The case of the Trustees of Mrs. M. Cunliffe v. the Central London Railway came again before Mr. J. W. Penfold, F.R.I.B.A., sitting as sole arbitrator, at the Surveyors' Institution on the 8th inst. The case is one in which damages to the extent of £4,800 are claimed against the Central London Railway for alleged damage to No. 2, Lancaster Gate, Bayswater-road, caused by subsidence of the soil consequent upon the construction of the railways.—Mr. A. G. Mantou, C.E., chief agent to the contractor, in giving evidence on behalf of the company, said it was his opinion that the subsidence was due to the bursting of a water main belonging to the East London Water Company. It was quite impossible that the railway could have had anything to do with it. The house was built upon a layer of mud, and any considerable stream of water, such as would result from the bursting of a large water-pipe, would certainly tend to shift the foundations and ultimately to cause the cracks complained of.—Sir Douglas Fox also gave evidence for the railway company. He said the method of the construction of the tunnel of the Central London and similar railways was such as to preclude all possibility of overhead subsidence. After the Greathead shield had cut its way, and the iron lining plates fixed in position, the inch and a half of space remaining between the plates and the soil of the tunnel was immediately filled with a clayey composition injected through the plates, so that the whole was as firm and compact as before. Subsidence was in that way rendered impossible. He had watched the construction of the railway for the Mercers' Hall and the Royal Exchange, and he had found out that any subsidences that occurred invariably took place some time before the spot was reached by the work-

men, and that no movement occurred subsequently. Even then the cracks were only "hair cracks." He concluded that for the tunnel to have affected the house the damage must have been done in the autumn of 1897, whereas it did not take place till much later. As the house was built upon the valley of a once-existing brook, the ground, if it became saturated by water from a burst water-main, would certainly give way and cause cracks in the houses above. Another reason which made him believe that the tube had not affected the house was that a 6-ft. sewer which ran between the house and the railway was quite intact. The construction of vertical shafts for stations very often caused subsidences in the adjacent buildings, but as No. 2, Lancaster Gate was 440 ft. from a station, this cause was extremely unlikely.

Mr. J. Seaton, the resident engineer, gave corroborative evidence, and the case was adjourned provisionally until March 1.

ACTION BY A SCENIC ARTIST.

THE case of Ryan v. the Portsmouth Theatre, Limited, came before Mr. Justice Bigham, sitting without a jury, in the King's Bench Division on the 11th inst. It was an action brought by the plaintiff, Mr. Thomas Edward Ryan, a scenic artist, to recover from the defendants 73*l.* 11*s.* 10*d.*, his fees for an act drop representing the ship *Victory* being towed into port, and which he alleged was executed by him to the order of the defendants' managing director.

It appeared that the price agreed on for the act drop was 50*l.*, and that the plaintiff made a sketch which was submitted to Mr. Matcham, the defendants' architect. The plaintiff, to complete the work, obtained the assistance of Mr. T. T. White, who painted the figures at a cost of 20*l.*, which the plaintiff paid. The act drop had been used at the defendants' theatre from August 6 down to the present time, but defendants refused to pay the full price for it on the grounds that it was not according to the instructions given by their architect, and that the architect had not given a certificate for the work. The defendants paid 58*l.* 11*s.* 10*d.* into Court as being sufficient to satisfy the plaintiff's claim.

For the defence, Mr. F. Matcham, defendants' architect, in giving evidence said he told the plaintiff he wanted three or four fair-like figures, with wreaths of roses and other flowers, attached to the bow of the ship *Victory*, towing the ship into port. He wanted Britannia at the side, drawing the drapery back and disclosing the picture. The plaintiff said it was a good idea. The plaintiff did not say it could not be done. He did not approve of either of the sketches, neither did he approve of the "act drop," and suggested alterations—namely, other figures to be added. The plaintiff intimated that he would do that and do his best to make it comply with his wishes. He did not think that the act drop as executed carried out his ideas, and he refused to certify that it was done to his satisfaction.

In the result judgment was entered for the plaintiff for 15*l.* beyond the amount paid into court, with costs.

Mr. Stephen Lynch appeared for the plaintiff, and Mr. Emanuel for the defendants.

BREACH OF CONTRACT.

[NORTHERN CIRCUIT.]

MESSRS. NEILL & SONS, builders, of Manchester, brought an action recently to recover damages for breach of contract from Mr. Hamor Lockwood, a contractor. Mr. C. A. Russell, K.C., and Mr. Gilbert Jordan appeared for the plaintiff, and Mr. Pickford, K.C., and Mr. Langdon for the defendant. A watching brief for an insurance company was held by Mr. Acton. From the statements of counsel it appeared that the plaintiffs, who were builders in Manchester, entered into a contract with the Lancashire and Yorkshire Railway Company for the construction of certain works, and relet a portion of the asphalt work to the defendant, a contractor in Manchester, under a sub-contract. In the specifications and conditions attached to the sub-contract there was a clause stipulating that the defendant should include in his tender insurance of the workmen employed by him, there being a condition that the plaintiffs were not to be responsible for any accident which might befall any of the defendant's workmen. During the execution of the work an employee of the defendant's was injured and died. A claim was made by his widow under the Workmen's Compensation Act, 1897, and both the plaintiffs and defendant were made parties to the action, which came before Judge Parry, of the Manchester County Court, sitting as arbitrator. Judge Parry, following a decision of the Court of Appeal, which laid down that a sub-contractor was not an "undertaker" within the Act, awarded the widow 234*l.* damages against the present plaintiffs and dismissed the case as against the present defendant. The plaintiffs now sought to recover that sum, together with 21*l.*, the costs of the arbitration, from the defendant. Mr. Russell argued on behalf of the plaintiffs that the defendant was bound to indemnify them against any claim for damages for

injuries sustained by the defendant's workmen. For the defence it was submitted that the defendant, in taking out a policy of insurance, had fulfilled his obligations under the clause in question, and that there was no contract to indemnify the plaintiffs against damages in any accident which might be brought against them. In the course of his judgment the learned Judge said that he was of opinion that the clause in question was inserted for the protection of the plaintiffs with the object of throwing upon the defendant the obligation to discharge any claims which might be brought against the plaintiffs by any of the defendant's workmen. He thought that the intention of a clause was that the defendant was to take out a policy under which the insurance company would be responsible for any claim brought against either the plaintiffs or the defendant by the defendant's workmen. Such intention was, he considered, sufficiently shown by the words in the contract, "it being a condition that we are not responsible for any accident occurring to your workmen." The meaning of this clause was clearly that the defendant should take such steps as would prevent any liability falling upon the plaintiffs in respect of any accident happening to the defendant's workmen. There would be judgment for the plaintiffs for the amount claimed, with costs. A stay of execution was applied for by Mr. Pickford, and granted.—*Times*.

BUILDING CONTRACT: ARCHITECT'S CERTIFICATE: NOTICE TO TREAT.

IN the Official Referee's Court, on the 6th inst., before Mr. Verey, the case of Lole and Lightfoot v. Vidal was heard. This was an action brought by the plaintiffs, a firm of builders at Chelsea, to recover 485*l.* 10*s.*, and loss of profit on a building contract, and raising the question of whether architects' certificates should be issued after a notice to treat had been served on the owner.

Mr. Morton Smith appeared for the plaintiffs; the defendant, who conducted his own case, had paid 500*l.* into Court.

Mr. Morton Smith said that in the latter part of 1899 negotiations took place between the plaintiffs and defendant as to rebuilding No. 51, Shaftesbury-avenue, and other premises in Wardour-street. The defendant ultimately accepted the plaintiffs' tender of 610*l.* for the work, but afterwards altered his view as to what was required to be done, and on March 22, 1900, the parties entered into another contract for 872*l.*, including an addenda which contained priced items commencing with the 610*l.* The contract contained clauses stipulating that when, in the opinion of the defendant's architect, work to the value of 200*l.* was done, the contractor should be entitled to be paid at the rate of 85 per cent., that the defendant's architect should give certificates from time to time, and that after a stoppage for a month the contract could be determined. On April 2 the architect, Mr. J. A. Soutar, authorised the builders to proceed, and they pulled down and cleared away the wall next Wardour-street, the defendant agreeing to pay 50*l.* for it, as the architect thought the work necessary. On April 17 both the architect and the defendant wrote to the builders directing the work to be stopped, and a notice to treat had been served on the defendant by the Strand Board of Works, the land being required for widening the street. In consequence the builders stopped at once, but the plant and materials were left on the site for about six weeks. On May 3 the builders applied for payment of 485*l.* 12*s.*, being the account rendered for work executed up to the date of the stoppage of the work. The works having been stopped one month and no further orders to proceed given, the contract was determined. On May 24 the defendant's solicitors wrote informing them that items in their claim were not covered by the architect's certificate, and mentioning the compensation claim against the Strand Board of Works. The builders replied that the compensation claim had nothing to do with them, and required payment by the architect's certificate. On June 25 the architect made out a certificate for 250*l.* (including 50*l.* for the wall), and again, on July 20, gave a final certificate for 200*l.* intimating also that any claim for loss of profit by non-completion of the contract was not within his province. The defendant declined to pay for loss of profit; and thereupon the plaintiffs brought this action. The job was an awkward one to do, as the land was only 3 ft. in depth and 48 ft. in length, and therefore, in estimating for work of this kind, a builder would look for a larger profit than he would in other work, because of the extraordinary amount of risk and difficulty which he would have, and the plaintiffs had put this profit at 15 per cent. on 572*l.*, or 85*l.* 10*s.* In the certificates of 350*l.* was included the 50*l.* authorised by the defendant for the party wall.—Mr. Wm. Chas. Lole, a member of the plaintiff firm, bore out the counsel's opening statement, and said the minimum profit would be 15 per cent.—Mr. Henry F. Williams, surveyor, Fleet-street, E.C., agreed that 15 per cent. was a reasonable profit for a builder to expect for work of this character.—Mr. J. A. Soutar, architect, Bishopsgate-street Within, said he was employed in the matter by Mr. Vidal, and exercised his judgment on the amount of work actually done. He obtained the schedule of

prices from the builders as to how they arrived at the 610*l.* He arrived at the opinion that 350*l.* was a fair contract price for the work done, leaving 572*l.* for work under the contract not carried out. A builder would expect 15 per cent. profit on an awkward job like that. The building was up to the ground floor.—The Official Referee said the certificates were binding upon him, unless fraud and dishonesty were proved.—Other evidence having been given, the Official Referee held that the clause stipulating that the builders could not claim loss of profit if they determined the contract did not apply. He gave judgment for the amount certified by the architect, 350*l.*, and for loss of profit at 12½ per cent., 71*l.* 15*s.*, with costs.—*Estates Gazette*.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

20,432.—AUTOMATIC WATER SUPPLY FOR WATER-CLOSETS: R. C. Grundy, D. R. Grundy, and D. Grundy.—For supplying water in fixed quantities; the valve casing into which the supply pipe enters has an inlet and a discharge valve worked by a weighted lever that is raised or lowered by the seat of the closet, and is joined to the spindle of the outlet valve; water will flow through a pipe into a container when the inlet valve is lifted through the engagement of its spindle with the extended spindle of the outlet valve as the latter is pressed against its seating; water flows into the closet upon the opening of the outlet valve, which depresses and shuts the inlet valve; the latter valve is disposed adjustably upon its spindle, and its conical shape is intended to obviate the deposit of dust and dirt; escape of air is provided for by means of an adjustable float-valve fitted upon the container, which also has a funnel-shaped opening for the prevention of overflow; the container is admitted through a spring or weight-balanced valve at the top of the container.

20,435.—LINING-PLATES FOR BRICK MOULDS: J. E. Brindley and F. Rowley.—The lining-plates are made of some such hard substance as porcelain, stone, steel, or glass, and are fastened to one another in their places around the die or plunger so as to form a frame to be placed within a flanged casing made of cast-iron, to which they are cemented, the cement interlocking with projections and recesses fashioned upon the lining-plates.

20,437.—A CONTRIVANCE FOR USE WITH LATCHES AND LOCKS: D. Beards.—The cap or back-plate is secured to the body of a lock or latch-case by lugs upon the plate, which will pass through holes cut in the fore-end; at the back of the case is another lug, which is clinched over after it has been inserted through a hole at the edge of the plate; if the fore-end does not pass through a hole or holes in the plate, and the plate-lugs will then pass into holes made in the back of the case; in another form the lugs and holes are set on opposite sides, instead of at the ends, of the plate.

20,460.—SHEET-ROOFING: C. H. Windle and B. D. Meares.—Hooks or clips that are bolted on to the purlins are employed for fastening corrugated metal roofing sheets in their position, the upper edge of each sheet being placed between the hook and the purlin, and the lower overlapping edge of the sheet immediately above being inserted underneath a round purlin which extends from the hook.

20,470.—SIPHONICAL DISCHARGE: C. D. Martin.—The flush is started through the forcing down of water over the crown of the siphon by means of the fall of a piston within a cylinder, which is fitted in the top of a flattened receiver, at the bottom of which is a non-return valve, and into the top of which the shorter leg of the siphon is introduced. A silent discharge and the collection of dirt between the cylinder and its piston are prevented by means of a ring around the top of the cylinder.

20,480.—ELECTRICAL SWITCHES AND CUT-OUTS: A. Faray.—Metal bushings are sunk below the surface of each distribution board in such a manner that they cannot be touched and in such a manner that fit in deep grooves cut in the face of the board, the bushings being connected to insulating handles and connecting the plug terminals constitute the simple fuses; for the switches the fuse is connected to one of the plugs and to one of the contacts, the other plug being connected to the other contact.

20,489.—BRICKS AND BLOCKS FOR BUILDERS USE: S. Ritter von Blönski.—The bricks and blocks, moulded in various suitable shapes, are intended for floors, ceilings, arches, walls, conduits, paving, foundations, and so on; they are hollow and are to be joined together with their interlocking grooves and tongues and hollow or solid cores that will pass into two or more bricks. The bricks should be vitrified or baked into clinkers when they are required for the building of vaults and floors, and the passage through them will serve for the drainage of water, the circulation of air, and the conveyance of smoke.

20,492.—PERCUSSIVE ROCK-DRILLS: R. Avery and H. C. Campbell.—A clamp between adjustable collars forms the mounting upon a standard of the casing in which the drill that is to be struck with hammers is held and turned, the drill passes through split bushes in the ends of the casing, which consists of two parts screwed together, and it is gripped between pawls pivoted upon a sleeve by means

INK: PHOTO SPRAGUE & CO. LTD. 4 & 5, EAST HARGING STREET FETTER LANE, E.C.

THE BUILDER, FEBRUARY 16, 1901.

INK PHOTO SPRAGUE & CO., LTD., 4 & 5, EAST HARDING STREET, LONDON, E.C.

CHOIR STALLS, LINCOLN CATHEDRAL.—DRAWN BY MR. JAMES McLACHLAN. (Pugin Student, R.I.B.A.)

of a spring, whilst another pawl, carried on a ring, operates a sleeve upon which are sliding lugs that turn the former sleeve in order to turn the drill; the drill can be raised clear of the end of the hole when it is turned by means of ratchet teeth on the latter sleeve that engage with teeth upon a plate so as to force the plate backwards upon the pivoted pawls and make them hold and raise the bit.

20,505.—CHIP-AND-SLEEVE AND BUTT-AND-FLANGE JOINTS FOR PIPES: D. H. Nesbit.—The couplings or joints are intended for metal tubes and pipes which have tapered ends for collars and rings, the joints being tightened by the bolting together of other collars. A projecting lip or ring upon one collar will engage with a groove in the opposite collar and so secure the jointing washer. The tube ends may be expanded or riveted over so as to fit into recesses made in the faces of the collars, or the collars may be screwed. By another method of coupling, a loose collar or ringed flange, which is fashioned with an interrupted boss, will fit with an interrupted collar or shoulder upon the end of the pipe.

20,518.—AN ARTIFICIAL MARBLE: S. Weill.—A paste is made by stirring together water, glycerine, and white English marble cement, to which is added an earthy colouring substance mixed with smoothed stone, and then, having been dried again, a smoothed with whetstone, stopped, and smoothed over with a polishing stone. They are next soaked in olive oil and well polished. For a hard one-tinted marble an admixture of cinder dust, white English marble cement, glycerine, water, and colouring matter should be used.

20,557.—AN APPLIANCE FOR DISC MILLS FOR GRINDING LIME, ASHES, SANDSTONE, &c.: F. E. Whitham.—The grinding mills are provided with a balancing contrivance that consists of two, or three, rings, which have a channel-shaped section and are placed adjustably around the span of the runner, or, it may be, upon the stone, lime, &c.; wooden packing rings effect the vertical adjustment of the balancing rings, which are made solid throughout their greater part in each instance.

20,585.—A LOWERING APPARATUS FOR ESCAPE FROM FIRE: F. E. Young.—The apparatus, which was a liquid brake, comprises a drum or reel that is mounted within a window frame or a similar fitting, and is made in two portions upon which the ropes are wound in contrary directions in order that one rope shall be wound up as a person is lowered by the other and unwinding rope within the drum as a piston which is fixed and within the drum through the cylinder. A projection which fits in the rope prevents the piston from turning, whilst the descent is regulated by the forcing of the liquid through an orifice in the piston so as to set up the action of a cushion or brake.

20,592.—AN APPARATUS FOR HYDRAULIC RAMS: McC. Kline and S. Wetzel.—A spring, which is a thickened foot for its adjustment and attachment to a lug upon the valve seating, carries the waste valve, the spring carrying the valve adjustably with nuts. A similar support is contrived for the r-chamber valve, of which the spring crosses the valve seating, and is mounted upon lugs at the sides, or an increase of the delivery pressure a tapering inlet joins the air chamber and the discharge pipe. 20,606.—A TRAVELLING CRANE: H. A. L. Barry.—Overhead rails support the carriage, and of the two working ropes, which are guided by pulleys, one of which are placed obliquely and one is secured to carriage and the other is passed through the fall-block and so to the carriage; on the end of the axle the sheave in the fall-block is affixed a two-armed arm; after the loaded skip has reached the place where it is to be unloaded, a reversal of the engine causes the cam strike against a pawl upon a lever which is joined to the firing-line of the skip, thus the lever is lifted to work the two drums for tipping the skip. In order that the two drums shall be driven one direction when the clutch is in action, and in the other when the clutch is out of action one drum may be stopped and locked whilst the other drum comes into its work, the drums revolve loosely upon the shaft, and on the shaft, are two discs, on the ends of which are eccentric pinions for engagement respectively with a fixed gear-wheel on a gear-wheel upon the end of the drum.

20,655.—THE MOUNTING OF THE ENDS OF DRAINS AND CONDUITS: Abton Clay Co. and Drain Pipes.—For moulding spigot and socket ends, a is dropped upon guide-rods into the middle of socket and the spigot end of the conduit is put in a mould that is mounted upon a base-plate, a pot and a socket are then made in alignment one another by means of a filling of cement, or the mould and core; spring arms attached to cross-head and core; an adjustable bar which is pressed to brackets upon the cross-head hold the end of the conduit in its place; a screw or r may be used for lifting and lowering the core, which may be balanced with a weight and cord. Conduits are after the kind specified in No. 1 of 1898.

20,681.—AN APPLIANCE FOR USE WITH FLUSHING TRAPVALVES: F. H. Williams.—The appliance consists of a vessel or receiver, which has a funnel with a siphon for its outlet, and is to be filled with a disinfectant, or some similar material, before

it is placed within a flushing or other kind of cistern. Every time a flush is made the receiver will be discharged to the level of its siphon outlet.

20,723.—BOLTS FOR DOORS, &c.: W. Doyle.—The bolt and then towards parallel to the bolt again so as to have a turned-up end at its end, the bolt will both slide and turn in a casing and will engage with a keeper, as well as in an additional keeper when it is turned upwards. The door is to be partly opened by drawing the bolt backwards as far as its turned-up end will allow, whilst the arm slides upwards inside of the keeper.

20,759.—TREATMENT OF SEWAGE: T. F. Barnard.—After the sewage has been caused to pass through a series of filter beds containing carbon in various forms it is directed to a filter bed of lime, and thence through settling-tanks to another range of filtering beds containing sand, and carbon consisting of coal slack, coke, or coke breeze, and charcoal, which, after it has been mixed with the separated solids and with coal tar, will serve for fuel.

20,796.—AN APPLIANCE FOR SLIDING SHUTTERS AND SHAKES: G. Barnes.—Spiral balancing springs are wound up, when the shashes are lowered, by means of twisted square rods or screws that operate as archimedean twist-drills, and are worked by nuts secured to the washers. The upper square end of each rod engages in a squared socket of the spring axle, and its lower end travels in a detachable split guide or bearing, the spring is prevented from running down at the withdrawal of the rod and bearing plates by means of a ratchet and pawl upon the spring axle. Portions of the frame are binged in order that they may turn the shashes inwards upon the rods, and the catch can be held in any position desired through the engagement of a cranked swivelling fork or catch with one of the square rods.

20,803.—ENERGY METERS (ELECTRICAL): Elith Thomson.—For alternating currents the induction motor meter is composed of stationary main current and pressure coils that produce separate magnetical fields, wherein two armatures are geared to one spindle and rotate together. Each of the interconnected armatures consists of a core, around which are coils, each of which upon one armature is permanently connected in a closed circuit with a coil upon the other. Each pair of interconnected coils may lie in one plane, one set of field coils being put at a suitable angle with the other, or if all the field coils are parallel to one another, the coils upon one armature are displaced about the spindle extending from the connected coils upon the other armature. If each armature carries two coils, the displacement amounts to 45 deg., and to 60 deg. if each armature carries three coils.

MEETINGS.

FRIDAY, FEBRUARY 15.

Architectural Association.—Mr. E. S. Prior on "Gothic Architecture and the Basis of its Beauty," 7.30 p.m. Royal Institution.—Professor J. J. Thomson M.A., on "The Existence of Bodies Smaller than Atoms," 9 p.m. Institution of Mechanical Engineers.—Mr. J. Ashford on "Light Lathes and Screw Machines," 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law," III., 7 p.m. Architectural Association of Ireland (Technical Demonstrations).—Mr. J. E. Barry on "Glass Manufacture," 4.30 p.m. (at 1, Upper Camden-street).

SATURDAY, FEBRUARY 16.

Architectural Association.—First spring visit to the Roman Catholic Cathedral and Cardinal's House, Ashley Gardens, Victoria-street, Westminster, by permission of the architect, Mr. J. F. Bentley.

MONDAY, FEBRUARY 18.

Royal Institute of British Architects (Business and Ordinary).—(1) To read the address presented by the Council to His Majesty the King on behalf of the Royal Institute. (2) To make an announcement concerning the Royal Gold Medal for the year. (3) Election of candidates for membership. (4) Mr. G. T. Hine on "Asylums and Asylum Planning," 8 p.m.

London Institution.—Mr. Arnold Mitchell on "Medical Sanitary Illustrations," 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Duties of a Sanitary Inspector," Outdoor, 8 p.m.

Local and Technical Architectural Society.—Mr. H. C. Corlette on "The Planning and Design of Churches," 6.30 p.m.

Liverpool Architectural Society.—To consider further the draft memorandum and Articles of Association in connexion with the proposed incorporation of the Society, 6 p.m.

TUESDAY, FEBRUARY 19.

Institution of Civil Engineers.—Paper to be discussed: "The Nightingale Mountain Railway," by Mr. W. J. Weightman, 8 p.m.

Royal Institution.—Professor J. A. Ewing, M.A. F.R.S., on "Practical Mechanics (experimentally treated): First Principles and Modern Illustrations," VI., 3 p.m. Architectural Association of Ireland.—Mr. G. Coffey on "Optical Refractions in Classic and Medieval Architecture," Lantern Views, 7.45 p.m.

WEDNESDAY, FEBRUARY 20.

British Architectural Association.—Mr. W. Ferguson Irvine on "Some Old Halls in Wiltshire," With illuminated illustrations, 8 p.m.

Builders Foremen and Clerks of Works Institution.—Ordinary meeting of the members, 8 p.m. Institution of Junior Engineers.—Mr. A. H. Parker, B.A., on "Works Management," II., 8 p.m.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers).—(4) Inspection in the district of St. George's, Hanover-square, 2 p.m. (5) Dr. J. Priestley, M.D., on "Duties of a Sanitary Inspector: Indoor," 8 p.m.

THURSDAY, FEBRUARY 21.

Carpenters' Hall, London Wall (Free lectures on matters connected with building).—Mr. H. Heathcote Statton on "Architecture at the Paris Exhibition," 8 p.m. Institution of Electrical Engineers.—(Meeting at Institution of Civil Engineers).—If the discussion on Mr. Morley's paper is closed, the following paper will be read: "The Electrical Power Bill of 1900: Before and After," by Mr. W. L. Madgen.

FRIDAY, FEBRUARY 22.

Royal Institution.—Sir W. Roberts-Austen on "Metals as Fuel," 9 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. J. L. Crillon on "Automatic Coupling," 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Duties of a Sanitary Inspector: Offensive Trades and Trade Nuisances," 8 p.m. Glasgow Architectural Craftsmen's Society.—Mr. J. G. Dunn on "The Practice of Chimney Building and Boiler Setting," 8 p.m.

SATURDAY, FEBRUARY 23.

Builders Foremen and Clerks of Works Institution.—Annual dinner, King's Hall, Holborn Restaurant, 6 p.m. Edinburgh Architectural Association.—Visit to Brunnsfild House and St. Oswald's Church. Royal Institution.—Right Hon. Lord Rayleigh, M.A. on "Sound and Vibration," I., 3 p.m. Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Friern Barnet Sewage Works, 3 p.m. Dundee Institute of Architecture.—Visit to General Accident Assurance Buildings, Perth. Institution of Junior Engineers.—Visit the Willesden Station of the Metropolitan Electric Supply Company, 2.30 p.m.

SOME RECENT SALES OF PROPERTY:

Table with columns for date, location, and price. Includes entries for February 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31.

The Unhappy Antiquities of Palestine.

Now, unhappily, these most interesting cities (like an unburied Pompeii) exist no more. The latest accounts from various travellers give the same sad result. Gerasa is occupied by a band of colonists from Bosnia (Mohammedans dissatisfied with an Austrian administration), and they are pulling down the Roman ruins wholesale, and the columns of the famous "street of columns" are being removed, to some extent, for the purpose of replacing the injured columns of the great Mosque of Damascus. The Roman masonry is otherwise being broken up to serve for garden walls and ordinary mud-hut architecture. The marvellously-preserved carving, which has survived fifteen centuries of Byzantine and Arab carelessness, is now being hacked off the squared stones in order to fit them for insertion in a Turkish "Khan" or "hareem" wall. In Ammán the destruction of the classic city is even more complete; very few of the public buildings now remain, and the columns of the "street" are being thrown down for the purpose of breaking up into small pieces for enclosure walls. The "Circassians" as these colonists call themselves, act in a methodical manner, and they are gradually eating through the city. They employ the curious carts of Turkish peasants, with the solid wheels, for transporting the broken up remains. The famous theatre of Ammán is now quite gone; the temples, in fact, the city, as a monument of the early centuries has completely disappeared, and the very few tourists who visited it during the past few years were privileged in seeing an extraordinarily preserved Classic town, which has since been swept away.

Nothing can now be done to preserve Ammán and Gerasa, but their fate suggests what threatens nearly all the most famous monumental remains in Turkey. Can anything be done to arrest the Turkish Destroying Angel (or perhaps we may say culture). The Turk has discovered that there is something to be made out of an increased population, and so he invites his co-religionists from the Balkans, the Caucasus, or Algeria—where they "suffer" the "persecution" associated with a Christian domination; and the deserted districts of Syria or Asia Minor, which teem with the monumental remains of past civilisations, afford an excellent squatting ground for

these comparative savages. The promoters and prospectors of these colonies naturally seize on such sites as have the original advantage of good water, an air of former cultivation, and a ready-made quarry of old building stone. In this way we may conclude that, within a measurable time, all the most famous ancient sites will be converted into the more or less permanent settlements of the "Circassians," as these colonists are termed, whether they come from Algeria or Herzegovina. To the archaeologist and historical student such a state of things is sufficiently deplorable, but what can be done? The case seems hopeless; still, an international protest might perhaps be set on foot to induce the Constantinople authorities to use some discretion in encouraging the wholesale destruction of the monuments of the different countries constituting the Ottoman Empire. The English archaeological societies should surely not find such an enterprise outside the scope of their institution, and the Russian Imperial Archaeological Institute would doubtless cooperate.

Much still remains in these countries to preserve and protect. Palmyra will be threatened before long; it possesses abundant water and heaps of old masonry suitable for building Circassian "houses." Surely it is worth while trying to preserve such a place.

The beginning of a transformation is taking place in Turkey. Bolstered up by the flattery and "moral support" of the European Powers, the warlike savagery of the race tamed by so many years of peace, and by the introduction of railways, telegraphs, and the general machinery of civilisation, the modern Turks are displaying the first gleams of an intelligent desire to develop the resources of their country for their own benefit. Within the last year or two the Sultan has inaugurated this new system by laying claim to the whole valley of the Jordan and the whole of the Dead Sea as his personal property. Title-deeds, or "cushans," are being rigorously inquired into on all hands, and the Mohammedan legal profession is in a fair way to become as important as the military system of former days. All the mineral riches of Palestine and Syria are now being jealously guarded as soon as discovered; and foreign enterprise, which is

these comparative savages. The promoters and prospectors of these colonies naturally seize on such sites as have the original advantage of good water, an air of former cultivation, and a ready-made quarry of old building stone. In this way we may conclude that, within a measurable time, all the most famous ancient sites will be converted into the more or less permanent settlements of the "Circassians," as these colonists are termed, whether they come from Algeria or Herzegovina. To the archaeologist and historical student such a state of things is sufficiently deplorable, but what can be done? The case seems hopeless; still, an international protest might perhaps be set on foot to induce the Constantinople authorities to use some discretion in encouraging the wholesale destruction of the monuments of the different countries constituting the Ottoman Empire. The English archaeological societies should surely not find such an enterprise outside the scope of their institution, and the Russian Imperial Archaeological Institute would doubtless cooperate.

Much still remains in these countries to preserve and protect. Palmyra will be threatened before long; it possesses abundant water and heaps of old masonry suitable for building Circassian "houses." Surely it is worth while trying to preserve such a place.

The beginning of a transformation is taking place in Turkey. Bolstered up by the flattery and "moral support" of the European Powers, the warlike savagery of the race tamed by so many years of peace, and by the introduction of railways, telegraphs, and the general machinery of civilisation, the modern Turks are displaying the first gleams of an intelligent desire to develop the resources of their country for their own benefit. Within the last year or two the Sultan has inaugurated this new system by laying claim to the whole valley of the Jordan and the whole of the Dead Sea as his personal property. Title-deeds, or "cushans," are being rigorously inquired into on all hands, and the Mohammedan legal profession is in a fair way to become as important as the military system of former days. All the mineral riches of Palestine and Syria are now being jealously guarded as soon as discovered; and foreign enterprise, which is

continually being offered for the development of these riches, is viewed with the utmost hostility. The English railway started to run from Haifa to Damascus some eight years ago has been nipped in the bud; and as part of this new system of setting the Mohammedan house in order, an influx of colonists is being encouraged from those fringes of the European world where Mohammedanism is recoiling from the distasteful manners and customs, and modern ideas, of civilisation. Every steamer to Beyrout brings whole families of Algerines, Tunisians, or Albanians, and these people find their way into the *hinterland* and serve to swell the forces of Mohammedan obstructiveness against Western enterprise and influence. From any point of view except that of archaeology such a state of things would be merely curious, but as it involves the destruction of some of the most interesting historical monuments ever erected, the disaster must be considered [the greatest of the kind the world has seen, more especially considering that at the present day it ought to be so completely prevented.

The first suggestion for this new Turkish system of colonisation probably originated in the days when the English sentiment for "restoring" the Jews to Palestine was at its height in the seventies and eighties. Even then the Turks, who looked upon the Jews as very unwelcome strangers, began to consider the advisability of meeting this unavoidable difficulty by the usual oriental expedient of pitting one race against another, and so wherever the Jews were settled by foreign influence the Turks have started a "Circassian" colony. Caesarea on the coast was one of the first to be founded, and the Roman ruins and the interesting remains of the crusading kingdom have been broken up to build the squalid "Circassian" huts with thatched roofs, and the rough walls of straggling gardens. And this is the last fate of the vestiges of that classic civilisation which has been the theme of study and "renaissance" all through the centuries of the immediate past. How little Volney, De Vogue, or Renan, thought the interesting ruins they were so instrumental in recovering for European study would, within a comparatively few years, be sacrificed to the sordid greed and interests of a barbarous Turkish colonisation.

USE OF SLATE IN NORTH-EAST CORNWALL.

THROUGHOUT Cornwall slate is in commoner use than in any other part of the United Kingdom. Particularly is this the case in the north-east part of the county, owing to the great pits of the old Delabole slate quarries, in the parish of St. Teath, which are still in active operation. St. Teath is bounded on the north by Tintagel, on the east by Lanteglos and Michaelstow, on the south by St. Tudy and St. Kew, and, on the west by Endellion and the sea. These quarries are of considerable antiquity; they were of much repute in the days of Queen Elizabeth. Carew, writing about 1600, says:—"Delabole slate is in substance thinn, in colour faire, in weight light, in lastinge stronge, and generally carrieth to good regard, as (besides the supply for home provision) great store is

yerely conveyed by shipping, both to other parts of the Realme, and also beyond the seas into Britaine and Netherland." Borlase gives the Delabole slate a very good character. In his "Natural History of Cornwall," published in 1758, it is stated that "the stone of this quarry is not subject to rot or decay, to imbibe water, or split with falling; but for its lightness and enduring weather, is generally preferred to any slate in Great Britain." Nor is this too high praise, considering that much of the ornamentation and lettering [of the Delabole slate used for memorials is as fresh and delicate in its cutting as it was when it left the mason's yard in the days of Elizabeth or James I.

The slate of these quarries has somewhat deteriorated of late years in texture and lamination, but it still retains its special qualities of lightness and durability. Notwithstanding the great depth at which the quarries are now worked and the amount of debris required to be removed, the use of improved machinery and the nearness of the new line of railway have so developed the industry, that about 150 tons of material are raised daily to the surface. In addition to considerable land sales for local use, the railway conveys about 1,000 tons per month of dressed slates for shipment at Wadebridge or Padstow. These are of every size, from the great slabs for cisterns down to the smallest of roofing slates. From the North Cornwall coast they are conveyed not only to the great English ports, but to almost every part of Europe.

The processes of quarrying and preparing the slates are ingenious, and much more interesting to the intelligent visitor than those of the great Welsh quarries. It is not, however, our intention to offer any descriptive comments on these processes, or on the simpler and more antique methods by which they were preceded, but rather to notice briefly the chief purposes for which these slates are, or have been, used in that part of Cornwall.

One of the least picturesque uses to which the larger spoil of the quarries is put—and has been for many a long year—is the construction of rude but fairly effective fences. In the immediate vicinity of Delabole, and for some few miles round, slabs of rough slate of various sizes and heights, some square and some pointed at the tops, are driven into the ground close to each other, and form a durable fence between fields or round gardens and yards, so long as they remain upright. In the dusk, when tramping some moorland road or track, these fences, suddenly encountered, have rather a ghost-suggestive effect, as the traveller seems to be continuously approaching a succession of graveyards.

The same scarcity of wood and the lack of brickmaking clay throughout this district, which induced the inhabitants to use slate for fences, has also caused them to use still larger slabs for the walls of pigstyes, hovels, and a variety of farm outhouses, including even some of the humbler and older cottages. We have several times measured slabs used for such purposes, and have found some of the largest 7 or even 8 ft. high by 4 ft. wide. The kitchens and back premises of the older houses, as well as the cottages and their approaches, are usually paved with slate slabs. The older examples, through constant foot friction, attain such a bright

and polished surface that they might almost be taken for a deep blue marble. This is especially the case with church paviers, though absolutely in this land of slate not a few of the church "restorers" have of late ejected these time-worn slabs, so beautiful and restful to the eye, in order to replace them with the cheapest kind of encaustic tiling! The smallest size slate that is ever cut is 6 in. by 3 in.; these are occasionally used for paving church porches or church towers, or other places where there is much traffic. They are pitched on their edges in squares of 6 inches, arranged alternately in different directions. This was a very old use in the North Cornwall churches, but has of late for the most part disappeared; it can still be seen in the churches of St. Minver and Lancaust.

It might be thought by the unobservant that there could be little or no difference in the application of slates for roofing purposes; but the fact is that there is no greater contrast in Cornish building than the ancient and modern roofings of the slate districts. Some of the old manor-houses, once so numerous in St. Teath and the adjacent parishes, where the manors were mostly of small extent, still possess in whole or in part sixteenth and seventeenth century slated roofs—such as Pengenna, Polrode, Penrose, Trehame, and the back part of Trehannick. The same may be noticed with some of the old mills and cottages. There was then no elaborate machinery for the splitting and shaping of the slates; they were somewhat thicker and varied much in size; the smaller ones, that predominated, measuring from 6 in. to 8 in. or 10 in. in length. As a rule, the old slaters used larger and larger slates as they neared the eaves, some of them as much as 3 ft. in length at the extreme margin. These old slated roofs, in their pleasing irregularity and with their occasional depressions, are charming in outline, and the whole often assumes a silvery greyness of tone most soothing to the artistic eye. In the Cornish church restorations of the last half century, many of which (especially those undertaken in the "sixties") were grievously vulgar in character, it seems to have been the invariable rule to choose for the new roofs the thinnest and glossiest of slates, all of precisely the same size, and geometrically arranged in exactly parallel lines. The effect is disastrous, and often imparts a look of smugness to these interesting churches so largely rebuilt in the fifteenth century, the contrast of the sleek purple slates and smooth red ridge tiles with the granite walls and tracery being so excessive. Nowhere within a circuit of many miles round Delabole is there a single old church roof left, save at the little unrestored church of Tremayne. Nor is there the least excuse to be found for this wholesale construction of brand new slating under the plea that the House of God must be safely ceiled from the weather, for, within the self-same circuit, many a roof of picturesque beauty can still be noted over manor-house farmstead, or cottage that was probably slated in the time of Elizabeth or in early Jacobean days. Even if it was proved, in certain cases, that an old church must have new slates, a slight increase in the expense would have procured rougher and thicker slates, and would have allowed for the sizes to be graded. Possibly some few old

churches or other old buildings remain in
ornamental wall that may ere long be crying for
new roofs, when, if they are really required,
architects might surely strive to get rid of
the glossy meagreness that is the charac-
teristic of most of the new slating.

It is pleasant to notice an old use of
slates in connexion with Cornish churches
survived in some of the more successful
restorations, such as that of St. Tudy, where
slates with scolloped or vandyked edges are
used under the gable ends as protections for
the woodwork, the effect being somewhat the
same as that of the ornamental bargeboards
of half-timbered and other dwellings.
The ruthlessly restored churches of
St. Andrew, Minster, and Forraburg had
mainly of slates thus treated, a few having
ornamental perforations mostly of cruci-
form pattern. We noticed one or two of
this character in new work at the exposed
church of Advent.

A nice use for slate slabs, when so easily
and cheaply procurable, which seems to be
a comparatively modern invention, is to
face them over the outer doorways of
cottages or other dwellings at a considerable
angle, supported by simple iron brackets.
These slabs, 2 ft. to 4 ft. in width and of a
length that corresponds with the breadth of
the doorway, form a good break in the wall-
plane, and afford a useful degree of shelter
from rain or sun.

But the most interesting, if not the most
serviceable use to which the great slates of
Delabole have been put for many and many
generations is in the formation of memorials
to the departed. The graveyards for miles
around are full of upstanding slate head-
stones, hardly 1 per cent. being of any other
material. Those whose tastes lie in the
direction of copying old epitaphs with their
own rhymes will find abundant occupa-
tion in this district. Down to the present
day, the Cornish folk love to have in-
scribed over the grave of relative or
friend a verse of a hymn, or some
well-worn or original doggerel in rhyme.
In many a parish in the shires the
verse of the incumbent is that naught save
a verse from the Scriptures is to form the
comment on a headstone or other memorial,
and the ruling is meekly accepted. But who
could the Cornish parson who attempted to
carry out any such regulation! The
durability of the Delabole slate is strikingly
emphatically exemplified by these churchyard headstones.
Seventeenth century epitaphs can frequently
be found, and occasionally sixteenth, with
lettering almost as legible as the day it was
cut.

When slate began to be used for memo-
rials within churches it is not possible
now to say. The only one of pre-Reforma-
tion date that we have noticed in this
district is the stone to John Boskarrock in
the church of Endellion. The slab, which
is now placed against the east wall of the
north aisle, has a cross with a floriated head
spanning the whole length. The marginal
inscription in Latin to this gentleman of one
of the most ancient of Cornish families, is
intended to record his death, 1537, concluding
with the pious aspiration: "Cujus amine
proficietur Deus. Amen." In the days of
Elizabeth, when high-sounding and often
bombastic and presumptuous epitaphs be-
came the fashion, slate lent itself readily to
the custom, and was commonly used by the
wealthy families of this neighbourhood not

only for epitaphs and highly ornamental
Renaissance borderings and ornaments, but
also for heraldic display and for effigies
in high relief. The treatment of the effigies
is noteworthy, and the slate in the best
examples yields itself admirably for the por-
trayal of features and of details of dress and
ornament. The best of this kind of work
that we have noticed are three dateless and
nameless ladies in the north aisle of the
church of St. Tudy, and two Nichol monu-
ments at the west end of the south aisle of
the same church, *temp.* Elizabeth and James
I.: Honor, wife of John Webber, and her
three children in the church of St. Kew;
Christopher Rogers and wife, and Lewis
Adams (vicar) and wife in St. Breward
Church, both erected in 1609; and the
Bennet effigies in St. Teath Church, 1636.
For a quaintly debased style of incised
slate effigy, the slab to the memory
of Jane Meredith, 1662, in the church
of Michaelstow should be noted.

These have all been originally table tombs,
but at times of re-pewing or "restoration"
have been dismantled and portions placed
against the walls. The Rogers tomb, how-
ever, in St. Breward Church is still erect.
There is good heraldry, with mantling, and
ornamental borders to the Kestell family,
1581, in the church of Eglosayle, banished
under the tower as though discreditable
during the restoration; at Trevalyn, to a
Roscarrow, 1646; at Padstow, to the
Prideaux family; and in connexion with
the above-named effigies. The great mural
monument to the Trederick family, 1578, in
the church of St. Broock, is the most ambi-
tious effort in slate that we have noticed.

"Restorations" are also responsible for
ejecting a variety of slate memorial slabs
and stones and breaking up or losing others
out of the churches. The worst instance of
this is the beautifully situated church of
Lanteglos, where, to make room for a poor
set of coloured tiles, already in bad repair
and slovenly condition, slates with inscrip-
tions of much interest, and of dates varying
from 1585 to 1652, were turned out, and now
lean against the outer walls of the church,
where they are overgrown with ivy, weeds,
and rank grass. At St. Teath there are
several Elizabethan inscribed slates against
the outer east wall of the church, and one to
John Brod, gentleman, 1577, near the porch
at Michaelstow. These ejected memorials
ought to be replaced under cover for pre-
servation. However durable Delabole slate
may be, these particular stones were not
chosen for exposure.

An early use of slate for a well-defined
ecclesiastical purpose is to be noted in the
north chancel chapel of the church of St.
Marcelliana at Tintagel, where there is an
altar of solid masonry, the *mensa* of which,
with its five consecration crosses, is of slate.
This, however, was not the usual material
for Cornish altar stones. The altar stone of
the chapel of St. Julitta on the castle rock
at Tintagel is of granite, and there is a
similar stone for the altar in the south aisle
of the church of St. Breward. A later
church use for slate was for the tables of the
Ten Commandments. At the west end of
the south aisle of the church of St. Tudy
are slate tablets inscribed with the Command-
ments; they are well lettered and have
good head and tail strips of ornament.
They are of some age, and it seems a pity
that they were displaced at the church's

restoration. The Commandments on slate
are also to be found in the church of
Michaelstow; in that instance they are
relegated to the north aisle.

It only remains to state, after the briefest
fashion, some of the uses to which the
Delabole slate is now put which have
not been previously noted. It is made into
cisterns (as large as 2,000 gallons), corn-
chests, pig-troughs, mangers, pump-troughs,
baths, setting-troughs, milk-coolers, chimney-
tops, mantelpieces, window-sills, lintels,
quoins, caps for mow-steads, butter-stones,
and garden-edging. The larger and coarser
refuse is also much used for general building
purposes. The one purpose for which
Delabole slate seems quite unfitted is the
framed slate for school purposes. The
ordinary slate pencil hardly makes any im-
pression on a Delabole slate.

NOTES.

IT appears from the local
papers that the special com-
mittee appointed to consider
the question of a site for a cathedral at
Liverpool have rejected the idea of erecting
one on the site of St. Peter's Church (the
present pro-cathedral). We think they are
right, both because the site, in an archi-
tectural sense, is too confined, and
because it would involve the destruction
of St. Peter's Church, which, though ugly
enough, has a historical interest as one of
the older churches of Liverpool. The other
two sites talked of are that of St. Luke's
Church, and that in Monument-place,
London-road. The St. Luke's site is open
to the same kind of objections as the St.
Peter's site. In an architectural sense it is
a side position, with no street leading up to
it which could centrally face the proposed
cathedral; and St. Luke's is one of the most
important of the early Gothic revival churches,
and for the date of its erection is not with-
out merit, besides being also a kind of
historical monument of that phase of nine-
teenth century English architecture, and it
would be a pity to destroy it. What is called
the Monument site is a wide space just below
a point where two streets diverge; it is rather
narrow, but in other respects it is an archi-
tecturally advantageous site; the west front
of the cathedral would face a tolerably wide
road leading centrally up to it, and would
(if we remember right) be seen from St.
George's Hall. In an architectural sense it
is the best site that has been recently
proposed.

It is clear that in the approach-
ing County Council Election
each side intends to make the
housing question one of importance. This
is as it should be. At the same time, from a
practical point of view, it is desirable that
each side should go into detail on this matter.
In what way do they differ? The Progressives
point to the past, the Conservatives to a
future, in which, if they are given a major-
ity, they will do more than their opponents.
But in what way do they intend to do
better? Last week we gave a *résumé*
of the housing work in London for the
last half century. It is useless to deal
in generalities. What the voter desires to
know is in what way the policies of the two
opposing sides differ. These divisions in
two parties are in many ways absurd.
The need of the electors is the choice of

Cathedral
Question.

The
Housing
Question.

capable men who will attend to [municipal business. Attempts to sketch rival policies on broad outlines can have no practical result, since the question of housing is essentially one of details. It is so important, that we hope the various candidates will enlighten the electors on their views on the various points which arise on this question.

On the invitation of the London County Council we had an opportunity last week of inspecting a model conduit system of electric traction which has been set up at Camberwell. We were disappointed to find that the electric car exhibited was running on the Westinghouse track, and was the one recently exhibited at the Agricultural Hall. There was shown, however, a model of the conduit system which the County Council propose to adopt on several of their tramways. We studied this with great interest, as it is Dr. Kennedy's solution of the most important question of electric traction for London. Midway between the ordinary rails there is a third rail, which has a narrow slot—only $\frac{3}{4}$ in. wide—down its centre. This slot leads into a concrete conduit, the bottom of which is about 1 ft. 9 in. below the top of the slot rail. The live conductors will be two steel rails, one on each side of the conduit, and supported every 15 ft. on insulators. The current will be collected from the conductors, and transmitted to the motors on the car by rubbing contacts on a plough carried by the car and passing down through the slot. This is nothing very novel, but the problem is not one that calls for startling inventive ability so much as for skilful mechanical engineering and attention to details of drainage, the prevention of leakage from the conductors, and the cleaning out of mud and refuse. Judged from this point of view, we regard it as a successful solution. Of course it would have been better to have had a larger and deeper conduit, but this would have enormously increased the expense, owing to the network of pipes, &c., under the streets. It is intended that the whole of the Council's tramways south of the Thames shall be supplied with electrical energy generated at the Camberwell station and distributed from numerous sub-stations. The first part of the Council's tramways will be reconstructed and worked by electricity in about eighteen months' time.

A CURIOUS and important decision has just been delivered, in the case of *Hull v. The London County Council*, by a Divisional Court of the King's Bench Division, on Section 73, Sub-Section 3, of the London Building Act. The question was whether an advertising sign came within the words of that sub-section, and if so, the permission of the County Council for its erection should have been obtained. The words of the sub-section are "except in so far as is permitted by this section in the case of shop fronts and projecting windows, and with the exception of water pipes and their appurtenances, copings, string courses, coruices, facias, window-dressings, and other like architectural decorations, no projection from any building shall extend beyond the general line of buildings in any street, except with the

The London Building Act, Advertising Signs.

permission of the Council." The Court came to the conclusion that a sign of this kind—a case attached to the wall by iron brackets—was not within the words of the section, for the intention of the Legislature was to prevent projections of an architectural kind—such things, in fact, as formed part of the building. This decision, therefore, is one on the principle of construction to be adopted in construing this portion of the Act. Moreover, as the Court pointed out, the Council is empowered by Section 164 of the Building Act to make by-laws for, among other things, the regulation of signs and structures overhanging the public way. It is clear, therefore, that regulations can be made to prevent advertising signs from being detrimental in any way to the public interest.

THE paper read to the Institution of Electrical Engineers this week by Mr. W. L. Madgen on "The Electrical Power Bills of 1900: Before and After," was a strong plea in favour of improved legislation in connexion with electrical matters. He pointed out that the general supply of electrical energy for industrial and domestic purposes is practically governed by the Act of 1882. Now, when this Act was framed, it was thought that a mile from the central station was about the outside limit to which electrical energy could be economically supplied. The Act contemplated that the Local Authority would become the ultimate owner of the local undertaking, and hence the restrictions as to the period and the terms of the purchase, the clauses as to consent, &c., which heavily handicap private enterprise. A Joint Committee of the two Houses reported in 1898 that in their opinion when it was for the public advantage that electrical energy should be supplied over wide areas, including the districts of numerous Local Authorities, then the provisions of the Electric Lighting Acts, which require the consent of the Local Authority, should be amended. During the last two or three years nothing whatever has been done to carry out this recommendation, and Mr. Madgen alleges that the misuse by the Local Authorities of the powers conferred on them by the Acts is notorious. However, four power Bills were passed last Session, and the main power station of the "County of Durham" company will be available in a few months for a comprehensive system of supply. Some very hard things were said about the Tramways Act of 1870 and its provisions in rigidly limiting the term of the concession to twenty-one years, and practically fixing the price at which the municipality may take it over at something considerably below its value. In conclusion, Mr. Madgen asked the Council to appoint a committee to consider what steps should be taken to remove the legal restrictions which have hampered the progress of the industry. The paper presents the case for private enterprise very strongly, but it would perhaps have more weight if it recognised the excellent pioneer work done by many municipalities, and the disastrous consequences that sometimes follow when private companies make haste to get dividends.

The Baptist Union Corporation.

MR. ARTHUR KEEN has prepared plans and designs for new buildings to be erected, at a cost of about 34,000*l.*, as headquarters of

the Baptist Union upon a site in the new street from High Holborn to the Strand. The new Baptist Church House will take the place of the Baptist Chapel in Kingsgate-street, High Holborn, which was established there in 1735, and is marked for demolition in the course of the projected improvements in that quarter.

Decorative Art of Primitive Peoples.

In a lecture at the London Institution on Thursday, February 14, Professor A. C. Haddon dealt with the decorative art of primitive peoples. The lecture was confined to a brief outline of the subject, and to some of its detailed developments, well illustrated by a number of photographic lantern slides. The Professor made it very clear what an important part decoration assumes in ethnology; how universal was the expression of powerful emotions, religious, warlike, and superstitious, by means of natural forms, developing ultimately into symbols widely differing in form with each race, and influenced by the local circumstances of materials and manners. These primitive arts are valuable not only for their historic significance, their quaintness of form and of invention, but also for the philosophy and reasonableness of the system adopted, of which much modern decoration is entirely innocent. The closing years of the nineteenth century saw certain changes in the value of decorative art, a tendency to study the subject more seriously, and to draw attention to its influence on character; but popular decoration is still too uncertain a quantity to be representative among other attainments of the present age. An obstacle to advance in the arts is the tendency to specialisation; the sharp distinction that is drawn between the useful and the ornamental is characteristic of the age; the average person possesses a positive knowledge of the former and a negative knowledge of the latter. The artistic and scientific inquirer have much to learn from each other before good decoration will be recognised and welcomed as a useful and necessary art.

MR. HENRY ROSE writes to us from Chard:—"I enclose a sketch of a variation of the Norfolk latch, which is quite new to me. I do not think that you will deny it the publicity of a place in your columns. It would have delighted the soul of Viollet-le-Duc; he would have made a diagram showing how it was cut out of a single sheet, and had a ring welded on at each end of the hollow handle. It occurs on the external door of a

STUDY OF AN INDIAN HOUSE

as disappeared already; meanwhile, it is covered in with corrugated iron, perhaps more in character with the lath. Little isolated districts of three or four cottages have names about here, the one in question is Paintmoor. As to the date of the lath, I know nothing—probably last century."

The small sketches in water-colour by Mr. Wilfrid Ball, of scenes in Cornwall, Devon, and Somerset, now on view at the Fine Art Society's Gallery, form a charming collection of landscape studies of great truth and delicacy. Many of them are coast scenes,—an expanse of sand with the sea beyond, a kind of subject in which the author is specially happy. Among the best of these are "Whitesand Bay" (2); two sketches at St. Columb's Porth (12 and 17); "Calm after Rain, Sennen" (21); "Clear and fresh, near Port Isaac" (25), a dark sea behind a flashing white breaker; and "Sea Pools, near Sennen Cove" (40). Some of the inland subjects are also admirable studies of tone and atmospheric effect; "Colyton" (33) is a beautiful miniature landscape study; and "Short Cut by the Cliffs, Berry Head" (47); "South Devon farmstead" (58); and "A Spring Day" (65). Mr. Lee Hankey's collection of drawings at the same gallery we are not very much taken with; the style is too woolly and the colour in many of them not agreeable or (to our thinking) natural. "The Empty Basket" (30) is a well composed little picture of artistic quality; "The Kindling Dawn" (19) is a good landscape study. But we were not able to feel very much interested in the collection as a whole.

A Mission Church Competition. An architect sends us a characteristic circular which has been sent round among the architects of the district in regard to a proposed new mission church for Melton Constable. The building committee invite designs and estimates "to be submitted or their approval. "While economy must be strictly studied, the committee do not bind themselves to accept the lowest estimate or any of the plans submitted." The document proceeds to point out that sketch-plans will suffice in the first instance, "but they must be sufficiently detailed to give a fair idea of the general design and construction, and should include four principal elevations, one longitudinal and two transverse sections, and ground plan." No premiums are offered, and all this is to be done on the chance that the committee will deign to make use of one of the designs!

PLAISTOW PUBLIC BATHS.—Public baths have been erected by the West Ham Corporation in Balaam-street, Plaistow. The baths have been built by Messrs. Spencer, Santo, & Co., from plans prepared by the architect, Mr. Saxon Snell. Mr. Gardner was the clerk of works. The exterior is of Portland stone relieved by red bricks. From the entrance hall branch off to the right and left the swimming baths. On the left is the first-class swimming bath, some 150 ft. long, round which runs a gallery with a balustrade in front. On the right-hand side of the entrance is the second-class swimming bath. This is 60 ft. long and 27 ft. broad, and the depth ranges from 4 ft. to 7 ft. There are sixty-two dressing-boxes to the first bath and fifty-two to the second. In between the two are the slipper baths, some twelve in number, while at the rear is the establishment laundry, close by the engine and boiler houses. Going up from the sides of the entrance hall are two stone staircases, the one leading to the ladies' first and second class private baths, ten in number, and the other leading to the gentlemen's baths, which are rather more numerous.

WHITCHURCH ASYLUM COMPETITION.

The drawings of the five selected designs in the final stage of the competition for the Cardiff Asylum at Whitchurch, Glamorgan-shire, were on view in the Council Chamber of the Town Hall, Cardiff, last week. The site is conveniently situated a few miles north of Cardiff and Llandŷn, in pretty country, bounded by the Merthyr-road on the east, the Glamorgan canal on the west, and the new Cardiff railway to the north. The institution is proposed to accommodate 1,250 patients, of whom only 800 are to be provided in the first instance, but the plans show the complete scheme. The distribution of the several classes was left to the discretion of the competitors, who were furnished with copies of the instructions, and suggestions issued by the Lunacy Commissioners, as the basis of the arrangements. Mr. G. T. Hine, who acted as the assessor, in advising the Corporation in both competitions, reported that No. 56, the design of Messrs. G. H. Outley and W. S. Skinner, of Bristol, was the best and more closely followed the instructions than any other. In this selection we fully concur. The plan is an able exposition of the requirements of such an important undertaking, and is evidence of much skill, without doubt the product of matured experience.

The lay-out is naturally based upon the imperative considerations of aspect, allocation of classes, administrative supervision, and easy extension. The skeleton of the plan is formed by the main arterial corridors, which would almost make an equilateral triangle, wide at the top and cut off before reaching the bottom. This is intersected by the only horizontal corridor which runs across the plan, with the kitchen as a centre; the other corridors intersect at obtuse angles, the two lower ones being curves, all of which connect the several blocks. The principal entrance is at the top of the vertical axis, while the assistant medical officers' quarters, a detached building, is at the bottom. Commencing at this latter point and ascending, the arrangement of the heart of the triangle may be thus described.

The assistant medical officers' quarters are connected by a long passage to the main building front, which is occupied by the matron's quarters, dispensary, pathological-room, &c. Areas supervene between this and room, &c. Areas supervene between this and the recreation hall, which is also used for dining purposes. This is a large apartment, 100 ft. by 50 ft., and is provided with a stage and dressing-rooms, this is placed longitudinally upon the plan; a hall scullery with large areas on either side part it from the kitchen, which has convenient serving lobbies at either end, and provides messroom, cooks' room, and other offices. At this point is reached the corridor before referred to, which bisects the plan horizontally.

Above this, parted by the large kitchen-court, is the steward's department, which is spaciouly arranged with gallery over, both this and the kitchen-court have suitable cart access. A corridor lighted on one side, having on the other bakery, cooling-room, and other offices connected with the steward, leads to the official block, which is at the top of the plan, having servants' quarters over. Behind the official block to the left are the laundries, with ample drying-grounds, the boiler-houses, machinery, and yards. On either side of the recreation-hall and kitchen are vertical corridors off which on the left in convenient proximity are the attendants' mess-rooms below, and the servants' mess-rooms above; while on the corresponding side to the right are the provision stores placed on the kitchen court side. We have thus outlined the arrangement of the interior or administrative part, around which are grouped the blocks occupied by the patients in their several classes; the females on the left the males on the right.

The sick and infirm blocks are naturally kept at the bottom, near the medical officers' quarters, while the noisy patients are placed where least inconvenience will be felt, the bath-houses being conveniently placed off the corridors. The arrangement of these blocks has been admirably conceived, each being placed at an obtuse angle and in echelon to gain the maximum of sun light to the day rooms, which are provided with large bays, and the wards. There are some points, however, for criticism; among which may be noted the arrangement of the beds in the sick wards, and the planning of the sanitary towers, which might be improved upon.

A strong point in the design, and one upon which too much emphasis cannot be laid, is the able way in which the staircases and the accesses have been arranged, forming an integral intention in the design, for the direct and unhindered exit in one of two or more possible ways in case of fire or panic. The extensions comprise a large block at the top point on either side, where such can be conveniently made; the other—i.e., female 68, and males 42—are within internal courts which it will be inconvenient to reach. Of all the designs, this seems to be the most economically one arranged, and open with free surrounding air and withal compact.

The remaining buildings are spread over the site in the following disposition. Above the official block on the central vertical line, and parted therefrom by the broad entrance drive is the chapel, to the right of which is the steward's house. Above the chapel, with an intervening space of 30 yds. is the mortuary, and on the same axis, 70 yds. higher up still, is located the isolation hospital. To the right of the steward's house, and near the Merthyr-road, are quarters for the clerk of works, gardeners, and engineers, besides a group of six cottages and the entrance lodge. The medical superintendent's house is on the opposite side of the site, detached, overlooking the Glamorgan Canal.

Little remains to be said about the architectural character, which is strictly utilitarian, and very depressing. We venture to hope some attention will be given to the necessary and healthful element of beauty in pleasing and simple outlines and detail, which is surely absolutely necessary in such an institution. The dominating feature is the small water-tower with the adjacent chimney-shaft; these might be combined as there is an ample pressure, and but two days' storage is required for emergency. The remaining features are the various louvred ventilating-shafts, which are carried up some 20 ft. above the ridges.

The total estimate is 235,000/., which is about 188/ per bed for the complete scheme; the first portion being 194,000/., or 242/ 10s. per bed. This estimate, together with those of the other competitors, the assessor considers to be too low.

No. 57. Messrs. Wills & Andersen, of Swansea, have a good plan, with many excellent points and much evidence of a grasp of the subject. The disposition of the blocks and the corridors is, however, not so happy as in the selected design, besides exhibiting major and minor defects. The plan covers more ground, being about 200 ft. wider at the top. The extensions would not come in quite as conveniently as they should do. The elevations are very pleasing, an important element much lacking in the selected design. A simple and artistic detail of one of the principal elevations is shown; all of the drawings are admirably rendered.

No. 54. Messrs. J. H. Greenaway and J. E. Newberry have also an excellent set of drawings, the receding elevations being very effectively delineated. The planning and general disposition, however, do not exhibit that virtue of economy which it is so necessary to have and difficult to attain. The central portion is well arranged in a parallelogram, and is compact and well balanced, while the extensions are suitably considered; but there is much lost space in the large open courts.

No. 53. Messrs. Hooley & Sander, of Nottingham, have a plan not unlike Claybury, which is very well laid out, but rather suggests a treatment for a larger establishment than that proposed, and is much spread out. The elevations are quite unadorned and unelevating.

No. 55. Messrs. Law & Allen, London, have a full and carefully worked-out plan, with a long front-block, while the infirmaries seem to be about the best arranged in the whole competition, although here, also, the arrangement of the beds leaves much to be desired. A good and complete scheme of farm buildings has also been included by the authors, which the other competitors have not done. The buildings have a distinct architectural treatment, which has been well shown.

STATUE OF QUEEN VICTORIA, HOVE.—A statue of the late Queen which has been erected at the foot of Grand-avenue, Hove, was unveiled on the 9th inst. The statue is 13 ft. in height, and of bronze. It stands on a pedestal, 14 ft. in height, of grey Aberdeen granite. The statue was originally intended as a Diamond Jubilee memorial. Mr. Thomas Brock was the sculptor.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute of British Architects was held on Monday evening last at No. 9, Conduit-street, Regent-street, Mr. E. A. Gruning, Vice-President, presiding, in the absence of the President, Mr. W. Emerson, through indisposition.

The Late Queen.

The minutes having been taken as read, Mr. W. J. Locke, Secretary, read the President's remarks on the death of the Queen, the members all standing. "Gentlemen," said the President, "I must ask you all to rise for a moment as a tribute of respect to our late great Queen. Since last we met together here, a most solemn and soul-stirring incident has occurred. The Empire has sustained an incomparable loss. The Victorian era, a most memorable epoch, has passed. The British Empire and the world in general, wherever civilisation exists, is mourning the death of our late Sovereign. Europe, Asia, Africa, America, and Australia have been deeply touched, and have all given kindly expression to their profound sympathy with us. It is not only the loss of a great ruler that is mourned, but also the loss of an inexpressible influence of a good, religious, wise, and gracious lady, and of a sympathetic woman. Who can have read without having been deeply touched her oft-repeated solicitude for those in distress, whether her soldiers, sailors, or others, of her subjects. Our late Queen's influence must necessarily have been greater than that of any previous monarch in the world's history. For Queen Victoria's Empire has been the only one in which influence, whether for good or evil, could have been felt over an extent of territory so great that in it the sun never sets. But we as members of this Institute have even a closer tie, a deeper cause for mourning. Her late Majesty was not only our beloved Queen, but also our most gracious, beneficent patron. Her kindly interest in us commenced with the action of her Royal Consort in our foundation, and has been evinced from time to time during the whole of her long and glorious reign. Those who have had the honour of receiving from this Institute the Queen's Gold Medal for Architecture will cherish no possession more highly. It is a memento of the greatest Queen the world has seen, and also of the kindly encouragement her late Majesty so beneficently extended to influence for good our art of Architecture. Her reign has been the most memorable in the annals of this country for the marvellous increase of her Empire, and its unrivalled prosperity, as well as for the unprecedented advancement in learning, science, and art. I feel sure there is not one amongst us who not only deeply sorrows, but who must also feel a loneliness at heart at the loss of our late beloved Sovereign Queen Victoria. There is a great blank.

But in our grief we have happiness in welcoming our King's accession. From his known affection and sympathetic understanding of his people, his careful attention to his duties, and his gracious promises to follow in the footsteps of his Royal mother, we feel every confidence that he will so wisely rule as to endear himself to his subjects, who will entertain the deepest feelings of loyalty and devotion to His Most Gracious Majesty King Edward the Seventh. God save the King!

As a matter of form I must ask you to ratify the action of your President and Council in sending to his Majesty an Address expressing on behalf of this Institute and its allied Societies the sincere expression of our sorrow and loyalty. The Address is as follows:—

The Humble and Loyal Address of the R.I.B.A. to His Most Gracious Majesty the King.

May it please your Majesty,—

We, your dutiful subjects, the President and Council, on behalf of the members of the Royal Institute of British Architects and of the societies both in the British Islands and the colonies in alliance therewith, beg leave humbly and respectfully to approach your Majesty, and to offer our deep and heartfelt sympathy in the inexpressible loss your Majesty, the members of the Royal Family, and the nation have sustained by the death of your Royal mother our late Most Gracious Sovereign Queen Victoria of glorious memory. Her late revered Majesty encouraged with her Royal and generous patronage the art that is so dear to us, and we mourn with deepest sorrow, not only in common with the rest of the

British Empire, our beloved ruler, but also the gracious and beneficent patron of the Royal Institute throughout the whole length of her long reign. We most respectfully and dutifully tender to your Majesty our sincere devotion and loyalty on your accession to the Throne, and earnestly pray that the Almighty will grant your Majesty and your Royal Consort Queen Alexandra a long, happy, and glorious reign, during which the nation may prosper, the arts flourish, and your Empire enjoy all the blessings of peace."

The Royal Gold Medal.

The Chairman said that under ordinary circumstances that would have been the night on which the choice of the Royal Gold Medalist for the year would have been announced, but under the circumstances it was impossible to do so. The Royal Gold Medal was a personal gift of their late revered Sovereign, and with her death that gift ceased. Time did not allow them, nor would it be politic, to approach his Majesty the King on the subject, and therefore for the present and for this year the award would remain in abeyance. The continuance of the presentation depended entirely on the wish of the King, and the Council of the Institute intended to make application in a proper manner in the hope that the award of the medal might be continued in the future.

Elections.

The following gentlemen were then elected: As *Fellows*—F. S. Baker, Toronto; A. C. Blomfield, M.A., London; C. J. Blomfield, London; G. F. Collinson, London; William Flockhart, London; John Leeming, London; and Joseph Leeming, London. As *Associates*—T. B. Ball, Weston-super-Mare; E. W. Banfield, London; G. Brumell, Morpeth; H. M. Cautley, London; W. G. St. John Cogswell, London; W. E. B. Froome Crook, London; H. A. Douglass, Brighton; T. W. Gordon, Nottingham; A. H. Goslett, Great Stanmore, Middlesex; S. Harrison, Leicester; C. E. Hutchinson, London; A. L. MacGibbon, Edinburgh; R. H. J. Mayhew, Anerley, S.E.; W. V. Morgan, Carmarthen; R. Wynn Owen, Liverpool; A. Wyatt Papworth, Maida Hill, W.; J. Quail, Manchester; F. J. Osborne Smith, London; E. J. Tench, Cambridge; C. Boswood Thomas, London; H. A. Tinker, London; P. J. Turner, London; W. J. Walford, Anerley, S.E. As *Hon. Fellow*—Sir Lawrence Alma-Tadema, R.A., F.S.A.

Asylums and Asylum Planning.

Dr. Hayes Newington then read an exhaustive paper, prepared by Mr. G. T. Hine, on "Asylums and Asylum Planning," of which the following is an abstract:—

Mr. Hine said that asylum construction embraced the study of almost every description of building, from a church to a cow-shed, and the art of combining so many dissimilar structures into one harmonious whole, with the engineering skill necessary to provide for and supply heat, light, and water to what is practically a little town, made asylum architecture an almost distinct profession in itself. Further, asylums are built for people who have to be watched, nursed, and provided with employment and recreation under conditions inapplicable to sane people, and to provide for all these, while the subjects are under enforced detention, a very special knowledge is required to make their lives bearable, and, as far as possible, pleasurable. In order to make his paper of some use to the student of this branch of architecture, he proposed dealing chiefly with asylums at home and their most fitting form of planning, and referring to some of the most interesting examples in foreign countries.

Starting with a brief historical sketch of the building of public asylums, the author stated that there was no certain evidence of asylums for the insane before the Middle Ages. Early in the fifteenth century there is record of a most sumptuous building erected in Cairo for the exclusive use of lunatics. In 1641 the asylum of Notre Dame de la Paix at Charenton was founded for the reception of lunatics, and is now one of the largest of such institutions in France. In 1660, in the Hôtel Dieu at Paris two small wards were set apart for the mentally afflicted. Ghent, in Belgium, has been a resort for lunatics for many centuries. Here patients were brought to be cured, boarding with the peasants of the district, and from this has gradually developed a colony of resident lunatics, numbering to-day nearly 2,000, who, while still chiefly boarding with the inhabitants of the place, are under a strict code of regulations framed by the Government. In

England there are records of an asylum for the insane at Barking, founded in 1370. Bethlehem Hospital was founded in 1247, but it was not till 1403 that we have any record of lunatics being received there. Of other early buildings of the kind in this country were St. Peter's Hospital at Bristol, founded in 1606; the Manchester Royal Lunatic Hospital in 1706; Bethel Hospital, Norwich, in 1713; St. Luke's Asylum, London, in 1751; and the Liverpool Lunatic Hospital in 1792.

Up to the end of the eighteenth century such lunatics as were not at large were confined in prisons or in the few houses then erected for their accommodation, and were frequently treated worse than felons, often with the greatest cruelty. But in the year 1796 the "Retreat" at York was founded by the Society of "Friends," an institution where an intelligent system of treatment was initiated and carried out under the able direction of Mr. William Tuke. This institution and the novelty of its treatment constitute a landmark in the history of lunacy. It roused a spirit of inquiry into the housing and care of the insane, which resulted in the passing of an Act in 1818 permitting county justices to erect asylums for the accommodation and treatment of pauper lunatics. In 1845 another Act was passed, making it compulsory on local authorities to provide asylums for the insane in boroughs and counties throughout England and Wales. This Act established the present Lunacy Commission with six paid Commissioners, whose work of inspection and direction has done so much to ameliorate the condition of the unfortunate people under their care. In 1845 there were only about thirty pauper asylums and hospitals, the latter chiefly for private patients, besides a number of registered houses, and, as nearly as could then be estimated, about 17,000 pauper lunatics in England and Wales. Now (in 1901) there are no fewer than 100 county and borough asylums and hospitals, together with something like seventy registered houses, all of which have to be inspected once—in some cases four times—a year, and 107,000 certificated lunatics to be interviewed by the Commissioners. Scotland and Ireland have also their separate Acts relating to lunacy—in Scotland on somewhat similar lines to those in this country, with a Board of Commissioners; but in Ireland the construction and direction of asylums are more directly controlled by the State.

Turning to the actual buildings, the author described some of the most notable erections since the Act of 1845, indicating the various stages in the evolution of asylum planning, a study of which is essential to a proper appreciation of its latest developments. Existing types of plan are all more or less developments of the corridor and pavilion systems. In the early days the corridor system, consisting of a long gallery, with single rooms opening out of it, was the only recognised principle on which an asylum could be built. The form was usually quadrilateral. After the Act of 1845, while the internal arrangements savoured less of restraint, the principle of the corridor system still prevailed. The first development was an attempt at classification by the introduction of a ward for the sick and infirm on each side of the building; the number of cells was reduced and more patients were allowed to sleep in associated dormitories. In the seventies special provision began to be made for epileptics, and the Lunacy Commissioners in 1874 published a plan designed by Mr. Howell for an epileptic ward, which has been adopted with trifling variations in nearly every asylum designed within the last twenty years. In the decade 1871-80 the most notable departure in planning is met with in the Lancashire County Asylum, at Whittingham, designed in what Burdett describes as the corridor-pavilion style, and characterises as one of the finest specimens of asylum architecture in England. The Gloucestershire second county asylum, erected on the pavilion system, the blocks being arranged in echelon, was the first of this type erected in England, and may be said to have originated the oblique or broad-arrow form of corridor now so commonly adopted in asylum designs. The Surrey second county asylum at Cane Hill, one of Mr. Howell's chief works, and accommodating 2,000 patients, is on the pavilion type, the blocks radiating from a main corridor of horse-shoe form. Criticising the variation of floor levels in this building, which necessitated flights of steps in the corridor, the author was of opinion that this irregularity could have

been avoided by a more careful consideration of the surface levels of the ground, and a little more excavating. He urged architects designing asylums to give a first consideration to the site. In many of the plans coming under his official notice the buildings are generally left to adapt themselves to the site rather than the site being adapted to the buildings. Describing the Claybury Asylum, designed by himself, the problem to be solved was how to accommodate 2,000 patients within reasonable distance of the administrative centre without prejudice to the position and aspect of their wards. The plan he adopted was a modification of the échelon type, the wards being approached from obtusely oblique corridors, the pavilion system being almost a necessity from the conditions issued. The asylum is built on the top of a hill, falling all ways, and by removing the apex of the mound, representing nearly 100,000 yards of soil, which was well disposed of in filling up a valley to the north of the asylum, a level plateau was obtained, sufficient to allow of about half the patients' blocks and the whole of the administrative department being erected at one uniform level, the remaining wards being slightly lower, but in no case more than 5 ft. below the central buildings. At Bexley Asylum the author first introduced the villa system on a tentative scale of three villas holding thirty-five patients each, and a detached hospital for fifty phthisical cases or others requiring isolated treatment. In this asylum, which accommodates 2,000 patients, all the wards communicate with one another, and an officer may pass from one end of the male or female side to the other without retracing his footsteps or being obliged to return to the main corridor. Bexley has proved so satisfactory that the London Asylums Committee have arranged with Mr. Hine to use the same plans, with a few modifications and improvements, for a second edition of this asylum at Horton.

Numerous other asylums were referred to, the author indicating their distinctive features and in many cases exhibiting plans.

The London Asylums Committee have found it necessary to add temporary buildings to some of their asylums. These erections, chiefly of wood and iron, provide accommodation for 1,700 patients at a total cost of about 173,000*l.*, averaging 100*l.* a bed—a costly expedient, considering the limited life of these structures.

Scotch asylums are administered by a Board of Commissioners, whose duties, though similar in many respects to those of the English Commissioners, are exercised under different laws and with different results in the planning of these buildings. The system of housing in the acute hospital the curable and incurable cases together is encouraged by the Scotch Commissioners, who consider it undesirable to separate entirely the two classes. This view is upheld by Dr. Conolly, who considers the absolute separation of the curable from the incurable to be neither practicable nor desirable—the incurable patients being generally fitter companions for the curable than the curable patients are. English medical experts, however, hold that a hospital, totally distinct and apart from the asylum, for the reception and treatment of new cases which are not diagnosed as hopelessly incurable, must prove an important factor in the cure of lunacy. It is well known that many forms of insanity are curable at an early stage, but by neglect or unfavourable conditions often result in permanent and incurable disease.

In 1889 the London County Council appointed a committee to inquire into and report upon the advantages of the establishment, as a complement to the existing asylum system, of a hospital with a visiting medical staff for the study and curative treatment of insanity. The committee held meetings, and invited leading medical experts to give evidence. Their report showed the evidence to be greatly in favour of the scheme, and they summed up strongly recommending the establishment of such a hospital. The County Council nevertheless ignored the recommendation, and have continued building asylums on the old lines. Other county authorities, however, have taken up the matter, and are providing hospitals for the reception and treatment of curable cases. The provision of an acute hospital the author considered to be one of the most important evolutions in modern asylum planning.

Touching asylums on the Continent, various plans were shown of German asylums, and interesting details given of the villa system as seen in the asylum at Alt Scherbitz, which may

be said to have originated this type of planning, now adopted more or less in modern American asylums, and more recently, but to a less extent, in England. The villas are constructed very much like boarding-schools, with day and class-rooms on the ground floor and associated dormitories above. The doors and windows are open, and the patients come and go as they please, wander about or work in the grounds, enjoying comparative freedom, but always under the watchful eye of carefully-trained attendants. No wall encloses the estate, only a light and easily climbable fence. The gardens surrounding the houses in the central establishment are enclosed with palings, grown over with plants and creepers. The colony is bounded on the south by the river Elster, which flows at the foot of a steep hill in the grounds, and there is nothing to prevent a patient rushing down the hill and plunging into the river. Great value is attached to residence in the colony, and patients are given to understand that their stay there depends on their good behaviour, and are thus encouraged to exercise self-control.

Having given an account of asylums as they are, the author went on to deal with future possibilities of asylum designing, and then to give a detailed description of an asylum as it should be, instancing a building to accommodate, say, 800 patients, with provision for future extension to 1,200. As an illustration, the plans were referred to of the new East Sussex Asylum now erecting at Hellingly, which has been designed on the most modern lines, the whole scheme having been most carefully thought out by a committee of the County Council, with Dr. Hayes Newington at its head, whose wide experience, acquired in many years' association with asylum work, gave his committee an immense advantage in determining the basis on which they should work.

To understand the first principles of asylum construction, it is necessary to know something of the eccentricities of insanity and the habits and treatment of the insane. The author recommended the student in asylum planning to make friends at all opportunities with the medical experts, and to study the subject in the light of those whose duty it is to look after the insane. The architect can materially assist the doctor in both the cure and protection of the patient by the careful consideration he gives to the details of planning and construction of the asylum, and in doing this he will find that he must design buildings which give security without appearance of restraint. The ever-present sense of detention is, in a way, as inimical to cure as were the cells and fetters of the eighteenth century.

In the ideal asylum the most important building must be the acute hospital. Here it is that every patient, unless hopelessly incurable, is admitted, and during his stay in this hospital his future life is probably determined, whether he shall recover and go back into the world, or whether he shall pass on to the main asylum for the remainder of his days, to eke out an unhappy existence at a cost of more than 30*l.* a year to his country. On every ground we cannot afford to neglect anything—consideration, care, or money necessary to produce a building—which affords the doctors the best opportunities for treating and curing their patients. Any money thus spent will prove the truest economy in the end.

The various parts of his ideal asylum having been discussed in detail, together with the engineering works, internal fittings, laundry, systems of heating and ventilation, &c., the author concluded his paper by a reference to the cost. He was of opinion that a well-built asylum, designed on liberal principles, and fitted with all modern appliances, cannot be erected for much less than 300*l.* a bed. Twenty-five years ago Nottingham Borough Asylum cost 170*l.* a bed. But that the increased cost is not out of proportion to that of other building works is shown by the report of the Metropolitan Commissioners, where the cost of fifteen asylums erected before the year 1845 is stated to have averaged 200*l.* a bed, some even then approaching as much as 300*l.* a bed.

Dr. E. M. Cooke, one of his Majesty's Lunacy Commissioners, said it gave him much pleasure to propose a vote of thanks to Mr. Hine for his valuable address. No medical man who had watched the subject could fail to appreciate how much they were indebted to the members of the architectural profession, and in particular to Mr. Hine, for the excellent accommodation now provided for the insane poor. There were

critics who said that we were working too much in a groove, or too slowly, in regard to the planning and construction of our asylums, and that we were behind other countries, and Germany especially, in our slowness to adopt the cottage style of building rather than those of the usual institutional type. He, however, thought that we had been wise in hesitating to make any great change in the principles of hospital construction. It must be borne in mind that many of the so-called lunatics in German asylums were of a very mild type, and in this country they would not be considered suitable for asylum treatment, but would be dealt with in workhouses, or would remain in their own homes. He thought it did not follow, therefore, that what had been found necessary in an asylum like that at Alt Scherbitz, where the cottage system was largely in vogue, would answer in this country. He was in favour of having in all asylums of any size, a separate or detached building or hospital for the segregation and special treatment of all cases which presented any prospect of cure, but he by no means agreed with the idea of locating in scattered villas all, or nearly all, the chronic cases of an asylum. He was convinced that such a plan must add to the difficulties of administration and supervision, and tend largely to increase the cost of maintenance. In every asylum there were, no doubt, a certain number of well-behaved chronic lunatics, at the outside not more than 10 per cent. of the population, whose lives could be rendered happier in buildings more like their own homes, and for these detached cottages might be built; but he would continue to treat the great bulk of the chronic cases in a large main building, as had hitherto been done. He thought that one of the greatest steps in modern asylum construction had been the splitting up of the acute wards in which the noisy, violent cases were located, as was done in the Headingly Asylum, where the acute ward had very wisely been divided into three small rooms, so that the number of patients in each would be comparatively small. Such a system must, he felt sure, tend to reduce excitement and prevent difficulties amongst the patients. He thought a little more attention was needed in regard to single rooms. In many of our old asylums, of the badly-ventilated, badly-lighted, and badly-warmed kind, the single rooms were occupied by the noisy, violent patients and those who were degraded in their habits. It was most essential that there should be no corners, cracks, or flues where any filth could lodge. Mr. Hine had indicated a preference for the plenum system of heating wherever it could be adopted. His (the speaker's) experience tended to make him prefer steam coils. He was against flues wherever they could possibly be avoided in asylum construction; so many of the patients had such unfortunate habits that, although architects might do their best to put the flues in such a position that they could easily be cleaned out, in practice they were not cleaned out, and sooner or later they became sources of much that was objectionable. He did not think sufficient attention was paid by some architects to the size of the airing courts, and in one or two recently-constructed asylums the airing courts were cramped and prison-like, and the patients when turned out were huddled together and surrounded by iron fences, in some cases 7 ft. high.

Dr. Urquhart, in seconding the vote of thanks, said that those who practised in these asylums had a very high opinion of Mr. Hine, who had for some time been an hon. member of the Medico-Psychological Association. Mr. Hine had been very modest in his paper, as he (the speaker) was reminded in thinking of Claybury Asylum. The site of that was an extremely difficult one, as the architects who entered into competition discovered. The valley at the top of the hill was some 80 ft. deep, and it required a good deal of consideration and time to solve the problem. But even Claybury was getting old-fashioned. We had gone from the West Riding, Wakefield, Asylum—which was an extremely interesting building to all architects as one of the earliest asylums planned by an architect in conjunction with a man who had had practical experience with the insane, and it became the model of many asylums in this country, and was at the time it was built a very great advance in England in regard to asylum planning. That building was still in use to-day, although it had been varied in many respects. It embodied

the germ of the notion shown in the East Sussex Asylum, and if any architect was desirous of knowing what was the best and latest in asylum work, he should study the detail and plan of that building; doctors thought the building was as far as could be gone on the lines laid down. Perhaps the best American asylum was the St. Lawrence State Asylum, which was a collection of small asylums, probably containing 300 or 400 patients each. The cost was enormous, and the idea had not been imitated there. In England lately the process of devolution had gone further, and, as Mr. Hine had mentioned, a scheme had been prepared for the Edinburgh Parish Asylum, though the ratepayers were up in arms against it, and he did not know whether those charming villas and cottages and the village church, hall, and reading-rooms would be carried out. The Aberdeen Council and Mr. Marshall MacKenzie, their architect, had decided that their new asylum should be built entirely on the segregated principle. On the subject of heating, in a small town in America he had visited the whole town was heated by steam from central boilers, the inhabitants being charged so much on the ratable value of the houses they occupied, and they themselves turned on the steam for heating. We move more slowly in this country, but Mr. Hine had inaugurated that system in the asylum world, and, no doubt, the sane population would have the advantage of it later.

Mr. Clifford Smith said that the temporary buildings referred to were, he knew, not altogether beloved by architects, seeing that they were built of galvanised iron. Yet the great idea in constructing temporary buildings was not so much to save money as to get speed of construction. It was desired to get buildings rapidly, and the only way that could be done was to put up those that could be speedily constructed, and without any special preparation of plans; and, as a consequence, the ratepayers spent 173,000*l.*, at the rate of 10*l.* a bed. Therefore, though they were comparatively costly, yet for the reason that the London County Council wanted them they were cheaper at the time, because they accommodated people who otherwise would have been sent out of London, and therefore they served their purpose. With regard to the question of asylums, he had had occasion to visit some of the more ancient asylums belonging to the London County Council—Hanwell, to wit—and he must say that he never went from Hanwell to Claybury without being struck with the charming difference in favour of Claybury. The difference was so very marked, and the advantage so very patent, that nobody with a trained eye, or even without a trained eye, could fail to appreciate the improvement that had taken place during the period that had elapsed since the Hanwell Asylum was built, 1831, to the time of the building of Claybury in 1887. The difference was most marked, and the advantages to the people were as great. Again, an asylum well designed was more cheaply maintained; heating, electric lighting, cooking, laundry-work, hot-water service—all these points represented hard cash, and he was bound to say that Mr. Hine had given them in these respects the greatest advantage that they would get in their modern asylums in comparison with the older ones. With a central boiler-house, and the whole arrangements radiating therefrom, they got the maximum result with the minimum of expenditure. With an asylum accommodating 3,000 patients they had to write off one and a half to two tons of coal per patient per annum, and it would be seen at once that if there could be any economy at all in a pound of coal extending over 4,000 tons a year—if they could get another ton of water raised to a pound of coal—there must be a gain; and at Claybury they had all these benefits, and they showed an improvement on the Heath Asylum. Mr. Hine rather surprised him when he stated that while he advocated the use of a central boiler-house and the utilisation of exhaust steam, yet at the same time he did not think electricity should be used for driving machinery. He thought Mr. Hine had concealed that secret very well. It showed how considerate he was to those who were called upon to work with him, when he had allowed him (the speaker) to have his own way at Heath Asylum in that particular respect. It was probable, however, that they should be able to make a comparison between the arrangement Mr. Hine had adopted in the new asylum and the arrange-

ment they would probably adopt at Heath Asylum. With regard to heating, Mr. Hine advocated the plenum system where suitable, and Dr. Cooke spoke of steam heating without flues. His experience was—and he had had to deal with seven of the London County asylums, where they had installed almost every type of heating—high-pressure water, low-pressure water, the plenum system, the semi-plenum system, low-pressure steam, and medium-pressure steam—that the low-pressure steam arrangement, with a radiator in the wall and the pressure immediately behind it, and with a proper outlet for vitiated air, gave the best result, the condition being always established that too high a pressure of steam is not maintained in the radiator, to "burn the air," if he might use that expression. He found that if they did not exceed 205 degrees in the steam radiator they got very satisfactory results, provided there was a proper fresh-air inlet.

Mr. P. Gordon Smith said that in looking at some of the plans he was somewhat puzzled as to the arrangements which were best for adoption. For instance, he was troubled very much in regard to aspect in some of these buildings, for what appeared right on one side for aspect must be, it seemed to him, wrong on the other side. He was surprised, also, at the construction of wards for four rows of beds in these new asylums, for he knew that in 1867 a committee known as the Cubic Space Committee condemned that form of ward, and the Local Government Board had for some years given up sanctioning that form of ward for Poor Law buildings; and yet it was found in the up-to-date asylum—a Poor Law building of another kind! In regard to the isolation hospital, he did not understand why they should be different from those of an ordinary village community; in one of the plans there seemed to be no arrangement for isolating one disease from another. Perhaps it did not so much matter in a lunatic asylum, where there was such absolute control over the inmates and so little chance of their contracting infectious diseases. Still, the arrangement was very different from that advocated in the Local Government Board memorandum on the subject of isolation hospitals.

The vote of thanks was then put to the meeting and heartily agreed to.

Mr. Hine, in reply, said he agreed with Dr. Cooke's suggestion that more attention should be given to single rooms; but when it was considered that a fourth or a fifth of the whole number of patients in an asylum occupied single rooms, it would be seen that great increase in the space would be required, and the difficulty of planning would be greater, and also the cost of those single rooms required to be enlarged. Architects, who knew the great cost of building asylums, shrank from adding largely to the expenditure, as they would do if they increased the size of so many rooms. With regard to the statement that he was in favour of the plenum system of heating, he was afraid the words he used were a little misleading. He said that there were advantages in the plenum system over others, and he thought there were; but there were also great disadvantages. If they could get the plenum system without its disadvantages, he should say it would be quite an ideal system. Perhaps he might refute the suggestion best by stating that he had erected eight asylums since the one referred to, and in not one of these was the warming on the plenum system. With regard to the question of aspect, referred to by Mr. Gordon Smith, he should be glad if Mr. Smith would suggest how they could get a perfect aspect to each ward. No doubt, if the asylum could be extended all over the country a perfect aspect might be secured. But it must be remembered that each block must be brought within reasonable distance of the administrative centre, and one could only give the best aspect one could under the circumstances. As a rule, the best aspect was given to the day-rooms of the patients. Mr. Gordon Smith had also called attention to the dormitories with three or four rows of beds. In hospital wards and wards where patients were in bed in the day time, it was never usual to construct them with more than a double row of beds. In wards which require supervision at night it was necessary to get a certain number of patients within the hearing and sight of the attendant, so that it was sometimes necessary, particularly in epileptic wards, to have three and sometimes four rows of beds in a dormitory, where the patients were very rarely in

bed in the daytime. Mr. Gordon Smith, in his remarks about the isolation hospital, must have been confusing the acute hospital with the isolation hospital. He had not shown a plan of an isolation hospital, but each asylum had a small hospital for infectious diseases, where the cases could be isolated. They were constructed very much on the lines of the Local Government Board isolation hospitals.

A vote of thanks having been accorded to Dr. Hayes Newington for reading Mr. Hine's paper, the meeting terminated.

The next meeting of the Institute will be held on the 25th inst., when the President will read an address to students, and Mr. J. A. Golch, of Kettering, will offer some critical remarks on students' drawings, after which the prizes will be presented by the President.

THE WEST FRONTS OF THE ENGLISH CATHEDRALS: A COMPARATIVE CRITICISM.*

IN making some observations on the west fronts of our English cathedrals, I beg to say in the first place that I am not essentially or professedly an archaeologist, and that although many of these fronts, as they now stand, present a curious record of changes and altered intentions and interrupted designs, on some of which we may touch in passing, the consideration of them in this historical aspect is not my present object. I am inviting you to consider and compare them from a purely architectural and critical point of view. I think there is hardly enough of this purely critical spirit in our usual manner of regarding ancient and especially mediæval architecture. By "critical," of course, I do not mean necessarily fault-finding, which, in fact, is not the true meaning of the word criticism—a word often much misused; it means really rational appreciation of merits and defects. We are too much in the habit of regarding mediæval architecture from a merely archaeological point of view; finding a great interest in tracing out the causes and the history of various apparently anomalous incidents in their existing design; hunting out the original design of a Norman façade or transept end from indications built up with the later masonry, or the reasons why a string-course of a certain date suddenly stops short at a point where there seems no obvious reason why it should have stopped. All mediæval buildings of any size and extent are full of puzzles of this kind, arising from the naïve manner in which the mediæval builder totally disregarded what his predecessor had done, if it came in his own way. These innumerable little problems no doubt give a greatly added interest to the study of our cathedrals; but it is an interesting historical rather than artistic; and it has exercised, not seldom, an unholy fascination on the custodians and the restoring architect of the building. With trouble and ingenuity and much reasoning, in the sweat of our brain, so to speak, we have made some portion of the building yield up its secret, we have got a notion what the first and original builder had erected or intended to erect; and then, of course, people think, shall we not use this hardly-acquired knowledge in order to restore what was or what should have been there? We know only too well to what pernicious lengths this temptation has decoyed respectable and well-meaning persons. But even when we look at mediæval buildings purely for their architectural effect, we are too much accustomed to assume an attitude of mere indiscriminate admiration, as if we had no right to find fault with them. This is not either reasonable or altogether instructive. The architects were human like ourselves, and it is more to the purpose to regard their buildings just as we should a piece of modern architecture; and if one is finer and more effective than another, to consider why it is so, and what are the reasons of comparative failure and success. Moreover, such a comparison, as I think we shall see, leads to some conclusions which have an important bearing on our estimate of mediæval architecture, and also suggests some points in regard to the *rational* of what is called restoration.

Now there are some special reasons for selecting the west fronts of the English cathedrals for this kind of comparative criticism. In the first place, there has always been a kind of

* A paper read by Mr. H. H. Statham before the Sheffield Society of Architects and Surveyors, on Thursday, February 14.

facit feeling that the entrance front of a great building should have some special treatment to emphasise and render it effective. It is the most prominent face of the building, and the one which meets our view as we approach in order to enter it. The practical convenience, too, of having some kind of portico immediately before the entrance of a building, so that when there are crowds who may have to defile slowly through the actual entrance door they may have some cover till they can get up to it, gives an excuse for a depth of treatment and recessing for which there is often not the same excuse on any other face of the building. The entrance, too, is a peculiarly important feature, as the link between the exterior and the interior architecture. In too many modern buildings we find this recognised in a very false spirit, in buildings in which all the funds available for embellishment are expended on the principal street front, leaving the rest plain and generally carried out in an inferior material. This is the fruit of that despicable modern virtue of economy, one of the greatest hindrances to modern architecture, but a virtue especially worshipped in this practical and commercial nation. Perhaps also this vice of having show fronts to a cheap building is partly promoted by the unhappy spirit of sham and making "the best show with your money" which is essentially a characteristic of modern life. I do not recollect that there is any example in ancient architecture of a show front attached to a building the remainder of which is carried out in an inferior material. But both in mediæval and Renaissance architecture the desire to make an impressive entrance façade appears to have been a recognised object in a great majority of cases. In the Renaissance period in Italy this was so much the case that the front was sometimes built up at first with a mere bare enclosing wall to keep out the weather, until funds should be available for building a grand façade. In the case of Florence Cathedral the façade was in fact never completed till the middle of the nineteenth century; and, as you will all remember, there was a few years ago a great international competition for a new front to Milan Cathedral, which, in spite of the death of the architect of the selected design, it is, I understand, still the intention to carry out. In England this Italian precedent was followed in the case of the Catholic church called the Oratory, at Brompton, which has only recently received its entrance front. Whether this practice of leaving the entrance façade for a possibly indefinite period a mere blank wall, in the hope that a future generation will treat it architecturally, is a desirable one, may be open to question.

Apart from the general interest of entrance façades, there is, however, a particular interest, among mediæval buildings, in those of the English cathedrals, in respect of their remarkable variety of design and conception. In France the general type of design of the west front of a cathedral is very well marked, and seldom varies; two towers, and the end of the nave showing between them. But in England, except in the case of those in which a specially designed façade has hardly been attempted, there is not one which resembles another; they are all distinct architectural conceptions. I do not think the importance of this fact, in its bearing on our estimate of English mediæval architecture, has been sufficiently appreciated. I shall have a word more to say in regard to it at the conclusion of this paper.

As to the architectural morality of façades in general, there is an especial reason why some such treatment was almost necessary in the case of mediæval cathedrals. The central pointed roof, with the sloping roofs of the aisles at each side of it, is a very good and satisfactory constructional profile when seen in section, but it is an exceedingly weak profile when seen as that of the exterior termination of a building; unless in the case of a small parish church, where a picturesque simplicity is all that can be aimed at. When a building is on a large scale, and anything like grandeur of effect is desired, it is inevitable that such a profile as this should be masked in some way. This is strikingly illustrated in the west front of Tewkesbury Abbey-church, the centre portion of which is a remarkable example of the attempt to give dignity and impressiveness to the entrance by filling the whole with one immense and deeply recessed arch, one of the finest things in English mediæval architecture, and which seems like a kind of forecast of the

treatment at Peterborough Cathedral. But you cannot fail to observe what an exceedingly weak effect the sloping lines of the aisle roofs have in comparison with the bold square treatment of the centre. In this case we have two different principles of treatment combined in one front; the end of the nave roof is masked; that of the aisles is not.

We may distinguish two main principles in the treatment of the west fronts of cathedrals. Reference has already been made to the type usual in France; the two towers stopping the ends of the aisles and allowing (in general) the end of the nave roof to be seen between them; and this we may distinguish as the French type. The other method is that of erecting a screen in front of the whole section of the building and letting the roofs abut against it. This is a method so largely followed in Italy, that we may call it the Italian type. There is no doubt that the French method is the more dignified and the more truly architectural. The basement story of the towers forms a porch to the aisles in a natural and appropriate manner, and the space between them allows the gable of the nave to assert itself. When used on the great scale of height found in many of the French cathedrals, and in such a building as Cologne, for example, it has the drawback that it is impossible to produce anything at the crossing which will dominate the western towers, and the façade assumes almost too great importance in comparison with the rest of the building. The Italian method is much more manageable, and, as at Florence and St. Peter's, allows the central feature to predominate. An objection often raised to it is that it is in some sense a sham, but I hardly think it need be regarded in this light. There are so many minor details in architecture which require a "stop"—cornices, mouldings, &c. This is only the same principle applied on a larger scale—a "stop" for the whole lines of nave and aisle roofs. It must be admitted, however, that when you get to the side or to the back of it, the Italian method in its pure form, as seen at Salisbury, for instance, has a weak effect.

The English fronts can all be grouped more or less under one or other of these types, though in some cases the Italian type has been so modified and improved in its application as to nearly lose its objectionable qualities, and become an exceedingly artistic architectural development.

The problem to be solved in treating a front of the Italian type is, while masking the weak line of the triple-aisle section, at the same time not to ignore it, but sufficiently to indicate its existence by the position of doors, windows, and other features in the façade. That is the first point; the second, which applies equally to both types, is that there should be a distinctly predominant idea in the design, to which all the details are subordinated. The best and most truly architectural effect is not to be obtained by sheer richness and multiplicity of detail. There must be an effect of contrast and the evidence of thought in the design, and the absence of these qualities is not to be condoned merely because the building is six or seven hundred years old. Architecture no doubt was a different thing then, in a sense; it was more of a national and less of an individual art; but there was good architecture and bad architecture all the same; and we cannot get the best lessons from ancient architecture unless we recognise that fact, and regard it with a discriminating and not a slavish admiration.

The Durham front, of which the plan was laid out and the lower portion built, up to the level of the nave walls, about 1130 or a little later, was, like most Norman fronts, of the French type, and of extraordinarily bold and grand design. The towers, though they form porches to the side aisles, are spread out laterally considerably beyond them, and, occupying each a square of about 44 ft., while the width of the nave is only 33 ft., the proportions belonging to the section of the nave are reversed; the side masses are the widest and the end of the nave seems narrow and squeezed in between them. There is a certain falsity and bravado about this which, however, is compensated for by the broad and massive proportion of the towers. Regret has been expressed that the Norman design was not carried out completely; the effect would have been more homogeneous no doubt, and we should have escaped the somewhat incongruous effect of the late pinnacles and parapet, which

seem a too light and fanciful termination to towers of which the lower part is so sternly plain. I must confess, however, that I cannot bring myself to regret that the upper portion of these towers was completed in the Transitional period. Contrast, as already observed, is an important source of effect in a façade; and it almost seems here as if the richer yet perfectly restrained treatment of the upper stories, with their rows of arcading, supplied just what was wanting to give an effective yet not inharmonious contrast with the stern mass of the lower walls; as if the Norman artist had been employed up to the point at which his manner of work was most effective, giving a rock-like base to the towers, and the Transitional artist had stepped in just where æsthetic considerations called for his hand. He made, however, one mistake. But for his entering on the scene, it is probable that the small enriched wall-arcading which, runs across under the gable and finishes on each adjoining buttress of the towers, would have been carried right across the front, binding the whole together in a manner which is now rather wanting. It is evident that the Norman builders' work had stopped at the string below the line of this arcade, except at the centre and on the innermost walls of the towers, which had to be carried up a little higher to meet the end of the nave walls; and it is a curious example of the indifferent way in which these ancient gentlemen went to work, that the Transitional builders should have totally ignored this obvious and important feature in the design as projected by their predecessors. In the main, however, they did nobly, and I am inclined to think the towers are finer objects now (always excepting the pinnacles, which are out of keeping with the whole) than they would have been if the Norman design had been carried out complete. The weak appearance of the screen gable, which (as in many other instances in mediæval architecture) does not in the least coincide with the actual section of the nave roof, is a serious defect; and the large decorated tracery window, inserted below, though a fine one in itself, is painfully out of place there, appearing quite crushed by the mass of plain walling around it. As regards the architectural composition, it would have looked far better had the window been made to follow and fill up to the circular Norman wall-arch above it; but at that time such a piece of accommodation could not be thought of; pointed arches were the order of the day, and there was no salvation outside of them; whereby we may gauge the difference of the attitude towards architectural design in those days and in our own.

Lincoln is, in a sense, one of the most interesting of all our west fronts, though (or some may say, because) it is a kind of medley of two opposing ideas struggling for the mastery; a blend of the Italian and French types. As first planned by Remigius in the latter part of the eleventh century, it was a French front, with the preparation for two towers which, in the most orthodox fashion, marked the termination of the aisles, the internal width of the towers being probably coincident with that of the aisles, though the thickness of the tower walls gave a certain external projection. The nave was widened by 5 ft. on each side when it was rebuilt in the Early English period, and hence the inner side walls of the towers do not now coincide with the line of the nave arcade, as they originally did; but I have no doubt the inner face of the Norman aisle walls coincided, as the present aisle walls do, with the inner face of the tower walls; in other words, the outer wall of the nave was rebuilt on the Norman foundations; because a reference to the plan will show that, according to usual proportions, the aisles are too narrow; the centre compartment was widened, the aisles were not. The second stage of the west front, in the Transitional period, was the erection of gables adorned with arcading over each of Remigius's large arches, as over the three great arches at Peterborough, which the whole composition at this stage must have somewhat resembled, and perhaps even suggested it. The change came when the nave was rebuilt under Bishop Grosseteste, circa 1230, when a façade of the Italian type was planted on, and as an extension to, the Norman façade. This was all part of the ambition and emulation of the period; the effort of one establishment to outdo another in the striking character of its western façade; so that it is evident that the mediæval clergy fully appreciated one motive which has been

suggested for a special treatment of the entrance front—that of forming a kind of advertisement. Cathedrals might be dedicated to a saint, and built professedly to the glory of God; but there was as much human nature about it, after all, as in building a railway terminus: each new company tries to build a more imposing station than the last one. In the present case there was evidently some unwillingness to meddle with the bulky walls of the Norman towers; the easiest way to increase the ambitious character of the front was to spread out a screen on each side of it, so as to widen the whole composition, and then to make it rich with diversities of arcades. Finally, in the Early Perpendicular period, the towers were at length carried up and emerged from behind their screen. Up to the beginning of the last century they had small spires or spirelets, which were then removed, probably because they needed repair, and it was cheaper to pull them down; a good enough reason in the Georgian era. It should be noticed too that when Grosseteste built the new nave, the gable of which comes out through the Norman front, he altered the centre arch to a point, to harmonise with the new work. It may also be noted, in comparing Lincoln with Durham, how much more satisfactory is the effect of the gable, which really represents the section of the roof, in comparison with that fallacious gable at Durham which stands up flat by itself.

A good many harsh criticisms have been made on Lincoln front, and it cannot be denied that, as a whole, it has little claim to be considered a design; it is a picturesque medley, though a most graphic piece of architectural history. Yet I owe to it one memory of an effect that will last my lifetime. I first saw Lincoln in company with the first Architectural Association excursion organised by the late Mr. Edmund Sharpe, I do not know how many years ago. On the third day of the ceremonial we were driving back into Lincoln after a glorious summer's day spent among some of the neighbouring churches. After climbing the long hill up to the town, rather in shadow, our vehicles made a turn round into the open space in front of the cathedral, and we came suddenly on this façade, with its naturally warm-tinted stone absolutely golden in the strong rays of the setting sun. As a piece of scenic effect, coming on one as a sudden surprise, it was magnificent. One forgot all about the questionable details in the glory of the picture as a whole.

