matter to be operated upon; 2. To prevent its being diſſipated; 3. To produce as much heat with as little fuel as poſſible; and, 4. To have it in our power to regulate the degree of heat according to our pleaſure.

To anſwer the firſt intention, the fire is uſually confined in a chamber or cavity built on purpoſe for it, and furniſhed with a door for putting in the fuel; a grate for ſupporting it, and allowing air to paſs thro', as well as the aſhes to drop down into a cavity provided on purpoſe, and called the *aſh-pit*. Thus the heat produced by the inflamed fuel is confined by the ſides of the furnace, and obliged to ſpend great part of its force upon the ſubject incloſed.

The ſecond intention, *viz.* to prevent the diſſipation of the heat, is obtained by ſhutting the door of the furnace; taking care that the chimney be not too wide, and that the matter to be acted upon be placed in ſuch a manner that the fire may have its full effect upon it as it goes up the chimney.

The third intention, which is the moſt important, is at the ſame time the moſt difficult to anſwer, and depends entirely upon the proportion between the ſpaces betwixt the furnace bars and the wideneſs and height of the chimney. This will appear from a conſideration of the principles on which the degrees of inflammation are produced. Theſe depend entirely on the current of air which paſſes through the inflamed fuel. As ſoon as the fuel is ſet on fire, a certain degree of heat is produced; but unleſs a conſtant influx of air is admitted through the burning fuel, the fire is inſtantly extinguiſhed; nor is it poſſible by any means to renew the inflammation until we admit a ſtream of freſh air among the fuel. When this is done, a rarefaction commences in the air of the fire-place of the furnace; ſo that it is no longer a counterpoiſe to the external air, and is therefore driven up the chimney by that which enters at the aſh-pit. This again paſſing through the fuel, is rarefied in its turn; and giving place to freſh quantities, there is a conſtant flow of air up the chimney. In proportion to the rarefaction of the air in the fire-place, the greater is the heat. But by a certain conſtruction of the furnace, the under part of the chimney will become almoſt as ſtrongly heated as the fire-place; by which means, though a very ſtrong current of air is forced through the fuel, yet as great part of the heat is ſpent on the chimney, where it can be of no uſe, the fuel is waſted in a very conſiderable degree. To avoid this, we have no other method than to contract the throat of the chimney occaſionally by a ſliding plate; which when put quite in, ſhuts up the whole vent; and by being drawn out more or leſs, leaves a larger or ſmaller vent at pleaſure. This plate ought to be quite drawn out till the fuel is thoroughly kindled, and the furnace well heated, ſo that a current of air may flow ſtrongly through the fuel. After this the plate is to be put in a certain length, ſo as juſt to prevent the ſmoke from coming out at the door of the furnace. The rarefaction of the air in the fire-place will ſolicit a very conſiderable draught of air, which will keep the fuel inflamed to a great degree; at the ſame time that the heat, being reflected from every part of the furnace excepting that narrow paſſage where the ſmoke goes up, becomes very intenſe. A large quantity of fuel may be put in at once, which will conſume ſlowly, and thus require but little attention in compariſon with thoſe furnaces where no ſuch precaution is uſed. The ſliding-plate may be made of caſt-iron in thoſe furnaces where no great heat is excited; but in others fire-clay will be more convenient. The contrivance, however, is ſcarce applicable to thoſe furnaces where great quantities of metal are to be melted; and accordingly the waſte of fuel there is immenſe. It is computed, that the iron works of Carron in Stirlingſhire conſume annually as many coals as would be ſufficient for a city containing 700,000 inhabitants.

Furnace.

The fourth intention, *viz.* that of regulating the heat, is accompliſhed by allowing only a certain quantity of air to paſs through the fuel. For this purpoſe, according to Dr Black, it is neceſſary to have the command of the furnace below; the parts above being frequently filled with ſmall quantities of ſoot. The beſt method of managing this is to ſhut up the door of the aſh-hole perfectly cloſe, and to have a ſet of round holes bearing a certain proportion to one another; and their areas being as 1, 2, 4, 8, 16, &c. Seven or eight of theſe ought to be made in the door of the aſh-pit, which will give a ſufficient command over the fire. When the fire is to be increaſed to the utmoſt, all the paſſages both above and below are to be thrown open, and the height of the vent augmented; which, by increaſing the height of the column of rarefied air, increaſes alſo the motion of that through the fuel, and of conſequence alſo the heat of the furnace. Maequer recommends another tube applied to the aſh-pit, wideſt at the end fartheſt from the furnace, and tapering gradually towards it. The intention of this is to augment the current and velocity of the air by its being made to paſs from a wider into a narrower vent; but though this is no doubt true, the air will not ultimately move with greater velocity than

Furnace. if the tube were not there. It can only be useful therefore in cases where the furnace is placed in a small room, and the tube itself has a communication with the external air.

Pl. CCIV. fig. 1. An *Essay* or *Cupelling Furnace* is made in the following manner. 1. Make with iron plates a hollow quadrangular prism, eleven inches broad and nine inches high (*aa*, *bb*), ending at top in a hollow quadrangular pyramid (*bb*, *cc*) seven inches high, terminating in an aperture at top seven inches square. This prism must be closed at bottom with another iron plate, which serves as a basis or bottom to it (*aa*). 2. Near the bottom make a door (*e*), three inches high, and five inches broad, that leads to the ash-hole. 3. Above this door, and at the height of six inches from the basis, make another door (*f*), of the figure of a segment of a circle, four inches broad at its basis, and three inches and a half high in the middle. 4. Then fasten three iron plates on the forepart of this furnace. Let the first of them (*gg*), eleven inches long and half an inch high, be fastened, so that its lower edge shall rest against the bottom of the furnace, with three or four rivets; and in such a manner, that there may be between the upper edge of the said plate and the side of the furnace a groove so wide, as that the sliders of the lower door (*kk*) may be put into it, and freely move backwards and forwards therein: these must be made of a thicker iron-plate. The second iron-plate (*hh*), eleven inches long, three inches high, and perfectly parallel to the foregoing plate, must be fastened in the space between the two doors, in such manner that both the upper and the lower edges of it may form a hollow groove with the side of the furnace. One of these grooves, which is turned downwards, serves to receive the upper edge of the sliders that shut the lower door (No 2). The other, that turns upwards, is to receive the inferior edges of the sliders of the small door above (No. 3). The third plate (*ii*), which is like the first, must be rivetted close above the upper door, in such manner, that it may form a groove turning downwards, and contiguous to the upper edge of the upper door (No. 3.) 5. In order to shut both doors (No 2, 3.), you must adapt to each of them two sliders made of iron-plates, that may move within the above mentioned grooves (*kk*, *ll*). But the two sliders belonging to the upper door (No. 3.) must have each a hole near the top; that is, one a small hole one fifth part of an inch broad, and one inch and a half long (*m*); and the other a semicircular aperture, one inch high and two inches broad (*n*). Let, besides, each slider have a handle, that they may be laid hold of when they are to be moved. 6. Moreover, let five round holes, one inch broad, be bored in the furnace; two of which must be made in the fore-part of the furnace (*oo*), two others in the back part; all at the height of five inches from the bottom, but three inches and a half distant from each side of the furnace; and, finally, a fifth hole (*p*), at the height of one inch above the upper edge of the upper door (*f*). 7. In short, let the inside of the furnace be armed with iron-hooks, jetting out half an inch, and about three inches distant from each other, to fasten the lute with which the furnace is to be covered over within. 8. Let then an iron, moveable, hollow, quadrangular pyramid (*g*), three inches high, be adapted to the upper aperture (*d*) of the furnace, at the basis seven inches broad, ending upwards in a hollow tube (*r*), three inches in diameter, two inches high, almost cylindrical, though somewhat convergent at top. This prominent tube serves to support a funnel or flue, which is almost cylindrical, hollow, made of iron plates, and two feet high; and which, when a very strong fire is required, is put perpendicularly upon the shorter tube, in such a manner, that it enters close into it, one inch and a half or two inches deep, and may again be taken off at pleasure, when there is no need of so strong a fire. But this pyramidal cover (*q*) must besides have two handles (*ss*) adapted to it, that it may be laid hold of, and thus be taken away or put on again: and that this, being put on the aperture (*d*) of the furnace, may not be easily thrown down, let an iron plate be rivetted to the right and left upper edge of the furnace (*cc*), and be turned down towards the inside, so as to make a furrow open before and behind, into which the latteral edges of the cover may enter and be fastened, and at pleasure be moved backwards and forwards, whenever it must be put on, or moved. 9. Let a square ledge, made of a thick iron-plate, be fastened at top of the upper edge of the lower door (*e*): this is designed to support the grate and the lute; but it must be made of two pieces, that it may be easily introduced into the cavity of the furnace. Thus you will have an assay oven, which must afterwards be covered over on the inside with lute. This you are to do as follows:

Cramer's Art of Essaying.

That the fire may be better confined, and that the iron may not be destroyed by growing red-hot, the whole inside of the furnace must be covered over with lute, one finger or one finger and a half thick. The lute fit for this is described under the article CHEMISTRY, n 604, 605. But before you cover the inside of your furnace with this lute, you must first put within the furnace small iron bars, equal in length to the diameter of the oven, quadrangular, prismatical, half an inch thick, having their extremities supported by a square iron ledge, and three fourths of an inch distant from each other; and you must fasten them so, that their flat sides may be oblique with regard to the transverse section of the furnace, and that the two opposite angles may look one upwards and the other downwards: the bars must not be laid flat, but edgewise; by which situation you hinder the ashes of the fuel of the fire from being detained too long between the interstices of the said iron-bars, and from making an obstruction that would oppose the free draught of the air. The furnace being then covered over with lute, and dried up by a gentle heat, is at last fit for docimastical operations, and especially for such as must be performed in the assay-oven.

If then an operation is to be made in the furnace, hitherto described, you must let through the four lower holes above described of the furnace (*oo*) placed before and behind, and directly opposite to each other, two iron-bars one inch thick, and long enough that their extremities on every side may jut out of the holes a small matter. These serve to support the muffle and its bottom. You then introduce the muffle through the upper aperture of the furnace (*d*), and place it upon the above described iron-bars, in such a manner, that the open fore-side of it be contiguous to the inward

Machines for blowing Air into Furnaces.

Fig. 1.

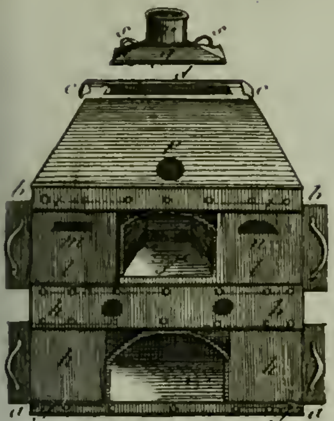

Fig. 2.

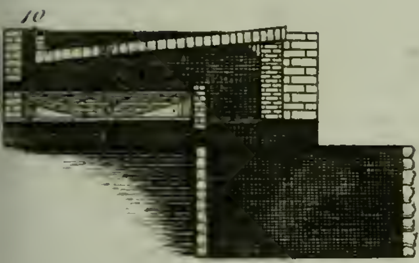

Fig. 3.

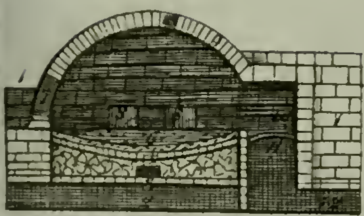

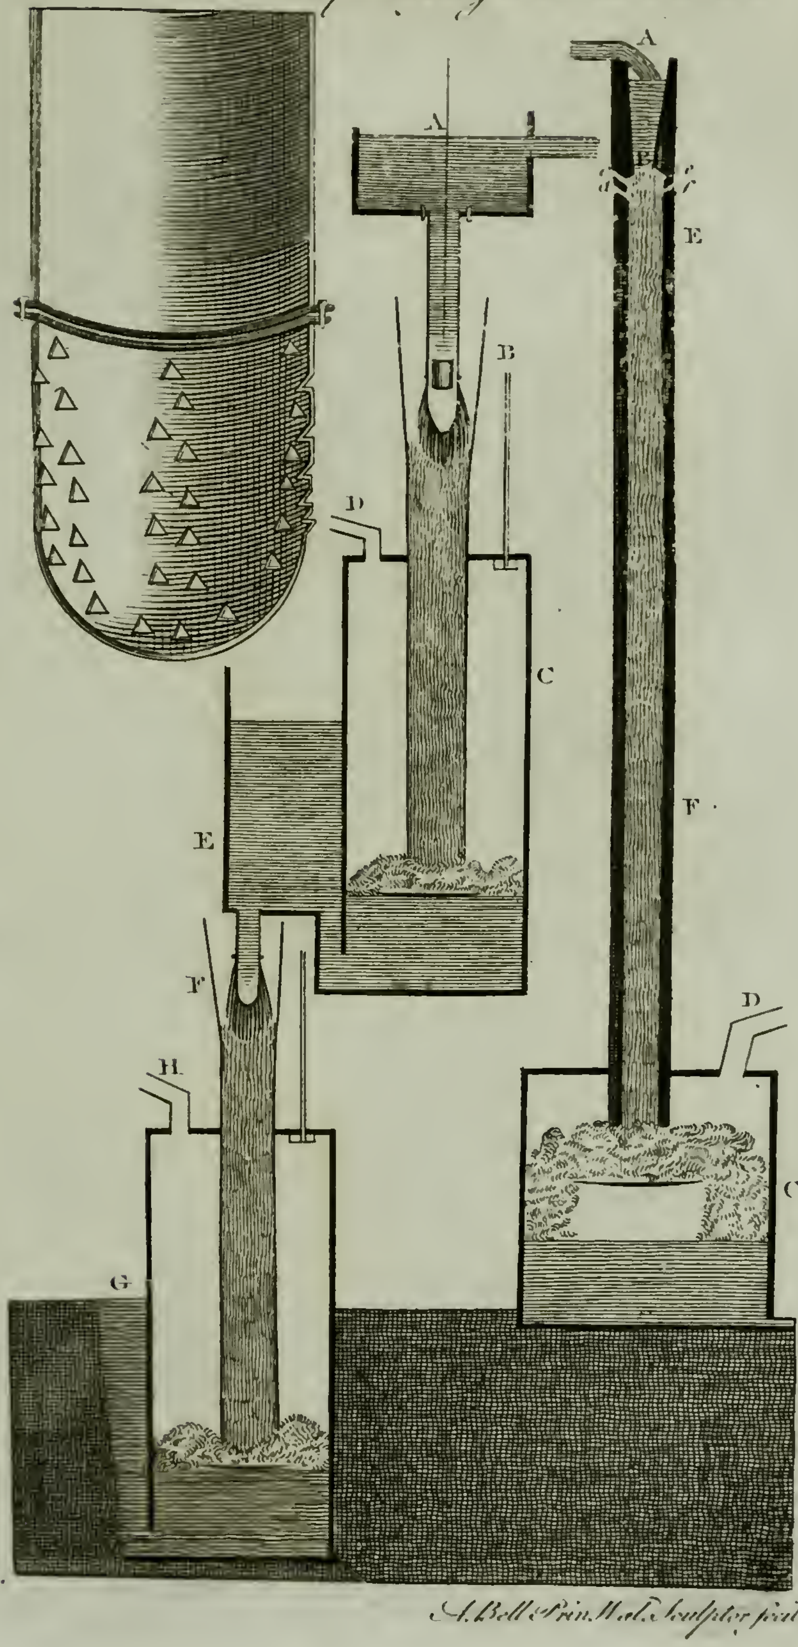

A. Bell Prin. Wal. Sculptor fecit.

Furnace. ward border of the upper door (*f*). The fuel of the fire is introduced through the top of the furnace (*d*); the cover of which (*g*), on this account, muſt be moveable, and not very heavy. The beſt fuel for the fire is charcoal made of the hardeſt wood, eſpecially of beech, broken into ſmall pieces of the bigneſs of an inch, wherewith the muffle muſt be covered over ſome inches high. We then reject larger bits of coals, becauſe they cannot fall through the narrow interſtices, between the ſides of the muffle and thoſe of the furnace, and cannot of courſe ſufficiently ſurround the circumference of the muffle. Whence it happens, that there are on every ſide places void of fuel, and the fire is either not ſtrong enough or unequal. But if, on the contrary, you uſe coals too ſmall, then a great part fall immediately through the interſtices of the grate into the aſh-hole; and the tendereſt particles of them turn too ſoon into aſhes, and, by increaſing the heap of aſhes, obſtruct the free draught of the air, which is here greatly requiſite.

A perfect management of the fire is moſt commonly neceſſary in the performing of operations in this furnace: therefore the chemical reader muſt give attention to what follows. If the door of the aſh-hole (*e*) is quite open; and the ſliders of the upper door (*f*) drawn towards each other, ſo as to touch one another in the middle of the door; and if, beſides, the cover (*g*), and the funnel adapted to its tube (*r*), is upon the top (*q*) of the furnace; the fire will be then in the higheſt degree poſſible; though, in the mean time, it is hardly ever neceſſary to put the funnel on, except in a very cold ſeaſon: but if, after having diſpoſed the furnace in the manner juſt deſcribed, you put red burning coals into the open upper door (*f*) of it, the fire is ſtill more increaſed thereby: however, this artifice is never, or very ſeldom, neceſſary. When you ſhut the upper door with only that ſlider that has a narrow oblong hole in it (*m*), then the heat becomes a little leſs; but it diminiſhes ſtill more when you ſhut the door with the other ſlider that has in it the ſemicircular hole (*n*), which is larger than that of the firſt ſlider: nay, the heat again is leſs when you take away the funnel put at the top of the cover: finally, the door of the aſh-hole being either in part or totally ſhut, the heat is ſtill diminiſhed; becauſe the draught of air ſo neceſſary to excite the fire, is thereby hindered: but if, beſides all theſe, you likewiſe open the upper door quite, then the cold air, ruſhing into the muffle, cools the bodies put under it, that are to be changed, to a degree never required in any operation, and ſuch as will entirely hinder the boiling of lead. If, during the operation, the fire begins to decay, or to grow unequal, it is a ſign that there are places void of coals between the ſides of the furnace and thoſe of the muffle: therefore, in this caſe, you muſt ſtir your coals on every ſide with an iron rod, which is to be introduced through the upper hole (*p*) of the furnace, that they may fall together, and thus act in a proper manner and equality.

However, you are to obſerve concerning the regimen of the fire juſt deſcribed, that though the apparatus is made with all the exactneſs mentioned, nevertheleſs the effect does not always anſwer it. The cauſe of which difference has moſt commonly its origin in the various diſpoſitions of the air: for as every fire is more excited by coals in proportion as the air, more condenſed, and more quickly agitated, ſtrikes them more violently (which the effect of the bellows plainly ſhows); it thence appears, that in warm and wet weather, when the atmoſphere is light, the fire muſt be leſs efficacious in furnaces; that likewiſe, when ſeveral furnaces, ſituated near each other, are burning at the ſame time, the fire is in part ſuffocated, becauſe the ambient air is thereby rendered more rare and lighter. The ſame effect is produced by the ſun, eſpecially in ſummer-time, when it ſhines upon the place where the furnace is ſituated. The atmoſphere, on the contrary, being heavier in cold dry weather, excites a very great fire. Furnace.

The heat of the fire acts the ſtronger upon the bodies to be changed, as the muffle put in the furnace is leſs; as the ſaid muffle has more and larger ſegments cut out of it; as the ſides of this muffle are thinner; in ſhort, as there are more veſſels placed in the hinder part of the muffle; and on the contrary. In this caſe, when many of the conditions requiſite for the exciting of fire are wanting, then indeed the artificer, with all his ſkill, will hardly be able to excite the fire to a ſufficient degree, in order to perform operations well, in common aſſay-ovens, even though he uſes bellows, and puts coals into the upper door of the furnace. For this reaſon, the grate ought to be put almoſt three inches below the muffle, leſt the air, ruſhing through the aſh-hole, ſhould cool the bottom of the muffle, which happens in common aſſay-ovens; and again, that the ſmaller coals, almoſt already conſumed, and the aſhes, may more eaſily fall through the interſtices of the grate, and the larger coals ſtill ſit to keep up the fire be retained. Laſtly, The above-mentioned funnel is added, that the blowing of the fire being, by means of it, increaſed as much as poſſible, this might at laſt be carried to the requiſite degree; for the fire may always be diminiſhed, but not always be increaſed at pleaſure, without the aſſiſtance of a proper apparatus.

Fig. 2. Repreſents a longitudinal ſection of a *Reverberatory* FURNACE uſed in the ſmelting of ores. 1. The maſonry. 2. The aſh-hole. 3. A channel for the evaporation of the moiſture. 4. The grate. 5. The fire-place. 6. The inner part of the furnace. 7. A baſon formed of ſand. 8. The cavity where the melted metal is. 9. A hole through which the ſcoria is to be removed. 10. The paſſage of the flame and ſmoke, or the lower part of the chimney; which is to be carried up to a height of about 30 feet. 11. A hole in the roof, through which the ore is thrown into the furnace. This furnace is 18 feet long, 12 feet broad, and 9½ high.

Fig. 3. Repreſents a longitudinal ſection of the *Refining* FURNACE. 1. The maſonry of the pillars and walls ſurrounding the furnace. 2. The channels for carrying off the moiſture. 3. Other ſmall channels which join in the middle of the baſon. 4. The baſon made of bricks. 5. A bed of aſhes. 6. The hollow or baſon in which the metal is melted and refined. 7. The great flame-hole. 8. The two openings for the entry of the tuyeres of the bellows. 9. The vault or dome of the furnace. 10. The fire-place. 11. The grate. 12. The draught-hole. 13. A hole in the vault, which, being opened, ſerves to cool the furnace.

Machines for Blowing Air into FURNACES. The earlieſt method of animating large fires in the furnaces where ores were fmelted, ſeems to have been by expoſing them to the wind. Such was the practice of the Peruvians before the arrival of the Spaniards among them. Alonſo Barba relates, that their furnaces, called *guairas*, were built on eminences, where the air was freeſt; that they were perforated on all ſides with holes, through which the air was driven in when the wind blew, which was the only time when the work could be carried on; that under each hole was made a projection of the ſtone-work, on which were laid burning coals, to heat the air before it entered the furnace. Some authors ſpeak of ſeveral thouſands of theſe guairas burning at once on the ſides and tops of the hills of Potoſi; and ſeveral remains of this practice are to be found in different parts of Great Britain.

This method of ſupplying air being found exceſſively ineffectual and precarious, the inſtruments called *bellows* ſucceeded. Theſe were at firſt worked by the ſtrength of men; but as this was found to be very laborious and expenſive, the force of running water was employed to give motion to theſe machines. Thus a much greater quantity of metal could be procured than formerly, and the ſeparation was likewiſe more complete; inſomuch, that in many places the flags or cinders from which the iron had formerly been extracted were again uſed as freſh ore, and yielded plenty of metal.

But though this method was found to be greatly preferable to the others, yet great improvements were ſtill wanted. In order to melt very large quantities of ore at a time, it was neceſſary to uſe bellows of an immenſe ſize; and in proportion to their ſize they ſtood in need of the more frequent and expenſive repairs. The oil, alſo, which the bellows required in large quantity, becoming rancid, was found to generate a kind of inflammable vapour, which ſometimes burſt the bellows with exploſion, and thus rendered them totally uſeleſs. A new method, therefore, of blowing up fires altogether free from the abovementioned inconveniences, was fallen upon by means of water. It depends on the following principle, viz. That a ſtream of water, running through a pipe, if by any means it is mixed with air at its entrance into the pipe, will carry that air along with it, and part with it again as ſoon as it comes out of the pipe; and if the air is then collected by a proper apparatus, it may with ſucceſs be uſed for exciting the moſt violent degrees of heat.

Machines of this kind are repreſented on Plate CCIV. fig. 4. In the right-hand machine, AB repreſents a ſtream of water falling into the funnel, whoſe throat is contracted at B; after which the ſtream runs through the perpendicular pipe EF, in the upper part of which there are ſome ſmall holes repreſented by *cdef*. Thro' theſe holes the air has acceſs to mix itſelf with the deſcending water, which being daſhed againſt the ſides of the pipe is reduced to froth, and thus fills the whole cavity of the pipe EF, which is conſiderably larger than the throat of the funnel B. When this frothy ſtream enters the veſſel C, the air extricates itſelf from the water; and as it cannot return through the pipe EF becauſe it is continually filled with a ſtream of liquid matter, it flies off with conſiderable force through the ſmaller pipe D, by which it is conveyed to the furnace. Furn

From this deſcription, it is evident that the principal thing to be kept in view in the conſtruction of theſe machines is, to mix the deſcending ſtream of water with as great a quantity of air as poſſible. For this purpoſe the contrivance repreſented in the left-hand machines anſwers much better than the former. By this the water deſcending from the reſervoir A, falls into a kind of cullender B, perforated with a great number of holes in its ſides. Thus the water being forced out in a number of ſmall ſtreams is very effectually daſhed againſt the ſides of the wide deſcending pipe, when it enters the condenſing veſſel C, and is ſent off by the pipe D, as in the former.

In ſome machines of this kind the conſtructors ſeem to have been of opinion, that a great height was required in the water-fall; but Dr Lewis, who hath made a great number of experiments upon the ſubject, ſhows, that an exceſs in height can never make up for a deficiency in the quantity of the water. Four or five feet, he thinks, is a ſufficient height for the water-fall; where there is a greater height, however, it may be rendered uſeful, by joining two or more machines together in the manner repreſented in the plate; where the water, after having once emitted its air in the condenſing veſſel C, flows out into a new reſervoir E. From thence it deſcends through another cullender F, and deſcending from it into a condenſing veſſel G, the air is extricated, and carried off through the pipe H. The upper figure repreſents the cullender, with the ſhapes of the holes and their proportional diſtances, according to Dr Lewis. *Phil. of Ar.* P. 26

Thus, with very little expence, where there is a ſufficient quantity of water, as ſtrong a blaſt of air as can be deſired may be readily obtained; for ſeveral machines may be conſtructed, and joined together in a manner ſomewhat ſimilar to that above mentioned, until all the quantity of water is employed. It is proper to obſerve, however, that as by this method the air is loaded with moiſture, it is proper to make the condenſing veſſel as high as conveniently may be, that the air may arrive at the furnace in as dry a ſtate as poſſible.—The long ſlender pipes in the left-hand machines repreſent a gage filled with mercury or water, by which the ſtrength of the blaſt may be determined.

In the large iron founderies another method is uſed for blowing up the fires by means of a kind of air-pumps. Theſe conſiſt of caſt-iron cylinders of about three feet diameter, exactly fitted with a piſton moved up and down by means of a water-wheel. In the bottom of the cylinder is a large valve like that of a bellows, which riſes as the piſton is lifted up, and thus admits the air into the cavity of the cylinder from below. Immediately above the bottom is a tube which goes to the furnace; and as it proceeds from the cylinder is furniſhed with a valve opening outward. Thus, when the piſton is drawn up, the valve in the bottom riſes and admits the air that way into the cylinder; while the lateral valve ſhuts, and prevents any air from getting into it through the pipe. When the piſton is thruſt down, the valve in the bottom ſhuts, while the air being compreſſed in the cavity of the cylinder is violently forced out through the lateral tube into the

the furnace. In the great foundery at Carron, four of theſe large cylinders were a few years ago employed at their principal furnace, and ſo contrived that the ſtrokes of the piſtons, being made alternately, produced an almoſt uninterrupted blaſt. Some little interminſion might indeed be perceived by the ear, but it was too trifling to produce any ſenſible effect on the heat of the furnace. Even this could have been prevented by means of a large reſervoir into which all the four cylinders might diſcharge their blaſt. This ſhould be furniſhed with an heavy piſton; whoſe weight being ſupported by the air of the cylinder alone, would force it out through its lateral tube in a manner perfectly equable, without any of that puffing or interruption in the blaſt, perceptible though but in a ſmall degree in the other.

FUROR UTERINUS, a diſorder peculiar to women. See MEDICINE-*Index*.

FURR, in commerce, ſignifies the ſkin of ſeveral wild beaſts, dreſſed in alum with the hair on; and uſed as a part of dreſs, by princes, magiſtrates, and others. The kinds moſt in uſe are thoſe of the ermine, ſable, caſtor, hare, coney, &c. See MUSTELA.

It was not till the later ages that the furs of beaſts became an article of luxury. The more refined nations of ancient times never made uſe of them: thoſe alone whom the former ſtigmatiſed as barbarians were clothed in the ſkins of animals. Strabo deſcribes the Indians covered with the ſkins of lions, panthers, and bears; and Seneca, the Scythians clothed with the ſkins of foxes and the leſſer quadrupeds. Virgil exhibits a picture of the ſavage Hyperboreans, ſimilar to that which our late circumnavigators can witneſs to in the clothing of the wild Americans, unſeen before by any poliſhed people.

Gens effræna virûm Riphæo tunditur Euro;
Et peſudum fulvis velantur corpora ſetis.

Moſt part of Europe was at this time in ſimilar circumſtances. Cæſar might be as much amazed with the ſkin-dreſſed heroes of Britain, as our celebrated Cook was at thoſe of his new-diſcovered regions. What time hath done to us, time, under humane conquerors, may effect for them. Civilization may take place; and thoſe ſpoils of animals, which are at preſent eſſential for clothing, become the mere objects of ornament and luxury.

It does not appear that the Greeks or old Romans ever made uſe of furs. It originated in thoſe regions where they moſt abounded, and where the ſeverity of the climate required that ſpecies of clothing. At firſt it conſiſted of the ſkins only, almoſt in the ſtate in which they were torn from the body of the beaſt; but as ſoon as civilization took place, and manufactures were introduced, furs became the lining of the dreſs, and often the elegant facing of the robes. It is probable that the northern conquerors introduced the faſhion into Europe. We find, that about the year 522, when Totila king of the Viſigoths reigned in Italy, the Suethons (a people of modern Sweden) found means, by help of the commerce of numberleſs intervening people, to tranſmit, for the uſe of the Romans, *ſuphilinas pelles*, the precious ſkins of the ſables. As luxury advanced, furs, even of the moſt valuable ſpecies, were uſed by princes as linings for their tents: thus Marco Polo, in 1252, found thoſe of the Cham of Tartary lined with ermines and ſables. He calls the laſt *Zibelines* and *Zambolines*. He ſays that thoſe and other precious furrs were brought from countries far north; from the *land of Darkneſs*, and regions almoſt inacceſſible by reaſon of moraſſes and ice. The Welſh ſet a high value on furrs as early as the time of Howel Dda, who began his reign about 940. In the next age, furrs became the faſhionable magnificence of Europe. When Godfrey of Boulogne and his followers appeared before the emperor Alexis Comnene, on their way to the Holy Land, he was ſtruck with the richneſs of their dreſſes, *tam ex oſtro quam auriſrigio et niveo opere harmelino et ex mardrino griſioque et vario*. How different was the advance of luxury in France from the time of their great monarch Charlemagne, who contented himſelf with the plain furr of the otter! Our Henry I. wore furrs; yet in his diſtreſs was obliged to change them for warm Welſh flannel. But in the year 1337 the luxury had got to ſuch a head, that Edward III. enacted, that all perſons who could not ſpend a hundred a-year ſhould abſolutely be prohibited the uſe of this ſpecies of finery. Theſe, from their great expence, muſt have been foreign furrs, obtained from the Italian commercial ſtates, whoſe traffic was at this period boundleſs. How ſtrange is the revolution in the furr-trade! The north of Aſia at that time ſupplied us with every valuable kind; at preſent we ſend, by means of the poſſeſſion of Hudſon's Bay, furrs, to immenſe amount, even to Turkey and the diſtant China.

New Voyages in Search of FURRS. During the late Captain Cook's laſt voyage to the Pacific Ocean, beſides the various ſcientific advantages to be derived from it, a new ſource of wealth was laid open to future navigators, by trading for furrs of the moſt valuable kind on the north-weſt coaſt of America. The firſt veſſel which engaged in the new branch of trade pointed out by that great navigator, was equipped by ſome gentlemen in China. She was a brig of 60 tons and 20 men, commanded by James Hanna. She failed from the Typa the end of April 1785; proceeded to the northward, along the coaſt of China; paſſed through Diemen's Straits, the ſouth end of Japan; and arrived at Nootka in Auguſt following. Soon after her arrival, the natives, whom Captain Cook had left unacquainted with the effects of fire-arms, tempted probably by the diminutive ſize of the veſſel (ſcarce longer than ſome of their own canoes) and the ſmall number of her people, attempted to board her in open day; but were repulſed with conſiderable ſlaughter. This was the introduction to a firm and laſting friendſhip. Captain Hanna cured ſuch of the Indians as were wounded; an unreſerved confidence took place; they traded fairly and peaceably; a valuable cargo of furrs was procured; and the bad weather ſetting in, he left the coaſt in the end of September, touched at the Sandwich Iſlands, and arrived at Macao the end of December of the ſame year.

Captain Hanna ſailed again from Macao in May 1786, in the ſnow Sea-Otter of 120 tons and 30 men, and returned to Macao in February 1787. In this ſecond voyage he followed his former track, and arrived at Nootka in Auguſt; traced the coaſt from thence as far as 53 degrees, and explored the extenſive ſound diſcovered a ſhort time before by Mr Strange,

6 and

Furr. and called by him Queen Charlotte's Sound, the latitude of which is 51 degrees north, longitude 128 weſt.

The ſnow Lark, Captain Peters, of 220 tons and 40 men, ſailed from Macao in July 1786. Her deſtination was Kamtſchatka (for which ſhe was provided with a ſuitable cargo of arrack, tea, &c.), Copper Iſlands, and the N. W. coaſt. Captain Peters was directed to make his paſſage between Japan and Corea, and examine the iſlands to the north of Japan, ſaid to be inhabited by hairy people; which, if Captain Cook had lived, would not have been left to the French to determine. No account having been received of this veſſel ſince her departure, there is every reaſon to fear ſhe has periſhed.

In the beginning of 1786, two coppered veſſels were fitted out at Bombay, under the direction of James Strange, Eſq; who was himſelf a principal owner. Theſe veſſels were, the ſnow Captain Cook of 300 tons, and ſnow Experiment of 100 tons. They proceeded in company from the Malabar coaſt to Batavia; paſſed through the Straits of Macaſſar, where the Experiment was run upon a reef, and was obliged to haul aſhore upon Borneo to repair; from thence they ſteered to the eaſtward of the Palaos Iſlands; made Sulphur Iſland; and arrived at Nootka the end of June following. From Nootka, where they left their ſurgeon's mate (Mackay) to learn the language and collect ſkins againſt their intended return (but who was brought away in the Imperial Eagle the following year), they proceeded along the coaſt to Queen Charlotte's Sound, of which they were the firſt diſcoverers; from thence in a direct courſe to Prince William's Sound. After ſome ſtay there, the Experiment proceeded to Macao (their veſſels being provided with paſſes by the governor-general of Goa): the Captain Cook endeavoured to get to Copper Iſland, but without ſucceſs, being prevented by conſtant weſt winds.

Two coppered veſſels were alſo fitted out by a ſociety of gentlemen in Bengal, viz. the ſnow Nootka of 200 tons, and the ſnow Sea Otter of 100 tons, commanded by John Meares and William Tipping, lieutenants in the royal navy. The Nootka failed in March 1786 from Bengal; came through the China Seas; touched at the Baſhees, where they were very civilly treated by the Spaniards, who have taken poſſeſſion of theſe iſlands; arrived at Oonalaſka the beginning of Auguſt; found there a Ruſſian galliot and ſome furriers; diſcovered accidentally near Cape Greville a new ſtrait into Cook's River, 15 leagues wide and 30 long; ſaw ſome Ruſſian hunters in a ſmall bay between Cape Elizabeth and Cape Bear; and arrived in Prince William's Sound the end of September. They determined wintering in Snug Corner Cove, lat. 60. 30. in preference to going to the Sandwich Iſlands, which ſeem placed by Providence for the comfort and refreſhment of the adventurers in this trade, and were frozen up in this gloomy and frightful ſpot from the end of November to the end of May. By the ſeverity of the winter they loſt their third and fourth mates, ſurgeon, boatſwain, carpenter, and cooper, and twelve of the fore-maſt men; and the remainder were ſo enfeebled as to be under the neceſſity of applying to the commanders of the King George and Queen Charlotte, who juſt at this time arrived in the ſound, for ſome hands to aſſiſt in carrying the veſſel to the Sandwich Iſlands, where, giving over all further thoughts of trade, they determined (after getting a ſea-ſtock of fiſh off Cape Edgecumbe) immediately to proceed. The Nootka arrived at Macao the end of October 1787. Furr

The Imperial Eagle, Captain Barkley, fitted out by a ſociety of gentlemen at Oſtend, ſailed from Oſtend the latter end of November 1786; went into the bay of All Saints; from thence, without touching any where, to the Sandwich Iſlands, and arrived at Nootka the beginning of June; from thence to the ſouth, as far as 47° 30', in which ſpace he diſcovered ſome good and ſpacious harbours. In the lat. of 47° 46', loſt his ſecond mate, purſer, and two ſeamen, who were upon a trading party with the long-boat, and imprudently truſting themſelves aſhore unarmed, were cut off by the natives. This place ſeems to be the ſame that Don Antonio Mourelle calls the *Iſla de los Dolores*, where the Spaniards going aſhore to water, were alſo attacked and cut off.

The King George of 320, and the Queen Charlotte of 200 tons, commanded by Captains Portlock and Dixon, who ſerved under Captain Cook in his laſt voyage, were fitted out by a ſociety of gentlemen in England, who obtained a privilege to trade to the north-weſt coaſt of America, from the South-Sea and Eaſt India companies.

Thoſe veſſels ſailed from England the beginning of September 1785; touched at the Falkland Iſlands, Sandwich Iſlands, and arrived in Cook's River in the month of Auguſt. From thence, after collecting a few furrs, they ſteered in the end of September for Prince William's Sound, intending, it is ſaid, to winter there; but were prevented entering, by heavy ſtorms and extreme bad weather, which obliged them to bear away, and ſeek ſome other part of the coaſt to winter at. The ſtorms and bad weather accompanied them till they arrived off Nootka Sound, when they were ſo near the ſhore, that a canoe came off to them: but though thus near accompliſhing their purpoſe, a freſh ſtorm came on, and obliged them finally to bear away for the Sandwich Iſlands, where they remained the winter months; and returning again to the coaſt, arrived in Prince William's Sound the middle of May. The King George remained in Prince William's Sound; and during her ſtay, her long-boat diſcovered a new paſſage from the Sound into Cook's River. The Queen Charlotte proceeded along the coaſt to the ſouth; looked into Behring's Bay, where the Ruſſians have now a ſettlement; examined that part of the coaſt from 56 to 50, which was not ſeen by Captain Cook, and which conſiſts of a cluſter of iſlands, called by Captain Dixon *Queen Charlotte's Iſlands*, at a conſiderable diſtance from the Main, which is thus removed farther to the eaſtward than it was ſuppoſed to be: ſome part of the continent may, however, be ſeen from the eaſt ſide of theſe iſlands; and it is probable, the diſtance does not any where exceed 50 leagues. On this eſtimation, Hudſon's Houſe, lat. 53° long. 106° 27' weſt, will not be more than 800 miles diſtant from that part of this coaſt in the ſame parallel. It is therefore not improbable, that the enterpriſing ſpirit of our Canadian furriers may penetrate to this coaſt (the communication with which is probably much facilitated by lakes or rivers), and add to the comforts and luxu-

Furr. ries of Europe this invaluable furr, which in warmth, beauty, and magnificence, far exceeds the richeſt furrs of Siberia. Queen Charlotte's iſlands are inhabited by a race of people differing in language, features, and manners, from all the other tribes of this coaſt. Among other peculiarities, they are diſtinguiſhed by a large inciſion in the under lip, in which is inſerted a piece of poliſhed wood, ſometimes ornamented with mother-of-pearl ſhell, in ſhape and ſize like a weaver's ſhuttle, which undoubtedly is the moſt effectual mode of deforming the human face divine that the ingenious depravity of taſte of any ſavage nation has yet diſcovered. Theſe ſhips, after diſpoſing of their furrs in China, were loaded with teas on account of the Engliſh company, ſailed from Wampoa the end of February, and arrived in England a ſhort time ſince, after an abſence of three years.

The year after the departure of the King George and Queen Charlotte, the ſame ſociety to which they belonged fitted out two other veſſels, viz. the Princeſs Royal of 60 tons, and the Prince of Wales of 200 tons, commanded by Captains Colnet and Duncan, the former of whom had ſerved under Captain Cook. Theſe veſſels left England in Auguſt 1786; touched at New Year's harbour on Staten Land, where they left an officer and 12 men to kill ſeals againſt the arrival of a veſſel which was to follow them from England; from thence they proceeded directly to Nootka, where they arrived the 6th of July, ſickly and in bad condition, and found here the Imperial Eagle, which had left Europe ſome months after them. Leaving Nootka, they ſteered along the ſhore to the northward, and ſoon after fell in with the Queen Charlotte.

In the beginning of 1788, Captain Mears ſailed again with two other veſſels, the Felice, which he commanded himſelf, and the Iphigenia, Captain Douglas, to Nootka Sound. Here he purchaſed of the chief of the diſtrict a ſpot, on which he built a houſe for his reſidence and more convenient intercourſe with the natives, hoiſting the Britiſh colours thereon, ſurrounding it with a breaſt-work, and mounting a three pounder on the front. Having ſo done, he ſent Mr Douglas in the Iphigenia to trade along the northern coaſt, while he himſelf proceeded to the ſouth; and by preſents to the chiefs obtained the ports Cox and Effingham, and the promiſe of an excluſive trade with the natives of the diſtrict, and alſo ſome other places, which he took poſſeſſion of in the name of the king. Captain Douglas likewiſe, by preſents to the chiefs of the countries he viſited, obtained ſimilar privileges, no other European veſſel having ſailed there before him.

On their return to Nootka, they found a veſſel finiſhed which the commander had laid down before his departure. This, which he named the North-weſt America, he left at Nootka with the Iphigenia, while he ſailed with a cargo of furrs in the Felice to China.

A few days after his arrival at China, two veſſels, the Prince of Wales and Princeſs Royal, came to Canton from their trading voyage above mentioned. Captain Mears, fearing a competition of intereſts might be injurious to both parties, propoſed a copartnerſhip, which was mutually agreed to; and another ſhip was purchaſed by the firm, and called the *Argonaut*. In the month of April 1789, Captain Mears gave Mr Colnet the command of the Princeſs Royal and Argonaut, which were loaded with ſtores and articles eſtimated ſufficient for three years trade, beſides ſeveral artificers, and near 70 Chineſe, who intended to become ſettlers on the north-weſt coaſt of America, under protection of the new company. Furr.

In the mean while, the Iphigenia, and North-weſt America (the veſſel built at Nootka) having wintered in Sandwich Iſlands, returned to Nootka in the latter end of April. Soon after which, two Spaniſh ſhips of war, under the command of Don Martinez, anchored in the ſound. For a few days mutual civilities paſſed between the Spaniſh captain and Mr Douglas; but at the end of about a week, Don Martinez ſummoned the latter on board his own ſhip the Princeſſa, telling him he was his priſoner, and that the king of Spain had commanded him, Don Martinez, to ſeize all veſſels he ſhould find on that coaſt. He therefore inſtructed his officers to take poſſeſſion of the Iphigenia, which they accordingly did in the name of his Catholic majeſty; and the officers and crew were conveyed as priſoners on board the Spaniſh ſhips, where they were put in irons, and otherwiſe ill treated. Immediately after this, Don Martinez took poſſeſſion of the little ſettlement, hoiſting the ſtandard of Spain, and modeſtly declaring all the lands from Cape Horn to 60 degrees north latitude belonged to his maſter. To aggravate the inſult, he forcibly employed the crew of the Iphigenia in building batteries, &c. and offered no kind of violence to two American veſſels that were at the ſame time in the harbour. At this time the North-weſt America was ſent to explore the Archipelago of St Lazarus. On her return to Nootka ſhe met with a ſimilar treatment, and the ſkins ſhe had collected were ſeized, with the reſt of her cargo.

A few days after the Princeſs Royal (which we have mentioned as leaving Canton in company with the Argonaut) arrived. The Spaniſh commander, for reaſons that do not appear, ſuffered her to depart. The ſkins collected by the North-weſt America were ſhipped on board her for the benefit of her owner, and ſhe proceeded to trade in the neighbouring iſles. On the 3d of July, the Argonaut arrived at the Sound; and Don Martinez, after making every profeſſion of civility to Mr Colnet the commander, took poſſeſſion of the ſaid ſhip in the name of his maſter, and made priſoners of the crew. Soon after, the Princeſs Royal returning to receive inſtructions from Mr Colnet, director of the Enterprize, was ſeized by the Spaniſh captain.

The crews of the Britiſh veſſels were differently diſpoſed of; ſome ſent to China by the American veſſels, and others to Spaniſh America: but the Chineſe were all detained, and employed in the mines which were opened on the lands purchaſed by Captain Mears. What theſe mines conſiſted of we are no where informed. Mr Colnet was ſo much affected at the failure of the enterprize as to be deprived of reaſon.

This, as ſoon as known, occaſioned a ſpirited repreſentation from the Britiſh court to that of Spain; at the ſame time that vigorous preparations were made

Furtenburgh || Fusee

for war in case adequate satisfaction should be refused. Matters, however, were prevented from coming to extremities, by a compliance on the part of Spain, after many delays and much artifice of negociation, with the requisitions of Britain: in consequence of which, among other advantages unnecessary to be here recited, the whole trade from California to China is completely laid open; and the British allowed the full exercise of navigation and commerce in those parts of the world which were the subject of discussion.

In some accounts of the voyages above mentioned, the furr-trade in those parts have been greatly magnified. In that published by Captain Portlock, however, this officer observes, that the gains hitherto have certainly not been 'enviably' great; though the merchants have no doubt found the trade lucrative.

FURSTENBURGH, a town and castle of Germany, the capital of a county of the same name, 30 miles north west of Constance. E. Long. 8. 30. N. Lat. 47. 50.

FURTHCOMING, in law, the name of an action competent to any person who has used arrestment in the hands of his debtor's creditor, for having the subject arrested declared his property.

FURUNCULE, or Boil, in surgery, a small resisting tumor, with inflammation, redness, and great pain, arising in the adipose membrane, under the skin. See Surgery.

FURZE, in botany. See Ulex.

FUSANUS, in botany: A genus of the monœcia order, belonging to the polygamia class of plants. The hermaphrodite calyx is quinquefid; there is no corolla; there are four stamina; the germen beneath; there are four stigmata; the fruit a plum.

FUSAROLE, in architecture, a moulding or ornament placed immediately under the echinus, in the Doric, Ionic, and Composite capitals.

FUSE or Fuze, in artillery. See Fusee.

FUSEE, in clock-work, is that conical part drawn by the spring, and about which the chain or string is wound; for the use of which, see Clock and Watch.

Fusee, or *Firelock*. See Musquet.

Fuse, *Fuze* or *Fuse*, of a bomb or grenado, is that which makes the whole powder or composition in the shell take fire, to do the designed execution.

Fuzes are chiefly made of very dry beech-wood, and sometimes of hornbeam, taken near the root. They are turned rough, and bored at first, and then kept for several years in a dry place; the diameter of the hole is about $\frac{1}{4}$th of an inch; the hole does not come quite through, leaving about $\frac{1}{4}$th of an inch at the bottom; and the head is made hollow, in the form of a bowl.

Military Diet voce *Laboratory.*

The composition for fuzes is saltpetre 3, sulphur 1, and mealed powder 3, 4, and sometimes 5. This composition is drove in with an iron-driver (whose ends are capped with copper to prevent the composition from taking fire), and equally hard as possible; the last shovel-full being all mealed powder, and two stands of quick-match laid across each other being drove in with it, the ends of which are folded up into the hollow top, and a cap of parchment tied over it till used.

When these fuzes are driven into the loaded shell, the lower end is cut off in a slope, so that the composition may inflame the powder in the shell: the fuze must have such a length as to continue burning all the time the shell is in its range, and to set fire to the powder as soon as it touches the ground, which instantly bursts into many pieces. When the distance of the battery from the object is known, the time of the shell's flight may be computed to a second or two; which being known, the fuze may be cut accordingly, by burning two or three, and making use of a watch or a string by way of a pendulum to vibrate seconds.

Fusibility || Fustian.

FUSIBILITY, in natural philosophy, that quality of bodies which renders them fusible. Gold is more fusible than iron or copper; but less so than silver, tin, and lead. Borax is frequently mixed with metals, to render them more fusible.

FUSIL, in heraldry, a bearing of a rhomboidal figure, longer than the lozenge, and having its upper and lower angles more acute and sharp than the other two in the middle. It is called in Latin *fusus*, "a spindle," from its shape.

FUSILIERS, Fusileers, or *Fuzileers*, in the military art, are soldiers armed as the rest of the infantry, but wearing caps like the grenadiers, though somewhat shorter. There are three regiments in the British service: the royal regiment of Scots fuzileers raised in 1678; the royal regiment of English fuzileers raised in 1685; and the royal regiment of Welsh fuzileers raised in 1688-9.

FUSION, the state of a body rendered fluid by fire. See Fluidity, and Chemistry-*Index*.

FUST, or Faustus, a citizen of Mentz, and one of the earliest printers. He had the policy to conceal his art; and to this policy we are indebted for the tradition of "The Devil and Dr Faustus," handed down to the present times. Fust, in partnership with Peter Schoeffer, having in 1462 printed off a considerable number of copies of the Bible to imitate those which were commonly sold in MS. Fust undertook the sale of them at Paris, where the art of printing was then unknown. At first he sold his copies for so high a sum as 500 or 600 crowns, the prices usually demanded by the scribes. He afterwards lowered his price to 60 crowns, which created universal astonishment: but when he produced copies as fast as they were wanted, and lowered the price to 30 crowns, all Paris was agitated. The uniformity of the copies increased the wonder; informations were given into the police against him as a magician; his lodgings were searched; and a great number of copies being found, they were seized: the red ink with which they were embellished was said to be his blood; it was seriously adjudged that he was in league with the devil; and if he had not fled, most probably he would have shared the fate of those whom ignorant and superstitious judges, condemned in those days for witchcraft. See (History of) Printing.

FUSTIAN, in commerce, a kind of cotton stuff, which seems as it were whaled on one side.

Right fustians should be altogether made of cotton-yarn, both woof and warp; but a great many are made, the warp of which is flax, or even hemp.

There are fustians made of several kinds, wide, narrow, fine, coarse; with shag or nap, and without it.

Fustian, is also used for a bombast style, or a high swelling

Fuſtick | Future.

ſwelling kind of writing made up of heterogeneous parts.

FUSTICK, or FOSTOCK, a yellow wood, that grows in all the Caribbee iſlands, uſed in dying yellow. It pays no duty on importation. It is a ſpecies of MORUS.

FUSTIGATIO, in the Roman cuſtoms, a puniſhment inflicted by beating with a cudgel. This puniſhment was peculiar to freemen: for the ſlaves were ſcourged or laſhed with whips.

FUTTOCKS, in a ſhip, the timbers raiſed over the keel, or the encompaſſing timbers that make her breadth.

FUTURE, ſomething to come hereafter. We ſay a *future* ſtate, a *future* contingency; there is none but God to whom *future* things are preſent.

FUTURE, or *FUTURE Tenſe*, in grammar, denotes an inflexion of verbs, whereby they denote, that a thing will be in ſome time yet to come. See GRAMMAR.

FUZES, or FUSEES, in artillery. See FUSEE. Fuzes || Fyte.

FUZILEERS. See FUSILEERS.

FYTT (John), a celebrated painter of animals and flowers, &c. was born at Antwerp about the year 1625, and proved one of the beſt artiſts of his time. He frequently painted in conjunction with Rubens, and Jordaens; and whatever ſubject he choſe to repreſent in the ſtyle which he adopted, was always deſigned and finiſhed in a maſterly manner. His general ſubjects were live and dead game, wild boars, hares, dogs, fruits, flowers, and birds, particularly partridges; which he deſcribed with ſurprizing truth, nature, and ſtrength. He likewiſe imitated ſucceſsfully the bas relieves on vaſes of marble or porphyry; and gave uncommon freſhneſs to his fruits and flowers; and in objects of the animal kind, he deſcribed even the hairs of the animals and the plumage of his fowl with wonderful ſpirit, exactneſs, and freedom of pencil.

G.

G THE ſeventh letter and fifth conſonant of our alphabet; though in the alphabets of all the oriental languages, the Hebrew, Phenician, Chaldee, Syriac, Samaritan, Arabic, and even Greek, *G* is the third letter. The Hebrews call it *ghimel* or *gimel*, *q. d.* "camel;" by reaſon it reſembles the neck of that animal; and the ſame appellation it bears in the Samaritan, Phenician, and Chaldee: in the Syriac it is called *gamel*, in Arabic *giim*, and in Greek *gamma*.

The gamma (Γ) of the Greeks is manifeſtly the gimel (ג) of the Hebrews or Samaritans. All the difference between the gamma and gimel conſiſts in this, that the one is turned to the right and the other to the left, according to the different manners of writing and reading which obtained among thoſe different nations; ſo that all the pains Salmaſius has taken on Solinus, to prove that the G was derived from the Greek kappa, is loſt.

From the Greeks the Latins borrowed their form of this letter; the Latin G being certainly a corruption of the Greek gamma Γ, as might eaſily be ſhown, had our printers all the characters and forms of this letter which we meet with in the Greek and Latin MSS. through which the letter paſſed from Γ to G.

Diomed, lib. ii. cap. *De Litera*, calls G a new letter. His reaſon is, that the Romans had not introduced it before the firſt Punic war; as appears from the roſtral column erected by C. Duilius, on which we every where find a C in lieu of G. It was Sp. Carvilius who firſt diſtinguiſhed between thoſe two letters, and invented the figure of the G; as we are aſſured by Terentius Scaurus. The C ſerved very well for G; it being the third letter of the Latin alphabet, as the Γ or γ was of the Greek.

. The G is found inſtead of C on ſeveral medals: *Vaillant, Num. Imperat.* tom. i. p. 39.

M. Beger produces a medal of the *Familia Ogulnia*, where GAR is read inſtead of CAR, which is on thoſe of M. Patin. But the C is more frequently ſeen on medals in lieu of G; as, AUCUSTALIS CALLAECIA CARTACINENSIS, &c. for AUGUSTALIS, &c. Not that the pronunciation of thoſe words was altered, but only that the G was unartfully or negligently cut by the workmen: as is the caſe in divers inſcriptions of the eaſtern empire; where AUC, AUCC, AUCCC, are frequently found for AUG, &c.

The northern people frequently change the G into V or W; as in *Gallus*, *Wallus*; *Gallia*, *Wallia*, *Vallia*, &c. For in this inſtance it muſt not be ſaid that the French have changed the W into G; becauſe they wrote *Gallus* long before *Wallus* or *Wallia* was known, as appears from all the ancient Roman and Greek writers. And yet it is equally true, that the French change the W of the northern nations, and V conſonant, into G; as, *Willielmus*, "William," into *Guillaume*; *Wulphilas* into *Gulphilas*; *Vaſco* into *Gaſcon*, &c.

The letter G is of the mute kind, and cannot be any way ſounded without the help of a vowel. It is formed by the reflexion of the air againſt the palate, made by the tongue as the air paſſes out of the throat; which Martianus Capella expreſſes thus, G *ſpiritus cum palato*; ſo that G is a palatal letter.

The modern G takes its form from that of the Latins. In Engliſh it has two ſounds, one from the Greek Γ, and the Latin, which is called that of the hard *G*, becauſe it is formed by a preſſure ſomewhat hard on the fore-part of the tongue againſt the upper gum;

Gabale || Gabel.

which found it retains before *a*, *o*, *u*, *l*, *r*; as *gate*, *go*, *gull*. At the end of a word it is always hard, as *ring*, *ſing*, &c. The other ſound, called that of the ſoft *G*, reſembles that of *j*; and is commonly, though not always, found before *e* and *i*, as in *geſture*, *giant*, &c. To this rule, however, there are many exceptions; *G* is often hard before *i*, as *give*, &c. and ſometimes before *e*, as *get*, &c. It is alſo hard in derivatives from words ending in *g*, as *ſinging*, *ſtronger*, &c. and generally before *er*, at the end of words, as *finger*. *G* is mute before *n*, as *gnaſh*, *ſign*. *Gh* has the ſound of the hard *G* in the beginning of a word, as *ghoſtly*; in the middle, and ſometimes at the end, it is quite ſilent, as *right*, *though*. At the end of a word *Gh* has often the ſound of *f*, as *laugh*, *rough*, *tough*.

As a numeral, G was anciently uſed to denote 400; and with a daſh over it thus $\overline{G}$, 40,000.

As an abbreviature, G. ſtands for *Gaius*, *Gellius*, *gens*, *genius*, &c. G. G. for *gemina*, *geſſit*, *geſſerunt*, &c. G. C. for *genio civitatis* or *Cæſaris*. G. L. for *Gaius libertus*, or *genio loci*. G. V. S. for *genio urbis ſacrum*. G. B. for *genio bono*. And G. T. for *genio tutelari*.

In muſic, G is the character or mark of the treble cleff; and from its being placed at the head, or marking the firſt ſound in Guido's ſcale, the whole ſcale took the name *gamut*.

GABALE, in mythology, a deity worſhipped at Heliopolis under the figure of a lion, with a radiant head; and it is thus repreſented on many medals of Caracalla.

GABARDINE, from the Italian *gavardina*, has been ſometimes uſed to denote a coarſe frock, or mean dreſs. In this ſenſe it is uſed by Shakeſpeare in his Tempeſt and Merchant of Venice, and by Butler in his Hudibras, book i.

GABARA, or Gabbara, in antiquity, the dead bodies which the Egyptians embalmed, and kept in their houſes, eſpecially thoſe of ſuch of their friends as died with the reputation of great piety and holineſs, or as martyrs. See Embalming, and Mummy.

GABEL (*Gabella*, *Gablum*, *Gablagium*), in French *Gabelle*, i. e. *Vectigal*, hath the ſame ſignification among the ancient Engliſh writers that *gabelle* hath in France. It is a tax; but hath been variouſly uſed, as for a rent, cuſtom, ſervice, &c. And where it was a payment of rent, thoſe who paid it were termed *gablatores*. When the word *gabel* was formerly mentioned without any addition to it, it ſignified the tax on ſalt, tho' afterwards it was applied to all other taxes.

In the French cuſtoms, the gabel, or tax on ſalt, computed to make one-fourth of the whole revenue of the kingdom, is ſaid to have had its riſe in France in 1286, under Philip the Fair. Philip the Long took a double per livre on ſalt, by an edict in 1318, which he promiſed to remit when he was delivered from his enemies; which was renewed by Philip de Valois in 1345; and the duty was raiſed to four deniers per livre; king John reſumed it in 1355, and it was granted to the dauphin in 1358, to ranſom king John. It was continued by Charles V. in 1366; after his deceaſe it was ſuppreſſed, but revived again by Cha. VI. in 1381. Louis XI. raiſed it to 12 deniers per livre; and Francis I. in 1542 to 24 livres per muid: and it has been conſiderably augmented ſince that time; ſo that a minot of ſalt latterly paid a duty of 52 livres, 8 ſols, and 6 deniers. Philip de Valois firſt eſtabliſhed granaries and officers of the gabelles, and prohibited any other perſons from ſelling ſalt: from which time the whole commerce of ſalt for the inland conſumption continued wholly in the king's hands, every grain thereof being ſold and diſtributed by his farmers and officers created for the purpoſe.—This very odious and oppreſſive tax has lately been aboliſhed by the National Aſſembly.

Gabii || Gabres.

GABII, (anc. geog.), a town of Latium, midway almoſt between Rome and Preneſte to the eaſt, often mentioned in the hiſtory of Tarquin the Proud. *Cinctus Gabinus* denoted a particular way of tucking the gown, by drawing it forwards on the breaſt, and tying it into a knot; as the people of Gabii did at a ſolemn ſacrifice, on the ſudden attack of an enemy, in order to be fitter for action. In this manner the conſul uſed to declare war, to ſacrifice, and burn the ſpoils of the enemy; and then he was ſaid to be *præcinctus*. The place now extinct.

GABINIAN laws, in Roman antiquities; laws inſtituted upon ſeveral occaſions by perſons of the name of *Gabinius*. The firſt was the *Gabinia lex de Comitiis*, by A. Gabinius the tribune, in the year of Rome 614. It required that in the public aſſemblies for electing magiſtrates, the votes ſhould be given by tablets, and not *vivâ voce*.—Another *de Comitiis*, which made it a capital puniſhment to convene any clandeſtine aſſembly, agreeable to the old law of the 12 tables.—Another *de Militiâ*, by A. Gabinius the tribune, year of Rome 685. It granted Pompey the power of carrying on the war againſt the pirates during three years, and of obliging all kings, governors, and ſtates, to ſupply him with all the neceſſaries he wanted, over all the Mediterranean ſea, and in the maritime provinces as far as 400 *ſtadia* from the ſea.—Another *de Uſurâ* by Aul. Gabinius the tribune, year of Rome 685. It ordained that no action ſhould be granted for the recovery of any money borrowed upon ſmall intereſt to be lent upon larger. This was an uſual practice at Rome, which obtained the name of *verſuram facere*.—Another againſt fornication.

GABIONS, in fortification, baſkets made of ozier-twigs, of a cylindrical form, ſix feet high and four wide; which, being filled with earth, ſerve as a ſhelter from the enemy's fire.

GABLE, or *Gable-End*, of a houſe (from *gaval*, Welſh), is the upright triangular end from the cornice or eaves to the top of the houſe.

GABRES, or Gavres, a religious ſect in Perſia and India; called alſo *Gebres*, *Guebres*, *Gevres*, *Gaurs*, &c. See Magi.

The Turks call the Chriſtians *Gabres*, *q. d.* infidels, or people of a falſe religion; or rather, as Leunclavius obſerves, heathens or gentiles: the word *Gabre*, among the Turks, having the ſame ſignification as *pagan* or *infidel* among the Chriſtians, and denoting any thing not Mahometan.

In Perſia the word has a more peculiar ſignification; wherein it is applied to a ſect diſperſed through the country, and ſaid to be the remains of the ancient Perſians or followers of Zoroaſter, being worſhippers of fire. They have a ſuburb at Iſpahan, which is called *Gaurabad*, or "the town of the *Gaurs*," where they are

are employed in the meaneſt and vileſt drudgery: ſome of them are diſperſed through other parts of Perſia; but they principally abound in Kerman, the moſt barren province in the whole country, where the Mahometans allow them liberty and the exerciſe of their religion. Several of them fled many ages ago into India, and ſettled about Surat, where their poſterity remain to this day. There is alſo a colony of them at Bombay. They are a poor, ignorant, inoffenſive people, extremely ſuperſtitious, and zealous for their rites, rigorous in their morals, and honeſt in their dealings. They profeſs to believe a reſurrection and a future judgment, and to worſhip only one God. And though they perform their worſhip before fire, and direct their devotion towards the riſing ſun, for which they have an extraordinary veneration, yet they ſtrenuouſly maintain that they worſhip neither; but that theſe are the moſt expreſſive ſymbols of the Deity, and that for this reaſon they turn towards them in their devotional ſervices.—However, ſome have ſuppoſed, that theſe are Perſians converted to Chriſtianity, who, being afterwards left to themſelves, mingled their ancient ſuperſtitions with the truths and practices of Chriſtianity, and ſo formed for themſelves a religion apart: and they allege, that throughout the whole of their ſyſtem of doctrine and practice, we may diſcern the marks and traces of Chriſtianity, though grievouſly defaced; the annunciation, the magi, the maſſacre of the infants, our Saviour's miracles, his perſecutions, aſcenſion, &c.

GABRIEL, the name of one of the principal angels in heaven. It ſignifies *the ſtrength of God*. There are a few events, in which this exalted being was concerned, recorded in ſcripture. He was ſent to the prophet Daniel, to explain to him the viſion of the ram and goat, and the myſtery of the ſeventy weeks, which had been revealed to him. He was ſent to Zecharias, to declare to him the future birth of John the Baptiſt. Six months after, he was ſent to Nazareth to the Virgin Mary, to warn her of the birth of Jeſus Chriſt.

The Orientaliſts add ſeveral particulars to what the ſcriptures inform us concerning the angel Gabriel. The Mahometans call him the *faithful ſpirit*; and the Perſians, by way of metaphor, the *peacock of heaven*. We read, in the ſecond chapter of the Koran, that *whoſoever is an enemy to Gabriel ſhall be confounded*. It was Gabriel, they believe, who brought to Mahomet their falſe prophet the revelations which he publiſhed; and it was he who conducted him to heaven mounted upon the animal Borak.

GABRIELITES, in eccleſiaſtical hiſtory, a ſect of anabaptiſts that appeared in Pomerania in 1530. They derive their name from Gabriel Scherling; who, after having been for ſome time tolerated in that country, was obliged to remove, and died in Poland.

GAD (anc. geog.), a diſtrict of the Transjordan Paleſtine, ſituated between Gilead and the kingdom of Baſhan to the north, and the kingdom of the Amorrhites to the ſouth; having the Jordan to the weſt, and bounded by various people on the eaſt; ſo called from a tribe of that name.

GAD, among miners, a ſmall punch of iron, with a long wooden handle, uſed to break up the ore.

One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by ſtriking it with a ſledge-hammer.

GAD-Bee, or *Gad-Fly*. See OESTRUS. Gad-Bee

GADARA (anc. geog.), a town of the Peræa, or Transjordan, in the Decapolis, a very ſtrong place. Reſtored by Pompey after its demolition by the Jews (Joſephus). After Herod's death it was joined to the province of Syria by Auguſtus. Gadus.

GADARENORUM AGER (anc. geog.), the country of the Gadarenes, called by Matthew the country of the Gergeſens, becauſe it was a diſtrict that lay between Gadara and Gergeſa, otherwiſe called *Geraſa*, both which lay within the Decapolis on the other ſide Jordan.

GADES, or GADIRA (anc. geog.), a ſmall iſland in the Atlantic, on the Spaniſh coaſt, 25 miles from the Columns of Hercules. It was ſometimes called *Tarteſſus* and *Erythia* according to Pliny. Geryon, whom Hercules killed, fixed his reſidence there. Hercules, ſurnamed Gaditanus, had there a celebrated temple in which all his labours were engraved with excellent workmanſhip. The inhabitants are called Gaditani.

GADUS, in ichthyology, a genus of fiſhes belonging to the order of jugulares. The head is ſmooth; there are ſeven cylindrical rays in the branchioſtege membrane; the body is oblong, with deciduous ſcales; the whole fins are covered with the common ſkin of the fiſh; the rays of the back-fins are blunt, and thoſe of the breaſt are ſharp. There are 17 ſpecies, principally diſtinguiſhed by their cirri and the number of back-fins. The moſt remarkable are,

1. The *morhua*, or COMMON COD, is cinereous on the back and ſides, and commonly ſpotted with yellow: the belly is white; but they vary much, not only in colour, but in ſhape, particularly that of the head. The ſide-line is white, and broad, and ſtraight, till it reaches oppoſite the vent, when it bends towards the tail. Codlings are often taken of a yellow, orange, and even red colour, while they remain among the rocks; but on changing their place aſſume the colour of other cod-fiſh. The jaws are of an equal length, and at the end of the lower is a ſmall beard; the teeth are diſpoſed in the palate as well as in the jaws.

The cod is found only in the northern parts of the world; it is, as Rondeletius calls it, an ocean fiſh, and never met with in the Mediterranean Sea. It affects cold climates, and ſeems confined between the latitudes 66° and 50°; what are caught north and ſouth of thoſe degrees being either few in quantity or bad in quality. The Greenland fiſh are ſmall, and emaciated through want of food; being very voracious, and having in thoſe ſeas a ſcarcity of proviſion. This locality of ſituation is common to many other ſpecies of this genus, moſt of them being inhabitants of the cold ſeas, or ſuch as lie within regions that can juſt claim the title of *temperate*. There are nevertheleſs certain ſpecies found near the Canary Iſlands, called *cherny*, of which we know no more than the name; but which, according to Captain Glaſs, are better taſted than the Newfoundland kind.

The great rendezvous of the cod-fiſh is on the banks of Newfoundland, and the other ſand-banks that lie off the coaſts of Cape Breton, Nova Scotia, and New England. They prefer thoſe ſituations, by reaſon of the quantity of worms produced in thoſe ſandy bottoms, which tempt them to reſort there for food; but

another

Gadus. another cauſe of the particular attachment the fiſh have to theſe ſpots, is their vicinity to the polar ſeas, where they return to ſpawn: there they depoſite their roes in full ſecurity; but want of food forces them, as ſoon as the firſt more ſouthern ſeas are open, to repair thither for ſubſiſtence. Few are taken north of Iceland, but on the ſouth and weſt coaſts they abound: they are again found to ſwarm on the coalls of Norway, in the Baltic, off the Orkney and the Weſtern Iſles; after which their numbers decreaſe, in proportion as they advance towards the ſouth, when they ſeem quite to ceaſe before they reach the mouth of the Straits of Gibraltar.

Before the diſcovery of Newfoundland, the greater fiſheries of cod were on the ſeas of Iceland, and off our Weſtern Iſles, which were the grand reſort of ſhips from all the commercial nations; but it ſeems that the greateſt plenty was met with near Iceland. The Engliſh reſorted thither before the year 1415: for we find that Henry V. was diſpoſed to give the king of Denmark ſatisfaction for certain irregularities committed on thoſe ſeas by his ſubjects. In the reign of Edward IV. the Engliſh were excluded from the fiſhery by treaty; and forbidden to reſort there under pain of forfeiture of life and goods. Notwithſtanding this, that monarch afterwards gave licence to a ſhip of Hull to ſail to Iceland, and there relade fiſh and other goods, without regard to any reſtrictions to the contrary. The right of the Engliſh in latter times was far from being confirmed: for we find queen Elizabeth condeſcending to aſk permiſſion to fiſh in thoſe ſeas from Chriſtian IV. of Denmark; yet afterwards ſhe ſo far repented her requeſt, as to inſtruct her ambaſſadors at that court to inſiſt on the right of a free and univerſal fiſhery. In the reign of her ſucceſſor, however, they had not fewer than 150 ſhips employed in the Iceland fiſhery; which indulgence might ariſe from the marriage of James with a princeſs of Denmark. But the Spaniſh, the French, and the Bretons, had much the advantage of the Engliſh in all fiſheries at the beginning, as appears by the ſtate of that in the ſeas of Newfoundland in the year 1578, when the number of ſhips belonging to each nation ſtood thus:

Spaniards, 100, beſides 20 or 30 that came from Biſcay to take whale for train, being about five or ſix thouſand tons.
Portugueſe 50, or three thouſand tons.
French and Bretons 150, or ſeven thouſand tons.
Engliſh, from 30 to 50.

The increaſe of ſhipping that reſort to thoſe fertile banks is now unſpeakable. Britain now enjoys the greateſt ſhare; which ought to be eſteemed our chiefeſt treaſure, as it brings wealth to individuals, and ſtrength to the ſtate. See FISHERY.