Ely is the one front of the first importance which cannot be referred either to the French or the Italian type. It is a unique conception, resembling nothing else among our English cathedrals. It may be said to be the Italian screen type with a great tower interposed in the centre; the screen extends far beyond the main plan of the nave, and behind it, at each end, is a small chapel outside the line of the aisle walls. It will be remembered that the treatment of the crossing at Ely is supposed to have suggested to Wren the plan of the same portion of St. Paul's; but there is another point of similarity which has not been so much remarked upon, but which can hardly be accidental. The plan of the west front of St. Paul's, like this, extends beyond the line of the nave and has a small chapel behind each projection. In the middle of the thirteenth century the west front of Ely, as originally designed, might have been seen in its entirety. The line of the tower, just sufficiently projected to define it, was seen down to the ground, unscreeled by the Early English Galilee porch now erected in front of it, and which certainly does not improve the composition architecturally. There can be no doubt that, like the small building between the great piers at Peterborough, this porch, however a ritual use and name might be assigned to it afterwards, was originally placed there for purely practical reasons, in order to afford a better western abutment to the tower arches. The tower ended at the string below the present octagonal lantern and turrets, and was probably crowned by a lofty timber spire with spirelets at the angles;* the angle turrets, without the battlementing, by smaller octagonal spirelets of the same type. For a finish to the tower I think the present lantern, though weak in detail and so far out of keeping with the rest, is finer and more effective than the wooden spire, and the building has gained by the

alteration. It is a noticeable point that the usual three doorways, to nave and aisles, are not found at Ely, there being only one central doorway. This is in keeping with the general character of the design, in which the centre is strongly emphasised.

When this façade was complete in its original form it was one of the finest, best balanced, and most artistic architectural conceptions of its kind to be found in England or anywhere else; in spite of its originality and individual character, there is in it no straining after effect, no touch of eccentricity; it is a noble and dignified architectural design, marked by repose and breadth of effect. As you all know, the northern side of the screen fell down, there seems to be no precise record either when or why; unless there was something very wrong with the foundations, one is almost led to suppose that it was a piece of wanton destruction. One of the interesting questions which crop up in connexion with our subject, is, whether it would be worth while, and a right thing to do, to rebuild this destroyed portion after the model of the south side, and thus once more complete the design. I am decidedly of opinion that it would be. No one is more opposed than I am to that kind of restoration which consists in polishing up ancient work to make it look "as good as new," or to that which consists in conjecturally restoring some vanished feature from a few fragments, just because something of the kind is surmised to have been there before; as Scott absurdly did with the pyramidal termination of the south choir aisle at Chester, and Mr. Pearson did with the double cloister, as he called it, at Westminster Hall. Such restorations are neither architecture nor history. But it is a quite different matter when a repeating portion of a complete design has perished. It was perfectly justifiable to rebuild the fourth side of the cloister at Chester, which had been pulled down; it was simply making the design complete again by replacing a portion for which the other three sides afforded the model. And it is the same with Ely. The north side was identical in design with the south side; it has been destroyed; why not reinstate it, taking the south side as the guide? I have heard indeed one argument used against this class of restoration, to the effect that no one would think of restoring a missing limb to an antique statue; but the argument is absurd; and the two cases are not in the least analogous. No one can say what the position or modelling of a missing limb in a statue may have been; sculpture imitates Nature, which is capable of infinite varieties of movement. Architecture does not imitate Nature, and architectural design is in the majority of cases symmetrical—in the case here referred to we know that it was so; and the reproduction of such conventional features as turrets, mouldings, and arcades, to repeat a design still existing on the other side of the axis line, is a perfectly different problem from piecing a statue.

Peterborough is a front of exactly the opposite character to Ely. While the latter, as already observed, is specially marked by repose and a perfectly logical balancing of parts, Peterborough represents an inspiration of genius which disdains all ordinary considerations of logic—a passionate desire to do something great and astonishing and unprecedented, even at the cost of reasonableness and the proportion of things. The three great arches, regarded as a portico, are entirely out of scale with the whole building—out of scale, too, with the real requirements of a portico. All this we can easily say, and, for all that, I must agree with Fergusson's judgment that as a portico it is the grandest and finest in existence. It is true that all the rest of the building is an anticlimax, for only giants could have built anything that was not; but we may well be thankful for having one portico at least on a colossal scale, even if it was impossible to have the whole building to match; and it is curious that, great as is the contrast with Ely, it is to Ely indirectly that we owe it. It is the human weakness of emulation over again. Peterborough was to have had a flat front, with square towers projecting half beyond the line of the aisle walls. But while this was half finished arose the new and striking front of Ely. "Brethren, shall we be outdone, almost within sight of our own doors? Go to, let us build something that will take the conceit out of Ely." And truly they did it, only unhappily, they looked not warily to the foundations, wherefore their great conception

has been in imminent danger of falling over. It is a curious contrast that while Lincoln at first had a front of three great arched recesses, and then proceeded to embellish it by projecting a screen design each side of them, Peterborough ended with the three great arches as the culminating effort. One hears the question sometimes, Why is the middle bay narrower than the others? But that is the wrong way to put it. The question is, Why are the side bays wider than the middle one? Nor is there any mystery about it. The position of the centre piers was settled by that of the doors and piers in the first intended front; the increased width of the outer bays is simply for glory. They could not conveniently make the centre bay wider than they did, but at least they would spread out with a wider sweep in the side bays. The three gables, however, are made to range, and rightly. There would have been great want of unity if they had all been sprung in the same manner and with the same rake, and consequently with the centre apex lower than the side ones. The difficulty, however, is perhaps hardly got over in the best way by making the gable copings abut at different levels against the intervening turrets, preserving the same rake. It is rather a clumsy way of doing it. I think that if the springing had been the same and the rake different the effect would have been better; the difference in rake would have been less noticeable and the difference in width of the arches would have fully justified and explained it. The delicate little late porch, built between the piers to bind them together, is so completely out of scale with everything around that it always appears to me an eyesore; as a constructional expedient it is a very curious example of the way in which an engineering construction in the Middle Ages was presented under the guise of an architectural fantasy. Apart from this, the weak point in the front is the design of the flanking turrets, which look far too feeble to act as abutments to that immense arcade, and the decorative arcades formed on their surface make them look still weaker; they should have been treated as plain ponderous masses, with only some decorative diversification at the top. But the mediæval builders would have said, like Hamlet's friend, "Twere to consider too curiously, to consider so."

One can hardly mention Peterborough without reference to what may be called the great Peterborough restoration "row" a little while since. Having had the opportunity of going all over the front while the scaffolding was up, and examining the state of the vaulting at close quarters, I have no hesitation in saying that there never was a more unreasonable clamour than that which was got up in the Press to prevent the absolutely necessary repair to a structure which was in imminent danger of falling to pieces; and I feel satisfied that if the knot of architects, of peculiar opinions, who said that they could set it all right by tunnelling through the pack of the loose debris over the back of the vaulting and putting new backing behind the facing masonry, had been taken at their word and asked to undertake the work, they would have backed out; or if they had not, they would have dug their own graves, or those of their workmen. I should have gone further; I should have said, take down the whole front and rebuild it with the same facing stones on a concrete foundation, truly vertical and with a solid and well-bonded backing. It would have been, no doubt, a most complicated and costly job, but not an impossible one, and the unique grandeur of the front is such that it would be worth while to go to the expense in order to put it on a sure basis and preserve it perhaps for another five centuries to the world. As it is, after all the fuss, I believe the front is in a precarious state. From the upper scaffold the overhang of these immense masses appears most alarming, and it is rather problematical whether, in its present state, it will last out the century, unless something more is done. The erection of the scaffold gave one, however, the advantage of being able to go all over the front and see all the detail at close quarters. I do not think anything else gives one such a vivid idea of the extraordinary and bold character of mediæval work—of its difference from everything modern—as to go up among these shafts and niches and sculptures which have been beaten by the wind and rain of centuries, till they have almost lost the appearance of being man's handiwork and look like natural phenomena.

* See Mr. Beresford Pite's restoration of it in "Cathedrals of England and Wales."

mena, and to realise the boldness and depth of the mouldings and relief which seem so graceful and delicate from below, but which, viewed at close quarters, suggest the idea that "there were giants on the earth in those days."

This experience I have also had at Wells, which I had the good fortune to visit for the first time when the scaffolding for the late Mr. Ferrey's restoration was all over the front; a disappointment at the first glance, but which turned out a blessing in disguise, for I was lucky enough to elude the argus eyes of the clerk of works (for whom I had no credentials), and had time to climb all over the front and make a number of sketches of figures, caps, and mouldings at close quarters before my discovery by a conscientious foreman. Wells is more refined in detail than Peterborough, but even here the spread of the foliage carving on the caps, and the depth and intricate profile of the mouldings, take one's breath away. Wells is the sculptured front *par excellence*, and it is noticeable how completely architecturalised is most of the sculpture; the figures of kings and saints in their niches are so severe and square-cut in line that they hardly have human interest, but on that very account they are so effective architecturally; they seem not so much sculpture as architectural carving. One band of sculpture, however, here is in the spandrels of the arches just below the upper string course which runs right across the front, which is of a different type; the Resurrection series, which are as full of life as the sculptor could make them. They are all nude, which may be one reason why they were placed so high up (medieval feeling did not tolerate nudity even in art); but whether this was the reason or not, they are decoratively in the right place; being the only figures with movement in them, they fall naturally with the up-and-down lines of the window heads and the arcading, as the stiff statues below fall in naturally with the vertical lines of the niches. The Resurrection figures are so far weather-worn that it is difficult to judge how far they were originally well-modelled, but they are certainly full of spirit and expression, and I have always believed that they must have been done by Italian sculptors brought over; there is nothing at all like them in English work. The reality with which the sculptor has conceived his subject is remarkable: we see one man pushing aside a tombstone, and joyfully looking upward; another seated in a solemn attitude of resignation, as if waiting for his doom; a woman obviously much embarrassed at having to issue naked from her tomb; every figure has its own characteristic attitude and expression, here is a good set of drawings of these figures in some publication—I forget what; at no one can have realised fully their interest in those who has not stood by the actual figures, and tried to realise the thoughts and intention of the man or men who carved out in naive, yet thrilling, representation of sinful man called to judgment.

Architecturally, the Wells front is the French type extended, so that the two towers, instead of forming the termination to the aisles, extend completely out beyond them, and the whole partakes somewhat of the character of a screen before the actual building. The design possesses in a remarkable degree two of the most important qualities to be desired; a marked individuality of treatment, and a striking effect of contrast. It is consistent with itself throughout, and totally unlike any other temple in England. There is an almost assiduous severity of line throughout, and the principal divisions are more strongly marked than is usual in Gothic. The comparative plainness of the upper portion of the towers contrasts effectively with the richness of the lower portion; each story of the design is complete in itself and designed with a purpose; there is nothing accidental or careless. Were the towers intended to have pinnacles? I have never been on the top of them, and therefore cannot speak as to the actual evidence of the work; but it is quite possible the present finish was the ultimate one. It is unusual, but the whole design is unusual in so many points at this need not weigh much. I certainly prefer them as they are. The central feature of the roof line is not very well designed; and a deep cut between it and the towers is rather awkward, and seems to want something to fill in.

Rochester is a peculiar and not very beautiful front, but it is worth attention as again illustrating the extraordinary variety in con-

ception of these English fronts. Here again we have a design entirely different from any of the others—entirely distinct in itself. Instead of two western towers we have four turrets, and the side turrets do not form the termination of the aisles, but of the outer aisle walls; a kind of square head, on plan, at the end of the wall; the centre turrets performing the same function in reference to the nave arcades. Thus, instead of the front expressing the triple division of the section of the nave into three compartments, it emphasises the existence of the four parallel walls which divide the compartments. It is not such a fine, nor, I think, such a correct architectural treatment; but as a suggestion it is certainly interesting. It is not very easy now to conjecture how the central portion appeared as originally built. The present late battlemented finish cuts very awkwardly into the turrets, and goes far to spoil the effect. As originally built, it may have been an admirable whole, though on a rather small scale.

Salisbury as a whole is one of the most beautiful of all our cathedrals, especially in bright summer weather (it wants that to show it at its best); but the front is a vexation, and is to my mind the weakest and poorest of all. It has, to be sure, been restored to the bone, and looks terribly new and raw, but it must be presumed that the restoration fairly represents the original details, and it fails through complete want of purpose, concentration, and contrast; it is a medley of detail covering the whole face, with apparently no motive except to cover it and leave not a blank space for the eye to rest on. It illustrates, when seen from behind or at the side, the weak point of the Italian façade; a great part of the back of it forming a blank wall above the aisle roof.

The front of Ripon is a good example of the pleasing effect to be obtained by very simple and broad treatment of windows and wall, with hardly any ornament. It has one rather curious and perhaps illogical feature; it shows the three west doorways so common in cathedral fronts, and generally leading respectively into nave and aisles; but in this case all three open into the nave; the towers represent the end of the aisles, but are not pierced with doorways. The pinnacles and battlements do not of course belong to the original design; the towers were probably crowned, or intended to be crowned, by timber spires. The reticence and good taste of this front make it an instructive contrast to the fussiness of Salisbury.

Gloucester is a mere end, rather than a front, which replaced a Norman façade of which all external trace has disappeared. The flanking turrets of the centre are prettily treated, but otherwise there is not much to be said for it. Norwich, perhaps, shows some indication of what Gloucester may have been. There is plenty of the original Norman work left, but so hacked about that it has almost ceased to be a design. It seems probable that it was originally something like Rochester, with a turret at the end of each of the four walls; but the turrets are much less boldly developed than at Rochester.

Worcester is another "end" which has replaced a Norman front. It looks picturesque standing over the river, but it is totally devoid of greatness of effect, and looks like the end of a parish church. The Decorated window was substituted by Scott for a Perpendicular one, as a rebuke to the mediæval architects.

Winchester is another "end," but it ranks much higher than Worcester or Gloucester, as it shows a consistent, well-defined, and rather massive treatment. The weak effect of the raking lines of the aisles, it may be observed, is much less felt with the flat pitch of late Gothic than with the roofs of earlier date; it seems to support the centre better. The design illustrates also the value of tracery for giving continuity and coherence to wall and window-space. There was, of course, a Norman front before this, which stood about 40 ft. westward of the line of the present front, but as to the cause of this alteration I have never seen any explanation suggested.

The Exeter front, of the middle of the fourteenth century, with a screen added half a century later, depends for its effect mainly on the sculpture; the screen fits badly on to the earlier composition, and is too palpably an afterthought. The whole is picturesque owing to the richness of the details, but as an architectural design it is fragmentary, and looks more so in the side view than even in front.

Southwell is an interesting example of a plain and simple Romanesque front, with a certain

North German character about it, of course much interfered with by the large late west window inserted in it. The timber spires are modern; I should surmise that the original ones were rather loftier than these. The towers represent the end of the aisles. The later upper stage of the north tower has an arcade of intersecting round arches, producing pointed arches at the intersection; the arcade in the same position on the southern tower shows pointed arches. In view of the idea that has been sometimes maintained (but which I entirely repudiate) that the notion of the pointed arch arose from the intersection of round arches, this juxtaposition is a curious coincidence; but unless we had any proof that the northern tower was completed first, it of course counts for nothing.

Lichfield is one of the most beautiful, graceful, and complete of all our façades; and though exceedingly rich, the decoration is so judiciously disposed that it does not suggest a sense of overcrowding; in this it is an instructive contrast to Salisbury, where the decoration is disposed without method, and consequently looks crowded and confused. A particularly good point in the design is the manner in which the whole is bound together by the small arcading just above the ground story, carried right across the front. The towers represent the end of the aisles, but are extended slightly beyond them. The sculpture is not nearly so architecturally disposed as at Wells; instead of filling the niches and forming a part of the lines of the architecture, the greater part of it seems only stuck on the wall in the middle of the niche, with very inferior effect. It is true that a great deal of this is modern ecclesiastical mason's sculpture, and much of it very bad; but I presume that it approximately represents the proportions and position of the original sculpture; Scott, who restored it, would at all events have seen to that.

Canterbury is a completely French type of front, but deficient in marked character and in grandeur of design. The northern tower was rebuilt in 1834, and the other one is much restored and refaced, but still they represent the original design. The towers are exactly coincident with the aisles. On the whole, the front is the least interesting portion of Canterbury, but the towers have the merit of fine proportion and line, though somewhat tame architecture.

York is the most completely French in type of all our cathedral fronts, for which reason it is the favourite with American architectural critics, who think everything French is better than anything English. It will always impress every spectator from its great size (for English work) and its stately completeness; but I think nevertheless that it has been rather overpraised. It shows none of the genius of Peterborough and Wells; it is very correct but not strikingly original. It is however a design very well and thoughtfully carried out in all its details; everything is very well proportioned; the great depth of the buttresses, with their rich arcading, is very effective, and the manner in which the whole is bound together by the string-courses and the band of decoration carried right round at the point just below the gable, is very good. The only serious fault in it is in the treatment of the strongly emphasised and projecting corbel table below the balustrade, with the weathering of the buttresses finishing against the wall just underneath, producing an awkward in-and-out angle at this point; the pinnacles beginning over again and entirely disconnected from the buttresses, to which they ought in fact to form a finish. It would surely have been better if the buttresses had been carried partly through the corbel table and the pinnacles connected with them.

In observing that it is (in every respect but this) a design "thoughtfully" worked out, it is necessary to realise that these towers are of three different dates. The lower portion is early decorated; above that to the roofs, is late decorated; the upper stages are late fifteenth century. The difference of dates is obvious enough when we come to regard the details; but it is certainly remarkable what care the builders of the later portions seem to have taken to conform the general lines of the towers to one design; so that at a distance and apart from the details they might very well pass for towers built all at once by the same generation of men. This is an unusual circumstance in mediæval work, where in general the builders of one age did not care the least whether they spoiled or contradicted the design of their predecessors; and it looks

very much as if the towers had been carried out from a completely preconceived design which was expressed in a drawing, and had been conscientiously followed throughout. If not, the complete harmony of proportion of the whole is very remarkable and indeed almost inexplicable. The gable, it may be observed, correctly represents the rake of the roof, and the towers exactly represent the aisles, not even showing the slightest extension beyond the aisle walls; a very tame conception as far as plan is concerned at all events.

Westminster Abbey front has been so knocked about and restored and refaced that it has little real architectural interest now; and perhaps its chief value consists in the fact that the upper portion of the towers is the work of Wren, and that they form at once an example of Wren's unflinching sense of proportion in general design, and of his utter inability to understand the character of Gothic detail, or its value. Whether Wren intended to erect towers in the style of the rest of the building, and thought that he had done so; or whether he thought that he was substituting a superior kind of detail to that of the barbarous Gothic, and did this intentionally, we can only guess; but I think the latter is the true reading, and that he considered he was improving Westminster by an addition in a superior kind of architecture.

These towers serve, however, as a transition to our one classic English cathedral. The front of St. Paul's is essentially the French type, with the towers extended considerably beyond the line of the aisles (not the full width however), and with chapels in their rear somewhat resembling, as already observed, those in a similar position at Ely. The real life of this front lies in those beautifully designed towers, among the best things which Renaissance architecture has produced; or rather, we should perhaps say, the upper stages to the towers, for the tower character is nearly lost below through the continuance round them of the two stories of orders, destroying their vertical effect; but when a man has once sold himself as a slave to the Orders they will exercise this kind of tyranny over him. It is a pity that by putting a clock in the circular opening of the south tower their symmetrical expression has been destroyed; those two openings were not, I fancy, intended for clocks at all, but simply as sources of shadow and effect. At all events, if there is to be a clock in one, they might as well put something else, say a barometer, in the other; instead of leaving a dark socket on one side and a fish-like eye on the other. The middle portion of the front does not express the structure of the plan; for though the second couple of columns on each side of the ground-floor portico is coincident with the nave arcade, the point is not emphasised in any way, at least not in the colonnade itself—the tyranny of the Order again, perhaps; but still it would have been quite possible to have treated these and the end columns differently from the rest. The deep recess of the centre of the portico has a fine effect of shadow, and reminds one how much this element is wanting in the flat treatment of the rest of the exterior. I have seen bitter criticisms made on Wren for the sin of using coupled columns,—a criticism which seems absurd; the coupled columns have a very good effect, and as a matter of construction they really afford a better seat for the entablature than a single column does. It can hardly be said, however, that this would be a remarkable front were it not for the cupolas; and they can perhaps hardly be praised too highly.

There is one point in regard to which, I think, the comparative consideration of the west fronts we have been looking at is very important in its bearing on our view of mediæval architecture. I have several times referred, in going through them, to their remarkable diversity in conception and treatment, a diversity much greater than that to be found in an equal number of the most important French cathedrals. This fact, it seems to me, is quite at variance with the theory, supported especially by William Morris and critics of his school, that Gothic architecture in this country was entirely the work of what we should now call masons; artisans working spontaneously on the ground of a common tradition. True, this common tradition is shown in details, which for each period are all on the same pattern. But if there were no influence but this, surely our west fronts, not to mention other important features of the

buildings, would also all have been alike at the same period. But, as we see, they were as different as possible; even startlingly different. When Peterborough wished to eclipse Ely, whose new front had just been finished, they produced a front so utterly different in architectural idea and conception that, as far as the general idea is concerned, one would hardly think the two belonged to the same country. What are we to gather from this? Surely that these various designs were each the work of one independent man of genius, evolving his own architectural idea from his own inner consciousness. There are those who will tell you that there were no architects then; it is even asserted that it is the architects who prevent there being real architecture now. I take that to be nonsense. It is only the name that is new. There was no one called an architect in mediæval England, but there were persons whom we should call architects if they lived now, and they designed the fronts of Peterborough, and Ely, and Wells. Those productions were no mere mason's work.

And in what consists the grandeur of effect, the impression produced on our minds, by such works as these? It is strange, if we come to think of it, that we should feel the impression of power and sublimity from erections so relatively small—mere dots in comparison with the extent of surface of the globe. It is not mere material size that does it. A small hill is much larger than a large cathedral, but it does not impress us so much. Imagine three natural caverns the size of the three arches of Peterborough; would they produce on us any special impression of sublimity? What is it then? It is the shaping power of human intellect that gives the buildings their effect; it is the expression of human aspiration that appeals to our sympathies. The soul measures things by its own standard. As Browning says in "Sordello":—

"A sphere is but a sphere;
Small, Great, are merely terms we bandy here;
Since to the spirit's absoluteness all
Are like."

The mere material scale of the building is the human figure: the grandeur of the Peterborough portico is not in its absolute size, but in its size relative to the mere bodily scale. The body can enter through a very small door; it is the soul that demands the expression of its dignity, its aspirations, in the great arches of the portal. For all architecture is a symbolism.

THE STATE OF LONDON STREETS.*

THIS day twelvemonth a most valuable paper on "The Insanitary Condition of London Streets" was read here by Mr. W. Nisbet Blair, the Engineer at that date of the Parish, but now of the Metropolitan Borough, of St. Pancras. It may be that this change of name has something to do with the invitation given me to open this discussion, for our new municipalities are recognising their enlarged powers and their heavier responsibilities, or it may be that the subject, always before us and always growing, has sprung up again with the promise of spring.

I refer you to Mr. Blair's paper, with nearly every sentiment in which I agree, for a great deal of useful information, the result of his large experience. My own duty is to occupy a more limited field. Like many more, I have always been compelled to rely largely on my own unassisted senses of sight and smell, and for me bacteria and bacilli might grow in peace until they were visible to the naked eye. If I ask you to agree with me that our streets are dirty and ought to be cleansed, it is because I can see the dirt and know that the means of cleansing are well within our reach.

I will not say, as some have said, that London streets are the dirtiest of any to be found in the cities of Europe, but amongst the great Continental towns that I have seen, whether capitals or not, there is nothing similar to them. In all such towns the streets, however they may be paved, are kept clean, chiefly by manual labour and the use of water, which, in summer at least, is employed, not only for washing away the slush or to keep down the dust, but for the pleasure and comfort of the man and also the woman in the street.

Let us see of what the dirt of the street con-

sists. A good deal comes from the wear and tear of macadamised roads, less from granite and wood pavements, least from asphalt. In some roads, particularly when there are tram lines, and on smooth pavements, there is a considerable amount of sand that has been used to prevent slipperness. All these materials are harmless or of small account compared with the great bulk, which is simply horse droppings, worked up by wheels into slush in wet weather and ground into dust in dry. In some streets of small traders and where costermongers congregate, there is a very serious addition of animal and vegetable refuse which would not exist if the law were properly enforced, or which can be and ought to be swept up by special arrangements.

I am disposed to think, from what one sees, that the London dog is getting either more numerous or dirtier in habits. The Local Authority which is responsible for cleansing the footways should pay special attention to this form of nuisance.

The slush, even in our best thoroughfares, except in the city, usually covers the roadway so that it is impossible to cross it without gathering up a material portion to be carried home, and either left upon the step or deposited on mats and carpets. The clothes are fouled either by the act of walking or by splashes from vehicles; this dirt is brushed off inside the house in the form of dry dust. The dust in the street, composed practically as I have said, is allowed to blow about in clouds that obscure the view, that are bitterly annoying to passengers, and that get into the houses at every means of access, chiefly by the window when it is open to admit the fresh air! I do not know what a bacteriologist would say as to its effect upon our stores of fresh and cooked food, but investigations comparatively rude may suffice. When shelves of slate and wood in the fishmongers' and hutchers' shops were being replaced with marble, I thought that what was good for the food while in their custody would be good for it in mine. Accordingly, I had the larder fitted with white polished marble. The next thing I heard was that dirt was coming through the perforated zinc as it had never done before; it was plain enough to see on the marble, though not conspicuous on slate or wood, and we had to try and stop it with a fine gauze. I do not think many of us realise the amount of sweeping and dusting that falls to the lot of the female members of every London household compared with what they would find in the country, besides which country dirt is clean.

These domestic trials are nothing to people who have plenty of space and plenty of help. It is the poor who suffer from them most. A dirty street in a poor neighbourhood is an unbearable affliction to the households that exist in it; the street is the only playground a poor child can have. I have had to act professionally and officially on property so situated, and have noted the flights of stairs up and down which children are always running with the dirt of the street upon them. It is impossible for any woman to keep her rooms clean or her children tidy against such odds. I am convinced that a main cause of the dirty and ragged aspect of many in our streets is traceable to such surroundings. There are those in our population, not necessarily dishonest or ill-behaved, who contentedly go about the streets in the garb and uniform of the tramp. If the streets were clean these could not accumulate so much dirt, and would be ashamed to walk about or ride in public vehicles in such rags.

I will give a few examples of the treatment of the streets of Continental cities. If you say that London is far greater, so are the penny post and the London and North-Western Railway and universal providers far greater than the agencies of our humdrum ancestors. Economy resides with those who grasp details and deal with them in a wholesale manner. And they are often very ordinary-looking people.

In Paris the street dirt is to a great extent washed down into the sewers, but the streets are swept where necessary. I have gone to the lowest localities on the south side of the Seine, where at night it would be unsafe to enter some of the houses, and have seen a man carefully sweeping the street. In the northern suburbs, the abode of poverty and reputed anarchy, I asked a man why he was watering with the hose a street that looked perfectly clean. He replied that he was watering it to cool the air.

* A paper read by Mr. Thomas Blashill, F.R.I.E.A., at the sessional meeting of the Sanitary Institute, on the 13th inst.

In Vienna they wash the streets three times or at least twice per day according to their importance. Every shopkeeper must wash his footway twice per day, or he is fined.

In Berlin to be dirty is an offence. The scavengers are dressed in clean white slops and uniform caps with smart leggings on account of the water, not of the dirt. They are as clean and respectable as postmen or policemen. This speaks volumes. Compare the rough clothes and the dirty occupations of our own scavengers.

In Prague, punctually to the minute, I do not know how many times a day two men with hand-truck and hose come down the street and wash the surface, though it may appear to be clean. In that ancient city they go into every alley four times every day, pick up the garbage, and clean it with water and broom.

In the busiest parts of Brussels the housemaid comes out and washes the footway with a house flannel as she might wash a kitchen floor. The most sober description of the scenes in any old Dutch town on a Friday afternoon or a Saturday, when the whole female population turns out to wash the fronts of the houses as high as they can reach by throwing and squirting, sounds like caricature. This is going away from the street, but the clean street is a civilising influence; it provokes to cleanliness within the house and without, and in the outer man at least—to go no further.

There is a fine street in Budapest twice as wide as some of our noblest. On a brilliant day I saw a sight not to be seen in any of our towns. A young man in the dress of a warehouse clerk, but with uniform cap, carrying from point to point four feet of hose-pipe, was sending up into the air the most delicate spray, more like a thick haze, so as to just wet when it fell the whole surface for 100 ft. round. Pedestrians did not mind it, the sun made rainbows in it; he was not drenched, but might have just wiped his fingers and gone anywhere, or kept any company within the range of such as he seemed to be. In Budapest many working women go barefoot on the streets, looking singularly bright and clean. In a full tramcar I saw an English lady offer to share her narrow seat with one of these rather than see her stand. Politeness that speaks all languages is, nevertheless, discriminating. I am not sure that this would have happened in the City-road.

Thirty years ago the condition of the roadways in London both as to paving and cleansing was a matter of serious consideration. Wood had been tried unsuccessfully for the time; granite was practically the only material, but it was noisy and exceedingly dirty. The Poultry, with 17,000 vehicles per day, and all the busier streets had to be left untouched between morning and night. Then asphalt, which had been used in Paris for several years, was introduced. I visited professionally the principal mines on the Continent to report on the manufacture and use of the materials. When we got asphalted streets the dirt was more than ever conspicuous. Just then some genius suggested constant cleaning by boys whom he called "street orderlies." They took up the droppings before they were dispersed by the traffic and put them in large baskets. When these were full heaps were formed beside them; often the baskets were kicked over. I took some interest in the matter, and sketched the design from which was made the "street orderly bin" that is now used on nearly all our asphalt roadways for holding the droppings, and may be seen in the chief Continental cities; any one has always been free to make or to use it. In Glasgow they have hundreds of receptacles sunk in the pavement. Sometimes trucks or barrows are used, as in Holland, where the town streets are admirably kept.

I am convinced that for town thoroughfares this is the only satisfactory principle. If the droppings get ground into dust they blow about and befoul everything; then comes the water-cart and more sunshine, the road gets dry again, and the dust reappears. In wet weather the material soaks up the water so that a slush is formed many times the bulk and weight of the droppings, expensive to gather up and worthless when got. If the droppings are collected fresh they will form a valuable manure—they will not form dust; the principal use of the water-cart will be to cool the air, and the rain will flow away freely into the sewers. Some sweeping will be required, but the work will be lighter. The work of a

scavenger should no longer be considered of a low class or even "unskilled"; it should be well paid, and made to attract respectable able-bodied men.

The horse-broom, where needed, should be used with discretion and kept in good order. Very often this machine leaves the surface in about the condition which it ought to present when the work is begun. These brooms may do the heaviest work, but they do not finish so well as hand labour.

The removal of snow is a process capable of improvement, but I had rather leave it in the hands of those who are responsible for dealing with it. All these practical persons say we ought to return to the old system of cleansing the footways by private residents. Do the public authorities offer enough pay for a very unpleasant and trying kind of work? When that has been tried and has failed, the matter may be fit for reconsideration.

I will only offer one suggestion as to the material for roadways. "Macadam" has its merits and its faults, but it is never carried out as the inventor intended. Stones that will pass through a two-inch ring and that are covered with dirt or boggin do not form a macadam road. I never saw one of these rings in this country. An old road surveyor used to test the size by making the stone-breaker put the stone in his mouth, an unsatisfactory and probably illegal measure of capacity. On one of the splendid routes in France I once saw a man carefully putting every stone of a small heap through a ring that seemed to be about 1½ in.—that is macadam. I am reminded by a paragraph in the *Times* of a scheme that has often seemed to me feasible. At the City of Hamilton, in Ontario, they have, after long experiment, adopted a macadam of limestone saturated with boiling tar. I should think that if broken granite of the size I have mentioned were mixed dry with boiling pitch, as is done with large gravel, and laid on a firm bed, then sprinkled with fine chippings and lightly rolled, a good hard roadway would be obtained.

Having expressed, as I do, a strong and unhesitating opinion that the dirt in our streets, apart from odious comparisons, has increased, is increasing, and ought to be diminished, I must venture one or two suggestions upon questions of practicability and cost.

When next I go to an old village, where in my youth the pillion survived on which my grandmother rode to escape the jolting of a wheeled vehicle over the rough highway; where, in my own recollection, every woman walked to church in her pattens; I shall go over the same highway, whether wet or dry, whether by day or by night, without obliterating on my boots the condemnatory evidence that, some five hours previously, I had picked my way across an important London street. This reform has been the work of pottering surveyors of highways and aboriginal road-menders; and shall the engineers of our twenty-eight metropolitan boroughs be restrained from the pursuit of similar ends?

Upon the question of expense I will quote the hateful and hostile evidence of my half-yearly parish rate, which shows that while I pay 7d. in the £ for schooling, with whatever there may be to show for it, the total cost of paving, watering, and cleansing is only 5d. And I ask whether we should really be brought to ruin by lavishing an additional 1d., or even a much begrudged 2d., on making usable and tolerable—and, at any rate, visible—the pavement that is supposed to be of gold.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—A meeting of the Sheffield Society of Architects and Surveyors was held in the School of Art, Arundel-street, on the 14th inst. The President, Mr. Joseph Smith, was in the chair. The winners of prizes in the competition promoted by the Society for measured drawings of old buildings in the neighbourhood of Sheffield were announced. Mr. H. W. Inott won the Society's prize of three guineas and the President's prize of five guineas; Mr. J. Miller the second prize of two guineas; and Mr. E. R. Bower's drawing was highly commended. The drawings will be displayed in the Montgomery Hall at an early date. It was unanimously decided to forward the following address to his Majesty in the

name of the Society:—"We, the President and members of the Sheffield Society of Architects and Surveyors, dutifully approach your Majesty to express our heartfelt sorrow at the lamented death of her Most Gracious Majesty Queen Victoria, whose pure life and noble character throughout the longest reign in English history have rightly endeared her name and enshrined her memory for evermore in the hearts of the millions of her subjects. We gladly testify here to her enlightened patronage during that long reign of the arts and sciences, notably to that of the ancient art of architecture, for which she has justly earned our lasting gratitude. We humbly tender our fullest assurance of loyalty and devotion to your Majesty, whom may God safeguard and guide long to reign over us."—Mr. H. H. Statham afterwards gave a lecture on "Our Cathedral Fronts: a Comparative Criticism," which is printed on another page. A vote of thanks was accorded to the lecturer, on the motion of Mr. Gibbs, seconded by Mr. Withers, and supported by Mr. Wigfull, Mr. H. L. Paterson, Mr. T. H. Waterhouse, Mr. Fenton, and the President.

BRISTOL SOCIETY OF ARCHITECTS.—The ordinary monthly meeting was held at the Fine Arts Academy on the 11th inst., Mr. F. W. Wills in the chair. Before the business of the meeting the President alluded in feeling terms to the death of Queen Victoria, who, as patron of the Royal Institute of Architects and the donor of an annual gold medal for the promotion of architecture, was directly connected with the profession. Quite apart from this personal side, the President dwelt upon the great loss the nation had sustained, and which has been so universally felt and acknowledged. After the routine business a paper was read on "Church Restoration" by Mr. C. H. Samson, F.R.I.B.A., of Taunton. The paper, which was the outcome of many years' experience as a diocesan surveyor, dealt very fully with the practical work of church restoration as applied to the fine old village churches to be found in West Somerset. The lecturer strongly advocated the preservation of all old work, and insisted that any necessary new work should be simple in character and of the very best materials. A collection of drawings of churches was exhibited. Upon the motion of Mr. Joseph Wood, seconded by Mr. Cyril Thompson, a hearty vote of thanks was accorded Mr. Samson.

EDINBURGH ARCHITECTURAL ASSOCIATION.—This Association visited, on the 12th inst., the City Observatory, Calton Hill. The party numbered between twenty and thirty, and they were conducted over the buildings by Mr. William Peck and his assistant, Mr. Ritchie. At the outset, Mr. Peck gave a short history of the Observatory buildings, the original design of which was by Playfair. The various transit and other instruments for determining time, instruments for measuring angular distances, equatorial instruments, and reflecting and refracting telescopes were described and their uses explained to the party, special attention being directed to the constitution and working of the domes.

DUNDEE INSTITUTE OF ARCHITECTURE.—A meeting of the student section of the Dundee Institute of Architecture was held on the 9th inst. in the Technical Institute, Mr. P. H. Thoms, President, in the chair, when a lecture was delivered by Mr. J. Donald Mills, architect, on "Some Staffordshire Buildings." Mr. Mills commenced by describing some characteristics of the natural features of the county. Part of the county contains some exceedingly picturesque scenery, and is altogether outside of the "Black Country." After a short résumé of the history and archaeology of the county, Mr. Mills proceeded to show a selection of lantern slides, drawings, and sketches illustrating some of the beautiful and interesting old stone manor houses, village churches, and other buildings, including the following examples, which were described:—Lichfield Cathedral, Ashbourne Church, Wootton House, and Moreton Old Hall. He also crossed the border into Derbyshire, so as to include Haddon Hall. Reference was also made to some modern buildings of note, such as All Saints' Church, Leek, the work of Mr. Norman Shaw, R.A., and the Monastery of St. Bernard, by Pugin.

THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.—A general meeting of the members of the Royal Institute of the Architects of Ireland was held recently at the Institute rooms, 20, Lincoln-place. In the absence of the President, the chair was taken by Mr

J. Rawson Carroll, F.R.I.B.A. The following resolution was adopted by the meeting:—"We, the members of the Royal Institute of the Architects of Ireland, in general meeting assembled, desire to express our profound sorrow at the death of our revered and honoured Sovereign and Patroness her Majesty Queen Victoria, and to convey with loyal and dutiful respect to his Majesty King Edward VII., the Queen Consort, and the other members of the Royal Family, our deepest sympathy in their great bereavement." The President and hon. secretary were requested to take the necessary steps to have the foregoing resolution brought under the notice of the King.

Illustrations.

STUDY OF AN INDIAN HOUSE.

THIS is a reproduction in monochrome of one of the coloured drawings which gained for their author, Mr. Hervey Rutherford, the Owen Jones Studentship of this year.

It shows part of the façades of two dwelling-houses built of teak wood, carved and painted. They are seventeenth-century work from Ahmedabad, Guzerat.

FIREPLACE, HOTEL-DE-VILLE, AUDEGARDE.

This illustration is from the numerous collection of sketches which gained for their author, Mr. H. W. Cotman, the Institute's Pugin Studentship this year.

In regard to the subject itself, Mr. Cotman writes:—

"This late Gothic fireplace was executed by Paul van Schelden during the regency of Margaret of Austria, and it is interesting to compare it with his well-known doorway screen which forms the entrance to the Council Chamber, in which this chimney-piece is.

Its date is 1529, two years earlier than that of the Renaissance portal. It will be noticed that the Austrian eagle of the Empire forms the device of the centre shield in the lower part, with the collar of the Golden Fleece and the Imperial crown. The eagle occurs again in the left-hand panel of the upper part. The shields to the left and right bear the lions rampant of the Court of Flanders and Dukes of Burgundy. The blazoning of these shields is kept bright by fresh paint.

The figures under the canopies to the left and right probably represent Justice and Truth, with Our Lady under the centre one, bearing in her arms the Church of Notre Dame de Pamele of this town with its octagonal centre tower.

The hexagonal canopies are similar in design to those on the exterior. The chimney-piece, which is similar to the one below in the Salle des Pas Perdus, is in excellent preservation. The fireback and dogs are somewhat later in date, as the inscription shows."

DESIGN FOR ENTRANCE GATEWAY TO A PUBLIC PARK.

This design, by Mr. Walter Fairbairn, of Edinburgh, is the one to which the Council of the Institute this year awarded the Tite Prize, instituted for the encouragement of the study of Italian Renaissance architecture.

We have already expressed our opinion on this and most of the other designs submitted, in an article on the Students' designs in our issue of January 10.

The author writes:—"In preparing my design I was undecided at first whether to have one large gateway or a double system with a separate entrance and exit. I decided on the former as being more suitable for a large and imposing treatment (although more difficult to keep in scale), and also fulfilling the traditional idea of a gateway better than the latter."

ROYAL MASONIC INSTITUTION, WOOD GREEN.—We read that the Governors of the Royal Masonic Institution for Boys are about to vacate their premises at Wood Green which have been acquired for purposes of the Home and Colonial Training College, in Gray's Inn-road. New schools for the Royal Masonic Institution are being erected at Bushey, Hertfordshire

THE ARCHITECTURAL ASSOCIATION : THE BASIS OF GOTHIC ARCHITECTURE.

An ordinary fortnightly meeting of this Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., the President, Mr. W. H. Seth Smith, occupying the chair.

The minutes of the last meeting having been read and confirmed, and Mr. M. N. Castello having been elected a member,

The Chairman announced that a special general meeting would be held on Friday, 8th prox., when the Committee's scheme for the establishment of day classes in connexion with the Association would be submitted to the members. The scheme had been drawn up by a strong education committee, and had been adopted by the general committee with a few amendments; but in accordance with the by-laws it is necessary to bring it before the general body of members before it can finally pass.

The Chairman then called upon Mr. E. S. Prior to read a paper on "The Basis of Gothic Architecture," of which the following is an abstract:—

Mr. Prior said that so recently as last November they had heard such an able paper by Mr. F. C. Bond on English and French cathedrals,* accompanied by many illustrations of the beauties of Gothic art, that he felt he ought almost to apologise for again bringing the subject before them; but there was this advantage in following Mr. Bond: that he could ask them to recall the beautiful lantern illustrations they had seen on that occasion. No doubt an inquiry into the basis of this beauty would incline to that psychological side of art which many people considered a region of barren speculation, where one wandered in the quest of conjecture. For was there such a thing as beauty in Gothic art, or in anything else? Tolstoi, in his recent work on art, said that beauty in art was a phantasm, but he (the speaker) would beg that question. What if beauty had for ever hid her face? Still the love of beauty must be admitted, and it existed as a force to be counted on, for from this love of beauty came the emotions which expressed themselves in creative work. Was it not human nature that we counted that beautiful which we loved?

That was as far as he intended to go into the region of speculation, and he would ask them to swallow no more metaphysics, but turn to the practical question: Who really were the creators of Gothic beauty—whose love of beauty made the beauty of Gothic art? It would be conceded, he trusted, that the Gothic creation was one of a very marked kind, having a distinct geographical range which was sufficiently remarkable apart from the art and science of it all. To the separateness of the Gothic style (which was equally astonishing) we should be more alive were we not saturated with the modern revivals of it. The life of the Middle Ages was all coloured and transfigured by the glory of a distinct Gothic creation; the mediæval city was distinct of its kind among the cities of all ages—not only by its laws and government, its customs and morals, but still more by its saturation with an active art that affected everything. It was the exact reverse of the hole-and-corner successes of individual art faculties. In mediæval life every art and every craft was to be seen under a dominant emotion, and it was this aspect of a specific energy making everything beautiful—in a word, the passion of it all—that was, to his mind, the most significant fact of Gothic art. Anyway, that art had aroused almost endless discussions and given rise to many theories, some of which he proposed to discuss in order to see how far they accounted for the wonder of this Gothic style; and he would divide them according as they alleged causes affecting the whole body of the community, or as they indicated individuals as being the creators of art.

For example, the religious theory might assert generally that art was the handmaid of religion; or, on the other hand, that the exaltation of religious sentiment in the artist made him a gifted designer. These two sides were capable of being separately weighed, and we were entitled to ask, when the beauty of any work was laid at the door of faith, whether the general condition of the com-

munity or the personal faith of the artist was brought into court. He proposed to deal in some degree with the personality of the mediæval artist, and would endeavour to show that this personality constantly eludes us, so that it must have counted for little and could practically be disregarded. Even to-day, with our practice of individual art production, it was difficult to maintain that men of noble mind, or of religious faith, or of any particular training, by reason of such endowments, achieved great art; and in mediæval records there was no evidence to suggest that noble aspirations led to anything like our modern individualism.

Mr. Prior then proceeded to discuss the three following theories of the origin of Gothic art, viz., the Ecclesiastic, the Freemason, and the Architect, though he said he did not suggest that such classifications were exhaustive. That which he nicknamed the Ecclesiastic theory would derive the growth of mediæval art from the personal faith and character of the religious orders—the monks, canons, and friars who were in the heyday of their influence and importance. Was it possible to associate in a personal way the members of a religious order with the designing of Gothic art? Most certainly that art arose in the building and decoration of houses and churches for monks, canons, and friars, and the history of Gothic art was mostly written in abbeys and cathedrals. The supposition of the Ecclesiastic theory was that in these ecclesiastics we had the personal creators of the Gothic style—this idea during the last fifty years appearing in the views of many writers, including at one time Street, who thought it "sacrilegious" to question it—for we had only to revive a similar state of society as existed in the Middle Ages to achieve a like distinction for our architecture to-day. This, of course, was the special pleading of a religious revival, and outside such propaganda, what was there in the records to connect great ecclesiastics with building? It could not, with any show of probability, be contended that fierce soldiers and busy politicians, like Bishops Roger, of Salisbury, and Pusey, of Durham, could have been the personal designers of the great churches. Everything tended to prove that the bishops hired their builders and masons to carry out their building work: there was no evidence to show that what we call the design of a building lay with the authority that ordered it. He believed that no English document remained to tell us that ecclesiastical authority set out the ground plan even of its churches. It was probable that it did so by word of mouth, and perhaps in draught, though there was nothing to indicate this last. There was no doubt that the cleric dictated the general ideas of what the building was to be, but that was not what we mean by personal design nowadays. In the origin of the great Gothic buildings the ground plan was very much prescribed by tradition, and what followed was the work of accomplished masons, well exercised in their craft. That was radically different from the system of individual designing. The religious control so far was only the dictation of what was to be built, although it entitled certain bishops to be called the builders of their churches. Mr. Wyatt Papworth had so thoroughly sifted all the mediæval material at hand as to the appointment of ecclesiastics for the management of building, that it was only necessary to read his paper in the 1887 "Transactions" of the Royal Institute of British Architects to feel sure that no designing function as an artist could be indicated in posts which were held by poets like Chaucer as well as by bishops like the Bishop of Salisbury. Still there were certain references to the personal intervention of ecclesiastics in regard to building which should not be passed over, and they were found in our earliest records. It is significant that the earliest missionaries to our ancestors in the seventh century introduced workmen into this country to build in stone in the Roman manner. There were indications that St. Augustine brought such workmen from the Continent; and Wilfrid of York, sixty years later, may have got them to build at Hexham and Ripon. Thereafter the reputed saintliness of building craft remained for some five hundred years in mediæval tradition, as can be shown by many entries in the records.

In the foundations of mediæval society, faith and civilisation were walking hand in hand. But in the making of Gothic the personal sentiment of religious life was not discoverable and no more could the personal skillfulness of

the masonic guild be found therein. This latter theory had been revived by an Italian writer, Merzario, whose researches have been introduced to us in a recent work by "Leader Scott." It was, however, Thomas Hope who, in 1835, had started the idea, and in 1852 Macaulay told Mrs. Beecher Stowe that all the cathedrals of Europe arose nearly simultaneously, and were built by a body of freemasons.

Mr. Prier, having referred in some detail to "Leader Scott's" book, "Cathedral Builders," said that if any one should be charmed by the symbolist interpretation of ancient documents and inscriptions by which that work made out the Comacine Guild, he would ask them to read chapter xxi. of Thomas Hope's Historical Essay, and then turn to the actual records in order to test the accuracy of this theory of the universal domination of the guild. For example, Geware's account of the rebuilding of Canterbury choir indicated no dominant authority of freemasons, but only that the monks appointed and organised the workmen. They were hired and dismissed, as the case required. As Street, from his examination of the Spanish archives, declared against the freemason theory, so Wyatt Papworth says that the earliest records of the local guilds of masons showed that they were not under any central masonic organisation. There was little proof either for Merzario's theory that Italian masons had a guild with a dominant authority during the thirteenth and fourteenth centuries. Was there, then, no brotherhood of masonry, no mystery of craft? The craft of masons had, of course, its methods and secrets; and there was this interesting point with regard to mediæval masons, viz., that it was by reason of their stone carving that they established themselves as the chief experts of Gothic building. Stone constituted the bone and flesh of Gothic building. Christianity introduced the ambition for chiselled stone, and it was the stone-dressing workman who came to be the ruler over the other workmen, and the knowledge of setting out necessary for his craft made him the acknowledged expert for the setting out of the building. So the master mason's craft marked him out as the ruler of Gothic architecture. His idea of proportion, though based on the easiest manipulation of compass and square, had a sacredness on which he could establish the mystery of freemasonry. But such could hardly be reckoned as the essence of Gothic work, and this little geometrical knowledge was not what we mean by personal quality in the work of individual architects.

With the Renaissance in Italy appeared the scholar architect, but the Architect theory would undate this event some five or six hundred years, and would make the beauty of Gothic buildings depend on the architect in the sense that it does to-day. No doubt the word might be used generally for any human agent of architecture; but what was meant now by the title was a specialist architect who designed buildings and had them carried out by builders. It could be said of the Middle Ages, that we do not know where the architect ended and the builder began. To-day the functions of architect and builder were separated by definitions which allowed of no confusion. Both terms in this sense were of comparatively modern origin; the term "builder" came into use early in the nineteenth century, and that of "architect" in England in the last part of Elizabeth's reign, and it was clear that any transference to ages long antecedent of the terms which these terms had been specialised to convey must create confusion. It was obvious, and yet it was forgotten—of only by the vulgar and unlearned, but by scholars, and the idea of the personal individual architect governed most views on Gothic architecture. Even with Street, in his "Architecture in Spain," all through his sympathetic description of mediæval cathedrals, it could be seen how he thought that the architecture he is describing came into existence as the result of personal genius like his own, and he recorded the excellences and peculiarities of the arches he described as essentially the result of design, and not of growth, and as if a set of wings signed by an architect was responsible for them. It was wonderful that Street could speak of the mediæval *magistri* as though they were architects like himself, when his own complete analysis of the documents shows how complete was the difference.

If, then, there was no class of "designers" in mediæval times, was there no drawing of a building? He had already referred to plan-making which existed in the great

creative period of Gothic art, and if any one called that plan-drawing "designing," he was welcome to that opinion. In England we did not find our mediæval buildings copied one from another in the large matters of design, though in the Ile de France, as Mr. Bond had shown, the church buildings were copied a great deal. Now the point of his inquiry had been as to whether the capacity of the personally-designing architect could be accepted as lying at the root of Gothic excellences. Such transcripts of existing work by master masons went straight for his point, since they were carried from place to place for the purposes of reproduction, and the decadence of such copied work is, as Mr. Bond pointed out, very evident. There was clearly no room for the architect as we know him—the trained imaginer who planned the shape, construction, and detail, so that the workmen following him could carry it out. Plan, construction, and beauty in mediæval building were not matters of any one's fancy to be put this way or that as the modern architect wished. Such things were not at the mercy of the designer-architect; the plan was set by an authority which brooked no deviations. The construction of buildings in each period of the Gothic style was carried on by practical masons, who were not turned aside by considerations of design.

The personality of the one-architect theory must therefore be dismissed, and the broad basis of Gothic architecture must be considered to be due to environment and habit. It was because it was due to cosmic forces that Gothic art seemed to be so transcendent. But Gothic art did not stand alone in that position. Separated by centuries, there were, besides the Gothic, other eras in which man had shown himself an inspired creator; and looking at the matter in this way we could see the ebb and flow of cosmic art—the creation of distinct styles, such as Egyptian, Byzantine, Greek, Gothic, &c. He knew, of course, that the coming and going of art was by many correlated with the phases of religious faith. It was held that at the times of great art there was great life, when the whole vigour of man's nature spoke with a full voice. But he could not see as far as that; the phases of great creative expressions of art seemed independent of great religious fervour or great nobility of life. Great art and great life had on occasion coincided, as had bad art and bad life, but such coincidences were marred by others of very doubtful interpretation.

He had shown that the distinction of producing Gothic art could not be assigned to the personality of one particular class—ecclesiastic, freemason, or architect. Still, it was clear that building work could not continue as the common habit of the community, and it became delegated to a class of craftsmen, and there arose a building class, although for some time after the monks continued to do their own building. The expression "architect" once meant the whole community; then the whole body of craftsmen; and now it was parsimoniously applied to the single designer who had monopolised the name. Gothic art was great because it was not individual but cosmic.

The Chairman, in inviting discussion, said they had had a great intellectual, archaeological, and artistic treat. Mr. Prier's work was full of freshness, and raised points in their minds which were of great interest and importance to them as a profession. Mr. Prier's views were startling sometimes, but they were always worthy of the very closest investigation.

Mr. G. B. Carvill, in proposing a vote of thanks to Mr. Prier for his eloquent address, said he could not altogether agree with the theory of not having an individual architect. It seemed to him incredible that Lincoln Cathedral, for instance, should be produced from a ground plan by a body of craftsmen, and he thought that a drawing of some description must have been used. He could not see how a craftsman could set out a piece of masonry unless he had had something to go upon, and he thought that the *magistri* who had been referred to must have been something of an architectural ghost, and knew a little more about what was going to be put up than what we were given to understand.

Mr. G. H. Fellowes Prynne, in seconding the vote of thanks, said that anyone who had heard the lecture that evening and who had read Mr. Prier's book would recognise the same warm enthusiasm for the subject he had in

hand which made both his reading and writings so interesting to those who heard and read them. It was impossible to speak on such a paper with any positiveness and in any detail without having considered the paper previously, but, in a superficial way, he might say that the theories they had put before them must give them rather a shock. Of course, the discussion as to the existence of these craftsmen and freemasons had been going on for some time. Undoubtedly guilds of craftsmen did exist, but he could not help feeling that what Coleridge said was true, viz., "that the architecture of our churches was simply the expression of religion." He could not help feeling that the religious life of the middle ages made itself felt in every single detail of the buildings that were erected, and he could not conceive that Salisbury Cathedral, for instance, did not have one mind starting the idea of its plan, and seeing to the whole scheme—not perhaps as the professional architect saw to it now, but nevertheless guided throughout by one master mind. That guiding in particular showed very strongly the mind of one man marked throughout. He felt inclined to say "What's in a name?" It did not matter if it was the architect to-day and the *magistri* in the mediæval days. One felt that we were growing gradually from what had existed, but we could not believe that such an absolutely different system existed in mediæval times. Of course the professional idea did not exist in the middle ages, but the same system, to an extent, to a master mind designing and controlling the erection of a building must have existed then, and indeed since building itself existed. He quite felt that Mr. Prier had given sufficient proof of the influence the monks had had on ecclesiastical art; they made it part of their religious life to work in churches. Take a church like Woodstock—a little church where one saw in the carving almost the expression of the monks when they did the capitals of that building—so real was their interest and pleasure in the work they were doing. That sort of nobly religious and sympathetic feeling was certainly not brought about only by outside masons brought from abroad, though there was no doubt the monks were often helped by them, but the work was taken up by the ecclesiastics of the time, and made part of their religious community life. He could not help thinking that the strong distinction Mr. Prier had drawn between architect and workmen of to-day, would not apply very much to the past. The architect undoubtedly was much more of a workman, and no doubt put his hand to the chisel; still, he was the man who conceived and drew the great scheme. He (the speaker) was glad that the subject of Gothic architecture was not being neglected by the Association. The idea that Gothic architecture was dead had got about recently. In one sense, perhaps, that was true, but Gothic architecture could never be dead. It had much more vitality and life in it than to be killed by the fads and fancies of the modern day. He expressed the hope that the study of Gothic architecture would not be neglected by students, and that the great spirit which had brought about such exquisite art in our country—which we could almost call national art—would not be neglected. He spoke as an enthusiastic lover of Gothic work.

Mr. H. H. Statham said he was rather in opposition to the views of the lecturer, to whose paper he had listened nevertheless with great pleasure, as the work of a cultivated and thoughtful mind. But he could not understand the anxiety there seemed to be amongst some people in the present day to make out that there was nothing in the middle ages analogous to the architect as we thought of him. It was amusing to him (the speaker) in another way, for only the previous evening, in a paper on the west fronts of English cathedrals read at Sheffield, he came to the opposite conclusion to that which Mr. Prier had tried to establish. When Mr. Prier referred to what he called the tame repetition in the design of some of the French cathedrals, he (the speaker) agreed that there was far greater variety in the design of English cathedrals. But let them look less at mere documents and more at the internal evidence of buildings. He did not see why it should be assumed that the person whom we call "architect" in modern times did not exist in the middle ages because he was not known by that name, and he did not see how some buildings would have got their very remarkable individuality except from the imagination of one mind. He would suggest that the real difference between the

architect and the mason was something like the difference between the sculptor and carver; the sculptor must be able to carve with his own hands, but he also imagined the figure; whereas the carver only reproduced from some well-worn model. But was not an architect a man who thought in stone, and thought out his conceptions? and a mason the man who knew how to set that out and put the stones together? Mr. Prior had referred to two or three cases of people who were given certain advantages because they were good builders, not because they were good designers of buildings. Did Mr. Prior mean to tell them that Bishop Gundulph put on the apron and worked with the chisel on the stone? If not, what did he do? Did Gundulph go about and tell the others what to do? If so, how was that essentially different from making a drawing and giving directions on paper? which, after all, was only an easier way of showing the workmen what to do. Coming to illustrations of individual work, there was one instance which appeared to him almost conclusively to prove the exercise of the individual mind, and that was the remarkable case of the west fronts of Ely and Peterborough Cathedrals. In Ely we found a west front which was totally different from anything to be found in England; it was a screen front of an Italian type, with a centre door. There was evidence to show that at the time that was built the front of Peterborough was much less magnificent than what it is at the present day, and it was clear that the present front was commenced just at the time Ely was being built. When the people of Peterborough saw what was being done at Ely, they became dissatisfied with their own west front, and they introduced a new and magnificent design in front of the old—the design of the three magnificent arches which we now know. Could there be two such features so absolutely different as the front of Ely and the front of Peterborough, carried out within a generation of each other by people who could almost see one building from the other, unless there were an individual designer in each case? He did not see how such a result could be possible if those two buildings were produced merely by a number of masons. From whose head did the conception of those three grand arches at Peterborough come? for it must have come from the head of some one man; he may not have been called an architect, but he must have performed functions similar to those which the architect of to-day carried out. The mistaken idea seemed to be that because no such name as architect had been used, except once or twice, and then in a different sense, there then was no such person as an original thinker in mediæval building. As to the traditional treatment of mouldings and ornament, it was perfectly clear that there was a school for that kind of work, and one found the same kind of mouldings everywhere; but in regard to the west fronts of our cathedrals, there was great variety of conception and treatment. It was impossible to imagine that being so without admitting that one mind in each case conceived the idea and gave the instructions to carry it out.*

Mr. Francis Hooper said he had the pleasure, when studying in Yorkshire (which he regarded as the home of the most beautiful Gothic work), of meeting the late Rev. Mackenzie Walcott, who was studying in connexion with a book on the Cathedrals and Convents of the country. One may learn a great deal from a lay enthusiast, and the Canon seemed able to throw those he met back into the Middle Ages, so great was his grasp of, and intimacy with, the life of the monks; and he described many of the characteristics and habits of the Cistercians and Benedictines, explaining why the buildings they occupied differed in plan and arrangement. He (the speaker) believed he was right in stating that the Canon explained the methods of work and the tradition which was followed in those days as the migration of workmen collectively from one building to another. That any body of workmen could move and work without a responsible head seemed to be absolutely impossible, but with that head everything seemed simple; and whether he was called by the name of master of the work or by the Greek name of architect seemed to be of very little consequence. No doubt he was frequently in holy orders. If

he commended himself to his patrons, he and his fellow-workers were invited to undertake work elsewhere, so taking traditions from one place to another, but always working under the master mind. All would recollect the extremely interesting speech made by the late Bishop of London on the occasion of their annual dinner—how he explained his theory in regard to the increasing magnificence and the progress of church building in this and other countries, and in an interesting way how he showed that the progress of the art of architecture was largely due to the rivalry of the religious houses. Gothic work was almost entirely confined to church work, and implied self-genial, which, in our commercial age, scarcely exists. Men in those days delighted to devote their whole lives to their work, believing in principles which are foreign to many people of the twentieth century. He (the speaker) believed that the late Mr. Pearson used to send from one building to another the same set of workmen of a given employer who worked for him thus again and again. Such men became intimate with each other, and knew what the architect wanted, and he knew what they could do. He believed the late Mr. Sedding did much the same among his Cornish churches. In restoring those churches he often went to the same builder, and the same workmen were employed again and again. This seemed a modern parallel of what was done in the Middle Ages under different conditions, and appeared a possible way out of present-day difficulties. There were many difficulties in producing good architecture to-day, but, fortunately, there were many men who could do uncommonly good work in spite of all. The tap-root of the difficulties was commercialism, work being generally given to the man who tendered lowest.

The Chairman, in putting the vote of thanks to the meeting, said that the paper was a delight and a pleasure, and not for that evening alone, but would be so during excursions and holidays, enabling them thoroughly to enjoy the work they devoted themselves to. There was an old print in the British Museum of the supposed architect of St. Albans showing his design to the King. What did Mr. Prior think about that? It was rather discouraging to hear Mr. Prior's remarks about sketching; if they had to abandon sketching, they would do so with very great sorrow. In Mr. Prior's view our professional system must be radically changed if we were to have a national architecture again. How was it to be changed? The modern architect was a development, and he appeared to be still developing, and it would seem to be impossible to change his present constitution—certainly not suddenly. One or two lessons might be learnt from Mr. Prior's paper, and they must be perfectly clear to every one. One was that architects must be content to leave more to the craftsman, both as to the work and as to the design, though it appeared to him (the speaker) that the architect must keep a general control so as to get harmony throughout his building. Then we must have what Mr. Prior beautifully described as the passion for building. They should get thoroughly saturated with the love of architecture, with the beauty of it—as an Association or Guild—in order to bring about its promotion. It seemed to him that architects should do everything in their power to stimulate public opinion as to the importance of beauty in architecture, and he was quite sure that nothing like the care and thought and effort had been devoted to that particular point which might have been. It was true that something was just beginning to be done, and, in his opinion, the University Extension Lectures were doing more than anything else at the present time to help on a national appreciation of architecture. He thought that Mr. Hooper's point as to the practice of the late Mr. Pearson and the late Mr. Sedding in regard to the employment of the same builder was a very good one. If that practice was more extensively followed there would be a greater chance of getting a sort of continuity of work and developing ideas which were good.

The vote of thanks having been heartily agreed to,

Mr. Prior, in reply, said that he quite agreed with Mr. Carvell that it was an astonishing thing that Lincoln Cathedral should have come into existence without being designed on paper, as we design nowadays—that was, it was strange to those who had been brought up with the idea that buildings must be set up in that

way. From that standpoint it seemed absolutely incredible that a building like Lincoln should come into existence by mason-craft instead of by architect-craft. But he thought it would appear less extraordinary if they considered the circumstances a little. Lincoln remained almost the sole example in that part of England of the work of the last part of the twelfth century, for the destruction of Lincolnshire abbeys (which were mostly founded in the twelfth century) had been almost complete, so that cathedral stood almost alone, as if it had come ready-made out of somebody's mind. But really there can be little doubt that the style of Lincoln Cathedral had been prepared for in other works carried out by masons. There had been an ancestry of working masons, who carried out the work of Lincoln Cathedral not so much as an entirely new thing as it appeared to us. Mr. Prynne made some remarks which no doubt he thought were in opposition to his (the speaker's) views, but, as a matter of fact, he was very much in accord with those views. Mr. Prynne spoke of the pleasure it must have been to the monks who put their heads together and carried out certain pieces of sculpture. He was quite of that opinion, too, and he thought that the first work of the Cistercians, with their working communities, was the building of their churches; but at that time building was a common thing; it was part of the work of the whole community, very much as building is in the backwoods of America to-day—everybody coming to help when a building is put up. He did not say that; that was so all through the Middle Ages; it was evidently so only at the beginning, when society was on quite a different footing from what it was now. There were not the grades that we had now, and it was no more degrading to a monk or a bishop to handle a trowel than it was to-day for the farmer in the backwoods to put up his log hut. The idea that the work must have been carried out by inferiors in the times he spoke of was not justified at all by the evidence. [Mr. Statham: Did Bishop Gundulph work on his own building with his own hands?] Certainly, but not all day. When the chronicler referred to him as working with his own hands he meant that it was saintly to build. Mr. Prynne also referred to the difficulty of understanding how Salisbury Cathedral came to be built except from the designs of a personal designer. Well, we knew very much how Salisbury Cathedral came into existence, how the Bishop decreed it, how the administrator had charge of it, and how the mason ruled there for twenty years; and therefore Salisbury did afford evidence of one man's mind in this foreman of masons, and Salisbury was the most monotonous of English cathedrals he knew of. But did that singleness of mind make up what we call an architect? It did not seem so to him, and he regarded it as an accident in the making of the cathedral, which made it duller than it otherwise would have been. Mr. Prynne also suggested what was very far from his (the speaker's) mind, that we English introduced masons from abroad to do our buildings. Except in very early ages—before, in fact, building had taken any hold in England—this was not the fact. The introduction of stone building must have come from somewhere, and he thought the evidence was strong that it came in from abroad after the seventh century, when the missionary bishops first brought Christianity to England. That was a different thing, however, from saying that our masons were continually being brought from abroad, for the cases in which that had occurred were so few that one might disregard them. Nowadays we thought that plan and design must go together; so we had difficulty in seeing how, in the Middle Ages, plan and mason craft were not one thing, but two. Mr. Statham had a very distinct way of looking upon the art of architecture, and he clearly thought that it was by a sort of intellectual process that the elements of art were brought into a certain form and produced a certain result. It might be an incapacity on his (the speaker's) mind in understanding what intellect is, but he did not agree with that view at all. Art ends when intellect begins, and he had not the least doubt in regard to the difference between the west front of Ely and the west front of Peterborough, that there was some intellectual mind at work which thought that those three great arches would look very fine at Peterborough, but he did not think this process of intellectual conception made the art

* These remarks are nearly a repetition of those in Mr. Statham's paper read at Sheffield the evening before, and also printed in this issue; but as Cuddie Headrigg said, "A gude tale's name the waur o' bein' twice tauld, and a body has aye the better chance of understandin' it!"

of Peterborough. It lay in the whole shape—in the feeling, expression, sculpture, the whole of the building, and not in anything which could be called a designing process, such as an architect now is perfectly capable of doing. He believed there was in the case of Peterborough someone who had to determine that sort of thing up to a certain point, for there were contracts which showed how authority settled how many feet broad or high a building was to be, and no doubt there was some one at Peterborough who decided there must be three arches. [Mr. Statham: That is all I want.] Yes, but the points of view were different. In regard to what McKenzie Walcott had said about companies of masons going from one church to another, it was almost certain, from the records which remain, that that was the case. But he had not found the least evidence that these masons went from place to place under the headship of a master mason whose designs they carried out. [Mr. Hooper: Canon Walcott did not mean that all work was done so; no doubt local men were employed in some cases.] The masons might have gone to and from abbeys in Yorkshire, for instance, but he did not think there was any evidence to show that they migrated from Yorkshire to Devon, for there was such a difference in the different crafts in the different parts of the country that it did not seem possible that masons could have travelled systematically as a body, except perhaps in their own county. In reply to the chairman, he had to confess that he had not seen the drawing of the architect of St. Albans handing his design to the king, but he might mention that Viollet-le-Duc, in the frontispiece of his book, showed a mediæval architect dictating his plan to the monk, but no document or record remained to support this relative position. The evidence was the other way—that the monastic authorities—the bishops, canons, and monks—held a tight hand on their masons, and there was no dictating by the mason to the authority; he had to do what he was ordered. Wilars de Honne-court was well known by his book of drawings—his sketch-book as it was called. He believed there were eighty-three of these drawings, and nearly two-thirds of them were drawings of the figure, nearly half of the remainder being drawings of "machines" for various purposes. One was a drawing of a lectern on which, he wrote, "This is the best sort I make." Then there were drawings which were copies of well-known places, chiefly bits of Rheims. In all the drawings there was only one thing which had not been copied, and that was a plan, as to which he wrote, "I designed this"—designed, invented, or whatever they liked to call it—"with Peter de Corbie in dispute with him." Evidently the sketch-book was not the sort of thing we were accustomed to nowadays, and it was really no proof that the masons made drawings from which buildings were erected. The whole point of his inquiry was whether in the Middle Ages there was a class of designing architects; there may have been people who supplied ideas for building as architects do now, but the real architects were the masons who worked with their hands and carried out what they thought. No doubt, as Mr. Statham had pointed out, there was a difference between the sculptor and the carver, and so in regard to the erection of buildings some master mind controlled. But these were not like architects of the present day, because they lived on the work and worked at it. To-day architects were a class apart from the work; they did not live in it; they had another faculty specialised for them, viz., the faculty of designing apart from the work. Architects of to-day took up a little bit of the work of the mediæval builder and magnified it and multiplied it, while the greater work of the mason of those days—that was left undone. As to whether the present system could be changed, he had no thought of suggesting anything of the kind. As the chairman said, the architect had grown up by stages, and he would continue to grow as the times made him. He thought it utterly impossible to go back to the way of the mediæval builders. Whether we produced architecture by our methods, however, was another matter. As he had said before, he thought architecture would begin where the architect ended.

The Chairman announced that the next ordinary meeting would be held on March 1, when a paper on the Paris Exhibition will be read by Mr. Wonnaoot.

The meeting then terminated.

COMPETITIONS.

THE NEW TOWN HALL, AYR.—On the 11th inst., at a private meeting of the Town Council held after the ordinary meeting, a report by Mr. John J. Burnet, A.R.S.A., Glasgow, on the designs submitted in competition for the restoration of Ayr Town Hall was read. Mr. Burnet reported that the arrangements, both of the court-house and police department and of the hall in No. 1 design, appeared to him so good that he had no hesitation in placing it first. The Council unanimously adopted the recommendation of the assessor, and resolved to proceed with the erection of the hall. The successful design is that of Mr. J. Kennedy Hunter, architect, Ayr, and the cost of carrying it out will, according to the estimate of the measurers, Messrs. Douglas, Hunter, & Whitson, Glasgow, amount to 9,515*l.* The hall, with its principal accessories, will be comprised within the four walls of the original building, and its total seating accommodation will be 1,078. In connexion with the police office a new court-room is to be provided, and there are also to be matron's room, production room, chief constable's room, superintendent's room, and muster room.

BRANCH FREE LIBRARY, NINEVEH-ROAD, LEEDS.—Mr. Leonard Stokes (of London), the assessor appointed by the Corporation of Leeds, has awarded Mr. William Bakewell, F.R.I.B.A., architect, the first premium in this competition.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday afternoon in the County Hall, Spring Gardens, Alderman Dickinson, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Battersea Borough Council 3,165*l.* for street improvements; the Bermondsey Borough Council 21,140*l.* for the erection of stables, workshops, stores, &c.; the Lewisham Borough Council 15,500*l.* for the enlargement of the Town Hall; the Woolwich Borough Council 2,340*l.* for infectious diseases shelter and post-mortem rooms; the Hammersmith Guardians 10,000*l.* for the purchase of land and premises as a site for relief offices; and the Metropolitan Asylums Board 100,000*l.* for the erection of a hospital.

Historic Buildings.—On the recommendation of the General Purposes Committee it was resolved to appoint a new standing committee, for the purpose of considering and reporting upon questions relating to historic buildings in London, and of dealing with the preservation and publication of historical records of the Council, the administration of the library, and other cognate matters.

Berlin Fire Brigade Exhibition.—The same Committee, having further considered the letter from the German Ambassador, with a prospectus of an International Exhibition of appliances and arrangements for protection against fire, which is to be held in Berlin in June, recommended that the Home Secretary be informed that the Council regretted they could not see their way to take part in the International Fire Exhibition.

Mr. Campbell protested against the action of the Committee as being discourteous to the German Government, and moved that the wish of the German Government be complied with, and that the Committee be requested to carry out the necessary arrangements.

Colonel Legge, M.P., seconded the amendment, which was rejected and the Committee's recommendation agreed to.

Electric Tramways.—The Highways Committee recommended that the estimates for 145,000*l.* and 478,500*l.* submitted by the Finance Committee be approved; that the expenditure be authorised for the purposes of reconstruction for electric traction of the Council's tramways between (a) Westminster Bridge-road and Upper Tooting-road; (b) Kennington Park-road (at its junction with Kennington-road) and the terminus at Blackfriars-road; and (c) St. George's-circus and the terminus in Waterloo-road, of sums not exceeding these amounts respectively in respect of (1) buildings and railway sidings, and (2) lines, machinery, generating plant, rolling stock, and electrical equipment. This was agreed to.

Plague Precautions.—The Public Health Committee recommended certain precautionary measures against plague, and asked for authority to expend, if necessary, 50,000*l.*

This was agreed to.

Streets and Street Traffic.—The General Purposes Committee brought up a report on the resolutions passed by the recent Conference on streets and street traffic. It was resolved to send copies to the Borough Councils for their consideration and report. We may be able to print the resolutions in our next issue.

Land Registry Office.—The Building Act Committee brought up the following report, the recommendation being agreed to:—

"We have had under consideration for some time past the scheme of H.M. Office of Works for the erection of the new Land Registry Office on the south side of Lincoln's Inn Fields, including the question of the frontages in Serle-street and Lincoln's Inn Fields. The original scheme provided that the new offices would be 50 ft. high, with a one-story building next Lincoln's Inn Fields partly on the site of the previously-existing one-story buildings and partly on the forecourt, with the boundary of the new building next Serle-street set back to the line of the area railings in front of certain buildings, a strip of land next Serle-street given up to the public way, and also with an area not less than 4 ft. deep formed round the building for the purpose of affording light to the basement. As the Council is aware, buildings vested in or in the occupation of the Government are specially exempted from the provisions of the London Building Act, 1894, relating to buildings and structures, but we deemed it expedient in the public interest to enter into negotiation with H.M. Office of Works with a view to obtaining some slight modifications of the scheme. It subsequently came to our notice that there was a proposal before H.M. Office of Works to erect the new offices 60 ft. high with two stories in the roof to within 4 ft. of the pavement both in Lincoln's Inn Fields and Serle-street. We viewed this proposal, involving the erection of a building of great height projecting 28 ft. in advance of the general line of buildings on the south side of Lincoln's Inn Fields, with very great concern, and by our direction a communication was addressed to H.M. Office of Works pointing out that the arrangement was one which the Council would not sanction in the case of a private individual, and asking that the matter might be further considered. In reply, a letter was received from the Office of Works to the effect that the suggestion to erect the new buildings to the full height over the forecourt had been made by certain authorities interested in the new offices, but that the First Commissioner shared to a great extent the views of the Council upon the question, which was still under consideration. The clerk of the Council and the superintending architect have since, with our approval, been in further communication with the Office of Works, with the result that the following letter has now been received:— . . . [The letter stated that in view of all the circumstances, Mr. Akers Douglas has decided that the building line of the square shall be, if possible, adhered to; and in any case, should it be found necessary to advance the frontage of portions of the new building, such advance shall not extend further than 6 ft. beyond the building line of the square.] The arrangement proposed by H.M. Office of Works appears to us to be a very satisfactory one from the public point of view, especially having regard to the exemption of Government buildings from the provisions of the London Building Act, 1894, and to the fact that it is not, we understand, proposed to rebuild on the site of the existing one-story buildings at the south-east corner of the square. We have therefore given directions for a letter to be addressed to H.M. Office of Works, thanking the First Commissioner for the courtesy with which he has received the Council's representations, and stating that the Council, whilst welcoming the proposal contained in the letter of February 11th, ventures to express the hope that in the contemplated re-building the original line of frontage will be maintained. We recommend that the course taken be approved."

Tender.—It was agreed to accept the tender of Mr. H. W. Budd for 50*l.* for levelling the area cleared under the Mill-lane, Deptford, improvement scheme.

Labourers' Cottages and Lodges, Farmfield.—The Inebriates Acts Committee recommended—

(a) That the estimate of 2,898*l.* submitted by the Finance Committee be approved, and that an expenditure of not exceeding that sum be sanctioned for the erection of four labourers' cottages and two lodges on the Farmfield estate, and for incidental works and expenses in connexion therewith.

(b) That the Inebriates Acts Committee be authorised to invite tenders and take the necessary measures for the execution of the works.

The recommendations were agreed to.

Petroleum Flash Point.—The Public Health Committee brought up a further report on lamp accidents, and recommended that the Home Secretary be asked to introduce a Bill to raise the legal flash-point of petroleum from 73 deg. to 100 deg.—i.e., to prevent the impor-

tation and use of the low-flash oil for the future.

The recommendation was adopted.
The Council adjourned soon after six o'clock.

CLERKS OF WORKS ASSOCIATION: ANNUAL DINNER.

The eighteenth annual dinner of the Clerks of Works' Association of Great Britain was held on Monday at the King's Hall, Holborn Restaurant. Mr. W. E. Riley, F.R.I.B.A., the Superintendent Architect to the London County Council, presided, and was supported by Professor Roger Smith, Messrs. Maurice B. Adams, F. R. Farrow, T. Blashill, J. Hebb, Chatfield Clarke, F. Plowman (President), Spencer Green (Vice-President), J. Aitchinson, J. C. Hill, J. W. Stone, J. H. Freeman, W. Woodward, &c. There were about 200 present.

After the toast to the "King and the Royal Family," the Chairman submitted "The Navy, Army, and Reserve Forces," which was responded to by Mr. J. Aitchinson.

Mr. Spencer Green, in proposing "The Architects and Surveyors," said this toast was particularly acceptable, because the architects and surveyors were their best friends, and they were pleased to have so many of them present. The ideal and aim of the members was to have the confidence of their employers—to serve the architects with unswerving fidelity—faithful and intrepid from beginning to end. By enjoying this confidence they felt that to some extent they relieved their architects from great anxiety on the different jobs, and enabled them to concentrate their best thoughts on the designs for future great works. The question of their salaries as clerks of works was of great importance to them. Some two years ago Mr. Dashwood, on behalf of the Association, asked for the support of architects and surveyors to the proposal to secure more adequate remuneration to clerks of works, maintaining that for large jobs they ought to receive six guineas per week. The architects and surveyors then present promised to do all in their power to bring about this very desirable increase. This promise, he was glad to say, had been largely fulfilled.

Mr. Thomas Blashill responded for the architects. He said that every practical architect must feel how much he was indebted to his clerk of works. It would be impossible to carry out works of the present magnitude without them—men of the greatest efficiency, who had been trained in the art of building and perfected themselves by other studies for the intricate business to which they had devoted themselves. It was only natural that as the buildings increased the remuneration of men whose duties were so onerous should increase also. It was the proper thing for any professional man when he got on in his work to look forward to be entrusted with more important duties at a higher remuneration. He would like to commend to their notice the question of the materials used in fire-proof construction. He had had something to do in regard to the safety of town buildings for many years past, and it was a great subject. They would find it to their interest to pay special attention to the matter, because before long it would be a rarity to see a building of any importance being constructed that would not absolutely resist the kind of fires which were now so frequent.

Mr. Chatfield Clarke then responded for the surveyors. He mentioned that the Editor of the *Builder* had pointed out over and over again that architects even did not get a fair recognition of their work. During the reign of our late Queen no art had gone more ahead than that of architecture, and no city in the world during the past fifty years had produced greater architects. In descriptions of buildings, however, the public were more interested in the cost than in the name of the architect. If the architect did not reap any recognition, what about the quantity surveyor? He was never heard of at all, and yet that profession had made great progress during the past half century.

Mr. Spooner, Past President, proposed, the "Worshipful Company of Carpenters," to whom he said the Association were deeply indebted for encouragement and assistance.

Professor Roger Smith, the Master of the Carpenters' Company, in reply said that this Company, like the other City Companies, was of great antiquity. In the early days there was a spice of trades-unionism about

their proceedings, but after a time the connexion with the trades dropped away. Now the connexion with the trades was being revived. This Company, by their lectures, examinations, the two technical schools which they maintained, and the house-room they gave to one or two technical societies, endeavoured to assist, as far as possible, the members of the carpenters' and joiners' trades, and in fact the whole building trade. Another method they had employed for this purpose was the holding of exhibitions of carpentry and joinery. They were going to hold an exhibition this year, and they had offered prizes for models of wooden houses. He believed that wooden houses formed one solution of the problem of housing the agricultural labourer, and he hoped that as a consequence of this forthcoming exhibition some wooden houses would be constructed in various parts of the country where they were not forbidden by by-laws.

"The Clerks of Works' Association" was then proposed by the Chairman. He said that many changes had taken place since Sir Christopher Wren was clerk of works at St. Paul's Cathedral. Their work was the emblem of the great morals of the world in representing construction as against destruction. There was a great moral lesson in the growth of a building, and its finished condition, when it was well done, was a moral example. He noticed in the qualifications in connexion with this Association one that stipulated that no man was eligible for membership until he had practised his art for three or four years and attained the age of forty years. It was an excellent rule to see that their members were properly qualified, but he thought some men might be qualified before they were forty. He was glad to see that they stipulated that the members should have a technical knowledge of carpentry, because his experience was that the best clerk of works was one who understood this. He also highly approved the qualification that the members should be good sanitarians. With regard to the question of remuneration, he considered that there were few men engaged in work of this importance who were so badly paid as clerks of works. He trusted that the matter would be brought to a successful issue.

Mr. F. Plowman, the President, in response said the Association was founded nineteen years ago, and he was pleased to see many of those who originated it present that evening. It was their desire to raise the status of the Association, and they looked to the Royal Institute of British Architects and the Institution of Civil Engineers to assist them. The Association was of great usefulness, its papers, lectures, and meetings being of great advantage to the members. In regard to the question of remuneration, he condemned the system of public bodies like the London County Council paying three and a half guineas per week only to clerks of works.

Mr. J. Davies, in proposing "The Visitors," said that evolution of clerks of works commenced, not from the time of Sir Christopher Wren, but from the time of the building of Solomon's Temple, when Hiram was obviously the clerk of works.

Mr. J. C. Hill expressed the thanks of the visitors, and suggested that a benevolent fund should be formed in connexion with the Association.

Toasts to the Hon. Treasurer (Mr. G. Oldrid Scott) and the Chairman concluded the proceedings.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.—

Lines of Frontage.

Hackney, Central.—A one-story addition to Sussex Cottage, No. 10, Kenninghall-road, Upper Clapton, at the corner of London-road (Mr. S. A. Smith for Mr. M. Smith).—Consent.

Bethnal Green, South-West.—One-story shops on part of the forecourts of Nos. 86 and 88, Old Bethnal Green-road, Bethnal Green (Mr. C. B. Hollist, jun., for Mr. C. Sully).—Consent.

Fulham.—A coal-cellar in front of a bakehouse at the rear of a house and shop on the west side of Tamworth-street, Fulham, at the corner of Raclon-road (Mr. W. Cave for Mr. J. Wendon).—Consent.

Hammersmith.—Five dwelling-houses on the west side of Pennard-road, Shepherd's Bush (Messrs. G. Leyford & Son).—Consent.

Barnodesey.—Retention of a temporary one-story shop on the forecourt of No. 254, Southwark Park-road, Barnodesey (Messrs. Pearks, Gunston, & Tee, Limited).—Consent.

Lewisham.—Two houses on the west side of Newlands Park, Sydenham, at the corner of Homecroft-road (Mr. E. Bates for Welford's Surrey Dairies, Limited).—Refused.

Barnodesey.—The retention of a wood and glass show-case, attached to the front of No. 32, Jamaica-road, Barnodesey (Mr. J. Harries for Mr. E. Ellis).—Refused.

Barnodesey.—One-story shops on the forecourts of Nos. 61 to 73 (odd numbers only), Lower-road, Rotherhithe (Mr. T. W. Biggs for Mr. S. Single and Messrs. Stansfeld & Co., Limited).—Refused.

Dulwich.—A warehouse building the south-east side of Green-lane, Penge (Mr. E. Williams for Mr. A. Olby).—Refused.

Projections.

St. George, Hanover-square.—The retention of an iron and glass shelter in front of the porch of the Coburg Hotel, Carlos-place, St. George, Hanover-square (Mr. F. W. Anson for the Coburg Hotel, Limited).—Consent.

St. George, Hanover-square.—An additional story to a bay-window at No. 52A, Berkeley-square, St. George, Hanover-square, next Charles-street (Mr. Macartney).—Consent.

Wandsworth.—Six balconies in front of a block of residential flats to be erected on the south side of Lower Richmond-road, Putney, at the corner of The Flat (Messrs. Falgrave & Co. for Mr. G. Crowden).—Consent.

Woolwich.—A wooden portico, two wooden bay windows, and wooden barge-boards at the Red Lion public-house, Shooter's Hill, Plumstead (Mr. J. O. Cook for Mr. C. Beasley).—Consent.

City of London.—That Mr. P. B. Tubbs be informed that the Council is not prepared to accede to his request for an extension of the periods within which the erection of an iron landing at the first-floor level in front of No. 26, Paper-street, City, was required to be commenced and completed.—Agreed.

Width of Way.

Poplar.—A one-story addition at the rear of the Railway Tavern, West India Dock-road, Poplar, at less than the prescribed distance from the centre of Garford-street (Messrs. Yetts, Sturdy, & Usher for Mr. C. Brown).—Consent.

Mile End.—A temporary brick and iron church at the rear of No. 381, Mile End-road, Stepney, at less than the prescribed distance from the centre of Linton-road (Mr. F. A. Walters for the Rev. W. Donlevy).—Consent.

Lines of Frontage and Width of Way.

Hammersmith.—An extension of the periods within which the erection of two dwelling-houses on the western side of Goodwin-road, Greenside-road, Hammersmith, was required to be commenced and completed (Mr. F. S. Hammond).—Consent.

Woolwich.—A stanchion and projecting stonework to an addition to the London Music Hall, High-street, Shoreditch, at less than the prescribed distance from the centre of Jane Shore-court, and in advance of the general line of buildings in that court (Mr. F. Matcham for the London Music-hall Company, Limited).—Consent.

Brixton.—A block of residential flats on the site of Nos. 400 and 402, Coldharbour-lane, Brixton (Mr. G. Windsor for Mr. A. G. H. Brown).—Refused.

Clapham.—Ten houses with bay-windows on the eastern side of Loats-road, Clapham, and of seven houses with bay-windows on the western side of Lyham-road (Messrs. Down Bros. for Mrs. R. S. Gray).—Refused.

Hammersmith.—Two blocks of buildings on the west side of Ravenscourt-park, Hammersmith, one on each side of Hamlet-gardens (Mr. T. Athley for Mr. W. H. Gibbs).—Refused.

Width of Way and Space at Rear.

Whitechapel.—Deviations from the plan certified by the District Surveyor, under Sections 13 and 43 of the Act, so far as relates to the proposed rebuilding of the back portion of Nos. 16A and 17A, Bell-lane, Spitalfields (Messrs. Wigg, Oliver, Hudson, & Co. for Mr. N. Frost).—Consent.

Greenwich.—That the application of Mr. R. Whaley for an extension of the periods within which the rebuilding of No. 223, Trafalgar-road, East Greenwich, to abut also upon Colomb-street, was to be commenced and completed, be granted.—Agreed.

Width of Way and Dispensation of By-law.

Deptford.—A one-story addition to a saw mill at the Baltic Saw Mills, Blackhorse-road, Deptford, with the boundary fence at less than the prescribed distance from the centre of the street, and without the site of the addition being covered with a layer of good concrete at least 6 in. thick, as required by such by-laws (Mr. H. E. Newton for Mr. A. Capon).—Consent.

Formation of Streets.

Wandsworth.—That an order be issued to Mr. J. Briggs, for the Housing Committee of the Council,

Correspondence.

To the Editor of THE BUILDER.

ARCHITECTURE IN CRETE AND TURKEY.

SIR,—In connexion with my essay on this subject published in your last week's issue, I should like to call attention to the similarity in interior design of the Green Turbsh at Broussa (mentioned in my paper) and a tomb at the Mosque of Bajazet II. at Constantinople. When walking round the South Kensington collection the other evening I noticed a water-colour drawing of the interior of the Bajazet Tomb, by the late J. F. Lewis, R.A., which might have been copied, in every particular, from the earlier tomb at Broussa.

I should like to add that two of the photographs illustrating Candia published by you last week were taken by Mr. D. G. Hogarth—the back of the Armoury, and the Turkish Arches in the main street. The others, as you stated, were taken by Mr. F. B. Welch.

Also, I should have said that a later Greek and not a later Roman settlement existed beside the ancient remains at Ghoulas, in Crete.

D. T. FYFE.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

8.—LAVATORIES.

THE material generally used for household lavatories is white earthenware or pottery, commonly known as porcelain, or by some special name such as queensware. Better fittings are now made of a semi-vitrified porcelain, while for the strongest lavatories enamelled fireclay is often adopted. Cast-iron basins are also made, enamelled in various ways.

The ordinary lavatory, with pottery overflow for connexion with lead pipe and with plug waste, is too well known to need illustration. It is generally defective in several important details—the overflow is too small to carry off the water from a high-pressure service, and cannot possibly be kept clean, and the waste is too small to admit of the basin being emptied with sufficient rapidity either for convenience in use or for cleansing the trap and waste-pipe. The grating under the plug is also so small, that it is soon choked with hairs, soap, &c., and is placed at such a depth that these cannot easily be removed. At one time the dishes for soap and brushes were sunk below the slab, and the water drained away through small holes into pottery nozzles, from which it was conveyed by small pipes to the trap under the basin. These holes and pipes were difficult to keep clean, and have long been superseded by simple grooves which convey the water from the dishes directly into the basin.

The improvement of the overflow was the next stage. In order to simplify the plumber's work, the overflow was formed entirely in pottery from the overflow openings to the waste-outlet, a perforated washer being used for the plug, as shown in fig. 7, chapter 7 (page 167 ante). This overflow was quite as difficult to clean as the old-fashioned pipe, and a further improvement was effected by continuing the overflow tube up through the slab in the manner described and illustrated in the chapters on sinks. The opening in the slab is generally fitted with a loose porcelain or metal cover. Such an arrangement is shown in fig. 1; in this case a safety plug with spindle and knob takes the place of the ordinary plug and chain, the advantage being that the plug cannot be removed, that the basin cannot be damaged by letting the plug fall upon it, and that the grating is level with the bottom of the basin, and can, therefore, easily be kept clean and free from obstruction.

One of the latest modifications of this kind of overflow is shown in fig. 2, in combination with a new waste arrangement. The overflow is of large area, so as to be capable of carrying away the water from a high-pressure service, and is covered with a nickel-plated brass grating, hinged at the top. The valve, or plug, which is covered with soft rubber, works horizontally instead of vertically, and is

actuated by the lever handle at the back of the slab. The discharge grating may be of porcelain, or of nickel-plated brass hinged so that the plug and seating can be cleaned. This lavatory is known as Shailes's "Perfecto."

The standing waste-and-overflow has also been applied to lavatories. In the earlier arrangements the apparatus was concealed in a pottery chamber at the back of the basin, and was not easily accessible for cleansing; an overflow of this type is shown in fig. 3. A modified form, known as Milne's patent "Lift-out" accessible waste, is illustrated in fig. 4; the chamber is of good size, and the standing waste, together with the knob and shield, can be removed by a simple pull, and can be pressed back into position with equal ease. The shape of the chamber is better than that shown in fig. 3, as the long acute angle at the bottom of the latter is avoided by making the back of the basin vertical.

Other forms of standing waste are exposed to view in the basin. The "Neros" waste (fig. 5) is of this type. By lifting the knob and giving it a quarter-turn the waste is suspended above its seat, so that the water can escape through the holes in the lower portion; the holes near the top are for the overflow. Doulton's "Waverley" waste (fig. 6) is a modification of this type, and possesses some interesting features. An outlet grate is provided in the shape of a perforated flange around the bottom of the cylinder in which the standing waste slides. When the waste is raised from its seat the water escapes through the grating. As in the other types, the waste can be suspended by raising the knob and giving it a quarter-turn. The grating is fitted into a screwed washer, and can be easily removed by unscrewing it, and the standing waste can then be taken out.

One of the most recent forms of standing waste (fig. 7) is also the simplest, being nothing more than a tube of xylonite slightly tapered at the bottom to fit into the outlet washer. An arched metal bar is fixed across the top for the attachment of a chain. In other words, a xylonite standing waste-and-overflow takes the place of the ordinary brass or vulcanite plug. This waste, designed by Adams & Co., can easily be kept clean, but on account of the somewhat fragile nature of the material can only be recommended for houses and other places where the fittings will be carefully used.

The common lavatory basin is generally round or oval, but the D-shaped basin is now preferred as more convenient in use. Sometimes the central part of the front is slightly recessed, so that the person using the lavatory can stand more closely to the basin. The slab is usually in one piece with the basin, and a low pottery skirting along the back and ends also forms an integral part of the fitting. Many high-class lavatories are made with porcelain basins and marble or onyx slabs and skirting—about 1 in. thick; it is an advantage to have the slabs slightly dished (fig. 8) to prevent water flowing over the slab on to the floor. Slate slabs are used instead of marble for cheaper fittings. The bottom of a lavatory basin ought to have a good slope to the waste-outlet, so as to prevent as much as possible the deposit of soapsuds. Figs. 1 to 5 show different sections of basins.

Twin lavatories, containing two basins with slab and skirting, are now made in one piece of pottery, and, as already mentioned, combined sinks and lavatories can be obtained in a single piece of enamelled fireclay.

The most general size of lavatory slabs is about 27 in. by 20 in., but many smaller sizes are made, and also larger sizes up to about 30 in. by 22 in. A specially large lavatory made by one firm has a slab measuring 39½ in. by 28½ in., with a rectangular basin 24½ in. by 16½ in. The marble slabs used for lavatories range in size from about 30 in. by 24 in. to 36 in. by 25 in.

Tip-up lavatories were at one time much used for hotels, railway stations, and other places where it is essential that the water should be rapidly emptied, but they are not as satisfactory in other respects as the modern ordinary basin. They consist as a rule of two principal parts—the basin and the container as shown in fig. 9—and are made either of porcelain or cast iron. The basin is fitted outside with two metal bushes, one at each side, to receive the ends of two trunnions, on which the basin swings; a buffer is provided to keep the basin at its normal level. An improved form of pivot is made, so that the basin can be

sanctioning the formation or laying out of new streets for carriage traffic on the Totterdown Fields Estate, Upper Totting-road, Wandsworth, and in connexion therewith the widening of a portion of Church-lane and of a footpath leading to Totterdown.—Agreed.

Bethnal Green, South-West.—That an order be issued to Mr. H. H. Collins, sanctioning the formation or laying out of a new street, for carriage traffic, to lead from Blythe-street, Bethnal Green, to a proposed new street to be named Teesdale-street (for Messrs. Davis Brothers). That the name Aller-street be approved for the new street.—Agreed.

Islington, West.—That the period within which the street for foot traffic, to be named Macready-place, to lead from Holloway-road to Writers-road, Islington, was required to be paved, and to have posts erected so as to prevent such street being used for carriage traffic, be extended to two years from May 8, 1900.—Agreed.

Woolwich.—That an order be issued to Mr. J. O. Cook sanctioning the formation or laying out of a new street for carriage traffic to form continuation of Marmadon-road, Plumstead, into Church Manor-way, and in connexion therewith the widening of a portion of Church Manor-way (for Mr. T. Driver). That the name Marmadon-road (in continuation) be approved for the new street.—Agreed.

Woolwich.—That an order be issued to Messrs. Meakin & Archer, sanctioning the formation or laying out of a new street for carriage traffic in continuation of Marmadon-road, Plumstead. That the name Marmadon-road (in continuation) be approved for the new street.—Agreed.

Woolwich.—A variation from the plan sanctioned on October 10, 1899, for the formation of new streets upon the Eltham Park Estate, Eltham, so far as relates to the alterations in the width of the street, to be named Glensk-road (Mr. R. Stewart for Mr. A. Cameron Corbett, M.P.)—Refused.

Levensham.—That an order be issued to Messrs. H. & G. Taylor, refusing to sanction the formation or laying out of new streets for carriage traffic out of Laleham-road, Catford, on the site of the Catford sports ground.—Refused.

Width of Way and Artisans' Dwellings.

Lambeth, North.—Three blocks of intended dwelling-houses, to be inhabited by persons of the working-class, and proposed to be erected, not abutting upon a street, on a site between Gloucester-street and Burdett-street, Lambeth, and two blocks of intended dwelling-houses, to be inhabited by persons of the working-class, proposed to be erected on the north side of Burdett-street and South side of Gloucester-street respectively, with irregular open spaces at the rear, and the boundary fences of the site at less than the prescribed distance from the centres of Gloucester-street and Burdett-street (Mr. S. Bircham for the London and South Western Railway Company).—Consent.

Means of Escape from top of High Buildings.

Brixton.—Means of escape in case of fire, proposed to be provided on the fifth story of a building to be known as Ingram House, to be erected on a site on the east side of Eastcote-street, Stockwell, at the rear of Nos. 43, 44, and 46, Stockwell-road (the upper surface of the floor of which story will be above 60 ft. from the street level) for the persons dwelling or employed therein (Mr. A. T. Bolton and Mr. C. Clark, for Ingram Houses, Limited).—Consent.

Holborn.—Means of escape in case of fire, proposed to be provided on the topmost story of the Thackeray Temperance Hotel, Nos. 56 and 57, Great Russell-street, Bloomsbury—the upper surface of the floor of which story is above 60 ft. from the street level (Mr. C. Fitzroy Doll, for Mr. J. Trustlove).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

THE CEMENT INDUSTRY. (Engineering Record Office, New York.)

LIME, MORTAR, AND CEMENT. By W. J. Dibdin. (Sanitary Publishing Company.)

BERMONDSEY: ITS HISTORIC MEMOIRS AND ASSOCIATIONS. By Edward T. Clarke. (Elliot Stock.)

ROYAL CALEDONIAN ASYLUM.—Subject to the sanction of their project by the Charity Commissioners, the London County Council have agreed to acquire at an estimated cost of 16,500l. the buildings and site covering just 2 acres, and having a frontage of 250 ft. in Caledonian-road, Holloway, of the Royal Caledonian Asylum, which was founded in 1815. The Governors of the Asylum have obtained a site of 7 acres for new schools in Hertfordshire; the London County Council propose to take the Caledonian-road property for the erection, in terms of the Housing of the Working Classes Act, 1890, of artisans' dwellings which will accommodate 1,400 persons.

removed without pulling out the pin or unscrewing the trunnion. Adams's "Tip-over" lavatory (fig. 10) is of more novel form, but is only made in "metallic-enamelled" cast-iron, and is intended for cheap work. In this the ordinary container is superseded by a horizontal outlet at the back of the basin. As shown in the illustrations, the back of the basin is curved over, and is continued in each direction as a pipe stopped at one end and connected at the other with the waste-pipe A by means of a joint which permits the basin to be raised so that the water can escape down the waste-pipe. Unless the waste-pipe is of large size, the rapidity of the discharge will be no greater than in the ordinary basin with large plug, and in any case there will be considerable risk of splashing.

The siphonic discharge has also been applied to lavatories as to water-closets, but there are certain disadvantages in the apparatus which render it of doubtful value.

Some lavatories have been made with flushing rims, so that the surface of the pottery can be cleansed by simply turning the tap. They have not proved very satisfactory, and are seldom used.

THE NEW APOLLO THEATRE, LONDON.—This theatre has been erected in Shaftesbury-avenue, next door to the Lyric Theatre. The seating capacity is for 1,200 persons. The lighting is entirely by electricity. Mr. Lewin Sharp is the architect of the building.

GENERAL BUILDING NEWS.

WESLEYAN CHURCH, LLANISHEN, GLAMORGANSHIRE.—A new Wesleyan Methodist Chapel was opened at Llanishen recently. The edifice is erected in the centre of the village, and is approached by a broad thoroughfare branching from the main road from Cardiff to Llanishen. The accommodation is for about 275 people. A gallery has been erected at the northern end to contain the organ, choir, and supplementary seating, and it is intended in the future to extend this gallery along the sides of the building. An assembly-room, some 30 ft. in length, has been erected at the rear to be used for school-room purposes. The building, which has been erected from plans by Mr. E. Seward, is of Newbridge stone with Bath stone dressings, and is in the late Perpendicular style. The total cost of erection is 1,500.

METHODIST CHAPEL, HILLSBRO, SHEFFIELD.—It is proposed to erect a new Methodist chapel at Hillsbro', on Langsett-road, from the design of Mr. John W. Firth, of Oldham. The building will be a lofty structure, and at the corner, to the left of the main entrance, it will be surmounted by a spire. Choir and ministers' vestries will be provided, along with a gallery at the end of the building, over the main entrance, and when completed the church will be capable of providing seating accommodation for from 450 to 500 persons. At the rear, adjoining the main structure, will be placed the large school. The school will afford accommodation for 350 persons, and classrooms will be provided, including a room for a men's class. The entrance to the schools will be from the side street.

CATHOLIC CHURCH, SEAFORTH.—The new Catholic church at Seaforth, which is dedicated to Our Lady Star of the Sea, was opened on the 10th

inst. The new church, which has accommodation for 600, is situated on a corner site on the north side of Church-road and the west side of Crescent-road, Seaforth, the main gable facing south towards Church-road. It consists of nave and aisles, apsidal chancel, and two side chapels, baptistry, antechapel, and three porches, together 125 ft. long and 55 ft. wide, with three confessionals, priests' and boys' sacristies, and passage behind the chancel for convenient access from the sacristies. Above the antechapel and porches are a choir gallery and organ chamber, separated from the nave by a stone screen with traceried balustrade. The nave arcade is supported by granite columns, with carved capitals. Above these, springing from carved corbels, granite shafts are carried up to the roof. The nave is lighted by traceried windows. The roof is carried up by hammer beam principals, with traceried spandrels, &c. The chancel floor, of oak parquetry, is raised six steps above that of the nave. A lofty arch divides the chancel from the nave, and beyond it, the chancel shows five large traceried and gabled windows, three of which are filled with stained glass by Messrs. Hardman, of Birmingham. The church is lighted by electricity, and warmed by low-pressure hot-water pipes. Externally, the church is built of Parbold stone, with Runcorn stone dressings. The south gable is divided into two bays for the greater part of its height, with statue niche in centre between two traceried windows, and rose window above. At the south-east corner of the church a tower and spire are intended, but these are at present completed only as high as the nave. Messrs. Sinnott, Sinnott, & Powell, of Liverpool, are the architects; Mr. Williams, Seaforth, clerk of works; and Mr. W. Winnard, Wigan, the contractor. The contract amount is between 10,000. and 11,000. The greater part of the carving has been executed by Mr. P. Honan, of Liverpool.

FREE LIBRARY, BRISTOL.—The new North District Library, Cheltenham-road, Bristol, was opened on the 13th inst. The building was designed by Mr. Gough, and erected by Mr. Wilkins.

CHANCELLOR MEMORIAL CHURCH, BELFAST.—In College-street South on the 9th inst. the foundation-stones were laid of this edifice. The new structure is being built on the site of the old Reformed Presbyterian Church. The site of the old church and schools has been taken, and on this building operations are being carried out. In College-street South the front is occupied by a vestibule and entrance to the church. Opening off the vestibule are classroom, library, and cloakroom accommodation. A separate entrance will give access to the library and schoolroom, so that these portions of the buildings can be used for week-night meetings independent of the church. The interior of the church is 60 ft. long by 44 ft. wide, with a small end gallery. It is lighted by windows grouped in pairs between each roof principal. The gable end of the edifice will be occupied by a pulpit of pitch pine, with a panelled and cusped front. In front of this at a lower level will be the platform, with choir seats at sides and open space in centre for communion. Behind the pulpit will be an arched recess. The seating is to be of selected pitch pine. Artificial lighting will be by electricity throughout the premises. The school and classroom accommodation is arranged for all purposes that the buildings will be used for, either for the Sabbath-school or for congregational meetings. On the first floor the lecture-hall will be 44 ft. long by 24 ft. wide, and a classroom at one end can be opened up to supplement the accommodation of this hall by means of a sliding partition. Accommodation is provided for a

caretaker's residence. The exterior of the church is of red brick, with red stone dressings. Mr. Thomas M-Millan, the builder, is carrying out the work from the plans and under the superintendence of Messrs. J. J. Phillips & Son, architects.

SUNDAY SCHOOL BUILDING, PENISTONE, YORKSHIRE.—Memorial stones have been laid of a Sunday-school building at Penistone. Mr. J. W. Firth, of Oldham, is the architect.

BUSINESS PREMISES, BELFAST.—No. 39, High-street, Belfast, has recently been altered to accommodate a clothier's business. The work was carried out under the supervision of Mr. W. J. Fennell by the following contractors:—Mr. J. Andrews, the shop-front; Mr. W. Agnew, the interior alterations and fittings; Messrs. Gilmore & Lytle, the electric lighting; painting and ceiling decorations, Mr. John Moore, a and polishing, Mr. Edward Killen.

OXFORD BOARD SCHOOLS.—Accommodation for boys has been provided in Gloucester-green, Oxford, a girls' school and pupils teachers' centre has been erected in New Inn Hall-street, and the East Oxford School in Union-street, Cowley-road, is approaching completion, the total estimated cost of sites, buildings, and equipment being 35,000. The Central Girls' schools are situated in New Inn Hall-street, and besides accommodation for 270 girls, contains a cookery centre, where some fifty children can be taught cookery, and also a pupil teachers' centre for 100 pupil teachers, male and female. In designing these buildings, the Board were of opinion that they should be of such a nature as to hold their own, as far as possible, with the colleges, which are in close proximity, as it was thought an ordinary brick School Board building, such as is often seen in other towns, would be out of place in the heart of a University city; hence a stone front was adopted, and some degree of dignity was aimed at. The roofs are all covered with Yorkshire stone slates, which are much larger than the stone slates usually seen in Oxford. There is also a turret containing a bell.

It was found necessary to have four entrances and two staircases abutting on New Inn Hall-street. Two have been arranged to open direct on to the pavement, these being for the pupil teachers, and two for the girls into the forecourt. Over these two latter doorways are carved panels representing Life and Knowledge, Life being represented by the pomegranate tree and Knowledge by the myrtle. On each tree seven doves are introduced, representing the seven gifts of the Holy Spirit. The forecourts enclosed by an iron railing, with gateway in same. On the ground floor the girls' school is arranged round a large hall, off this hall open five classrooms. The cookery centre is raised on columns in the playground, underneath being a covered playground for the girls in wet weather. The accommodation consists of a room about 27 ft. by 25 ft., where the cooking is taught; also a cloak-room and a scullery, which latter opens off the cookery classroom. The classroom, besides having a close range, has also an open fire range and gas stove, so that children can be taught to cook on the various stoves most commonly found in their homes. The two staircases before referred to lead to the first floor, where there are three classrooms for the pupil teachers, besides their cloak-rooms, &c., and a room for the teachers themselves. The classrooms are all arranged so as not to overlook the street, thus avoiding the noise. Messrs. T. H. Kingerlee & Son, of Oxford, have erected the schools.

The Central Boys' School is situated in Gloucester-green, where the Board had acquired property on which stood some rather picturesque old cottages. The Board consulted their architect as to the possibility of incorporating any of these cottages in his design for the new school. Mr. Stokes, however, reported that this would be very detrimental to the school itself, and reluctantly advised the Board to abandon the idea. It was then decided to try and give the new school somewhat of the picturesque character of the old cottages, hence the stone bay windows overlooking the market place, these bay windows lighting cloakrooms on the ground floor, and the master's or committee rooms, &c., on the first floor. The cloakrooms, &c., are kept to this extent as considerable noise at times goes on in the market place. The material used for the exterior, apart from the bay windows just described, is of two kinds of brick, arranged in panels and bands. The roofs are covered with Yorkshire stone slates, and there is a bell turret. Over the principal entrance, which is Gothic in character, is a carving presenting on one hand King Alfred, and on the other St. Frideswide, both in the act of instructing children. The site being an exceedingly irregular one, a feature in the shape of what is practically a regular central hall, was adopted, off which are classrooms to accommodate 220 boys. The same system of warming and ventilating as at New Inn Hall-street schools is adopted. Over two of the classrooms is placed a manual room, some 45 ft. long by 22 ft. wide, where boys will be instructed in some useful trade, such as carpentry. This room is approached by a separate and independent staircase, so that boys belonging to other schools can attend the classes, in the same way that girls receive instruction in other schools will be taught cook at New Inn Hall-street. This school has already been in use for some little time, and was erected by Mr. John Woodbridge, of Oxford, besides the two school buildings just described, the

Board is erecting a third, which is rapidly approaching completion at East Oxford. This consists of three departments, viz., boys', girls', and infants', arranged to accommodate a total of about 400 children, with provision for an extension to hold about another 100. In addition, there is a cookery centre, similar to the one at New Inn Hall-street, and a manual room for the boys of a like nature to that at Gloucester-green School. The site, having once been a brickfield, where extensive excavations had taken place, the building had to be arranged to stand where practicable upon the unexcavated part of the ground, hence the somewhat irregular arrangement. Room for the infants' school, which is a separate building, could not, however, be found on the solid ground; it has, therefore, been placed on a concrete raft, and "floats" on the made ground between the old excavations. This school has been erected of brick throughout, and is covered with a tile roof. The infants' school, which, as previously stated, is a detached building, when completed will have four large classrooms, opening off a spacious central hall, where musical drill, &c., can take place. The boys' and girls' schools are placed in one block, the girls being on the upper floor. The plan of these two floors is practically identical, and, when completed, each will consist of a large central hall and four classrooms. These buildings are nearly finished. Messrs. Boxall & Sons, of Pangbourne, are the builders. The architect for all three schools is Mr. Leonard Stokes, of Westminster.—*Oxford Chronicle*.

COTTAGE HOSPITAL, SELBY, YORKSHIRE.—A cottage hospital, at the bottom of New-lane, opposite the School of Art, Selby, was opened on the 16th inst. The building has two stories, and is of brick with stone dressings. On the ground-floor are waiting-room, dispensary, matron's room, store-room, accident ward, and bathroom. The height of the ward is 12 ft., and the walls are plastered in Portland and Parian cement. The floors are of pitch-pine boards, and the place is heated by means of a Shorland stove. Upstairs are three bedrooms, and adjoining are the bathroom and linen-closets. The roof is covered with Penrhyn slates and Staffordshire red. The cost of the building has been about 1,500. It was erected by Mr. T. S. Ullathorne, of Selby, from designs by Mr. Brownlow Tompson, of Hull.

WAREHOUSE, LEEDS.—It is proposed to erect a new warehouse in Wellington-street, Leeds, from designs prepared by Messrs. Corson & Jones and Perkin & Bulmer, architects, Leeds. The principal elevation will be 186 feet long.

PROPOSED REBUILDING OF LIVERPOOL CHILDREN'S INFIRMARY.—At the recent annual meeting of the subscribers to the Liverpool Infirmary for Children, a report was read which stated that owing to an outbreak of diphtheria the infirmary, which is situated in Myrtle-street, had been closed for six weeks during the past year, when structural alterations to improve the sanitary condition of the infirmary had been carried out. Another outbreak having occurred, Mr. T. W. Cutler, of London, was consulted. Mr. Cutler submitted a plan for extensive alterations at an estimated cost of 30,000. However, as the proposed alterations would entail a reduction in the number of beds, it has been decided to erect an entirely new building at a cost of 50,000.

CHURCH INSTITUTE, RIPON.—Premises which have been erected in High Skelgate for the Ripon Church Institute were opened on the 8th inst. The building contains a reading-room 28 ft. by 10 ft. Mr. T. Wall, of Ripon, was the architect, the contractors being Messrs. Mr. J. H. Coldbeck, the masonry, carpentering, and plastering; Messrs. Benson & White, the plumbing and glazing; Mr. J. Baynes, the slating; and Mr. A. J. G. Almond, the painting. The stoves, tiled hearths, &c., were supplied by Mr. W. E. Dixon.

SANITARY AND ENGINEERING NEWS.

WATER PUMPING STATION, FRAMPTON COTTRELL, GLOUCESTERSHIRE.—A new engine-house and pumping engine have been erected at the West Gloucestershire Water Company's works at Frampton Cottrell. The engine was started on the 11th inst. Mr. E. D. Marten was the engineer. The pumping plant has been made and erected by Messrs. Easton and Company, Limited, of Erith, and the engine-house has been built by Messrs. Cowlin and Son, of Bristol.

SEWAGE DISPOSAL NEAR DONCASTER.—A Local Government Board inquiry was held at Doncaster by Mr. W. O. E. Meade-King, C.E., as to the compulsory purchase of land for sewerage and sewage disposal purposes for Askern, Bawtry, Bentley, Bentley-riding, and Arkeby. The schemes, which have been prepared by Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, comprise the main sewerage of the above places, all of which will gravitate to underground storage tanks, from which the sewage will be pumped to the site of disposal works there, to be treated in bacterial tanks, and afterwards on land. Various opponents to the scheme were represented by counsel, who objected chiefly on the ground of cost.

MISCELLANEOUS.

RAILWAY EXTENSIONS, MANCHESTER.—Victoria station, north-west Manchester, is being enlarged by the Lancashire and Yorkshire Railway Company. New platforms for local trains, and a special siding for the fish trade will be provided. In connexion with the improvements, a new bridge has been built by the company to connect Corporation-street with Cheetham Hill-road. The bridge was built by Messrs. Aston, Smith, Sons, & Senior, of Manchester, and is partly a steel-girder bridge, but has a double brick arch, the upper arch being immediately under the roadway, and the lower one forming a roof to a culvert over the river Irk.

DISCOVERY OF A ROMAN PAVEMENT, LEICESTER.—During the excavations now proceeding at the site of the Highcross Coffee House, at the corner of Highcross and High-streets, an excellently-preserved portion of a Roman pavement has been discovered. At the present time only a small portion has been uncovered, but this is being taken great care of, and arrangements are being made to have the surrounding earth carefully removed, so as not to damage the other part of the pavement. It is said that the portion which has been already laid here compares favourably with any other pavement found in Leicester, the cubes being very small, and being set in an artistic pattern with that care and exactness which characterised the best Roman work. What will be done with the discovery is not yet decided, and probably will form the subject of discussion between the directors of the Coffee House Company and the Corporation, but the probability is that the stone work will be removed in as complete a form as possible.—*Leicester Post*.

SOCIETY OF ANTIQUARIES OF SCOTLAND.—The usual monthly meeting of the Society of Antiquaries of Scotland was held in their library at the Museum of Queen-street, Edinburgh, on the 11th inst. Sir Thomas Gibson-Carmichael, vice-president, presiding. In the first paper, Mr. Andrew W. Lyons, architect, gave a detailed description of the painted ceiling in the Montgomery aisle of the Old Church at Largs, of which he had presented to the Museum a drawing made to scale in 1897. The roof, which is about 20 ft. by 24 ft., is barrel-vaulted and lined with wood, painted on the under faces of the boards with a most elaborate and beautifully designed and executed series of subjects historical, emblematical, or heraldic, arranged in forty-one compartments, divided from each other by imitation mouldings painted in monochrome. The central panel contains a mantled escutcheon, charged with the quartered armorial bearings of Montgomery and Eglinton, impaled with those of Douglas and Mar, surmounted by a knight's helmet, crest, and motto. Beneath the coat of arms is an oblong cartouche, with the names of Sir Robert Montgomery and Dame Margaret Douglas, and suspended from it a circular tablet with the date 1638. In another compartment are four shields, with the arms of Eglinton, Semple, Drumlanrig, and Lochinvar. Others have emblematical representation of the virtues, the signs of the Zodiac, and the seasons, with landscapes of the surrounding district. One of the larger panels has a representation of the Temptation in the Garden of Eden, and the other has what is believed to be a historical event connected with the Montgomery family, the tragic death of the wife of Sir Robert Montgomery from the kick of a horse in 1624. In the same panel is the signature of the artist, Stalker, of whom nothing is known, and the date 1638. The ceiling, which is most elaborate, well-proportioned, and beautiful in design, may fairly claim to be the best example of the early seventeenth century tempera decorative painting now extant in Scotland. In the next paper Dr. Joseph Anderson gave an account of a remarkable group of brochs in the district of Keiss, Caithness, recently excavated by Sir Francis Tress Barry, Bart., M.P., Keiss Castle.

THE COST OF MUNICIPAL HOUSE BUILDING, SHEFFIELD.—The minutes of the Sheffield Health Committee, submitted at the last meeting of the Sheffield Corporation, contained a report by the City Surveyor that ten of the cottages in Handislane were ready for occupation, and that five more would be ready in a few days. The approximate total cost was stated to be 5,793l. 10s. 3d.—Mr. Turner asked whether the plans had been carried out as passed by the Health Committee, and whether the cost had exceeded the estimate?—Mr. Utley defended Corporation officials who were attacked, and who had no opportunity of denying what was said against them. The cost, as a matter of fact, was slightly under the estimate. Mr. Utley went on to describe the houses, and speaking of the rents (6s. 6d. per week) said if people were to have all the conveniences provided they would have to pay more rent. It was better for a working man to pay 1s. a week more in rent and have an entire yard, and five decently and in comfort, than to pay a low rent and have to mix with other people in the same yard. The people who argued that the houses were too well built did not understand what belonged to good sanitation and property.—Sir Charles Skelton said those who formed committees should exercise the common-sense that they would exercise if they were doing their own business. There was not a member of the Council who would have required twenty-six plans before they decided what they would have in connexion with property of their

the street, but a party wall between the two houses was intact. Previously to the accident Knight had been employed in the work of demolition for five and a-half days, at the rate of 35s. a week. No evidence was tendered at the hearing as to the height of the building at the commencement of his employment.

Mr. Minton-Senhouse, on behalf of the respondents—continued the judgment—contended, in the first place, that No. 17 was not, at the time of the accident, a building within the meaning of the Act, as the part which was in course of demolition, and on which Knight was working, did not exceed 30 ft. in height, and in support of this contention he relied on the case of *Billings v. Ulloay*, 1899, 1 Q.B., 70, where it was held that a building in course of erection, and not exceeding 30 ft. in height, but was intended to exceed that height, was not within the Act. His Honour, however, did not think that the converse necessarily applied, as whatever the height of the building at the time of the accident, a building of the required height was in course of demolition, whilst in the case relied on, the building in question had not, and might never have reached that height. In the present case, moreover, the party wall, which certainly was part of the building, was intact, a fact which, in His Honour's opinion, further distinguished it from *Billings v. Ulloay*, and clearly brought it within the Act.

The case of *Rexivin v. Pritchard*, 1900, 1 Q.B., 800, was also cited, but His Honour did not think that this had any application to the present case.

On behalf of the respondents a further point was taken, namely, that they were not "undertakers" within the meaning of the Act, as the work sub-let by them to Clements was merely auxiliary to the business carried on by the respondents. The learned counsel had referred to *Pearce v. London and South Western Railway Company*, 1900, 2 Q.B., 100, but His Honour could not agree with this contention, as the respondents' agreement with Messrs. Woolland Bros. was both to demolish and to re-construct, and they sub-let the former part of the undertaking to Clements, who thus became a sub-contractor for the execution of the work which, if executed by workmen immediately employed by respondents, would have rendered them liable to pay compensation under the Act to those workmen in respect of any accident arising out of, or in the course of, their employment.

His Honour thought, however, that the respondents were entitled to be indemnified by Clements, as coming within the proviso contained in Section 4 of the Act.

With regard to the amount of the award, in the event of the award being in favour of the applicant, it was contended by Mr. Minton-Senhouse that, having regard to the fact that Knight had only been employed for five and a-half days, his average weekly earnings were not 35s. a week, but only half that sum; in other words, that the 35s. must be spread over two weeks before an average could be struck. His Honour, however, was unable to agree with this contention, and he thought that, according to the provisions in Schedule 1 of the Act, the man's average weekly earnings should be taken at 35s. a week.

His Honour, therefore, assessed the amount of the compensation to be paid by the respondents at 273/, and awarded that sum to the applicant, with costs. The 273/ was to be apportioned as follows: 100/ to be paid to the applicant, and the remaining 173/ to be divided amongst the four children, the money to be deposited in the Post Office Savings Bank by the Registrar, and interest paid to the applicant, with liberty to apply.

The Judge now ordered that the amount of the award should be paid into court within a fortnight, and that if notice of appeal were not given within twenty-one days, the money should be paid out to the applicant.

CONSTRUCTION OF DISTRICT COUNCIL BY-LAW.

AT Brentford Police-court on Monday, Mr. F. W. Smith, of Shirley-gardens, Hanwell, was sued by the District Council for Hanwell for having contravened the by-laws by neglecting to give notice of the completion of Nos. 28 and 30, Shirley-gardens.

Mr. T. A. Woodbridge appeared for the Council and Mr. W. Hook defended.

Mr. Woodbridge said that the proceedings were taken under the 9th By-Law, which required "that every person who shall erect a building shall within reasonable time after completion deliver or send to the Surveyor notice in writing of the completion, and shall within seven days thereafter and at all reasonable times before such building is occupied, allow the Surveyor access for the purposes of inspection. On October 28 the Surveyor, on going to the houses, found them occupied. He also found that the drainage was not completed, inasmuch as it was contrary to the by-laws, there being no separate system for storm-water.

Mr. Sidney Barnes, the surveyor, having borne out this statement in evidence, in cross-examination said that he did not consider the buildings finished, as the sewage was not in order. He admitted receiving on October 16 a letter from defendant to the effect that he was not the builder, but had a contract with the builder, who was responsible. As the builder had not given notice, he would do so

then and there. The drainage was laid two years ago, and the houses remained as carcasses for some time until defendant bought them. He had seen defendant's men at work on the houses, and his foreman lived in one. He had seen the defendant on the land adjoining. He could not swear that two houses were finished in July, but he could not say if anything was done to them after that date.

Mr. Hook submitted that there was no case. The defendant was specifically summoned for not giving notice of completion, but the Surveyor had sworn that the houses were not completed, and until they were there could be no offence, since the notice was not necessary. Assuming, however, the houses were completed, there was no definition of "reasonable time" upon which the Court could act, and it was incumbent that the District Council should show when the completion took place in view of the time limits of the Act. He should show, if necessary, that they were finished in July, and therefore these proceedings were barred by time, the summonses having been issued after six months had expired. The Surveyor, however, admitted having had a notice in October, and though it might have been late, it was given three months before the Council took these proceedings.

The Chairman: But it must be given before the house is occupied.

Mr. Hook denied that that point entered into the case. Nothing was said in the by-laws about notice being given before occupation. He urged as a further point that the defendant was not "the person erecting the building." He was the owner of the land, but he had entrusted the building to a Mr. Hands.

The Chairman: Surely he was the person who erects. He causes the building even if he does not lay the bricks.

Mr. Hook said the words of the by-law must be interpreted strictly. In the criminal law a man could not be shot at through his agent. If that were so a gentleman who instructed a builder to erect a mansion might in absolute ignorance be liable for an offence through an omission of the builder.

The Chairman said the Court were of opinion that the District Council had been to blame for not keeping a better look out on these carcasses. But taking it that they were finished in July, there was unreasonable delay before the giving of the notice to the Court, and for that the defendant was liable. The Court found that having regard to the evidence that the defendant was seen about the buildings and at work next door, that he was in law the person responsible to give the notice, and they also found he was in default in letting the houses before the Surveyor could inspect them. He would be fined 4l. and costs.

Mr. Hook asked for a case, which the Court granted.

BREACHES OF BUILDING BY-LAWS AT HALIFAX.

ON the 12th inst., at the Halifax Borough Court, before Mr. J. T. Riley and other Justices, Wilkinson Pickles, Gads Hill, a member of the Halifax School Board, was summoned by the Halifax Corporation for allowing houses to be tenanted before the same had been certified by the Borough Surveyor as being fit for habitation. Mr. F. M. Tordoff appeared for the prosecution, and stated that the defendant was owner of a block of five houses at Rhondadale, Mile Cross. The Borough Surveyor received notice from the defendant on December 4 that the houses were completed. Two days later an inspector went to the buildings, and as he found them to be defective in certain parts a notice was served upon the defendant on December 8 calling upon him to carry out some requirements, such as channelling, providing fall pipes, &c. Before these alterations were made and before the houses had been certified as "fit" three dwellings became tenanted. The provision of fall pipes had not yet been made. Mr. J. R. Farrar appeared for Mr. Pickles, and stated that he had not intentionally broken the law. He gave orders for the works required to be done, and thought they had been completed. A fine of 5s. and 8s. 6d. costs was imposed.—Harry Aspinall, of Mount Tabor, owner of the Shoulder of Mutton Inn at that place, was summoned on a similar charge. Notice of the completion of the new building was received at the Town Hall on January 2, and when the inspector went to look at the premises he found them occupied. The defendant stated that he was under the impression that his getting leave to build the premises was all he required. A fine of 5s. and 8s. 6d. costs was imposed. The chairman stated that future offenders would be more severely dealt with.

CAB PROPRIETOR AND ARCHITECT.

AT Newcastle County Court recently the case in which Mr. J. C. Parsons, architect, sued Mr. Edwin Gowan, cab proprietor, Heaton, for 37l. 10s., the cost of preparing plans, four years ago, for the erection of a proposed livery stable at Heaton, was concluded.

The defence was that according to an arrangement made there was to be no payment in consequence of the plans having failed to pass the Town Improvement Committee.

His Honour, in giving judgment, said the defendant had put it forward that there was an express undertaking that unless the plans were passed by the Corporation and the work went on plaintiff was to get nothing for the preparation of the plans. He was asked to believe and credit this story because defendant had been bitten once before, and had been compelled to pay for an architect's services without receiving anything in return. It was perfectly true that for about three years no claim was made, and during that time, apparently, attempts were being made to induce the Corporation to pass the plans. But ultimately the account was sent in to defendant, who, for some months took no notice of the letters of Mr. Parsons. Then, on September 9th, 1900, he wrote asking for a detailed account, as it wanted looking into. He (the Judge) could not agree that that was the natural reply for an unprofessional man to make in such a case. The simple reply, one would have supposed, under the circumstances, would have been, "I owe you nothing." Judgment must be given for plaintiff for the amount claimed with costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

20,901.—A CONTRIVANCE FOR WINDOWS: *D. Oldham*.—In order that the sashes may be turned inwards for purposes of ventilation and be readily removed in case of fire, &c., the pivots of the sashes are made to fit within slotted socket-plates secured to the frame; to afford weather-tight joints, rounded beads and grooves are made upon the rails, the lower corners of the sash stiles being cut away so as to clear the outside beams of the frame; sliding bolts fasten the sashes when they are closed, when they are opened they are secured with stay cords or with bolts that will enter into holes cut in quadrant-arms, and to prevent the sashes from becoming detached before they have been turned to an extent already determined they are fitted with stop-blocks which press against curved guides.

20,920-30.—BRICKS AND SIMILAR BUILDING BLOCKS: *G. De Bruyn*.—The brick or block is fashioned in two portions that will interlock with one another, and to render the block non-conducting of heat, a layer of asphalt, asphalt paper, &c., is placed between its two parts. For affording a support or key for plaster the surfaces of the bricks are roughened by the forcing into them, when in a plastic condition, of bits of stone or some such hard substance.

20,936.—A COMPOSITE MATERIAL FOR BUILDERS' USE: *A. Macfarlane*.—A material for slabs, panels, cornices and other ornamental is made by mixing a ceramic setting paste composed of pulverised calcined Mandouli stone, 4 parts; powdered baryta, 4 parts; pulverised baked clay, 2 parts; crushed sandstone, 1 part; and sodium silicate in solution; the moulded articles are hardened at a temperature ranging from 300 deg. to 500 deg. C., their outer surfaces may be fused; for producing perforations, incombustible plugs made of prepared recesses, incombustible plugs made of prepared wood, cork, metal, papier-mâché, and so on are inserted into the paste when it is in the moulds.

20,996.—A MITERING-GUIDE: *A. Macfarlane and A. Jones*.—The inventors seek to facilitate the angular adjustment of the saw-guide; they make it frame and guide, and undercut, plain, or other producing perforations, incombustible plugs made of prepared recesses, incombustible plugs made of prepared wood, cork, metal, papier-mâché, and so on are inserted into the paste when it is in the moulds.

21,086.—GAS BURNERS: *P. Nöel*.—The burner, which is adapted for incandescent heating and lighting, has an air and gas mixing chamber, of which the size can be altered, and air-ornices which can be correspondingly varied with changes in the pressure of the gas; the upper portion comprises a larger mixing chamber and a smaller part in which moves the upper end of a hollow screwed stem in the form of a piston. When the piston is screwed up and down the consequent rise or fall of a sleeve increases or lessens the cross-section of air-inlets, which are made in the stem around the gas-inlet, the stem working in a nut to which the sleeve is attached.

21,130.—GAS BLOWPIPES: *F. Speidel*.—The inventor's object is to afford means of regulating the gas supply together with a pilot igniting jet; a spring piston valve is inserted in the supply branch so as, under normal conditions, to cut off the supply of gas, but gas will flow through an inner pipe to the nozzle of the blowpipe whenever the valve is forced inwards, and a pilot flame which is fed with a small branch pipe will thereupon ignite the jet-screw, to the nozzle; a bent rod, clamped with its end to the valve, is inserted in an opened position, serves to retain the valve in an opened position.

21,173.—MACHINERY FOR CUTTING WOOD: *G. Pickles and A. T. Pickles*.—The invention relates to the balancing of the cranks which are employed to drive reciprocating saws and other similar wood-cutting machines; that result is provided for by the attachment of balancing weights opposite the webs or by fashioning extensions upon the webs themselves.

THE BUILDER, FEBRUARY 23, 1901.

THE TOWER OF THE VIRGIN, AUDENARDE,
NORTH BRUNSWICK

IN PHOTO. SPRAGUE & CO. 4 & 5 LEAST HARDING STREET, PETER LANE, E.C.

(Pugin Studentship, R.I.B.A., 1801.)

21,205.—SPANNERS: F. Kettler.—In order that the stem of the upper jaw shall slide without turning in the lower jaw it is started with an oblong section, its edges also are threaded for engagement with corresponding threads upon the rounded bore of the handle of the tool which is swivelled on to the lower jaw and is pierced with an aperture for the insertion of a lubricant.

21,211.—STONE-SAWING MACHINERY: T. Dawson.—Balance weights are mounted upon extensions, that project above the shaft of the rods from which the frame of the saw is hung. The weights may be carried with a girder-and-bracket arrangement, and further tapered weights can be inserted into recesses which are cut in them.

21,214.—HANDLES FOR FILES AND OTHER TOOLS: L. Grob.—The handle consists of a piece of reed cane, which is wrapped within a casing of paper, or some similar envelope, and is then put into the bored-end of the wooden haft. A hole in the cane takes the tang of the file, &c., and the paper wrapping is wound around and cemented upon the cane. In another shape the haft is shapened out of the paper envelope around the reed cane.

21,220.—A COMPOSITION FOR THE TREATMENT OF WOOD: J. Gibbs.—The compound is devised for use as a filling for the preparation of wooden surfaces that are to be polished. It consists of an admixture of shellac that has been macerated in methylated spirit, ground alum, linseed oil, pumice powder, whitening, and plaster of Paris.

21,230.—COUPLINGS FOR PIPES: C. A. Barclay.—The coupling, which is used more particularly for pipes of soft metal, is formed by means of an internally screw-threaded collar which can be screwed on to a pipe-end, the thread having narrow ridges and a sharpened end in order that it may cut into the softer metal. In a variant form a tapered bore is adapted to the collar, the pipe being expanded when the collar has been screwed on to it.

21,245.—WEIGHING APPARATUS, AND HYDROSTATIC APPARANCES: T. Fern.—The beam from which the platform-carrying rod hangs is suspended from a hand-lever that bears against the frame, and carries another beam upon which is a hook for engagement with the hand-lever. Weights that slide upon the beams are graduated to it, may be stones and cwts. At the ends of the beams are vessels, filled with liquid, and carried by arms to which are attached pointers that will indicate respectively fractions of the units of weight, fixed plungers are disposed above the vessels which may however be arranged above the beams—in that case the hand-lever will not be needed.

21,256.—A FIRE-ESCAPE: F. F. Glaser.—For the lowering of a rope ladder out of a window is devised a frame mounted upon castors, which is supported at its top by a bar that is laid against the sides of the window, in the frame is mounted an axis upon which are pulleys, on to which the sides of the rope ladder are wound; the ladder is passed over guide-pulleys mounted at the end of a hinged frame, which can be folded up when it is not required for use; the descent of the ladder is checked with a brake lever and wheel attached to the axis.

21,260.—WOOD-SCREWS, SCREWED SHANKS OF HOOKS, &c.: J. W. Caldwell.—On the tapered shanks are fashioned highly pitched threads, of which the upper faces are steep and the lower faces are flat and inclined to a degree that will provide for the sharp cutting edge being that part of the thread which shall first enter into the hole of the wood; to obviate the necessity of boring a hole before the screw or hook-shank is put into the wood, the threads are made with sharp wings that project from their ends; the screws can be driven with blows by a hammer.

21,261.—PIPE-WRENCHES: T. E. Ryan.—A separated piece, which is firmly seated upon the end of the shank, and is secured with a pin passed through a socket in the shank and a lug upon the jaw, constitutes the fixed jaw of the wrench. A bar having a set of lugs arranged parallel to the shank and engaging with recesses cut in the shank holds the pin which joins the binged jaw to the shank in any one of a line of notches, and another pin is passed through the shank and the lugs; a pivoted catch holds the other end of the bar.

21,290.—BRICKS FOR VENTILATION: H. W. Roberts.—A contracted overhanging inlet aperture is laid through the brick by forming the brick in two parts, of which the side top and bottom surfaces are sloped. In the inner side of the wall is constructed a recess into which a detachable box of metal is to be inserted. The box has an opening lid a backing plate, which is joined with four rods to the back of the box.

21,303.—A TOP FOR CHIMNEYS: W. S. Shreeve.—The inventor has contrived a chimney-top that presents a tier of cones, two or more in number, and above which the pipe is raised cap, which is unshaped and is inverted; a clamping-ring is used for fastening the lowest open cone of the tier on to plain pipe or chimney-pot.

TO CORRESPONDENTS.

CLERK OF WORKS (No space this week).—F.R.I.E.A. (We cannot publish letters which are sent without the name and address of the writer enclosed).—M. & F. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £500, unless in some exceptional cases and for special reasons.]

The Strength of Timber.

One who has examined a series of tests of timber, or who has compared the tests carried out on any variety of timber by different experimentalists, can have failed to be struck by the wide divergence in the strength of many of the specimens. It is this divergence which has rendered all attempts to ascertain the normal strength of timber more or less unsuccessful. The important investigations instituted by the U.S.A. Department of Agriculture (Forestry Division) have added much to our knowledge of the subject; but, unfortunately, they were abandoned while still incomplete. Nevertheless the published records of these investigations furnish the most trustworthy information which has yet been obtained, and as they are not so well known in this country as they deserve to be, they will be largely quoted in this article.

It has long been known that "green" timber is weaker than seasoned. Sixty years ago Hodgkinson made a few tests for the purpose of ascertaining the difference of crushing strength, but his experiments were not carried out with sufficient accuracy, nor on a sufficient number of specimens, to render the results of much use. The degree of moisture in the original specimens does not appear to have been ascertained, but we are told that they were "moderately dry," and that the specimens in the second series had been kept two months longer in a warm place. Baywood, mahogany, and pitch-pine showed no increase of strength; Alder, ash, cedar, and white deal very little increase; while other woods showed increases varying up to more than 100 per cent.

Bauschinger's tests are more satisfactory, and go to prove that "green" pine timber may have less than half the compressive

strength of dry, but that the difference is not so great for transverse stresses. The results of his compressive tests on Scotch pine (*i.e.*, red or yellow deal) are particularly instructive. Four pieces of timber were taken, and sections from these were cut and tested "green"; these contained on the average 59 per cent. of moisture calculated on the *dry* weight of the wood, or 37 per cent. calculated on the *wet* weight, and had a crushing strength of about 4,400 lbs. per square inch. Four tests were afterwards made on partly-seasoned sections, containing moisture equal to 17 per cent. of the *dry* weight, or 14.6 per cent. of the *wet* weight, the average crushing strength being 6,500 lbs. per square inch. Finally, four tests were made on thoroughly-seasoned sections, which contained 9 per cent. of moisture on the *dry* weight, or 8.2 per cent. on the *wet* weight; these had an average strength of 10,700 lbs. per square inch. In other words, the partly-seasoned wood was about half as strong again, and the thoroughly-seasoned wood about two-and-a-third times as strong, as the green wood.

The experiments carried out by Professor J. B. Johnson and Mr. Roth for the U.S.A. Division of Forestry are particularly valuable, on account of the number of tests which were made and the care with which the investigations were conducted. The tests of the four "Southern pines" will be briefly considered. These are the Cuban pine (*Pinus cubensis*), the Longleaf pine (*Pinus palustris*), the Shortleaf pine (*Pinus taeda*), and the Loblolly pine (*Pinus echinata*). These are known by a great many local names, but, speaking broadly, it may be said that they are classed as "yellow" pine in America, and as "pitch" pine in this country. The ratios of transverse and compressive strength are given in Table I. for four different degrees of moisture—namely, 33 per cent. ("green" timber), 20 per cent. ("half-dry"), 15 per cent. ("yard-dry"), and 10 per cent. ("room-dry"). On the average the strength of the timber is increased

46 per cent. by "ordinary good yard-seasoning," and 82 per cent. by "thorough seasoning in kiln or house." With regard to these tests, Mr. B. E. Fernow, Chief of the Division of Forestry, states that "large timbers require several years before even the yard-season condition is attained, but 2 in. and lighter material is generally not used with more than 15 per cent moisture."

TABLE I.

Influence of Moisture on Strength of Southern Pines.

Nature of Stress.	Percentage of moisture calculated on "dry" weight.	Relative Strength.				
		Cuban.	Longleaf.	Loblolly.	Shortleaf.	Average.
Bending.....	33	100	100	100	100	100
	20	118	116	117	118	117
	15	142	142	138	134	139
	10	181	182	168	160	173
Crushing endwise.....	33	100	100	100	100	100
	20	132	122	128	122	126
	15	157	154	156	142	152
	10	184	205	206	168	191
Mean of both bending and crushing.....	33	100	100	100	100	100
	20	125	119	122	120	122
	15	149	148	147	138	146
	10	182	194	187	164	182

The actual compressive strength in lbs. per square inch is shown graphically in fig. 1, and varies on the average from about 4,200 lbs. to 8,100 lbs. per square inch, according to the degree of moisture. The illustration is reproduced with slight alterations from one in Circular No. 12, United States Department of Agriculture (Division of Forestry), from which also the other particulars of the tests have been obtained.

The importance of moisture as a factor in the strength of timber can scarcely be over-estimated. The results already recorded show clearly that little reliance can be placed on tests of timber, unless the amount of moisture has been carefully ascertained. The failure to determine this factor is one cause of the great discrepancy between the ultimate strengths recorded by different investigations. It also accounts in a great measure for the difference of strength

observed between small test-pieces and large scantlings of the same timber. To be strictly comparable, all tests should be reduced to a common standard of moisture (say, 15 per cent.), and, until this is done, the investigation into the strength of timber will make little progress.

The specific gravity or weight of dry timber is another important factor of strength. It has long been known that, of timber of the same species, the heavier is generally the stronger, and recent experiments appear to indicate that this truth is of wider application. If this should prove to be the case, the subject of timber physics will be vastly simplified. Bauschinger's tests of pine, larch, spruce, and fir led him to the conclusion that the crushing strength of these timbers increases almost directly as the specific gravity, or, more exactly—

$$\text{Crushing strength in lbs. per square inch} = (13,800 \times \text{s.g.}) - 900.$$

American tests of "green" cypress, whose specific gravity varied from .58 to .35, showed a gradual diminution of strength from 6,500 lbs. to 2,900 lbs. per square inch under compression, and from 7,800 lbs. to 5,000 lbs. per square inch under a transverse stress.

The specific gravity or weight of the four Southern pines already described is a very accurate index of their transverse and compressive strength, but apparently the relationship between the specific gravity or weight and the tensile and shearing strength is not so intimate, at any rate as regards Cuban pine. We need not particularise these tests, but will briefly indicate the results obtained from a series of specimens specially tested for transverse strength and specific gravity. Taking the value of Cuban pine at 100 both for strength and specific gravity, we have, for Longleaf pine, strength = 91, s.g. = 94; for Loblolly pine,

strength = 84, s.g. = 82; and for Shortleaf pine, strength = 77, and s.g. = 77. The relationship is remarkably exact throughout.

To ascertain the specific gravity of wood special apparatus is required, but a close approximation is in many cases possible by simple inspection or measurement. The greater the relative proportion of the dark summer-wood rings the greater will be (other things being equal) the specific gravity and the strength. Thus, among the southern pines, the dark rings have in good timber a specific gravity varying from .9 to 1, while the light-coloured spring-wood rings have a specific gravity of about .4 only. A log, therefore, in which the dark rings are one-third of the whole will have a specific gravity of .56, calculated thus:—

$$\left(\frac{1}{3} \times 9\right) + \left(\frac{2}{3} \times 4\right) = .56.$$

In the words of Mr. Fernow, "the relative amount of summer wood furnishes altogether the most delicate and accurate measure of these differences of weight as well as strength . . . especially since this relation is free from the disturbing influence of both resin and moisture contents of the wood, so conspicuous in weight determinations."

It follows from the facts just recorded that slowly-grown timber, with narrow annual rings, is not necessarily stronger than quickly-grown timber. The question is not so much one of the width of the annual rings as of the proportion between the light and dark parts of the rings; that is to say, between the spring wood and summer wood. As we shall see hereafter, the age of the tree has also a considerable influence on the strength of the wood.

While it is satisfactory to know that, other things being equal, the transverse and crushing strength of timber of the same species varies almost directly as the specific

gravity, a still more important point for determination is whether the relationship between specific gravity and strength holds good for timbers of different species and genera. The results of tests of thirty-two different American woods, including pines, cedars, ash, oaks, hickories, &c., show clearly that there is an intimate relation between the two, but that assumption of the U.S. Division of Forestry—that the strength varies directly as the weight—does not appear to us to be borne out by the facts. If the transverse tests are plotted graphically, the theoretical line of strength, according to this assumption, will be a straight line, and this will divide the tests into two unequal groups, eight species being on one side of the theoretical line of strength, and twenty-four on the other. The following original formula, devised by the writer, gives a curved line of strength, which divides the woods into two equal groups, sixteen on each side of the line, and therefore accords much more closely with the tests:—

$$W = 5000 + 38 w^2,$$

where W = ultimate transverse strength in lbs. per square inch, and w = weight of a cubic foot of "dry" wood in lbs.

It must not be forgotten, however, that, in the words of the Report, "these tests and weight determinations (especially the latter) were not carried on with that fineness which would be required for a scientific demonstration of a natural law," and that cross-grain, knots, moisture, and other conditions, may have affected the results in some cases more than others. The conclusions of the Division of Forestry are thus cautiously stated in circular No. 15:—"We can now extend the application of the law of relation between weight and strength a step farther, and state as an indication of our tests that probably, in woods of uniform structure, strength increases with specific weight, independently of species and genus distinction, i.e., other things being equal, the heavier wood is the stronger. We are at present inclined to state this important result with caution, only as a probability or indication."

We have seen that seasoned timber is much stronger than green, but the method of seasoning deserves consideration, as it may have considerable influence on the ultimate strength. Many experts are of opinion that natural seasoning gives the best results, but the time required is so long that more rapid methods are now indispensable. Drying in kilns is the process most generally adopted, and, if due care is exercised, appears to be perfectly satisfactory; on the other hand, if carried on too quickly, it may prove injurious, especially to hardwoods of complicated structure (such as oak), in which it produces a great amount of checking or cracking. Cuban pine in small scantlings (4 in. by 4 in.) has been found to have the same transverse and compressive strength when seasoned in warm air (about 100 deg. Fahr.), and when dried at temperatures varying from 150 deg. at the entrance of the kiln to 190 deg. at the exit. Higher temperatures, however, appear to be injurious. Scantlings of Longleaf pine, tested after drying at a temperature of over 300 deg. Fahr. and under a pressure of 150 lbs., were found to have the compressive strength reduced about 24 per cent. and the transverse strength no less than 37 per cent.

The soaking of wood by rafting or floating does not appear to have any injurious effect on the strength, provided that the wood is properly dried or seasoned before use.

The nature of the soil and climate has some effect on the strength of timber, but this effect is much more marked in some varieties than in others. Thus, Cuban and Longleaf pines appear to be very little affected by the locality in which they are grown, but the same cannot be said of other yellow pines. In the case of cypress, also, the difference in strength appears to be rather "a matter of individual variation than of soil or climate." Bauschinger found a marked difference in the compressive strength of whitewood or spruce from different localities, as shown in Table II.

TABLE II. (AFTER LANZA)

Bauschinger's Tests of Compressive Strength of Red Deal (*Pinus Silvestris*) and Whitewood (*Picea Excelsa*).

Time of Felling.	Red Deal from Lichtenhof.		Whitewood from					
			Frankenhöhe.		Regenhöhe.		Schliersee.	
	1 lbs. per sq. in.	2 lbs. per sq. in.	1 lbs. per sq. in.	2 lbs. per sq. in.	1 lbs. per sq. in.	2 lbs. per sq. in.	1 lbs. per sq. in.	2 lbs. per sq. in.
Summer....	6,244	7,183	4,592	6,416	5,379	6,287	3,143	4,579
Winter.....	6,784	6,343	5,618	6,756	5,348	6,343	4,233	4,779

which is also interesting for the light it sheds on the influence which the date of felling has on the strength of timber. The tests three months after felling (columns No. 1) show that the winter-felled wood is much stronger than summer-felled, but this advantage is lost with thorough seasoning, as it is merely due to the fact that in winter there is less moisture in the wood than in summer. The tests of the seasoned wood (column No. 2) may be conveniently compared by averaging them, when (1) tested three months after felling; (2) tested five years after felling, it will be found that the average strength of the summer-felled timber is 6,114 lbs. per square inch, and of the winter-felled, 6,055. It may therefore be stated that the time of felling has no permanent influence on the strength of timber, but that summer-felled wood requires longer seasoning than winter-felled, as it contains more moisture.

Different parts of the same tree vary greatly in strength, as well as in specific gravity. In the case of longleaf pine it has been proved that the lightest, and therefore weakest, part of the stem of the tree is the pith and adjacent rings, representing the young sapling of less than fifteen or twenty years' growth. The maximum weight is grown between the ages of forty and sixty years. In other varieties of timber, the age of greatest weight and strength is different; thus, in Loblolly and Shortleaf pines, the maximum is reached between the ages of thirty and forty years. The sapwood of old trees is always weaker, but this is not due to the sap, but to the fact that in old age trees naturally produce lighter and therefore weaker wood. The weight and strength of the wood decrease from the butt or stump upwards; in Longleaf pine, wood cut from a tree at the height of 60 ft. from the ground was found to be nearly 25 per cent. weaker than wood cut from the stump.

Knots, cracks, and other defects of course affect the strength of timber very injuriously. Columns less than about 25 diameters in

height, generally fail at knots, and not by direct crushing of the fibres. Even small "live" knots are injurious, but as these cannot be avoided in large scantlings, they must be accepted as an inherent defect of the material. No definite rule can be laid down as to the weakening effect of knots and other defects in a certain piece of timber; the architect must exercise his discretion as to whether the defects are so serious, considered in relation to the duty the timber has to perform, as to call for its rejection.

In conclusion, we will state briefly the most important lessons which this article is intended to convey. Timber for constructive purposes ought to be thoroughly seasoned, either naturally or at moderate temperatures; it ought to contain a large relative proportion of dark summer

wood, and to be straight-grained, and as free as possible from large and "dead" knots, shakes, and other defects. The truth of the further lesson may also be assumed—that, other things being equal, heavier timber is almost invariably stronger than lighter timber, whether of the same species or genus or not.

NOTES.

The Housing Question.
THE question of the housing of the working classes is certainly now taking a larger share of the public attention; but whether this will produce practical results remains to be seen. It calls forth, at any rate, various schemes. The latest is that of the versatile Lady Jeune, for which there is a good deal to be said. Her suggestion is that the Government should take the housing question out of the hands of the municipalities and make it an Imperial matter, placing it in the hands of a permanent Commission or similar body. There is a good deal to be said for this plan. It would enable the subject to be dealt with on larger and more consistent lines, and it would place the Imperial credit at the back of the Commission. On the other hand, it would inevitably tend still further to overburden the House of Commons, since every action of the Commission would be discussed in Parliament because, however capable the Commission might be, Parliament would be the final power with whom would lie the duty of supplying the necessary funds. But to every plan there must be objections, and we are inclined to think that Lady Jeune's idea is one which, if carried into effect, might to some degree enable this important subject to be coped with effectually.

A PARLIAMENTARY paper issued on Monday last shows that the further sums required on the Civil Service list in connexion with public buildings, for the twelve months ending March 31, 1901, amount to 1,018,731*l.*

Of that sum certain items are distributed thus:—Art and science buildings: British Museum (1,450*l.*), Natural History Museum (950*l.*), and Edinburgh Museum (100*l.*); for the adaptation of Hertford House, Manchester-square, for the Wallace Collection, 3,125*l.*, and of the buildings of the Imperial Institute for purposes of the London University, 9,960*l.*; and for works in respect of diplomatic and consular buildings in Vienna, Brussels, Lisbon, Cairo, and elsewhere, 2,000*l.* The total original net estimate for public buildings in Great Britain was 323,000*l.*; an additional sum of 35,200*l.* is now required. It is stated that the incidental expenses for the Wallace Collection are estimated at 4,275*l.*, since the preparation for opening the collection to the public involved a much greater expenditure than that at first provided for; and that the total original estimate for the Wallace Collection (8,967*l.*) should now be increased to the extent of 3,333*l.* Of the 5,000*l.* required for the Houses of Parliament buildings, 1,300*l.* represents the additional expenditure on the occasion of the recent opening of Parliament by the King and Queen in person.

Lighting the Embankment. ON Saturday afternoon Mr. Dickinson, the Chairman of the London County Council,

opened the electric works at Charing Cross which are used for the lighting of the Victoria Embankment and Westminster Bridge. It will be remembered that twenty years ago the Victoria Embankment and Waterloo Bridge were lighted by Jablochkoff candles, but the constant breakdowns made the return to gas advisable. The County Council have been considering the question of returning to electric lighting ever since 1892, so they cannot be accused of acting with undue haste. The generating station is next door to the Charing Cross District Railway station, and is admirably adapted for its purpose. Four gas engines of 70 h-p each drive four dynamos by means of cotton ropes. The pressure generated being 500 volts, the lamps are run in batches of ten in series. There are sixty-seven lamps on the parapet of the Embankment and there will be eighty on the kerbs and on Westminster Bridge. The latter lamps are double the candle-power of the former, but they are not so close together. The Council have, wisely in our opinion, made use of the old standards which were used to support the gas-lanterns, and the general effect of the lighting along the curved line of the Embankment wall is distinctly good. The arc-lamps are of the open type and have a high efficiency. They are double-carbon lamps, and the inventor claims that the parapet lamps will burn forty hours without retrimming. A special beaded kind of glass is used for the parapet lanterns which diffuses the light very successfully. We expect, however, that scrubbing and washing this glass will take up a good deal of the trimmers' time. From the electrical engineer's point of view, there is a good deal of the general arrangement of the station open to criticism. The total power generated is only some 300 h-p., and yet nearly all the large floor space is taken up with gas engines and dynamos. If steam engines and direct driving were employed, there is room for machines that would develop ten times the power. Mr. Dickinson mentioned that gas was chosen so as to avoid the smoke and dirt

inseparable from steam driving. Still, steam being so much more economical, it would have been possible to use the best Welsh steam coal producing practically no smoke, and as for dirt, it is only necessary to inspect any well-managed corporation electricity works to see how easily engineers can overcome that difficulty.

An important step has been taken by the American Senate in the appointment of a Commission of Architects to consider the best means of furthering the architectural and æsthetic improvement of Washington, and of the district of Columbia State adjoining the capital. This movement was owing, in the first instance, to the initiative of the American Institute of Architects, who presented to Congress a Bill for the appointment of a Commission which should procure a general plan for the city of Washington, and determine the location of public buildings, ordering of landscape and statuary, and the extension of the park system in the district of Columbia. The result of this has been the adoption by the Senate of the United States of the following joint resolution:—

"Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the President of the United States be, and he is hereby, authorised to appoint a Commission, to consist of two architects and one landscape architect eminent in their professions, who shall consider the subject of the location and grouping of public buildings and monuments to be erected in the District of Columbia and the development and improvement of the entire park system of said district, and shall report to Congress thereon the first Monday in December, nineteen hundred and one.

That to carry out the provisions of this resolution the sum of ten thousand dollars be, and the same is hereby, appropriated, out of any money in the Treasury not otherwise appropriated, to be expended under the direction of the President."

In another issue we will give the interesting summary of what may be called the æsthetic history of Washington and its neighbourhood, drawn up by Mr. Glenn Brown, the Secretary of the American Institute of Architects.

Lifting a Stone Building.

As an example of what can be done in the direction of underpinning, the alteration recently made to a two-story masonry structure in Illinois, is decidedly worthy of attention. The building, used as a County Court-house, covers an area of nearly 10,000 square feet, the walls are about 60 ft. high, and the roof is surmounted by a heavy dome. For the purpose of forming a new lower story, the entire structure was raised bodily by more than 12 ft. The mode of operation seems to have been particularly simple, and was as follows:—Rectangular holes at short intervals were cut through all the outer and two cross walls, about 3 ft. above the ground level. Two or three 15-in. steel I-beams were then inserted in each hole, the ends being supported on 12-inch square timbers parallel with the walls, and the timbers in turn were set on 10-ton screw-jacks resting upon two 12-in. square sills. By the aid of a large gang of men the jacks were screwed up gradually until the whole building had been lifted 6 in., when the load was transferred to timber beams placed on each side of the walls, these beams being shored up whilst cribwork was built beneath the jacks so that the next lift might be made.

When the structure had been raised 2 ft., the old foundations were taken away, and a third crib was added and continuously built up as the work progressed. Finally the centre crib was removed and in its place new foundations were formed, and new walls were carried up to the old work. Each front of the building includes a massive portico, having four stone columns, each weighing about 50 tons. These porticoes were raised together with the main walls by using longer steel beams at the necessary points. It is said that the work was successfully accomplished without cracking the masonry or causing any other structural injury.

Mr. F. H. WILLIAMS, of Pennsylvania, has recently published the results of some corrosion experiments made with pieces of soft steel containing respectively, 0.078, 0.145, and 0.263 per cent. of copper. The steel without copper was found to lose 1.85 per cent. of its weight under the conditions of the experiment, while the pieces containing copper lost only 0.89, 0.75, and 0.74 per cent. in weight. Some experiments with wrought iron showed that the addition of 0.393 per cent. of copper to the iron materially reduced its rate of corrosion. Further information with regard to the effect of the presence of small quantities of copper upon other properties of the iron and steel would be of interest.

The School for the Indigent Blind, St. George's, S.E.

It is stated that the sale of the site and buildings of the Schools for the Indigent Blind, in Southwark, has just been completed. The amount of the purchase-money, 140,000*l.*, was agreed upon after consultation between Mr. Reginald Roumieu, as surveyor to the charitable foundation, and Mr. Leslie R. Vigers, as surveyor on behalf of the Baker-street and Waterloo Railway Company, who have scheduled the site of the school for purposes of an electricity-generating station for the extension of their authorised line from Waterloo Station to the Elephant and Castle, at Newington, where a terminus will be constructed, at an estimated cost of 9,000*l.*, with subways communicating with the stations of the City and South London and the (old) London, Chatham, and Dover railways. The Blind School was first established near the Dog and Duck in St. George's Fields in 1799; thirteen years afterwards the premises were taken for the building of Bethlehem Hospital, and the Governors obtained a fresh site opposite the Obelisk. In 1834-8 the school buildings were enlarged and remodelled after the plans and designs of John Newman (*obit* 1859). Messrs. Roumieu & Aitchison were appointed in 1897 Honorary Architects and Surveyors to the Corporation, who will erect new schools at Leatherhead, Surrey.

Bushey Park.

THE Commissioners of H.M. Works and Public Buildings are about to erect a building in Bushey Park for the purposes of the National Physical Laboratory, as a department of the establishment at Kew. Shortly before her death Queen Victoria signified her sanction to the assignment of a lease of Bushey House, together with 30 acres of surrounding grounds, for the carrying on of

physical and scientific research by the Royal Society, and the Government agreed to increase the building grant by 2,000*l.* for necessary alterations of the house, which the Duke of Clarence, as Ranger of the park, occupied during many years before he succeeded to the throne as William IV. It had formerly been the residence of Lord North. The park, which extends over 1,100 acres, contains near the lodge some fine old oak and thorn trees, and is described by Norden in his account of Hampton Court, *temp.* James I. The famous avenues of chestnut trees, nine in number, were planted by King William III., who removed from the Palace grounds to the pond the fountain popularly known as "the Diana fountain," which in the inventory of 1659 is described as "one large brasses (*sic*) Statue on the top of the Fontaine called Arethusa." The statue, by the way, holds a gilded apple, and as Mr. Ernest Lav suggests in his work upon Hampton Court Palace, may be intended for Venus. The single gate at the Teddington entrance was replaced three years ago with two gates separated by an iron pier, and for a length of about 50 ft. an iron railing was substituted for the high wall. Last June was unveiled the memorial, in terra-cotta, which Mr. Buckmaster, of Ashleigh, Hampton Wick, set up in honour of Timothy Bennet, the shoemaker of Hampton Wick who, at his own charges, successfully resisted the closing, about 150 years ago, by Lord Halifax of the footpaths across the park to all persons other than ticket-holders; that obstruction, which existed in the time of Charles I. and Cromwell, had been removed by Charles II. shortly after the Restoration. Home Park (about 750 acres) and Bushey Park formed part of the 2,000 acres acquired by Cardinal Wolsey when, in 1514, he took a lease for ninety-nine years at 50*l.* per annum of the Preceptory, with its "manor-house" (Hampton Court), of the Knights Hospitaller of St. John of Jerusalem, to whom, in 1211, the manor had been devised by Joan, widow of Sir Robert Gray.

LETTER FROM PARIS.

THE jury appointed to judge the "Concours de Maisons," or the annual competition for the medals and awards to be given to the architects and owners of the most artistic houses erected at Paris during the past two years, has now been completed by the adherence of the two members elected by the builders of the fifty-nine houses taking part in the second competition. The two new members are MM. Vaudremer and Nénot. The jury is now composed of four architects, MM. Bouvard, Sauger, Nénot, and Vaudremer, and five Municipal Councillors, with M. Bouvard as Chairman. The jury will commence operations this week. Twelve medals will be awarded, and the owners of the premiated houses will benefit by a reduction of half of the building taxes.

The Académie des Beaux-Arts has decided that in future the competitions for the annual Prix de Rome shall be anonymous; the names of the competing students and those of their professors shall no longer, as has been the custom until now, be marked on the plans and drawings. This decision has caused much dissatisfaction amongst the students. The public exhibition of the drawings will, however, take place as usual for three days before the visit of the jury.

The Higher Committee of the Ecole des Beaux-Arts has decided to add a new clause to the general rules of the Ecole concerning the awards to students of foreign birth, a decision which is the cause of considerable emotion in the section of architecture, where foreign students are numerous. The new article, No. 105, runs in substance as follows:—

"Foreign students—male or female—cannot

124 PHOTO. SPAGUE & CO. L.P. 4 & 5, EAST HARDING STREET POTTER LANE E.C.

THE BUILDER. MARCH 2, 1901.

PART OF A TAPESTRY PANEL: "ADORATION OF THE INFANT CHRIST" (FLEMISH: circa 1510).—FROM A DRAWING BY MR. HERVEY RUTHERFORD.

claim the awards of sums of money coming from the various foundations of the schools, or connected with the medals awarded for the school competitions. In the cases where the jury designates a foreign student as winner of an award consisting of a medal, prize, and sum of money, the foreign student will be declared winner of the honorary award, viz., the diploma and the medal, but not the monetary reward, which shall be reserved. The jury will then decide whether the work of a French student in the same competition is worthy of an award, and in that case the money award will be given to the latter. In the contrary case the sum of money will be reserved and divided between two French students, winners of the same competition in the following year.

The subject for the annual competition in decorative architectural design, called "Concours Rougevin," was an episcopal throne, and was competed for by 186 students of the first class. The awards were made on the day following the application of the above new rule regarding foreign students, and the winner of the first medal, second prize—Mr. Brown, an American student—was the first foreigner to whom the new rule was applied. The first medal, with a money prize of 241, was awarded to M. Cret, pupil of M. Pascal, the second medal being awarded to Mr. Brown, pupil of M. Laloux; but the money prize, of a value of 161, was awarded to M. Roy, winner of the third medal.

The organising Committee of the next Salon of the "Société des Artistes Français" (Old Salon) has elected MM. Pascal, Scellier de Gisors, and Courtois-Suffit as delegates for the section of architecture. The exhibits of drawings of architecture, &c., should be delivered at the Grand Palais des Beaux-Arts from April 1 to 5 next. The two Salons—Old and New—will both hold their exhibition at the Grand Palais des Beaux-Arts, the first from April 22, the second from May 1, and both to June 30, 1901. The New Salon has modified its rules to the effect that foreigners shall no longer form portion of the jury, and that members of the society shall be limited to five exhibits only. The Old Salon admits two exhibits only from each member, but each exhibit may include several drawings in one frame, and the jury reserves the right of excluding any drawing which may not be considered absolutely necessary for the proper comprehension of the whole exhibit. The public will now have to pay a separate entrance fee to each Salon instead of (as has been the case at the recent Salons) one entrance fee for visiting the two Salons.

The city of Paris has just acquired for the sum of 1,600, the remarkable high-relief "Frise des Travailleurs," which decorated the entrance to the Porte Monumentale of the Exhibition. It is proposed to place this frieze in the new museum at Montmartre, but it would appear to be much better in place as a backing to some circular sward in the Cours la Reine. The frieze is due to the talent of the young sculptor, M. Anatole Guillot, and the skill of M. Emile Muller, ceramist.

The Commission des Programmes at the Ecole des Beaux-Arts gave "A Building for National Assemblies at New York" as the subject for the competition called "Prix de Reconnaissance des Architectes Américains." The building was to comprise a large assembly hall, capable of containing 4,000 people, for national assemblies and for the Presidential elections, and was to contain an important tribune at the end of the hall for the speakers; six large rooms for committee meetings, with private rooms for sub-committees and the chairmen; a large hall for the archives, a large library, and all the necessary dependences; an immense waiting hall preceded by vestibules for the accommodation of a large concourse of people; refreshment and correspondence rooms, reading-rooms and press-rooms, post, telegraph, and telephone offices, and an important signal tower. A connexion is to be made with the Metropolitan Railway by means of wide staircases and lifts. The employment of brick in the construction was recommended as being the material largely in use at New York. Stone and rich marble from Europe should also largely enter into the design, and as the funds (due to the donation of a rich person) were unlimited, nothing should be spared as regards the sumptuousness of the exterior and interior of the building and the employment of architectural and sculptural orders. The longest dimension of the available ground was 630 ft., the scale of the elevations was to be 1:25th full size. As no prize was awarded last year, two equal prizes were given this time for the best plans and

designs for this building, for which the programme was truly Prix de Rome, and these two were carried off by M. Charles Duval, pupil of M. Pascal, and M. Hulot, pupil of M. Marcel Lambert.

The efforts of the Parisian archaeologists and some of the members of the Commission du Vieux Paris concerning the preservation of the old residence called "Résidence de la Reine Blanche," in the Rue des Gobelins, of which mention was made in the last letter, have met with success. The Government has given orders for complete measured plans of the old building, which M. Jules Geoffrey, Director of the Manufacture Nationale des Gobelins, proposes to add to the present manufactory and instal therein an interesting museum of Gobelins' work. The Commission du Vieux Paris has named M. André Hallays, editor of the *Journal des Débats*, and M. Henri Lavedan, the dramatic author, as members of the Commission in place of the late Dr. Lamoureux and M. Jules Perrin.

M. Nénot, the architect of the New Sorbonne, has been appointed "Commandeur" in the Legion of Honour.

The new building of the Cour des Comptes which will replace that which existed on the embankment opposite the Tuileries and was burnt down during the Revolution of 1870 is very interesting as an example of the employment of armed cement in the construction of a building destined to contain important documents and archives, and for that reason necessarily as fireproof as possible. The architect, M. Moyeux, has constructed the staircases, vanits, floors, and all the interior portion entirely of armed cement, including the immense number of cupboards, shelves, and pigeon-holes for storing the archives, the whole of the latter being painted with a metallic white enamel paint called Siléxore, which will preserve the surface and at the same time keep the interior bright and light.

The new lines of the Metropolitan Railway, viz., those of the Palais Royal (Place du Danube), Auteuil (Opéra), and Bastille (Place de la République) are now being put in hand.

The interesting old church of Montmartre, one of the oldest of Parisian churches, has been saved from destruction, and is now in the hands of MM. Sauvageot and Boutré, architects, for complete restoration. This old church, of which the chapel was consecrated in 1147 by Pope Eugène III, is to be carefully restored and made complete, a large portion of the oldest remains of the building have been discovered, and sufficient data of the old tower which fell several hundred years ago has been found to facilitate the restoration and reconstruction. The magnificent marble column which supported the dome, and which were brought over by the Roman legions, have been discovered surrounded by a thick coating of cement and plaster. The work will occupy about two years and will cost 12,000.

The well-known Pavillon de Hanovre, an interesting specimen of eighteenth century French architecture, at the corner of the Rue de la Michodière, will not be saved from the demolisher's hands despite all efforts which have been made. The pavilion will be pulled down and its place occupied by a large building for the offices of the United States Mutual Life Assurance Company.

The leases have been signed handing over the building of the Bourse by the Town of Paris to the company which is about to undertake the work of restoring the present building and the important additions to be made on either side.

The three new Parisian hospitals destined for sick children, and to replace the old Trousseau Hospital, will be inaugurated early in April. The first situated in the Rue Etex, and called Hôpital Brelonneau, will contain 234 beds; the second, in the Rue Michel-Bizot, called new Hôpital Trousseau, will contain 237 beds; the third, on the Place du Danube, called Hôpital Hérod, will contain 221 beds.

M. Rodin, the sculptor, has accepted the presidency of a new literary and artistic society, which professes as its object to promote the artistic education of the people by teaching them to understand the union of the beautiful with the useful in life. With this object, and under the patronage of the author of the too celebrated statue of Balzac, provincial centres are to be formed by groups of artists carefully selected, who are to organise lectures and exhibitions intended to refine the popular taste, and to direct it towards an æsthetic ideal, formulated by M. Rodin. We have not much

faith in the results of this mission, which seems likely to share the fate of the new Académie des Beaux-Arts, which M. Gérôme has endeavoured to found, but which has come to nothing. This eminent artist had obtained promises of support from members of both Salons, but they seem suddenly to have reflected that the new society would injure the existing Salon, and have all begun to excuse themselves from acting, more especially as the first condition was that they should resign membership of the Salons.

The sister of Courbet, the late painter, has been desirous to organise in some municipal building a permanent exhibition of several pictures which her brother had left to her, and which she proposes to present to the municipality. The Hôtel Lauzun has been spoken of as the place for this exhibition. The pictures might be an interesting possession for the city of Paris, but they would be very much out of place in the Hôtel de Lauzun. Courbet was a realistic painter of pictures sombre in colour and often incorrect in drawing, and the refined decorations of the Hôtel Lauzun, a building eminently aristocratic in its associations, would form a very unsuitable frame for them. The Hôtel de Lauzun itself will be one of most interesting artistic curiosities in Paris, if the intention is carried out of collecting here, in their original surroundings, the furniture, tapestries, and objects of art and luxury belonging to the aristocratic residence of a "Grand Seigneur" of the seventeenth century. But Courbet, the Communist painter, would be sadly out of place there.

At the Bibliothèque Nationale the arrangement of the new buildings is in progress, in which, towards the autumn of this year, the collection of engravings and medals will be installed. The new wing, which has been a year in building and has cost 400,000 francs, is just finished; and M. Pascal, the architect, will shortly commence another addition, intended to contain a reading-room lighted by electricity, and which will be open in the evenings. Little by little the Bibliothèque, which has been left so many years in an unsatisfactory condition, will in the end be entirely rebuilt; but as it is a question of voting money, and Parliament has shown itself very parsimonious, the whole work will probably not be finished for four or five years.

M. Noël, who has been commissioned to execute the architectural part of the monument to Balzac, has designed a pedestal on very plain lines, but which will harmonise with the façade of the Palais Royal, in front of which the work of Falguière is to be placed.* It is probable that the monument will be completed for inauguration on May 16, which is the anniversary of Balzac's birthday. The monument to Victor Hugo, the model of which has been executed by M. Barrias, is at present being cast at the Barbédienne Foundry.

The Luxembourg Museum is at present closed for various re-arrangements in view of the return of the works lent for the great Exhibition, and for the placing of the new works required by the State. In the meantime M. Bénédite, the curator, has organised in a special gallery an exhibition of the works of Rosa Bonheur, which will have great interest for the artistic world.

The exhibition of the "Union de Femmes peintres et sculpteurs" is being held in some of the galleries of the large Art Palace in the Champs Elysées. The Duchesse d'Uzès is now the president of this association. The exhibition includes 907 pictures, and thirty-five pieces of sculpture, which are arranged on the first floor of the building next the Avenue d'Antin. There are very few original or interesting works. Among the landscapes we may mention the "Champs Elysées" of Madame Nancy Adam; a view of Angoulême by Madame Lenoy; and the "Eglise de Saint Martin," by Mdlle. Bonlian. Among the portraits, Mdlle. Madeleine Carpentier shows really fine qualities of composition and drawing. The pastels by Mdlle. Vallet-Bisson, and the translucent enamels by Mdlle. Montigny, are also worthy of note.

We have to record the death, at the age of sixty-three, of the poet Armand Silvestre, who was also an art critic of great taste and knowledge, and who filled with distinction the office of Inspecteur des Beaux-Arts to the Department of Public Instruction.

Paris has lost a well-known architect in the

* The statue is illustrated in the *Builder* of June 10, 1899.

person of M. Ernest Brunarius, Officier d'Académie, who was killed last week in the catastrophe brought about by the avalanche at Mount Mirantin. Born at Paris in 1857, he became pupil of M. Coquart at the Ecole des Beaux-Arts, carried off two medals at the Salons of 1888 and 1889, and was architect of several buildings at Paris in which he showed a great originality of ideas and design. One of his last works was the Protestant Orphanage for Girls at Puteaux, a building which on account of its excellent arrangement of plan and the simplicity of its style may be considered as one of the types of this kind of establishment.

STAPLETON NEW INFIRMARY COMPETITION.

The designs for the infirmary which the Bristol Guardians propose to erect at Stapleton, near Bristol, were on view the whole of last week at the ancient St. Peter's Hospital. Fourteen architects were invited to compete, the assessor being Mr. Keith D. Young, and seven designs were eventually received, all of which exhibited knowledge of the subject and were above the average.

The site is situate near the city, with Stapleton Church and the river Frome on the west. It will be reached by a new road from Blackberry Hill, which upon the opposite side bounds the grounds of the lunatic asylum, having the workhouse to the north-east. A careful model of the site, prepared by Mr. W. S. Skinner, was on view in the room.

The first premiated is design E., by Mr. H. Percy Adams, London. The building fronts to the south, and consists of coupled pavilions of sick wards to accommodate 852 patients, three of which are upon the west side and two on the east, leaving space for the extension of another pair, the administration block in the middle, the whole bisected by a horizontal corridor. Above this block and with an intervening space are the laundries and machinery, &c., and higher still on the site, parted by a brick fence wall about 60 ft. distant, is placed the isolation hospital with its offices and adjuncts in three small blocks on a terrace. These have been arranged for double pavilions of six beds each, with a small detached block between, containing doctor and nurses' rooms, wash-house, &c. Above these buildings is placed the mortuary, while at the north-east corner of the site have been located the lodge and receiving block, which latter is arranged with double wards for eight of either sex, with the usual adjuncts, besides waiting-room, attendants' room, &c. The first floor has been allocated to patients' clothes store, arranged in bays, with shelves all round; three additional storerooms and a bedroom are also provided.

The pavilions of the infirmary are connected by the long arterial corridor before mentioned, which is 10 ft. wide, arched on the ground floor, enclosed with windows on the first story, and having open sides on the topmost floor under a covered roof. The ward pavilions are also connected at either extreme end by iron balconies that lead one to the other, but afford no direct access to the ground from the top, excepting by the one principal stair-case at either end of central corridor. This has been suitably and properly arranged and isolated from adjacent wards. An unenclosed patients' lift is placed in the well of stairs, and the nurses' water-closet and scrubbers' room and a movable bath are also conveniently located here. There are four children's wards, respectively two of thirteen beds and two of twelve beds, divided by a glazed screen in each case. The end of each long ward so treated has a cross ventilating passage right across, giving access to the balcony, and the space so enclosed provides the sanitary adjuncts, as placed elsewhere in towers, of water-closets, sink and bathroom. The male and female wards are planned on the principle of one window to every two beds, excepting in the wards for lying-in women and offensive cases of either sex, where the arrangement is one bed to two windows, but in all cases there are no windows provided at either end.

The bathrooms are not in the sanitary towers, which latter are very much cramped in planning, two water-closets, sinkroom, and lavatory, including a lobby, being arranged in a space of about 15 ft. square.

The administrative department occupies the

heart of the lay-out, and is admirably arranged. This measures about 280 ft. from top to bottom, by 160 ft. across. The lower half, with the exception of a few projections, is lighted from one side. The entrance-hall and offices are at the bottom, to the right the medical officers' apartments, to the left the nurses' dining and recreation rooms. The upper part of this court is occupied by the chapel, lighted on one side and seating 250; this is approached from two corridors by a vaulted vestibule. The upper part of the block on the ground floor is taken up by the kitchen and steward's department, which is economically arranged. Two stories over, the topmost being partly in the roof, are devoted to the sleeping quarters of the whole establishment, lighted on one side, properly separated, and provided with escape doors.

The entire block plan is the most unencumbered of any shown. The elevations are treated in a broad and pleasing manner, and the drawings, which cover fifteen strainers, are vigorously executed; there is a complete absence of figured dimensions on the drawings.

The second premium has been awarded to design A., by Messrs. Giles, Gough, & Trollope. Naturally this does not materially differ from the others excepting in the planning of the administrative department and the arrangement of the sanitary towers, which, although they include the baths, are more spacious. A full and carefully detailed block plan gives an excellent idea of the whole proposal, and fire-escape stairs are provided.

The planning of the isolation and receiving block is more fully treated than in the selected design, the patients' clothes store being on the ground floor, which is a good point. The administrative block is, however, somewhat crowded. The chapel, standing in the front court, has four accesses, with the dispensary behind and the operation room over. An element of importance and of institutional character has been given to the elevations, and it is unnecessary to say that the whole of the drawings have been clearly and carefully shown.

Design B., by Mr. Arthur Marshall, of Nottingham, to which the third premium has been awarded, is a very attractive set of drawings, and the problem is illustrated in an able and pleasing manner. The general arrangement of the administrative block is, however, unlike designs E. and A., in that it is recessed in the middle, with large projecting wings on either side, and a fine central feature of a tower. The wards have curved ends, and the details show a full knowledge of the subject. The sanitary towers are not, however, effectively isolated from the wards, and although the plans have many points of considerable merit, they do not as a whole, apparently, seem to completely provide the accommodation exhibited by the other premiated designs. A general sketch elevation is shown of the whole frontage, and the whole of the drawings exhibit much ability.

Design G., by Mr. C. W. Bevis, of Southsea, has a well-disposed administration block and good open courts. The isolation block is placed at the north-west corner of site at an obtuse angle to the other buildings. The chapel is separated from the general buildings, and the mortuary is placed near the entrance lodge. A good arrangement is shown connecting the bathroom with the sanitary tower and ward by a triangular lobby. No ward has been arranged with one bed to two windows. The elevations are simply treated with hipped roofs.

Design F., by Messrs. Newman & Newman (London), shows much knowledge of the subject, but it has several defects in detail which are evident after a careful inspection, although there is not much manifest deviation in the main lines. There is, however, some extravagance of space shown in the long flats, 5 ft. to 6 ft. wide, over the administrative department, although the blocks are well broken up; further consideration would probably have produced more economy. The isolation of the principal stairs, nurses' water-closet, &c., in the ward pavilions seems to be indispensable, and cupboard and store accommodation is very short. The day rooms are provided at the end of the wards.

In design D., by Mr. H. C. M. Hirst (Bristol), the wards also have their day rooms at the end of wards, which are made conspicuous features, and the baths are placed in towers corresponding to the sanitary towers. The isolation blocks are planned in an unusual way, the two wards forming an L, with the

nurses' room in the angle. The elevations are utilitarian in character.

In design C., Mr. Henry Williams (Bristol), places his entrance from the city at the lower part of the site, and the receiving wards are tacked on to the main building at the axial corridor. The plan is arranged with three pavilions on the left of the administration block and two on the right, all four floors in height. The planning of the administration department is somewhat involved; the chapel is on the second floor in front, and is made a prominent feature in the elevation; the disposition of the buildings is well shown on the ground. The grounds are well laid out, tennis courts being provided, also shelters and conveniences for both sexes.

ROYAL INSTITUTE OF BRITISH ARCHITECTS:

ADDRESS TO STUDENTS.

An ordinary general meeting of this Institute was held on Monday evening last at No. 9, Conduit-street, Regent-street, W., Mr. Wm. Emerson, President, in the chair.

The minutes of the last meeting having been taken as read,

Mr. W. J. Lock, secretary, read the following "Address to Students," prepared by the President, whose voice did not permit him to read the address—

"In the few words I have the pleasure to address to my younger friends—I will not say to the students, for in our profession we must all be students to the last days of our lives, but to the junior members of the profession—I will endeavour to lead you to some higher planes of thought in relation to the practice of the art of architecture, rather than to mere practical business elements material to success. I presume, of course, that those of you who have taken the trouble to pass our examinations and become members of this Institute, have in your minds the idea of practising in the profession. That is to say, I presume your intentions are those of actual performance of an architect's duties in the designing and carrying out of building operations, as opposed to mere theory, the function of the professor. I will therefore consider some few of the things involved in this word practice, the objects, aims, and points in connexion therewith, that should be weighed by one undertaking such responsibilities.

There is a right use or proper employment of architecture. I need hardly point out that building is the most necessary of all sciences; in its objects it subserves the highest and the lowliest wants of humanity. It provides fitting tabernacles for the worship of the Creator, suitable courts for the administration of governments and justice, appropriate palaces for the great and dwellings for the poor; it supplies institutions for the education of all classes in all branches of learning, for the amelioration of the diseased, the poor, and the mentally afflicted, and every kind of commercial establishment; also all other forms of edifices to meet the complex requirements of the world: all these in their aggregation evolve cities, towns, and villages. It is a science, but the love of beauty inherent in our natures makes us demand that it be more—that it be an art as well—and this side of it is architecture, and, if good, unites with it all arts. It is therefore of the highest universal importance that those practising it, on whose skill and taste its proper employment is dependent, should be so educated as to plan for use, to design with appropriate beauty, and to construct with scientific knowledge.

To this end I pointed out last year how a thorough education, not only in architecture itself, but on a wide and comprehensive basis, is essential; and this education should not only be gained by study of man's work in the arts and sciences, but also by study of God's work in nature. There should be besides an inquisitive, diligent searching into the reasons of things. The constant use of our faculties in effort with application and judgment is essential, and our highest duty. Idleness will not compass proficiency. As Shakespeare says in 'Hamlet':—

'He that made us with such large discourse,
Looking before and after, gave us out
That capability and godlike reason
To rust in us unused.'

Architecture should be more than mere building in the best material and manner; the thought and needs of the time must be ex-

pressed. It does not suffice to satisfy the one only who has conceived it, but should be capable of pleasing all people in all times. Such a true expression of the architect's mind—

'Like the unchanging sun
Clears and improves whatever it shines upon:
It glids all objects, but it alters none.'

It is the divine element in man materialised in his works: his two natures, the human and the spiritual, are evidenced in his individual conceptions.

In real architecture there must be not merely the individual bias or personality exhibited by one's particular devices, peculiarities, or the excellences of one's draughtsmanship, but there must be the expression in all sincerity of spiritual sentiment also. Ralph Waldo Emerson says:—

'The hand that rounded Peter's dome
And groined the aisles of Christian Rome
Wrought in a sad sincerity;
Himself from God he could not free.
He builded better than he knew,
The conscious stone to beauty grew.'

That is what I take to be the meaning of the proverb, 'Ars est celare artem.' The artist's material personality or mechanical dexterity should not be predominant so much as the spiritual or divine influence inspiring him. If such be our aim, we shall rightly use any powers of architectural design with which we may be endowed, and be enabled to express the highest mind that is in us by the forms of which draughtsmanship will convey the conventional rendering. This habit of mind, combined with constant practice, care, and accuracy, will lead to dexterity of expression of feeling which is essential.

But more than habit of mind for fitting expression in our art is necessary for successful practice. There should be habit of method in study, and attention to apparently trifling details, and in business conduct. For as to study it has been well said:

'If not to some peculiar end designed,
Study's the specious trifling of the mind.'

As to the details and little points that constantly arise, if there is not the methodical habit of carefully looking into them, things seemingly insignificant are easily overlooked, resulting in endless trouble to both the client and the architect. In regard to habits of method in business, I believe that the men with methodical habits usually get through infinitely more work, and do it better and quicker, than those lacking in this respect. Methodical habits tend to avoidance of worry, for an architect's life consists, to a large extent, of attention to details of all kinds, which should all have methodical attention in turn. And there is nothing so prejudicial to artistic effort as worry. It should be avoided in every way: a quiet and restful mind is essential to the right exercise of thought and creative power. Moreover, to worry at all is bad, and a correct feeling of what life is, and its inseparability from difficulties and troubles, should prevent our giving way to it. A nature so disposed frequently troubles itself over evils that never arise; it shows lack of faith, for

'Deep in man sits fast his fate
To mould his fortunes, mean or great.'

Therefore the architect whose soul is in his art should strive by methodical habits and rules of business to render himself as impervious as possible to worry. Rules no doubt are irksome, and perhaps especially so to the artistic temperament; but without method or rule one is apt to be slovenly. One good rule is to encourage a habit of work every day, and this—however disinclined one may feel, and however little in the humour—with the effort to work the imagination will fire. It may be said the artist cannot work without the inspiration; but he can go on waiting so long for the inspired feeling that it may never come. An architect has this advantage in his life, that effort in the same groove does not recur each day; the variety of the claims upon his attention is one charm of his work. Cultivate earnestly methodical habits. I speak with some reason, for I was never brought up with these habits, and have learned the great necessity of them, particularly to the architect.

The importance in practice of study with thoroughness in both the theoretical and practical sides cannot be too strongly inculcated. There have been articles in some of the papers lately pointing out how, if England is to retain her position in trade and power, the highest intellectual education is necessary in

all modern businesses. Not merely smartness or push is wanted, but intellect thoroughly trained, and of a type in which it is stated this country is woefully deficient. It is said that our business men are simply amateurish and incompetent compared with the newer type of highly educated Germans and Americans.

If it be true that in trade this highly trained intellect is so essential, in how much greater degree must it be so for the profession of architecture! For beyond the mere business element, without which, to a certain extent, it is impossible for the architect to practise successfully, there is the necessity for a thorough knowledge of art, with much of many other subjects, such as science, history, &c., combined with the study necessary for the acquirement of that dexterity without which he cannot express his ideas. How superior the educational methods in regard to architecture are in America to those in this country has lately been shown in our 'Journal' in a most able manner by Mr. Arthur Cates.

Therefore a serious reflection for the young student in this country is how very much his education must depend upon himself and his own exertions if his work is to be more than that of an amateur and have vital force, and if he wishes to succeed by his power and competency rather than by smartness and push, or playing off upon the public the eccentricities of fashions of the moment. The days of mere building by architects in this country are, we hope, fast passing away; and this century the public will demand, not only that the architect be versed in all practical details of his calling, but that, by really cultivated taste and intellect, he may build with power, beauty and perfect utilitarianism.

But by those who wish to excel as artists (time must be allowed for the study of Nature. The delicate tones of colour in the trees and herbage and sky, the perfection in drawing and beauty of colour in details of leaves, flowers, fruit, animals, birds, insects, &c., and the forms of fishes are lessons in decoration which should be learned at first hand. Deductions and inspirations innumerable may be gathered from them, with a freshness no study at second hand from man's work can give. Burges used constantly to make his pupils draw all sorts of flowers and insects and colour them, as well as study from the life in his office. Emerson says: 'In every landscape the point of astonishment is the meeting of the sky and the earth, and that is seen from the first hillcock as well as from the top of the Alleghanies.' And what a truth is here! It is in the meeting of the heaven and the earth, the spiritual and the material, that art is rendered capable of conveying sentiment and lessons.

The study of Nature, no matter under what aspect, puts some germ of life, some sentiment, into the spirit of the artist, whether he be an architect, sculptor, painter, poet, or musician. Inconsistencies or vulgar eccentricities are never found in Nature, though infinite wonders are discoverable to the observant mind; and in its study one may learn all beauties of proportion, form, and colour. Therefore, cultivate habits of study and reading, as Bacon said, 'not to contradict or believe, but to weigh and consider.'

Higher education is absolutely necessary if the status of the architect is to be raised. It should be remembered that doctors and barristers are almost always University men; and it will be well to bear in mind that the sooner it becomes the rule, rather than the exception, for architects to receive a higher, or perhaps a University education, the sooner will the acknowledged status of the profession be elevated.

Then for facility of practice the architect should cultivate his memory; and as all cannot perform feats of memory, a practice of writing down useful information should form another habit. The architect in designing not only requires to remember details of old and other work, as a guide, incentive, or restraint to his own, but he must recollect endless details of construction and many specialities for building purposes necessary in modern structures; and this is no trivial matter. But, above all, he must remember the effect certain proportions, details, and compositions have given, in isolation or when in juxtaposition in former examples, ancient or modern. He will thus be enabled to reject or improve the crude, and profit by the excellent. Masters in our art have followed the teach-

ing of many old examples, and they have felt it necessary to reject others. Originality of design is not shown by the utilisation of forms which better and more cultivated men than ourselves have seen good reason to discard. An educated perceptive faculty and a good memory are necessary to realise the full teaching of past times.

There is also, in connexion with the practice of the art of architecture, such a word as proportion; and the value and meaning of this word may easily be lost sight of. To the architect's mind may probably immediately be suggested the comparative relation of one architectural detail to another and to the whole composition. But besides the objective symmetry and harmonic degree of form or size, proportion may be considered by the architect in other ways. Of course, proportion in this sense is the very first essential of fine architecture. It should be an inherent faculty in the architect and artist, but it may be cultivated.

It is by the proportions as much as—or even more than—by the beauty of detail that the mind is impressed by works like the Parthenon, the Pantheon, Westminster Abbey, Chartres Cathedral, the 'Mercury' by Praxiteles, the 'Venus di Milo,' Michelangelo's 'Moses,' or Cellini's 'Perseus,' or by the delicate refinement of the proportion of scale and relief in the decoration of the Villa Madama. And proportion must descend, also, to the smallest details. The perfection of Cellini's goldsmith's work is as much in its proportion and as important to its excellence as his wonderfully finished detail. The same applies to Etruscan goldwork and the best Indian works. Proportion in colour is also a most important factor in the excellence of artistic work.

The study of nature is the guide as to how much of any one colour will harmonise with another. How often is work spoiled by the introduction of too much colour or by its tone—by the coldness or excess of blue, or the foxiness of too much red, or the unpleasantness of a superabundance of yellow! Such faults never occur in nature. The general tones of nature, whether brilliant, as in the East, or sombre, as is often the case here, are always in perfect harmonic proportion; so also are the details of brilliant colour in birds, insects, and flowers. It should be noticed that it is only in details like these that brilliant spots of colour are found in nature. The Owen Jones prize is given as an incentive to study of colour in reference to architecture. It might well include in the students' works studies from nature.

It seems a pity that a greater proportion of colour cannot be effectively introduced in the buildings of our towns, which are usually so fearsome in their sombre dullness. But there can be no doubt much colour in buildings requires a bright sunshine, as in Greece, Egypt, and India, to give it its true value. Nevertheless, I think we might be a little more cheerful in our streets with some advantage.

There is also a proportion in architectural work, which requires to be maintained, between coarseness and refinement. This is a very subtle point in all good work. Too much refinement in architectural work tends to weakness of effect, and deprives it of its masculinity. At the other extreme, 'muscular' architecture, as it was termed when the 'reaction from the Late Perpendicular of the early part of the century set in, and a phase of Early French architecture was the fashion, may degenerate into coarseness. It is the carefully balanced proportion between these that avoids either extreme. The effect of all the finest architecture has been attained by a combination of strength and power with refinement of well-proportioned and beautiful detail.

Too much care cannot be bestowed on the proportion that sculptured and other decorations bear, first, to the whole composition, and, secondly, to each other. They either give scale or destroy it. They either adorn it or make it appear tawdry. In all this the architect's should be the guiding spirit, however much may be done by the craftsman or sculptor.

Then there is the proportion that the workshop of one's art should bear to one's life. It is often said, as if it were the greatest praise, 'He lives solely for his art.' I doubt if this could be said of any truly great man. It is too circumscribing and belittling. The larger the environment the greater the sphere of usefulness in life; and so long as the time occupied in other affairs is not out of pro-

portion to the valuable hours necessary to one's life's work, mingling with others and doing work in other ways enlarges the mind, is our moral duty, and should benefit our art.

Success is an object of life, but need not involve a want of sympathy with others, nor pushing on self, regardless of their claims, nor flinging on one side all other considerations on the road. Success in the practice of an architect, as in other callings, should be aided by a proportionate feeling sympathetic with a life full of effort and enthusiasm.

Nevertheless, success in the art of architecture should be the settled purpose of him who proposes to practise, and that to the fullest extent, 'in proportion to his being a human being, living his life amongst his fellow-creatures, to whom he can impart or derive something. The aim of culture is to make us better company as men and women in the world.' The greatest men, like Michelangelo, Donatello, Cellini, and Goethe, were all men of other affairs besides their art, and were in sympathy with their surroundings of thought, work, and politics. To quote Ralph Waldo Emerson again, 'However much of real power is found in solitude and in silent moments, a proportion must also be developed by exchange of thought and ideas in mingling with sympathetic interest with our fellow-men.'

There is also a proportion that should be observed between the ideal and the sentimental. The one is the spiritual in our art, the other the simply sensuous.

Aestheticism, another American writer says, is not 'the vital force inherent in the idealist; much of what in our architectural art of to-day seems to satisfy the casual and thoughtless is devoid of the life and spirit of art. The one is the appreciator and creator of all noble forms of art, the other is at home among the ginger-jar style of decorative effect.' 'It is the idealist who will, with a strong faith in the spirit that is in him and with energy of purpose, strike out for himself fresh achievements. He may fail, but he is ready to take the risk, and has the courage of his opinions. To the aesthete a lower plane of work altogether, a pretty tone of colour or eccentric form, a delicate curve or a sentimental line of poetry, devoid of the spiritual essence of the ideal but pleasing to the fancy, will afford infinite satisfaction.'

So there should be proper proportion maintained between artistic sentiment and practical purpose. The man who sacrifices the purpose to the art is not a useful member of the community. While he who sacrifices his art altogether to utility does not elevate the community. It is the correct judgment weighing the proportionate values of the one and the other which makes the architect.

It has been said the aim of the ancient philosophies was to raise man above common notions of happiness, an endeavour to crush his humanity and develop his divinity, to make him happy by refinement of mind and soul and by the ignoring of his material pleasures—meaning, I suppose, if this be a true rendering, complete self-denial, not so much for the benefit of humanity at large as for the individual's own exaltation. The Baconian philosophy which marked the beginning of the great strides in science and utilitarianism that have taken place during the last century was very different. It taught that nothing can be beneath our attention that may minister to the physical or material benefit of mankind. The first was grand, but scarcely attainable, or alone desirable for our human natures; the second was attainable and useful to man as he is. So the art part of architecture, the soul of it, a most potent factor in mental pleasure, is for the satisfaction of the divine side of humanity; but alone, it does not altogether satisfy the requirements of humanity; the utilitarian side of architecture is also most necessary for the satisfaction of our physical needs. The needs of both soul and body must be fulfilled in good work, and are equally worthy of the highest efforts of our intellects and imaginations. In architecture it is the hopeful spirit of the men of imagination coupled with practical common sense, a level brain, and a cultivated taste that is wanted to weigh well the boundaries of the respective values of a practical idealism and a maudlin sentimentalism.

Then there is the necessity for a proper proportion being maintained between work and rest. There is such a thing as staleness. The want of recreation makes a man dull, unfit

for companionship or sympathetic mingling with or interest in his fellows; and his work suffers in consequence. Also there must be margin for reflection and thought. Great achievements usually germinate in quiet moments. An overworked brain and no physical activity or recreation must have a bad result both on a man's work and his life. So time should be proportioned that there is leisure both for light reading, the study of nature, and for recreation; then there will be freshness and vigour in your work; and if you always aim above your mark, and remember that what you do should not only be for your own personal satisfaction, but for that of others and for future generations, your restful moments may benefit the world.

Then of much importance in connexion with the practice of the architect, as in all other businesses in life, there is another thing that must be borne in mind, and that is right principle. This in architecture will mean an avoidance of shams and false construction, which somehow always manage to look wrong, even though worked on such a grand scale as the external walls of St. Paul's, or the impudent ugliness of our shops with stone façades, apparently standing on nothing. Truth makes work look consistent and correct; lack of it offends good taste. Palatial decorations in offices, ecclesiastical embellishments in restaurants, the affectation of a cottage simplicity in a palace, or *vice versa*, imply a want of appreciation of the fitness of things, and are wrong in principle; and this element of truthful principle in architectural art should be carried down to the smallest detail, if the work is to live.

Then there should be right principle in your motive of action; and this is a most important point, if you desire not only your personal position to be respected by others, but also wish to uphold the dignity and status of your profession generally. Professional respect must ever depend on the character, conduct, and aims of the units in the profession. Each individual has his own particular influence on the appreciation with which his profession as a whole is viewed by the public. Dubious transactions entered into for the sake of emolument, a too great regard for personal advantage, or a disregard of the interests of others, tend to acts lowering to the profession. On this ground I would recommend due consideration before entering into competitions. See at least that the conditions are not derogatory to the dignity of a great profession, and see that they are fair as much in your competitor's as your own interests; and let no unworthy thoughts of possible interest or influence induce an activity which in the long run not only must be disadvantageous to you personally, but also detrimental to the profession as a body.

The highest principles of morality should be the guide in professional practice, not only in regard to art, but also in all dealings with employers, contractors, tradesmen, craftsmen, and others with whom business relations bring you in contact. Work cannot be obtained without employers, nor carried out without tradesmen and labour of all sorts, and your success is bound up with these; therefore it is to your interest to treat all with a high-minded, unsparring sympathy. The architect should, on principle, enrich his mind and render himself proficient in all branches of his work, as his duty to his clients, and should deal fairly and avoid harshness in dealing with those over whom he is set as supervisor.

A high principle in these directions would avoid much of the litigation and many of the unsatisfactory arbitrations so constantly arising. It wants a kindly spirit united to a firm will—the iron hand in the velvet glove—to perform all an architect's duties in the highest manner, and to render himself and his profession honoured and respected by the public and those with whom he has business. Always remember the words—

'Thy credit wary keep, 'tis quickly gone,
Being got by many actions, lost by one.'

and our reputations are the immortal part of ourselves.

Principle also should not only lead you to strive after success in your own practice, which is, of course, your high duty to yourself, but also to aim at helping others who may have less experience or knowledge than you have, and thus assist in elevating your profession. With this view you cannot interest yourselves too much in the work of this Institute, whose

objects are to encourage the art of architecture, to uphold the interests of the profession, and improve its status. This obligation will be best served by a large-minded way of looking at all sides of thought, and by cultivating broadness of views in our art of architecture, with a proper consideration for the sentiments of others, and not by the pushing forward of any particular school or clique.

In combination we are strong; separated we are comparatively weak. There is room in this Institute for all architects who are capable and honest in their views and endeavours, and the wider the circle of thought it enrolls, the greater the sphere of its influence will be, and the more it will foster education and dispel ignorance, and maintain the reasonable humility that should distinguish all those who claim to be artists; for, as Prior says:—

'By ignorance is pride increased:
They most assume who know the least.'

Mr. J. A. Gotch, F.S.A., then read a criticism of the designs and drawings recently submitted for the prizes and studentships. Mr. Gotch, in the course of his remarks, said that the Pugin Studentship was perhaps the most fascinating of all the prizes offered by the Institute; 'for it is earned, not by laborious plodding in a dull office, not by a consideration of dreary formulas, or a study of the wants of man in his various capacities as the user of a club, or a stroller in a park, or a foot-passenger desirous of crossing a stream, but in delightful journeys from one village to another, either in our own richly-endowed land

'Or by the lazy Scheldt or wandering Po'

journeys in which every sketch has its own memory—the quiet of a country church, the gloom of a castle guard-room, the rain pattering on lead roofs, the sun drawing shadows across lichen-covered walls, amid the scent of old-fashioned flowers and the hum of the distant reaper. That is how the Pugin is earned, and it is spent in a more systematic prolongation of the same delights. Yet, after all, the Pugin is only a means to an end. Its object is not merely to make young men facile sketchers, but to lead them, through the observation of the work of the men of old, to do their own better.'

In referring to the Soane Medallion, he said: 'This great increase in the number of designs submitted is very gratifying; we may conclude that it indicates among students an increasing interest in their work. Whether it also implies an increasing slackness of work in the respective offices to which they are attached I do not know. We may also say that with the increase of numbers the number of fairly good designs has proportionately increased. It is not merely the fringe that is longer, but the garment itself. At the same time, so far as the Soane is concerned, the increase has not produced the master-hand; and this competition must be pronounced disappointing on the whole. It is no secret that the reason which led the Council to withhold the medal was the absence of a really good plan; and it is of the utmost importance to impress upon young designers the vital necessity of a good plan. There was more than one design in which the plan was sacrificed for the preconceived necessities of the front façade. As a matter of fact, neither plan nor elevation should be preconceived; they should grow up together. It is quite as much from the influence of modern life upon the arrangement of our buildings as from the introduction of new materials that we may look for the characteristics of a latter-day style. It should be borne in mind that the money prize accompanying the Soane Medallion would represent a very fair premium even in a competition for an actual building; it is, therefore, worth taking as much pains for as if the Soane building were actually to be erected; and to perfect the designs of an important building actually to be erected, no pains are excessive. But there is about the Soane competition an absence of enduring responsibility which surely ought to stimulate the imagination and prompt young men possessed of all the freshness and daring of youth to embody some of the lofty ideals which they must have conceived. Do we find much daring originality among the twenty-two designs submitted this year? I can hardly say we do. It is true that out of that number there are seventeen or eighteen which might be built without materially decreasing the sum of human happiness, so far as their external appearance is concerned. But is there

one which could be regarded, even by the most enthusiastic, as epoch-making? However, we cannot reasonably expect a new epoch to be started every year, and although, from this particular point of view, my remarks may have been disparaging, yet, if we apply a more ordinary standard, there is something to gratify us in nearly all the designs."

Proceeding, he said: "I must take the opportunity afforded by these remarks on students' drawings to protest against the affectation already mentioned as being prevalent among certain draughtsmen. It affects the accessories chiefly: skies are made to look like masses of telegraph wires, or are divided into parallel strips of dark cloud divided by thin regular lines of sky; figures are introduced hard and badly drawn, imitating the unpleasant style of Aubrey Beardsley. Sometimes the building itself suffers: coarse lines obliterate all delicate detail—and it should be borne in mind that very often 'thick lines hide thin designs'—or the elevation and perspectives are put in with quivering, hard-drawn lines. These are only some of the forms which affectation takes—and occasionally with the hope of attracting attention which would never be bestowed upon the design itself. All such devices ought to be eschewed by a broad-minded student. But let no one be discouraged by finding that he is not so expert a draughtsman as his neighbour. Drawing and designing are by no means interchangeable terms, and a study of the lists of past prize-winners may not only gratify the prize-winners of to-day, but go far towards comforting unsuccessful competitors with the thought that though their names do not appear on any of those lists, they may, nevertheless, be ultimately written in some corner of the scroll of fame."

The President then presented the prizes and certificates gained in the recent competitions. Mr. H. W. Cotman was introduced as Pugin Student for the year, and the Medal of Merit was presented to Mr. J. Forbes Smith, and a Certificate of Hon. Mention to Mr. A. J. Pitcher. The following presentations were also made:—

Tile Certificate and 30s.—Certificate to Mr. Walter Fairbairn; Prize of Ten Guineas to Mr. Ralph Knott; Certificate of Hon. Mention to Mr. W. A. Mellon.

Grissell Gold Medal and 10l. 10s.—Medal, &c., to Mr. Edwin Forbes.

Ashpit Prize, 1000—Books, value 10l., to Shirley Harrison, Ashpitel Prizeman; Cheques value 5l. 5s. each, to Mr. C. H. F. Conyn and Mr. C. E. Varnell.

Owen Jones Studentship, 1899.—Certificate to Mr. John Stewart.

Pugin Studentship, 1900.—Pugin Medal to Mr. James McLachlan.

Essays.—Institute Silver Medal and Twenty-five Guineas to Mr. A. Maryon Watson; Certificate of Hon. Mention to Mr. W. Curtis Green.

Measured Drawings.—Institute Silver Medal and Ten Guineas to Mr. Lawrence L. Bright; Medal of Merit and Five Guineas each to Mr. A. Wyatt Papworth and Mr. H. F. Trayley.

Souane Medallion.—Prize of Thirty Guineas each to Mr. H. M. Cautley, Mr. M. J. Dawson, and Mr. J. B. Fulton.

Owen Jones Studentship and 100l.—Mr. Hervey Kutherford was introduced as Owen Jones Student, 1901; Medals of Merit were presented to Mr. Percy E. Nobbs and Mr. Ramsay Traquair, and a Certificate of Hon. Mention to Mr. E. H. Bennett.

Mr. John Slater, B.A., proposed a vote of thanks to the President and Mr. Gotch for their remarks.

Mr. Aston Webb, A.R.A., seconded the motion, which was agreed to.

The President having briefly acknowledged the vote of thanks, the meeting terminated.

MESSRS. WOOLLAMS & Co.'s SALE.—The established business of Messrs. Wm. Woollams & Co., carried on for some years past at 110, High-street, Marylebone, together with the extensive stock of hand and machine-made wall paper, printing blocks, machinery, and trade fittings, with the goodwill of the business, was offered for sale at the Holborn Restaurant on Tuesday last by Messrs. Frederick Miller & Reid, of Clement's Inn. The result of the sale was that Lot 1, comprising the trustee's interest in the business, trade fittings, machinery, and goodwill, realised 1,900l. Lot 2, which comprised the leases of the premises, was not sold, in consequence of the same being somewhat heavily charged.

THE SURVEYORS' INSTITUTION: THE PRESENT CONDITION OF THE BUILDING INDUSTRY.

An ordinary general meeting of the Surveyors' Institution was held on Monday evening at No. 12, Great George-street, Westminster, Sir John F. Rolleston, M.P., Vice-president, presiding.

The minutes of last meeting having been read and confirmed and some donations to the Library having been announced,

The Chairman said he thought it was becoming to refer to the great loss the Institution has sustained by the death of their chief clerk, Mr. Bennett. He was sure all the members would fully recognise Mr. Bennett's good qualities—his unvarying courtesy to members and his many years of devoted service to the Institution. He (the Chairman) was sure they would all join with him in expressing to the widow and son deep sympathy and regret in their loss.

This having been agreed to in silence, Mr. Thomas Blashill then read a paper entitled "The Present Condition of the Building Industry."

After some preliminary remarks, Mr. Blashill said he would begin by insisting upon one radical difference between the crafts which make up the building industry and the class of solitary trades or manufactures. It was likely that he who was first to foresee the usefulness of a house had to design and build it for himself. It would be the realisation of a single, simple, complete idea. But however complex the idea of a house may have now become, and no matter how many of us may be employed over it, it was still a single and complete thing that was wanted, our separate contributions towards it being useless if they stood alone. It was their combination that gave them value. The architect, the mason, and the carpenter were by no means to be looked upon as so many isolated artists, like the statuary, the potter, or the coppersmith. Unless each worker should understand his fellows and look beyond his own department to the scheme as a whole, if any should act stupidly or inactively, or if they should quarrel among themselves, it was not one particular part of the building that would be damaged, and it was not a particular class that would suffer, but the whole. Before considering the details of our various arts and crafts, and the arrangements for their harmonious working, it might be well to give some thought to him who sets all to work, but who, standing outside this co-partnership, was, perhaps, in danger of being overlooked.

In a building contract he was styled the employer, a term which was wanted for the builder or contractor in relation to the workman; but the client was really the employer of them all. It was he who felt the want of a building or judged it prudent to spend his money in that way rather than in some other. He was the source of all fees, wages, and profits. When his purse was full and open we were busy and prospering; when it was shut we stood idle in the market place. He (Mr. Blashill) was decidedly of opinion that the client was entitled to more consideration than he commonly receives, and it was not certain that even the architect, who was nearest to him, always understood him so well as he ought.

Many of them could speak from sad experience of the difficulty of getting from a client his real meaning, and so embodying it in drawings that he thoroughly understood what he would get for his money. But this had to be done, and no pains were too great to ensure it. Otherwise the client might want to alter the design as soon as he saw the building begun. A good model would be helpful to him, interesting and stimulating to everybody, and instructive even to the architect himself. Insufficient estimates, designs that had to be cut down, or designs that were defective and had to be supplemented, were the fruitful seeds of trouble between all parties and no credit was to be got out of them. Upon this subject there was an admirable letter, that all young architects should read, from John Wilson Croker to Decimus Burton when, as a young man, he was carrying out the Athenæum Club, and had suggested some desirable improvement. He pointed out that, good as the motives might be, few would hear the arguments, while all would see the extra charge, and that a young architect could hardly have a worse reputation than that of one who exceeds his estimates. An

architect, of whatever age, who had that reputation was likely to be one with whom contractors as well as clients are dissatisfied.

If the building was simple and alterations were avoided, or if it could be easily supervised from the office, the clerk of works might not be necessary; otherwise he was indispensable. To an experienced foreman this post was usually the only promotion to which he could aspire. But it should really be promotion. To pay a man in a position so highly responsible no more, or even less, than a builder's foreman was unwise. Yet with all that had been done for the artisan little was heard about better pay for the clerk of works.

Notwithstanding what he had said and had yet to say about the client, one must remember that the architect must act fairly between him and the contractor. There were many persons who, whether in their private capacity or as members of public bodies, thought it fair to take every advantage of a contractor and expect the architect to assist. In view of such a contingency it was important that the contract, which was usually stringent enough as regards the contractor, should be incapable of being used unfairly against him. He (Mr. Blashill) need not insist on the delicacy and the difficulty of the position of the architect, who had to act impartially between two parties, one of whom was his employer and paymaster.

It was very important to see that none but builders of good reputation were allowed to tender, and not too many of them. Corporations usually advertised for tenders, and although they might reserve power to reject, it was practically impossible to convince a committee on the clearest evidence as to the unsuitability of a builder if his tender was the lowest. A grasping client would endeavour to take the same course, but the architect should make all possible resistance.

"To get a good tender from a trustworthy builder, three things," proceeded Mr. Blashill, "seem to be specially necessary—to make it perfectly clear what he will have to do and how much he will get; to avoid hampering him with troublesome restrictions and conditions; and so to draw the contract that he shall not fear the application to himself of clauses that are meant for a builder of another sort."