All this immenſe fiſhery is carried on by the hook and line only. We have been informed that they fiſh from the depth of 16 to 60 fathoms, according to the inequality of the bank, which is repreſented as a vaſt mountain, under water, above 500 miles long, and near 300 broad; and that ſeamen know when they approach it by the great ſwell of the ſeas and the thick miſts that impend over it. The bait is herring, a ſmall fiſh called a *capelin*, a ſhell-fiſh called *clams*, and bits of ſea-fowl; and with theſe are caught fiſh ſufficient to find employ for near 15,000 Britiſh ſeamen, and to afford ſubſiſtence to a much more numerous body of people at home, who are engaged in the various manufactures which ſo vaſt a fiſhery demands. Gadi

The food of the cod is either ſmall fiſh, worms, teſtaceous or cruſtaceous animals, ſuch as crabs, large whelks, &c.; and their digeſtion is ſo powerful as to diſſolve the greateſt part of the ſhells they ſwallow. They are very voracious, and catch at any ſmall body they perceive moved by the water, even ſtones and pebbles, which are often found in their ſtomachs.

Fiſhermen are well acquainted with the uſe of the air-bladder or ſound of the cod; and are very dexterous in perforating this part of a live fiſh with a needle, in order to diſengage the incloſed air; for without this operation it could not be kept under water in the well-boats, and brought freſh to market. The ſounds of the cod ſalted is a delicacy often brought from Newfoundland. Iſinglaſs is alſo made of this part by the Iceland fiſhermen: a proceſs which deſerves the attention of the natives of the north of Scotland, where theſe fiſh are plentiful. It is given under the article ICHTHYOCOLLA.

Providence hath kindly ordained, that this fiſh, ſo uſeful to mankind, ſhould be ſo very prolific as to ſupply more than the deficiences of the multitudes annually taken. Leuwenhoeck counted 9,384,000 eggs in a cod-fiſh of a middling ſize; a number, ſure, that will baffle all the efforts of man, or the voracity of the inhabitants of the ocean, to exterminate, and which will ſecure to all ages an inexhauſtible ſupply of grateful proviſion.

In our ſeas they begin to ſpawn in January, and depoſite their eggs in rough ground among rocks. Some continue in roe till the beginning of April. The cod-fiſh in general recover quicker after ſpawning than any other fiſh; therefore it is common to take ſome good ones all the ſummer. When they are out of ſeaſon, they are thin-tailed and louſy; and the lice chiefly fix themſelves on the inſide of their mouths.

The fiſh of a middling ſize are moſt eſteemed for the table; and are choſen by their plumpneſs and roundneſs, eſpecially near the tail, by the depth of the fulcus or pit behind the head, and by the regular undulated appearance of the ſides, as if they were ribbed. The glutinous parts about the head loſe their delicate flavour after it has been 24 hours out of the water, even in winter, when theſe and other fiſh of this genus are in higheſt ſeaſon.

One mentioned by Mr Pennant as the largeſt that he ever heard of taken on our coaſts, weighed 78 pounds: the length was five feet eight inches, and the girth round the ſhoulders five feet. It was taken at Scarborough in 1755, and was ſold for one ſhilling. But the general weight of theſe fiſh in the Yorkſhire ſeas, he ſays, is from 14 to 40 pounds. This ſpecies is ſhort in proportion to its bulk, the belly being very large and prominent.

2. The *eglefinus*, or HADDOCK, has a long body; the upper part of a duſky brown colour, and the belly and lower part of the ſides ſilvery: On the back are three fins reſembling thoſe of the common cod-fiſh; the lateral line is black; and the tail is forked: The head ſlopes down to the noſe; on the chin is a ſhort beard; and on each ſide beyond the gills is a large black ſpot. Superſtition aſſigns this mark to the impreſſion

lus. preſſion St Peter left with his finger and thumb when he took the tribute out of the mouth of a fiſh of this ſpecies, which has been continued to the whole race of haddocks ever ſince that miracle. Large haddocks begin to be in roe in the middle of November, and continue ſo till the end of January; from that time till May they are very thin-tailed, and much out of ſeaſon. In May they begin to recover; and ſome of the middling ſized fiſh are then very good, and continue improving till the time of their greateſt perfection. The ſmall ones are extremely good from May till February, and ſome even in February, March, and April, *viz.* thoſe which are not old enough to breed.

The fiſhermen aſſert, that in rough weather haddocks ſink down into the ſand and ooze in the bottom of the ſea, and ſhelter themſelves there till the ſtorm is over; becauſe in ſtormy weather they take none, and thoſe that are taken immediately after a ſtorm are covered with mud on their backs.

In ſummer they live on young herrings and other ecies ſmall fiſh; in winter on the ſtone-coated worms *, uls. which the fiſhermen call *haddock-meat*.

The grand ſhoal of haddocks comes periodically on the Yorkſhire coaſts. It is remarkable that they appeared in 1766 on the 10th of December, and exactly on the ſame day in 1767: theſe ſhoals extended from the ſhore near three miles in breadth, and in length from Flamborough head to Tinmouth-caſtle, and perhaps much farther northwards. An idea may be given of their numbers by the following fact: Three fiſhermen, within the diſtance of a mile from Scarborough harbour, frequently loaded their coble or boat with them twice a-day, taking each time about a ton of fiſh: when they put down their lines beyond the diſtance of three miles from the ſhore, they caught nothing but dog-fiſh, which ſhows how exactly theſe fiſh keep their limits. The beſt haddocks were ſold from eightpence to a ſhilling *per* ſcore; and the poor had the ſmaller ſort at a penny and ſometimes a halfpenny *per* ſcore.

The large haddocks quit the coaſt as ſoon as they go out of ſeaſon, and leave behind great plenty of ſmall ones. It is ſaid that the large ones viſit the coaſts of Hamburgh and Jutland in the ſummer. It is no leſs remarkable than providential, that all kinds of fiſh (except mackrel) which frequent the Yorkſhire coaſt, approach the ſhore, and as it were offer themſelves to us, generally remaining there as long as they are in high ſeaſon, and retire from us when they become unfit for uſe. It is the commoneſt ſpecies in the London markets. They do not grow to a great bulk, one of 14 pounds being of an uncommon ſize, but thoſe are extremely coarſe; the beſt for the table weighing from two to three pounds.

3. The *barbatus*, or POUT, never grows to a large ſize, ſeldom exceeding a foot in length. It is diſtinguiſhed from all others by its great depth; one of the ſize above mentioned being near four inches deep in the broadeſt part. The back is very much arched, and carinated; the colour of the fins and tail are black: at the bottom of the pectoral fins is a black ſpot. The lateral line is white, broad, and crooked. The tail is even at the end, and of a duſky colour. The colour of the body is white; but more obſcure on the back than the belly, and tinged with yellow.—It is called at Scarborough a *lug*, and is a very delicate fiſh.

4. The *Minutus*, or POOR, is the ſmalleſt ſpecies yet diſcovered, being little more than ſix inches long. On the chin is a ſmall beard: the eyes are covered with a looſe membrane: on the gill-covers and the jaws there are on each ſide nine punctures. The colour on the back is a light brown; on the belly a dirty white. It is taken near Marſeilles, and ſometimes in ſuch quantities as to become a nuiſance; for no other kinds of fiſh are taken during their ſeaſon. It is eſteemed good, but incapable of being ſalted or dried. Belon ſays, that when it is dried in the ſun, it grows as hard as horn. We owe the diſcovery of this kind in our ſeas to the Reverend Mr Jago. Gadus.

5. The *carbonarius*, or COAL FISH, is of a more elegant form than the cod-fiſh: they generally grow to the length of two feet and an half, and weigh about 28 or 30 pounds at moſt. The head is ſmall; the under jaw a little longer than the upper: The tail is broad and forked. They vary in colour: Some have their back, noſe, dorſal fins, and tail, of a deep black; the gill-covers, ſilver and black; the ventral and anal fins, and the belly, white: Others are duſky, others brown; but, in all, the lateral line is ſtraight and white, and the lower part of the ventral and anal fins white. This fiſh takes its name from the black colour that it ſometimes aſſumes. Belon calls it the *colfiſch*, imagining that it was ſo named by the Engliſh, from its producing the Ichthyocolla; but Geſner gives the true etymology. Theſe fiſh are common on moſt of our rocky and deep coaſts, but particularly thoſe of the north of Great Britain. They ſwarm about the Orkneys, where the fry are the great ſupport of the poor. The young begin to appear on the Yorkſhire coaſt the beginning of July in vaſt ſhoals, and are at that time about an inch and an half long. In Auguſt they are from three to five inches in length, and are taken in great numbers with the angling rod: they are then eſteemed a very delicate fiſh; but grow ſo coarſe when they are a year old, that few people will eat them. Fiſh of that age are from 8 to 15 inches long, and begin to have a little blackneſs near the gills and on the back, and the blackneſs increaſes as they grow older.

The fry is known by different names in different places: they are called at Scarborough *parrs*; and when a year old, *billets*. About 20 years ago ſuch a glut of parrs viſited that part, that for ſeveral weeks it was impoſſible to dip a pail into the ſea without taking ſome.

Though this fiſh is ſo little eſteemed when freſh, yet it is ſalted and dried for ſale.

6. The *pollachius*, or POLLACK, has the under jaw longer than the upper; the head and body riſes pretty high, as far as the firſt dorſal fin. The ſide line is incurvated, riſing towards the middle of the back, then ſinking and running ſtraight to the tail; it is broad, and of a brown colour. The colour of the back is duſky, ſometimes inclining to green: the ſides beneath the lateral line are marked with lines of yellow; and the belly is white.—This fiſh is common on many of our rocky coaſts: during ſummer they are ſeen in great ſhoals frolicking on the ſurface of the water, and flinging themſelves into a thouſand forms. They are at that time ſo wanton as to bite at any thing that appears on the top of the waves, and are often taken with

Gadus. with a gnofe-feather fixed to the hook. They are very ſtrong, being obſerved to keep their ſtation at the feet of the rocks in the moſt turbulent and rapid ſea. They are a good eating fiſh. They do not grow to a very large ſize; at leaſt the biggeſt ſeldom exceed ſix or ſeven pounds: but ſome have been taken in the ſea near Scarborough, which they frequent during winter, that weighed near 28 pounds. They are there called *leets*.

7. The *merlangus*, or WHITING, is a fiſh of an elegant make: the upper jaw is the longeſt; the eyes are large, the noſe is ſharp; the teeth of the upper jaw are long, and appear above the lower when cloſed. The colour of the head and back is a pale brown; the lateral line white, and crooked; the belly and ſides are ſilvery, the laſt ſtreaked lengthwiſe with yellow.

Theſe fiſh appear in vaſt ſhoals in our ſeas in the ſpring, keeping at the diſtance of about half a mile to that of three from the ſhore. They are caught in vaſt numbers by the line, and afford excellent diverſion. They are the moſt delicate, as well as the moſt wholeſome, of any of the genus: but they do not grow to a large ſize, the biggeſt not exceeding 20 inches; and even that is very uncommon, the uſual length being 10 or 12; though, it is ſaid, that whitings from 4 to 8 pounds in weight have been taken in the deep water at the edge of the Dogger-Bank.

8. The *merlucius*, or HAKE, is found in vaſt abundance on many of our coaſts, and of thoſe of Ireland. There was formerly a vaſt ſtationary fiſhery of hake on the Nymph Bank off the coaſt of Waterford, immenſe quantities appearing there twice a-year; the firſt ſhoal coming in June, during the mackrel-ſeaſon; the other in September, at the beginning of the herring-ſeaſon, probably in purſuit of thoſe fiſh: it was no unuſual thing for ſix men with hooks and lines to take a thouſand hake in one night, beſides a conſiderable quantity of other fiſh. Theſe were ſalted and ſent to Spain, particularly to Bilboa. We are at this time uninformed of the ſtate of this fiſhery; but find that Mr Smith, who wrote the hiſtory of the county of Waterford, complains even in his time (1746) of its decline. Many of the gregarious fiſh are ſubject to change their ſituations, and deſert their haunts for numbers of years, and then return again. Mr Smith inſtances the loſs of the haddock on the Waterford ſhores, where they uſed to ſwarm; and we can bring the capriciouſneſs of the herrings, which ſo frequently quit their ſtations, as another example.—Sometimes the irregular migration of fiſh is owing to their being followed and haraſſed by an unuſual number of fiſh of prey, ſuch as the ſhark kind; ſometimes to deficiency of the ſmaller fiſh, which ſerved them as food; and laſtly, in many places to the cuſtom of trawling, which not only demoliſhes a quantity of their ſpawn, which is depoſited in the ſand, but alſo deſtroys or drives into deeper waters numberleſs worms and inſects, the repaſt of many fiſh.—The hake is in England eſteemed a very coarſe fiſh, and is ſeldom admitted to table either freſh or ſalted. When cured, it is known by the name of *Poor John*. Theſe fiſh are from a foot and an half to near twice that length: they are of a ſlender make, of a pale aſh-colour on their backs, and of a dirty white on their bellies.

10. The *molva*, or LING, is uſually from three to four feet long, but have been heard of ſeven feet long. Gad
The body is very ſlender; the head flat: the upper jaw is the longeſt; the teeth in that jaw are ſmall and very numerous; in the lower, few, ſlender, and ſharp: on the chin is a ſmall beard. They vary in colour, ſome being of an olive hue on the ſides and back, others cinereous; the belly white. The ventral fins are white: the dorſal and anal edged with white. The tail is marked near the end with a tranſverſe black bar, and tipt with white. The ling takes its Engliſh name from its length, being corrupted from the word *long*: It abounds about the Scilly Iſles, on the coaſt of Scarborough, and thoſe of Scotland and Ireland, and forms a conſiderable article of commerce. This branch of trade was conſiderable ſo long ago as the reign of Edward III. an act for regulating the price of lob, *ling*, and cod, being made in his 31ſt year. In the Yorkſhire ſeas they are in perfection from the beginning of February to the beginning of May, and ſome till the end of that month. In June they ſpawn, depoſiting their eggs in the ſoft oozy ground of the mouth of the Tees: at that time the males ſeparate from the females, and reſort to ſome rocky ground near Flamborough-head, where the fiſhermen take great numbers without ever finding any of the female or roe'd fiſh among them. While a ling is in ſeaſon its liver is very white, and abounds with a fine-flavoured oil; but as ſoon as the fiſh goes out of ſeaſon, the liver becomes red as that of a bullock, and affords no oil. The ſame happens to the cod and other fiſh in a certain degree, but not ſo remarkably as in the ling. When the fiſh is in perfection, a very large quantity of oil may be melted out of the liver by a ſlow fire; but if a violent ſudden heat be uſed for that purpoſe, they yield very little. The oil, which nature hoards up in the cellular membranes of the fiſhes, returns into their blood, and ſupports them in the engendering ſeaſon, when they purſue the buſineſs of generation with ſo much eagerneſs as to neglect their food. Vaſt quantities of ling are ſalted for exportation as well as for home-conſumption. When it is cut or ſplit for curing, it muſt meaſure 26 inches or upwards from the ſhoulder to the tail: if leſs than that, it is not reckoned a ſizeable fiſh, and conſequently not intitled to the bounty on exportation; ſuch are called *drizzles*, and are in ſeaſon all ſummer.

11. The *lota*, or BURBOT, in its body has ſome reſemblance to that of an eel, only ſhorter and thicker; and its motions alſo reſemble thoſe of that fiſh: they are beſides very ſmooth, ſlippery, and ſlimy. The head is very ugly, being flat, and ſhaped like that of a toad: the teeth are very ſmall, but numerous. On the end of the noſe are two ſmall beards; on the chin another. The colour varies: ſome are duſky, others are of a dirty green, ſpotted with black, and oftentimes with yellow; and the belly in ſome is white; but the real colours are frequently concealed by the ſlime. This fiſh abounds in the lake of Geneva, where it is called *lota*; and it is alſo met with in the Lago Magiore and Lugano. In Britain it is found in the Trent; but in greater plenty in the river Witham, and in the great eaſt fen in Lincolnſhire. It is a very delicate fiſh for the table, though of a diſguſting appearance when alive. It is very voracious, and preys on the fry and leſſer fiſh. It does not often take a bait, but is gene-

rally

Garlic || Gage.

rally caught in weels. The largeſt taken in our waters weigh between two and three pounds, but abroad they are ſometimes found of double that weight.

12. The *muſtela*, or FIVE-BEARDED COD, very much reſembles the former. The beards on the upper jaw are four, viz. two at the very end of the noſe, and two a little above them: on the end of the lower jaw is a ſingle one. The fiſh are of a deep olive brown, their belly whitiſh. They grow to the ſame ſize as the former.—The Corniſh fiſhermen are ſaid to whiſtle, and make uſe of the words *bod, bod, vean*, when they are deſirous of taking this fiſh, as if by that they facilitated the capture. In the ſame manner the Sicilian fiſhermen repeat their *mamaſſu di pajanu*, &c. when they are in purſuit of the ſword-fiſh.

13. The TORSK, or, as it is called in the Shetlands, *tuſk* and *briſinack*, is a northern fiſh; and as yet undiſcovered lower than about the Orkneys, and even there it is rather ſcarce. In the ſeas about Shetland, it ſwarms, and forms (barrelled or dried) a conſiderable article of commerce. The length is about 20 inches, the greateſt depth four and a half. The head is ſmall; the upper jaw a little longer than the lower; both jaws furniſhed with multitudes of ſmall teeth: on the chin is a ſmall ſingle beard: from the head to the dorſal fin is a deep furrow. The colour of the head is duſky: the back and ſides yellow; belly white; edges of the dorſal, anal, and caudal fins, white; the other parts duſky; the pectoral-fins brown.

GAELIC LANGUAGE. See HIGHLANDS.

GÆTULIA, (anc. geog.), a country of Africa, lying to the ſouth of Mauritania, called *Gætulia Propria*, and *Vetus*. *Gætuli*, the people, were diſtinguiſhed by different epithets; as *Nigri*, *Autololes*, *Dæræ*, and *Baniuræ*, (Pliny). The *Gætuli* were among the firſt inhabitants of Africa; a rough, unpoliſhed people, living on veniſon and the ſpontaneous productions of the earth; a roving wandering people, who took up with the firſt place in which night ſurprized them, (Salluſt.).

GAFF, a ſort of boom or pole, frequently uſed in ſmall ſhips, to extend the upper edge of the mizen; and always employed for the ſame purpoſe on thoſe ſails whoſe foremoſt edges are joined to the maſt by hoops or lacings, and which are uſually extended by a boom below. Such are the main-ſails of all ſloops, brigs, and ſchooners.

GAFFAREL (James), a French divine, and very learned writer, born about 1601. He acquired great ſkill in the oriental and ſeveral other languages; and was particularly verſant in the cabbaliſtic and occult ſciences, which he learned, expoſed, and refuted. Cardinal Richelieu made choice of him for his library-keeper, and ſent him into Italy to collect the beſt manuſcripts and books. He publiſhed a book, intitled *Curioſitez Inouies*, i. e. Unheard-of Curioſities. It is ſaid the cardinal deſigned to employ him in his grand project for the re-union of religions. He died in 1681, aged 80. He had been labouring for many years, and had almoſt finiſhed, a hiſtory of the ſubterranean world; containing an account of the caves, grottoes, vaults, catacombs, and mines, he had met with in 30 years travels.

GAGATES, or JET. See JET.

GAGE, in our ancient cuſtoms, ſignifies a pledge or pawn, given by way of ſecurity. The word is only properly uſed in ſpeaking of moveables; for immoveables, *hypotheca* is uſed. Gage.

If the gage periſh, the perſon who received it is not to anſwer for it, but only for extreme negligence, &c.

GAGE is alſo uſed for a challenge to combat: See CARTEL. In which ſenſe, it was a pledge, which the accuſer or challenger caſt on the ground, and the other took up as accepting the challenge: it was uſually a glove, gauntlet, chaperoon, or the like. See COMBAT, and DUEL.

GAGE is only now retained as a ſubſtantive. As a verb, the *G* is changed into *W*, and of *gage* is formed *wage*: as, to wage law, to wage deliverance, *q. d.* to give ſecurity a thing ſhall be delivered. See WAGE.

If a perſon who has diſtrained be ſued for not having delivered what he had taken by diſtreſs, he ſhould wage, or gage, or gager, deliverance; that is, put in ſurety that he will deliver them.

Mort-GAGE, is that which is left in the hands of the proprietor, ſo that he reaps the fruits thereof.

In oppoſition to *vif-gage*, where the fruits or revenues are reaped by the creditor, and reckoned on the foot of the debt, which diminiſhes in proportion thereto. The ſecond acquits or diſcharges itſelf; the firſt does not.

GAGE, in the ſea-language. When one ſhip is to windward of another, ſhe is ſaid to have the weather-gage of her. They likewiſe call the number of feet that a veſſel ſinks in the water, the ſhip's *gage*; this they find by driving a nail into a pike near the end, and putting it down beſide the rudder till the nail catch hold under it; then as many feet as the pike is under water is the ſhip's gage.

GAGE, among letter-founders, a piece of box, or other hard wood, variouſly notched; the uſe of which is to adjuſt the dimenſions, ſlopes, &c. of the different ſorts of letters. See FOUNDERY.

GAGE, in joinery, is an inſtrument made to ſtrike a line truly parallel to the ſtraight ſide of any board or piece of ſtuff. Its chief uſe is for gaging of tenons true, to fit into mortiſes; and for gaging ſtuff of an equal thickneſs. It is made of an oval piece of wood, fitted upon a ſquare ſtick, to ſlide up and down ſtiffly thereon, and with a tooth at the end of a ſtaff, to ſcore, to ſtrike a line upon the ſtuff at any diſtance, according to the diſtance of the oval from it.

Sliding GAGE, a tool uſed by mathematical inſtrument-makers for meaſuring and ſetting off diſtances.

Sea-GAGE, an inſtrument invented by Dr Hales and Dr Deſaguliers for finding the depth of the ſea; the deſcription whereof is this. AB (Plate CCV. fig. 1. n° 1.) is the gage-bottle, in which is cemented the gage-tube *Ff* in the braſs cape at G. The upper end of tube F is hermetically ſealed, and the open lower end *f* is immerſed in mercury, marked C, on which ſwims a ſmall thickneſs or ſurface of treacle. On the top of the bottle is ſcrewed a tube of braſs HG, pierced with ſeveral holes to admit the water into the bottle AB. The body K is a weight hanging by its ſhank L, in a ſocket N, with a notch on one ſide at *m*, in which is fixed the catch *l* of the ſpring S, and,

Gage. passing through the hole L, in the ſhank of the weight K, prevents its falling out when once hung on. On the top, in the upper part of the braſs tube at H, is fixed a large empty ball, or full-blown bladder I, which muſt not be ſo large, but that the weight K may be able to ſink the whole under water.

The inſtrument thus conſtructed is uſed in the following manner. The weight K being hung on, the gage is let fall into deep water, and ſinks to the bottom: the ſocket N is ſomewhat longer than the ſhank L; and therefore, after the weight K comes to the bottom, the gage will continue to deſcend till the lower part of the ſocket ſtrikes againſt the weight: this gives liberty to the catch to fly out of the hole L, and let go the weight K: when this is done, the ball or bladder I inſtantly buoys up the gage to the top of the water. While the gage is under water, the water having free acceſs to the treacle and mercury in the bottle, will by its preſſure force it up into the tube F*f*, and the height to which it has been forced by the greateſt preſſure, viz. that at the bottom, will be ſhown by the mark in the tube which the treacle leaves behind it, and which is the only uſe of the treacle. This ſhows into what ſpace the whole air in the tube F*f* is compreſſed; and conſequently the height or depth of the water which by its weight produced that compreſſion, which is the thing required.

If the gage-tube F*f* be of glaſs, a ſcale might be drawn on it with the point of a diamond, ſhowing, by inſpection, what height the water ſtands above the bottom. But the length of 10 inches is not ſufficient for fathoming depths at ſea, ſince that, when all the air in ſuch a length of tube is compreſſed into half an inch, the depth of water is no more than 634 feet, which is not half a quarter of a mile.

If, to remedy this, we make uſe of a tube 50 inches long, which for ſtrength may be a muſket-barrel, and ſuppoſe the air compreſſed into an hundredth part of half an inch; then by ſaying, as 1 : 99 :: 400 : 39600 inches, or 3300 feet; even this is but little more than half a mile, or 2640 feet. But ſince it is reaſonable to ſuppoſe the cavities of the ſea bear ſome proportion to the mountainous parts of the land, ſome of which are more than three miles above the earth's ſurface; therefore, to explore ſuch great depths, the doctor contrived a new form for his ſea-gage, or rather for the gage-tube in it, as follows. BCDF (*ibid.* n° 2.) is a hollow metalline globe communicating on the top with a long tube AB, whoſe capacity is a ninth part of that globe. On the lower part at D, it has alſo a ſhort tube DE, to ſtand in the mercury and treacle. The air contained in the compound gage-tube is compreſſed by the water as before; but the degree of compreſſion, or height to which the treacle has been forced, cannot there be ſeen through the tube; therefore, to anſwer that end, a ſlender rod of metal or wood, with a knob on the top of the tube AB, will receive the mark of the treacle, and ſhow it when taken out.

If the tube AB be 50 inches long, and of ſuch a bore that every inch in length ſhould be a cubic inch of air, and the contents of the globe and tube together 500 cubic inches; then, when the air is compreſſed within an hundredth part of the whole, it is evident the treacle will not approach nearer than five Gage. inches of the top of the tube, which will agree to the depth of 3300 feet of water as above. Twice this depth will compreſs the air into half that ſpace nearly, viz. 2½ inches, which correſpond to 6600, which is a mile and a quarter. Again, half that ſpace, or 1¼ inch, will ſhow double the former depth, viz. 13200 feet, or 2½ miles; which is probably very nearly the greateſt depth of the ſea.

Bucket Sea-Gage: an inſtrument contrived by Dr Hales, to find the different degrees of coolneſs and ſaltneſs of the ſea, at different depths: it conſiſts of a common houſehold pail or bucket, with two heads. Theſe heads have each a round hole in the middle, about four inches in diameter, covered with ſquare valves opening upward; and that they may both open and ſhut together, there is a ſmall iron rod fixed to the upper part of the lower valve, and the other end to the lower ſide of the upper valve. So that as the bucket deſcends with its ſinking weight into the ſea, both the valves may open by the force of the water, which by that means has a free paſſage through the bucket. But when the bucket is drawn up, then both the valves ſhut by the force of the water at the upper part of the bucket; ſo that the bucket is drawn up full of the loweſt ſea water to which it has deſcended. When the bucket is drawn up, the mercurial thermometer fixed in it is examined; but great care muſt be taken to obſerve the degree at which the mercury ſtands, before the lower part of the thermometer is taken out of the water in the bucket, leſt it be affected by the different temperature of the air. In order to keep the bucket in a right poſition, there are four cords fixed to it, reaching about three feet below it; to which the ſinking weight is fixed. The reſult of ſeveral trials with this gage was, that when it was let down to different depths, from 360 feet to 5346 feet, in lat. 25. 13. N. and long. 25. 12. W. it was diſcovered by the thermometer, that the cold increaſed gradually in proportion to the depths, till it deſcended to 3900 feet, *viz.* near ⅘ths of a mile, whence the mercury in the thermometer came up at 53°; and though it was afterwards ſunk to 5346 feet, *i. e.* a mile and 66 feet, it came up no lower: the warmth of the water upon the ſurface, and that of the air, was all that time 84°. When the water in the bucket was become of the ſame temperature with that on the ſurface of the ſea, equal quantities of both were weighed and tried by the hydrometer; that from below was found to be the heavieſt, and conſequently the ſalteſt. Fig. 2.

Dr Hales was probably led to the conſtruction of this ſea-gage from an inſtrument invented by Dr Hook, and deſigned for the ſame purpoſe. This conſiſts of a ſquare wooden bucket C, whoſe bottoms are ſo contrived, that as the weight A ſinks the iron B, to which the bucket C is faſtened by two handles D, D, on the end of which are the moveable bottoms or valves E E, and thereby draws down the bucket, the reſiſtance of the water keeps up the bucket in the poſture C, whereby the water, whilſt the bucket is deſcending, hath a free paſſage through it; whereas, as ſoon as the bucket is pulled upwards by the line F, the reſiſtance of the water to that motion beats the bucket downwards, and keeps it in the poſture G, whereby the included

Gage. cluded water is kept from getting out, and the ambient water kept from getting in. Phil. Trans. N° 9. p. 149. and N° 24. p. 447. or abr. vol. ii. p. 260.

Aqueo mercurial GAGE, is the name of an apparatus contrived by Dr Hales, and applied in various forms to the branches of trees, in order to determine the force with which they imbibe moisture. Let *e r*, Fig 3. be a cylindric glass, e. gr. of an inch diameter within, and eight inches long. Into this glass is introduced the branch of a young thriving apple-tree *b*, about three feet long, with lateral branches; the diameter of the transverse cut *i* being $\frac{1}{4}$ of an inch. Having fitted the joint *r* to the tube at *r*, by folding a piece of sheep's skin round the stem, it is cemented with a mixture of bees-wax and turpentine melted together, in such a proportion as to make a very stiff clammy paste when cold, and over the cement folds of wet bladders are bound firmly with packthread. To the lower end *e* of the large tube, a smaller tube *z e* is cemented, being about $\frac{1}{4}$ of an inch diameter, and 18 inches long, and in substance full $\frac{1}{8}$ of an inch thick. These tubes are cemented together at *e* with common hard brick-dust or powdered chalk cement, and the joint is farther secured with the cement of bees-wax and turpentine, over which a wet bladder is bound. The apparatus being thus prepared, the branch is turned downwards, and the glass tube upwards, and then both tubes are filled with water; with the finger applied to the open end of the small tube, it is inverted and immersed in the glass cistern *x*, full of mercury and water. In this situation the lower end of the branch was immersed six inches in water, viz. from *r* to *i*; the water was imbibed by the branch at its transverse cut *i*; and during its ascent into the sap-vessels of the branch, the mercury rose in the tube *e z* from the cistern *x*, so that in half an hour it was risen $5\frac{1}{4}$ inches high, as far as *z*. The height of the mercury indicated, in some measure, the force with which the sap was imbibed, though not the whole force; because, while the water was imbibed by the branch, its transverse cut was covered with innumerable little hemispheres of air, and many air-bubbles issued out of the sap-vessels, which partly filled the tube *e r*, as the water was drawn out of it: and therefore, the height of the mercury could only be proportionable to the excess of the quantity of water drawn off above the quantity of the air which issued out of the wood. If the quantity of air issuing from the wood had been equal to the quantity of water imbibed, it is plain that the mercury could not rise at all, because there would be no room for it in the tube: but if nine parts in twelve of the water be imbibed by the branch, and only three such parts of air issue into the tube in the same time, the mercury must rise near six inches, and so proportionably in other cases. Dr Hales observed, that the mercury rose highest, in most cases, when the sun was clear and warm, and that it subsided three or four inches towards evening, but rose again the next day as it grew warm, though seldom so high as it first. Dr Hales adapted the size and shape of the glass apparatus to a great variety of branches of several sizes and of different kinds of trees, and repeated the experiment above described, *mutatis mutandis*, in a variety of instances. See his Vegetable Statics, vol. i. chap. ii. p. 84, &c.

*Tide-*GAGE, is the name of an instrument used for Gage. determining the height of the tides by Mr Bayly, in the course of a voyage towards the south pole, &c. in the Resolution and Adventure, in 1772, 1773, 1774, and 1775. This instrument consists of a glass tube, whose internal diameter was seven-tenths of an inch, lashed fast to a ten feet fir rod, divided into feet, inches, and quarters: this rod was fastened to a strong post fixed upright and firm in the water. At the lower end of the tube was an exceeding small aperture, through which the water was admitted. In consequence of this construction, the surface of the water in the tube was so little affected by the agitation of the sea, that its height was not altered one-tenth of an inch, when the swell of the sea was two feet; and Mr Bayly was certain, that with this instrument he could discern a difference of one-tenth of an inch in the height of the tide.

*Wind-*GAGE, an instrument for measuring the force of the wind upon any given surface. It was invented by Dr Linn, who gives the following description of it, Phil. Trans. Vol. LXV.

This instrument consists of two glass tubes AB, CD, of five or six inches in length. Their bores, which are so much the better for being equal, are about four-tenths of an inch in diameter. They are connected Fig. 4. together like a siphon, by a small bent glass-tube *a b*, the bore of which is about one-tenth of an inch in diameter. On the upper end of the leg A B there is a tube of latten brass, which is kneed, or bent perpendicularly outwards, and has its mouth open towards F. On the other leg CD, is a cover with a round hole G in the upper part of it, two-tenths of an inch in diameter. This cover and the kneed tube are connected together by a slip of brass *ed*, which not only gives strength to the whole instrument, but also serves to hold the scale HI. The kneed tube and cover, are fixed on with hard cement or sealing wax. To the same tube is soldered a piece of brass *e*, with a round hole in it to receive the steel spindle KL; and at *f* there is just such another piece of brass soldered to the brass-hoop *gh*, which surrounds both legs of the instrument. There is a small shoulder on the spindle at *f*, upon which the instrument rests, and a small nut at *i*, to prevent it from being blown off the spindle by the wind. The whole instrument is easily turned round upon the spindle by the wind, so as always to present the mouth of the kneed tube towards it. The end of the spindle has a screw on it; by which it may be screwed into the top of a post or a stand made on purpose. It has also a hole at L, to admit a small lever for screwing it into wood with more readiness and facility. A thin plate of brass *k* is soldered to the kneed tube, about half an inch above the round hole G, so as to prevent rain from falling into it. There is likewise a crooked tube A B (fig. 5.) to be put occasionally upon the mouth of the kneed tube F, in order to prevent rain from being blown into the mouth of the wind-gage when it is left out all night, or exposed in the time of rain.

The force or momentum of the wind may be ascertained by the assistance of this instrument, by filling the tubes half full of water, and pushing the scale a little up or down, till the o of the scale, when the instrument is held up perpendicularly, be on a line with

Gage. the surface of the water in both legs of the wind-gage. The instrument being thus adjusted, hold it up perpendicularly, and turning the mouth of the kneed tube towards the wind, observe how much the water is depressed by it in the one leg, and raised in the other. The sum of the two is the height of a column of water, which the wind is capable of sustaining at that time; and every body that is opposed to that wind will be prest upon by a force equal to the weight of a column of water, having its base equal to the altitude of the column of water sustained by the wind in the wind-gage. Hence the force of the wind upon any body where the surface opposed to it is known, may be easily found; and a ready comparison may be made betwixt the strength of one gale of wind and that of another.

The force of the wind may be likewise measured with this instrument, by filling it until the water runs out at the hole G. For if we then hold it up to the wind as before, a quantity of water will be blown out; and if both legs of the instrument are of the same bore, the height of the column sustained will be equal to double the column of water in either leg, or the sum of what is wanting in both legs. But if the legs are of unequal bores, neither of these will give the true height of the column of water which the wind sustained. But the true height may be obtained by the following formulæ.

Suppose that after a gale of wind which had blown the water from A to B (fig. 6.), forcing it at the same time through the other tube out at E, the surface of the water should be found standing at some level D G, and it were required to know what was the height of the column E F or A B, which the wind sustained. In order to obtain this, it is only necessary to find the height of the columns D B or G F, which are constantly equal to one another; for either of these added to one of the equal columns A D, E G, will give the true height of the column of water which the wind sustained.

1. Let the diameters AC, EH, of the tubes, be respectively represented by cd; and let a=AD, or EG, and x=DB, or GF: Then it is evident, that the column DB is to the column EG, as c^2x to d^2a. But these columns are equal. Therefore $c^2x = d^2a$; and consequently $x = \frac{d^2a}{c^2}$.

2. But if at any instant of time whilst the wind was blowing, it was observed, that, when the water stood at E, the top of the tube out of which it is forced, it was depressed in the other to some given level BF, the altitude at which it would have stood in each had it immediately subsided, may be found in the following manner. – Let b=AB or EF.—Then it is evident that the column DB is equal to the difference of columns EF, GF. But the difference of these columns is as $d^2b - d^2x$; and consequently $x = \frac{d^2b}{c^2+d^2}$.

For the cases when the wind blows in at the narrow leg of the instrument: Let AB=EF=b, EG, or AD=a, GF=DB=x, and the diameters EH, GA, respectively =d, c, as before. Then it is evident, that the column AD is to the column GF as ac^2 to d^2a. But these columns are equal; therefore $d^2x = ac^2$; and consequently $x = \frac{ac^2}{d^2}$. It is also evident, that the column AD is equal to the difference of the columns AB, DB; but the difference of these columns is as $bc^2 - c^2x$. Therefore $d^2x = bc^2 - c^2x$. Whence we get $x = \frac{bc^2}{d^2+c^2}$.

Gage || Gainage.

The use of the small tube of communication $a\,b$ (fig. 4.), is to check the undulation of the water, so that the height of it may be read off from the scale with ease and certainty. But it is particularly designed to prevent the water from being thrown up to a much greater or less altitude, than the true height of the column which the wind is able at that time to sustain, from its receiving a sudden impulse whilst it is vibrating either in its ascent or descent. As in some cases the water in this instrument might be liable to freeze, and thus break the tubes, Dr Lind recommends a saturated solution of sea-salt to be used instead of it, which does not freeze till Fahrenheit's thermometer falls to 0.

GAHNIA, in botany: A genus of the monogynia order, belonging to the hexandria class of plants. The calyx is an involucrum with two or five flowers; the corolla is two-valved; the stamina six capillary and very short filaments; the antheræ linear, sharp-pointed at the apex, and as long as the corolla; there is no pericarpium: the seed is single and oblong.

GAIETA, an ancient, handsome, and strong town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, with a fort, citadel, harbour, and bishop's see. It was taken by the Austrians in 1707, and by the Spaniards in 1734. It is seated at the foot of a mountain near the sea, in E. Long. 13. 37. N. Lat. 41. 30.

GAIN, the profit or lucre a person reaps from his trade, employment, or industry. Some derive the word from the German *gewin:* whereof the Italians had made *guadagno;* the French and English *gain.*

There are legal and reputable gains, as well as forbid and infamous ones. What is gained beyond a certain sum, by gaming, is all liable to be restored again, if the loser will take the benefit of the law.

GAIN, in architecture, is the workmens term for the bevelling shoulder of a joist or other timber. It is used, also, for the lapping of the end of the joist, &c. upon a trimmer or girder; and then the thickness of the shoulder is cut into the trimmer, also bevelling upwards, that it may just receive the gain; and so the joist and trimmer lie even and level with the surface. This way of working is used in floors and hearths.

To GAIN *the wind,* in sea-language, is to arrive on the weather-side or to windward of some other vessel in sight, when both are plying to windward, or sailing as near the wind as possible.

GAINAGE, GAINAGIUM, in our ancient writers, signifies the draught-oxen, horses, wain, plough, and furniture, for carying on the work of tillage by the baser sort of fokemen and villains.

Gainage is the same with what is otherwise called *wainage.* Bracton, lib. i. cap. 9. speaking of lords and servants, says, *Ut si eos destruant, quod salvum non possit eis esse wainagium suum.* And again, lib. iii. tract. 2. cap.

ainage || anthus.

cap. 1. *Villanus non amerciabitur, nisi salvo wainagio suo.* For anciently, as it appears both by Magna Charta and other books, the villain, when amerced, had his gainage or wainage free; to the end his plough might not ſtand ſtill: and the law, for the ſame reaſon, does ſtill allow a like privilege to the huſbandman; that is, his draught-horſes are not in many caſes diſtrainable.

GAINAGE is alſo uſed for the land itſelf, or the profit raiſed by cultivating it.

GAINSBOROUGH, a town of Lincolnſhire in England, 150 miles from London, ſeated on the river Trent near the ſea. It is a large well built town, with a pretty good trade, and has the title of an earldom. W. Long. 0. 40. N. Lat. 53. 26. The north marſh in its neighbourhood is noted for horſe-races. The Danes who invaded the kingdom brought their ſhips up to this place. It was here that Sweno the Dane was murdered by one of the Engliſh, who was never diſcovered.

GALACTITES, in the hiſtory of foſſils, a ſubſtance much reſembling the morochthus or French chalk, in many reſpects; but different from it in colour. The ancients found it in the Nile and in ſome rivers in Greece, and uſed it in medicine as an aſtringent, and for deſluxions and ulcers of the eyes. At preſent it is common in Germany, Italy, and ſome parts of France, and is wholly overlooked, being eſteemed a worſe kind of morochthus. See MOROCHTHUS.

GALACTOPHAGI, and GALACTOPOTÆ, in antiquity, perſons who lived wholly on milk, without corn or the uſe of any other food. The words are compounded of γαλα, γαλακτος, *milk*; φαγω, *to eat*; and ποτης of πινω, *I drink*.

Certain nations in Scythia Aſiatica, as the Getæ, Nomades, &c. are famous, in ancient hiſtory, in quality of *galactophagi*, or milk-eaters. Homer makes their eloge, Iliad, lib. iii.

Ptolemy, in his geography, places the Galactophagi between the Riphæan mountains on one ſide, and the Hircanian ſea on the other.

GALANGALS, in the materia medica. See KÆMPFERIA.

GALANTHUS, the SNOW-DROP, in botany: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the ninth order, *Spathaceæ*. There are three concave petals; and the nectarium conſiſts of three ſmall emarginated petals; the ſtigma is ſimple. There is but one ſpecies, viz. the nivalis; which is a bulbous-rooted flowery perennial, riſing but a few inches in height, and adorned at top with ſmall tripetalous flowers of a white colour. There are three varieties, viz. the common ſingle-flowered ſnow-drop, the ſemi double ſnow-drop, and the double ſnow-drop. They are beautiful little plants; and are much valued on account of their early appearance, often adorning the gardens in January or February, when ſcarce any other flower is to be ſeen. They frequently burſt forth when the ground is covered with ſnow, and continue very often till the beginning of March, making a very ornamental appearance, eſpecially when diſpoſed in cluſters towards the fronts of the borders, &c. The ſingle kind comes firſt into bloom, then the ſemi-double, and after that the double. They will ſucceed any where, and multiply exceedingly by off ſets from the roots.

Galata || Galaxy.

GALATA, a great ſuburb belonging to Conſtantinople, oppoſite to the ſeraglio, on the other ſide of the harbour. It is here the Greeks, Armenians, Franks, Chriſtians, and Jews inhabit, and are allowed the exerciſe of their reſpective worſhips.

GALATÆA and GALATHÆA, (fab. hiſt.), a ſea-nymph, daughter of Nereus and Doris. She was paſſionately loved by the cyclops Polyphemus, whom ſhe treated with coldneſs and diſdain; while Acis, a ſhepherd of Sicily enjoyed her unbounded affection. The happineſs of theſe two lovers was diſturbed by the jealouſy of the Cyclops, who cruſhed his rival to pieces with a piece of a broken rock while he repoſed on the boſom of Galatæa. The nymph was inconſolable for the loſs of Acis; and as ſhe could not reſtore him to life, ſhe changed him into a fountain.

GALATIA, the ancient name of a province of Aſia Minor, now called *Amaſia*. It was bounded on the eaſt by Cappadocia, on the weſt by Bithynia, on the ſouth by Pamphylia, and on the north by the Euxine ſea. It was the north part of Phrygia Magna; but upon being occupied by the Gauls was called *Galatia*; and becauſe ſituated amidſt Greek colonies, and itſelf mixed with Greeks, *Gallogræcia*. Strabo calls it *Galatia*, and *Gallogræcia*: hence a two-fold name of the people; *Galatæ* and *Gallogræci*. The Greeks called it *Gallia Parva*; to diſtinguiſh it from the *Tranſalpina*, both which they called *Galatia*. It was reduced under the ſubjection of the Romans in the time of Auguſtus, and is now in the hands of the Turks. Here St Paul founded a church, to which he directed that epiſtle which is ſtill known by the name of the *Epiſtle to the Galatians*, and was written to reclaim them from the obſervation of Jewiſh ordinances, into which they had been ſeduced by ſome falſe teachers.

GALAX, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is ſalver-ſhaped; the calyx decaphyllous; the capſule unilocular, bivalved, and claſtic.

GALAXY, in aſtronomy, that long, white, luminous track, which ſeems to encompaſs the heavens like a ſwath, ſcarf, or girdle: and which is eaſily perceivable in a clear night, eſpecially when the moon does not appear. The Greeks call it γαλαξιας, *Galaxy*, of γαλα, γαλακτος, *Milk*; on account of its colour and appearance: the Latins, for the ſame reaſons, call it *via lactea*; and we, the *milky-way*. It paſſes between Sagittarius and Gemini, and divides the ſphere into two parts; it is unequally broad; and in ſome parts is ſingle, in others double.

The ancient poets, and even philoſophers, ſpeak of the Galaxy, as the road or way by which the heroes went to heaven.

Ariſtotle makes it a kind of meteor, formed of a crowd of vapours, drawn into that part by certain large ſtars diſpoſed in the region of the heavens anſwering hereto.

Others, finding that the Galaxy was ſeen all over the globe, that it always correſponded to the ſame fixed ſtars, and that it tranſcended the height of the higheſt planets, ſet aſide Ariſtotle's opinion, and placed the

Galba ‖ Gale.

the Galaxy in the firmament, or region of the fixed ſtars, and concluded it to be nothing but an aſſemblage of an infinite number of minute ſtars.

Since the invention of the teleſcope, this opinion has been abundantly confirmed. By directing a good teleſcope to any part of the milky-way; where, before, we only ſaw a confuſed whiteneſs, we now deſcry an innumerable multitude of little ſtars, ſo remote, that a naked eye confounds them. See ASTRONOMY, n° 119.

GALBA (Servius Sulpicius), a Roman emperor, born the 24th of December, five years before the Chriſtian era. He was gradually raiſed to the greateſt offices of the ſtate, and exerciſed his power in the provinces with the greateſt equity and unremitted diligence. He dedicated the greateſt part of his time to ſolitary purſuits, chiefly to avoid the ſuſpicions of Nero. His diſapprobation of the emperor's oppreſſive command in the provinces was the cauſe of new diſturbances. Nero ordered him to be put to death; but he eſcaped from the hands of the executioner, and was publicly ſaluted emperor. When he was ſeated on the throne, he ſuffered himſelf to be governed by favourites, who expoſed the goods of the citizens to ſale to gratify their avarice. Exemptions were ſold at a high price; and the crime of murder was blotted out, and impunity purchaſed with a large ſum of money. Such irregularities in the emperor's miniſters greatly diſpleaſed the people; and when Galba refuſed to pay the ſoldiers the money which he had promiſed them when he was raiſed to the throne, they aſſaſſinated him in the 73d year of his age, and the eighth month of his reign. The virtues which had ſhone ſo bright in Galba when a private man, totally diſappeared when he aſcended the throne; and he who ſhowed himſelf the moſt impartial judge, forgot the duties of an emperor and of a father of his people.

GALBANUM, in pharmacy, a gum iſſuing from the ſtem of an umbelliferous plant growing in Perſia and many parts of Africa. See BUBON.

The juice, as brought to us, is ſemipellucid, ſoft, tenacious; of a ſtrong, and to ſome unpleaſant, ſmell; and a bitteriſh warm taſte: the better ſort is in pale coloured maſſes, which, on being opened, appear compoſed of clear white tears. Geoffroy relates, that a dark greeniſh oil is to be obtained from this ſimple by diſtillation, which, upon repeated rectifications, becomes of an elegant ſky blue colour. The purer ſorts of galbanum are ſaid by ſome to diſſolve entirely in wine, vinegar, or water; but theſe liquors are only partial menſtrua with regard to this drug; nor do ſpirit of wine or oils prove more effectual in this reſpect: the beſt diſſolvent is a mixture of two parts ſpirit of wine and one of water. Galbanum agrees in virtue with gum ammoniacum; but is generally accounted leſs efficacious in aſthmas, and more ſo in hyſterical complaints. It is an ingredient in the gum pills, the gum plaſter, and ſome other officinal compoſitions.

GALE, in the ſea-language, a term of various import. When the wind blows not ſo hard but that a ſhip may carry her top-ſails a-trip (that is, hoiſted up to the higheſt), then they ſay it is a loom-gale. When it blows very ſtrong, they ſay it is a ſtiff, ſtrong, or freſh gale. When two ſhips are near one another at ſea, and, there being but little wind blowing, one of them finds more of it than the other, they ſay that the one ſhip gales away from the other.

Gale ‖ Galea

GALE (Dr John), an eminent and learned miniſter among the Baptiſts, was born at London in 1680. He ſtudied at Leyden, where he diſtinguiſhed himſelf very early, and afterwards at Amſterdam, under Dr Limborch. He was choſen miniſter of the Baptiſt congregation at Barbican; where his preaching, being chiefly practical, was greatly reſorted to by people of all perſuaſions. Four volumes of his ſermons were publiſhed after his death, which happened in 1721. His *Reflections on Dr Wall's Hiſtory of Infant-baptiſm*, is the beſt defence of the Baptiſts ever publiſhed, and the reading of that performance induced the learned Mr William Whiſton and Dr Foſter to become Baptiſts.

GALE (Theophilus), an eminent nonconformiſt miniſter, born in 1628. He was invited to Wincheſter in 1657; and continued a ſtated preacher there until the re-eſtabliſhment of the church by Charles II. when he rather choſe to ſuffer the penalties of the act of conformity, than to ſubmit to it contrary to his conſcience. He was afterwards engaged by Philip lord Wharton as tutor to his ſons, whom he attended to an academy at Caen in Normandy; and when this duty was fulfilled, he became paſtor over a congregation of private conventiclers in Holborn. He died in 1678; and is principally known by an elaborate work, intitled, the *Court of the Gentiles*, calculated to ſhow, that the Pagan philoſophers derived their moſt ſublime ſentiments from the Scriptures.

GALE (Dr Thomas), a learned divine, born at Scruton in Yorkſhire, in the year 1636, was educated at Cambridge, and at length became profeſſor of the Greek language in that univerſity. He was afterwards choſen head maſter of St Paul's ſchool, London; and was employed by the city in writing thoſe elegant inſcriptions on the monument erected in memory of the conflagration in 1666. In 1676 he was collated to a prebend in the cathedral of St Paul's; and was likewiſe elected a fellow of the Royal Society, to which he preſented a Roman urn with its aſhes. About the year 1697, he gave to the new library of Trinity college, in Cambridge, a great number of Arabic manuſcripts; and in 1697 was admitted dean of York. He died in that city in 1702; and was interred in the cathedral, where a monument, with a Latin inſcription, was erected to his memory. He was a learned divine, a great hiſtorian, one of the beſt Greek ſcholars of his age, and maintained a correſpondence with the moſt learned men abroad as well as at home. He publiſhed, 1. *Hiſtoriæ Poeticæ Antiqui Scriptores*, octavo. 2. *Opuſcula Mythologica, Ethica, & Phyſica*, in Greek and Latin, octavo. 3. *Herodoti Hiſtoria*, folio. 4. *Hiſtoriæ Anglicanæ Scriptores quinque*, in folio. 5. *Hiſtoriæ Britannicæ, Saxonicæ, Anglo-Danicæ, Scriptores quindecim*, in folio. 6. *Rhetores Selecti*, &c.

GALEA, in antiquity, a light caſque, head-piece, or morrion, coming down to the ſhoulders, and commonly of braſs; though Camillus, according to Plutarch, ordered thoſe of his army to be of iron, as being the ſtronger metal. The lower part of it was called *buccula*, and on the top was a creſt. The Velites wore a light galea, made of the ſkin of ſome wild beaſt to make it more terrible.

GALEASSE, a large low-built veſſel, uſing both ſails

lega, alen.

fails and oars, and the biggeſt of all the veſſels that make uſe of the latter. It may carry twenty guns, and has a ſtern capable of lodging a great number of marines. It has three maſts, which are never to be lowered or taken down. It has alſo thirty-two benches of rowers; and to each bench ſix or ſeven ſlaves, who ſit under cover. This veſſel is at preſent uſed only by the Venetians.

GALEGA, in botany: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The calyx is compoſed of ſubulated nearly equal dents or ſegments; the legumen has oblique ſtriæ, and ſeeds lying between them.

GALEN (Claudius), in Latin *Galenus*, prince of the Greek phyſicians after Hippocrates, was born at Pergamus in the Leſſer Aſia, about the year 131. His father was poſſeſſed of a conſiderable fortune; was well verſed in polite literature, philoſophy, aſtronomy, and geometry; and was alſo well ſkilled in architecture. He himſelf inſtructed his ſon in the firſt rudiments of learning, and afterwards procured him the greateſt maſters of the age in philoſophy and eloquence. Galen having finiſhed his ſtudies under their care, choſe phyſic for his profeſſion, and chiefly ſtudied the works of Hippocrates. Having at length exhauſted all the ſources of literature that were to be found at home, he reſolved to travel, in order to converſe with the moſt able phyſicians in all parts, intending at the ſame time to take every opportunity of inſpecting on the ſpot the plants and drugs of the countries through which he paſſed. With this view he went to Alexandria, and ſtaid ſome years in that metropolis of Egypt: from thence he travelled through Cilicia; paſſed through Paleſtine; viſited the iſles of Crete and Cyprus; and made two voyages to Lemnos, in order to examine the Lemnian earth, which was then eſteemed an admirable medicine. With the ſame view he went into the Lower Tyria, in order to obtain a thorough inſight into the nature of the opobalſamum, or balm of Gilead; and having completed his deſign, returned home by the way of Alexandria.

Galen had been four years at Pergamus, where his practice was attended with extraordinary applauſe, when ſome ſeditious commotions induced him to go to Rome, where he reſolved to ſettle: but the proofs he gave of his ſuperior ſkill, added to the reſpect ſhown him by ſeveral perſons of very high rank, created him ſo many enemies among his brethren of the faculty, that he was obliged to quit the city, after having reſided there four or five years. But he had not long returned to Pergamos, when he was recalled by the emperors Aurelius and Verus. After their death, he retired to his native country; where he died, about the year 200. He wrote in Greek; and is ſaid to have compoſed two hundred volumes, which were unhappily burnt in the temple of Peace. The beſt editions of thoſe that remain, are, that printed at Baſil in 1538, in five volumes, and that of Venice in 1625, in ſeven volumes. Galen was of a weak and delicate conſtitution, as he himſelf aſſerts: but he nevertheleſs, by his temperance and ſkill in phyſic, arrived to a great age; for it was his maxim, always to riſe from table with ſome degree of appetite. He is juſtly conſidered as the greateſt phyſician of antiquity, next to Hippocrates; and he performed ſuch ſurpriſing cures, that he was accuſed of magic.

Galena ‖ Galeopſis.

GALENA, a name given by mineraliſts to a ſpecies of poor lead-ore. It was alſo the original name given by Andromachus to the theriaca, from its effect in bringing on a pleaſing calm over the blood and ſpirits on taking it.

GALENIA, in botany: A genus of the digynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is trifid; there is no corolla; the capſule is roundiſh and diſpermous.

GALENIC, or GALENICAL, in medicine, is that manner of conſidering and treating diſeaſes, founded on the principles of Galen, or introduced by GALEN. This author, collecting and digeſting what the phyſicians before him had done, and explaining every thing according to the ſtricteſt doctrine of the Peripatetics, ſet phyſic on a new footing: he introduced the doctrine of the four elements; the cardinal qualities and their degrees; and the four humours or temperaments.

GALENIC is more frequently uſed as contradiſtinguiſhed from *chemical*.

The diſtinction of *galenical* and *chemical* was occaſioned by a diviſion of the practitioners of medicine into two ſects, which happened on the introduction of chemiſtry into medicine. Then the chemiſts, arrogating to themſelves every kind of merit and ability, ſtirred up an oppoſition to their pretenſions, founded on the invariable adherence of the other party to the ancient practice. And though this diviſion into the two ſects of galeniſts and chemiſts has long ceaſed, yet the diſtinction of medicines which reſulted from it is ſtill retained.

Galenical medicines are thoſe which are formed by the eaſier preparations of herbs, roots, &c. by infuſion, decoction, &c. and by combining and multiplying ingredients; while thoſe of chemiſtry draw their more intimate and remote virtues by means of fire and elaborate preparations, as calcination, digeſtion, fermentation, &c.

GALENISTS, a denomination given to ſuch phyſicians as practiſe, preſcribe, or write, on the galenical principles; and ſtand oppoſed to the *chemiſts*. See GALENICAL. At preſent the galeniſts and chemiſts are pretty well accommodated; and moſt of our phyſicians uſe the preparations and remedies of both.

GALENISTS, or *Galenites*, in church-hiſtory, a branch of Mennonites or Anabaptiſts, who take in ſeveral of the opinions of the Socinians, or rather Arians, touching the divinity of our Saviour. In 1664 the Waterlandians were divided into two parties, of which the one were called *Galeniſts*, and the other *Apoſtolians*. They are thus called from their leader Abr. Galenus, a learned and eloquent phyſician of Amſterdam, who conſidered the Chriſtian religion as a ſyſtem that laid much leſs ſtreſs on faith than practice; and who was for taking into the communion of the Mennonites all thoſe who acknowledged the divine origin of the books of the Old and New Teſtament, and led holy and virtuous lives.

GALEON. See GALLEON.

GALEOPSIS, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the

Galericulum || Galileo.

42d order, *Verticillatæ*. The upper lip of the corolla is a little crenated or arched; the under lip more than bidentate.

GALERICULUM, was a cap worn both by men and women amongſt the ancient Romans. It conſiſted of ſkin, which was ſo neatly dreſſed with human hair, that the artificial covering could ſcarcely be diſtinguiſhed from the natural. It was uſed by thoſe whoſe hair was thin; and by wreſtlers, to keep their own hair from receiving any injury from the naſty oils with which they were rubbed all over before they exerciſed. It ſeems to have reſembled our wigs.

GALIC, or *Gaelic*, *Language*. See HIGHLANDS.

GALICIA, a province of Spain, bounded on the north and weſt by the ocean, on the ſouth by Portugal, and on the eaſt by Aſturias and the kingdom of Leon. The air is temperate along the coaſt; but, in other places, it is cold and moiſt. It is but thin of people; and the produce is wine, flax, and citrons: here alſo are good paſtures, copper, and lead; and the foreſts yield wood for building of ſhips. St Jago di Compoſtella is the capital town.

GALILEE, once a province of Judea, now of Turky in Aſia, was bounded by mount Lebanon on the north, by the river Jordan and the ſea of Galilee on the eaſt, by the Chiſon on the ſouth, and by the Mediterranean on the weſt. It was the ſcene of many of our Saviour's miracles; but the bounds of the country are not now well known, nor yet the places where many of the towns ſtood.

GALILEANS, a ſect of the Jews. Their founder was one Judas a native of Galilee, from which place they derived their name. Their chief, eſteeming it an indignity for the Jews to pay tribute to ſtrangers, raiſed up his countrymen againſt the edict of the emperor Auguſtus, which had ordered a taxation or enrolment of all the ſubjects of the Roman empire.

They pretended that God alone ſhould be owned as Maſter and Lord, and in other reſpects were of the opinion of the Phariſees; but, as they judged it unlawful to pray for infidel princes, they ſeparated themſelves from the reſt of the Jews, and performed their ſacrifices apart.

As our Saviour and his apoſtles were of Galilee, they were ſuſpected to be of the ſect of Galileans; and it was on this principle, as St Jerome obſerves, that the Phariſees laid a ſnare for him; aſking, Whether it was lawful to give tribute to Cæſar; that in caſe he denied it, they might have an occaſion of accuſing him.

GALILEO (Galilei), the famous mathematician and aſtronomer, was the ſon of a Florentine nobleman, and born in the year 1564. He had from his infancy a ſtrong inclination to philoſophy and the mathematics; and made prodigious progreſs in theſe ſciences. In 1592, he was choſen profeſſor of mathematics at Padua; and during his abode there he *invented*, it is ſaid, the teleſcope; or, according to others, improved that inſtrument, ſo as to make it fit for aſtronomical obſervations: (See ASTRONOMY, p. 423, col. 1.) In 1611, Coſmo II. grand duke of Tuſcany ſent for him to Piſa, where he made him profeſſor of mathematics, with a handſome ſalary; and ſoon after inviting him to Florence, gave him the office and title of *principal philoſopher and mathematician to his highneſs*.

He had been but a few years at Florence, before he was convinced by ſad experience, that Ariſtotle's doctrine, however ill-grounded, was held too ſacred to be called in queſtion. Having obſerved ſome ſolar ſpots in 1612, he printed that diſcovery the following year at Rome; in which, and in ſome other pieces, he ventured to aſſert the truth of the Copernican ſyſtem, and brought ſeveral new arguments to confirm it. For theſe he was cited before the inquiſition; and, after ſome months impriſonment, was releaſed upon a ſimple promiſe, that he would renounce his heretical opinions, and not defend them by word or writing. But having afterwards, in 1632, publiſhed at Florence his "Dialogues of the two greateſt ſyſtems of the world, the Ptolemaic and Copernican," he was again cited before the inquiſition, and committed to the priſon of that eccleſiaſtical court at Rome. In June 32d N. S. that year, the congregation convened; and in his preſence pronounced ſentence againſt him and his books, obliging him to abjure his errors in the moſt ſolemn manner; committed him to the priſon of their office during pleaſure; and enjoined him, as a ſaving penance, for three years to come, to repeat once a-week the ſeven penitential pſalms: reſerving to themſelves, however, the power of moderating, changing, or taking away altogether or in part, the abovementioned puniſhment and penance. On this ſentence, he was detained a priſoner till 1634; and his "Dialogues of the ſyſtem of the World" were burnt at Rome.

Galil

He lived ten years after this, ſeven of which were employed in making ſtill further diſcoveries with his teleſcope. But by the continual application to that inſtrument, added to the damage he received in his ſight from the nocturnal air, his eyes grew gradually weaker, till he became totally blind in 1639. He bore this calamity with patience and reſignation, worthy of a great philoſopher. The loſs neither broke his ſpirit, nor hindered the courſe of his ſtudies. He ſupplied the defect by conſtant meditation; whereby he prepared a large quantity of materials, and began to dictate his own conceptions; when, by a diſtemper of three months continuance, waſting away by degrees, he expired at Arcetri near Florence, in January 1642, N. S. in the 78th year of his age.

Among various uſeful inventions of which Galileo was the author, is that of the ſimple pendulum, which he had made uſe of in his aſtronomical experiments. He had thoughts of applying it to clocks; but did not execute it: the glory of that invention was reſerved for Vicenzio his ſon, who made the experiment at Venice in 1649; and M. Huygens afterwards carried this invention to perfection. He wrote a great number of treatiſes, ſeveral of which were publiſhed in a collection by Signor Mendeſſi, under the title of *L'opera di Galileo Galilei Lynceo*. Some of theſe, with others of his pieces, were tranſlated into Engliſh and publiſhed by Thomas Saliſbury, Eſq; in his mathematical collections, &c. in two volumes folio. A volume alſo of his letters to ſeveral learned men, and ſolutions of ſeveral problems, were printed at Bologna in quarto. Beſides theſe, he wrote many others, which were unfortunately loſt through his wife's devotion; who, ſolicited by her confeſſor, gave him leave to peruſe her huſband's manuſcripts; of which he tore and took away as many as he ſaid were not fit to be publiſhed.

Galinaceus. || Gall.

GALINACEUS LAPIS. See GALLINACEUS.

GALIUM, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The corolla is monopetalous and plain; and there are two roundiſh ſeeds. There are a great many ſpecies; of which the moſt remarkable are, the *verum*, or yellow lady's bed-ſtraw; and the *aperine*, clivers, or gooſe-graſs. The former has a firm, erect, brown, ſquare, ſtem; the leaves generally eight in each whirl, linear, pointed, brittle, and often reflex; branches ſhort, generally two from each joint, terminating in ſpikes of ſmall yellow flowers. It grows commonly in dry ground, and on road ſides. The flowers will coagulate boiling milk; and the beſt Cheſhire cheeſe is ſaid to be prepared with them. The French preſcribe them in hyſteric and epileptic caſes. Boiled in alum-water, they tinge wool yellow. The roots dye a red not inferior to madder; for which purpoſe they are uſed in the iſland of Jura. In the Edinburgh medical commentaries we have accounts of ſome violent ſcorbutic complaints being cured by the juice of this plant.—Sheep and goats eat the plant; horſes and ſwine refuſe it; cows are not fond of it. The aperine, or clivers, has a ſquare, very rough, jointed, very weak ſtem, two, three, or four feet long, and adheſive: the branches are oppoſite; the joints hairy at the baſe: the leaves, conſiſting of eight or ten at each joint, are narrow, pointed, above rough, beneath ſmooth, and carinated: the ſeeds are rough; flowers white, ſmall, few on ſlender foot-ſtalks on the tops of the branches. It is frequent in fields by the ſides of hedges, &c. The expreſſed juice of this plant taken internally, and the bruiſed leaves applied by way of poultice, are ſaid to have been uſed with ſucceſs as a cure for the cancer. The effects being ſlow, though ſure, the courſe, it is ſaid, often requires to be continued for nine or ten months.

GALL, in the animal economy. See BILE.

Gall, was generally given amongſt the Jews, to perſons ſuffering death under the execution of the law, to make them leſs ſenſible of their pain; but gall and myrrh are ſuppoſed to have been the ſame thing; becauſe at our Saviour's cruciſixion, St Matthew ſays, they gave him vinegar to drink mingled with gall; whereas St Mark calls it wine mingled with myrrh: The truth of the matter perhaps is, that they diſtinguiſhed every thing bitter by the name of gall. The Greeks and Romans alſo gave ſuch a mixture to perſons ſuffering a death of torture.

A great number of experiments have been made upon the gall of different animals, but few concluſions can be drawn from them with any certainty. Dr Percival, however, hath ſhown, that putrid bile may be perfectly corrected and ſweetened by an admixture of the vegetable acids, vinegar, and juice of lemons. Theſe, he obſerves, have this effect much more completely than the mineral ones: and hence, he thinks, ariſes the great uſefulneſs of the vegetable acids in autumnal diſeaſes; which are always attended with a putreſcent diſpoſition of the bile, owing to the heat of the preceding ſummer. On this occaſion he takes notice of a common miſtake among phyſicians, who frequently preſcribe elixir of vitriol in thoſe diſeaſes, where vinegar or lemon juice would be much more effectual.

From this effect of acids on the gall, he alſo thinks, we may ſee why the immoderate uſe of acids is ſo pernicious to digeſtion. It is neceſſary to health that the gall ſhould be in ſome degree acrid and alkaleſcent: but as acids have the property of rendering it perfectly mild and ſweet, they muſt be proportionably pernicious to the due concoction and aſſimilation of the food; which without an acrid bile cannot be accompliſhed. Hence the body is deprived of its proper nouriſhment and ſupport, the blood becomes vapid and watery, and a fatal cahexy unavoidably enſues. This hath been the caſe with many unfortunate perſons, who, in order to reduce their exceſſive corpulency, have indulged themſelves in the too free uſe of vinegar. From the mild ſtate of the gall in young children, Dr Percival alſo thinks it is, that they are ſo much troubled with acidities. Gall.

GALL Bladder. See ANATOMY, n° 97.

GALL, in natural hiſtory, denotes any protuberance or tumor produced by the puncture of inſects on plants and trees of different kinds.

Theſe galls are of various forms and ſizes, and no leſs different with regard to their internal ſtructure. Some have only one cavity, and others a number of ſmall cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilſt others are ſoft and ſpongy; the firſt being termed *gall nuts*, and the latter *berry galls*, or *apple-galls*.

The general hiſtory of the gall is this. An inſect of the fly kind * is inſtructed by nature to take care for the ſafety of her young, by lodging her eggs in a woody ſubſtance, where they will be defended from all injuries: ſhe for this purpoſe wounds the leaves or tender branches of a tree; and the lacerated veſſels, diſcharging their contents, ſoon form tumors about the holes thus made. The external coat of this excreſcence is dried by the air; and grows into a figure which bears ſome reſemblance to the bow of an arch, or the roundneſs of a kernel. This little ball receives its nutriment, growth, and vegetation, as the other parts of the tree, by ſlow degrees, and is what we call the *gall-nut*. The worm that is batched under this ſpacious vault, finds in the ſubſtance of the ball, which is as yet very tender, a ſubſiſtence ſuitable to its nature; gnaws and digeſts it till the time comes for its transformation to a nymph, and from that ſtate of exiſtence changes into a fly. After this, the inſect, perceiving itſelf duly provided with all things requiſite, diſengages itſelf ſoon from its confinement, and takes its flight into the open air. The caſe, however, is not ſimilar with reſpect to the gall-nut that grows in autumn. The cold weather frequently comes on before the worm is transformed into a fly, or before the fly can pierce through its incloſure. The nut falls with the leaves: and although you may imagine that the fly which lies within is loſt, yet in reality it is not ſo; on the contrary, its being covered up ſo cloſe, is the means of its preſervation. Thus it ſpends the winter in a warm houſe, where every crack and cranny of the nut is well ſtopped up; and lies buried as it were under a heap of leaves, which preſerves it from the injuries of the weather. This apartment, however, though ſo commodious a retreat in the winter, is a perfect priſon in the ſpring. The fly, rouſed out of its lethargy by the firſt heats,

* See *Cynips*.

Gall, Galla.

heats, breaks its way through, and ranges where it pleaſes. A very ſmall aperture is ſufficient, ſince at this time the fly is but a diminutive creature. Beſides, the ringlets whereof its body is compoſed, dilate and become pliant in the paſſage.

Oak galls put, in a very ſmall quantity, into a ſolution of vitriol in water, though but a very weak one, give it a purple or violet colour: which, as it grows ſtronger, becomes black; and on this property depends the art of making our writing ink, as alſo the arts of dying and dreſſing leather, and other manufactures. See INK.

The beſt galls come from Aleppo: theſe are not quite round and ſmooth like the other ſorts, but have ſeveral tubercles on the ſurface. Galls have a very auſtere ſtyptic taſte, without any ſmell: they are very ſtrong aſtringents, and as ſuch have been ſometimes made uſe of both internally and externally, but are not much taken notice of by the preſent practice. Some recommend an ointment of powdered galls and hog's lard as very effectual in certain painful ſtates of hæmorrhois; and it is alleged, that the internal uſe of galls has cured intermittents after the Peruvian bark has failed. A mixture of galls with a bitter and aromatic has been propoſed as a ſubſtitute for the bark.

GALL (St), a conſiderable town in Swiſſerland, and in the Upper Thurgow, with a rich and celebrated abbey, whoſe abbot is a prince of the empire. This place has for ſome time been a republic, in alliance with the Cantons. It is not very large; but is well built, neat, populous. It contains about 10,000 inhabitants, who are chiefly employed in the linen manufacture; and make annually, it is ſaid, 40,000 pieces of linen, of 200 ells each; which renders it one of the richeſt towns in Swiſſerland. The inhabitants are Proteſtants; for which reaſon there are often great conteſts between them and the abbey about religious affairs. It is ſeated in a narrow barren valley, between two mountains, and upon two ſmall ſtreams. E. Long. 29. 5. N. Lat. 47. 38.

GALL-Fly. See CYNIPS.