In order to make clear what the contractor has to do, and also to enable him to go on with speed, it is now highly desirable, if not necessary, to prepare full detail drawings before any step is taken to procure a tender. This involves delay at an early stage, and it may be said that the old plan of making out details during the progress of a building in such order as they seem to be required is enough. But the modern system of building requires that the contractor should get in prices of materials and should prepare for his manufacturing processes at the earliest possible date. It is very disturbing to a contractor if he is kept waiting for details till the architect thinks he wants them. A quantity surveyor will tell you that if he has then to work from both speed and correctness will be facilitated. I am assured by a leading contractor that if he can have all the details on signing a contract he will finish a job in half the time. Although this looks like an exaggeration, I am convinced that, so far at least as it relates to those parts of a building which are capable of being hastened, he is not very far off the mark.

I shall have more to say about the possibility of speedy construction, but here I will urge the immense importance of it to contractor and client, and also to the architect. A client as a rule does not want his building twelve months or even nine months hence—he wants it now. For work not speculative the money is generally waiting at poor interest or is within easy reach. The money gain to a contractor in interest, freedom of his workshops, in supervision, and by getting his work quickly finished is enormous. And if the architect can finish his part of the business straight off, while the thing is fresh, so that it is done before he and the client have time to change their minds, that is perhaps the clearest gain of all.

It is worth while for the architect to choose such materials and methods as will make for speed, and to clear his mind of the idea that everybody is expecting him to invent new features, even new mouldings and fastenings, irrespective of their advantages and of his client's willingness to pay the enhanced bill. It is a duty to others as well as to himself to

avoid orders, for variations which are confusing to the contractor's staff are the chief obstacle to the settlement of the account, and give the enemy—and even the friend—occasion to blaspheme.

In my time, the old practice of leaving it to the builders to select the quantity surveyor has given place to selection by the architect, the builders being at liberty to decide, from what may be known of the person selected, whether they can safely accept his quantities as representing the work drawn and specified. A private client of moderate means may have to be protected from the chance of paying more money than he can afford, while he has got no more than the building agreed to be built. It is no comfort to him to be told that the quantity surveyor has made a mistake, or that in settling up the job the contractor has got the best of certain arguments on doubtful points. Many clients have been seriously crippled through such means, or have even had to sell the building that they had hoped to occupy. It is the contractor's business to contract; he is a capitalist who can appreciate his risks and protect himself or stand the loss. But in the case of a public body and of all such clients as are able to run a risk that is very seldom serious the quantities should form the basis of the contract, and, if reasonably priced, should be the basis for settling the accounts.

Sub-letting by the contractor is properly discountenanced when there is danger of his losing control of the work or bringing upon it a person whom the architect may have reason to distrust or of lowering the quality of the work. It should be watched and kept within bounds.

There is, on the other hand, the very risky practice of introducing into a contract a great number of special works for which the architect has made arrangements with other parties whose tenders he puts down in the specification, stipulating that the general contractor shall adopt those parties as 'sub-contractors' under him, and pay them the amounts of their tenders. Serious misunderstandings arise out of this practice.

In such cases the contractor complains that by nominating a particular person with whom he must deal the architect deprives him of the advantage of bargaining as to price and of dealing with the firm he usually employs, and there is a group of objections and risks that may arise through the presence upon a building of the sub-contractor's workmen. But the architect acting for the client must be the person to select and to decide in the case of certain accessories and of certain artists or workmen whose employment cannot safely be left to the contractor's judgment either as to questions of quality, skillful workmanship, or price. I hope that the conditions of contract now under discussion between the Institutes of Architects and Builders may put this matter on as good a footing as is possible in the circumstances (I am sorry to say, from what I have heard to-day, that the prospect is not so good); but I suggest that the items of a contract needing special treatment should be reduced to a minimum. If they are very small in relation to the whole undertaking the contractor is not likely to object to them, and as to such as are left, the contractor should have a reasonable opportunity of making his profit. This, in large matters, is a source of great difficulty.

When in a specification I provided 1,000*l.* to be paid to a sub-contractor for iron construction, and suggested that those who tendered should add their own profit, I found that the tender which was the lowest included nothing for profit, and that the contractor delayed payment in order to get from the sub-contractor 10 per cent. in addition to the usual cash discount. When I added to the provision too, so that the contractor should take that as his profit, I found that he had struck the item so added out of the quantities, and was delaying payment with the same object as before. Although this could be put right by paying the so-called sub-contractor direct, there remained the disagreeable fact that the general contractor went without profit, and as he was not a philanthropist any more than I, there was planted a root of bitterness that we could have well spared. If you buy and pay direct for any large quantity of these special materials, leaving the contractor to charge for fixing only, he will miss the profit which he thinks he ought to make on the materials, and it is a question whether either party has reason to be satisfied.

If the architect has taken pains to go to such sources of information as manufacturers' price-lists and showrooms, trade advertisements, and building exhibitions, he ought to know what he wants, and may be able to select alternative specimens, so that the contractor may make the best bargain he can between them, so long as a lower class article is not substituted by the manufacturer for the sake of a low quotation. I had a lesson through specifying a first-class article at a price which I believed to be that which would be payable to the maker. The builder was anxious for the substitution of other goods that were manifestly inferior, alleging the unreasonableness of the manufacturer nominated in the matter of discount. But this person produced evidence that he had offered a discount of 52 per cent. besides the usual discount for cash. I quite believe I had been allowing the full price, with 10 per cent. profit.

I am told that the secret of trade lists with their discounts cannot be penetrated by the architects, and the system cannot be altered. If that be so, we should cut the knot by demanding to know at any time from those who send price lists and offer their goods for our choice their lowest price to a safe cash customer. If this is inconvenient to anybody, the architect should take the ground that things must be made convenient to him. The worst feature in the system of large and varying trade discounts is that they furnish a fund out of which 'secret commissions' can be paid to persons ordering for the client particular goods. I am not sure how far such practices can escape the law, but they are strictly prohibited amongst reputable architects, and the offer of them to a young architect is a snare that ought not to be set. The best course is to let the contractor make or buy and fix every article that can safely be left to him. As to the very large and increasing item of ironwork, we have much need to keep pace with engineers in experience and technical skill. It is best to have the ironwork details calculated and completely worked out in the office, and to let the contractor make the best arrangements he can as to their supply, subject to tests that can very easily be applied. But a large contractor can buy his materials and make up his girders on his own premises. As iron construction supersedes timber construction, a builder's yard will be more occupied by smiths and less by carpenters. A modern builder's yard should be less of a storage place for bulky materials, and ought to be more of a factory. Whether that shall come to pass depends on considerations which I shall invite you to discuss.

There are two more questions arising out of the ordinary routine of work under a contract that must be considered—the faithful execution of the work contracted for and, if alterations have been unavoidable, the final settlement of the accounts. A contract is a business document, legally binding. The specification with the drawings should set out clearly what is to be done. If these are vague there will be disputes, and if a contractor who stands to lose should take all possible advantage of this vagueness nobody need be surprised; but when there is no reason to doubt the 'true intent and meaning' of the specification, to try to evade it by submitting materials of inferior quality or by omitting things set down to be done, is a proceeding the immorality of which should be better understood. The contract is not to do so much of the work as by sharp inspection the contractor can be made to do, nor to supply materials as near to the quality specified as he is obliged to supply; but unless the contract is lawfully modified, to do the very thing set down to be done. A stranger may walk into any shop in any civilised country at random, buy goods, and order them to be sent to his hotel, and, except through misunderstanding or accident, the parcel will contain the number or weight or the length and the quality ordered: otherwise it is fraud. No respectable contractor will put his responsibility lower than that. One who is perpetually trying to shirk his responsibilities will be found out and dealt with accordingly.

The settlement of accounts under a contract affords much legitimate opportunity for discussions on details, with reasons offered on behalf of the contractor why extra works should be treated in one way rather than another so as to increase the charge, and arguments as to the proper prices to be allowed for items outside the contract. But these admissions afford no excuse for throwing dust in

the eyes of the surveyor, as by representing that things have been done that were not done or giving false information as to the things done. When such a procedure is mentioned to the contractor it is repudiated, and would not be done under his orders: that it is attempted at all may arise from too great responsibility for the result of a contract being devolved on assistants, who feel that for their own credit they must do all they can to make the job a financial success.

In such a complicated business there is great necessity for the more firm establishment of customs by which the representatives of both parties should be governed. If I ask different surveyors to define 'prime cost' I can get different answers. In a matter of daily routine this should not be possible; it makes the amount of the client's cheque depend not on what he gets in return for it, but on the skill or the pertinacity or the sense of honour of the parties arguing over the final account.

Extras that are occasioned by a changeable client who has been well warned may only be a nuisance to the architect and the measuring surveyor; it is the extra which comes of an ill-considered design or of some sudden inspiration of the architect apart from the client that gives real trouble. Double the time spent over the drawings and half the time over the building should annihilate such extras and would be a gain all round. But all changes act unfairly on the client unless the omissions are watched as narrowly as the extras. With extensive changes and a quantity surveyor bound no doubt to act fairly between two parties, only one of them being before him, a fair settlement is impossible.

I am not sure that without a special guarantee the legal responsibility of the quantity surveyor can be put higher than to do his best with reasonable care and skill. He is indispensable to the architect in a hurry, and his wider experience is always helpful. A specification written by him with all the information before him will be a clearer and more logical document than the architect would be likely to write, but he should not be entrusted with the responsibility of deciding upon everything that does not make for the beauty of the design. Although there is only one person between him and the client the chain that connects them is already too long. He cannot know as the architect ought to know precisely what is wanted and in pounds sterling how much it is wanted, but if, besides his ordinary duties in respect of quantities and the settlement of accounts, he will suggest easier or more efficient means of attaining the end which the client has in view, his influence will be salutary.

The general contractor, as we know him, appears to have been evolved in the first quarter of the last century. The brothers Cubitt are credited with the chief part in this, but in 1819 St. Pancras Church was undertaken by a general contractor, though there seems to have been much done apart from him. Though the old system of separate contracts worked well enough in small jobs, it was a clear gain to get a large and complicated building undertaken by one builder whose staff was under one control. The occupation of a builder is not so attractive that many men without habits and knowledge gained in the business are tempted to embark in it, but if the general contractor is not a practical craftsman he may be a good administrator who has learned enough of his business and is able and willing to keep his engagements. I do not care to choose between them. Both may grow together; their race has developed the builder of to-day, and he is developing the builder of to-morrow.

A modern builder on a large scale should have a fancy for machinery and be ever ready to seize on improvements. His steam-engine will probably drive the dynamo, but the gas-engine will not be despised. Instead of the rattle and friction of heavy chains there is the swift, smooth-working wire rope. His stone is sawn, squared, and elaborately moulded or turned while the modern mason looks on. His moderate stock of timber comes in of any scantling he may order, clean and dry, and fit for high-speed machines. The piece that is going into the shops passes straight through the machine, and will come out with its four sides moulded or grooved, or sunk, or planed complete. Then, after careful markings, morticing and tenoning are an affair of seconds, and all the parts of the framing come together where the joiner awaits them with his wedges

and glue-pot, he being literally and practically a joiner and nothing else, unless he should possess the skill of a fixer as well. His box of tools, once prized, with which he wrought and moulded, is now seasoning at home for a place in some industrial museum. The workshops are warmed and lighted as comfortably as the office, and as building materials in general are amongst the cleanest things to handle, the workman may, if he likes, keep himself as tidy as the clerk.

So far as is practicable these improved conditions of labour in the shop are getting applied on the building. I am not sure how far this is due in London to our native smartness, or how far to the example of Scotland and the North or to the pertinacity of American inventors. I have usually seen either in Scotland or abroad a new invention for saving labour years before it gets on our building sites. As I was looking over a large establishment newly fitted with American machinery, the inventor called to take home his final cheque. Daring a polite farewell his customer said, 'I suppose we shall see you back some day?' The Yankee replied promptly, 'Yes, sir, I shall be here in the spring with my new system of machinery, which is calculated to entirely supersede this of yours.'

In discussing the English builder of tomorrow it is impossible to ignore the work of the American builder of to-day, who is a constructional engineer. In the recent Paris Exhibition models were shown of a tall office building in New York, only one of many now going up in all the larger American cities. The dimensions and records of progress are full of interest. It stands on a corner plot, nearly 100 ft. by 50 ft., and has eighteen stories above the street, not more—some have twenty-two.

The lowest visible stories are in handsome granite work, the highest stories are in elaborate terra-cotta, coloured and enamelled. The builders of it wax enthusiastic as to its artistic character. The time spent in foundations was what they consider rather long, but once above the plinth they made amends. Would it be about fair to say that, with us, a first-class City building might rise at the rate of one story in three weeks? This New York building shot up through its ordinary and plainest stories at the rate of one story in three days, or two stories per week. In the artistic lower and upper stories the rate cannot have been much slower than one story per week; and all this was done in the winter months of November, December, and January. This speed was made possible by their system of skeleton steel construction, filled in and faced with more costly materials. I have details of other tall buildings erected at only twice or three times our pace.

Our Institution has lately provided itself with this handsome building. If our neighbours had no rights of light and air, and we had desired to rehouse the whole of the firms cleared away from this vicinity as well as ourselves, the American building first mentioned might have been duplicated here. It would have risen from the pavement to its present height in less than a month, and would have gone up square and solid 225 ft.—as high as the tall pinnacles of the western towers of Westminster Abbey—in a total period of fifteen weeks; and, I suppose, the internal fittings, with the complicated heating and ventilating apparatus, steam engine, electric plant, and express lifts, would have been finished complete in three months more. I am not advocating these methods. The persons who are carrying them out in America are anxious to try them here, so we may wait and judge for ourselves. I mention this and many other subjects for forethought, not for prophecy.

If we desire to know whether our present arrangements, by which the architect prepares the drawings and the contractor executes the work, are entirely satisfactory to the client, we have not far to seek. There have always been builders able and ready to advise the client as to the design and to carry out the structure. One of these maintained an office, with a staff of architectural draughtsmen, who were in fact architects. Royal Osborne was one of the products of this organisation, and the practice is not becoming less common. If you go to the estate department of one of the general providers to inquire about a house you may learn that they carry out repairs and additions, inspect and renew drainage and build new houses from their own designs, while their staff of assistants may be four times as large as that of average London architects.

There is no reason to think that the work is done especially badly, and if the builder or the architect should object to this system they might be asked whether they buy everything at old-fashioned shops or take advantage of the stores. They would find no sympathy outside their own circles, but if they would gain anything out of such a lesson it may show them the good policy of combined efforts to save time and trouble to the client.

We have been considering the details of business under the contract system, but the system of building upon a schedule of prices is adopted on a considerable scale and may be getting more prevalent. One would have thought that in the making of a bargain of that kind without competitive tenders the client would be at a disadvantage, but I know of cases in which prices so arranged have been materially lower than any that could be got by open tendering. Two or three years ago, when brickwork was at its highest, it was being done cheerfully on schedules of prices by more than one firm of good standing at two or three pounds per rod less than the lowest prices in competitive tenders, and at several pounds per rod less than the price at which a builder of great experience showed me that such work was costing him. I shall try to account for this under another branch of the subject.

One of the useful products of times comparatively modern is rather curiously called the speculating builder. We know of speculators in stocks and corn, and have heard of the land speculator. These buy or sell simply with the view of making money by a rise or a fall in a fluctuating market. But this builder, whose object is no doubt similar, proceeds, often with great skill, to acquire land, buy materials, organise labour, and produce a house for the customer whom his sagacity foresees. He is a manufacturer and a merchant. We do not talk of speculating cabinet-makers and speculating hat-makers. He who, with sufficient command of capital, carries on this business honestly is no speculator in the ordinary sense. Nowadays he buys, not a field, but a farm, makes roads, studies the requirements, the tastes, and the means of his customers, and is distinguished for the excellence of his plans. His elevations are up to the latest architectural craze—in fact, 'art' elevations. He gives the authorities no trouble, pays rather more than the standard rate of wages, turns out his houses, not in groups, but by long roads at a time, and will let on long or short terms or sell outright. If he injures anybody, it is the architect, who, suffering in silence, may be left out of account.

The man who, with nothing to lose, gets hold of sites, is financed, runs up houses that just escape the meshes of the law, mortgages, sells, and is gone, is the jerry-builder. For him building laws are primarily made and are always too lax. Their greater stringency would be a protection to men against whom they are not required.

I approach the subject of the building operative, conscious that it will cover a space large, but not too large, for him who, alone amongst us all, brings into visible shape the things for which his collaborators are content to design and arrange.

Looking back, as I do, just fifty years, when, in a district charmingly remote, I was entrusted—perhaps prematurely—with the oversight of works where, without any sort of machinery, every kind of building material had to be raised from the quarry or felled in the wood, and seasoned and converted for use, the boards and quarterings laboriously planed and grooved, and moulded and mortised with resounding blows—when during hours of labour that were long and for wages astonishingly low the masons and joiners turned out their work with a perfection of finish that modern machinery can do no more than imitate, I can realise the contrast between the old style and the new.

I have always been impressed with the skill of these artificers in stone and wood, the truth of their joints, the perfection of their angles, the beauty of their finished surfaces, the rarity of mistakes in their setting out and of material cut to waste. No architectural draughtsman has such a task before him, or need strain after their exceeding accuracy. Accomplishments such as these were the result of long apprenticeship and the constant handling of well-sharpened tools. After many years spent then and since in direct communication with men of this class I am conscious that, however well we and they may understand each other for

purposes of business, we may get no better qualified to enter into their thoughts and feelings. Between us and them there is built up a barrier stout and high. For some of us it may be getting lower, but there it remains.

I remember, long ago, sitting on a bench encouraging a friendly joiner to develop some grievances that he had hinted against the system of which he was a helpless part. One of them has always stuck in my memory—his scorn of the employer, a large builder, who had never done a day's work in his whole life, who was always rushing about in his carriage trying to get financed, and who went off with all the profit on the job. It may have been profit or loss, but I knew that the brougham was used also in looking after the materials on which the joiners were exercising their skill, in finding work for them that they could not have found for themselves, and in visits paid to the architect, in order to convince him that these men had done rather more work than appeared by my weekly returns. I asked why do not you and your mates undertake all this work for yourselves and share the profits? I dare say his reply was conclusive from his point of view, but I gathered that, in his view, if everybody had their rights the finished building would belong to them as the makers of it all.

I might have suggested that, much as they were doing to it, they had not quarried the stone, nor felled the timber, nor hauled or stored the materials, nor brought them to the job, nor paid for the ready-made accessories, nor made the design, nor organised the labour, nor found the capital, nor stood the risks of actions or losses. And yet for fully twelve months before the building could produce to anybody profit or comfort they had week by week been furnished punctually with the means of living, whether other contributors to the result were paid or not. He would probably not have seen the point of this, and in his place I might not have seen it, but it is at least an element worth a moment's thought in the wide subject which we have so little time to discuss.

After all, they were really making or manipulating a large proportion of the items and putting them together, skillfully as I have said, and looking at the lengthened chain of responsibility, passing through so many hands, between the client and themselves, if any of the parties should fail to understand the other, or if the result should not turn out quite so well as had been hoped, the wonder may be that things were no worse. For the barrier that divides them from so many of us is serious; it is not difference of birth, nor of education, nor of social status, nor of dress, or hours of rising, or of mere hand labour or rate of pay. It is the practical fixity of their position without reasonable expectation of betterment while craftsmen; with little hope of getting out of their groove and with no assurance of a comfortable provision against old age.

The whole tribe of clerks or assistants, down to the boy who fetches and carries, is paid by time at wages often no higher than those of the workman, but from the day they enter their calling they are cheered with prospects of promotion which, though seeming to recede at times, will in the ordinary course of events, with age, industry, experience, and good manners, come within reach, and may bring any of them to the highest position in the scale. But if, at the age of manhood, the clerk, or assistant, or office boy should see that he was encompassed by a dead wall over which, in ordinary routine, he could never climb, through which he could never break, no matter how he might grow in age or strength or grace, he would look upon his position as that of a serf, and if wise and energetic he would get out of it into the free air by whatever road. If slow of thought or unlucky, he would sink into the chronic grumbler against fate and circumstances. For the burden of servitude does not gall by its weight and composition so much as by its deadly hopelessness. I have seen such men in such positions, and I know. But if there were to be these last just one loophole open in the prospect of better pay, is there any reason to doubt that, either alone or in combination, they would use every effort to scheme and contrive as these workmen do towards their ideal of life on a higher scale? "

* The remainder of the paper will be given in our next issue.

Illustrations.

PART OF A TAPESTRY PANEL.

HIS illustration is from a fine water-colour drawing by Mr. Hervey Rutherford, forming a portion of the drawings for which he obtained the Owen Jones Studentship this year.

It is a portion only of a composition representing the adoration of the infant Jesus. The original work is Flemish and of early sixteenth century date.

DESIGN FOR FAÇADE OF A MILITARY MUSEUM.

The illustration is of a drawing hung in the Royal Academy Exhibition, 1900. The design and details of the façade are intended to convey as clearly as possible the nature of the building—viz., a museum in which the military relics of a nation might be preserved.

J. E. SPAIN.

DESIGN FOR LEAMINGTON FREE LIBRARY AND TECHNICAL SCHOOLS.

This design was submitted in a limited competition in May, 1899, and was awarded the second premium. The building was to consist of a free library and science and art schools. The instructions to competitors were very explicit, and gave the approximate area of every room; the limit of cost was stated to be 12,000*l.*, exclusive of furniture.

The building, planned for a corner site, consisted of a central block with obtuse-angled wings, parallel with the adjoining roads. The library, in the east block, was arranged entirely on the ground floor, with main entrance from the principal road and staff entrance at rear. The central block comprised entrance to schools, cloakrooms, and stairs which gave access to the science and technical schools on the north-west and the art schools on the east, over the front portion of the library. The art schools were thus entirely lighted from the north, the small windows on the south front being provided for purposes of ventilation. A relief stair and emergency exit was arranged at the extreme north-west of the building. The caretaker's residence was placed on the upper floor of the central portion with separate entrance and stair.

Externally the building was intended to be faced with red brick up to the plinth level, the upper part of the walls being finished with "rough-cast" rendering with arches, and window aprons in red brick, and window sills, cornice, doorways, and dome in Hollington stone. The roofs were proposed to be covered with red Italian tiles. The drawing from which the illustration has been reproduced was exhibited in last year's Royal Academy Exhibition.

J. E. NEWBERRY.

THE HOMESTEAD, WOODBOURNE ROAD, EDGBASTON.

The aspect and view from the site necessitated the dining-room of this house being placed at the south-east corner, and the kitchens at the opposite diagonal corner, in order to be near the tradesmen's entrance and the separated out-offices in the rear, the difficulty of access between the two being got over by placing the pantry under the stairs. This position is found convenient for answering the front door. The hall is in communication with the dining and drawing rooms by wide folding doors, and when these are open an apartment 56 ft. long is obtained.

The house is finished with oak, Kenilworth stone fireplaces, some ornamental plaster, and metalwork. The whole of the external walls are covered with rough cast, the chimneys being built of old bricks and the roofs covered with Colley Urston stone slates.

The house is at the top of a sloping site, a series of terraces being formed with retaining walls of old bricks. Messrs. James Smith & Sons, of Birmingham, were the builders, and Messrs. Bateman & Bateman the architects.

THE GABLE HOUSE, KING'S HEATH.

This house was erected about five years ago upon a residential estate near Birmingham now being developed for this class of property, and adjoins a new station in course of con-

struction by the Midland Railway upon their line to King's Norton. Thin Leicester facing bricks, with Quilting stone of a yellow colour, are used externally, and Codsall stone of a red colour for the chimney-pieces internally. The roofs are covered with tiles of mixed colours, cleft oak boarding being used for the bay window and gabled over. The walls of the rooms are covered with panelling, and the ceilings are of open exposed timbers. The archway is useful for getting in and out of the carriage in bad weather and for the children to play under. The proprietor employed his own workmen, who were directed by Messrs. Bateman & Bateman, the architects.

COMPETITIONS.

JOINT ISOLATION HOSPITAL, DEVIZES.—A meeting of the committee for carrying out the Joint Isolation Hospital for the Urban and Rural District of Devizes, met at the Town Hall on the 21st ult. for the purpose of accepting the report of Mr. C. E. Ponting, the assessor who had been appointed to examine forty-five sets of plans sent in for competition, in response to an offer of two premiums of 20*l.* and 10*l.* Five sets of plans were selected, and the committee awarded the first premium of 20*l.* to "Hygiene II." (Messrs. E. C. Isborn, Devizes, and G. Boughton, Woodlands, Ryde, Isle of Wight). The second premium of 10*l.* was awarded to "G" (Messrs. Bell, Withers, & Meredith, London). Three other sets were accepted, in reserve, viz., "Efficiency" (R. W. Goodman, Reading); "Esculapius" (R. J. Brinkworth, Chippenham); and "Deviser" (H. H. Clark, London). The committee agreed to accept the second premiated set of plans as being most likely to come within the amount they wished to spend.

SEVENOAKS ISOLATION HOSPITAL.—There were forty sets of plans sent in in this competition, in which Mr. Keith D. Young, F.R.I.B.A., acted as assessor. The premium was awarded to the plans signed "Lucidity," by Mr. W. H. Ansell, A.R.I.B.A., 11, Great James-street, Bedford-row, W.C. The Urban District Council has endorsed the assessor's award, and the hospital—with certain omissions and modifications—is to be proceeded with at once.

BOARD SCHOOL, VICKERSTOWN, BARROW-IN-FURNESS.—A competition was recently held at Barrow-in-Furness for a Board school to be built near the growing suburb of Vickerstown, on Walney Island, for the Barrow-in-Furness School Board. The competition was open to local architects only, and Mr. Thos. Bell, of Burnley, was appointed the assessor. He placed the plans of Mr. H. T. Fowler, architect, of Ramsden-square, Barrow-in-Furness, first, those of Mr. J. Y. Macintosh second, and those of Mr. W. Moss Settle third, and the decision has been confirmed by the Board, who have appointed Mr. Fowler their architect to carry out the work. The school is to provide accommodation for 600 children, including temporary accommodation for 180 infants, who will be removed to a separate infants' building as soon as the requirements of the district necessitate the increased accommodation.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—A meeting of the Leeds and Yorkshire Architectural Society was held in the society's rooms, Park-street, Leeds, on the 18th ult., when a paper was read by Mr. H. C. Corlette, of London, on the "Planning and Design of Churches." Mr. Corlette said he did not propose to discuss doubtful points in ecclesiastical architecture, or the history of churches, but to address to practical men a few practical remarks upon their planning of the building with which their interest as architects was especially associated. In the first place, he pointed out with some emphasis the necessity of the building being made to belong to and to harmonise with its surroundings, and he proceeded to advise architects not to put too much egotism into their composition. Let the personal element be found rather in their work than in an ostentation amounting to vulgar display, which forced its recognition upon the notice of all who looked at the building. Proceeding, he offered some advice with regard to the selection of sites and the adaptation of the buildings to their surroundings; and he went on to deal with the technical

features of plans, such as those relating to the construction of the sanctuary, the choir, the nave, the side-chapel, and the vestries.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—A meeting was held on the 20th ult., Mr. S. W. Kershaw, M.A., F.S.A., presiding, when an interesting paper was read upon "Some Old Halls in Wirral," by Mr. W. Ferguson Irvine, who illustrated it by many fine photographic views shown by the limelight lantern. The Hundred of Wirral possesses many special characteristics, due mainly to its peculiar surroundings and situation. Wirral, or "Wurrall," as the old natives call it, is the tongue of land lying between the estuaries of the Mersey and the Dee, and contains the only coast line which the county of Cheshire possesses; it is, in fact, a peninsula, being connected with the rest of the county by one narrow end. The halls and manor houses of Wirral differ in many respects from the rich examples of domestic architecture for which Cheshire is so celebrated; nevertheless, they are not without quaint and picturesque features. One peculiarity about them is the half-timber construction, which is confined entirely to the frontages, the rest of the walls being of masonry. In Bidstone Hall we have a good specimen of the style of architecture of the early seventeenth century, the house being built in 1620 to 22. In the deer park is still standing an old wall over 6 ft. high and about 4 ft. thick built of rough stones, which is referred to in almost every lease of the Hall as far back as 1609 as "the great stone wall"; its antiquity may be much greater, as tradition records it was built when wages were a penny a day. The wall is popularly known amongst the villagers as the "Penny-a-day Dyke." Chief amongst the buildings described and illustrated were Leasowe Castle; Storeton Hall, connected with many memories of the historic house of Stanley, dating from about 1360, and architecturally a good example of the fourteenth century; Shotwick Hall, and the partly timbered houses of Irby, Hooton, and Plessington. A somewhat unusual feature of these old halls is that not one of them can boast of having been the residence of a king or queen, yet the histories of many of them, as told by the lecturer, were romantic and interesting.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The second Lecture of the series on "Works Management" was delivered by Mr. A. H. Barker, Wh.Sc., B.A., B.Sc., at the Westminster Palace Hotel, on the 20th ult. Mr. Ernest King, Vice-Chairman of the Institution, presiding. Continuing the discussion of carrying and lifting appliances introduced in the first Lecture, hand-cranes, ordinary power cranes, and cranes worked electrically were considered, the relative economy in working being pointed out. Their cost was treated, as also that of radial cranes, both hydraulic and hand. Trucks and rails in the shop and railway sidings were dealt with. The lecturer then passed on to the essential features of the foundry; and considered the cost of cupolas, and foundry lifting and conveying appliances. Moulding machines of various types were described, and the relation of the number of moulders and labourers to output was entered into. The appliances of the brass foundry received attention, particular reference being made to the crucibles. General arrangements of various works were reviewed, the most advantageous positions of the different departments being shown. The systems appertaining to the tool-room and stores were touched upon, and questions with reference to heating, ventilating, and lighting discussed. Further information on the points raised in the Lecture was given by Mr. Barker at the close, in reply to various questions put to him. The third Lecture takes place on the 7th March.

NEW LONDON FIRE BRIGADE STATIONS.—The new fire-station in Redcross-street, City, was opened on the 23rd ult. The station contains an engine-room 33 ft. by 47 ft., watch and recreation room, a basement for laundry and stores, and the quarters for the men.—The fire-station which has been erected in Uxbridge-road, Shepherd's Bush, was opened on the same day. The building is of red brick, and the cost has been 12,600*l.*

THE LONDON COUNTY COUNCIL.

The last meeting of the present London County Council was held on Tuesday in the County Hall, Spring Gardens, Alderman Dickinson, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend the Battersea Borough Council 10,600*l.* for electric light installation; the Kensington Borough Council 2,748*l.* for the extension of the town hall; the Stepney Guardians 1,845*l.* for erection of boiler-house at the workhouse; and the Metropolitan Asylums Board 18,316*l.* for purchase of land and erection of buildings.

Wandsworth Park.—The Parks Committee recommended and it was agreed, that the estimate submitted by the Finance Committee be approved, and that an expenditure of 12,500*l.* be authorised for the embankment and laying out of Wandsworth Park, including the provision of campshedding along the river front, the supply and erection of iron boundary railings next Putney Bridge-road, the erection of conveniences, both, cart shed, tool shed and temporary bandstand, the provision of three watch boxes, and the execution of the necessary ground work; and that the Parks Committee be authorised to invite tenders and enter into any necessary contracts for the supply of materials or execution of work.

Tender.—On the recommendation of the Highways Committee, it was agreed that the tender of the Stirling Boiler Company to supply, for a sum not exceeding 22,782*l.*, the boilers and mechanical stokers required for the electricity generating-station, to be erected by the Council at the Camberwell tramways depot, be accepted.

London Government Act, 1890—Transfer of Powers.—The Building Act Committee reported as follows, the recommendation being agreed to:—

"By the provisions of the London Government Act, 1890, the power hitherto exercised by the Council under Section 84 of the London Building Act, 1894, to license the setting up of wooden structures, and the power to take proceedings for default in obtaining, or observing the conditions of, a licence under that section, are transferred to the Metropolitan Borough Councils constituted under the first-mentioned Act. There is, however, some doubt as to what constitutes a "wooden structure" within the meaning of Section 84 of the London Building Act, and a question has arisen with the Council of the City of Westminster as to whether temporary wooden stagings put up on public occasions, such, for instance, as stagings erected in connexion with the opening of Parliament, and on other recent occasions, come within Section 84 of the Act as "wooden structures," or within Section 83 of the Act as "structures of a temporary character." The City of Westminster contend that they come within Section 84, whereas the solicitor advises us that, in his opinion, they do not, but come within Section 83. We have been in communication with the Local Government Board upon this and other points of difficulty arising upon the transfer of powers under the London Building Act, and a reply has been received stating that the Board have no jurisdiction to determine the question, which is rather one for the decision of the High Court in accordance with the provisions of Section 29 of the London Government Act, 1890. We have now received a letter from the Council of the City of Westminster, stating that they have resolved to at once take the necessary steps for the submission to the High Court of the questions raised. We recommend—that the solicitor do take all necessary steps for supporting before the High Court the view of the Council that structures or erections put up on public occasions do not come within the provisions of Section 84 of the London Building Act, 1894."

Office Accommodation.—The Establishment Committee proposed to let on lease the ground-floor of 25, Cockspur-street.

Mr. Pigott moved, and Sir J. B. Maple, M.P., seconded, an amendment to refer the matter back until the special committee had reported on the site for the new county hall.

The amendment was lost, and the Committee's recommendation was accepted.

After transacting other business, the Council dissolved.

The new Council, which is to be elected on Saturday (to-day), will assemble on Tuesday week. Meanwhile, the Committees will continue to hold office until March 8.

SHUTTLEWORTH MEMORIAL TABLET, EGLOSHALE CHURCH, CORNWALL.—A memorial tablet to the late Professor H. Shuttleworth has just been unveiled in Egloshale church. The tablet, which was the work of Messrs. Hems, of Exeter, covers an urn containing the ashes of the late professor.

THE ARCHITECTURAL ASSOCIATION:

FIRST SPRING VISIT, FEBRUARY 16.*

Mr. BENTLEY'S Westminster Cathedral is in many ways the most interesting building in progress in London, and the Association was wise in selecting it for one of their periodical visits.

Up to the present time it is only possible to gauge the ultimate effect of the interior by studying the proportions and the general lines; but from the point of view of construction the visit was opportune, as in several instances the centering for and the filling in of the vaulted aisles could be readily followed.

Since the previous visit of the Architectural Association considerable progress has been made, especially as far as the Cardinal's House is concerned. The general drawings of the cathedral only were on view, and, though these were of great interest, it would have been of assistance to the members if the drawings of the Cardinal's House and other departments of the scheme could have been exhibited showing the working of the whole plan.

The assembly hall, with its barrel vaulted ceiling, is the most notable feature of the building, apart from the cathedral; it is placed in a position accessible to the public and also to the residential and working departments.

In a few isolated cases marble columns and caps were in position in the choir and nave, but a considerable period must yet elapse before the building assumes any appearance of finality.

The exterior is in every way a remarkable study, the effort to obtain grandeur being fully realised. The tower, which is becoming a familiar monument, is approaching the final stages, and grouped with the whole building there is a dignity in the square mass which is unusual and entirely satisfactory.

At a future date it is hoped that the Association will again have the opportunity of visiting the building.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The sixth meeting of the Discussion Section of the Architectural Association for this Session was held at 56, Great Marlborough-street, W., on the 22nd ult., Mr. C. H. Strange, Chairman of the Section, in the chair. The paper of the evening was entitled "Domestic Heating, Ventilating and Lighting," by Mr. Fredk. J. Osborne Smith. Mr. Osborne Smith called attention to the fact that high temperatures were detrimental to health and were often the cause of lung trouble. He then pointed out the importance of making the most use of the aspect when planning a house, of keeping the outer walls as thick as circumstances would permit, and of guarding against the prevailing habit of using too much glass in the form of windows, thereby increasing the cooling surface of the room.

The ventilating grate was suggested as being very suitable in living rooms, inasmuch as fresh air could be warmed and introduced not only into the room, but also into the bedroom over, care being taken to divide the air chamber into two parts. He advocated warming the hall and staircase as well as the rooms, either by a grate or radiator, which latter should be placed near the entrance door; in addition to being warmed they should be thoroughly ventilated. In small houses a single radiator might be worked off the hot-water service if convenient, and would be found economical and efficient, stop-cocks being provided to shut it off in summer. Independent warming is advantageous, but requires extra attention, although it is a great convenience to be able to keep a country house warm and dry when not being occupied by means of radiators or pipes judiciously placed under windows and in corridors. Slow combustion grates with fire-clay backs and sides were recommended for warming, inasmuch as they saved fuel and ventilated the rooms, besides being more cheerful than stoves.

Considering ventilation, Tobitt tubes were condemned as being filthy and antiquated. The author preferred Sherringham ventilators placed near the ceiling in such positions as would favour a cross current. Ventilators, he said, do not always act as outlets, and this should be borne in mind when deciding the

position for them. In conjunction with these ventilators deep sill fillets for double-hung sashes and fanlights for mullioned windows were advised.

Lighting was briefly dealt with, mineral oil lamps being suggested as a very pleasant light. Electric light was considered expensive, but as possessing many advantages, although many found it harmful to their eyes.

Mr. F. G. W. Buss opened the discussion and proposed a vote of thanks to the author for his paper. Mr. Ernest King seconded, and the discussion was continued by Messrs. R. H. Weymouth, J. H. Pearson, L. S. Crosbie, G. Lee, A. Gray, and C. H. Strange.

Mr. Osborne Smith having replied, the Chairman announced that the next meeting will be held on March 13, when Mr. H. P. G. Maule will read a paper entitled "The Architect and the Garden."

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.

The annual dinner of the Provident Institution of Builders' Foremen and Clerks of Works was held in the King's Hall, Holborn Restaurant, on Saturday last week under the chairmanship of Mr. B. I. Greenwood (who presided in consequence of an accident to his partner, Mr. Jas. S. Holliday, who was to have occupied the chair), supported by Messrs. Banister F. Fletcher, C. Dunch, R. B. Marsh, H. O. Ellis, C. Wall (President of the London Master Builders' Association), Howard Colls, S. B. Depree, L. F. Maton, A. Kibby, A. Roberts, and T. Costigan, the company numbering 334.

The toasts of "The King and Queen and all the Royal Family," and the "Navy, Army, and Imperial Forces," having been honoured (Mr. Thomas Costigan, Secretary of the London Master Builders' Association, responding for the "Navy, Army, and Imperial Forces").

The Chairman proposed the toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works." The Institution, he said, had distributed during the past year the sum of 390*l.* to the needy and necessitous, and who could measure the good that had been done, and how many lives brightened, by the judicious distribution of even such a comparatively small sum as that? The Institution had many good rules, one of which was that no clerk of works should be admitted who did not know a trade. He appreciated that rule, for he had had some experience of clerks of works, and he said without hesitation that the worst clerk of works one could have to deal with was the man who did not know his trade—the man, for instance, who was sometimes sent out from an architect's office to act as clerk of works. There was no man more difficult to please than the man who did not know what he wanted. The Institution was one to which all clerks of works and foremen should belong, and he was glad to say that some of the foremen in the employ of his firm were members of the Institution, and he thought they all ought to be. He was inclined to think that if all the foremen engaged by his firm would become members of the Institution, the firm would be very pleased to pay half of their subscription. Why not all? some might say. Well, he believed in helping a man to do a thing, but he did not believe in doing it all for him, and that was his reason for objecting to the Workmen's Compensation Act. It was a good thing that a workman in case of accident should be supported during the time he was prevented from proceeding with his ordinary avocation: he should be helped, but not have it all done for him, otherwise he became a pauper. Builders' foremen and clerks of works came more directly into contact with the workmen than did the employer; and no doubt they had noticed the great and growing danger which threatened the commercial prosperity of the country: he referred to the persistent and systematic limitation of output. There had never been in the labour history of the country any more pernicious or abominable system than that of refusing to do what a man could very well do, and ought to do, if he had the will, and, unfortunately, that system prevailed in almost every industry. If they wanted to know why British trade was diminishing, and why foreign competitors were getting trade that used to belong to us, they would find the cause in the limitation of output he had referred to. The work that was now done for

* Unavoidably postponed from last week.

a fair day's pay was nothing like that which used to be done. Moreover, the employer was not now able to say what he wanted; all he could now say was what he would like to have. No doubt things would improve, but the sooner the better. The Institution had been able to carry forward a balance of 209*l.*, which was a very satisfactory thing. The expenses of administration were very small, and much of the work that was done by the officers of that Institution must be regarded as honorary work, for the amount of their remuneration was very moderate.

Mr. John Beer, secretary, replied, remarking that the past year had been one of steady progress for the Institution. A larger amount had been paid to pensioners than had ever been paid in one year before, and a larger sum put to the reserve fund. But there were many members who were in the evening of their life, and the funds of the Institution might have a heavy call on them at any time. Two years ago the amount of the pensions had been raised, and it was hoped to still further increase the amount, giving the men 18*s.* per week, and the widows a sum that would at least pay their house rent.

Mr. Howard Colls then gave the toast of the "Architects and Surveyors." He referred to the very high standard English architecture had attained to during the last years of the Queen's reign, and said that some of the work that was now done would compare very favourably with the work of the past, and, in his opinion, it would last longer, because it was built better, than the buildings of past times. What was wanted in the erection of a building was good fellowship, from the highest to the lowest, combined to produce first-class work. The responsibility of all connected with building work remained to remind them of it, and that showed how important it was to strive to do the best work.

Mr. Banister Fletcher, who responded, said architects had a good deal to learn—amongst other matters, how to insure the erection of halls like the King's Hall suitable for hearing in. But there was so much to learn, and an architect was supposed to know so much, that it would be necessary to live much longer than one usually did before a man could be thoroughly master of his profession. As they could not do that, they had to rely to an extent on men in the trades allied to architecture, and on builders' foremen and clerks of works, and to them architects were specially indebted. As to the chairman's remarks in regard to trades-union policy, he might say that in the United States a man worked as hard as he could, not as little as he could; whereas in this country the idea which some workmen seemed to be to work as little as possible and get as much pay as possible. For a man to be told that he must not lay more than a certain number of bricks per day in order that a man round the corner might have the benefit of it, was not a system which ought to have the support of the British nation. In the United States a man did get better pay than a man here, but he did twice the work. The system in this country greatly added to the cost of building, which was becoming almost prohibitive on that account.

Mr. Fletcher then proposed the toast of "The Builders and Contractors," remarking that the prosperity of the builder was linked with that of the architect. The lot of the modern builder and contractor was clearly not a happy one, for he had to contend, amongst other difficulties, with various labour disputes, and such matters as the price of materials which were continually being brought into the market, and the complicated matter of extras and omissions. Speculative and jerry builders were, he believed, a product of the present wants of the age, and were as necessary as the more respectable builder and contractor. It had occurred to him that an Institution like the Builders' Foremen's Provident Institution might have obtained quarters at Carpenters' Hall, and he was quite sure that the Carpenters' Company would be glad to give them accommodation which would probably be an advantageous matter to the Institution in the way of rent. With the toast he coupled the name of Mr. Charles Wall.

Mr. Wall, in reply, said that Mr. Fletcher was quite right in saying that a builder had many difficulties to face, but if they wanted to know the real difficulties of a builder they should become a President of the Master Builders' Association. In that capacity he had

had several attacks of conciliation. Mr. Wall then spoke of the difficulties which had existed as to which trade should do certain work. He felt that the time had arrived when those men who could do the work best should undertake it, and further that the builder ought to know better than any one else what trade should carry out certain work. The builder to an extent was in the hands of the architect, the clerk of works, and the foreman. Good builders tried to pay the highest wages they could, for after all it was not so much a matter of wages as a question of how much work one got for those wages. It was absolutely necessary, if building was to be continued in England as it ought to be, that the cost must be materially reduced. That was not to be done if the builder continued to be overruled by trades unions, and it was for any builder's foreman or clerk of works who belonged to a union to consider whether he would serve the master or the union. He believed that men could not serve two masters. Builders did not want to deprive their men of any benefits they might be getting from a trades union, but it was most important that a builder's foreman should be a servant of the builder, and not of the trades union.

Mr. J. Stapleton (treasurer) proposed the toast of "The Governors and Trustees" (Messrs. F. H. Dove, H. Colls, and J. Greenwood); "Donors and Honorary Subscribers and Visitors," coupled with the name of Mr. J. C. Hill, President of the Institute of Clayworkers. Mr. Hill suitably responded, and enumerated the qualifications necessary for a builder's foreman and the difficulties the builder's foreman had to contend with.

Mr. F. Hann then proposed the health of the Chairman, and Mr. Greenwood, in reply, said that in regard to trades unionism he might mention a good retort to a man who once said he did not do too much work in order to make a job for another man. "Yes," said the workman's friend, "and I'll tell you where that man is. It is quite true you are making a job for another man, but he lives in America, and when he gets the job he will keep it."

The last toast was that of "The Press," coupled with the name of our representative. During the evening subscriptions to the amount of 16*5*l.** 10*s.* 6*d.* were announced, including 2*1*l.** from Mr. J. S. Holliday.

A NEW ALTERNATING CURRENT ARC LAMP.

THE Reason Manufacturing Company, of Brighton, exhibited last week at the Croydon Electricity Works a new type of arc lamp invented by Mr. Frank Lewis. Mr. Lewis is well known in the electrical profession as the inventor of an alternating current arc lamp suitable for "parallel" running which is extensively used. The new lamp which he is bringing out is suitable for "series" running, and will probably come into extensive use for street lighting. At the Croydon works there were twelve lamps on view exhibited in series on a thousand-volt alternating current circuit. Some of the lamps were hung on poles in an adjoining field, and others were exhibited in the test-room, so we had the opportunity of inspecting them under various conditions.

The mechanism of the new Lewis lamp is extremely simple and is very effective in action. The principle is to shunt the alternating arc by a choking coil, so that the failure of any arc has practically no effect on the rest of the circuit. A clause in the specification states that even when 30 per cent. of the arcs are extinguished the remainder must continue to burn perfectly in series. The lamps exhibited passed this test successfully, as there was no perceptible flicker in the other lamps when two of the arcs were broken.

The lamp is of the enclosed type—that is, the carbons glow in a small glass globe, which prevents oxygen getting access to the arc. One effect is that the carbons consume away very slowly. The carbons in a Lewis lamp will last seventy hours, whilst in an ordinary "open" arc lamp they only last ten hours. This effects not only a considerable saving in the annual bill for carbons, but a still greater saving in the cost of maintenance, as one trimmer can attend to four times as many lamps. Another effect of enclosing the arc is to distribute the light much better and to make the quality of the light approach sunlight more nearly.

The voltage across the terminals of each

lamp is 70, and the current they take is about 7 amperes. Mr. Lewis has noticed the curious fact that the more alternating current arcs we have in series the greater the voltage they require between their terminals. The product of the volts and the amperes is only about 20 per cent. greater than the watts taken by the circuit, and compares favourably with the best results hitherto obtained in series arc lighting. This apparent discrepancy between the true watts and the apparent watts can be considerably reduced by supplying a "balancing" current in parallel with the circuit, and the inventor showed us several methods by which this could be done.

No claim is made for any very high efficiency in converting the electric energy into light energy. From the central-station engineer's point of view, the most important points in connexion with any system of arc lighting are immunity from breakdowns and small cost of maintenance. These are far more important considerations than economy in first cost or very high "light" efficiency. In our opinion the Lewis series system fulfils these two essential requisites, and as two sets of thirty-three of these lamps are already ordered for lighting along the tramway routes at Croydon, central-station engineers will soon have an opportunity of inspecting these lamps in actual work.

THE HOUSING OF THE WORKING CLASSES.

THE Report of the Housing of the Working Classes Committee of the London County Council, containing the following paragraphs, was received at Tuesday's meeting of the Council, with the exception of the part relating to the Tottenham scheme, which was postponed:—

Reid's Brewery Site, Clerkenwell.

"We have had under consideration plans for the development of the Reid's Brewery site, Clerkenwell, which was acquired by the Council for the provision of accommodation for persons to be displaced by the formation of the new street from Holborn to the Strand. The site has frontages to Clerkenwell-road, Leather-lane, Portpool-lane, and Gray's Inn-road. The plan which we have approved, and which has also received the approval of the Secretary of State, provides for the erection of five-story block dwellings all round the site except on the frontage to Gray's Inn-road, where the existing buildings will remain for the present. These dwellings will be pierced with six archways up to the second floor, giving access to the interior of the site. There are also two existing archways of the site. The main interior of the site will be occupied by five-story transverse blocks of dwellings divided by yards and gardens. The narrow end of the site next Gray's Inn-road will contain another short block of five-story dwellings, and the remainder of the site between this block and Gray's Inn-road frontages will be laid out as a playground and garden. An estate office and twenty-three shops will be provided on the ground floor of the dwellings facing Clerkenwell-road and Leather-lane. The accommodation will consist of 551 tenements, of which only thirteen will be associated and the remainder self-contained. The thirteen associated tenements all consist of one room; there will be 361 two-room tenements, 130 three-room tenements, and 41 four-room tenements. Accommodation will be provided in all for 2,614 persons, exclusive of the shops. We have received from the architect the working drawings for three of the interior blocks of dwellings, and have given instructions for bills of quantities and other particulars to be prepared. We propose that the course adopted on the Millbank estate of having a number of blocks erected under the same schedule of prices shall also be followed in this case.

Seymour and Somerset Buildings, Churchway, St. Pancras.

We report for the information of the Council that working drawings are completed for Seymour and Somerset Buildings, Churchway, St. Pancras. These dwellings are to be erected on the two sites on the east side of Churchway on the land acquired from Lady Henry Somerset under the London (Churchway, St. Pancras) Improvement Scheme, 1895. Each block will be five stories in height, and accommodation will be provided in 100 tenements for 472 persons. These tenements will all be entirely self-contained, and will comprise one tenement of one room, sixty-six of two rooms, twenty-nine of three rooms, and four of four rooms.

Tottenham Fields Estate, Tooting.

On January 23, 1901, the Council decided to acquire under Part III. of the Housing of the Working Classes Act, 1890, an estate at Tooting, consisting of about 38½ acres, and known as the Tottenham Fields Estate. The financial and other par-

particulars which were then submitted showed that the estate could be successfully developed by the erection of cottages. Since that date we have had under consideration the details of various methods of development, but it has been a matter of some little difficulty to frame a scheme which should comply strictly with the Council's general requirements as to working-class dwellings, and which at the same time should avoid putting too great a number of cottages on the estate. We are now in a position to inform the Council that we have approved a scheme of development which successfully meets both these difficulties.

The particulars of this scheme are as follows:— Three lateral streets run eastwards from Tooting High-road straight through to Church-lane. The middle one of these three will be 45 ft. wide, and the other two 40 ft. wide. A short 40-ft. street connects the southern of these lateral streets with the middle one, and from this short transverse street a fourth lateral street, also 40 ft. wide, runs straight through to Church-lane. Three main 45-ft. streets divide the estate transversely, and are so arranged as to provide for their continuation on the development of the adjoining land. All the 45-ft. streets will be lined with plane trees, which will be planted just inside the forecourts of the cottages abutting upon them. The forecourts abutting on the 45-ft. streets will be 14 ft. in depth, and the forecourts abutting on the 40-ft. streets will average 5 ft. in depth. The arrangement of roads outlined above enables the whole estate to be divided into 1,244 plots for the erection of cottages of four different kinds. The average sizes of the plots will be as follows:—

	Area in square feet.	Frontage.	Depth.
First-class cottage plot	2,494	fr. in.	ft. in.
Second-class cottage plot	1,104	33 8	74 0
Third-class cottage plot	799	10 0	72 9
Fourth-class cottage plot	1,210	12 2	66 0

The minimum distance between the streets will be 103 ft. and the maximum will be 158 ft. The distance between the backs of the houses will vary from 35 ft. to 90 ft. The cottages will be arranged in terraces of about eighteen cottages to each terrace; and between these terraces will be a space of about 15 ft. None of the cottages will have back additions, and the free circulation of air will therefore be unimpeded. The accommodation provided will be according to the following schedule:—

Cottages.	No.	No. of rooms.	No. of person provided for.	Average size of			
				Living room.	1st bed-room.	2nd bed-room.	3rd bed-room.
1st class.....	89	5 and scullery	290	150*	104	104	95
2nd class.....	109	3 and kitchen	654	158†	115	98	95
3rd class.....	818	3 and scullery	4,998	144	96	96	—
4th class.....	188	3 and scullery (upper flat) 2 and kitchen (lower flat)	1,128	130	96	96	—
Totals.....	1,244	—	8,532	—	—	—	—

* Parlour, 99 sq. ft. † Kitchen, 79 sq. ft. ‡ Kitchen, 60 sq. ft.

It will thus be seen that it is proposed to put 8,532 persons on an estate of about 38½ acres. This is an average of about 221 persons per acre. This may at first sight appear a high average when compared with the whole of London (57) but it must be borne in mind that the latter number of persons per acre is arrived at by including in the acreage land covered not with dwelling-houses alone, but with factories, warehouses, and commercial property generally, as well as all open spaces. The only fair comparison would be between the estate as proposed to be developed and an area of similar acreage exclusively covered with dwelling-houses. It will be seen that the proposed arrangement of the estate provides only two-story buildings, with gardens in the rear, abutting on 45-ft. and 40-ft. streets, and a 45 deg. angle of light to all windows is in all cases more than provided for, the maximum height of the cottages being only 17 ft. to eaves, and the minimum space at the back and front being 38 ft. and 50 ft. respectively.

From these facts the Council will understand that the scheme which we have adapted for the development of the Tooting-down-fields estate is one which can be thoroughly recommended on sanitary grounds. We have given instructions for the preparation of working drawings to be proceeded with or the portion—about one-third—of the estate nearest to Tooting High-road.

Clare Market, Strand, Scheme.

On February 12, 1901, the Council authorised us to advertise for tenders to be delivered to the

Council on 26th inst. for the erection of the dwellings on the Duke's-court site, Drury-lane, for the accommodation of 610 persons of the working classes to be displaced by the carrying out of the Clare-market, Strand, scheme. We now submit the working drawings, bills of quantities, specification, and architect's estimate, amounting to 26,285l. in respect of the three blocks of dwellings, which will be known as Sheridan, Beaumont, and Fletcher buildings. . . . The dwellings will consist of three blocks of five-story dwellings, which will provide accommodation for 610 persons in 130 tenements; of these ten will be of one room, seventy-five of two rooms, thirty-five of three rooms, and ten of four rooms; 120 tenements will be entirely self-contained, and the remaining ten will have private water-closets, but sculleries common to two tenements. . . .

Lordship-lane Estate, Tottenham.

In accordance with the decision of the Council to acquire land under Part III. of the Housing of the Working Classes Act, 1890, with a view to providing accommodation for the working classes, we instructed the valuer in May, 1900, to search for suitable sites for the erection of working-class dwellings in the north and north-west districts outside the county boundary. Inquiries were accordingly made, with the result that an estate at Tottenham, consisting of about 225 acres, was brought to our notice. The estate consists of two detached portions, the larger portion fronting Lordship-lane and the smaller portion lying to the north of White Hart-lane. As the estate appeared to us to be a suitable one for the purposes

of workmen's cottages, we instructed the architect to prepare a plan for its development. Upon the consideration of the plan submitted by the architect showing the development of a portion of the land, we instructed the valuer to communicate with the owners to ascertain the price at which they would sell a portion of the estate and alternatively the whole of the land. As a result of the negotiations with the owners' agent, we learnt that the owners would require a higher price per acre if

the southern site only were purchased. . . . The valuer continued his negotiations with the agent, and ascertained that 400l. per acre would be accepted on condition that the whole of the estate of 225 acres were acquired by the Council.

The estate comprises, as before stated, about 225 acres, and is six miles distant from London. The southern or larger portion of about 170 acres has a frontage of a little over half a mile to Lordship-lane, which is a main thoroughfare from High-road, Tottenham, to Green-lanes, Wood Green. It has also a frontage at its north-west end to White Hart-lane of some 650 yards. The northern or smaller portion of the estate north of White Hart-lane, containing about 40 acres, is about 440 yards distant, is detached from the southern site, and is approached by a narrow road, 30 ft. wide, from White Hart-lane. The means of communication between the greater part of the estate and London are good. The Enfield branch of the Great Eastern Railway would serve the bulk of the estate on the east side, Bruce-grove and White Hart-lane stations being respectively 850 and 580 yards from the nearest point of the southern site, while White Hart-lane station is 730 yards from the nearest point on the northern site. From both of these stations there are five workmen's trains running daily between 4.50 and 6 o'clock a.m. to Liverpool-street at a return fare of 2d., while there are three others between 6.35 and 6.55 a.m. at a return fare of 3d. The extreme west of the southern site is best served by the Palace Gates branch of the Great Eastern Railway, Palace Gates and Green-lanes stations being respectively 1,430 and 1,460

yards distant from this point. There are at present no workmen's trains from these stations, but the Council has prepared a case against the company for a service of workmen's trains on this branch. Wood Green and Bowes Park stations on the Enfield branch of the Great Northern Railway are within 1,040 and 1,800 yards respectively of the western end of the southern site. From the former of these stations there are eight workmen's trains between 4.58 and 7.1 a.m., running to King's Cross and Moorgate at return fares of 3d. and 3½d. respectively, while from the latter five trains between 4.58 and 6.58 run to the same stations at return fares of 3½d. and 4d. In addition to the railway facilities, trams run along High-road, Tottenham, within 800 yards of the eastern end of the estate, communicating with Moorgate-street, London Docks and Euston-road at a fare of 3d. In addition, and similarly along Green-lanes within 1,250 yards of the western end of the estate, The Middlesex County Council has also obtained powers to construct a light railway connecting the existing tramway at Bruce-grove, Tottenham, with that in Green-lanes, Wood Green, which will afford direct communication between the southern portion of the estate and these points. . . .

After careful consideration it appears to us that the northern site, which is less suitable for immediate development than the southern site, should not be dealt with until the southern site has been developed. The architect informs us that it could be developed to accommodate 2,400 persons in 1,029 cottages. The valuer also states that every house built and occupied on the southern site will tend to render the northern site not only more suitable for development, but also more valuable. The scheme of development, therefore, which we have had before us deals only with the southern site, comprising 170 acres. . . .

Accommodation for 33,000 persons will be provided in 4,750 self-contained two-story cottages, and 2,000 more will be provided for in tenements over shops. The cottages will be of various classes, and each cottage will have its own garden. The number of persons to be placed on the site will not crowd the land unduly. The depths of the various cottage plots will be generally greater than the by-laws of the local authorities require, and forecourts will in all cases be provided. The frontages to the main roads are very suitable for shops, and about 10½ acres of land will be given up to this purpose, upon which about 250 shops will be erected, and from these a considerable income could probably be obtained should the Council decide itself to build the shops. It will be necessary to widen Lordship-lane for the construction of the proposed tramway, and the shop plots have been made of sufficient depth to allow of this being done. Access to the site will be given by eight roads leading from Lordship-lane, Snakes-lane, and Hatherley-road on the south, three from Church-lane on the east, eight from White Hart-lane on the north, and provision will be made upon the other boundaries for future continuation of the roads should opportunity arise. The principal roads providing thoroughfares over the site, both east and west and north and south, are 50 ft. wide, with trees on each side, and the majority of the remaining roads are 40 ft. wide, with the exception of those within the district of Wood Green, which are in all cases 50 ft. wide as required by the Urban District Council.

It is proposed to take advantage of the river Moselle, which runs through the eastern portion of the estate, and some slightly rising ground upon its bank, which is difficult to build on, to arrange a public garden of about 2½ acres, with the river flowing through it. Four other smaller gardens will be arranged on other parts of the site, which will help to preserve the healthiness of the estate. The parish church of Tottenham and the church-yard are very picturesque, and effective use will therefore be made of them in laying out the estate. The total accommodation that can be provided on both sites is 42,500 persons in 5,770 cottages.

The estimated cost of erecting the cottages on the south side only, providing the roads, gardens, sewers, diversion of the river Moselle, &c., and provision of shops is 1,530,858l. On the other hand, the estimated sum available after allowing for the cost of the land, interest and sinking fund charges and all outgoings is 1,521,800l., or a deficiency of 9,058l. The difference represents only three-fifths per cent. on the total estimate. We may point out that 2 per cent. of the estimated gross rental has been set aside in the estimate under the heading of contingencies, and a very small saving under this heading will convert the deficiency into a surplus.

The Standing Order No. 336 (1)—(4) requiring that there shall be no charge on the county rate in respect of the erection of working-class dwellings applies only to schemes or areas dealt with under Parts I. and II. of the Housing of the Working Classes Act, 1890, and does not affect schemes under Part III. of the Act, but Standing Order 336 (5) relates to Part III. and only requires that the Finance Committee shall simultaneously report with us on the estimated financial effect of a Part III. scheme, and this will be done in the present instance. It may be mentioned that on December 6, 1898, the Council by resolution approved of action being taken under Part III. of the Act, pro-

vided that no charge be placed on the county rate thereby.

The amount of the estimate, which has been forwarded to the Finance Committee, and which the Council will be asked to approve, is 91,500l. This includes the value of the land, the agent's fee, and all expenses connected with the sale and purchase of the land. The sale of the estate is subject to the condition that the Council shall take over the land subject to the existing tenancies and tithes. The gross rental received from the agricultural tenants on the estate is stated to be 500l. per annum. The tithe and tithes rent charge amount to 65l. 17s. 11d. per annum normal, the value in 1899 being 43l. 19s. per annum.

The Committee recommend accordingly.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Projection.

Bermundsey.—The retention of a pilaster on the flank wall of No. 103, Southwark Park-road, Bermundsey, abutting on St. James'-road (Mr. E. Crosse for Mr. W. H. Hobbs).—Consent.

Width of Way.

Bermundsey.—A two-story office building on the north-west side of Upper Russell-street, Bermundsey, at less than the prescribed distance from the centre of the street (Mr. J. A. Stayner for Messrs. Onley).—Consent.

Woolwich.—A building at the rear of No. 1, Beresford-square, Woolwich, at less than the prescribed distance from the centre of Beresford-street (Mr. A. E. Parnell for Mr. M. Barnett).—Refused.

Lines of Frontage and Width of Way.

Kensington, North.—A block of studios on the site of Nos. 80 and 91, Ladbrooke-road, Kensington, to abut upon Ladbrooke-road and Boyne-terrace-mews (Mr. W. Flockhart for Mr. E. Davis).—Consent.

Formation of Streets.

Greenwich.—That an order be issued to Messrs. Bendel, Wood, & Co., sanctioning the formation or laying out of new streets for carriage traffic on the Eastcombe estate, Charlton-road, Greenwich, and in connexion therewith the widening of a portion of Charlton-road (for the Norwich Union Life Assurance Company). That the names Eastcombe-avenue, Wyndcliff-road, Sandtoft-road, Eversley-road, Bramshot-avenue, Sberington-road, Hopedale-road, and Mayhill-road be approved for the new streets.—Agreed.

Lewisham.—That an order be issued to Messrs. J. Edmondson & Son sanctioning the formation or laying out of six new streets for carriage traffic on the Old House estate, Sydenham-road, Sydenham, and in connexion therewith the widening of a portion of Mayow-road. That the names Bishopsthorpe-road, Queensthorpe-road, Earlsthorpe-road, Kingsthorpe-road, Princethorpe-road, and Dukethorpe-road be approved for the new streets.—Agreed.

Hoolwich.—That the request of Mr. G. F. Logsdail for Mr. G. F. Jones, for an extension of the period within which the roadways of four new streets for carriage traffic, to be named respectively Cadwallon-road, Gerda-road, Thaxted-street, and Rushbrook-street, out of the south side of Southwood-road, New Eltham, were required to be clearly defined throughout by posts and rails, or so otherwise as the Council might permit, be granted.—Agreed.

Cubic Extent.

Lambeth, North.—A building to exceed in extent 250,000, but not 450,000 cubic feet, and to be used only for the purposes of a railway station, mortuary, chapel, and residence for officials, on the west side of Westminster-bridge-road, Lambeth, and abutting also on Newnham-terrace (Messrs. Perry & Co. for the London and South-Western Railway Company).—Consent.

Space at Rear.

Norwood.—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a two-story addition at the rear of No. 78, Upper Tulse-hill, Norwood, with an irregular open space at the rear (Messrs. Crabb & Son for Mr. A. B. Passmore).—Consent.

Width of Way and Height of Building.

Holborn.—A chapel, shops and offices on a site on the east side of Southampton-row, Holborn, at less than the prescribed distance from the centre of Eagle-street, and to exceed in height the width of that street (Mr. A. Keen for the Baptist Union Corporation, Limited).—Consent.

The recommendation marked † is contrary to the view of the Local Authorities.

BOOKS RECEIVED.

BRICKLAYING. By Owen B. Maginon. PROCEEDINGS OF THE SECOND ANNUAL CONVENTION OF THE ARCHITECTURAL LEAGUE OF AMERICA. (R. R. Donnelley & Sons, Chicago.) LIST OF R. H. S. CURVES, in complete set of twenty-three templates. By Professor R. H. Smith. (Casell & Co.) LLANDAFF CHURCH PLATE. By G. Eley Halliday, F.R.I.B.A. (Bemrose & Sons.)

Correspondence.

To the Editor of THE BUILDER.

HINTS ON STABLES.

SIR,—While I agree with much that your contributor has written,* there are several points on which I differ from him.

Certainly ventilation is a most important and difficult point. I think fall-back windows—either iron or wood—with side hoppers, make the best inlets. Although I have used a large number of roof extractors, by at least four different manufacturers, I have found none completely satisfactory. Probably extracts near the floor of the stable, with flues carried to an upcast at one end or the centre of a range, with the draught helped by heat or a fan, would be the best.

I have not found that horses do best in stone-walled stables, and they are certainly dangerous if horses are put in before they are thoroughly dry; and they require an inside lining. Cement, I think, looks well if painted with enamel paint. Wood linings usually have a space behind at least the thickness of the grounds, in which mice and other vermin collect.

In brick stables blue Staffordshire bricks make a good dado, and are the best for division walls, as it is possible to get a fair face on both sides of a 9-in. wall. I like Aston Hall buff bricks above, as they are clean and free from gloss. Glazed bricks make a good dado for passages and washing-boxes, but are apt to get chipped in a loose-box.

To my mind, the best boxes for hunters are those built of wood, with tiled roofs. Horses nearly always do well in these, and they can be designed to look well. If fixed on piles they are tenants' fixtures—a great advantage to many hunting men. I have built a large number with the framing outside, the horizontal pieces being cut on the diagonal to throw off the rain (see sketch), with two thick-

nesses of 3/4-in. boarding, with inodorous felt between, nailed on the inside, and 1 1/4-in. kicking-boards, with rounded top as a dado, 3 ft. 6 in. high. The 3/4-in. boards are nailed vertically to break joint and the kicking-boards horizontally. The graining can be blacked and the panels coloured. I have also built them with match-boarding inside and weather-boarding on the outside, but do not

consider them so strong, and the space between the boarding collects vermin.

There is usually no difficulty in keeping the drains outside the stables, but when it is necessary to have gullies inside, the outside end of the drain can be disconnected and have an air-pipe and an upcast shaft fixed at the head of the drain.

A loft over the stables is not good for hay and tends to block light and air from the yard, but it is convenient and often economical. A fodder store at the end of the passage, where there is one, is quite as convenient, but takes up space.

I like passages 7 ft. 6 in. wide, but I do not feel so sure about wide doors being an advantage. I think that a cart comes oftener to grief at a wide gateway than at a narrow one, and the same may apply to a stable door. Wide doors take a great deal of room in opening, unless they slide.* I have put 7 ft. 6 in. sliding doors to a racing stable, where I believe they answer well. For ordinary loose-box doors 4 ft. is a good width, but I prefer 4 ft. 6 in. or 5 ft. for brood-mares.

All angles should be well rounded about any stable. I do not like grooved bricks for floors. They are very bad to keep clean. Plain clinkers, or Buckley grey brick on edge make the best, but small paving stones laid in and hushed with cement make an excellent floor, and are largely used in Ireland, where good paving bricks are expensive. For fall I generally give 3 in. in the length of a box, which is enough for drainage. A horse looks best when standing slightly uphill, but I doubt if it is a natural position. A horse will choose that position at the covert side with a man on his back, but he usually places his forelegs uphill when loose in a field with no weight on his back. I have even given less fall in both hunting and racing stables.

Twelve feet six inches by 10 ft. 6 in. is a good loose-box for a hunter. For racehorses I have found 13 ft. by 11 ft. 6 in. a good size. I strongly object to wide stalls. A horse gets across them, and is more likely to get cast than in a 6-ft. stall. Large horses and cart-horses should have 6 ft. 6 in.

I prefer glazed earthenware mangers and water-pots to any other. Slate mangers are also good. I have fitted a large number of boxes with water troughs supplied automatically by ball-tap cisterns at the end of each range. If desired, galvanised-iron lids can be fitted to fold down over the water to prevent the horse drinking, but personally I think it is very seldom that a horse will drink too much if a supply is always available, while there is a danger of his doing so if he only gets it occasionally.

Corrugated iron is not a good material for stables. It is hot and noisy, and reflects a great deal of heat into the yard, and does not last so long as wood and tiles. RICHARD T. BECKETT.

WHITCHURCH ASYLUM COMPETITION.

SIR,—In regard to your remark that our plan covers more ground than the winning one, the winning design measures approximately 1,950 ft. by 750 ft. over the main buildings, ours measures 1,250 ft. by 550 ft., and is consequently a little more, not less, compact. Our two longest main corridors measure 650 ft., the two longest on the winning design 600 ft. and 700 ft. respectively.

As the planning of different sections of the ward blocks is different for the several sections of patients, we considered we were right in arranging them so that both in the smaller and larger schemes patients occupied wards planned for them instead of getting the smaller scheme, as in the winning design, by cutting out one entire class of patients and distributing those of the patients (in the smaller scheme) in buildings to be ultimately adapted for another class of patient. WILLS & ANDERSON.

CHIMNEY PIECE, AUDENARDE.

SIR,—At my second visit to Audenarde in 1887 I made a sketch and took several plans and measurements of the interesting chimney in the Salle du Conseil, which appears in the Builder of February 23. In my drawing the date, 1529, occurs in the centre of the lintel, from which I gather that the Coat of Austria, surrounded by the *Tison d'Or*, as shown by Mr. Cotman, is a modern innovation. It certainly was not there in 1887, and the shield, be it noticed, is earlier in shape than those of the other four coats. I merely send these few words to show the addition, and not to criticise the drawing; indeed, with the heraldries re-coloured, it would be difficult to detect and detach the old from the new, and I only found it out by comparing Mr. Cotman's good sketch with my poor one.

I fancy the coat on the sinister end of the lintel is that of Luxemburg (not Burgundy). The spacing out indicates clearly that the arrangement as at present is unusual, and, as a composition, rather too crowded. E. SWINFEN HARRIS.

"AN ANCIENT LATCH."

SIR,—Referring to the interesting note and sketch of a Norfolk latch in your issue of last week, I may

* Should they not always be made to slide?—Ed.

allowed to remark that I came across a similar form of hitch in a farm house near Cardiff, when making a survey of dilapidations, just before Christmas last. This house was at least 100 years old.

H. L. HILEY.

The Student's Column.

ANITARY FITTINGS AND PLUMBING.
9.—LAVATORIES (continued).

THE prejudice against exposed lavatories and waste-pipes is now nearly dead, and the practice of supporting them on metal brackets or legs is rapidly increasing. We need not enter into the details of these supports, but may point out that elaborate scrollwork and ornamentation are quite out of place. The simpler the support is the better. Cheap fittings, the brackets and frieze are generally of painted iron; sometimes the iron is enameled, but this is more expensive. The neatest arrangement we have seen consists of round nickel-plated brass brackets or legs (with similar rails fixed horizontally a few inches below the slab to form towel-rails). Some use porcelain-enameled fireclay legs are used; for the most expensive work marble

brackets or legs are sometimes used in conjunction with marble friezes, tops, and skirtings.

Many persons, however, still prefer "cabinet lavatories," especially for dressing-rooms, but as the actual fittings do not differ materially from those already described, no illustrations need be given. A word of warning, however, should be uttered against certain combinations occasionally adopted. In one catalogue a tip-up lavatory is fixed over a *stop-sink*, the whole being inclosed in an elaborate piece of cabinet-work. The writer of a book on plumbing, published about half-a-dozen years ago, describes as "a very handy combination" a cabinet lavatory having a small urinal basin attached inside the door of the cupboard under the lavatory; the urinal is fixed close to the hanging stile of the door, and is connected to the waste-pipe with a swivel joint; the waste from the lavatory passes into the urinal basin, when the cupboard door is shut, but what happens when the urinal is brought forward by opening the door we are not told. Contrivances like these, however ingenious they may be, are simply abominations. Urine is one of the very foulest parts of domestic sewage, and ought to be kept as far away from lavatories as possible. Among the adjuncts of domestic lavatories

may be mentioned receptacles (generally of nickel-plated brass or other metallic compound) for sponge, soap, tumbler, &c., and it is a good plan to provide a receptacle for rings. This often takes the form of a small cup at the top of the brass fitting to which the upper end of the plug-chain is attached. The other receptacles are generally fixed to project from the marble or other skirting at the back of the basin.

Folding lavatories are often adopted in offices where exposed basins would be somewhat unsightly, and also in confined spaces such as the lavatory compartments of railway carriages and the state-rooms of ships. An example is given in fig. 1. They consist of a white earthenware or enamelled-iron basin fixed to the inside of a fall-down door. The basin has a projecting rim to prevent splashing, except at the back; on closing the door the contents are discharged over the back of the basin into a receiver below, which is fitted with a connexion for the waste-pipe. The taps and soap-dishes fit into the basin when the door is closed.

Small hand lavatories (fig. 2) are more frequently seen on the continent than in this country; the foul nature of our atmosphere compels us to adopt basins where a more

thorough ablation can be obtained than in these small fittings.

Surgical lavatories are now almost invariably made with treadle action, so that the hot and cold supplies and the waste can be operated by the foot or knee; this is a great convenience to the surgeon, and does away with the risk of contaminating the taps with foul or possibly infectious matter from the operator's hands. Fig. 3 shows a pair of the surgical lavatories, fitted by Shanks & Co., in the operating theatres of the Western Infirmary, Glasgow. The basins are of white vitreous porcelain, 1 ft. 6 in. in diameter, and fixed 2 ft. 2 in. from centre to centre on short vertical studs rising from circular cast-iron rims, the rims being carried by central back supports fixed clear of the wall. Every part of the framework can therefore be easily cleaned. The slabs are of glass $\frac{3}{4}$ in. thick, and are fitted with a patent catch arrangement so as to be removable and adjustable. The hot and cold supplies are actuated by treadles fitted with rubber pads. The gun-metal box fixed to the wall above the basins has inlets for hot and cold water, and a swivel arm at each end for douche and spray. The standing waste-and-overflow is actuated by a knee treadle fitted with rubber pad, and can be easily removed for cleaning. The waste-pipe is copper, held in position by a patent clutch, so that it can be removed for cleaning, and discharges into an open channel in the floor.

A modification of the supply arrangements consists in having a single treadle for both cold and hot supplies. A slight depression of the treadle opens the cold-water supply, and a further depression opens the hot-water supply, the hot and cold water being mixed in the gun-metal box before reaching the basin. This prevents the risk of scalding the hands or breaking fragile instruments.

"Constant-stream" lavatories are also made for surgical purposes. In these a constant stream of water is admitted in a series of jets from perforations in the front of the basin, the water being continuously discharged over a weir at the back (see fig. 9). After the valves are closed, the water in the basin drains away to the waste-pipes through a small hole in the bottom. The valves are actuated by treadles, and the hot and cold water passes through a mixing box before reaching the basin. With lavatories of this kind a waste treadle is not required.

Enamelled fireclay lavatories are largely adopted in schools and other places where they are likely to be subjected to rough usage. The ordinary basin (fig. 4) contains no special features. The overflow is formed in the fireclay, and the ends of adjacent slabs are either formed with plain built-joints or with an enamelled fireclay joint-piece which overlaps as shown at A. Sections of two of these basins are given in fig. 5. These lavatories may be supported on glazed brick piers, enamelled fireclay pedestals, or iron brackets or standards. The sizes of the tops range from about 20 in. by 18 in. to 26 in. by 20 in. To facilitate the cleaning of the floors and walls, "corbel" lavatories are now made, having fireclay lugs for building into the walls. The example in fig. 6 is known as Shanks's "Projector"; it has a rounded front, a safety waste, and an improved overflow, and the glaze is continued under the basin. The sizes range from 18 $\frac{1}{2}$ in. by 15 $\frac{1}{2}$ in. to 25 in. by 19 $\frac{1}{2}$ in. Adams's "Helios" lavatory range (fig. 7) has fireclay brackets in addition.

"Constant-stream" lavatories are now largely used for schools and other public institutions. The great advantage they possess over the ordinary basins is that the water is constantly changing, and two or more children cannot therefore wash in the same water; this reduces the risk of spreading contagious or infectious diseases. A further advantage is that a great number of persons can wash in a short time, as no time is lost in waiting for the emptying of basins. A single tap can be fitted to a range, and this tap can be so arranged as to be under the sole control of the attendant. One of the simplest lavatories of this kind is the trough lavatory with sprays (fig. 8). The illustration shows Doulton's arrangement, the troughs being 40 in. long and 12 in. wide, supported on iron brackets. The waste-pipes are of glass-enamelled iron and discharge into a floor channel. The sprays are 20 in. apart.

Fig. 9 is a section of Shanks's "Instantan" lavatory, in which the water is admitted to the shallow basin through a series of perforations

B in the front, and overflows over a weir at the back; a small hole A is provided for emptying the basin when the water is turned off. No plug or other waste fitting is required. The iron standards are arranged to carry a horizontal waste-pipe C, into which the water from each basin flows directly. For schools the slabs measure 18 $\frac{1}{2}$ in. by 17 $\frac{1}{2}$ in., and for asylums 27 $\frac{1}{2}$ in. by 18 $\frac{1}{2}$ in.

GENERAL BUILDING NEWS.

RE-OPENING OF ST. JOHN'S CHURCH, CHAPELTOWN, YORKSHIRE.—The Parish Church of St. John, Chapel-town, was re-opened on the 23rd ult. after undergoing enlargement. A new aisle has been added, a vestry and organ-chamber built, and the chancel extended. Mr. J. W. Sykes, of Hoyland, was the architect.

SWIMMING BATH, & C., BROAD-STREET, BLOOMSBURY.—Messrs. Clarkson have prepared plans and designs for the new swimming baths, &c., about to be erected upon a site in this street for the Metropolitan Borough of Holborn. The Guardians of the Poor for the Parishes of St. George, Bloomsbury, and St. Giles-in-the-Fields have adopted Mr. J. Grafton Izard's plans and designs for the Nurses' Home and Receiving House for Children which they are about to build in that same thoroughfare. In both cases the bills of quantities were prepared by Messrs. Gardiner & Theobald.

PROPOSED RECONSTRUCTION OF EMPIRE THEATRE, NEWCASTLE-ON-TYNE.—It is proposed to reconstruct this building according to plans by Mr. Frank Matcham, of London.

FISH MARKET, CARLISLE.—The new fish market at Carlisle was opened on the 10th ult. The building was designed by Mr. W. Harpur, the Borough Engineer.

PROPOSED HOSPITAL, KIRKBURTON, YORKSHIRE.—At a recent meeting of the Kirkburton Joint Isolation Hospital Committee, the Sites Sub-committee reported that Mr. Joe Berry, architect, Huddersfield, had been engaged to prepare plans, quantities, &c., for a hospital at Kirkburton. Mr. Berry's plans provide for an administration block of two stories, facing south. On the ground floor will be matron's, nurses', and doctor's rooms; kitchen, scullery, pantry, storeroom, and lavatory; a suite of discharging-rooms on the western side, consisting of undressing-room, bathroom, and dressing-room. On the first floor will be six bedrooms, a dressing-room, and bathroom. The out-buildings in connexion with the kitchen will be arranged on the northern side, and the tradesmen's entrance on the eastern side. It is proposed to build the ward pavilion practically on pillars, so as to allow a free circulation of air round and underneath the whole building, and it will provide accommodation for fourteen patients—eight in one ward and six in another. The entrance is to be in the centre of the building, and on the left of it is to be a cloak-store and pantry, and on the right a bath-room. Immediately opposite will be the ward kitchen, having two fixed windows allowing complete observation of the two wards. The isolation ward will contain accommodation in two wards for four patients, and there will be a ward kitchen in the centre. An open verandah will be built along the whole length of the building. Provision is made in the laundry block for wash-house, laundry, and drying closet, and there will be disinfecting rooms, ambulance stable, mortuary and view room, coal, coke, and wood stores. The entrance lodge, one story high, will contain living room, scullery, and one bedroom, and will be provided with out-buildings behind.

CONSTITUTIONAL CLUB, WEST HARTLEPOOL.—It is proposed to erect a new Constitutional Club at West Hartlepool from plans prepared by Mr. J. J. Wilson. The cost of carrying out these plans is estimated at 8,000l. The ground floor will contain several suites of offices. On the first floor is shown a billiard-room and clubrooms; and on the second floor a large hall and additional offices.

THEATRE, SOUTHSEA.—Plans of the new theatre to be erected in Elm-grove, Southsea, at the corner of Thicket-place, have been passed by the Roads and Works Committee. The theatre, upon which it is estimated 40,000l. will be spent, has been designed by Mr. W. G. R. Sprague. The site is situated about the building, which will have a frontage of 100 ft. to Elm-grove, and a depth of 100 ft., will be set well back from the roadway, and a covered porch in front will afford shelter to people waiting at the doors for admission. The house will comprise a pit and stalls on the basement level, a dress circle on the first tier, with raised balcony forming the second tier, above which will be placed the gallery. The specifications provide that the materials to be used in the building are stone, brick, and concrete, and the construction of the auditorium, galleries, and roofs will be carried out in concrete and steel girders and joists. The elevation to Elm-grove will be carried out in stone or brick, with stone or cement dressings. The decoration of the auditorium and entrances are proposed to be executed in fibrous plaster and carton pierre in gold and colour. Saloons or lounges and retiring-rooms are planned for the different sections of the audiences.

The seating accommodation is estimated approximately at 1,644, divided up as follows:—Stalls, 144; pit, 650; dress circle, 160; balcony, 102; gallery, 450; 16 private boxes (to hold three each), 48.

SALTMED HALL, CARLISLE.—On the 13th ult. the memorial stones of the new Saltmed Hall of the Cardiff Forward Movement were laid. The new hall is situated at the corner of Hereford-street and Maitland-place, Grangetown, and has been erected from the designs of Messrs. J. P. Jones, Richards, and Budgen, architects. The building is capable of holding 737 people, not including the choir. The body of the hall is surrounded on three sides by galleries, while at the rear of the platform is a gallery for the choir, capable of seating forty-six people. The galleries are supported by cantilevers, and are approached by two stone staircases with direct access from the street, while the body of the hall has three doorways. Provision is made for ministers' and other retiring rooms, with lavatory accommodation. Owing to the unstable nature of the ground concrete pillars had to be built up from the main 18 ft. below the ground level, the superstructure being wholly carried on arches and girders. The elevation is carried out in red brick with Bath stone mullions, &c., and the roof is of American green slates. The interior woodwork is stained and varnished dark and light oak, and the ironwork painted a soft green. The contract for carrying-out the work was 1,038l., exclusive of seating, the contractors being Messrs. Handford & Elsworth, Cardiff.

NEW THEATRE, COLCHESTER.—At a meeting of the Council at Colchester on February 20, plans for the new Theatre Royal, which is to be erected on the site of the present theatre in St. Botolph's-street, for Mr. Chas. Macdonald, were submitted and approved. The plans have been prepared by Mr. John P. Briggs, of London. The theatre will be fireproof throughout, and the entire house will be fitted with electric light. The whole of the auditorium, entrances, saloons, dressing-rooms, &c., will be heated by hot-water pipes and radiators, and the ventilation will be carried out on scientific lines. It is hoped to have the alterations completed by the autumn.

FOREIGN.

FRANCE.—Varnishing day for the New Salon will be on April 21, that of the Old Salon on April 30. The pavilion which was erected for the works of Rodin in the square De l'Alma, adjoining the great exhibition, is to be re-erected at Passy.—M. Saint-Marceaux has just completed the monument to President Faure, which is to be placed in Père la Chaise cemetery. The monument consists of a sarcophagus, on which is a recumbent figure in bronze of the late President, round which are draped the Russian and French flags.—MM. Allain and Heubes, architects, have been commissioned to rebuild the School of Physics and Industrial Chemistry. The cost is estimated at nearly 2,000,000 fr.—M. Fleury has been elected President of the Society of Architects of the Seine-et-Oise for 1901. M. Tendon has been elected President of the Society of Architects of Anjou.

A building is to be erected for the Municipality of Auray (Morbihan) which is to contain a hospital for invalids, and an atelier for the aged. The Municipality of Paris will next month take official possession of the smaller art palace on the Champs Elysees.—In the new Maire at Suresnes three allegorical ceiling paintings are to be placed in position shortly, executed by M. Michel Lançon; also two landscapes by M. Jules Ferry, representing views taken in that part of the suburban district.—A certain number of the inhabitants of Toulouse have entered a protest against the intention of the Municipality of that town to place in a public garden the relief by M. Injalbert, "Fausnesses et Satyres," left to the town by a private owner, under the pretext that this work is of a "nudité inconvenante."—The Municipal Council of Blois has entered an energetic protest against the intention of the city of Paris to take a part of the waters of the Loire to complete the Paris drinking water supply.—M. Jaquet has been elected President for 1901 of the whittaker's Union of Lyons.—The Municipal Council of Marseilles has voted a sum of 25 million francs for the improvement of the old quarters of the city in the rear of the Bourse.

MESSRS. KIRK & RANDALL, THE METROPOLITAN ASYLUMS BOARD.—We understand that the claim of Messrs. Kirk & Randall against the Metropolitan Asylums Board for damages under their contract for the erection of a fever hospital at Tooting, involving a sum of 41,475l., has been terminated by the withdrawal of the plaintiffs' claim on condition that costs were not claimed by the Board.

BARRY RAILWAY VIADUCT, TAFF VALLEY.—The permanent way has been laid over the railway viaduct across the Taff Valley at Taff's Well. The viaduct connects the Barry system with the Rhydney system, and crosses two roads, two railways, the river Taff, and the Glamorganshire canal. The structure consists of seven spans, the highest point from ground to parapet being 112 ft. The total length is 1,420 ft. The viaduct was designed by Sir John Wolfe Barry, the contractors having been Messrs. Price & Wills, of Westminster.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.

—Mr. Samuel Knight, architect, of 175 and 176, The Temple Chambers, Tudor-street, E.C., has taken into partnership Mr. C. E. Lancaster Parkinson. Mr. Parkinson, for a considerable recent period, has been engaged as an official in the Architects Department of the London County Council. The style of the firm will be "Samuel Knight and Parkinson."—Messrs. Greaves, Bull, and Lakin, of Warwick, dealers in limes and cements, have converted their business into a limited company under the title "Greaves, Bull, & Lakin, Limited," and have removed their head office from Warwick to their works at Harbury, the postal address being "Harbury, Leamington."

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

—The annual dinner of the members of the Nottingham Master Builders' Association was held on the 22nd ult., Mr. H. Vickers presiding. The loyal toast having been honoured, Mr. Price proposed "The Mayor and Corporation of Nottingham," and coupled the toast with the names of the Sheriff and Councillor J. Wright.—The Sheriff, in reply, observed that the Corporation as a whole had during the past twenty or thirty years been setting themselves the task of improving the town in many respects, and it could not be denied that their efforts had to a great extent been successful. Councillor Wright also responded. In submitting "Success to the Nottingham Builders' Association," Mr. J. W. Woodcock remarked that the Association had had a fair amount of success, but they would all like it to have more. Such associations were very necessary, because without them builders would be to a great extent at the mercy of the trades-unions. In self-defence, therefore, they were practically obliged to come together. But they did not want to band themselves together with the sole idea of defensive tactics; it was proper to be associated if only for the opportunity of having such enjoyable evenings as that.—The toast was acknowledged by Mr. F. H. Fish, who said the builders were never in a better form for dealing with the men, and the relations between employers and employed were never better. Up to the end of last year they were very much troubled with the plastering section of the trade, but through the instrumentality of that association, which formed a committee to deal with the matter, they were enabled to get a very good settlement with the men.—Mr. James Wright submitted the toast of the "National Federation and Kindred Associations," and in doing so said their Association was connected with one of the most ancient and important trades in existence—a trade which paid over sixty millions of pounds in wages per year. He urged the Association to continue connexion with the National Federation. The Midland Branch of the National Federation was an attempt to unite and weld into one body all the master builders' associations of the Midland counties. There were many interests to guard against and many rights to defend of necessity in such a great and important industry as the building trade, not only in regard to their relationship with workmen, but also with regard to their relationship with architects, great public bodies, and the public at large for whom they worked. The National Federation had now in hand, and had had in hand for many years, with the Institute of British Architects, the drawing up and forming of a national and recognised form of contract which, when it was complete, would be satisfactory to all parties. During the past year this had been under discussion by the Midland Federation, and a form of estimate had also been under consideration. The Midland Federation had had a prosperous year, and new builders' associations had been started in many towns where such organisations had not previously existed. The speaker urged those present to support the associations financially; it was due from them as employers that they should make some sacrifice to protect their own interests and for the general welfare of the trade. In reply, Mr. A. Chambers said they seemed to lose sight to a very great extent of one of the greatest objects of their federation, and this was organisation. It had been said that they were not only formed for defence, but the latter was unimportant as a very good object, and it they were desirous of peace they must be prepared for war. He hoped the time was not far distant when they would have the benefit of a national form of contract—one in which they could place reliance.—Mr. J. B. Alliot also responded, and remarked that the necessity for being united was very much greater among the employers than among the workmen. Mr. J. H. Vickers proposed "The Visitors," Mr. John Sully, suitably replying. The health of "The Chairman" was submitted by Mr. W. Edgar and duly responded to.

LONDON COUNTY COUNCIL ELECTION.—The list of nominations made in this election includes the following candidates:—Mr. L. Sharp (Brixton), Mr. J. E. Sears (North Hackney), Mr. R. Williams (North Lambeth), Mr. C. Fitzroy Doll (South St. Pancras), Mr. T. W. Emden (Strand), and Mr. W. Hunt (Wandsworth), architects; Mr. J. Ellis (Greenwich), Mr. W. Goodman (West Islington), and Mr. C. Angel (North Lambeth), builders; Mr. E. G. Paddon (South Paddington), sanitary engineer; Mr. J. A. Baker (East Finsbury), Mr. J.

Richmond (North Hackney), Mr. W. C. Parkinson (North Islington), engineers; Mr. H. R. Taylor (North Camberwell), bricklayer; Mr. J. Jeffrey (Chelsea), Mr. J. A. Thornhill (Dulwich), Mr. G. H. Booth (Mile End), and Mr. T. B. Westcott (West St. Pancras), surveyors; Mr. T. P. Gaskell (Clapham) and Mr. H. Ward (Hoxton), civil engineers; Mr. S. Collins (Leamington), stone merchant; Mr. J. Williams (North Lambeth), timber merchant.

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.

—At the usual meeting of the society, held on the 23rd ult., Mr. John G. Dunn read a paper on the "Practice of Chimney Stalk and Boiler Building." To ensure the stability of a stalk, he said, the foundations must be built with best Portland cement, with footings projecting the thickness of the wall, or inverted arches used. The stalk should have a square base, a batter of 1-in. to the foot, with hoop iron horizontal ties. The brick courses should be at right angles to the batter, and no port holes cut after the stalk had taken its bearing. Further remarks were made on the subject of efficiency of draught and architectural treatment, and then the lecturer passed on to the consideration of boiler setting, explaining carefully the various types of flues, boilers, and fuel economisers, the entire paper being of a most practical nature.

NATIONAL FEDERATION OF BUILDING EMPLOYERS.

—We learn that Mr. A. Krauss, builder and contractor of Bristol, has been unanimously elected President of the National Federation of Building Employers of the United Kingdom.

FIRE AT PARISH CHURCH, STURTON, NOTTINGHAMSHIRE.

—The Parish Church of St. Peter's, Sturton, was practically destroyed by fire on the morning of the 24th ult. The edifice was gutted, only the outside walls and the tower remaining.

BUILDING TRADES EXHIBITION.

—At the forthcoming Building Trades Exhibition one feature will be a special exhibition to be called "The Surveyor's" exhibition, illustrating everything in connexion with house drainage, sewerage, sewage disposal, and road-making materials and appliances. The exhibition will include drawings representing old defective and modern improved systems of drainage; models of sections of drainage badly laid and well laid for comparison, photographs of bad drainage work taken on the spot; also "photographs of eminent sanitarians who have insisted on the essentials of sound drainage." There will also be a varied exhibition of sanitary fittings and drainage and road materials.

DRAINAGE OF CHELSEA WORKHOUSE.

—The Guardians of the Poor have instructed Mr. Chas. E. Gritton, A.M. Inst. C.E., of London and Selhurst, to prepare a scheme for the drainage of Chelsea Workhouse for the approval of the Local Government Board.

CAPITAL AND LABOUR.

THE NORTHERN BRICKLAYERS' DISPUTE.—We read that the bricklayers and labourers in Newcastle and Gateshead returned to work on the 25th ult., after a cessation of labour for about eight months.

ABERDEEN PLASTERERS' STRIKE.

—The majority of the operative plasterers in Aberdeen struck work on the 25th ult against a reduction of wages from 84d. to 7s. an hour. Messrs. James Bannochie & Sons, the principal firm in the trade, and another employer have agreed to continue the present rate of wages, and as work is plentiful meantime it is not anticipated that the strike will be long continued. A meeting of the men affected by the dispute was held on the 25th ult., when arrangements were made for carrying on the strike. During the time they are idle the operatives will be in receipt of 27s. a week each, the whole of them being connected with two trades-unions. The masters regard the present rate of pay as excessive, and express determination to resist the demands of the men.—*Glasgow Herald.*

LEGAL.

IMPORTANT POINT AFFECTING ARCHITECTS.

THE cases of J. T. Chambers v. Harrop Goldthorpe, and Restell and others v. Nye came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Collins and Romer, on the 26th and 27th ults. As the same point practically was raised by both appeals, they were heard together.

The case of Chambers v. Goldthorpe came before the Court on the appeal of the defendant from the judgment of a Divisional Court composed of Justices Channell and Bucknill. This was an action brought by Mr. J. T. Chambers, an architect, for fees. The defendant employed the plaintiff to prepare plans for buildings he was then about to erect, and to superintend and measure up the work. The work was done by a contractor. The contract between the defendant and the contractor provided by Clause 20 that "a certificate of the architect or an award of the referee hereinafter referred to, as the case may be, showing the final balance due or payable to the contractor, is to be conclusive evidence of the works having been duly completed, and that the

contractor is entitled to receive payment of the final balance." Clause 22 provided that in case of any question, dispute, or difference arising between any proprietor, or the architect on his behalf, and the contractor as to the various matters therein specified arising under or out of the contract, including questions "as to the works having been duly completed," or in case the contractor should be dissatisfied with any certificate of the architect under certain clauses of the contract, "or in case he (the architect) shall withhold or not give any certificate to which the contractor may be entitled, then such question, dispute, or difference, or such certificate, or the value of the matter which should be certified, as the case may be, is to be from time to time referred to arbitration." It seemed that the plaintiff had incorrectly measured up certain of the materials used, the result being that the amount of the certificate was larger than it ought to have been. The defendant admitted the plaintiff's claim, but counterclaimed for damages and negligence. The County Court Judge of Holmfirth gave judgment for the plaintiff on the claim and for the defendant on the counter-claim, and from this decision the plaintiff appealed to the Divisional Court, which held that the plaintiff under the contract was acting in a judicial position, and therefore that no action would lie for negligence apart from fraudulent or dishonest conduct. From this decision the defendant now appealed.

Mr. Lowenthal, for the appellant (defendant), contended that in the circumstances the plaintiff as architect was liable, because in measuring up the quantities he was acting as the servant of the defendant and not as an arbitrator. His contention also was that under the terms of the contract between the defendant and the builder the plaintiff was never employed in any sense as arbitrator between them.

Mr. Scott Fox, K.C., for the respondent (plaintiff), contended that his client acted as arbitrator under the contract, and that so long as he acted honestly he was not liable to an action for damages for want of skill.

Their lordships reserved judgment in this case until the next case was heard.

The case of Restell and others v. Nye came before the Court on the plaintiff's appeal from the judgment of Mr. Justice Mathew in the King's Bench Division.

This was an action against an architect, in which the plaintiff sought to recover money—alleged to have been received by the defendant to the plaintiff's use—also damages for the defendant's negligence. The defendant was employed by the plaintiff as architect in connexion with the building of a bungalow for the plaintiff in Sussex. The terms of the employment of the defendant were contained in certain letters which passed between the parties, from which it appeared that the defendant was to be paid by the plaintiff for "plans, specifications, and supervision of works," 5 per cent. upon the amount of the expenditure, travelling and out-of-pocket expenses to be charged extra. In accepting the defendant's offer the plaintiff wrote that the charge was to be an inclusive charge, covering everything. The defendant entered upon the work. He prepared a specification on which tenders were obtained, and included therein a provision that surveyor's charges for bill of quantities should be 2½ per cent. on the amount of the estimate, and for drawings, &c., 10s. 10s. The defendant prepared a bill of quantities and obtained a tender from some builders at Brighton for the erection of the bungalow for 1,700l. This tender was accepted, and a contract was signed by the plaintiff which provided that the price should be paid by instalments upon the defendant's certificates, and that his final certificate should be conclusive evidence that the builders were entitled to receive payment of the final balance. The work was completed, and the plaintiff paid the contract price, together with the cost of certain extras on the defendant's certificates. The defendant was paid by the builders 2½ per cent. on the contract price for taking out the quantities, and the ten guineas for the drawings. The plaintiff alleged that the receipt of these payments by the defendant was a breach of the defendant's term of employment, and was alternatively a secret profit made by the defendant in the course of his employment. The defendant contended that the ordinary course of business had been followed, and that the plaintiff was fully aware that the cost of taking out the quantities was not included in the defendant's charges for acting as architect to the work. The plaintiff's second head of claim was for damages for negligence on the part of the defendant. The plaintiff's case was that the defendant had omitted to check the builder's accounts with due skill and diligence, and had passed as extras works included in the contract, and had certified for sums improperly passed. The defendant denied these allegations. The plaintiff had died since the action was commenced, and the executors were substituted as plaintiffs. Mr. Justice Mathew held that the agreement between the plaintiff and the defendant did not cover the cost of taking out the quantities, but his Lordship felt compelled to add that he did not think the defendant had acted as an honourable man, because he had concealed from the plaintiff the fact that he was making this arrangement with regard to

the quantities. His Lordship said he was of opinion that the defendant had not held the scales impartially, and had been guilty of negligence which had benefited the builder at the expense of the plaintiff, but he was clearly of opinion that damages were not recoverable by the plaintiff in the circumstances. His Lordship therefore gave judgment for the defendant, but without costs. Hence the present appeal of the plaintiff.

Mr. Bray, K.C., and Mr. E. Morten appeared for the appellant (plaintiff), and Mr. Boxall and Sir Lennox Napier for the respondent (defendant).

The Master of the Rolls in giving judgment in both cases dealt first with the case of Chambers v. Goldthorpe. He said the only question raised by the appeal was one which arose on the counterclaim, and was whether Mr. Chambers was placed in the position of an arbitrator, or whether he was merely in the position of a person acting as agent of the building owner.

If he was an arbitrator, then the building owner could not sue him for negligence; he could only sue him for fraud or collusion, and there was no suggestion in this case of anything of the kind. When they looked at the building contract it was plain that under many of the clauses of the contract Mr. Chambers was only to act as agent for Goldthorpe. In those clauses his duty was simply to look after the interests of Goldthorpe, and in respect of those matters no doubt he would be liable to an action for negligence. But when they came to Clause 20 the question arose, did the architect still remain the agent of the building owner, or was he not an arbitrator? It seemed, said his Lordship, impossible to say that with regard to Clause 20 the architect's sole duty was to look after the interests of the building owner. The architect undertook the duty of bringing out a final certificate, and with respect to that he owed a duty to the builder as well as to the building owner, his duty being to hold the balance fairly between the one and the other. He therefore came to the conclusion that Mr. Chambers was in the position of an arbitrator, and that the counterclaim could not be maintained, and that the appeal must be dismissed. For the same reason he thought that the claim in the other case, "Restell v. Nye," could not be maintained, and that the appeal in that case should also be dismissed.

Lord Justice Collins concurred in thinking that the architect in each case was in the position of a quasi arbitrator, and that both appeals should be dismissed.

Lord Justice Romer dissented. He thought that if a person undertook for reward to value or estimate for another work to be done for his principal by a third person, he did not, so far as his principal was concerned, become in the position of an arbitrator, merely because he knew that his principal and the third person had by contract between them agreed that, in default of dispute previously arising with regard to the matter, his valuation or estimate was to be taken as conclusive and as determining the price to be paid by his principal for the work to be done by the third person. Acting as he would do, for his principal, if he was guilty of negligence causing damage he would be liable to his principal in an action brought by him. He therefore thought that the appeals in both cases ought to be allowed.

By a majority of the Court, therefore, both appeals were dismissed.

ACTION BY AN ARCHITECT.

On the 20th ult., at Darlington County Court, before Judge Temple, Mr. William Perkins, architect, Bishop Auckland, sued Messrs. Sykes & Co., ironmongers, Darlington, for repayment of 33*l.* paid by him in error of account. Mr. Luck, barrister, instructed by Messrs. Main & Co., solicitors, was for plaintiff, and Mr. Edward Wooler for defendants. The plaintiff's case, as stated, was that he was the architect for thirteen houses at Etherley-lane. Prior to that an arrangement existed with defendants by which he was to obtain some share of profits from business he introduced. He had paid defendants sundry cheques on account, but found they had debited him with 33*l.* for gas-fittings for these houses. He (plaintiff) did not order the fittings. Defendants should have looked to the contractor, Mr. T. Hilton, for the money. Defendants made a counter-claim for 8*l.* 7*s.*, and it was urged by Mr. Wooler that plaintiff could not claim the money even were it due, but the Co-operative Society, who had the houses built. It was further held that 20*l.* was paid by Hilton, the builder, and that the 33*l.* should come out of that. The case lasted a considerable time. The Judge decided in favour of the plaintiff, giving judgment for 33*l.* on the claim, and he also gave a verdict for plaintiff on the counter-claim.—*Newcastle Chronicle.*

WHAT IS A SCAFFOLDING?

At the Halifax County Court on the 21st ult., before Mr. Vincent Thompson, Assistant Judge, a claim under the Workmen's Compensation Act was heard. The claimant was Mrs. Harriet Hodgson, of Back Raglan-street, Halifax, and she sought to recover damages amounting to 200*l.* in respect of

an accident which befel her husband, Charles Hodgson, on September 11 last. The defendant was John Riley, plumber, Stanland-road, West Vale. Mr. W. H. Boocock appeared for the applicant, and Mr. F. C. Reed (Leayrod & Co., Huddersfield) for the defendant. The facts of the case, as stated by Mr. Boocock, were deposed to by witnesses, were that Hodgson, who only entered Riley's employ on the day of the accident as a journeyman plumber, was engaged in fixing new skylights in Briggs-royd Mill. Two ladders were used to get to the roof from the interior of the mill. The deceased fell from a platform between these ladders a distance of some 17 ft., fractured the base of his skull, sustained other injuries, and died the next day. The defence was that the platform on which the deceased was standing was not scaffolding within the meaning of the Act.—After hearing arguments on both sides, the Judge decided that the platform was not a "scaffolding," and gave a verdict for the defendant. He expressed sympathy with the widow. Mr. Reed said he did not ask for costs.—*Bradford Observer.*

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

21,356.—METAL LATHING: *M. Hillon.*—The laths are made out of strips of sheet-metal, and to enable them to "key" with the plaster as well as to stand out from the joists they are punched so as to present loops or tongues, which may be curved angular or rectangular in shape, and be set parallel to the sides of the strips or at an angle with them. The machine which bends and shears the rectangular tongues has two lifting-bars which sever the strip from the lower die and are joined to the upper die crosshead with rods and a crossbar. With the specification should be read No. 10,664 of 1899.

21,358.—METERS FOR GAS AND LIQUIDS: *H. Jensen.*—With the fixed walls of the meters are contained bellows of which the membrane has on one side, or both, a central solid plate surrounded with solid rings in order to leave narrow spaces or strips of the flexible material between them, the rings and the plate being joined to one another and to the walls of the meter by means of lever-links.