GALLA, an Abyſſinian nation, originally dwelling, as Mr Bruce ſuppoſes, under the line, and exerciſing the profeſſion of ſhepherds, which they ſtill continue to do. For a number of years, our author tells us, they have been conſtantly migrating northwards, though the cauſe of this migration is not known. At firſt they had no horſes; the reaſon of which was, that the country they came from did not allow theſe animals to breed: but as they proceeded northward and conquered ſome of the Abyſſinian provinces, they ſoon furniſhed themſelves with ſuch numbers, that they are now almoſt entirely cavalry, making little account of infantry in their armies. On advancing to the frontiers of Abyſſinia, the multitude divided, and part directed their courſe towards the Indian Ocean; after which, having made a ſettlement in the eaſtern part of the continent, they turned ſouthward into the countries of Bali and Dawaw, which they entirely conquered, and ſettled there in the year 1537. Another diviſion having taken a weſterly courſe, ſpread themſelves in a ſemicircle along the banks of the Nile; ſurrounding the country of Gojam, and paſſing eaſtward behind the country of the Agows, extended their poſſeſſions as far as the territories of the Gongas and Gafats. Since that time the Nile has been the boundary of their poſſeſſions; though they have very frequently plundered, and ſometimes conquered, the Abyſſinian provinces on the other ſide of the river, but have never made any permanent ſettlement in theſe parts. A third diviſion has ſettled to the ſouthward of the low country of Shoa, which the governor of that province has permitted, in order to form a barrier betwixt him and the territories of the emperor, on whom he ſcarcely acknowledges any dependence. Galla.

The Galla are of a brown complexion, and have long black hair; but ſome of them who live in the valleys are entirely black. At firſt their common food was milk and butter; but ſince their intercourſe with the Abyſſinians, they have learned to plough and ſow their land, and to make bread. They ſeem to have a predilection for the number ſeven, and each of the three diviſions already mentioned are ſubdivided into ſeven tribes. In their behaviour they are extremely barbarous; and live in continual war with the Abyſſinians, whom they murder without mercy as often as they fall into their hands. They cut off the privities of the men, and hang them up in their houſes by way of trophies; and are ſo cruel as to rip up women with child, in hopes of thus deſtroying a male. Yet notwithſtanding their exceſſive cruelty abroad, they live under the ſtricteſt diſcipline at home; and every broil or quarrel is inſtantly puniſhed according to the nature of the offence. Each of the three diviſions of the Galla above mentioned has a king of its own; and they have alſo a kind of nobility, from among whom the ſovereign can only be choſen: however, the commonalty are not excluded from riſing to the rank of nobles if they diſtinguiſh themſelves very much in battle. None of the nobility can be elected till upwards of 40 years of age, unleſs he has with his own hand killed a number of enemies which added to his own age makes up 40. There is a council of each of the ſeven tribes, which meets ſeparately in its own diſtrict, to ſettle how many are to be left behind for the governing and cultivating of the territory, and other matters of importance. Theſe nations have all a great veneration for a tree which grows plentifully in their country, called *wanzey*, and which theſe ſuperſtitious people are even ſaid to adore as a god. Their aſſemblies for the choice of a king are all held under one of theſe trees; and when the ſovereign is choſen, they put a bludgeon of this wood in his hand by way of ſceptre, and a garland of the flowers upon his head.

The Galla are reported to be very good ſoldiers, eſpecially in caſes of ſurpriſe; but, like moſt other barbarians, have no conſtancy nor perſeverance after the firſt attack. They will, however, perform extraordinary marches, ſwimming rivers holding by the horſe's tail, and thus being enabled to do very great miſchief by reaſon of the rapidity of their movements. They are excellent light-horſe for a regular army in an hoſtile country; but are very indifferently armed on account of the ſcarcity of iron among them. Their principal arms are lances made of wood ſharpened at the end and hardened in the fire; and their ſhields are compoſed only of one ſingle fold of bull's hide; ſo that they are extremely apt to warp by heat, or become too ſoft in wet weather. They are exceedingly cruel; and make a ſhrill horrid noiſe at the beginning of every

Gall ‖ Galle.

every engagement, which greatly terrifies the horſes, and very often the barbarous riders which oppoſe them.

The Galla, according to Mr Bruce's account, are ſomewhat below the middle ſize, but extremely light and nimble. The women are fruitful; and ſuffer ſo little in child-bearing, that they do not even confine themſelves for a ſingle day after delivery. They plough, ſow, and reap the corn, which is trodden out by the cattle; but the men have all the charge of the cattle in the fields. In their cuſtoms they are filthy to the laſt degree; plaiting their hair with the guts of oxen, which they likewiſe twiſt round their middle, and which by the quick putrefaction occaſion an abominable ſtench. They anoint their heads and whole bodies with butter or greaſe; in which, as well as in other reſpects, they greatly reſemble the Hottentots. It has been ſuppoſed that they have no religion whatever; but Mr Bruce is of opinion that this is a miſtake. The wanzey, he ſays, is undoubtedly worſhipped by all the nations as a god; and they have likewiſe certain ſtones which are worſhipped as gods: beſides theſe, they worſhip the moon, and ſome ſtars, when in certain poſitions, and at ſome particular ſeaſons of the year. They all believe in a reſurrection; and have ſome faint notions of a ſtate of happineſs, but no idea of future puniſhment. Some of them to the ſouthward profeſs the Mahometan religion, but thoſe to the eaſt and weſt are generally pagans. All of them intermarry with each other; but will not allow ſtrangers to live among them, though the Moors have at laſt found out a method of trading ſafely with them. The commodities they deal in are blue Surat cloths, myrrh, and ſalt; the laſt being the moſt valuable article.

The marriages among the Galla are celebrated with ſome of the diſguſting cuſtoms of the Hottentots; and after theſe ceremonies the bridegroom promiſes to give the bride meat and drink while ſhe lives, and to bury her when dead. Polygamy is allowed among them; but it is ſingular, that among theſe people the women ſolicit their huſbands to take others to their embraces. The reaſon of this cuſtom is, that the men may have numerous families of children, who may be capable of defending them againſt their enemies; as the Galla, according to our author, always fight in families, whether againſt foreign enemies or with one another.

GALLAND (Anthony), a learned antiquarian, member of the Academy of Inſcriptions, and profeſſor of Arabic in the Royal College of Paris, was born of poor parents at Rollo, a village in Picardy. Having ſtudied at the Sorbonne and other univerſities, he travelled into the eaſt; where he acquired great ſkill in the Arabic tongue, and in the manners of the Mahometans. He wrote ſeveral works; the principal of which are, 1. An Account of the Death of the Sultan Oſman, and the Coronation of the Sultan Muſtapha. 2. A Collection of Maxims, drawn from the works of the Orientals. 3. A Treatiſe on the Origin of Coffee. 4. The Arabian Nights Entertainments, &c.

GALLANT, or Galant, a French term adopted into our language, and ſignifying polite, civil, and well-bred, with a diſpoſition to pleaſe, particularly the ladies. It alſo ſignifies brave or courageous.

GALLE, the name of ſeveral engravers, of whom the principal was Cornelius, who flouriſhed about the 1600. He learned the art of engraving from his father, and imitated his ſtiff ſtyle, till he went to Rome, where he reſided a conſiderable time, and there acquired that freedom, taſte, and correctneſs of drawing, which are found in his beſt works. He ſettled at Antwerp upon his return from Italy, where he carried on a conſiderable commerce in prints. His beſt prints are thoſe done after Rubens.

Galleon ‖ Gallerics.

GALLEON, in naval affairs, a ſort of ſhips employed in the commerce of the Weſt Indies. The Spaniards ſend annually two fleets; the one for Mexico, which they call the *flota;* and the other for Peru, which they call the *galleons*. See Flota.

By a general regulation made in Spain, it has been eſtabliſhed, that there ſhould be twelve men of war and five tenders annually fitted out for the armada or galleons; eight ſhips of 600 tons burden each, and three tenders, one of 100 tons, for the iſland Margarita, and two of 80 each, to follow the armada; for the New Spain fleet, two ſhips of 600 tons each, and two tenders of 80 each; and for the Honduras fleet, two ſhips of 500 tons each: and in caſe no fleet happened to ſail any years, three galleons and a tender ſhould be ſent to New Spain for the plate.

They are appointed to ſail from Cadiz in January, that they may arrive at Porto Bello about the middle of April; where, the fair being over, they may take aboard the plate, and be at Havannah with it about the middle of June; where they are joined by the flota, that they may return to Spain with the greater ſafety.

GALLEOT, a ſmall galley deſigned only for chace, carrying but one maſt and two pattereroes; it can both ſail and row, and has 16 or 20 oars. All the ſeamen on board are ſoldiers, and each has a muſket by him on quitting his oar.

GALLERY, in architecture, a covered place in a houſe, much longer than broad, and uſually in the wings of a building; its uſe being chiefly to walk in.

GALLERIES, in gardening, are certain ornaments made with trees of different kinds; which are very common in all the French gardens, but are ſeldom introduced into the Britiſh ones, eſpecially ſince the taſte for clipped trees has been exploded. For thoſe, however, who may ſtill chooſe to have them, Mr Miller gives the following directions.

In order to make a gallery in a garden with porticoes and arches, a line muſt firſt be drawn of the length you deſign the gallery to be; which being done, it is to be planted with hornbeam, as the foundation of the gallery. The management of galleries is not difficult. They require only to be digged round about; and ſhеared a little when there is occaſion. The chief curioſity required is in the ordering the forepart of the gallery, and in forming the arches. Each pillar of the porticoes or arches ought to be four feet diſtant from another, and the gallery 12 feet high and 10 feet wide, that there may be room for two or three perſons to walk abreaſt. When the hornbeams are grown to the height of three feet, the diſtance of the pillars well regulated, and the ground-work of the gallery finiſhed, the next thing to be done is to form the frontiſpiece; to perform which, you muſt ſtop the hornbeam between two pillars for that purpoſe, which forms the arch. As it grows, you muſt with your ſheers cut off thoſe

Gallery, Galley.

boughs which outſhoot the others. In time they will grow ſtrong, and may be kept in form by the ſheers. Portico-galleries may be covered with lime-trees.

GALLERY, in fortification, a covered walk acroſs the ditch of a town, made of ſtrong beams covered over with planks, and loaded with earth: ſometimes it is covered with raw hides, to defend it from the artificial fires of the beſieged.

GALLERY of a Mine, is a narrow paſſage or branch of a mine carried on under ground to a work deſigned to be blown up. See MINE.

GALLERY, in a ſhip, that beautiful frame, which is made in the form of a balcony, at the ſtern of a ſhip without board; into which there is a paſſage out of the admiral's or captain's cabbin, and is for the ornament of the ſhip.

GALLEY, a kind of low flat-built veſſel, furniſhed with one deck, and navigated with ſails and oars, particularly in the Mediterranean. By the Greek authors under the eaſtern empire, this kind of veſſel was called γαλαια and γαλεαι: and by the Latin authors of the ſame time, *galea;* whence, according to ſome, the modern denomination. Some ſay it was called *galea*, on account of a caſk or helmet which it carried on its prow, as Ovid atteſts, *de Triſtib.* The French call it *galere;* by reaſon, they ſay, that the top of the maſt is uſually cut in the form of a hat, which the Italians call *galero.* Others derive both *galea*, and *galere*, from a fiſh by the Greeks called γαλεωτης, or ξιφιας, and by us the *ſword-fiſh*, which this veſſel reſembles. Laſtly, others derive the *galley*, *galea*, *galere*, *galeaſſe*, &c. from the Syriac and Chaldee *gaul*, and *gallin*, a man expoſed on the water in a veſſel of wood.

The largeſt ſort of theſe veſſels is employed only by the Venetians. They are commonly 162 feet long above, and 133 feet by the keel; 32 feet wide, with 23 feet length of ſtern-poſt. They are furniſhed with three maſts, and 32 banks of oars; every bank containing two oars, and every oar being managed by ſix or ſeven ſlaves, who are uſually chained thereto. In the fore-part they have three little batteries of cannon, of which the loweſt is of two 36 pounders, the ſecond of two 24 pounders, and the uppermoſt of two 2 pounders: three 18 pounders are alſo planted on each quarter. The complement of men for one of theſe galleys is 1000 or 1200. They are eſteemed extremely convenient for bombarding or making a deſcent upon an enemy's coaſt, as drawing but little water; and having by their oars frequently the advantage of a ſhip of war, in light winds or calms, by cannonading the latter near the ſurface of the water; by ſcouring her whole length with their ſhot, and at the ſame time keeping on her quarter or bow, ſo as to be out of the direction of her cannon.

The galleys next in ſize to theſe, which are alſo called *half-galleys*, are from 120 to 130 feet long, 18 feet broad, and 9 or 10 feet deep. They have two maſts, which may be ſtruck at pleaſure; and are furniſhed with two large lateen ſails, and five pieces of cannon. They have commonly 25 banks of oars, as deſcribed above. A ſize ſtill leſs than theſe are called *quarter-galleys*, carrying from 12 to 16 banks of oars. There are very few galleys now beſides theſe in the Mediterranean, which are found by experience to be of little utility except in fine weather; a circumſtance which renders their ſervice extremely precarious. They generally keep cloſe under the ſhore, but ſometimes venture out to ſea to perform a ſummer cruiſe.

Galley Galli.

GALLEY-Worm, in zoology. See IULUS.

GALLI, in antiquity, a name given to the prieſts of Cybele, from the river Gallus in Phrygia; but of the etymology of the name we have no certain account. All that we learn with certainty about them is, that they were eunuchs and Phrygians, and that in their ſolemn proceſſions they danced, bawled, drummed, cut and ſlaſhed themſelves, playing upon timbrels, pipes, cymbals, &c. and driving about an aſs loaded with the ſacred rites and trumpery of their goddeſs. When a young man was to be initiated, he was to throw off his cloaths, run crying aloud into the midſt of their troop, and there draw a ſword and caſtrate himſelf; after this he was to run into the ſtreet with the parts cut off, in his hand, throw them into ſome houſe, and in the ſame houſe put on a woman's dreſs.

Theſe prieſts had the names alſo of *Curetes*, *Corybantes*, and *Dactyli*. The chief prieſt was called *Archi-Gallus*. This order of prieſthood is found both amongſt Greeks and Romans. See an account of them in *Lucret.* lib. ii. and *Juv.* ſat. vi.

GALLI, the *Gauls*. See GALLIA and GAULS.

GALLI, five ſmall deſolate iſlands on the coaſt of the Principato Citra of Naples. They are ſuppoſed to be the Syrenuſæ, or iſlands once inhabited by the Sirens, which Ulyſſes paſſed with ſo much caution and hazard. Great revolutions, however, have been occaſioned in their ſhape, ſize, and number, by the effects of ſubterranean fire; and ſome learned perſons go ſo far as to aſſert, that theſe rocks have riſen from the bottom of the ſea ſince Homer ſang his rhapſodies; conſequently, that thoſe monſters dwelt on ſome other ſpot, probably Sicily or Capri. The tradition of Sirens reſiding hereabouts is very ancient and univerſally admitted; but what they really were, diveſted of their fabulous and poetical diſguiſe, it is not eaſy to diſcover. See SIREN.

The Sirenuſæ were only three in number; and therefore if theſe and the Galli be the ſame, two more muſt have ſince riſen, or the three have been ſplit into five by a ſubterraneous convulſion. On the largeſt is a watch-tower, and the next has a deſerted hermitage. The principal iſland is only a narrow ſemicircular ridge covered with a ſhallow coat of ſoil; two other little iſlands and ſome jagged rocks juſt peeping above the waves, correſpond with this one ſo as to trace the outline of a volcanical crater. The compoſition of them all is at top a calcareous rock extremely ſhaken, tumbled, and confuſed, mixed with maſſes of breccia, diſpoſed in a moſt irregular manner; below theſe is lava, and the deeper the eye follows it the ſtronger are the marks of fire: below the ſurface of the water, and in ſome places above it, the layers are complete blocks of baſaltes. Hence it is fair to preſume, that central fires have heaved up to light the torrified ſubſtances that originally lay near their focus, with all the intermediate ſtrata that covered them from the ſea. The layers incline downwards from eaſt to weſt; the air ſeems to have forced its way into part of the maſs while in fuſion, and by checking its workings cauſed many large

caverns

Gallia, alliard.

caverns to be left in it. These islands are uncultivated and uninhabited since the old hermit of St Antonio died. Myrtle covers most of the surface.

GALLIA, a large country of Europe, called *Galatia* by the Greeks. The inhabitants were called *Galli*, *Celtæ*, *Celtiberi*, and *Celtoscythæ*. Ancient Gaul was divided into four different parts by the Romans, called *Gallia Belgica*, *Narbonensis*, *Aquitania*, and *Celtica*. Gallia Belgica was the largest province, bounded by Germany, Gallia Narbonensis, and the German ocean; and contained the modern country of Alsace, Lorraine, Picardy, with part of the low countries, and of Champagne, and of the isle of France. Gallia Narbonensis, which contained the provinces now called *Languedoc*, *Provence*, *Dauphiné*, *Savoy*, was bounded by the Alps and Pyrenean mountains, by Aquitania, Belgicum, and the Mediterranean. Aquitania Gallia, now called the *provinces of Poitou*, *Santonge*, *Guienne*, *Berry*, *Limosin*, *Gascogny*, *Auvergne*, &c. was situated between the Garumna, the Pyrenean mountains, and the ocean. Gallia Celtica, or Lugdunensis, was bounded by Belgium, Gallia Narbonensis, the Alps, and the ocean. It contained the country at present known by the name of *Lyonnois*, *Touraine*, *Franche Comté*, *Senenois*, *Switzerland*, and part of *Normandy*. Besides these grand divisions, there is often mention made of Gallia Cisalpina or Citerior, Transalpina or Ulterior, which refers to that part of Italy which was conquered by some of the Gauls who crossed the Alps. By Gallia Cisalpina, the Romans understood that part of Gaul which lies in Italy, and by Transalpina, that which lies beyond the Alps, in regard only to the inhabitants of Rome. Gallia Cispadana, and Transpadana, is applied to a part of Italy conquered by some of the Gauls; and then it means the country on this side of the Po, or beyond the Po, with respect to Rome. By Gallia Togata, the Romans understood Cisalpine Gaul, where the Roman gowns *togæ* were usually worn. Gallia Narbonensis was called *Braccata*, on account of the peculiar covering of the inhabitants for their thighs. The epithet of *Comata* is applied to Gallia Celtica, because the people suffered their hair to grow to an uncommon length. The inhabitants were great warriors, and their valour overcame the Roman armies, took the city of Rome, and invaded Greece in different ages. They spread themselves over the greatest part of the world. They were very superstitious in their religious ceremonies, and revered the sacerdotal order as if they had been gods. They long maintained a bloody war against the Romans. and Cæsar resided 10 years in their country before he could totally subdue them. See GAUL.

GALLIARD, or GAGLIARDA, a sort of dance anciently in great request; consisting of very different motions and actions, sometimes proceeding *terra à terra* or smoothly along; sometimes capering; sometimes along the room, and sometimes across. The word is French, *gailliarde*, or rather Italian; and literally signifies "gay, merry, sprightly." This dance was also called *Romanesque*, because brought from Rome.

Thoinot Arbeau, in his Orchesography, describes it as consisting of five steps, and five positions of the feet, which the dancers performed before each other, and whereof he gives us the score or tablature, which is of six minims, and two triple times. Galliarda || Gallipoli.

GALLIARDA, in the Italian music, the name of a tune that belongs to a dance called a *galliard*. The air of it is lively in triple time.

GALLICAN, any thing belonging to France: thus the term *Gallican church* denotes the church of France, or the assembly of the clergy of that kingdom.

GALLICISM, a mode of speech peculiar to the French language, and contrary to the rules of grammar in other languages. With us it is used to denote such phrases or modes of speech in English as are formed after the French idiom.

GALLINACEUS LAPIS, a glossy substance produced by volcanic fires; the same with the *lapis obsidianus* of the ancients. A kind of it is brought from Paris, of a beautiful black, resembling the colour of a large crow in that country named *gallinaço*.

GALLINÆ, in ornithology, an order of birds. See ORNITHOLOGY.

GALLINACIOUS, an appellation given to the birds of the order of the gallinæ.

GALLING, or EXCORIATION, in medicine. See EXCORIATION.

Galling of a Horse's Back, a disorder occasioned by heat, and the chafing or pinching of the saddle.

In order to prevent it, some take a hind's skin well garnished with hair, and fit it neatly under the pannel of the saddle, so that the hairy side may be next the horse.

When a horse's back is galled upon a journey, take out a little of the stuffing of the pannel over the swelling, and sew a piece of soft white leather on the inside of the pannel: anoint the part with salt butter, and every evening wipe it clean, rubbing it till it grow soft, anointing it again with butter, or, for want of that, with grease: wash the swelling or hurt every evening with cold water and soap; and strew it with salt, which should be left on till the horse be saddled in the morning.

GALLINULE. See FULICA.

GALLIPOLI, a sea-port town of Italy, in the kingdom of Naples, and in the Terra-di-Otranto, with a bishop's see. It stands on a rocky island, joined to the continent by a bridge. From the remotest antiquity, this was a station so favourable to commerce, that every maritime power wished to secure it; and it is a reproach to government, that nothing has been done to improve its natural advantages: at present, Mr Swinburn informs us, it has neither harbour nor shelter for shipping. Charles II. demolished Gallipoli for its adherence to Frederick of Aragon. The Venetians treated it with great cruelty in the 15th century; and in 1481 it was pillaged by the Turks. To preserve it from future calamities, Charles V. repaired and strengthened its fortifications; and, since that period, it has enjoyed the benefits of peace and trade, which have rendered it the most opulent and gayest town upon the coast, though its inhabitants do not exceed 6000 in number. Consumptions and spitting of blood are rather frequent here, occasioned by the great subtilty of the air, which is ventilated from every quarter. The buildings are tolerable, and some of

Gallipoli ‖ Gallois.

of the churches have good paintings. The cotton trade brings in about 30,000 ducats a-year. Good muſlins, cotton ſtockings, and other parts of apparel, are manufactured here, and purchaſed by the Provençals; for Gallipoli has no direct trade with the metropolis. Silk and ſaffron were formerly objects of traffic; but heavy duties and oppreſſion have cauſed them to be abandoned. The wine of this territory is good; but from dryneſs of climate, and ſhallowneſs of ſoil, the vintage frequently fails in quantity; and then the Gallipolitans have recourſe to Sicily for a ſupply. Oil is the great ſupport of the place: two-thirds of the produce of its olive plantations are exported to France, and the north of Italy; the remainder is ſent to Naples, and other ports of the kingdom. Neapolitan merchants, by means of agents ſettled at Gallipoli, buy up the oils, from year to year, long before an olive appears upon the tree; and the price is afterwards ſettled by public authority. The Neapolitans ſell their oil to the merchants of Leghorn; and, if faithfully ſerved by their factors in Terra di Otranto, ought to double their capital in two years. But, to balance this advantage, they run great riſks, pay exorbitant intereſt, and have frequent bankruptcies to guard againſt. E. Long. 18. 10. N. Lat. 40. 20.

GALLIPOLI, a ſea-port town of Turky in Europe, in the province of Romania, ſeated at the mouth of the ſea of Marmura, with a good harbour, and a biſhop's ſee. It contains about 10,000 Turks, 3500 Greeks, beſides a great number of Jews. The bazar or bezeſtein, the place where merchandizes are ſold, is a handſome ſtructure, with domes covered with lead. It is an open place, and has no other defence than a paltry ſquare caſtle. The houſes of the Greeks and Jews have doors not above three feet and an half high, to prevent the Turks riding into their houſes. E. Long. 26. 59. N. Lat 40. 30.

GALLIUM, in botany. See GALIUM.

GALLO, an iſland of the South Sea, near the ſea-coaſt of Peru, in South America, which was the firſt place poſſeſſed by the Spaniards when they attempted the conqueſt of Peru; it is alſo the place where the bucaneers uſed to come for wood and water, and to refit their veſſels when they were in theſe parts. W. Long. 88. 0. N. Lat. 2. 30.

GALLO-Græcia, a country of Aſia Minor, near Bithynia and Cappadocia. It was inhabited by a colony of Gauls, who aſſumed the name of *Gallogræci*, becauſe a number of Greeks had accompanied them in their emigration. See GALATIA.

GALLOIS (John), born at Paris in 1632, was an univerſal ſcholar; but chiefly noted for having been, in conjunction with M. de Sallo who formed the plan, the firſt publiſher of the *Journal des Sçavans*. The firſt journal was publiſhed January 5. 1665; but theſe gentlemen criticiſed new works ſo rigorouſly, that the whole tribe of authors united and cried it down. De Sallo declined entirely after the publication of the third number: but Gallois ventured to ſend out a fourth, on January 4th 1666; though not without a moſt humble advertiſement at the beginning, wherein it was declared, that the author "would not preſume to criticiſe, but ſimply give an account of the books." This, with the protection of M. Colbert, who was greatly taken with the work, gradually reconciled the public to it: and thus began literary journals, which have been continued from that time to this, under various titles, and by various writers. Gallois continued his journal to the year 1674, when more important occupations obliged him to turn it over to other hands. M. Colbert had taken him into his houſe to teach him Latin; and when he loſt his patron in 1683, he was firſt made librarian to the king, and then Greek profeſſor in the royal college. He died in 1707.

Gallon ‖ Galloway.

GALLON, a meaſure of capacity both for dry and liquid things, containing four quarts. But theſe quarts, and conſequently the gallon itſelf, are different, according to the quality of the thing meaſured: For inſtance, the wine-gallon contains 231 cubic inches, and holds eight pounds averdupois of pure water; the beer and ale gallon contains 281 ſolid inches, and holds ten pounds three ounces and a quarter averdupois of water; and the gallon for corn, meal, &c. 272$\frac{1}{2}$ cubic inches, and holds nine pounds thirteen ounces of pure water.

GALLOP, in the manege, is the ſwifteſt natural pace of a horſe, performed by reaches or leaps; the two fore-feet being raiſed almoſt at the ſame time; and when theſe are in the air, and juſt ready to touch the ground again, the two hind-feet are lifted almoſt at once. The word is borrowed from the barbarous Latin *calupare*, or *calpare*, "to run." Some derive it from *caballicare*; others from the Greek καλπαζειν, or καλπαν, *to ſpur a horſe*.

GALLOPER, in artillery, is the name of a carriage which ſerves for a pound and a half gun. This carriage has ſhafts ſo as to be drawn without a limber, and is thought by ſome to be more convenient and preferable to other field carriages; and it may likewiſe ſerve for our light three and ſix pounders.

GALLOWAY, a county of Scotland, which gives the title of Earl to a branch of the noble family of Stuart. It is divided into two diſtricts; the weſtern, called *Upper Galloway*, being the ſame with Wigtonſhire; and the eaſtern, or ſtewartry of Kirkcudbright, called *Lower Galloway*. See KIRKCUDBRIGHT and WIGTONSHIRE.

Mull of GALLOWAY, the ſouth cape or promontory of all Scotland, in the county of Galloway, on the Iriſh ſea.

GALLOWAYS is the name of a peculiar ſort of horſes, ſo called from the county of Galloway in Scotland, where they are bred. Tradition reports, that this kind of horſes ſprung from ſome Spaniſh ſtallions, which ſwam on ſhore from ſome of the ſhips of the famous Spaniſh armada, wrecked on the coaſt; and coupling with the mares of the country, furniſhed the kingdom with their poſterity. They were much eſteemed, and of a middling ſize, ſtrong, active, nervous, and hardy.

GALLOWS, an inſtrument of puniſhment, whereon perſons convicted capitally of felony, &c. are executed by hanging.

Among our anceſtors it was called *furca*, "fork;" a name by which it is ſtill denominated abroad, particularly in France and Italy. In this latter country, the

Gallus
||
Galway.

the reaſon of the name ſtill ſubſiſts; the gallows being a real fork drove into the ground, acroſs the legs whereof is laid a beam, to which the rope is tied. See FURCA.

GALLUS (Cornelius), an ancient Roman poet, born at Forum Julium, now called *Frejus*, in France, He was a particular favourite with Auguſtus Cæſar, who made him governor of Egypt: but his maladminiſtration there occaſioned his baniſhment, and the loſs of his eſtate; for grief of which he put an end to his own life. He wrote four books of love-elegies; and Virgil has complimented him in many places.

GALLUS, or COCK, in ornithology. See PHASIANUS.

GALLY, in printing, a frame into which the compoſitor empties the lines out of his compoſing-ſtick, and in which he ties up the page when it is completed.

The gally is formed of an oblong ſquare board, with a ledge on three ſides, and a groove to admit a falſe bottom, called a *gally-ſlice*.

GALWAY, or GALLOWAY, a county of Ireland, which is 82 miles in length, and 42 in breadth, bounded by the counties of Clare, Tipperary, King's County, Roſcommon, and the ſea. The river Shannon waſhes the frontiers of the eaſt and ſouth-eaſt, and forms a lake ſeveral miles in length. There is another great lake called *Corlis*, or *Carib*, which is near 20 miles long, and five broad. The county contains 15,420 houſes, 136 pariſhes, 17 baronies, and 13 boroughs; and ſends 8 members to parliament. The capital town is of the ſame name.

GALWAY, a town of Ireland, in the county of the ſame name, and province of Connaught, of which it is the capital. It is ſeated on the bay of Galway on the weſtern ocean, 108 miles weſt of Dublin, and gives title of Viſcount to the family of Monkton. It is ſurrounded with ſtrong walls, has large ſtraight ſtreets, and the houſes are generally well built with ſtone. It has a good trade into foreign parts, on account of its harbour, which is defended by a fort. It is governed by a mayor, ſheriffs, and recorder, and returns two members to parliament. It has but one pariſh church, which is a large and beautiful Gothic ſtructure; an exchange; barracks for 10 companies of foot, a charter-ſchool, and an hoſpital. This was one of the ſtrongeſt towns in the kingdom: it held out ſome time againſt general Ginkle, who inveſted and took it after the battle of Aughrim. Its fortifications were then repaired; the walls are flanked by baſtions, but are moſtly gone to decay. The ſalmon and herring fiſheries are carried on here with great ſpirit, and employ 700 boats, the quantity of kelp manufactured and exported is conſiderable; and the growth of the linen manufacture, though of late introduction, is become very important. In 1296, Sir William de Burgh founded a monaſtery here for Franciſcan friars, on St Stephen's iſland, ſituated without the north gate of the town. In 1381, there being two popes at Rome, and the people of Ireland being doubtful to which they ſhould pay obedience, pope Urban, to fix them entirely to his intereſt, empowered the guardian of this monaſtery to excommunicate every perſon in the province of Connaught who ſhould adhere to Clement VII. who he aſſured them was antipope. The tomb of the founder of this monaſtery was diſcovered in June 1779, upwards of four feet under ground, with his family-arms, and a very long broad ſword, elegantly carved thereon; ſome of the remains are ſtill to be ſeen.—Near the weſt gate of the town, without the walls, was the monaſtery of St Mary of the hill: on the nuns forſaking it, the ſecular clergy entered into and kept poſſeſſion of it for a conſiderable time; but on the petition of the inhabitants of the town, to pope Innocent VIII. it was granted to the Dominican friars, by a bull dated the 4th December 1488; there are no remains of this foundation except the cemetery; the whole building having been demoliſhed by the townſmen in the year 1652, in order to prevent Cromwell from turning it into a fortification againſt themſelves: there was alſo an Auguſtinian friary, on a hill near this town, founded by Stephen Lynch, and Margaret his wife, in the year 1508, at the earneſt ſolicitation of Richard Nangle, a friar of the ſame order, who afterwards became archbiſhop of Tuam.

Gama
||
Gamboge.

GAMA (Vaſco de), a Portugueſe admiral, celebrated for his diſcovery of the Eaſt Indies by the Cape of Good Hope, was born at Synes; and, in 1497, was ſent to the Indies by king Emanuel: he returned in 1502, and ſailed thither again with 13 veſſels richly laden. He was made viceroy of the Indies by king John III.; and died at Cochin, on the 24th of December 1525. Don Stephen and Don Chriſtopher de Gama, his ſons, were alſo viceroys of the Indies, and celebrated in hiſtory.

GAMBIA, a large river of Negroland in Africa, generally ſuppoſed to be a branch of the Niger. See NILE, NIGER, and SENEGAL.

GAMBOGE, is a concreted vegetable juice *, partly of a gummy and partly of a reſinous nature. It is chiefly brought to us in large cakes or rolls from Cambaja in the Eaſt Indies. The beſt ſort is of a deep yellow or orange colour, breaks ſhining and free from droſs: it has no ſmell, and very little taſte, unleſs kept in the mouth for ſome time, when it impreſſes a ſlight ſenſe of acrimony. It immediately communicates to ſpirit of wine a bright golden colour, and almoſt entirely diſſolves in it; Geoffroy ſays, except the ſixth part. Alkaline ſalts enable water to act upon this ſubſtance powerfully as a menſtruum: the ſolution made by their means is ſomewhat tranſparent, of a deep blood-red colour, and paſſes the filtre: the dulcified ſpirit of ſal ammoniac readily and entirely diſſolves it, and takes up a conſiderable quantity; and what is pretty remarkable, this ſolution mixes either with water or ſpirit, without growing turbid.

* See *Garcinia*.

As a pigment, it makes a beautiful yellow, which is much uſed by the painters. Dr Lewis ſays, that it makes a beautiful and durable citron yellow ſtain upon marble, whether rubbed in ſubſtance on the hot ſtone, or applied, as dragon's-blood ſometimes is, in form of a ſpirituous tincture. When it is applied on cold marble, the ſtone is afterwards to be heated, to make the colour penetrate.

As a medicine, gamboge evacuates powerfully both upwards and downwards; ſome condemn it as acting with too great violence, and occaſioning dangerous hypercatharſes; whilſt others are of a contrary opinion. Geoffroy ſeems particularly fond of this medicine,

Game. cine, and informs us, that he has frequently given from two to four grains, without its proving at all emetic; that from four to eight grains, it both vomits and purges, without violence; that its operation is soon over; and that if given in a liquid form, and sufficiently diluted, it stands not in need of any corrector; that in the form of a bolus or pill, it is most apt to prove emetic, but very rarely has this effect if joined along with *mercurius dulcis*. He nevertheless cautions against its use where the patient cannot easily bear vomiting.—It has been used in dropsy with cream of tartar or jalap, or both, to quicken their operation. It is also recommended by some to the extent of 15 grains with an equal quantity of vegetable alkali in cases of the tape-worm. This dose is ordered in the morning; and if the worm is not expelled in two or three hours, it is repeated even to the third time with safety and efficacy. It is asserted that it has been given to this extent even in delicate habits. This is said to be the remedy alluded to by Baron Van Swieten, which was employed by Dr Herenschward, and with him proved so successful in the removal of the tænia lata.

GAME, in general, signifies any diversion or sport, that is performed with regularity, and restrained to certain rules. See GAMING.

Games are usually distinguished into those of exercise and address, and those of hazard. To the first belong chess, tennis, billiards, &c. and to the latter those performed with cards or dice, as back-gammon, ombre, picquet, whist, &c. See *Back-Gammon*, &c.

GAMES, in antiquity, were public diversions, exhibited on solemn occasions. Such among the Greeks, were the Olympic, Pythian, Isthmian, Nemean, &c. games; and, among the Romans, the Apollinarian, Circensian, Capitoline, &c. games. See OLYMPIC, PYTHIAN, FUNERAL, &c.

GAME, in law, signifies birds, or prey, taken or killed by fowling or hunting.

The property of such animals *feræ naturæ* as are known under the denomination of *game*, with the right of pursuing, taking, and destroying them, is vested in the king alone, and from him derived to such of his subjects as have received the grants of a chace, a park, or a free warren.

By the law of nature, indeed, every man, from the prince to the peasant, has an equal right of pursuing, and taking to his own use, all such creatures as are *feræ naturæ*, and therefore the property of nobody, but liable to be seized by the first occupant. But it follows from the very end and constitution of society, that this natural right, as well as many others belonging to man as an individual, may be restrained by positive laws enacted for reasons of state, or for the supposed benefit of the community. This restriction may be either with respect to the *place* in which this right may, or may not, be exercised; with respect to the *animals* that are the subjects of this right; or with respect to the *persons* allowed or forbidden to exercise it. And, in consequence of this authority, we find that the municipal laws of many nations have exerted such power of restraint; have in general forbidden the entering on another man's grounds, for any cause, without the owner's leave; have extended their protection to such particular animals as are usually the objects of pursuit; and have invested the prerogative of hunting and taking such animals, in the sovereign of the state only, and such as he shall authorize. Many reasons have concurred for making these constitutions: as, 1. For the encouragement of agriculture and improvement of lands, by giving every man an exclusive dominion over his own soil. 2. For the preservation of the several species of these animals, which would soon be extirpated by a general liberty. 3. For prevention of idleness and dissipation in husbandmen, artificers, and others of lower rank; which would be the unavoidable consequence of universal licence. 4. For prevention of popular insurrections and resistance to the government, by disarming the bulk of the people: which last is a reason oftener meant than avowed, by the makers of forest or game laws. Nor, certainly, in these prohibitions is there any *natural* injustice, as some have weakly enough supposed: since, as Puffendorf observes, the law does not hereby take from any man his present property, or what was already his own; but barely abridges him of one means of acquiring a future property, that of occupancy; which indeed the law of nature would allow him, but of which the laws of society have in most instances very justly and reasonably deprived him.

Game.

Blackst. Comment.

Yet, however defensible these provisions in general may be, on the footing of reason, or justice, or civil policy, we must, notwithstanding, acknowledge, that, in their present shape, they owe their immediate original to slavery. It is not till after the irruption of the northern nations into the Roman empire, that we read of any other prohibitions, than that natural one of not sporting on any private grounds without the owner's leave.

With regard to the rise and original of our present civil prohibitions, it will be found, that all forest and game laws were introduced into Europe at the same time, and by the same policy, as gave birth to the feodal system; when those swarms of barbarians issued from their northern hive, and laid the foundation of most of the present kingdoms of Europe, on the ruins of the western empire. For when a conquering general came to settle the economy of a vanquished country, and to part it out among his soldiers or feudatories, who were to render him military service for such donations; it behoved him, in order to secure his new acquisitions, to keep the *rustici* or natives of the country, and all who were not his military tenants, in as low a condition as possible, and especially to prohibit them the use of arms. Nothing could do this more effectually than a prohibition of hunting and sporting: and therefore it was the policy of the conqueror to reserve this right to himself, and such on whom he should bestow it; which were only his capital feudatories, or greater barons. And, accordingly, we find, in the feudal constitutions, one and the same law prohibiting the *rustici* in general from carrying arms, and also proscribing the use of nets, snares, or other engines for destroying the game. This exclusive privilege well suited the martial genius of the conquering troops, who delighted in a sport which in its pursuit and slaughter bore some resemblance to war. *Vita omnis* (says Cæsar, speaking of the ancient Germans) *in venationibus atque in studiis rei militaris consistit.* And Tacitus in like manner observes, that *quoties bella non-*

Game. *ineunt, multum venatibus, plus per otium transigunt.* And indeed, like ſome of their modern ſucceſſors, they had no other amuſement to entertain their vacant hours; they deſpiſing all arts as effeminate, and having no other learning, than was couched in ſuch rude ditties as were ſung at the ſolemn carouſals which ſucceeded theſe antient huntings. And it is remarkable, that, in thoſe nations where the feodal policy remains the moſt uncorrupted, the foreſt or game laws continue in their higheſt rigour. In France, all game is properly the king's; and in ſome parts of Germany it is death for a peaſant to be found hunting in the woods of the nobility.

With us in Britain, alſo, hunting has ever been eſteemed a moſt princely diverſion and exerciſe. The whole iſland was repleniſhed with all ſorts of game in the times of the Britons; who lived in a wild and paſtoral manner, without incloſing or improving their grounds; and derived much of their ſubſiſtence from the chaſe, which they all enjoyed in common. But, when huſbandry took place under the Saxon government, and lands began to be cultivated, improved, and incloſed, the beaſts naturally fled into the woody and deſart tracts, which were called the *foreſts*; and, having never been diſpoſed of in the firſt diſtribution of lands, were therefore held to belong to the crown. Theſe were filled with great plenty of game, which our royal ſportſmen reſerved for their own diverſion, on pain of a pecuniary forfeiture for ſuch as interfered with their ſovereign. But every freeholder had the full liberty of ſporting upon his territories, provided he abſtained from the king's foreſts.

However, upon the Norman conqueſt, a new doctrine took place: and the right of purſuing and taking all beaſts of chaſe or *venary*, and ſuch other animals as were accounted *game*, was then held to belong to the king, or to ſuch only as were authorized under him. And this, as well upon the principles of the feodal law, that the king is the ultimate proprietor of all the lands in the kingdom, they being all held of him as the chief lord, or lord paramount of the fee; and that therefore he has the right of the univerſal ſoil, to enter thereon, and to chaſe and take ſuch creatures at his pleaſure: as alſo upon another maxim of the common law, that theſe animals are *bona vacantia*, and, having no other owner, belong to the king by his prerogative. As therefore the former reaſon was held to veſt in the king a *right* to purſue and take them any where; the latter was ſuppoſed to give the king, and ſuch as he ſhould authorize, a *ſole* and *excluſive* right.

This right, thus newly veſted in the crown, was exerted with the utmoſt rigour, at and after the time of the Norman eſtabliſhment; not only in the ancient foreſts, but in the new ones which the conqueror made, by laying together vaſt tracts of country, depopulated for that purpoſe, and reſerved ſolely for the king's royal diverſion; in which were exerciſed the moſt horrid tyrannies and oppreſſions, under colour of foreſt-law, for the ſake of preſerving the beaſts of chaſe; to kill any of which, within the limits of the foreſt, was as penal as the death of a man. And, in purſuance of the ſame principle, king John laid a total interdict upon the *winged* as well as the *fourfooted* creation: *capturam avium per totam Angliam interdixit* *. The cruel and unſupportable hardſhips which theſe foreſt-laws created to the ſubject, occaſioned our anceſtors to be as zealous for their reformation, as for the relaxation of the feodal rigours and the other exactions introduced by the Norman family; and accordingly we find the immunities of *carta de foreſta* as warmly contended for, and extorted from the king with as much difficulty, as thoſe of *magna carta* itſelf. By this charter, confirmed in parliament †, many foreſts were diſafforeſted, or ſtripped of their oppreſſive privileges, and regulations were made in the regimen of ſuch as remained; particularly killing the king's deer was made no longer a capital offence, but only puniſhed by a fine, impriſonment, or abjuration of the realm. And by a variety of ſubſequent ſtatutes, together with the long acquieſcence of the crown without exerting the foreſt-laws, this prerogative is now become no longer a grievance to the ſubject.

Game. * *M. Paris*, 303.

† 9 Hen. III.

But as the king reſerved to himſelf the *foreſts* for his own excluſive diverſion, ſo he granted out from time to time other tracts of lands to his ſubjects under the names of *chaſes* or *parks*; or gave them licence to make ſuch in their own grounds; which indeed are ſmaller foreſts in the hands of a ſubject, but not governed by the foreſt-laws; and by the common law no perſon is at liberty to take or kill any beaſts of chaſe, but ſuch as hath an ancient chaſe or park; unleſs they be alſo beaſts of prey.

As to all inferior ſpecies of game, called *beaſts and fowls of warren*; the liberty of taking or killing them is another franchiſe or royalty, derived likewiſe from the crown, and called *free-warren*; a word which ſignifies preſervation or cuſtody: as the excluſive liberty of taking and killing fiſh in a public ſtream or river is called a *free-fiſhery*; of which, however, no new franchiſe can at preſent be granted, by the expreſs proviſion of *magna carta*, c. 16. The principal intention of granting a man theſe franchiſes or liberties was in order to protect the game, by giving him a ſole and excluſive power of killing it himſelf, provided he prevented other perſons. And no man but he who has a chaſe or free-warren, by grant from the crown, or preſcription, which ſuppoſes one, can juſtify hunting or ſporting upon another man's ſoil; nor indeed, in thorough ſtrictneſs of common law, either hunting or ſporting at all.

However novel this doctrine may ſeem, it is a regular conſequence from what has been before delivered, that the ſole right of taking and deſtroying game belongs excluſively to the king. This appears, as well from the hiſtorical deduction here made, as becauſe he may grant to his ſubjects an excluſive right of taking them; which he could not do, unleſs ſuch a right was firſt inherent in himſelf. And hence it will follow, that no perſon whatever, but he who has ſuch derivative right from the crown, is by common law intitled to take or kill any beaſts of chaſe, or other game whatſoever. It is true, that, by the acquieſcence of the crown, the frequent grants of free-warren in ancient times, and the introduction of new penalties of late by certain ſtatutes for preſerving the game, this excluſive prerogative of the king is little known or conſidered; every man that is exempted from theſe modern penalties, looking upon himſelf as at liberty to do what he

Game. pleaſes with the game: whereas the contrary is ſtrictly true, that no man, however well *qualified* he may vulgarly be eſteemed, has a right to encroach on the royal prerogative by the killing of game, unleſs he can ſhow a particular grant of free-warren: or a preſcription, which preſumes a grant; or ſome authority under an act of parliament. As for the latter, there are but two inſtances wherein an expreſs permiſſion to kill game was ever given by ſtatute; the one by 1 Jac. I. *c.* 27. altered by 7 Jac. I. *c.* 11. and virtually repealed by 22 and 23 Car. II. *c.* 25. which gave authority, ſo long as they remained in force, to the owners of free-warren, to lords of manors, and to all freeholders having 40 l. *per annum* in lands of inheritance, or 80 l. for life or lives, or 400 l. perſonal eſtate (and their ſervants), to take partridges and pheaſants upon their own, or their maſter's free-warren, inheritance, or freehold: the other by 5 Ann. *c.* 14. which empowers lords and ladies of manors to appoint gamekeepers, to kill game for the uſe of ſuch lord or lady; which with ſome alteration ſtill ſubſiſts, and plainly ſuppoſes ſuch power not to have been in them before. The truth of the matter is, that theſe game-laws do indeed *qualify* nobody, except in the inſtance of a gamekeeper, to kill game: but only to ſave the trouble and formal proceſs of an action by the perſon injured, who perhaps too might remit the offence, theſe ſtatutes inflict *additional* penalties, to be recovered either in a regular or ſummary way, by any of the king's ſubjects, from certain perſons of inferior rank who may be found offending in this particular. But it does not follow that perſons excuſed from theſe additional penalties are therefore *authoriſed* to kill game. The circumſtance of having 100 l. *per annum*, and the reſt, are not properly qualifications, but exemptions. And theſe perſons, ſo exempted from the penalties of the game-ſtatutes, are not only liable to actions of treſpaſs by the owners of the land; but alſo, if they kill game within the limits of any royal franchiſe, they are liable to the actions of ſuch who may have the right of chaſe or free-warren therein.

Upon the whole, it appears, that the king, by his prerogative, and ſuch perſons as have, under his authority, the ROYAL FRANCHISE of CHACE, PARK, or *Free-Warren* *, are the *only* perſons who may acquire any property, however fugitive and tranſitory, in theſe animals *feræ naturæ*, while living; which is ſaid to be veſted in them *propter privilegium*. And it muſt alſo be obſerved, that ſuch perſons as may thus lawfully hunt, fiſh, or fowl, *ratione privilegii*, have only a qualified property in theſe animals: it not being abſolute or permanent, but laſting only ſo long as the creatures remain within the limits of ſuch reſpective franchiſe or liberty, and ceaſing the inſtant they voluntarily paſs out of it. It is held indeed, that if a man ſtarts any game within his own grounds, and follows it into another's, and kills it there, the property remains in himſelf. And this is grounded on reaſon and natural juſtice: for the property conſiſts in the poſſeſſion; which poſſeſſion commences by the finding it in his own liberty, and is continued by the immediate purſuit. And ſo, if a ſtranger ſtarts game in one man's chaſe or free-warren, and hunts it into another liberty, the property continues in the owner of the chaſe or warren; this property ariſing from privilege, and not being changed by the act of a mere ſtranger. Or if a man ſtarts game on another's private grounds, and kills it there, the property belongs to him in whoſe ground it was killed, becauſe it was alſo ſtarted there; this property ariſing *ratione ſoli*. Whereas if, after being ſtarted there, it is killed in the grounds of a third perſon, the property belongs not to the owner of the firſt ground, becauſe the property is local; nor yet to the owner of the ſecond, becauſe it was not ſtarted in his ſoil; but it veſts in the perſon who ſtarted and killed it, though guilty of a treſpaſs againſt both the owners. See the article *Game-Laws*.

Game ‖ Gaming

Game-Cock, a fighting cock, or one kept for ſport; a barbarous practice, which is a diſgrace to any civilized nation. See *Cock Fighting*.

GAMELIA, in Grecian antiquity, a nuptial feaſt, or rather ſacrifice, held in the ancient Greek families on the day before a marriage; thus called from a cuſtom they had of ſhaving themſelves on this occaſion, and preſenting their hair to ſome deity to whom they had particular obligations.

GAMELION, in the ancient chronology, was the eighth month of the Athenian year, containing 29 days, and anſwering to the latter part of our January and beginning of February. It was thus called, as being, in the opinion of the Athenians, the moſt proper ſeaſon of the year for marriage.

GAMING, the art of playing or practiſing any game, particularly thoſe of hazard; as cards, dice, tables, &c.

Gaming has at all times been looked upon as a thing of pernicious conſequence to the commonwealth; and is therefore ſeverely prohibited by law. It is conſidered as a practice generally intended to ſupply, or retrieve, the expences occaſioned by LUXURY: it being a kind of tacit confeſſion, that the company engaged therein do, in general, exceed the bounds of their reſpective fortunes; and therefore they caſt lots to determine upon whom the ruin ſhall at preſent fall, that the reſt may be ſaved a little longer. But, taken in any light, it is an offence of the moſt alarming nature; tending, by neceſſary conſequence, to promote public idleneſs, theft, and debauchery, among thoſe of a lower claſs; and, among perſons of a ſuperior rank, it hath frequently been attended with the ſudden ruin and deſolation of ancient and opulent families, an abandoned proſtitution of every principle of honour and virtue, and too often hath ended in ſelf-murder. To reſtrain this pernicious vice among the inferior ſort of people, the ſtatute 33 Hen. VIII. *c.* 9. was made; which prohibits, to all but gentlemen, the games of tennis, tables, cards, dice, bowls, and other unlawful diverſions there ſpecified, unleſs in the time of Chriſtmas, under pecuniary pains and impriſonment. And the ſame law, and alſo the ſtatute 23 Geo. II. *c.* 24. inflict pecuniary penalties, as well upon the maſter of any public houſe wherein ſervants are permitted to game, as upon the ſervants themſelves who are found to be gaming there. But this is not the principal ground of modern complaint: it is the gaming in high life that demands the attention of the magiſtrate; a paſſion to which every valuable conſideration is made a ſacrifice, and which we ſeem to have inherited from our anceſtors the ancient Germans; whom Tacitus deſcribes to have been bewitched with the ſpirit of play to a moſt exor-

bitant

* See thoſe articles.

Gaming. bitant degree. "They addict themselves (says he) to dice (which is wonderful) when sober, and as a serious employment; with such a mad desire of winning or losing, that, when stript of every thing else, they will stake at last their liberty, and their very selves. The loser goes into a voluntary slavery; and, though younger and stronger than his antagonist, suffers himself to be bound and sold. And this perseverance in so bad a cause they call the point of honour: *ea est in re prava pervicacia, ipsi fidem vocant.*" One would almost be tempted to think Tacitus was describing a modern Englishman. When men are thus intoxicated with so frantic a spirit, laws will be of little avail: because the same false sense of honour that prompts a man to sacrifice himself, will deter him from appealing to the magistrate. Yet it is proper that laws should be, and be known publicly, that gentlemen may consider what penalties they wilfully incur, and what a confidence they repose in sharpers; who, if successful in play, are certain to be paid with honour, or, if unsuccessful, have it in their power to be still greater gainers by informing. For, by stat. 16 Car. II. *c.* 7. if any person by playing or betting shall lose more than 100 l. at one time, he shall not be compellable to pay the same; and the winner shall forfeit treble the value, one moiety to the king, the other to the informer. The statute 9 Ann. *c.* 14. enacts, that all bonds and other securities, given for money won at play, or money lent at the time to play withal, shall be utterly void: that all mortgages and incumbrances of lands, made upon the same consideration, shall be and enure to the heir of the mortgager: that, if any person at one time loses 10 l. at play, he may sue the winner, and recover it back by action of debt at law; and, in case the loser does not, any other person may sue the winner for treble the sum so lost; and the plaintiff in either case may examine the defendant himself upon oath: and that in any of these suits no privilege of parliament shall be allowed. The statute farther enacts, that if any person cheats at play, and at one time wins more than 10 l. or any valuable thing, he may be indicted thereupon, and shall forfeit five times the value, shall be deemed infamous, and suffer such corporal punishment as in case of wilful perjury. By several statutes of the reign of king George II. all private lotteries by tickets, cards, or dice (and particularly the games of faro, basset, ace of hearts, hazard, passage, rolly polly, and all other games with dice, except backgammon), are prohibited under a penalty of 200 l. for him that shall erect such lotteries, and 50 l. a-time for the players. Public lotteries, unless by authority of parliament, and all manner of ingenious devices, under the denomination of *sales* or otherwise, which in the end are equivalent to lotteries, were before prohibited by a great variety of statutes under heavy pecuniary penalties. But particular descriptions will ever be lame and deficient, unless all games of mere chance are at once prohibited; the invention of sharpers being swifter than the punishment of the law, which only hunts them from one device to another. The stat. 13 Geo. II. *c.* 19. to prevent the multiplicity of horse-races, another fund of gaming, directs, that no plates or matches under 50 l. value shall be run, upon penalty of 200 l. to be paid by the owner of each horse running, and 100 l. by such as advertise the plate. By statute 18 Geo. II. *c.* 34. the statute 9 Ann. is farther enforced, and some deficiencies supplied: the forfeitures of that act may now be recovered in a court of equity; and, moreover, if any man be convicted, upon information or indictment, of winning or losing at any sitting 10 l. or 20 l. within 24 hours, he shall forfeit five times the sum. Thus careful has the legislature been to prevent this destructive vice: which may show that our laws against gaming are not so deficient, as ourselves and our magistrates in putting those laws in execution. Gaming.

Chance, or Hazard, in GAMING. Hazard, or chance, is a matter of mathematical consideration, because it admits of more and less. Gamesters either set out upon an equality of chance, or are supposed to do so. This equality may be altered in the course of the game, by the greater good-fortune or address of one of the gamesters, whereby he comes to have a better chance, so that his share in the stakes is proportionably better than at first. This more and less runs through all the ratios between equality and infinite difference, or from an infinitely little difference till it come to an infinitely great one, whereby the game is determined. The whole game, therefore, with regard to the issue of it, is a chance of the proportion the two shares bear to each other.

The probability of an event is greater or less, according to the number of chances by which it may happen, compared with the number of all the chances by which it may either happen or fail.

M. de Moivre, in a treatise *de Mensura Sortis*, has computed the variety of chances in several cases that occur in gaming, the laws of which may be understood by what follows.

Suppose p the number of cases in which an event may happen, and q the number of cases wherein it may not happen, both sides have the degree of probability, which is to each other as p to q.

If two gamesters, A and B, engage on this footing, that, if the cases p happen, A shall win; but if q happen, B shall win, and the stake be a; the chance of A will be $\frac{pa}{q+p}$, and that of B $\frac{qa}{p+q}$; consequently, if they sell the expectancies, they should have that for them respectively.

If A and B play with a single die, on this condition, that, if A throw two or more aces at eight throws, he shall win; otherwise B shall win; What is the ratio of their chances? Since there is but one case wherein an ace may turn up, and five wherein it may not, let $a=1$, and $b=5$. And again, since there are eight throws of the die, let $n=8$; and you will have $\overline{a+b}|^n - b^n - nab^n - 1$, to $b^n + nab^n - 1$: that is, the chance of A will be to that of B as 663991 to 10156525, or nearly as 2 to 3.

A and B are engaged at single quoits; and, after playing some time, A wants 4 of being up, and B 6; but B is so much the better gamester, that his chance against A upon a single throw would be as 3 to 2; What is the ratio of their chances? Since A wants 4, and B 6, the game will be ended at nine throws; therefore, raise $a+b$ to the ninth power, and it will be $a^9 + 9a^8b + 36a^7bb + 84a^6b^3 + 126a^5b^4 + 126a^4b^5$, to $84a^3b^6 + 36aab^7 + 6ab^8 + b^9$: call a 3, and b 2, and

Gaming

you will have the ratio of chances in numbers, viz. 1759077 to 194048.

A and B play at ſingle quoits, and A is the beſt gameſter, ſo that he can give B 2 in 3: What is the ratio of their chances at a ſingle throw? Suppoſe the chances as z to 1, and raiſe $z+1$ to its cube, which will be z^3+3z^2+3z+1. Now ſince A could give B 2 out of 3, A might undertake to win three throws running; and conſequently the chances in this caſe will be as z^3 to $3z^2+3z+1$. Hence $z^3=3z^2+3z+1$; or $2z^3=z^3+3z^2-3z+1$. And therefore $z\sqrt[1]{2}=z+1$; and, conſequently, $z=\frac{1}{\sqrt[1]{2}-1}$. The chances, therefore, are $\frac{1}{\sqrt[1]{2}-1}$, and 1, reſpectively.

Again, ſuppoſe I have two wagers depending, in the firſt of which I have 3 to 2 the beſt of the lay, and in the ſecond 7 to 4; What is the probability I win both wagers?

1. The probability of winning the firſt is $\frac{3}{5}$, that is the number of chances I have to win, divided by the number of all the chances: the probability of winning the ſecond is $\frac{7}{11}$: therefore, multiplying theſe two fractions together, the product will be $\frac{21}{55}$, which is the probability of winning both wagers. Now, this fraction being ſubtracted from 1, the remainder is $\frac{34}{55}$, which is the probability I do not win both wagers: therefore the odds againſt me are 34 to 21.

2. If I would know what the probability is of winning the firſt, and loſing the ſecond, I argue thus: the probability of winning the firſt is $\frac{3}{5}$, the probability of loſing the ſecond is $\frac{4}{11}$: therefore multiplying $\frac{3}{5}$ by $\frac{4}{11}$, the product $\frac{12}{55}$ will be the probability of my winning the firſt, and loſing the ſecond; which being ſubtracted from 1, there will remain $\frac{43}{55}$, which is the probability I do not win the firſt, and at the ſame time loſe the ſecond.

3. If I would know what the probability is of winning the ſecond, and at the ſame time loſing the firſt, I ſay thus: The probability of winning the ſecond is $\frac{7}{11}$; the probability of loſing the firſt is $\frac{2}{5}$: therefore, multiplying theſe two fractions together, the product $\frac{14}{55}$ is the probability I win the ſecond, and alſo loſe the firſt.

4. If I would know what the probability is of loſing both wagers, I ſay, the probability of loſing the firſt is $\frac{2}{5}$, and the probability of loſing the ſecond $\frac{4}{11}$: therefore the probability of loſing them both is $\frac{8}{55}$: which, being ſubtracted from 1, there remains $\frac{47}{55}$: therefore, the odds of loſing both wagers is 47 to 8.

This way of reaſoning is applicable to the happening or failing of any events that may fall under conſideration. Thus if I would know what the probability is of miſſing an ace four times together with a die, this I conſider as the failing of four different events. Now the probability of miſſing the firſt is $\frac{5}{6}$, the ſecond is alſo $\frac{5}{6}$, the third $\frac{5}{6}$, and the fourth $\frac{5}{6}$; therefore the probability of miſſing it four times together is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{625}{1296}$; which being ſubtracted from 1, there will remain $\frac{671}{1296}$ for the probability of throwing it once or oftener in four times: therefore the odds of throwing an ace in four times, is 671 to 625.

But if the flinging of an ace was undertaken in three times, the probability of miſſing it three times would be $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{216}$; which being ſubtracted from 1, there will remain $\frac{91}{216}$ for the probability of throwing it once or oftener in three times: therefore the odds againſt throwing it in three times are 125 to 91. Again, ſuppoſe we would know the probability of throwing an ace once in four times, and no more: ſince the probability of throwing it the firſt time is $\frac{1}{6}$, and of miſſing it the other three times, is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}$, it follows, that the probability of throwing it the firſt time, and miſſing it the other three ſucceſſive times, is $\frac{1}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{1296}$; but becauſe it is poſſible to hit every throw as well as the firſt, it follows, that the probability of throwing it once in four throws, and miſſing it the other three, is $\frac{4\times125}{1296}=\frac{500}{1296}$; which being ſubtracted from 1, there will remain $\frac{796}{1296}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 500 to 796 the worſt of the lay, or 5 to 8 very near.

Gaming.

Suppoſe two events are ſuch, that one of them has twice as many chances to come up as the other; what is the probability, that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the caſe of flinging 7 with two dice before 4 once? Since the number of chances is as 2 to 1, the probability of the firſt happening before the ſecond is $\frac{2}{3}$, but the probability of its happening twice before it is but $\frac{2}{3}\times\frac{2}{3}$ or $\frac{4}{9}$: therefore it is 5 to 4 ſeven does not come up twice before four once.

But, if it were demanded, what muſt be the proportion of the facilities of the coming up of two events, to make that which has the moſt chances come up twice, before the other comes up once? The anſwer is, 12 to 5 very nearly: whence it follows, that the probability of throwing the firſt before the ſecond is $\frac{12}{17}$, and the probability of throwing it twice is $\frac{12}{17}\times\frac{12}{17}$, or $\frac{144}{289}$; therefore the probability of not doing it is $\frac{145}{289}$: therefore the odds againſt it are as 145 to 144, which comes very near an equality.

Suppoſe there is a heap of thirteen cards of one colour, and another heap of thirteen cards of another colour; What is the probability, that, taking one card at a venture out of each heap, I ſhall take out the two aces?

The probability of taking the ace out of the firſt heap is $\frac{1}{13}$, the probability of taking the ace out of the ſecond heap is $\frac{1}{13}$; therefore the probability of taking out both aces is $\frac{1}{13}\times\frac{1}{13}=\frac{1}{169}$, which being ſubtracted from 1, there will remain $\frac{168}{169}$: therefore the odds againſt me are 168 to 1.

In caſes where the events depend on one another, the manner of arguing is ſomewhat altered. Thus, ſuppoſe that out of one ſingle heap of thirteen cards of one colour I ſhould undertake to take out firſt the ace; and, ſecondly, the two: though the probability of taking out the ace be $\frac{1}{13}$, and the probability of taking out the two be likewiſe $\frac{1}{13}$: yet, the ace being ſuppoſed as taken out already, there will remain only twelve cards in the heap, which will make the probability of taking out the two to be $\frac{1}{12}$; therefore the probability of taking out the ace, and then the two, will be $\frac{1}{13}\times\frac{1}{12}$.

In this laſt queſtion the two events have a dependence on each other; which conſiſts in this, that one of the

events

ning
ger.

events being ſuppoſed as having happened, the probability of the other's happening is thereby altered. But the caſe is not ſo in the two heaps of cards.

If the events in queſtion be n in number, and be ſuch as have the ſame number a of chances by which they may happen, and likewiſe the ſame number b of chances by which they may fail, raiſe $a+b$ to the power n. And if A and B play together, on condition that if either one or more of the events in queſtion happen, A ſhall win, and B loſe, the probability of A's winning will be $\frac{\overline{a+b}|^n - b^n}{\overline{a+b}|^n}$; and that of B's winning will be $\frac{b^n}{\overline{a+b}|^n}$; for when $a+b$ is actually raiſed to the power n, the only term in which a does not occur is the laſt b^n: therefore all the terms but the laſt are favourable to A.

Thus if $n=3$, raiſing $a+b$ to the cube $a^3+3a^2b+3ab^2+b^3$, all the terms but b^3 will be favourable to A; and therefore the probability of A's winning will be $\frac{a^3+3a^2b+3ab^2}{\overline{a+b}|^3}$, or $\frac{\overline{a+b}|^3 - b^3}{\overline{a+b}|^3}$; and the probability of B's winning will be $\frac{b^3}{\overline{a+b}|^3}$. But if A and B play on condition, that if either two or more of the events in queſtion happen, A ſhall win; but in caſe one only happen, or none, B ſhall win; the probability of A's winning will be $\frac{\overline{a+b}|^n - nab^{n-1} - b^n}{\overline{n+1}|^n}$; for the only two terms in which aa does not occur, are the two laſt, viz. nab^{n-1} and b^n.

GAMMONING, among ſeamen, denotes ſeveral turns of a rope taken round the bowſprit, and reeved through holes in knees of the head, for the greater ſecurity of the bowſprit.

GAMMUT, Gamut, *Gam-ut*, in muſic, a ſcale whereon we may learn to ſound the muſical notes, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, in their ſeveral orders and diſpoſitions. See Music.

The invention of this ſcale is owing to Guido Aretin, monk of Arezzo, in Tuſcany, about the year 1009; though it is not ſo properly an invention, as an improvement on the diagram or ſcale of the ancients. See Aretin.

Several alterations have been made in the gammut. M. le Maire, particularly, has added a ſeventh note; viz. *ſi*; and the Engliſh uſually throw out both *ut* and *ſi*, and make the other five ſerve for all.

GANDER, in ornithology, the male of the gooſe-kind; one of which, it is ſaid, will ſerve five geeſe. See Anas.

GANG-way, is the ſeveral paſſages or ways from one part of the ſhip to the other; and whatſoever is laid in any of thoſe paſſages, is ſaid to lie in the gang-way.

GAGANELLI. See Clement XIV.

GANGES, a large and celebrated river of India. It has its ſource in the mountains which border on Little Thibet, in 96 degrees of longitude, and 35. 45. of latitude. It croſſes ſeveral kingdoms, running from north to ſouth; and falls into the bay of Bengal, by ſeveral mouths. The waters are loweſt in April and May, and higheſt before the end of September. It overflows yearly like the Nile; and renders the kingdom of Bengal as fruitful as that of the Delta in Egypt. The people in theſe parts hold the water of this river in high veneration; and it is viſited annually by a prodigious number of pilgrims from all parts of India. The Engliſh have ſeveral ſettlements on this river, which will be taken notice of in their proper places. The greateſt happineſs that many of the Indians wiſh for, is to die in this river.

Ganglion
Gaol.

GANGLION, in anatomy, denotes a knot frequently found in the courſe of the nerves, and which is not morbid; for wherever any nerve ſends out a branch, or receives one from another, or where two nerves join together, there is generally a ganglion or plexus, as may be ſeen at the beginning of all the nerves of the medulla ſpinalis, and in many other places of the body.

Ganglion, in ſurgery, a hard tubercle, generally moveable, in the external or internal part of the carpus, upon the tendons or ligaments in that part; uſually without any pain to the patient.

GANGRENE, a very great and dangerous degree of inflammation, wherein the parts affected begin to corrupt, and put on a ſtate of putrefaction. See Medicine, and Surgery.

GANNET, or *Soland Gooſe*, in ornithology. See Pelicanus.

GANTLET, or Gauntlet, a large kind of glove made of iron, and the fingers covered with ſmall plates. It was formerly worn by the cavaliers, when armed at all points. The word is derived of the French *gantelet*; and that from *gand* or *gant*, "glove."

The caſque and gauntlets were always borne in the ancient marches in ceremony. Gauntlets were not introduced till about the 13th century.

The gauntlet was frequently thrown like the glove, by way of challenge.

GANTLOPE. See Gauntlope.

GANYMEDE, in mythology, a beautiful youth of Phrygia, ſon of Tros and brother to Ilus; according to Lucian, he was the ſon of Dardanus. Jupiter was charmed with him; and carrying him away, made him his cup-bearer in the room of Hebe. Some ſay that he cauſed him to be carried away by an eagle, and others affirm he was himſelf the raviſher under the form of that bird. He deified this youth; and to comfort his father, made a preſent to him of ſome of thoſe very ſwift horſes that the gods rode upon.

GAOL (*Gaola*, Fr. *Geole*, i. e. *Caveola*, "a cage for birds"), is uſed metaphorically for a priſon. It is a ſtrong place or houſe for keeping of debtors, &c. and wherein a man is reſtrained of his liberty to anſwer an offence done againſt the laws: and every county hath two gaols, one for debtors, which may be any houſe where the ſheriff pleaſes; the other for the peace and matters of the crown, which is the county gaol.

If a gaol be out of repair, or inſufficient, &c. juſtices of peace, in their quarter ſeſſions, may contract with workmen for the rebuilding or repairing it; and by their warrant order the ſum agreed on for that purpoſe to be levied on the ſeveral hundreds, and other diviſions in the county by a juſt rate, 11 & 12 Wil. III. c. 19. See Priſon.

Gaol-Delivery. The adminiſtration of juſtice being originally in the crown, in former times our kings

in

Gaoler ‖ Garamond.

in perſon rode through the realm once in ſeven years, to judge of and determine crimes and offences; afterwards juſtices in eyre were appointed; and ſince, juſtices of aſſiſe and gaol-delivery, &c. A commiſſion of gaol-delivery, is a patent in nature of a letter from the king to certain perſons, appointing them his juſtices, or two or three of them, and authoriſing them to deliver his gaol, at ſuch a place, of the priſoners in it: for which purpoſe it commands them to meet at ſuch a place, at the time they themſelves ſhall appoint; and informs them, that, for the ſame purpoſe, the king hath commanded his ſheriff of the ſame county to bring all the priſoners of the gaol, and their attachments, before them at the day appointed.

The juſtices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, treſpaſs, &c. and to order to execution or reprieve: they may likewiſe diſcharge ſuch priſoners, as on their trials are acquitted, and thoſe againſt whom, on proclamation being made, no evidence has appeared: they have authority to try offenders for treaſon, and to puniſh many particular offences, by ſtatute 2 *Hawk.* 24. 2 *Hale's hiſt. Placit. Cor.* 35.

GAOLER, the keeper of a gaol or priſon. Sheriffs are to make ſuch gaolers for whom they will be anſwerable: but if there be any default in the gaoler, an action lies againſt him for an eſcape, &c. yet the ſheriff is moſt uſually charged; 2 Inſt. 592. Where a gaoler kills a priſoner by hard uſuage, it is felony; 3 Inſt. 52. No fee ſhall be taken by gaolers, but what is allowed by law, and ſettled by the judges, who may determine petitions againſt their extortions, &c. 2. Geo. II. c. 22.

GAONS, a certain order of Jewiſh doctors, who appeared in the Eaſt, after the cloſing of the talmud. The word *Gaons* ſignifies "excellent, ſublime;" as in the divinity-ſchools we formerly had Irreſragable, Sublime, Reſolute, Angelic, and Subtile doctors. The Gaons ſucceeded the Seburæans or Opiners, about the beginning of the ſixth century. Chanan Meiſchtia was the head, and firſt of the excellents. He reſtored the academy of Pandebita, which had been ſhut up for 30 years.

GAR-FISH, *Horn-fiſh*, or *Sea-needle*. See Esox.

GARAMA (anc. geog.), the capital of the Garamantes in Libya Interior; near the ſprings of the Cinyphus, now in ruins. Garamantes the people. It lay to the ſouth of the Gætulia, extending from the ſprings of the Cinyphus, and the adjacency of the river Gir, to the mountains which form at the *Vallis Garamantica* (Pliny); or from the ſprings of the Bagrades to the lake Nuba (Ptolemy).

GARAMOND (Claude), a very ingenious letter-founder, was born at Paris; where he began, in the year 1510, to found his printing types free from all the remains of the Gothic, or (as it is generally called) the *black letter*, and brought them to ſuch perfection, that he had the glory of ſurpaſſing all who went before him, and of being ſcarcely ever excelled by his ſucceſſors in that uſeful art. His types were prodigiouſly multiplied; both by the great number of matrices he ſtruck, and the types formed in reſemblance of his in all parts of Europe. Thus in Italy, Germany, England, and Holland, the bookſellers, by way of recommending their books, diſtinguiſhed the type by his name; and in particular the ſmall Roman was by way of excellence known among the printers of theſe nations by the name of *Garamond's ſmall Roman.* By the ſpecial command of king Francis I. he founded three ſizes of Greek types for the uſe of Robert Stephens, who with them printed all his beautiful editions of the New Teſtament, and other Greek authors. He died at Paris in 1561.