21,353.—SOUND-PROOF AND FIRE-PROOF FLOORS AND CEILINGS: *P. Hobbs.*—About the lower flanges of the metal joists are arranged hollow flanged skew-backs made of concrete, cement, terra-cotta, &c., upon the flanges of the latter are dropped rabbetted ceiling-slabs, whilst upon their upper edges are laid metal sheets which may be grooved, corrugated, or expanded in shape; then above the metal network, or sheets, and round about the upper flanges of the joists is laid a mass of concrete, a coating of plaster being applied underneath the slabs; for the ceiling-plaster the lower flanges of the skew-backs are grooved dovetail-wise, and by another method the concrete skew-backs may be cast about the joists when *in situ*.

21,350.—A CONTRIVANCE FOR WEIGHING MACHINES: *J. W. Cartwright.*—In the case of scales that indicate fractional parts of, say, a pound after the required weight to the nearest pound has been put into the weights' pan, a vertical arm is mounted upon the beam, and at its lower end is a weight which will oscillate within a dash-pot and is fitted with a strap to a drum on which is mounted a pointer travelling over a graduated scale above the beam; upon the vertical arm slides a weight for adjustment, which may be altered in respect of both its weight and place.

21,356.—A METHOD OF VENTILATION: *W. Birch.*—The appliance is for the withdrawal of polluted air by the operation of a gas-burner or furnace which is placed at the bottom of a shaft with which the ducts for foul air from the room are connected. In one form of the invention, and adapted for buildings, the foul air, as it flows through openings in the wall and ceiling of the room, is carried through flues to a shaft wherein a gas-burner is placed; in some instances the burner is arranged concentrically within a tube and eccentrically within the casing.

21,351.—A SAW GUIDE FOR MITERING MACHINES: *P. F. MacDonell.*—The saw guide is mounted so that one can set it at any angle about two axes, which are disposed at a right angle to one another, and is carried by a vertical standard which is joined with a ball-and-cup bearing to the table or base-board. The post or standard can, moreover, be set at any angle in the vertical plane as one turns it between two plates set at an angle of 90 deg. to the base-board.

21,301.—CLAMPS FOR JOINERS' USE: *G. Schmidt.*—The inventor's object is to enable one to clamp pieces of wood together at varying angles during the process of gluing; the jaws of the clamp are pivoted to two arms which are pivoted on to a boss between them, which has lugs that guide the arms and is screw-threaded that it may take a screw, at one end of which is a pivot-jaw and at the other end a handle; a right-and-left-handed screw serves to draw together the two arms for closing the jaw of the clamp. In another mode an eccentric, with a handle, is used for the adjustment of the arms, the eccentric being pivoted to links which are pivoted on to one of the arms and being caused to bear against the other arm, which a hook

that is in engagement with a slot retains in its position to support the thrust; the eccentric, when adjusted, is maintained in place by means of a pawl, which engages with ratchet teeth upon the eccentric.

21,400.—A SELF-CLOSING VALVE: *S. Kaplanik.*—A conical valve shuts the casing at its inlet side, and at a point midway a valve spindle closes it also, a groove cut in the valve spindle permits the current of liquid to the outlet when the valve has been forced inwards and the inlet end has at the same time been opened; either a spring or the pressure of the liquid will serve to force the valve against its seating.

21,411.—AN EXTINGUISHER: *F. S. Bright.*—The cylinder-shaped container of metal has a lid which makes an air-tight joint, being screwed on with packing, and to the middle of the lid is screwed the nozzle of the discharge-pipe, at the lower end of which, within the vessel, is screwed a strainer. At the side of the casing is a cage or holder for the acid-bottle, against the side of which is a thumb-screw which, when turned from without, will break the bottle.

21,413.—ELECTRICAL CUT-OUTS: *J. Sachs.*—For cut-outs with a fuse, which is placed inside a casing, a second fine wire is laid outside the casing, which will answer the purpose of an indicator through its own fusing when the main fuse blows, the pin terminals should be passed through an end piece of the tube-shaped casing, and the auxiliary fuse may be made of a strip of foil upon asbestos paper or some similar material.

21,427.—AN APPARATUS FOR PAINTERS' USE: *G. E. Holloway and Dellanga & Co.*—For purposes of paint-spraying the inventors cause compressed air to be forced through a tube, together with paint through the tail-ends of other tubes, into the spraying-nozzles upon a straightened or bent tube, which is to be rocked with the hand or with a lever; the tail-ends of the supply tubes are dipped either into the paint in the reservoir or into a vessel upon the shaft which dips into the paint, and will serve to stir up the paint.

21,439.—FLUSHING CLOSETS AND THEIR FITTINGS: *A. Male and J. Hodgson.*—For a float-valve in the inlet of the cistern, which is made air-tight, the inventors substitute an air valve, which is regulated with a float, and will prevent the entry of water just as it prevents the escape of air. In one modification of the apparatus the cistern is divided into two portions by an inner wall. The connection from one part to the other is regulated with a valve. The closing of the valve upon the opening of the discharge valve, together with the reversal of that action, provide a reserved flush. The principle involved may be adapted for a siphon discharge cistern, and for a single valve cistern also.

21,493.—BALL-AND-FLY VALVES: *F. J. Brazier.*—The float is arranged so that it shall slide in a vertical direction between guides upon the end of the outlet pipe, whilst levers which are pivoted on to a casing at the end of the pipe join the float to a lug that projects from beneath the valve; by those means the movement of the float is communicated, to a lessened extent, to the valve which is seated upon the outlet of the pipe. In a variant adaptation a partial or entire balancing of the valve is obtained by extending the valve downwards in order that the lower end may operate as a piston in a corresponding extension of the casing into which the water flows through a port within the valve.

21,530.—LADDERS, STEP-LADDERS, AND TRETTLES: *A. Barr.*—The three sections of a telescopic ladder are fixed with weighted hooks when it is fully extended, the hooks being pivoted on to the upper two sections and fitting over the rungs of the lowest section. Anti-friction rollers press against the wall, and the sections are retained in their places with guide-rollers. For a trestle or step-ladder in two sections the sides are pierced with holes through which side-struts are to be hooked, and there are holes in the sections for a hinge-pin or bolt; a horizontal notched bar that engages with the rungs fastens the sections when they are extended; the ladders, &c., being after the cover like an extensible kind, are such as are specified in No. 21,183 of 1896.

21,537.—STEELYARDS: *W. E. Hipkins.*—The steelyard is adapted for use with weighing-bridges and platform machines, and embodies a compound-lever adjustment; to the steelyard is secured a notched bar, which is engaged by a supplementary nib mounted upon the poise. Any damage of the steelyard by the nib is obviated by cutting the notches upon the auxiliary bar more deeply than the notches upon the steelyard itself. Nor will the steelyard suffer injury when both nibs are in position for engagement with their notches respectively.

21,683.—AN APPLIANCE FOR SCOURING AND CLEANING PIPES AND CONDUITS: *F. Novotny and O. Mierisch.*—For a guide and piston an oval-shaped body is put within the pipe or conduit; a scraping instrument and a brush are attached to the guiding portion, the brush or ribs of the scraper being set at an angle to the longer diameter of the appliance in order that it may rotate as it is drawn through the pipe; the brush sweeps away the dirt, &c., which the scraper removes as the apparatus is being forced through the pipe by means of compressed steam or other fluid.

21,710.—PROCESS OF MOULDING SINKS, &c.: *J. Woodton and J. Parker.*—A loose ring or mould is

THE BUILDER. MARCH 2, 1901.

DESIGN FOR FACADE OF A MILITARY MUSEUM

SCALE 1/4" = 1'-0"

PLAN

J. H. SPAIN, ARCHITECT

INK PHOTO SPRAGUE & CO. LONDON 4 & 5, EAST HARDING STREET, FETTER LANE, E.C.

L. N. 10

mounted upon the die or mouthpiece of a pipe-making or extrusion machine, and reposes upon bevelled ribs of the balanced table, which also carry a core that is secured to a rod. After the table has been freed from its locked position, and as it descends, the suspension bolts limit the amount of the fall of the mould, so that a cutting-off wire can be drawn between the mould and the die. If it be desired to form ornamental designs around the sink or other article, loose pattern-plates should be inserted at the sides of the mould.

21,746.—COVERS FOR MANHOLES: T. P. G. Egger. A flange which has gates arranged at regular intervals affords support for a circular grating; in the rim of the cover are fashioned half-round recesses which will, or will not, register (as may be desired for purposes of ventilation) with the gates in the flange, as a projection engages with one or with the other of two other recesses.

21,779.—MANUFACTURE OF LIME CEMENT: C. Straub.—Moisture is expelled from calcined limestone that has been partly hydrated by heating it in an oven or upon a hot plate. The broken lumps of limestone are then pulverised, and the resultant lime cement is then pulverised, and the resultant lime is mixed with sand for mortar. When finely sifted and compounded with a colouring material, it may be used as a wall paint. Steam of water can be employed for the process of hydration. The water may be mixed with a glue or gum solution, calcium sulphate, or alkaline salts of boracic or other acid.

MEETINGS.

FRIDAY, MARCH 1.

Architectural Association.—Mr. E. W. M. Wonnacott on "The Paris Exhibition, 1900." 7.30 p.m.
Royal Institution.—Mr. H. H. Conyngham, C.B., on "Enamels." 9 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. R. Kenwood on "Water: Composition, Pollution, and Purification." 8 p.m.
Institution of Junior Engineers (Westminster Palace Hotel).—Paper on "Carburetted Water Gas," by Mr. Samuel Cutler, Jun. 8 p.m.

SATURDAY, MARCH 2.

Royal Institution.—The Right Hon. Lord Rayleigh, on "Sound and Vibrations." 11. 3 p.m.
British and Certified Carpenters (Carpenters' Hall, E.C.).—Mr. W. H. Betamens on "Wood Beams: their Properties and Design." Professor R. E.ley Smith, Vice-President, will take the chair. 6 p.m.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Islington Disinfecting Station. 6 p.m.
Edinburgh Architectural Association.—Visit to Glasgow International Exhibition Buildings.

MONDAY, MARCH 4.

Society of Engineers.—Paper by Mr. G. J. G. Jensen, entitled "Notes on certain Details of Drainage Construction." 7.30 p.m.
Cold Storage and Ice Association (Fishmongers' Hall).—Mr. P. F. Kensett on "Practical Insulation." 30 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. H. R. Kenwood on "Elementary Statistics." 8 p.m.
Liverpool Architectural Society.—Professor Beresford to read "The Architectural Treatment of Stone-work."
Leeds and Yorkshire Architectural Society.—Mr. Lewis Lucas on "Logical Building and its influence on Architecture." 6.30 p.m.

TUESDAY, MARCH 5.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table with columns for material types (e.g., Bricks, Hard Stocks, Rough Stocks, Smooth, Facing Stocks, Shippers, Flettons, Red Ware Cuts, Best Farnham Red, Best Red pressed, Ruabon Facing, Best Blue Pressed, Staffordshire, Do., Bournemouth, Best Stourbridge, Fire Bricks, GLAZED BRICKS, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Seconds Quality White and Dipped Salt Glazed) and their respective prices per unit.

NOTE.—The cement and lime is exclusive of the ordinary charge for sacks.
Grey Stone Lime 13s. 6d. per yard, delivered
Stourbridge Fire-clay in sacks, 22s. 6d. per ton at fly, dpt.
[See also page 225.]

Some Plain Truths in regard to the London Water Question.

THE total collapse of the London water companies, who, after suggesting an interval of a week in the Local Government Board Inquiry in order to consider whether they could modify any of their demands, at the end of that time withdrew them entirely, was a dramatic termination to the inquiry hardly expected by even the most sanguine opponents of the policy of the companies. The fact that they could have felt under the necessity of taking this course, after the drastic and wholesale demands put forth in their recent ultimatum for revised regulations, is a blow to their prestige from which they will not readily recover, and shows how fully they must have felt compelled to realise the general and determined nature of the opposition which their attempt at forging new fetters for the London householders has aroused. In fact, had Government made any attempt to enforce these regulations there would have been something like a publicurrection. That the water companies, whose prolonged existence has for some time been threatened, and who have become more and more unpopular of late years, could have chosen the present juncture to throw their hand in this way, and to formulate demands that would give them an absolutely tyrannical power over those who are necessarily their customers, seems like a vivid illustration of the old proverb—*Quos vis nulli perdere, prius dementat*. It is no purpose to say that under any system of water supply it would be necessary that a strong official inspection should be maintained over fittings, in order to prevent waste. Unless supply were by meter on which point we may have a word to say further on—such inspection would no

doubt be necessary ; but it is one thing to have inspection carried out in the interests of the public and by a public authority, and another thing to have it carried out by a private trading company in the interests of their shareholders. The mere fact that the supply of a necessary of life and health, like water, to the largest and most crowded city in the world, should be in the hands of private companies who are trading in it to their own advantage, is an anomaly so monstrous that it is a wonder that public opinion has not long since risen up in arms against the continuance of such a system. As to the pretence put forward by the representatives of the water companies at the recent inquiry, that their proposed regulations were for the good of the consumers, the statement involves such a degree of unblushing impudence as one can hardly adequately characterise in parliamentary language. They know perfectly well, for example, that the storage of water for family use in large cisterns has been condemned by all hygienic authorities as leading to insanitary conditions, and yet they expect us to believe that in trying to compel the use of larger cisterns than ever, so as to enable them to interrupt constant supply whenever it is convenient to them, they are actuated only by consideration for the convenience of their customers! It is not worth while to refer to other similar points in the evidence offered to the Local Government Board Commissioners ; it is all in the same strain, and offers an example of cynical indifference to public opinion which seems almost incredible.

The plain truth of the matter is that, partly owing to this false position of the water companies as traders in a necessary of life, and the influence they possess in many quarters,* the question of London water supply has come to be regarded and treated almost entirely as a political stalking-horse. We scarcely ever come across an utterance on the subject which, if traced to its

* It is perfectly obvious, for instance, that some important journals, for whatever reason, have completely taken up the cause of the water companies.

origin, is really concerned with what is best for the London public. We find one water scheme recommended because it is the hobby of a particular party in the London County Council, and they cannot bear that the other party should beat them. The same scheme is opposed by other persons because it would be against the interests of the water companies, for whom this or that person is really though not nominally acting. This is really the history of all that long paper and discussion at the Surveyors' Institution, recently reported in our columns. Mr. Middleton's paper was in many respects a very able one ; but Mr. Middleton was a witness for the water companies before the Royal Commission ; his paper all went to show that the present provision for water was sufficient for many years to come : "argal" (as the grave-digger in "Hamlet" says) if that is so, why disturb the water companies? That was not said, but that was what was meant. Otherwise, how are we to explain the presence at the meeting of two eminent legal counsel, both of whom have been employed for the water companies, and their obvious mission to scoff at any speaker who opposed the *status quo*? Eminent barristers are not professionally interested in water engineering, nor are they, we believe, in the habit of attending meetings on subjects in which they are not interested unless there is some special reason for their attendance ; and it would be interesting to know on whose behalf and on what grounds these eminent legal luminaries attended at the Surveyors' Institution. It was not in the interests of the London public at all events, nor were those interests fairly represented in the discussion on that occasion.

One of the results of the fact that water has been so long supplied to London by trading companies is that the whole class of water engineers, and those who are in any way connected with the subject of water supply, have got into the habit of regarding water not as a substance to be supplied as liberally as possible, but as something which is to be dealt out grudgingly, and in the use

of which the inhabitants of a city are to be taught and compelled to be as niggardly as possible. This was obvious over and over again in the discussion at the Surveyors' Institution. One engineer after another spoke as if the great object was to reduce the use of water to the lowest possible quantity. The more copious use of water for ablation, which is fortunately increasing every year, was actually spoken of as if it were not only a folly but a kind of moral aberration which was to be regretted and should be put down compulsorily; one engineer suggesting that with proper rules and regulations it would be possible again to reduce the measure of supply to the twenty-five gallons per head which he remembered as obtaining in happier and more enlightened days. Some part of this wrong-headed movement for curtailing the use of water is probably due to sheer ignorance. Some of the men who are efficient water engineers are men of otherwise little general education, and whose own habits of life do not enable them to form any idea of the extent per head to which water is used, and beneficially used, in the best class of houses. Waste of water,—i.e., the running away of water which has not been used at all, is always to be deprecated. But the copious use of water is not waste; on the contrary, it is one of the most important conditions of healthy life in large cities, and we are inclined to think that if even the superior class of engineers who lay down the law that thirty, or thirty-five gallons per head is an ample supply, were compelled to restrict themselves to the contents of a 30-gallon cistern filled in the morning, and to draw from that for everything for the day—including, it must be remembered, not only personal ablation, but cooking, washing up, and what may be included under the general term of "scavenging," they would find out before the close of the day that they were short of water, and would reconsider their statements.

The two points to be prominently kept in mind, then, in the future consideration of the question of London water supply are—first, that it is a question which no one has any right to consider except on the broad ground of public health and the public good, and that all importation into the question of merely political motives—the success of this or that party or this or that corporation, are not only from the purpose, but, in connexion with such a subject, are absolutely immoral. The second is, that a copious, and not a niggardly supply, is what is wanted for a great city; that the object should be not to see how little water you can give people, but how much. Whether, by means of impounding reservoirs, the supply of the Thames can be made to yield enough for the future supply of London, or whether it will be necessary to seek an auxiliary supply from a distant source, are questions of detail. We are inclined to think that the auxiliary supply will prove to be necessary. But whether it prove to be so or not, the general principle to be kept in mind is that the public good alone is to be considered, and that an ample supply is demanded, and will be more and more demanded with every decade. There is water enough in this country for all to have an ample supply; the only difficulty is to collect it at the places where it is wanted.

We have referred to the question of supply by meter; and without pronouncing

decisively in its favour, we think it is a point to be kept in mind. What is the precise reason of the violent opposition to it on the part of the water companies and their supporters we do not exactly understand; but as there is that opposition, we may take it for granted that in some way they regard it as disadvantageous to themselves and favourable to the consumers. The most absurd reasons were adduced against it at the Surveyors' Institution meeting; among other things, that it would be impossible to furnish the number of meters necessary, those who used this argument apparently forgetting that there is a gas meter in every house in London: why is it any more impossible to furnish a water meter? The really valid objection to meter supply is that the poorest class, if charged by the amount they used, would endeavour to dispense with the use of water altogether. This, however, might be met by placing houses below a certain low standard of rental on a rate. The advantage of a meter supply would be that the onus of keeping his apparatus watertight and in proper order would then be thrown on the householder, who would certainly not fail to see to his fittings in that case; and the whole expense, trouble, and irritation inseparable from official inspection, whether by a government or a trading company, would be done away with. There may be reasons of greater urgency on the other side, but we have not heard them yet. The question is, at all events, one which should be kept open for due consideration in connexion with the future of London water supply.

SILVER AT THE BURLINGTON CLUB.

THE loan exhibition of silversmith's work now on view to members and their friends at the Burlington Fine Arts Club, is not only one of quite exceptional richness and beauty, but it has a special interest in regard to the fine character of the English works exhibited. Some of the Flemish and Spanish objects exhibited are more sumptuous in style, but for refined beauty of design there is nothing superior to the best English work exhibited. The cup and cover gilt, No. 1 in case C, a piece of early seventeenth-century English work, has such a classic refinement of detail that at first glance it suggests rather work of the best period of the Italian Renaissance. The bowl in this instance is in the form of an ostrich egg. To the moulding on the cover are hinged what the catalogue justly calls "three exquisitely designed vertical straps in the form of caryatide figures," which secure the egg. No. 3 in the same case, of slightly earlier date, has the same refined Italian character. The works in this case are all English, and though some of them are of small size and comparatively simple in design, they are more truly artistic in feeling, and especially in refinement of outline, than many of the larger and richer works in other cases. We may also notice in Case D (also all English work) the cup and cover numbered 19, a melon shell mounted as a sea-monster, supported by dolphins on a circular base.

It would be impossible to describe the collection in detail; the task would be endless. It would be more to the purpose here to consider some of the various ways

of treating silver which are illustrated in different classes of articles exhibited. We find some articles in which the object is to take the eye captive by a universal richness of treatment, leaving no portion of the surface untouched. A typical example of this is the large German cast and embossed cup, No. 1 in case F, long believed to be a work of Cellini's, but now recognised as of Augsburg make. We confess we are surprised at the belief that it was Cellini's; it has not the Italian character, and it has what is so often the characteristic of German work, richness of surface without refinement of line. The English cup in the same case (No. 3), sufficiently of the same character and size to be called a companion piece, though less sumptuous than the German example, is better in outline and so far more artistic. It is in form that both English and Italian pieces assert their superiority to German. No pedigree is given of the massive silver table from Wentworth Castle, shown in case G, but we should be surprised if it is not Italian; the bold and yet finished and graceful form of the supports is in the highest style. There is something similar in character in the two gueridons (tall circular pedestals) in Case K at the opposite end of the room, lent by her late Majesty; there is here the same richness of decoration without losing sight of clearness and precision of form in the supporting parts, especially in the finely-designed scroll feet (why these are called "marine-looking" in the catalogue is not apparent). There is, however, no statement of place or date attached to these either. It would be interesting to know their artistic history.

Most of the fine and large cups and tazzas in Case I are English, one of the finest of all being one of the smaller objects, viz., Mr. Kennedy's two-handled gilt porringer and cover, standing on ball feet with a removable outer casing of silver, pierced and embossed with a design of foliage intertwined with children and birds; a perfectly beautiful work, of the date 1670. Among the various other articles in this case we may contrast with the last-named very rich piece of work the two large plain flagons, Nos. 67 and 72, the body carefully modelled with a pronounced entasis; there is little ornament, the whole effect is obtained by the large and ample modelling and curvatures of the main lines; but these are in their way two of the finest pieces of work in the case, and should be studied for the effect to be obtained by mere line apart from elaborate surface ornament. In the large cup lent by St. John's College, Cambridge, it is worth notice, as a point in design, that the ornament is too flat to have any effect in comparison with the large scale of the cup, and looks weak in consequence.

In Case J we come on a different school, mostly Flemish, German, and Spanish work, and the first two objects in the numbering, a Flemish chalice and a Spanish ewer, are both typical examples of the sumptuous character of decoration of this school; for just as with point lace, so it is with silversmith's work, there is a very strong similarity between Spanish and Flemish work. Among the objects in this cabinet three German cups (No. 4) are noticeable for a marked speciality of character and design; they have three bands of engraved ornament, one over the other, with very good effect, and are exceed-

THE BUILDER, MARCH 9, 1901

187 PHOTO SPRAGUE & CO. 4 & 5 EAST HARDING STREET, PETER LANE, E.C.

enterprise that has not yet been equalled in the world's history, and at the threshold of a new century era, to open the door to unknown possibilities.

Perhaps it will be well to mention here that there is now a feeling—almost universal—that these International Exhibitions are being held too frequently, and one feels quite gorged with them. It would be better to have them forty or fifty years apart, in the same territory, those in the interval being held by the rival nations.

Having fixed the date so early as 1892, we see it took six years to progress to fruition. The services, staff, &c., were settled in 1893, the site fixed in 1894, and the regulations and rules promulgated in 1896, leaving four clear years, in which were to be brought forth the designs (in competition or otherwise) and the erection of the buildings themselves.

It was left to M. Alfred Picard, Inspector General of roads and bridges, the official reporter of the 1889 show, to draft the preliminary ideas of the 1900 Exhibition. On the general lines laid down by him (which included for the first time the right bank of the river), a competition for the supply of ideas was initiated in which 108 competitors entered. Parliament voted a credit of 100,000 francs for the purpose. The competitors were at liberty, by the conditions, to raze everything within the selected boundaries, except the Palace of the Trocadero and the Eiffel Tower. The majority of the competitors favoured the opening up of a new avenue from the Champs Elysées to the Invalides, which would entail the destruction of the Palais de l'Industrie, a relic of the 1855 Exhibition. Round this scheme raged a hot and angry discussion, but eventually it was decided to adopt it, and the avenue (now known as the Avenue Nicholas II.) was almost an accomplished fact. Singularly enough, towards the close of the eighteenth century, the same thing had been talked of by Gabriel, the well-known French architect of that time, when he proposed to shave off the top of the rising ground where now stands the Arc de Triomphe, and to make various extensive improvements in this quarter of Paris. The murmurs of the approaching Revolution postponed its accomplishment until our own day.

Then came the second competition, in 1896, for the arrangement of the Exhibition buildings. M. Picard having decided on the knotty problem of how to provide, on almost the same site, as regards size, as the 1889 show, about triple the area for the 1900 one. The idea being already adopted of an avenue terminating in the Invalides, with a palace on each side of it, next the Champs Elysées, the jury selected nine schemes for the large palace and eight for the small. A final ballot brought out the name of M. Girault as architect for the Petit Palais, while for the Grand Palais were selected (1) M. Louvet, (2) M. Deglane and Binet, and (3) M. Thomas. Eventually most of these were associated together in the design and construction of the Grand Palais (except M. Binet, who received as consolation the commission to erect a monumental gateway at the principal entrance of the Exhibition). The architects who were placed second in the competition for the Petit Palais were commissioned to execute the architectural decorations of the new bridge, forming the connecting link between the Champs Elysées and the Invalides. MM. Cassien Bernard and Cousin, the architects referred to, were to work hand-in-hand with the engineers already appointed, MM. Resal and Alby.

Staff.—A word as to the staff—the architectural department which worked under the direction of M. Picard. This was housed in a fine red brick building or pavilion, and offices on the Avenue la Bourdonnais. Very complete plans, &c., can be seen in Vols. 13 and 14 of "La Construction Moderne," copies of which can be seen in the Royal Institution of British Architects' library. The building is not of sufficient importance to deserve detailed notice here.

Finance.—Perhaps a word or two on the financial aspect of a great Exhibition may not be without value. In 1867 the State and town furnished a subvention of 12 million francs and a Guarantee Corporation had 6 millions more in hand, but was not called on to pay, there being a balance on the right side.

In 1878 the State, jointly with the town, executed the operation, and there was a deficit of 20 millions, but of this sum 10 millions went to pay for the Trocadero Palace.

But that of 1889 resulted quite otherwise,

and the surplus of receipts over expenditure reached the respectable total of 8 million francs.

The 1900 Exhibition, of which the official accounts have been already published, results in a deficiency of over 2 million francs, but this applies to the official work only. There are in addition the unofficial shows also to consider, (670 projects were submitted in the preliminary competition, sixty of them retained for the final selection) which had to pay extortionate rents for their ground space, and were moreover over-capitalised, many of them closing their doors early in the summer. The total amount of capital raised for these unofficial shows was 4½ million francs, nearly 2,000,000. The immense Globe Celeste was the most unfortunate, on account of the disaster to the bridge which fell when the centering was being struck. The show was at once closed by the authorities, and only reopened when the summer was nearly over. "Paris in 1400," was another speculation which ended in ruin early in August, and was for sale then at the break-up price of 2,000 francs. Several of the others were practically bankrupt before they were ready to open their doors to the public, their shares in the market being so much waste paper. An example may interest you: one restaurant, the capital at starting being 10,000, was re-sold, in three months, for 4,000, and one month later to a new proprietor for 1,600. Of the others, such as the moving platform, the great wheel, the Marécorama, and the Palace of Optics, the capital depreciated very greatly, in some cases 90 per cent. So we see much money was sunk by the concessionaires, and nothing was reaped from it.

Also in the case of the Exhibition bonds, the only means of raising money to float the Exhibition at all. Over three million pounds was easily raised by the French bankers by means of 11. bonds, which were greedily snapped up by the public; but they were practically given away, for each bond carried the right of twenty one-franc tickets for admission, a reduction of 25 per cent. on certain side shows, and participation in the drawings of the lotteries, the latter being the only prospect of remuneration on the outlay. But I must weary you no longer with details of this sort.

Works and Construction.—The wreckers (those wolves of the architects, as they have been called) and the navvies were looked after by a Committee of Hygiene. All the immense masses of earth that were moved, whether in foundations, road or tramway cuttings, were profusely sprinkled every day, when work ceased, with pulverised sulphate of iron 100 parts to quicklime 200 parts to every square metre. This precaution to us may seem absurd, but it must not be forgotten that Paris is a very insanitary city, and still abounds everywhere with hidden cesspools and middens. A strong staff of inspectors were told off for this special service of sanitation.

Demolitions.—I have no data of the cost of demolishing the structures that formerly stood on the site of the late Exhibition, but I may mention that the old Palais de l'Industrie was removed for the sum of 200,000 fr., only the colossal group that crowned the structure, by Elias Robert, being preserved. The dome, the "Dome Centrale," on the Champ de Mars site, cost 20,000 fr. to pull down; and the Pavilion of the Town of Paris—from the last Exhibition—20,000 fr. Besides these, there were razed the Palaces of the Fine and Liberal Arts, but I have no items of cost. It is estimated that it would cost, to remove the Galerie des Machines, 1,000,000 fr. if decided on.

Workyards.—The contractors' yards for heavy material were laid out in a most methodical manner, amply provided with tramways and railways, cranes and hoists, and everything desirable to facilitate despatch: and despatch was the order of the day. The daily labour roll amounted to over 5,000 hands, in spite of the fact that everything that could be fitted together before arrival on the site was so done.

There were twenty-three of these workyards, each under an architect, in some cases under two architects.

Stone.—That most largely used was the calcaire grossier, a white freestone largely found in the Paris basin: from the quarries of Châteaufort, near Nemours (Seine et Marne), as was used for the Arc de Triomphe; also the stone from the Aisne and Oise Valleys, as the new Louvre: those of Charentenay and Courson (Yonne) as we see in the Hôtel de Ville. The ashlar work of the Petit Palais was

a hard freestone from Coutarnoux (Yonne) up to the first band, and above that a freestone from Méry. In the Grand Palais, where there were about 40,000 tons (French)—17,000 cubic metres—used, the lower part was from Villebois, and was the only example I could trace of a quarry-worked stone. All the rest was cut and worked on the site, the freestone being from Euville, Lerouville (Meuse), and Larrys (Bourgogne) for the *socle*, and from Villers-Adam and Vic-sur-Aisne.

We also see pink mottled limestone from the Côte d'Or, or Burgundy, employed in decoration and pilasters, similar in appearance to our Devon limestones. Also grey granites from Calvados, white and golden yellow freestones from Poitevin sources, and the valley of the Oise.

Stucco.—But the material most profusely used throughout the Exhibition for the temporary buildings was the stucco or "staff" applied over the light wood or iron skeleton of the structures on fireproof lathing or wirework. As most of the buildings were temporary, they were executed almost wholly in this way. This "stuc" (the use of which we can readily trace back to the days of the Romans) was very largely used in the seventeenth and eighteenth centuries, and is now the universal material used by speculating builders in Paris, for the vestibules, staircases, entrees, &c., and an old example can be seen by the curious in the Presidency of the Chamber of Deputies, where the stuc was coloured; the work was by Jules de Joly, then architect of the Palais Bourbon.

Ciment Armé.—Then there was the ciment armé, or concrete with steel cores, used in large masses, profusely used in nearly all the buildings, whether permanent or temporary, especially for staircases and landings, and galleries of wide span. I shall touch on this later when dealing with the Petit Palais.

Steel.—But looking back over the century just passed, the material that has come most to the front is steel. At the opening of the nineteenth century iron or steel construction was unknown except in the form of cast girders and occasional roof trusses, either wholly or partly in iron. But the succeeding years bring us by rapid strides, through the demand for high and wide buildings, and the commercial use of the steel process, past such landmarks as the Crystal Palace of 1851, and the Gare St. Lazare, in 1867 the elliptical exhibition building, in 1878 the machinery gallery, trusses without tie rods, of 110 metres span, by the eminent engineer De Dion, outvying our own St. Pancras station, in 1889 the Eiffel Tower, 300 metres high, and the far famed Forth Bridge. In 1900 steel had become almost the universal material for the frame of structures, even if temporary. But specially to be noticed is that magnificent bridge, the Pont Alexandre III., the metal work of which cost over two and three-quarter million francs. Over 50,000 tons of steel were used in the two Fine Art Palaces alone.

An example from the statistics will show the great economy effected as the result of previous experience, gained in the former exhibitions. In 1878 it cost nearly 5 fr. per cubic metre to erect the steelwork coverings; in 1889 this was reduced to 2.77 fr., while in the recent Exhibition I am assured the figure barely reached 2 fr. per metre cube.

Foundations in Bad Ground.—A singular process was employed in the marshy part of the Exhibition site, where the ground was soft and spongy—that was, mechanical compression, in which a steam pile-driver was first used to perforate the ground down to a hard bottom, then to enlarge the bottom of the hole thus formed, and finally to beat down and consolidate the concrete thrown in to form the foundation, a large concrete pile standing on a kind of mushroomed foot on the hard bottom. This avoided the necessity of removing large masses of poor soil, and gave at the same time a stable substructure for the subsequent erections.

Estimates.—A word on the system of estimates prepared by the architects for the builders. Instead of pricing a bill of quantities, as with us, and the job going to the lowest tenderer, the architect, or his surveyor, gives in his estimate at a given figure. Invitations are then sent out to the contractors, and the game then is to find out who will give the greatest rebate below the already quoted price.

Design.—As regards the buildings collec-

* "Staff" is a variety of fibrous plaster, cast in moulds.

tively, one must regard this Exhibition as a spectacular achievement, an architectural fairyland; and one can overlook the faults of too exuberant, or fantastic detail, and similar things, bearing in mind that these productions were for a festal occasion, and festive they undoubtedly were, great was the variety of form and mass, extraordinary originality and vitality were displayed in the detail and decorations, while most vigorous was their execution. Picturesqueness was supplied by a row of foreign pavilions on the river bank, the Château d'Eau the gardens of the Trocadero, and other parts of the Exhibition, while dignity was worshipped in the symmetry displayed in the vistas of the Champ de Mars and the Esplanade des Invalides. All this combination was entirely due to the genius of the French artists and their unique methods of training.

Plan, &c.—With the aid of a plan, or rather a map, of that portion of Paris lying on either bank of the Seine from the Pont de la Concorde down to the Pont d'Iéna, and even a little beyond, we find that the Exhibition was laid out on four main sites, two on each bank of the river, with connecting strips bordering immediately on the river itself; but these four sites fall into two groups, each of which consists of a piece of ground on one side of the river connected with another similar plot on the other by means of a bridge, which forms the axis of each group. Thus we have the Champ de Mars—the largest of these four plots—connected with its opposite neighbour, the Trocadero gardens, by the Pont d'Iéna. Similarly we have the Esplanade des Invalides joined to the Champs Elysées portion by the magnificent Pont Alexandre III. Then these two groups are connected themselves by narrow enclosures or strips of ground on the banks of the Seine, as the Rue des Nations on the left bank (the Quai d'Orsay) and the Rue de Paris and Old Paris on the right bank. But the axes of these two groups are inclined to one another, almost meeting on the south side, and diverging to the north, on the large bend made by the river between the two bridges above named.

The area of the site covered is much more than in previous exhibitions, and amounts to 112 hectares, including the overflow site in the forest of Vincennes, allotted to the railway and heavy machinery exhibits.

Description of the Plan.—Champs Elysées Portion.—At the main entrance, overlooking the Place de la Concorde, we find the Porte Monumentale, the principal entrance (of forty-five in all) that gave access to the grounds. This was designed by M. Binet. We pass along a broad walk, parallel to the river, bordered by statues, sculptures, and horticultural exhibits, leading to the magnificent Avenue Nicholas II. and the new bridge, the Pont Alexandre III. and we then find on our right the two Palaces of the Fine Arts, the one nearest to us as we emerge on to the avenue being known as the Petit Palais (although itself an immense structure), and facing it on the other side of the avenue the Grand Palais, the rear of which abuts on to the Avenue d'Antin. These features, the two palaces and the bridge, are intended to be permanent embellishments of the town of Paris. Without staying to describe these fine buildings, we pass along the continuation of the broad walk above referred to, cross the Avenue d'Antin and the Pont des Invalides by a picturesque footbridge, of which you will have a view later, and enter a narrow enclosure between the Cours de la Reine and the river, known as the Rue de Paris, containing chiefly the large pavilion of the town of Paris, by M. Gravigny; the Palace of Horticulture, with its aquarium in the centre; and the Palace of Congress and Social Economy. Each of these structures borders on the river, and on the other side of the Rue de Paris is a miscellaneous crowd of small shows, quite Parisian, such as the Maison du Rire, le Grand Guignol (French Farce), the upside-down house, and so on. Then by another footbridge by the Pont de l'Alma into the picturesque portion known as Old Paris, also bordering on the river, past several bakery exhibits, and emerge on the large garden of the Trocadero, where are situated the French and foreign colonial exhibits, the eastern portion being allotted to the latter and the western to the French colonies and protectorates. The Palace of the Trocadero, remaining from the 1878 Exhibition, was not itself a part of the 1900 Exhibition, although included in the site (a portion of the basement

and cellars excepted), and at the northern extremity at the rear of the palace a large panorama of Madagascar. From the Palace of the Trocadero we get our first view over the crowd of buildings forming the Exhibition, looking south to the Champ de Mars, and the plan of the western portion of the site becomes apparent. Before us is the Pont d'Iéna, and opposite us is the Eiffel Tower; beyond it is the Champ de Mars, flanked on either side by a range of palaces, and at the end the vista is closed in by the Château d'Eau and the Palace of Electricity. At the rear of the last-named is the old Galerie des Machines, still standing, and now very much transformed. The terraces of the Champ de Mars, on which stood the Palaces of the Fine and Liberal Arts of the 1889 Exhibition, by M. Formigé, have been demolished.

The Champ de Mars is connected with the Esplanade des Invalides by the Rue des Nations, where we find the most picturesque spectacle of the Exhibition, the row of foreign pavilions abutting on the river, destined to be wiped out of existence by the time I am addressing you, although a few of them are to be re-erected in various parts of the world. On the same bank of the river, before entering the Street of Nations, we pass the Palaces of Forestry, Navigation, and that of the Land and Sea Forces.

Then coming to the Esplanade des Invalides, we find, as on the Champ de Mars, two parallel ranges of buildings, devoted entirely to the decorative and industrial arts, the avenue between these two rows being a continuation of the Avenue Nicholas II. and the Pont Alexandre III., and terminating southwards in the fine vista of the Hôpital des Invalides. It is in this portion of the Exhibition that we find the buildings designed on a high artistic level; the façades are very fine, the masses happily grouped, and the details, if somewhat exuberant, are extremely suitable.

In order to be able to circulate round these vast congeries of buildings, there were two routes, in opposite directions, the electric railway, and the *plateforme noblie* (which we shall meet again at the Glasgow Exhibition during the coming summer); then also there were the many lines of penny steamers, several lines of railways, and the ever-present "bath chair."

La Porte Monumentale, designed by M. Binet.—This is a difficult structure to describe without a plan and drawings, but the secret is easily seen and its construction grasped in a view here given, together with the drawings on the walls, the construction being of three large arches on a triangular plan, supporting a large gilded dome. It was well set back from the roadway, and was visible from all sides. An immense archway forms the main entrance, 65 ft. wide, flanked by decorative minarets, 160 ft. high. Behind were other two arches, the whole covering the numerous turnstiles giving access to the grounds, while at the rear was a large wrought-iron gateway, the "Porte des Echevins," reserved for official processions, these all supporting the immense decorated dome. The whole was covered with rich colour, frescoes, and glass mosaics, interspersed with innumerable tinted electric lamps, quite indescribable; while at night one saw charming colour effects produced by the luminous globes, and concealed lights of great power, throwing up the whole into brilliant and overpowering splendour. Its effect to the mind of an architect can only be described as "Arabesque," for its author, who has a passion for colour, was undoubtedly influenced by the art of the Far East.

The crowning feature of this composition was the piquant figure of Modern Paris in the attitude of welcoming the nations, represented by a lady in a rich evening dress and cloak. This figure was the work of M. Moreau-Vauthier, and was the cause of a lengthy and rather hot discussion. The Government decided to remove it, but it remained *in situ* throughout the period of the Exhibition. Then the Ship of State (also the arms of the City of Paris)—a motif in high relief—ornamented the front or spandril portion of the main arch, and at the base of the flanking masses was the original and powerful conception of M. Guillot, a fine bold frieze in bas-relief, the "Iris du travail," representing the contribution of Labour to the Exhibition.

An ingenious arrangement of the turnstiles must not be overlooked, calculated to accommodate the passage of over 60,000 persons per hour (see plan lent by the Royal Institute of

British Architects). A very careful and exact model was first made, and from this M. Binet produced his final studies.

The whole structure stands on a foundation of piles; the skeleton was a very light construction of iron, overlaid with a framework of wood, and covered with plastic or "staff," then enamelled or painted in colour. Its estimated cost was 20,000 l.

Recently this was advertised for sale, as old materials. There were 200 tons of iron, 250 cubic metres of wood, 1,000 of building stone, 150 of brick, 750 of other materials, and 7,500 pieces of glass and lamp globes. In a recent issue of a French professional journal I see the price it fetched was 408 l., about 10,200 fr.

Le Grand Palais des Beaux Arts.—This building, on the largest and most monumental scale, was, during the Exhibition, the home of the French and foreign displays of the fine arts, painting, sculpture, and architecture; but it will remain as the permanent home of the French annual Salon, and possibly will also be used as the locale of many Government fêtes and displays. The building is of immense size, covering nearly ten acres; its plan resembles the letter H. The commission for this was given to three architects, who worked together most cordially in its production, and so successfully treated the various portions as to make them appear one great building externally. The front portion, that facing on the Avenue Nicholas II., was entrusted to M. Deglane, who was responsible for the immense façade, and the great hall or "nave" forming the sculpture hall. M. Louvet executed the central portion, forming the link between the front and rear, with the grand staircase, "l'Escalier d'Honneur," for ceremonial use, leading to the concert rooms and picture galleries on the first floor. The rear portion was allotted to M. Albert Thomas, comprising the front facing the Avenue d'Antin, a large central hall, covered by an elliptic dome, and the wings.

The cost of this was estimated at 25,500,000 fr. The foundations, over 550,000 fr., were put in with great difficulty, as a portion of the site was a mere marsh, with beds of peat and clay; part of the palace is therefore constructed on oak piles, and part on concrete bedded on a sandy clay. The stonework, 40,000 French tons, in a brilliant white freestone, the calcaire grossier, was all cut on the site by a diamond saw, led by a ten ton traveller, running on rails. Stone was exclusively used on the external fronts, but the inner walls were of rubble and brick, faced with stone. Ciment armé, i.e., cement concrete strengthened with steel wire of large gauge, has been largely adopted for the staircases and galleries.

Then for the roof were used about 6,000 tons of steel, executed by Dayd & Pille, of Creil. I was informed the strains have been so carefully calculated that the resultants pass through the points of support, thus relieving entirely the masonry construction forming the enclosing screen walls of the palace.

Façade.—M. Deglane was obliged to alter and modify his first conception in order that the Petit Palais, facing it, should not be overpowered by its more important neighbour. Instead of one large entrance porch, as originally intended, of great height, we find now three wide bays with doorways and a colonnade; the basement was considerably lowered, and the roof put almost of sight. But the glory of the façade was retained in the glass mosaic frieze, about 250 ft. long, designed by M. Fournier.

The immense nave, or sculpture court, 200 by 55 metres, is under one great glass roof, the central part being dome shaped, of about 230 ft. diameter, carried on curved principals formed as box girders, grouped in pairs, and decoratively treated with wrought iron scrolls and ornaments.

Centre.—The intermediate part, by M. Louvet, or bridge of the H comprises a return of the nave, and the staircase of honour, with two short façades on the north and south sides respectively, each 65 metres long. M. Louvet had a knotty problem to settle when asked to provide for exhibitions of all sorts; the ground floor being intended for the Concours Hippiques, and equestrian performances; for sculpture and various art exhibitions; the first floor for picture galleries, and a salon d'honneur, and the basement for stables and stores, while his staircase of honour, besides being the principal means of access to the upper story, was to be the grand decorative feature of the interior. Moreover he had to

arrange this portion as a complete whole, with its own entrances, stairs, lift, and service, so that it could be used for functions quite apart from the Great Hall in the rear block. How he has managed this, only those who have seen and studied carefully the plan, can appreciate.

At the head of the wrought-iron staircase, sumptuously gilded, is the great concert-room, for 1,500 persons.

Rear.—M. Albert Thomas, who did the rear portion of the great palace, had a fine opportunity, and has produced a very fascinating work. It comprises a rectangle of 150 metres by 45 wide, covering nearly 7,000 square metres, with an important façade on the Avenue d'Antin, set well back from the frontage, and raised about 4½ metres above the roadway, giving a well-lighted basement to be utilised as stables during the horse competitions, with room for 600 horses, and accommodating also all the auxiliary services of this vast edifice, such as police, fire and ambulance posts, telephone service, office staff, tobacco bureau, &c.

A large hall, nearly circular, forms the central feature on the ground floor, being about 29 metres diameter and 34 metres high, top-lighted, and of great beauty and originality of design; a large gallery, 5.50 metres wide, running all round the outside, on two floors; and two rectangular halls in the two wings, 20 metres by 45 metres, two stories high, containing the means of access to the upper floors, and giving an uninterrupted vista from end to end of the building.

The front to the Avenue is treated with coupled columns, partly detached from the wall, with a central projecting portion forming the second main entrance to the palace, having in front a vast flight of steps. This portion is intended to be used for special exhibitions and functions, independently of the remainder of the palace.

A fine frieze in bas-relief, by M. Joseph Blanc, about 300 ft. long, represents the history of art, and is placed behind the colonnade above mentioned. It has been executed at Sèvres, in opaque pottery or ceramic, and gave a most remarkable effect, being obviously inspired by the Assyrian friezes of Darius.

The Petit Palais, by M. Girault.—This very fine building, to me the gem of the Exhibition, covers a surface of 7,000 square metres, or nearly 1½ acres. It is intended, like the grand palace, to be a permanent home for French art, a State museum in fact, and will become the property of the City of Paris, for which the Municipality gave twenty million francs. As part of the Exhibition it contained the retrospective exhibit of French art, such as ivory, bronze, and ceramic work, furniture, jewellery, glass, &c., from the earliest times to the most recent. In construction it should be noted that in this building steel was used to only a limited extent. The walls were all of rubble faced with ashlar, the vaults and floors of brickwork set in gypsum, and the roofs, with a little steel, covered all. I was very much interested, in 1899, when I had the privilege several times of visiting all the works in progress, of seeing how these particular vaults in the Petit Palais were constructed. They were of brick, set in plaster, i.e., the plaster of Paris, which is the universal cementing material, without any centering, only a small curved template being used as a guide; the men worked very rapidly (as plaster sets quickly) in laying the rings or courses of the domes or vaults till the shell was complete; this formed a centre for the next, and even a third, if required, shell on top of this. The cost of this style of work, very light and very strong, was 40 fr. per square metre; it was very quickly built, and exerted practically no thrust on the walls. The internal stucco decoration was then laid over the surface of the vault as required.

Several developments of the ciment armé were worked out by M. Girault. One corner of the palace was built entirely in cement concrete, with a criss-cross of iron rails bedded in the concrete (38 kilo. the metre, spaced 0.80 cent.)—whereas, the adjoining walls were on piles in the ordinary way.

Then his floors were largely in ciment armé, details of which can be seen in "La Construction Moderne."

In plan this palace was D-shaped, the interior being a garden surrounded by a semicircular colonnade, round which was grouped a double range of galleries in a semi-hexagonal form for the exhibits; the straight part of the D formed the façade, the main entrance being

in the centre, leading into a fine domed hall off which were two lateral galleries at a slightly higher level, and at the ends or corners, two saloons, from which one enters upon the galleries at rear. Several modifications were made in the design in M. Girault's final drawings, and even during the progress of the works, in order to harmonise with the great palace opposite. The lateral façades were made more ornamental.

In front the chief feature is a semicircular porch, approached by a fine expansive flight of steps, and at the head of this a "gate of honour," with beautifully designed iron gates, gilded. The order employed in the façade is an Ionic one, with lofty bays in the intercolumniations, the shafts being free from the wall, while in the end pavilions the columns repeat the order but are "engaged." Sculpture is used in abundance, the central porch giving us some very fine "motifs."

Internally the decoration is as surprising as the scheme of the exterior, the vaults and domes being covered with relief ornament and sculpture, very fine in treatment and used unsparingly. The columns and pilasters are of a bright and cheerful pink tone.

The loggia surrounding the garden I have already mentioned, but the charm of this portion of the composition cannot be described. One sought this corner gratefully, away from the crowd, with intense relief, and one could study at leisure the work of the master hand who carried off the prize so easily from all his competitors. I refer to the architect M. Girault.

From the further side of the loggia we look back at the inner side of the central pavilion, with the dome and gilded lantern rising above, and the pediment with its gilt bronze figures; the spandrels of the large arch had two fine nude figures in bas-relief.

The Pont Alexandre III.—Time presses, and I must go on with the description of the Pont Alexandre. This, though a purely engineering work, claims our close attention, for were not two of the leading Parisian architects employed to co-operate with the engineers? As M. Lucas so admirably put it when reading his paper before the Royal Institute of British Architects:—"This Pont Alexandre III. will remain an irrefutable witness to the necessity of the alliance between architects and engineers in works of public utility. More than to any structure of our time can we justly apply to it the motto of the Institute—*Usui civium, decori urbium.*"

Can we point to any such example in England, or even in the world? And what is the result? The finest bridge, considered from either the constructive or decorative aspect, that has yet been seen, retaining its monumental character and bearing a great dignity in spite of its festal decorations. The names of its authors I have already given, but will here repeat them, for they are not to be forgotten—MM. Resal and Alby, the engineers, and MM. Cassien-Bernard and Cousin, their architectural collaborators.

The bridge is constructed entirely of steel, 350 ft. in span, in one low sweep, the rise being 6½ metres, composed of fifteen girders (representing the width of the bridge, which is of the noble dimension of 40 metres), each girder being in two pieces, hinged, or articulated at each abutment and in the centre to allow of the necessary spring (see small print). The roadway had to be kept level, or nearly so, with the approaches, in order that the vista of the Invalides should not be interfered with when seen from the opposite bank. The cost of the metal work used in this bridge was about 2½ million francs, and the accepted tender for the foundations amounted to over 1½ million more, 12 per cent. below the engineers' price. The contractors were MM. Lefellier and Boutriquin, who had already done the foundations of the Pont Mirabeau (one of the newest bridges in Paris), under the same engineers.

The chief decorative features are the pylons, the statues, the lamp standards, the parapets, and the cartouches. The pylons or monumental piers, 17 metres high, are two at each end of the bridge, with figures representing—

N. side.—France of the middle ages, by M. Lenoir;
France of to-day, by M. Michel.
S. side.—France of the Renaissance, by M. Coustan;
France of Louis XIV., by M. Marquesta.

On each pylon is a gilt group of Fame and Pegasus, each by a different artist, and designed with great freedom and vigour. Then there are the lion groups on each approach, which can be seen in the views.

The strain on the abutments is about 50 kilogrammes per square centimetre. It took over 7,000 tons of steel, all from the Creusot works (of Long Tom fame), laid from a lattice-framed gangway or temporary bridge, first erected to facilitate the placing the girders in position, and then removed. The abutments are in granite blocks from the Vosges, the only material, perhaps, that would stand the immense strain. The setting out was so carefully done, that on joining up in the centre the discrepancy amounted to $\frac{1}{10}$ of a millimetre on a total length of over 350 ft.

The foundations had to be carried down to a depth of 54 ft. on the right bank, and nearly 60 ft. on the other. Caissons were sunk in the proper positions, and afterwards filled with concrete and granite. Needless to say, compressed air was employed in the subfluvial excavations. Some very massive castings bedded in the abutments receive the ends of the fifteen steel girders, a pin, circular in section, separating the ends of the girders from the cup in the casting to allow of the necessary movement. Each outer girder weighed 107 tons, and the others 144 tons. The platform carrying the roadway is supported by vertical members, connected to the longitudinal girders and then floored over with steel plates riveted down to the substructure, and extending over the quays, as well, where a system of masonry arches takes the place of the steel framing of the bridge.

While we have the word bridge in our minds, I may here mention for a casual glance the other bridges of the Exhibition, though they are all merely temporary, and of no importance compared with the magnificent Pont Alexandre III. The one connecting the Palace of the Land and Sea Forces with the Quai de Billy was a light and graceful iron footbridge, or "passerelle," partly in lattice and partly in plate girder work. The footway was suspended from an arch in lattice work springing from masonry piers on each side of the river, the span being 80 metres between the piers, and the width 8 metres.

The Pont d'Iena, one of the existing bridges of Paris, was absorbed in the Exhibition site, and effectively disguised by being widened, the footpaths on each side being thrown out over the river on girders supported on cantilevers secured to the masonry piers of the bridge. All this extension work is to be removed, and the bridge restored to its former state.

Two other temporary bridges were built across the river for pedestrians, one close to the Pont de l'Alma, and one to the Pont des Invalides, both on piles, and constructed of timber.

Then, too, we must not overlook the numerous and picturesque footbridges of timber over streets and ways in the Exhibition itself, and which were most artistically treated in what we should call rustic woodwork, with domes in trellis work over, as we see in this view, with a profusion of decorative barndoor fowls symbolising France.

The Palace of Horticulture comes next in order along this bank, designed by M. Charles Gautier. It was constructed wholly of iron and glass, with lateral galleries separated by a central nave, and a rotunda at each end. The framework was of extremely light iron angle-bars; and trellis-work in wood, often in very ornamental forms and groupings, was freely used to conceal the ironwork. The dimensions of this palace were 270 ft. long, 100 ft. wide, and 67 ft. high.

It is proposed to hand over these buildings to the City, to be re-erected, in all probability, at Passy, or to be retained in their present position, if the municipal authorities so choose.

Pavilion of the Town of Paris.—Then we arrive at the dignified pavilion, which the municipality had commissioned the architect, M. Gravigny, to erect—a large and handsome structure, covering more than 5,000 square metres, constructed entirely of timber, for easy removal. It contained a very important class of exhibits, embracing the various classes of public works undertaken by the municipality, with curiosities and other things of historical interest and value concerning the City. It was planned with a large central court, surrounded with galleries on the first floor, with central

stairs for access to the galleries as the principal feature at each end internally.

Palace of Social Economy, &c.—Passing along, we come to the Palace of Social Economy, or the Palais des Congrès, by M. Mewes. It is about 330 ft. long and 100 ft. wide, and its execution was carried out in a peculiar manner, eight of the best known co-operative industrial associations combining to do the work. It is entirely of timber, covered with "staff," and no steel was used because there happened to be no trade union representing the metal trades. The treatment of the river façade was very broad and simple, standing on piles, and encroaching on the river bed. The bays were divided by broad shallow pilasters. It contained, besides galleries for exhibits, ample and lofty rooms for meetings and congresses of all sorts, and was largely used for such during the whole course of the Exhibition.

Old Paris.—Passing down stream, we come to old Paris, on the same bank, lending itself to the picturesqueness that would otherwise be wanting on that bank of the river. It extended over 750 ft. along the right bank, built almost entirely on piles, and in the hands of M. Robida, who was responsible for its restoration, has given us a delightful conception of a medieval town. M. Robida was assisted by seven other architects. I will not stop to describe in detail the various buildings there represented, the towers, churches, gateways, and streets, but will refer you to the pictures and other illustrations on the walls. Suffice it to say there were two main "quarters," that of the Middle Ages and that of the Renaissance. The principal buildings in the Gothic quarter were the Porte St. Michel, the Tour du Louvre, the Rue des Vieilles-Ecoles, the Rue des Remparts, the Church of St. Julien-des-Ménestriers, and the Pillory of St. Germain-des-Près.

In the more modern quarter we found the Châtelet, a fragment of the Palais de la Cité (its celebrated Grand Salle), the external staircase of Sainte Chapelle, the Tour de l'Archevêché, and la foire St. Laurent.

The Champ de Mars.—The plan gives quite clearly the position and extent of the palaces, with their grouping, and we shall glance at the buildings as we pass along the left side round to the right. For these buildings, the four on the flanks and the one at the end, the bill for the iron and steel construction, which was of the most economical materials, came to the little total of 6,000,000 fr.

The terraces, on which stood the Palaces of the Fine and Liberal Arts, by M. Formigé, from the time of the 1889 Exhibition, have been removed, and the inclined plane formed leading up to the Palace of Water and Fire. On our left is the Mining and Metallurgy Palace, by M. Varcollier; next it that of the Textiles, entrusted to M. Blavette; these are balanced by the Civil Engineering and Education Palaces, the former by M. Hermant and the latter by M. Sortais. At the end is the Palace of Mechanical Science, with the grand set piece the Château d'Eau, by M. Paulin, and behind it, only visible as regards its roof, is the Palace of Electricity, which takes the place of the central dome of the 1889 Exhibition.

The area of the Champ de Mars thus covered is more than sixty acres, and one can hardly realise the vast extent of the buildings and grounds until the dimensions are given in detail, as you will hear presently. At one time the Commission entertained the tempting idea of covering the whole of this space with one large roof, to mark the progress of steel construction, but funds and time did not allow of this scheme being thrashed out. Perhaps we shall even have this monstrosity in the Exhibition of 1911, when the next international display falls due, and probably lighter and stiffer metals will then be in common use. Indeed, we hardly know where the triumphs of electricity are leading us.

The Palace of Mines and Metallurgy. By M. Varcollier, architect.—This is a well-designed building, facing on the central avenue for an extent of 315 ft., and on the return front, parallel to the river, of 250 ft. At the angle where the two fronts join is the entrance, surmounted by a lofty dome, flanked by pavilions, containing each a circular staircase for access to the broad open gallery or loggia on the first floor. The steel framework is covered with wood, over which is the usual wire lathing and plaster painted in a happy scheme of polychrome decoration.

The entrance portion is very striking—striking in more than one sense—for over the

porch is a little carillon tower containing a fine peal of bells, which gave much entertainment to the crowds that assembled to hear the performances.

The interior was a vast place, of light iron-work, and the exhibits were so treated to lend themselves to the decoration of the avenues. It was a great surprise to see how such an intractable material, in the hands of the manufacturers, could be made to follow the most pleasing lines and groupings at will, affording a glimpse of the time when swords shall be beaten into ploughshares, for here were firearms and weapons of offence undergoing all sorts of contortions to present a decorative display.

The Palace of Textiles, the shortened form of the official name, the Palace of Yarns, Cottons, and Vestments, was still larger than the last, being 923 ft. long by 424 ft. wide—by no means a small building. It was undertaken by M. Blavette. It had similar conditions imposed on it as the others of this group, e.g., a broad open arcade on the avenue front, the first story being about 23 ft. from the ground.

The large entrance porch was very dignified, and treated, as were nearly all the buildings on the Champ de Mars, with a polychrome scheme in very good taste. The effect at night, too, was very happy. It should be said that this entrance, as well as the one opposite to it, was used to accommodate traffic in the evenings, when the galleries and exhibits were closed to the public.

From the drawings you will gather much more information than I can stay to give.

This view shows the angle pavilion, where the frontage line sets forward, and illustrates the external staircase for access to the loggia on the first floor.

At the end of the Champ de Mars we have the two palaces, or rather one palace in two halves, devoted to Mechanical Science and to Chemical Industries, with the masterpiece of M. Paulin in between, the Château d'Eau, closing the vista at the southern end. These two palaces I am now describing are connected at the rear of the grand cascade by a broad corridor at the first-floor level (you must not forget the inclined plane I mentioned just now). In plan, each half palace consists of three wide halls separated by narrower galleries. Each building is almost square, being about 456 ft. by 453 ft., with an external arcade, details of which you will see on one of the screens, and are worth your close attention.

Now for the Château d'Eau, M. Paulin's chef-d'œuvre, placed in front of the Palais de l'Electricité. It was built on rubble piers, at the head of the immense slope where the fountains and basins were laid out. Its principal feature was the vast architectural niche, 24 metres in diameter, from the head of which issued the water, the fall and jets being arranged in a very artistic and original manner. Most of this water was pumped from the Seine and was for the use of the boilers and condensers at work close by, as you will presently hear. Some charming sculpture and statuary groups, with fantastic and impossible monsters were scattered about, and the fountain jets added to the picturesque grouping and happy disposition of the architectural features of this remarkable piece of work.

But it was at night that one felt the indescribable charm, when lighted up by its thousands of lamps in ever changing harmonies of colour, and one carried away a never-to-be-forgotten picture of this fairy-like groto that scarcely seemed the work of human hands.

Palace of Electricity. By M. Hénard.—This was at the rear of, and masked by, the Château d'Eau, therefore the architect raised the roof of the gallery and threw all his inventive genius into the skyline he thus formed, a broad open cresting of metal and glass, like lacework by day, and suggestive of a fairy embroidery by night, with its changing lights. In the centre was a figure symbolic of electricity, borne on a car, drawn by two symmetrical animals, a Pegasus for the poetry of science, and a dragon for its material power, backed by a metal sun 40 ft. diameter, placed at a height of 66 metres, nearly as high as the towers of Notre Dame. The palace measures about 230 ft. high, and its front extends the whole width of the Champ de Mars avenue, 150 metres long. Its construction was entirely of iron and glass.

It was owing to the enormous machinery power for driving the dynamos, &c., in this

building that the vast quantity of water—72,000 litres per minute—was required; this complicated the problem, and resulted in the Château d'Eau being emphasised at the expense of the Palace of Electricity.

M. Hénard had also another delightful work in hand, the Hall of Illusions; two drawings on the walls describe this by a plan and a view of the interior. The astounding effects of changing colour and infinite space that one can scarcely describe were produced by large mirrors and coloured lights.

The Palace of Civil Engineering, by M. Hermant, is the counterpart, as regards size and disposition, of the Palace of Textiles, which it faces. The entrance porch, of which you see a view, with further details on the walls, is 27 metres wide; on each side of this is the usual open arcade and gallery, over which is a fine frieze, 2½ metres high, in an appropriate architectural setting, representing the various means of transport, by M. Allard. The detail gives an idea of it.

Instead of the ordinary iron lathing or wire netting we usually find as the foundation of the decorative plaster work the contractors here used flat sheets of metal punched or stamped out into tongues, which projecting formed the key for the plaster.

The Palace of Education, M. Sortais, architect.—This palace, covering over 27,000 square metres, is similar in its general lines to its fellow opposite, the Palace of Mines, first described. Its angle pavilion is very charming, best illustrated by the drawings, with the delightful campanile of about 150 ft. high.

The steel construction of this and the last described building (Civil Engineering) was exceedingly economical, being built up entirely of small sections, which meant easy handling, quickness and facility of construction, and cheapness of execution. We again find the open gallery or loggia which was imposed on the architects of the neighbouring buildings.

The Salle des Fêtes, by M. Rautin, was one of the attractions of the Exhibition, and is destined, I trust, to remain for some time to come, although its fate is not yet settled. It must be remembered that the old Machinery Gallery of the 1889 Exhibition remained standing, and was absorbed into the 1900 one, but the centre portion of this was screened off, forming a square in plan (although the impression to the spectator is a circular plan) and will accommodate 20,000 to 25,000 people. Its dimensions are 535 ft. by 460 ft. on plan. The dome is 300 ft. diameter, and is 147 ft. from the floor.

It may be that by now it is decided to remove the whole of the old Machinery Gallery, including the Salle des Fêtes, in order that the facade of the Ecole Militaire may be shown more adequately, as intended by its architect Gabriel. This scheme is favoured by M. Bouvard, Architect to the city of Paris, who wishes to turn the Champ de Mars into a fine public park, but the public and the Press are very much against it.

Two artistic façades form the screens which divide the hall from the two ends of the Machinery Gallery. Models and studies were made for this hall to a large scale, allowing all the details to be seen and worked out, leaving nothing to remain to be executed at haphazard. The result was something charming. The coloured glass dome was most happy in its effect, not vulgar, but very soft, the ceiling paintings and reliefs were things deserving of a permanent shrine, and the ironwork supporting the dome and roof was most graceful. The study of this charming interior would well repay a careful student. Unfortunately, I could obtain no slides to adequately show the effect of the interior, but on the walls are some details of the decorative work in painting and modelling. The four great panels were by M. François Flameng, M. Rochegrosse, M. Maignan, and M. Cormon.

Before leaving the Champ de Mars there are a few little buildings at which we might glance, to see the festal character of the pavilions erected for the purposes of the shows and attractions. The Luminous Palace, the creation of M. Ponsin, carried out by M. Latapy, on a special site near the Eiffel Tower. Glass formed almost the entire material of the structure, and at night the whole was illuminated, walls, columns and all, by electric lights skillfully concealed, and arranged to change the colours at will.

The next is the Women's Palace, for the exhibits connected with the fair sex, and is a type of the temporary structures I am speaking

of. It shows the French are not afraid to spend both brains and money on merely ephemeral buildings, and to do their utmost to carry out our own motto, "Design with beauty."

Next we have the Pavilion of Ecuador, at the foot of the Eiffel Tower, which is rather more flamboyant than the last.

Lastly the Café de la Belle Meunière, known perhaps to some of you who are fond of interiors.

Turning our attention to the buildings on the left bank of the river, beginning at the west end and proceeding up stream, we see first the Globe Celeste, the most unfortunate of the private speculations of the exhibitors. Undoubtedly most valuable from an educational point of view, and certainly bearing a charm of its own with the architectural character of the base and setting, this side show suffered by the alarming accident that happened in the early days of the Exhibition, when the bridge leading to it from the Champ de Mars fell down during the process of striking the centering, and the show was at once closed by the authorities.

Then we come to the Palace of Forests (with Sport generally), over 600 ft. long on its river front, constructed entirely of wood, and decorated with the various forestry exhibits and ornamental timbers. It was designed by MM. Tronchet and Rey, who were also entrusted with the neighbouring Palace of Navigation. This was also on the river front, beyond the Pont d'Iéna, with a façade of 480 ft. long. This also was a timber structure, built in a fashion similar to our steel construction, and covered with "staff," the decorative details being most charming, suggested by slips and their trimmings, and affording materials for many hours' sketching.

After this is the Creusot Pavilion, the exhibit of the great firm of Schneider, who carried out the steel work of the Pont Alexandre III., a huge domed pavilion, painted in red oxide. Why this hideous structure, out of scale and colour with its surroundings, was allowed to be planted down on the river bank, and spoil the otherwise picturesque view, I cannot conceive. It should have been relegated to a back site. Its construction was very interesting, in spite of its ugly appearance, and well repaid study, but its position was unhappily selected. The diameter of the dome was 140 ft. and in height it was 105 internally; this was covered with a lantern or belfry. The framing of the dome was of twenty-four curved plate girders, connected at intervals horizontally by box girders, the lower ends of the ribs resting on steel roller bearings.

The dome itself is of cement slabs on a wood sheathing, although the colour it was painted was the contractor's usual coat of red oxide of iron, that suggested iron wholly in its construction, and deceived one so much that one began to hunt for the rivets that were not there. The entire weight of the lantern and dome was some 400 tons.

Another constructional point to be studied was the system of covering the railway cutting which ran under a portion of the site.

Within was one of the famous Long Tom guns, on a revolving stage.

Then we pass on to the Army and Navy Palace, or, to be correct, the Palace of the Land and Sea Forces, an immense building, bordering on the river, for more than 340 ft. in length, designed in a style more or less mediæval. It was built of wooden framing, trussed up with iron tie rods and bolts, and the plaster covering was attached in slabs nailed to the timbers, then an external finishing coat, and the decorations were laid on this.

Next came the Palace of Hygiene, of which I have no illustrations or drawings.

After that the Pavilion of Mexico, one of the streets of foreign nations that I shall presently deal with.

Passing on and crossing the end of the Pont de l'Alma, by another of those picturesque footbridges already mentioned, we enter the Street of Nations, which for the moment I will pass over, and come to the remainder of the Exhibition buildings on the Esplanade des Invalides, returning afterwards to complete our tour of the Exhibition by the Rue des Nations.

In order to preserve the vista ending in the dome of the Invalides, for which the Avenue Nicholas II. and the Pont Alexandre III. were designed, M. Picard, the Commissioner, arranged the palaces of the diverse industries on each side of the continuation avenue. Two

half palaces at each end and two others in the centre form the group that borders on the east and west sides of the Esplanade des Invalides, all too narrow in width, I may remark. Looking towards the dome, the buildings on the left were reserved for French work, and those on the right for the various foreign nations. All are of the lightest possible construction consistent with safety. Their contents were the exhibits of those industries that minister to luxury and to the surroundings of our public and private life.

The two palaces facing the quay are those of the National Manufactures, with curved porticoes, the work of MM. Toudoire and Pradelle. The slides and drawings will give all the details, and illustrate more fully than my description the richly decorated architecture. In extent these cover a surface of 12,000 square metres. In the large wall surfaces and panels are fine allegorical frescoes by such eminent men as Paul Buffet, Vauthier, Chabas, and so on.

Of the two centre palaces, that on the left looking south, is by M. Esquie, and is balanced on the right by one similar in extent, and following the general lines, by MM. Larche and Nachon, the delightful details of the latter being suggested and based on the French flora, and reflecting great credit for their freedom and vigour on the designers and sculptors.

These palaces are to shelter the exhibits of the various industries connected with our homes, such as decorative furniture, window glass work, goldsmiths' work and jewellery, bronze and iron work, and so on.

Unfortunately, I have no slides to show either of these in a proper manner, but on the screens are several good drawings and photos of both palaces.

The next four slides give some of the details of the forms taken by the decorations, based on the flora of the country:—A campanile, capitals of the first-floor arcade, an angle cartouche, and keystones of the arches. These show the originality brought to bear on the temporary works of this portion of the Exhibition.

At the south end of the esplanade are two half palaces by M. Tropey-Bailly (for ceramic work, which showed up very strong in this Exhibition, and for glass work), with the wonderful Invalides front, on the Rue de Grenelle. This elevation consists of two symmetrical façades, with an exceedingly well treated frieze in bas-relief representing the Decorative Arts and Labour. Notice must also be taken of the graceful pinnacles in white and gold, and of the two pavilions immediately inside the entrance, with the semi-circular hallowed fronts forming a charming little circus. The grouping, and, in fact, the general arrangement and treatment of M. Tropey-Bailly's work is most happy.

In front of the half pavilion here shown stood a remarkable exhibit of Sèvres ceramic ware, the fountain, which may be seen in some of the views. This is destined to stand in the Champs Elysées after that thoroughfare has recovered from the upheaval caused by the Exhibition works.

The portico, too, also in Sèvres ware, which also stood in the Esplanade des Invalides, is destined to be re-erected in the Square of St. Germain-des-Près, or its immediate neighbourhood.

The Street of Nations.—This I will describe in the reverse order to the way we have travelled. The more important buildings are near the Pont des Invalides, where the Rue des Nations commences.

Italy has on the Quai d'Orsay the largest and most imposing of all the foreign pavilions, a florid building in fifteenth century style, consisting of a cathedral-like structure, with suggestion of Venice, Florence, and Pavia. This has a central dome with four angle cupolas, all gilt. The windows, which are very large, are filled with tracery.

The interior is very imposing, but suffered by the crowds of stalls for the sale of so-called works of art and small mementoes, destroying the dignity of effect that otherwise would have had an effective charm to a person who could be left alone to enjoy it, but the pity was you could not be left alone. The architects were MM. Carle Coppi and Salvadori.

Turkey.—Of this I have unfortunately no slide, so must refer you to the long panorama on the wall and the photos on the screens. The Ottoman Pavilion is more modest than the Italian and has more reserve, and the work was

entrusted to a French architect, M. Dubuisson, who has suggested one of the innumerable mosques of Stamboul.

United States.—A bold and dignified building, with a great porch on the river front, forming the background to the equestrian statue of George Washington. The building is simply planned, and effect is produced by the lavish use of statues, groups, and the omnipresent American eagle. Other features to notice were the well-lighted interior, the bold staircases, the number of lifts, and the colour decorations. The architects were MM. Coolidge and Morin-Goustaux.

Austria.—The architect was M. Baumann, who has produced a pleasing exterior suggestive of the Louis XVI. style, but partaking of the nature of a hunting-lodge ornamented with grotesque beads, festoons, and garlands.

Bosnia.—Nothing is worth particular mention in this building except that the wooden eaves are very bold and the corbelled-out balconies are suggestive of Turkish work. The architect was M. Panek, who adopted rather a rural style for his composition. Its scheme of decoration was in blue and white. The tower represented a kouba, or old Bosnian dungeon.

Hungary.—This was rather a medley of styles, embodying nearly all that had existed since the foundation of the Magyar State. MM. Zoltan-Balint and Jambor, of Buda-Pesth, were the architects. The south side, on the Quai d'Orsay, was Romanesque; the north, or river front, was Gothic; the tower was a reproduction of a church tower with an unpronounceable name, and the doorways were also exact reproductions from other churches. The Salle des Hussards (see view) was a notable feature of the interior, with an original decoration.

The British Pavilion, very small beside some of its neighbours, and of which I could not anywhere obtain a slide. It was intended by the British Commission to make this the special show of our native construction and decoration, and the plan decided on was to reproduce an old English manor-house. Mr. Lutyens was entrusted with the commission, and he has given us in the north front a replica of that of Kingston House, near Bath, the other façades being adapted from contemporary buildings.

Its construction was entirely of steel framework, for easy and future removal, for which Sir B. Baker was responsible. Various well-known firms undertook the decoration and furnishing of the interior. The City of Bath sent the pieces of Elizabethan work in the Library; the great gallery was adapted from the Cartoon Gallery at Knole, near Sevenoaks.

It would be impossible to name in detail all the firms who have contributed, but I must here thank Mr. Geo. Wragge for the loan of some photos and a cartoon of his stained-glass windows in the dining-room. These are on the walls and may be seen afterwards.

This has been dismantled, and possibly at the present moment has been entirely removed.

Belgium.—On the other side of an open space, on which abuts the British Pavilion, is the Pavilion of Belgium, an exact reproduction of the Town Hall of Oudenarde, with all its florid Gothic detail and profusion of carving. This was entrusted to MM. Acker and Mankels, who preferred to present to us the masterpiece of Flemish work in the sixteenth century (1525-1530). Now destroyed.

Norway has arranged a pavilion distinct from Sweden, and the commission was entrusted to M. Sinding-Larsen. Its style was peculiar, and it was entirely constructed of wood, lavishly coloured.

Germany, which comes next, has quite a festal appearance, with its elaborately-coloured walls and exuberant detail. Inside there was a fine rich staircase, wall paintings everywhere.

Spain.—Next to it, in this view, is the Pavilion of Spain, the work of M. Urioste y Velada, who has suggested the Sevillian type of architecture, the details being taken from various well-known buildings of the Renaissance. It was planned round a central courtyard or cortile, formed with colonnades and balustrades, one lofty tower and others more modest. The whole was very dignified in effect.

The pavilion has been recently destroyed, fetching about 1,000l.

Monaco.—Next we see the Pavilion of Monaco, the little principality that has made a big show. In this view, before we leave it, I will point out

also the Pavilion of Sweden. Monaco has presented us with an Italian type of architecture, and a fine tower suggestive of the Palazzo Vecchio in an imitation granite.

On the return front is a double loggia, the vault of the upper one being decorated in a scheme of blue.

Sweden.—An extraordinary building, which I confess I am unable to describe to you. But the wall picture will sufficiently illustrate anything you may wish to use up in your next competition. M. Boberg was the architect.

Greece comes next, the production of M. Magne, architect, in the Byzantine style, a brick (or imitation brick) building with a stilted cupola covered with red tiles.

Serbia, almost the last of the range before we reach the Pont de l'Alma, affects a florid type of Byzantine, an octagon dome over the centre, and external arcades rather highly coloured. Small cupolas cover the angles. M. Baudry was the designer.

It is at present uncertain if any of these foreign pavilions will be preserved, for the matter is still under discussion. Several schemes are yet in the air, but in all probability the whole, or the majority, of them will be removed.

The Chairman, in inviting discussion, said they must all have been greatly struck by the excellent way Mr. Wonnacott had made use of his time in Paris, and the interesting manner in which he put before them the knowledge he had acquired. The way in which Mr. Wonnacott had dealt with the inception of this great Exhibition and then of the organisation by which it was brought about and the construction, science, and art shown in it, would be of great value to all of them, and he congratulated Mr. Wonnacott on his effort to carry out the spirit of the prize, which he won in competition with several other candidates.

Mr. C. H. Brodie briefly proposed a hearty vote of thanks to Mr. Wonnacott for his paper and for bringing before them such a splendid collection of drawings and lantern slides.

Mr. Bamford Slack said he seconded the vote of thanks with considerable pleasure. In the course of a ten days' visit to Paris last year he had endeavoured to see the fringe of the Exhibition, but he had found it impossible to look more than into the corners of it. He was not an architect, and the features which struck him as the most interesting were not necessarily the architectural beauties of the Exhibition, though wherever one looked one could not fail to be struck by the beauty of many of the buildings. The fact which struck him, as a layman, most was that although the buildings were of such enormous size, they were so beautifully proportioned that one did not dwarf the other. In the case of the Grand Palais, it did not dwarf the Petit Palais, which was so closely opposite to it, and one did not realise its massiveness, so well as it proportioned. Looking at the Exhibition, quite apart from the architectural point of view, there were five features which pleased him most, viz.—the British Pavilion, with its exhibits of all that was best in British art; the Petit Palais, which was crammed full of the art treasures of France; the Grand Palais; the tapestries in the Spanish Pavilion; and the German collection of French pictures made by Frederick the Great. The Château d'Eau was exceedingly beautiful at night. But, to his mind, the most wonderful thing in all Paris—in all Europe—was "that wretched thing," as the lecturer had called it, the Eiffel Tower, which he always regarded as the greatest triumph of the skill of man that Paris could show. He said that at the risk of shocking the feelings of architects; but he could not help feeling that the Eiffel Tower was a wonderful monument of what man could do with a few bars and rivets of steel.

The Chairman, in putting the vote of thanks to the meeting, said that one result of Mr. Wonnacott's paper was to show them the state of art in France at the beginning of the new century. It showed how insensibly the functions of the architect were being changed by the architect being placed in co-operation with the engineer, and it showed how essential to the training of an architect was some knowledge of science and scientific construction, as well as the principles of art. No doubt that tendency would become more pronounced, and though the functions of architects and engineers were in a way separate, yet it was most desirable that the members of those two professions should understand

better the work of one another, and he hoped before long English architects and engineers would work more in alliance than they had done in the past and were doing now. At the present time the importance of this did not seem to be realised, and it would be impossible under the present order of things to produce in London a bridge like the New Alexander III. bridge in Paris—not only because we had not the same art feeling that the French had, but because the public had no notion of the absolute importance and necessity of an alliance of an architect or architects with an engineer in the production of a monumental structure like a bridge over the Thames.

The vote of thanks having been heartily agreed to,

Mr. Wonnacott said he had only read a portion of the report which, in fulfilment of the conditions imposed on him, he would submit to the Association. He should like them to include in the vote of thanks the name of Mr. Lutyens for his kindness in lending for the occasion his drawings of the British Pavilion, to Mr. Geo. Wragge for his kindness in sending one of the stained-glass lights, and to the Royal Institute of British Architects for lending him several of M. Charles Lucas's collection of drawings of the Exhibition.

The Chairman announced that the next meeting, after the special general meeting previously referred to, would be held on March 15 when Mr. H. B. Measures would read a paper on "Rowton Houses."

The meeting then terminated.

THE SURVEYORS' INSTITUTION.

THE following is the remainder of Mr. Thomas Blashill's paper on "The Present Condition of the Building Industry," which was read before the Surveyors' Institution, Great George-street, on the 25th ult, and the first part of which was printed in our last issue:—

"The trades-union is a natural engine for accomplishing what the isolated craftsman cannot bring about for himself. If it had been instituted in these days, when every section of commercial and professional life, however small, has its society to look after its interests, nobody would have given the matter a thought. If its methods differ from societies of another class, it is because the wants of its members are different and must be differently met. From a perusal of the rules, kindly given to me, of some important trade societies, I fail to see anything to which reasonable objection can be taken by an impartial person. Apart from unemployed and sick benefit and the preservation of internal harmony, their object is the protection of the trade rights and the privileges of the members. They go beyond the rules of our professional societies in certain matters, as in the limitation of the age at which a person may enter the trade, but that can only apply to their own members, and if we should think such a policy advisable we could do the like. If they prescribe the lowest rates at which their members may work, so might we. The constitution and proceedings of branch societies are very strictly regulated. It may be that those proceedings are with equal strictness supervised, though I do not see how this is done. But as the union must to a large extent be responsible for the conduct of its branches, that is a point of some importance, and I shall have more to say upon it. So far as the union is concerned we may look upon it as the thinking soul of a body every particle of which is supposed to contribute to the process.

With the regulation of wages and hours of labour, important as such details may seem, I shall not concern myself. These are regulated, not on any fixed principle, but with reference to time and place and circumstances, and so are many other trade regulations, and though these must not be overlooked, they are dwarfed by comparison with the great principle at the bottom of disputes between capital and labour. To put the matter in a nutshell, it is the prevention of "sweating" and the improvement of the position of craftsmen as a whole. In this consideration questions between payment by time and payment by results play a leading part. Not that, in the eyes of the workman, there is anything specially sacred in either alternative. There are now far more workmen, trade unionists, paid by the piece than are paid by time, and the principle of payment by the piece is as

stubbornly fought for in certain trades as is payment by time in others. The question is by which system the dangerous and abhorrent practice of "sweating" can most effectively be prevented. If a man is working with a machine that can be driven at an increased speed, at the will of the employer he can be made to turn out an ever-increasing quantity of work while his wages may remain the same. That is day-work "sweating," and in such a case it is only through payment by the piece that the machine hand can get a fair return for his increased labour. But if men are working by the piece at a pace regulated only by their own strength or energy, the man who is the strongest and the quickest will earn the most, and the employers may lower their rate of pay not only to him, but to the workmen all round. This is piecework "sweating" combined with individual bargaining, and the building industry is one of those in which from bitter experience it is resisted with might and main.

I am not quite sure that sweating is inevitable with piecework, but before discussing that matter we will try to see what day work really is, the fair day's work for which a fair day's wage is the equivalent.

The late Baroness de Bunsen, the daughter of a very capable mother, tells how that mother when placing some additional household duty upon her would say, "It is all in your day's work." She adds, "That idea of a day's work, as much as one's strength can perform and no more, but not less, and limited to a term, the day, was always fully satisfactory to me, and it is equally satisfactory now." That is the notion of the energetic house-mother who, so long as she is awake, must always be doing something for her home and family. It also describes the habit of the energetic man who is working for himself. But if such a task were put on the shoulders of men in a free country, paid by the day or hour, it would not be borne.

It would bring us back to the fourteenth century, and the struggles of the bondmen, who thereby, and by many a struggle since, have reduced the day's work within bounds more reasonable, if less easily defined. The day's work, even in the eyes of the employer, is not a day of exhaustive toil. Perhaps it may, at the highest, be defined as so much work within fixed hours as can be done by the ordinary workman comfortably—that is, without injury to his health and without diminishing his capacity for enjoying the rest of the day as he may think fit. I put it as high as this because the day's work is a valuable commodity which he has to sell, and if he unduly diminishes it he must in the long run be the loser. But, in practice, the day's work will be so much work as the workman and the employer with this knowledge before them are fairly contented to give and to accept at the date and under all the circumstances. There must be security against sweating, but if the workman puts in much less than this he runs the risk of outside competition, encourages the employer to look out for cheaper ways of getting the work done, or even diminishes his desire to have it done at all. I know it has been said that labour is not a commodity in the ordinary sense; but "labour" is often confused with "time" with mischievous results. Not workmen only, but the rest of us, get into a habit of talking about our "time" as if it were something valuable by which money ought to be made. But mere time is worthless to any one except the owner, perhaps to him. No employer would think of paying for it. We are confusing the means by which a thing is measured with the thing itself. This notion of payment for time seems to be at the bottom of the aversion which some thinkers on the labour question feel to treating labour as a commodity to be dealt in by purchase and sale. It would be doubt to be a hateful thing to buy and pay for so much of a man as his necessity forced him to sell. What the employer really buys is so much improvement to the material which he puts before the workman as may reasonably be expected to be done in the time by which the payment is calculated. This is simply measurement by the town clock instead of by the 5-ft. rod, and if a day's work were a fixed quantity the clock would measure it as accurately and much more conveniently than any scale of feet and inches. So long as clock measurement is fairly used by both parties, without hurrying or chasing on the one hand and without loitering on the other, its record should be fairly satisfactory. But if we look

at the matter honestly or guilefully, it is impossible to get out of the fact that directly you interfere with the rate of work, payment by time becomes piecework under another name. Not only from what I have said, but from a study of the disputes which often arise over the day's work is this evident. When we come to the question of loitering I will give two or three illustrations of this.

The desire to have an easy life is common amongst time-workers of every class. A great modern novelist found subjects for his satire among gentlemen engaged in the public service, and one has heard of conspicuous instances in real life. In fact, short hours and light work seem to have been traditional in times past in certain offices. A few weeks ago there died a very aged gentleman who could recall the time when his office hours were from eleven to two, while the holidays were just as exemplary. If a workman is merely idle, he is only like many more of us who prefer an easy time. An employer must recognise that, and take his chance of being recompensed by extra energy in some other quarter. But when men are working together so that all must go at the same pace, the pace will be that of the weakest, the least energetic, and the slowest. In such a case health and strength and briskness go for nothing, and to the employer it may be just the same as if his whole staff on that particular work had been recruited from the class to which the feeblest among them belongs. A judicious employer will therefore select his slowest hand with some care.

There is, however, a far more serious matter than mere idleness. It is the deliberate loitering of which employers have long complained, the effect of which is to prolong the job so as to delay the day when the men will have to be paid off, or so as to keep the work longer in hand for the benefit of workmen in general. I am disposed to put down the few bad cases that came under my notice to natural idleness with lax supervision; but this is not the view taken by such employers as have dealt with the subject. The reading of a paper by Mr. Brassey, now Lord Brassey, at the Royal Institute of British Architects in 1878 brought out much evidence on this subject. Messrs. Lucas had found that labour on brickwork which had been estimated on previous experience to cost 2*l.* 17*s.* 0*d.* or 3*l.* 3*s.* 0*d.* per rod actually cost 5*l.* They found that although they had provided machinery which should have made up for the recent rise in wages, the cost of building had actually increased by 20 to 30 per cent, the cost of materials remaining practically unaltered. This, they say, was entirely due to the small amount of work done by the men. They found, in fact, that men did little more than half the work for ninepence per hour than they formerly did for sixpence. Mr. Lucas said that the unions forbid piecework, with the object of obtaining "the largest amount of pay for the smallest amount of work in the least number of working hours," so that "the public are hit all round."

One or two architects were shocked because this statement as to work and pay and hours was defended by a trades-union speaker, though I think he had only meant to embody the desire that most of us have to sell our services at a higher rate. But the professional man, whether he may be paid by time or by the piece, manages the matter by raising his charges if he can, while he either goes on giving the same service, or even making it more or better. Wages, like fees, may rise or may fall, but I think we shall be of opinion that the service, if it is not excessive, should remain at least the same. We will make a note of what was said about "the public," to whom I have not yet alluded.

The view of contractors in general on this point may be gathered from a list of lowest tenders extending from 1880 to 1898, in which stock brickwork rose from 11*s.* per rod to 20*s.* and even to 22*s.*; a rise of 100 per cent. But no item in the cost of brickwork had risen very seriously except bricks, which had gone up 30 per cent. Bricklayers' wages had risen only 10 per cent., and the explanation given by contractors was that the men did less work. Contractors have been saying recently what was said twenty-three years ago, "It is impossible to calculate beforehand the cost of labour." Contrast this with the labour on the rapid construction of America, where, as the *Times* correspondent says, the engineer watches his machine even during his meals, and where an English traveller has recently reported that every one saves time and does

his best for his employer. For all this there must be a reason.

I have quoted enough to show what employers have publicly stated as to loitering and what their tenders prove. One instance was given to show that it was systematic. Some Gothic capitals, for which 5*l.* each had been provided, were given to the men, and the first one cost that sum or less, but the others cost 8*l.* each. It was explained that the shop steward had said that they were worth this sum, and they must be made to come to it. Many similar cases have come to me at first hand. A foreman set a new hand to do some piece of joinery which he considered would be finished well within the day. After an hour or two he noticed that there was practically no progress, and, on remonstrating, the man replied, "This job is a day and a half;" so they parted, and it was done in half a day. This is fixing the quantity of work to be done for a day's pay, and is really piecework disguised as daywork, and it points to a system well enough understood to be acted on by the individual workman without the help of a shop steward.

Another instance carries the matter much further. A foreman on seriously discussing with the leading hand or perhaps the shop steward, on a job, the delay plainly evident, was told that the amount of the contract for the particular work was so much, there had been three-fourths done, and the cost had only been so much; there was, therefore, no occasion to complain as yet. Upon that view this was not merely piecework, it was partnership—a limited firm in which one partner took so much as he considered to be reasonable, leaving the other, who had no voice, just so much as ought to be left for him. The mischief of this reaches further. If this division of the profits were frankly understood the men might finish off the work at their own pace, and take their share. But being on daywork they can only take it out in hours, and however the employer or the public may suffer by the delay, delay there must be. The sagacity of the plumbers of Chicago has shown them a more excellent way. They fix what they consider their day's work of seven hours, do it in five or six hours, and take their full day's pay. Surely this is piecework pure and simple!

In the discussion of 1878 a labour leader met all statements as to loitering by laying the blame on incompetent foremen. He said a foreman should know how much work a man ought to do. So he should, no doubt; but the foreman's story is that it is useless to attempt to get more work even by turning off men when the new hands do only the same as the old. My own impression is that this is scarcely true. A foreman is of real use when he is good-natured and firm, and has at his back an employer of good position, but who may be depended on to shut up the work when he feels he is being badly used. I think this is the reason why certain employers of high standing can get work done cheaper than some others.

There are many things charged against workmen besides loitering. Some of them, though very troublesome to the employer, have grown out of a reasonable anxiety to prevent disputes among their fellows in other trades; others appear to be the fag-ends of old trade customs; others arise out of the splitting up of a trade into branches, which, under certain circumstances, has its convenience, but they may be mere substitutes for loitering. There are also impediments of progress in work caused by a genuine anxiety to keep their trade free from intruders—at the expense of the employer. And in certain trades there is grave obstruction caused by a bigoted adherence to a rule against overtime, even when an emergency occurs that demands some trivial relaxation.

The demand for skill of various kinds, the diversity of materials and the necessity for different tools, must naturally have suggested the division of the building industry into separate crafts. The principle is good if not carried too far. Work in stone differs radically from work in wood. Carpenters differ just enough from joiners to justify division so long as convenient. "Three-branch" hands may flourish where work is scarce and lies wide, but they become one-branch in busy towns. Workers in brass and zinc and tin and iron may be divided so rigorously that an article passes through half-a-dozen hands when it might be finished by one or two. When it took ten men to make a pin I suspect that

about five of them were practically lookers-on, till the machine produced a revolution that swallowed up not the five only but the ten. That is a melancholy but common story.

What is convenient when you are manufacturing by the gross may be folly when a single article is in question or in case of an emergency. If there is to be no elasticity, a bricklayer, however handy he may be with his trowel, could not stop a rat-hole in a plastered wall. The frequent disputes amongst bricklayers and plasterers and tilers that engage the attention of unions, arbitrators, and the Labour Department of the Board of Trade may lend interest to life, but these battles should not be fought at the expense of the employer or ultimately of the client.

By all accounts the plasterer gives more trouble by his trade regulations than any other craftsman. He claims work that other workmen think to be theirs, and he insists on doing his own work in an expensive way. In an important provincial town, after a strike over the allotment of some work to floors between plasterers and bricklayers, an agreement was come to, and after further delay, through disorganisation, the work recommenced. Then the plasterers objected because the labourers wheeled the plaster or mortar in on a barrow instead of carrying it on a head-board; they objected again because the labourers mixed plaster for cornices on a board with a trowel, and so it had to be mixed in a bucket and stirred with a stick. In a building some little cement work had failed to be done on a Saturday so as to be hard and ready for other trades to follow on next week. The foreman plasterer, to avoid delay, remained behind for ten minutes and did it himself. This was seen and reported to the local lodge, which fined him a pound for working overtime, that being strictly forbidden. The rules, in fact, seem to have been so strict as to forbid a concession to the convenience of the employer not much more onerous than any workman might, out of mere politeness, make to a stranger in the street.

I need only refer to such matters as limiting the things that may be done by labourers, and the loads that may be carried, and the tools that may be used by workmen with the object of delaying the work or getting out of it as much money as it may be supposed to owe to the workman. When in early youth, I saw on the Continent certain tools that did their work quickly. I was told by an old workman that they were well enough known here, but they were "unfair" tools, because they got through work too fast. I should like to show him now a machine that does the work twenty times as fast. And, to mention another subject akin to this, the dependence of a grown man on work that in most other countries would be done by boys or women in the expectation that a "living wage"—enough for himself with his household—can be made out of it, is risky, to say the least. Besides the effect of machinery, of articles ready made, and of imported goods and outside labour, besides, even the great questions of work lost and building projects abandoned, there is the exceedingly important question of work lost to trades by changes in modes of construction, apart from the policy of employers or employed.

The demand for fire-resisting construction has already affected very seriously the trade of the carpenter. In London and other places public buildings and many others must by law be constructed very largely in fire-resisting materials. Fire-resisting floors are necessary over certain shops, and will probably be demanded over all. I have found floors of steel and concrete cheaper than good floors of wood. As an examiner in building construction, protests reached me against questions on the framing of floors, because that subject was all out of date! Timber partitions are out of date, and for a large class of buildings wooden roofs will follow suit. In rebuilding the Cripplegate area after the great fire, hardly a roof has failed to be voluntarily made fire-resisting. If the rise in the price of timber is maintained the use of substitutes for carpentry and joinery will be automatically increased. Asbestos that can be fixed dry is dangerous to the joiner as well as to the plasterer; whatever work steel and concrete cannot do it will. The wooden staircase, with scientific handrailing, is gone from important buildings, and wooden lining to the walls and ceilings is gone; all with enthusiastic final arewells! Such losses are beyond preven-

tion, but there are others which might be temporarily staved off.

Masons' work, which for a time recovered its place after its long struggle with imitative cement, has now to compete with cut brick-work and the more threatening terra-cotta (the work of the potter) in most of our finest buildings. It is said that this change was brought about by a masons' strike, but, as a fire resisting material inside or outside a building, stone as hitherto used in the City of London is discredited finally.

In the case of the plasterer, trade disputes are dangerously interesting. From the nature of his work he is the most unpopular artificer to have about a house. In a new building just as the walls are getting dry he comes in and makes everything in a mess for two months or three. Then they have to be dried again. Every effort is being made to dispense with him. Lath and plaster work is forbidden in fire-resisting constructions. There are a dozen substitutes for plaster—none, perhaps, quite so satisfactory. A single architect is now using one of these by the acre. Brickwork is being left bare or painted or whitewashed or "dinged," or covered with prepared papers or linocrusta or compo-board or incombustible panelling. Walls that fifty years ago would have been covered with plaster are now finished with glazed brick, or even terra-cotta.

But the plasterer seems to have let slip the artistic and interesting branch of his work. Old ceilings that in this country used to be covered with ornaments, cast or worked in situ, ceilings that all over the Continent are now elaborately ornamented, are being done in imitative materials. The richest panelled ceilings are put up in stamped steel. All this while the County Council is giving fabulous thousands to preserve a house in Fleet-street rather than ruin by removal its ceiling, which is a relic of a decaying art.

May we not detect a process something like this in rapid development? All work that requires special skill is getting done by men or by processes outside the regular trade. Work of the simplest kind is being taken up by machinery. And machinery is rapidly encroaching on that which is left between these two. I find in the church records of a small provincial town that, four hundred years ago, when they required a new image of the highest object of their reverence, they employed the very man who hung a gate, mended the bell frame, or set up a pew. When, in early days, I drew and modelled a coat of arms badly, the village mason saw the point and carved it well. His predecessors had furnished the churchyard with tombstones that art enthusiasts now sketch and publish. When I asked one who undertakes stone-carving in a large way whether his men were made out of the better sort of masons, I found that this was not so. The fact that a stone-carver holds his chisel just a shade differently from a stonemason does not seem an insuperable obstacle.

I will only say of brickwork, which seems the least liable to be supplanted, that concrete is encroaching upon it fast—concrete that just failed to become a dangerous substitute twenty years ago, when brickwork was hardly more than half its recent price—concrete that is unskilled labour, that makes such admirable partitions and such reliable retaining walls.

Not merely from curiosity I said to a very enlightened man who is turning out wood-work made with the newest machinery, "I suppose you catch intelligent joiners for this." He said, "No, I begin with the raw material, find a man with a turn for machinery, and we teach him the little joinery he need know." Still, joiners are largely employed in this way, but they are employed in doing the work that it would take many joiners to do by hand, or in fitting together and fixing work from the machine. Not only in the joinery trade, but in others, the enormous quantity of work that is bought by the builder ready made, or is imported, is competing with the contractor's workshop and developing a class of men who are fitters and fixers rather than all-round craftsmen.

At this point it will be convenient to look a little more closely at that which is the real basis of discussion on labour and wages, of negotiation, disputation, and it may be, of quarrel—the work that for whatever reason has to be done. I notice in a certain class of literature a tendency to look upon the work that is going on at any particular time as something that can be and ought to be shared out

fairly between the whole body of workmen; or, to take a narrower view, among those of them who belong to a particular organisation. It would be highly convenient if by some means we could so arrange that at all times the number of workers and the amount of work might be made to fit. In default of this we have to handle with our own clumsy and unaccustomed fingers a mechanism of infinite delicacy easily put out of gear. In dull days of depression before the faintest whisper of improving business has been heard; long before the client has dropped the first hint to the architect; even before he has felt the impulse within himself, there has sprung up through influences quite unforeseen, the genial breath that in due time refreshes and revives. Foreknowledge of this would be priceless; the after-knowledge may be read in any paper, and is dear at a penny. Meanwhile let us do as little mischief as we can.

We have to understand and practically apply the truth that every rise in materials, from whatever cause; every increase in wages, however well intentioned; every check placed on the turn-out of work acts with unflinching certainty upon the mechanism I have named with an effect in proportion to the cause.

When the cost of building rises, designs already prepared are "hung up," dimensions and qualities are cut down, buildings are abandoned, the desire to build declines. The builder looks out for cheaper methods of construction and quick working machinery; hand labour is dispensed with; foreign manufactured stuff is imported, and in all ways work is lost to the English workman.

All this is consistent with the appearance of prosperity in trade. The Board of Trade returns show an extremely low percentage of unemployed in the building trades; they do not show the amount of work that is leaving those trades, that is even leaving the country through rises in prices and from other causes which are no less important; and though it is no special business of ours just now, briskness of trade in reference only to the number of workers engaged proves nothing as to the general prosperity of the working class, for if there are numbers kept out of a trade who in the natural course of things would be in it, they have to make a living in some other way, and probably overcrowd other trades. But the whole question seems to deserve careful investigation by some impartial authority. There can be no difficulty in ascertaining from documents the real relation between wages paid and work done, and there can be no insuperable difficulty in estimating the amount which might reasonably have been done.

Practical Englishmen as we are, our mode of dealing with the three chief elements of the labour question, time and pay and work, would excite the emotions of a philosopher of either school—the grave or the gay.

We measure the working hours by the nicest instruments that science can produce, the sun's inconsistencies being detected and exposed. Hence comes the signal which calls the workman to his labour, and that which, at the appointed instant, arrests his impending stroke. The coin that rewards his day's work is weighed to the estimation of a hair, and warranted with all the pomp and ceremony of Goldsmiths' Hall. And yet, on this side the Atlantic, no workman, no employer, no public authority, seriously attempts to apply in our own industry any measurement to the "day's work" itself.

After all our talk it was left for the genius of the Chicago plumber to solve the problem. And surely his method of declaring how much should be done in the seven-hours' day, and then claiming the right to do it in five hours for seven hours' pay, is, in principle, transparently honest and conspicuously fair. For our own credit's sake, I am happy to refer to a home-made scheme on similar principles that seems to be acting fairly well in other important industries.

In the tailoring trade, among others, there is a contrivance mysteriously called a "Log." The tailor works either on daywork or on piecework, but his piecework is done under the disguise of daywork, at so much per hour. Every part of a garment has been valued and estimated in time, and is paid for by the artificial hour. If he finishes a "day's work" in advance of the clock he can leave with his day's pay. If he is behind the clock he must put in more time. But, as I understand, he cannot be sweated in a fair shop that adopts the log. There is no individual bargaining.

In arranging for daywork the wage varies according to individual aptitude, both parties having in their mind some reference to the cost of work by the log.

I see no insuperable difficulty in devising for any branch of the building industry a log that may act as a standard day, leaving the wage for the artificial hour to correspond with the wage paid at the time for the actual hour to men on daywork, thus enabling the quick and skilled workman to reap the advantage of his speed and skill, and the less enterprising workman to go on as now at so much a day.

I have formed this opinion with some deliberation, because in the discussion on Mr. Brassey's paper, in which payment by results was very strongly advocated, a prominent labour leader said it was almost impossible to apply piecework throughout a building. But I have before me, and every surveyor has always under his hand, a document called a bill of quantities, in which every item about a building is set down in minute detail. I see a lengthening row of annual price books in which labours are separated from materials and put down in decimal constants. The builder, as contractor, must make up his tender from such separable details, the architect acts upon them, the surveyor digs among them for his daily bread. And yet when the builder, as employer, demands a similar arrangement, he is met with a suggestion of impossibility. That measurement by the 5-ft. rod would cause a hundred times more trouble than measurement by the clock is very probable, and as it is only suggested as a remedy against loitering, this may be used as an argument why the loiterer should mend his pace.

My reference to strikes and lock-outs must be brief. However trivial a dispute may be, the occasion may get magnified to an important question of principle, and for want of a peacemaker at the early stage war may be declared and carried on with a ruthlessness that in the view of the looker-on may be out of all proportion to the point at issue. Whatever may be the occasion, the stoppage of the works of an employer, not only on the job where the dispute arose, but on all his contracts and at his yard, while clients and architects are pressing, while his expenses are going on and his financial engagements have to be met, is a measure that one feels ought by all fair means to be prevented. The general lock-out follows, and after months of loss and suffering to many an arbitrator is called in, who, if appointed at the outset, might have stopped the disaster. It is a very important gain to all concerned that a department of the Board of Trade now invites the submission of disputes to arbitration. The *Labour Gazette* shows month by month what these disputes have been and how they stand or how they have been arranged. More good than appears in print must arise through the establishment of precedents about which the parties will cease to dispute.

The habit of employing a builder to do for you what you cannot conveniently do for yourself has thrown into the background the ancient practice of direct employment, but modern ideas have long been tending that way. It is the distinct and considered policy of certain labour leaders to encourage working without the intervention of a contractor, especially as regards public work. The idea of saving the contractor's profit is tempting to public bodies and to private persons, and the facilities for carrying out the system have been growing very fast. If a client has a fancy to try the experiment, his architect will prepare drawings, and, if he is wise, a surveyor will take out quantities in sufficient detail. He or his trusted agent may proceed to engage a good foreman and workmen, insure against everything, and contract for carting away, buying his raw materials and such scaffolding and tools as he wants for the job. His iron will be ordered long before, and delivered when wanted; his joinery will be imported or got from a manufactory; everything else about a house can be bought from the pattern-books just as easily as it is now selected by the architect. The terms being cash, the lowest quotations may be got; that is proved by experience. The workmen will fix and fit. As they manufacture nothing, no workshops will be required.

At the end of the job, plant and surplus stuff will be sold as a railway contractor would do on completion of his contract. The elements of saving are many. Months may be gained out of the time occupied in completing drawings for a contract. Whether all the con-

tractor's profit is saved may be doubted, but savings in interest on capital, in the prices of materials and fittings, and in salary of a clerk of works should amount to a very considerable sum. Then we are very distinctly promised that the workman will go on faster on direct employment than when working for a contractor, but that would have to be proved. Against these savings must be set off some extra charges for management, but on paper such a plan seems feasible enough. It has actually succeeded in practice, when nothing of importance went wrong.

As to systematic loitering, or other flagrant misconduct, it is certain that a man spending his own money direct would not tolerate it. Not being bound by any contract—that anvil upon which the builder, as employer, can be so effectually hammered—and not being burdened with workshops and expensive machinery, or interest on capital, nor with other undertakings of the same kind open to attack, he could generally afford to wait until men would come forward and carry out his work in a more reasonable way.

It is difficult and disheartening to discard the idea that a company of workmen undertaking contracts might be successful and improve their own position, but after much inquiry I find very little to encourage such a system. Small companies seem to succeed for a time, and then decay through want of business management, or through dissensions among themselves. The best combination I remember in which a contractor's general foreman and a contractor's book-keeper took the lead was as short lived as any other. It may be that in this intricate business there is no prospect open to the workman through the road of co-operation, or it may be that some modification of the system, such as has been tried in France and also in this country, may have better success.

All along, as must have been noticed, I have been harping on that personality outside our fraternity whom I have called the client. My final word about him, like my first, must be to suggest that he is worth more of our consideration than he commonly receives. But I avow that throughout I have been thinking, not so much of the immediate client who comes to us in purple and fine linen, well able to take care of himself, but of that host marching behind him, of which, though indirectly we are the servants and, in a sense, the pioneers. After we have all had our say, the business of the country must be carried on, and will be carried on; for the public is an imperious master that will not wait indefinitely while its servants squabble over the work.

I have been thinking, amongst other grave and weighty matters, of that which is called the great question of the day, which is pressing upon and puzzling every urban authority in the land: the housing of that class who, through one client or another, must in some way be housed. It is the duty of all of us at this juncture, and not of one section of us more or less than another, to take up our fair share of this burden and bear it as handsomely as we know how.

Partly through the scarcity of vacant land, but also very largely through the increased cost of building, nearly all the societies that have been building for this class have had to suspend their work, and it appears to me that unless the cost of building can be materially reduced, for which purpose a reduction of wages is not necessary, rents will very materially rise, not only in such buildings, but in all buildings in every growing town. Whether the effect of good wages will be to attract any considerable number of the working class who are now deserting the country for the town, time must show.

Apprenticeship of the old pattern in which the youth was bound for seven years, during two or three of which he learnt very little and was of very little practical use, is vanishing with other mediæval customs. That the journeymen in a trade should have consented so long to assist in the training of youths who were so soon to be their rivals may be due in part to the obstinate persistency of habit, and in part to the establishment of a kind of understanding that apprentices should be limited to so few that no practical danger need be apprehended from them. But the workmen have deemed it necessary for their own protection to limit much more strictly than formerly the admittance of apprentices into their trades. So stringent have the rules now become that in some trades it is practically impossible to get a boy apprenticed unless he is the son of a

man in that trade. Cases have been mentioned to me in which a master tradesman was not allowed to bring up his own son to his trade.

This may be necessary as a measure of self-defence, and so long as there are enough men in the trade to do the work nobody outside need trouble. But if all the architects and all the surveyors were to combine for the strict limitation of new pupils into offices or new members in their professions it cannot be supposed that positions so lucrative, with prospects so splendid, would not draw in talent quite irrespective of our own interests or our regulations. No doubt the work would at the outset be execrably done, but it would improve day by day, and meanwhile, in whatever fashion, it would unquestionably be done.

Every halfpenny added to the wage per hour, every limitation of the hours of labour, every reduction of the output of work, every addition to the comfort of the workman on the job, every precaution taken and every provision made to protect and insure life and limb is a full-page advertisement for such as are worse-paid, harder-worked, and for whom fewer comforts are provided.

The position of the building operative amongst his fellow men has been improving. There is no reason why he should not, like the poorly-paid French artisan or the doubly-paid American, leave his work at night in a condition as to dress and general appearance good enough for any company into which he may care to go. This cannot fail to appeal to a wider class.

I should like to show you one or two of the board schools in which education is not now directed solely to the production of clerks and university graduates. The children are taught the names and the uses of tools, and to a certain extent how to handle them. You might see three or four hundred boys, with no exception made, taking their turn at drawing, modelling, and rudimentary carpentry or immature engineering. Most of them will go into offices, but not all.

We are yet only at an early stage in the technical instruction of young men. There are institutions in which every kind of help is given them, either for small fees or none, to learn any trade they may wish to take up. At present it is necessary to see that public money is spent only on such as have actually entered their trade, but that is not a rule without exceptions, and the knowledge of tools and processes must very soon become as common as the knowledge of arithmetic.

But I am disposed to think that any increased and more pressing demand for building operatives will be met, as in former times such demands have been met by an influx from the remoter parts of the country where work is slack and the surplus population must go out into the world to gain their bread. And whether as apprentices or as improvers, those of the rising generation whom we are doing so much to train are not likely to ask anybody for leave to earn a living in whatever way they may prefer.

If in my opening sentences on the unity of the building industry I carried my audience with me, I may hope that we shall finish in the like accord. There are thinkers, many architects being of the number, who go so far as to advocate the placing of design and workmanship in the self-same hands. Some say that the designer by profession should, so far as possible, carry his design into execution; others think that none but the trained artisan ought to be entrusted with the design. The millennium may comprehend both or neither. My own suggestion on that particular head shall take the form of a question.

As artists, as men of business, as craftsmen, we are all in the same boat. This is one industry; there is only one craft of masonry and one of carpentry, and one of any other trade. Why should we not all learn them in the same school and at the same bench, at least so far as we have to travel together? The workmen would leave comparatively early in the journey, and the rest of us at stages which preference or necessity might dictate. But so far as we might journey together we should be learning the very same things. We should understand each other for the rest of our lives. And if one who might have started with lower ambitions should find his way into the higher grades of the industry, it is not the class to which I belong that would begrudge him the success which he has earned.

With these suggestions, and those on other

points which I have felt able to make, I commit this paper to your candid criticism.

Mr. Chatfield Clarke said he desired to propose a very hearty vote of thanks to Mr. Blashill for the valuable paper he had read to them. It was one of the most valuable papers that had been read before the Institution in recent years, and the members were especially indebted to Mr. Blashill for his breezy address, which, though long, seemed quite short in the reading. Mr. Blashill must have devoted many hours in the preparation for the paper, which dealt with one of the greatest problems of the century—viz., the labour problem. If the paper was to be considered as Mr. Blashill's diploma paper since elected to the council it was a brilliant example of what could be done in that direction. It was not the intention to discuss the paper that evening, and he therefore moved the adjournment of the debate.

Mr. Daniel Watney seconded the vote of thanks, and said he thought the paper would require a great deal of thought and attention before it could be adequately discussed.

The Chairman, on putting the resolution, said he thoroughly endorsed the remarks made by Mr. Chatfield Clarke as to the breezy and valuable character of the paper. Mr. Blashill's contribution to the science of political economy was especially valuable, and the point of view required discussion and elucidation.

The vote of thanks having been agreed to, it was announced that the discussion would be adjourned until that day fortnight.

The meeting then terminated.

ELY PLACE, HOLBORN.

An interesting site will shortly be cleared for re-building purposes. It is at present covered by certain freehold properties—Nos. 15-20, Ely-place and 1-13, Ely-mews, in the rear—yielding a total rental of 1,987*l.* per annum, which were erected in or about 1775 by C. Cole, as architect and builder, instead of, as had been proposed, a new Fleet Prison, upon ground that had vested in Lord Hatton's son-in-law, Daniel, Earl of Winchelsea and Nottingham.

The six houses in Ely-place and the mews stand on the ground formerly occupied by the garden on the north side of the chapel of Ely Place, the London "inn" of the Bishops of Ely. Bishop John de Kirkby, who died in 1290, bequeathed a messuage and ten cottages there, on ground rising from the right bank of the Fleet, to his successors in the See. William de Louth extended the lands, and in 1297 devised them to the See on condition that service should be maintained in St. Etheldreda's Chapel. John de Hotham (*obit* 1336) planted the vineyard, orchard, kitchen garden, &c., depicted in Aggas's map, and Thomas de Arundel, preferred to the See in 1374, reinstated the residence and the chapel, and built the Stone gatehouse in Holborn, where is now Holborn Viaduct.* We need not rehearse here the story of the occupancy of Ely Place by Sir Christopher Hatton, his nephew, and his nephew's widow, who, having married Sir Edward Coke, died there in 1616. The Bishops of Ely had made several attempts to recover their alienated property, but during Bishop Wren's long imprisonment in the Tower the greater part of the precincts were laid out for Hatton-garden, Hatton-wall, Bleeding Heart-yard, Saffron-hill, Vine, Kirby, Cross, Charles, and other streets. Bishops White, Wren, and Laney died at Ely Place. In Bishop Patrick's time, 1691-1707, a rent-charge of 100*l.* upon the Hatton estate was created in favour of the See, and a plot of ground in Hatton-garden was assigned to the See for a new chapel built by Christopher, Lord Hatton, which is now the St. Andrew's parochial schools, at the corner of Cross-street. Under an Act 12 George III., c. 43, the Crown acquired Ely Place for 6,500*l.*, with a further perpetual annuity of 200*l.* for the bishop, and in its stead built for the See a town house in Dover-street. All of the old Place, the chapel excepted, was pulled down shortly afterwards. St. Etheldreda's Chapel, having served in turn as a military prison and hospital (during the Commonwealth), a soldiers' canteen, beer and wine

* See Mr. H. W. Brewer's drawing, "A Monastic Suburb of Old London in the Sixteenth Century," *Builder*, January 7, 1898; A. Van Wyngaerde's view, circa 1550, in the Bodleian Library; and the bird's-eye view, 1572, in Braun and Hogenburg's "Civitates Orbis Terrarum." There are later views by J. Carter, Royce, and S. Hooper.

vaults, a schoolroom and offices for the National Society (1815), and a Welsh Episcopalian church (opened on December 10, 1843), was bought twenty-five years ago for 5,000l. by the Lazarist Fathers of Charity, and restored for purposes of divine worship by Mr. John Young, jun., and Mr. Bernard Whelan. In R. Godfrey's print, 1775, the chapel appears as roofless; in 1875 the removal of the slates in a line up to the ridge disclosed the ancient timber roof, after the simple style of the fourteenth century.

Its construction is that of a coupled-rafter roof. There is no ridge-piece, and no longitudinal tie except the two wall-plates and the external boarding. The rafters, averaging 8 in. by 6 in., laid flat-wise, are about 9 in. apart. There is a vertical strut framed into the inner wall-plate and the rafters, and above are cross-pieces and a collar, all about 8 in. by 4 in. All the pieces are united by double tenons, and secured with projecting wooden pegs. The material used appears to be chestnut wood (*Quercus castanea*) and is in good preservation.—*Builder*, April 24, 1875.

On the north side, which may be seen from the mews, was an entrance into the chapel and its crypt below; the upper doorway remains internally. The beautiful east window was filled in 1879 with stained glass, the Duke of Norfolk's gift, executed by Saunders & Co. after designs by Lonsdale and Mr. F. Weeks, and on St. Ethelreda's day, June 23 of that year, the chapel was rededicated and reopened by Cardinal Manning. On the chapel's south side towards Holborn stood the cloisters, the hall, coeval with the chapel, the colonnade, and the Mitre tavern, of which the sign yet exists. We may add that the Gothic screen and gallery at the west end of the chapel for the organ (by Lewis & Co.) were designed by Mr. Bentley, and that the west window is partly filled with stained glass, representing the martyrs, by Mr. John Hardman. Sir George G. Scott was of opinion that St. Ethelreda's Chapel was built in the period 1200-7. The indenture of conveyance, dated April 4, 1862, between the Bishop of Ely and the Church Estates Commissioners, which conveyed the St. Andrew's Schools in Hatton-garden to the surviving lessees, describes the school house (with a small burial-ground attached) as having been "intended for a church." The property we describe, in Ely-place, was sold on February 23 at the Auction Mart for 36,500l.

ARCHITECTURAL SOCIETIES.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—The members of this Association visited St. Oswald's Church and Bruntfield House on the 23rd ult. At the former they were received by the Rev. H. J. Wotherspoon, M.A., and were conducted over the building by Mr. Henry F. Kerr, A.R.I.B.A., President of the Association and architect for the church, the cost of which, including all furnishings and furniture, amounted to 7,481l. A cordial vote of thanks was accorded to Rev. Mr. Wotherspoon for kindly granting permission, and to Mr. Kerr for acting as leader. By permission of Sir George Warrender, Bart., Bruntfield House was next visited, Mr. J. T. Baillie acting as leader. Interesting mention was made of the various families who have successively owned the estate since Richard Broun, its first recorded owner. In viewing the mansion-house, the features of the plan and the exterior were dwelt upon, and appreciation was expressed of the fact that although additions have from time to time been made, the oldest part of the existing house still clearly displays the architectural characteristics of its period, and is still inhabited by its owners.

STONEHENGE.—The falling of the upright of one of the trilithons at Stonehenge is shortly to be investigated by a special committee which is being appointed for the purpose of considering the advisability of replacing in an upright position the stone that recently fell, as well as that which fell in 1798. The committee is to be composed of members selected from the Wilts Archeological Society, the Society of Antiquaries of London, the Society for the Protection of Ancient Monuments, joined by one or two local archaeologists. Sir Edmund Antrobus, the owner of Stonehenge and the surrounding downland, has appointed his own architect, who will superintend any works that are decided upon; but, fully appreciating the great archaeological interest and value of Stonehenge, Sir Edmund Antrobus is prepared, it is stated, to accept any scheme which the committee may suggest.

Illustrations.

WREXHAM CHURCH TOWER.

THE fine drawing of this celebrated tower was made by Mr. Harry Phibbs, and was one of the set of drawings, including several of great merit, which were submitted by him in competition for the Pugin Studentship of the Institute of Architects.

Wrexham Tower was built in the reign of Henry VII. Each succeeding stage of the tower is set back from the face of the one below, so that the parapet is on the inside line of the wall. The hexagonal turrets at the angles are of different heights, that on the north-west corner being the highest, and having a spiral stair right up to the top, where it ends abruptly.

The tower is now undergoing very necessary repair, the turrets and parapets having been restored in 1867.

The resemblance of Wrexham to the usual Somersetshire type of tower has been often remarked; it gives the idea of a Somersetshire tower which has strayed away from its proper county.

ST. ANNE'S CATHEDRAL AND PRESBYTERY, LEEDS.

IN consequence of a street improvement having been decided upon by the Leeds Corporation, it was necessary to acquire the site of the present cathedral, presbytery, and schools, and the whole of these buildings will have, therefore, to be pulled down and built elsewhere.

The site of the proposed cathedral and presbytery is adjoining the old one, with a frontage of about 119 ft. to Cookridge-street, 143 ft. to St. Anne-street, and 170 ft. to Great George-street, with about 75 ft. to a private road, so that it is almost on an isolated site.

The shape of the site, being very wide in comparison to its length, has involved a treatment of plan with a wide nave of 42 ft. and double side aisles, with all the altars at the east end. The principal entrances are at the west end.

The section of nave shows a flat, segmental pointed roof, with nave piers and arches carried up as high as possible, in order to give loftiness. The side aisles have also flat roofs over them, in order to get the utmost height for clearstory and aisle windows.

The choir and sanctuary, which is about 30 ft. wide by 50 ft. long, has an ambulatory all round, and there is a gallery over the latter for the organ and orchestra or additional choir. There are two turret staircases. The roof to this gallery runs through level with that of the nave, and is treated in a similar way.

The high altar will be treated simply with choice marbles, and will have a lofty baldachino over it, and a reredos of carved wood coloured and gilt.

The chapter house, which is approached from ambulatory, is octagonal in plan, and is situated at the east end of St. Anne-street; underneath will be a parish-room, about 40 ft. by 21 ft., entered by porches from St. Anne-street, and from the presbytery by a small turret staircase.

The reredos to the present high altar will be removed, and erected behind the altar in the Lady Chapel.

The two sacristies, which are placed in the George-street front, will be about 30 ft. by 20 ft. each, and are in connexion with the ambulatory and presbytery, the boys' sacristy having a separate entrance from George-street.

The presbytery is situated at the north-east end of the site, having a frontage of about 50 ft. to George-street and 75 ft. to the private road.

The first floor provides accommodation for the sitting-rooms and bedrooms of the canon and priest of the cathedral. The ground floor provides large dining-room, serving-room, and lift, reception-room, smoking-room, and parlour or waiting-room, with central hall, and staircase with large lantern light over it. The ground-floor level of the presbytery is almost level with the gallery over the ambulatory round the choir, so that this gallery can be easily entered from the presbytery staircase, and there is also an oriel window projecting into the sanctuary from a landing of this staircase, which affords a view over the whole interior of the cathedral.

The basement of the presbytery has a

kitchen, scullery, larder, beer, coal, and wine cellar, laundry, servants' sitting-room, &c. The windows of same to George-street are almost clear above level of ground.

The nave, aisles, Lady Chapel, and transept will seat 850 persons, and the choir 50, exclusive of canons' stalls.

The materials of construction are as follows:—

The external walls of the cathedral are to be faced with Weldon stone and Ketton stone for dressings, and for tracery, carvings, mouldings, &c.

The internal finish will be of Corsham Down stone.

The wide 42-ft. span of nave roof has principals of latticed steel ribs, and the roofs are covered with Delabole slating.

The external walls of the presbytery are to be faced with sand-faced Suffolk bricks, and Ketton stone in the porch, pilasters, strings, niches, copings, &c.

The floor of the nave and aisles is to be of wood-block flooring with terrazzo paving to the aisles. The paving of the sanctuary and choir will be of marble.

The cost of the whole, including heating, seating, organ rebuilding, &c., will be about 36,000l.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS.

THE ROYAL SCHOOL OF ART NEEDLEWORK.

THE old building of this school has been for some years inadequate in many ways for the excellent work produced there, and recent developments necessitated the erection of the new building visited by the Association on their second spring visit on the 2nd inst. Although the site chosen at the corner of the Exhibition-road and the Institute-road is ideal from several points of view, the close proximity of the Imperial Institute and the Technical Training College has rendered the task of the architect, Mr. F. B. Wade, a problem of striking contrast to either building.

The new school, which is approaching the finishing stages, is a three-storied building mainly carried up in Portland stone, with the exception of the wall surfaces of the main floor, which are in red brickwork. The rectangular plan is arranged with an open court above the semi-basement.

Two large apartments extending the whole length of the south front are for the display of finished work, and these form the most prominent features of the scheme.

The whole of the semi-basement is planned for work and lecture rooms, and, together with the back wings of the main building, a large amount of accommodation is provided for extending the various classes and lectures so essential for the proper working of the school.

It is to be regretted that at the present time it is not proposed to complete the outside carving. In a building of this description "blocks left for carving" would suggest a plea for poverty, unfortunately too frequently met with. There is always a danger when scaffolding is once removed from a new work that this disfigurement of incompleteness is for an indefinite period.

Miss Wade, the manageress of the school, conducted the members over the old building and gave them interesting descriptions of the work carried on. The various designs for tapestry and decorative panels were of great interest and demonstrated the excellence of the education to be obtained at the classes.

Mr. Wade personally explained the drawings of the new building, and the thanks of the Association are due to him for an interesting visit.

DIRECTORY OF TELEGRAPHIC ADDRESSES.—We have received from Mr. Henry Sell, of Fleet-street, a copy of "Sell's Directory of Registered Telegraphic Addresses" for 1901, which has been compiled from official lists, and which contains all the information received from the Post Office to January 1. As we have previously remarked, the directory is a very reliable one, and includes an exhaustive list of London and provincial telegraphic addresses, alphabetically arranged—in the first section under the names of firms and in the second section under the telegraphic address, with number showing the page on which the name and address of a firm appears. The directory also gives the telephone number of various firms. A new feature of the 1901 edition is a list of our Consuls in foreign countries, classified under the towns in which they are resident. With the volume is issued a map of South Africa in colours.

THE CHURCH CRAFTS LEAGUE.

A MEETING of members of this society was held on the 28th ult. at the Vale Studio, King's-road, Chelsea, S.W., when the President, the Bishop of Rochester, occupied the chair. The subject down for discussion was "The Present Disuse of Art in the Church—its Reasons and Results," and the chairman called on Dr. Biggs to read a paper on the subject.

Dr. Biggs prefaced his remarks by calling attention to the attempts which the church had made towards art in the latter part of the nineteenth century, as instanced in such buildings as All Saints, Margaret-street, Keble College Chapel, and several others. He also dealt with some of the difficulties which clergy and committees had to meet in dealing with artists. In his opinion greater accuracy of detail was wanted in the artistic treatment of biblical scenes and subjects. Many people visited Palestine now, and these travellers were often disappointed because the actual country was so unlike any representations of it they had seen in their churches. At the same time he appealed to artists to treat sacred subjects in the traditional manner which had been laid down by the church, and which distinguished sacred art from secular.

Mr. Lionel Cust, the next speaker, referred at length to the historical view of the subject, pointing out the causes which led to the practical abolition of art in our churches at the time of the Reformation.

Mr. Selwyn Image disagreed with Dr. Biggs as to the distinction between sacred and secular art. Art was a man's self, and his individuality must impress itself on everything that he did. In work intended for a church the artist confined himself to certain subjects, and in work intended for a drawing-room he dealt with other subjects, but beyond this there could be no further distinction between sacred and secular art. He reminded the meeting that in days when Gothic churches were built, people also built Gothic houses. Every artist had an individuality, and each age had a style. Therefore, if any person or firm offered to do work in any style required, it might be taken for granted that the work would be bad. Although we lived in an age which (for many social and economic reasons) had no style, yet every artist had an individuality which must impress itself on everything he did.

After an interesting discussion, in which Canon Armitage Robinson, Mr. H. Wilson, Mr. John P. Seddon, Mr. W. S. Frith, and Mr. T. Stirling Lee took part, the Bishop of Rochester expressed his appreciation and thankfulness for the remarks which had fallen from the clergy and the artists present. The two professions had much in common, and the Church Crafts League would justify its existence if it only called together such meetings as the one they were having that evening. The subject they had been dealing with was of tremendous importance, and he hoped soon to have another opportunity of hearing the subject discussed.

The next general meeting of the League will be held early in May. Any non-members caring to attend will be welcome. Tickets can be had from the Secretary of the League, at the Church House, Westminster, S.W.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the meeting of this Institution held at the Westminster Palace Hotel on March 1, the Chairman, Mr. Percival Marshall, presiding, a paper was read on "Carburetted Water Gas" by Mr. S. Cutler, jun., M.I.Mech.E. After reviewing the progress of the carburetted gas industry since its introduction into this country in 1891, the author proceeded to indicate a few reasons why the system had been adopted as an auxiliary plant in conjunction with coal gas apparatus for the production of illuminating gas, the principal being the prevailing scarcity of canal, which had been extensively used as an enricher to increase the illuminating power of the gas obtained from common coal to a degree prescribed by the statutory standard. The importation of cheap carburetted oils rendered the process of carburetted water gas an economical one, and many plants were installed. It was soon found the system was possessed of several advantages, which led to its fairly extensive use. The principal features of the plant were the independence of labour, rapidity of production,

utilisation of a large portion of a bye product of the coal, viz., coke, assistance in the prevention of naphthalene deposits, smaller capital cost, and reduced area for accommodation of the apparatus. It was not surprising that engineers in the United States, where there are vast oil supplies, should be the first to evolve a practical plant, and of the many types tried, the "Lowe" apparatus had met with most favour, and formed the basis of most of the present day plants. With the aid of diagrams the method of manufacture was then described, the complete apparatus necessary for the production and purification of the carburetted water gas being illustrated. The manner in which the raw gas-making materials—water, carbon, and petroleum—became transformed into the finished illuminating gas was traced from stage to stage, and the chemical reactions occurring in the generator and analysis showing the various changes in the composition of the gas in the course of its passage through the different vessels of the plant, were included on a sectional diagram of the generating portion of the apparatus. Special reference was made to the constituents, carbon monoxide and carbon dioxide. In the year 1897, at which time twenty companies and eleven corporations had installed plants at their works, the Home Office instituted an inquiry as to the unlimited use of a gas containing 30 per cent. of carbon monoxide on account of its well-known toxic properties. The result was a recommendation for restricted use, but at present no legal limit had been enforced. English gas companies, however, did not desire to, or rarely did, exceed a limit of more than 30 to 40 per cent. of water gas in their total production. In America, on the other hand, over 70 per cent. of the total gas consumed was pure carburetted water gas. Various details of the plant were next considered, including the method of dealing with the effluents from the washers and the separation of tar, a process attended with some difficulty, owing to the slight differences in the specific gravities of the liquids. A safety gear, a model of which was exhibited, was described. By means of this gear the operator was enabled to perform in proper sequence the various changes of valves from "run" to "blow," and *vice versa*. The question of oil was next entered into, and it was pointed out that as the cost of this ingredient formed over 60 per cent. of the total cost of the gas, it was of great importance to obtain from it the highest possible duty. The author, in conclusion, referred to the present position of carburetted water gas in relation to the coal industry. The enhanced prices of oil had restricted somewhat the use of the system as a means of producing the gas as economically as coal gas was obtained; the value of the process was, therefore, exemplified more in collateral advantages. That companies and municipal corporations were still adopting and extending the process indicated that the benefits to be derived from its introduction were unmistakably definite.—A discussion ensued, and a vote of thanks having been accorded the author, the proceedings closed with the announcement of a visit, arranged in connexion with the paper, to take place on March 9, when the Southall station of the Brentford Gas Company would be open for inspection, including the plant for the manufacture of carburetted water gas.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on the 4th inst., Mr. Charles Mason, President, in the chair, a paper was read on "Notes on Certain Details of Drainage Construction," by Mr. Gerard J. G. Jensen. The author, at the outset, pointed out the desirability of giving attention to the merest details in drainage construction, and he then proceeded to discuss certain matters which up to the present have been misunderstood or neglected. Amongst these, none, he thought, claimed greater attention than the construction and arrangement of ventilation pipes. He drew attention to the reprehensible practice of constructing ventilation pipes of iron, as they were invariably found to rust in the interior, thereby not only deteriorating and making renewal necessary, but also becoming blocked and thereby rendering insanitary that which might otherwise be a good system of drainage. This latter, he pointed out, was especially serious in view of the fact that the householders who have their drains periodically inspected are still in the minority. Amongst other details of construc-

tion pertaining to ventilation pipes, he further brought under notice the still inexact knowledge regarding the action of drain air upon the human constitution. Pending a more complete knowledge on the subject, he urged the necessity of erring upon the safe side in choosing positions for liberating drain air through ventilation pipes. As tending to prove the evil effects which might ensue from neglect on this point, he instanced the case of a large school in which he had traced the cause of various outbreaks of follicular tonsillitis to the faulty arrangement of ventilation pipes, which in most cases were placed near the dormitory windows. The wards of a recently-erected sanatorium at the same school, he stated, were under similar influence, and though it still remained to be seen whether any evil results would ensue, he regretted that those about to be experimented upon were not guinea-pigs, nor rats, but human beings. Continuing, the author touched upon the still frequent practice of providing waste-pipes with hopper heads at the points at which branches from fittings within the house join the main pipe. He could imagine no more insanitary and offence-giving construction, and thought that the fullest measure of the evils of the system was perhaps experienced under the, at present, fashionable flat life. An alternative and more satisfactory system of arranging and constructing waste-pipes was described, as were also the most efficient methods of arranging their discharge into surface traps. Some observations on manholes and drain joints followed, the paper concluding with some remarks on overflow pipes from lavatory basins, baths, and sinks. The author considered that too little attention is, as a rule, bestowed upon these details, and suggests that the musty smells in bath-rooms and similar apartments might frequently be ascribed to faulty overflows. The continued manufacture and use of uncleanly overflow-pipes, he thought, must be one of the wonders of house drainage, since their evils must be patent to all. The paper was illustrated by a number of diagrams.

COMPETITIONS.

HULL ROYAL INFIRMARY EXTENSIONS.—The assessors in this Competition have just made their award on the designs submitted in competition. The first premium has been awarded to No. 3, submitted by Messrs. Worthington & Sons, Manchester, and the second premium to design No. 4, submitted by Mr. T. Percy Adams, 28, Woburn-place, London.

ST. MATTHIAS SCHOOLS, SALFORD.—The Improvement Committee of the Salford Corporation received a number of plans in answer to their advertisement inviting competitive designs for the erection of the new St. Matthias Schools. The plans were referred to the assessor, Mr. Royle, of Messrs. Royle & Bennett, architects, Manchester, to choose out of the number of plans sent in (viz., seventy-two) not more than ten as designs for the consideration of the Committee. A sub-committee carefully examined these plans, with the assistance of the Clerk to the Salford School Board, and eventually made the following awards:—(1st) Plan No. 59; (2nd) Plan No. 29; (3rd) Plan No. 22. The corresponding envelopes containing the names of the competing architects were thereupon opened, and it was found that the successful architects are:—Plan 59, Mr. Benjamin Bower (Birmingham); Plan 29, Messrs. Woodhouse & Willoughby (Manchester); Plan 22, Mr. Alfred H. Mills (Manchester). The plans which have been received will be on view at the Town Hall on the 12th and 13th insts.

PUBLIC SHELTER, FLEETWOOD, LANCs.—The design placed first in the competition for public shelter, with pleasure grounds, Fleetwood, Lancs, is by Mr. H. A. Luke, R.E. Office, Curragh Camp, co. Kildare, Ireland.

NEW HEAD OFFICES FOR NORWICH UNION LIFE INSURANCE.—In a limited competition for new buildings at Norwich for the above-named insurance company, the design of Messrs. G. J. and F. W. Skipper, of Norwich, has been placed first, and that by Mr. A. R. Mayston, of London, second.

PROPOSED ADDITIONS TO ST. PETER'S CHURCH, EASTBOURNE.—It is proposed to build a new choir vestry and practice-room at St. Peter's Church, Eastbourne. Mr. C. W. Tomes, of Eastbourne, has prepared the plans.

Books.

The Mechanical Triumphs of the Ancient Egyptians. By Commander F. M. BARBER, United States Navy (retired). London: Kegan Paul & Co. 1900.

THE author of this small book has endeavoured to sum up the evidence and the probabilities in regard to the manner in which the Egyptians moved and raised their immense colossi, and finished the outer casing of the pyramids; the latter operation being, as he says, the real problem in regard to the pyramids, as the mere piling up of material without any outside finish was, with unlimited compulsory labour, only a matter of time. As far as the question of the use and capabilities of tackle of any kind are concerned, a naval officer has some special qualifications for treating the subject, from his professional experience in the use of ropes and hoisting tackle; and Captain Barber's observations on the ancient Egyptian representations of boats and the way they are rigged, and on the way the obelisks appear to have been secured on the boats, are of considerable interest. Whether he brings us any nearer solving the question as to the *modus operandi* of finishing the pyramids is doubtful; in fact, his views seem rather contradictory. He assumes that the Egyptians were a very scientific people, yet he points out that they seem to have had no means of moving a colossal statue from the place where it was made to its ultimate destination except by the sheer pull of hundreds of men. He remarks that the use of men instead of animals for such labour was probably because they could be trained to pull by repeated efforts at a word of command in a way that animals could not; which is a point we have not seen remarked on before in connexion with this subject. But in regard to the pyramids he falls back on the idea of an immense inclined plane of earth collected and built up, with a longer and longer slope as the pyramid rose higher; up which slope the stones were hauled by the sheer pull of hundreds of men, as with the transport of the colossi along the level. The objection as to the immense amount of material which must have been piled for such a purpose, only to be removed again, he considers to be met again by the consideration of the unlimited unpaid labour which was at the command of the Egyptian rulers; this is an answer, of course, but it is surely incompatible with the idea of the Egyptians being a scientific people; it is about as bungling and round-about a method as could be imagined.

It is curious that the numerous representations of men at work, in Egyptian paintings, show nothing of such tackle as would have been necessary in order to raise the finishing courses of the pyramids to their places. But we may take it for granted that where there is the general and free use of ropes, of which, in the case of the Egyptians, we have ample evidence, there will be the knowledge and use of the pulley; and the description by Herodotus of the manner in which he was informed that the stones were raised is quite according to reason and common sense as far as it goes, and only presupposes the idea of ropes, pulleys, and a swinging arm or else a simple form of traveller:—

"The pyramid was built in steps, battlement-wise, as it is called, or, according to others, altar-wise. After laying the stones for the base, they raised the remaining stones to their places by means of machines formed of short wooden planks. The first machine raised them from the ground to the top of the first step. On this there was another machine, which received the stone upon its arrival, and conveyed it to the second step, whence a third machine advanced it still higher. Either they had as many machines as there were steps in the pyramid, or possibly they had but a single machine, which being easily moved, was transferred from tier to tier as the stone rose.—Both accounts are given, and therefore I mention both. The upper portion of the pyramid was finished first, then the middle, and finally the part which was lowest and nearest the ground."

(Herodotus: Rawlinson's translation.)

The last sentence is thoroughly practical; the pyramid being first built so as to leave a succession of steps on the face, the final casing, which would fill in and obliterate the steps, would naturally be commenced at the top, the lower steps serving as stages for raising the blocks to the courses above them.

Although the visit of Herodotus to Egypt

was so long posterior to the erection of the Great Pyramids, it is reasonable to suppose that the correct tradition still remained as to the manner in which they had been built, in a land where all things were so slow to change; and certainly the idea which he suggests as to the *modus operandi* is far more reasonable and probable than the inclined plane theory which Captain Barber has endeavoured to revive, and which would leave us to suppose that the Egyptians were deficient in all but the most primitive methods of construction, worthy only of a barbarous people.

The Architectural History of the Cathedral Church and Monastery of St. Andrew at Rochester. By W. H. ST. JOHN HOPE, M.A. London: Mitchell & Hughes.

ARCHITECTURAL descriptions of minsters and monasteries by Mr. St. John Hope are always worthy of attention, and the evidences with regard to buildings from chartularies or other documents are always reliable. This monograph on Rochester, to a considerable extent a republication of previous papers, fully sustains his reputation for accuracy and clear judgment.

The series of plans are invaluable adjuncts to the letterpress, and are made most explicit through their careful colouring. The first one is a conjectural plan of Gundulf's work (1077-1090) showing the existing remains, which are chiefly on the south side of the nave. The Early Norman work (1095-1100) is carefully distinguished. The foundations of the Early Saxon church of 604 are also shown at the west end. The second plan gives the whole of the minster as it now stands, and is of a most elaborate, but, at the same time, clear character. It brings before us at a glance no fewer than twelve different periods—Early Norman, Later Norman, repairs after fire of 1170, new choir of William of Hoo (1227), contemporary work in choir aisles, north transept (1240-1255), south transept from 1280, alterations from 1300, insertions c. 1340 and later, fifteenth century works, and post-Suppression and modern.

The third plan deals with the crypt, and here we are able to distinguish between seven different dates, according to Mr. Hope's deductions from observation and evidence.

The fourth plan deals with Rochester Priory, giving a plan of the precinct based on the Ordnance Survey. The mediæval remains are coloured red, and it is interesting to note that they are far more considerable than is usually supposed.

The last plan is also of Rochester Priory, but is confined to the church and monastic buildings. By an ingenious arrangement, the choir and presbytery in this plan can be raised, showing the intricate crypt arrangement immediately below. It reminds one of the exciting surprises in some of the superior toy-books of one's childhood.

Mr. Hope gives his reason for assuming that the foundations at the west front, which were discovered in 1888, and which contained a good deal of Roman material, are the remains of the church built by Æthelbert in 604. Its measurements are almost identical with the small church of St. Pancras, at Canterbury, and harmonise with two other early Kent churches—St. Martin's, at Canterbury, and the foundations of Æthelburga's church at Lyninge. All these have been personally planned by Mr. Hope.

The account of the monastery is of particular value, for it represents the careful investigation and planning which Mr. Hope undertook in the "eighties" when resident at Rochester for four years. He had also the run of the muniment room, and was fortunate in lighting upon sundry useful pieces of information. The buildings of the Benedictine priory attached to the Cathedral church of Rochester occupied a most unusual position, for they were erected on the south side of the presbytery, instead of being north or south of the nave. This had an important effect on the disposition of the claustral buildings.

In addition to the plans, which are Mr. Hope's own work, there are a variety of illustrations specially drawn by Mr. Roland W. Paul, whilst others have been lent by Messrs. Murray and Messrs. Parker & Co. Several of the new ones by Mr. Paul cannot fail to be of service to architects as well as of interest to the general reader. A slip inserted by Messrs. Mitchell & Hughes mentions that there are only 200 copies of this monograph for sale.

We shall be surprised if they remain long in the market.

The Churches of Rouen. By the Rev. THOMAS PERRINS, M.A., F.R.A.S. London: George Bell & Sons, 1900.

"ROUEN" is certainly one of the best of Messrs. Bell's handbooks. The cathedral and the churches of St. Ouen and St. Maclou present, it is true, so much interest that it should be a difficult matter for an author to fail in making a small book on such subjects a readable one. Nevertheless, the characteristics of these churches are so various, their architecture is representative of so many periods, that to attempt to treat of them without a generous catholicity of opinion would have resulted in the production of a handbook so negative in its tendency as to leave but little that was beneficial or helpful to the reader anxious to admire. Mr. Perkins wisely, as we think, finds something to praise in that period of French architecture which may almost be said to be a renaissance of former styles rather than a style itself. We have nothing that corresponds to it in English mediæval work. Our Perpendicular style developed beneath the steady process of evolution. In France the architects of the closing fifteenth century and of the sixteenth arranged a theme with variations based upon the features of styles gone by.

Thus, to any one seeking such inspiration as originality gives, much of the detail composing the cathedral must strike him as disappointing. If, however, he will but abate his rigour and regard the whole as something that is wonderfully picturesque, he cannot be otherwise than well satisfied. If he desires refinement he will find it at St. Ouen; indeed, he may possibly find too much. To those who regard the *finale* of Gothic architecture as an attempt to reduce all points of support to the lowest terms, St. Ouen will stand as a revelation. Yet it may reasonably be questioned whether, in its endeavour to secure grace, it has not sacrificed that architectural birthright—the evidence of stability.

The book is furnished with many good photographs, which simplify, and increase the value of, the text. These have been taken by the author himself, who has been thereby enabled to select those points of view best suited to his remarks. The preface acknowledges a debt due to the courteous sacristan of St. Ouen, M. Edouard Julien. We also have a lively recollection of Edouard; indeed, he and the church over whose safety he presides are inseparable in our mind. Hitherto he has been satisfied to quote the opinions of Mr. Ruskin; we hope that he may now add those of Mr. Perkins.

We may remind our readers that a fine drawing by Mr. Brewer of the spires and towers of Rouen amid their picturesque surroundings appeared in our New Year's issue. The city has already suffered much by the exigencies of modern improvement, and is likely to suffer still more. Such a record is therefore particularly valuable.

Old Cottages and Farmhouses in Kent and Sussex. Illustrated in 100 Plates printed in Collotype from a Special Series of Photographs taken by W. GALSWORDTHY DAVIE, with some Descriptive Notes and Sketches by E. GUY DAWBER, Architect. London: B. T. Batsford, 1900.

ANY work on the domestic architecture of England is always welcome; the subject is one of inexhaustible interest in itself, and to students of architecture is associated with the pleasantest of their duties—that of wandering, sketch-book in hand, from village to village, wherever and whenever opportunity permits. The present work is confined to the illustration and analysis of the smaller and more homely architecture of the villages of Kent and Sussex.

Mr. Dawber points out that the architecture of the larger houses, which has been the subject of so much research, is a subject apart, owing, as it does, much to foreign influence and workmen. The English tradition is clearly defined in the country cottages and yeoman's houses, where every noticeable change in appearance is one of adaptation to requirements; in Mr. Dawber's words, "They never pretend to be anything but what they are, and there seems to be no effort in either their construction or ornamentation, but merely a simple handing on from generation to generation of well worn

and tried tradition." The notes and sketch diagrams illustrating the photographic plates, emphasise the all-important details which compose the little architectural harmonies, and will help the student to study old work in the most advantageous way. For to be able to indicate the elements that make the charm of the old work in a clear and sympathetic manner is a step towards good design in modern cottages and small houses, where all agree that the work of the past is worthy of emulation. The first point attention is drawn to, is the distinctive character given to districts by their geological formation. Thus in Sussex the buildings were mostly built of timber, until the iron industry, once so prosperous in this now agricultural county, destroyed its forests for use in smelting the iron ore. The appearance of these timber-framed houses is different in character to those of the timber building counties of Shropshire and Lancashire. Mr. Davber merely points out that they are less elaborate and more purely constructional; we suppose the reason for this is partly due to the larger houses in the south being built of stone or brick, whereas in the north they were very often entirely of timber, and are besides of a later date. Among other features that influenced the design of these smaller houses, attention is drawn to the fine breadth of feeling and proportion that the old builders attained in their chimneys, a feature much neglected in modern cottages; and also to the roof, with its broad expanse of hatch or tiles, that gives such a sense of sheltering protection to the houses. The quiet plaster fronts are more frequently found in Kent than in Sussex, in which county flint and link diaper are also used with picturesque effect. The book, with its 100 well-chosen photographic plates, is a valuable record of these counties presented in a very attractive form.

A Short History of Renaissance Architecture in England, 1500-1800. By REGINALD BLOMFIELD, M.A. George Bell & Sons, London, 1900.

IN our issues of April 16 and 23, 1898, we reviewed this important work in detail. The present edition is a somewhat abridged form of the same work in a small single volume forming a handbook of the subject. A valuable addition is a plate of the five orders of Palladio, taken from Freart's "Parallel." Considering the great technical importance of the orders in the architecture of the seventeenth and eighteenth centuries, the student of the Renaissance cannot have these models too firmly impressed upon his memory. The omissions in the smaller work are amongst the illustrations, which are reduced to the most important examples connected with each stage and cause of the historical development of the Renaissance; and also those parts of the original text dealing with architectural treatises and literature.

Laxton's Builder's Price-Book for 1901. Originally Compiled by WILLIAM LAXTON. Eighth-fourth Edition. London: Kelly's Directories, Limited.

ONE cannot study this latest volume and compare it with one of the earlier ones without being struck by the great improvement in the matter and form, and especially in regard to the prime object of the work, *i.e.*, the prices. The time has now passed for the surveyor, when dealing with the builder, sarcastically to suggest that "perhaps he would like Laxton's prices." Possibly this may be due to the healthy competition of that other now recognised price-book, "Lockwood," noticed below. Be that as it may, the effect is, that the Laxton of the present day so far exceeds in usefulness the earlier editions, that, if there is a use for a price-book, one wonders to what extent these earlier editions answered their purpose.

We are pleased to see that the carpenter's prices have been revised throughout, but generally there has been little need for revision. There are still some unfortunate anomalies which it would be well to eliminate. Really it is about time that pages 274-5 were rewritten, and steel given its due as a constructive material. How many architects, we wonder, now specify rolled iron joists; and even this list is given without weights.

Taking all things into consideration, however, "Laxton" will doubtless still find a place

upon the shelves as the father of the other works of the same nature, and deservedly so.

Lockwood's Builder's and Contractor's Price-Book for 1901. Edited by FRANCIS T. W. MILLER, A.R.I.B.A. London: Crosby Lockwood & Son, 1901.

THE prices for building work having remained almost stationary for the past twelve months, with the exception of one or two branches, the work of the reviser of price-books has been somewhat light. Light as this work has been, the editor has hardly done all he could in this direction, no note having been taken of the continued rise in timber, which has reached a price almost unprecedented. Almost the only reduction during the year—and that during the later months—was in steel constructional work. The prices quoted are rather high, but the reduction is so uncertain that possibly there is an excuse for no note being taken of this. The heading given is merely "Wrought Steel," but certainly something should be said as to whether of English or foreign manufacture. The prices would indicate that "English" is referred to.

There is the usual mass of general information—legal and otherwise—and tables, which all tend to make the work useful in other directions than those for which it is specially designed.

The production of this work of late years has been so much improved as to make it a formidable competitor with its much older companion, "Laxton," which for so long held its position as a standard work—a healthy competition, nevertheless, of which the users of a price-book reap the advantage.

A Practical Treatise upon Steam-Heating. By FREDERICK DYE, M.R.I. London: E. & F. N. Spon, Limited. 1901. 238 pp.

IN his preface Mr. Dye draws attention to the want of an English book on the subject of heating buildings by steam, and considers that this is one reason why steam-heating has not been more generally adopted in this country. In factories with steam-power, steam has, of course, been largely used for heating for a great many years, but installations in other buildings have not been so entirely successful as to encourage architects to prefer steam to hot water. The principal objections to steam are the noises in the pipes—often so loud as to terrify timid people—the difficulty of regulating the heat, and the rapidity with which the pipes cool. The last objection loses its force in the case of buildings which are occupied only for short periods, such as places of worship, concert-rooms, and theatres, and neither of the other objections is insurmountable, as Mr. Dye's book shows. Steam-heating has, however, been adopted in this country to a greater extent than Mr. Dye seems aware of; English architects and engineers are not all unacquainted with American books on the subject, such as Baldwin's "Steam-Heating for Buildings," the writer's copy of which (dated 1895) bears the legend, "Thirteenth Edition," and the subject has not been entirely neglected by English writers. Mr. Dye's book, however, is a valuable addition to the literature concerning steam-heating, and can be recommended as a trustworthy source of information. The author writes without bias, pointing out the defects as well as the advantages of the system, and giving particulars of every part of the apparatus. The chapter on boilers is somewhat inadequate, but with this exception the different kinds of low-pressure and high-pressure apparatus are fully described. The expression, "much data is available" (p. 117), must be corrected in the next edition, and also the statement, on p. 137, that in buildings heated with low-pressure steam "the air . . . undergoes no perceptible change in dryness."

The book is well illustrated, and contains a large amount of information which cannot fail to be of service to architects and engineers, as steam is undoubtedly a valuable heating agent for certain classes of building.

Exercises in Graphic Statics: with Examples of its Application to Practical Designing of Constructional Ironwork. By G. F. CHARNOCK, A.M.Inst.C.E. Part II. Manchester: J. Halden & Co. 1900.

THE second part of Mr. Charnock's exposition of graphics is chiefly devoted to a consideration

of beams and girders. Altogether, there are fifty-two sheets of diagrams, with explanatory letterpress; a few of the diagrams relating to work coming under the especial province of the civil engineer, but the greater part of the work is of particular interest to the architect and the builder. Of course, it is to be understood that the volume is addressed to students, yet its contents should prove of great assistance to those who wish to ascertain for themselves the actual value of beams or stanchions for some particular purpose. It is not infrequently the case that the essential factors for a given calculation are not to be found ready made in the ordinary book of tables. A knowledge of the methods which are so ably expounded by the author would at once remove the difficulty thereby experienced. Dealing with simple and compound beams of various types, the use of rolled joists as stanchions, the design of steelwork in floors and roofs, and the forms and proportions of riveted joints, this set of diagrams is one of much intrinsic value.

TRADE CATALOGUES.

THE Gohsen Manufacturing Company, of Canton, Ohio, U.S.A., has sent us a pamphlet on "The Preservation of Wood, Steel, and Galvanised Surfaces." This company manufactures all the common varieties of paint, but makes a speciality of the manufacture of a paint termed "carbonising coating," which, it is claimed, will protect exposed iron and steel from corrosion for a period of from ten to fifteen years, and which, owing to its remarkable covering capacity, is the most economical protective paint on the market. It is well known, says the pamphlet, that the steel as manufactured in structural shapes of to-day is a much harder body to protect from rust than the iron used years ago, and consequently requires special care in the matter of paint. The use of red lead is deprecated, as the red lead "dries too rapidly and hard (at the expense of the oil), becoming brittle, and does not allow for the expansion and contraction of the metal." In the chapter on "Mistaken Expert Testimony on Red Lead" we are told that "many of the trade booklets which find their way into the hands of the engineer and structural builder, calculating, as they do, to foist some special brand of paint as being the most permanent paint for iron and steel, contain theories, assertions, and ideas which, to a careful reader, do not accord with the laws of Nature, chemistry, or practical demonstration. These false theories emanate from a want of knowledge, misunderstanding, or in an attempt at nullifying all other coatings save the one which they are desirous of selling." We agree; and although the booklet before us strongly advocates the use of a certain paint, of a composition not quoted, which is manufactured only by the Gohsen Manufacturing Company, and contains statements and theories which will not pass unchallenged, it is by no means devoid of information which may be of practical utility to those who have to select paint for various purposes.

Messrs. Lockerbie & Wilkinson send us a finely got-up catalogue of locks, brass foundry, ironmongery, &c. The illustrations are all by photographs from the original objects. The mortice lock furniture shows a variety of designs mostly in very good style, both in wood and metal. Large sized photographs of the interiors of the locks are given, so that their construction can be studied almost as from examination of the originals. The weighted mortice lock, in which the return of the latch to its position is actuated by a weight instead of a spring, is particularly worthy of attention. The catalogue includes also rim locks, rim night latches, stock locks, light weighted mortice locks and lock handles, lock and finger plates in brass and in beaten copper, electric pushes, and casement handles, the latter very effective in regard both to appearance and action. Front door furniture, sash fasteners and axle pulleys are also included, and beaten copper or brass cabinet fittings. Attention should also be given to the ball-bearing runners for sliding doors, various forms of which are illustrated and described in the catalogue. Among the contents of the catalogue are also a variety of fan-light openers, among which is the "Lockerbie" rod opener for working a vertical series of fanlights, and the "Victoria" gearing for opening horizontal and vertical series of lights. The decorative grate designs in beaten copper and in inlaid

wood are admirable, and quite above the average style of design seen in catalogues.

Messrs. J. Hodson & Son (Nottingham) send us a pamphlet in recommendation of Killer's Hopton Wood Stone, in which they deal, containing photographs of various buildings carried out by them in this stone, a beautiful material, which has been used in various important buildings in this country. The following particulars given in the pamphlet may be of interest:—

"The quarries produce three qualities of stone known as the white bed, grey bed, and dark bed. The white bed is used for monumental purposes. The grey bed is used for best finished and polished work, and has been used in the buildings mentioned in the list; it will take a polish equal to marble or granite, and can be supplied at less cost than either; it is suitable for exterior or interior use, and can be seen with good effect in the Imperial Institute and other buildings. The dark bed is the hardest, and is now put on the market for all descriptions of general masonry requiring a hard and durable stone, giving a clean, impervious surface; the crushing stress, as tested by Messrs. Kirkaldy, is 810 tons per cubic foot."

Messrs. Ham, Baker, & Co. send us illustrations and descriptions of their patent water waste preventer for street fountains or pillars, which enables any required quantity of water to be drawn, but prevents the possibility of the water being left running. The apparatus consists of a tap connected to a cylinder, holding a known quantity (say one gallon). When the handle of the tap is turned the contents of the cylinder are discharged through the outlet of the tap. The water then stops automatically, and no more will flow until the handle of the tap is reversed, when a similar quantity is drawn, again stopping automatically, this quantity being the maximum obtainable with one turn of the handle. The principle on which it works is shown in the accompanying diagram. Water from the main

which their material has been employed—a form of illustration which is not very much to the point. At the end of the book, however, are some sections showing the application of the material, and especially drawing attention to the saving of room in the upper portion of a house owing to the capability of the material (alternating with asphalt) being laid as a flat roof instead of with the slope necessary for tiles or slate. The vulcanite roof has, we believe, stood very strong tests in regard to fire-resisting quality.

Messrs. Colledge & Bridgen (Wolverhampton) send us an illustration and description of their "New Century" patent case-stay, of

which we append an illustration. The object, in the words of the patentees, is "to dispense with the weak double joint."

Messrs. Neatby Evans & Co., a new firm of decorative artists in Percy-street, W., send us a pamphlet circular in true "up-to-date" style, printed on grocers' wrapping-paper with uncut edges, with illustrations in thick lines and little blots of colour. We should surmise from what we gather from the illustrations that their work will probably have a good deal of character—the sketch for a clock for instance is very original—and we may have more to say about their work on another occasion; but we regard this kind of make-up of a catalogue as a mere artistic pose, a fashion of the moment, in which there is no merit but eccentricity.

Mrs. Starkie Gardner sends a pamphlet describing and illustrating some works in metal made by her. These include a special lever lock of which the section is given; and some examples of decorative metal-work; hand-beaten work, of which the same design is not repeated,

Messrs. Ham, Baker, & Co.'s Patent Water-waste Preventer for Street Fountains, &c.

enters at A 1, flows through the port in the plug tap A to pipe P into the cylinder B, forcing piston B 1 to the opposite end of the cylinder, and at the same time expelling the contents of this cylinder through pipe P 1 to the outlet of plug tap A 4. When the piston B 1 arrives at the end of its travel the water ceases to flow.

Messrs. Davenport & Coward, constructional engineers, send us a leaflet containing illustrations of some of their special forms of fire-resisting construction. These include a good form of suspended ceiling, in which ceiling bars, protected by concrete, are suspended by a special form of clip to the flanges of the main rolled-iron girders. They also show concrete floors without joists for spans up to 12 ft. of concrete with a "tension bond" embedded. Messrs. Davenport & Coward are also licenced for the expanded metal system of channel-arch flooring for warehouses, and the employment of expanded metal and cement for interior and exterior walls.

The Patent Vulcanite Roofing and Asphalt Company sends us a catalogue which consists principally of photographs of buildings in

which their material has been employed—a form of illustration which is not very much to the point. At the end of the book, however, are some sections showing the application of the material, and especially drawing attention to the saving of room in the upper portion of a house owing to the capability of the material (alternating with asphalt) being laid as a flat roof instead of with the slope necessary for tiles or slate. The vulcanite roof has, we believe, stood very strong tests in regard to fire-resisting quality.

Messrs. Colledge & Bridgen (Wolverhampton) send us an illustration and description of their "New Century" patent case-stay, of which we append an illustration. The object, in the words of the patentees, is "to dispense with the weak double joint."

Messrs. Neatby Evans & Co., a new firm of decorative artists in Percy-street, W., send us a pamphlet circular in true "up-to-date" style, printed on grocers' wrapping-paper with uncut edges, with illustrations in thick lines and little blots of colour. We should surmise from what we gather from the illustrations that their work will probably have a good deal of character—the sketch for a clock for instance is very original—and we may have more to say about their work on another occasion; but we regard this kind of make-up of a catalogue as a mere artistic pose, a fashion of the moment, in which there is no merit but eccentricity.

Mrs. Starkie Gardner sends a pamphlet describing and illustrating some works in metal made by her. These include a special lever lock of which the section is given; and some examples of decorative metal-work; hand-beaten work, of which the same design is not repeated,

APPOINTMENT.—Mr. W. D. Caroe, F.S.A., architect to the Ecclesiastical Commissioners, has been appointed architect to the Deau and Chapter of Canterbury, in place of the late Sir Arthur Blomfield.

BOOKS RECEIVED.

ENGINEERING COST ACCOUNTS. By Francis G. Burton. Second edition, 3s. (The Technical Publishing Company.)
THE LAND AND HOUSE PROPERTY YEAR-BOOK FOR 1901. (Estate's Gazette Office.)

Correspondence.

To the Editor of THE BUILDER.

THE DATE OF THE PANTHEON.

SIR,—Would you be obliging enough to correct an error of your compositor? In column 3, page 130, of my second Royal Academy Lecture he left out an "8," putting "13 A.D." instead of "138" in the date of the building of the Pantheon at Rome.

My attention was drawn to it by one of my foreign correspondents, who asked me if I dated its erection from Agrippa, who died in 12 A.D. He supposed it showed a want of agreement with Mr. Chedanne's researches.

G. AITCHISON.

BUILDERS' FOREMEN AND TRADES-UNIONS.

SIR,—Having seen so many attacks on builders' foremen who are members of a trade union, the latest being those made at the dinner of the Provident Institution of Foremen and Clerks of Works, would you kindly give me (as a foreman belonging to a trade-union) space for a few remarks on the other side of the question?

In the first place builders' foremen, unlike poets, are made, not born (I notice one of the speakers at the above dinner is in favour of the evolution); the majority of them have served their time at a trade, and worked for a certain period at it; during that time, if they have troubled to think about it, they have perceived the benefits of combination; for benefits there must be, or why the masters' associations? When they have obtained a foremanship, the need for belonging to a workmen's combination no longer exists; but they are still men, most probably married, with a family, and like all men subject to sickness; that is the reason they still belong to the union. The remarks made at the above dinner as to serving two masters are, I think, beside the question, as they ignore the friendly society side of it; the speakers should, as a matter of justice, recognise that a trade-union is not formed for the sole purpose of fighting the masters. If instead of calling the union hard names at public dinners the masters were to try and perfect the scheme proposed some time ago, whereby the foremen could have a trade benefit society independent of the workmen's unions and auxiliary to the friendly societies, they would confer a lasting good, both to themselves and their foremen. As far as I am aware the existing societies for foremen do not include any provision for regular sick-pay.

A BUILDER'S FOREMAN
BELONGING TO A TRADE-UNION.

"INDIGENT BLIND SCHOOL."

SIR,—In your "Notes" of last week's *Builder* we see that we are credited with the appointment of honorary architects and surveyors to the above charitable institution.

This is not so, as Mr. Roumieu was only appointed honorary surveyor. He visited and reported on the site chosen at Leatherhead, but the designing and carrying out of the new schools has been placed, by the Committee, in the hands of another architect.

ROUMIEU & AITCHISON.

THE STUDENTS' COLUMN.—In consequence of the pressure of other matter, our Students' Column article ("Sanitary Fittings and Plumbing") is held over until next week.

THE PEABODY FUND.—In the thirty-sixth annual report of the Peabody Fund, for the year 1900, it is stated that on December 14 last her late Majesty Queen Victoria granted to the Governors, and their successors in office, a Royal charter incorporating them under the name and style of "The Governors of the Peabody Donation Fund." In pursuance of the directions contained in the charter, all the estates and property belonging to the Trusts will now be vested in the Corporation by name, and arrangements for this purpose are in progress. At the end of the year the Governors had provided for the artisan and labouring poor of London 11,439 rooms, besides bathrooms, laundries, and lavatories. These rooms comprised 5,159 separate dwellings, viz., 100 of four rooms, 1,770 of three rooms, 2,440 of two rooms, and 849 of one room. On the Home Hill Estate twelve blocks of buildings of forty rooms each, besides laundries, lavatories, &c., are now in course of construction, and it is hoped, will be ready for occupation by the end of the year.

GENERAL BUILDING NEWS.

COUNTY SCHOOL, BARRY, GLAMORGANSHIRE.—Barry Intermediate School, which has undergone considerable enlargement, has just been reopened. The school buildings are erected on an elevated site near the Buttrills at Barry, and as now completed provide accommodation for 144 boys and eighty girls. The first school was completed in 1895, and in 1897 there were added two new ordinary classrooms, new laboratories, and cookery kitchen. The work just completed includes the enlargement of the assembly-hall, the building of one new ordinary classroom for boys, and of new chemical and physical laboratories, new science lecture-room and art studio. The old workshop has been converted into two cycle stores, and the workshop stands in place of the old chemical laboratory, and the rooms formerly providing a physical laboratory and balance-room have been converted into a gymnasium. The entrances and cloakrooms are separate for boys and girls, and are placed at the west and east ends of the main building respectively. There are now four ordinary classrooms, and a large assembly-hall in which when required four classes can be accommodated. The old building was a one-story building, but in this last contract the roof was taken off the centre part and a floor put over the present assembly-hall, on which are the new laboratories, lecture and balance and art rooms. The old art studio has been converted into a staircase hall and a stone staircase has been erected. The main corridor on the ground floor runs through from end to end. All the rooms are entered from the corridors, and the classes are so arranged as to have left-hand light, and chiefly north light. The cloak-rooms have been considerably enlarged, and the accommodation formerly used by the caretaker has had to be taken in for teachers' rooms and stores. The head and assistant teachers have private sitting-rooms. In a new detached building are now provided dining-halls for boys and girls, with pantries, &c., and attached to them is the caretaker's house with direct connexion with each hall. The floor of the assembly-hall and of the first floor rooms are laid with wood blocks by Mr. Ebner, of London, and the corridors and cloak-rooms have been refloored in tiles. The first floor is fireproof, formed of steel joists and girders, and concrete, by Messrs. Homan & Rodgers, of Manchester. The contract for the alterations and additions just completed has been carried out by Mr. Alban Richards, of Barry; Mr. W. Fry, of Cardiff, acting as clerk of works. Mr. W. Britton, of Barry, has in hand now a contract for new boundary walls and other work of the new recreation grounds. The cost of the present alterations and additions to the school has been £3,200, and the price for the other work will add another 818. The architect is Mr. W. H. Dashiwood Caple, of Cardiff.

DUNOON GRAMMAR SCHOOL, ARGYLSHIRE.—This building has just been opened by Mr. D. N. Nicol. As now completed, the whole building is of two stories. There are the usual classrooms and, in addition, an art room, lecture-room, chemical laboratory, physical laboratory, cookery-room, music-room, rector's room, lady teachers' room, and separate cloakrooms for boys and girls and infants. Exclusive of the science and art rooms, there is accommodation for 820 scholars. The architect was Mr. Wm. Fraser.

PROPOSED ENLARGEMENT OF MIDDLESBROUGH ASYLUM.—Mr. A. G. Malet, Local Government Board Inspector, held an inquiry at the Municipal Buildings, Middlesbrough, on the 27th ult., respecting the application of the Town Council for permission to borrow 23,000l. for purposes of the Middlesbrough Borough Lunatic Asylum. The proposed works comprise additional blocks for 160 patients, night nurses' quarters, and staff cottages. The scheme was explained in detail by the architect, Mr. A. J. Wood, of London.

ELECTRIC LIGHTING NEWS.

ELECTRICITY WORKS, DEVONPORT.—The foundation stone of the Devonport Corporation Electricity works, which are in course of erection in Newport-street, Stonehouse, was laid on the 21st ult. Mr. C. Furness is the engineer, and Mr. A. N. Jones the builder.

ELECTRIC LIGHT, FULHAM.—The inauguration of the electric light in Fulham took place on the 1st ult. The generating station is situated near Vandsworth Bridge. There is a refuse destructor in connexion with the scheme. Mr. F. H. Medhurst was the engineer, and the plant was supplied by the General Electric Company.

ELECTRIC LIGHTING, SUNDERLAND.—On the 1st ult. Mr. M. K. North, an Inspector to the Local Government Board, held an inquiry at the Town Hall, Sunderland, into an application by the Corporation for sanction to borrow 73,000l. for purposes of electric lighting. The scheme was explained by Mr. J. F. C. Snell, the Corporation Electrical Engineer.

ELECTRIC LIGHTING, NEWCASTLE.—The Newcastle Corporation having applied to the Local Government Board for sanction to borrow 100,000l. under the Newcastle-on-Tyne Tramways and Improvement Act, 1899, Mr. A. A. G. Malet,

A.M.Inst.C.E., held an inquiry at the Town Hall, on the 26th ult., into the subject matter of the application. Mr. Le Rossignol, the Resident Electrical Engineer, described the scheme, which is for lighting the principal thoroughfares.

STAINED GLASS AND DECORATION.

STAINED GLASS WINDOW, UNITED FREE CHURCH, ABERDEEN, ABERDEENSHIRE.—The circular window behind the pulpit in the east end of this church has been replaced by one of stained glass. The work was executed by Messrs. Swaine, Bourne, & Sons, of Birmingham, under the supervision of Mr. George Couets, of Aberdeen.

MEMORIAL WINDOWS, WINCHOMBE CHURCH, GLOUCESTERSHIRE.—Three stained glass windows have been placed in the north aisle of Winchcombe parish church, in memory of the late Mrs. Dent, of Sudeley Castle. The windows were the work of Messrs. Powell, of Whitefriars.

FOREIGN.

FRANCE.—The Municipality of Paris has renewed its negotiations with the State in reference to the long-talked-of subject of the lighting of the Tuileries gardens with electricity.—The Government has established a French School of Oriental Art, on the model of the existing French schools at Rome and Athens. It will have for its primary object the archaeological exploration of the Indo-China peninsula and the neighbouring regions.

Work is at work on the friezes, after sketches left by Puvion de Chavannes, which were intended to crown the frescoes executed by the deceased artist in the Pantheon.—In the small square of St. Germain des Prés, at Paris, there has been set up the portico in ceramic ware which recently stood on the Esplanade des Invalides, and which was carried out at the Sevres manufactory. In the centre of the portico is an alto-relief figure, symbolising "Le Céramique," which has been modelled by M. Coutan. In the opposite square are being erected the fragments of a Gothic cloister which was formerly part of the ancient Bibliothèque des Benedictins, and was built by Pierre de Montreuil.—Parliament will be shortly occupied with a scheme for the improvement of the canal from the Escout to the Saône, and of one or two other connecting canals, and also with the general question of the navigable character of the Loire between Nantes and Angers; also the improvement of the basins and ports of Marseilles, Bordeaux, Havre, Rouen, Dieppe, Saint-Nazaire, Bayonne, and Cette.—M. Injalbert's group of "Faunesses et Satyres," which, as before mentioned, was refused by the town of Montpellier as immoral, is now to be offered to Paris.—The municipality of Reims intend to place in their museum the statue of Louis XV, by Pigalle, now on the Place Royale, and which has already suffered injury at the hands of Republican enthusiasts. The statue of Colbert will be erected in its place.—M. Girault, the architect of the Petit Palais, has been appointed Architect to the Palace of Fontainebleau, in place of M. Boitte.—M. Paul Cbarbonnier, of Nancy, has been appointed architect in charge of "Monuments Historiques" for the Department of Meurthe-et-Moselle, in place of the late M. Schuler.—M. Treppey-Bailly has been appointed Architect of the Right "Section of Architecture" of the city of Paris, comprising the Ninth and Seventeenth Arrondissements, in place of M. Saufroy, retired. M. Refol has been appointed Architect to the Second Section (Third and Eleventh Arrondissements).—M. Decraix, architect, has been commissioned to erect a new Hôtel de Ville at Calais at an estimated cost of 750,000 fr.; and the Municipality of the same town has commissioned M. Constant, engineer, to build a new theatre at a cost of over a million francs.

AUSTRALASIA.—A conference of Australian architects, held in Sydney, has decided to form a Federal Institute of Architects. Whilst recognising the value of the R.I.B.A. examinations, and strongly urging young Australian architects to qualify both for the Associateship and Fellowship of the Institute, the general feeling is that architects at the Antipodes are "too far away from the old country to reap any special advantage therefrom, and if affiliated lose our individuality, and to a certain extent our independence, and sink to the level of a small provincial society in England." "An Australian Institute should occupy the same position in relation to the parent society that the colonies occupy towards the mother country;" such is the opinion in Australia. It is proposed that the Federal Institute should be independent of, but work in harmony generally, with architects in other parts of the world for the welfare of the whole profession. It is held that the passing of the Royal Institute of British Architects' examination by Australian architects should be regarded in the same light as colonial medical men look upon the taking of an English degree—viz., as an extra qualification, giving them a higher status in their profession.—The New Zealand Government has invited competitive designs for new Houses of Parliament; the buildings are estimated to cost 100,000l. The first, second, and third premiated designs are to be awarded 500l., 200l., and 100l., respectively.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.

—Messrs. Johnson & Phillips, electric cable manufacturers, &c., at Old Charlton, have opened a West End depot at 37, King-street, Covent Garden.—A company has been formed, under the title of "W. Oliver Sons & Howard, Limited," for the purpose of acquiring and combining the business of Messrs. W. Oliver & Sons, of 120, Bunhill-row (wainscot, mahogany, and general timber merchants), and the hardwood portion of the business of Messrs. W. W. Howard Bros. & Co., of 100, Fenchurch-street. The temporary office of the company is at the latter address, and the registered office at 120, Bunhill-row. (See advertisement in this week's issue.)

CARPENTERS' HALL LECTURES.—The series of five Thursday Evening Lectures at Carpenters' Hall commenced on the 21st ult., with a lecture by Mr. H. H. Statham on the Architecture of the Paris Exhibition. He said the architectural features of that exhibition had afforded a remarkable evidence of the architectural genius and power of impersonation of the French, and the temporary architecture was of interest in another sense; it suggested a special problem, for temporary architecture need not have, and indeed ought not to have, the same qualities as permanent or monumental architecture. With a plan exhibited on the screen the lecturer sketched the history of the site, and the gradual extension of the exhibition ground in each exhibition since that of 1856, when the Palais de l'Industrie was built. He then described in detail the new bridge and the two art palaces on the Champs-Élysées, the beautiful permanent features which the Exhibition had left; a number of photographs of these and a plan of the smaller art-palace were shown with the lantern. They would next take the temporary buildings, of which a number of photographs were shown, commencing with the entrance gate from the Place de la Concorde; then taking the buildings of the Esplanade des Invalides going from north to south; then some of those of the Champ de Mars, and concluding by a series showing the buildings on the right and left banks of the river, ending with the Italian Palace which formed the eastward termination of the Rue des Nations.—On the 28th ult. the second of the course of lectures was delivered by Mr. H. C. Richards, M.P., K.C. The subject was "Old London," and it is an encouraging sign for those who are endeavouring to prevent the obliteration of the existing remnants of old London, that the lecture attracted a large audience. Antiquaries did not perhaps glean many new facts from the lecture, but an illustrated discourse by so able and enthusiastic an antiquary as Mr. Richards will always be listened to with interest. The lecturer stated that Cornhill was the site of the first Roman settlement in London, and that here was built the first Christian church of London. Cheapside was not so old, but its history as an inhabited area could, nevertheless, be traced for a thousand years. The fact that William the Conqueror and the citizens of London so readily came to terms, to the great advantage of London property, was ascribed by the lecturer to the circumstance that the Bishop of London at that time was also a Norman, and that for some time before the Conquest Norman influence had become a power in the city. Mr. Richards referred in caustic terms to the disappearance of certain ancient bequests, and the callousness of the City and County ceremonies, but gave due credit to the London County Council for its action in appointing a committee to keep a watch upon all places of historic interest within the county.

WHAT IS A "CURTLAGE."—Under this heading the following appears in the last issue of the *Sanitary Chronicle of St. Marylebone* (monthly):—"The word 'drain' under the Metropolitan Management Acts is defined to mean and include any drain of and used for the drainage of one building only, or premises within the same curtilage," it also includes drains for draining any block of buildings by a combined operation under the order of a Local Authority. The word 'sewer' is only defined in the statute by a process of exclusion, pipes for draining premises must apparently be either sewers or drains, and if they are not drains then they are 'sewers.' It is hardly necessary to observe that sewers are under the jurisdiction of Local Authorities, drains are private matters. Golden Horse Yard consists of a group of stables with living-rooms over them, enclosing a yard approached from Taunton-mews, there is also a way into the yard through two houses in Linhope-street, the back doors of these houses opening on to the yard. The yard is entirely enclosed by the stables and the two houses in Linhope-street. The drainage of the stables and houses was found to be defective, and a notice from the Council duly served upon the owners to remedy the defect. Thereupon the owners sought to cast the responsibility on the Council, arguing that the drain in this confessedly private yard was 'a sewer.' The owners were informed by the officers of the Sanitary Department that the yard was 'a curtilage,' and the stables, &c., were all situated in the same curtilage, and, therefore, the various conduits were private drains and not sewers. This question on summons was heard before the

stipendiary and ably argued on both sides. The solicitor to the Council relied upon certain leading cases and the facts to prove the yard was curtilage to the stables generally. On the other side it was contended that the houses being more of the nature of stables than houses, this common yard could not be said to be the curtilage of any one of them or the curtilage of all of them, and that the idea of curtilage was insupportably connected with that of dwelling-house and could not be applied to stables. The stipendiary adopted this view, and gave his judgment in favour of the defendants, but granted a 'case.'

FIND OF POTTERY.—The Dover correspondent of the *Morning Advertiser* says that one of the finest collections of ancient Roman pottery ever found in Kent has been discovered quite close to Walmer Castle, the Cinque Ports residence of Lord Salisbury. The discovery was made by Messrs. Mawson, landscape gardeners, of Windermere, while excavating at Walmer Lodge. Altogether the collection comprises about forty pieces. They have been removed to one of the buildings adjoining the grounds, where they are now being privately exhibited. According to archeological authorities who have seen them some of the specimens are very valuable. Some of the pieces of pottery are in a remarkable state of preservation.

IMPROVEMENT SCHEME, LEEDS.—A Local Government Board inquiry was opened by Mr. Robert Bicknell, M.Inst.C.E., on the 1st inst., in the Council Chamber at the Leeds Town Hall, with reference to the scheme of the Leeds Corporation for clearing the vicinity of Quarry Hill of all its back alleys, dark courts, and insanitary property. The area proposed to be dealt with is 311,318 square yards in extent. In this area are 2,104 dwelling-houses, 177 joint dwelling-houses and shops, five lodging-houses, forty-eight public-houses, one board-school, one Roman Catholic school, one church, three chapels, four Jewish synagogues, four Sunday-schools, and 360 warehouses, mills, factories, &c. The miscellaneous buildings, it appears, include ten bakeries, four clubs, two cow-houses, three slaughter-houses, one herring-curing establishment, one sausage-skin factory, one tripe factory, and one pigery. The carrying-out of the scheme will disturb between 4,000 and 5,000 people, and, according to the City Engineer, will cost the ratepayers of Leeds 298,054*l.* The Corporation will have to pay 450,567*l.* for property, and 77,467*l.* for alterations to, and the formation of, streets—a total of 528,034*l.* From this sum is deducted 225,000*l.*, as the amount the Corporation is likely to obtain for surplus land.

LAMBETH COUNCIL AND TENDERS FOR JARRAH.—At a meeting of the Lambeth Borough Council held on the 21st ult. at the Town Hall, Kennington, the General Purposes Committee submitted the following list of tenders received for the supply of 3,000 loads of jarrah wood for paving purposes during the ensuing summer:—Jarrah Timber and Wood Paving Corporation (as required), 7*l.* 12*s.* 6*d.* per load; Churchill & Son (May, June, and July), 7*l.* 3*s.* per load; W. Griffiths & Co. (May, June, and July), 7*l.* 2*s.* 6*d.* per load; Millars' Karri and Jarrah (May, June, and July), 7*l.* per load; Jarrahdale (May, June, and July), 7*l.* per load; A. F. Manuelle (as per specification), 6*l.* 10*s.* 6*d.* per load; Acme Wood Flooring Company, Limited (May, June, and July), 6*l.* 10*s.* 3*d.* per load. The committee stated that with the tender from the Jarrahdale Jarrah Company was enclosed a letter from Mr. F. Chapman, who stated that:—"The freight market has been ruling rather high, but it would be quite prepared to do what I did on a previous occasion with the fall of the freight market." In commenting upon this letter the committee stated that although the tender appeared on the face of it to be 3*s.* 9*d.* per load in excess of the lowest tender, it was possible that the proposal as to freight might vary to that or even a greater extent. In addition the company had given every satisfaction in previous deliveries, and a considerable benefit was obtained from the saving on freight. The committee, therefore, recommended the Council to accept the tender of the Jarrahdale Jarrah Forests and Railways, Ltd., for 3,000 loads of hardwood at 7*l.* per load subject to the Council receiving any benefit in the fall of the freight market. Councillor Thwaite, as an amendment, proposed the acceptance of the tender of the Acme Wood Flooring Co. at 6*l.* 10*s.* 3*d.* per load. He said that he could not understand the committee's recommendation when, by accepting the lowest tender, the Council would save 562*l.* Councillor Hubbard seconded the amendment, which, after further discussion, was carried. It was then agreed to unanimously as a substantive motion, and the contract was thus awarded to the Acme Wood Flooring Co.

BRISTOL ASSOCIATION OF CLERKS OF WORKS.—The annual dinner of the Bristol Clerks of Works and Builders' Foremen's Association was held on Saturday night at the Royal Hotel. The chair was taken by Mr. Frank W. Wills, President of the Bristol Society of Architects, and he was supported by Councillor Lee, Mr. W. J. Steele, Deputy City Engineer; Mr. H. Dare Bryan, Hon. Sec. Bristol Society of Architects; Mr. A. Krauss, President of the National Association of Master Builders of Great Britain; Mr. G. Humphreys, President of

the Bristol Association of Master Builders, and others. In the course of the evening Mr. W. Kidwell proposed "Trade and Commerce," which was acknowledged by Councillor Lee, who quoted figures showing that between the years 1800 and 1900 the population of Bristol had increased eight-fold, the tonnage of the port in the last sixty-seven years fifteen times, and the rateable value twelve times. Mr. F. N. Cowlin proposed the toast of "The Architects," and Mr. H. Dare Bryan having responded, Mr. W. Hollyman proposed "The Master Builders." Mr. Krauss, in responding to this toast, urged upon the members of the Association to adopt as their motto in the north, had their scheme for accidents, sick and annuity provision, as well as life policies. In the north the assistance kindly and willingly rendered by the Master Builders, plus the contributions of the members, had already put this on a sound and satisfactory footing. He pointed out to the members that they could not serve two masters, the men's trade union and the builders, and remarked that they would be benefited by forming their association into a benefit society, so that those members who now belong to the Trades Union might be free from the men's union and at the same time lose none of the benefits. The Chairman proposed "The Bristol Association of Clerks of Works and Builders' Foremen," and congratulated his hearers on the progress the Association had made.

FIRE PREVENTION EXHIBITION AT THE AGRICULTURAL HALL. A meeting of the commercial section of the British Fire Prevention Committee was held on the 6th inst., Mr. F. R. Farrow presiding, when most of the firms represented took the opportunity of announcing their intention of participating in the Fire Prevention section of the Building Trades' Exhibition. Among the firms to whose space has already been allotted are the Asbestos and Asbestic Co., Ltd.; Messrs. D. Anderson & Son; The British Luxfer Prism Syndicate, Ltd.; Mr. Bugg; The British Uralite Co., Ltd.; Messrs. Broadbent & Co., Ltd.; Messrs. Clark, Bunnett, & Co., Ltd.; The Crittall Manufacturing Co.; The Conduit and Insulation Co., Ltd.; The Columbian Fireproofing Co.; Messrs. Green & Co.; Messrs. Hobbs, Hart, & Co.; Mr. F. Jones; The Mural and Decorations Syndicate; The Expanded Metal Co.; The Non-Flammable Wood Co.; Messrs. Pilkington Bros.; Messrs. Potter & Co., Ltd.; Messrs. G. A. Williams & Sons. Details as to classification were discussed with Mr. Hammond, Chairman of the Exhibition Sub-Committee, and it was arranged that with regard to firms that had not yet definitely applied, application should be made before March 15 to the offices of the Committee, 1, Waterloo-place, Pall-mall.

HULL MASTER BUILDERS' FEDERATION.—The members of the Hull Branch of the Yorkshire Federation of Building Trades Employers held their annual dinner at the Grosvenor Hotel, Hull, on the 21st ult. The President (Mr. C. Hebblewhite) presided. The health of the King and Queen having been honoured, Mr. E. Good (Vice-President) proposed "The Navy, Army, and Auxiliary Forces," to which Mr. W. S. Walker briefly responded. The toast of "Success to the Hull Federation of Building Trades Employers" was proposed by Mr. Hewitson. He said that during the past few years they had been passing through uncertain and irregular trade. He hoped that all disputes between master and man had been settled for some time to come, and that they might have a quiet and prosperous time. He hoped that the power of that organisation would always be used in the direction of settling disputes in an amicable manner. The Chairman, in responding, said that there was not one in that room that had the idea of oppressing their workmen. There were times when difficulties did and would always arise, and some fresh means should be adopted to settle those difficulties. He assured them that if the demands made upon them in the future were reasonable, they would be met in a reasonable spirit. Labour during the past year or two had cost 33 per cent. more than it did a few years ago, and that was a state of affairs the builder would have to reckon with. He was bound to confess that in hundreds of instances the masters did not get a fair return for the money they paid. He defied any man on the opposite side to say that they did if they knew anything about practical work. With all the latest machinery there were hundreds of instances where the same amount of work was not produced as when he had to take the plane and saw in his own hands. He hoped, however, that in the future they would be able to adjust matters on more peaceable lines.—Mr. J. Watson submitted the toast of the "National and Federated Branches and Kindred Associations of the Building Trade." After speaking of the growing strength of the various branches of the trade, he went on to say that with prices fluctuating as they had been lately, it was most difficult for the builders to make estimates. Prices had gone up by leaps and bounds. Within the last six or seven years the cost of labour and materials had gone up 25 per cent. in Hull. He very much doubted whether there could be any building of a speculative nature that could show a reasonable return at the present prices. Mr. Longden, in responding, said always a rule that as wages went up a penny per hour the work went down twopence per hour. Messrs. G.

England and J. Biggin also briefly responded. Mr. F. Beilby gave "The City of Hull and Hull" and Mr. Councillor Scott, P., briefly responded. Councillor Scott, J.P., gave "The Architects and Surveyors," to which Messrs. Walker and W. E. Barry responded. Mr. J. Townley proposed "The Visitors," which was acknowledged by Messrs. Rhodes and Earnshaw.—The Executive of the Yorkshire Building Trades Employers' Federation met at the Builders' Exchange, Posterngate, on the 21st ult. The attendance, however, was not large owing to the Yorkshire Association's meeting in London, at which many of the Yorkshire delegates were engaged. The Yorkshire President (Mr. James Longden, Sheffield) occupied the chair, and was supported by representatives from Sheffield, Barnsley, Bridlington, Halifax, Huddersfield, &c. The delegates appointed to carry out organising work during the past month, reported satisfactory progress, and said that further meetings had been duly arranged. This being the annual executive meeting the secretary (Mr. Hanson, Halifax) was unanimously re-elected to that position, and Mr. W. R. Thompson (Devsbury) was re-elected to the treasurer'ship.

CARFAX IMPROVEMENT, OXFORD.—An inquiry into an application by the Oxford Corporation to the Local Government Board to issue a provisional order to empower the Council to put to rights, with reference to certain lands required by them for the purpose of widening and improving Cornmarket-street, the powers of the Land Clauses Act, with respect to the purchase and taking of land otherwise than by agreement, was held at the Municipal Buildings, Oxford, recently, by Mr. H. H. Law, an Inspector to the Board. It was stated that the premises proposed to be purchased were No. 1, Cornmarket-street, the owners being the trustees of the St. Aldate Parochial Charities. Certain premises in the street having been pulled down, the Corporation had made a new building line, and this necessitated the pulling down of the premises at No. 1, which were known as the Creamery. The owners of the property had fixed the value at 5,000*l.* Evidence was given by the City Engineer, Mr. W. H. Whitte. After the inquiry the premises were visited by the Inspector.

INCORPORATED SOCIETY FOR PROMOTING THE BUILDING OF CHURCHES AND CHAPELS.—This Society held its usual monthly meeting on Thursday, 21st of February, at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. The first business was the reading and passing of a loyal address to the King. Grants of money were then made in aid of the following objects viz.: Building the first portion of the proposed new church of the Ascension, Victoria Docks, Essex (Fetted School Mission), 120*l.*; rebuilding on a new site the Church of St. James, Grove, near Wantage, 50*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Radcliffe-cum-Chackmore, St. John the Evangelist, near Buckingham, 30*l.*; Stourton Caudle Parish Church, near Sherborne, Dorset, 25*l.*; Stow Longa, St. Botolph, near St. Neot's Huntingdon, 25*l.*; Wesley Rocks, St. Ichn, near Stoke-on-Trent, 20*l.* The following grants were also paid for works completed: Denaby Main, All Saints, near Rotherham, York, 55*l.*; Huddington, St. Michael and All Angels, Droitwich, Worcester, 30*l.*; Erchfont, St. Michael and All Angels, near Devizes, Wilts, 20*l.*; New Brighton, Emmanuel, Cheshire, 20*l.*; Horley, St. Bartholomew, Surrey, 20*l.*; Crofton Park, St. Hilda, Cantford, Kent, 40*l.*; and Walthamstow, St. Paul, Essex, 40*l.* In addition to this the sum of 295*l.* was paid towards the repairs of nineteen churches from trust funds held by the Society. The Annual General Court of the Society will be held at 3 p.m. on Friday, the 17th May, at the Church House, Dean's-yard, Westminster, when the chair will be taken by the Archbishop of Canterbury, President of the Society.

WASHED SAND.—We have received a sample of washed pit sand from Messrs. Heather, Bailey & Co., Limited, Commercial-road, Lambeth, respectively, which they remark that the material comes from Erith, and that they have recently erected a plant to deal with it. The sand is said to be reasonable in price, and to be beneficial to numbers of builders who are at present obliged to wash their sand in the old way by hand. We find, on examining the material, that it is of medium-grain, slightly ferruginous, and composed almost exclusively of fragments of quartz and flint. The sand grains are, for the most part, sub-angular, and are of varying size; the largest, which are few in number, might be termed fine grit, and these are, nearly all, of white flint. It is certainly a good sample of builders' sand, free from shell fragments, and has been washed exceedingly clean.

CAPITAL AND LABOUR.

THE QUARRYMEN'S STRIKE IN NORTH DERBYSHIRE.—The strike of quarrymen in North Derbyshire, which has existed several weeks, has come to an end. As the result of a conference held at Buxton, the 1,500 men who refused to "sign on" under terms which had additions have resumed work, the agreement being that an engagement in the future be terminable by a month's notice on either side.

KIRKCALDY BUILDING TRADE.—The operative masons have received notice from the Masters' Association of a reduction of wages from 8d. to 8d. per hour, commencing at the end of May. The operatives have decided not to accept the reduction, holding that the strike of a halfpenny had not been taken off last year. Operative joiners have received notice of a reduction from 8d. to 7½d. They have decided against the reduction. Bricklayers at most of the buildings in progress in the district have been notified of a reduction of a halfpenny per hour, from 9½d. to 9d.

ABERDEEN PAINTERS' STRIKE.—The *Aberdeen Free Press* states that at a meeting of the members of the Aberdeen branch of the Scottish Amalgamated Society of House and Ship Painters, held in the Trades Hall on the 27th ult. for the purpose of considering what action the men were to take in the dispute which has been going on for some time, after a long discussion it was unanimously agreed to accept the finding of the masters and not contest the question further. The point in dispute was that rule 6 should be altered to read as follows:—"That the men shall be at a shop job or radius at the hour of commencing work, the radius to be one and a half miles, Union Bridge as a centre." The masters at first wished the radius, which was formerly one mile, to be doubled. The men objected and the masters agreed to make it one and a half miles, and to this the men have agreed. Other points were disputed, but these were mutually agreed to. The men asked that instead of 5s. extra per week being allowed for country work the figure should be 6s. The masters requested that country working hours should be regulated by daylight and other circumstances, but gave way, and agreed that in country work there would not be less than seven hours per day, and if more than eight that extra money would be paid.

NORWICH BUILDING TRADE PROSPECTS.—The strike on the part of the Norwich bricklayers still continues, and there is no immediate prospect of a settlement. What makes the outlook gloomier still is that various other operative branches of the building trade are making a move in favour of higher wages; and that even if the bricklayers get back to work the paralysis of the building trade promises to continue. We learn that the Norwich Master Builders' Association are in receipt of no fewer than three further demands. The Amalgamated Society of Carpenters have given notice for an advance of 3d. an hour and a proportionate increase for overtime, to take effect on June 1, 1901. The Navvies, Builders' Labourers, and General Labourers' Union are asking also for 1d. advance, to take effect on June 1, and the Amalgamated Society of House Decorators and Painters demand an increase of 1½d. an hour, the present rate being 6d., and various alterations of the rules. These latter, if granted, bring about a reduction of working hours, and would transfer to the painting trade all whitewashing and distemping done with hair brushes. The master builders have not yet fixed a meeting at which these demands will be discussed. —*Eastern Daily Press.*

LEGAL.

BUILDING DISPUTE AT HARROGATE.

The case of the Mayor, &c., of Harrogate v. Holmes came before Mr. Justice Cozens-Hardy in the Chancery Division last week, concluding on the 18th ult., an action brought by the Mayor, Aldermen, and Burgesses of the Borough of Harrogate against Mr. William Holmes, of 1, Valley-drive, Harrogate. The plaintiffs asked for an injunction to restrain the defendant, his contractor, builders, agents, and workmen from erecting or permitting any buildings already erected by defendant to remain in Valley-drive and Valley-mount, in the Borough of Harrogate in such a manner as to be contrary to the Harrogate Corporation Act of 1893 and the by-laws in force within the borough; or otherwise than in accordance with the plans deposited by the defendant with the plaintiffs pursuant to the by-laws and approved by the plaintiffs. The Corporation also asked for a declaration that they were entitled to remove, alter, pull down, or otherwise deal with the works constructed by the defendant contrary to the provisions of the Act of 1893.

Mr. Micklem, K.C., and Mr. R. J. Parker appeared for the plaintiffs; and Mr. E. Ve, K.C., and Mr. Perks represented the defendant.

Mr. Micklem said that the action was brought by the Corporation of Harrogate to restrain the infringement of its building by-laws. Harrogate was incorporated by charter in 1884. Before the Commissioners had been appointed to carry out the provisions of the Harrogate Improvement Act of 1841 and they had adopted the provisions of the local Government Act of 1858 and became the local Board of Health. The Commissioners passed certain by-laws in accordance with the 1858 Act and incorporated the Public Health Act, 1875, and those by-laws became the by-laws of the Corporation. The plaintiffs complained that the defendant had put up large buildings which they were not pulled down, would fall

down shortly; plans were approved; but the defendant had erected buildings contrary to them, and he had now delivered amended plans, which the plaintiffs had rejected for good reason. Upon approving a plan depended such matters as the thickness of walls and the height of buildings. His lordship would hear in evidence that the defendant had put up walls 4½ in. thick, rising to a height of 70 ft. Since the action had been set down for trial some part of the lower wall had begun to bulge. The second by-law which had been infringed was the provision as to air space at the back of the houses. The by-laws stated that a building of three stories should be 20 ft. from the nearest property, but in the houses of the defendant, which were four stories, there must be 25 ft. of space at the rear of the premises. The approved plans were for three-story buildings, but the defendant had erected houses of four stories and three attics. The third infringement had reference to the height of a building adjoining the street.

His Lordship asked if there was any dispute as to facts?

Mr. Eve said he knew nothing about the defendant's houses tumbling down. There would be no dispute as to the height of the houses to a particular point on the opposite property or as to the height of the eaves in front.

Mr. Micklem stated that the four houses of the defendant stood at the corner of streets known as Valley-drive and Valley-mount. The plans were passed in 1896; two houses had been erected in accordance with the plan, and two other houses were those in question in the action.

Mr. Eve stated that the defendant thought there were too many builders on the Corporation.

Mr. Micklem said Valley-mount was 36 ft. wide, and it went round the rear of the defendant's houses into Valley-drive. Valley-mount was 60 ft. wide. The plaintiffs contended that the defendant could not put up a house facing Valley-mount of a greater height than the width of the road.

His Lordship asked the defendant's counsel if he disputed that he was building contrary to the plans.

Mr. Eve replied that the plans which were approved by the Corporation were subsequently found not to be in accordance with the by-laws, and it became necessary to modify the plans.

Mr. Micklem said the by-laws provided that every building to be erected and used as a dwelling-house should have in the rear 150 square feet free of any erection thereon, and by the Corporation Act no house was to be erected of a greater height than the distance from the front of the building to the opposite side of the street. The plaintiffs gave the defendant notice not to continue building in contravention of the by-laws, but no notice was taken of that.

Mr. Geo. Richardson Strachan, M.Inst.C.E., examined by Mr. Micklem, said he had examined plan A, which was submitted, and disapproved of it, in January last. Witness had not visited the locality, but had studied the plan, and he should say it represented a building of slight, flimsy structure, and in a condition of critical instability. That was to say, if one part gave way the whole structure would come down like a pack of cards.

Mr. Eve said he admitted that the building was not in accordance with any of the plans approved. The defendant's point was that it was in accordance with the by-laws.

Mr. Parker observed that in cases of this sort if a plan was disapproved on any ground which was not tenable by reason of the by-laws, then the disapproval did not prevent the building being erected in accordance with the plan. It was pleaded generally by his learned friend for the defendant that the whole building was in accordance with the by-laws, and therefore he had a right to go on with it; but this was merely to show the court that the building was of such a nature that it was a building which never could have been passed because it would be a danger to the public. The thickness of the walls provided by the by-law was one of the safeguards against such a contingency.

Mr. Frank Bagshaw, the Borough Surveyor of Harrogate, in his evidence, said that he had been connected with the Harrogate Corporation for fourteen years. The road on the Valley Park Estate came under the control of the Corporation. The Corporation in 1896 approved certain plans submitted by the defendant for the erection of twelve houses in Valley-mount and those plans were approved in July, 1896. Two houses were erected in accordance with the plans, but in June last witness called defendant's attention to the fact that two other houses differed from the plans which had been approved. Amended plans were sent in but they were disapproved because the height of the eaves of the buildings exceeded the height permissible in proportion to the width of the street; the drainage did not agree with the plans. Some of the bedrooms had less than 100 superficial feet, had no fireplaces, and were without proper ventilation; the causeway was not wide enough, and the defendant was excavating within 600 yards of the old sulphur well. Some of the plans showed that the buildings were to be of three stories, but the defendant had put up four-story buildings, the means of exit from which were totally inadequate. He had seen the

buildings recently, and there was a big bulge in one of the walls which had to be shored up.

Cross-examined, the witness said that no plans of the buildings in question had ever been approved by the Corporation. The drainage was put right in subsequent plans, and to a certain extent the small bedrooms had since been ventilated. As to the statute prohibiting excavations within 600 yards of the old sulphur wells, he agreed that the defendant only excavated a few feet for the purpose of laying foundations. A wall 4½ in. thick was not common in Harrogate. He thought that some of the walls of defendant's houses should be considerably more than 9 in. in width.

This concluded the case for the plaintiffs, and Mr. Eve said that the action had been founded on three points, *i.e.*, that the plans were not approved by the plaintiffs, that the houses were in violation of the statutory provision that the height should be equivalent to, and not exceeding, the width of the road to which they fronted, and that the ventilation space at the back was not in accordance with the by-law. He admitted that the defendant had not got the approval of the Corporation to the plans, and that the height of the buildings was in excess of the height permitted, but he contended that the ventilation was thorough, and that the defendant had complied with the spirit of the by-law.

Mr. Justice Cozens-Hardy said he was very much impressed by the fact that some of the walls were only 4½ in. thick.

Mr. Eve thought that could be rectified, and if there was any danger from the internal walls being too thin, they could be converted into a proper thickness.

His Lordship did not suppose that the Harrogate Corporation desired to do anything but their duty, but the defendant was in mercy and he must make some terms with them.

Mr. Eve hoped that his lordship would bear in mind that the defects in construction were not put forward in the statement of claim.

His Lordship did not think that a public body was bound to go through the plans and specify every objection. The defendant had deliberately gone on building when he knew that his plans were not approved.

At this stage learned counsel consulted with their respective clients, and

Mr. Micklem informed his lordship that the parties had agreed to an order. The defendant was prepared to remove the upper part of his building, to strengthen all the walls as might be required by the Corporation, and to submit forthwith plans to be approved.

Mr. Eve stated that on defendant giving that undertaking there would be no order in the action except that the defendant should pay the costs.

His Lordship said he approved of the arrangement, and said it was a matter of extreme importance to the Corporation that builders should be taught they could not go on with buildings without the plans being approved.

FINSBURY-CIRCUS IMPROVEMENT

In the City of London Court, on the 26th ult., Messrs Rall Bros., 25, Finsbury-circus, sued Messrs. Werner, Beit, & Co., 120, Bishopsgate Within, by way of an appeal under the London Building Act, 1894, for an order to set aside an award, dated December 18, which had been made by Mr. Thomas Blashill and Mr. H. T. Gordon as surveyors in an arbitration with respect to premises in Finsbury-circus. Mr. R. H. Bray, K.C., and Mr. Rowlett were counsel for Messrs. Rall, and Mr. Macmorran, K.C., and Mr. Eower for Messrs. Werner, Beit, & Co. Mr. Bray said that the plaintiffs were the occupiers and lessors of Nos. 25, 26, and 27, Finsbury-circus. Their buildings were surrounded by a number of other buildings, of which, apparently, Messrs. Werner had taken a lease from the Corporation. They had pulled down those buildings, and they now wanted to pull down all Messrs. Rall's outside walls (the wall of No. 27) and there was an east wall (at No. 25), while the south wall formed the back part of the premises. The defendants wanted to pull all three of them down. If this were done the plaintiffs would be compelled to move from their premises for some months, and that would involve serious expenditure, probably amounting to 500l. That they naturally did not want to do. The defendants' contention was that under the Building Act they were entitled, as building owners, to do what the award had said they might carry out. Mr. Commissioner Kerr said the point in dispute was simply concerned with the construction of the Act of Parliament. As both parties had stated that they intended appealing whichever way the decision went, he would say at once that he was inclined to dismiss the appeal from the arbitrators. Before doing that the case might stand over so that the parties might go direct to the High Court, and have the matter decided there. —*City Press.*

THE LONDON BUILDING ACT:

AN "IMPRACTICABLE AND WORTHLESS" MEASURE.

At the Mansion House recently, before Alderman Sir H. E. Knight, Messrs. Weary & James, builders,

were summoned by Mr. Hugh McLachlan, the District Surveyor for the western division of the City, for having on the 14th ult. begun to execute certain work at 169, Fleet-street, without serving upon him a notice as required by Section 145 of the London Building Act, 1894. Mr. Weary, who appeared, said that notice was given. Mr. McLachlan stated that the document he received did not contain sufficient particulars. As he had to make returns to the London County Council, giving all details, he wrote to the defendants, and asked them, amongst other things, for the name of the owner of the premises. He received a reply to the effect that they did not know it. Sir Henry: I understand that the work done was the putting-in of a shop-front. This section requires the builder to state the situation, area, &c. Is he to make a survey? Mr. McLachlan: Evidently the law requires it. Sir Henry: Then the number of stories, and the "intended occupation" are required. The Act is so badly drawn that you ask a man to do the impossible. He could not state the "intended occupation," because the place was already occupied. The Chief Clerk: And you could not give the number of stories to a shop front? Sir Henry: The Act may have been drawn by some philosopher, who sat in his closet and thought it a theoretical accomplishment, but I look upon it as impracticable and worthless. Mr. McLachlan said that if the defendants now gave him the name and address of the owner he would be satisfied with the costs of the summons. Sir Henry: That is my business. You must not tell me what to do. Looking at the case all round, I dismiss the summons.—*City Press.*

WOODEN STRUCTURES ERECTED WITHOUT LICENCES.

On Tuesday, the 5th inst., at Marlborough-street Police Court, four builders were summoned for having erected wooden structures at various premises in Piccadilly, for viewing the procession on the return of Lord Roberts in January last, without having obtained licences as required under Part VII. of the London Building Act, 1894. The offences were admitted and a penalty of 40s. and 12s. 6d. costs was imposed in each case.

THE BLUE LIAS LIME PROSECUTION.

The prosecution under the Merchandise Marks Act, in which the Cam Portland Cement Company, Limited, are sued by the Blue Lias Lime Company for selling as blue lias lime that which it is alleged was not blue lias lime, was on Wednesday, at the Westminster Police-court, adjourned for a week, owing to the inability of Mr. Willis, who is prosecuting, to attend.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

21,810.—ELECTRICAL CURRENT METERS: *H. P. Davis and F. Conrad.*—For ampere (or volt) meters a single permanent U-shaped magnet is used, or for that may be substituted two U-shaped permanent magnets, set parallel to one another and having their like poles together, carrying two hook-shaped pole pieces of which the curved portions are disposed with a small interval between them and parallel to one another, with a curved and adjustable magnetical plate beneath the pole pieces; the pivots of a light movable frame are carried by two jewelled pins fixed in a horizontal rectangular frame mounted upon the magnet or magnets, the movements are damped magnetically with a flat plate that balances the movable frame and is passed between the pole pieces; two flat spiral springs carried by the jewelled pins are connected at their outer ends with the ends of the coil that is wound upon the bobbin of the movable frame, whilst the outer ends of the springs are secured to, but are insulated from, the arms of that frame; on the magnets is a curved scale which is traversed by a pointer upon the movable frame.

21,814.—A METHOD OF TREATING WOOD: *G. F. Lebiada.*—A preservative compound, consisting of a solution of formaldehyde combines with and tends to make insoluble the albuminous substances contained in the wood, and if sufficient of those substances is not in the wood, the formaldehyde should be mixed with a solution of agar-agar or some such gelatinous material. The invention is specified as being applicable for use with telegraph-posts, railway sleepers, and so on.

21,823.—A BRICKLAYING MACHINE: *F. H. Knight.*—The machine is intended for travelling along a rack at the top of a beam or girder that is fastened with pins or bolts to pierced standards. Rotating flexible arms, on to which the bricks are fed by hand, impel them into position beneath a pressing-roller mounted upon a winch shaft, of which the pinion will gear with the rack, the winch-spindle driving the arms by means of a friction clutch and an endless chain. The bricks are kept in their lines

with a separate guide-roller, or a straight-edge secured to the beam is arranged so as to press against one side of the wall, whilst the pressing-roller is flanged at the other side of the wall. A hopper applies mortar or grouting to the upper surfaces of the bricks upon the return motion of the machine. For the apertures of windows and doors, the machine lays dummy bricks made of wood or hollow metal, that are to be removed afterwards for ordinary bricks, at times which are joined with bells or gongs upon the beam, which is sounded by chains to counter-weights, and is lifted when the invention are specified; in one of them the roller, instead of the beam, is lifted after the laying of each second, third, or other course, by its being mounted upon a pivoted arm, so that it can be dipped to beneath the beam and for the laying of foundation or ground courses, the winch shaft driving it with footbed gearing upon the pivoted arm.

21,826.—PERCUSSIVE TOOLS: *A. Taylor.*—The hammer-head that strikes the chipping or other tool constitutes a part of a piston to be operated with compressed air that is forced from annular chambers through passages to either the top or the bottom of the cylinder. By means of a handle that is screwed into the inlet the tool can be held as an ordinary hammer.

21,877.—ELECTRICAL ARC LAMPS: *A. Tesmer.*—The two electrodes are made of nickel or a nickel alloy (or one of them may be made of copper), and are attached at a distance of a few millimetres apart, a small current being used under a high pressure, so that their wear shall be inappreciable as the end of the nickel electrode takes a coating of oxide from which the light is emitted. It is claimed that the employment of an alternating current of 1 ampere at 500 volts and electrodes having a diameter of three millimetres will produce a light of fifty candle-power.

21,880.—SURVEYING INSTRUMENTS, INCLUDING THEODOLITES: *R. Reeh.*—For stadiometers, miners' tachometers, theodolites, and kindred instruments which give readings in altitude and azimuth, the inventor contrives that an image of the azimuth and altitude circles shall be brought into the field of the telescope. He fashions the telescope trunnions in the shape of tubes which are provided with prisms and lenses; the tube on the left hand constitutes, together with a tube mounted upon the Y's and having a lens and a reflector, a microscope, that, aided by a split lens, will focus an image of the azimuth scale in the plane of the crossed wires. The Y's carry the altitude circle, which is graduated inside, an image being likewise produced by means of another tube having a lens and a reflector; a right-hand tube, and a split lens. Direct vision is provided for by means of the sufficient space between the halves of the lens.

21,920.—AN ATTACHMENT FOR DRAWING-COMPASSES: *A. H. Woodward.*—To adapt compasses for the holding of differently sized pencils is devised a blank having arms that form ears in which a tightening lever can be pivoted; when the lever is turned upwards the pencil becomes gripped between the toothed edges of the appliance.

21,929.—COCKS OF PIPES AND HYDRAULIC: *W. R. Sage.*—In order to drain water out of the cocks and so to prevent them from becoming frozen, an additional valve is made to open a duct into the drain pipe with the action of turning the plug in order to cut off the supply. Ingress of flood water to the stand-pipe is obviated with a check valve.

21,936.—A FLUSHING-WATER APPLIANCE: *C. Birbery and T. Stanish.*—A tubular stem sliding within a concentric stem that rises from the bottom of a cup mounted upon legs is fitted upon the outlet valve, a float which has a tubular stem slides upon the outside of the cup, the lifting of the valve for effecting a flush causes it to be locked through the engagement of a pawl pivoted on to the stem of the valve, with a slotted peak upon the float-stem. Upon the escape of water from the cup through a time-passage the float continues to fall until the pawl has been liberated through the impact of the tripping-lever against the bottom of an adjustable slot so as to let the valve fall down on to its seating. The top of the valve becomes closed with a loose disc when it has been lifted, and the disc is lifted through contact with the float-stem when the valve rests upon its seating, so that the valve-stem is thereby left free to act as an overflow pipe.