Ga
Garc

GARASSE (Francis), a remarkable jeſuitical writer, the firſt author of that irreconcilable enmity that ſtill ſubſiſts between the Jeſuits and Janſeniſts in the church of Rome, was born at Angouleſme in 1585: and entered the Jeſuits college in 1600. As he had a quick imagination, a ſtrong voice, and a peculiar turn to wit, he became a popular preacher in the chief cities of France; but not content with this honour, he diſtinguiſhed himſelf ſtill more by his writings, which were bold, licentious, and produced much controverſy. The moſt conſiderable in its conſequences was intitled *La ſomme theologique des veritez capitales de la religion Cretienne;* which was firſt attacked by the abbot of St Cyran, who obſerving in it a prodigious number of falſifications of the ſcriptures and of the fathers, beſides many heretical and impious opinions, conceived the honour of the church required him to undertake a refutation. Accordingly he publiſhed a full anſwer to it; while Garaſſe's book was alſo under examination of the doctors of the Sorbonne, by whom it was afterwards condemned. Garaſſe replied to St Cyran; but the two parties of Jeſuits and Janſeniſts, of whom theſe were reſpectively the champions, grew to an implacable animoſity againſt each other, that is not even now likely to ſubſide. The Jeſuits were forced to remove their brother to a diſtance from Paris; where, probably weary of his inactive obſcurity, when the plague raged at Poictiers in 1631, he begged leave of his ſuperior to attend the ſick, in which charitable office he caught the diſorder, and died.

GARBE, in heraldry, a ſheaf of any kind of grain, borne in ſeveral coats of arms, and ſaid to repreſent ſummer, as a bunch of grapes does autumn.

GARBLE, a word uſed to ſignify the action of ſeparating the droſs and duſt from ſpice, drugs, &c. *Garbling* is the cleanſing and purifying the good from the bad; and may come from the Italian *garbo*, i. e. finery or neatneſs: and hence, probably, we ſay, when we ſee a man in a neat habit, that he is in handſome *garb*.

GARCILASSO (de la Vega), a celebrated Spaniſh poet, born of a noble family at Toledo in 1500. He was educated near the emperor Charles V. who had a particular regard for him, and whom he attended in all his military expeditions; acquiring as much renown by his courage as by his poetry. In Provence he commanded a battalion; and was killed in the 36th year of his age, by a ſtone thrown at his head by a country man from a turret. He had ſtrong natural talents for poetry; and not only extended the bounds, but introduced new beauties, into that of the Spaniſh language. —We muſt not confound this poet with another perſon of the ſame name, a native of Cuſco, who wrote in Spaniſh a Hiſtory of Florida, and of Peru and the Incas.

GARCINIA, in botany: A genus of the monogynia order, belonging to the dodecandria claſs of plants;

Garcinia.

Plate CCVI.

A Bell Pin Wal Sculptor fecit.

plants; and in the natural method ranking under the 18th order, *Bicornes*. The calyx is tetraphyllous inferior; there are four petals; the berry is octoſpermous; and crowned with a ſhield-like ſtigma. There is but one ſpecies, the mangoſtana, a tree of great elegance, and producing the moſt pleaſant fruit of any yet known. See Plate CCVI.

This tree has been very accurately deſcribed by Dr Garcin *, in the 35th volume of the Philoſophical Tranſactions. It grows, he informs us, to about 17 or 18 feet high, "with a ſtraight taper ſtem like a fir," having a regular tuft in form of an oblong cone, compoſed of many branches and twigs, ſpreading out equally on all ſides, without leaving any hollow. Its leaves, he obſerves, are oblong, pointed at both ends, entire, ſmooth, of a ſhining green on the upper ſide, and of an olive on the back. Its flower is compoſed of four petals, almoſt round, or a little pointed: their colour reſembles that of a roſe, only deeper and leſs lively. The calyx of this flower is of one piece, expanded, and cut into four lobes. The two upper lobes are ſomething larger than the lower ones; they are greeniſh on the outſide, and of a fine deep red within: the red of the upper ones is more lively than that of the lower ones. This calyx incloſes all the parts of the flower; it is ſupported by a pedicle, which is green, and conſtantly comes out of the end of a twig above the laſt pair of leaves. The fruit is round, of the ſize of a ſmall orange, from an inch and an half to two inches diameter. The body of this fruit is a capſula of one cavity, compoſed of a thick rind a little like that of a pomegranate, but ſofter, thicker, and fuller of juice. Its thickneſs is commonly of a quarter of an inch. Its outer colour is of a dark brown purple, mixed with a little grey and dark green. The inſide of the peel is of a roſe colour, and its juice is purple. Laſt of all, this ſkin is of a ſtyptic or aſtringent taſte, like that of a pomegranate, nor does it ſtick to the fruit it contains. The inſide of this fruit is a furrowed globe, divided into ſegments, much like thoſe of an orange, but unequal in ſize, which do not adhere to each other. The number of theſe ſegments is always equal to that of the rays of the top which covers the fruit. The fewer there are of theſe ſegments, the bigger they are. There are often in the ſame fruit ſegments as big again as any of thoſe that are on the ſide of them. Theſe ſegments are white, a little tranſparent, fleſhy, membranous, full of juice like cherries or raſberries; of a taſte of ſtrawberries and grapes together. Each of the ſegments incloſes a ſeed of the figure and ſize of an almond ſtripped of its ſhell, having a protuberance on one of its ſides. Theſe ſeeds are covered with two ſmall ſkins, the outermoſt of which ſerves for a baſis to the filaments and membranes of which the pulp is compoſed. The ſubſtance of theſe ſeeds comes very near to that of cheſnuts, as to their conſiſtency, colour, and aſtringent quality.

"This tree (according to our author) originally grows in the Molucca iſlands, where it is called *mangoſtan;* but has been tranſplanted from thence to the iſland of Java and Malaca, at which laſt place it thrives very well. Its tuft is ſo fine, ſo regular, ſo equal, and the appearance of its leaves ſo beautiful, that it is at preſent looked upon at Batavia as the moſt proper for adorning a garden, and affording an agreeable ſhade. There are few ſeeds, however (he obſerves), to be met with in this fruit that are good for planting, moſt part of them being abortive."—He concludes his deſcription by mentioning, that one may eat a great deal of this fruit without any inconvenience; and that it is the only one which ſick people may be allowed to eat without any ſcruple. Garcinia || Garden.

Other writers concur in their praiſes of this fruit. Rumphius obſerves, that the mangoſtan is univerſally acknowledged to be the beſt and wholſomeſt fruit that grows in India; that its fleſh is juicy, white, almoſt tranſparent, and of as delicate and agreeable a flavour as the richeſt grapes: the taſte and ſmell being ſo grateful, that it is ſcarce poſſible to be cloyed with eating it.—He adds, that when ſick people have no reliſh for any other food, they generally eat this with great delight; but ſhould they refuſe it, their recovery is no longer expected. "It is remarkable (ſays he) that the mangoſtan is given with ſafety in almoſt every diſorder. The dried bark is uſed with ſucceſs in the dyſentery and teneſmus; and an infuſion of it is eſteemed a good gargle for a ſore mouth or ulcers in the throat. The Chineſe dyers uſe this bark for the ground or baſis of a black colour, in order to fix it the firmer."

According to Captain Cook, in his Voyage round the World, vol. iii. p. 737, the garcinia mangoſtana of Linnæus is peculiar to the Eaſt Indies. It is about the ſize of the crab-apple, and of a deep red wine colour. On the top of it is the figure of five or ſix ſmall triangles joined in a circle; and at the bottom ſeveral hollow green leaves, which are remains of the bloſſom. When they are to be eaten, the ſkin, or rather fleſh, muſt be taken off; under which are found ſix or ſeven white kernels, placed in a circular order; and the pulp with which theſe are inveloped is the fruit, than which nothing can be more delicious. It is a happy mixture of the tart and the ſweet, which is no leſs wholeſome than pleaſant; and, as well as the ſweet orange, is allowed in any quantity to thoſe who are afflicted with fevers either of the putrid or inflammatory kind.

GARCON, or GARSOON, a French term, literally ſignifying a boy or male child any time before his marriage.—It is alſo applied to divers inferior officers, among us called *grooms, garçiones*. Thus all the ſervants in the French king's chambers, wardrobe, &c. who do the leſſer offices thereof under the proper officers, are called *garçons de la chambre, de la garderobe*, &c.

GARDANT, or GUARDANT, in heraldry, denotes any beaſt full-faced, and looking right forward.

GARDEN, a piece of ground properly laid out, cultivated, and ornamented with a variety of plants, flowers, fruits, &c. See GARDENING.

Gardens are uſually diſtinguiſhed into flower-garden, fruit-garden, and kitchen-garden: the firſt of which, being deſigned for pleaſure and ornament, is to be placed in the moſt conſpicuous part, that is, next to the back-front of the houſe; and the two latter, being deſigned for uſe, ſhould be placed leſs in ſight. But though the fruit and kitchen gardens are here mentioned as two diſtinct gardens, yet they are now uſually in one; and that with good reaſon, ſince they both require a good ſoil and expoſure, and equally require to be placed out of the view of the houſe. See *KITCHEN-Garden.*

In the choice of a place proper for a garden, the moſt

Garden. most essential points to be considered are, the situation, the soil, the exposure, water, and prospect.

1st, As to the situation, it ought to be such a one as is wholesome, and in a place neither too high nor too low; for if a garden be too high, it will be exposed to the winds, which are very prejudicial to trees; and if it be too low, the dampness, the vermin, and the venomous creatures that breed in ponds and marshy places, add much to their insalubrity. The most happy situation is on the side of a hill, especially if the slope be easy, and in a manner imperceptible; if a good deal of level ground be near the house; and if it abounds with springs of water: for, being sheltered from the fury of the winds, and the violent heat of the sun, a temperate air will be there enjoyed; and the water that descends from the top of the hill, either from springs or rain, will not only supply fountains, canals, and cascades for ornament, but, when it has performed its office, will water the adjacent valleys, and, if it be not suffered to stagnate, will render them fertile and wholesome.

2dly, A good earth or soil is next to be considered; for it is scarce possible to make a fine garden in a bad soil. There are indeed ways to meliorate ground, but they are very expensive; and sometimes, when the expence has been bestowed of laying good earth three feet deep over the whole surface, a whole garden has been ruined, when the roots of the trees have come to reach the natural bottom. To judge of the quality of the soil, observe whether there be any heath, thistles, or such like weeds, growing spontaneously in it; for they are certain signs that the ground is poor. Or if there be large trees growing thereabouts, observe whether they grow crooked, ill-shaped, and grubby; and whether they are of a faded green, and full of moss, or infested with vermin: if this be the case, the place is to be rejected. But, on the contrary, if it be covered with good grass fit for pasture, you may then be encouraged to try the depth of the soil. To know this, dig holes in several places, six feet wide and four deep; and if you find three feet of good earth it will do very well, but less than two will not be sufficient. The quality of good ground is, neither to be stony nor too hard to work; neither too dry, too moist, nor too sandy and light; nor too strong and clayey, which is the worst of all for gardens.

3dly, The next requisite is water; the want of which is one of the greatest inconveniences that can attend a garden, and will bring a certain mortality upon whatever is planted in it, especially in the greater droughts that often happen in a hot and dry situation in summer; besides its usefulness in fine gardens for making fountains, canals, cascades, &c. which are the greatest ornaments of a garden.

4thly, The last thing to be considered is the prospect of a fine country; and though this is not so absolutely necessary as water, yet it is one of the most agreeable beauties of a fine garden: besides, if a garden be planted in a low place that has no kind of prospect, it will not only be disagreeable, but unwholesome.

In the laying out and planting of gardens, the beauties of nature should always be studied; for the nearer a garden approaches to nature, the longer it will please. According to Mr Miller, the area of a handsome garden may take up 30 or 40 acres, but not more; and the following rules should be observed in the disposition of it. There ought always to be a descent of at least three steps from the house to the garden; this will render the house more dry and wholesome, and the prospect on entering the garden more extensive. The first thing that ought to present itself to view should be an open lawn of grass, which ought to be considerably broader than the front of the building; and if the depth be one-half more than the width, it will have a better effect: if on the sides of the lawn there are trees planted irregularly, by way of open groves, the regularity of the lawn will be broken, and the whole rendered more like nature. For the convenience of walking in damp weather, this lawn should be surrounded with a gravel-walk, on the outside of which should be borders three or four feet wide for flowers: and from the back of these the prospect will be agreeably terminated by a slope of ever-green shrubs; which, however, should never be suffered to exclude agreeable prospects, or the view of handsome buildings. These walks may lead through the different plantations, gently winding about in an easy natural manner; which will be more agreeable than either those long straight walks, too frequently seen in gardens, or those serpentine windings that are twisted about into so many short turns as to render it difficult to walk in them; and as no garden can be pleasing where there is a want of shade and shelter, these walks should lead as soon as possible into plantations, where persons may walk in private, and be sheltered from the wind.

Narrow rivulets, if they have a constant stream, and are judiciously led about a garden, have a better effect than many of the large stagnating ponds or canals so frequently made in large gardens. When wildernesses are intended, they should not be cut into stars and other ridiculous figures, nor formed into mazes or labyrinths, which in a great design appear trifling.

In short, the several parts of a garden should be diversified; but in places where the eye takes in the whole at once, the two sides should be always the same. In the business of designs, the aim should be always at what is natural, great, and noble. The general disposition of a garden and of its parts ought to be accommodated to the different situations of the ground, to humour its inequalities, to proportion the number and sorts of trees and shrubs to each part, and to shut out from the view of the garden no objects that may become ornamental. But for a more extended view of this subject, see the article GARDENING.

A practical attention to a garden, is by some esteemed a degrading employment. It is true, indeed, that pastoral and agricultural manners, if we may form a judgment from the dignified descriptions of Virgil, are greatly degenerated. The employments of shepherds and husbandmen are now become mean and sordid. The work of the garden is usually left to a peasant. Nor is it unreasonable to assign the labour, which wearies without amusement, to those who are sufficiently amused by the prospect of their wages. But the operations of grafting, of inoculating, of pruning, of transplanting, are curious experiments in natural philosophy; and that they are pleasing as well as curious, those can testify who remember what they felt on seeing their attempts in the amusement of practical gardening attended with success. Among the

Garden employments suitable to old age, Cicero has enumerated the superintendence of a garden. It requires no great exertion of mind or body; and its satisfactions are of that kind which please without violent agitation. Its beneficial influence on health is an additional reason for an attention to it at an age when infirmities abound.

In almost every description of the seats of the blessed, ideas of a garden seem to have predominated. The word Paradise itself is synonymous with garden. The fields of Elysium, that sweet region of poesy, are adorned with all that imagination can conceive to be delightful. Some of the most pleasing passages of Milton, are those in which he represents the happy pair engaged in cultivating their blissful abode. Poets have always been delighted with the beauties of a garden. Lucan is represented by Juvenal as reposing in his garden. Virgil's Georgics prove him to have been captivated with rural scenes; though, to the surprise of his readers, he has not assigned a book to the subject of a garden. Our Shenstone made it his study; but, with all his taste and fondness for it, he was not happy in it. The captivating scenes which he created at the Leasowes, afforded him, it is said, little pleasure in the absence of spectators. The truth is, he made the embellishment of his grounds, which should have been the amusement of his life, the business of it; and involved himself in such troubles, by the expences it occasioned, as necessarily excluded tranquil enjoyment.

It is the lot of few, in comparison, to possess territories like his, extensive, and sufficiently well adapted to constitute an ornamented farm. Still fewer are capable of supporting the expence of preserving it in good condition. But let not the rich suppose they have appropriated the pleasures of a garden. The possessor of an acre, or a smaller portion, may receive a real pleasure, from observing the progress of vegetation, even in a plantation of culinary plants. A very limited tract, properly attended to, will furnish ample employment for an individual. Nor let it be thought a mean care; for the same hand that raised the cedar, formed the hyssop on the wall. Even the orchard, cultivated solely for advantage, exhibits beauties unequalled in the shrubbery; nor can the green-house produce an appearance to exceed the blossom of the apple and the almond.

Hanging Gardens, in antiquity, gardens raised on arches by Nebuchadnezzar king of Babylon, in order to gratify his wife Amyctis, daughter of Astyages king of Media. Q. Curtius makes them equal in height to the walls of the city, viz. 50 feet. They contained a square of 400 feet on every side, and were carried up into the air in several terraces laid above one another, and the ascent from terrace to terrace was by stairs 10 feet wide. The arches sustaining the whole pile were raised above one another, and it was strengthened by a wall, surrounding it on every side, of 22 feet in thickness. The floors of each of the terraces were laid in the following manner: on the top of the arches were first laid large flat stones 16 feet long and 4 broad, and over them was a layer of reed mixed with a great quantity of bitumen, over which were two rows of bricks closely cemented together by plaster, and over all were laid thick sheets of lead; and lastly, upon the lead was laid the mould of the garden. The mould or earth was of such a depth as to admit the largest trees to take root and grow; and it was covered with various kinds of trees, plants, and flowers. In the upper terrace there was an aqueduct or engine, whereby water was drawn up out of the river for watering the whole garden. Garden.

Floating Gardens. We are informed by the abbé Clavigero in his History of Mexico, that when the Mexicans were brought under subjection to the Colhuan and Tepanecan nations, and confined to the miserable little islands on the lake of Mexico, they ceased for some years to cultivate the land, because they had none, until necessity and industry together taught them to form moveable fields and gardens, which floated on the waters of the lake. The method which they pursued to make those, and which they still practise, is extremely simple. They plait and twist willows and roots of marsh plants or other materials together, which are light, but capable of supporting the earth of the garden firmly united. Upon this foundation they lay the light bushes which float on the lake; and over all, the mud and dirt which they draw up from the bottom of the same lake. Their regular figure is quadrangular; their length and breadth various; but generally they are about eight perches long, and not more than three in breadth, and have less than a foot of elevation above the surface of the water. These were the first fields which the Mexicans owned after the foundation of Mexico; there they first cultivated the maize, great pepper, and other plants necessary for their support. In progress of time, as those fields grew numerous from the industry of the people, there were among them gardens of flowers and odoriferous plants, which were employed in the worship of their gods, and served for the recreation of the nobles. At present they cultivate flowers and every sort of garden herbs upon them. Every day of the year, at sun-rise, innumerable vessels loaded with various kinds of flowers and herbs, which are cultivated in those gardens, are seen arriving by the canal, at the great market-place of that capital. All plants thrive there surprisingly; the mud of the lake is an extremely fertile soil, and requires no water from the clouds. In the largest gardens there is commonly a little tree, and even a little hut to shelter the cultivator and defend him from rain or the sun. When the owner of a garden, or the *Chinampa* as he is usually called, wishes to change his situation, to remove from a disagreeable neighbour, or to come nearer to his own family, he gets into his little vessel, and by his own strength alone if the garden is small, or with the assistance of others if it is large, he tows it after him, and conducts it wherever he pleases with the little tree and hut upon it. That part of the lake where those floating gardens are, is a place of infinite recreation, where the senses receive the highest possible gratification.

GARDENING;

THE art of planning and cultivating gardens. In its utmoſt extent, whatever contributes to render the ſcenes of nature delightful, is amongſt the ſubjects of gardening; and animate as well as inanimate objects are circumſtances of beauty or character. The whole range of nature is open to the gardener, from the parterre to the foreſt; and whatever is agreeable to the ſenſes or the imagination, he may appropriate to the ſpot he is to improve: it is a part of his buſineſs to collect into one place the delights which are generally diſperſed through different ſpecies of country.

Hiſtory of Gardening.

Hiſt. of Mod. Gardening, ſubjoined to the 4th vol. of his *Anecdotes of Painting.*

GARDENING, Mr Walpole * obſerves, was probably one of the firſt arts that ſucceeded to that of building houſes, and naturally attended property and individual poſſeſſion. Culinary, and afterwards medicinal herbs, were the objects of every head of a family: it became convenient to have them within reach, without ſeeking them at random in woods, in meadows, and on mountains, as often as they were wanted. When the earth ceaſed to furniſh ſpontaneouſly all thoſe primitive luxuries, and culture became requiſite, ſeparate incloſures for rearing herbs grew expedient. Fruits were in the ſame predicament; and thoſe moſt in uſe or that demand attention muſt have entered into and extended the domeſtic incloſure. The good man Noah, we are told, planted a vineyard, drank of the wine, and was drunken; and every body knows the conſequences. Thus we acquired kitchen-gardens, orchards, and vineyards. No doubt the prototype of all theſe ſorts was the garden of Eden; but as that Paradiſe was a good deal larger than any we read of afterwards, being incloſed by the rivers Piſon, Gihon, Hiddekel, and Euphrates; as every tree that was pleaſant to the ſight and good for food grew in it; and as two other trees were likewiſe found there, of which not a ſlip or ſucker remains; it does not belong to the preſent diſcuſſion. After the Fall, no man living was ſuffered to enter into the garden; and the poverty and neceſſities of our firſt anceſtors hardly allowed them time to make improvements in their eſtates in imitation of it, ſuppoſing any plan had been preſerved. A cottage and a ſlip of ground for a cabbage and a gooſeberry-buſh, ſuch as we ſee by the ſide of a common, were in all probability the earlieſt ſeats and gardens: a well and bucket ſucceeded to the Piſon and Euphrates. As ſettlements increaſed, the orchard and the vineyard followed; and the earlieſt princes of tribes poſſeſſed juſt the neceſſaries of a modern farmer.

Matters, we may well believe, remained long in this ſituation; and we have reaſon to think that for many centuries the term *garden* implied no more than a kitchen-garden or orchard.

The garden of Alcinous, in the Odyſſey, is the moſt renowned in the heroic times. Is there an admirer of Homer who can read his deſcription without rapture? or who does not form to his imagination a ſcene of delights more pictureſque than the landſcapes of Tinian or Juan Fernandez? "Yet (continues our author) what was that boaſted Paradiſe with which

> the gods ordain'd
> To grace Alcinous and his happy land?

Why, diveſted of harmonious Greek and bewitching poetry, it was a ſmall orchard and vineyard, with ſome beds of herbs and two fountains that watered them, incloſed within a quick-ſet hedge. The whole compaſs of this pompous garden incloſed—four acres:

> Four acres was th'allotted ſpace of ground,
> Fenc'd with a green incloſure all around.

The trees were apples, figs, pomegranates, pears, olives, and vines.

> Tall thriving trees confeſs'd the fruitful mold;
> The red'ning apple ripens into gold.
> Here the blue fig with luſcious juice o'erflows,
> With deeper red the full pomegranate glows.
> The branch here bends beneath the weighty pear,
> And verdant olives flouriſh round the year.
> * * * * *
> Beds of all various herbs, for ever green,
> In beauteous order terminate the ſcene.

Alcinous's garden was planted by the poet, enriched by him with the fairy gift of eternal ſummer, and no doubt an effort of imagination ſurpaſſing any thing he had ever ſeen. As he has beſtowed on the ſame happy prince a palace with brazen walls and columns of ſilver, he certainly intended that the gardens ſhould be proportionably magnificent. We are ſure, therefore, that, as late as Homer's age, an incloſure of four acres, comprehending orchard, vineyard, and kitchen-garden, was a ſtretch of luxury the world at that time had never beheld."

Previous to this, however, we have in the ſacred writings hints of a garden ſtill more luxuriouſly furniſhed. We allude to the Song of Solomon, part of the ſcene of which is undoubtedly laid in a garden †. Flowers and fruits are particularly ſpoken of as the ornaments and the produce of it; and beſides theſe, aromatic vegetables formed a conſiderable part of the gratifications it afforded. The camphor and the cinnamon tree, with all trees of frankincenſe, and all the chief ſpices, flouriſhed there ‡. Solomon tells us in another place ‖, That he made him great works;—gardens and orchards, and planted in them trees of every kind. Indeed we muſt ſuppoſe his gardens to have been both amply and curiouſly furniſhed, ſeeing the kinds, nature, and properties of the vegetable tribes, ſeem to have been a favourite ſtudy with the royal philoſopher, and to have been deemed a ſubject worthy of his pen: for we are told, that he wrote of plants, from the great cedar of Lebanon down to the hyſſop of the wall §. Fountains and ſtreams of water appear alſo to have had a ſhare in the compoſition, and probably for ornament as well as uſe.

† Chap. ii. 1.

‡ Cant. iv. 12.

‖ Eccl ii. 5.

§ Kings i. 33.

The hanging gardens of Babylon, mentioned in a preceding article, were a ſtill greater prodigy. But as they are ſuppoſed to have been formed on terraces and the walls of the palace, whither ſoil was conveyed on purpoſe, Mr Walpole concludes, "they were what ſumptuous

tuous gardens have been in all ages till the preſent, unnatural, enriched by art, poſſibly with fountains, ſtatues, balluſtrades, and ſummer-houſes, and were any thing but verdant and rural."

Others, however, have allowed them greater praiſe. They ſeem, in many reſpects, to have been laid out with good taſte. Their elevation not only produced a variety and extent of view, but was alſo uſeful in moderating the heat. Such a ſituation would likewiſe ſuit a greater variety of trees and plants than a plain ſurface, and would contain a larger as well as a more diverſified extent.

The ſuiting of the ſituation to the nature of the trees ſeems, from the account given by Joſephus, to have been one view * in the erecting the building in ſuch a manner. And the ſucceſs ſeems to have been anſwerable, as the trees are ſaid to have flouriſhed extremely well †, and to have grown as tall as in their native ſituations. On the whole, then, however different theſe may appear from modern gardens, they ſeem to have been formed with judgment and taſte, and well adapted to the ſituation and circumſtances.

Contra Apion, l. 1. 19

† *Q. Curt.* 5.

It ſeems probable, from ſeveral circumſtances, that the eaſtern gardens were adjoining to the houſe or palace to which they belonged. Thus, king Ahaſuerus goes immediately from the banquet of wine to walk in the garden of the palace ‡. The garden of Cyrus, at Sardis, mentioned by Xenophon ||, was probably contiguous to the palace; as was that of Attalus, mentioned by Juſtin §. The hanging gardens at Babylon, were not ſo much adjacent to the palace, as a part of the palace itſelf, ſince ſeveral of the royal apartments were beneath them ¶.

Eſther vii.

L. 36. 4.

Died. l. 2.

It is not clear what the taſte for gardening was among the Grecks. The Academus, we know, was a wooded ſhady place; and the trees appear to have been of the olive ſpecies. It was ſituated beyond the limits of the walls, and adjacent to the tombs of the heroes; and though we are nowhere informed of the particular manner in which this grove was diſpoſed or laid out, it may be gathered from Pauſanias, in his Attica, that it was an elegant ornamented place. At the entrance was an altar dedicated to Love, which was ſaid to be the firſt erected to that Deity. Within the Academus, were the altars of Promotheus, of the Muſes, of Mercury, of Minerva, and Hercules; and at a ſmall diſtance was the tomb of Plato. So that, in all probability, it was highly adapted by art, as well as nature, to philoſophic reflection and contemplation.

We are told by Plutarch, that before the time of Cimon, the Academus was a rude and uncultivated ſpot: but that it was planted by that general, and had water conveyed to it; whether this water was brought merely for uſe to refreſh the trees, or for ornament, does not appear. It was divided into gymnaſia, or places of exerciſe, and philoſophic walks, ſhaded with trees. Theſe are ſaid to have flouriſhed very well, until deſtroyed by Sylla (when he beſieged Athens), as well as thoſe in the Lyceum.

Near the academy were the gardens of the philoſophers, of Plato and of Epicurus; which, however, were probably but ſmall. The ſcene of Plato's Dialogue concerning Beauty is elegantly deſcribed as being on the banks of the river Iliſſus, and under the ſhade of the plantane; but no artificial arrangement of objects is mentioned, nor any thing which will lead us to imagine the proſpect to be any other than merely natural.

Among the Romans, a taſte for gardening, any otherwiſe than as a matter of utility, ſeems not to have prevailed till a very late period; at leaſt the writers on huſbandry, Cato, Varro, Columella, and Palladius, make not the leaſt mention of a garden as an object of pleaſure, but ſolely with reſpect to its productions of herbs and fruits. The Lucullan gardens are the firſt we find mentioned of remarkable magnificence; though probably from the extravagance to which theſe were arrived, they were not the firſt. Plutarch ſpeaks of them as incredibly expenſive, and equal to the magnificence of kings. They contained artificial elevations of ground to a ſurpriſing height, of buildings projected into the ſea, and vaſt pieces of water made upon land. In ſhort, his extravagance and expence were ſo great, that he acquired thence the appellation of the Roman Xerxes. It is not improbable, from the above account, and from the conſideration of Lucullus having ſpent much time in Aſia, in a ſituation wherein he had an opportunity of obſerving the moſt ſplendid conſtructions of this kind, that theſe gardens might be laid out in the Aſiatic ſtyle. The vaſt maſſes of building ſaid to have been erected, might have borne ſome reſemblance, in the arrangement and ſtyle, to the Babylonian gardens; and the epithet of the Roman Xerxes might be applicable to the taſte, as well as to the ſize and expence of his works.

The Tuſculan Villa of Cicero, though often mentioned, is not any where deſcribed in his works, ſo as to give an adequate idea of the ſtyle in which his gardens or grounds were diſpoſed.

There is but little to be traced in Virgil relative to this ſubject. Pines *, it ſeems probable, were a favourite ornament in gardens; and flowers †, roſes eſpecially, were much eſteemed, perfumes indeed having been always highly valued in warm climates. Virgil places Anchiſes in Elyſium, in a grove of bays; and is careful to remark, that they were of the ſweet-ſcented kind. The Pæſtan roſes were chiefly valued for their excellent odour; and the ſame quality appears to be the cauſe why they were placed by Tibullus as ornaments to the Elyſian fields. There appears alſo to have prevailed among the Romans a piece of luxury relative to gardens, which is equally prevalent at preſent among us, namely the forcing of flowers at ſeaſons of the year not ſuited to their natural blowing: and roſes were then, as at preſent, the principal flowers upon which theſe experiments were tried, as appears from Martial ‡ and others.

* *Eclog.* vii. 65, &c.

† *Geor.* iv. 118.

When Roman authors (Mr Walpole remarks), whoſe climate inſtilled a wiſh for cool retreats, ſpeak of their enjoyments in that kind, they ſigh for grottos, caves, and the refreſhing hollows of mountains, near irriguous and ſhady founts; or boaſt of their porticos, walks of planes, canals, baths, and breezes from the ſea. Their gardens are never mentioned as affording ſhade and ſhelter from the rage of the dog-ſtar. Pliny has left us deſcriptions of two of his villas. As he uſed his Laurentine villa for his winter retreat, it is not ſurpriſing that the garden makes no conſiderable part of the account. All he ſays of it is, that the geſtatio or place of exerciſe, which ſurrounded the garden (the

‡ Vide *Epigr.* l. vi. ep. 80. l. xiv. ep. 127. and *Lampridius in vit. Elegab.*

latter conſequently not being very large), was bounded by a hedge of box, and, where that was perifhed, with roſemary; that there was a walk of vines; and that moſt of the trees were fig and mulberry, the ſoil not being proper for any other ſorts. On his Tuſcan villa he is more diffuſe; the garden makes a conſiderable part of the deſcription:—and what was the principal beauty of that pleaſure-ground? Exactly what was the admiration of this country about threeſcore years ago; box-trees cut into monſters, animals, letters, and the names of the maſter and the artificer. In an age when architecture diſplayed all its grandeur, all its purity, and all its taſte; when aroſe Veſpaſian's amphitheatre, the temple of Peace, Trajan's forum, Domitian's baths, and Adrian's villa, the ruins and veſtiges of which ſtill excite our aſtoniſhment and curioſity; a Roman conſul, a poliſhed emperor's friend, and a man of elegant literature and taſte, delighted in what the mob now ſcarce admire in a college-garden. All the ingredients of Pliny's correſponded exactly with thoſe laid out by London and Wiſe on Dutch principles. He talks of ſlopes, terraces, a wilderneſs, ſhrubs methodically trimmed, a marble baſon, pipes ſpouting water, a caſcade falling into the baſon, bay-trees alternately planted with planes, and a ſtraight walk, from whence iſſued others parted off by hedges of box and apple-trees, with obeliſks placed between every two. There wants nothing but the embroidery of a parterre, to make a garden in the reign of Trajan ſerve for a deſcription of one in that of king William. In one paſſage above, Pliny ſeems to have conceived that natural irregularity might be a beauty; *in opere urbaniſſimo*, ſays he, *ſubita vidat illiati ruris imitatio*. Something like a rural view was contrived amidſt ſo much poliſhed compoſition. But the idea ſoon vaniſhed, lineal walks immediately enveloped the ſlight ſcene, and names and inſcriptions in box again ſucceeded to compenſate for the daring introduction of nature.

In the paintings found at Herculaneum are a few traces of gardens, as may be ſeen in the ſecond volume of the prints. They are ſmall ſquare incloſures, formed by trellis-work and eſpaliers, and regularly ornamented with vaſes, fountains, and careatides, elegantly ſymmetrical, and proper for the narrow ſpaces allotted to the garden of a houſe in a capital city.

From what has been ſaid, it appears how naturally and inſenſibly the idea of a kitchen-garden ſlid into that which has for ſo many ages been peculiarly termed a *garden*, and by our anceſtors in this country diſtinguiſhed by the name of a *pleaſure-garden*. A ſquare piece of ground was originally parted off in early ages for the uſe of the family:—to exclude cattle, and aſcertain the property, it was ſeparated from the fields by a hedge. As pride and deſire of privacy increaſed, the incloſure was dignified by walls; and in climes where fruits were not laviſhed by the ripening glow of nature and ſoil, fruit-trees were aſſiſted and ſheltered from ſurrounding winds by the like expedient; for the inundation of luxuries, which have ſwelled into general neceſſities, have almoſt all taken their ſource from the ſimple fountain of reaſon.

When the cuſtom of making ſquare gardens incloſed with walls was thus eſtabliſhed to the excluſion of nature and proſpect, pomp and ſolitude combined to call for ſomething that might enrich and enliven the inſipid and unanimated partition. Fountains, firſt invented for uſe, which grandeur loves to diſguiſe and throw out of the queſtion, received embelliſhments from coſtly marbles, and at laſt, to contradict utility, toſſed their waſte of waters into air in ſpouting columns. Art, in the hands of rude man, had at firſt been made a ſuccedaneum to nature; in the hands of oſtentatious wealth, it became the means of oppoſing nature; and the more it traverſed the march of the latter, the more nobility thought its power was demonſtrated. Canals meaſured by the line were introduced in lieu of meandering ſtreams, and terraces were hoiſted aloft in oppoſition to the facile ſlopes that imperceptibly unite the valley to the hill. Baluſtrades defended theſe precipitate and dangerous elevations, and flights of ſteps rejoined them to the ſubjacent flat from which the terrace had been dug. Vaſes and ſculpture were added to theſe unneceſſary balconies, and ſtatues furniſhed the liſeleſs ſpot with mimic repreſentations of the excluded ſons of men. Thus difficulty and expence were the conſtituent parts of thoſe ſumptuous and ſelfiſh ſolitudes; and every improvement that was made, was but a ſtep farther from nature. The tricks of waterworks to wet the unwary, not to refreſh the panting ſpectator, and parterres embroidered in patterns like a petticoat, were but the childiſh endeavours of faſhion and novelty to reconcile greatneſs to what it had forfeited on. To crown theſe impotent diſplays of falſe taſte, the ſheers were applied to the lovely wildneſs of form with which nature has diſtinguiſhed each various ſpecies of tree and ſhrub. The venerable oak, the romantic beech, the uſeful elm, even the aſpiring circuit of the lime, the regular round of the cheſnut, and the almoſt moulded orange tree, were corrected by ſuch fantaſtic admirers of ſymmetry. The compaſs and ſquare were of more uſe in plantations than the nurſery-man. The meaſured walk, the quincunx, and the etoile, impoſed their unſatisfying ſameneſs on every royal and noble garden. Trees were headed, and their ſides pared away; many French groves ſeem green cheſts ſet upon poles. Seats of marble, arbours, and ſummer-houſes, terminated every vida; and ſymmetry, even where the ſpace was too large to permit its being remarked at one view, was ſo eſſencial, that, as Pope obſerved,

> ——each alley has a brother,
> And half the garden juſt reflects the other.

Knots of flowers were more defenſibly ſubjected to the ſame regularity. Leiſure, as Milton expreſſed it,

> ——in trim gardens took his pleaſure

In the garden of Marſhal de Biron at Paris, conſiſting of 14 acres, every walk is buttoned on each ſide by lines of flower-pots, which ſucceed in their ſeaſons.

It does not preciſely appear what our anceſtors meant by a bower: It was probably an arbour; ſometimes it meant the whole frittered incloſure, and in one inſtance it certainly included a labyrinth. Roſamond's bower was indiſputably of that kind; though whether compoſed of walls or hedges, we cannot determine. A ſquare and a round labyrinth were ſo capital ingredients of a garden formerly, that in Du Cerceau's architecture, who lived in the time of Charles IX. and Henry III. there is ſcarce a ground-plot without one of each.

In Kip's Views of the Seats of our Nobility and Gentry, we ſee the ſame tireſome and returning uniformity.

formity. Every house is approached by two or three gardens, consisting perhaps of a gravel-walk and two grass plats or borders of flowers. Each rises above the other by two or three steps, and as many walls and terraces, and so many iron gates, that we recollect those ancient romances in which every entrance was guarded by nymphs or dragons. Yet though these and such preposterous inconveniences prevailed from age to age, good sense in this country had perceived the want of something at once more grand and more natural. These reflections, and the bounds set to the waste made by royal spoilers, gave origin to Parks. They were contracted forests, and extended gardens. Hentzner says, that, according to Rous of Warwick, the first park was that at Woodstock. If so, it might be the foundation of a legend that Henry II. secured his mistress in a labyrinth: it was no doubt more difficult to find her in a park than in a palace, where the intricacy of the woods and various lodges buried in covert might conceal her actual habitation.

It is more extraordinary that, having so long ago stumbled on the principle of modern gardening, we should have persisted in retaining its reverse, symmetrical and unnatural gardens. That parks were rare in other countries, Hentzner, who travelled over great part of Europe, leads us to suppose, by observing that they were common in England. In France they retain the name, but nothing is more different both in compass and disposition. Their parks are usually square or oblong inclosures, regularly planted with walks of chesnuts or limes, and generally every large town has one for its public recreation.

"One man, one great man we had (continues Mr Walpole), on whom nor education nor custom could impose their prejudices; who, 'on evil days though fallen, and with darkness and solitude compassed round,' judged that the mistaken and fantastic ornaments he had seen in gardens, were unworthy of the Almighty hand that planted the delights of Paradise. He seems with the prophetic eye of taste to have conceived, to have foreseen modern gardening; as Lord Bacon announced the discoveries since made by experimental philosophy. The description of Eden is a warmer and more just picture of the present style than Claud Lorrain could have painted from Hagley or Stourhead. The first lines we shall quote exhibit Stourhead on a more magnificent scale:

> Thro' Eden went a river large,
> Nor chang'd his course, but thro' the shaggy hill
> Pass'd underneath engulph'd; for God had thrown
> That mountain as his garden mound, high rais'd
> Upon the rapid current——

Hagley seems pictured in what follows:

> Which thro' veins
> Of porous earth with kindly thirst updrawn,
> Rose a fresh fountain, and with many a rill
> Water'd the garden——

What colouring, what freedom of pencil, what landscape in these lines!

> ——from that sapphire fount the crisped brooks,
> Rolling on orient pearl and sands of gold,
> With mazy error under pendent shades,
> Ran nectar, visiting each plant, and fed
> Flow'rs worthy of Paradise, which not *nice art*
> In beds and curious knots, but *nature* boon
> Pour'd forth profuse on hill and dale and plain,
> Both where the morning sun first warmly smote
> The *open field*, and where the unpierc'd shade
> Imbrown'd the noon-tide bow'rs—*Thus was this place*
> *A happy rural seat of various view.*

Read this transporting description, paint to your mind the scenes that follow, contrast them with the savage but respectable terror with which the poet guards the bounds of his paradise, fenced

> ——with the champaign head
> Of a steep wilderness, whose hairy sides
> With thicket overgrown, grotesque and wild,
> Access denied; and over head up grew
> Insuperable height of loftiest shade,
> Cedar and pine, and fir, and branching palm,
> A sylvan scene, and, as the ranks ascend,
> Shade above shade, a woody theatre,
> Of stateliest view——

and then recollect, that the author of this sublime vision had never seen a glimpse of any thing like what he has imagined; that his favourite ancients had dropped not a hint of such divine scenery; and that the conceits in Italian gardens, and Theobalds and Nonsuch, were the brightest originals that his memory could furnish. His intellectual eye saw a nobler plan, so little did he suffer by the loss of sight. It sufficed him to have seen the materials with which he could work. The vigour of a boundless imagination told him how a plan might be disposed, that would embellish nature, and restore art to its proper office, the just improvement or imitation of it.

"Now let us turn to an admired writer, posterior to Milton, and see how cold, how insipid, how tasteless is his account of what he pronounced a perfect garden. We speak not of his style, which it was not necessary for him to animate with the colouring and glow of poetry. It is his want of ideas, of imagination, of taste, that deserve censure, when he dictated on a subject which is capable of all the graces that a knowledge of beautiful nature can bestow. Sir William Temple was an excellent man; Milton, a genius of the first order.

"We cannot wonder that Sir William declares in favour of parterres, fountains, and statues, as necessary to break the sameness of large grass-plats, which he thinks have an ill effect upon the eye, when he acknowledges that he discovers fancy in the gardens of Alcinous. Milton studied the ancients with equal enthusiasm, but no bigotry; and had judgment to distinguish between the want of invention and the beauties of poetry. Compare his paradise with Homer's garden, both ascribed to a celestial design. For Sir William, it is just to observe, that his ideas centered in a fruit-garden. He had the honour of giving to his country many delicate fruits, and he thought of little else than disposing them to the best advantage.

'The best figure of a garden (says he) is either a square or an oblong, and either upon a flat or a descent: they have all their beauties, but the best I esteem an oblong upon a descent. The beauty, the air, the view, make amends for the expence, which is very great in finishing and supporting the terrace-walks, in levelling the parterres, and in the stone-stairs that are necessary from one to the other. The perfectest figure of a garden I ever saw, either at home or abroad, was that of Moor-park in Hertfordshire, when I knew it about 30 years ago. It was made by the Countess of Bedford, esteemed among the greatest wits of her time, and celebrated by Dr Donne; and with very great care, excellent contrivance, and much cost; but greater sums may be thrown away without effect or honour, if there want sense in proportion to money, or

'if nature be not followed;' which I take to be the great rule in this, and perhaps in every thing elſe, as far as the conduct not only of our lives but our governments.' [We ſhall ſee how natural that admired garden was.] 'Becauſe I take the garden I have named to have been in all kinds the moſt beautiful and perfect, at leaſt in the figure and diſpoſition, that I ever have ſeen, I will deſcribe it for a model to thoſe that meet with ſuch a ſituation, and are above the regards of common expence. It lies on the ſide of a hill, upon which the houſe ſtands, but not very ſteep. The length of the houſe, where the beſt rooms and of moſt uſe or pleaſure are, lies upon the breadth of the garden; the great parlour opens into the middle of a terrace gravel-walk that lies even with it, and which may lie, as I remember, about 300 paces long, and broad in proportion; the border ſet with ſtandard laurels and at large diſtances, which have the beauty of orange-trees out of flower and fruit. From this walk are three deſcents by many ſtone-ſteps, in the middle and at each end, into a very large parterre. This is divided into quarters by gravel-walks, and adorned with two fountains and eight ſtatues in the ſeveral quarters. At the end of the terrace-walk are two ſummer-houſes, and the ſides of the parterre are ranged with two large cloiſters open to the garden, upon arches of ſtone, and ending with two other ſummer-houſes even with the cloiſters, which are paved with ſtone, and deſigned for walks of ſhade, there being none other in the whole parterre. Over theſe two cloiſters are two terraces covered with lead and fenced with baluſters; and the paſſage into theſe airy walks is out of the two ſummer-houſes at the end of the firſt terrace-walk. The cloiſter facing the ſouth is covered with vines, and would have been proper for an orange-houſe, and the other for myrtles or other more common greens, and had, I doubt not, been caſt for that purpoſe, if this piece of gardening had been then in as much vogue as it is now. From the middle of this parterre is a deſcent by many ſteps flying on each ſide of a grotto that lies between them, covered with lead and flat, into the lower garden, which is all fruit-trees ranged about the ſeveral quarters of a wilderneſs, which is very ſhady; the walks here are all green, the grotto embelliſhed with figures of ſhell rock-work, fountains, and water-works. If the hill had not ended with the lower garden, and the wall were not bounded by a common way that goes through the park, they might have added a third quarter of all greens; but this want is ſupplied by a garden on the other ſide the houſe, which is all of that ſort, very wild, ſhady, and adorned with rough rock-work and fountains. This was Moor-park when I was acquainted with it, and the ſweeteſt place, I think, that I have ſeen in my life, either before or ſince, at home or abroad.'

"It is unneceſſary to add any remarks on this deſcription. Any man might deſign and build as ſweet a garden, who had been born in and never ſtirred out of Holborn. It was not, however, peculiar to Sir William Temple to think in that manner. How many Frenchmen are there who have ſeen our gardens, and ſtill prefer natural flights of ſteps and ſhady cloiſters covered with lead! Le Nautre, the architect of the groves and grottos at Verſailles, came hither on a miſſion to improve our taſte. He planted St James's and Greenwich Parks—no great monuments of his invention.

"To do farther juſtice to Sir William Temple, we muſt not omit what he adds. 'What I have ſaid of the beſt forms of gardens is meant only of ſuch as are in ſome ſort regular; for there may be other forms wholly irregular, that may, for aught I know, have more beauty than any of the others; but they muſt owe it to ſome extraordinary diſpoſitions of nature in the ſeat, or ſome great race of fancy or judgment in the contrivance, which may reduce many diſagreeing parts into ſome figure, which ſhall yet, upon the whole, be very agreeable. Something of this I have ſeen in ſome places, but heard more of it from others, who have lived much among the Chineſes, a people whoſe way of thinking ſeems to lie as wide of ours in Europe as their country does. Their greateſt reach of imagination is employed in contriving figures, where the beauty ſhall be great and ſtrike the eye, but without any order or diſpoſition of parts, that ſhall be commonly or eaſily obſerved. And though we have hardly any notion of this ſort of beauty, yet they have a particular word to expreſs it; and when they find it hit their eye at firſt ſight, they ſay the Sharawadgi is fine or is admirable, or any ſuch expreſſion of eſteem: but I ſhould hardly adviſe any of theſe attempts in the figure of gardens among us; they are adventures of too hard atchievement for any common hands; and though there may be more honour if they ſucceed well, yet there is more diſhonour if they fail, and it is twenty to one they will; whereas in regular figures it is hard to make any great and remarkable faults.'

"Fortunately Kent and a few others were not quite ſo timid, or we might ſtill be going up and down ſtairs in the open air. It is true, we have heard much lately, as Sir William Temple did, of irregularity and imitations of nature in the gardens or grounds of the Chineſe. The former is certainly true: they are as whimſically irregular, as European gardens are formally uniform and unvaried:—but with regard to nature, it ſeems as much avoided, as in the ſquares and oblongs and ſtraight lines of our anceſtors. An artificial perpendicular rock ſtarting out of a flat plain, and connected with nothing, often pierced through in various places with oval hollows, has no more pretenſion to be deemed natural than a lineal terrace or a parterre. The late Mr Joſeph Spence, who had both taſte and zeal for the preſent ſtyle, was ſo perſuaded of the Chineſe Emperor's pleaſure-ground being laid out on principles reſembling ours, that he tranſlated and publiſhed, under the name of Sir Harry Beaumount, a particular account of that inſcloſure from the Collection of the Letters of the Jeſuits. But except a determined irregularity, one can find nothing in it that gives any idea of attention being paid to nature. It is of vaſt circumference, and contains 200 palaces, beſides as many contiguous for the eunuchs, all gilt, painted, and varniſhed. There are raiſed hills from 20 to 60 feet high, ſtreams and lakes, and one of the latter five miles round. Theſe waters are paſſed by bridges:—but even their bridges muſt not be ſtraight—they ſerpentize as much as the rivulets, and are ſometimes ſo long as to be furniſhed with reſting places, and begin and end with triumphal arches. The colonades undulate in the ſame manner. In ſhort, this pretty gaudy

dy ſcene is the work of caprice and whim, and, when we reflect on their buildings, preſents no image but that of unſubſtantial tawdrineſs. Nor is this all. Within this fantaſtic Paradiſe is a ſquare town, each ſide a mile long. Here the eunuchs of the court, to entertain his imperial majeſty with the buſtle and buſineſs of the capital in which he reſides, but which it is not of his dignity ever to ſee, act merchants and all ſorts of trades, and even deſignedly exerciſe for his royal amuſement every art of knavery that is practiſed under his auſpicious government. Methinks this is the childiſh ſolace and repoſe of grandeur, not a retirement from affairs to the delights of rural life. Here too his majeſty plays at agriculture: there is a quarter ſet apart for that purpoſe; the eunuchs ſow, reap, and carry in their harveſt, in the imperial preſence; and his majeſty returns to Pekin, perſuaded that he has been in the country.

"Having thus cleared our way by aſcertaining what have been the ideas on gardening in all ages, as far as we have materials to judge by, it remains to ſhow to what degree Mr Kent invented the new ſtyle, and what hints he had received to ſuggeſt and conduct his undertaking.

"We have ſeen what Moor-park was, when pronounced a ſtandard. But as no ſucceeding generation in an opulent and luxurious country contents itſelf with the perfection eſtabliſhed by its anceſtors, more perfect perfection was ſtill ſought; and improvements had gone on, till London and Wiſe had ſtocked all our gardens with giants, animals, monſters, coats of arms, and mottos, in yew, box, and holly. Abſurdity could go no farther, and the tide turned. Bridgman, the next faſhionable deſigner of gardens, was far more chaſte; and whether from good ſenſe, or that the nation had been ſtruck and reformed by the admirable paper in the Guardian, N° 173, he baniſhed verdant ſculpture, and did not even revert to the ſquare preciſion of the foregoing age. He enlarged his plans, diſdained to make every diviſion tally to its oppoſite; and though he ſtill adhered much to ſtraight walks with high clipped hedges, they were only his great lines; the reſt he diverſified by wilderneſs, and with looſe groves of oak, though ſtill within ſurrounding hedges. As his reformation gained footing, he ventured, in the royal garden at Richmond, to introduce cultivated fields, and even morſels of a foreſt appearance, by the ſides of thoſe endleſs and tireſome walks that ſtretched out of one into another without intermiſſion. But this was not till other innovators had broke looſe too from rigid ſymmetry.

"But the capital ſtroke, the leading ſtep to all that has followed, was the deſtruction of walls for boundaries, and the invention of foſſes—an attempt then deemed ſo aſtoniſhing, that the common people called them Ha! Ha's! to expreſs their ſurpriſe at finding a ſudden and unperceived check to their walk.

"A ſunk fence may be called the *leading ſtep*, for theſe reaſons. No ſooner was this ſimple enchantment made, than levelling, mowing, and rolling, followed. The contiguous ground of the park without the ſunk fence was to be harmonized with the lawn within; and the garden in its turn was to be ſet free from its prim regularity, that it might aſſort with the wilder country without. The ſunk fence aſcertained the ſpecific garden; but that it might not draw too obvious a line of diſtinction between the neat and the rude, the contiguous out-lying parts came to be included in a kind of general deſign; and when nature was taken into the plan, under improvements, every ſtep that was made pointed out new beauties, and inſpired new ideas. At that moment appeared Kent, painter enough to taſte the charms of landſcape, bold, and opinionative enough to dare and to dictate, and born with a genius to ſtrike out a great ſyſtem from the twilight of imperfect eſſays. He leaped the fence, and ſaw that all nature was a garden. He felt the delicious contraſt of hill and valley changing imperceptibly into each other, taſted the beauty of the gentle ſwell or concave ſcoop, and remarked how looſe groves crowned an eaſy eminence with happy ornament; and while they called in the diſtant view between their graceful ſtems, removed and extended the perſpective by deluſive compariſon.

"Thus the pencil of his imagination beſtowed all the arts of landſcape on the ſcenes he handled. The great principles on which he worked were perſpective, and light and ſhade. Groupes of trees broke too uniform or too extenſive a lawn; evergreens and woods were oppoſed to the glare of the champaign; and where the view was leſs fortunate, or ſo much expoſed as to be beheld at once, he blotted out ſome parts by thick ſhades, to divide it into variety, or to make the richeſt ſcene more enchanting by reſerving it to a farther advance of the ſpectator's ſtep. Thus, ſelecting favourite objects, and veiling deformities by ſcreens of plantation; ſometimes allowing the rudeſt waſte to add its foil to the richeſt theatre: he realiſed the compoſitions of the greateſt maſters in painting. Where objects were wanting to animate his horizon, his taſte as an architect could beſtow immediate termination. His buildings, his ſeats, his temples, were more the works of his pencil than of his compaſſes. We owe the reſtoration of Greece and the diffuſion of architecture to his ſkill in landſcape.

"But of all the beauties he added to the face of this beautiful country, none ſurpaſſed his management of water. A lake to canals, circular baſons, and caſcades tumbling down marble ſteps, that laſt abſurd magnificence of Italian and French villas. The forced elevation of cataracts was no more. The gentle ſtream was taught to ſerpentize ſeemingly at its pleaſure; and where diſcontinued by different levels, its courſe appeared to be concealed by thickets properly interſperſed, and glittered again at a diſtance where it might be ſuppoſed naturally to arrive. Its borders were ſmoothed, but preſerved their waving irregularity. A few trees ſcattered here and there on its edges ſprinkled the tame bank that accompanied its meanders; and when it diſappeared among the hills, ſhades deſcending from the heights leaned towards its progreſs, and framed the diſtant point of light under which it was loſt, as it turned aſide to either hand of the blue horizon.

"Thus, dealing in none but the colours of nature, and catching its moſt favourable features, men ſaw a new creation opening before their eyes. The living landſcape was chaſtened or poliſhed, not transformed.

Freedom was given to the forms of trees: they extended their branches unreſtricted; and where any eminent oak, or maſter beech, had eſcaped maiming and ſurvived the foreſt, buſh and bramble was removed, and all its honours were reſtored to diſtinguiſh and ſhade the plain. Where the united plumage of an ancient wood extended wide its undulating canopy, and ſtood venerable in its darkneſs, Kent thinned the foremoſt ranks, and left but ſo many detached and ſcattered trees, as ſoftened the approach of gloom, and blended a chequered light with the thus lengthened ſhadows of the remaining columns.

"Succeeding artiſts have added new maſter-ſtrokes to theſe touches; perhaps improved or brought to perfection ſome that have been named. The introduction of foreign trees and plants, which we owe principally to Archibald Duke of Argyle, contributed eſſentially to the richneſs of colouring ſo peculiar to our modern landſcape. The mixture of various greens, the contraſt of forms between our foreſt-trees and the northern and Weſt Indian firs and pines, are improvements more recent than Kent, or but little known to him. The weeping-willow, and every florid ſhrub, each tree of delicate or bold leaf, are new tints in the compoſition of our gardens.

"But juſt as the encomiums are that have been beſtowed on Kent's diſcoveries, he was neither without aſſiſtance or faults. Mr Pope undoubtedly contributed to form his taſte. The deſign of the Prince of Wales's garden at Carlton-houſe was evidently borrowed from the Poet's at Twickenham. There was a little of affected modeſty in the latter, when he ſaid, of all his works he was moſt proud of his garden. And yet it was a ſingular effort of art and taſte to impreſs ſo much variety and ſcenery on a ſpot of five acres. The paſſing through the gloom from the grotto to the opening day, the retiring and again aſſembling ſhades, the duſky groves, the larger lawn, and the ſolemnity of the termination at the cypreſſes that lead up to his mother's tomb, are managed with exquiſite judgment; and though Lord Peterborough aſſiſted him

To form his quincunx and to rank his vines,

thoſe were not the moſt pleaſing ingredients of his little perſpective.

"Having routed profeſſed art (for the modern gardener exerts his talents to conceal his art), Kent, like other reformers, knew not how to ſtop at the juſt limits. He had followed Nature, and imitated her ſo happily, that he began to think all her works were equally proper for imitation. In Kenſington garden he planted dead trees, to give a greater air of truth to the ſcene—but he was ſoon laughed out of this exceſs. His ruling principle was, that nature abhors a ſtraight line. His mimics, for every genius has his apes, ſeemed to think that ſhe could love nothing but what was crooked. Yet ſo many men of taſte of all ranks devoted themſelves to the new improvements, that it is ſurpriſing how much beauty has been ſtruck out, with how few abſurdities. Still in ſome lights the reformation ſeems to have been puſhed too far. Though an avenue croſſing a park or ſeparating a lawn, and intercepting views from the ſeat to which it leads, are capital faults; yet a great avenue cut through woods, perhaps before entering a park, has a noble air, and

Like footmen running before coaches
To tell the inn what lord approaches,

announces the habitation of ſome man of diſtinction. In other places the total baniſhment of all particular neatneſs immediately about a houſe, which is frequently left gazing by itſelf in the middle of a park, is a defect. Sheltered and even cloſe walks, in ſo very uncertain a climate as ours, are comforts ill exchanged for the few pictureſque days that we enjoy; and whenever a family can purloin a warm and even ſomething of an old-faſhioned garden from the landſcape deſigned for them by the undertaker in faſhion, without interfering with the picture, they will find ſatisfactions on thoſe days that do not invite ſtrangers to come and ſee their improvements."

Part I. PRINCIPLES of GARDENING.

GARDENING, in the perfection to which it has been lately brought in Britain, is intitled to a place of conſiderable rank among the liberal arts. It is (ſays Mr Wheatley) as ſuperior to landſcape-painting as a reality to a repreſentation: it is an exertion of fancy; a ſubject for taſte; and being releaſed now from the reſtraints of regularity, and enlarged beyond the purpoſes of domeſtic convenience, the moſt beautiful, the moſt ſimple, the moſt noble ſcenes of nature, are all within its province. For it is no longer confined to the ſpots from which it takes its name; but, as already obſerved, regulates alſo the diſpoſition and embelliſhments of a park, a farm, a foreſt, &c. and the buſineſs of a gardener is to ſelect and apply whatever is great, elegant, or characteriſtic, in any of them to diſcover, and to ſhow all the advantages of the place upon which he is employed; to ſupply its defects, to correct its faults, and to improve its beauties.

Sect. I. *Materials of Gardening.*

These may be divided into two general claſſes; *Natural*, and *Factitious*.

§ 1. *Of the Natural Materials.*

These, according to Mr Wheatley's enumeration, are: Ground, Wood, Water, and Rocks.

I. GROUND. By this is meant that portion of naked ſurface which is included within the place to be improved; whether that ſurface be ſwamp, lawn, roughet, or broken ground; and whether it be a height, a valley, a plain, or a compoſition of ſwells, dips, and levels.

The following paſſage has been quoted from Mr Gilpin's obſervations on the Wye *, as affording a ſublime idea of what ground ought to be.—"Nothing (ſays he) gives ſo juſt an idea of the beautiful ſwellings of ground as thoſe of water, where it has

* P. 6

Wood. has sufficient room to undulate and expand. In ground which is composed of very refractory materials, you are presented often with harsh lines, angular insertions, and disagreeable abruptnesses. In water, whether in gentle or in agitated motion, all is easy, all is softened into itself; and the hills and the valleys play into each other in a variety of the most beautiful forms. In agitated water, abruptnesses indeed there are, but yet they are such abruptnesses as in some part or other unite properly with the surface around them; and are on the whole peculiarly harmonious. Now, if the ocean in any of these swellings and agitations could be arrested and fixed, it would produce that pleasing variety which we admire in ground. Hence it is common to fetch our images from water, and apply them to land: we talk of an undulating line, a playing lawn, and a billowy surface; and give a much stronger and more adequate idea by such imagery, than plain language could possibly present."

The exertions of art, however, are here inadequate; and the artist ought not attempt to create a mountain, a valley, or a plain: he should but rarely meddle even with the smaller inequalities of grounds. Roughets and broken ground may generally be reduced to lawn, or hid with wood; and a swamp may be drained or covered with water; whilst lawn may be variegated at pleasure by wood, and sometimes by water.

II. WOOD, as a general term, comprehends all trees and shrubs in whatever disposition; but it is specifically applied in a more limited sense, and in that sense we shall now use it.

Every plantation must be either a *wood*, a *grove*, or a *clump*. A wood is composed both of trees and underwood, covering a considerable space. A grove consists of trees without underwood. A clump differs from either only in extent: it may be either close or open: when close, it is sometimes called a *thicket*; when open, a *groupe of trees*; but both are equally clumps, whatever may be the shape or situation.

1. One of the noblest objects in nature (Mr Wheatley observes) is the *surface of a large thick wood*, commanded from an eminence, or seen from below hanging on the side of a hill. The latter is generally the more interesting object. Its aspiring situation gives it an air of greatness; its termination is commonly the horizon: and, indeed, if it is deprived of that splendid boundary, if the brow appears above it (unless some very peculiar effect characterises that brow), it loses much of its magnificence: it is inferior to a wood which covers a less hill from the top to the bottom; for a whole space filled is seldom little. But a wood commanded from an eminence is generally no more than a part of the scene below; and its boundary is often inadequate to its greatness. To continue it, therefore, till it winds out of sight, or loses itself in the horizon, is generally desirable: but then the varieties of its surface grow confused as it retires; while those of a hanging wood are all distinct, the furthest parts are held up to the eye, and none are at a distance though the whole be extensive.

The varieties of a surface are essential to the beauty of it: a continued smooth shaven level of foliage is neither agreeable nor natural; the different growths of trees commonly break it in reality, and their shadows still more in appearance. These shades are so many tints, which, undulating about the surface, are its greatest embellishment; and such tints may be produced with more effect, and more certainty, by a judicious mixture of greens; at the same time an additional variety may be introduced, by grouping and contrasting trees very different in shape from each other; and whether variety in the greens or in the forms be the design, the execution is often easy, and seldom to a certain degree impossible. In raising a young wood, it may be perfect. In old woods, there are many spots which may be either thinned or thickened: and there the characteristic distinctions should determine what to plant, or which to leave; at the least will often point out those which, as blemishes, ought to be taken away; and the removal of two or three trees will sometimes accomplish the design. The number of beautiful forms, and agreeable masses, which may decorate the surface, is so great, that where the place will not admit of one, another is always ready; and as no delicacy of finishing is required, no minute exactness is worth regarding; great effects will not be disconcerted by small obstructions and little disappointments. Wood.

The contrasts, however, of masses and of groupes must not be too strong, where *greatness* is the character of the wood; for unity is essential to greatness: and if direct opposites be placed close together, the wood is no longer one object; it is only a confused collection of several separate plantations. But if the progress be gradual from the one to the other, shapes and tints widely different may assemble on the same surface; and each should occupy a considerable space: a single tree, or a small cluster of trees, in the midst of an extensive wood, is in size but a speck, and in colour but a spot; the groupes and the masses must be large to produce any sensible variety.

When, in a romantic situation, very broken ground is overspread with wood, it may be proper on the surface of the wood to mark the inequalities of the ground. *Rudeness*, not greatness, is the prevailing idea; and a choice directly the reverse of that which is productive of unity, will produce it. Strong contrasts, even oppositions, may be eligible; the aim is rather to disjoint than to connect: a deep hollow may sink into dark greens; an abrupt bank may be shown by a rising stage of aspiring trees, a sharp ridge by a narrow line of conical shapes: firs are of great use upon such occasions; their tint, their form, their singularity, recommend them.

A hanging *wood of thin forest-trees*, and seen from below, is seldom pleasing: those few trees are by the perspective brought nearer together; it loses the beauty of a thin wood, and is defective as a thick one: the most obvious improvement, therefore, is to thicken it. But, when seen from an eminence, a thin wood is often a lively and elegant circumstance in a view; it is full of objects; and every separate tree shows its beauty. To increase that vivacity, which is the peculiar excellence of a thin wood, the trees should be characteristically distinguished both in their tints and their shapes; and such as for their airiness have been proscribed in a thick wood, are frequently the most eligible here. Differences also in their growths are a further source of variety; each should be considered as a distinct ob-

Wood.

ject, unleſs where a ſmall number are grouped together; and then all that compoſe the little cluſter muſt agree: but the groupes themſelves, for the ſame reaſon as the ſeparate trees, ſhould be ſtrongly contraſted; the continued underwood is their only connection, and that is not affected by their variety.

2 Of the outline of a wood.

Though the ſurface of a wood, when commanded, deſerves all theſe attentions, yet the *outline* more frequently calls for our regard: it is alſo more in our power; it may ſometimes be great, and may always be beautiful. The firſt requiſite is irregularity. That a mixture of trees and underwood ſhould form a long ſtraight line, can never be natural; and a ſucceſſion of eaſy ſweeps and gentle rounds, each a portion of a greater or leſs circle, compoſing all together a line literally ſerpentine, is, if poſſible, worſe. It is but a number of regularities put together in a diſorderly manner, and equally diſtant from the beautiful both of art and of nature. The true beauty of an outline conſiſts more in breaks than in ſweeps; rather in angles than in rounds; in variety, not in ſucceſſion.

Every variety in the outline of a wood muſt be a *prominence* or a *receſs*. Breadth in either is not ſo important as length to the one and depth to the other. If the former ends in an angle, the latter diminiſhes to a point; they have more force than a ſhallow dent, or a dwarf excreſcence, how wide ſoever. They are greater deviations from the continued line which they are intended to break; and their effect is to enlarge the wood itſelf, which ſeems to ſtretch from the moſt advanced point, back beyond the moſt diſtant to which it retires. The extent of a large wood on a flat, not commanded, can by no circumſtance be ſo manifeſtly ſhown as by a deep receſs; eſpecially if that receſs wind ſo as to conceal the extremity, and leave the imagination to purſue it. On the other hand, the poverty of a ſhallow wood might ſometimes be relieved by here and there a prominence, or clumps which by their apparent junction ſhould ſeem to be prominences from it. A deeper wood with a continued outline, except when commanded, would not appear ſo conſiderable.

Whately's Obſervat. on Modern Gardening.

An inlet into a wood ſeems to have been cut, if the oppoſite points of the entrance tally; and that ſhow of art depreciates its merit: but a difference only in the ſituation of thoſe points, by bringing one more forward than the other, prevents the appearance, though their forms be ſimilar. Other points, which diſtinguiſh the great parts, ſhould in general be ſtrongly marked: a ſhort turn has more ſpirit in it than a tedious circuity; and a line broken by angles has a preciſion and firmneſs, which in an undulated line are wanting; the angles ſhould indeed commonly be a little ſoftened; the rotundity of the plant which forms them is ſometimes ſufficient for the purpoſe; but if they are mellowed down too much, they loſe all meaning. Three or four large parts thus boldly diſtinguiſhed, will break a very long outline. When two woods are oppoſed on the ſides of a narrow glade, neither has ſo much occaſion for variety in itſelf as if it were ſingle; if they are very different from each other, the contraſt ſupplies the deficiency to each, and the interval between them is full of variety. The form of that interval is indeed of as much conſequence as their own: though the outlines of both the woods be ſeparately beautiful, yet if together they do not caſt the open ſpace into an agreeable figure, the whole ſcene is not pleaſing; and a figure is never agreeable, when the ſides too cloſely correſpond; whether they are exactly the ſame, or exactly the reverſe of each other, they equally appear artificial.

Wood.

Every variety of outline hitherto mentioned may be traced by the underwood alone; but frequently the ſame effects may be produced with more eaſe, and with much more beauty, by a few trees ſtanding out from the thicket, and belonging, or ſeeming to belong, to the wood, ſo as to make a part of its figure. Even where they are not wanted for that purpoſe, detached trees are ſuch agreeable objects, ſo diſtinct, ſo light, when compared to the covert about them, that ſkirting along it in ſome parts, and breaking it in others, they give an unaffected grace, which can no otherwiſe be given to the outline. They have a ſtill further effect, when they ſtretch acroſs the whole breadth of an inlet, or before part of a receſs into the wood: they are themſelves ſhown to advantage by the ſpace behind them; and that ſpace, ſeen between their ſtems, they in return throw into an agreeable perſpective.

3 Of a Grove.

2. The prevailing character of a wood is generally grandeur: the principal attention therefore which it requires, is to prevent the exceſſes of that character, to diverſify the uniformity of its extent, to lighten the unwieldineſs of its bulk, and to blend graces with greatneſs. The character of a *grove* is beauty. Fine trees are lovely objects: a grove is an aſſemblage of them; in which every individual retains much of its own peculiar elegance, and whatever it loſes is transferred to the ſuperior beauty of the whole. To a grove, therefore, which admits of endleſs variety in the diſpoſition of the trees, differences in their ſhapes and their greens are ſeldom very important, and ſometimes they are detrimental. Strong contraſts ſcatter trees which are thinly planted, and which have not the connection of underwood; they no longer form one plantation; they are a number of ſingle trees. A thick grove is not indeed expoſed to this miſchief, and certain ſituations may recommend different ſhapes and different greens for their effects upon the ſurface; but in the outline they are ſeldom much regarded. The eye attracted into the depth of the grove, paſſes by little circumſtances at the entrance; even varieties in the form of the line do not always engage the attention: they are not ſo apparent as in a continued thicket, and are ſcarcely ſeen if they are not conſiderable.

But the ſurface and the outline are not the only circumſtances to be attended to. Though a grove be beautiful as an object, it is beſides delightful as a ſpot to walk or to ſit in; and the choice and the diſpoſition of the trees for effects within, are therefore a principal conſideration. Mere irregularity alone will not pleaſe: ſtrict order is there more agreeable than abſolute confuſion: and ſome meaning better than none. A regular plantation has a degree of beauty; but it gives no ſatisfaction, becauſe we know that the ſame number of trees might be more beautifully arranged. A diſpoſition, however, in which the lines only are broken, without varying the diſtances, is equally improper. The trees ſhould gather into groupes, or ſtand in various irregular lines, and deſcribe ſeveral figures: the intervals between them ſhould be contraſted both in ſhape and in dimen-

Wood. Ibid.

fions: a large ſpace ſhould in ſome places be quite open; in others the trees ſhould be ſo cloſe together, as hardly to leave a paſſage between them; and in others as far apart as the connection will allow. In the forms and the varieties of theſe groupes, theſe lines, and theſe openings, principally conſiſts the interior beauty of a grove.

New ſher in arry.