21,995.—CONSTRUCTION OF HOLLOW WALLS: *L. F. Fink.*—Dove-tail recesses are fashioned in building blocks so that they may take transverse dove-tail bonding blocks. The building blocks consist of an admixture of light beton made up of cement 1 part and sand 4 parts, a stronger beton or burned clay being used for the bonding blocks. In order to check the passage of moisture from the outer to the inner wall, tar or asphalt is applied to the inner surfaces of the building blocks and to the bonding blocks.

21,970.—A CUTTER FOR CONDUIT TUBES, &c.: *H. von Appen.*—On the jaws of the tool, which is intended for cutting through the tubes that serve to protect and insulate electrical conductors, &c., are mounted two or more parallel blades having their cutting edges curved and spaced apart; in one modification a blade will cut the outside protecting

tube at a distance from its end, whilst another blade cuts the inner insulating tube. Springs that extend between the pivoted handles of the tool serve to force the cutters against the tubes, and either anti-friction rollers or additional similar blades can be placed opposite the cutting blades.

21,971.—BASINS FOR LAVATORIES AND THEIR FASTENINGS: *R. W. MacDonald.*—The basin is fastened securely in two ways, upon the soil-pipe standard are disposed clamping rings with which arms are adjusted, and the soil-pipe, to the top of which the basin is fixed, is mounted upon legs which surround the trap below.

21,985.—HOISTING APPARATUS: *F. Price.*—Upon a shaft are mounted two winding-drums, the one drum being for lifting purposes and the other for the rope which operates the bucket; the relative revolution of the drums is provided for by means of a spiral groove having about three complete turns which is made in the end of the one drum, and will engage with a cranked pin at the end of the other drum.

22,104.—A GUARD FOR CIRCULAR SAWS: *F. Bodger and D. Handford.*—For circular saws and tools wherein the hood is raised automatically, a sleeve that will slide along an inclined rod (which is clamped on to the radial arm of the pillar) is fitted upon the hood, which is made of two plates set side by side with a space between them for the saw. As the wood is being pushed forwards beneath a curved rod it raises the hood. For means of access to the saw the workman hooks a stud upon the sliding sleeve into a hook that hangs above from the clamp of the rod and loosens the set-screw in the order that the radial arm may turn about the pillar.

22,141.—PREVENTION OF FIRE IN LIFTS: *F. Toy.*—A fireproof flap, which remains shut during all the time when the lift is not being used, is provided at each floor-level of the well. The flaps are raised whenever the lift is at work, being moved in unison with a rod upon which are projections to engage with slotted links. Of every link one end will slide in a guide upon the back of its corresponding flap, whilst the other end is secured with a pivot.

22,155.—CONSTRUCTION OF WALL LININGS, &c.: *P. Chick.*—The bricks are fashioned with undercut grooves, and the boards, skirting, wall-linings, or similar woodwork is fastened on to dove-tailed strips or strips, which are inserted into the grooves. The strips can be made so as to project as much as the thickness of the plaster, and thereby afford a guide for the plasterer, or they may be built in flush with the brickwork of the wall.

22,165.—A SPIRIT LEVEL: *A. Gohl.*—The inventor has devised a spirit-level tube which he shapes as a circle-quadrant and mounts upon a straight-edge, whereof the weaker portion is strengthened with a plate of metal; he also provides a U-shaped plate which is to be pulled up when the instrument is being used, and will thus protect the tube; the position of the bubble will be accurately read with a sliding index to which a vernier may be attached.

22,167.—LIFTING JACKS: *C. Busch.*—Between the two standards of the jack is a screwed shaft on which a nut travels up and down the shaft, being turned with a crank that operates by means of bevel gearing and pinions whereof one is affixed to the top of the shaft; beneath the load which it is desired to raise is laid a beam of which the ends are put upon the nuts of two of the jacks.

22,200.—SPIGOT-AND-SOCKET JOINTS FOR PIPES: *T. Cartman.*—The invention is for making a joint between pipes of hard metal or material, such as iron, brass, cast-iron, or pipes of soft metal or material; the soft pipe is inserted into the socket of the hard pipe for which it constitutes a lining, and hemp is used as a packing between the joint and the cement.

22,248.—AN APPLIANCE FOR PURPOSES OF VENTILATION: *R. T. Preston and G. C. Ralston (of Stone & Co.).*—The appliance is contrived for the drawing-off of foul air from buildings, tunnels, mines, and other places, into a tank by means of water or other liquid under pressure, and for effecting a discharge of the mixed air and water. Below the water-level in the tank is laid a double pair of ejectors, to which water is supplied under pressure. The foul air, after it has been drawn in through pipes, is discharged, together with the water, into an overflow pipe. Each ejector is fitted with an adjustable nozzle, and, for mines, the ejector-tank apparatus is rendered portable by being mounted upon wheels.

22,271.—MEANS OF HEATING BY ELECTRICITY: *A. Logé.*—Admixtures of finely pulverised metals and refractory non-conductors with a liquid, are moulded into resistances that will sustain high temperatures, and are pressed in the moulds so as to bring about uniform results; having been dried the articles are heated in hydrogen, though at the outset to a temperature that will just entirely reduce the oxide upon the particles of metal, then the non-conducting components are caused to "frit" (care being taken to exclude carbon) by increasing the heat up to the welding-heat of the metal, whilst in the atmosphere of hydrogen; the constituent parts of the compound comprise nickel, cobalt, or wolfram, together with kaolin, alumina, quartz, talc, and other rare earths or oxides, and the articles are specified as being available for beating bodies which need preliminary heating in order to make them conductive.

* See our issue for February 9, page 145, for a report of a previous hearing of the case.

MEETINGS.

FRIDAY, MARCH 8.
Architectural Association.—Special general meeting to consider the Committee's scheme for the establishment of day classes. 7.30 p.m.
Royal Institution.—Mr. W. A. Shenstone, F.R.S., on "Virrified Quartz." With experimental illustrations. 9 p.m.
Institution of Civil Engineers (Students' Meetings).—Mr. C. Johnston on "Sewage Treatment." 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Professor T. Roger Smith on "Sanitary Building Construction and Planning; Soil and Local Physical Conditions." 8 p.m.
Glasgow Architectural Craftsmen's Society.—Mr. J. Lochhead on "The Decay of Building Materials." 8 p.m.

SATURDAY, MARCH 9.

Royal Institution.—Right Hon. Lord Rayleigh on "Sound and Vibration." III. 3 p.m.
Institution of Junior Engineers.—Visit to the Southall Station of the Brentford Gas Company to inspect the carburetted gas plant, inclined retorts, &c. 3 p.m.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Beddington Sewage Farm. 3 p.m.
Dunedin Institute of Architecture.—Mr. C. G. Soutar on "Ecclesiastical Architecture in Fifeshire." With line-drawing illustrations. 7 p.m.
Edinburgh Architectural Association.—Visit to Archers' Hall and Craigmillar Park United Free Church. 3 p.m.

MONDAY, MARCH 11.

Surveyors' Institution.—Adjourned discussion on Mr. Thomas Blashill's paper on "The Present Condition of the Building Industry." 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. C. Tyndale on "Ventilation, Warming, and Lighting." 7 p.m.
Society of Arts (Lectures).—Major Philip Cardew on "Electric Railways." I. 8 p.m.
Clerks of Works' Association (Carpenters' Hall, London Wall).—Monthly meeting. 7.30 p.m.
Bristol Society of Architects.—Mr. Archibald Dawney on "Constructional Steelwork as Applied to Building." 8 p.m.

TUESDAY, MARCH 12.

Institution of Civil Engineers.—Mr. J. Husband on "The Aesthetic Treatment of Bridge Structures." 8 p.m.
Society of Arts (Applied Art Section).—Mr. Hugh Stannus on "Some Examples of Romanesque Architecture in North Italy." Mr. T. G. Jackson, R.A., will preside. 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. C. Tyndale on "Calculations, Measurements, and Plans and Sections." 7 p.m.

WEDNESDAY, MARCH 13.

Architects' Benevolent Society.—Annual General Meeting of the Subscribers and Donors, in the Rooms of the Royal Institute (Lecture by the President, Mr. William Emerson, will take the chair at 5 o'clock).
Architectural Association Discussion Section.—Mr. H. P. G. Maule on "The Architect and the Garden." 8 p.m.
Sanitary Institute.—Dr. Christopher Childs, M.A., on "Ventilation: Success and Failures of the Methods at Present in Use." 8 p.m.
Society of Arts.—Mr. F. B. Behr on "The Proposed High-Speed 'Monorail' between Liverpool and Manchester." Sir William Preese will preside. 8 p.m.

Institution of Civil Engineers.—Students' Visit to the Millbank Street Pumping Station of the London Hydraulic Power Company (assemble at the works, 51, Millbank Street, Westminster). 2.30 p.m.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Boake, Roberts, & Co.'s Chemical Works, Stratford. 2.30 p.m.
Institution of Sanitary Engineers (Incorporated).—Examination and Literary Committee at 3 p.m.; General Purposes and Finance Committee at 4 p.m.; Election Committee at 5.15 p.m.; Sessional Meeting at 7 p.m.
Edinburgh Architectural Association.—Mr. J. M. Brydon on "The Work of Cockerell." 8 p.m.
Edinburgh Architectural Association.—Mr. J. Stuart Syme on "San Michel and his Work." 8 p.m.
Northern Architectural Association.—Annual meeting. 3 p.m.

THURSDAY, MARCH 14.

Carpenters' Hall, London Wall.—Mr. W. E. Riley on "Dwellings for the Working Classes." 8 p.m.
Royal Institution.—Professor Percy Gardner on "Greek and Roman Portrait Sculpture." III. 3 p.m.
Society of Arts (Indian Section).—Mr. H. J. Todd, A.C., on "The Growth and Trend of Indian Trade during Years' Survey." 4.30 p.m.
Institution of Architectural Engineers (at the Institution of Civil Engineers).—Mr. A. C. Eborall on "Polypphase Station Machinery." 8 p.m.
Sheffield Society of Architects and Surveyors.—Paper by Mr. E. W. Mountford. 7 p.m.

FRIDAY, MARCH 15.

Architectural Association.—Mr. H. B. Measures on Rowton Houses." 7.30 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. C. Tyndale on "Sanitary Appliances." 7 p.m.
Institution of Mechanical Engineers.—Mr. A. N. Bennett on "Combined Trolley and Conduit Tramway Systems." 8 p.m.

SATURDAY, MARCH 16.

Architectural Association.—Third Spring Visit to Lambrope House, Park-lane, W., by permission of the architect, Mr. W. H. Romayne-Walker. 2.30 p.m.
Royal Institution.—The Right Hon. Lord Rayleigh on "Sound and Vibration." IV. 3 p.m.
Incorporated Association of Municipal and County Engineers.—Home District Meeting, to be held at Mibleton.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage and Destructor Works, Ealing. 2.15 p.m.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

February 27.—By GERMAN & GERMAN (of Loughborough).
Normanton-on-Soar, Notts.—The Manor House Estate, 116 a. 2 r. 16 p. f., including the Manor (in lots) £10,948
February 22.—By HORNE & CO.
Walworth.—1, Hampton-st., with car-yard and stabling, 1 a. 6 1/2 a.; also a railway arch, u.t. 968 yds. f. 1,490
By JONES, LANG, & CO.
Kensington.—23 and 25, Kensington Park-rd., u.t. 61 yds., g.r. 304, r. 107, u.t. 855

ngly picturesque objects, though smaller and less costly in appearance than many others in the case. Among the most characteristic objects in this case are also the two small and rather squat German cups, Nos. 21 and 26; low wide cups each on a shallow moulded circular foot. A large oval dish—Spanish, late seventeenth century—sent by her late Majesty, is one of the examples which show that richness of surface embossing and chasing will not atone for bad form: the whole design is ragged in outline. We may notice also that in the cup No. 38, the figure of an armed warrior makes a very weak stem, quite out of keeping with the scale of the cup; besides which, a figure should never be introduced here it must be used as a handle for the grasp of the hand; it is degrading the figure to use it in that manner.

With case L we come to some of the ecclesiastical designs, in which we find, almost for the first time in the collection, architectural forms frankly used in silver work. It shows how the cathedral forms of architecture had become synonymous with the notion of religious art, that we so constantly find them used in articles which are specially intended for religious use. Thus in case I we find a "censer of architectural design," on a hexagonal plan, with buttresses and pinnacles at each angle; a late fourteenth century English work. No form of design could be more unsuited for a swinging censer; it looks as if it must come to pieces in use. A less unfitting use of architectural detail is found in the fine chalice, No. 8 in the same case; a longitudinal gabled form, with heavy angle brackets perched on the top of foliated capitals in a manner which would never have been tolerated in actual built architecture. This is nevertheless a fine piece of work of the kind (French, of the fourteenth century); it is worth noting that the scroll design on the slope of what would in actual architecture be the roof is far too large in pattern, quite out of scale with the rest of the design. Case M contains a remarkable German cup of architectural design, the stem consisting of elaborate tabernacle work, exceedingly bad to handle; it is noticeable though not noticed in the catalogue, that we have an example of the especially German vice of apparent penetration; the upper portion of the finial, above the cup, is designed so as to appear like a continuation of the stem carried through the middle of the cup. Nothing could be in worse taste, though the workmanship is admirable. In the same case, assorted oddly with the medieval work, are the two or three examples in the connexion of Classic work; a Greco-Roman cantharos (6), a libation cup of pure Classic form, assumed to be of the work of the fourth century B.C., and of excellent preservation; a little Græco-Roman model amphora; and a very beautiful little nude statuette of Apollo, probably Gallo-Roman. A Flemish chalice is another of the elaborate architectural designs, with a stem so delicate in its detail that one would be afraid of grasping for fear of injuring the work. In case N are several monstrances, in which architectural forms are largely used; a German one (5) is remarkable for the fine and distinctive manner in which miniature window-dressery is made use of; and an Italian example (No. 12) is interesting for the

manner in which the feeling and detail of Italian Gothic are reproduced on a small scale. There are two more architectural censers, as unsuitable for their purpose as the one previously mentioned; and a rather simple chalice (10) notable for the charming and unusual manner in which a little crucifix in relief is introduced on one of the lobes of the spreading base, the remainder of which is quite plain. This little incident gives quite a special interest to the work.

Among the remaining exhibits we have only space to notice two or three. One of these is the splendid nautilus cup of German work lent by her late Majesty, with a figure of Jupiter above and a figure of Neptune on a sea-horse supporting the cup, a splendid piece of work much more Italian than German in general feeling (date 1600); and, in Case O, a bowl of Venetian Gothic work of the fifteenth century, with a design formed of radiating scallops in ogee curves, enriched with foliated ornaments and animals, and which is a perfect model of style for silver-smith's work. It is stated to have been found in one of the canals of Venice. Another work in Case R, which should not be passed over, is an exceedingly fine reliquary cross, described as "French or German circa 1340," with the peculiarity of a double arm to the cross, one above the other; the bold and effective plan of the base, and indeed the whole design, are in the highest style of art.

We have merely touched on some of the salient points in this splendid collection, which every one interested in decorative art should see. Owing to the liberality of the committee and members, access to it is easy for all who care for the subject.

NOTES.

It seems to be intended, as might have been expected, that an important monument to our late beloved Queen should be raised somewhere in London, though it has not transpired that any special site or any special idea in regard to the form of the monument has been proposed. It is to be hoped that whatever is done will be done in a manner that shall be artistically worthy of the nation and of the occasion. We must expect to find that various absurd proposals will be made by people who have pet theories to promote; and already that irrepressible person, Mr. Shaw-Lefevre, has attempted to revive the idea of a modern Gothic chapel attached to Westminster Abbey, which has been condemned over and over again. What we ought to have is a great architectural and sculptural monument, for which there should be a competition open to all British artists.

ON every governing body, municipal or imperial, there must be progressives and anti-progressives, and when the progressives temper progress with prudence, they form the party to be supported. The Progressives on the London County Council have—as is natural—made mistakes, but they are earnestly bent on improving the condition of the Metropolis, and they bring to the work a lively enthusiasm. Every one, therefore, who desires to see London improved should be gratified at the result of the recent election. The attempt of the so-called Moderates to confuse imperial

and municipal questions was ill-advised and deserved to fail. The English people have always been in favour of steady progress; they kept that aim in view in politics till all the great political grievances were removed. The democracy of London for a long time has not known its strength in municipal matters, and has not understood what it wanted. Now it has, after some years' newspaper reading, come to the conclusion it wants the water supply in its own hands, and it wants better locomotion. It has been so often told that London is behind-hand that it has decided to get something done. Having thus made up its mind, London was certain to vote for the Progressives. If the Government thwart the wishes of London, it is equally certain that in no long time the Metropolis will return Liberal members to Parliament.

SIR COURTENAY BOYLE presided at a Board of Trade inquiry at the Westminster Town Hall, on the 1st inst., to consider the question of whether electric light companies are to be allowed to raise the pressure of supply without the consent of the consumer. The action of the Westminster Company, in applying that the proviso in one of the Board of Trade regulations, which insists that the consent of the consumer must be obtained, should be altered so as to allow the question being settled by an arbitrator appointed by the Board of Trade, led to this inquiry. Mr. Balfour Browne pointed out that the Westminster Company had divided their gains with the consumers without pressure from the London County Council or the Board of Trade. There were only eight clients of the company who preferred the 100 volts, notwithstanding that they were charged 8d. a unit as against an average charge of 4d. for the rest of the consumers. This necessitated a double set of mains and put the company to great expense. It would be for the benefit of the great bulk of their clients if the eight low-pressure consumers would agree to change over. The various opposing counsel, representing the City Corporation, County Council, &c., submitted that the Board of Trade could not alter this regulation, as it was not a regulation at all. The right of existing consumers to a 100-volt supply could not be altered without their consent except by an Act of Parliament. Sir Courtenay Boyle decided that this inquiry might discuss whether it was expedient for the Board of Trade to alter this regulation. Technical evidence of a one-sided character having been given in support of the alteration, the inquiry was adjourned to this week. In our opinion this inquiry would never have been necessary at all if the supply companies had approached their consumers with more consideration in the first instance. Having in many instances simply tricked their consumers into accepting the higher voltage without any reduction in their tariff, and having made wild assertions about increased efficiency, no danger of shock, &c., they now pose as much injured bodies because a few consumers are willing to pay exorbitantly for the more desirable lower pressure.

THE adjourned discussion on Mr. Madgen's paper on "The Electrical Power Bills of 1900" at the Institution of Electrical Engineers

last week gave rise to an unexpectedly interesting debate. Mr. Hammond criticised the paper very severely. He pointed out that the questions that really concerned the Institution of Electrical Engineers were those connected with the proper size of the distributing stations and the best methods of distributing power, and not those connected with certain real or imaginary restrictions on "free trade" in electricity. Mr. Madgen's paper was a dirge, and the Institution would be ill-advised in appointing a committee to make the path of the company promoter easier. If we were behind other nations in electric lighting, it was not due to restrictive legislation, but simply to the keen competition that was going on with cheap gas. Electric lighting in this country had often to compete with gas at 2s. per 1,000 cubic feet, whilst on the Continent and in America the average price of gas was three or four times as great. He pointed out that in this country municipalities were, as a rule, supplying electricity to consumers at a much cheaper rate than companies. He also mentioned the excellent municipal electric-lighting stations there were in Germany. Professor Ayrton gave his experience of one of the new power companies. He had advised a small town in the North to get its electricity in bulk from this company instead of laying down a station of its own. The company, however, refused to supply at a cheaper rate than 3d. a unit, which was obviously prohibitive. This statement of Professor Ayrton's is an exceedingly serious one, and Mr. Madgen, in his reply, accentuated it by saying that he thought the company ought to have charged 6d. a unit. Several directors and promoters of various power schemes spoke strongly against what they called the "dog in the manger" policy of municipalities, and the general feeling of the somewhat sparsely attended meeting was obviously with them.

AN appeal is made for subscriptions towards a sum of 150,000*l.* in completion of the endowment and equipment of Owens College, of which the first jubilee will be celebrated in the course of the current year. The Committee, of which the Duke of Devonshire is Chairman, desire to establish new Chairs of Architecture, English Literature, and Hebrew, to provide for hygienical and bacteriological investigation, for research fellowships, and for a pension fund on behalf of the professorial and general staffs. It is stated that an immediate sum of 20,000*l.* is needed for the extinction of existing liabilities, more particularly in respect of the medical side of the college, and that at present the yearly income fails to meet the annual expenditure. Owens College, which was founded in 1846 by John Owens, a Manchester merchant who devised nearly 100,000*l.* to trustees for the establishment of a teaching University (being the first after its kind in the provinces), and was opened in 1851 in a house that had formerly been the residence of Richard Cobden. Some twenty years afterwards the college migrated to the new buildings erected from the designs and plans of Mr. Alfred Waterhouse, R.A., and since enlarged by Messrs. Alfred Waterhouse & Son. In 1867 the capital of the foundation was increased by contributions to a total of about 400,000*l.*, and in 1880 a charter of incorporation was granted for the

establishment of Victoria University, to consist of affiliated colleges having their centre at Manchester. With Owens College has been amalgamated the Royal School of Medicine, founded in 1824; Dr. J. Prince Lee, first Bishop of the diocese, bequeathed his library, containing upwards of 6,000 volumes, and to the buildings have been removed the library of the Medical Society and scientific collections from the Manchester Museum.

IN the course of next month will be offered for sale at the Mart the Crown lease of No. 4 Whitehall-gardens. The house was erected for Sir Robert Peel from the plans and designs of Sir Robert Smirke, who was the architect also of Peel's country seat at Drayton-Bassett, near Tamworth, where the portrait gallery, added at the south-eastern corner of the house, was completed in 1846, after the designs of Sydney Smirke (see the *Builder*, May 10, 1845). It was at Whitehall-gardens that Sir Robert Peel formed the fine collection of Dutch, Flemish, and English pictures, comprising paintings by Rembrandt, Vandyck, Teniers, I. and A. Ostade, A. and W. Van der Velde, Lely, Reynolds, Sir Thomas Lawrence, and Wilkie, together with portrait busts of Pope, Prior, Sir Walter Scott (by Chantrey), &c., the greater portion of which was dispersed at auction last year.

WE learn that this house, Hogarth's House, which stands on the west side of Hogarth-lane, is about to be pulled down for the erection of villa residences upon the site, including the garden. The house, having been for some time previously out of repair and rented in tenements, was taken in 1890 by the Typographic Etching Company, for the Hogarth Works. In the following year an attempt was made to collect a sum of 500*l.* for the establishment of a maintenance trust, and to clear away some buildings that had been intruded on the south side. The house was built in the earlier years of the eighteenth century, of red brick with rubbed brick dressings, and has a bold wooden bay-window on the first floor of the north and principal front, with a moulded wooden eaves course (see the view in the *Builder* of February 8, 1890). Hogarth bought the house in or about 1750, after he returned from his visit to Calais. He occupied it as a summer residence until his death on October 26, 1774, in Leicester Fields. He left the house to his widow, who demised it to her relative, Mrs. Mary Lewis, at whose death in 1803 it passed to some persons named in Mrs. Hogarth's will. The house was subsequently occupied by Henry Cary, the translator of Dante, who died in 1844. It is said that the two leaden urns upon the gateposts were given to Hogarth by Garrick.

At a meeting of the Fine Arts Society on Thursday, February 28, a lecture was delivered by Mr. F. H. Evans on Southwell Minster, illustrated by limelight views from original photographs. The lecturer briefly outlined the history of the Minster, and strongly condemned the more recent alterations, which, in the case of the introduction of the organ, have hidden much beautiful detail, and

spoiled the interior effect. Of the large number of carefully-selected photos that were put upon the screen, those of the Norman work throughout the church were exceedingly interesting, showing variety of feeling and individuality, of which the caps now hidden behind the organ are particularly charming specimens, unique in their archaic character. Mr. Evans has also secured a splendid collection of details from the rood-screen, a beautiful example of Late Decorated work. Mr. Doran Webb, who was in the chair, at the close of the lecture emphasised the necessity of suppressing the modern tendency to give undue prominence to the organ as a feature. With this we quite agree where it is an old church or cathedral that is under consideration, but in the case of modern church design the organ is so important a factor that it should be an essential part of the design, not a mere incident to be pushed from sight.

THE ARCHITECTURAL ASSOCIATION THE PARIS EXHIBITION, 1900.

THE ordinary fortnightly meeting of the Architectural Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 1, Conduit-street, Regent-street, the President, Mr. W. H. Seth-Smith, presiding.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members of the Association, Messrs. D. Hill and A. Gilbert Scott.

On the motion of the Chairman, a vote of thanks was accorded to Mr. R. C. Harrison presenting to the library forty volumes of *Builder*.

The Chairman said he would like to recommend members of the special general meeting, to be held that day week, for the purpose of considering a scheme of proposed day classes for the Association. No doubt a good deal of interest would be felt in regard to the Committee's proposals, and there would be a meeting on the occasion.

The Chairman then announced that A. H. Hart's lectures on "The Architect's U. Colour" would commence on March 13. The subject was one of considerable interest to architects, and any gentleman desirous of joining should send in his name to the Secretary at once.

The Chairman then called on Mr. E. W. Wonnacott, the Cates Prize-man, to read a paper on "The Paris Exhibition, 1900," illustrated by a large number of lantern slides, as well as a number of drawings hung round the room.

Mr. Wonnacott, in the course of some preliminary observations, said he would like to explain that last year a travelling student was offered for the study of the building, the Paris Exhibition of 1900, and it was Mr. Arthur Cates, the father of the professor, if he might call him so, that the Association owed a debt of gratitude in offering studentship, and for his generosity in handing over to the treasurer the funds necessary for the purpose. The Committee of the Association was charged with finding a suitable candidate, on certain conditions which he recalled, except one, viz., that the person chosen must read a paper on the subject of his visit before the Association. The Committee's choice having fallen on him, he stood before them in fulfilment of the conditions imposed.

Mr. Wonnacott then read the following paper:—

Historical.—Every eleventh year France since 1855, has invited the nations to come and vie with her in the great industrial show initiated. The Exhibition of last year, long foreseen, but it nevertheless was decided on in a hurry, for Berlin had intended to do the century with a magnificent universal exhibition there, but France, ever jealous of her door neighbour, sailed in a point near the wind, and bespoke the date mentioned. A formal decree settled everything. France to have the next Exhibition. Whichever nation it was that was to have the honour of holding the international show, there was the opportunity of closing in a magnificent way, a century of artistic, scientific, and commercial

TO CORRESPONDENTS.

W. B. M.—W. E. P. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out hooks and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £200, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted.

ABERDEEN (Mon.).—For the erection of school buildings, &c., for the Aberysth School Board. Mr. R. L. Roberts, architect, Victoria Chambers, Aberdeen. Quantities by architect:— A. G. SIDCUP.—For the new police-station at Sidcup:— Lawrence & Sons £8,798 Sydney Hart £8,327 C. Parker 8,490 Higgs & Hill, Ltd. 8,284 Graham & Co. 8,489 Thomas Knight 8,089 Charles Ansell 8,383 Burman & Sons 8,075 Holloway Bros. 8,350 Chessum & Sons 7,977 Smith & Sons, Ltd. 8,338

C. B. N. SNEWIN MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, RAY STREET, FARKINGTON ROAD, E.C.

THE LARGEST STOCK OF ALL KINDS OF WOODS IN EVERY THICKNESS, DRY, AND FIT FOR IMMEDIATE USE. Telephone, No. 274 Holborn. Tele. Address: "SNEWIN, London."

LONDON SCHOOL BOARD TENDERS.

At the last meeting of the London School Board, the Works Committee submitted the following list of tenders. Mr. T. J. Bailey is the Board's Architect:—

Recommended for acceptance. CANTERBURY ROAD.—Improvements (Boys' and girls' departments).—Providing new staircases, cloakrooms, and lavatories; also boys' teachers' room; extending classroom A to accommodate 60; re-dividing and re-stepping classrooms B, C, and D; providing new drainage scheme, new fittings for water closets, new boiler-room, and low pressure hot-water apparatus, improving lighting of junior mixed school. Revised accommodation: boys, 268; girls, 268; infants, 387; total, 923. Loss of 16 places:— Lawrence & Sons £5,795 Johnson & Co., Ltd. £6,398 Bullard & Co. 6,619 W. Downs 6,992 F. & H. F. Higgs 6,531 Holliday & Greenwood 5,997 Lorden & Son 6,505 W. Smith 5,838 Garrett & Son 6,376 J. Appleby 5,978 Marsland & Sons 6,335

OFFORD-ROAD (P.T.C.)—Wiring, &c., for electric lighting:— Weston & Co. £370 0 Peto & Radford, Ltd. £341 0 Drake & Gorham 365 5 C. Mayo Ching & Co. 324 0

PLASSY-ROAD (Enlargement).—Extending existing low-pressure hot-water apparatus to six new classrooms:— Morris & Co. £223 0 Wenham & Waters, J. Grundy 220 0 Ltd. 1,185 0 Wintner, Smith, Gray, & Co. 209 0 Ltd. 182 0 G. & E. Bradley 186 10 Duffield & Sons 157 0

Supply of Black Drill, on a running contract:— Harriet Evans £2 7 3 per piece of 36 ft. by 50 in. to 51 in. Dowler & Son 1 15 0 per piece of 36 yd. James & Co. 1 14 0 per piece of 36 ft. by 50 in. James & Co. 1 2 4 1/2 per piece of 36 ft. by 49 in.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 7s. per annum (63 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 7s. per annum. Remittances payable to DOUGLAS FOURDRINER should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C. SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office, 79s. per annum (52 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder," by Friday Morning's Post.

W. H. Lascelles & Co., 121, BUNHILL ROAD, LONDON, E.C. Telephone No. 1365, London Wall.

HIGH-CLASS JOINERY, LASCELLES' CONCRETE Architects' Designs are carried out with the greatest care. CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, & Shop Fittings, CHURCH BENCHES & PULPITS. ESTIMATES GIVEN ON APPLICATION.

THE BATH STONE FIRMS

BATH. FOR ALL THE PROVED KINDS BATH STONE. FLUATE, for Hardening, Waterproof, and Preserving Building Material.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Doulting Stone (Incorporating the Ham Hill Stone Co. and C. Tra The Doulting Stone Co.) Chief Office:—Norton, Stoke-under-I Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

Asphalte.—The Seyssel and Metallurgical Asphaltic Company (Mr. H. Glenn), Office, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse flat roofs, stables, cow-sheds, and milk granaries, tun-rooms, and terraces. Contractors to the Forth Bridge Co.

SPRAGUE & CO., Ltd., PHOTOLITHOGRAPHERS, 4 and 5, East Harding-street, Fetter-lane.

QUANTITIES, &c., LITHOGRAPHED accurately and with despatch. METCHIM & SON, QUANTITY SURVEYORS' DIARY AND IA For 1901, price 6d. post 7d. In leather 1/1-10s

The Architectural Association Day Classes Scheme.

THE scheme for day classes in architecture which has been drawn up by a committee of the Architectural Association, and which was formally accepted at a special meeting of the Association, reported on another page of this issue, is a very important move in architectural education in this country, and one which may have far-reaching effects. In its efforts to improve the opportunities of education for architectural students the Association has been for many years going on to wider and wider schemes. Its evening classes were in themselves an elaborate institution, which has been a great success in a qualitative if not in a quantitative sense; the numbers attending have not we believe been so large as might have been hoped, but probably all the members of the Association who have joined these classes will testify that they have received great benefit from them; and the question may now be asked, are these evening classes, some of which necessarily treat the same subjects which must be prominent in the work of the day classes, likely to be continued concurrently with the day classes? or will they suffer by the institution of the day classes?

The two sets of classes do not, it must be pointed out, stand on exactly the same footing in regard to architectural education. The evening classes may be considered as being supplementary to the apprenticeship system; they are to give to pupils articled in architects' offices the opportunity of studying various branches of architectural design and construction in a more systematic way than they could be studied in an office, even under the best intentioned and most conscientious principal. They are classes, therefore, concurrent with pupilage. The day classes, on the other hand, are intended

to be classes preparatory to pupilage. The promoters of the scheme, while they do not deny that the knowledge and experience to be acquired by an articled pupil in the routine of office work is indispensable, and such as no other kind of training can supply, take the view (in which we entirely concur) that the student will be much better able to get the best advantage from the routine of actual work in an office if he has previously gone through a systematic study of the elements of architecture, and learned also the use of drawing instruments. He will also in that case be a much more useful person in the office than he could otherwise become till he had been at least two years in it; and the principal or the older assistants, as one speaker pointed out at the meeting, will be saved the interruption to their work from having to show the new-fledged pupil the elementary use of the tools of his trade. There is moreover the great advantage to the student, that before signing articles and committing his parents or guardians to a considerable expense and himself to a career, he will have had the opportunity of discovering whether he likes architectural work and has any ability for it, at no further cost than that of the fees for one or two terms at the Association's day classes. There will be an advantage both to principal and pupil. The general acceptance of the day classes by those who think of becoming architects will entirely modify the terms of pupilage, and the wisest thing for the principal, when asked to take a pupil, will be to say—as one eminent architect states his intention to say in the future—"Let him go through a year's course of the Architectural Association classes first, and then we will see."

It seems to us that such an institution, so obviously supplying a need in our system (or should we say no-system?) of architectural education, cannot fail to be a success; indeed, we should expect that there would almost be a rush to join these classes—to which, however, it must be remembered, a student is not to be eligible without some form of written recommendation. The question is,

whether it would be necessary or desirable to carry on the evening classes concurrently with the day classes; whether this would not involve a waste of effort. There is no question that there will never be such good work done at an evening class as at a day class. An evening class in its nature is a supplement to the ordinary day's work, and is entered upon after the mind has been to some extent drawn upon and fatigued by the work of the day. And Mr. Slater, speaking at the meeting already referred to, remarked that there was much less inclination to evening work now than twenty years ago; that the tendency was to spend more time in recreation and on subjects alien to one's professional study. That is the case, and to some extent it indicates a decline in energy, an inclination to take life more easily, which we fear is rather on the increase. But so far as this dislike to evening work means an increased attention to health and to the relaxation which is essential to health, it is an improvement. The greatest professional acquirements attained by unintermittent study will be of little value to a man, if he has not the health to exercise them to the best advantage, or to enable him to enjoy his life, and therefore it is possible that a disinclination to evening studies, if it exists, is not altogether unwise; at all events, they should not be incessant, and these considerations point to the probability that the Architectural Association day classes, if (as we fully expect) they become an established success, will at all events modify the scheme of the evening classes. The best conclusion would probably be this—that the day classes should be regarded as concerned only with those things which directly bear upon architectural design and architectural practice, and which a student intending to put himself into harness in an architect's office, must or ought to know; and that the evening classes should be kept up for the study of those branches of work connected with architecture, but not so entirely indispensable, which a man may desire to study to increase the range of his proficiency. Under this head might come, for instance,

such subjects as hygiene, land surveying, water-colour, colour design, modelling, &c.; subjects which are already carried on in the evening classes, and to which more time might then be given. In addition to this there may be the opportunity for setting up a life class for figure-drawing among the evening classes, which would be a most valuable addition to the scheme of instruction. Such subjects as elementary construction and physics, the history of architecture, elementary design, &c., would be better delivered over entirely to the day classes. Otherwise it is likely there will be a waste of effort.

And what are to be the subjects taught in these preliminary day classes, which are to be preparatory to the office engagement of the student? They are given in the report of the Association meeting in another column, and we turned to them with some interest, to see what was considered to be the true line of study in preparation for entry into an architectural office. No attempt has been made to shadow forth, in the curriculum, any new or out-of-the-way theory of architecture; and this is right. Whether or not we think that some of the ordinarily accepted routine as to architectural studies needs revising, it is clear that the attempt to institute a new series of classes for architectural study is no occasion for any such reform; it would be very hazardous; one must be content to furnish students with that programme of instruction which is, for the present, matter of common consent and agreement. "The use of instruments and scales" comes properly as the first item in the programme, and its prominence seems almost like an intentional protest against the views of those who assert that drawing has nothing to do with architecture. In a sense, no doubt, it is true that architecture is not drawing; but drawing is a necessary means towards properly planning and constructing a modern building; and the fact is that many persons have got into the habit, in England, of making architectural drawings much less precise and careful than they ought to be, for the proper carrying out of a complicated modern structure. The drawing instruments are the tools with which the modern architect has got to work; let the student begin by learning how to use them, and let him not despise them. Architectural and engineering drawing instruments are beautiful implements in themselves, and a man who uses them clumsily will be likely to be clumsy in more serious matters also. "Freehand drawing" naturally follows, and we presume that will be taught on the strictest and severest lines, to develop the capacity of drawing difficult and delicate curves with ease and precision. "The O of Giotto" is a lesson in art training as significant now as it ever was. Then follows "The Five Orders of Classic Architecture." We can fancy some critics raising their eyebrows at that, and asking, "Are we never going to get rid of the Orders?" We do not say that is not a question to be asked; but we have to recognise the fact that we have not got rid of them yet; and though the architects of the immediate future may be disposed to treat them with a great deal more freedom than was the case in the past, in order to treat them with freedom it is essential to have an accurate knowledge of them as a basis to start from. It must not

be forgotten, besides, that the study of the Orders in their original scholastic precision of detail is one of the most valuable means of training the eye in the perception of scale and proportion. All things considered, we do not see how the Orders can be omitted for the present from any scheme of architectural education.

"The elements of the various styles of architecture" is a somewhat vaguely expressed item in the programme. One is tempted to ask—Which styles? and what are we to understand by their "elements?" There are various quite recognisable styles of architecture which are nevertheless not worth inserting in an elementary educational curriculum. "The principles of mechanics" and "elementary construction" are of course all right; nor have we any objection to make to the courses of lectures on architectural history. The sooner architectural students get a general knowledge of the history of their art, the better will they be able to understand and to place, as one may say, the details which they learn to draw, and which are all inevitably dependent on something that has gone before. We observe, however, that nothing is said, in either the first or second year's course, about either drainage or ventilation. Much there is in regard to these subjects which can only be learned by actual experience with buildings; but surely elementary knowledge in regard to them should form part of a preparatory training.

Mr. Stratton's criticism, that perspective should have been put in the first year's course, is also not without point. During the vacation of three months students would probably employ themselves partly in sketching; and no sketching can be carried on in any satisfactory manner without a knowledge of the general principle of perspective representation. Without that, a sketcher does not really appreciate the meaning of the forms he sees, nor their relation to the lines which he can put upon paper to represent them. Such refinements as scientific sciography, as well as the more complicated problems of perspective, are properly relegated to the second year's course; but the main principle of perspective should be part of the first year's course, though it should not be surrounded with the mysteries of complicated diagrams which are calculated to frighten students away from it as too difficult a subject. The main principle of perspective is really an exceedingly simple thing, often made quite unnecessarily puzzling by teachers and instruction books, which bewilder the student with a number of detailed problems instead of confining his attention to the principle, which is the same in all cases, and can be illustrated as well in a simple as in a complicated diagram.

The really important difficulty for the Architectural Association lies in the question of adequate premises for carrying on a scheme which in fact is a very ambitious one. They have gone on the principle that it is best to start at once with the opportunities at hand, instead of waiting for new premises; the promoters of the scheme point out that the premises are there all day, in their hands and rented, but little used; and that they thus have the economic advantage of having rooms ready for their use to start with, without entering at once on any fresh expenditure. This is true, but on the other hand those

most favourably disposed to the scheme cannot but see that, if it is to be a success on any such scale as to make it worth carrying on, the present premises must be regarded as quite inadequate, not only in regard to space but in regard to dignity of position and entrance, for an institution which is professing to provide a preparatory school for entrance to a great profession. It appears to be hoped that the school itself will materially assist in furnishing funds for the erection of new premises. We fear it will be a good while before it realises funds on a sufficiently large scale to afford any very substantial assistance towards an adequate building; and as far as we can gather them, it seems to us that the views of the promoters in regard to the necessary extent and cost of any building which would be at all worth erecting, or at all worthy of the importance of the object, are very much too limited. We should suggest that the true course would be not to wait till the funds accruing from the working of the school, together with the promises of subscriptions here and there, had amounted to a fund adequate for the purpose—which would probably mean waiting an indefinite time but to borrow capital for the erection of an adequate building at once, and repay it out of the working of the school. It is quite certain that such a school of architectural training cannot have the necessary dignity of *entourage*, cannot be regarded as adequately or suitably housed, in the present premises of the Architectural Association.

THE ÆSTHETIC TREATMENT OF BRIDGES.

THE announcement of a paper to be read at the Institution of Civil Engineers on "The Æsthetic Treatment of Bridge Structures" was certainly something new—we doubt such a paper has been read to that assembly before; and it was not less surprising to find that it was to be read by an engineer. Having gone through Mr. Husband's paper carefully, along with the diagrams attached to it, we can only congratulate him heartily on an essay which is throughout admirably reasoned, and in which, as far as the general opinions expressed are concerned, there is hardly anything said with which architects for the most part will not fully concur. Some of the types of bridges illustrated which are selected for commendation may not appear to us to be very beautiful; in these matters reasoning is one thing, graphic illustration is another; and it is possible to have a structure which illustrates the sound principles without being in itself beautiful. But in his statement as to the objects which should be kept in view, as far as appearance is concerned, in the designing of large bridges, Mr. Husband shows a degree of perception which is certainly not often found among engineers; and though the engineering profession in general refuse to listen to the opinions of architects on the subject of design, or to attach any weight to them, it is to be hoped that they will listen when they have words of wisdom addressed to them by an Associate member of their own representative body.

We give on another page a *résumé* of the paper as furnished by the Institution.

having read the paper in full, we may here remark on one or two of the points in it which seem worth special attention.

The author divides his subject into three heads—masonry bridges, iron bridges, and those in which masonry and iron are used in combination. In regard to the purely masonry bridge, he points out that the use of a moulded architrave on a large span bridge has the effect of reducing scale by using a kind of detail habitually associated with arches of a smaller scale, and that the megalithic character of a bridge is better asserted by depending simply on the arrangement of the voussoirs and spandrel masonry. In like manner, the employment of the niche as a means of doing something with the face of a pier, even where no sculpture is intended and where the niche is far too large in scale for any but colossal sculpture, is in reality a false employment of an architectural feature proper to a different scale and to a different class of structure. The treatment of the piers in moulded panels, as in the Grosvenor bridge at Chester, we quite agree with him in repudiating; it is treating monumental structure like a piece of furniture. In regard to the design of the piers of a bridge Mr. Husband has a passage on the frequent use of columnar forms as ornaments in this portion of the structure which so well put that it is worth while to quote *verbatim* :—

"A few words may here be said regarding the use of classical pillars or pediments on this portion of the structure. The pillar is essentially a weight-bearing member, and in order to show to the best advantage, this feature should be given due emphasis. Its employment, generally as a fairly massively proportioned member, for the superstructure on the cut-water of a bridge is seldom successful, since at the most its supporting function is limited merely carrying the weight of a short entablature mounted by the parapet. Added to this the use of the pillar in classical architecture is so generally associated with repetition—pillars being usually grouped to form colonnades in which four is the minimum number employed—that the sight of a pair of columns or a single detached pillar upon the face of a pier gives rise to a suggestion of strangeness and isolation. For these reasons London bridges may perhaps be regarded as of higher æsthetic value than Waterloo Bridge. Were it advisable to employ a columnar design for the cut-water itself, the result would be much more satisfactory, since the pillars might then be suitably grouped and have superimposed upon them a considerable mass of masonry, thus calling into play the significance of their essential function. In the same way the pediment being so intimately associated with temple architecture, its adoption is often greater solecism than that of the pillar."

On one point in reference to masonry bridges, however, we must differ from him, viz. in his approval of the common system of building a cut-water on the downstream side of a pier as well as on the upstream side. He defends this on the ground of symmetry; we consider it is giving up one means of imparting character to a bridge, by letting the general form of the pier be frankly influenced by actual circumstances by the run of the water in which it is built. It is absurd to build a pier as if the water ran both ways, when we know that it can under no circumstances do so except a tidal estuary.

Bridges entirely of iron, or rather steel, include, as the author observes, all the very largest span bridges, many of which are on such a scale that anything like the applica-

tion of ornamental treatment becomes economically impossible.

"In these structures not only would the addition of ornament be false in principle, as being foreign to the purposes of design, but its systematic application could only be indulged in at the expense of a great increase in weight with a corresponding sacrifice of economy. From these considerations it is plain that the standard of æsthetic criticism to be adopted depends, firstly, upon the most perfect economic application of material, and secondly, in cases where distinctly optional design is possible, upon the adoption of the most pleasing outline consistent with economy. It has repeatedly been urged that these erections as a class are amongst the least æsthetic ever designed by man. That this scathing judgment may be true of a few isolated examples in which the essential principles of æsthetic construction have, apparently through sheer ignorance, been totally neglected, is not denied; but such a sweeping statement can only be the result of an appeal to standards as false as the verdict is unfair."

In the case of structures like cantilever and suspension bridges, where the working parts of the structure are frankly and nakedly shown, the structure itself is sufficient to give interest to the eye, and is its own best apology. There are some very good remarks on cantilever bridges, and especially on the falsity of the attempts which have been made in one or two instances to disguise the break between the cantilever and the horizontal span by giving a curve to the upper members of the cantilevers and continuing this curve through the upper member of the horizontal span; thus falsifying the structure, destroying its character, and sacrificing economy of material. In regard to suspension bridges, the author mentions, but with no expression of opinion, the method of stiffening the chain adopted in the shore spans of the Tower Bridge (he does not quote this example), by forming them in the shape of fish-bellied hanging girders. We regard this method as very ugly, losing all the natural beauty of the catenary curve; and the stiffening of the roadway can be just as well or better effected by a suspended horizontal stiffening girder. In regard to the piers of metal structures Mr. Husband speaks so well and forcibly that we are again tempted to quote his own words :—

"Although this section of the paper treats of structures built entirely of metal, yet it may be remarked that the kind of pier adopted for a suspension bridge is a matter of primary influence as regards æsthetic appearance, and those examples which are supported by masonry piers are, in general, far superior to those carried on piers of iron or steel. Considering those cases in which metal piers have been employed, their adoption cannot be said to have achieved any decided success. In many examples the design consists of an iron or steel tower, presenting some resemblance to a masonry structure. This is undoubtedly one of the most fatal errors into which the designer can fall. Attempts to repeat, in a plated and riveted structure, the outward form of a masonry arch, as is the case with the piers of the Tay Bridge, or to copy in iron that which in stone is eminently suitable for the propylon of an Egyptian temple, as has been done in more than one notable instance for the towers of suspension bridges, can only result in dire failure. It is possible, whilst viewing such structures from a considerable distance, to coerce the mind into a belief that they are actually of stone, as their form would suggest; but closer acquaintance robs them of all semblance of propriety. It is much preferable in lofty piers of iron or steel to adhere to some suitably-braced design removed as far as possible from the suggestion of a masonry prototype."

We can only hope that engineers who listened to these words will profit by them

In speaking of the class of bridges which combine steel with masonry, Mr. Husband is, we think, a little under a misapprehension in regard to the Alexandre III. Bridge, of which he speaks with much admiration, but observes that the masonry pedestals at its approaches are a little too high for so flat an arch, and "are situated too far in the rear of the visible recipients of the thrust; their position, in fact, scarcely renders them liable to criticism as a legitimate part of the structure." They are not meant to be regarded as a part of the structure. It must be remembered that the Alexandre III. Bridge is essentially a kind of festal or triumphal bridge, and the flanking piers with their sculpture are put there simply for glory, not for any suggestion of use; they were to give a pompous appearance to the entry of the bridge, and are no more utilitarian features than is a triumphal arch. The Alexandre III. Bridge might really have been more properly classed as one of the metal structures; it is true that it has masonry counterforts on the banks, but so has the Forth Bridge—not exactly counterforts, for that is not their function, but anchoring blocks, besides a granite approach bridge.

In connexion with the whole subject, however, we may point out that the best reasoning on the subject of the æsthetics of engineering design will be to very little purpose unless engineers will make up their minds to make it part of their education to study the design and the meaning of architectural and decorative detail, so as to train the eye to appreciate the distinction between good and bad detail, and to understand the real meaning of architectural forms and thereby at least avoid their misapplication in such a way as to be unmeaning and absurd. Reasoning alone on such questions will not suffice; they are matters of perception, which is not to be developed without a special training to that end.

NOTES.

THE discussion in the House of Lords last week on the Housing Question was singularly disappointing. There was a hope that Lord Salisbury would enunciate some kind of policy on the subject, but he left things exactly where they were. The result of the discussion is to magnify at once the demands and the difficulties of the question. If the Prime Minister can only point out difficulties, what chance is there of any scheme being carried out? That the subject is one most troublesome to deal with cannot be questioned, and it is doubtful if any number of Acts of Parliament will do more than modify the difficulties of the problem. The unfortunate part of the matter at the present time is that Ministers and Members tell us that no subject so immediately demands attention, thereby raising public expectation, and then when the question is brought forward in Parliament no remedy is suggested. As we have said over and over again, the subject is so complex, so variable, and so continually growing, that it can never be cleared away, as some sanguine persons would seem to think. But that is no reason why the Cabinet should not either formulate some scheme, or if it has not the will or capacity to do so, then keep silence—admit the difficulty of the problem and the impossibility of solving it

It is clear from the case of *Sadgrove v. Hole*, decided last week by the Court of Appeal, that if a building owner writes to a builder pointing out errors in an architect's plans or a quantity surveyor's measurements, it is a privileged communication. But it is equally clear that care must be taken as to the manner of communication, and that to send such complaints by a post-card so that all the world may read them may take away the privilege. "He had no doubt," said Lord Justice Collins, "that it was within the right of the defendant to communicate with the builder on the matter in question, and therefore as between the defendant and the builder the occasion was privileged. That privilege covered the libel, unless there was what he might call a superfluous publication to any person other than the builder to whose knowledge the post-card might be brought." In the present case the odd thing was that the plaintiff was a clerk in the architect's employment who was responsible for the quantities. He was not even named on the card, which merely stated that there were great mistakes in the quantities. That being so, the Court held that there was no publication as regarded the plaintiff. That, however, is a point of much less importance than the general proposition laid down as to privilege and as to publication as between the building-owner and the builder. It is a little difficult to see why in the present case the plaintiff went to law at all. However, he has been the means of eliciting from the Court of Appeal a decidedly interesting decision.

In a general leading article on various legal cases in the *Times* of Monday last, reference is made to a decision of the Court of Appeal to the effect that an architect employed by a building owner and authorised, as usual, by the compact to give final and conclusive certificates, is in the position of an arbitrator and not liable for negligence. Commenting on this, the *Times* observes:—"It speaks volumes for the general confidence in the architects of the country that everybody puts himself at their mercy without practical redress if they are careless as judges or arbitrators in giving their certificates." This kind of recognition of architects is something new for the *Times*. Better late than never.

MR. O'GORMAN read an abstract of his paper on the insulation of electric lighting cables to the Institution of Electrical Engineers last week. When we consider that of the capital expended on electrical schemes at least half is on the cables, it will be seen that the subject is one of the greatest importance to the industry. Mr. O'Gorman's paper is of somewhat unequal merit; it contains a few brilliant suggestions, some useful tables, some indifferent calculations and formulæ, and a great deal of compiled matter from foreign technical journals. It will probably occupy about one hundred pages of the *Journal*, but could most advantageously have been cut down at least fifty per cent. He quotes almost in its entirety a paper on cables, communicated by Mr. Swinburne to the Engineering Conference two years ago. This paper gives a few empirical calculations and an exceedingly doubtful formula, which

Mr. O'Gorman seemed to appreciate highly. The main conclusion to be drawn from the paper is that, with cables for high-pressure alternating currents, attention has to be paid not only to the specific insulation of the insulating material, but also to the dielectric strength and the dielectric capacity. He showed a striking experiment, illustrating how when the electric pressure between two conductors suspended in air was very high, introducing a piece of glass between them increased the "potential gradient" of the air and caused an arc to start between them. He suggested rightly, we think, that the "potential gradient" measures the liability of an insulating material to break down under electric stress, and suggested that the layers of insulating material in concentric cables should be graded so that the disruptive stress might be the same at every point. In the subsequent discussion Mr. Swinburne stated that the insulation of a cable was more a matter for experiment than for calculation. He had found that the paper called "butter-skin," in which butter is wrapped, had a high inductive capacity, and he had used it for making alternating current condensers.

AT the meeting of the Church Sanitary Association last week a resolution was passed in favour of inculcating "the Christian obligation" of pure air and water, abundant light, and wholesome surroundings. We trust that this Association will not be satisfied with good resolutions, but will endeavour to get its members to do practical work in their parishes, and will bring to the country clergy especially the knowledge of the great opportunities which they have of improving the sanitary condition of English villages. A country clergyman knows, as a rule, more of the sanitary condition generally of his district than any other person. He visits the poor and sees the interior of their dwellings. If he will bring to the notice of the Local Authority sanitary defects, he may do an immense amount of good. It may be said that his business is spiritual and not material, but as a ratepayer he has a right to give information to his Local Authority. He can also do much by advice and teaching to induce poor parishioners to attend to the sanitation of their dwellings. This Association could not do better work than circulate among the parish clergy leaflets giving hints upon sanitary subjects.

A LEASE of the premises having The Adelphi Theatre, been taken by a limited company, the theatre is now being remodelled and improved from the plans and designs of Messrs. Ernest Runtz & Co. For an extension of the façade, in accordance with the present design of the principal front, the site has been taken of the adjoining house on the west side, No. 412, Strand, and we understand that it is proposed to carry up the new portion by one story in the form of a tower above the existing elevation. The Adelphi Theatre has undergone various structural changes since the building of it was begun in 1802 for John Scott, who, with his daughter, opened it as the Sans Pareil on November 27, 1806. In 1821 Scott sold the theatre to Rodwell and Jones, who renamed it the Adelphi. Having been for some while under the management of Charles Mathews the elder and Yates, the house was modified internally, and a new

front, by Samuel Beazley, was erected in 1840. Then the house was rebuilt, in Benjamin Webster's time, after the design of Thomas Henry Wyatt—a view of the interior will be found in the *Builder* volume for 1858, p. 871—and reopened on December 27, 1858. The present front includes the Adelphi restaurant, which was built about fourteen years ago by the late Mr. Spence Chadwick; subsequent enlargements, and improvements of the theatre, have been made after Mr. W. Barnard Pinhey's plans and designs. A plan on p. 834 of our volume cited above shows the enlarged site and auditorium for Wyatt's building, with the extension that included nearly all the west side of Bull Inn-court. The old narrow front and entrance in the Strand remain until the restaurant was erected.

Some New
Decorative
Work.

LAST week we noticed the "1901 Book" of Messrs. Neatby, Evans, & Co., and have since then had an opportunity of seeing their exhibition of furniture and interior decoration. As we expected from the illustrations and general get-up of the catalogue, their work is of the ultra phase of the "Arts and Crafts" movement which is so popular with a certain section of the public. Mr. Neatby and Mr. Evans have both been trained in architects' offices, and we understand that they have been engaged in their present venture for less than a year. For so short a period the exhibition shows surprising versatility of subjects and materials handled—furniture, metal work, enamel, stained glass, embroidery, wall-papers, &c. Some of these are treated with originality and success, but as a whole the work strikes us as being of too popular a nature. Something more than novelty and precociousness is needed in furnishing a house. The one is obtrusive on entering a room for the first time, and the other soon comes wearisome. Occasionally we see modern furniture as good as that of the best periods of English furniture, and it is noticeably free from the self-consciousness that so permeates most modern designs. Much of the best furniture of Chippendale, Sheraton, and Hepplewhite is not beautiful, but it satisfies the mind that it is suitable construction and form for the purpose which it was intended. We believe, however, that Messrs. Neatby, Evans, & Co. will be successful in their venture; their training as architects is the best guarantee for their enterprise, more especially if some of the restrained design that is essential in architecture is carried into their new work.

The Goupil
Gallery.

THE Spring Exhibition at the Goupil Gallery contains a certain proportion of the kind of landscapes of which we are seldom wont to see examples there—landscapes such as Mr. Muhrman's "The Thames at Gunpowderbury," and M. Boudin's "Rue St. Roméouen," and others, which impress one as being painted in mud rather than in colour, but in spite of the rather dingy impression of the whole, there are some interesting works in the collection. Perhaps the most interesting is a small and very broadly handled forest landscape by Gainsborough (23), different from any other Gainsborough we have seen; a small landscape in grand style, and which has some quality almost reminding one of Diaz. There are two or three small works by Col-

of which "The Lake" (14), a composition and effect of which there are several repetitions among his works, may be said to be the only one which represents the real and typical Corot. A large work by Troyon, "A Normandy Fair" (45), represents a collection of peasants and cattle on bare plain with a tremendous rain-cloud over it; the figures and animals are treated with the painter's usual power, but it is a singularly unpicturesque and unattractive specimen of Troyon. Mr. Bertram Priestman's "Sunny Pastures" (3)—of very "sunny" is a good cattle picture with a quality of style about it. Among others of the more important works Mr. Weiss's "Midwinter" (57) is a fine though gloomy scene; Mr. Mouncey's "Kircudbright Lane" (62) is an example of very rough style of handling which nevertheless has a powerful effect when considered *en masse*; and Herr Steelink's "Flock on the Dunes" (65), a little picture which owes its inspiration to Mauve, has true artistic completeness.

The small room at 14, Brook-street, which is called by its owners the Dutch Gallery, occupied at present by a collection of figure studies in drawing, pastel, and photograph by Mr. C. H. Shannon. In general these works are not remarkable for beauty, but they show a variety of studies of the figure of considerable originality and power. The pretty features in the collection are the two sets of small circular wood-cuts of figure subjects treated in a decorative manner. They are stated to have been drawn, cut, and hand-printed by an artist, and appear to be printed in two parts; we do not quite understand the process, but the result is a novel and very pleasing effect.

THE ARCHITECTURAL ASSOCIATION DAY CLASSES.

A SPECIAL general meeting of the Architectural Association was held in the Meeting Room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, on Friday evening last week, Mr. W. H. Rath-Smith, President, occupying the chair, when a scheme for the establishment of day courses of instruction was submitted for the consideration of members.

Early in the present session a strong Education Committee was appointed to consider and report upon the whole subject. This Committee consisted of Messrs. Cole A. Mans, F. T. Baggallay, R. S. Balfour, G. B. Arvill, Arthur Cates, B. F. Fletcher, H. L. Gorence, F. T. W. Goldsmith, H. T. Hare, G. F. Hooper, P. J. Marvin, E. W. Mountford, Beresford Pite, W. A. Pite, H. W. Pratt, H. Fellowes Prynn, E. Howley Sim, H. D. Charles-Wood, W. Howard Rath-Smith, John Water, Leonard Stokes, and Aston Webb, A.R.A. After six meetings, their Report was presented to the General Committee of the Association which had actually adopted the whole Report with few amendments. The proposals are as follows:—

1. That the studio be opened during the day, and that day classes be established forthwith. The work in these classes and in the studio to be of a preparatory and supplementary nature suitable for those who have entered or are about to enter architects' offices as pupils.
2. That this branch of the work of the Architectural Association be known as the day school, while the present classes be called the evening school.
3. That the first course of studies be arranged to cover one year, but students to be afforded the opportunity of taking a second year in the studio, when they might also attend some of the evening classes.
4. That each year be divided into three terms, namely, autumn, spring, and summer, consisting nearly as may be of thirteen weeks each.

5. That the work in the studio be supplemented by a certain number of lectures on history and construction, so that the students may better understand their work.

6. That a master of the studio be appointed at a salary to be fixed by the committee, who shall deliver lectures on the "History of Architecture and Elementary Building Construction." The master to nominate an assistant to help him in the studio, such assistant, if approved, to be remunerated as may be deemed expedient by the committee.

7. That the studio be open from 9.30 a.m. to 5 p.m. (1 p.m. on Saturdays), and that the assistant-master be in attendance during these hours. The master himself, however, would attend at stated times to instruct the students and deliver his lectures.

8. That the fee for the full course be 12 gs. per term or 35 gs. per annum, but students taking only the lectures to pay a fee of 2 gs. per term for each course, or 5 gs. per annum. Students wishing to join the day school must submit a letter of recommendation.

9. That after payment of the fees for the first year's course students shall be eligible for election as ordinary members of the Association without paying the usual entrance fee.

10. That students should be encouraged to cultivate a thorough knowledge of the French and German languages (if they have not already acquired same), as these languages are particularly useful for purposes of study and when travelling abroad.

11. That the studio library be augmented as may be found necessary, and be available at all times when the schools are open.

12. That the management of the school be under the direction of the Committee of the Architectural Association, assisted by an advisory board of eminent architects and other gentlemen.

13. That the following subjects be included in the curriculum:—

First Year's Course.

- (a) The use of instruments and scales.
- (b) Freehand drawing.
- (c) The five orders of classic architecture.
- (d) The elements of the various styles of architecture.
- (e) The principles of mechanics.
- (f) Elementary construction.
- (g) Sketching and measuring details and portions of existing buildings.
- (h) Thirty-six lectures on the history of architecture (illustrated by visits to buildings and museums).
- (i) Thirty-six lectures on elementary construction and materials (illustrated by visits to workshops and buildings in progress).

Each student will be expected to take up a course of reading under the direction of the studio master.

Second Year's Course.

- (a) Continuation when necessary of the subjects forming the first year's course.
- (b) Perspective and scenography.
- (c) Descriptive and applied geometry and graphic statics.
- (d) Principles of architectural design.

Each student will be expected to take up a course of reading under the direction of the studio master.

N.B.—Students taking a second year in the studio, should attend such lectures or classes, day or evening, as the master may advise.

The master of the studio will direct students as to their vacation studies.

The Chairman in opening the proceedings briefly explained the object of the meeting, and called on Mr. Aston Webb to put the scheme before them.

Mr. Aston Webb said that he looked at the matter from the general standpoint whether or not day schools should be started for the education of architects and the advancement of architecture. We were occasionally told that those buildings of old that we admire so much were erected without architects at all. That might be so, though he supposed if that were so they must, like Topsy, have "grown." Whether there were architects or not there must, at all events, have been some one to look after the buildings that were being erected, and judging from the lists of members of the Architectural Association and other architectural societies, there were likely to be architects for some time to come, and many of them. There were also many yet to join the ranks, and the question to be considered was whether, under the present system, or want of system, a young man entering the profession had sufficient opportunities for properly learning his calling. The two points that seemed naturally to arise were these: Were these day classes required, were they worth starting? If they were, was the Architectural Association the right body to start them? As to whether the classes were required, he would ask

what were the present opportunities a young man has in London of learning the profession of architecture. A young man could enter either as articled pupil to an architect, or as a paid assistant in an office where he might pick up what knowledge he could, gradually working himself into a position where he could obtain work for himself. Well, were architects content with that state of things? Was that sufficient? A pupil went into an office and was set to work drawing the Orders and learning the elementary problems of construction, mixing up those pursuits with a certain amount of office work, at first largely consisting of tracing. Now, the idea which occurred to the committee which had gone into this question of day classes, and certainly the idea which presented itself to his mind, was whether drawing of Orders and the acquiring of knowledge of elementary problems of construction—strains and stresses, the weights that various materials could carry, and such general elementary matters—could not be better taught elsewhere than in the office—at all events, for the first year or two of a young man's career. Judging from his own experience both as a pupil and as one who had had pupils, he was inclined to think that the acquisition of such elementary knowledge could best be started under the direction of an instructor in some such classes as those proposed, rather than in the more or less haphazard, fragmentary way in which it was now acquired. If pupils went through a year or two of such a course, they would enter an office better prepared to learn what they required to know than if they went into the office straight away. To be quite candid in the matter, he must confess that he had had no uncertainty in regard to these proposals. It occurred to him several times that a young man, in going through a course of one or two years in the Association classes (especially in the case of a two years' course) might by chance think that at the end of that course he was a perfectly fledged architect, or fit to go to some office as an assistant, or even start in practice himself. Young men were so sanguine and were so inclined to rush in where others were more careful, that he had thought that this might prove to be a danger; and, certainly, if anything of that kind occurred it would be a great misfortune. We knew that to a certain extent trades had given up their practice of apprenticeship, and all who were concerned with building knew how great the loss of that system had been, and then no technical institutes could take the place of the old system of apprenticeship to a trade or craft. In regard to this fear he wrote to Professor Simpson, who had been carrying on at Liverpool classes of this sort for some time, asking him for his experiences; and in the course of his reply Professor Simpson said that there was not the slightest danger of men, after a short course of systematic training, thinking they could dispense with practical experience in an office. "I hold," continued the Professor, "that the system I have started here is superior to the American or French system, because it does not carry this theoretical and liberal teaching beyond a certain point, and obliges the student to supplement it by a further term of years in an office." That seemed to him (the speaker) to dispose of his little difficulty. The Association's scheme seemed to afford an excellent opportunity to young men who desired it (and, of course, if they did not care for such an opportunity they could let it alone) of taking a course of a year or two of systematic training before entering an office. One part of the education of an architect which was extremely necessary was a knowledge of the history of architecture, and that could be better imparted by an instructor than by the busy architect during office hours. Of course, buildings were erected, and could very well be erected, by men who had no knowledge of what had been done in past ages, but for all that he did not think there would be any one who would suggest that it was not desirable for an architect to know the history of his art, or possess a knowledge of what had been done in past times. Professor Aitchison, he thought, used to tell a story of a Bishop of London who at a dinner once sat next to an architect, and who remarked subsequently to some friends: "It is most extraordinary, I have been sitting next to an architect, and have been speaking to him about the Temples of Prestum, and I found I knew more about

the temples than he did." We knew that a man might be a good architect and yet be ignorant about the Temples of Paestum; but surely, as a matter of education, architects ought to know more, or, at least, quite as much, about matters connected with their profession as an outsider knew. The Bishop, as a cultivated English gentleman, had a knowledge of matters other than those which immediately concerned him, and in the same way architects should have a knowledge of things which were not immediately connected with their practice as architects. It would be a very insignificant profession if it dealt merely with knowledge necessary to carry out their work.

It seemed to him that the committee had done wisely in deciding that it was necessary and desirable to start these day classes: what had been done in Liverpool with success could be done in London. Then the question arose, was the Association the right body to carry the work through? Those who thought the Association was the right body might ask: what other body is there? Well, of course, there were other bodies. The Government, had already, to some extent, provided the means for the establishment of art schools all over the country, starting at South Kensington; and in many, if not all of them, architecture was part of the curriculum for students; but he believed that most architects would prefer that architecture should be taught by or under the control of architects themselves, for architects in such matters would be more likely to know what the requirements of students were than instructors who were not necessarily architects at all. Then there were the County Councils to which people looked for most things nowadays. They did most things that were wanted of them, and no doubt they might start architectural schools. As a matter of fact, the London County Council had started an excellent technical school quite close by, where architecture was taught to some extent; but the same remark applied to them as to the Government schools. The Royal Academy had an excellent free architectural school, but it was very properly required in that school that before students could enter they must possess a certain knowledge of architecture, and must have proved to some extent their capacity. That requirement was insisted on in regard to all art students. The Academy did not undertake to find out whether a man was likely to be a painter or an architect, but if he showed certain knowledge and capacity the student was instructed for nothing, and so really the Academy school was the goal for a student after being through those classes. Then there was the Royal Institute of British Architects. Well, the Institute might possibly take up this work, but it had not done so, and therefore the opportunity appeared to have arisen for the Association to distinguish itself by at any rate making a start in this matter.

As to the risks which they ran, it might be asked whether a body of young men should run any risk, and was it a scheme that young men should attempt to carry through? He thought it was, because no one else was attempting exactly the same thing. Their President and the Committee saw that the Association had premises for which a heavy rent was paid, and which premises were at present only used in the evening, being vacant during the day. It was thought that the day classes might be started practically without paying rent, which was a good business proposal. The Committee had also had the foresight to realise that the members of the Association should be free from any financial risk in starting this scheme, and consequently it had been arranged that any possible losses which might arise in consequence of students not joining the classes should be covered by promises of help which would absolutely free the Association from any financial risk. It was really a case of "heads, you win; tails, you don't lose;" though there was really a very great chance that the classes would be successful, because they would meet a want. If that were so, the Association would have laid all their young professional brethren under considerable obligation in starting the classes. If the Association did not start these classes now, it was obvious that they would not be started for some time, and some other agencies for supplying the want might arise over which the Association would have no control. It was possible that in the future these classes might so

develop that other assistance might be required, but that necessity had not arisen yet. Therefore, as a member of the Association, he thought they should make the experiment in order to see whether the classes were wanted. The scheme which the Committee had drawn up might have to be altered or varied as occasion required; but it seemed to him, for a start, that it would answer very well, and if that meeting gave its general approval to the scheme, instructors would be obtained, the scheme would be advertised, classes would shortly start, and it would then be seen whether students would be willing to come forward. That would depend, he thought, to some extent on how far the senior members of the profession would assist in the matter, and that could not be known until the scheme was really started. When started, a practising architect, when a parent brought his boy to him for the purpose of articling him, might help the scheme by saying to the parent: "Let your son take a year's course at the Association schools, during which time it will be seen whether the boy is likely to take to the work, and if he does, at the end of that term I shall be pleased to take him into my office." If members of the profession would assist in that way, he felt sure the scheme would be a success. He intended to take that course, and he believed that other architects would do the same. It might be said that a young man could not afford to give a year of his time as proposed, and then go into an office; that, however, was not a real difficulty, because there were many men now who could and did spare the time to go to a University, and then enter an office to be articled. There were many men practising now who had done that to their great advantage, and their three years at the University had not been thrown away, for they had been enabled in that way to learn their art afterwards far more readily than they otherwise would have done. He had followed this course in regard to his own son, and he believed that the knowledge he thus acquired would enable him to make up for what might appear to be lost time. If the classes were financially successful, as he believed they would be, the Association would be able to expand its work considerably. Any one who knew the premises at Great Marlborough-street knew the need of more accommodation there, and it was probably known that with the present means at the disposal of the Association it was difficult to obtain the necessary extension. He had served for some time on a Committee for the acquisition of new premises. Several apparently promising schemes which they would have liked to carry through had been gone into, but when they came to the question of cost they had had to put aside those schemes as impossible. If, however, these classes succeeded, there would be no such word as "impossible" in connexion with any work the Association might undertake. He, therefore, proposed that the classes should be started, experimentally at first, and that they should undertake them on the lines indicated. He hoped that they would all do what they could in this very important departure in the work of the Association—a work which would be beneficial to all, and especially to their professional brethren coming after them.

Mr. John Slater said that after the exhaustive way in which Mr. Webb had brought the matter before them there was very little for him to say in seconding the motion. The fact was that somebody—some institution—was bound to take up this question of the systematic education of young men who were going to be architects, and if the Association did not move in the matter now it might be too late usefully to do anything later on. There might be some feeling among members of the Association, especially among elder members, that the Association was going beyond its proper sphere in entering upon this scheme, but in his opinion it was too late in the day to give effect to such opinions should they be held. When the system of voluntary education, which was the *idée mère* of the Association came to an end, and when, after that very exhaustive inquiry into what was likely to be of benefit to the Association and students, Mr. Leonard Stokes carried his scheme of a regular system of education, the Association was bound to take up the system of day classes if the evening classes and the Studio work became, as they had become, a success. He did not know whether it was because of changes which had come over the method of living

during the last thirty years, but we now gave more time to recreation and to mate apart from our work than we used to, and he was afraid it was impossible to expect young men who were going in for a profession to give up evening after evening of the year round for study alone. Therefore I thought they must have some system of day classes. As Mr. Webb had said, a good deal of the success of the scheme would depend on the senior members of the profession, but though the success of such a scheme depended more upon putting the merits of it carefully before the parents and guardians of the rising generation. He quite agreed that a pupil would be of far more value to an architect, and would be able to learn his profession far more quickly if, instead of entering an office immediately after leaving school, he went for a year or two into classes such as those proposed; he would become a far better man all round. There might be a feeling that the institution of the classes would clash with others which were now running in the metropolis. As to that, he might say that the committee appointed to inquire into the whole subject carefully considered that point, and came to the conclusion that the style of class which would be recommended would not clash with anything being done in London at the present time. As to the advantage of a young man entering such classes on leaving school rather than immediately entering an office, he was quite sure that any one who knew the enormous advantage of a few years of study at a University would agree that students who made use of such classes would have a far better chance of better their education. Most of them knew what had been done in Liverpool and Manchester and elsewhere, and it was necessary that the same facility should exist in London. He hoped that the day classes which were proposed would be as great a success as the evening classes had been.

The Chairman said they would be glad to have some remarks from Mr. Stokes, the father of the present educational system of the Association.

Mr. Stokes said he could not claim to be the father of the system, although his name had been associated with it a good deal. It was true he did what he could, but he was greatly assisted by a very influential committee who did most of the work. He was very glad to think that the evening classes had proved a success, however, and he hoped that the Association would be encouraged to go on with the work they had begun, and on lines which in the days, when they first began to teach, were considered very radical and improper by some of their members. If the Association could work evening classes, he thought it ought to be able to work day classes, though, of course, there were great difficulties to face. One important difficulty was as to getting a thoroughly good staff, and a great deal would depend on the staff of professors, or whatever they called them. No doubt the committee would deal very carefully with that point, and would not clutch at the first men who came along. One great recommendation for day classes (he spoke from his own knowledge) was that as there were many parents who objected to their sons being out late at night, a scheme of day classes would be welcomed by them. He did not see why there should be any hesitation at all in regard to the committee proposals, for it could not fail to be a good thing for a young man to have some technical training before he went into an office. In an office it was very difficult for a green youth to pick up knowledge which would be of use to him, and it was months before he was fit to absorb the knowledge which was spread before him or hidden away behind him, unless he could discriminate he lost much time instead of acquiring knowledge which would be of use to him. The more pupils knew the more easily they learnt; and if they were grounded pretty thoroughly in some preparatory classes, and taught to know certain technical terms, and how to understand drawing, they were more ready to learn from their architect master all he had to teach. The students would learn in the school well all such things as principals, joists, mullions &c., meant, and that was the real reason why he was in favour of this proposal: it would not only prove a good thing for the pupil, but it would be good for the principal. It was an intolerable nuisance when one had some absorbing work on hand to have to instruct some raw youth in the

A. MATEAR, F.R.I.B.A., ARCHITECT.

ments of his profession, especially as that could be better taught by some one who had more patience. He thought the Academy School set them a very good example. The Academy School existed to teach architecture, not how to use a T-square—that must be learnt elsewhere. Why should not an architect insist on the same conditions? "I should like to teach you to be an architect, but you must learn first to use your T-square and instruments, and when you understand something about the profession I will touch you up a little." If architects were to say that he thought it would be to the benefit of all parties.

Mr. A. S. Tayler asked if the scheme had been prepared with the idea of being of advantage to those gentlemen who had already entered into a three years' pupillage. As to proposal No. 8, would it not be better to leave the terms to be settled by the committee rather than to pass a hard-and-fast resolution? There might be students who would like to attend the school one day or two days a week; apparently they would have to pay the full fee if recommendation No. 8 were left exactly as it stood.

The Chairman said that the day classes would be under the same regulations as those which governed the evening school, and under by-law 2, the arrangements for the payment of lecturers, instructors, and visitors, and the fees to be charged, were left to the committee. They would be perfectly free to vary the fees in certain cases and to take a smaller fee for a partial course. Professor Simpson had assured him that at Liverpool, in the earlier years of the school, there had been a good many casual students, who were no doubt articulated in offices and who wanted to take up special subjects in the Studio or classes. No doubt the Association would have students who would take up part of the course, and the fees would vary accordingly.

Mr. Arthur Stratton said he had had a little to do with the system of day training in the Liverpool school. From the time of the foundation of that school he had, until recently, been Demonstrator and Lecturer under Professor Simpson, and he had seen the working of the whole thing. It was rather begging the question nowadays to ask whether such education was needed. Perhaps, if there were no irritable or impatient masters like those referred to by Mr. Stokes, the old system of pupillage might continue to answer, for it had many fine points to recommend it; but the fact remained that, for some reason or other, it did not now answer, and there existed no systematic education for the architect. The Association had made a start with its evening classes, but they were not sufficient. A systematic course of education was certainly wanted, and among architects in Liverpool there was a sense of surprise that nothing had been done in London like that which was being carried out at Liverpool with success. It was actually a fact that young men wishing to become architects had gone from London and the South to join the Liverpool school, because there was nothing suitable in London. As to Mr. Aston Webb's fear that, after a two years' course, some young men might consider themselves equipped as architects, he could quite endorse what Professor Simpson had written on the subject. The success or otherwise of the classes would depend greatly on the teaching and the teachers. It was quite true that the Science and Art schools and Polytechnics did not teach architecture in the way the profession wanted it taught; it was done in a very amateurish way. The teaching, to be of value, should be done by practical architects and by men who had access to works in progress. One had only to take a student who had been through a two-year course to see how systematic was his knowledge as compared with that of the ordinary pupil. It was time gained, not lost, to a man who, because of his previous education in such classes, on entering an office as pupil or assistant, was of use from the commencement. It might be rather premature to discuss the curriculum, but there was one little point to which he would draw attention, and that was with regard to perspective being put in the second year. There was a three months' vacation, which he was afraid would always be a stumbling-block to the student, for imagine a young man in his first year being left to himself for three months! That difficulty did not occur in the case of an articulated pupil; unless a man were a University graduate, or had had already a good

training, he would probably waste those three months entirely. The first thing that a student should be induced to do was to go sketching during the summer vacation, but that he could not do without a knowledge of perspective, and therefore perspective should come in the first year. The Association was a vigorous body, and had done a great amount of good work in the past, and this movement could not be in better hands, and if the day classes were properly started and with enthusiasm, they would certainly be a thorough success.

Mr. Arnold Mitchell said that the question of the use the student would make of his time discussed by the Committee, and it had been suggested that the Instructor of the Studio would guide in some measure the studies which the student would pursue during the vacation. But he did not look at the matter quite from the point of view of the last speaker. The Cambridge vacations were long, and it might or might not be that the students in architectural study which existed for working up old work, for instance, there was reason to hope that the time of the Association student would be far more profitably employed during the vacation in any event than the time of the University student. On the general question there was one point to which he would like specially to refer, and that was as to the way in which education and facilities for it had grown to be a necessity of the day. We should be beaten in the race if we did not take every possible care in this matter of education. The whole tendency of the present day was to educate, educate, educate. In trade, England for a long time held commercial supremacy; that supremacy was being rapidly overtaken; foreign trade was increasing by leaps and bounds, and England was losing in a great degree the supremacy she formerly held. What applied to trade applied also to the profession of an architect. Other nations were educating, and though we hoped and believed that we were still ahead in the matter of architectural education and practice, there was not the smallest doubt that other nations were overtaking us. That very afternoon a young Norwegian architect who was seeking employment called on him with a roll of his drawings, which amazed him and others who saw them by their excellence. There were something like fifty drawings, and it was a great pleasure to look at them. He (the speaker) was astonished at the quality of the drawings, and still more amazed when he was told by the young Norwegian that some of the drawings, and these not the least good of those submitted had actually been done during school days before professional life commenced. We did not feel this competition in England yet, but we were bound to feel it in the near future. Let the Association provide facilities for young men gaining that knowledge and experience which would enable them to hold their own in the time of struggle which was undoubtedly coming. Who would not be in favour of doing all they could to help forward their profession by assisting the study and practice of their art, so that architects of the future might have every possible chance in the race of life? They must do all that they could, collectively and individually, to forward this good work in every possible way.

Mr. F. G. F. Hooper said the scheme had been very carefully thought out and studied. They all desired to help on the work of the Association, and the education of themselves and fellow-members. The difficulty of the long vacation had been anticipated by the Committee, and it had been thought that fellow-students in the Association day classes might be encouraged to spend their holidays together in that most enjoyable way by studying one or more buildings. As to perspective being placed in the first year, it was not likely that any student would attend their classes who had not already learnt the elements of sketching or drawing in perspective. He did not think the term "perspective" was intended to apply to sketching, but rather to the setting out of plans of work on paper in perspective. He most cordially welcomed the scheme and he wished it had been commenced long ago.

Mr. H. P. G. Maule said that if any one had come there that evening with doubts of the wisdom of the proposed scheme, those doubts would have been set at rest by the speeches they had heard. He had had considerable

doubt, for it seemed to him rather a large undertaking, which would retard the acquisition of new premises; but after what Mr. Webb had said new premises seemed to be more of an accomplished fact than before. New premises were essential to the well-being of the Association, for the present ones at Great Marlborough-street were not worthy of the Association, and a great effort should be made to get more adequate premises. He was now inclined to think that the proposed scheme of day classes might help them to get what they wanted. Looking at the names of those who had assisted in the preparation of the scheme just submitted to them, the ordinary rank and file of the Association must realise that an immense amount of trouble had been taken and everything done that could be done to ensure success. Every member of the Association, therefore, should help on the scheme in the best way he could.

The Chairman said he had received the following letter from Professor Beresford Pite, who was recently appointed Professor of Architecture in the Royal College of Fine Arts at South Kensington:—

"DEAR PRESIDENT,—I am sorry to see in the current number of A.A. Notes the circular announcing the conclusions of the Committee on the day classes, including my name as though agreeing with their recommendations. As you know that I am clearly of opinion that the proposal is unwise in the true interests of the A.A., I rely on your explanation to the meeting this evening that I entirely dissociate myself from the recommendations of the Committee to the general meeting. An important business engagement will prevent my attendance to-night.—Yours truly,

BERESFORD PITE."

The Chairman said he was sorry if there was any reason for Professor Pite's criticism on the way the circular had been sent out. He did not see that there could be, because Professor Pite's name was still on the Committee which drew up the new scheme of day classes. Professor Pite had never withdrawn his name from the Committee, and he was the only member who had withheld his support from the scheme. He was very glad to hear Mr. Mitchell's remarks, for the matter was an important one. The Committee was fully alive to what education meant, and they did not believe it consisted in cramming a lot of facts into the student, and in working out the scheme they would remember that education meant the opening of a man's mind in all directions and the guiding of students in their training and practice. They would try to make the system as flexible and comprehensive as possible, giving to the student's mind that information which was necessary to enable him to work out those problems he would be called upon to solve; and they would endeavour to make the student as susceptible as possible to every influence that would be of value to him as an architect. As to new premises, the matter had not been lost sight of, and when the day classes were properly started an opportunity would no doubt present itself for getting better premises. Even if within the next two or three years they did not get sufficient money to build new premises, there was no doubt that they would then be able to rent larger premises. The Committee had it in their minds to make an urgent appeal shortly in the matter. Already they could see their way to 1,500l.; three gentlemen had promised 250l. each. The whole thing looked very hopeful, but the difficulty was to get a site, and members of the Association might help forward the matter by making inquiries, wherever possible, for a suitable site near Oxford-circus in a street sufficiently dignified for the purpose. As to the day classes, they knew the Institute would help them by calling the attention of its members to the matter, and would ask the profession to afford every facility to pupils to attend the classes. As to the three months' vacation, if the students were worth anything they would make good use of their time and would be envied by the articulated pupil.

Mr. G. B. Carvill said that the hearty thanks of the Association were due to those gentlemen who evening after evening had given so ungrudgingly time and consideration to the scheme. The Association must be very grateful to them, and especially to Mr. Aston Webb for putting the matter before them as he had.

The Chairman said he must endorse the remarks made by Mr. Carvill, for the Association was greatly indebted to those gentlemen for their invaluable help. It only remained for him to put Mr. Webb's motion to the

meeting, viz., that the Association adopt the Committee's scheme for the establishment of day classes of instruction in architecture.

This having been agreed to unanimously, the following amendments and additions to the By-laws, consequent on the adoption of the Committee's scheme, were agreed to:—

Add to By-law No. 14, "Each student who has paid the fee for the first year's course of day classes shall be eligible for election as an ordinary member without payment of an entrance fee."

Add to By-law No. 15 after the words "Each ordinary member" (with the exception stated in By-law No. 14).

Add to By-law No. 27 at end, "or one of the Hon. Secretaries."

Add to By-law No. 30 before the word "Auditors" "Honorary."

Add to By-law No. 36 the word "Honorary" before "Auditors" in every case.

By-law No. 43 to read as follows:—

"A special general meeting shall be called when required by the Committee, or at any time, not less than two weeks nor more than eight weeks, after the receipt of a requisition stating the purpose for which the meeting is required, and signed by at least twelve ordinary members. The presence of twenty-five ordinary members shall be necessary to constitute a quorum at any meeting called under this by-law, and in each case the agenda of business to be considered, specifying the place, day, and hour of meeting shall be duly posted up in the premises of the Association, advertised, sent by post or otherwise, as may be determined by the Committee, at least one clear week prior to the meeting, and no other business shall be taken at such meeting."

Omit By-law No. 44.

Add the following new By-law:—

"No member of the Committee shall be appointed to a paid office or Lectureship in connexion with the Association."

The meeting then terminated.

MAGAZINES AND REVIEWS.

THE *Architectural Review* (Boston), vol. vi, No. 7, contains an article on and illustrations of the work of Mr. F. Lloyd Wright, an architect who seems to have made a good many original experiments in house-planning and the exterior treatment of houses. The whole of the plates are occupied also with illustrations of his work, in a style of quasi-ornamental drawing which is rather pretentious and not very attractive. There is certainly cleverness in Mr. Wright's work, but not the feeling for architectural treatment; the illustration given of a high building (no title) looks quite absurdly like a Broddingnagian bookcase or cabinet; there is no sense of scale about it. No. 1 of Vol. III. contains an article on the formal garden of Longleat, and a more important one by Mr. Robert Brown, on "English Half-Timber Architecture," which, however, the writer says distinctly he does not advocate the revival of; he is only considering it as a beautiful chapter in old English architecture. In regard to the overhanging of the upper stories, he suggests that this was really to preserve the lower part of the walls from weather, and not for want of space, as this overhanging is found in country houses in isolated situations as well as in towns. But it is perfectly possible that its use in country houses is only an imitation of a practice first used for economy of space in cities. It must be remembered also that in any case it means economy of foundation walls. The illustrations include a bird's-eye view of the proposed buildings for Washington University, St. Louis; an immense scheme, in which, so far as we can judge from the small views of the buildings in the drawing, English Elizabethan types of University buildings seem to have been taken as a model. We do not think that there could be a better model, and perhaps there is an æsthetic consistency in repeating in the New World the architectural type of the universities of the Old World, which have formed to some extent their educational type also. A number of detail sections of various portions of the proposed buildings are given.

The *Berliner Architektur-Welt* contains a number of illustrations of recent Berlin house architecture, half-timbered villas for which we have little admiration, and a more dignified and solid stone structure, the villa Ernst Hester, in classic style and very effectively decorated with sculpture, which is an exceedingly good example of the superior class of domestic architecture. Herr Ravoth, of Berlin, is the architect. The German architects are nearly always good in this kind of Classic and sculptured house; it is in the "picturesque" villa

style that they fail. There are a good many examples of modern decorative work, among which some open-work metal screens for heating apparatus (*Heizkörper-per-Kleidung*) are worth notice as being in artistic treatment quite beyond the usual style of work for this purpose.

The most interesting article in the *Art Journal* is that by Mr. Solen, entitled "Pâte-sur-Pâte," and which is an illustrated description of the design and methods of the Sèvres manufactory. The illustrations are very beautiful both in themselves and in execution. The writer shows how artfully some of the materials used in Sèvres ware are fashioned to produce changing effects of light and colour to add to the charm of the work.

"A compound of bichromate of potash and alumina, fritted together," is used to produce the changing effects of the "Pâtes changeantes" of the Sèvres manufactory. Its delicate shade of pink possesses the peculiarity of being highly intensified by artificial light. It lends itself to the following artifice:—A small quantity of the compound may be introduced (without producing any apparent alteration by daylight) into a blue or green paste; but when the mixture is exposed in a room illuminated by gas, blue and green are so completely altered as to become, respectively, bright lilac and warm red.

A Hungarian appreciation of Mr. Walter Crane is the subject of another short article, in which Mr. Lewis F. Day sums up some of the expressions in regard to the English artist's work which were made in the Budapest Press at the time of the exhibition of his works there.

The *Magazine of Art* contains an illustrated article on the "Decoration of the Grand Piano," by Mr. Aymer Vallance. In the course of it he suggests that the treatment of the modern heavy grand piano with sturdy legs at the angles but no central support is defective; but this is in accordance with the make of the instrument, the strong frame of which is necessarily entirely self-supporting; and the intrusion of central brackets or supports is therefore not only constructively unnecessary, but has the appearance and would probably have the effect of checking sonority; and in all piano decoration it must be remembered that the musical efficiency of the instrument is the first point, the decoration only the second. In our opinion some of the more elaborate piano decorations of recent days have had the effect of obscuring and making secondary the real object of the instrument—so much so that we are under the impression that these highly-decorated pianos are seldom or never found in really "musical" houses. What is wanted for the grand piano is not so much elaborate decoration as a well-considered shaping of the parts in accordance with the structure and function of the instrument. Mr. Vallance indeed points out, and quite rightly, that the design made by Burne-Jones, which is among the number illustrated, and which is a fine one in itself, is carried out entirely irrespective of the hinge in the front part of the lid, and that the exterior design is so placed as to stand on its head when the top of the piano is propped open. This is not decorating a piano; it is merely making it a surface for painting a picture on.

The *Artist* devotes an article to the work of the clever and original artist Mucha, a Parisian in work and domicile though not in name, with a number of his figure sketches. "A Summer Cottage" designed by Mr. Quennell is the subject of another article. The plan, we observe, is given without a compass, though this is surely a very important point in a "summer cottage."

Among the contents of the *Studio* (February 15) is an illustrated article on Mr. Frampton's sculpture decoration for the Glasgow Exhibition building; one on Maori houses, with the quaint wood carving, and some illustrations of the interiors of a new house, "Glen Park," near York, of which Messrs. Penley are the architects, and in which there seems to be a good deal of originality of decorative treatment.

To *Fellden's Magazine* Mr. William Brew contributes the first half of a valuable article on "Electrical Fires." Interesting photographs are given of tin, copper, and platinum fuses at the moment of "blowing," and the different way in which the arc acts in these various cases is pointed out. When a tin fuse "blows" the arc is very much displaced, and may strike any live metal in its neighbourhood. This is a strong argument against employing double pole fuses under the same cover, as a disastrous

arc may start between the positive and negative terminals. Mr. Brew is strongly of opinion that with the high voltages now in use a more suitable material for fuses than tin might be employed with advantage to the porcelain bases. He agrees with us in thinking that the insulation resistance between the mains ought always to be determined. He points out that when the voltage is raised from 100 to 250 the insulation resistance ought to be 6.25 times greater. He has come across cases where the section of the positive wire has been so reduced by electrolysis due to leakage currents, that became red-hot when the normal current was flowing. This shows the necessity of a high standard of insulation resistance. We do not agree with Mr. Brew that a concentric system with the outer earthed is the system of the future. From the central station point of view there are many drawbacks to this system apart altogether from the electrolytic damage it would do to gas and water pipes. An article by Mr. Kilburn Scott on "Electric Driving of Textile Factories" is a timely one. It is extraordinary that while a Bradford firm supplies thousands of looms fitted for electric driving to the Continent, yet it sells none in this country. Mr. Scott mentions that the ribbon industry in the score or so of towns and villages about St. Etienne, in France, has revived owing to the establishment of a large public electric power supply company in the neighbourhood. This company supplies power to 2,500 ribbon looms, each having its own little 1 h.p. motor. The charge for power is ten francs per motor per month. We recommend any one who is sceptical about the suitability of electric motors for machine-driving to read Mr. Scott's article.

The *Engineering Magazine* has an article on "Engineering Opportunities in Asia," which gives some interesting information in regard to the manner in which modern machinery and methods are slowly penetrating into the Far East. There is another article on "American Locomotives on British Railways," the title of which is misleading; it should be "on British Colonial railways," for that is the real point; the engines referred to are all in use on New Zealand, Australian, and South African railways. The truth seems to be that since these Colonial railways are for the present but roughly constructed, the roughly finished American locomotive suits their work, and is more economical than the highly finished and conscientiously built English machine. That is not, it is true, what the writer of the article wishes us to conclude, but that is the conclusion we draw from it. The same number contains an article on "Electric Power Machinery in Iron and Steel Works," by Mr. S. F. Walker, which deserves study by all interested in the important industry of iron and steel making. Illustrated descriptions are given of various kinds of electric cranes which lift iron pigs, rails, and plates simply by the attraction of powerful electro-magnets. Magnetic separator are also shown which recover the iron from the waste slag left in the converter. The slag is first ground up into a powder in a mortar mill. It is then poured into the magnetic separator, round the drum of which are placed magnetic poles which magnetise the particles, first in one direction and then in the other, so that the non-magnetic material clinging to them is thrown off by their continual rotations and so the cleaning is done very efficiently. Mr. Walker rightly points out that motors are often designed on too small a scale, leaving a very small margin for emergencies, and the consequent frequent "blowing" of the fuses has unjustly discredited electric driving. Unlike steam-engines, the efficiency of motors is often greatest at a light load, and hence it is more economical to have the motor too large than to have it too small. It is stated that enclosed arc lamps have now displaced the large glow lamps which were formerly used for lighting the rail mills. In conclusion, Mr. Walker discusses the relative advantages of polyphase and direct-current systems, and sums up in favour of the former. In an editorial Mr. Whitehouse's theory that the internal heat of the earth may be generated electrically by eddy currents in the earth's substance produced by magnetic lines of force between the earth and the sun, is commented on favourably. In our opinion, however, seeing that all the direct experimental evidence of magnetic observations negatives the supposition of lines of force fixed in space, this theory is quite untenable—the theory of thermo-electric currents enunciated by Lyell fifty years ago.

The *Nineteenth Century* contains an article by Signor Boni on "Strata in the Roman Forum." This describes the method of investigation he has been pursuing by sinking shafts through the various archaeological strata, as he calls them, of the Forum, and the discoveries which have been made in this manner, and also in the existing shafts in the shape of ancient wells. More than thirty wells have been found in the Forum area, either of the Republican period, and sunk previous to the building of the aqueducts, or of the mediæval period, and sunk after their destruction. No well has been found which appears to belong to Imperial times, the aqueducts having then sufficed for the supply of water. Signor Boni says—

"The interest of these wells is as storehouses, for they have preserved to us, among the earth and mud of which they are full, the innumerable miscellaneous articles which found their way into them. A rope wore out, or a pail broke; a passer-by, lazy or mischievous, threw down something to the depth or to hear the water splash; things were thrown in to be rid of them, or accidentally pushed over the edge. The accumulations of a well may represent few or many years, according as it was frequently cleaned out, or was abandoned long before filling it up. Each is like a sealed packet 1000 years old, with a value dependent on our power of appreciating it."

The same number also contains an article by Mr. R. C. Witt on the Romney portraits at the Grafton Gallery, which, however, as our readers would have already gathered, we do not think are of sufficient importance as to demand a special article. Romney at his best was a very fine painter, but his second-best works were hardly worth discussing in so serious a strain.

The *Monthly Review* contains an important illustrated article by Mr. Arthur Evans on his recent discoveries in Crete; and an article by Captain Hart-Davis on "London—a Seaport," of the course of which it is suggested that a canal of forty millions should be raised on the security of the existing property in docks and wharves, and placed in the hands of a Trust to be used in improving the river and forming better key and dock accommodation. There is no doubt that the improvement of London as a port is a matter of the greatest moment, and the suggestions in the article should at all events receive consideration.

In the *Century* Mr. Birrell continues his articles on "Down the Rhine," with the illustrations by Mr. Castaigne; they are interesting considerations of a well-worn topic in a new light. Some "Personal Recollections of Rahms" by Herr Henschel will interest our usual readers.

In *Scribner*, under "The Field of Art," the subject of "French Architectural Decoration" is considered by M. Alexandre Sandier (we presume it is a French article translated), with special reference to the Sévres manufactory exhibit at the Paris Exhibition. The article is, however, merely historical and descriptive, so far as it is carried in the present number; it appears to be intended to continue the subject.

The *Fortnightly Review* contains an article by Mr. H. Heathcote Statham on the Loan Exhibition of Pictures at Burlington House, mainly occupied with the consideration as to which of the artists deceased within the last fifty years best stand the test of the revival of their works. The absence of any representation of either Macise or Creswick in the exhibition is noted.

The *Pall Mall Magazine* has an article on the style Howard and its contents, by Lord Ronald Gower, who, however, has little to say of Vanbrugh's architecture, except that the general effect of the building is "sublime" and "the family is mostly occupied with the history of the works of art contained in it. The numerous illustrations add, of course, much to the interest of the article. The same number contains also a short article by Sir Robert Ball "Signalling to Mars," not, as may be supposed, a code of directions for the purpose, but a common-sense demonstration of a practical clear-headed man of science as to the utter possibility of signalling to Mars by any means within present human knowledge. It is an article, in short, calculated to put an end to a good deal of nonsense which has been written on the subject.

The *Revue Générale* has an article by M. Eugène Gilbert under the title "Impressionistes Critiques," which is really a criticism of various art criticisms, and serves to give a kind

of summary of some contemporary French opinions on matters artistic. It appears that there are some critics of the day who are very bitter against the Paris Exhibition. A M. André Hadlays is particularly sarcastic about the Exhibition architecture, in which we certainly do not agree with him; and about the expenditure of so much money and labour on a temporary spectacle. On that head there is certainly something to be said.

The *Essex Review* (quarterly) contains an article on the subject of "The London Littoral," the scenery and small towns on the Thames banks below London, particularly written to urge that some of them at least should be left as they are. That, however, is not in the power of any law or any argument, we fear, to accomplish. A historical and biographical article on "The Dunthornes of Colchester,"—two artists, father and son, who lived there in the eighteenth century, is interesting, and is illustrated by reproductions of some curious old prints.

The *Quarry* contains a long and important article on "The Building Stones of London," with some photographs from portions of old buildings to show the wear of the stone, and an alphabetical list of buildings and stones referred to in the article.

Among the contents of *Knowledge* is a summary by Mr. Crommelin of the total solar eclipses of the twentieth century, with a chart showing the track of totality for each one. The series of articles on the size of ocean waves is continued.

We have received also *Harper* and the *Gentleman's Magazine*, neither of which contains anything which it comes within our scope to comment on.

THE SURVEYORS' INSTITUTION:

THE PRESENT CONDITION OF THE BUILDING INDUSTRY.

AN ordinary fortnightly meeting of the Surveyors' Institution was held at Great George-street on Monday evening last, Mr. John Shaw, President, in the chair.

Some donations to the library and library fund having been announced, and a vote of thanks passed to the donors, the Chairman called on Mr. H. Chaffield Clarke to resume the discussion on the paper by Mr. Thomas Blashill, read at a previous meeting, on the "Present Condition of the Building Industry."

Mr. H. Chaffield Clarke said that Mr. Blashill had referred to the employer and to the necessity of showing him more consideration. That was no doubt true, but one thing to be insisted upon was that the employer should tell his architect everything, keeping nothing back, and should treat him as he would his solicitor. Often the client only told half the facts, and that was not quite fair to the architect or surveyor, who would respect confidence as much as the solicitor. Once the drawings and specification were completed, and the contract signed, he had been taught never to depart from it, except for very good reasons, and not alter a specification without very careful consideration; rather complete the building and then alter, than alter when in progress. Slight variations led to all sorts of trouble. Mr. Blashill had written some very wise words regarding the employer who took every advantage of a contractor. Many employers seemed to think they could bind down the builder and do any shabby thing, such as they would not think of doing to any other tradesman. The architect should hold the balance fairly between the parties. As to the selection of the builder, the whole success of the building depended largely on that. The architect must be responsible for the builder selected, and should the client do the selection, it was always well to warn him, unless one knew the builder, that he must take the risk of the selection; for it was perfectly impossible for an architect to teach a builder (although a builder would not allow that he wanted teaching), nor were they paid 5 per cent. to play the detective. Mr. Blashill suggested that they should prepare full-sized details before the tenders were obtained. That was a most Utopian idea, and he thought that if an architect supplied 1/4th scale drawings with 1/2-in. details, the quantity surveyor could take off from them. Surely that was sufficient for the quantity surveyor; besides, one must have some power of varying details

as the work proceeded. Of course, it was important not to hinder the builder in any way, but it did not seem practical to give him full-sized details before the job had started. The difficulty of speed was largely controlled by materials, and one of the materials to avoid if there were to be no risks of delay was terra-cotta. As to quantities, the employer's architect very often recommended a quantity surveyor and selected one, but it was a very usual course in any large job for the builders to select a quantity surveyor and the two surveyors to take off the quantities between them. That seemed to be a very fair and proper system, and one to be encouraged. He saw no necessity for making the quantities part of the contract. The quantities were only a means of obtaining tenders and prices; they were not part and parcel of the specification from which the job should be carried out. But it was wise to price them out and deposit them to measure variations upon. As to subletting, that was a very important question, and there again the architect must retain the power of selecting certain materials as well as the firms who tender, and put the amount of the lowest tender into the builder's contract. The builder should bind down the sub-contractor to time as he himself was bound down. He agreed with the author that most of the trouble in building work was avoided by clear drawings and specifications before the works were commenced, and nearly all disputed accounts which had come before him had arisen from want of proper drawings and specifications, and the interference, perhaps, of the lady client. It was a most important point to be remembered by young men in the profession that drawings and specifications should be perfectly clear; while it was especially unfair to builders and contractors when they were not. He did not agree with Mr. Blashill that the quantity surveyor should write the specification, for he thought it was the architect's business to do that, but the quantity surveyor could correct it from the quantities. As to Mr. Blashill's remarks about American buildings and the promptitude with which they were erected, he would like to know what the width of the streets in the States was where these monstrosities were put up. A building of from eighteen to twenty-six stories would have a height of from 180 to 200 ft., and was it wise in any city to have such buildings unless the streets were of abnormal width? Healthiest streets were light and air and sunlight. The healthiest streets in London were the East End streets—Whitechapel-road, Mile End-road, and Commercial-road—beautifully wide streets with low buildings on either side. The most dismal and draughty and unpleasant street was surely Northumberland-avenue, where very little sun got, besides being draughty, cold, and dull. The great height entailed much greater risks from loss of life by fire. Rather than build such high buildings he would prefer to take people a little further out, into the suburbs, where they would get more light and air. Mr. Blashill touched very lightly on a delicate subject, viz., the question of an architect's office in a builder's firm. Although Osborne and houses in Park-lane had been built by builders with an architect's office, although they might be good architecturally, and although there might be many competent architects in builders' firms, if that system were pursued the desirable check of the architect on prices and materials, and on the non-waste of materials, was done away with, and he thought the practice ought to be discouraged in every way. As Mr. Blashill said, the most satisfactory way to build was to build on a schedule of prices, and all in that room would wish to carry out their work in that way; but few young architects had, as a rule, enough weight to have their work so executed; but still it was the fairest way, and gave the best results for money. As to speculative builders, there existed also a class who might be better described as financial architects, who were very much in evidence in London just now, and did great harm to architects by taking sites at ruinous ground-rents, out of which no man could live, and on which they put up buildings. This had a serious effect on legitimate building, for it stopped genuine speculation. They were really not ground-rents at all, but half ground-rents. The practice was very much to be deprecated. In regard to the labour question, they should all approach it away from politics. It was much too important a question, for it was associated with the success of the country, and must be approached from

* See our issues for March 2 and 9.

the point of view of the good of the community. He had always felt that the question was approached from two different sides, and for the good of the few and not for the many. Since 1870 there had been such an education as had never been dreamt of before, and a serious question was whether it had been the stepping-stone for their improvement and the improvement of the country. And had it helped the people to look the future fairly in the face? There was also the much bigger question of technical education, against which he had not a word to say, especially as he knew what good work was being done by the City Companies, such as the Carpenters, Plumbers, Drapers, and Fishmongers. But what had the technical schools done towards fitting the artisan towards getting a living, for that was the practical point? Did they help a man to do his work when he left them? Hundreds of men attended these classes; what proportion turned out good craftsmen? Some time ago he went to a large manufacturer to inspect some models, and he asked the head man what number of men coming from technical schools were good craftsmen, and the answer was that the number was very limited—practically none. That was a sad observation to make, seeing what was spent every year in this work. Any one who had had anything to do with colour—even the simple painting of a door of a house in two colours, in contrast—would realise how difficult it was to get a workman to do this satisfactorily. It was all very well while one stood over the man, but if they left him to do it, the chances were that the work would have to be done again, and one would have to mix the colours oneself, for the workman seemed neither to care nor to take the trouble to appreciate the elements of colour. He believed there was in London at the present time a great opening for a colourist, or a combination of them, who could colour simply and well, and not at an extravagant rate. If, therefore, technical education, although useful, failed to produce men who could put their learning into practice, what was the remedy? In his opinion it was to go back to the old system of apprenticeship. A lad should be put with a good craftsman and be bound to learn his trade, and not dragged up to his trade and polished off by some technical class. He could not understand why workmen should object to the system, for if the number of workmen was limited, so the scope and amount of trade was limited. That was a political economy question, but that seemed to him to be the result; and he would ask the workmen and the unions to consider the question seriously, and in this light. Until the system was encouraged again and masters took a pride in their apprentices, so long should we suffer from incompetent workmen, and men with no love for their trade, and who merely looked upon it as a means of livelihood. Nobody doubted the legality and usefulness of trades-unions to their members, and they had doubtless been a necessity to prevent sweating; but were the unions looking well to the future, and considering all the problems of the questions of supply and demand, capital and labour? Were they not looking too much to the present and the "flesh pots of Egypt"? Had not the limitation of hours and the amount of work which by unwritten laws they enforced a tendency to drive capitalists to seek labour elsewhere? and was that not a serious question for them all? He recently had an illustration of this, when a London architect, who was building a house for himself, told him he was using Swedish doors and sashes because they were good and cheaper than English work. That architect had no desire to buy foreign goods, neither had he (the speaker), but the result of those unwritten laws he had referred to was to drive employers to seek labour elsewhere. During the carpenters strike seven or eight years ago, a leading London firm of builders was seriously considering the question whether to set up works in Belgium where labour could be got without trouble and undue expense. What he feared was that the unions were making work so expensive that they were crippling trade, and was not a steady and increasing trade a necessity for the country? In the current issue of the *Nineteenth Century and After* was an article by Mr. W. Woodward on the question, in which the writer gave the Board of Trade returns showing the enormous rise in wages of 115,000*l.* per week in 1899 compared with 1898, and in eight months in 1900 a net

increase of 150,000*l.* per week, by far the greatest rise recorded in any similar period. Were mechanics really better off for that? They certainly ought to be; and were they putting money by for the future? The mechanic was better paid than clerks, and if he worked had he not as much or more chance of success as the clerk? There were such positions as foremen, overseers, &c., open to the mechanic, and altogether his life was not without interest and not without hope for the future if he worked industriously. But did the men with this increased pay really work better in the limited hours or not? He was afraid there would be but one answer by any one who had been on works and seen how the men worked. He had no hesitation in saying from an experience of twenty years that they did not. The men seemed to think that restrictions on output were good for them and made work for men on the streets; but, of course, that was a fallacious argument. They were trying to step in between supply and demand and create an artificial state of things which could not last long. He thought it was most important that the trades-unions of the country, powerful as they were, instead of fighting the employers, should, as much as possible, pull together with them and strengthen their trade. There was no better way to do that than to have a proper system of apprenticeship through all the trades, and so teaching men their trade thoroughly.