The force of them is moſt ſtrongly illuſtrated at Claremont*: where the walk to the cottage, though deſtitute of many natural advantages, and eminent for none; though it commands no proſpect; though the water below it is a trifling pond; though it has nothing, in ſhort, but inequality of ground to recommend it; is yet the fineſt part of the garden: for a grove is there planted in a gently curved direction, all along the ſide of a hill, and on the edge of a wood, which riſes above it. Large receſſes break it into ſeveral clumps, which hang down the declivity; ſome of them approaching, but none reaching quite to the bottom. Theſe receſſes are ſo deep as to form great openings in the midſt of the grove; they penetrate almoſt to the covert: but the clumps being all equally ſuſpended from the wood; and a line of open plantation, though ſometimes narrow, running conſtantly along the top; a continuation of grove is preſerved, and the connection between the parts is never broken. Even a groupe, which near one of the extremities ſtands out quite detached, is ſtill in ſtyle ſo ſimilar to the reſt as not to loſe all relation. Each of theſe clumps is compoſed of ſeveral others ſtill more intimately united: each is full of groupes, ſometimes of no more than two trees, ſometimes of four or five, and now and then in larger cluſters: an irregular waving line, iſſuing from ſome little crowd, loſes itſelf in the next; or a few ſcattered trees drop in a more diſtant ſucceſſion from the one to the other. The intervals, winding here like a glade, and widening there into broader openings, differ in extent, in figure, and direction; but all the groupes, the lines, and the intervals, are collected together into large general clumps, each of which is at the ſame time both compact and free, identical and various. The whole is a place wherein to tarry with ſecure delight, or ſaunter with perpetual amuſement.

The grove at Eſher-place was planted by the ſame maſterly hand; but the neceſſity of accommodating the young plantation to ſome large trees which grew there before, has confined its variety. The groupes are few and ſmall; there was not room for larger or for more: there were no opportunities to form continued narrow glades between oppoſite lines; the vacant ſpace are therefore chiefly irregular openings ſpreading every way, and great differences of diſtance between the trees are the principal variety; but the grove winds along the bank of a large river, on the ſide and at the foot of a very ſudden aſcent, the upper part of which is covered with wood. In one place, it preſſes cloſe to the covert; retires from it in another; and ſtretches in a third acroſs a bold receſs, which runs up high into the thicket. The trees ſometimes overſpread the flat below; ſometimes leave an open ſpace to the river; at other times crown the brow of a large knole, climb up a ſteep, or hang on a gentle declivity. Theſe varieties in the ſituation more than compenſate for the want of variety in the diſpoſition of the trees; and the many happy circumſtances which concur

Wood.

——— In Eſher's peaceful grove,
Where Kent and nature vie for Pelham's love,

render this little ſpot more agreeable than any at Claremont. But though it was right to preſerve the trees already ſtanding, and not to ſacrifice great preſent beauties to ſtill greater in futurity; yet this attention has been a reſtraint; and the grove at Claremont, conſidered merely as a plantation, is in delicacy of taſte, and fertility of invention, ſuperior to that at Eſher.

It is, however, poſſible to ſecure both a preſent and a future effect, by fixing firſt on a diſpoſition which will be beautiful when the trees are large, and then intermingling another which is agreeable while they are ſmall. Theſe occaſional trees are hereafter to be taken away; and muſt be removed in time, before they become prejudicial to the others.

The conſequence of variety in the diſpoſition, is variety in the light and ſhade of the grove; which may be improved by the choice of the trees. Some are impenetrable to the fierceſt ſun-beam; others let in here and there a ray between the large maſſes of their foliage; and others, thin both of boughs and of leaves, only chequer the ground. Every degree of light and ſhade, from a glare to obſcurity, may be managed, partly by the number, and partly by the texture, of the trees. Differences only in the manner of their growths have alſo correſponding effects: there is a cloſeneſs under thoſe whoſe branches deſcend low, and ſpread wide; a ſpace and liberty where the arch above is high; and frequent tranſitions from the one to the other are very pleaſing. Theſe ſtill are not all the varieties of which the interior of a grove is capable: trees, indeed, whoſe branches nearly reach the ground, being each a ſort of thicket, are inconſiſtent with an open plantation: but though ſome of the characteriſtic diſtinctions are thereby excluded, other varieties more minute ſucceed in their place; for the freedom of paſſage throughout brings every tree in its turn near to the eye, and ſubjects even differences in foliage to obſervation. Theſe, ſlight as they may ſeem, are agreeable when they occur: it is true, they are not regretted when wanting; but a defect of ornament is not neceſſarily a blemiſh.

4 Of Clumps.

3. It has been already obſerved, that *Clumps* differ only in extent from woods, if they are cloſe; or from groves, if they are open: they are ſmall woods, and ſmall groves, governed by the ſame principles as the larger, after allowances made for their dimenſions. But beſides the properties they may have in common with woods or with groves, they have others peculiar to themſelves which require examination.

They are either *independent* or *relative*: when independent, their beauty, as ſingle objects, is ſolely to be attended to; when relative, the beauty of the individuals muſt be ſacrificed to the effect of the whole, which is the greater conſideration.

The *occaſions* on which independent clumps may be applied, are many. They are often deſirable as beautiful objects in themſelves; they are ſometimes neceſſary to break an extent of lawn, or a continued line whether of ground or of plantation; but on all occaſions a jealouſy of art conſtantly attends them, which irregularity in their figure will not always alone remove. Though elevations ſhow them to advantage, yet a hillock evidently thrown up on purpoſe to be crowned with a clump, is artificial to a degree of diſ-

Water. Ibid. guſt: ſome of the trees ſhould therefore be planted on the ſides, to take off that appearance. The ſame expedient may be applied to clumps placed on the brow of a hill, to interrupt its ſameneſs: they will have leſs oſtentation of deſign, if they are in part carried down either declivity. The objection already made to planting many along ſuch a brow, is on the ſame principle: a ſingle clump is leſs ſuſpected of art; if it be an open one, there can be no finer ſituation for it, than juſt at the point of an abrupt hill, or on a promontory into a lake or a river. It is in either a beautiful termination, diſtinct by its poſition, and enlivened by an expanſe of ſky or of water about and beyond it. Such advantages may balance little defects in its form: but they are loſt if other clumps are planted near it; art then intrudes, and the whole is diſpleaſing.

But though a multiplicity of clumps, when each is an independent object, ſeldom ſeems natural; yet a number of them may, without any appearance of art, be admitted into the ſame ſcene, if they bear a *relation* to each other: if by their ſucceſſion they diverſify a continued outline of wood, if between them they form beautiful glades, if all together they caſt an extenſive lawn into an agreeable ſhape, the *effect* prevents any ſcrutiny into the means of producing it. But when the reliance on that effect is ſo great, every other conſideration muſt give way to the beauty of the whole. The figure of the glade, of the lawn, or of the wood, are principally to be attended to: the fineſt clumps, if they do not fall eaſily into the great lines, are blemiſhes; their connections, their contraſts, are more important than their forms.

5 Of a Lake. III. WATER. All inland water is either *running* or *ſtagnated*. When ſtagnated, it forms a *lake* or a *pool*, which differ only in extent; and a *pool* and a *pond* are the ſame. Running waters are either a *rivulet*, a *river*, or a *rill*; and theſe differ only in breadth: a *rivulet* and a *brook* are ſynonymous terms; a *ſtream* and a *current* are general names for all.

1. Space or expanſion is eſſential to a *Lake*. It cannot be too large as a ſubject of deſcription or of contemplation; but the eye receives little ſatisfaction when it has not a form on which to reſt: the ocean itſelf hardly atones by all its grandeur for its infinity; and a proſpect of it is, therefore, always moſt agreeable, when in ſome part, at no great diſtance, a reach of ſhore, a promontory, or an iſland, reduces the immenſity into ſhape. An artificial lake, again, may be comparatively extravagant in its dimenſions. It may be ſo out of proportion to its appendages, as to ſeem a waſte of water; for all ſize is in ſome reſpects relative: if this exceeds its due dimenſions, and if a flatneſs of ſhore beyond it adds ſtill to the drearineſs of the ſcene; wood to raiſe the banks, and objects to diſtinguiſh them, are the remedies to be employed. If the length of a piece of water be too great for its breadth ſo as to deſtroy all idea of circuity, the extremities ſhould be conſidered as too far off, and made important to give them proximity; while at the ſame time the breadth may be favoured, by keeping down the banks on the ſides. On the ſame principle, if the lake be too ſmall, a low ſhore will, in appearance, increaſe the extent.

But it is not neceſſary that the whole ſcene be bounded: if form be impreſſed on a conſiderable part, the eye can, without diſguſt, permit a large reach to ſtretch beyond its ken; it can even be pleaſed to obſerve a tremulous motion in the horizon, which ſhows that the water has not there yet attained its termination. Still ſhort of this, the extent may be kept in uncertainty; a hill or a wood may conceal one of the extremities, and the country beyond it, in ſuch a manner as to leave room for the ſuppoſed continuation of ſo large a body of water. Opportunities to chooſe this ſhape are frequent, and it is the moſt perfect of any: the ſcene is cloſed, but the extent of the lake is undetermined; a complete form is exhibited to the eye, while a boundleſs range is left open to the imagination. Water.

But mere form will only give content, not delight: that depends upon the outline, which is capable of exquiſite beauty; and the *bays*, the *creeks*, and the *promontories*, which are ordinary parts of that outline, together with the accidents of *iſlands*, of *inlets* and of *outlets* to rivers, are in their ſhapes and their combinations an inexhauſtible fund of variety.

Bays, creeks, and promontories, however, though extremely beautiful, ſhould not be very numerous: for a ſhore broken into little points and hollows has no certainty of outline; it is only ragged, not diverſified; and the diſtinctneſs and ſimplicity of the great parts are hurt by the multiplicity of ſubdiviſions. But iſlands, though the channels between them be narrow, do not ſo often derogate from greatneſs: they intimate a ſpace beyond them whoſe boundaries do not appear; and remove to a diſtance the ſhore which is ſeen in perſpective between them. Such partial interruptions of the ſight ſuggeſt ideas of extent to the imagination.

6 Of a River 2. Though the windings of a *River* are proverbially deſcriptive of its courſe; yet without being perpetually wreathed, it may be natural. Nor is the character expreſſed only by the turnings. On the contrary, if they are too frequent and ſudden, the current is reduced into a number of ſeparate pools, and the idea of progreſs is obſcured by the difficulty of tracing it. Length is the ſtrongeſt ſymptom of continuation: long reaches are therefore characteriſtic of a river, and they conduce much to its beauty; each is a conſiderable piece of water, and variety of beautiful forms may be given to their outlines.

A river requires a number of *accompaniments*. The changes in its courſe furniſh a variety of ſituations; while the fertility, convenience, and amenity, which attend it, account for all appearances of inhabitants and improvement. Profuſion of ornament on a fictitious river, is a juſt imitation of cultivated nature. Every ſpecies of building, every ſtyle of plantation, may abound on the banks; and whatever be their characters, their proximity to the water is commonly the happieſt circumſtance in their ſituation. A luſtre is from thence diffuſed on all around; each derives an importance from its relation to this capital feature: thoſe which are near enough to be reflected, immediately belong to it; thoſe at a greater diſtance ſtill ſhare in the animation of the ſcene; and objects totally detached from each other, being all attracted towards the ſame intereſting connection, are united into one compoſition.

In the front of Blenheim was a deep broad valley, which

ater. bid.

which abruptly ſeparated the caſtle from the lawn and the plantations before it; even a direct approach could not be made without building a monſtrous bridge over the vaſt hollow: but this forced communication was only a ſubject of raillery; and the ſcene continued broken into two parts, abſolutely diſtinct from each other. This valley has been lately flooded: it is not filled; the bottom only is covered with water: the ſides are ſtill very high; but they are no longer the ſteeps of a chaſm, they are the bold ſhores of a noble river. The ſame bridge is ſtanding without alteration: but no extravagance remains; the water gives it propriety. Above it the river firſt appears, winding from behind a ſmall thick wood, in the valley; and ſoon taking a determined courſe, it is then broad enough to admit an iſland filled with the fineſt trees: others, correſponding to them in growth and diſpoſition, ſtand in groupes on the banks, intermixed with younger plantations. Immediately below the bridge, the river ſpreads into a large expanſe: the ſides are open lawn. On that furtheſt from the houſe formerly ſtood the palace of Henry II. celebrated in many an ancient ditty by the name of Fair Roſamond's Bower. A little clear ſpring, which riſes there, is by the country people ſtill called Fair Roſamond's Well. The ſpot is now marked by a ſingle willow. Near it is a fine collateral ſtream, of a beautiful form, retaining its breadth as far as it is ſeen, and retiring at laſt behind a hill from the view. The main river, having received this acceſſion, makes a gentle bend; then continues for a conſiderable length in one wide direct reach; and, juſt as it diſappears, throws itſelf down a high caſcade, which is the preſent termination. On one of the banks of this reach is the garden: the ſteeps are there diverſified with thickets and with glades; but the covert prevails, and the top is crowned with lofty trees. On the other ſide is a noble hanging wood in the park: it was depreciated when it ſunk into a hollow, and was poorly loſt in the bottom; but it is now a rich appendage to the river, falling down an eaſy ſlope quite to the water's edge, where, without overſhadowing, it is reflected on the ſurface. Another face of the ſame wood borders the collateral ſtream, with an outline more indented and various; while a very large irregular clump adorns the oppoſite declivity. This clump is at a conſiderable diſtance from the principal river: but the ſtream it belongs to brings it down to connect with the reſt; and the other objects, which were before diſperſed, are now, by the intereſt of each in a relation which is common to all, collected into one illuſtrious ſcene. The caſtle is itſelf a prodigious pile of building; which, with all the faults in its architecture, will never ſeem leſs than a truly princely habitation; and the confined ſpot where it was placed, on the edge of an abyſs, is converted into a proud ſituation, commanding a beautiful proſpect of water, and open to an extenſive lawn, adequate to the manſion, and an emblem of its domain. In the midſt of this lawn ſtands a column, a ſtately trophy, recording the exploits of the duke of Marlborough, and the gratitude of Britain. Between this pillar and the caſtle is the bridge, which now, applied to a ſubject worthy of it, is eſtabliſhed in all the importance due to its greatneſs. The middle arch is wider than the Rialto, but not too wide for the occaſion; and yet this is the narroweſt part of the river: but the length of the reaches is every where proportioned to their breadth. Each of them is alone a noble piece of water; and the laſt, the fineſt of all, loſes itſelf gradually in a wood, which on that ſide is alſo the boundary of the lawn, and riſes into the horizon. All is great in the front of Blenheim: but in that vaſt ſpace no void appears; ſo important are the parts, ſo magnificent the objects. The plain is extenſive, the valley is broad, the wood is deep. Though the intervals between the buildings are large, they are filled with the grandeur which buildings of ſuch dimenſions and ſo much pomp diffuſe all around them; and the river, in its long varied courſe, approaching to every object, and touching upon every part, ſpreads its influence over the whole. Water.

In the compoſition of this ſcene, the river, both as a part itſelf, and as uniting the other parts, has a principal ſhare. But water is not loſt though it be in ſo confined or ſo concealed a ſpot as to enter into no view; it may render that ſpot delightful. It is capable of the moſt exquiſite beauty in its form; and though not in ſpace, may yet in diſpoſition have pretenſions to greatneſs; for it may be divided into ſeveral branches, which will form a cluſter of iſlands all connected together, make the whole place irriguous, and, in the ſtead of extent, ſupply a quantity of water. Such a ſequeſtrated ſcene uſually owes its retirement to the trees and the thickets with which it abounds: but, in the diſpoſition of them, one diſtinction ſhould be conſtantly attended to. A river flowing through a wood which overſpreads one continued ſurface of ground, and a river between two woods, are in very different circumſtances. In the latter caſe, the woods are ſeparate; they may be contraſted in their forms and their characters, and the outline of each ſhould be forcibly marked. In the former, no outline ought to be diſcernible; for the river paſſes between trees, not between boundaries; and though, in the progreſs of its courſe, the ſtyle of the plantations may be often changed, yet on the oppoſite banks a ſimilarity ſhould conſtantly prevail, that the identity of the wood may never be doubtful.

A river between two woods may enter into a view; and then it muſt be governed by the principles which regulate the conduct and the accompaniments of a river in an open expoſure. But when it runs through a wood, it is never to be ſeen in proſpect: the place is naturally full of obſtructions; and a continued opening, large enough to receive a long reach, would ſeem an artificial cut. The river muſt therefore neceſſarily wind more than in croſſing a lawn, where the paſſage is entirely free. But its influence will never extend ſo far on the ſides: the buildings muſt be near the banks; and, if numerous, will ſeem crowded, being all in one track, and in ſituations nearly alike. The ſcene, however, does not want variety: on the contrary, none is capable of more. The objects are not indeed ſo different from each other as in an open view; but they are very different, and in much greater abundance: for this is the interior of a wood, where every tree is an object, every combination of trees a variety, and no large intervals are requiſite to diſtinguiſh the ſeveral diſpoſitions; the grove, the thicket, or the groupes,

may

Water

Ibid.

may prevail, and their forms and their relations may be conſtantly changed, without reſtraint of fancy, or limitation of number.

Water is ſo univerſally and ſo deſervedly admired in a proſpect, that the moſt obvious thought in the management of it, is to lay it as open as poſſible, and purpoſely to conceal it would generally ſeem a ſevere ſelf-denial: yet ſo many beauties may attend its paſſage through a wood, that larger portions of it might be allowed to ſuch retired ſcenes than are commonly ſpared from the view, and the different parts in different ſtyles would be fine contraſts to each other. If the water at Wotton* were all expoſed, a walk of near two miles along the banks would be of a tedious length, from the want of thoſe changes of the ſcene which now ſupply through the whole extent a ſucceſſion of perpetual variety. That extent is ſo large as to admit of a diviſion into four principal parts, all of them great in ſtyle and in dimenſions, and differing from each other both in character and ſituation. The two firſt are the leaſt. The one is a reach of a river, about the third of a mile in length, and of a competent breadth, flowing through a lovely mead, open in ſome places to views of beautiful hills in the country, and adorned in others with clumps of trees, ſo large, that their branches ſtretch quite acroſs, and form a high arch over the water. The next ſeems to have been once a formal baſin encompaſſed with plantations, and the appendages on either ſide ſtill retain ſome traces of regularity; but the ſhape of the water is free from them: the ſize is about 12 acres; and out of it iſſue two broad collateral ſtreams, winding towards a large river, which they are ſeen to approach, and ſuppoſed to join. A real junction is however impoſſible, from the difference of the levels; but the terminations are ſo artfully concealed, that the deception is never ſuſpected, and when known is not eaſily explained. The river is the third great diviſion of the water; a lake into which it falls, is the fourth. Theſe two do actually join; but their characters are directly oppoſite; the ſcenes they belong to are totally diſtinct; and the tranſition from the one to the other is very gradual: for an iſland near the conflux, dividing the breadth, and concealing the end of the lake, moderates for ſome way the ſpace; and permitting it to expand but by degrees, raiſes an idea of greatneſs, from uncertainty accompanied with increaſe. The reality does not diſappoint the expectation; and the iſland, which is the point of view, is itſelf equal to the ſcene: it is large, and high above the lake; the ground is irregularly broken; thickets hang on the ſides; and towards the top is placed an Ionic portico, which commands a noble extent of water, not leſs than a mile in circumference, bounded on one ſide with wood, and open on the other to two ſloping lawns, the leaſt of an hundred acres, diverſified with clumps, and bordered by plantations. Yet this lake, when full in view, and with all the importance which ſpace, form, and ſituation can give, is not more intereſting than the ſequeſtered river, which has been mentioned as the third great diviſion of the water. It is juſt within the verge of a wood, three quarters of a mile long, every where broad, and its courſe is ſuch as to admit of infinite variety without any confuſion. The banks are cleared of underwood; but a few thickets ſtill remain, and on one ſide an impenetrable covert ſoon begins: the interval is a beautiful grove of oaks, ſcattered over a green ſward of extraordinary verdure. Between theſe trees and theſe thickets the river ſeems to glide gently along, conſtantly winding, without one ſhort turn or one extended reach in the whole length of the way. This even temper in the ſtream ſuits the ſcenes through which it paſſes; they are in general of a very ſober caſt, not melancholy, but grave; never expoſed to a glare; never darkened with gloom; nor, by ſtrong contraſts of light and ſhade, exhibiting the exceſs of either. Undiſturbed by an extent of proſpect without, or a multiplicity of objects within, they retain at all times a mildneſs of character; which is ſtill more forcibly felt when the ſhadows grow faint as they lengthen, when a little ruſtling of birds in the ſpray, the leaping of the fiſh, and the fragrancy of the woodbine, denote the approach of evening; while the ſetting ſun ſhoots its laſt gleams on a Tuſcan portico, which is cloſe to the great baſin, but which from a ſeat near this river is ſeen at a diſtance, through all the obſcurity of the wood, glowing on the banks, and reflected on the ſurface of the water. In another ſtill more diſtinguiſhed ſpot is built an elegant bridge, with a colonnade upon it, which not only adorns the place where it ſtands, but is alſo a picturesque object to an octagon building near the lake, where it is ſhown in a ſingular ſituation, over-arched, encompaſſed, and backed with wood, without any appearance of the water beneath. This building in return is alſo an object from the bridge; and a Chineſe room, in a little iſland juſt by, is another: neither of them are conſiderable, and the others which are viſible are at a diſtance, but more or greater adventitious ornaments are not required in a ſpot ſo rich as this in beauties peculiar to its character. A profuſion of water pours in from all ſides round upon the view; the opening of the lake appears; a glimpſe is caught of the large baſin; one of the collateral ſtreams is full in ſight, and the bridge itſelf is in the midſt of the fineſt part of the river: all ſeem to communicate the one with the other. Though thickets often intercept, and groupes perplex, the view, yet they never break the connection between the ſeveral pieces of water; each may ſtill be traced along large branches, or little catches; which in ſome places are overſhadowed and dim; in others gliſten through a glade, or glimmer between the boles of trees in a diſtant perſpective; and in one, where they are quite loſt to the view, ſome arches of a ſtone-bridge, but partially ſeen among the wood, preſerve their connection.

* Vale of Aylesbury, Buckinghamſhire.

Water.

3. If a large river may ſometimes, a ſmaller current undoubtedly may often, be conducted through a wood: it ſeldom adorns, it frequently diſfigures, a proſpect, where its courſe is marked, not by any appearance of water, but by a confuſed line of clotted graſs, which diſagrees with the general verdure. A *Rivulet* may, indeed, have conſideration enough for a home ſcene, though it be open; but a *Rill* is always moſt agreeable when moſt retired from public view. Its characteriſtic excellencies are vivacity and variety, which require attention, leiſure, and ſilence, that the eye may pore upon the little beauties, and the ear liſten to the low murmurs of the ſtream without interruption. To ſuch indulgence a confined ſpot only is favourable; a cloſe

Of a Rill and a Rivulet.

7

copſe

Water. Ibid.

copſe is therefore often more acceptable than a high wood, and a ſequeſtered valley at all times preferable to any open expoſure: a ſingle rill at a very little diſtance is a mere water-courſe; it loſes all its charms; it has no importance in itſelf, and bears no proportion to the ſcene. A number of little ſtreams have indeed an effect in any ſituation, but not as objects; they are intereſting only on account of the character they expreſs, the irriguous appearance which they give to the whole.

The full tide of a large river has more force than activity, and ſeems too unwieldy to allow of very quick tranſitions. But in a rill, the agility of its motion accounts for every caprice: frequent windings diſguiſe its inſignificance; ſhort turnings ſhow its vivacity; ſudden changes in the breadth are a ſpecies of its variety; and however fantaſtically the channel may be wreathed, contracted, and widened, it ſtill appears to be natural. We find an amuſement in tracing the little ſtream through all the intricacies of its courſe, and in ſeeing it force a paſſage through a narrow ſtrait, expatiate on every opportunity, ſtruggle with obſtructions, and puzzle out its way. A rivulet, which is the mean betwixt a river and a rill, partakes of the character of both: it is not licenſed to the extravagance of the one, nor under the ſame reſtraints as the other: it may have more frequent bends than the river, longer reaches than a rill: the breadth of a ſtream determines whether the principal beauty reſults from extent or from variety.

The murmurs of a rill are amongſt the moſt pleaſing circumſtances which attend it. If the bed of the ſtream be rough, mere declivity will occaſion a conſtant ripling noiſe: when the current drops down a deſcent, though but of a few inches, or forcibly bubbles up from a little hollow, it has a deep gurgling tone, not uniformly continued, but inceſſantly repeated, and therefore more engaging than any. The flatteſt of all, is that ſound rather of the ſplaſhing than the fall of water, which an even gentle ſlope, or a tame obſtruction, will produce: this is leſs pleaſing than the others; but none ſhould be entirely excluded: all in their turns are agreeable; and the choice of them is much in our power. By obſerving their cauſes, we may often find the means to ſtrengthen, to weaken, or to change them; and the addition or removal of a ſingle ſtone, or a few pebbles, will ſometimes be ſufficient for the purpoſe.

8 Caſcades.

A rill cannot pretend to any ſound beyond that of a little water fall: the roar of a caſcade belongs only to larger ſtreams; but it may be produced by a rivulet to a conſiderable degree, and attempts to do more have generally been unſucceſsful. A vain ambition to imitate nature in her great extravagancies betrays the weakneſs of art. Though a noble river, throwing itſelf headlong down a precipice, be an object truly magnificent, it muſt however be confeſſed, that in a ſingle ſheet of water there is a formality which its vaſtneſs alone can cure. But the height, not the breadth, is the wonder: when it falls no more than a few feet, the regularity prevails; and its extent only ſerves to expoſe the vanity of affecting the ſtyle of a cataract in an artificial caſcade. It is leſs exceptionable if divided into ſeveral parts: for then each ſeparate part may be wide enough for its depth; and in the whole, variety, not greatneſs, will be the predominant character. But a ſtructure of rough, large, detached ſtones, cannot eaſily be contrived of ſtrength ſufficient to ſupport a great weight of water: it is ſometimes from neceſſity almoſt ſmooth and uniform, and then it loſes much of its effect. Several little falls in ſucceſſion are preferable to one great caſcade which in figure or in motion approaches to regularity.

Rocks.

When greatneſs is thus reduced to number, and length becomes of more importance than breadth, a rivulet vies with a river; and it more frequently runs in a continued declivity, which is very favourable to ſuch a ſucceſſion of falls. Half the expence and labour which are ſometimes beſtowed on a river, to give it at the beſt a forced precipitancy in one ſpot only, would animate a rivulet through the whole of its courſe. And, after all, the moſt intereſting circumſtance in falling waters is their animation. A great caſcade fills us with ſurpriſe: but all ſurpriſe muſt ceaſe; and the motion, the agitation, the rage, the froth, and the variety of the water, are finally the objects which engage the attention: for theſe a rivulet is ſufficient; and they may there be produced without that appearance of effort which raiſes a ſuſpicion of art.

To obviate ſuch a ſuſpicion, it may be ſometimes expedient to begin the deſcent out of ſight; for the beginning is the difficulty: if that be concealed, the ſubſequent falls ſeem but a conſequence of the agitation which characteriſes the water at its firſt appearance; and the imagination is, at the ſame time, let looſe to give ideal extent to the caſcades. When a ſtream iſſues from a wood, ſuch management will have a great effect: the bends of its courſe in an open expoſure may afford frequent opportunities for it; and ſometimes a low broad bridge may furniſh the occaſion: a little fall hid under the arch will create a diſorder; in conſequence of which, a greater caſcade below will appear very natural.

9 Of Rocks.

IV. ROCKS. Rocks are themſelves too vaſt and too ſtubborn to ſubmit to our controul; but by the addition or removal of appendages which we can command, parts may be ſhown or concealed, and the characters with their impreſſions may be weakened or enforced: to adapt the accompaniments accordingly, is the utmoſt ambition of art when rocks are the ſubject.

Their moſt diſtinguiſhed characters are, *dignity*, *terror*, and *fancy*: the expreſſions of all are conſtantly wild: and ſometimes a rocky ſcene is only wild, without pretenſions to any particular character.

Rills, rivulets, and caſcades, abound among rocks: they are natural to the ſcene; and ſuch ſcenes commonly require every accompaniment which can be procured for them. Mere rocks, unleſs they are peculiarly adapted to certain impreſſions, though they may ſurpriſe, cannot be long engaging, if the rigour of their character be not ſoftened by circumſtances which may belong either to theſe or to more cultivated ſpots: and when the drearineſs is extreme, little ſtreams and water-falls are of themſelves inſufficient for the purpoſe; an intermixture of vegetation is alſo neceſſary, and on ſome occaſions even marks of inhabitants are proper.

Large cleſts, ſloping or precipitous, with a dale at bottom, furniſh ſcenes of the wildeſt nature. In ſuch ſpots, verdure alone will give ſome relief to the drearineſs of the ſcene; and ſhrubs or buſhes, without trees,

are

Rocks. are a ſufficiency of wood: the thickets may alſo be extended by the creeping plants, ſuch as pyracantha, vines, and ivy, to wind up the ſides or cluſter on the tops of the rocks. And to this vegetation may be added ſome ſymptoms of inhabitants, but they muſt be ſlight and few; the uſe of them is only to cheer, not to deſtroy, the ſolitude of the place; and ſuch therefore ſhould be choſen as are ſometimes found in ſituations retired from public reſort; a cottage may be lonely, but it muſt not here ſeem ruinous and neglected; it ſhould be tight and warm, with every mark of comfort about it, to which its poſition in ſome ſheltered receſs may greatly contribute. A cavity alſo in the rocks, rendered eaſy of acceſs, improved to a degree of convenience, and maintained in a certain ſtate of preſervation, will ſuggeſt ſimilar ideas of protection from the bittereſt inclemencies of the ſky, and even of occaſional refreſhment and repoſe. But we may venture ſtill further; a mill is of neceſſity often built at ſome diſtance from the town which it ſupplies; and here it would at the ſame time apply the water to a uſe, and increaſe its agitation. The dale may beſides be made the haunt of thoſe animals, ſuch as goats, which are ſometimes wild, and ſometimes domeſtic; and which accidentally appearing, will divert the mind from the ſenſations natural to the ſcene, but not agreeable if continued long without interruption. Theſe and ſuch other expedients will approximate the ſevereſt retreat to the habitations of men, and convert the appearance of a perpetual baniſhment into that of a temporary retirement from ſociety.

Ibid.

But too ſtrong a force on the nature of the place always fails. A winding path, which appears to be worn, not cut, has more effect than a high road, all artificial and level, which is too weak to overbear, and yet contradicts, the general idea. The objects therefore to be introduced muſt be thoſe which hold a mean between ſolitude and population; and the inclination of that choice towards either extreme, ſhould be directed by the degree of wildneſs which prevails; for tho' that runs ſometimes to an exceſs which requires correction, at other times it wants encouragement, and at all times it ought to be preſerved: it is the predominant character of rocks, which mixes with every other, and to which all the appendages muſt be accommodated; and they may be applied ſo as greatly to increaſe it: a licentious irregularity of wood and of ground, and a fantaſtic conduct of the ſtreams, neither of which would be tolerated in the midſt of cultivation, become and improve romantic rocky ſpots; even buildings, partly by their ſtyle, but ſtill more by their poſition, in ſtrange, difficult, or dangerous ſituations, diſtinguiſh and aggravate the native extravagancies of the ſcene.

Greatneſs is a chief ingredient in the character of *dignity*, with leſs of wildneſs than in any other. The effect here depends more upon amplitude of ſurface, than variety of forms. The parts, therefore, muſt be large: if the rocks are only high, they are but ſtupendous, not majeſtic: breadth is equally eſſential to their greatneſs; and every ſlender, every groteſque ſhape, is excluded. Art may interpoſe to ſhow theſe large parts to the eye, and magnify them to the imagination, by taking away thickets which ſtretch quite acroſs the rocks, ſo as to diſguiſe their dimenſions; or by filling with wood the ſmall intervals between them, and thus, by concealing the want, preſerving the appearance of continuation. When rocks retire from the eye down a gradual declivity, we can, by raiſing the upper ground, deepen the fall, lengthen the perſpective, and give both height and extent to thoſe at a diſtance: this effect may be ſtill increaſed by covering that upper ground with a thicket, which ſhall ceaſe, or be lowered, as it deſcends. A thicket, on other occaſions, makes the rocks which riſe out of it ſeem larger than they are. If they ſtand upon a bank overſpread with ſhrubs, their beginning is at the leaſt uncertain; and the preſumption is, that they ſtart from the bottom. Another uſe of this bruſhy underwood is to conceal the fragments and rubbiſh which have fallen from the ſides and the brow, and which are often unſightly. Rocks are ſeldom remarkable for the elegance of their forms; they are too vaſt, and too rude, to pretend to delicacy: but their ſhapes are often agreeable; and we can affect thoſe ſhapes to a certain degree, at leaſt we can cover many blemiſhes in them, by conducting the growth of ſhrubby and creeping plants about them.

Rocks.

For all theſe purpoſes mere underwood ſuffices: but for greater effects larger trees are requiſite: they are worthy of the ſcene; and not only improvements, but acceſſions to its grandeur: we are uſed to rank them among the nobleſt objects of nature; and when we ſee that they cannot aſpire to the midway of the heights around them, the rocks are raiſed by the compariſon. A ſingle tree is, therefore, often preferable to a clump: the ſize, though really leſs, is more remarkable: and clumps are beſides generally exceptionable in a very wild ſpot, from the ſuſpicion of art which attends them; but a wood is free from that ſuſpicion, and its own character of greatneſs recommends it to every ſcene of magnificence.

On the ſame principle, all poſſible conſideration ſhould be given to the ſtreams. No number of little rills are equal to one broad river; and in the principal current, ſome varieties may be ſacrificed to importance: but a degree of ſtrength ſhould always be preſerved: the water, though it needs not be furious, ſhould not be dull; for dignity, when moſt ſerene, is not languid; and ſpace will hardly atone for want of animation.

This character does not exclude marks of inhabitants, though it never requires them to tame its wildneſs: and without inviting, it occaſionally admits an intermixture of vegetation. It even allows of buildings intended only to decorate the ſcene: but they muſt be adequate to it, both in ſize and in character. And if cultivation is introduced, that too ſhould be conformable to the reſt; not a ſingle narrow patch cribbed out of the waſte; but the conſines of a country ſhelving into the vale, and ſuggeſting the idea of extent: nothing trivial ought to find admittance. But, on the other hand, no extravagance required to ſupport it: ſtrange ſhapes in extraordinary poſitions, enormous weights unaccountably ſuſtained, trees rooted in the ſides, and torrents raging at the foot of the rocks, are at the beſt needleſs exceſſes. There is a temperance in dignity, which is rather hurt by a wanton violence on the common order of nature.

The terrors of a ſcene in nature are like thoſe of a dramatic repreſentation: they give an alarm; but the ſenſations are agreeable, ſo long as they are kept to

ſuch

such as are allied only to terror, unmixed with any that are horrible and disgusting. Art may therefore be used to heighten them, to display the objects which are distinguished by greatness, to improve the circumstances which denote force, to mark those which intimate danger, and to blend with all here and there a cast of melancholy.

Greatness is as essential to the character of *terror* as to that of dignity: vast efforts in little objects are but ridiculous; nor can force be supposed upon trifles incapable of resistance. On the other hand, it must be allowed, that exertion and violence supply some want of space. A rock wonderfully supported, or threatening to fall, acquires a greatness from its situation, which it has not in dimensions; so circumstanced, the size appears to be monstrous: a torrent has a consequence which a placid river of equal breadth cannot pretend to: and a tree, which would be inconsiderable in the natural soil, becomes important when it bursts forth from a rock.

Such circumstances should be always industriously sought for. It may be worth while to cut down several trees, in order to exhibit one apparently rooted in the stone. By the removal perhaps of only a little brushwood, the alarming disposition of a rock, strangely undermined, rivetted, or suspended, may be shown; and if there be any soil above its brow, some trees planted there, and impending over it, will make the object still more extraordinary. As to the streams, great alterations may generally be made in them: and therefore it is of use to ascertain the species proper to each scene, because it is in our power to enlarge or contract their dimensions; to accelerate or retard their rapidity; to form, increase, or take away obstructions; and always to improve, often to change, their characters.

Inhabitants furnish frequent opportunities to strengthen the appearances of force, by giving intimations of danger. A house placed at the edge of a precipice, any building on the pinnacle of a craig, makes that situation seem formidable, which might otherwise have been unnoticed: a steep, in itself not very remarkable, becomes alarming, when a path is carried aslant up the side: a rail on the brow of a perpendicular fall, shows that the height is frequented and dangerous: and a common foot-bridge thrown over a cleft between rocks has a still stronger effect. In all these instances, the imagination immediately transports the spectator to the spot, and suggests the idea of looking down such a depth: in the last, that depth is a chasm, and the situation is directly over it.

In other instances, exertion and danger seem to attend the occupations of the inhabitants:

> ——Half way down
> Hangs one that gathers samphire; dreadful trade!

is a circumstance chosen by the great poet of nature, to aggravate the terrors of the scene he describes.

The different species of rocks often meet in the same place, and compose a noble scene, which is not distinguished by any particular character: it is only when one eminently prevails, that it deserves such a preference as to exclude every other. Sometimes a spot, remarkable for nothing but its wildness, is highly romantic: and when this wildness rises to *fancy*; when the most singular, the most opposite forms and combinations are thrown together; then a mixture also of several characters adds to the number of instances which there concur to display the inexhaustible variety of nature.

So much variety, so much fancy, are seldom found within the same extent as in Dovedale †. It is about two miles in length, a deep, narrow, hollow valley: both the sides are of rock; and the Dove in its passage between them is perpetually changing its course, its motion, and appearance. It is never less than ten, nor so much as twenty yards wide, and generally about four feet deep; but transparent to the bottom, except when it is covered with a foam of the purest white, under water-falls, which are perfectly lucid. These are very numerous, but very different. In some places they stretch straight across, or aslant the stream: in others, they are only partial: and the water either dashes against the stones, and leaps over them, or, pouring along a steep, rebounds upon those below; sometimes it rushes through the several openings between them; sometimes it drops gently down; and at other times it is driven back by the obstruction, and turns into an eddy. In one particular spot, the valley almost closing, leaves hardly a passage for the river, which pent up, and struggling for a vent, rages, and roars, and foams, till it has extricated itself from the confinement. In other parts, the stream, though never languid, is often gentle; flows round a little desart island, glides between bits of bulrushes, disperses itself among tufts of grass or of moss, bubbles about a water-dock, or plays with the slender threads of aquatic plants which float upon the surface. The rocks all along the dale vary as often in their structure as the stream in its motion. In one place, an extended surface gradually diminishes from a broad base almost to an edge; in another, a heavy top hanging forwards, overshadows all beneath: sometimes many different shapes are confusedly tumbled together; and sometimes they are broken into slender sharp pinnacles, which rise upright, often two or three together, and often in more numerous clusters. On this side of the dale, they are universally bare; on the other, they are intermixed with wood; and the vast height of both the sides, with the narrowness of the interval between them, produces a further variety: for whenever the sun shines from behind the one, the form of it is distinctly and completely cast upon the other; the rugged surface on which it falls diversifies the tints; and a strong reflected light often glares on the edge of the deepest shadow. The rocks never continue long in the same figure or situation, and are very much separated from each other: sometimes they form the sides of the valley, in precipices, in steeps, or in stages; sometimes they seem to rise in the bottom, and lean back against the hill; and sometimes they stand out quite detached, heaving up in cumbrous piles, or starting into conical shapes, like vast spars, 100 feet high; some are firm and solid throughout; some are cracked; and some, split and undermined, are wonderfully upheld by fragments apparently unequal to the weight they sustain. One is placed before, one over another, and one fills at some distance behind an interval between two. The changes in their disposition are infinite; every step produces some new combination; they are continually crossing, advancing, and retiring:

† Near Ashbourne in Derbyshire.

Rocks. Ibid.

tiring: the breadth of the valley is never the ſame 40 yards together: at the narrow paſs which has been mentioned, the rocks almoſt meet at the top, and the ſky is ſeen as through a chink between them: juſt by this gloomy abyſs, is a wider opening, more light, more verdure, more cheerfulneſs, than any where elſe in the dale. Nor are the forms and the ſituations of the rocks their only variety: many of them are perforated by large natural cavities, ſome of which open to the ſky, ſome terminate in dark receſſes, and through ſome are to be ſeen ſeveral more uncouth arches, and rude pillars, all detached, and retiring beyond each other, with the light ſhining in between them, till a rock far behind them cloſes the perſpective: the noiſe of the caſcades in the river echoes amongſt them; the water may often be heard at the ſame time gurgling near, and roaring at a diſtance; but no other ſounds diſturb the ſilence of the ſpot: the only trace of men is a blind path, but lightly and but ſeldom trodden, by thoſe whom curioſity leads to ſee the wonders they have been told of Dovedale. It ſeems indeed a fitter haunt for more ideal beings: the whole has the air of enchantment. The perpetual ſhifting of the ſcenes; the quick tranſitions, the total changes; then the forms all around, groteſque as chance can caſt, wild as nature can produce, and various as imagination can invent; the force which ſeems to have been exerted to place ſome of the rocks where they are now fixed immoveable, the magic by which others appear ſtill to be ſuſpended; the dark caverns, the illuminated receſſes, the fleeting ſhadows, and the gleams of light glancing on the ſides, or trembling on the ſtream; and the lonelineſs and the ſtillneſs of the place, all crowding together on the mind, almoſt realize the ideas which naturally preſent themſelves in this region of romance and of fancy.

The ſolitude of ſuch a ſcene is agreeable, on account of the endleſs entertainment which its variety affords, and in the contemplation of which both the eye and the mind are delighted to indulge: marks of inhabitants and cultivation would diſturb that ſolitude; and ornamental buildings are too artificial in a place ſo abſolutely free from reſtraint. The only accompaniments proper for it are wood and water; and by theſe ſometimes improvements may be made. When two rocks ſimilar in ſhape and poſition are near together, by ſkirting one of them with wood, while the other is left bare, a material diſtinction is eſtabliſhed between them: if the ſtreams be throughout of one character, it is in our power, and ſhould be our aim, to introduce another. Variety is the peculiar property of the ſpot, and every acceſſion to it is a valuable acquiſition. On the ſame principle, endeavours ſhould be uſed not only to multiply, but to aggravate differences, and to increaſe diſtinctions into contraſts: but the ſubject will impoſe a caution againſt attempting too much. Art muſt almoſt deſpair of improving a ſcene, where nature ſeems to have exerted her invention.

Practical Treatiſe on Planting and Gardening, p. 593, &c.

§ 2. *Of* FACTITIOUS ACCOMPANIMENTS.

THESE conſiſt of Fences, Walks, Roads, Bridges, Seats, and Buildings.

"I. The FENCE, where the place is large, becomes neceſſary; yet the eye diſlikes conſtraint. Our ideas of liberty carry us beyond our own ſpecies: the imagination feels a diſlike in ſeeing even the brute creation in a ſtate of confinement. The birds waſting themſelves from wood to grove are objects of delight; and the hare appears to enjoy a degree of happineſs unknown to the barriered flock. Beſides, a tall fence frequently hides from the ſight objects the moſt pleaſing; not only the flocks and herds themſelves, but the ſurface they graze upon. Theſe conſiderations have brought the unſeen fence into general uſe. Fence, Ibid.

This ſpecies of barrier it muſt be allowed incurs a degree of deception, which can ſcarcely be warranted upon any other occaſion. In this inſtance, however, it is a ſpecies of fraud which we obſerve in nature's practice: how often have we ſeen two diſtinct herds feeding to appearance in the ſame extended meadow; until coming abruptly upon a deep ſunk rivulet, or an unfordable river, we diſcover the deception.

Beſides the ſunk fence, another ſort of unſeen barrier may be made, though by no means equal to that, eſpecially if near the eye. This is conſtructed of paling, painted of the inviſible green. If the colour of the back-ground were permanent, and that of the paint made exactly to correſpond with it, the deception would at a diſtance be complete; but back-grounds in general changing with the ſeaſon, this kind of fence is the leſs eligible.

Clumps and patches of woodineſs ſcattered promiſcuouſly on either ſide of an unſeen winding fence, aſſiſt very much in doing away the idea of conſtraint. For by this means

> The wand'ring flocks that brouſe between the ſhades,
> Seem oft to paſs their bounds, the dubious eye
> Decides not if they crop the mead or lawn. MASON.

"II. The WALK, in extenſive grounds is as neceſſary as the fence. The beauties of the place are diſcloſed that they may be ſeen; and it is the office of the walk to lead the eye from view to view; in order that whilſt the tone of health is preſerved by the favourite exerciſe of nature, the mind may be thrown into uniſon by the harmony of the ſurrounding objects.

The direction of the walk muſt be guided by the points of view to which it leads, and the nature of the ground it paſſes over: it ought to be made ſubſervient to the natural impediments (the ground, wood, and water) which fall in its way, without appearing to have any direction of its own. It can ſeldom run with propriety any diſtance in a ſtraight line; a thing which rarely occurs in a natural walk. The paths of the Negroes and the Indians are always crooked; and thoſe of the brute creation are very ſimilar. Mr Maſon's deſcription of this path of nature is happily conceived.

> The peaſant driving through each ſhadowy lane
> His team, that bends beneath th' incumbent weight
> Of laughing Ceres, marks it with his wheel;
> At night and morn, the milk-maid's careleſs ſtep
> Has, through yon paſture green, from ſtile to ſtile
> Impreſt a kindred curve: the ſcudding hare
> Draws to her dew-ſprent ſeat, o'er thymy heaths,
> A path as gently waving. ——— *Eng. Gard.* v. 60.

"III. The ROAD may be a thing of neceſſity, as an approach to the manſion; or a matter of amuſement only, as a drive or a ride, from which the grounds and the ſurrounding country may be ſeen to advantage.

It

dge, &c. Ibid.

It ſhould be the ſtudy of the artiſt to make the ſame road anſwer, as far as may be, the two-fold purpoſe.

The road and the walk are ſubject to the ſame rule of nature and uſe. The direction ought to be natural and eaſy, and adapted to the purpoſe intended. A road of neceſſity ought to be ſtraighter than one of mere convenience: in this, recreation is the predominant idea; in that, utility. But even in this the direct line may be diſpenſed with. The natural roads upon heaths and open downs, and the graſſy glades and green roads acroſs foreſts and extenſive waſtes, are proper ſubjects to be ſtudied.

" IV. The BRIDGE ſhould never be ſeen where it is not wanted: a uſeleſs bridge is a deception; deceptions are frauds; and fraud is always hateful, unleſs when practiſed to avert ſome greater evil. A bridge without water is an abſurdity; and half an one ſtuck up as an eye-trap is a paltry trick, which, though it may ſtrike the ſtranger, cannot fail of diſguſting when the fraud is found out.

In low ſituations, and wherever water abounds, bridges become uſeful, and are therefore pleaſing objects: they are looked for; and ought to appear not as objects of ornament only, but likewiſe as matters of utility. The walk or the road therefore ought to be directed in ſuch a manner as to croſs the water at the point in which the bridge will appear to the greateſt advantage.

In the conſtruction of bridges alſo, regard muſt be had to ornament and utility. A bridge is an artificial production, and as ſuch it ought to appear. It ranks among the nobleſt of human inventions; the ſhip and the fortreſs alone excel it. Simplicity and firmneſs are the leading principles in its conſtruction. Mr Wheatley's obſervation is juſt when he ſays, " The ſingle wooden arch, now much in faſhion, ſeems to me generally miſapplied. Elevated without occaſion ſo much above, it is totally detached from the river; it is often ſeen ſtraddling in the air, without a glimpſe of water to account for it; and the oſtentation of it as an ornamental object, diverts all that train of ideas which its uſe as a communication might ſuggeſt." But we beg leave to differ from this ingenious writer when he tells us, " that it is ſpoiled if adorned; it is diſfigured if only painted of any other than a duſky colour." In a ruſtic ſcene, where Nature wears her own coarſe garb, " the vulgar foot bridge of planks only guarded on one hand by a common rail, and ſupported by a few ordinary piles," may be in character; but amidſt a diſplay of ornamented nature, a contrivance of that kind would appear mean and paltry; and would be an affectation of ſimplicity rather than the lovely attribute itſelf. In cultivated ſcenes, the bridge ought to receive the ornaments which the laws of architectural taſte allow; and the more poliſhed the ſituation, the higher ſhould be the ſtyle and finiſhings.

" V. SEATS have a two-fold uſe; they are uſeful as places of reſt and converſation, and as guides to the points of view in which the beauties of the ſurrounding ſcene are diſcloſed. Every point of view ſhould be marked with a ſeat; and, ſpeaking generally, no ſeat ought to appear but in ſome favourable point of view. This rule may not be invariable, but it ought ſeldom to be deviated from.

In the ruder ſcenes of neglected nature, the ſimple trunk, rough from the woodman's hands, and the butts or ſtools of rooted trees, without any other marks of tools upon them than thoſe of the ſaw which ſevered them from their ſtems, are ſeats in character; and in romantic or recluſe ſituations, the cave or the grotto are admiſſible. But wherever human deſign has been executed upon the natural objects of the place, the ſeat and every other artificial accompaniment ought to be in uniſon; and whether the bench or the alcove be choſen, it ought to be formed and finiſhed in ſuch a manner as to unite with the wood, the lawn, and the walk, which lie around it.

The colour of ſeats ſhould likewiſe be ſuited to ſituations: where uncultivated nature prevails, the natural brown of the wood itſelf ought not to be altered; but where the rural art preſides, white or ſtone colour has a much better effect."

" VI. BUILDINGS probably were firſt introduced into gardens merely for convenience, to afford refuge from a ſudden ſhower, and ſhelter againſt the wind; or, at the moſt, to be ſeats for a party; or for retirement. They have ſince been converted into objects, and now the original *uſe* is too often forgotten in the greater purpoſes to which they are applied: they are conſidered as objects only; the inſide is totally neglected, and a pompous edifice frequently wants a room barely comfortable. Sometimes the pride of making a laviſh diſplay to a viſitor without any regard to the owner's enjoyments, and ſometimes too ſcrupulous an attention to the ſtyle of the ſtructure, occaſions a poverty and dullneſs within, which deprive the buildings of part of their utility. But in a garden they ought to be conſidered both as beautiful objects and as agreeable retreats: if a character becomes them, it is that of the ſcene they belong to; not that of their primitive application. A Grecian temple, or Gothic church may adorn ſpots where it would be affectation to preſerve that ſolemnity within which is proper for places of devotion: they are not to be exact models, ſubjects only of curioſity or ſtudy: they are alſo ſeats: and ſuch ſeats will be little frequented by the proprietor; his mind muſt generally be indiſpoſed to ſo much ſimplicity, and ſo much gloom, in the midſt of gaiety, richneſs, and variety.

Mr Wheatley's Obſervations reſumed.

But though the interior of buildings ſhould not be diſregarded, it is by their exterior that they become *objects*; and ſometimes by the one, ſometimes by the other, and ſometimes by both, they are intitled to be conſidered as *characters*.

Buildings. Ibid.

1. As objects, they are deſigned either to *diſtinguiſh*, or to *break*, or to *adorn*, the ſcenes to which they are applied.

Of buildings intended for objects.

The differences between one wood, one lawn, one piece of water, and another, are not always very apparent; the ſeveral parts of a garden would, therefore, often ſeem ſimilar, if they were not diſtinguiſhed by buildings: but theſe are ſo obſervable, ſo obvious at a glance, ſo eaſily retained in the memory, they mark the ſpots where they are placed with ſo much ſtrength, they attract the relation of all around with ſo much

Buildings. power, that parts thus diſtinguiſhed can never be confounded together. Yet it by no means follows, that therefore every ſcene muſt have its edifice: the want of one is ſometimes a variety; and other circumſtances are often ſufficiently characteriſtic: it is only when theſe too nearly agree, that we muſt have recourſe to buildings for differences: we can introduce, exhibit, or contraſt them as we pleaſe: the moſt ſtriking object is thereby made a mark of diſtinction; and the force of this firſt impreſſion prevents our obſerving the points of reſemblance.

Obſerv. on Mod. Gardening.

The uniformity of a view may be broken by ſimilar means, and on the ſame principle: when a wide heath, a dreary moor, or a continued plain, is in proſpect, objects which catch the eye ſupply the want of variety: none are ſo effectual for this purpoſe as buildings. Plantations or water can have no very ſenſible effect, unleſs they are large or numerous, and almoſt change the character of the ſcene: but a ſmall ſingle building diverts the attention at once from the ſameneſs of the extent; which it breaks, but does not divide; and diverſifies, without altering, its nature. The deſign, however, muſt not be apparent. The merit of a cottage applied to this purpoſe, conſiſts in its being free from the ſuſpicion: and a few trees near it will both enlarge the object, and account for its poſition. Ruins are a hackneyed device immediately detected, unleſs their ſtyle be ſingular, or their dimenſions extraordinary. The ſemblance of an ancient Britiſh monument might be adapted to the ſame end, with little trouble, and great ſucceſs. The materials might be brick, or even timber plaſtered over, if ſtone could not eaſily be procured: whatever they were, the fallacy would not be diſcernible; it is an object to be ſeen at a diſtance, rude, and large, and in character agreeable to a wild open view. But no building ought to be introduced, which may not in reality belong to ſuch a ſituation: no Grecian temples, no Turkiſh moſques, no Egyptian obeliſks or pyramids; none imported from foreign countries, and unuſual here. The apparent artifice would deſtroy an effect, which is ſo nice as to be weakened, if objects proper to produce it are diſplayed with too much oſtentation; if they ſeem to be contrivances, not accidents; and the advantage of their poſition appear to be more laboured than natural.

But in a garden, where objects are intended only to adorn, every ſpecies of architecture may be admitted, from the Grecian down to the Chineſe; and the choice is ſo free, that the miſchief moſt to be apprehended is an abuſe of this latitude in the multiplicity of buildings. Few ſcenes can bear more than two or three: in ſome, a ſingle one has a greater effect than any number: and a careleſs glimpſe, here and there, of ſuch as belong immediately to different parts, frequently enliven the landſcape with more ſpirit than thoſe which are induſtriouſly ſhown. If the effect of a partial ſight, or a diſtant view, were more attended to, many ſcenes might be filled, without being crowded; a greater number of buildings would be tolerated, when they ſeemed to be caſual, not forced; and the animation, and the richneſs of the objects, might be had without pretence or diſplay.

Too fond an oſtentation of buildings, even of theſe which are principal, is a common error; and when all is done, they are not always ſhown to the greateſt advantage. Though their ſymmetry and their beauties ought in general to be diſtinctly and fully ſeen, yet an oblique is ſometimes better than a direct view: and they are often leſs agreeable objects when entire, than when a part is covered, or their extent is interrupted; when they are boſomed in wood, as well as backed by it; or appear between the ſtems of trees which riſe before or above them: thus thrown into perſpective, thus grouped and accompanied, they may be as important as if they were quite expoſed, and are frequently more picturesque and beautiful. Building

But a ſtill greater advantage ariſes from this management, in connecting them with the ſcene: they are conſiderable, and different from all around them; inclined therefore to ſeparate from the reſt; and yet they are ſometimes ſtill more detached by the pains taken to exhibit them: that very importance which is the cauſe of the diſtinction ought to be a reaſon for guarding againſt the independence to which it is naturally prone, and by which an object, which ought to be a part of the whole, is reduced to a mere individual. An elevated is generally a noble ſituation. When it is a point or a pinnacle, the ſtructure may be a continuation of the aſcent; and on many occaſions, ſome parts of the building may deſcend lower than others, and multiply the appearances of connection: but an edifice in the midſt of an extended ridge, commonly ſeems naked alone, and impoſed upon the brow, not joined to it. If wood, to accompany it, will not grow there, it had better be brought a little way down the declivity; and then all behind, above, and about it, are ſo many points of contact, by which it is incorporated into the landſcape.

Accompaniments are important to a building; but they loſe much of their effect when they do not appear to be caſual. A little mount juſt large enough for it; a ſmall piece of water below, of no other uſe than to reflect it; and a plantation cloſe behind, evidently placed there only to give it relief; are as artificial as the ſtructure itſelf, and alienate it from the ſcene of nature into which it is introduced, and to which it ought to be reconciled. Theſe appendages therefore ſhould be ſo diſpoſed, and ſo connected with the adjacent parts, as to anſwer other purpoſes, though applicable to this: that they may be bonds of union, not marks of difference; and that the ſituation may appear to have been choſen at the moſt, not made, for the building.

In the choice of a ſituation, that which ſhows the building beſt ought generally to be preferred: eminence, relief, and every other advantage which can be, ought to be given to an object of ſo much conſideration: they are for the moſt part deſirable; ſometimes neceſſary; and exceptionable only when, inſtead of riſing out of the ſcene, they are forced into it, and a contrivance to procure them at any rate is avowed without any diſguiſe. There are, however, occaſions, in which the moſt tempting advantages of ſituation muſt be waved; the general compoſition may forbid a building in one ſpot, or require it in another; at other times, the intereſt of the particular groupe it belongs to, may exact a ſacrifice of the opportunities to exhibit

ildings. exhibit its beauties and importance: and at all times, the pretenſions of every individual object muſt give way to the greater effect of the whole.

Ibid.

2. The ſame ſtructure which adorns as an object, may alſo be expreſſive as a *character*. Where the former is not wanted, the latter may be deſirable: or it may be weak for one purpoſe, and ſtrong for the other; it may be grave, or gay; magnificent, or ſimple; and, according to its ſtyle, may or may not be agreeable to the place it is applied to. But mere conſiſtency is not all the merit which buildings can claim: their characters are ſometimes ſtrong enough to *determine*, *improve*, or *correct*, that of the ſcene: and they are ſo conſpicuous, and ſo diſtinguiſhed, that whatever force they have is immediately and ſenſibly felt. They are fit therefore to make a firſt impreſſion; and when a ſcene is but faintly characteriſed they give at once a caſt which ſpreads over the whole, and which the weaker parts concur to ſupport, though perhaps they were not able to produce it.

Nor do they ſtop at fixing an uncertainty, or removing a doubt; they raiſe and enforce a character already marked: a temple adds dignity to the nobleſt, a cottage ſimplicity to the moſt rural, ſcenes; the lightneſs of a ſpire, the airineſs of an open rotunda, the ſplendor of a continued colonnade, are leſs ornamental than expreſſive; others improve cheerfulneſs into gaiety, gloom into ſolemnity, and richneſs into profuſion: a retired ſpot, which might have been paſſed unobſerved, is noticed for its tranquillity, as ſoon as it is appropriated by ſome ſtructure to retreat; and the moſt unfrequented place ſeems leſs ſolitary than one which appears to have been the haunt of a ſingle individual, or even of a ſequeſtered family, and is marked by a lonely dwelling, or the remains of a deſerted habitation.

The means are the ſame, the application of them only is different, when buildings are uſed to correct the character of the ſcene; to enliven its dulneſs, mitigate its gloom, or to check its extravagance; and, on a variety of occaſions, to ſoften, to aggravate, or to counteract, particular circumſtances attending it. But care muſt be taken that they do not contradict too ſtrongly the prevailing idea: they may leſſen the drearineſs of a waſte, but they cannot give it amenity; they may abate horrors, but they will never convert them into graces; they may make a tame ſcene agreeable, and even intereſting, not romantic; or turn ſolemnity into cheerfulneſs, but not into gaiety. In theſe, and in many other inſtances, they correct the character, by giving it an inclination towards a better, which is not very different; but they can hardly alter it entirely: when they are totally inconſiſtent with it, they are at the beſt nugatory.

The great effects which have been aſcribed to buildings do not depend upon thoſe trivial ornaments and appendages which are often too much relied on; ſuch as the furniture of a hermitage, painted glaſs in a Gothic church, and ſculpture about a Grecian temple; groteſque or bacchanalian figures to denote gaiety, and death's-heads to ſignify melancholy. Such devices are only deſcriptive, not expreſſive, of character; and muſt not be ſubſtituted in the ſtead of thoſe ſuperior properties, the want of which they acknowledge, but do not ſupply. They beſides often require time to trace their meaning, and to ſee their application; but the peculiar excellence of buildings is, that their effects are inſtantaneous, and therefore the impreſſions they make are forcible. In order to produce ſuch effects, the general ſtyle of the ſtructure, and its poſition, are the principal conſiderations: either of them will ſometimes be ſtrongly characteriſtic alone; united, their powers are very great; and both are ſo important, that if they do not concur, at leaſt they muſt not contradict one another. Buildings.

Every branch of architecture furniſhes, on different occaſions, objects proper for a garden; and there is no reſtraint on our ſelection, provided it be conformable to the ſtyle of the ſcene, proportioned to its extent, and agreeable to its character. 72 Species and ſituations of buildings.

The choice of ſituations is alſo very free. A hermitage, indeed, muſt not be cloſe to a road; but whether it be expoſed to view on the ſide of a mountain, or concealed in the depth of a wood, is almoſt a matter of indifference; that it is at a diſtance from public reſort is ſufficient. A caſtle muſt not be ſunk in a bottom; but that it ſhould ſtand on the utmoſt pinnacle of a hill, is not neceſſary: on a lower knole, and backed by the riſe, it may appear to greater advantage as an object, and be much more important to the general compoſition. Many buildings, which from their ſplendor beſt become an open expoſure, will yet be ſometimes not ill beſtowed on a more ſequeſtered ſpot, either to characteriſe or adorn it; and others, for which a ſolitary would in general be preferred to an eminent ſituation, may occaſionally be objects in very conſpicuous poſitions. A Grecian temple, from its peculiar grace and dignity, deſerves every diſtinction; it may, however, in the depth of a wood, be ſo circumſtanced, that the want of thoſe advantages to which it ſeems intitled will not be regretted. A happier ſituation cannot be deviſed, than that of the temple of Pan on the ſouth lodge on Enfield chace. It is of the uſual oblong form, encompaſſed by a colonnade; in dimenſions, and in ſtyle, it is equal to a moſt extenſive landſcape: and yet by the antique and ruſtic air of its Doric columns without baſes; by the chaſtity of its little ornaments, a crook, a pipe, and a ſcrip, and thoſe only over the doors; and by the ſimplicity of the whole both within and without; it is adapted with ſo much propriety to the thickets which conceal it from the view, that no one can wiſh it to be brought forward, who is ſenſible to the charms of the Arcadian ſcene which this building alone has created. On the other hand, a very ſpacious field, or ſheep-walk, will not be diſgraced by a farm-houſe, a cottage, or a Dutch barn; nor will they, though ſmall and familiar, appear to be inconſiderable or inſignificant objects. Numberleſs other inſtances might be adduced to prove the impoſſibility of reſtraining particular buildings to particular ſituations, upon any general principles: the variety in their forms is hardly greater than in their application. Only let not their uſes be diſguiſed, as is often abſurdly attempted with the lumbler kinds. "A barn * dreſſed up in the habit of a country-church, or a farm-houſe figuring away in the fierceneſs of a caſtle, are ridiculous deceptions. A landſcape daubed upon a board, and a wooden ſteeple ſtuck up in a wood, are beneath contempt."

* *Planting and Gardening*, p. 593.

Temples, thoſe favourite and moſt coſtly objects in gardens, too generally merit cenſure for their inutility, their

Buildings. their profuſion, or the impropriety of their purpoſe. "Whether they be dedicated to Bacchus, Venus, Priapus, or any other demon of debauchery, they are in this age, enlightened with regard to theological and ſcientific knowledge, equally abſurd. Architecture, in this part of its ſphere, may more nobly, and with greater beauty and effect, be exerciſed upon a chapel, a mauſoleum, a monument, judiciouſly diſpoſed among
Ibid. p. 599. the natural ornaments. The late Sir William Harbord, has given us a model of the firſt kind, at Gunton, in Norfolk; the pariſh-church ſtanding in his park, and being an old unſightly building, he had it taken down, and a beautiful temple, under the direction of the Adams's erected upon its ſite for the ſame ſacred purpoſe:—The mauſoleum at Caſtle-Howard, in Yorkſhire, the ſeat of the earl of Carliſle, is a noble ſtructure:—And as an inſtance of the laſt ſort, may be mentioned the Temple of Concord and Victory at Stowe, erected to the memory of the great lord Chatham and his glorious war; a beautiful monumental building, ſuited to the greatneſs of the occaſion."

To the great variety above mentioned muſt be added, Mr Wheatley obſerves, the many changes which may be made by the means of ruins. They are a claſs by themſelves, beautiful as objects, expreſſive as characters, and peculiarly calculated to connect with appendages into elegant groupes. They may be accommodated with eaſe to irregularity of ground, and their diſorder is improved by it. They may be intimately blended with trees and thickets; and the interruption is an advantage: for imperfection and obſcurity are their properties; and to carry the imagination to ſomething greater than is ſeen, is their effect. They may for any of theſe purpoſes be ſeparated into detached pieces; contiguity is not neceſſary, nor even the appearance of it, if the relation be preſerved; but ſtraggling ruins have a bad effect, when the ſeveral parts are equally conſiderable. There ſhould be one large maſs to raiſe an idea of greatneſs, to attract the others about it, and to be a common centre of union to all: the ſmaller pieces then mark the original dimenſions of one extenſive ſtructure; and no longer appear to be the remains of ſeveral little buildings.

Obſervations on Mod. Gardening.

All remains excite an inquiry into the former ſtate of the edifice, and fix the mind in a contemplation of the uſe it was applied to; beſides the characters expreſſed by their ſtyle and poſition, they ſuggeſt ideas which would not ariſe from the buildings if entire. The purpoſes of many have ceaſed: an abbey, or a caſtle, if complete, can now be no more than a dwelling; the memory of the times, and of the manners to which they are adapted, is preſerved only in hiſtory, and in ruins; and certain ſenſations of regret, of veneration, or compaſſion, attend the recollection. Nor are theſe confined to the remains of buildings which are now in diſuſe: thoſe of an old manſion raiſe reflections on the domeſtic comforts once enjoyed, and the ancient hoſpitality which reigned there. Whatever building we ſee in decay, we naturally contraſt its preſent to its former ſtate, and delight to ruminate on the compariſon. It is true that ſuch effects properly belong to real ruins; they are however produced in a certain degree by thoſe which are fictitious: the impreſſions are not ſo ſtrong, but they are exactly ſimilar; and the repreſentation, though it does not preſent facts to the memory, yet ſuggeſts ſubjects to the imagination. But, in order to affect the fancy, the ſuppoſed original deſign ſhould be clear, the uſe obvious, and the form eaſy to be traced: no fragments ſhould be hazarded without a preciſe meaning, and an evident connection; none ſhould be perplexed in their conſtruction, or uncertain as to their application. Conjectures about the form, raiſe doubts about the exiſtence of the ancient ſtructure: the mind muſt not be allowed to heſitate; it muſt be hurried away from examining into the reality, by the exactneſs and the force of the reſemblance. Buildings.

In the ruins of Tintern abbey †, the original conſtruction of the church is perfectly marked; and it is principally from this circumſtance that they are celebrated as a ſubject of curioſity and contemplation. The walls are almoſt entire; the roof only is fallen in, but moſt of the columns which divided the ayles are ſtill ſtanding: of thoſe which have dropped down, the baſes remain, every one exactly in its place; and in the middle of the nave four lofty arches, which once ſupported the ſteeple, riſe high in the air above all the reſt, each reduced now to a narrow rim of ſtone, but completely preſerving its form. The ſhapes even of the windows are little altered: but ſome of them are quite obſcured, others partially ſhaded, by tufts of ivy; and thoſe which are moſt clear, are edged with its ſlender tendrils, and lighter foliage, wreathing about the ſides and the diviſions: it winds round the pillars; it clings to the walls; and in one of the ayles cluſters at the top in bunches, ſo thick and ſo large as to darken the ſpace below. The other ayles, and the great nave, are expoſed to the ſky: the floor is entirely overſpread with turf; and to keep it clear from weeds and buſhes, is now its higheſt preſervation. Monkiſh tomb-ſtones, and the monuments of benefactors long ſince forgotten, appear above the green ſward; the baſes of the pillars which have fallen, riſe out of it; and maimed effigies, and ſculpture worn with age and weather, Gothic capitals, carved cornices, and various fragments, are ſcattered about, or lie in heaps piled up together. Other ſhattered pieces, though diſjointed and mouldering, ſtill occupy their original places; and a ſtair-caſe much impaired, which led to a tower now no more, is ſuſpended at a great height, uncovered and inacceſſible. Nothing is perfect; but memorials of every part ſtill ſubſiſt; all certain, but all in decay; and ſuggeſting at once every idea which can occur in a ſeat of devotion, ſolitude, and deſolation. Upon ſuch models, fictitious ruins ſhould be formed: and if any parts are entirely loſt, they ſhould be ſuch as the imagination can eaſily ſupply from thoſe which are ſtill remaining. Diſtinct traces of the building which is ſuppoſed to have exiſted, are leſs liable to the ſuſpicion of artifice, than an unmeaning heap of confuſion. Preciſion is always ſatisfactory, but in the reality it is only agreeable; in the copy it is eſſential to the imitation.

† Between Chepſtow and Monmouth.

A material circumſtance to the truth of the imitation is, that the ruins appear to be very old. The idea is beſides intereſting in itſelf: a monument of antiquity is never ſeen with indifference; and a ſemblage of age may be given to the repreſentation by the hue of the materials, the growth of ivy and other plants, and cracks

rts, &c. Ibid.

cracks and fragments feemingly occafioned rather by decay than by deſtruction. An appendage evidently more modern than the principal ſtructure will ſometimes corroborate the effect: the ſhed of a cottager amidſt the remains of a temple, is a contraſt both to the former and to the preſent ſtate of the building; and a tree flouriſhing among ruins, ſhows the length of time they have lain neglected. No circumſtance ſo forcibly marks the deſolation of a ſpot once inhabited, as the prevalence of nature over it:

Campos ubi Troja fuit,

is a ſentence which conveys a ſtronger idea of a city totally overthrown, than a deſcription of its remains; but in a repreſentation to the eye, ſome remains muſt appear; and then the perverſion of them to an ordinary uſe, or an intermixture of a vigorous vegetation, intimates a ſettled deſpair of their reſtoration.

Sect. II. *Principles of Selection and Arrangement in the Subjects of Gardening.*

lanting d Gar- ning, 602.

I. Of ART. In the lower claſſes of rural improvements, art ſhould be ſeen as little as may be; and in the more negligent ſcenes of nature, every thing ought to appear as if it had been done by the general laws of nature, or had grown out of a ſeries of fortuitous circumſtances. But in the higher departments, art cannot be hid; and the *appearance* of deſign ought not to be excluded. A human production cannot be made perfectly natural; and held out as ſuch it becomes an impoſition. Our art lies in endeavouring to adapt the productions of nature to human taſte and perceptions; and if much art be uſed, do not *attempt* to hide it. Art ſeldom fails to pleaſe when executed in a maſterly manner: nay, it is frequently the deſign and execution, more than the production itſelf, that ſtrikes us. It is the artifice, not the deſign, which ought to be avoided. It is the labour and not the art which ought to be concealed. The rural artiſt ought, therefore, upon every occaſion, to endeavour to avoid labour; or, if indiſpenſably neceſſary, to conceal it. No trace ſhould be left to lead back the mind to the expenſive toil. A mound raiſed, a mountain levelled, or a uſeleſs temple built, convey to the mind feelings equally diſguſting.

13 f Scenery. *Ibid.*

II. PICTURESQUE BEAUTY. Tho' the aids of art are as eſſential to gardening, as education is to manners; yet art may do too much: ſhe ought to be conſidered as the hand-maid, not as the miſtreſs, of nature; and whether ſhe be employed in carving a tree into the figure of an animal, or in ſhaping a view into the form of a picture, ſhe is equally culpable. The nature of the place is ſacred. Should this tend to landſcape, from ſome principal point of view, aſſiſt nature and perfect it; provided this can be done without injuring the views from other points. But do not diſfigure the natural features of the place:—do not ſacrifice its native beauties, to the arbitrary laws of landſcape painting.

> Great Nature ſcorns controul; ſhe will not bear
> One beauty foreign to the ſpot ſhe ſoil
> She gives thee to adorn: 'Tis thine alone
> To mend, not charge her features. MASON.

Nature ſcarcely knows the thing mankind call a *landſcape*. The landſcape-painter ſeldom, if ever, finds it perfected to his hands;—ſome addition or alteration is almoſt always wanted. Every man who has made his obſervations upon natural ſcenery, knows that the miſſetoe of the oak occurs almoſt as often as a perfect natural landſcape; and to attempt to make up artificial landſcape upon every occaſion is unnatural and abſurd. Character.

If, indeed, the eye were fixed in one point, the trees could be raiſed to their full height at command, and the ſun be made to ſtand ſtill, the rural artiſt might work by the rules of light and ſhade, and compoſe his landſcape by the painter's law. But, whilſt the ſun continues to pour forth its light impartially, and the trees to riſe with ſlow progreſſion, it would be ridiculous to attempt it. Let him rather ſeek out, imitate, and aſſociate, ſuch ſtriking paſſages in nature as are immediately applicable to the place to be improved, with regard to rules of landſcape, merely human; —and let him,

> ——————— in this and all
> Be various, wild, and free, as Nature's ſelf. MASON.

Inſtead of ſacrificing the natural beauties of the place to one formal landſcape, let every ſtep diſcloſe freſh charms unſought for.

III. Of CHARACTER. Character is very reconcileable with beauty; and, even when independent of it, has attracted ſo much regard, as to occaſion ſeveral frivolous attempts to produce it: ſtatues, inſcriptions, and even paintings, hiſtory and mythology, and a variety of devices, have been introduced for this purpoſe. The heathen deities and heroes have therefore had their ſeveral places aſſigned to them in the woods and the lawns of a garden: natural caſcades have been diſfigured with river-gods, and columns erected only to receive quotations; the compartiments of a ſummer-houſe have been filled with pictures of gambols and revels, as ſignificant of gaiety; the cypreſs, becauſe it was once uſed in funerals, has been thought peculiarly adapted to melancholy; and the decorations, the furniture, and the environs of a building, have been crowded with puerilities under pretence of propriety. All theſe devices are rather *emblematical* than expreſſive: they may be ingenious contrivances, and recal abſent ideas to the recollection; but they make no immediate impreſſion: for they muſt be examined, compared, perhaps explained, before the whole deſign of them is well underſtood. And tho' an alluſion to a favourite or well known ſubject of hiſtory, of poetry, or of tradition, may now and then animate or dignify a ſcene; yet as the ſubject does not naturally belong to a garden, the alluſion ſhould not be principal: it ſhould ſeem to have been ſuggeſted by the ſcene; a tranſitory image, which irreſiſtibly occurred; not ſought for, not laboured; and have the force of a metaphor, free from the detail of an allegory. *Whately's Obſervations.* 14 Of emblematical characters.

Another ſpecies of character ariſes from direct *imitation*; when a ſcene or an object, which has been celebrated in deſcription, or is familiar in idea, is repreſented in a garden. Artificial ruins, lakes, and rivers, fall under this denomination. The air of a ſeat extended to a diſtance, and ſcenes calculated to raiſe ideas of Arcadian elegance or of rural ſimplicity, with many more which have been occaſionally mentioned or will obviouſly 15 Of imitative characters.

Character. obviously occur, may be ranked in this class. They are all representations. But the materials, the dimensions, and other circumstances, being the same in the copy and the original, their effects are similar in both: and if not equally strong, the defect is not in the resemblance; but the consciousness of an imitation checks that train of thought which the appearance naturally suggests, Yet an over-anxious solicitude to disguise the fallacy is often the means of exposing it: too many points of likeness sometimes hurt the deception; they seem studied and forced; and the affectation of resemblance destroys the supposition of a reality. A hermitage is the habitation of a recluse; it should be distinguished by its solitude, and its simplicity: but if it is filled with crucifixes, hour-glasses, beads, and every other trinket which can be thought of, the attention is diverted from enjoying the retreat to examining the particulars: all the collateral circumstances which agree with a character, seldom meet in one subject; and when they are industriously brought together, though each be natural, the collection is artificial.

16 Of original characters.

But the art of gardening aspires to more than imitation: it can create *original* characters, and give expressions to the several scenes superior to any they can receive from allusions. Certain properties, and certain dispositions, of the objects of nature, are adapted to excite particular ideas and sensations: many of them have been occasionally mentioned, and all are very well known. They require no discernment, examination, or discussion; but are obvious at a glance, and instantaneously distinguished by our feelings. Beauty alone is not so engaging as this species of character: the impressions it makes are more transient and less interesting; for it aims only at delighting the eye, but the other affects our sensibility. An assemblage of the most elegant forms in the happiest situations is to a degree indiscriminate, if they have not been selected and arranged with a design to produce certain expressions; an air of magnificence, or of simplicity, of cheerfulness, tranquillity, or some other general character, ought to pervade the whole; and objects pleasing in themselves, if they contradict that character, should therefore be excluded: those which are only indifferent, must sometimes make room for such as are more significant; many will often be introduced for no other merit than their expression; and some, which are in general rather disagreeable, may occasionally be recommended by it. Barrenness itself may be an acceptable circumstance in a spot dedicated to solitude and melancholy.

The power of such characters is not confined to the ideas which the objects immediately suggest; for these are connected with others, which insensibly lead to subjects far distant perhaps from the original thought, and related to it only by a similitude in the sensations they excite. In a prospect enriched and enlivened with inhabitants and cultivation, the attention is caught at first by the circumstances which are gayest in their season, the bloom of an orchard, the festivity of a hay-field, and the carols of harvest-home; but the cheerfulness which these infuse into the mind, expands afterwards to other objects than those immediately presented to the eye; and we are thereby disposed to receive, and delighted to pursue, a variety of pleasing ideas, and every benevolent feeling. At the sight of a ruin, reflections on the change, the decay, and the desolation before us, naturally occur; and they introduce a long succession of others, all tinctured with that melancholy which these have inspired; or if the monument revive the memory of former times, we do not stop at the simple fact which it records, but recollect many more coeval circumstances, which we see, not perhaps as they were, but as they are come down to us, venerable with age, and magnified by fame. Even without the assistance of buildings or other adventitious circumstances, nature alone furnishes materials for scenes which may be adapted to almost every kind of expression: their operation is general, and their consequences are infinite: the mind is elevated, depressed, or composed, as gaiety, gloom, or tranquillity, prevails in the scene; and we soon lose sight of the means by which the character is formed; we forget the particular objects it presents; and giving way to their effects, without recurring to the cause, we follow the track they have begun, to any extent which the disposition they accord with will allow. It suffices that the scenes of nature have a power to affect our imagination and our sensibility; for such is the constitution of the human mind, that if once it is agitated, the emotion spreads far beyond the occasion; when the passions are roused, their course is unrestrained; when the fancy is on the wing, its flight is unbounded; and, quitting the inanimate objects which first gave them their spring, we may be led by thought above thought, widely differing in degree, but still corresponding in character, till we rise from familiar subjects up to the sublimest conceptions, and are rapt in the contemplation of whatever is great or beautiful, which we see in nature, feel in man, or attribute to divinity.

General arrangement

IV. GENERAL ARRANGEMENT. Notwithstanding the nature of the place, as already observed, ought not to be sacrificed to the mansion;—the house must ever be allowed to be a principal in the composition. It ought to be considered as the centre of the system; and the rays of art, like those of the sun, should grow fainter as they recede from the centre. The house itself being entirely a work of art, its immediate environs should be highly finished; but as the distance increases, the appearance of design should gradually diminish, until nature and fortuitousness have full possession of the scene. *Pract. Treat. on Planting and Gardening.*

In general, the approach should be to the back-front, which, in suitable situations, ought to lie open to the pasture-grounds. On the sides more highly ornamented, a well-kept gravel-walk may embrace the walls; to this the shaven lawn and shrubbery succeed; next, the grounds closely pastured; and, lastly, the surrounding country, which ought not to be considered as out of the artist's reach: for his art consists not more in decorating particular spots, than in endeavouring to render the whole face of nature delightful.

Another reason for this mode of arrangement is, objects immediately under the eye are seen more distinctly than those at a distance, and ought to be such as are pleasing in the detail. The beauties of a flower can be discerned on a near view only; whilst at a distance a roughet of coppice-wood, and the most elegant ar-

Hunting-Box, &c.

rangement of flowering-shrubs have the same effect. The most rational entertainment the human mind is capable of receiving, is that of observing the operations of nature. The foliation of a leaf, the blowing of flowers, and the maturation of fruit, are among the most delightful subjects that a contemplative mind can be employed in. These processes of nature are slow; and except the object fall spontaneously under the eye of the observer, the inconveniences of visiting it in a remote part, so far interfere with the more important employments of life, as to blunt, if not destroy, the enjoyment. This is a strong argument in favour of shrubs and flowers being planted under or near our windows, especially those from whence they may be viewed during the hours of leisure and tranquillity.

Ibid. p. 606.

Further, the vegetable creation being subject to the animal, the shrub may be cropt, or the flower trodden down in its day of beauty. If therefore we wish to converse with nature in private, intruders must be kept off,—the shrubbery be severed from the ground;—yet not in such a manner as to drive away the pasturing stock from our sight. For this reason, the shaven lawn ought not to be too extensive, and the fence which incloses it should be such as will not interrupt the view: but whether it be seen or unseen, suspected or unsuspected, is a matter of no great import: its utility in protecting the shrubs and flowers,—in keeping the horns of the cattle from the window, and the feet of the sheep from the gravel and broken ground,—in preserving that neatness on the outside, which ought to correspond with the finishings and furniture within,—render it of sufficient importance to become even a part of the ornament.

Villa.

PART II. EXECUTION OF THE GENERAL SUBJECTS.

IMPROVEMENTS in general may be classed under the following heads: The *Hunting-Box*, The *Ornamented Cottage*, the *Villa*, and the *Principal Residence*.

But before any step can be taken towards the execution of the design, be it large or small, a map or plan of the place, exactly as it lies in its unimproved state, should be made; with a corresponding sketch, to mark the intended improvements upon. Not a hovel nor a twig should be touched, until the artist has studied maturely the natural abilities of the place, and has decidedly fixed in his mind, and finally settled on his plan, the proposed alterations: and even then, let him "dare with caution."

1. *Of Improvements adapted to a* HUNTING-BOX.

HERE art has little to do. Hunting may be called the amusement of nature; and the place appropriated to it ought to be no farther altered from its natural state than decency and conveniency require:—With men who live in the present age of refinement, "a want of decency is a want of sense."

Ibid. p. 610, &c.

The style throughout should be *masculine*. If shrubs be required, they should be of the hardier sorts; the box, the holly, the laurustinus. The trees should be the oak and the beech, which give in autumn an agreeable variety of foliage, and anticipate as it were the season of diversion. A suite of paddocks should be seen from the house; and if a view of distant covers can be caught, the back-ground will be complete. The stable, the kennel, and the leaping-bar, are the factitious accompaniments; in the construction of which simplicity, substantialness, and conveniency, should prevail.

2. *Of the Style of an* ORNAMENTED COTTAGE.

NEATNESS and simplicity ought to mark the style of this rational retreat. Ostentation and show should be cautiously avoided; even elegance should not be attempted; though it may not be hid, if it offer itself spontaneously.

Nothing, however, should appear vulgar, nor should simplicity be pared down to baldness; every thing whimsical or expensive ought to be studiously avoided;—chasteness and frugality should appear in every part.

Near the house a studied neatness may take place; but at a distance, negligence should rather be the characteristic.

If a taste for botany lead to a collection of native shrubs and flowers, a shrubbery will be requisite; but in this every thing should be native. A gaudy exotic ought not to be admitted; nor should the lawn be kept close shaven; its flowers should be permitted to blow; and the herbage, when mown, ought to be carried off, and applied to some useful purpose.

In the artificial accompaniments, ornament must be subordinate; utility must preside. The buildings, if any appear, should be those in actual use in rural economics. If the hovel be wanted, let it appear; and, as a side-screen, the barn and rick-yard are admissible; whilst the dove-house and poultry-yard may enter more freely into the composition.

In fine, the ornamented cottage ought to exhibit cultivated nature in the first stage of refinement. It ranks next above the farm-house. The plain garb of rusticity may be set off to advantage; but the studied dress of the artist ought not to appear. That becoming neatness, and those domestic conveniences, which render the rural life agreeable to a cultivated mind, are all that should be aimed at.

3. *Of the Embellishments of a* VILLA.

THIS demands a style very different from the preceding. It ought to be elegant, rich, or grand, according to the style of the house itself, and the state of the surrounding country; the principal business of the artist being to connect these two in such a manner, that the one shall not appear naked or flaring, nor the other desolate and inhospitable.

If the house be stately, and the adjacent country rich and highly cultivated, a shrubbery may intervene, in which art may show her utmost skill. Here, the artist may even be permitted to play at landscape: for a place of this kind being supposed to be small, the purpose principally ornamental, and the point of view probably confined simply to the house, side screens may be formed, and a fore-ground laid out suitable to the best distance that can be caught.

If buildings or other artificial ornaments abound in the offscape, so as to mark it strongly, they ought also to

Principal Residence

to appear more or less in the fore-ground: if the distance abound with wood, the fore-ground should be thickened, lest baldness should offend; if open and naked, elegance rather than richness ought to be studied, lest heaviness should appear.

Ibid. It is far from being any part of our plan to cavil unnecessarily at artists, whether living or dead; we cannot, however, refrain from expressing a concern for the almost total neglect of the principles here in ornamenting the vicinages of villas. It is to be regretted, that in the present practice these principles seem to be generaly lost sight of. Without any regard to uniting the house with the adjacent country, and, indeed, seemingly without any regard whatever to the offscape, one invariable plan of embellishment prevails; namely, that of stripping the fore-ground entirely naked, or nearly so, and surrounding it with a wavy border of shrubs and a gravel walk; leaving the area, whether large or small, one naked sheet of green sward.

In small confined spots, this plan may be eligible. But a simple border round a large unbroken lawn only serves to show what more is wanted. Simplicity in general is pleasing; but even simplicity may be carried to an extreme, so as to convey no other idea than that of poverty and baldness. Besides, how often do we see in natural scenery, the holly and the fox-glove flourishing at the foot of an oak, and the primrose and the campion adding charms to the hawthorn scattered over the pastured lawn? And we conceive that single trees footed with evergreens and native flowers, and clumps as well as borders of shrubs, are admissible in ornamental as well as in natural scenery.

The species of shrub will vary with the purpose. If the principal intention be a winter retreat, evergreens and the early-blowing shrubs should predominate; but in a place to be frequented in summer and autumn, the deciduous tribes ought chiefly to be planted.

4. *Of the* Principal Residence.

Here the whole art centres. The artist has here full scope for a display of taste and genius. He has an extent of country under his eye, and will endeavour to make the most of what nature and accident have spread before him.

Round a principal residence, a gentleman may be supposed to have some considerable estate, and it is not a shrubbery and a ground only which fall under the consideration of the artist: he ought to endeavour to disclose to the view, either from the house or some other point, as much as he conveniently can of the adjacent estate. The love of possession is deeply planted in every man's breast; and places should bow to the gratification of their owners. To curtail the view by an artificial side-screen, or any other unnatural machinery, so as to deprive a man of the satisfaction of over-looking his own estate, is an absurdity which no artist ought to be permitted to be guilty of. It is very different, however, where the property of another intrudes upon the eye: Here the view may, with some colour of propriety, be bounded by a woody screen.

The grounds, however, by a proper management, may be made independent of whatever is external; and though prospects are no where more delightful than from a point of view which is also a beautiful spot, yet if in the environs of such a garden they should be wanting, the elegant, picturesque, and various scenes within itself, almost supply the deficiency. Principal Residence.

Mr Wheatley's description of Stowe gardens.

"This (says Mr Wheatley) is the character of the gardens at Stowe: for there the views in the country are only circumstances subordinate to the scenes; and the principal advantage of the situation is the variety of the ground within the inclosure. The house stands on the brow of a gentle ascent; part of the gardens lie on the declivity, and spread over the bottom beyond it: this eminence is separated by a broad winding valley from another which is higher and steeper; and the descents of both are broken by large dips and hollows, sloping down the sides of the hills. The whole space is divided into a number of scenes, each distinguished with taste and fancy; and the changes are so frequent, so sudden, and complete, the transitions so artfully conducted, that the same ideas are never continued or repeated to saticty.

These gardens were begun when regularity was in fashion; and the original boundary is still preserved, on account of its magnificence: for round the whole circuit, of between three or four miles, is carried a very broad gravel-walk, planted with rows of trees, and open either to the park or the country; a deep sunk fence attends it all the way, and comprehends a space of near 400 acres. But in the interior scenes of the garden, few traces of regularity appear; where it yet remains in the plantations, it is generally disguised: every symptom, almost, of formality is obliterated from the ground; and an octagon basin in the bottom is now converted into an irregular piece of water, which receives on one hand two beautiful streams, and falls on the other down a cascade into a lake.

In the front of the house is a considerable lawn, open to the water: beyond which are two elegant Doric pavilions, placed in the boundary of the garden, but not marking it, though they correspond to each other; for still further back, on the brow of some rising grounds without the inclosure, stands a noble Corinthian arch, by which the principal approach is conducted, and from which all the gardens are seen, reclining back against their hills: they are rich with plantations; full of objects; and lying on both sides of the house almost equally, every part is within a moderate distance, notwithstanding the extent of the whole.

On the right of the lawn, but concealed from the house, is a perfect garden-scene, called the *queen's amphitheatre*, where art is avowed, though formality is avoided. The fore ground is scooped into a gentle hollow. The plantations on the sides, though but just rescued from regularity, yet in style are contrasted to each other: they are, on one hand, chiefly thickets, standing out from a wood; on the other, they are open groves, through which a glimpse of the water is visible. At the end of the hollow on a little knole, quite detached from all appendages, is placed an open Ionic rotunda: beyond it, a large lawn slopes across the view; a pyramid stands on the brow; the queen's pillar, in a recess on the descent; and all the three buildings, being evidently intended for ornament alone, are peculiarly adapted to a garden-scene. Yet their number does not render it gay: the dusky hue of the pyramid, the retired situation of the queen's pillar, and the

Principal Residence.

the ſolitary appearance of the rotunda, give it an air of gravity; it is encompaſſed with wood; and all the external views are excluded; even the opening into the lawn is but an opening into an incloſure.

At the king's pillar, very near to this, is another lovely ſpot; which is ſmall, but not confined; for no termination appears; the ground one way, the water another, retire under the trees out of ſight, but nowhere meet with a boundary. The view is firſt over ſome very broken ground, thinly and irregularly planted; then between two beautiful clumps, which feather down to the bottom; and afterwards acroſs a glade, and through a little grove beyond it, to that part of the lake where the thickets, cloſe upon the brink, ſpread a tranquillity over the ſurface, in which their ſhadows are reflected. Nothing is admitted to diſturb that quiet: no building obtrudes; for objects to fix the eye are needleſs in a ſcene which may be comprehended at a glance; and none would ſuit the paſtoral idea it inſpires, of elegance too refined for a cottage, and of ſimplicity too pure for any other edifice.

The ſituation of the rotunda promiſes a proſpect more enlarged; and in fact moſt of the objects on this ſide of the garden are there viſible: but they want both connection and contraſt; each belongs peculiarly to ſome other ſpot: they all are blended together in this, without meaning; and are rather ſhown on a map, than formed into a picture. The water only is capital; a broad expanſe of it is ſo near as to be ſeen under the little groupes on the bank without interruption. Beyond it is a wood, which in one place leaves the lake, to run up behind a beautiful building, of three pavilions joined by arcades, all of the Ionic order: it is called *Kent's Building*. And never was a deſign more happily conceived: it ſeems to be characteriſtically proper for a garden; it is ſo elegant, ſo varied, and ſo purely ornamental: it directly fronts the rotunda, and a narrow rim of the country appears above the trees beyond it. But the effect even of this noble object is fainter here than at other points: its poſition is not the moſt advantageous; and it is but one among many other buildings, none of which are principal.

The ſcene at the temple of Bacchus is in character directly the reverſe of that about the rotunda, though the ſpace and the objects are nearly the ſame in both: but in this, all the parts concur to form one whole. The ground from every ſide ſhelves gradually towards the lake; the plantations on the further bank open to ſhow Kent's building, riſe from the water's edge towards the knole on which it ſtands, and cloſe again behind it. That elegant ſtructure, inclined a little from a front view, becomes more beautiful by being thrown into perſpective; and though at a greater diſtance, is more important than before, becauſe it is alone in the view: for the queen's pillar and the rotunda are removed far aſide; and every other circumſtance refers to this intereſting object: the water attracts, the ground and the plantations direct, the eye thither: and the country does not juſt glimmer in the offscape, but is cloſe and eminent above the wood, and connected by clumps with the garden. The ſcene all together is a moſt animated landſcape; and the ſplendor of the building; the reflection in the lake; the tranſparency of the water, and pictureſque beauty of its form, diverſified by little groupes on the brink, while on the broadeſt expanſe no more trees caſt their ſhadows than are ſufficient to vary the tints of the ſurface; all theſe circumſtances, vying in luſtre with each other, and uniting in the point to which every part of the ſcene is related, diffuſe a peculiar brilliancy over the whole compoſition.

Principal Reſidence.

The view from Kent's building is very different from thoſe which have been hitherto deſcribed. They are all directed down the declivity of the lawn. This riſes up the aſcent: the eminence being crowned with loſty wood, becomes thereby more conſiderable; and the hillocks into which the general fall is broken, ſloping further out this way than any other, they alſo acquire an importance which they had not before; that, particularly, on which the rotunda is placed, ſeems here to be a profound ſituation; and the ſtructure appears to be properly adapted to ſo open an expoſure. The temple of Bacchus, on the contrary, which commands ſuch an illuſtrious view, is itſelf a retired object, cloſe under the covert. The wood riſing on the brow, and deſcending down one ſide of the hill, is ſhown to be deep; is high, and ſeems to be higher than it is. The lawn too is extenſive; and part of the boundary being concealed, it ſuggeſts the idea of a ſtill greater extent. A ſmall portion only of the lake indeed is viſible; but it is not here an object: it is a part of the ſpot; and neither termination being in ſight, it has no diminutive appearance: if more water had been admitted, it might have hurt the character of the place, which is ſober and temperate; neither ſolemn nor gay; great and ſimple, but elegant; above ruſticity, yet free from oſtentation.

Theſe are the principal ſcenes on one ſide of the gardens. On the other, cloſe to the lawn before the houſe, is the winding valley abovementioned: the lower part of it is aſſigned to the Elyſian fields. Theſe are watered by a lovely rivulet; are very lightſome, and very airy, ſo thinly are the trees ſcattered about them; are open at one end to more water and a larger glade; and the reſt of the boundary is frequently broken to let in objects afar off, which appear ſtill more diſtant from the manner of ſhowing them. The entrance is under a Doric arch, which coincides with an opening among the trees, and forms a kind of villa, through which a Pembroke bridge juſt below, and a lodge built like a caſtle in the park, are ſeen in a beautiful perſpective. That bridge is at one extremity of the gardens; the queen's pillar is at another; yet both are viſible from the ſame ſtation in the Elyſian fields: and all theſe external objects are unaffectedly introduced, diveſted of their own appurtenances, and combined with others which belong to the ſpot. The temple of Friendſhip alſo is in ſight, juſt without the place; and within it, are the temples of ancient Virtue, and of the Britiſh worthies; the one in an elevated ſituation, the other low down in the valley, and near to the water: both are decorated with the effigies of thoſe who have been moſt diſtinguiſhed for military, civil, or literary merit; and near to the former ſtands a roſtral column, ſacred to the memory of Captain Grenville, who fell in an action at ſea: by placing here the meed of valour, and by filling theſe fields with the repreſentations of thoſe who have deſerved

Principal Residence.

beſt of mankind, the character intended to be given to the ſpot is juſtly and poetically expreſſed; and the number of the images which are preſented or excited, perfectly correſponds with it. Solitude was never reckoned among the charms of Elyſium; it has been always pictured as the manſion of delight and of joy: and in this imitation, every circumſtance accords with that eſtabliſhed idea. The vivacity of the ſtream which flows through the vale; the glimpſes of another approaching to join it; the ſprightly verdure of the green ſward, and every buſt of the Britiſh worthies reflected in the water; the variety of the trees; the lightneſs of the greens; their diſpoſition; all of them diſtinct objects, and diſperſed over gentle inequalities of the ground; together with the multiplicity of objects both within and without, which embelliſh and enliven the ſcene; give it a gaiety, which the imagination can hardly conceive, or the heart wiſh to be exceeded.

Cloſe by this ſpot, and a perfect contraſt to it, is the alder grove; a deep receſs in the midſt of a ſhade, which the blaze of noon cannot brighten. The water ſeems to be a ſtagnated pool, eating into its banks; and of a peculiar colour, not dirty but clouded, and dimly reflecting the dun hue of the horſe-chefnuts and alders which preſs upon the brink: the ſtems of the latter, riſing in cluſters from the ſame root, bear one another down, and ſlant over the water. Miſhapen elms and ragged firs are frequent in the wood which encompaſſes the hollow; the trunks of dead trees are left ſtanding amongſt them; and the uncouth ſumach, and the yew, with elder, nut, and holly, compoſe the underwood: ſome limes and laurels are intermixed; but they are not many: the wood is in general of the darkeſt greens; and the foliage is thickened with ivy, which not only twines up the trees, but creeps alſo over the falls of the ground: theſe are ſteep and abrupt: the gravel-walk is covered with moſs; and a grotto at the end, faced with broken flints and pebbles, preſerves, in the ſimplicity of its materials, and the duſkineſs of its colour, all the character of its ſituation: two little rotundas near it were better away; one building is ſufficient for ſuch a ſcene of ſolitude as this, in which more circumſtances of gloom concur than were ever perhaps collected together.

Immediately above the alder-grove is the principal eminence in the gardens. It is divided by a great dip into two pinnacles; upon one of which is a large Gothic building. The ſpace before this ſtructure is an extenſive lawn: the ground on one ſide falls immediately into the dip; and the trees which border the lawn, ſinking with the ground, the houſe riſes above them, and fills the interval: the vaſt pile ſeems to be ſtill larger than it is; for it is thrown into perſpective, and between and above the heads of the trees, the upper ſtory, the porticoes, the turrets and balluſtrades, and all the ſlated roofs, appear in a noble confuſion. On the other ſide of the Gothic building, the ground ſlopes down a long-continued declivity into a bottom, which ſeems to be perfectly irriguous. Divers ſtreams wander about it in ſeveral directions: the conflux of that which runs from the Elyſian fields with another below it, is full in ſight; and a plain wooden bridge thrown over the latter, and evidently deſigned for a paſſage, impoſes an air of reality on the river. Beyond it is one of the Doric porticoes which front the houſe; but now it is alone; it ſtands on a little bank above the water, and is ſeen under ſome trees at a diſtance before it: thus grouped, and thus accompanied, it is a happy incident, concurring with many other circumſtances to diſtinguiſh this landſcape by a character of cheerfulneſs and amenity.

Principal Reſidence

From the Gothic building a broad walk leads to the Grecian valley, which is a ſcene of more grandeur than any in the gardens. It enters them from the park, ſpreading at firſt to a conſiderable breadth; then winds; grows narrower, but deeper; and loſes itſelf at laſt in a thicket, behind ſome lofty elms, which interrupt the ſight of the termination. Lovely woods and groves hang all the way on the declivities: and the open ſpace is broken by detached trees; which, near the park, are cautiouſly and ſparingly introduced, leſt the breadth ſhould be contracted by them; but as the valley ſinks, they advance more boldly down the ſides, ſtretch acroſs or along the bottom, and cluſter at times into groupes and forms, which multiply the varieties of the larger plantations. Thoſe are ſometimes cloſe coverts, and ſometimes open groves: the trees riſe in one upon high ſtems, and feather down to the bottom in another; and between them are ſhort openings into the park or the gardens. In the midſt of the ſcene, juſt at the bend of the valley, and commanding it on both ſides, upon a large, eaſy, natural riſe, is placed the temple of Concord and Victory: at one place its majeſtic front of ſix Ionic columns, ſupporting a pediment filled with bas relief, and the points of it crowned with ſtatues, faces the view; at another, the beautiful colonnade, on the ſide, of ten lofty pillars, retires in perſpective. It is ſeen from every part; and impreſſing its own character of dignity on all around, it ſpreads an awe over the whole: but no gloom, no melancholy, attends it: the ſenſations it excites are rather placid; but full of reſpect, admiration, and ſolemnity: no water appears to enliven, no diſtant proſpect to enrich the view; the parts of the ſcene are large, the idea of it ſublime, and the execution happy; it is independent of all adventitious circumſtances, and relies on itſelf for its greatneſs.

The ſcenes which have been deſcribed are ſuch as are moſt remarkable for beauty or character; but the gardens contain many more; and even the objects in theſe, by their ſeveral combinations, produce very different effects, within the diſtance ſometimes of a few paces, from the unevenneſs of the ground, the variety of the plantations, and the number of the buildings. The multiplicity of the laſt has indeed been often urged as an objection to Stowe; and certainly, when all are ſeen by a ſtranger in two or three hours, twenty or thirty capital ſtructures, mixed with others of inferior note, do ſeem too many. But the growth of the wood every day weakens the objection, by concealing them one from the other: each belongs to a diſtinct ſcene; and if they are conſidered ſeparately, at different times, and at leiſure, it may be difficult to determine which to take away. Yet ſtill it muſt be acknowledged that their frequency deſtroys all ideas of ſilence and retirement. Magnificence and ſplendor are the characteriſtics of Stowe: it is like one of thoſe places celebrated in antiquity, which were devoted to the purpoſes of religion, and filled with ſacred groves, hallowed fountains,

incipal idence

tains, and temples dedicated to ſeveral deities; the reſort of diſtant nations, and the object of veneration to half the heathen world: this pomp is, at Stowe, blended with beauty; and the place is equally diſtinguiſhed by its amenity and its grandeur.

In the midſt of ſo much embelliſhment as may be introduced into this ſpecies of garden, a plain field, or a ſheep-walk, is ſometimes an agreeable relief, and even wilder ſcenes may occaſionally be admitted. Theſe indeed are not properly parts of a garden, but they may be comprehended within the verge of it; and the proximity to the more ornamented ſcenes is at leaſt a convenience, that the tranſition from the one to the other may be eaſy, and the change always in our option. For though a ſpot in the higheſt ſtate of improvement be a neceſſary appendage to a ſeat; yet, in a place which is perfect, other characters will not be wanting: if they cannot be had on a large ſcale, they are acceptable on a ſmaller; and ſo many circumſtances are common to all, that they may often be intermixed; they may always border on each other."

But on this head it would be in vain to attempt to lay down particular rules: different places are marked by ſets of features as different from each other as are thoſe in mens faces. Much muſt be left to the ſkill and taſte of the artiſt; and let thoſe be what they may, nothing but mature ſtudy of the natural abilities of the particular place to be improved can render him equal to the execution, ſo as to make the moſt of the materials that are placed before him.

Treat. Planting Garden. p. 615.

Some few general rules may nevertheleſs be laid down. The approach ought to be conducted in ſuch a manner, that the ſtriking features of the place ſhall burſt upon the view at once: no trick however ſhould be made uſe of: all ſhould appear to fall in naturally. In leading towards the houſe, its direction ſhould not be fully in front, nor exactly at an angle, but ſhould paſs obliquely upon the houſe and its accompaniments; ſo that their poſition with reſpect to each other, as well as the perſpective appearance of the houſe itſelf, may vary at every ſtep: and having ſhown the front and the principal wing, or other accompaniment, to advantage, the approach ſhould wind to the back-front, which, as has been already obſerved, ought to lie open to the park or paſtured grounds.

The improvements and the rooms from which they are to be ſeen ſhould be in uniſon. Thus, the view from the drawing-room ſhould be highly embelliſhed, to correſpond with the beauty and elegance within: every thing here ſhould be feminine, elegant, beautiful, ſuch as attunes the mind to politeneſs and lively converſation. The breakfaſting-room ſhould have more maſculine objects in view: wood, water, and an extended country for the eye to roam over; ſuch as allures us imperceptibly to the ride or the chace. The eating and banqueting rooms need no exterior allurements.

There is a harmony in taſte as in muſic: variety, and even wildneſs upon ſome occaſions, may be admitted; but diſcord cannot be allowed. If, therefore, a place be ſo circumſtanced as to conſiſt of properties totally irreconcileable, the parts ought, if poſſible, to be ſeparated in ſuch a manner, that, like the air and the recitative, the adagio and the allegro, in muſic, they may ſet off each other's charms by the contraſt.—

These obſervations, in the elegant performance whence they are extracted, the author illuſtrates by the following deſcription and propoſed improvement of Perſefield, the ſeat of Mr Morris, near Chepſtow in Monmouthſhire; a place upon which nature has been peculiarly laviſh of her favours, and which has been ſpoken of by Mr Wheatley, Mr Gilpin, and other writers, in the moſt flattering terms.

Principal Reſidence.

Deſcription of Perſefield, *ibid.* p. 616, &c.

"Perſefield is ſituated upon the banks of the river Wye, which divides Glouceſterſhire and Monmouthſhire, and which was formerly the boundary between England and Wales. The general tendency of the river is from north to ſouth; but about Perſefield it deſcribes by its winding courſe the letter S, ſomewhat compreſſed, ſo as to reduce it in length and increaſe its width. The grounds of Perſefield are lifted high above the bed of the river, ſhelving, and form the brink of a lofty and ſteep precipice, towards the ſouth-weſt.

"The lower limb of the letter is filled with Perſe-wood, which makes a part of Perſefield; but is at preſent an impenetrable thicket of coppice-wood. This dips to the ſouth-eaſt down to the water's edge; and, ſeen from the top of the oppoſite rock, has a good effect.

"The upper limb receives the farms of Llancot: rich and highly cultivated: broken into incloſures, and ſcattered with groupes and ſingle trees: two well looking farm-houſes in the centre, and a neat white chapel on one ſide: altogether a lovely little paradiſaical ſpot. The lowlineſs of its ſituation ſtamps it with an air of meekneſs and humility; and the natural barriers which ſurround it adds that of peacefulneſs and ſecurity. Theſe picturesque farms do not form a low flat bottom, ſubject to be overflowed by the river; but take the form of a gorget, riſing fulleſt in the middle, and falling on every ſide gently to the brink of the Wye; except on the eaſt-ſide, where the top of the gorget leans in an eaſy manner againſt a range of perpendicular rock; as if to ſhow its diſk with advantage to the walks of Perſefield.

"This rock ſtretches acroſs what may be called the *Iſthmus*, leaving only a narrow paſs down into the fields of Llancot, and joins the principal range of rocks at the lower bend of the river.

"To the north, at the head of the letter, ſtands an immenſe rock (or rather a pile of immenſe rocks heaped one above another) called *Windcliff*; the top of which is elevated as much above the grounds of Perſefield as thoſe are above the fields of Llancot.

"Theſe ſeveral rocks, with the wooded precipices on the ſide of Perſefield, form a circular incloſure, about a mile in diameter, including Perſe-wood, Llancot, the Wye, and a ſmall meadow lying at the foot of Windcliff.

"The grounds are divided into the upper and lower lawn, by the approach to the houſe: a ſmall irregular building, ſtanding near the brink of the precipice, but facing down the lower lawn, a beautiful ground, falling 'precipitately every way into a valley which ſhelves down in the middle,' and is ſcattered with groupes and ſingle trees in an excellent ſtyle.

"The view from the houſe is ſoft, rich, and beautifully picturesque; the lawn and woods of Perſefield and the oppoſite banks of the river; the Wye, near its mouth, winding through 'meadows green as emerald,'

Principal Reſidence.

rald,' in a manner peculiarly graceful; the Severn, here very broad, backed by the wooded and highly cultivated hills of Gloucesterſhire, Wiltſhire, and Somerſetſhire. Not one rock enters into the compoſition. The whole view conſiſts of an elegant arrangement of lawn, wood, and water.

" The upper lawn is a leſs beautiful ground, and the view from it, though it command the 'cultivated hills and rich valleys of Monmouthſhire,' bounded by the Severn and backed by the Mendip-hills, is much inferior to that from the houſe.

" To give variety to the views from Perſefield, to diſcloſe the native grandeur which ſurrounds it, and to ſet off its more ſtriking features to advantage, walks have been cut through the woods and on the face of the precipice which border the grounds to the ſouth and eaſt. The viewer enters theſe walks at the lower corner of the lower lawn.

" The firſt point of view is marked by an alcove, from which are ſeen the bridge and the town of Chepſtow, with its caſtle ſituated in a remarkable manner on the very brink of a perpendicular rock, waſhed by the Wye; and beyond theſe the Severn ſhows a ſmall portion of its ſilvery ſurface.

" Proceeding a little farther along the walk, a view is caught which the painter might call a complete landſcape: The caſtle with the ſerpentine part of the Wye below Chepſtow, intermixed in a peculiar manner with the broad waters of the Severn, form the fore-ground; which is backed by diſtant hills; the rocks, crowned with wood, lying between the alcove and the caſtle, to the right; and Caſtlehill farm, elevated upon the oppoſite banks of the river, to the left, form the two ſide-ſcreens. This point is not marked, and muſt frequently be loſt to the ſtranger.

" The grotto, ſituated at the head of Perſe wood, commands a near view of the oppoſite rocks; magnificent beyond deſcription! The littleneſs of human art was never placed in a more humiliating point of view; the caſtle of Chepſtow, a noble fortreſs, is, compared with theſe natural bulwarks, a mere houſe of cards.

" Above the grotto, upon the iſthmus of the Perſefield ſide, is a ſhrubbery; ſtrangely miſplaced! an unpardonable intruſion upon the native grandeur of this ſcene. Mr Gilpin's obſervations upon this, as upon every other occaſion, are very juſt. He ſays, 'It is pity the ingenious embelliſher of theſe ſcenes could not have been ſatisfied with the great beauties of nature which he commanded. The ſhrubberies he has introduced in this part of his improvements I fear will rather be eſteemed paltry.'——'It is not the ſhrub which offends; it is the formal introduction of it. Wild underwood may be an appendage of the grandeſt ſcene; it is a beautiful appendage. A bed of violets or of lilies may enamel the ground with propriety at the foot of an oak; but if you introduce them artificially in a border, you introduce a trifling formality, and diſgrace the noble object you wiſh to adorn.'

" The walk now leaves the wood, and opens upon the lower lawn, until coming near the houſe it enters the alarming precipice facing Llancot; winding along the face of it in a manner which does great honour to the artiſt. Sometimes the fragments of rock which fall in its way are avoided, at other times partially removed, ſo as to conduct the path along a ledge carved out of the rock; and in one inſtance, a huge fragment, of a ſomewhat conical ſhape and many yards high, is perforated; the path leading through its baſe. This is a thought which will hand down to future times the greatneſs of Mr Morris's taſte; the deſign and the execution are equally great; not a mark of a tool to be ſeen; all appears perfectly natural. The arch-way is made winding, ſo that on the approach it appears to be the mouth of a cave; and, on a nearer view, the idea is ſtrengthened by an allowable deception; a black dark hole on the ſide next the cliff, which, ſeen from the entrance before the perforation is diſcovered, appears to be the darkſome inlet into the body of the cave.

" From this point, that vaſt incloſure of rocks and precipices which marks the peculiar magnificence of Perſefield is ſeen to advantage. The area, containing in this point of view the fields of Llancot and the lower margin of Perſe-wood, is broken in a manner peculiarly picturesque by the graceful winding of the Wye; here waſhing a low graſſy ſhore, and their ſweeping at the feet of the rocks, which riſe in ſome places perpendicular from the water; but in general they have a wooded offset at the baſe; above which they riſe to one, two, or perhaps three or four hundred feet high; expoſing one full face, ſilvered by age, and bearded with ivy, growing out of the wrinkle-like ſeams and fiſſures. If one might be allowed to compare the paltry performances of art with the magnificent works of nature, we ſhould ſay, that this incloſure reſembles a prodigious fortreſs which has lain long in ruins. It is in reality one of nature's ſtrong-holds; and as ſuch has probably been frequently made uſe of. Acroſs the iſthmus on the Gloucesterſhire ſide there are the remains of a deep intrenchment, called to this day the *Bulwark*; and tradition ſtill teems with the extraordinary warlike feats that have been performed among this romantic ſcenery.

" From the perforated rock, the walk leads down to the cold-bath (a complete place), ſeated about the mid-way of the precipice, in this part leſs ſteep; and from the cold-bath a rough path winds down to the meadow, by the ſide of the Wye, from whence the precipice on the Perſefield ſide is ſeen with every advantage; the giant fragments, hung with ſhrubs and ivy, riſe in a gaſtly manner from amongſt the underwood, and ſhow themſelves in all their native ſavageneſs.

" From the cold-bath upward, a coach-road (very ſteep and difficult) leads to the top of the cliff, at the upper corner of the upper lawn. Near the top of the road is a point which commands one of the moſt pleaſing views of Perſefield: The Wye ſweeping through a graſſy vale which opens to the left:—Llancot backed by its rocks, with the Severn immediately behind them; and, ſeen in this point of view, ſeems to be divided from the Wye by only a ſharp ridge of rock, with a precipice on either ſide; and behind the Severn, the vale and wooded hills of Gloucesterſhire.

" From this place a road leads to the top of Windcliff—aſtoniſhing ſight! The face of nature probably affords not a more magnificent ſcene! Llancot in all its grandeur, the grounds of Perſefield, the caſtle and town of Chepſtow, the graceful windings of the Wye below, and its conflux with the Severn; to the left the foreſt of Dean; to the right, the rich marſhes and

picturesque

Principal Residence.

picturesque mountains of South Wales; a broad view of the Severn, opening its sea-like mouth; the conflux of the Avon, with merchant ships at anchor in King-road, and vessels of different descriptions under sail; Aust-Cliff, and the whole vale of Berkeley, backed by the wooded swells of Gloucestershire, the view terminating in clouds of distant hills, rising one behind another, until the eye becomes unable to distinguish the earth's billowy surface from the clouds themselves".

The leading principle of the improvement proposed by our author is, to "separate the sublime from the beautiful; so that in viewing the one, the eye might not so much as suspect that the other was near.

"Let the hanging walk be conducted entirely along the precipices, or through the thickets, so as to disclose the natural scenery, without once discovering the lawn or any other acquired softness. Let the path be as rude as if trodden only by wild beasts and savages, and the resting places, if any, as rustic as possible.

"Erase entirely the present shrubbery, and lay out another as elegant as nature and art could render it before the house, swelling it out into the lawn towards the stables; between which and the kitchen-garden make a narrow winding entrance.

"Convert the upper lawn into a deer-paddock, suffering it to run as wild, rough, and forest-like as total negligence would render it.

"The viewer would then be thus conducted: He would enter the hanging-walk by a sequestered path at the lower corner of the lawn, pursuing it through the wood to beneath the grotto, and round the head-land, or winding through Persewood, to the perforated rock and the cold-bath, without once conceiving an idea (if possible) that art, or at least that much art, had been made use of in disclosing the natural grandeur of the surrounding objects; which ought to appear as if they presented themselves to his view, or at most as if nothing was wanted but his own penetration and judgement to find them out. The walk should therefore be conducted in such a manner, that the breaks might be quite natural; yet the points of view obvious, or requiring nothing but a block or a stone to mark them. A stranger at least wants no seat here; he is too eager, in the early part of his walk, to think of lounging upon a bench.

"From the cold-bath he would ascend the steep, near the top of which a commodious bench or benches might be placed: the fatigue of ascending the hill would require a resting-place; and there are few points which afford a more pleasing view than this; it is grand, without being too broad and glaring.

"From these benches he would enter the forest part. Here the idea of Nature in her primitive state would be strengthened: the roughnesses and deer to the right, and the rocks in all their native wildness to the left. Even Llancot might be shut out from the view by the natural shrubbery of the cliff. The Lover's Leap, however (a tremendous peep), might remain; but no benches, nor other work of art, should here be seen. A natural path, deviating near the brink of the precipice, would bring the viewer down to the lower corner of the park; where benches should be placed in a happy point, so as to give a full view of the rocks and native wildnesses, and at the same time hide the farm-houses, fields, and other acquired beauties of Llancot.

"Having satiated himself with this savage scene, he would be led, by a still rustic path, through the labyrinth—when the shrubbery, the lawn, with all its appendages, the graceful Wye, and the broad silver Severn, would break upon the eye with every advantage of ornamental nature: the transition could not fail to strike.

"From this soft scene he would be shown to the top of Windcliff, where in one vast view he would unite the sublime and beautiful of Persefield."

Only one other particular remains to be noticed before closing this article. A place which is the residence of a family all the year is very defective, if some portion of it be not set apart for the enjoyment of a fine day, for air, and exercise, in winter. To such a spot shelter is absolutely essential; and evergreens being the thickest covert, are therefore the best: their verdure also is then agreeable to the eye; and they may be arranged so as to produce beautiful mixture of greens, with more certainty than deciduous trees, and with almost equal variety: they may be collected into a wood; and through that wood gravel-walks may be led along openings of a considerable breadth, free from large trees which would intercept the rays of the sun, and winding in such a manner as to avoid any draft of wind, from whatever quarter it may blow. But when a retreat at all times is thus secured, other spots may be adapted only to occasional purposes; and be sheltered towards the north or the east on one hand, while they are open to the sun on the other. The few hours of cheerfulness and warmth which its beams afford are so valuable as to justify the sacrifice even of the principles of beauty to the enjoyment of them; and therefore no objections of sameness or formality can prevail against the pleasantness of a straight walk, under a thick hedge or a south wall. The eye may, however, be diverted from the skreen by a border before it, where the aconite and the snowdrop, the crocus and hepatica, brought forward by the warmth of the situation, will be welcome harbingers of spring; and on the opposite side of the walk, little tufts of laurustines, and of variegated evergreens, may be planted. The spot thus enlivened by a variety of colours, and even a degree of bloom, may be still further improved by a green-house. The entertainment which exotics afford peculiarly belongs to this part of the year; and if amongst them be interspersed some of our earliest flowers, they will there blow before their time, and anticipate the gaiety of the season which is advancing. The walk may also lead to the stoves, where the climate and the plants are always the same. And the kitchen-garden should not be far off; for that is never quite destitute of produce, and always an active scene: the appearance of business is alone engaging; and the occupations there are an earnest of the happier seasons to which they are preparative. By these expedients even the winter may be rendered cheerful in a place where shelter is provided against all but the bitterest inclemencies of the sky, and agreeable objects and interesting amusements are contrived for every hour of tolerable weather.

For the particular operations in gardening, see PLANTING, PRUNING, GRAFTING, INOCULATING, *KITCHEN-Garden*, ORCHARD, *GREEN-House*, *HOT-House*, INARCHING, ESPALIER, &c. and the culture and management of different plants under their respective names.

GARDINER,

Gardiner || Garland.

GARDINER (Stephen), biſhop of Wincheſter, and lord chancellor of England, born at Bury St Edmunds in Suffolk, natural ſon to Richard Woodville, brother to queen Elizabeth wife to Edward IV. was learned in the canon and civil laws, and in divinity. He ſigned the divorce of Henry VIII. from Katharine of Spain: abjured the pope's ſupremacy; and writ *De vera et falſa obedientia*, in behalf of the king; yet in Edward's reign he oppoſed the reformation, and was puniſhed with impriſonment; but queen Mary coming to the throne, ſhe enlarged him. He drew up the articles of marriage between the queen and Philip of Spain, which were very advantageous to England. He was violent againſt the reformers; but on his death bed was diſſatisfied with his life, and often repeated theſe words: *Erravi cum Petro, ſed non flevi cum Petro.* He died in 1555.

GARGARISM (from γαργαρίζω, "to waſh the mouth;") a gargle. Its uſe is for waſhing the mouth and throat with, when inflammations, ulcerations, &c. are there. A ſmall quantity may be taken into the mouth, and moved briſkly about, and then ſpit out; or if the patient cannot do this to any advantage, the liquor may be injected by a ſyringe. When gargles are required, their uſe ſhould be more frequently repeated than is done in common practice.

GARGET, a diſeaſe of cattle, conſiſting in a ſwelling of the throat and the neighbouring parts; to prevent which bleeding in the ſpring is recommended.

GARGIL, a diſtemper in geeſe, which by ſtopping the head frequently proves mortal. Three or four cloves of garlic, beaten in a mortar with ſweet butter, and made into little balls, and given the creature faſting, are the ordinary cure.

GARIDELLA, in botany: A genus of the trigynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 26th order, *Multiſiliquæ*. The calyx is pentaphyllous, with leaves reſembling flower-petals; there are five bilabiate and biſid nectaria; the capſules are polyſpermous, and adhering together.

GARIZIM, Gerizim, or *Geriſim*, (anc. geog.) a mountain of Samaria, at the foot of which ſtood Sichem; ſo near, that Jotham could be heard by the Sichemites from its top, (Judges ix. 7.) Famous for the temple built on it by Sanballet, in favour of his ſon-in-law Manaſſeh, by the permiſſion of Alexander the Great, and 200 years after deſtroyed by John Hyrcanus, ſon of Simon, the fourth in ſucceſſion of the Aſmoneans (Joſephus).

GARLAND, a ſort of chaplet made of flowers, feathers, and ſometimes precious ſtones, worn on the head in manner of a crown.—The word is formed of the French *guirlande*, and that of the barbarous Latin *garlanda*, or Italian *ghirlanda*. Menage traces its origin from *gyrus*, through *gyrulus*, to *gyrulare*, *gyrlandum*, *ghirlandum*; and at length *ghirlanda* and *guirlande*; ſo that *guirlande* and *garland* are deſcended in the ſixth or ſeventh degree from *gyrus*.—Hicks rejects this derivation, and brings the word from *gardel handa*, which in the northern languages ſignify a *noſegay artfully wrought with the hand*.

Garland alſo denotes ornaments of flowers, fruits, and leaves, intermixed; anciently much uſed at the gates of temples, where feaſts and ſolemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, tournaments, &c.

Garlic || Garrick.

GARLIC. See Allium.

GARMENT, that wherewith any perſon is clothed. See Dress and Habit.

GARNET, in natural hiſtory, a very beautiful gem, of a red colour, with an admixture of blue. See Granate.

When pure and free from blemiſhes, it is little inferior in appearance to the oriental ruby, though only of a middle degree of hardneſs between the ſapphire and common cryſtal. It is found of various ſizes, from that of a pin's head to an inch in diameter.

Among our lapidaries and jewellers, genuine garnets are known by different names according to their different degrees of colour. 1. The garnet, ſimply ſo called, is the fineſt and moſt valuable kind, being of a very deep blood-red, with a faint admixture of blue. 2. The rock-ruby: a name very improperly given to the garnet when it is of a very ſtrong but not deep red, and has a fairer caſt of the blue: this is a very beautiful gem. 3. The ſorane or ſerain garnet; that of a yet brighter red, approaching to the colour of native cinnabar, with a faint blue tinge. 4. The almandine, a garnet only a little paler than that called the *rock-ruby*.

Garnet-Colour. See *Colouring of Glass.*

To imitate Garnets. The making the counterfeit garnet in paſte is done as follows.—Take prepared cryſtal two ounces, common red-lead ſix ounces, manganeſe 16 grains, zaffre three grains; mix all well, put them into a crucible, cover it with lute, and ſet it in a potter's kiln for 24 hours. Or take cryſtal two ounces, minium five ounces and a half, manganeſe 15 grains, zaffre four grains: mix them well together; and let all be baked, in a pot well luted, in a potter's kiln 24 hours.

GARONNE, a large river of France, which taking its riſe in the Pyrenean mountains, runs northweſt by the city of Tholouſe, divides the provinces of Guienne and Gaſcony, and, viſiting the city of Bourdeaux, falls into the Bay of Biſcay, about 60 miles below that city. It has alſo a communication with the Mediterranean, by means of the royal canal of Louis XIV. The tide flows up this river 20 miles above Bourdeaux.

GARRICK (David), Eſq; the great Roſcius of this age and country, who for near 40 years hath ſhone the brighteſt luminary in the hemiſphere of the ſtage, was born at the Angel Inn at Hereford, in the year 1716. His father, Captain Peter Garrick, was a French refugee, and had a troop of horſe which were then quartered in that city. This rank he maintained in the army for ſeveral years, and had a majority at the time of his death; that event, however, prevented him from ever enjoying it. Mr Garrick received the firſt rudiments of his education at the free-ſchool at Litchfield; which he afterwards completed at Rocheſter, under the celebrated Mr Colſon, ſince mathematical profeſſor at Cambridge. Dr Johnſon and he were fellow-ſtudents at the ſame ſchool; and it is a curious fact, that theſe two celebrated geniuſes came up to London, with the intention of puſhing themſelves into active life, in the ſame coach. On the 9th of March 1736, he was entered

Garrick

entered at the honourable ſociety of Lincoln's-Inn. The ſtudy of the law, however, he ſoon quitted; and followed for ſome time the employment of a wine-merchant: but that too diſguſting him, he gave way at laſt to the irreſiſtible bias of his mind, and joined a travelling company of comedians at Ipſwich in Suffolk, where he went by the name of *Lyddle*. Having in this poor ſchool of Apollo got ſome aquaintance with the theatric art, he burſt at once upon the world, in the year 1740-1, in all the luſtre of perfection, at the little theatre in Goodman's Fields, then under the direction of Henry Giffard.

The character he firſt performed was Richard III. in which, like the ſun burſting from behind a cloud, he diſplayed in the earlieſt dawn a ſomewhat more than meridian brightneſs. His excellence dazzled and aſtoniſhed every one; and the ſeeing a young man, in no more than his 24th year, and a novice in reality to the ſtage, reaching at one ſingle ſtep to that height of perfection which maturity of years and long practical experience had not been able to beſtow on the then capital performers of the Engliſh ſtage, was a phenomenon that could not but become the object of univerſal ſpeculation and of as univerſal admiration. The theatres at the weſt end of the town were deſerted; Goodman's Fields, from being the rendezvous of citizens and citizens wives alone, became the reſort of all ranks of men; and Mr Garrick continued to act till the cloſe of the ſeaſon.

Having very advantageous terms offered him for the performing in Dublin during ſome part of the ſummer (1741), he went over thither, where he found the ſame juſt homage paid to his merit which he had received from his own countrymen. To the ſervice of the latter, however, he eſteemed himſelf more immediately bound; and therefore, in the enſuing winter, engaged himſelf to Mr Fleetwood, then manager of Drury-Lane: in which theatre he continued till the year 1745, when he again went over to Ireland, and continued there the whole ſeaſon, joint manager with Mr Sheridan in the direction and profits of the theatre-royal in Smock-Alley. From thence he returned to England, and was engaged for the ſeaſon of 1746 with Mr Rich at Covent-Garden. This was his laſt performance as an hired actor: for in the cloſe of that ſeaſon, Mr Fleetwood's patent for the management of Drury-Lane being expired, and that gentleman having no inclination further to purſue a deſign by which, from his want of acquaintance with the proper conduct of it, or ſome other cauſe, he had conſiderably impaired his fortune; Mr Garrick, in conjunction with Mr Lacy, purchaſed the property of that theatre, together with the renovation of the patent; and in the winter of 1747, opened it with the greateſt part of Mr Fleetwood's company, and with the great additional ſtrength of Mr Barry, Mrs Pritchard, and Mrs Cibber, from Covent-Garden.

Were we to trace Mr Garrick through the ſeveral occurrences of his life,—a life ſo active, ſo buſy, and ſo full of occurrences as his, we ſhould ſwell this account to many pages. Suffice it to ſay, he continued in the unmoleſted enjoyment of his fame and unrivalled excellence to the moment of his retirement. His univerſality of excellence was never once attacked by competition. Tragedy, comedy, and farce, the lover and the hero, the jealous huſband who ſuſpects his wife without cauſe, and the thoughtleſs lively rake who attacks it without deſign, were all alike his own. Rage and ridicule, doubt and deſpair, tranſport and tenderneſs, compaſſion and contempt; love, jealouſy, fear, fury, and ſimplicity; all took in turn poſſeſſion of his features, while each of them in turn appeared to be the ſole poſſeſſor of his heart. In the ſeveral characters of Lear and Hamlet, Richard, Dorilas, Romeo, and Luſignane; in his Ranger, Bayes, Drugger, Kitely, Brute, and Benedick, you ſaw the muſcular conformations that your ideas attached to them all. In ſhort, Nature, the miſtreſs from whom alone this great performer borrowed all his leſſons, being in herſelf inexhauſtible, this her darling ſon, marked out for her trueſt repreſentative, found an unlimited ſcope for change and diverſity in his manner of copying from her various productions. There is one part of theatrical conduct which ought unqueſtionably to be recorded to Mr Garrick's honour, ſince the cauſe of virtue and morality, and the formation of public manners, are conſiderably dependent upon it; and that is, the zeal with which he aimed to baniſh from the ſtage all thoſe plays which carry with them an immoral tendency, and to prune from thoſe which do not abſolutely, on the whole, promote the intereſts of vice, ſuch ſcenes of licentiouſneſs and liberty, as a redundancy of wit and too great livelineſs of imagination have induced ſome of our comic writers to indulge themſelves in, and which the ſympathetic diſpoſition of our age of gallantry and intrigue has given ſanction to. The purity of the Engliſh ſtage has certainly been much more fully eſtabliſhed during the adminiſtration of this theatrical miniſter, than it had ever been during preceding managements. He ſeems to have carried his modeſt, moral, chaſte, and pious principles with him into the very management of the theatre itſelf, and reſcued performers from that obloquy which ſtuck on the profeſſion. Of thoſe who were accounted blackguards, unworthy the aſſociation of the world, he made gentlemen, united them with ſociety, and introduced them to all the domeſtic comforts of life. The theatre was no longer eſteemed the receptacle of all vice; and the moral, the ſerious, the religious part of mankind, did not heſitate to partake of the rational entertainment of a play, and paſs a cheerful evening undiſguſted with the licentiouſneſs, and uncorrupted by the immorality, of the exhibition.

Garrick.

Notwithſtanding the numberleſs and laborious avocations attendant on his profeſſion as an actor, and his ſtation as a manager; yet ſtill his active genius was perpetually burſting forth in various little productions in the dramatic and poetical way, whoſe merit cannot but make us regret his want of time for the purſuance of more extenſive and important works. It is certain, that his merit as an author is not of the firſt magnitude: but his great knowledge of men and manners, of ſtage-effect, and his happy turn for lively and ſtriking ſatire, made him generally ſucceſsful; and his prologues and epilogues in particular, which are almoſt innumerable, poſſeſs ſuch a degree of happineſs, both in the conception and execution, as to ſtand unequalled. His Ode on the death of Mr Pelham run through four editions in leſs than ſix weeks. His Ode on Shakeſpeare is a maſterly piece of poetry; and when deliver-

Garrick ed by himſelf, was a moſt capital exhibition. His al-
|| terations of Shakeſpeare and other authors have been
Garſtang. at times ſucceſsful, and at times exploded. The cut-
ting out the grave-diggers ſcene from Hamlet will never be forgot to him by the inhabitants of the gallery at Drury. Though neceſſary to the chaſteneſs of the ſcene, they cannot bear to loſe ſo much true ſterling wit and humour; and it muſt be owned, that exuberances of that kind, though they hurt the uniformity, yet increaſe the luxuriance of the tree. Among his alterations the following are part: Every Man in his Humour, altered from Ben Johnſon; Romeo and Juliet, Winter's Tale, Catherine and Petruchio, Cymbeline, Hamlet, &c. altered and made up from Shakeſpeare; Gameſters, a comedy, from Shirley; Iſabella, from Southerne. To theſe we add, as original productions, The Farmer's Return, and Linco's Travels, interludes; Guardian, Lethe, Lying Valet, Miſs in her Teens, Male Coquet, Iriſh Widow, and other comedies in two acts; Enchanter, a muſical entertainment; Lilliput; the Chriſtmas Tale is aſcribed to him, and many others.

We now bring him to the period of his retirement in the ſpring of 1776; when, full of fame, with the acquirement of a ſplendid fortune, and growing into years, he thought proper to ſeek the vale of life, to enjoy that dignified and honourable eaſe which was compatible with his public ſituation, and which he had ſo well earned by the activity and the merits of his dramatic reign. But very ſhort indeed was the period allotted to him for this precious enjoyment: for on the 20th of January 1779, he departed this life; leaving no one rival in excellence upon earth to compenſate for his loſs, or a hope of our ever meeting with his like again.

GARRISON, in the art of war, a body of forces, diſpoſed in a fortreſs, to defend it againſt the enemy, or to keep the inhabitants in ſubjection; or even to be ſubſiſted during the winter-ſeaſon: hence *garriſon* and *winter-quarters* are ſometimes uſed indifferently for the ſame thing; and ſometimes they denote different things. In the latter caſe, a garriſon is a place wherein forces are maintained to ſecure it, and where they keep regular guard, as a frontier town, a citadel, caſtle, tower, &c. The garriſon ſhould be always ſtronger than the townſmen.

Du Cange derives the word from the corrupt Latin *garniſio*, which the latter writers uſe to ſignify all manner of munition, arms, victuals, &c. neceſſary for the defence of a place, and ſuſtaining of a ſiege.

Winter-quarters ſignify a place where a number of forces are laid up in the winter ſeaſon, without keeping the regular guard.

GARSTANG, a town in Lancaſhire, 223 miles from London, in the poſt road between Preſton and Lancaſter. It is a large populous place, near a mile in length, but built in a very irregular manner, with dirty ſtreets, and very indifferent houſes. The church is a ſtately Gothic ſtructure. By the late inland navigation, it has communication with the rivers Merſey, Dee, Ribble, Ouſe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Weſtmoreland, Cheſter, Stafford, Warwick, Leiceſter, Oxford, Worceſter, &c.

GARTER, a ligature for tying up the ſtocking; Garter.
but particularly uſed for the badge of a noble order of knights, hence denominated the

Order of the GARTER, a military order of knighthood, the moſt noble and ancient of any lay-order in the world, inſtituted by Edward III. The knights-companions are generally princes and peers; and the king of England is the ſovereign or chief of the order. The number of knights was originally 26; but ſix were added in 1786, on account of the increaſe of the royal family. They are a college or corporation, having a great and little ſeal.

Their officers are a prelate, chancellor, regiſter, king at arms, and uſher of the black rod. They have alſo a dean, with 12 canons, and petty canons, vergers, and 26 penſioners or poor knights. The prelate is the head. This office is veſted in the biſhop of Wincheſter, and has ever been ſo. Next to the prelate is the chancellor; which office is veſted in the biſhop of Saliſbury, who keeps the ſeals, &c. The next is the regiſter, who by his oath is to enter upon the regiſtry, the ſcrutinies, elections, penalties, and other acts of the order with all fidelity: The dean of Windſor is always regiſter *ex officio*. The fourth officer is Garter and King-at-arms, being two diſtinct offices united in one perſon. Garter carries the rod and ſceptre at the feaſt of St George, the protector of this order, when the ſovereign is preſent. He notifies the elections of new knights, attends the ſolemnity of their inſtallations, carries the garter to the foreign princes, &c. He is the principal officer within the college of arms, and chief of the heralds. See *KING-at-Arms*.

All theſe officers except the prelate have fees and penſions. The college of the order is ſeated in the caſtle of Windſor, within the chapel of St George, and the charter-houſe, erected by the founder for that purpoſe. The habit and enſign of the order are, a garter, mantle, cape, george, and collar. The three firſt were aſſigned the knights companions by the founder; and the george and collar by Henry VIII.

The garter challenges pre-eminence over all the other parts of the dreſs, by reaſon that from it the noble order is denominated; that it is the firſt part of the habit preſented to foreign princes and abſent knights, who, and all other knights-elect, are therewith firſt adorned; and it is of ſo great honour and grandeur, that by the bare inveſtiture with this noble enſign, the knights are eſteemed companions of the greateſt military order in the world. It is worn on the left leg between the knee and calf, and is enamelled with this motto, HONI SOIT QUI MAL Y PENSE; i. e. *Shame to him that thinks evil hereof:* The meaning of which is, that king Edward having laid claim to the kingdom of France, retorted ſhame and defiance upon him that ſhould dare to think amiſs of the juſt enterpriſe he had undertaken, for recovering his lawful right to that crown; and that the bravery of thoſe knights whom he had elected into this order, was ſuch as would enable him to maintain the quarrel againſt thoſe that thought ill of it.

The mantle is the chief of theſe veſtments made uſe of upon all ſolemn occaſions. The colour of the mantle is by the ſtatutes appointed to be blue. The length of the train of the mantle only diſtinguiſhes the ſovereign from the knights-companions. To the collar of

the

Garter. the mantle is fixed a pair of long ſtrings, anciently wove with blue ſilk only, but now twiſted round, and made of Venice gold and ſilk, of the colour of the robe, with knobs or buttons, and taſſels at the end. The left ſhoulder of the mantle has from the inſtitution been adorned with a large garter, with the device, Honi soit, &c. Within this is the croſs of the order, which was ordained to be worn at all times by king Charles I. At length the ſtar was introduced, being a ſort of croſs irradiated with beams of ſilver.

The collar is appointed to be compoſed of pieces of gold in faſhion of garters, the ground enamelled blue, and the motto gold.

When the knights wear not their robes, they are to have a ſilver ſtar on the left ſide; and they commonly bear the picture of St George, enamelled on gold, and beſet with diamonds, at the end of a blue ribbon, croſſing the body from the left ſhoulder. They are not to appear abroad without the garter, on penalty of 6s. 8d. paid to the regiſter.

The manner of electing a knight-companion into this moſt noble order, and the ceremonies of inveſtiture, are as follow. When the ſovereign deſigns to elect a companion of the garter, the chancellor belonging to this order draws up the letters, which, paſſing both under the ſovereign's ſign-manual and ſignet of the order, are ſent to the perſon by Garter principal king at arms; and are in this manner, or to the ſame effect: "We, with the companions of our moſt noble order of the garter, aſſembled in chapter, holden this preſent day at our caſtle at Windſor, conſidering the virtuous fidelity you have ſhown, and the honourable exploits you have done in our ſervice, by vindicating and maintaining our right, &c. have elected and choſen you one of the companions of our order. Therefore, we require you to make your ſpeedy repair unto us, to receive the enſigns thereof, and be ready for your inſtallation upon the — day of this preſent month, &c."

The garter, which is of blue velvet bordered with fine gold-wire, having commonly the letters of the motto of the ſame, is, at the time of election, buckled upon the left leg, by two of the ſenior companions, who receive it from the ſovereign, to whom it was preſented upon a velvet cuſhion, by Garter king at arms, with the uſual reverence, whilſt the chancellor reads the following admonition, enjoined by the ſtatutes: "To the honour of God omnipotent, and in memorial of the bleſſed martyr St George, tie about thy leg, for thy renown, this noble garter; wear it as the ſymbol of the moſt illuſtrious order, never to be forgotten or laid aſide; that thereby thou mayeſt be admoniſhed to be courageous; and having undertaken a juſt war, in which thou ſhalt be engaged, thou mayeſt ſtand firm, valiantly fight, and ſucceſſively conquer." The princely garter being then buckled on, and the word of its ſignification pronounced, the knight-elect is brought before the ſovereign, who puts about his neck, kneeling, a dark blue ribbon, whereunto is appendant, wrought in gold within the garter, the image of St George on horſeback, with his ſword drawn, encountering with the dragon. In the mean time, the chancellor reads the following admonition: "Wear this ribbon about thy neck, adorned with the image of the bleſſed martyr and ſoldier of Chriſt St George, by whoſe imitation provoked, thou mayeſt ſo overpaſs both proſperous and adverſe adventures, that having ſtoutly vanquiſhed thy enemies both of body and ſoul, thou mayeſt not only receive the praiſe of this tranſient combat, but be crowned with the palm of eternal victory." Then the knight elected kiſſes the ſovereign's hand; thanks his majeſty for the great honour done him; riſes up, and ſalutes all the companions ſeverally, who return their congratulations. See a repreſentation of the above inſignia, among others, on the plate belonging to *Orders of* Knighthood. Garter.

Since the inſtitution of this order, there have been eight emperors and twenty-eight kings, beſides numerous ſovereign princes, enrolled as companions thereof. Its origin is ſomewhat differently related. The common account is, that the counteſs of Saliſbury at a ball happening to drop her garter, the king took it up and preſented it to her with theſe words, "*Honi ſoit qui mal y penſe;*" i. e. Evil to him that evil thinks. This accident, it is ſaid, gave riſe to the order and the motto; it being the ſpirit of the times to mix love and war together: but as in the original ſtatutes of this order there is not the leaſt conjecture to countenance ſuch a feminine inſtitution, credit cannot be given to this tradition. Camden, Fern, &c. take it to have been inſtituted on occaſion of the victory obtained by Edward over the French at the battle of Creſſey: that prince, ſay ſome hiſtorians, ordered his garter to be diſplayed, as a ſignal of battle; in commemoration whereof, he made a garter the principal ornament of the order erected in memory of this ſignal victory, and a ſymbol of the indiſſoluble union of the knights.

It appears from Raſtel's chronicle, lib. vi. quoted by Granger in the ſupplement to his Biographical Hiſtory, that this order was deviſed by Richard I. at the ſiege of the city of Acres, when he cauſed twenty-ſix knights, who firmly ſtood by him, to wear thongs of blue leather about their legs, and that it was perfected in the nineteenth year of Edward III.

In 1551, Edward VI. made ſome alterations in the ritual of this order: that prince compoſed it in Latin, the original whereof is ſtill extant in his own hand-writing. He there ordained, that the order ſhould no longer be called the order of St George, but that of the garter; and, inſtead of the George, hung at the collar, he ſubſtituted a cavalier, bearing a book on the point of his ſword, with the word *protectio* graven on the ſword, and *verbum Dei* on the book; with a buckle in the left-hand, and the word *fides* thereon. Larrey.

Garter, principal King at Arms. This office was inſtituted by Henry V.

Garter, and principal king at arms, are two diſtinct offices united in one perſon: Garter's employment is to attend the ſervice of the order of the garter; for which he is allowed a mantle and badge, a houſe in Windſor-caſtle, and penſions both from the ſovereign and knights, and, laſtly, fees. He alſo carries the rod and ſceptre at every feaſt of St George, when the ſovereign is preſent, and notifies the election of ſuch as are new choſen; attends the ſolemnity of their inſtallations, and takes care of placing their arms over their ſeats; and carries the garter to foreign kings and

Garter, Garth.

princes, for which ſervice it has been uſual to join him in commiſſion with ſome peer, or other perſon of diſtinction.

Garter's oath relates only to ſervices being performed within the order, and is taken in chapter before the ſovereign and knights. His oath, as king at arms, is taken before the earl marſhal.

GARTER is alſo a term in heraldry, ſignifying the moiety or half of a bend.

GARTH is uſed in ſome parts of England for a little backſide or cloſe. It is an ancient Britiſh word. Gardd, in that language, ſignifies *garden*, and is pronounced and written *garth*. This word is alſo uſed for a dam or wear, &c.