Mr. H. Lovegrove said that Mr. Blashill was certainly right in insisting that good pay should be given to clerks of works, so as to ensure good trained men, and not men who were only good foremen. It was very desirable to get good clerks of works, and he thought that good ones could generally be got from the Clerks of Works' Association. Many architects had to make a stand for fair treatment of the builder at the hands of a grasping client or committee. Some people seemed to regard a contract as a sort of lottery, and their idea seemed to be to get the main contract settled and then grind as much as they could out of the builder. As to sub-contractors, it seemed to him that the contractor should appoint the sub-contractor under the very same conditions as he had been bound under. Delay was frequent under the present conditions, and sub-contractors for terra-cotta and ironwork were frequently at fault. As to commissions to architects on introducing business, that was an utterly wrong principle, and nearly all architects, certainly all good architects, would have nothing to do with firms which made such offers. Unfortunately, some people seemed to think that the practice was a common one, and it was even said that the builder gave the architect a commission. As to builders not being practical craftsmen, he thought that provincial contractors, as a rule, were more practical than London men, the London men having much to do with financial matters, and some of them were not "builders" at all. The country builders were brought up to the business by their fathers. The larger class of speculative builders was doubtless very injurious to the profession of architects, for they built in a wholesale way, though not always with the best materials. As to apprenticeship, much had been lost by giving up the system. In the old days men learnt their trade thoroughly, and never thought of attending evening classes; still, the artisan ought to attend evening classes now, so as to get theoretical as well as practical instruction. The building trade was looked after very closely by trades-unions and the authorities, but other trades and callings were left alone. No one seemed to think of the big carriers and the hours of their men, but the workmen in the building trade were protected in many ways. The paper had dealt with another important matter, which was intimately connected with the difficulty under the present conditions of dear land, high rate of wages, and cost of materials of providing houses for the very poor.

Mr. J. Randall said that Mr. Blashill was quite right in saying that before a building was started the drawings, specifications and details should be placed in the hands of the quantity surveyor. It was quite impossible for the quantity surveyor to take out quantities from the crude and incorrect drawings sometimes sent out from architects' offices, and it was unfair to client and builder, for it was simply impossible to make an estimate on improperly prepared drawings. A great deal of trouble arose from defective drawings and specifications, and if large bodies like the

Office of Works and other Government Departments could give proper drawings surely architects concerned in buildings costing large sums of money could get out proper drawings and specifications. He was carrying out work for the Government now which was costing three-quarters of a million, and he had no trouble such as he sometimes had with architects, who gave a little bit of the ironwork masonry, or woodwork at intervals. As to Mr. Blashill's remarks about steelwork being prepared by some builders, his firm turned upwards of 2,000 tons a year. It was no more trouble for them to buy steel than the expert and his firm prepared nearly all their steelwork, and that was largely the practice in America. That lesson might be learnt by everyone, and there would be no need to call the expert, who had to get his price. It was too often the fact that this expert got most of the profit, and it was impossible to get him down or claim for delay, for he would ignore the builder, except for payment, saying he was employed by the architect. He was decidedly against provisional amounts going into estimates, and he might say that if Government did not allow it. As to technical education, we get a lot of it now, but that did not seem to produce better workmen. Of course much work was now done by machinery, and the workmen did not, for instance, cut out the wood and do the labour himself as used to be the case. The result was that there were apprentices, and as long as a man belonged to a trades-union he could consider himself a mechanic. The old mechanics were dying out fast, and he was quite sure that if the country was to hold its own they would have to go back to the old apprenticeship system. Another point he might mention was that it was almost impossible to get merchants to agree to time bargains, for they had a club to protect themselves in the case of a strike. For that and other reasons, a large quantity of materials came into this country from abroad. Probably nine-tenths of the glass used in the country came from abroad; there were really now only about two glass firms in this country. It was the same with the cement and steel. He gave an order about twelve months ago to an English firm for steel, and had not yet got the whole delivery. He gave an order to a foreign firm in November last for a similar amount, and he had got the whole of the goods. He would give another illustration of what the trades-unions were doing for the country. The other day his foreman said they wanted a new machine for moulding sashes. They sent to two or three English firms, and those firms could not do the work in less than from three to six weeks. A German firm supplied the machine in seven days.

Mr. C. John Mann said, as to Mr. Blashill's remark that the employer was entitled to make consideration, the employer generally knew about what amount of money he wished to expend, but that amount was very often exceeded by the estimates, to the annoyance of the employer. That annoyance could be prevented to a large extent if an approximate estimate were made by the surveyor and submitted in writing to the employer or architect. If that were done, a great deal of trouble would be saved to all concerned. Another point, which quantity surveyors were very sensitive as to mistakes in quantities, though, thought, mistakes were not often made, and quantities should not be made a part of the contract on this account. Mr. Blashill might have been a little clearer as to what he meant by "reasonably priced quantities" forming the basis of the contract. Was that to be ascertained by the quantities being opened? or was that to be done before the contract was entered into? How was it to be ascertained that they were "reasonably priced" and a proper basis for a settlement of a contract? He did not think it was always a good thing for quantities to be made the basis of a contract. He differed from Mr. Blashill where he said that a fair settlement was impossible with extensive changes in a contract. It was quite possible to obtain a fair settlement and with carefully taken out bills of quantities he saw no difficulty in arriving at a perfect fair settlement of any amount of variation and it would be a great mistake to restrict the employer in making alterations in his building if those alterations would make it more satisfactory to him. He hoped they would not see in this country any of those lofty buildings to which reference had been made, whatever the

width of the street might be. He believed it would be a great gain to the country if the apprenticeship system could be reintroduced in the building trade.

Mr. H. H. Bartlett (Perry & Co.) said as to sub-contractors, that was a sore point with builders. Where there were sub-contractors (and they had in some cases become rather numerous) the chief contractor had little control over them, for the sub-contractor was appointed practically by the architect. The builder was very strictly tied down, both as to time and the manner of carrying out the work, but he had little or no control over the sub-contractor. That was a difficulty which it was quite within the power of architects to remedy; and if architects could do so, and there was more confidence in the chief contractor, then buildings would be erected in a far more satisfactory manner. As to technical education, the results so far were very poor. In his opinion the British workman was not in the slightest degree more intelligent than he was thirty years ago, and though there had been time for great improvements, the result of the expenditure of mind, time, and money on education was not what might have been expected. The introduction of foreign manufactures would very probably increase, though trades-unions were not entirely responsible for that. One of those was that rents, taxes, and outgoings were less in those countries where iron, for instance, was produced, and steel and iron manufactures put together, than they were here. That meant a great deal in the course of a year. In this country the manufacturer was taxed with very high outgoings and many ways the cost of production was increased as well as the cost of labour. Again, with foreign joinery, a great deal of stuff went otherwise go to waste was crined into mouldings and different portions of raw material, though it was as manufactured goods. All that did away with waste. Still the cheap foreign article was the result of cheaper labour as compared with British labour. He read with what had been said about apprenticeship, and he thought workmen themselves were beginning to see the folly of their ways. He had found it much easier recently to get apprentices than it was a few years ago. During the time of good trade, when work was plentiful and men scarce, inferior men, so-called mechanics (really men who had never properly handled a tool) were forced into the ranks of the mechanics and the contractor had to help for it, for the work had to be done and he could not. He was sorry that the trades-unions, though professing to have none of the good mechanics in their ranks, did not see that that rule was carried out, for whatever the unions might say, they could not supply all good workmen. He was amused by Mr. Blashill's remarks about having had access to some of the trades-unions' books of rules, &c., and Mr. Blashill's view that there was little to complain of in those rules. He (the speaker) read some of those rules, and he saw nothing to complain of; but it was not the written, but the unwritten, rule that he complained of—the rule that marked a man if he was more than a certain amount of work. One of the things of such rules, nor of the rule that a workman should dictate what sort of work belonged to him; but those unwritten rules existed among the men, and were carried out very loyally. The result was serious for the country, for it greatly enhanced the cost of building, and superior workmen were held back from getting the position they ought to get, simply because the standard of work was brought down to the meanest capacity instead of being raised to the highest capacity.

Mr. H. R. Taylor, L.C.C., said, as a workman himself, he was very much concerned about one or two of the labour points raised in Mr. Blashill's excellent paper and in the speeches he had already heard. Mr. Blashill had mentioned the old-time method of getting out masons' work, and had referred to excellent character of the work. He quite agreed with that, for he had seen some of that work himself, but what it showed was that they were given more time in those days and had better selection of materials than they had at present time. Moreover, men in those days mended and finished their work, and, contently, took more pride in it than did men who had to finish half-a-dozen other men's work in a given time. Then, as to the complaint of the joiner mentioned in the paper

against the builder-employer, who rushed about in a carriage in order to look after works, any man of intelligence would scout that as an argument in favour of doing less work. A workman of any common sense would realise that as possible. Still, the workmen of to-day read what they did not read thirty or forty years ago, and some of them studied statistics, Board of Trade returns, and reports; and they were beginning to understand that the wealth of the country was accumulating far more quickly than the population, and at a far greater rate than the increase in wages. The wealth of the country had doubled within the last twenty-five years, and the population had doubled in fifty years, and he was quite sure that wages had not doubled in twenty-five years. These were points which had to be reckoned with, and it was this that was in the minds of the class he represented. Mr. Blashill had said that short hours and light work seemed to have been traditional in some offices of the past—and the present, he (the speaker) would add. As to the rise in the cost of brickwork, Mr. Blashill quoted from Mr., now Lord, Brassey's paper before the Institute of Architects in 1878. The fact that work estimated to cost 21. 17s. or 31. 3s. per rod actually cost 51. was all very well on the face of it, but one had to consider the conditions under which the work was done. In all probability the work which had previously been carried out for 21. 10s. was a straightforward job, which made a great deal of difference. A great deal of the increased cost of work was due to a want of management, a want of organisation on the part of the builders' representatives themselves. Another point mentioned in the paper was that the unions did not allow piecework, with the object, it was said, of obtaining the largest amount of pay for the least number of hours worked. That was the result of the inevitable swing of the pendulum. He remembered when one or two men were paid an extra halfpenny or penny an hour to rush the work along, and the policy adopted by the employers in those days to get as much work for as little wages as possible had had its result in this reaction. He would not defend loitering, malingering, or idling, and he said that when employers were prepared to pay a standard rate of wages agreed upon by the trades-unions, every workman ought to be prepared to do a fair day's work. Among every intelligent and sensible body of workmen the loafer or idler was treated with supreme contempt—ignored, boycotted; and when various speakers said that there was an unwritten law in the trades-unions that only a certain amount of work should be done, he challenged the statement, because nothing of the kind had ever occurred with the knowledge of the unions. If any one could bring a case of the kind before any union he was quite sure the unions would deal with the man or men. [A voice: Are you speaking of work in the shop or on the building?] Of work on the building. As to adopting the principle adopted by the Chicago plumbers, he strongly objected to it, and he believed the majority of them would object too. That system would encourage the old tendency to scamp work, which, they had practically settled, they would not put their hands to under any consideration. If the Chicago system were instituted here, he was convinced it would militate against the best interests of the employers and the public. As to the sub-division of labour and the disputes about the demarcation of trades, he said (and he had often got into trouble for saying it, though that did not matter) it was not the business of the unions to decide what was this man's work and the other man's work. That was his own opinion and not the opinion of the unions. So long as men were working under one set of conditions and in receipt of the same rate of wages, it was the employer's business to decide what man should do this work and what men the other work; and if he were working on a job he would not mind if the builder put a carpenter to lay bricks and a bricklayer to hang the doors, for the builder would soon find out his mistake. He thought that such disputes would in time fritter out, and the time was not far distant. As to strikes and lock-outs, he agreed with Mr. Chatfield Clarke that the trades-unions and employers should pull together. He had always condemned strikes and lock-outs under any circumstances, and he believed if the unions and the employers could meet oftener, much good would be done. There was good reason

why, as mentioned by Mr. Randall, cement, steel, and glass were being sent over here by foreign firms. It was not because the British workman wanted higher wages, because a deputation consisting of ironmasters and employers in the metal industries, went over to Germany and Austria, and found that the workmen were getting higher wages, and were working under better conditions than the men employed in the same industries in this country. As to sub-contracting, he was convinced that if there were any attempt made to reintroduce the practice of sub-letting, so far as labour was concerned, it would lead to considerable difficulties with workmen and their employers. He agreed that the apprenticeship system should be reintroduced as far as possible, and he was convinced that if the masters would meet the unions on the subject it could very soon be satisfactorily settled. It was far better than the present system, which made it possible for young fellows to get on the field with a speculative builder and then endeavour to get on to a contract job and so into the trade. It was asked what advantage it had been to the workman to get increased wages, for the workman of to-day seemed the same, or not so good, as the workman of twenty-five years ago. Let them fairly compare the workman of to-day with the workman of the past, and they would see a great difference in favour of the modern man, and he hoped the men would go on improving in the same way. One speaker had referred to the number of men he saw loitering about on Mondays. No doubt those men ought to have been at work, but who knew but what they had been stopped on Saturday and were out looking for work on the Monday? There was very little of St. Monday now as compared with twenty years ago. Mr. Bartlett had said that the amount of work men did was regulated by what the slowest worker on the job did. That was not his (the speaker's) experience, though it might be so in some cases, and where true it did not reflect on the workmen as a whole; a few instances ought not to be taken as an indication of a common practice. It had always been the practice when he had been working for the younger men to do more than their share of the work where there were old men, so that the old men might keep up with the work. Much as the workman might be complained of, it must not be forgotten that he was just what the employers—the general public and the architects, the conditions, training, and education—made him, and those who were so ready to slate the workmen were generally those who had done nothing to raise him to the position it was said he ought not to be in. If the employer and workman could come together more frequently and discuss questions at issue, they would get on a great deal better and make more progress.

Mr. W. Woodward said he was amazed at Mr. Taylor's speech. Mr. Taylor had traversed the statement that there was no limitation of output by workmen, and that so astounded him that he must ask: Did Mr. Taylor state positively, as his honest conviction, that there was no unwritten law whatever in reference to the number of bricks a bricklayer should lay per day?

Mr. Taylor: Yes; I am quite certain of that.

Mr. Woodward, continuing, said he was astounded. He had heard the complaint from more than one builder, and he understood that some of the men, when spoken to on the subject, said:—"Well, you see; I am not allowed to lay more than about 470 bricks a day, and if I do, it will be made very warm for me and I shall not be allowed to lay bricks to-morrow." Mr. Taylor's remarks were contrary to one's experience. All that was asked for was a fair day's work for a fair day's wage, and what had the increased wealth of the people being out of proportion to increased wages of the workman to do with that? It was all a matter of contract—so much wage for so much work. It was the same with an architect, or any one else. An architect did not grumble at his remuneration because the client was making his thousands and he was only making his tens. If the percentage he was paid was not enough, he told the client so, and could decline to do the work unless he got higher remuneration. As to loitering on the job, he was equally astounded at Mr. Taylor's remarks, for the practice was so common—at all events while trade was brisk; the men practically said, "You cannot do without

us." Now, however, that trade was waning, the men were being brought to their senses, and would, no doubt, in time do what was expected of them under a contract. In regard to the question of which trade should do certain work, it was a question of considerable importance. A stone template was required to be laid the other day, and the bricklayer was not allowed to lay it, and the mason had to be taken from his work some distance off to come and put the template in its place, and then the bricklayer went on. Mr. Taylor minimised this, but such things were constantly going on, and while they did there would be a want of sympathy with the workman to the detriment of architects, builders, and employers. Take the question of workmen's dwellings. Why was it that they could not be built to give a profit to the man who built? Not the enhanced price of materials, but the organised idleness of the workmen. The facts they had heard that evening about foreign competition ought to bring the men to their senses, for trouble was bound to arise when the trade had left the country and men were idle of necessity. The other day the bricklayers struck on one of his works because a drunken bricklayer was not allowed to come on to the work. Fortunately, he was able to get other bricklayers from the country and the work proceeded; but just think of the facts! An accident to the drunken bricklayer might have cost the builder 150*l.* under the Workmen's Compensation Act. Surely all this ought to engage the attention of all serious-minded men.

The chairman said there were still several other gentlemen who desired to speak, but at that late hour the discussion would have to be adjourned until that day fortnight, March 25. The meeting then terminated.

Country Meeting at Southampton.

It has been decided, on the invitation of the Hampshire, Dorset, and South Wilts Provincial Committee, to hold the next Country Meeting at Southampton, on May 30 and 31. The first day will be devoted to Papers and Discussions, with a Dinner in the evening; the second day to Excursions to various places of interest in Southampton and its neighbourhood.

ANCIENT BUILDINGS.

At the Carpenters' Hall on Thursday evening last week, Mr. John Slater delivered a lecture upon "Ancient Buildings." The chair was taken by Mr. C. Bird, the master of the "Elers' and Bricklayers' Company, and the lecture was illustrated by lime-light views. Mr. Slater took his hearers along the pathway of time to a very remote period. He said that the ancient inhabitants of the world, after vacating caves, built themselves structures of wood, the roofs being composed of trunks of trees. These structures had later been imitated in stone dwellings, particularly in regard to the roofs, a representation of the trunks being carved in stone. He dealt first with the buildings of the Egyptians, commencing from 3,000 B.C. He remarked that stone was almost exclusively used in this part of the world, and he showed photographs of the pyramids. The Egyptians built for eternity, and their structures which remained created wonder by their solidity and massiveness. He showed a section of the pyramid of Cheops, and explained how the tomb was placed in the centre and the main passage blocked up with stone, so that the body should not be disturbed for 3,000 years. The tomb of Beni Hassan, erected 2,500 B.C., was also illustrated, and he pointed out that this was a prototype of the Greek Doric order. He next referred to the temple of Karnac at Thebes with its 134 columns, and to the temple of Isis, Philæ, which he considered was lighted by means of openings in the top of the walls. In Asia there was a different race of ancients and different materials. There was no building stone at hand and the early structures were made of sun-dried bricks, but notwithstanding this some most important discoveries had been made in recent years, by means of excavations. The discoveries at Ninevah by Sir Henry Layard, Sir William Rawlinson, and others showed that the buildings were composed of different stones placed unsymmetrically and each coloured differently. The palace of Khorsabad was a remarkable structure and must have been ablaze with rich colour, as the people of

this time were adept in the manufacture of glazed tiles and used them extensively. On each of the steps leading to the palace there was a figure of a man exceedingly quaint and mythical. Some remains of beautiful structures in Persia had also been excavated, and the lecturer showed a picture of the ruins of the Palace of Persepolis, with its columns higher than those of the Parthenon. There were as many as from thirty to forty flutings in each column. In conclusion he said that it was quite certain that there were many ancient buildings still buried beneath the dust of the desert, beneath more modern dwellings, or covered by the encroaching sea. Discoveries were still being made, and in Crete, for example, a palace had recently been unearthed, which was of the greatest possible interest. Some ancient buildings had also been discovered in Mashonaland, and over the whole face of Egypt enthusiasts had come upon relics of remote civilisation, and seen that in skill and knowledge of building the ancients were giants in those days.

The chairman moved a vote of thanks to the lecturer, and remarked that the modern builder, unlike the ancient Egyptians, did not build for eternity.

The vote was then carried.

ARCHITECTS' BENEVOLENT SOCIETY.

The annual general meeting of the subscribers and donors of this Society was held on Wednesday in the rooms of the Royal Institute of British Architects, No. 9, Conduit-street, W., Mr. William Emerson, President, presiding.

The minutes of last meeting having been read and confirmed, the following report of the council was read:—

"The council of the Architects' Benevolent Society, in making their report to the contributors for the year of office 1900-1901, have the satisfaction to state that, notwithstanding the many calls upon private benevolence during the period under review, the income has not only been maintained, but increased. Although the society has suffered severely during the last few years by the death of many of its oldest and most generous supporters, its income, through the careful management of successive councils, has not been permitted to diminish; but, on the other hand, the financial progress has scarcely kept pace with the demands on the charity of the society. Last year it was thought that the society's growing needs might be met by the generous response which an explanation of its aims and position would receive at a public dinner; but, in view of the state of public affairs at the time, the project was deferred to a more favourable opportunity. Still, as a special effort was necessary to enable the council to carry on their philanthropic work without rejecting the claims of deserving applicants for relief, the president, with the honorary secretary, undertook to issue a letter of appeal to the members of the profession in the United Kingdom and Ireland, and such a letter was sent out in June last. In view of the large number—some 5,000 architects—to whom the appeal was made, the result was scarcely as favourable as might have been anticipated, but it was successful in so far that it enabled the council to afford a larger measure of practical help where it was urgently needed than would otherwise have been possible. . . . the amount received, or promised, in new annual subscriptions being 98*l.* 9*s.* 6*d.*, and in donations 151*l.* 17*s.*, while the total cost of issuing the appeal was 38*l.* 8*s.* 8*d.*

In connexion with the appeal the Council wish to express their cordial appreciation of the efforts of Mr. E. Monson, who successfully exercised his influence in securing additional subscriptions and donations. Suggestions have from time to time been received by the Council to the effect that the Society would be more liberally supported if its existence and objects were more widely known; but the Council fear that any further promulgation of the Society's aims than at present attempted would place it under a burden of expense without a prospect of adequate return. . . . The Council, at the suggestion of a subscriber, have had also under consideration the desirability of issuing voting papers to members of the Society, and have arrived at the decision that such a system, instead of advancing the objects of the Society, would be a contravention of By-law 68, which states "that the names of persons relieved by the Society shall not be published."

With reference to the society's income account, the Council desire to draw attention to the fact, notwithstanding that the amount received in subscriptions for the year was 522*l.* 0*s.* 6*d.*, as compared with 469*l.* 3*s.* received in 1899, there was a balance at the debit of the account on December 31 of 42*l.* 11*s.* 11*d.* It is the first time in the history of

the society that such a deficiency has occurred, and it is due to the large number of urgent applications for assistance which were considered and relieved. This bears eloquent testimony to the great need of the society for further support. It is hoped that the deficit may be promptly covered by the acquisition of a sufficient number of new annual subscribers.

The number of applications for relief has been greater than in any previous year, being fifty-five as compared with forty in 1899. The sum thus distributed was 677*l.* 13*s.*, while 112*l.* 10*s.* was paid to pensioners, making the total sum expended in relief 790*l.* 3*s.* Two of the Society's pensioners having died during the year, their places were filled by eligible and deserving applicants.

The Council have to record, with great regret, the decease of two distinguished architects who acted as trustees for the Society—Mr. Charles Barry and Mr. Henry Currey. Both gentlemen had taken lifelong interest in the Society, were frequent elected members of the Council, and were always helpful in promoting its usefulness. Other more recent losses were Mr. H. C. Boyes, a member of the Council at the time of his decease, and Mr. D. P. Fordham.

Mr. William Emerson, President of the Royal Institute of British Architects, and Mr. Arthur Cates have been nominated by the Council in election as trustees, to fill the vacancies caused by the death of Mr. Barry and Mr. Currey.

The following gentlemen, being the five members, retire by rotation from the Council: Mr. R. St. A. Rouveret, Mr. W. Woodward, Mr. E. E. Anson, Mr. E. H. Martineau, and Mr. E. T. H. To fill these vacancies and that caused by the death of Mr. Boyes, the council beg to nominate: Mr. Arthur Green, Mr. E. Monson, Mr. Sydney Smirke, Mr. H. L. Florence, Mr. Graham C. Awd, Mr. J. T. Christopher, and Mr. G. H. Fellows Prynn.

The balance-sheet and income account for year ended December 31, 1900, audited by Mr. J. T. Christopher and Mr. Henry Hall, are herewith submitted.

It remains for the Council to thank the Royal Institute of British Architects for office and for accommodation, and its officials for help and courtesy in any matter connected with the Society."

The Chairman, in moving the adoption of the report and balance-sheet, said the Society had existed for fifty-one years, and he did not think it said much for the profession (although it was true it was not a very lucrative profession) that their capital account and annual income were not greater. There were 111 members of the Institute of Architects, 25 out of that number there were only 245 who were donors or subscribers to this Society last year the Society sent out 5,000 letters appeal to architects, and they only had ninety-one in response. This was the only Society that existed to help unfortunate members of the profession, and during its existence had not been able to acquire more than 10,000 of capital. Last year Mr. Arthur Cates shows how inadequate were the subscriptions and donations to the Society from the profession generally; at the same time the Society was grateful to those who had helped them. He felt he must echo Mr. Cates' eloquent appeal for more support—not only from members of the profession, but also from the outside public, for in a sense the public benefited by the work of architects, and there were no doubt many who, if their attention were directed to the needs of the Society, might be disposed to help. But, of course, most of the help should come from members of the profession, and the members of the Institute were to subscribe only one shilling each it would be in double the 42*l.* of debt at the end of last year. It was certainly not for want of a knowledge of the facts, more help was not afforded by the profession and it must be in consequence of an inter-relationship of the unfortunate members of the profession or of a want of *esprit de corps*. If number of applicants went on increasing, funds would be insufficient to deal with cases. That afternoon the council had with eleven cases, and in one or two of them it was impossible to give more than very small sums; more money was needed if the number of applicants went on. He really thought next year some steps should be taken to have a public dinner in order to make the Society better known.

Mr. Macvicar Anderson said he was appointed at the result of Mr. Cates' appeal but he did not think an appeal to the public would do much good. Still, he thought it ought to do more to increase the funds of the Society, and he should be glad to give 50*l.* to cancel the debt; and he would be still pleased to make it 100*l.*, provided nine out

by the end of the year, would give a similar sum, or about twenty others 50*l.* each, so as to add 1,000*l.* to the capital.

The Chairman said he was sure they would all desire to pass a vote of thanks to Mr. Macvicar Anderson for his generous offer; he hoped that the full sum would be obtained by the end of the year.

Mr. Zeph. King seconded the vote of thanks, which was cordially agreed to.

A vote of thanks to the retiring council having been agreed to, Mr. Anderson moved that the following council for the ensuing year of office be elected: President, the President of the Royal Institute of British Architects; Messrs. T. M. Rickman, R. A. Biggs, Arthur Cates, E. A. Gruning, G. T. Hine, Zeph. King, G. Inskip, J. T. Wimpey, Arthur Green, E. Monson, Sydney Smirke, H. L. Florence, Graham C. Awdry, J. T. Christopher, and G. H. Fellowes Pryne.

This having been agreed to, Mr. W. Hilton Nash, hon. treasurer, moved that Mr. William Emerson and Mr. Arthur Cates be elected trustees. He added that Mr. Charles Morrison, an hon. Fellow of the Institute, had just made a donation of roof to the funds of the Society, for which they were very much obliged.

The motion was seconded by Mr. Percivall Currey, hon. sec., and agreed to.

Votes of thanks were then passed to the Hon. Treasurer and Hon. Secretary, and those gentlemen were also re-elected for the ensuing year.

Messrs. J. T. Christopher and Henry Hall were thanked for their services as auditors during the past year, and were also re-elected.

On the motion of Mr. H. L. Florence, seconded by Mr. King, a vote of thanks was passed to the Institute for the use of the rooms and for other assistance.

A vote of thanks was then accorded to the Chairman, who, in reply, said he would be one of the twenty subscribers of 50*l.* if the other sums could be obtained.

The proceedings then terminated.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—A lecture was delivered on the 4th inst. before the members of the Leeds and Yorkshire Architectural Society, at the Park-street Rooms, by Mr. Geoffrey Lucas, on the subject of "Logical Building and its Influence on Design." Mr. W. Carby Hall presided. The lecturer declared that the bulk of modern building did not express the deep underlying tendencies of present-day humanity in the same sense that architecture had incorporated such ideas, sympathy, and feelings in the past. Present aims seemed small and commonplace. Of course, good buildings were produced now-a-days, but the great architectural achievements of the lately closed century were almost entirely of a scholarly and archaeological order. Architecture was surely one of the great arts. It was, too, a science, and a progressive one. It demanded a thorough union of construction and adornment. Picturesqueness was a side issue. Buildings had been ostentatiously adorned. That, however, was illogical. What they would like to say of a building was that it was simple and an honest endeavour to meet the requirements involved. Replicas were too common. Truro Cathedral and the Houses of Parliament were not without their grandeur, but they hardly appeared to be in touch with the age. New Scotland-yard, on the other hand, was a vigorous and simple piece of modern work, well suited to the purposes in view. One of the best examples of modern logical building was the new Romanist Church of Westminster, which they might regard as marking the keynote of further progress. The complex conditions under which architects had now to work, the lecturer feared, told against advance. The withdrawal of the architect from personal contact with his work also handicapped him in comparison with his fellow-artificers of old. All details had now to be settled beforehand, and the competition system was another force acting adversely upon architecture as a progressive science. On the other hand, there were not a few advantages pertaining to the architects of the present time. They had the aid of photography, and possessed materials that the ancients could not command. Labour, again, was as plentiful as formerly. If they would advance, it must be on logical lines, purifying architecture of its "Billingsgate,"

and aiming solely at that which appeared true and essential.

ARCHITECTURAL ASSOCIATION OF IRELAND.—A meeting of the Architectural Association of Ireland was held on the 5th inst. in the Grosvenor Hotel, Westland Row, Dublin: Mr. F. Batchelor, President, in the chair. Mr. John Good, Hon. Sec. of the Master Builders' Association, delivered an address on "Some Aspects of the Labour Question as applied to the Building Industry." He said they had doubtless noticed that for many months past newspapers and magazines had been full of accounts of the rapid progress which characterised the century just ended; but while the sum of that progress was vast, yet as compared with other nations we found that we had not improved as rapidly as they had. Not only so, but we had been outstepped by our rivals, and we were no longer the centre of the great world of commerce. What was the remedy for all this, where was the deficiency? We must educate more thoroughly and more efficiently the mechanic who produced the work, as what the public wanted was a good article produced at the cheapest rate, and the nation that met these conditions best would get the trade. The building industry in Dublin was a large one, comprising upwards of 7,000 hands. It was generally recruited from apprentices, indentured and unindentured, for improvers. The indentured apprentice system—a very ancient one—had been found to yield the best results, although it was capable of immense improvement, both in instruction, inspection, and examination. The conditions of apprenticeship varied considerably in the different trades. In the carpenters and joiners' trade the apprentices were principally bound to the employers, and there was no limit to numbers. However, the percentage of apprentices and improvers here was too small, being 22.8 per cent., instead of 33.33. In the second largest skilled branch of the building industry—the stone and bricklayers—the apprentices must be the sons of a member of the trade; but under some circumstances the rule was relaxed on the payment of a 30*l.* fee. One would scarcely have thought that this hereditary or "caste" system could exist in these enlightened days. There were only 3.2 per cent. of apprentices in this trade, and 1 per cent. of improvers—less than one apprentice and improver to every twenty-four men, instead of one to three or four. —the necessary number to keep the trade in a healthy and efficient state. In the plastering trade, where the "caste" system in regard to apprentices also prevailed, and no improvers were allowed, there were 23 per cent. of apprentices, or 8.33 per cent. below the necessary number. In the stonecutting trade, in which, except under extreme circumstances, the "caste" system also prevailed, the percentage of apprentices was 19. In other words, in the entire trade there were 1775 on an average of apprentices, as against the necessary 3333 per cent.—an appalling deficiency of 600 being the result. Thus sufficient men were not being trained to fill the gaps in the ranks, tradesmen were coming from other places to fill the positions, and thousands of able, but unskilled, hands were forced to seek a living elsewhere. The speaker, having pointed out the necessity of a sound theoretical training and practical instruction in those trades in which there were no standards at present, said that this work of technical instruction should be in the hands of a public or Government department, and he trusted the present system would soon be amended through the exertions of the new Department of Technical Instruction, for which they owed a deep debt of gratitude to Mr. Horace Plunkett.—In the course of the discussion which followed, Mr. Beckett said that although Irishmen talked a good deal of republicanism Irish tradesmen were the most conservative people in the world perhaps, and the attempt to confine certain trades to families was doubtless only equalled by the "caste" system in India.

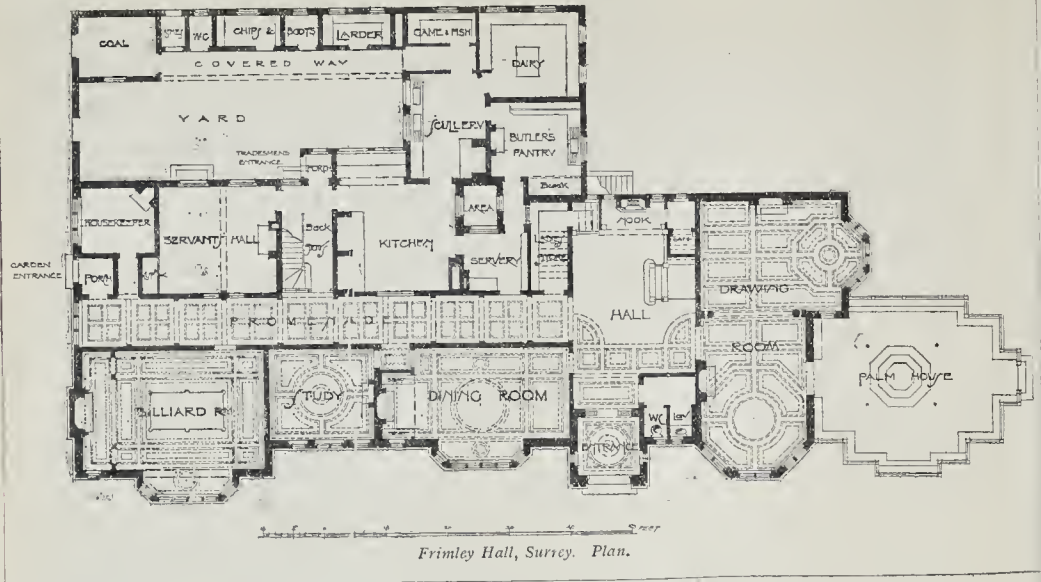

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.—The usual meeting of this Society was held on the 8th inst., Mr. Isaac Low, jun., presiding, when papers by Mr. Jas. McKissack and Mr. Jas. Lochhead were read on the subject of "Planning of Tenements for the Labouring Classes." Mr. McKissack confined his remarks to tenements constructed on the "common close" system, with reference to the arrangement of two-roomed and single apartment houses on the most sanitary and economic principles. The lecturer advocated

the desirability of providing a separate water-closet to each house, and showed suggested plans of such arrangements. Mr. Lochhead's paper dealt with that type of dwelling in which entrance is gained from a balcony at each flat, with common stair placed either outside or within. In planning on the "balcony" system the following points were to be considered:—The staircase should be placed outside preferably, and no bedrooms should overlook the balcony, the scullery or water-closet being placed adjacent to this. The site would require to be fairly level in order that the level balcony might serve a sufficient stretch of building.

ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—A general meeting was held on the 6th inst., Sir Henry H. Howorth, President, in the chair. The President submitted to the meeting an address of condolence to his Majesty the King on the death of the late Queen, and of congratulations on his Majesty's accession to the Throne, which was approved.—Mr. C. E. Keyser, F.S.A., described with the aid of lantern slides about 160 examples of sculptured tympana of the Norman doorways of our English churches. There were also exhibited nearly 200 bromide enlargements arranged on the walls and screens round the room. He stated that his object was to take his audience to see as many examples as possible of his subject, and not to enter on a general argument as to the origin of these sculptures or the craftsmen by whom they were executed. He therefore merely gave the name of each example as it appeared on the screen, with a brief explanation of some of the more obscure subjects represented, pointing out two or three groups which had been severally executed in the same workshop. The chief subjects represented were as follows:—Architectural ornament; crosses of various forms, either singly or in groups; trees or foliage, sometimes with animals; the Tree of Life (typifying the Cross) alone or flanked by animals; the Agnus Dei, alone or worshipped by animals; Sagittarius and Leo; St. Michael and the Dragon; St. George at Antioch; the Legend of St. Margaret; Christ with SS. Peter and Paul; the Majesty with Evangelistic symbols; the Majesty borne by angels, typifying the Ascension; the entry into Jerusalem.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—A meeting was held on March 6, Dr. W. de Gray Birch, F.S.A., presiding, when the following exhibits were submitted: Some pewter plates of about the middle of the eighteenth century, having an unusual pattern and bearing the maker's marks (spackman's) upon them. The coat-of-arms resembles that of Castile, and probably represents the institution or company to which the plates belonged. These were exhibited by Mrs. Collier. Mr. T. S. Bush exhibited a photograph of a curious circular wooden money chest or box, now belonging to St. Peter's Church, Bristol. The box is 6.4 in. in diameter outside, and 5 in. inside, and is 6.8 in. high to the top of the cover, which is raised or pie shaped. The box is bound with iron, hinged at the back, and has a strap over the cover, with a top plate and ring; the strap is hinged at the front and carried down to bottom band, forming a hasp over the lock plate, which has three keyholes, one on each side of the strap or hasp and one at the bottom smaller than the other two. There is no slit in the top for dropping in coins, and the box was most probably used for keeping money previously collected. The three locks being for the incumbent and the two churchwardens, and the box could not be opened except in the presence of all three. It is said by some people that this curious relic belonged to the Mint at Bristol, which adjoined the church, and existed from 1643 to 1698. The box, however, would seem to belong to the second half of the sixteenth century.—A paper was read by the Rev. H. J. Dukinfield Astley, M.A., hon. editorial secretary, upon "A Ramble Round Thetford," a quaint and fascinating old Norfolk town, or perhaps it should be called "city," for it was once an Episcopal See. An air of unmistakable antiquity seems to pervade the place, as one wanders through the narrow, winding ways and notices the many remains of ancient religious buildings now, alas! demolished, but still bearing evidence in their scattered fragments built up in modern dwellings of the importance of the town in olden times. In the sixteenth century, Thet-

Frimley Hall, Surrey. Plan.

ford possessed twenty churches, besides other religious buildings. Thetford is partly in Norfolk and partly in Suffolk, being situated at the confluence of the little Ouse and the Thet. The Local Authorities of to-day do not appear to possess much regard for the antiquities of their historic town, as in spite of protests, they have recently pulled down the old Guildhall. Thetford has a very ancient history, going far back into the dim and misty past when the devious and winding ways leading down to the riverside were cut through the primeval forest by the old Cuskanian or Iberian hunters of Neolithic days. In later times the powerful and warlike Iceni settled there, and when the Romans came and acquired the Iceni realm they found the place pleasant to look upon, as it is to-day, and there they built a town, generally supposed to have been that known as Sitomagus, an important station thirty-one miles from Venta Icenorum, now Caistor by Norwich, on the direct line of the Ick-nield Way to London—as Antonine Itinerary describes it. The Roman remains as yet discovered at Thetford have been neither numerous nor important, though there is little doubt as to the identification of the site of the Roman town. The tradition of many an ancient battle fought between the Romans, Britons, and Anglians, and afterwards between the Anglians and Danes, still lingers in the rustic mind. The great mound at Thetford, known as the Castle Hill, is said to have been thrown up by the Danes, whose occupation of Thetford was confirmed by Alfred in his treaty with Guthrum, and Thetford became so thoroughly Danish that it is noted as one of those places which never paid Danegeld. It was in the reign of William the Conqueror that Thetford became for a brief period a Bishop's See, and in 1091 the great East Anglian church builder, Hubert de Losing, succeeded as third bishop. He did not, however, long remain at Thetford, as in 1094 he removed the See to Norwich.—In the discussion which followed the paper, Mr. Gould remarked that the tradition assigning the erection of the Great Mound to the Danes is very probably correct, but these mound and court forts were erected by Saxons, Danes, and Normans, and belong to the ninth, tenth, and eleventh centuries. Mr. Compton, referring to Thetford as the site of Sitomagus, considered that undoubtedly Thetford was the site of a Roman station, but he thought that neither Thetford nor Woolpit occupy the site of Sitomagus, but that it is to be sought somewhere else in the neighbourhood. The chairman considered the paper an admirable illustration of the use to be made of archaeological research during a day's outing in the country. Mr. Astley, in replying, mentioned as an undoubted proof of the post-Roman (to say no more) date of the mound and

court forts, the fact that the castle-mound at Norwich, which tradition also ascribes to the Danes, stands right on the track of the Roman road from Caistor to Brancaster, as was ascertained during the course of some recent excavations, when the Roman road was discovered running right across the centre of the mound. A plan of Thetford Priory, several early editions of antiquarian works of the seventeenth and eighteenth centuries, and a fine series of drawings of the old halls and manor-houses of Norfolk, by the late Mr. E. P. Willin, illustrated the paper.

Illustrations.

COMPETITION DESIGN FOR ROYAL INFIRMARY, GLASGOW.

THIS design is the joint production of Messrs. Malcolm Stark and Fred Rowntree, of Great College-street, Westminster, and was submitted in the recent limited competition of London, Glasgow, and Edinburgh architects. The plans show accommodation for 647 beds, with all the usual accessories. The estimated cost was 254,000l.

FRIMLEY HALL, SURREY.

WE give a view and plan of this residence, which was built in 1895 from the plans and under the superintendence of Mr. Huon A. Matear, architect, of Liverpool; Messrs Hughes & Stirling of London and Liverpool, being the principal contractors.

The internal fittings, staircase, and panelling were executed by Messrs. Waring, Gillow, & Co., who also carried out the decoration.

The house is built with Bath stone in quoins, mullions, heads, sills, and string courses, filled in with cement, and dashed with Oporto pebbles. The roof is covered with Ruabon tiles. The floors to all the principal bedrooms and entertaining rooms are of oak.

The principal feature in the house is the staircase and hall, which is carried up two floors, and is entirely of oak.

DESIGNS FOR TEXTILES AND WALL PAPERS.

THESE illustrations are reproduced from designs by Mr. C. H. B. Quennell, architect. Of the textiles, No. 1 is a broadcated tapestry, part in silk and part wool; No. 2, a tapestry wholly in wool. Both are woven by Messrs. Alex. Morton & Co.

Of the wall papers, No. 1 is printed by Messrs. Jeffrey & Co.; No. 2 is a design not yet produced; No. 3 is printed by Messrs. Jeffrey & Co.; and No. 4 by Messrs. Sanderson & Co., of Chiswick.

COMPETITIONS.

STOCKPORT WORKHOUSE INFIRMARY.—At a special meeting of the Board of Guardians of the Stockport Union, held on the 4th inst. at Shaw Heath Workhouse, the award of Mr. Thomas Worthington, F.R.I.B.A., the assessor appointed to adjudge the competitive plans for a workhouse infirmary proposed to be erected at Stepping Hill, was opened. There had been seventeen sets of plans sent in. The competing architects had been informed that the site proposed to be utilised is about 9½ acres; the number of patients to be provided for about 300—males 150, females and children 150; the buildings to be arranged to allow for extension of accommodation when required up to 500 beds; and a separate block for thirty nurses. The Guardians offered three premiums of 1500l., 1000l., and 500l. respectively for the most suitable plans. The assessor has awarded these premiums as follows:—(1) Messrs. Giles, Gough, & Trollope, 28, Craven-street, Charing Cross, London; (2) Mr. H. Percy Adams, Woburn-place, Russell-square, London; (3) Mr. Charles W. Hardy, Rodney-street, Liverpool. All the plans are to be publicly exhibited before anything further is done in the matter.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting on Tuesday, March 12, Mr. James Mansergh, President, in the chair, the paper read was "The Aesthetic Treatment of Bridge Structures," by Mr. Joseph Husband, Assoc.M. Inst.C.E. This paper was devoted to the consideration of the aesthetic appearance of bridge structures in general, as resulting from various methods of treatment in design. The opening portion had reference to some fundamental laws of aesthetics which it was desirable to observe in general design, at the same time pointing out the connexion between aesthetic and economic treatment. The effects on aesthetic appearance of the necessity for rapid construction, choice of material, difficulties of site and magnitude of structure were noticed, together with the importance of making allowance for these in criticising completed works. Adverse criticism was shown to be frequently due to comparison with wrong or unsuitable standards, especially in the case of very large structures. The strong connexion between true economy and aesthetics, as evidenced by natural examples, was next mentioned, and the relation of these to artificial structures was considered. General requirements, such as simplicity in design, proper employment of materials, and choice of the most pleasing outline where option existed between two or more economical schemes, were noted, as well as the inadvisability

bility of attempting to lay down rules for regulating aesthetic design. Some cases existed in which external ornament might be appropriately employed with economy, whilst many others were totally unsuited for such treatment and suffered dereliction if it were allowed; and again, abuse of ornament led to aesthetic failure. Bridge structures in general were, for convenience of consideration, divided into three distinct classes—those built entirely of masonry, those constructed entirely of metal, and those in which masonry and metal both figured. These broadly corresponded to works of small span, large span, and intermediate span respectively. The strong relation between masonry types and architecture was noticed, and the various features of the masonry bridge were considered in detail. The effect on the general appearance of different modes of treatment as applied to the arch-ring, spandrels, piers, abutments, and parapet, was commented on, and several instances were cited in which the observance of the primary laws of aesthetics improved the design without militating against economy. Criticism of masonry structures almost invariably reverted to comparison with architectural standards, often an unfair procedure. Several existing structures were referred to in illustration of the points considered. The second class of structures, consisting of bridges constructed entirely of steel or iron, was subdivided into representative types, each one being considered separately. Emphasis was laid on the necessity of employing a totally different standard of comparison in estimating the aesthetic value of such works, adverse criticism being frequently due to the neglect of this requirement. True aesthetic effect in these structures was due in a much greater degree to a correct observance of the simple and economical design, and the adoption of the most pleasing outline consistent with the conditions, the use of applied ornament being almost aesthetically impossible and economically harmful. Several examples of cantilever, suspension, and arch bridges were referred to and illustrated, as well as lofty viaducts carried on metal piers. The various features each as affecting aesthetic appearance were noticed and cases were instanced in which special difficulties in the way of construction did not prohibit the employment of a pleasing outline, whilst economy in design had been preserved. The most recent examples of large bridge structures were cited wherever possible in demonstration of the points at issue. In dealing with the large-span arch, distinct varieties of outline were illustrated, and the relative merits of each were discussed from an aesthetic point of view. A short notice was devoted to the use of more or less lattice masonry towers in connexion with the steel arch bridge. In the third class of structures were considered large-span bridges employing masonry piers of such magnitude as to exert a considerable effect on their aesthetic appearance, the most successful examples being those from which architectural ornament had been strictly excluded, and in which simple but massive treatment had been employed in harmony with the dimensions of superstructure. In this section were also noted the various types of girder bridges of smaller span, many of which, although possessing little claim to aesthetic value, might yet be deemed more pleasing in appearance by careful attention to several salient features in their design. The paper concluded with a brief notice of the employment of cast-iron ornament in bridge structures, examples being quoted in which its application might be desirable, and others in which, by militating against economy, the fundamental principles of aesthetics were also violated. Instances of its eminently successful application were mentioned, and illustrations were supplied showing the comparative aesthetic effects of the use of cast-iron and steel structural work. The paper was accompanied by forty-seven illustrations and an appendix giving the leading particulars of all important bridges illustrated.

THE INSTITUTION OF JUNIOR ENGINEERS.—The third lecture of the course on "Works Management" was delivered by Mr. A. H. Cooper at the Westminster Palace Hotel on March 7, the Chairman, Mr. Percival Marshall, presiding. Further consideration was given to questions relating to the foundry, including the use of appliances, sand-mixing, compressed air, and hydraulic installations, moulding machines, dressing devices, best relative positions of the different parts of the foundry,

&c. The general scheme of successful works management was then entered upon, the objects to be kept in view being defined. The duty of the manager was discussed, and the directions in which he was likely to fail were indicated.—The next lecture takes place on Tuesday, March 19. On Saturday, March 9, a large number of the members, visited the Southall works of the Brentford Gas Company by the courtesy of the engineer, Mr. J. Husband. They were received and shown over by the superintendent, Mr. W. Bugby, who explained the construction and operation of the carburetted water gas plant, the system of coal gas manufacture by inclined retorts, and the other interesting features of the works. The visit was arranged in connexion with the paper on "Carburetted Water Gas," read before the Institution on March 1 by Mr. Samuel Cutler, jun.

THE LONDON COUNTY COUNCIL.

The first meeting of the newly-elected London County Council was held on Tuesday at the County Hall, Spring-gardens, Mr. W. H. Dickinson, Chairman of the late Council, presiding at the commencement of the proceedings.

Election of Chairmen.—The following gentlemen were elected for the ensuing year: As Chairman, Mr. A. M. Torrance; as Vice-Chairman, Mr. McDougall; and as Deputy-Chairman, Lieut.-Col. Rotton.

The Water Question.—After the transaction of other business,

Mr. T. McKinnon Wood moved:—"That, in view of the decisive verdict of the electors of London in favour of the Council's water policy, a deputation be appointed to urge upon the President of the Local Government Board that the Government should allow the Council's Purchase Bill to pass second reading, and to be referred to a Committee of Parliament."

Mr. Cornwall seconded the motion, which, after discussion, was carried.

The Council adjourned shortly after seven o'clock.

METROPOLITAN ASYLUMS BOARD.

The fortnightly meeting of this Board was held at the Board's office, Victoria Embankment, on Saturday last, Sir E. Galsworthy presiding.

The Works Committee, reporting with regard to the North-Eastern Hospital, recommended the managers to authorise, as an extra on the contract for the erection of the new laundry, the carrying out of certain works necessary for the completion of the roadway and the construction of a new trolley track between the old and the new buildings, and the paving of the space in front of the new coal store, in accordance with the specifications prepared by Messrs. A. & C. Harston, the architects, at the total sum of 394l. The original amount of the contract was stated to have been 8,865l., and the extras previously reported were 761l. The Board sanctioned the outlay recommended.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Greenwich.—The retention of a greenhouse in the garden of No. 11, Kidbrook Park-road, Greenwich, abutting on Hervey-road (Mr. W. Warmington for Mr. E. Edwards).—Consent.

Camberwell, North.—One-story shop-front on part of the forecourt of No. 52, New Church-road, Camberwell (Messrs. N. S. Joseph, Son, & Smith on behalf of the Four per Cent. Industrial Dwellings Company, Limited).—Consent.

Islington, North.—The retention of a gas-meter shed in the playground of the Montem-street school, to abut upon Marriott-road, Islington (Mr. T. J. Bailey for the School Board for London).—Consent.

Lewisham.—Six houses on the east side of Brockley-rise, Lewisham, at the corner of Brockley Park (Mr. J. W. Brooker for Mr. J. W. Webb).—Consent.

St. George, Hanover-square.—A variation from the plans approved on February 25, 1890, for the rebuilding of Nos. 327 and 329, Oxford-street, and

Nos. 85 and 86, New Bond-street, so far as relates to an alteration in the construction of the shop-front to such premises (Mr. W. J. Almond for Messrs. Hitchings, Limited).—Consent.

Dulwich.—A one-story shop on the forecourt of No. 72, Church-street, Camberwell (Mr. W. Seth Payne for Mr. C. Herman).—Refused.

Dulwich.—A one-story shop on the forecourt of No. 74, Church-street, Camberwell (Mr. W. Seth Payne for Dr. W. Morris).—Refused.

Dulwich.—One-story shops on the forecourts of Nos. 68 and 70, Church-street, Camberwell (Mr. W. Seth Payne for Mrs. Clarke).—Refused.

Dulwich.—One-story shops on the forecourts of Nos. 76 and 78, Church-street, Camberwell (Mr. W. Seth Payne for Mr. W. Adams Murphy).—Refused.

Hammersmith.—A detached one-story shop on part of the forecourt of No. 228, Uxbridge-road, Shepherd's Bush (Messrs. Holcombe, Betts, & West for Mr. J. Vellenger).—Refused.

Hampstead.—Buildings on the south side of the portion of West End-lane between West End Green and Honeybourne-road, and on the east side of the portion of West End-lane between West End Green and Fawley-road (Messrs. Boehmer & Gibbs for Mrs. E. J. Cave).—Refused.

Hampstead.—A building, 16 ft. high, on the east side of West End-lane, to abut upon Fawley-road (Messrs. Saltwell, Tryon, & Saltwell for Mr. J. Fryer).—Refused.

Hampstead.—Shops on the east side of West End-lane, Hampstead (Messrs. Saltwell, Tryon & Saltwell for Mr. J. Fryer).—Refused.

Lewisham.—A church on the east side of Trewharry-road, Sydenham (Mr. G. H. Fellowes-Pryne for the Vicar and Churchwardens of Christ Church, Lower Sydenham).—Refused.

Norwood.—Five blocks of residential flats, and a house with a shop on the ground floor, on the east side of Knight's-hill-road, West Norwood, at the corner of Rothschild-street (Mr. H. Bushell for Mr. H. Block).—Refused.

Paddington, North.—A parish hall with a projecting porch, on the east side of Macroom-road, St. Peter's Park, Paddington (Mr. J. S. Alder for Rev. W. P. Legg).—Refused.

Projections.

Islington, East.—That permission be given to Mr. J. Davison to retain a projection (an illuminated sign) at the Queen's Arms public-house, Queensland-road, Hornsey-road, Islington, extending beyond the general line of buildings in Albany-place (Mr. W. H. Fisher).—Agreed.

Woolwich.—Bay windows in front of Nos. 9 to 27 (odd numbers only, inclusive), Elderslie-road, Eltham (Mr. G. F. Logsdail for Mr. A. Cameron Corbett, M.P.).—Consent.

Islington, North.—The retention of bay windows in front of Nos. 10, 12, 14, 16, 18, and 20, Heathville-road, Islington (Mr. R. Midworth for Messrs. Wootton and Green).—Consent.

Marylebone, East.—An iron and glass-covered way at the entrance to Bechstein Hall, No. 36, Wigmore-street, St. Marylebone (Mr. T. E. Colcutt on behalf of Mr. E. Bechstein).—Refused.

Width of Way.

Greenwich.—The erection of a building, to adjoin the convent on the west side of Wellington-grove, Crooms Hill, Blackheath, with a portion of the building and the boundary fence at less than the prescribed distance from the centre of Wellington-grove (Mr. C. E. Mercer and Messrs. F. J. Eadie & Meyers for Reverend Mother of the Ursuline Convent).—Consent.

Hackney, Central.—The erection of a stable on land adjoining No. 47, Bloomfield-street, Dalston, with the boundary fence at less than the prescribed distance from the centre of the street (Messrs. Partridge Brothers for Mr. Yates).—Consent.

Wandsworth.—The erection of buildings and a boundary fence at Gothic Wharf, Frewhouse-lane, Putney, at less than the prescribed distance from the centre of the street (Mr. S. J. May on behalf of Messrs. Carlo Gatti & Stevenson, Limited).—Consent.

Hampstead.—The erection of blocks of residential flats on the site of Nos. 6 and 7, The Mount, Hampstead, with the forecourt boundary or fence at less than the prescribed distance from the respective centres of The Grove and a public footway leading from The Mount to The Grove (Mr. C. W. Matthews).—Refused.

Width of Way, Lines of Frontage and Projections.

St. George, Hanover-square.—The erection of an iron and glass shelter at the entrance to No. 46 Dover-street, Piccadilly (Mr. J. T. Martin on behalf of Mr. M. W. Carmichael).—Refused.

Hackney, Central.—The erection of an addition to a church on the north side of Pembury-grove, Lower Clapton, at less than the prescribed distance from the centre of the street (Mr. J. W. Dunford on behalf of the trustees of the church).—Refused.

Width of Way and Space at Rear.

Marylebone, West.—A block of buildings, to be inhabited by persons of the working class, on the east side of Ashland-place, St. Marylebone, to abut also upon Paradise-street, at less than the prescribed distance from the centres of those streets, and with

an open space at the rear (Mr. T. H. Watson on behalf of the Portland Industrial Dwellings Company, Limited).—Consent.

Westminster.—A building on the south-east side of Moreton-street, Vauxhall Bridge-road, Westminster, at less than the prescribed distance from the respective centres of Dean's-place and Garden-street, with an irregular open space at the rear (Mr. R. S. Ayling for the Brabazon House Company, Limited).—Consent.

Width of Way and Construction.

Holborn.—A play-shed at the school in Rosebery-avenue, Holborn, at less than the prescribed distance from the centre of Poole's-buildings (Mr. T. J. Bailey on behalf of the School Board for London).—Consent.

Cubical Extent.

Rotherhithe.—The erection, on the south side of St. Thomas-street, Rotherhithe, at the corner of Great Maze-pond, of a warehouse to exceed in extent 250,000, but not 450,000, cubic feet (Mr. P. Currey on behalf of Messrs. Tebbitt Brothers).—Consent.

Means of Escape from the Top of High Buildings.

Westminster (detached).—Means of escape in case of fire on the eighth and ninth stories of a block of buildings known as Park Mansions, on the south side of High-road, Knightsbridge, between Brompton-road and Knightsbridge Green, for the persons dwelling or employed therein (Mr. G. D. Martin for Messrs. A. Kellett & Sons, Limited).—Consent.

Line of Frontage and Construction.

Deptford.—A covered way at the rear of No. 100, Beakspers-road, St. John's, Deptford, to abut upon Glensdale-road (Mr. W. T. Barlow for Mr. C. E. Combe).—Refused.

Formation of Streets.

Lewisham.—That an order be issued to Messrs. D. & R. Kennard, refusing to sanction the formation or laying out of a street for carriage traffic out of the east side of Eliot Park, Blackheath.—Agreed.

Pekham.—That an order be issued to Mr. J. E. Lamerton, refusing to sanction the formation or laying out of a street for carriage traffic, to lead out of the west side of Honor Oak-rise, Forest Hill-road, Camberwell, and the widening in connexion therewith of a portion of Honor Oak-rise.—Agreed.

Wandsworth.—That an order be issued to Mr. H. Vallianey, refusing to sanction the formation or laying out of two streets for carriage traffic, to lead out of Franciscourt-road, Garratt Green, Wandsworth (for Mr. T. Hailstone and Mr. A. E. Elmes).—Agreed.

The recommendations marked † are contrary to the view of the Local Authorities.

Correspondence.

To the Editor of THE BUILDER.

THE VICTORIAN MEMORIAL.

SIR,—It is gratifying to find that you have taken up this important national question, and millions will agree with your deduction that "what we ought to have as a memorial of our late beloved Queen is a great architectural and sculptural monument, for which there should be a competition open to all British artists."

This architectural and sculptured monument should, I contend, have other *raison d'être* for its existence over and above its artistic beauty, and it would not be inopportune to point out why a sculptured monument, pure and simple, would be inadvisable—nay, I venture to say, unsuitable. We have raised such to commemorate disasters and achievements in naval and military warfare, as in the Nelson monument in Trafalgar Square and the Duke of York's Column, not to mention others, all useless enough and not beautiful; while for sculptured figures nearer the eye, the climatic conditions and our coal-consuming custom soon render them objects of positive disfigurement, entailing a constant outlay in cleaning, by which process they must lose any of the artistic qualities they may have originally had.

To raise a work on a colossal scale which should be unaffected by such conditions we should require a site from which the work could be seen from a distance; and then, I fear, such is the art education of the masses, that they would make pilgrimages to the base with field-glasses in order to discern the ornament, if any, on the edge of a garment.

If the provincial towns one and all want a sculptured effigy of the great Queen, by all means let them have it, but London—the city of the

world—wants that and something more. The Victorian monument must not be one commemorating war or disaster to ourselves or others, for it was during the Victorian reign that the arts of Peace were enabled to progress, that science and knowledge advanced, that commerce and industry increased, and that the civilising of the whole world to the glory of God advanced more rapidly than in all previous history. It must be a monument of a humanitarian people.

Speaking as one of the orthodox faith, I would not care to do more than draw attention to a far more serious mistake which might be made, in robbing such a monument of a truly national character by investing it with a particular religious phase, even if it be the state religion. We dare not overlook or ignore the fact that the great Queen Victoria ruled over millions of our brother citizens whose affinities have been drawn closer together by the greatness and wisdom of her reign, and by intermarriage of Catholics, Jews, Nonconformists, Quakers and many others whose religious faiths are so varied as to be almost impossible of enumeration, but in whose hearts lives the spirit of true devotion and loyalty, transferred by the un-failing instinct of right to our Most Gracious Majesty the King and his gracious Consort.

I am sure, Sir, if the matter were placed fairly and without prejudice before his Majesty he would, with his characteristic judgment, consider the matter, and do that which would meet with the sympathy and approval of all. There is no hurry, for in this instance the old proverb holds good "the more haste the less speed." GEO. C. HAITE.

* * Mr. Haite's remark as to the mistake of associating the monument with any special form of religious faith is perfectly true, and forms another reason against the Westminster Abbey chapel scheme.—ED.

THE LONDON WATER QUESTION.

SIR,—I am greatly interested in your article with reference to the London water question.

May I suggest that the best solution of the difficulty would be to fix a meter to every house (as you advocate), and at the same time to fix a minimum charge, *viz.* let every house pay for, say, 25 gallons per head per day, and for so much more (if any) as the meter registers.

Of course, there are drawbacks to every scheme. A tenant will still waste the water if the landlord has to pay, and people will water their gardens and indulge more in cold baths during a long spell of hot, dry weather than when it is chilly and wet.

I think the consumers (and not the landlords) must be made to pay directly for the water, and the latter difficulty might be met by doubling the rate chargeable for water consumed above the minimum during the quarter from Midsummer to Michaelmas.

It must be borne in mind that, for the next few years at any rate, the water supply will require husbanding during long droughts.

OSBORN C. HILLS.

* We did not exactly do that. We said it was a point to be considered seriously; that it would save all the expense and friction inseparable from official supervision; and that if there were insuperable objections to it we had not yet heard of them. We quite recognise that there may be serious difficulties connected with supply by meter.—ED.

PAINTINGS IN ALDERMASTON CHURCH.

SIR,—Your readers may be interested to know that the painting which has been proceeding on the east wall of Aldermaston Church for many months is now approaching completion.

Figures of Our Lord enthroned, the Virgin, and St. John Baptist, with angels, occupy the space immediately below the roof, while on the wall on each side of the east window appear figures of patriarchs, prophets, saints, and martyrs.

The painting is on the wall itself, executed in a wax medium, and with a palette I have restricted with a view to permanence. The old fourteenth-century diaper discovered in the transept by Mr. C. E. Keyser, F.S.A., and myself some years ago has been used as the basis of decoration in the chancel.

It may be valuable to mention that the method of preservation I adopted at the time of discovery has been completely successful. Besides the large fourteenth-century St. Christopher, a portion of a fifteenth-century picture of uncertain subject but fine style, and under an interesting canopy, has not further disintegrated, though the latter work, painted over the fourteenth-century diaper and forming a palimpsest, I found extremely difficult to retain upon the wall.

PHILIP H. NEWMAN, R.E.A.
P.S.—I dare say it needs but recalling to recollection that the transept alluded to contains the exceptionally fine sixteenth-century tomb of the Forders.

ROYAL ARCHAEOLOGICAL INSTITUTE.—The annual meeting this year will be held at Nottingham, from Tuesday, July 23, to Tuesday, July 30.

The Student's Column.

SANITARY FITTINGS AND PLUMBING
10.—BATHS.

BATHS are made of zinc, copper, sheet-steel, sheet-iron, cast-iron, enamel, fireclay, slate, and marble, and also of wood, either naked or lined with lead, but probably cast-iron is more used in this country than all the other materials put together. It is cheap, durable, impervious, and can be cast with widely-rounded angles and in a variety of forms either for standing exposed or for enclosing in wood.

Exposed baths are generally known in the trade as "Roman," and can now be obtained in almost any material. They are much to be preferred, as a wood enclosure not only renders access to the pipes more difficult, but also provides in many cases a convenient harbour for dirt and vermin. Baths are commonly 5 ft. 5 ft. 6 in., or 6 ft. long, but smaller sizes are made for children and others. The sides may be either "parallel" or "taper," and generally slope inwards towards the bottom; the foot of the bath is frequently vertical, while the head has a long slope. The object of the sloping head and sides is to reduce the quantity of water required, with the further advantage of producing obtuse angles, which can be more easily kept clean than right angles.

Baths are generally fixed by the waste and supply pipes, and if space can be afforded, it is a good plan to place them quite clear of the walls or with only the head or foot near a wall, as such arrangements admit of the floor of the room and the sides of the bath being kept clean. For hospitals, however, movable baths on wheels are largely used.

1. **Sheet-metal Baths.**—Under this head bath of copper, zinc, sheet-steel, and sheet-iron may be considered. Formerly these baths were made to be supported on wood cradling, which was concealed by a wood enclosure, but many are now made with roll edges and sufficiently strong to stand alone.

The old form of copper bath shown in fig. 1 has a flanged rim for fixing in wood casing the sides weigh 28 ozs. to the superficial for the ends (where the curve adds to the strength) 21 ozs., and the bottom 32 ozs. The total weight of copper in a bath of this design 5 ft. 6 in. long is only 65 lbs. There is a copper waste-well in the centre of the bottom from which a copper pipe 1½ in. or more in diameter leads to the foot of the bath, when a connexion can be made with a lead trap.

Sometimes hot and cold inlets are arranged: the sides of the bath with copper pipes attached as shown in fig. 3. The dimensions of the bath shown in fig. 1 are as follows: Length, 5 ft. 6 in. inside, and 5 ft. 9 in., outside length; width 24½ in. at head, and 20 in. at foot, inside flange depth, 21 in. inside; height from floor, 27 in. Baths 5 ft., 5 ft. 3 in., and 6 ft. long are also made.

The bath shown in fig. 1 has a flat bottom and the angles are difficult to keep clean. It better to have the angles well rounded, as in the steel bath (fig. 3). In the best modern bath only three sheets of copper are used (for the head, body, and foot), each being bent or pressed to the necessary curves. These are a great improvement on the old form. In cheaper bath one of the form shown in fig. 1 the sides and end are of sheet-steel or iron, the bottom only being of copper. This reduces the cost about 40 per cent., as copper is, of course, an expensive metal; but a cast-iron bath is better than composite bath of this kind.

When copper baths are to be fixed with wood enclosure, the flat flange at the top is replaced by a copper bead, or fitted with hardwood bead, and the bath is japanned on sides or finished in some other way. Sometimes a roll-edge of nickel-plated brass is used instead of the copper or hardwood bead.

Copper baths may be finished in a variety of ways. The surface of the copper may be "planished"; this has a good appearance, but is difficult to keep smooth and bright. The cheapest finish is obtained by japanning in plain finish, either white or (say) pine green, has the best and cleanest appearance. If the japan is polished to give smoother surface, the cost is slightly increased. The cost also varies according to the number of coats applied. A slightly more expensive finish is obtained by metallic-enamelling, the process being practically the same as japanning, and consisting in the application

Fig. 1.

Fig. 2.

Fig. 4.

Fig. 5.

Fig. 3.

Fig. 6.

Illustrations to Student's Column.

successive coats of a metallic (generally zinc) paint, each of which is burnt on to the metal at the necessary temperature. Three or four qualities of metallic enamel are quoted, the price varying according to the number of the coats and the smoothness of the finish. Before the metallic enamel is applied the copper is generally tinned, as this gives a better result. Tinned copper baths are often polished or highly polished. The appearance of a new bath of this kind is very pleasing, but it is difficult to keep the surface clean and bright. The coat of tin is generally obtained by dipping, but in some cases sheet tin is used and united to the copper by hydraulic pressure.

There can be no doubt that copper is an excellent material for baths. The metal is thin, and does not therefore abstract much heat from the water; it is also durable and can be repeatedly re-enamelled, and when the bath is ultimately worn out it will fetch a good price on account of the intrinsic value of the metal. Perhaps the principal objection to copper baths is that the first cost is so high.

Fig. 2 shows an "Indurated Wood Fibre" bath, lined with highly-polished tinned copper. The top has a French-polished wood capping, and the bath is supported on cast-iron feet.

Cheaper baths of similar design and dimensions to that shown in fig. 1 are made of zinc (plain or japanned), and sheet-iron (galvanised or tinned), with beaded or flanged tops. A sheet-steel bath (Braby's "Eupress") is shown in fig. 3. The plates are riveted together, the rivets being flushed inside, and the whole bath is galvanised after manufacture, and afterwards japanned or metallic-enamelled. The angles are well rounded, and as the baths are light and tough and "nest" closely together when packed, they are very suitable for export.

The parallel plate zinc bath (fig. 4) is made

of plate zinc $\frac{1}{8}$ in. thick, and has a roll edge on the front and head, and a square raised rim on the back and foot for fitting in the angle of a room. The waste is formed with an ordinary plug and washer with bent union, and an ordinary overflow can be fitted in the end. The surface may be either polished or japanned. Polished zinc is difficult to keep clean, and it must not be forgotten that some waters have a solvent action on the metal, and where this is the case it must be protected by enamelling.

Sheet-metal baths for hospitals are furnished with rubber-tyred wheels, and are fitted with plugs and washers or draw-off cocks, so that the baths can be emptied over floor channels or gullies. Tinned copper is the best material for the purpose, but other metals are also used. The indurated wood fibre baths lined with tinned copper are adapted for hospital use by mounting them on wrought-iron carriages with rubber-tyred wheels. A lip is formed around the inner edge of some hospital baths to prevent splashing while the baths are being wheeled about.

2. *Cast-iron Baths.*—Cast-iron is cheap, impervious, and stiff, and can be moulded in a variety of forms. The objections to the material are that it is somewhat heavy and liable to fracture, and that, in the inferior kinds, at any rate, the enamel is rather easily chipped off, thus exposing the metal to the water and air, which cause it to rust. The latter objection loses some of its force if the bath is "vitreous-enamelled," as the process of manufacture ensures a close adhesion of the enamel and iron. For a long time this enamel could only be applied to the inside of the bath, but after many experiments it has been found possible to apply it both inside and outside, and the best cast-iron baths are now made in this way. Cheaper baths are japanned or metallic-

enamelled in the manner already described. The vitreous enamel is not only smoother and less pervious, but is not acted upon by inferior soaps or by the acids and salts sometimes used by bathers, which is more than can be said for the ordinary japan or metallic enamel.

The ordinary cast-iron bath is too well known to need complete illustration. It may be encased with woodwork or left exposed. In the former case a simple flanged rim is formed at the top to receive the wood margin. A similar rim is also provided in some Roman baths so that wood margins can be screwed to them, as these are occasionally preferred because the wood is warmer to the touch than an iron roll-edge. The iron roll-edge is, however, more generally adopted. The ordinary roll is an almost exact semicircle, the diameter ranging from about 2 in. to 4 in.; the "Anti-splash" roll (fig. 5) introduced by Messrs. Doulton & Co. is an improvement. Other details will be illustrated in the chapter on bath-wastes and overflows.

3. *Enamelled Fireclay Baths.*—These were first made about fifty years ago, and many have been used. The porcelain enamel is the one great advantage which these baths possessed over those in vogue at the time when the fireclay baths were introduced, but the manufacture of vitreous enamelled cast-iron baths (which have a practically identical surface) appears likely to prevent enamelled fireclay baths being largely used in the future. Fireclay baths are expensive and have undoubtedly certain disadvantages. They are very heavy, a full-sized bath weighing about 5 cwt. or 6 cwt., and the material is so thick and cold, that it abstracts a very large amount of heat from the water. For hospitals, where a "hot" bath is often required for an urgent case, this is a serious disadvan-

tage, as the bath itself remains cold for some time after the hot water is turned into it, and may chill the patient, so that the "hot" bath, instead of being salutary, may be positively injurious. On the other hand, enamelled fireclay baths are strong, clean, and durable, and are easily kept free from infectious taint.

Fireclay baths are made with parallel or taper sides, and in lengths of 4 ft., 5 ft., 5 ft. 6 in., and 6 ft. (outside dimensions), and can be obtained with or without roll edges and enamelled inside only, or both inside and outside. They are sorted into qualities—a common classification being "best," "all but" or "selected second," and "second." The bottom of the bath is sometimes fluted with a main longitudinal channel and cross channels leading into it. The bath shown in fig. 6 is a "Cliffe Vale" Roman bath supported on enamelled fireclay feet, and has a wood rim inserted in the front roll. An enamelled tray, draining into the bath, is fitted at the back between the bath and wall, and forms a convenient receptacle for soap, sponges, brushes, &c.

4. *Other Baths*.—Baths made of slate or marble slabs bolted together have been used, but as they are heavy, cold, difficult to keep clean, and apt to leak, they cannot be recommended. Concrete baths were advertised some years ago, but the material has not proved suitable. Wood has the advantage of warmth, but is unsuitable in other respects. The appearance of lead-lined wood baths is not agreeable, and, as explained in the chapters on sinks, the lead forms into ridges under repeated expansion and contraction, and ultimately cracks.

GENERAL BUILDING NEWS.

BAPTIST CHURCH, LEICESTER.—The memorial stones of the Sunday schools attached to the Robert Hall Memorial Chapel, Narborough-road, were laid recently. The school building will be provided with a lecture-hall and kitchens and classrooms, the whole designed for the accommodation of some 800 scholars. The external elevations of the edifice are to be executed in red sand bricks, and the roof is to be covered with Broseley tiles. The estimated cost of chapel and schools, inclusive of the site, is about 12,000l. Mr. W. Brand is the architect.

ST. CYPRIAN, BROCKLEY.—The Church of St. Cyprian, which has been built in Adelaide-road, at the foot of the Hilly Fields, Brockley, was consecrated on the 23rd ult. The church was designed by the late Sir Arthur Blomfield.

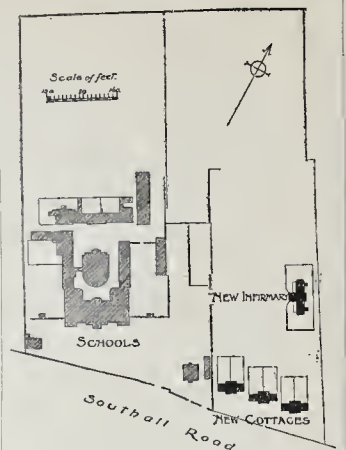

WESLEYAN CHURCH, ARNOLD, NOTTINGHAMSHIRE.—A new Wesleyan church was opened on the 7th inst. at Arnold. The building, which has been erected at a cost of about 2,500l., is situated in Church-drive on a corner site. It is 52 ft. long and 35 ft. wide, and will seat 300 persons. The choir and organ are located in a gallery behind the rostrum, on each side of which are vestries, one for the use of the choir and one for the minister. The main entrance is from Church-drive by means of a lobby communicating with the main aisles. The building is Gothic in style, and has been built of red bricks with Hollington stone dressings. The internal walls have a wood dado to a height of 4 ft. 6 in., and above this are plastered. The internal woodwork is of red deal, stained and varnished. The school buildings (opened some few months ago) are at the rear of the chapel. The main schoolroom is 36 ft. long and 25 ft. wide. There are two classrooms directly at the end, which open into the school by means of movable partitions, thus giving a room 50 ft. long and 35 ft. wide. Entrances are provided, separate for boys and girls. There is an infants' room, 20 ft. by 14 ft., and also a kitchen. The chapel and school are heated throughout by means of hot water on the low-pressure system, so arranged that the chapel and school can be heated as a whole or separately, as may be desired. The builder was Mr. A. Wayne, of Arnold; and the heating arrangements were carried out by Messrs. Tbos. Danks & Co., of Nottingham; the whole work being under the superintendence of Mr. W. H. Higginbottom, architect, of Nottingham.

PUBLIC LIBRARY AND READING-ROOM, NOTTINGHAM.—A block of buildings, erected on Carlton-road in the district of Sneinton, Nottingham, was opened on the 25th ult. as a free public library and reading-room. The buildings cover an area of about 850 square yards. There are two large rooms, each 66 ft. by 25 ft., both one story high. One has been furnished and arranged much after the style adopted at the principal reading-room in Sherwood-street; the other is being arranged for the accommodation of women and young people under the age of sixteen. The outer walls are of red pressed brick with Derbyshire stone dressings. The buildings have a main frontage to Carlton-road, with frontages also in St. Matthias-road and Cardiff-street. On the St. Matthias-road site is a dwelling-house for the caretaker. The architect was Mr. W. B. Starr, and the contractor Mr. W. Maule; while the oak fittings have been supplied by Mr. Henry Haines, and the

heating arrangements carried out by Messrs. T. Danks & Co.

CATHOLIC SCHOOL, NOTTINGHAM.—On the 7th inst. the foundation-stone of St. Mary's Convent School, Derby-road, Nottingham, was laid. The schools will provide accommodation for 143 infants, 168 boys and girls mixed, and cooking classroom for forty-eight girls, with playgrounds approached by separate entrances from Tunnel-road. The architect is Mr. John Howitt, and the schools are being built under his supervision by Mr. Henry Vickers at a cost of 4,250l.

ST. MARYLEBONE SCHOOLS, SOUTHALL: NEW PROBATIONARY WARDS AND INFIRMARY.—The new buildings are erected at the front part of the field on the north side of the school buildings, the three probationary cottages being placed in a line parallel to the public road, and the infirmary adjoining the north boundary. *Probationary Wards*.—With a view of preventing the introduction of infectious diseases into the schools at any time by children taken direct from their homes or elsewhere, it is essential that they should on entry be isolated for a certain period from the other children. This probation allows time for the development of symptoms, and the opportunity of removal to the proper institution before any harm is done. A period of fourteen to twenty-one days is generally considered sufficient probation. It has been found essential, however, to further protect the children during their term of probation from infection by others arriving perhaps within a day or two of their transference to the main school. In view of the great number of "ins and outs" (i.e., cases which are brought in on one day and taken away again by their

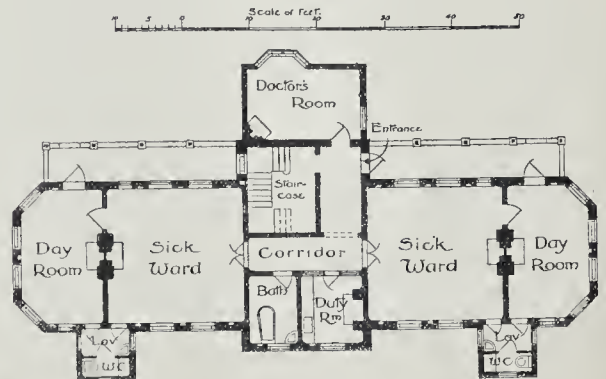

St. Marylebone Schools, Southall: Block Plan Showing Position of New Buildings.

RECEIVING COTTAGE

PROBATIONARY COTTAGE

INFIRMARY.

St. Marylebone Schools, Southall: Ground Plans of New Buildings.

parents or others within a few days, it is obvious that the old system was scarcely really effective. The new buildings are designed to obviate this contingency. On admission children will be taken to the centre cottage or receiving house, where they will be examined by the medical officer in a room provided for the purpose. They will then be bathed, and passed into the adjoining dayrooms, one of which is provided for boys and the other for girls and infants. Between these dayrooms are separate staircases to the upper floors, and a small kitchen. On the upper floor are two dormitories, respectively for boys and girls, and each to hold six beds, a nurses' bedroom, two separation-rooms—each for one bed—and a small overflow ward for either four boys, or four girls, or infants. After a week's probation in the receiving house the children would be removed to the second cottage for a further week, and then to the third cottage for the last week. If at the end of this time they have shown no signs of disease, they will be ready for transference to the main body of the school. The second and third cottages have similar accommodation to that of the receiving house, but no special room for the medical officer. Each cottage is provided with its own lavatories, bathrooms, and water-closets, and each has its separate airing yard, laid out with gravel, and small flower beds near the fences. **INFIRMARY.**—The old infirmary built many years since having become inefficient, and by its situation a source of possible danger to the school generally, the new infirmary has been built with better accommodation designed on modern lines, and placed as far as possible from the school buildings. The building is designed to accommodate a maximum of forty beds in no less than eight separate wards. It is simply arranged with two wings (respectively for boys and girls) containing the sick wards, and a centre part with the usual duty-room, bathroom, &c., and staircase. Each wing contains two wards, respectively on the ground and first floors, and two day-rooms. On an emergency each of these dayrooms can be used as an additional sick ward, with a separate entrance from the outside. The wards will accommodate six, and the dayrooms four, beds each. The duty-rooms are fitted with small range, sink, &c., and the bathroom with porcelain enameled baths and the lavatory basins. The ward offices are contained in two sanitary towers, and are cut off from the wards by cross ventilated lobbies. Two nurses' bedrooms and bathroom are provided on the second floor over the centre part of the building. Water-closets are provided on the south side of the wards. Adjoining the entrance is a medical officers' consulting-room, and above this a sitting-room for nurses. The buildings have been erected from the designs and under the superintendence of Mr. Alfred Saxon Snell, F.R.I.B.A., by Messrs. A. & B. Hanson, of Southall, whose contract for the work amounted to 11,000l. Mr. H. G. Rogers acted as clerk of works. The hot and cold water and gas supplies have been carried out by Messrs. J. & F. May, of High Holborn; tiling by Messrs. Carter & Co., and sanitary apparatus by Messrs. Emanuel & Sons. The quantities and measurements were carried out by Messrs. Northcroft, Son, & Neighbour.

BUILDING TRADE IN ABERDEEN.—The building trade in the city and neighbourhood is still very dull, and the ranks of unemployed masons have been swelled by a large number of men from the monumental granite yards, where work for masons is exceedingly flat, though machine polishings is fairly busy. An improvement on the present slackness in the building and monumental trades is, however, expected in a few weeks. The Town and County Bank have asked 30,000l. for three acres of ground at Clayhill, required for the extension of Aberdeen joint passenger station, and the matter has been referred to arbitration. The Town Council have applied for the requisite permission to borrow the sum needed for the proposed new electric station at Dee Village-road and other extensions.

THE IMPERIAL THEATRE.—In the course of next month the Imperial Theatre will be reopened. The house has been reconstructed for Mrs. Langtry, under the plans and designs of Mr. F. T. Verity.

IMBECILE WARDS, BURNLEY WORKHOUSE.—On the 7th inst. the female portion of the new imbecile wards being erected at the Burnley workhouse were formally opened. The wards when completed, accommodate about 140 patients. The building will be two stories in height. Wards for idiots and epileptics will be on the ground floor, and several rooms are provided for violent and noisy cases. Each class of inmates will be kept separate from each other. The floors will all be fireproof, and the architect is Mr. S. Lightly, Burnley.

HOUSING OF THE WORKING CLASSES AT BATH.—A meeting of the Housing of the Working Classes Committee was held at the Guildhall on the 1st inst., when the Mayor (Mr. T. B. Silcock) was elected Chairman. It was decided to recommend to the Council the plans submitted by the City Surveyor for thirty-nine houses on the Lampard's Buildings site, making provision for 180 persons. It was reported by the Surveyor that 12,035 loads of refuse had been tipped on the Dolemeads site to raise the land for the new dwellings being erected there.

CRABB MEMORIAL INSTITUTE, TUNBRIDGE WELLS.—The foundation-stone of this building was laid on the 25th ult. The building will be of red brick,

with dressings of stone. Messrs. H. H. & E. Cronk, of Tunbridge Wells, are the architects, the builders being Messrs. Leney & Son.

PROPOSED EXTENSION OF BRACEBRIDGE LUNATIC ASYLUM, LINCOLNSHIRE.—It is proposed to extend Bracebridge Pauper Lunatic Asylum. Plans are to be prepared by Mr. Albert E. Gough, of London. The extensions will accommodate 200 additional patients. The cost is estimated at over 75,000l.

TOWN HALL, CHISWICK.—The new Town Hall for Chiswick, which has been erected on the site of the old vestry offices, at the corner of Sutton-road, was opened on the 28th ult. A part of the old building. The work was incorporated in the new supervision of Mr. Ramsden, the Surveyor. The premises are heated by radiators by Messrs. Russell & Russell. The clerk of works was Mr. George. The cost has been about 18,000l.

MISCELLANEOUS.

SOUTH KENSINGTON MUSEUM.—Until further notice the Victoria and Albert Museum will be open to the public till six o'clock on the students' days (Wednesdays, Thursdays, and Fridays), and on Sundays.

ABERDEEN BOROUGH SURVEYOR'S DEPARTMENT.—With a view to lessen the pressure on the Borough Surveyor (Mr. W. Dyack), Aberdeen Town Council has requested its Water Committee to recommend the name of an eminent engineer to guide the Council as to the best source of a new water supply for the city.

HOME ARTS AND INDUSTRIES ASSOCIATION.—The seventeenth annual exhibition of the work done in the classes of the Home Arts and Industries Association will be held from May 10 to 20 in the gallery of the Royal Albert Hall. The exhibition will include specimens of wood-carving, inlay, metal repousse, embossed leather, baskets, spinning and weaving, lace, toys, and rugs, and of habits from the Brabazon and Home Art Scheme for Disabled Soldiers and Sailors. There will also be exhibited other arts and industries. There will also be exhibited Disabling Soldiers and Sailors. There will also be exhibited other arts and industries. There will also be exhibited Disabling Soldiers and Sailors.

THE LATE MR. H. C. BOYES.—By the will of the late Mr. H. C. Boyes, the architect and surveyor to the Grocers' Company, roof has been left to the Architects' Benevolent Society, and the same sum to the Charitable Fund of the Surveyors' Club. There were various other charitable bequests. The value of the estate was nearly 62,000l.

HYDE PARK.—In the House of Commons on Monday Colonel Legge asked the First Commissioner of Works whether it was proposed to remove the remaining iron railings inside Hyde Park; and whether he would consider the desirability of lighting the roadway between Victoria Gate and the Marble Arch.—Mr. Akers-Douglas: It is proposed ultimately to remove all the iron posts and rail fence in Hyde Park except the portion round the ride. I have not at present sufficient funds to meet the heavy expense of lighting the roadway referred to by my hon. and gallant friend. Seeing that there is a public roadway running parallel to it, and within a few yards, it is not so pressing as other changes.

ASSURANCE AMONG THE INDUSTRIAL CLASSES.—The fifty-second annual report of the Prudential Assurance Company states that in the industrial branch the premiums received during the year were 5,447,697l., being an increase of 278,739l. The surplus in this branch is 716,660l., including the sum of 315,853l. brought forward from last year. Out of this surplus the board have added 50,000l. to the reserve fund, which now stands at 82,000l.

HOUSING OF THE WORKING CLASSES.—The Hammersmith Borough Council, on Wednesday evening, decided to adopt Part III. of the Housing of the Working Classes Act, 1890. It was also agreed that a large scheme which the Works Committee have had under consideration for some time past, for the erection of workmen's dwellings on the Council's land near the electric lighting station, Fulham Palace-road, should be proceeded with as soon as possible.

DRIGHTLINGTON SEWAGE.—The Local Government Board have decided to issue a provisional order empowering the Drightlington Urban District Council to put in force the Land Clauses Act for the acquisition of land for sewage disposal works. The inquiry was held on January 30 before Mr. R. H. Bicknell, J. Esq., C.E. The District Council's proposal was strongly objected to by the owner, Sir R. Tempest. The scheme as prepared by the Engineer (Mr. John Waugh, C.E., of Bradford) provided for the whole of the drainage of the villages of Drightlington and Adwalton. The sewage, on arrival at the outfall works, is first treated in two large tanks by means of chemical precipitation, and then run on to four bacteria-beds, the effluent from which is treated on five acres of land laid out on the intermittent downward filtration system. The total estimated cost of the scheme is 12,000l.

REFUSE DESTROYER, BARRY, GLAMORGANSHIRE.—The refuse destructor which the Barry District Council have built at Barry-road, Cadocton, was opened on the 26th ult. The destructor is capable of burning 30 tons of house refuse per day. The plans were prepared by Mr. J. C. Pardoe, the Surveyor to the Council, the work having been carried out by Messrs. Lloyd & Tape, of Barry

Dock, at a cost of 8,000l. The chimney stack, 150 ft. in height, with a lining of fire-brick carried up 125 ft., was built by Mr. J. Prout, of Barry Dock.

BUNTON PAVILION.—A scheme of a very comprehensive character is on foot for altering and extending the buildings in connexion with the well-known Pavilion. The directors of the Buxton Gardens Company have called in the services and advice of Mr. Matcham, architect, of London, who has prepared plans for a main entrance to the gardens, with offices, and beyond that a theatre. The latter will occupy a very large area of ground, taking in the first conservatory, aviary, reading-room, and a wide margin of land facing St. John's-road. The existing theatre will be completely remodelled and converted into reading and billiard rooms, smoking-lounges, and, probably, billiard-rooms. The work is of considerable magnitude, and will have to be carried out in sections after the season of root.—*Sheffield Independent.*

MEMORIAL TABLET, KING'S COLLEGE, ABERDEEN.—A bronze tablet has been placed in the ante-chapel of King's College, Aberdeen, in memory of the Rev. George Cockburn, the pioneer missionary of the Church of Scotland's station at I-chang. The tablet was designed by Mr. Kelly, the sculptor having been Mr. Watt.

SEWERAGE SCHEME, LISBURN.—Mr. P. C. Cowan, Chief Engineering Inspector to the Local Government Board, recently held an inquiry in the Court-house, Lisburn, into a petition by the Lisburn Urban District Council under the Public Health (Ireland) Act, 1878 to 1896, for a provisional order empowering the Council to put into force the provisions of the Lands Clauses Acts for taking certain lands compulsorily for the purpose of providing sewerage works. The Council further asked for sanction to a loan of 23,266l. 12s. 9d. for the sewerage works. Evidence was given by Mr. W. Tennent Henry, J.P., the engineer for the scheme.

CAPITAL AND LABOUR.

THE BIRMINGHAM BUILDING TRADE.—Building operations have considerably slackened in the district of late, and as a consequence nearly a thousand bricklayers and half that number of carpenters are out of work. It is said that employment has not been so scarce in the trade for many years. The reasons given are over-rapid production, high prices of material, and the war.

ABERDEEN PLASTERERS AND PAINTERS.—The plasterers' strike still continues, with no immediate prospect of a compromise. A difficulty as to the working-by-laws in the painting trade has been amicably settled.

LEGAL.

ACTION AGAINST A BUILDING-OWNER.

The case of Bingham v. Turner came before Mr. Justice Channell, sitting without a jury, in the King's Bench Division on the 8th inst., an action by the plaintiff, of 105, Fulham-road, South Kensington, to recover from the defendant, Mr. Everitt Turner, 152l. 10s. in respect of certain ranges and marble slabs supplied by the plaintiff for the defendant's houses at Brighton.

It appeared that the plaintiff entered into a contract with Mr. J. H. Hackman, a builder of Brighton, under which the latter undertook to build four houses in Dyke-road, Brighton, for the defendant, and the question in dispute was whether the plaintiff was entitled to recover from the defendant (the building-owner) or the builder. The action turned upon a clause in the building contract which gave the architect power to decide whether the building for materials supplied by special artists and tradesmen. The architect certified against the defendant, and his Lordship, in the result, held that the defendant was liable and entered judgment for the plaintiff for the full amount claimed.

WHAT ARE DAMP COURSE SLATES?

At the Southwark County Court, on Monday, his Honour, Judge Addison, K.C., heard a remitted action in which Messrs. J. Williams & Co., slate merchants, of Dinorwic Wharf, Rotherhithe, sued Mr. John Cooke, a builder and builders' merchant, of Dorking, Surrey, to recover £31 3s. 9d. for slates sold and delivered. The defendant counter-claimed for a similar amount as damages for breach of warranty. Mr. Woodcock was counsel for the plaintiff and Mr. Walsh represented the defendant.

In opening the case, Mr. Woodcock said the plaintiffs were a large firm of slate merchants. On May 10 last one of their travellers called upon the defendant and asked him if he wanted any slates, as he had one or two cheap lines. Defendant said he could do with some damp course slates, and the traveller then and there booked an order for a truckload of damp course slates. The slates were sent off in due course, and after they had arrived at Dorking a letter was received from the defendant declaring that he had ordered only 1,000 of 18 by 9 and 1,000 of 14 by 9, but complaining that they had sent more than double the quantity of "some mineral substance cut into pieces and resembling

block, the drums and central disc being loosely mounted on a shaft that revolves in eccentric bearings. Each belt may be tightened so as to drive its corresponding drum. When the belts are loosened the shaft revolves so as to disengage the disc and to effect friction between the disc and a pulley upon the driving-shaft, whereupon the two drums will be driven in one direction for winding purposes, but they will be driven in opposite directions when the disc has been lowered on to the brake-block and one of the belts has been tightened.

22,459.—AN APPLIANCE FOR WINDOWS: C. M. Ford (executor of C. C. Mallett) and M. H. Mallett.—Hinged sliding beads or stops (each of which has a handle) are fitted on to the side frames of a glazed "hopper" window so that they can be turned back and admit of the sash being swung into the room for purposes of cleaning it, &c. When the beads are lifted their lugs engage with recesses cut in the frame, and when the beads are caused to slide downwards those projections are forced against stop-faces. When one moves the sash back again into the hopper the hooked supporting rods pivoted on to the frame are turned up out of the way.

22,475.—DOOR LATCHES: F. Bell and J. S. Bell.—The latch-bolt displaces and then falls behind a lever that is pivoted on to the striking-plate of a door or some similar latch. For a striking-plate of a latch-lock adapted for right-hand and left-hand doors a screw is inserted through the other end of the lever, and the lever can be displaced with a handle so that the door may be opened from within, the latch-lock not being used. In the case of a two-bolt mortise lock a channel is made which enables the latch-bolt to operate upon the lever.

22,485.—NOZZLES OR AUTOMATIC SPRINKLERS FOR THE EXTINCTION OF FIRE: L. A. Weston.—A strut, whereof the two parts are secured to one another with a fusible solder, maintains a valve upon its seating. Through the centre of the spreader is passed a screw which carries the upper end of the strut. A staple that locks the two parts of the strut to one another engages underneath a projection upon one of the two parts, and is soldered on to the bottom flange of the other part. At the fusing of the solder, the opening of a spring contributes to force the parts of the strut asunder.

22,514.—CONCRETE CONSTRUCTION FOR BUILDINGS: G. E. Clare.—A concrete which contains clinker, coke-breeze, &c., is filled in the wooden frames of floors, walls, roofs, bungalows, and similar structures. For the parts of a building constructed of concrete, plaster, and timber, the timbers, and boards or tiles are nailed to the walls. The wooden frames may be laid upon a flat surface and filled in with concrete, the sections serving for bungalows. Fillets nailed outside the frame keep the concrete in its place, and a key for plaster will be afforded by fixing lathing strips of metal on to the woodwork. The invention extends to the building up of hollow walls, roofs, and floors, and to the fixing of concrete slabs between the timbers.

23,549.—MANUFACTURE OF CEMENT: J. C. Goshing, J. H. Fraser, and R. Booth.—For drying the slurry and burning it as it is being passed through an inclined rotary kiln, which is heated with an admixture of air and combustible gas or vapour, a hopper turns the cement in its fall from the discharge outlet into spaces, beneath which are arranged shelves, upon which are reciprocating slides that impel the cement into trucks, the motion of the slides being imparted by levers and cams upon the rotating kiln. The containers into which the burned cement is diverted have their walls inside either of a set of tubes arranged like a grid, or of corrugated air-heating boxes, through which air is forced with a fan, its path being lengthened by means of baffle-plates, and so through a pipe to the outlet nozzle.

22,605.—A REGULATOR VALVE FOR WATER-CLOSES: H. L. Doullon.—For regulating the flow from the service-pipe to the flushing-pipe is devised a lift-valve, in whose upper end is fitted a piston within a cylinder that is joined with a time-passage to the service-pipe and to a push-valve with an opening; the working of the push-valve reduces the pressure upon the top of the lift-valve, so that it will rise and effect a flush, after which it becomes slowly closed as water flows through the time-passage; a simultaneous and automatic working will be afforded by attaching the valve-spindle to the working-lever of the closet discharge-valve, a weight upon that lever will serve to close the valve, or the valve may be shut by means of hydraulic pressure upon a piston applied to the lever.

22,616.—SPANNERS: W. Förster.—In order that spanners which have fixed jaws may fit on to differently sized nuts their jaws are provided with filling-pieces; the filling-piece is made of plates strengthened with a web and is secured with a screw through an extension of the web. For turning nuts readily which are close together the plates are disposed so as to project sideways.

22,651.—SHAVE-HOOKS FOR PLUMBERS' USE: W. F. Waylan.—The shave-hook is rendered applicable for use as a gauge and marker, and as a cutter for marking washers as well, by marking its shank with graduated divisions and making the sliding gauge-piece as long as, or a little longer than, the blade which is pear-shaped. If the workman wants to shave or mark the end of a pipe, he presses the gauge-piece up against the pipe-end and draws the

tool towards it or around the pipe; thus the gauge-piece may be employed as a marker upon flat surfaces when the blade touches an edge of the surface, and it will serve for marking disterns when its blade is held against one side; it is also available for cutting round washers of leather, lead, or other soft substances, and can be used as a pair of compasses.

22,641.—AN APPLIANCE FOR USE WITH SLIDING WINDOWS: G. Barnes.—In order that the bottom of the sash may be automatically forced outwards on to the weather-strip as one shuts the window by lifting the bearer, the upper edge of the bearer and the lower edge of the sash are fashioned bevel-wise. See No. 20,799, of 1899, for a specification of the working and holding apparatus of the windows.

22,647.—MECHANISM FOR SLIDING SASHES: A. H. Fisher.—For detaching and fastening the cord a yoke or loop at its end has lateral projections that will engage with inlets cut in a bracket in the sash stile. Two hooks upon a cross-shaft enter the yokes so as to liberate them from the sashes. The hooks when either lifted or lowered lock a handle upon the shaft with a pawl set for engagement with a notched disc at the end of the shaft. The beads are hinged that they may be turned back out of the way, and eyes or sockets attached to the sashes fit over fixed pintles.

22,651.—FIRE-PROOF STAIRCASES: J. A. Willmore.—The cast-iron steps of fireproof staircases (so described) have recesses cut in them for treads of oak, teak, or other material. The treads are fastened with screws driven from beneath them, and sheets of some fire-resisting substance, such as asbestos, are inserted between the metal steps and the wooden treads.

22,671.—A FLUSHING APPARATUS: M. J. Adams.—The inventor has contrived that the depression of the closet seat shall effect a lifting of a bell, and that the fall of the bell shall cause the flush to start as soon as the seat has been freed again. To the rear end of the seat is pivoted a rod that extends through a tube upwards into the cistern so as to impinge against a lever which is pivotted at its one end, and carries the bell at its other end.

22,686.—A SAFETY APPLIANCE FOR LIFTS: U. S. Aze and H. S. Nagengost.—Underneath the cage or car is a frame that holds two pairs of cylinders, of which the pistons are joined to bars that slide between plates respectively; the remoter ends of the cylinders are joined together with pipes and also with an air-compressing pump which derives its action from the motion of the car. Under normal circumstances the cage will descend as a spring air-fall can be arrested through the compression of the air in the cylinders by the pistons as the latter are forced inwards by blocks which are mounted upon the bars and slide in inclined guides attached to the sides of the well or shaft.

22,693.—CALLIPER GAUGES: F. Ullmer.—Of the two jaws of the gauge one is provided with a pointer that traverses a minutely graduated scale, and the other is set to the required dimension by means of another scale and its pointer; the first-named pointer, which travels over a curved scale, has at its wider end a rounded part which is pivotted, and to a slight extent out of centre, to the jaw, on the handle by which the pointer is moved for adjustment is a sector which gears with a pinion upon the eccentric spindle; a variation of the arrangement of the jaws is included in the invention.

22,714.—COMPOUNDS FOR BUILDERS' USE: C. Strath.—For the making of a cement, plaster, or mortar, hydrated aluminium, oxide or bauxite, and slaked lime, are mixed with water. To render the compound fire-proof some mica is added to it, whilst for the bauxite may be substituted gneiss, granite, syenite, crumbled schistose rock, or argillaceous shales, through which water has been caused to percolate for the washing out of the free soda or potash. The granite or other component when in a dry-like condition should be heated in order that it may act upon the lime, and there may be added to the materials such acids and salts as will contribute to the formation of insoluble and fixed combinations with alumina and lime.

22,723.—A COMBINED LATCH AND LOCK: A. Cashin.—A lock, for doors and gates, is contrived with a bolt which will turn upon a pin in order that it may serve for a lift-latch, and will, moreover, slide and thereby serve for a bolt-lock the follower acting upon a pivoted lever or directly upon the tail of the bolt. For raising the bolt, the forward end of the lever is set in engagement with a recess cut in the bolt. In the case of a long recess, or of direct action upon the bolt by the follower, one is prevented from turning the handles after the bolt has been locked, but if a shorter recess is used the disengagement of the forward end of the lever (after the locking of the bolt) causes the turning of the handles to be inoperative upon the bolt. A tumbler or levers retain the locked or unlocked bolt in its place.

MEETINGS.

FRIDAY, MARCH 15. Architectural Association.—Mr. H. B. Measures on "Rowton Houses," 7.30 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. C. Lyndale on "Sanitary Appliances," 8 p.m. Institution of Mechanical Engineers.—Mr. A. N.

Connott on "Combined Trolley and Conduit Tram Systems," 8 p.m.

SATURDAY, MARCH 16.

Architectural Association.—Third Spring Visit, Stanhope House, Park-lane, W., by permission of architect, Mr. W. H. Romaine-Walker, 2.30 p.m. Institution of Junior Engineers.—Anniversary dinner Westminster Palace Hotel, 6.30 p.m. Royal Institution.—Mr. R. P. Taylor on "Lord Rayleigh's Sound and Vibration," IV, 3 p.m. Incorporated Association of Municipal and Civil Engineers.—Home District Meeting, to be held Wimbledon. Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage and Destruction Works, Ealing, 2.15 p.m. British