GARTH-men is uſed in our ſtatutes for thoſe who catch fiſh by means of fiſh-garths, or wears. By ſtatute it is ordained, that no fiſher, nor garth-man, ſhall uſe any nets or engines to deſtroy the fry of fiſh, &c. 17 Ric. II. cap. 9. The word is ſuppoſed by ſome to be derived from the Scotch word *gart*, which ſignifies *forced* or *compelled*; becauſe fiſh are forced by the wear to paſs in a loop, where they are taken.

GARTH (Sir Samuel), an excellent Engliſh poet and phyſician, was deſcended from a good family in Yorkſhire. He was admitted into the college of phyſicians at London in 1693. He at that time zealouſly promoted and encouraged the erecting of the diſpenſary for the relief of the ſick poor, by giving them advice gratis, and medicines at low rates. This work of charity having expoſed him and many other phyſicians to the envy and reſentment of ſeveral perſons of the ſame faculty as well as apothecaries, he ridiculed them, with a peculiar ſpirit and vivacity, in a poem called the *Diſpenſary*, in ſix cantos, highly eſteemed. He was one of the moſt eminent members of the famous ſociety called the *Kit-Kat Club*, which conſiſted of noblemen and gentlemen diſtinguiſhed by their excellent parts and affection to the houſe of Hanover. Upon the acceſſion of George I. he was knighted, and made phyſician in ordinary to his majeſty, and phyſician-general to the army. Nor were theſe more than juſt rewards even of his phyſical merit. He had gone through the office of cenſor of the college in 1702; and had practiſed always with great reputation, and a ſtrict regard to the honour and intereſt of the faculty, never ſtooping to proſtitute the dignity of his profeſſion, through mean and ſordid views of ſelf-intereſt, to any even the moſt popular and wealthy apothecaries. In a ſteady adherence to this noble principle, he concurred with the much celebrated Dr Radcliffe, with whom he was alſo often joined in phyſical conſultations. He had a very extenſive practice, but was very moderate in his views of advancing his own fortune; his humanity and good-nature inclining him more to make uſe of the great intereſt he had with perſons in power, for the ſupport and encouragement of other men of letters. He choſe to live with the great in that degree of independency and freedom which became a man poſſeſſed of a ſuperior genius, whereof he was daily giving freſh proofs to the public. One of his laſt performances in polite letters, was his tranſlation of the whole fourteenth book, and the ſtory of Cinnus in the fifteenth book, of Ovid's Metamorphoſes. Theſe, together with an Engliſh verſion of the reſt, were publiſhed in 1717; and he has prefixed an excellent preface to the whole, wherein he not only gives an idea of the work, and points out its principal beauties, but ſhows the uſes of the poem, and how it may be read to moſt profit. The diſtemper which ſeized him the enſuing year, and ended not but with his life, cauſed a general concern; which was particularly teſtified by lord Lanſdown, brother-poet, though of a different party, in ſome admirable verſes written on the occaſion. He died, after a ſhort illneſs, which he bore with great patience, in January 1719.

Garumna Gas.

GARUMNA, a noble and navigable river of Gaul, which riſing from the Pyrenees, formerly bounded Aquitain on the north (Cæſar;) but by the new regulation of Auguſtus divided it in the middle, emptying itſelf, to the north of Burdegala, into the Aquitanic ocean. Now the *Garonne*. Mela obſerves concerning it, that unleſs it is ſwelled by winter rains, or the melting of the ſnow, it is for a great part of the year ſhoaly and ſcarce navigable: but when increaſed by the meeting tide, whereby its waters are repelled, it is ſomewhat fuller, and the farther the river advances, it is broader, till at length it reſembles a large frith or arm of the ſea; not only bearing large veſſels, but alſo ſwelling like a raging ſea, toſſes them extremely, eſpecially if the direction of the wind be one way and that of the current another.

GAS, a general name for all fluids of the aerial kind, excepting the common air we breathe. It is derived from the German *gaſcht* or *gaſt*, ſignifying an eruption of wind, or the ebullition attending the expulſion of elaſtic fluids from ſubſtances in a ſtate of fermentation or effervеſcence. It was originally given by Van Helmont to the vapour of charcoal, the ſame with the fluid now called *fixed air*, and ſome other factitious airs; and from him has been employed by modern philoſophers as a general term for all the fluids about which aerology is converſant.

Under the article AEROLOGY, the nature and properties of theſe fluids are explained at large; here, however, for the more eaſy comprehenſion of the ſubject, we ſhall give a liſt of theſe fluids, with a general account of the moſt remarkable particulars hitherto diſcovered concerning them. The gaſes, or permanently elaſtic fluids, as yet known, are,

1. Common or atmoſpherical air.
2. Fixed air.
3. Inflammable air.
4. Nitrous air.
5. Dephlogiſticated air.
6. Vitriolic-acid air.
7. Marine-acid air.
8. Nitrous-acid air.
9. Fluor-acid air.
10. Vegetable-acid air.
11. Alkaline air.
12. Dephlogiſticated nitrous air.
13. Sulphurated inflammable air.
14. Hepatic air.
15. Phlogiſticated air.

The moſt remarkable properties of theſe are as follow.

1. *Atmoſpherical air* ſupports both animal and vegetable life; and ſurrounding the whole globe to a conſiderable height, is one of the great agents employed by nature for executing her moſt important purpoſes.

Gas. It is compoſed of one part of dephlogiſticated air, and three or more of phlogiſticated air.

2. *Fixed air* is produced in great plenty in all kinds of combuſtion. If the combuſtible body be ſet on fire in pure dephlogiſticated air, the fixed air is proportionably pure; but if in the common atmoſphere the produce is contaminated by the whole quantity of phlogiſticated air contained in that portion of the atmoſphere by which the combuſtion was ſupported, it proves fatal to animals in a very ſhort time, but is favourable to vegetation. It is abſorbed in conſiderable quantities by water, to which it communicates an agreeable acidulous taſte, and a power of diſſolving iron; and is the principal ingredient in mineral waters. It is taken up in great quantity by pure alkaline ſalts whether fixed or volatile; by calcined magneſia, lime, or calcareous earth; all of which it naturalizes, and forms with them ſalts of different kinds. Lime abſorbs it more readily either when quite dry or entirely diſſolved in water than when expoſed to it in a moiſt maſs, and lime-water is readily precipitated by it; but magneſia attracts it more readily when in a moiſt maſs; and the fixed alkalies equally well in either caſe, unleſs when violently heated.

Fixed air is contained in great quantity in fermented liquors, to which it gives their agreeable taſte and briſkneſs; and by impregnating them with it, they may be recovered from a vapid ſtate, and rendered briſk and agreeable as before. It has a conſiderable antiſeptic power; and notwithſtanding its pernicious qualities when taken into the lungs, has been found ſerviceable in putrid diſeaſes when ſwallowed, or when injected by way of glyſter. Being a natural product of combuſtion, it is met with in great quantities in the neighbourhood of volcanoes, or mountains which have formerly been volcanoes, where it often produces miſchievous effects. It is alſo met with in mines, where it often proves fatal to the workmen. In the artificial way it is procured from fermenting liquors; from the calcination of magneſia and calcareous earths by heat; and from a mixture of theſe earths with acids, chiefly the vitriolic. When procured from large quantities of fermenting liquors, it lies in a large body on the ſurface of the liquor, generally nine inches or a foot thick, and affords an amuſing appearance on extinguiſhing lighted candles or chips of wood in it. In theſe experiments the ſmoke readily unites with the gas, ſo that little or none of it can diſperſe itſelf into the atmoſphere: and it is remarkable, that the upper ſurface of this ſmoke which floats in the fixed air is ſmooth and well defined, but the under part is ragged, and ſometimes even collecting itſelf into balls connected with the upper ſurface by ſlender threads. Sometimes the ſmoke will form itſelf into broad flakes parallel to the ſurface of the liquor, and at different diſtances from it, exactly like clouds; and theſe appearances will continue for upwards of an hour with very little variation. Dr Prieſtley tried the ſmoke of gun-powder, roſin, ſulphur, and other electric ſubſtances; and found them all retained equally by the fixed air, as well as the ſmoke of vitriolic acid raiſed by putting a burning coal in it.

Fixed air does not very readily unite with common air. It is near twice as heavy as atmoſpheric air, and acquires a proportionably greater elaſticity by heat. It is compoſed of dephlogiſticated air and phlogiſton; which two ingredients are partly ſeparated by the electric ſpark. It may be kept for any length of time in veſſels inverted into quickſilver, or even into water, with a coat of oil about half an inch thick on its ſurface. Gas.

3. *Inflammable air* is compoſed of phlogiſton and water rarefied by heat. It is the lighteſt fluid known in nature, being 10 or 12 times ſpecifically lighter than the common atmoſphere. It is pernicious to animals, but ſupports vegetable life. By itſelf it extinguiſhes flame; but when mixed with a certain quantity of common air, the whole explodes violently, and a ſmall portion of nitrous acid is produced. If dephlogiſticated air be uſed inſtead of common air, the exploſion is much more violent; Dr Prieſtley ſays 50 times. It is very readily abſorbed by the calces of ſome metals, particularly lead, to which it reſtores its metallic form; and is even decompoſed by keeping it long in a tube made of white glaſs, to which it communicates a black colour by its attraction for the lead in its compoſition. It is produced naturally in coal-pits and other mines; where, being mixed with common air, and frequently inflamed by the lights which the miners have along with them, it explodes with prodigious violence, and often produces much miſchief. Sometimes it riſes out of marſhes, or from the mud at the bottom of ſprings and rivers; in which caſe the water will ſeem to take fire on holding a lighted candle to its ſurface. It is produced from the vapours of rancid oil; whence it has ſometimes been collected in the large bellows uſed in founderies, and burſt them with exploſion. It ſeems alſo to be a natural product of putrefaction of every kind, being ſometimes met with in jakes and privies, where it has exploded as uſual on the approach of a candle. When mixed with common air it may be fired by an electric ſpark, but leſs readily by one from flint and ſteel; though there are inſtances of its taking fire in this manner alſo. In the artificial way, it is moſt uſually procured from iron-filings and diluted vitriolic acid; and lately from the ſteam of water conveyed over iron-filings through a red-hot tube. It is likewiſe obtained by diſtillation of wood, coal, &c. and by diſſipating charcoal with the heat of a burning glaſs *in vacuo*. Dr Pennington of Philadelphia informs us, that it reſiſts putrefaction; but its virtues in this way have not been particularly examined.

4. *Nitrous air* is produced from inflammable ſubſtances combined with the nitrous acid; and, according to that claſs of philoſophers ſtyled *Phlogiſtians*, conſiſts of nitrous acid ſuperſaturated with phlogiſton; according to the *Antiphlogiſtians*, it conſiſts of the ſame acid, deprived of a part of its oxygenous principle, the ſame with what the other party call the baſis of dephlogiſticated air. This is the moſt noxious of all the kinds of air hitherto diſcovered; being not only inſtantly fatal to animal life, but to vegetables alſo, as well as extinguiſhing flame in the moſt perfect manner. It has a ſtrong offenſive ſmell; and when mixed with a quantity of dephlogiſticated or common atmoſpheric air, a very conſiderable diminution of the latter takes place, attended with heat, red fumes, and the production of nitrous acid. The diminution is greateſt of all when pure dephlogiſticated air is made uſe of; and with atmoſpheric air is greater or leſs, according to its degree of purity or the quantity of dephlogiſticated air it contains. This kind

Gas. kind of air is a moſt powerful antiſeptic; and has been tried, but without ſucceſs, to preſerve meat freſh for a long time: though for a week or two it might perhaps be uſeful. It is heavier than common air.

5. *Dephlogiſticated air* ſupports animal life and flame in the moſt perfect manner, but is leſs friendly to vegetables; though it ſeems not to poſſeſs any property abſolutely detrimental to them, further than as it contains none, or only a ſmall quantity, of that phlogiſtic matter, which is now found to be the proper food of plants. The heat produced by it in burning bodies ſeems to be very little if at all inferior to that of a large burning mirror. It unites with water but in ſmall quantity; but attaches itſelf ſtrongly to iron when fired in it, cauſing the metal to burn with a bright flame, and being diminiſhed by this combuſtion to a ſurpriſing degree. With other inflammable matters it produces fixed air. It is naturally found in ſea-water, and riſes in ſome waters through the earth. It is produced in the day-time by the leaves of many plants; but not in the night. It is alſo produced from water expoſed to the ſun's light, eſpecially if certain ſubſtances be put into it, of which a particular account is given under the article AEROLOGY. It is alſo produced by the diſtillation of nitre, manganeſe, and other ſubſtances.

6. *Vitriolic-acid air* is not eſſentially different from the fumes of burning ſulphur, only that the latter are always mixed with common air. It is very heavy, and deſtructive both to animal and vegetable life; extinguiſhing flame alſo; and uniting in large quantity with water, from which, however, it is eaſily expelled by heat. By virtue of its properties as an acid, it readily unites with alkaline ſalts. It diſſolves alſo camphor, reducing it to a tranſparent liquor; from which, however, the camphor ſeparates on the affuſion of water. It is produced by diſtilling oil of vitriol mixed with inflammable ſubſtances with a gentle heat.

7. *Marine-acid air* is no other than the vapour of marine acid, which may be procured either by diſtilling the marine acid with a very gentle heat, or the mixture of vitriolic acid, and common ſalt uſually made uſe of for procuring that acid. It is abſorbed largely by water; ſo that a very ſtrong and ſmoking acid liquor can thus be obtained. It is pernicious to animal and vegetable life, but leſs ſo than the two former. It likewiſe extinguiſhes flame: but a candle will burn in common air, though mixed with a large proportion of it; in which caſe the flame appears of a moſt beautiful blue or green colour.

8. *Nitrous-acid air* has been but little examined on account of its extreme corroſive property, by which it deſtroys all kinds of liquids wherewith we attempt to confine it. By the addition of a certain quantity of phlogiſton it is converted into phlogiſticated air, as Dr Prieſtley found on attempting to confine it by means of whale oil. It is abſorbed by water, and forms nitrous acid; being the vapour of that, as the marine acid air is the vapour of the concentrated marine acid.

9. The *fluor-acid air* is not diſtinct from the vapour of that acid loaded with ſilicious earth, which it plentifully diſſolves. A full account of its properties is given under the article CHEMISTRY.

10. *Vegetable-acid air* was procured from an exceedingly concentrated acetous acid, but with more difficulty than the others on account of the volatility of the liquid. It extinguiſhes flame, unites with alkalies, and performs every other thing that could be expected from the acetous acid, manifeſting its inferior acid power even in its aerial ſtate. It is very readily imbibed by water and by charcoal. It is likewiſe abſorbed pretty readily by olive oil, on which it has a remarkable effect. The oil takes up about ten times its bulk of the air; and, from being of a yellowiſh colour, turns almoſt as clear as water, loſing alſo ſomewhat of its viſcidity, and approaching to the conſiſtence of an eſſential oil. Gas

A ſingular appearance was obſerved by Dr Prieſtley on attempting to determine how much of this air a certain quantity of water would imbibe. Having put the liquid into a glaſs tube cloſed at one end, and introduced it to the vegetable acid air, a ſmall bubble of common air which appeared at the bottom began to expand, and continued to do ſo till all the water was thrown out of the tube. The ſame effect took place when the tube was hermetically ſealed at the end. With ſpirit of wine it was the ſame, and with oil of turpentine the effect took place more quickly; but with olive oil it was more ſlow.

11. *Alkaline air* is lighter than that of the common atmoſphere, and much more expanſible by heat. It is now found to be compoſed of inflammable and phlogiſticated air. It has all the properties of cauſtic volatile ſpirits, uniting with acids and forming neutral ſalts. It is obtained from a mixture of ſal ammoniac and lime by diſtillation with a very gentle heat; or it may be had in great quantity by diſtilling ſpirit of wine with volatile alkaline ſpirit. It is inflammable when mixed with common air, but burns without any exploſion.

12. *Dephlogiſticated nitrous air* is produced from the nitrous kind expoſed to liver of ſulphur, or for a longer time to iron. It may alſo be produced directly in the operation for making nitrous air from the acid and iron. After a great quantity of nitrous air has been extricated from this mixture without heat, the dephlogiſticated nitrous air will come over by the application of heat. It is remarkable for being able to ſuſtain flame, without ſupporting animal life. In this kind of air a candle burns ſometimes naturally, and ſometimes with an enlarged flame of a blue or green colour. It is leſs proper as a teſt for the purity of the atmoſphere than common nitrous air.

13. *Sulphurated inflammable air* is a late diſcovery of Dr Prieſtley's, and ſeems to be compoſed of inflammable and hepatic air mixed together.

14. *Hepatic air* is the ſteam which ariſes from liver of ſulphur on the addition of water, but ſtill more copiouſly on the addition of an acid. It is fatal to animal life, and burns without exploſion. Its effect on vegetables is not well known; it is remarkable for the property of giving a black colour to ſome metallic calces, whence it has the property of rendering ſympathetic ink viſible.

15. *Phlogiſticated air* is one of the component parts of the atmoſphere; and is produced in great plenty by all the proceſſes of putrefaction, calcination of metals, and many caſes of combuſtion. It is very deſtructive to animal life, and likewiſe extinguiſhes flame; but it is exceedingly proper for the ſupport of vegetables, which

Gas. which thrive much better in it than in the common air. There are diſputes concerning its compoſition; the Antiphlogiſtians ſuppoſing it to be a primary element, and their antagoniſts that it is compoſed in great part of phlogiſton; though they have not been able to prove this part of their doctrine either by reviving the calces of metals, or purifying it in ſuch a manner as to make it reſpirable. It is ſomewhat lighter than atmoſpherical air. Mixed with dephlogiſticated and inflammable air, it produces nitrous acid by detonation. Inflammable, nitrous, and alkaline air, may be partly converted into it.

Having thus briefly recapitulated the properties of the different gaſes hitherto diſcovered, we ſhall next proceed to conſider the apparatus neceſſary for making the various experiments with theſe gaſes, which have been for ſome time in ſo much repute among modern philoſophers. Theſe experiments may be reduced to the following claſſes. 1. The production and preſervation of the gaſes themſelves. 2. The impregnating water or other fluids with them. 3. Trying their effects upon animals and vegetables. 4. The effects produced on them by electricity. 5. Their capacities for conducting heat.

Where one can have acceſs to large quantities of fermenting liquor, fixed air may be eaſily procured of tolerable purity, by filling a vial or tumbler with water, and then emptying it below the ſurface of the mephitic atmoſphere which floats above the ſurface of the liquor, the fixed air occupying the place of the water as it is diſcharged from the veſſel. It may then be preſerved by ſtopping the mouth of the vial with a cork; or, if it is a wide-mouthed veſſel, by inverting it in quickſilver, or in water covered with oil. In moſt caſes, however, the different kinds of air may be for a ſhort time preſerved in veſſels inverted in water alone without any oil. For experiments, therefore, on thoſe kinds of airs which may be preſerved in water, Dr Prieſtley made uſe of an oblong trough of wood, ſuch as is repreſented, Plate CCVII. fig. 1. The dimenſions were generally two feet in length, 18 inches in breadth, and 11 inches in depth. About an inch below the top is a wooden ſhelf all round, for the purpoſe of ſetting the inverted vials or jars of air upon it. The veſſels he commonly made uſe of were ſuch jars as he had been accuſtomed to uſe in his electrical batteries, about 10 inches long and 2½ wide; though for different experiments he had them of various ſhapes and ſizes. When he had occaſion to remove veſſels of air from the large trough, he put them into pots or diſhes of the form repreſented fig. 2; theſe diſhes being firſt put under water, and the jars then ſlid off the ſhelf upon them. For the mere removal of jars of air from one place to another, where they are to ſtand only for a few days, he makes uſe of common tea-diſhes, which hold water enough, unleſs the air be in a ſtate of diminution by any proceſs going on in the veſſel. When any thing, as a gallipot, is to be ſupported in a jar full of air, wire-ſtands, ſuch as are repreſented fig. 3. may be conveniently made uſe of. They anſwer better than any others, on account of their taking up leſs room, and being eaſily bent into any ſhape. When there is occaſion to pour a quantity of air from one veſſel to another, a funnel, fig. 4. muſt be made uſe of. Thus the operation is rendered exceedingly eaſy, by firſt filling the veſſel in which the air is to be conveyed with water, and holding the mouth of it together with the funnel both under water with one hand, while the other is employed in pouring the air; which, aſcending through the funnel up into the veſſel, makes the water deſcend, and takes its place. It will be convenient to have ſeveral of theſe funnels of different ſizes. They are beſt made of glaſs. An improvement on this part of the apparatus was made by the Duke de Chaulnes, and conſiſts in having the under part of the ſhelf hollowed out into the ſhape of a funnel, with an hole over the middle, on which the vial is to be placed, and the air aſcends without any trouble. When there is occaſion to transfer air from a jar ſtanding in the trough of water to a veſſel ſtanding in quickſilver, or any other ſituation whatever, the apparatus repreſented fig. 5. may be made uſe of. It conſiſts of a bladder furniſhed at one end with a ſmall glaſs-tube bent, and at the other with a cork perforated in ſuch a manner as juſt to admit the ſmall end of the funnel. When the common air is carefully preſſed out of this bladder, and the funnel thruſt tightly into the cork, it may be filled with any kind of air as eaſily as a glaſs jar. A ſtring being then tied above the cork in which the funnel is inſerted, and the orifice in the other cork cloſed by preſſing the bladder againſt it, it may be carried any where; and if the tube be carefully wiped, the air may be conveyed quite free from moiſture through a body of quickſilver or any thing elſe. When it is wanted to try whether a candle will burn in any kind of air, a cylindrical glaſs veſſel, fig. 6. may be uſed, with a bit of a wax candle *a* faſtened to the end of a wire *b*, and turned up in ſuch a manner as to be let down into the veſſel with the flame upwards. The veſſel ſhould be kept carefully covered till the moment the candle is admitted. In this manner, the Doctor tell us, he has frequently extinguiſhed a candle more than 20 times ſucceſſively; though it is impoſſible to dip the candle into it without giving the external air an opportunity of mixing more or leſs with that in the inſide. The candle *c* at the other end is very convenient for holding under a jar ſtanding in water, in order to burn as long as the incloſed air can ſupply it; for the moment that it is extinguiſhed, it may be drawn through the water before any ſmoke can have mixed with the air. To draw the air out of a veſſel which has its mouth immerſed in water, and thereby to raiſe the liquid to any height that may be required, a glaſs ſyphon is very convenient, ſuch as is repreſented, fig. 8. putting one of the legs up into the veſſel, and drawing the air out at the other end by the mouth, or rather, as moſt of the gaſes have a noxious quality, by a ſyringe properly faſtened to it. Dr Hales ſometimes made uſe of a valve at the top of the veſſel; but Dr Prieſtley does not think this can be altogether depended upon. If, however, a very ſmall hole be made at the top of a glaſs veſſel, it may be filled to any height by holding it under water while the air is iſſuing out at the hole, which is then to be cloſed with wax or cement. When the gas employed in the experiment is of ſuch a nature that it will neither be abſorbed by water, nor diminiſh common air, it may be convenient to put part of the materials which generate the gas into a cup, as at *f*, fig. 1. Then having, by means of a ſyphon, Fig. 7.

Gas. drawn the air to a convenient height, the ſmall glaſs veſſel may be eaſily puſhed into the cup by a wire introduced through the water. The contents of the ſmall veſſel may be diſcharged into the larger by a variety of contrivances; and the diſtance between the boundary of air and water, before and after the operation, will ſhow the quantity of the generated air. The effect of ſuch ſubſtances as diminiſh air may alſo be tried by this apparatus. When air is to be admitted to any thing that will not bear wetting, and yet cannot be conveniently put into a vial, and eſpecially if it be in the form of powder, and muſt be placed upon a ſtand (as in thoſe experiments in which the focus of a burning mirror is to be thrown upon it), the receiver in which it is to be placed muſt firſt be exhauſted; then having a glaſs tube bent for the purpoſe, as in fig. 9. it is ſcrewed to the transfer of an air-pump on which the receiver had been exhauſted; and introducing it through the water into a jar of air of that kind with which the receiver is to be filled, the purpoſe is gained by only turning the cock: but in this way, unleſs a great deal of care be taken, ſome common air is apt to get into the receiver. If it is wiſhed to try the goodneſs of any particular kind of air, two meaſures of it muſt be put into a jar ſtanding in water; and having marked on the glaſs the exact place of the boundary of the air and water, a meaſure of nitrous air is put to it; and after waiting a proper time, the quantity of its diminution is to be noted. If two kinds of air nearly alike are to be compared together after mixing them in a large jar, the mixture is transferred into a long glaſs tube, by which the ſcale can be lengthened as much as we pleaſe. When the quantity of air, the goodneſs of which we wiſh to aſcertain, happens to be ſo ſmall that it is contained in a portion of a glaſs-tube from which water will not run out, as *a* fig. 10. the length of the column of air in the tube is firſt to be meaſured with a pair of compaſſes, the remaining part being filled with water. The length of the column is then to be laid down upon a ſcale; and then thruſting into the tube a wire of a proper thickneſs *b*, it is drawn out again by means of a thin plate of iron bent to a ſharp angle *c*, when the whole of this little apparatus has been introduced through the water into a jar of nitrous air, and the wire being drawn out, the air from the jar muſt ſupply its place. The length of this column of nitrous air is then to be meaſured, and laid down upon the ſcale, ſo as to know the exact length of both the columns. After this, holding the tube under water, the two columns of air are to be forced into contact by means of a ſmall wire; and when they have been a ſufficient time together, the length of the whole is meaſured and compared with the length of both columns taken together.

In many experiments, the matters from which air is to be expelled muſt be ſubject to a very conſiderable degree of heat. In theſe caſes Dr Prieſtley frequently made uſe of a gun-barrel, fig. 11. Into this he put the ſubſtance from which the air was to be extracted; then filling it up with dry ſand ſo that very little air could be lodged in the barrel, and having alſo previouſly burned the ſand, ſo that no air could come from it, he luted to the open end the ſtem of a tobacco-pipe or ſmall glaſs tube. Then having put the cloſed end of the tube which contains the materials into the fire, the generated air, iſſuing through the tube, may be received into a veſſel of quickſilver, with its mouth inverted into a baſon of the ſame, ſuſpended all together by wires as repreſented in the figure. Any other fluid ſubſtance may be uſed inſtead of quickſilver. Gas

The beſt method, however, of procuring air from ſeveral ſubſtances by means of heat, is to put them into vials full of quickſilver, with their mouths immerſed in the ſame, and then throwing the focus of a burning mirror upon them. For this purpoſe the vials ſhould have round bottoms very thin, that they may not be liable to break on any ſudden application of heat. If it is wanted to expel air from any liquid, a vial is to be nearly filled with it; then having a cork perforated, a bent glaſs-tube is put through it and ſecured with cement, repreſented at *e*, fig. 1. The vial is then put into a kettle of water, which is ſet upon the fire and made to boil. The air expelled by the heat iſſues through the tube, and is received in the baſon of quickſilver, fig. 11. But inſtead of this ſuſpended baſon, the ſimple apparatus of a flaccid bladder, tied to the end of the tube in order to receive the generated air, may ſometimes be advantageouſly made uſe of. To produce air by the ſolution of metals, or any ſimilar proceſs, the materials are to be put into a vial prepared in the manner repreſented at *e*, fig. 1. and the end of the glaſs-tube put under the mouth of any veſſel into which it is wanted to convey the air. Heat may be eaſily applied while it hangs in this poſition, by means of a candle or red-hot poker.

In making experiments on ſuch kinds of air as are readily imbibed by water, quickſilver muſt always be made uſe of, as repreſented fig. 12. where *a* is the baſon of quickſilver, *b* a glaſs veſſel containing quickſilver with its mouth immerſed in it, *c* a vial containing the ingredients from which the air is to be produced, and *d* a ſmall recipient or glaſs veſſel to intercept any liquor that may come over along with the air, which muſt be tranſmitted as free from moiſture as poſſible into the veſſel *b*. If there be no danger of moiſture, however, the glaſs-tube only is made uſe of in the manner repreſented at *a*, fig. 1. To invert the veſſel *b*, fig. 12. it muſt firſt be filled with quickſilver, and its mouth then carefully covered with a piece of ſoft leather; after which it may be turned upſide down without any danger of admitting the air; and the leather may be withdrawn when it is plunged into the quickſilver.

The figures *aaa*, fig. 13. repreſent a kind of vials much uſed by Dr Prieſtley in all his experiments. They are made round and very thin at the bottom, and the mouth is to be ground ſmooth, ſo that they may be either uſed with a cork, or will ſtand firm when inverted after being filled with quickſilver or any other fluid. When uſed as common vials with corks, they will bear the application of a ſudden heat without breaking, much better than the common vials which are thickeſt at the bottom. Theſe veſſels are particularly uſeful in extracting air from any ſubſtance confined by quickſilver: for, ſtanding with their mouths downwards, and the ſubſtances with which the experiment is made lying upon the ſurface of the metal, juſt under the thineſt part of the glaſs, they are eaſily ſubjected to the action of a burning-glaſs without any danger of breaking the vial which contains them. Care muſt be taken,

Gas. taken, however, not to put them at once into the very focus, leſt the glaſs ſhould give way. In moſt caſes this moderate heat will produce a conſiderable quantity of air; by which means there will be ſome ſpace left between the glaſs and the ſubſtance from which the air is to be extracted, ſo that the greateſt heat of the glaſs may eaſily be directed upon the ſubſtance itſelf, independent of the glaſs which contains it; whence the latter is in no danger of being broken or melted. "A ſkilful operator (ſays Dr Prieſtley) will be able to fill his veſſel with the newly generated air by this means: but in general, he will do well to content himſelf with getting it half-full, or leſs; for as the glaſs is neceſſarily thicker towards the mouth, there will be ſome danger of breaking it when the rays are tranſmitted near that place, and of loſing the air that has been perhaps with great trouble and difficulty procured. If the ſubſtance on which the experiment is made be in the form of a powder, ſuch as red-lead, and even many very light ſubſtances, it will be moſt convenient to put them into the veſſel firſt; and the quickſilver may, with care, be poured upon them afterwards, ſo as to keep the ſubſtance at the bottom; and yet when the veſſel is inverted it will remain uppermoſt. When the light matter will not lie cloſe, it will not be difficult ſometimes to intercept it in the ſtrait part of the vial at the neck; but it will often be moſt convenient to form theſe light matters into ſmall balls, and put them into the veſſel through the quickſilver with which it has been previouſly filled. I would obſerve with reſpect to this proceſs, and every other in which veſſels are to be filled with quickſilver, and then to be placed inverted in baſons of the ſame, that no operation is eaſier (unleſs the mouth of the veſſel be exceedingly wide) when the mouth of it is covered with ſoft leather, and, if neceſſary, tied on with a ſtring, before it be turned upſide down; and the leather may be drawn from under it when it is plunged in the quickſilver. If the mouths of the veſſels be very narrow, it will be ſufficient, and moſt convenient, to cover them with one's finger. In this proceſs there remains leſs doubt of the generated air coming from the materials on which the experiment is made, than when the focus of the lens is thrown upon them in vacuo; becauſe there will often be room to ſuſpect, that common air may get into the receiver in the courſe of a long proceſs, at ſome place not ſufficiently guarded; and beſides it is a great ſatisfaction to ſee the quantity of air that is generated at any particular time, during the courſe of a proceſs, that the operator may ſtop when he ſees he has got a quantity ſufficient for his purpoſe, whereas unleſs he has a gage connected with his transferer (which may be inconvenient), he muſt admit water into his receiver before he can certainly tell whether he has obtained any air or not; and then it will be liable to be affected by the water, or by the air contained in the water, and which will be ſet looſe very copiouſly on its firſt admiſſion into the receiver. But in caſes where the air is apt to corrode the quickſilver, which always happens when the nitrous acid is concerned, recourſe muſt then be had to the vacuum: and for this purpoſe it is neceſſary to have the receivers made as thin as poſſible, the thick ones being very apt to break by the heat of the lens. Care muſt be taken in thoſe experiments to place the materials on a crucible, a piece of glaſs, or ſome ſubſtance of that kind which yields no air." Gas.

A vial, with a ground-ſtopper, having the latter perforated with a number of ſmall holes, will be found of excellent uſe to convey any liquid, or even any kind of air contained in it, through the water into a jar ſtanding with its mouth inverted in the liquid, without admitting any mixture of common air or even of the water, and yet the generated air will have a ſufficient outlet. Fig. 14. *c*, repreſents a kind of vial of the ſame form with thoſe ſhown at *a a a*, fig. 13. but fitted with a ground ſtopper terminating in a tube, and which is occaſionally to be uſed inſtead of that marked *c*, fig. 1. In moſt caſes this is preferable to the corks and tubes the Doctor formerly employed; but in ſome the latter are ſtill to be preferred, particularly where the fluor acid is to be uſed, which would ſoon corrode any of thoſe thin vials. For experiments with this acid, therefore, the Doctor recommends the uſe of common vials made very thick, eſpecially as no great degree of heat or ſudden application of it is ever wanted. The vial *c* will be found ſufficient for any purpoſe that does not require more heat than can be given by the flame of a candle held cloſe to the bottom of it; but if there be occaſion to place the vial in a ſand-heat, and conſequently if it muſt be put into a crucible placed on the fire, it will be neceſſary to have the tube in which the ground-ſtopple terminates made as long as poſſible, that the veſſel which receives the air may not be too near the fire. Nine or twelve inches will be a ſufficient length for the purpoſe. In ſuch experiments, however, as are not worth the expence of theſe vials and ſtoppers, and yet where gun-barrels cannot be ſafely truſted, the Doctor has recourſe to a vial made narrower at the open end than the other, of about 9 or 12 inches in length, and of an equal thickneſs throughout. When theſe vials are put into a crucible with ſand, the bottom may be made red-hot, while the top is ſo cold that a common cork into which a glaſs-tube is inſerted will not be affected by the heat. When the materials are put into this veſſel, it muſt be filled up to the mouth with fine ſand that will give no air by the application of heat; and the cork muſt be thruſt cloſe down upon the ſand. The air is to be received in the ſame manner as directed for the gun-barrel.

For the purpoſe of making a quantity of air paſs through a body of water or any other fluid, it is convenient to have a number of vials of the form repreſented fig. 15. the tube which conveys the air into the vial going nearly to the under part, and that which delivers it perforating only the upper part. Thus the air is forced to go through the whole body of the water or powder with which the vial may be filled. Theſe veſſels may be of various ſizes, from a pint down to half an ounce; the larger end may generally be ſtopped with a cork, though in ſome caſes it will be neceſſary to have this ſtopper alſo of glaſs, with only two perforations for inſerting the tubes. Sometimes he had occaſion to uſe a number of theſe veſſels placed together, as repreſented fig. 16. that the ſame air might paſs through them all; and ſometimes it was found improper to uſe any kind of lute or cement, ſo that all the ſtoppers, large as well as ſmall, were fitted by grinding; which made the apparatus very expenſive.

Gas. pensive. The long vial annexed to this apparatus was chiefly made use of where the nitrous acid was concerned. It was made deep in order to admit of a sudden and violent effervescence without any danger of the liquid being thrown over; and the tube proceeding from it ought to be long enough to go to the bottom of any vessel in which the vapour is to be delivered.

Plate CCVIII. Fig. 17. represents a simple apparatus, being no other than a frame of wood so disposed about a vessel containing quicksilver, that the latter may admit of several glass tubes which support themselves against its sides, and thus may be employed in experiments all at the same time.

Fig. 18. shows a cylindrical vessel of tin perforated with holes, and enclosing another of iron wire. A charcoal fire may be made in the outer one, while a vial containing any quantity of air which it is wished to heat may be put within the frame of iron wire. Thus an equable heat will be produced on every part of the glass, without heating the bottom more than the rest; which in many cases is greatly to be wished for.

Fig. 19. shows the apparatus by which were made the principal experiments relating to the apparent conversion of water into air, on which Dr Priestley bestowed consi-
* See Water. derable attention, tho' he found it at last to be a mistake*. It consists of an earthen vessel; the bulb of which, containing moistened clay, is fixed in the inside of a glass vessel, through which the heat of a burning lens may be thrown upon it; while the inside has a communication with a bason of water or of quicksilver, in which vessels may be placed to receive the air that is forced through the body of the earthen vessel, while the water or mercury in the bason in which the glass stands rises to supply its place.

Fig. 20. shows the apparatus for transmitting steam through a red-hot tube containing iron or other substances. The contrivance is evident from an inspection of the figure; only the vessel which receives the air must be much larger in proportion than is here represented. Instead of the small furnace, one of Argand's lamps may be advantageously used. Fig. 21. shows a method of receiving the air under a funnel, when large balloons are to be filled for the purposes of aerostation.

These are the principal parts of the apparatus used by Dr Priestley in his numerous experiments for the production of airs, of all different kinds, from a vast variety of substances, and for preserving, transferring, or mingling them with one another as occasion required. On this part of his apparatus no improvement of any consequence has ever been made. It has been otherwise, however, with the method he proposed for impregnating water with the various gases, especially fixed air, which for some time engrossed a considerable share of the public attention. In this operation a principal requisite is to expose as large a surface of the water as possible to the action of the air; for it is only in proportion to the expanded surface, and not to the depth of the liquid, that the air is taken up. It is also requisite to save the air as much as possible, by stopping every outlet, and at the same time to prevent the vessels from bursting, which they might otherwise be apt to do. The first apparatus invented by Dr Priestley, and which seems to have also been the first ever made Gas.
use of by any person, is represented fig. 22. It consists of a glass vessel *a*, with a pretty narrow neck, but so formed that it will stand with its mouth downwards; and having filled it with water, lay a slip of clean paper or thin pasteboard upon it: then if they be pressed close together, the vessel may be turned upside down without danger of admitting common air into it; and when it is thus inverted, it must be placed in another vessel in the form of a bowl or bason *b*, with a little water in it, so much as to permit the slip of paper or pasteboard to be withdrawn, and the end of the pipe *c* introduced. The pipe used by the Doctor was at first made of leather, that by means of its flexibility he might be able to shake the vessel *d* containing the effervescing mixture; but afterwards he found it more convenient to use one of glass, making use of two bladders instead of the one represented in the figure at *d*. These two are joined together by a perforated cork, and give room enough for shaking the vessel, which one would scarcely admit of. Having put the oil of vitriol to the calcareous earth in the bottle *e*, the fixed air will very soon distend the bladder or bladders *d*, which must then be pressed out into the vessel *a*, but will not suddenly be absorbed by it. A quantity proportionable to the bulk of the air will therefore descend into the bason; and after the bottle *a* has thus been about half emptied, it will be necessary to shake it briskly; when the agitation will cause the air to be imbibed, and the water will reascend into the bottle. This is to be repeated till the water will not take up any more; after which it ought to be put into a bottle well corked and cemented; the air being very apt to escape after being once taken up.

Though this apparatus must evidently answer the purpose of impregnating water with fixed air very effectually, yet it is troublesome on account of the attendance required; and objections were also made to the use of bladders in it, as being apt to communicate a disagreeable taste to the liquor. The latter objection was particularly insisted upon by Dr Nooth; who from his own experience declared, that the use of them communicated some degree of urinous flavour to the impregnated water. Dr Priestley made light of this objection, but allowed the validity of that from the attendance necessary during the impregnation. Though he reckoned Dr Nooth's apparatus therefore inferior to his own with regard to its power, and tho' slower in its operation as well as more expensive, he constantly used it himself in his after experiments; and it has now become almost universally employed for the purpose of impregnating small quantities of water with this kind of gas.

Dr Nooth's apparatus, with some improvements in it by Mr Parker, is represented fig. 23. and is all made of crystal glass. The lowermost vessel contains the chalk and diluted oil of vitriol; the middle one the water to be impregnated; and the upper one is designed to give vent to such part of the air as cannot be imbibed. The air is admitted to the water through a number of holes, so small that the water cannot get through them on account of the resistance made by the ascending gas. The uppermost vessel is filled to a certain height with water, which is prevented from descending into the middle vessel by the resistance of the air.

Gas. air in the empty part. As the gas aſcends, that part of it which is not condenſed compreſſes the water, and forces it up into the upper veſſel, leaving thereby a greater ſpace for the air to expand in; at the ſame time that a conſiderable preſſure is made by the weight of the incumbent water, which very much promotes the abſorption of this or any other gas. The effervescing materials may be renewed, and the water drawn off, by the cocks repreſented in the figure. Fig. 24. ſhows a farther improvement upon this apparatus by Mr Blades of Ludgate-hill. The only difference is in the ſhape of the veſſels, and having a glaſs cock for letting off the impregnated water inſtead of a tube cloſed with a cork.

Another apparatus, capable of anſwering the purpoſe at leaſt as well as that of Dr Nooth, and much leſs expenſive, was invented by Dr Withering, and is repreſented fig. 25. A, is a glaſs-veſſel about 10 inches high in the cylindrical part, and 6½ inches diameter. B, a glaſs-veſſel about 12 inches high in the conical part, 1½ in the neck, and 5 inches diameter at the bottom. C, a copper pipe paſſing through the ſtopper of the veſſel B, and tied faſt into the flexible tube D. This tube is made of ſtrong leather, and kept hollow by means of a ſpiral wire running through its whole length. E, a conical braſs-pipe, with a ſtop-cock faſtened to the tube D. F, a conical pipe, with a ſtop-cock G; having the end of the tube E accurately ground to it ſo as to be air tight. G, the ſtop-cock cutting off all communication with the atmoſphere when the pipe E is removed. H H, two large hog's bladders, each of which ought to contain two quarts. I, a ſtop-cock to prevent the water from riſing into the bladders when the veſſel A is agitated. K, a bladder tied to the crooked tube with the ſtop-cock L, which occaſionally opens or ſhuts the communication with the veſſel B. M, a glaſs funnel accurately fitted with the glaſs-ſtopple N. O, the aperture fitted with a glaſs-ſtopper, from which the impregnated water is to be drawn for uſe; or, inſtead of the glaſs-ſtopper, a ſilver-cock may be more conveniently applied. P, the tube opening into the veſſel A.

To make uſe of this apparatus, we muſt, 1. Fill the veſſel A with pure water, adding ſuch other ingredients as are neceſſary along with the gas. The veſſel is calculated to hold five quarts conveniently for impregnation. 2. Put into the veſſel B as much marble or whiting in ſmall lumps as will cover its bottom to the height of two inches, then pour in water to the height repreſented by the dotted line. 3. Let all the bladders be tied round their reſpective tubes, ſo that they may be perfectly air-tight. 4. Fit the mouth of the veſſel A tight with a cork, and through a hole in this paſs the tube P; putting on the cork ſome ſealing-wax of the ſofteſt kind, or elſe modelling wax, ſo that the whole may be made air-tight. 5. Stop the mouth of the veſſel B with a piece of mahogany prepared in the following manner. Let the wood be firſt turned in a lathe of a conical figure, but a little larger than the mouth of the glaſs will admit. Put this piece of wood into melted bees-wax, and heat the wax until the wood begins to grow black. When cool, turn it again in a lathe until it fits the mouth of the veſſel. The tubes C, L, and M, are fitted into holes bored through the wooden ſtopper previous to its being immerſed in the melted bees-wax. 6. Puſh theſe tubes through their reſpective holes in the wooden ſtopper; preſs their ſtopper into the orifice of the veſſel B, and cement the whole with ſealing or modelling wax. 7. Shut the ſtop-cocks I and L, having previouſly preſſed the air out of the bladder K; open the ſtop-cocks G and E; then ſqueeze the air out of the bladder H H; and afterwards preſs the conical pipe E into the pipe F. 8. Pour about a large ſpoonful of oil of vitriol through the funnel M, and ſtop it with its ſtopper N: on this the fixed air riſing through the tube C paſſes into the bladders H H, and diſtends them. 9. When the bladders are diſtended, open the ſtop-cock I, and draw off about a quart of water from the aperture at O. The empty ſpace left by the water will quickly be filled with gas, which the remaining water will begin to abſorb, and the abſorption will ſtill be ſupplied by freſh gas from the bladders; for which reaſon theſe muſt be kept pretty fully diſtended, by adding more oil of vitriol when they begin to grow flaccid. 10. If it be required to impregnate the water quickly, turn the ſtop-cocks at G and E, and open that at L; then ſeparate the pipe E from the tube F, and agitate the veſſel A. During this time the fixable air that is produced paſſes into the bladder K, from whence it may be afterwards preſſed into the other bladders when the parts of the apparatus are again united. 11. During the agitation cloſe the ſtop-cock at I, opening it only occaſionally to replace from the bladders H H the air abſorbed by the water. 12. If a ſtrong impregnation be deſired, the temperature of the room where the operation is carried on ought not to be more than 48° of Fahrenheit. 13. That the cocks may continue perfectly air-tight, it will be neceſſary to ſupply them once a-year with a very ſmall quantity of unſalted lard. Modelling wax, of which mention is made in this deſcription, may be made by adding two ounces of tallow and one of turpentine to half a pound of bees-wax. It may be coloured with red-lead or Spaniſh-brown; and the mixture muſt be kept ſtirring till cold.

Theſe are the principal diſcoveries which have yet been made concerning the method of impregnating water with fixed air, and they may undoubtedly be applied to the impregnation of that fluid with any other kind of gas which it will take up; only it muſt be obſerved, that where any of the acids are concerned, that of fluor alone excepted, there is an abſolute neceſſity for having all parts of the apparatus made of glaſs.

For making experiments on vegetables, the large cylindrical glaſs, fig. 2. is very proper. When it was wiſhed to try how long a ſmall animal would live in a certain quantity of air, Dr Prieſtley found a large beer-glaſs, ſuch as is repreſented at *d*, fig. 1. very convenient. The animals he moſt commonly made experiments upon were mice; and in a beer-glaſs containing between two and three ounces, he found that one of theſe creatures would live 20 minutes or half an hour. To obtain mice for ſuch experiments, he directs that they ſhould be caught in wire-traps, from whence they may be eaſily taken. To get them into the air, they muſt be paſſed through the water into the veſſel containing it. The wet they ſuſtain on this occaſion does Plate CCVII.

Gas. them no hurt; but if the air is of ſuch a quality that it is expected the mouſe can live any time, it muſt have ſomething to ſit upon out of the reach of the water. Where this is not the caſe, it will be proper to hold the animal by the tail, in order to withdraw it as ſoon as poſſible; but if the air has been thoroughly noxious, it will be irrecoverable by a ſingle inſpiration. The mice are kept in receivers open at top and bottom, ſtanding upon plates of tin perforated with many holes, and covered with others of the ſame kind to admit the air, kept down with weights, as in fig. 26. A quantity of paper or tow muſt be put into the veſſel, and changed every two or three days in order to clean it; for which purpoſe it is proper to have another receiver of the ſame kind ready cleaned to hold them in. Theſe animals muſt be kept in a place of a moderate temperature, either too much heat or too much cold being prejudicial to them. The place where Dr Prieſtley kept his had a temperature of about 70° of Fahrenheit. When they had been made to paſs through water, it was neceſſary to give them a conſiderable degree of heat in order to dry and warm them. In the courſe of his experiments he found, that mice will live entirely without water; for though he kept them for three or four months, and ſeveral times offered them water, they would never taſte it; notwithſtanding which they continued in perfect health and vigour. Two or three of them will live very peaceably together in the ſame veſſel; though the Doctor had one inſtance of a mouſe tearing another almoſt in pieces, when there was plenty of proviſions for both.

Some difficulty may occur in opening the mouth of a phial containing any kind of ſubſtance to which water muſt not be admitted in a jar of air: but this will eaſily be overcome, by having a cork cut tapering with a ſtrong wire thruſt through it, as in fig. 27. for thus it will eaſily fit the mouth of any phial; and by holding the phial in one hand, and plunging both into the trough of water, the phial can eaſily be conveyed through the water into the jar; which muſt either be held by an aſſiſtant, or be faſtened by ſtrings with its mouth projecting over the ſhelf. When the phial is thus conveyed into the jar, the cork may eaſily be removed, and put in again at pleaſure.

Plate CCVIII. Fig. 28. repreſents an apparatus for determining the conducting power of air with regard to heat. It conſiſts only of a jar, which may be filled with any kind of air, with a very ſenſible thermometer inſerted in it, as is repreſented in the figure. The ſcale of this was ſo large, that the Doctor could mark upon it 20 diviſions, each larger than half an inch, between the mean temperature of the atmoſphere and a heat much below that of boiling water. By frequent trials he at laſt adjuſted it in ſuch a manner, that having filled the veſſel with any kind of air, he could plunge it firſt in hot and then in cold water, ſo that the mercury would riſe to the diviſion 20 and fall to that of 6 or 7 in no great time; and thus, by means of a clock which beat ſeconds, he could not well make a miſtake of more than two in noting down any particular diviſion. The hot water was always made to boil, and the cold water was always brought freſh from the ſame pump. The mouth of the air-veſſel was placed in a cup of mercury kept always at the ſame height; ſo that he could thus try any kind of air with as much accuracy as one would think were poſſible. Notwithſtanding this, however, he could not thoroughly ſatisfy himſelf with the reſults; at leaſt he has not yet thought proper to publiſh fully the reſults of his experiments. The differences, he ſays, were leſs ſtriking than he expected. Inflammable air, however, appeared to conduct heat better than any other; the mercury aſcending the ſame ſpace in half the time in it that it took up in common air. Fixed air, and all the acid airs, were conſiderably worſe than common air. Alkaline air was a little better, and dephlogiſticated air a little worſe, than common air; but the reſult of this laſt experiment was uncertain. Gas. Gaſcoigne.

The electric ſpark is eaſily taken in any kind of air by filling a ſmall tube with the air deſired, with two wires approaching within ſtriking-diſtance of each other in the middle.

We ſhall cloſe this account of the apparatus for making experiments on gaſes with an account of an inſtrument invented by Dr Pearſon of London for collecting air of any kind which eſcapes in bubbles from the ſurface of ſprings or rivers. It conſiſts of a funnel inſerted into a phial in ſuch a manner that the gas as it iſſues through the water may come under the funnel, and thus riſe into the phial. For the convenient holding it to receive the air from any place where it may iſſue copiouſly, it is furniſhed with a handle and a ring, to which the funnel is tied by ſprings, as repreſented fig. 29.

GASCOIGNE (Sir William), chief juſtice of the court of king's bench under Henry IV. A moſt learned and upright judge: who being inſulted on the bench by the then prince of Wales, afterwards Henry V. with equal intrepidity and coolneſs committed the prince to priſon; and by this ſeaſonable fortitude laid the foundation of the future glory of that great monarch, who from this event dated his reformation from the licentiouſneſs of his youth. It is not well authenticated that the prince ſtruck Sir William, as recorded by Shakeſpeare; but all authors agree, that he interrupted the courſe of juſtice to ſcreen a lewd ſervant. Sir William died in 1413.

Gascoigne (George), an Engliſh poet of ſome fame in the early part of the reign of queen Elizabeth, was born at Walthamſtow in Eſſex, of an ancient family, and educated at both univerſities, but principally at Cambridge. From thence he removed to Gray's Inn, and commenced ſtudent of the law; but having a genius too volatile for that ſtudy, he travelled abroad, and for ſome time ſerved in the army in the Low Countries. He afterwards went to France; where he became enamoured of a Scottiſh lady, and married her. Being at length, ſays Wood, *weary of thoſe vanities*, he returned to England; and ſettled once more in Gray's Inn, where he wrote moſt of his dramatic and other poems. The latter part of his life he ſpent in his native village of Walthamſtow, where he died in the year 1578. He had the character of a polite gentleman, an eloquent and witty companion, *et vir inter poetas ſui ſeculi præſtantiſſimus*. His plays, firſt printed ſeparately, were afterwards, with ſeveral other poems, &c. reprinted in two volumes 4to; the firſt volume in 1577, the ſecond in 1587.

GASCOIN,

A. Bell Prin. Wal. Sculptor fecit.

Gaſcoin || Gaſſendi.

GASCOIN, or GASCOIGN, denotes the hinder thigh of a horſe, which begins at the ſtifle, and reaches to the ply or bending of the ham.

GASCONADE, a boaſt or vaunt of ſomething very improbible. The term has its riſe from the Gaſcoons, or people of Gaſcony in France, who it ſeems have been diſtinguiſhed for bragging and rhodomontado.

GASCONY, the moſt ſouth-weſt province of France, is bounded by Guienne on the north, by Languedoc on the eaſt, by the Pyrenees which ſeparate it from Spain on the ſouth, and by the Bay of Biſcay on the weſt. It had its name from the ancient inhabitants called *Gaſcones*, or *Vaſcones*; by the moderns *Baſques*, or *Vaſques*. After theſe were ſubdued by the Franks, they had for ſome time dukes of their own, who were ſubject to the dukes of Aquitaine; but both were at laſt diſpoſſeſſed by the kings of France. The country produces corn, wine, fruits, tobacco, hemp, brandy, prunes, &c. The inhabitants are noted for a corrupt and vicious pronunciation of the French tongue, as well as their vain-glorious boaſting.

GASSENDI (Peter), one of the moſt celebrated philoſophers France has produced, was born at Chanterſier, about three miles from Digne in Provence, in 1592. When a child, he took particular delight in gazing at the moon and ſtars as often as they appeared in clear unclouded weather. This pleaſure frequently drew him into bye-places, in order to feaſt his eye freely and undiſturbed; by which means his parents had him often to ſeek, not without many anxious fears and apprehenſions. They therefore put him to ſchool at Digne; where, in a ſhort time, he made ſuch an extraordinary progreſs in learning, that ſome perſons, who had ſeen ſpecimens of his genius, reſolved to have him removed to Aix, in order to ſtudy philoſophy under Feſay, a learned minor friar. This propoſal was ſo diſagreeable to his father, who intended to breed him up in his own way to country buſineſs, as being more profitable than that of a ſcholar, that he would conſent to it only upon condition that he ſhould return home in two years at fartheſt. Accordingly young Gaſſendi, at the end of the appointed time, repaired to Chanterſier: but he had not been long there when he was invited to be profeſſor of rhetoric at Digne, before he was quite 16 years of age; and he had been engaged in that office but three years, when his maſter Feſay dying, he was made profeſſor in his room at Aix. When he had been there a few years, he compoſed his Paradoxical Exercitations; which, coming to the hands of Nicholas Peireſe, that great patron of learning joined with Joſeph Walter prior of Valette in promoting him; and he having entered into holy orders, was firſt made canon of the church of Digne and doctor of divinity, and then obtained the wardenſhip or rectorſhip of that church. Gaſſendi's fondneſs for aſtronomy grew up with his years; and his reputation daily increaſing, he was in 1645 appointed royal profeſſor of mathematics at Paris. This inſtitution being chiefly deſigned for aſtronomy, our author read lectures on that ſcience to a crowded audience. However, he did not hold this place long; for a dangerous cough and inflammation of the lungs obliged him, in 1647, to return to Digne for the benefit of his native air.—Gaſſendi wrote againſt the metaphyſical meditations of Des Cartes; and divided with that great man the philoſophers of his time, almoſt all of whom were Carteſians or Gaſſendians. He joined to his knowledge of philoſophy and the mathematics an acquaintance with the languages and a profound erudition. He wrote, 1. Three volumes on Epicurus's Philoſophy; and ſix others, which contain his own philoſophy. 2. Aſtronomical Works. 3. The Lives of Nicholas de Peireſe, Epicurus, Copernicus, Tycho Brahe, Puerbachius, and Regiomontanus. 4. Epiſtles, and other treatiſes. All his works were collected together, and printed at Lyons in 1658, in ſix volumes folio. He died at Paris in 1655, aged 63.

Gaſtero-ſteus || Gaſtro-mancy.

GASTEROSTEUS, the STICKLE-BACK, in ichthyology, a genus of fiſhes belonging to the order of thoracici. There are three rays in the membrane of the gills; the body is carinated; and there are ſome diſtinct prickles before the back-fin. There are 11 ſpecies diſtinguiſhed by the number of prickles on the back. One of theſe ſpecies, the aculeatus, ſtickleback, banſticle, or ſharpling, is common in many of the Britiſh rivers. In the fens of Lincolnſhire, and ſome rivers that proceed from them, they are found in prodigious quantities. At Spalding there are once in ſeven or eight years amazing ſhoals that appear in the Welland, and come up the river in form of a vaſt column. They are ſuppoſed to be the multitudes that have been waſhed out of the fens by the floods of ſeveral years, and collected in ſome deep hole, till overcharged with numbers, they are periodically obliged to attempt a change of place. The quantity is ſo great, that they are uſed to manure the land, and trials have been made to get oil from them. A notion may be had of this vaſt ſhoal, by being informed, that a man being employed by the farmer to take them, has got for a conſiderable time four ſhillings a-day by ſelling them for a halfpenny per buſhel.—This ſpecies ſeldom reaches the length of two inches; it hath three ſharp ſpines on the back, that can be raiſed or depreſſed at pleaſure. The colour of the back and ſides is an olive-green; the belly white; but in ſome the lower jaws and belly are of a bright crimſon.

GAST-HOUND. See *Gaze-Hound*.

GASTRELL (Francis), biſhop of Cheſter, was born in 1662, appointed preacher to the ſociety of Lincoln's Inn in 1694, and made biſhop of Cheſter in 1714. He preached a courſe of ſermons for Boyle's lectures; engaged in the Trinitarian controverſy with Mr Collins and Dr Clarke; and publiſhed two excellent pieces, the one, intitled, Chriſtian Inſtitutes, and the other, A Moral Proof of a Future State. He vindicated the rights of the univerſity of Oxford againſt the archbiſhop of Canterbury, in the appointment of the warden of Mancheſter college; and oppoſed the violent proceedings againſt biſhop Atterbury in the houſe of lords, though he diſliked the biſhop as a man of arbitrary principles. He died in 1725.

GASTRIC, in general, ſomething belonging to the ſtomach.

Gastric-Juice, a thin pellucid liquor, which diſtils from certain glands in the ſtomach, for the dilution, &c. of the food. See ANATOMY, Sect. XIII.

GASTROCNEMIUS, in anatomy. See ANATOMY, *Table of the Muſcles*.

GASTROMANCY, or GASTROMANTIA, a kind of divination

Gastrography || Gate.

divination practiſed among the ancients by means of words coming or ſeeming to come out of the belly.

The word is Greek, γαστρομαντία, compoſed of γαστὴρ *belly*, and μαντεία *divination*.

There is another kind of divination called by the ſame name *gaſtromancy*, which is performed by means of glaſſes or other round tranſparent veſſels, within which certain figures appear by magic art. It is thus called, becauſe the figures appear as in the belly of the veſſels.

GASTRORAPHY, in ſurgery, the operation of ſewing up wounds of the abdomen. See SURGERY.

GASTROTOMY (of γαστὴρ and τέμνω, *I cut*), the operation of cutting open the belly; otherwiſe called the *Cæſarian ſection*. See MIDWIFERY.

GATAKER (Thomas), a learned critic and divine, was born at London in 1574, and ſtudied at St John's college, Cambridge. He was afterwards choſen preacher at Lincoln's Inn; which he quitted in 1611, for the rectory of Rotherhithe in Surry. In 1620, he made a tour through the Low Countries; and in 1624, publiſhed at London a book, intitled, Tranſubſtantiation declared by the Confeſſion of the Popiſh Writers to have no neceſſary foundation in God's Word: he wrote likewiſe a defence of this diſcourſe. In 1642, he was appointed one of the aſſembly of divines, and was engaged with them in writing annotations upon the Bible. He died in July 1654, in the 80th year of his age. Beſides the above works, he publiſhed, 1. A Diſſertation upon the Style of the New Teſtament. 2. *De nomine tetragrammato*. 3. *De diphthongis, ſive bivocalibus*. 4. An Edition and Tranſlation of the Emperor Marcus Antoninus's Meditations. 5. A Collection of Sermons, in folio; and many other works. His piety and charity were very exemplary; and his modeſty ſo great, that he declined all eccleſiaſtical dignity and court-preferments. His extenſive learning was admired by Salmaſius and other great men abroad; his houſe was a private ſeminary for young gentlemen of this nation, and many foreigners reſorted to him to receive advice in their ſtudies.

GATE, in architecture, a large door, leading or giving entrance into a city, town, caſtle, palace, or other conſiderable building. See ARCHITECTURE.

Thebes, in Egypt, was anciently known by the appellation *with a hundred gates*. In ancient Rome there was a triumphal gate, *porta triumphalis*. In modern Rome there is the *jubilee gate*, which is only opened in the year of a grand jubilee.

The gates of London were many of them converted into gaols or priſons, as Ludgate, Newgate, &c. but they are now removed. The leſſer or by-gates are called *poſterns*. Gates, through which coaches, &c. are to paſs, ſhould not be leſs than 7 feet broad, nor more than 12; the height to be 1½ the breadth.

GATE, or GAIT, in the manege, called in French *train*, is uſed for the going or pace of a horſe.

GATE, in a military ſenſe, is made of ſtrong planks, with iron bars, to oppoſe an enemy. They are generally made in the middle of the curtin, from whence they are ſeen, and defended by the two flanks of the baſtions. They ſhould be covered with a good ravelin, that they may not be ſeen or enfiladed by the enemy. Theſe gates, belonging to a fortified place, are paſſages through the rampart, which may be ſhut and opened by means of doors and a portcullis. They are either private or public.

Private gates are thoſe paſſages by which the troops can go out of the town unſeen by the enemy, when they paſs to and from the relief of the duty in the outworks, or on any other occaſion which is to be concealed from the beſiegers.

Public gates are thoſe paſſages through the middle of ſuch curtins, to which the great roads or public ways lead. The dimenſions of theſe are uſually about 13 or 14 feet high, and 9 or 10 feet wide, continued through the rampart, with proper receſſes for foot paſſengers to ſtand in out of the way of wheel-carriages.

GATES of Hell. This expreſſion is uſed in ſcripture, to denote figuratively either the *grave* or the *powers of darkneſs*, i. e. the devil and his angels.

The Mahometans uſe the expreſſion literally, and ſuppoſe that hell has ſeven gates. The firſt is that where Muſſulmans, who incur the guilt of ſin, will be tormented. The ſecond is for the Chriſtians. The third is for the Jews. The fourth for the Sabians. The fifth for the Magians or worſhippers of fire. The ſixth for Pagans and idolaters. And the ſeventh for hypocrites, who make an outward ſhow of religion, but have none.

GATESHEAD, in the county of Durham, is as it were the ſuburbs of Newcaſtle, though it lies in another county, being divided by the river Tyne; over which there is a fine ſtone-bridge, with an iron-gate in the middle, having the arms of Durham on one ſide, and thoſe of Newcaſtle on the other, which is the boundary between the biſhoprick and Northumberland. The church is a fine building, with a very high tower, ſeen at a great diſtance; and in the churchyard are ſeveral ancient monuments. There are few traces left of its ancient monaſtery, except a ſtone gateway, or rather a modern erection. The houſe covered two acres and a half of land. Here live the coal-pit men.

GATH, or GETH (anc. geog.), a celebrated city of the Philiſtines, and one of their five principalities. It is famous for having given birth to Goliah. David made a conqueſt of it in the beginning of his reign over all Iſrael; and it continued ſubject to the kings his ſucceſſors till the declenſion and decay of the kingdom of Judah. Rehoboam rebuilt or fortified it; king Uzziah retook it, and Hezekiah once more reduced it under his ſubjection.

Gath ſtood about five or ſix miles from Jamnia, about 14 ſouth of Joppa, and 32 weſt of Jeruſalem. Hence ſome authors (among whom is F. Calmet) have committed an egregious miſtake in making Gath the moſt ſouthern, and Ekron the moſt northern, of the Philiſtine cities; as if theſe two had been the two boundaries of their dominions, whereas theſe two cities are not above five miles aſunder; and Gaza is the laſt of the five ſatrapies ſouth. And Joſephus (in the place already quoted) expreſſes himſelf plainly enough, when he ſays, that Hezekiah took all the Philiſtine cities from Gaza to Gath; there being many more cities of that name, which ſignifies in the Hebrew a *wine-preſs*. Several more of the name of Geth or Gath are mentioned in Euſebius and St Jerom, whoſe ſituation,

Gath
ll
uden.

situation, according to them, plainly ſhows them to have been different places from this, and from each other; beſides thoſe which had an adjunct to diſtinguiſh them.

This city recovered its liberty and luſtre in time of the prophets Amos and Micah; but was afterwards demoliſhed by Hazael king of Syria, ſince which it became of but little conſideration till the time of the holy war, when Fulk king of Jeruſalem built a caſtle on its ruins.

Gath-Opher, *Gath-Epher*, or *Gath*, in the canton of Opher, in Galilee, was the birth-place of the prophet Jonah. Joſhua makes this city to be part of the tribe of Zebulun; and St Jerom, in his preface upon Jonah, ſays, that it was two miles from Sephoris, otherwiſe called *Diocæſarea*.

Gath-Rimmon, a city belonging to the tribe of Dan. St Jerom places it ten miles from Diopolis on the way from Eleutheropolis. It was given to the Levites of Kohath's family.

Gath-Rimmon, was alſo a city in the half-tribe of Manaſſeh, on this ſide Jordan, and was alſo given for a place of abode to the Levites of Kohath's family.

Gath-Rimmon, was likewiſe a city in the tribe of Ephraim, given to the Kohathites.

GATTON, a borough in the county of Surry, 19 miles from London. It lies under the ſide of a hill going to Reygate; and is ſuppoſed to have been known to the Romans by reaſon of their coins and other antiquities that have been found here. It is a borough by preſcription; and has ſent members to parliament ever ſince the 29th of Henry VI. It was formerly a large town; but is now a mean village, with a ſmall church, and without either fair or market. The members are returned by its conſtable, who is annually choſen at the lord of the manor's court.

GAUBIUS (Hieronymus David), a celebrated phyſician of Holland. He ſtudied under the illuſtrious Boerhaave; and became ſo much the favourite of his profeſſor, that he reſigned the chemical chair in his favour. He taught at Leyden with great applauſe for 40 years. In the year 1775 he laid down his office, as being no longer able to ſupport the fatigues of it. He was ſucceeded by John David Hahn, then profeſſor at Utrecht. His reputation was extended all over Europe by ſeveral valuable publications, particularly by his *Inſtitutiones Pathologiæ Medicinalis*, and his *Adverſaria*, which have contributed not a little to the improvement both of the theory and practice of medicine. He died at Leyen 29th November 1780, in the 76th year of his age.

GAUDEN (Dr Joſeph), ſon of John Gauden vicar of Mayfield in Eſſex, was born there in 1605. At the commencement of the civil war, he was chaplain to Robert earl of Warwick; who taking part with the parliament againſt the king, was followed by his chaplain. Upon the eſtabliſhment of the Preſbyterian model of church-government, he complied with the ruling powers, and was nominated one of the aſſembly of divines who met at Weſtminſter in 1643, and took the covenant; yet having offered ſome ſcruples and objections to it, his name was afterwards ſtruck out of the liſt. Nor did he eſpouſe the parliament cauſe any longer than they adhered to their firſt avowed principles of reforming only, inſtead of deſtroying, monarchy and epiſcopacy. In this ſpirit he was one of thoſe divines who ſigned a proteſtation to the army, againſt the violent proceedings that affected the life of the king: and a few days after his execution publiſhed the famous Εικων Βασιλικη, *A Portraiture of his Sacred Majeſty in his Soliitude and Sufferings*; which ran through 50 editions in the courſe of a year. Upon the return of Charles II. he was promoted to the ſee of Exeter; and in 1662 was removed to Worceſter, much to his regret, having flattered himſelf with the hopes of a tranſlation to Wincheſter; and his death happened the ſame year. He wrote many controverſial pieces ſuited to the circumſtances of the times, and to his own views from them. The *Eikon Baſilike* above mentioned he publiſhed as the king's private meditations: though on this point there has been a long controverſy. After the biſhop's death, his widow, in a letter to one of her ſons, calls it *The Jewel*; and ſaid, her huſband had hoped to make a fortune by it; and that ſhe had a letter of a very great man's, which would clear up that he writ it. This aſſertion, as the earl of Clarendon had predicted, was eagerly eſpouſed by the anti-royaliſts, in the view of diſparaging Charles I. But it has been obſerved, that Gauden had too luxuriant an imagination, which betrayed him into a rankneſs of ſtyle in the Aſiatic way; and from thence, as biſhop Burnet argues with others, it may be certainly concluded, that not he, but the king himſelf, was the true author of the Εικων Βασιλικη; in which there is a nobleneſs and juſtneſs of thought, with a greatneſs of ſtyle, that made it be looked on as the beſt written book in the Engliſh language.

Gauden,
Gavel.

GAVEL, or GABEL, among builders. See GABEL.

GAVEL, in law: tribute, toll, cuſtom, or yearly revenue; of which we had in old time ſeveral kinds. See GABEL.

Gavel-Kind, a tenure or cuſtom belonging to lands in the county of Kent. The word is ſaid by Lambard to be compounded of three Saxon words, *gyfe*, *eal*, *kyn*, "*omnibus cognatione proximis data.*" Verſtegan calls it *gavelkind*, quaſi "give all kind," that is, to each child his part: and Taylor, in his hiſtory of *gavelkind*, derives it from the Britiſh *gavel*, i. e. a hold or tenure, and *cannd*, "*generatio* aut *familia*;" and ſo *gavel cannd* might ſignify *tenura generationis*.—It is univerſally known what ſtruggles the Kentiſh men made to preſerve their ancient liberties, and with how much ſucceſs theſe ſtruggles were attended. And as it is principally here that we meet with the cuſtom of gavelkind (though it was and is to be found in ſome other parts of the kingdom), we may fairly conclude, that this was a part of theſe liberties; agreeably to Mr Selden's opinion, that gavelkind, before the Norman conqueſt, was the general cuſtom of the realm. The diſtinguiſhing properties of this tenure are various: ſome of the principal are theſe. 1. The tenant is of age ſufficient to alienate his eſtate by feoffment, at the age of 15. 2. The eſtate does not eſcheat in caſe of an attainder and execution for felony; their maxim being, "the father to the bough, the ſon to the plough." 3. In moſt places he had a power of deviſing lands by will, before the ſtatute for that purpoſe was made. 4. The lands deſcend, not to the eldeſt, youngeſt, or any one ſon only, but to all the ſons together; which was indeed anciently the moſt uſual courſe of deſcent

all

Gavelet
ll
Gauging.

all over England, though in particular places particular cuſtoms prevailed.

GAVELET, in law, an ancient and ſpecial ceſſavit uſed in Kent, where the cuſtom of gavelkind continues, by which the tenant, if he withdraws his rent and ſervices due to the lord, forfeits his land and tenements.

The proceſs of the gavelet is thus. The lord is firſt to ſeek by the ſteward of his court, from three weeks to three weeks, to find ſome diſtreſs upon the tenement, till the fourth court; and if at that time he find none, at this fourth court it is awarded, that he take the tenement in his hand in name of a diſtreſs, and keep it a year and a day without manuring; within which time, if the tenant pay his arrears, and make reaſonable amends for the with-holding, he ſhall have and enjoy his tenement as before: if he come not before the year and day be paſt, the lord is to go to the next county-court, with witneſſes of what had paſſed at his own court, and pronounce there his proceſs, to have further witneſſes; and then by the award of his own court, he ſhall enter and manure the tenement as his own: ſo that if the tenant deſired afterwards to have and hold it as before, he muſt agree with the lord; according to this old ſaying: "Has he not ſince any thing given, or any thing paid, then let him pay five pound for his were, e're he become healder again." Other copies have the firſt part with ſome variation; "Let him nine times pay, and nine times repay."

GAVELET, in London, is a writ uſed in the huſtings, given to lords of rents in the city of London. Here the parties, tenant and demandant, appear by *ſcire facias*, to ſhow cauſe why the one ſhonld not have his tenement again on payment of his rent, or the other recover the lands on default thereof.

GAUGAMELA, (anc. geog.), a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It is ſaid to have been allowed to Darius Hyſtaſpus for the maintenance of a camel; and hence the name. It was not far from a more conſiderable place called *Arbela*; whence the latter gave the name to the victory. See ARBELA.

GAUGE-POINT of a ſolid meaſure, the diameter of a circle whoſe area is equal to the ſolid content of the ſame meaſure.

GAUGER, a king's officer, who is appointed to examine all tuns, pipes, hogſheads, and barrels, of wine, beer, ale, oil, honey, &c. and give them a mark of allowance, before they are ſold in any place within the extent of his office.

GAUGING, See GEOMETRY.

GAUGING-Rod, an inſtrument uſed in gauging or meaſuring the contents of any veſſel. That uſually employed is the four-foot gauging-rod. It is commonly made of box, and conſiſts of four rules, each a foot long and about three-eighths of an inch ſquare, joined together by three braſs joints; by which means the rod is rendered four feet long when the four rules are quite opened, and but one foot when they are all folded together. On the firſt face of this rod, marked 4, are placed two diagonal lines; one for beer and the other for wine: by means of which the content of any common veſſel in beer or wine gallons may be readily found, by putting the rod in at the bung-hole of the veſſel till it meets the interſection of the head of the veſſel with the ſtaves oppoſite to the bung-hole. For diſtinction of this line, there is written thereon, *beer* and *wine gallons*. On the ſecond face, 5, are a line of inches and the gauge-line; which is a line expreſſing the areas of circles, whoſe diameters are the correſpondent inches in ale-gallons. At the beginning is written, *ale area*. On the third face, 6, are three ſcales of lines; the firſt, at the end of which is written *hogſhead*, is for finding how many gallons there are in a hogſhead when it is not full, lying with its axis parallel to the horizon. The ſecond line, at the end of which is written *B. L.* ſignifying a *butt lying*, is for the ſame uſe as that for the hogſhead. The third line is to find how much liquor is wanting to fill up a butt when it is ſtanding: at the end of it is written *B. S.* ſignifying a *butt ſtanding*. In the half of the fourth face of the gauging-rod, 7, there are three ſcales of lines, to find the wants in a firkin, kilderkin, and barrel, lying with their areas parallel to the horizon. They are diſtinguiſhed by letters *F. K. B.* ſignifying a *firkin*, *kilderkin*, and *barrel*.

Gau.
Plate CCV.

Uſe of the diagonal lines on this rod. To find the content of a veſſel in beer or wine gallons, put the braſed end of the gauging-rod into the bung-hole of the caſk, with the diagonal lines upwards, and thruſt this braſed end to the meeting of the head and ſtaves; then with chalk make a mark at the middle of the bung-hole of the veſſel, and alſo on the diagonal lines of the rod, right againſt, over one another, when the braſed end is thruſt home to the head and ſtaves: then turn the gauging-rod to the other end of the veſſel, and thruſt the braſed end home to the end, as before. Laſtly, ſee if the mark made on the gauging-rod come even with the mark made on the bung-hole when the rod was thruſt to the other end; which if it be, the mark made on the diagonal lines will, on the ſame lines, ſhow the whole content of the caſk in beer or wine gallons.

If the mark made on the bung-hole be not right againſt that made on the rod when you put it the other way, then right againſt the mark made on the bung-hole make another on the diagonal lines; and the diviſion on the diagonal line between the two chalks will ſhow the veſſel's whole contents in beer or wine gallons. Thus, *e. gr.* if the diagonal line of a veſſel be 28 inches four-tenths, its contents in beer gallons will be near 51, and in wine gallons 62.

If a veſſel be open, as a half-barrel, tun, or copper, and the meaſure from the middle on one ſide to the head and ſtaves be 38 inches, the diagonal line gives 122 beer-gallons; half of which, *viz.* 61, is the content of the open half tub.

If you have a large veſſel, as a tun or copper, and the diagonal line taken by a long rule proves 70 inches; the content of that veſſel may be found thus: Every inch at the beginning-end of the diagonal-line call ten inches. Thus ten inches becomes 100 inches; and every tenth of a gallon call 100 gallons; and every whole gallon call 1000 gallons.

Example. At 44.8 inches on the diagonal beer-line is 200 gallons; ſo that 4 inches 48 parts, now called 44 inches 8-tenths, is juſt two-tenths of a gallon, now called 200 gallons: ſo alſo if the diagonal line be 76 inches and 7-tenths, a cloſe caſk of ſuch diagonal will

Gauge, Gaul.

will hold 1000 beer-gallons; but an open cask but half so much, *viz.* 500 beer-gallons.

Use of the Gauge-Line. To find the content of any cylindrical vessel in ale-gallons: seek the diameter of the vessel in inches, and just against it on the gauge-line is the qnantity of ale-gallons contained in one inch deep: this multiplied by the length of the cylinder will give its content in ale-gallons.

For example, suppose the length of the vessel 32.06, and the diameter of its base 25 inches; to find what is the content in ale-gallons? Right against 25 inches on the gauge-line is one gallon and 745 of a gallon; which multiplied by 32.06, the length, gives 55.9447 gallons for the content of the vessel.

The bung diameter of a hogshead being 25 inches, the head diameter 22 inches, and the length 32.06 inches; to find the quantity of ale-gallons contained in it?—Seek 25, the bung diameter, on the line of inches; and right against it on the gauge-line you will find 1.745: take one-third of it, which is .580, and set it down twice: seek 22 inches in the head diameter, and against it you will find on the gauge-line 1.356; one-third of which added to twice .580, gives 1.6096; which multiplied by the length 32.06, the product will be 51.603776, the content in ale-gallons. Note, this operation supposes, that the aforesaid hogshead is in the figure of the middle frustum of a spheroid.

The use of the lines on the two other faces of the rod is very easy; you need only put it downright into the bung-hole (if the vessel you desire to know the quantity of ale-gallons contained therein be lying) to the opposite staves; and then where the surface of the liquor cuts any one of the lines appropriated to that vessel, will be the number of gallons contained in that vessel.

GAUL, the name given by the Romans to the country that now forms the kingdom of France.—The original inhabitants were descended from the Celtes or Gomerians, by whom the greatest part of Europe was peopled; the name of *Galli* or *Gauls*, being probably given them long after their settlement in that country. See GALLIA.

The ancient history of the Gauls is entirely wrapped up in obscurity and darkness; all we know concerning them for a long time is, that they multiplied so fast, that, their country being unable to contain them, they poured forth in vast multitudes into other countries, which they generally subdued, and settled themselves in. It often happened, however, that these colonies were so molested by their neighbours, that they were obliged to send for assistance to their native country. This was always very easily obtained. The Gauls were, upon every occasion, ready to send forth great numbers of new adventurers; and as these spread desolation wherever they came, the very name of *Gauls* proved terrible to most of the neighbouring nations.—The earliest excursion of these people, of which we have any distinct account, was into Italy, under a famed leader, named *Bellovesus*, about 622 years before Christ. He crossed the Rhone and the Alps, till then unattempted; defeated the Hetrurians; and seized upon that part of their country, since known by the names of *Lombardy* and *Piedmont*.—The second grand expedition was made by the Cœnomani, a people dwelling between the rivers Seine and Loire, under a general named *Elitonis*. They settled in those parts of Italy now known by the names of *Brescian, Cremonese, Mantuan, Carniola*, and *Venetian*.—In a third excursion, two other Gaulish nations settled on both sides of the river Po; and in a fourth, the Boii and Lingones settled in the country between Ravenna and Bologna. The time of these three last expeditions is uncertain.

1 Account of the Gaulish excursions into Italy.

Gaul.

The fifth expedition of the Gauls was more remarkable than any of the former, and happened about 200 years after that of Bellovesus. The Senones, settled between Paris and Meux, were invited into Italy by an Hetrurian lord, and settled themselves in Umbria. Brennus their king laid siege to Clusium, a city in alliance with Rome; and this produced a war with the Romans, in which the latter were at first defeated, and their city taken and burnt; but at length the whole army was cut off by Camillus, insomuch that not a single person escaped.

Some other expeditions the Gauls undertook against the Romans: in which, though they always proved unsuccessful, by reason of their want of military discipline; yet their fierceness and courage made them so formidable to the republic, that, on the first news of their march, extraordinary levies of troops were made, sacrifices and public supplications offered to the gods, and the law which granted an immunity from military service to priests and old men, was, for the time, abolished.

2 Expedition against the Greeks.

Against the Greeks, the expeditions of the Gauls were very little more successful than against the Romans. The first of these we hear of was about 279 years before Christ, in the year after Pyrrhus had invaded Italy. At this time, the Gauls finding themselves greatly overstocked at home, sent out three great colonies to conquer new countries for themselves. One of these armies was commanded by *Brennus*, another by *Cerethrius*, and the third by *Belgius*. The first entered Pannonia or Hungary; the second Thrace; and the third marched into Illyricum and Macedonia. Here Belgius at first met with great success; and enriched himself by plunder to such a degree, that Brennus envying him, resolved to enter the same countries, in order to share the spoil. In a short time, however, Belgius met with such a total defeat, that his army was almost entirely destroyed; upon which Brennus hastened to the same place. His army at first consisted of 150,000 foot and 15,000 horse: but two of his principal officers revolted, and carried off 20,000 men, with whom they marched into Thrace; where, having joined Cerethrius, they seized on Byzantium and the western coast of Propontis, making the adjacent parts tributary to them.—To retrieve this loss, Brennus sent for fresh supplies from Gaul; and having increased his army to 150,000 foot, and upwards of 60,000 horse, he entered Macedonia, defeated the general who opposed him, and ravaged the whole country. He next marched towards the straits of Thermopylæ, with a design to invade Greece; but was stopped by the forces sent to defend that pass against him. He passed the mountains, however, as Xerxes had formerly done; upon which the guards retired, to avoid being surrounded. Brennus then, having ordered Acichorius, the next to him in command, to follow at a distance with part of his army, marched with the bulk of the forces to Delphi, in order to plunder the rich temple there. This enterprise proved exceedingly unfortunate: a great number of his men were destroyed

Gaul. by a dreadful ſtorm of hail, thunder, and lightning; another part of his army was deſtroyed by an earthquake; and the remainder, ſome how or other, imagining themſelves attacked by the enemy, fought againſt each other the whole night, ſo that in the morning ſcarce one half of them remained. The Greek forces then poured in upon them from all parts; and that in ſuch numbers, that though Acichorius came up in due time with his forces, Brennus found himſelf unable to make head againſt the Greeks, and was defeated with great ſlaughter. He himſelf was deſperately wounded; and ſo diſheartened by his misfortune, that, having aſſembled all his chiefs, he adviſed them to kill all the wounded and diſabled, and to make the beſt retreat they could; after which he put an end to his own life. On this occaſion, it is ſaid that 20,000 of theſe unhappy people were executed by their own countrymen. Acichorius then ſet out with the remainder for Gaul; but by being obliged to march through the country of their enemies, the calamities they met with by the way were ſo grievous, that not one of them reached their own country. A juſt judgement, ſay the Greek and Roman authors, for their ſacrilegious intentions againſt Delphi.

3 Miſerable fate of their army.

4 Gaul invaded by the Romans.

The Romans having often felt the effects of the Gauliſh ferocity and courage, thought proper at laſt, in order to humble them, to invade their country. Their firſt ſucceſsful attempt was about 118 years before Chriſt, under the command of Quintus Marcius, ſurnamed *Rex*. He opened a way betwixt the Alps and the Pyrenees, which laid the foundation for conquering the whole country. This was a work of immenſe labour of itſelf, and rendered ſtill more difficult by the oppoſition of the Gauls, eſpecially thoſe called the Stæni, who lived at the foot of the Alps. Theſe people finding themſelves overpowered by the conſular army, ſet fire to their houſes, killed their wives and children, and then threw themſelves into the flames. After this Marcius built the city of Narbonne, which became the capital of a province. His ſucceſſor Scaurus alſo conquered ſome Gauliſh nations; and in order to facilitate the ſending troops from Italy into that country, he made ſeveral excellent roads between them, which before were almoſt impaſſable. Theſe ſucceſſes gave riſe to the invaſion of the Cimbri and Teutones; an account of whoſe unfortunate expedition is given under the articles CIMBRI, ROME, TUETONES, &c.

From this time, the Gauls ceaſed to be formidable to the Romans, and even ſeem to have been for ſome time on good terms with them. At laſt, however, the Helvetii kindled a war with the republic, which brought Cæſar over the Alps, and ended in the total ſubjection of the country. Orgetorix was the firſt cauſe of it; who had engaged a vaſt number of his countrymen to burn their towns and villages, and to go in ſearch of new conqueſts. Julius Cæſar, to whoſe lot the whole country of Gaul had fallen, made ſuch haſte to come and ſuppreſs them, that he was got to the Rhone in eight days; broke down the bridge of Geneva, and, in a few days more, finiſhed the famed wall between that city and mount Jura, now St Claude, which extended ſeventeen miles in length, was ſixteen feet high, fortified with towers and caſtles at proper diſtances, and a ditch that ran the whole length of it. If his own account of it may be relied upon, he did not ſet out till the beginning of April; and yet this huge work was finiſhed by the ides or 13th of the month: ſo that, ſubtracting the eight days he was acoming, it muſt have been all done in about five days: a prodigious work, conſidering he had but one legion there, or even though the whole country had given him aſſiſtance. Whilſt this was doing, and the reinforcements he wanted were coming, he amuſed the Helvetii, who had ſent to demand a paſſage through the country of the Allobroges, till he had got his reinforcements; and then flatly refuſed it to them: whereupon a dreadful battle enſued; in which they loſt one hundred and thirty thouſand men, in ſpite of all their valour; beſides a number of priſoners, among whom was the wife and daughter of Orgetorix, the leader of this unfortunate expedition. The reſt ſubmitted, and begged they might be permitted to go and ſettle among the Ædui, from whom they originally ſprung; and, at the requeſt of theſe laſt, were permitted to go.

5 Surpriſing ſucceſs of Julius Cæſar.

Gaul.

The Gauls were conſtantly in a ſtate of variance with one another; and Cæſar, who knew how to make the moſt of theſe inteſtine broils, ſoon became the protector of the oppreſſed, a terror to the oppreſſor, and the umpire of all their contentions. Among thoſe who applied to him for help, were his allies the Ædui; againſt whom Arioviſtus, king of the Germans, joined with the Averni, who inhabited the banks of the Loire, had taken the country of the Sequani from them, and obliged them to ſend hoſtages to him. Cæſar forthwith ſent to demand the reſtitution of both, and, in an interview which he ſoon after obtained of that haughty and treacherous prince, was like to have fallen a ſacrifice to his perfidy; upon which he bent his whole power againſt him, forced him out of his ſtrong intrenchments, and gave him a total overthrow. Arioviſtus eſcaped, with difficulty, over the Rhine; but his two wives, and a daughter, with a great number of Germans of diſtinction, fell into the conqueror's hand. Cæſar, after this ſignal victory, put his army into winter-quarters, whilſt he went over the Alps to make the neceſſary preparations for the next campaign. By this time all the Belgæ in general were ſo terrified at his ſucceſs, that they entered into a confederacy againſt the Romans as their common enemy. Of this, Labienus, who had been left in Gaul, ſent Cæſar notice; upon which he immediately left Rome, and made ſuch diſpatch, that he arrived upon their confines in about fifteen days. On his arrival, the Rhemi ſubmitted to him; but the reſt, appointing Galba, king of the Sueſſones, general of all their forces, which amounted to one hundred and fifty thouſand men, marched directly againſt him. Cæſar, who had ſeized on the bridge of the Axona, now Aiſne, led his light horſe and infantry over it; and whilſt the others were encumbered in croſſing that river, made ſuch a terrible ſlaughter of them, that the river was filled with their dead, inſomuch that their bodies ſerved for a bridge to thoſe who eſcaped. This new victory ſtruck ſuch terror into the reſt, that they diſperſed themſelves; immediately after which, the Sueſſones, Bellovaci, Ambiones, and ſome others, ſubmitted to him. The Nervii, indeed, joined with the Atrebates and Veromundui againſt them; and having firſt ſecured their wives and children, made a vigorous reſiſtance for ſome time; but

6 A general confederacy againſt him.

7 The Gauls defeated with great ſlaughter.

Gaul. but were at length defeated, and the greateſt part of them ſlain. The reſt, with their wives and old men, ſurrendered themſelves, and were allowed to live in their own cities and towns as formerly. The Aduatici were next ſubdued; and, for their treachery to the conqueror, were ſold for ſlaves, to the number of fifty thouſand. Young Craſſus, the ſon of the triumvir, ſubdued likewiſe ſeven other nations, and took poſſeſſion of their cities; which not only completed the conqueſt of the Belgæ, but brought ſeveral nations from beyond the Rhine to ſubmit to the conqueror. The Veneti, or ancient inhabitants of Vannes in Brittany, who had been likewiſe obliged to ſend hoſtages to the conqueror, were, in the mean time, making great preparations by ſea and land to recover their liberty. Cæſar, then in Illyricum, was forced to equip a fleet on the Loire; and having given the command of it to Brutus, went and defeated them by land, as Brutus did by ſea; and having put their chief men to death, ſold the reſt for ſlaves. The Unelli, with Veridorix their chief, together with the Lexovii and Aulercii, were about the ſame time ſubdued by Sabinus, and the Aquitani by Craſſus, with the loſs of thirty thouſand men. There remained nothing but the countries of the Morini and Menapii to be conquered of all Gaul. Cæſar marched himſelf againſt them: but he found them ſo well intrenched in their inacceſſible fortreſſes, that he contented himſelf with burning and ravaging their country; and having put his troops into winter-quarters, again paſſed over the Alps, to have a more watchful eye on ſome of his rivals there. He was, however, ſoon after obliged to come to defend his Gauliſh conqueſts againſt ſome nations of the Germans, who were coming to ſettle there, to the number of four hundred thouſand. Theſe he totally defeated, and then reſolved to carry his conquering arms into Germany: but for an account of his exploits there, ſee the article GERMANY.

8 The Gauls revolt, but are ſubdued.

Upon his return into Gaul, he found it labouring under a great famine, which had cauſed a kind of univerſal revolt. Cotta and Sabinus, who were left in the country of the Eburones, now Liege, were betrayed into an ambuſh by Ambiorix, one of the Gauliſh chiefs, and had moſt of their men cut off. The Aduatici had fallen upon Q. Cicero, who was left there with one legion, and had reduced him to great ſtraits: at the ſame time Labienus, with his legion, was attacked by Indutiomarus, at the head of the Rheni and Senones; but had better luck than the reſt, and, by one bold ſally upon them, put them to flight, and killed their general. Cæſar acquired no ſmall credit by quelling all theſe revolts; but each victory loſt the lives of ſo many of his troops, that he was forced to have recourſe to Pompey for a freſh ſupply, who readily granted him two of his own legions to ſecure his Gauliſh conqueſts.

9 A ſecond revolt.

But it was not long before the Gauls, ever reſtleſs under a foreign yoke, raiſed up a new revolt, and obliged him to return thither. His fear leſt Pompey ſhould gain the affections of the Roman people, had obliged him to ſtrip the Gauls of their gold and ſilver, to bribe them over to his intereſt; and this gave no ſmall handle to thoſe frequent revolts which happened during his abſence. He quickly, however, reduced the Nervii, Aduatici, Menapii, and Treviri; the laſt of whom had raiſed the revolt, under the command of Ambiorix: but he found the flame ſpread much farther, even to the greateſt part of the Gauls, who had choſen Vercingetorix their generaliſſimo. Cæſar was forced to leave Inſubria, whither he had retired to watch the motions of Pompey, and, in the midſt of winter and ſnow, to repaſs the Alps into the province of Narbonne. Here he gathered his ſcattered troops with all poſſible ſpeed; and, in ſpite of the hard weather, beſieged and took Noviodunum, now Noyons; and defeated Vercingetorix, who was come to the relief of that place. He next took the city of Avaricum, now Bourges, one of the ſtrongeſt in Gaul, and which had a garriſon of forty thouſand men; of whom he made ſuch a dreadful ſlaughter, that hardly eight hundred eſcaped. Whilſt he was beſieging Gergovia, the capital of the Arverni, he was informed that the Nitiobriges, or Agenois, were in arms; and that the Ædui were ſending to Vercingetorix ten thouſand men, which they were to have ſent to reinforce Cæſar. Upon this news, he left Fabius to carry on the ſiege, and marched againſt the Ædui. Theſe, upon his approach, ſubmitted, in appearance, and were pardoned; but ſoon after that whole nation roſe up in arms, and murdered all the Italian troops in their capital. Cæſar, at this, was in great ſtraits what meaſures to take; but reſolved at length to raiſe the ſiege of Gergovia, and at once attack the enemy's camp, which he did with ſome ſucceſs; but when he thought to have gone to Noviodunum, or Noyons, where his baggage, military cheſt, &c. were left, he heard that the Ædui had carried it off, and burnt the place. Labienus, juſtly thinking that Cæſar would want his aſſiſtance in the condition he now was, went to join him, and in his way defeated a Gauliſh general named *Camulogeno*, who came to oppoſe his march: but this did not hinder the revolt from ſpreading itſelf all over Celtic Gaul, whither Vercingetorix had ſent for freſh ſupplies, and, in the mean time, attacked Cæſar; but was defeated, and forced to retire to Aleſia, a ſtrong place, now Aliſe in Burgundy, as is ſuppoſed. Hither Cæſar haſtened, and beſieged him; and, having drawn a double circumvallation, with a deſign to ſtarve him in it, as he was likely to have done, upon that account refuſed all offers of a ſurrender from him. At length, the long-expected reinforcement came, conſiſting of 160,000 men, under four generals: theſe made ſeveral fruitleſs attacks on Cæſar's trenches; but were defeated in three ſeveral battles, which at length obliged Vercingetorix to ſurrender at diſcretion. Cæſar uſed all his priſoners with great ſeverity, except the Ædui and Arverni, by whoſe means he hoped to gain their nations, which were the moſt potent of Celtic Gaul: nor was he diſappointed; for both of them ſubmitted to him, and the former received him into the capital, where he ſpent the winter, after he put his army into winter quarters. This campaign, as it proved one of the hardeſt he ever had, ſo he gained more glory by it than any Roman general had done before: yet could not at all by this procure from the ſervile ſenate, now wholly dedicated to his rival, a prolongation of his proconſulſhip; upon which he is reported to have laid his hand upon his ſword, and ſaid, that that ſhould do it.

10 They are again ſubdued.

He was as good as his word; and the Gauls, upon their former ill ſucceſs, reſolving to have as many ſeparate armies as provinces, in order to embarraſs him

Gaul. the more, Cæſar, and his generals Labienus and Fabius, were forced to fight them one after another; which they did, however, with ſuch ſucceſs, that, notwithſtanding the hardneſs of the ſeaſon, they ſubdued the Bituriges, Carnuti, Rhemi, and Bellovaci, with their general Correus, by which he at once quieted all the Belgic provinces bordering on Celtic Gaul. The next who followed were the Treviri, the Eburones, and the Andes, under their general Dumnirus. The laſt place which held out againſt him was Uxellodunum; which was defended by the two laſt acting generals of the Gauls. Drapes, the Senonian, and Luterius the Cadurcean. The place being ſtrong, and well garriſoned, Cæſar was obliged to march thither, from the fartheſt part of Belgic Gaul; and ſoon after reduced it, for want of water. Here again he cauſed the right-hands of all that were fit to bear arms to be cut off, to deter the reſt from revolting afreſh. Thus was the conqueſt of Gaul finiſhed from the Alps and Pyrenees to the Rhine, all which vaſt tract was now reduced to a Roman province under the government of a prætor. During his ſeveral expeditions into Gaul, Cæſar is ſaid to have taken 800 cities; to have ſubdued 300 different nations; and to have defeated, in ſeveral battles, three millions of men, of whom one million were killed, and another taken priſoners.—The hiſtory of the country, from the time of its conqueſt by the Romans to the preſent, is given under the articles Rome and France.

11 Gaul reduced to a Roman province.

12 Character, &c of the ancient Gauls.

The Gauls anciently were divided into a great number of different nations, which were continually at war with one another, and at variance among themſelves. Cæſar tells us, that not only all their cities, cantons, and diſtricts, but even almoſt all families, were divided and torn by factions; and thus undoubtedly facilitated the conqueſt of the whole. The general character of all theſe people was an exceſſive ferocity and love of liberty. This laſt they carried to ſuch an extreme, that either on the appearance of ſervitude, or incapacity of action through old age, wounds, or chronic diſeaſes, they put an end to their own lives, or prevailed upon their friends to kill them. In cities, when they found themſelves ſo ſtraitly beſieged that they could hold out no longer, inſtead of thinking how to obtain honourable terms of capitulation, their chief care very often was to put their wives and children to death, and then to kill one another, to avoid being led into ſlavery. Their exceſſive love of liberty and contempt of death, according to Strabo, very much facilitated their conqueſt by Cæſar; for pouring their numerous forces upon ſuch an experienced enemy as Cæſar, their want of conduct very ſoon proved the ruin of the whole.

The chief diverſion of the Gauls was hunting; and indeed, conſidering the vaſt foreſts with which their country abounded, and the multitude of wild beaſts which lodged in them, they were under an abſolute neceſſity to hunt and deſtroy them, to prevent the country from being rendered totally uninhabitable. Beſides this, however, they had alſo their hippodromes, horſe and chariot races, tilts and tournaments; at all of which the bards aſſiſted with their poems, ſongs, and muſical inſtruments.—For an account of their religion, ſee the article Druid.

The Gauls were exceſſively fond of feaſting, in which they were very profuſe; as, like all other northern nations, they were great lovers of good eating and drinking. Their chief liquors were beer and wine. Their tables were very low. They eat but little bread, which was baked flat and hard, and eaſily broken in pieces: but devoured a great deal of fleſh, boiled, roaſted, or broiled; and this they did in a very ſlovenly manner, holding the piece in their hands, and tearing it with their teeth. What they could not part by this way, they cut with a little knife which hung at their girdle. When the company was numerous, the *Coryphæe*, or chief of the feaſt, who was either one of the richeſt, or nobleſt, or braveſt, ſat in the middle, with the maſter of the houſe by his ſide; the reſt took their places next according to their rank, having their ſervants holding their ſhields behind them. Theſe feaſts ſeldom ended without bloodſhed; but if by chance the feaſt proved a peaceable one, it was generally accompanied not only with muſic and ſongs, but likewiſe with dances, in which the dancers were armed cap-a-pee, and beat time with their ſwords upon their ſhields. On certain feſtivals they were wont to dreſs themſelves in the ſkins of beaſts, and in that attire accompany the proceſſions in honour of their deities or heroes. Others dreſſed themſelves in maſquerade habits, ſome of them very indecent, and practiſed ſeveral antic and immodeſt tricks. This laſt cuſtom continued long after their converſion to Chriſtianity.

Gaulanitis || Gauntlope.

GAULANITIS, or Gaulonitis, (Joſephus); (anc. geog.) according to the different manner of writing the capital, *Golan* or *Gaulon*; the extreme part of Baſhan to the ſouth, and bordering on the tribe of Gad. It was divided into the Superior, which to the eaſt extended to Arabia; and into the Inferior, which lay on the lake of Geneſareth, (Joſephus).

GAULON, or Golan, the capital of the Gaulanitis Superior; a Levitical city and place of refuge, (Moſes, Joſhua).

GAULOS, (anc. geog.) a ſmall iſland of Sicily, in the African ſea, adjoining to Melite or Malta; with commodious harbours; a colony of Phœnicians, with a cognominal town. Gaulonitae, the people, (Inſcription). Now called *Gozo*, five miles to the weſt of Malta.

GAULTHERIA, in botany: A genus of the monogynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 18th order, *Bicornes*. The exterior calyx is diphyllous, the interior quinquefid; the corolla ovate; the nectarium conſiſts of ten ſubulated points. The capſule is quinquelocular, covered with the interior calyx formed in the ſhape of a berry.

GAUNT-bellied, in the manege, is ſaid of a horſe whoſe belly ſhrinks up towards his flanks.

GAUNTLET. See Gantlet.

GAUNTLOPE, pronounced *Gauntlet*, a military puniſhment for felony, or ſome other heinous offence.

In veſſels of war, it is executed in the following manner. The whole ſhip's crew is diſpoſed in two rows, ſtanding face to face on both ſides of the deck, ſo as to form a line whereby to go *forward* on one ſide, and return *aft* on the other; each perſon being furniſhed with a ſmall twiſted cord, called a *knittle*, having two or three knots upon it. The delinquent is then ſtripped naked above the waiſt, and ordered to paſs forward

between

Gavies || Gauſe.

between the two rows of men, and aft on the other ſide, a certain number of times, rarely exceeding three; during which every perſon gives him a ſtripe as he runs along. In his paſſage through this painful ordeal, he is ſometimes tripped up, and very ſeverely handled while incapable of proceeding. This puniſhment, which is called *running the gauntlet*, is ſeldom inflicted, except for ſuch crimes as will naturally excite a general antipathy among the ſea-men; as, on ſome occaſions, the culprit would paſs without receiving a ſingle blow, particularly in caſes of mutiny and ſedition, to the puniſhment of which our ſailors ſeem to have a conſtitutional averſion.

In the land-ſervice, when a ſoldier is ſentenced to run the gauntlope, the regiment is drawn out in two ranks facing each other; each ſoldier, having a ſwitch in his hand, lathes the criminal as he runs along naked from the waiſt upwards. While he runs, the drums beat at each end of the ranks. Sometimes he runs three, five, or ſeven times, according to the nature of the offence. The major is on horſeback, and takes care that each ſoldier does his duty.

GAVIES, or GAUBS. See GABBES.

GAVOTTA, or GAVOTTE, is a kind of dance, the air of which has two briſk and lively ſtrains in common time, each of which ſtrains is twice played over. The firſt has uſually four or eight bars; and the ſecond contains eight, twelve, or more. The firſt begins with a minim, or two crotchets, or notes of equal value, and the hand riſing; and ends with the fall of the hand upon the dominant or mediant of the mode, but never upon the final, unleſs it be a rondeau; and the laſt begins with the riſe of the hand, and ends with the fall upon the final of the mode.

Tempi di Gavotta, is when only the time or movement of a gavotte is imitated, without any regard to the meaſure or number of bars or ſtrains.—Little airs are often found in ſonatas, which have this phraſe to regulate their motions.

GAURA, in botany: A genus of the monogynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quadrifid and tubular; the corolla pentapetalous, with the petals riſing upwards. The nut is inferior, monoſpermous, and quadrangular.

GAUSE, or GAWSE, in commerce, a very thin, ſlight, tranſparent kind of ſtuff, woven ſometimes of ſilk, and ſometimes only of thread.—To warp the ſilk for making of gauſe, they uſe a peculiar kind of mill, upon which the ſilk is wound: this mill is a wooden machine about ſix feet high, having an axis perpendicularly placed in the middle thereof, with ſix large wings, on which the ſilk is wound from off the bobbins by the axis turning round. When all the ſilk is on the mill, they uſe another inſtrument to wind it off again on two beams: this done, the ſilk is paſſed through as many little beads as there are threads of ſilk; and thus rolled on another beam to ſupply the loom.

The gauſe-loom is much like that of the common weavers, though it has ſeveral appendages peculiar thereto. See LOOM.

There are figured gauſes; ſome with flowers of gold and ſilver, on a ſilk ground: theſe laſt are chiefly brought from China.

Gay.

GAY (John), a celebrated Engliſh poet, deſcended from an ancient family in Devonſhire, was born at Exeter, and received his education at the free ſchool of Barnſtaple in that county, under the care of Mr William Rayner.—He was bred a mercer in the Strand; but having a ſmall fortune, independent of buſineſs, and conſidering the attendance on a ſhop as a degradation of thoſe talents which he found himſelf poſſeſſed of, he quitted that occupation, and applied himſelf to other views, and to the indulgence of his inclination for the muſes. In 1712 we find him ſecretary, or rather domeſtic ſteward, to the ducheſs of Monmouth, in which ſtation he continued till the beginning of the year 1714; at which time he accompanied the earl of Clarendon to Hanover, whither that nobleman was diſpatched by Queen Anne. In the latter end of the ſame year, in conſequence of the queen's death, he returned to England, where he lived in the higheſt eſtimation and intimacy of friendſhip with many perſons of the firſt diſtinction both in rank and abilities.—He was even particularly taken notice of by Queen Caroline, then princeſs of Wales, to whom he had the honour of reading in manuſcript his tragedy of the *Captives*; and in 1726 dedicated his *Fables*, by permiſſion, to the duke of Cumberland.—From this countenance ſhown to him, and numberleſs promiſes made him of preferment, it was reaſonable to ſuppoſe, that he would have been genteelly provided for in ſome office ſuitable to his inclination and abilities. Inſtead of which, in 1727, he was offered the place of gentleman-uſher to one of the youngeſt princeſſes; an office which, as he looked on it as rather an indignity to a man whoſe talents might have been ſo much better employed, he thought proper to refuſe; and ſome pretty warm remonſtrances were made on the occaſion by his ſincere friends and zealous patrons the duke and ducheſs of Queenſberry, which terminated in thoſe two noble perſonages withdrawing from court in diſguſt. Mr Gay's dependencies on the promiſes of the great, and the diſappointments he met with, he has figuratively deſcribed in his fable of the *Hare with many friends*. However, the very extraordinary ſucceſs he met with from public encouragement made an ample amends, both with reſpect to ſatisfaction and emolument, for thoſe private diſappointments.—For, in the ſeaſon of 1727-8, appeared his *Beggar's Opera*; the vaſt ſucceſs of which was not only unprecedented, but almoſt incredible.—It had an uninterrupted run in London of 63 nights in the firſt ſeaſon, and was renewed in the enſuing one with equal approbation. It ſpread into all the great towns of England; was played in many places to the 30th and 40th time, and at Bath and Briſtol 50; made its progreſs into Wales, Scotland, and Ireland, in which laſt place it was acted for 24 ſucceſſive nights; and laſt of all it was performed at Minorca. Nor was the fame of it confined to the reading and repreſentation alone, for the card-table and drawing-room ſhared with the theatre and cloſet in this reſpect; the ladies carried about the favourite ſongs of it engraven upon their fan-mounts, and ſcreens and other pieces of furniture were decorated with the ſame. In ſhort, the ſatire of this piece was ſo ſtriking,

Gay, Gaza

king, so apparent, and so perfectly adapted to the taste of all degrees of people, that it overthrew the Italian opera, that Dagon of the nobility and gentry, which had so long seduced them to idolatry, and which Dennis, by the labours and outcries of a whole life, and many other writers by the force of reason and reflection, had in vain endeavoured to drive from the throne of public taste. The profits of this piece was so very great, both to the author and Mr Rich the manager, that it gave rise to a quibble, which became frequent in the mouths of many, viz. *That it had made* Rich gay, *and* Gay rich; and it has been asserted, that the author's own advantages from it were not less than 2000 l. In consequence of this success, Mr Gay was induced to write a second part to it, which he intitled *Polly*. But the disgust subsisting between him and the court, together with the misrepresentations made of him as having been the author of some disaffected libels and seditious pamphlets, occasioned a prohibition and suppression of it to be sent from the lord chamberlain, at the very time when every thing was in readiness for the rehearsal of it. A very considerable sum, however, accrued to him from the publication of it afterwards in quarto.—Mr Gay wrote several other pieces in the dramatic way, and many very valuable ones in verse. Among the latter, his *Trivia*, or the *Art of walking the streets of London*, tho' his first poetical attempt, is far from being the least considerable, and is what recommended him to the esteem and friendship of Mr Pope: but as, among his dramatic works, his *Beggar's Opera* did at first, and perhaps ever will, stand as an unrivalled master-piece, so, among his poetical works, his *Fables* hold the same rank of estimation, the latter having been almost as universally read as the former was represented, and both equally admired. Mr Gay's disposition was sweet and affable, his temper generous, and his conversation agreeable and entertaining. But he had one foible, too frequently incident to men of great literary abilities, and which subjected him at times to inconveniences which otherwise he needed not to have experienced, viz. an excess of indolence, without any knowledge of economy. So that, though his emoluments were, at some periods of his life, very considerable, he was at others greatly straitened in his circumstances; nor could he prevail on himself to follow the advice of his friend Dean Swift, whom we find in many of his letters endeavouring to persuade him to the purchasing of an annuity, as a reserve for the exigencies that might attend on old age.—Mr Gay chose rather to throw himself on patronage, than secure to himself an independent competency by the means pointed out to him; so that, after having undergone many vicissitudes of fortune, and being for some time chiefly supported by the liberality of the duke and duchess of Queensberry, he died at their house in Burlington-gardens, in December 1732. He was interred in Westminster-abbey, and a monument erected to his memory, at the expence of his aforementioned noble benefactors, with an inscription expressive of their regards and his own deserts, and an epitaph in verse by Mr Pope.

GAZA (Theodore), a famous Greek in the 15th century, was born in 1398. His country being invaded by the Turks, he retired into Italy; where he at first supported himself by transcribing ancient authors, an employment the learned had frequent recourse to before the invention of printing. His uncommon parts and learning soon recommended him to public notice; and particularly to cardinal Bessarion, who procured him a benefice in Calabria. He was one of those to whom the revival of polite literature in Italy was principally owing. He translated from the Greek into Latin, Aristotle's History of Animals, Theophrastus on Plants, and Hippocrates's Aphorisms; and put into Greek, Scipio's Dream, and Cicero's Treatise on Old Age. He wrote several other works in Greek and Latin; and died at Rome in 1475.

Gaza II Gazna.

GAZA, (anc. geog.), a principal city and one of the five satrapies of the Philistines. It was situated about 100 stadia from the Mediterranean, on an artificial mount, and strongly walled round. It was destroyed by Alexander the Great, and afterwards by Antiochus. In the time of the Maccabees it was a strong and flourishing city; but was destroyed a third time by Alexander Jannæus. At present it has a miserable appearance. The buildings are mean, both as to the form and matter. Some remains of its ancient grandeur appear in the handsome pillars of Parian marble which support some of the roofs; while others are disposed of here and there, in different parts of almost every beggarly cottage. On the top of the hill, at the north east corner of the town, are the ruins of large arches sunk low into the earth, and other foundations of a stately building, from whence some of the bashaws have carried off marble pillars of an incredible size. The castle is a contemptible structure, and the port is ruined. E. Long. 34. 55. N. Lat. 31. 28.

GAZE-HOUND, or *Gast-hound*, one that makes more use of his sight than of his nose. Such dogs are much used in the north of England: they are fitter in an open champaign country than in bushy and woody places. If at any time a well-taught gaze hound takes a wrong way, he will return upon a signal and begin the chace afresh. He is also excellent at spying out the fattest of a herd; and having separated it from the rest, will never give over the pursuit till he has worried it to death.

GAZEL, in zoology, a species of CAPRA.

GAZETTE, a newspaper, or printed account of the transactions of all the countries in the known world, in a loose sheet or half-sheet. This name is with us confined to that paper of news published by authority. The word is derived from *gazetta*, a Venetian coin, which was the usual price of the first newspaper printed there, and which was afterwards given to the paper itself.

The first gazette in England was published at Oxford, the court being there, in a folio half-sheet, Nov. 7. 1665. On the removal of the court to London, the title was changed to the *London Gazette*. The Oxford gazette was published on Tuesdays, the London on Saturdays: and these have continued to be the days of publication ever since.

GAZNA, a city of Asia, once much celebrated, and the capital of a very extensive empire; but which is now either entirely ruined, or become of so little consideration, that it is not taken notice of in our

Gazna. books of geography.—This city was anciently an emporium and fortreſs of Sableſtan, not far from the confines of India. During the vaſt and rapid conqueſts of the Arabs, all this country had been reduced under their ſubjection. On the decline of the power of the khalifs, however, the vaſt empire eſtabliſhed by Mahomet and his ſucceſſors was divided into a number of independent principalities, moſt of which were but of ſhort duration. In the year of the Hegira 384, anſwering to the 994th of the Chriſtian era, the city of Gazna, with ſome part of the adjacent country, was governed by Mahmud Gazni; who became a great conqueror, and reduced under his ſubjection a conſiderable part of India, and moſt of Perſia. Gazna.

This empire continued in the family of Mahmud Gazni for upwards of 200 years. None of his ſucceſſors, however, were poſſeſſed of his abilities; and therefore the extent of the empire, inſtead of increaſing, was very conſiderably diminiſhed ſoon after Mahmud's death. The Seljuks made themſelves maſters of Khoraſan, and could not be driven out; the greateſt part of the Perſian dominions alſo fell off; and in the 547th year of the Hegira, the race of Gazni ſultans were entirely ſet aſide by one Gauri, who conquered Khoſru Shah the reigning prince, and beſtowed his dominions on his own nephew Gayathoddin Mohammed. Theſe new ſultans proved greater conquerors than the former, and extended their dominions farther than even Mahmud Gazni himſelf had done. They did not, however, long enjoy the ſovereignty of Gazna; for in 1218, Jenghiz Khan having conquered the greateſt part of China and almoſt all Tartary, began to turn his arms weſtward; and ſet out againſt the ſultan of Gazna at the head of 700,000 men.

To oppoſe this formidable army, Mohammed, the reigning ſultan, could muſter only 400,000 men; and, in the firſt battle, 160,000 of his troops are ſaid to have periſhed. After this victory, Jenghiz Khan advanced; Mohammed not daring to riſk a ſecond battle, the loſs of which would have been attended with the entire ruin of his kingdom. He therefore diſtributed his army among the ſtrongeſt fortified towns he had in his dominions; all of which Jenghiz Khan took one after another. The rapid progreſs of his conqueſts, indeed, almoſt exceeds belief. In 1219 and 1220, he had reduced Zarnuk, Nur, Bokhara, Otrar, Saganak, Uzkant, Alſhaſh, Jund, Tonkat, Khojend, and Samarcand.—Mohammed, in the mean time, fled firſt to Bokhara; but on the approach of Jenghiz Khan's army, quitted that place, and fled to Samarcand. When this laſt city was alſo in danger of being inveſted, the ſultan did not think proper to truſt himſelf in it more than in the other, though it was garriſoned by 110,000 of his braveſt troops; and therefore fled through byways into the province of Ghilan in Perſia, where he took refuge in a ſtrong fortreſs called *Eſtabad*. But being alſo found out in this retreat, he fled to an iſland in the Caſpian ſea called *Abiſkun*; where he ended his days, leaving his empire, ſuch as it was, to his ſon Jaloloddin.

The new ſultan was a man of great bravery and experience in war; but nothing was able to ſtop the progreſs of the Moguls. In 1220 and 1221, they made themſelves maſters of all the kingdoms of Karazim and Khoraſan, committing every where ſuch maſſacres as were never heard of before or ſince that time. In the mean time Jaloloddin aſſembled his forces with the utmoſt diligence, and defeated two detachments of the Mogul army. This happened while Jenghiz Khan was beſieging Bamiyan; but anſwered little other purpoſe, than ſerving to bring upon that city the terrible deſtruction, of which an account is given under the article BAMIYAN. Immediately after the reduction of that city, Jenghiz Khan marched towards Gazna; which was very ſtrongly fortified, and where he expected to have found Jaloloddin. But he had left the place 15 days before; and, as Jenghiz Khan's army was much reduced, he might perhaps have ſtood his ground, had it not been for an accident. He had been lately joined by three Turkiſh commanders, each of whom had a body of 10,000 men under his command. After his victories over the Moguls, theſe officers demanded the greateſt ſhare of the ſpoils; which being refuſed, they ſeparated themſelves from the ſultan. He uſed his utmoſt endeavours to make them hearken to reaſon; and ſent ſeveral meſſages and letters to them, repreſenting the inevitable ruin which muſt attend their ſeparation, as Jenghiz Khan was advancing againſt them with his whole army. At laſt they were perſuaded to lay aſide their animoſities: but it was now too late; for Jenghiz Khan, being informed of what paſſed, detached 60,000 horſe to prevent their joining the ſultan's army; who, finding himſelf deprived of this powerful aid, retired towards the river Indus. When he was arrived there, he ſtopped in a place where the ſtream was moſt rapid and the place confined, with a view both to prevent his ſoldiers from placing any hopes of ſafety in flight, and to hinder the whole Mogul army from attacking him at once. Ever ſince his departure from Gazna he had been tormented with a colic: yet, at a time when he ſuffered moſt, hearing that the enemy's vanguard was arrived at a place in the neighbourhood called *Herder*, he quitted his litter, and, mounting a horſe, marched with ſome of his choſen ſoldiers in the night; ſurpriſed the Moguls in their camp; and having cut them almoſt all in pieces, without the loſs of a ſingle man on his ſide, returned with a conſiderable booty.

Jenghiz Khan, finding by this that he had a vigilant enemy to deal with, proceeded with great circumſpection. When he came near the Indus, he drew out his army in battalia: to Jagatay, one of his ſons, he gave the command of the right wing; to Oktay, another ſon, he gave the command of the left: and put himſelf in the centre, with 6000 of his guards. On the other ſide, Jaloloddin prepared for battle like one who had no reſource but in victory. He firſt ſent the boats on the Indus farther off; reſerving only one to carry over his mother, wife, and children: but unluckily the boat ſplit when they were going to embark, ſo that they were forced to remain in the camp. The ſultan took to himſelf the command of the main body of the army. His left wing, drawn up under ſhelter of a mountain which hindered the whole right wing of the Moguls from engaging at once, was commanded by his vizir; and his right by a lord named *Amin Malek*. This lord began the fight; and forced the enemy's left wing, notwithſtanding the great diſparity of numbers, to give ground. The right wing of the Mo-

Moguls likewise wanting room to extend itself, the sultan made use of his left as a body of reserve, detaching from thence some squadrons to the assistance of the troops who stood in need of them. He also took one part of them with him when he went at the head of his main body to charge that of Jenghiz Khan; which he did with so much resolution and vigour, that he not only put it in disorder, but penetrated into the place where Jenghiz Khan had originally taken his station: but that prince, having had a horse killed under him, was retired from thence, to give orders for all the troops to engage.

This disadvantage had like to have lost the Moguls the battle; for a report being immediately spread that the enemy had broken through the main body, the troops were so much discouraged, that they would certainly have fled, had not Jenghiz Khan encouraged them by riding from place to place in order to show himself. At last, however, Jaloloddin's men, who were in all but 30,000, having fought a whole day with ten times their number, were seized with fear, and fled. One part of them retired to the rocks which were on the shore of Indus, where the enemy's horse could not follow them; others threw themselves into the river, where many were drowned, though some had the good fortune to cross over in safety; while the rest, surrounding their prince, continued the fight through despair. The sultan, however, considering that he had scarce 7000 men left, began to think of providing for his own safety: therefore, having bidden a final adieu to his mother, wife, and children, he mounted a fresh horse, and spurred him into the river, which he crossed in safety, and even stopped in the middle of it to insult Jenghiz Khan, who was now arrived at the bank. His family fell into the hands of the Moguls; who killed all the males, and carried the women into captivity.

Jaloloddin being now securely landed in India, got up into a tree, in order to preserve himself from wild beasts. Next day, as he walked melancholy among the rocks, he perceived a troop of his soldiers, with some officers, three of whom proved to be his particular friends. These, at the beginning of the defeat, had found a boat in which they had sailed all night, with much danger from the rocks, shelves, and rapid current of the river. Soon after, he saw 300 horse coming towards him; who informed him of 4000 more that had escaped by swimming over the river; and these also soon after joined the rest. In the mean time an officer of his household, named *Jamalarrazad*, knowing that his master and many of his people were escaped, ventured to load a very large boat with arms, provisions, money, and stuff to clothe the soldiers; with which he crossed the river. For this important service Jaloloddin made him steward of his household, and surnamed him the *Chosen*, or the *Glory of the faith*. For some time after, the sultan's affairs seemed to go on prosperously: he gained some battles in India; but the princes of that country, envying his prosperity, conspired against him, and obliged him to repass the Indus. Here he again attempted to make head against the Moguls; but was at last defeated and killed by them, and a final end put to the once mighty empire of Gazna.

The metropolis was reduced by Oktay; who no sooner entered the country in which it was situated, than he committed the most horrid cruelties. The city was well provided with all things necessary for sustaining a siege; had a strong garrison, and a brave and resolute governor. The inhabitants, expecting no mercy from Jenghiz Khan, who they knew had sworn their ruin, were resolved to make a desperate defence. They made frequent sallies on the besiegers, several times overthrew their works, and broke above 100 of their battering rams. But one night, after an obstinate fight, part of the city-walls fell down; and a great number of Moguls having filled up the ditch, entered the city sword-in-hand. The governor perceiving all was lost, at the head of his bravest soldiers rushed into the thickest of his enemies, where he and his followers were all slain. However, Gazna was not entirely destroyed, nor were the people all killed; for after the massacre had continued four or five hours, Oktay ordered it to cease, and taxed those who were left alive at a certain rate, in order to redeem themselves and the city. It does not, however, appear that after this time the city of Gazna ever made any considerable figure.—It was taken by the Moguls in the year 1222.

GEBRES. See Gabres.

GECCO, in natural history, a name given by the Indians to their terrible poison, which kills when mixed with the blood in ever such a small quantity. They say that this gecco is a venomous froth or humour vomited out of the mouths of their most poisonous serpents; which they procure in this fatal strength, by hanging up the creatures by the tails, and whipping them to enrage them: they collect this in proper vessels as it falls; and when they would use it, they either poison a weapon with it, or wounding any part of the flesh introduce the smallest quantity imaginable into it; and this is said to be immediate death.

GECKO. See Lacerta.

GED (William), an ingenious though unsuccessful artist, who was a goldsmith in Edinburgh, deserves to be recorded for his attempt to introduce an improvement in the art of printing. The invention, first practised by Ged in 1735, was simply this. From any types of Greek or Roman, or any other character, he formed a plate for every page, or sheet, of a book, from which he printed, instead of using a type for every letter, as is done in the common way. This was first practised, but on blocks of wood, by the Chinese and Japanese, and pursued in the first essays of Coster the European inventor of the present art. "This improvement (says James Ged the inventor's son) is principally considerable in three most important articles, viz. expence, correctness, beauty and uniformity." But these improvements are controverted.

In July 1729, William Ged entered into partnership with William Fenner, a London stationer, who was to have half the profits, in consideration of his advancing all the money requisite. To supply this, Mr John James, then an architect at Greenwich (who built Sir Gregory Page's house, Bloomsbury church, &c.) was taken into the scheme, and afterwards his brother Mr Thomas James, a letter-founder, and James Ged the inventor's son. In 1730, these partners applied to the university of Cambridge for printing bibles and

Geddes || Gelatinous.

and common-prayer books by blocks inſtead of ſingle types; and, in conſequence, a leaſe was ſealed to them April 23d 1731. In their attempt they ſunk a large ſum of money, and finiſhed only two prayer-books; ſo that it was forced to be relinquiſhed, and the leaſe was given up in 1738. Ged imputed his diſappointment to the villany of the preſsmen and the ill treatment of his partners (which he ſpecifies at large), particularly Fenner, whom John James and he were adviſed to proſecute, but declined it. He returned to Scotland in 1733, where he gave his friends a ſpecimen of his performance, by an edition of Salluſt. But being ſtill unſucceſsful, and having failed in obtaining redreſs from Fenner, who died inſolvent, he was preparing again to ſet out for London, in order to join with his ſon James as a printer there, when he died October 19. 1749 Thus ended his life and project; which, ingenious as it ſeems, is not likely to be revived, if, as Mr Mores ſuggeſts, "it muſt, had it at firſt ſucceeded, have ſoon ſunk under its own burden," for reaſons needleſs here to recapitulate.

GEDDES (James), born of a reſpectable family in Scotland in 1710, was educated for and practiſed at the bar ſeveral years; but died of a conſumption before he arrived at the age of 40. He publiſhed *An eſſay on the compoſition and manner of writing of the ancients;* and left behind him ſeveral other tracts.

GEHENNA, a ſcripture term, which has given ſome pain to the critics. It occurs in St Matthew v. 22. 29. 30. x. 28. xviii. 9. xxiii. 15. 33. Mark ix. 43. 45. 47. Luke xii. 5. James iii. 6.

The authors of the Louvain and Geneva verſions retain the word *gehenna* as it ſtands in the Greek; the like does M. Simon: the Engliſh tranſlators render it by *hell* and *hell-fire*, and ſo do the tranſlators of Mons and father Bohours.

The word is formed from the Hebrew *gehinnom*, i. e. "valley of Hinnom." In that valley, which was near Jeruſalem, there was a place named *Tophet*, where ſome Jews ſacrificed their children to Moloch, by making them paſs through the fire. King Joſias, to render this place for ever abominable, made a cloaca or common ſewer thereof, where all the filth and carcaſes in the city were caſt.

The Jews obſerve farther, that there was a continual fire kept up there, to burn and conſume thoſe carcaſes; for which reaſon, as they had no proper term in their language to ſignify *hell*, they made uſe of that of *gehenna* or *gehinnon*, to denote a fire unextinguiſhable.

GELA (anc. geog.), a city of great extent on the ſouth of Sicily, taking its name from the river Gelas, which waſhes it. It was built by coloniſts from Rhodes and Crete, 45 years after the building of Syracuſe, or in the third year of the 22d Olympiad, 690 before Chriſt; originally called *Lindii*, from the coloniſts of *Lindus*, a city of Rhodes, who ſettled there firſt. Now *Terranuova*, and the river called *Fiume di Terranuova*. The people were called *Geloi*, *Gelenſes*, and *Gelani*. The city Gela, after having ſtood 408 years, was deſtroyed by Phintias, tyrant of Agrigentum; and the inhabitants were removed to a new city, called *Phintias* after his name.

GELATINA, JELLY. See JELLY.

GELATINOUS, among the phyſicians, is applied to any thing approaching to the glutinous conſiſtence of a jelly.

Geld || Gelding.

GELD, in the Engliſh old cuſtoms, a Saxon word ſignifying *money*, or *tribute*. It alſo denoted a compenſation for ſome crime committed: Hence *wergeld*, in their ancient laws, was uſed for the value of a man ſlain; and *orfgeld*, of a beaſt.

GELDENHAUR (Gerard), in Latin *Geldenhaurius*, an hiſtorian and Proteſtant divine in the 16th century. He was a native of Nimeguen, and ſtudied claſſical learning at Deventer. He went through his courſe of philoſophy at Louvaine, where he contracted a very ſtrict friendſhip with ſeveral learned men, and particularly with Eraſmus. He became reader and hiſtorian to Charles of Auſtria, and afterwards to Maximilian of Burgundy. At length he embraced the Proteſtant religion; taught hiſtory at Marpurg; and afterwards divinity till his death, in 1542. He wrote, 1. Hiſtory of Holland. 2. Hiſtory of the Low Countries; 3. Hiſtory of the biſhops of Utrecht: and other works.

GELDERLAND. See GUELDERLAND.

GELDERS. See GUELDRES.

GELDING, the operation of caſtrating any animal, particularly horſes.

If the operation is to be performed on a colt, he may be gelded at nine or fifteen days old, if the teſticles be come down; in regard the ſooner he is gelt the better it will be for his growth, ſhape, and courage; though a horſe may be gelt at any age, if proper care is taken in the cure.

The manner of gelding is as follows. The beaſt being caſt down on ſome ſoft place, the operator takes the ſtones between his foremoſt and his great finger, and ſlitting the cod preſſes the ſtones forth; then taking a pair of nippers made very ſmooth, either of ſteel, box, or braſil-wood, he claps the ſtrings of the ſtones between them, very near to where the ſtones are ſet on, and preſſes them ſo hard that there may be no flux of blood; then with a thin, drawing, cauteriſing iron, ſears away the ſtone. This done, he takes a hard plaſter made of roſin, wax, and waſhed turpentine, well diſſolved together, and melts it on the head of the ſtrings: he then ſears them, and melts more of the ſalve, till ſuch time as he has laid a good thickneſs of it upon the ſtrings.

When is this done to one ſtone, the nippers are looſened, and the like is done to the other; and the two ſlits of the cod are then filled with white ſalt, and the outſide of the cod is anointed with hog's greaſe: and thus they let him riſe, and keep him in a warm ſtable, without tying him up. If he ſwells much in his cods or ſheath, they chafe him up and down, and make him trot for an hour in a day, which ſoon recovers him.

The manner of gelding a hog is as follows: The operator, after having made two croſs ſlits or inciſions on the midſt of the ſtones, preſſes them out, and anoints the ſore with tar. But another general method, yet ſomewhat more dangerous if not well done, is, firſt to cut the ſtone on the top, and after having drawn that one forth, the operator puts in his fingers at the ſame ſlit, and with a lancet cuts the ſkin between the two ſtones, and by that ſlit preſſes out the

Gele'e || Gelibran

other ſtone. Then having cleanſed out the blood, he anoints the part with freſh greaſe: and thus there is but one inciſion made in the cod. Boar pigs ought to be gelt about ſix months old; yet they are commonly gelded about three weeks or a month old.

GELEE (Claude). See CLAUDE.

GELENHAUSEN, a ſmall imperial town of Wetteravia in Germany, with a caſtle built by the emperor Frederic I. E. Long. 8. 13. N. Lat. 50. 20.

GELENIUS (Sigiſmund), a learned and excellent man, born of a good family at Prague, about the year 1498. Eraſmus conceiving an eſteem for him at Baſil, recommended him to John Frobenius as a corrector for his printing-houſe; which laborious charge he accepted, and had a great number of Hebrew, Greek, and Latin books to correct: he alſo tranſlated many works himſelf from the Greek into Latin; and publiſhed a dictionary in four languages, Greek, Latin, German, and Sclavonian. Profitable and honourable employments were offered him in other places, but nothing could tempt him to quit his peaceful ſituation at Baſil. He died in 1555. All his tranſlations are highly eſteemed.

GELINOTTE, or GRUS, in ornithology. See TETRAO.

GELLERT (Chriſtian), one of the fineſt geniuſes Germany has produced, was born at Hænichen, near Freyburg in Saxony, in 1715, and ſtudied at Leipſic; at which univerſity he was for many years profeſſor of philoſophy and the belles lettres. He early diſtinguiſhed himſelf by his talent for poetry; and contracted a ſtrict friendſhip with the moſt learned and polite writers in Germany. All his works are filled with ſentiment, and bear the impreſſion of the ſweetneſs of his diſpoſition. The moſt conſiderable of them are his comedies, his ſpiritual ſongs, and moral poems, and particularly his ſacred odes, his fables, and his tales. He died in 1769, much lamented.

GELLI (John Baptiſt), an eminent Italian writer, was born of mean parents at Florence, in the year 1498. He was bred a taylor: but had ſuch an extraordinary genius, that he acquired ſeveral languages, and made an uncommon progreſs in the belles lettres; and though he continued always to work at his trade, became acquainted with all the wits and learned men at Florence, and his merit was univerſally known. He was choſen a member of the academy there, and the city made him a burgeſs. He acquired the higheſt reputation by his works, which are, 1. *I. Capricci del Bottaio*, quarto; which contains ten dialogues. 2. *La Circe*, octavo. This, which alſo contains ten dialogues, and treats of human nature, has been tranſlated into Latin, French, and Engliſh. 3. Diſſertations in Italian on the poems of Dante and Petrarch. 4. The comedies of *La Sporta* and *La Errore*; and other works. He died in 1563.

GELLIBRAND, (Henry), a laborious aſtronomer of the laſt century, was born in 1597. Though he was not without good views in the church, yet he became ſo enamoured with mathematical ſtudies, that on the death of his father he became a ſtudent at Oxford, contented himſelf with his private patrimony, and devoted himſelf ſolely to them. On the death of Mr Gunter, he was recommended by Mr Briggs to the truſtees of Greſham college, for the aſtronomical profeſſorſhip there; to which he was elected in 1627. His friend Mr Briggs dying in 1630, before he had finiſhed his *Trigonometrica Britannica*, it was finiſhed by Gellibrand at his requeſt. He wrote ſeveral other things, chiefly tending to the improvement of navigation; and died in 1636.

Gellius || Gem.

GELLIUS (Aulus), a celebrated grammarian, who lived in the 2d century under Marcus Aurelius and ſome ſucceeding emperors. He wrote a collection of obſervations on authors, for the uſe of his children; and called it *Noctes Atticæ*, becauſe compoſed in the evenings of a winter he ſpent at Athens. The chief value of it, is for preſerving many facts and monuments of antiquity not to be found elſewhere. Critics and grammarians have beſtowed much pains on this writer.

GELLY. See JELLY.

GELO, or GELON, a ſon of Dinomenes who made himſelf abſolute at Syracuſe 484 years before the Chriſtian era. He conquered the Carthaginians at Himera, and made his oppreſſion popular by his great equity and moderation. He reigned ſeven years, and his death was univerſally lamented at Syracuſe. He was called the father of his people, and the patron of liberty, and honoured as a demigod. His brother Hiero ſucceeded him. See SYRACUSE.

GELLY. See JELLY.

GEM, in natural hiſtory, a common name for all precious ſtones; of which there are two claſſes, the pellucid and ſemipellucid.

The bodies compoſing the claſs of pellucid gems are bright, elegant, and beautiful foſſils, naturally and eſſentially compound, ever found in ſmall detached maſſes, extremely hard, and of great luſtre.

The bodies compoſing the claſs of ſemipellucid gems, are ſtones naturally and eſſentially compound, not inflammable nor ſoluble in water, found in detached maſſes, and compoſed of cryſtalline matter debaſed by earth: however, they are but ſlightly debaſed, and are of great beauty and brightneſs, of a moderate degree of tranſparency, and are uſually found in ſmall maſſes.

The knowledge of gems depends principally on obſerving their hardneſs and colour. Their hardneſs is commonly allowed to ſtand in the following order: The diamond the hardeſt of all; then the ruby, ſapphire, jacinth, emerald, amethyſt, garnet, carneol, chalcedony, onyx, jaſper, agate, porphyry, and marble. This difference, however, is not regular and conſtant, but frequently varies. Good cryſtals may be allowed to ſucceed the onyx; but the whole family of metallic glaſſy fluors ſeem to be ſtill ſofter.—In point of colour, the diamond is valued for its tranſparency, the ruby for its purple, the ſapphire for its blue, the emerald for its green, the jacinth for its orange, the amethyſt carneol for its carnation, the onyx for its tawny, the jaſper, agate, and porphyry, for their vermilion, green, and variegated colours, and the garnet for its tranſparent blood-red.

All theſe gems are ſometimes found coloured and ſpotted, and ſometimes quite limpid and colourleſs. In this caſe the diamond-cutter or poliſher knows how to diſtinguiſh their different ſpecies by their different degrees of hardneſs upon the mill. For the cutting or poliſhing of gems, the fine powder of the fragments of thoſe that are next in degree of hardneſs is always required to grind away the ſofter; but as none of them are harder than the diamond, this can only be poliſhed by its own powder.

Cron-

Gem. Cronſtedt obſerves of gems in general, that the colour of the ruby and emerald are ſaid to remain in the fire, while that of the topaz flies off: hence it is uſual to burn the topaz, and thence ſubſtitute it for the diamond. "Their colours (ſays our author) are commonly ſuppoſed to depend upon metallic vapours; but may they not more juſtly be ſuppoſed to ariſe from a phlogiſton united with a metallic or ſome other earth? becauſe we find that metallic earths which are perfectly well calcined give no colour to any glaſs; and that the manganeſe, on the other hand, gives more colour than can be aſcribed to the ſmall quantity of metal which is to be extracted from it." M. Magellan is of opinion, that their colour is owing chiefly to the mixture of iron which enters their compoſition; but approves the ſentiment of Cronſtedt, that phlogiſton has a ſhare in their production, it being well known that the calces of iron when dephlogiſticated produce the red and yellow colours of marble, and when phlogiſticated to a certain degree produce the blue or green colours.

With regard to the texture of gems, M. Magellan obſerves, that all of them are foliated or laminated, and of various degrees of hardneſs. Whenever the edges of theſe laminæ are ſenſible to the eye, they have a fibrous appearance, and reflect various ſhades of colour, which change ſucceſſively according to their angular poſition to the eye. Theſe are called by the French *chatorantes*; and what is a blemiſh in their tranſparency, often enhances their value on account of their ſcarcity. But when the ſubſtance of a gem is compoſed of a broken texture, conſiſting of various ſets of laminæ differently inclined to each other, it emits at the ſame time various irradiations of different colours, which ſucceed one another according to their angle of poſition. This kind of gems has obtained the name of *opals*, and are valued in proportion to the brilliancy, beauty, and variety of their colours. Their cryſtallization, no doubt, depends on the ſame cauſe which produces that of ſalts, earths, and metals, which is treated of under the article CRYSTALLIZATION: but as to the particular configuration of each ſpecies of gems, we can hardly depend upon any individual form as a criterion to aſcertain each kind; and when we have attended with the utmoſt care to all that has been written on the ſubject, we are at laſt obliged to appeal to chemical analyſis, becauſe it very often aſſumes various forms. The following table ſhows the component parts of gems according to the analyſis of Bergman and M. Achard; the letter B prefixed to each denoting Bergman's analyſis, and A that of Achard.

		Argil.	Silic.	Calc.	Iron.
Red oriental ruby,	B	40	39	9	10
Ditto,	A	37·5	42·5	9	11

Garnet from Bohemia,	A	30	48	11	10

The chryſopraſe from Koſeinitz in Sileſia was likewiſe analyſed by M. Achard; who found that it contained 456 grains of ſiliceous earth, 13 of calcareous, 6 of magneſia, 3 of copper, and 2 of iron. "This (ſays M. Magellan) ſeems to be the only gem that contains no argillaceous earth." Gem

Imitation or Counterfeiting of GEMS *in Glaſs.* The art of imitating gems in glaſs is too conſiderable to be paſſed without notice: ſome of the leading compoſitions therein we ſhall mention upon the authority of Neri and others.

Theſe gems are made of paſtes; and are noway inferior to the native ſtones, when carefully made and well poliſhed, in brightneſs or tranſparence, but want their hardneſs.

The general rules to be obſerved in making the paſtes are theſe: 1. That all the veſſels in which they are made be firmly luted, and the lute left to dry before they are put into the fire. 2. That ſuch veſſels be choſen for the work as will bear the fire well. 3. That the powders be prepared on a porphyry ſtone; not in a metal mortar, which would communicate a tinge to them. 4. That the juſt proportion in the quantity of the ſeveral ingredients be nicely obſerved. 5. That the materials be all well mixed; and, if not ſufficiently baked the firſt time, to be committed to the fire again, without breaking the pot: for if this be not obſerved, they will be full of bliſters and air-bladders. 6. That a ſmall vacuity be always left at the top of the pot, to give room to the ſwelling of the ingredients.

To make paſte of extreme hardneſs, and capable of all the colours of the gems, with great luſtre and beauty.—Take of prepared cryſtal, ten pounds; ſalt of polverine, ſix pounds; ſulphur of lead, two pounds; mix all theſe well together into a fine powder; make the whole with common water into a hard paſte; and make this paſte into ſmall cakes of about three ounces weight each, with a hole made in their middle; dry them in the ſun, and afterwards calcine them in the ſtraiteſt part of a potter's furnace. After this, powder them, and levigate them to a perfect fineneſs on a porphyry-ſtone, and ſet this powder in pots in a glaſs-furnace to purify for three days: then caſt the whole into water, and afterwards return it into the furnace, where let it ſtand 15 days, in which time all foulneſs and bliſters will diſappear, and the paſte will greatly reſemble the natural jewels. To give this the colour of the emerald, add to it braſs thrice calcined; for a ſea-green, braſs ſimply calcined to a redneſs; for a ſapphire, add zaffer, with manganeſe; and for a topaz, manganeſe and tartar. All the gems are thus imitated in this, by the ſame way of working as the making of coloured glaſſes; and this is ſo hard, that they very much approach the natural gems.

The colour of all the counterfeit gems made of the ſeveral paſtes, may be made deeper or lighter, according to the work for which the ſtones are deſigned; and it is a neceſſary general rule, that ſmall ſtones for rings, &c. require a deeper colour, and large ones a paler. Beſides the colours made from manganeſe, verdegris, and zaffer, which are the ingredients commonly uſed, there are other very fine ones which care and ſkill

Gem may prepare. Very fine red may be made from gold, and one not much inferior to that from iron; a very fine green from brafs or copper; a fky-colour from filver, and a much finer one from the granates of Bohemia.

A very fingular and excellent way of making the paſte to imitate the coloured gems is this: Take a quantity of facebarum ſaturni, or ſugar of lead, made with vinegar in the common way; ſet it in ſand, in a glaſs body well luted from the neck downwards; leave the mouth of the glaſs open, and continue the fire 24 hours; then take out the ſalt, and if it be not red but yellowiſh, powder it fine, and return it into the veſſel, and keep it in the ſand-heat 24 hours more, till it becomes as red as cinnabar. The fire muſt not be made ſo ſtrong as to melt it, for then all the proceſs is ſpoiled. Pour diſtilled vinegar on this calcined ſalt, and ſeparate the ſolution from the dregs; let the decanted liquor ſtand ſix days in an earthen veſſel, to give time for the finer ſediment to ſubſide; filter this liquor, and evaporate it in a glaſs body, and there will remain a moſt pure ſalt of lead; dry this well, then diſſolve it in fair water; let the ſolution ſtand ſix days in a glazed pan; let it ſubſide, then filtre the clear ſolution, and evaporate it to a yet more pure white and ſweet ſalt; repeat this operation three times; put the now perfectly pure ſalt into a glaſs veſſel, ſet it in a ſand-heat for ſeveral days, and it will be calcined to a fine impalpable powder, of a lively red. This is called *the ſulphur of lead.*

Take all the ingredients as in the common compoſition of the paſtes of the ſeveral colours, only inſtead of red lead, uſe this powder; and the produce will well reward the trouble of the operation, as experience has ten proved.

A paſte proper for receiving colours may be readily made by well-pounding and mixing ſix pounds of white ſand cleanſed, three pounds of red lead, two pounds of purified pearl-aſhes, and one pound of nitre. A ſofter paſte may be made in the ſame manner, of ſix pounds of white ſand cleanſed; red lead, and purified pearl-aſhes, of each three pounds; one pound of nitre, half a pound of borax, and three ounces of arſenic. For common uſe a pound of common ſalt may be ſubſtituted for the borax. This glaſs will be very ſoft, and will not bear much wear if employed for rings, buckles, or ſuch imitations of ſtones as are expoſed to much rubbing; but for ear-rings, ornaments worn on the breaſt, and thoſe little uſed, it may laſt a conſiderable time.

In order to give paſte different colours, the proceſs is as follows. For

Amethyſt. Take ten pounds of either of the compoſitions deſcribed under *Colouring of* GLASS, one ounce and a half of manganeſe, and one dram of zaffer; powder and fuſe them together.

Black. Take ten pounds of either of the compoſitions juſt referred to, one ounce of zaffer, ſix drams of manganeſe, and five drams of iron, highly calcined; and proceed as before.

Blue. Take of the ſame compoſition ten pounds; of zaffer ſix drams; and of manganeſe two drams; and proceed as with the foregoing.

Chryſolite. Take of either of the compoſitions for paſte above deſcribed, prepared without ſaltpetre, ten pounds, and of calcined iron five drams; and purſue the ſame proceſs as with the reſt. Gem.
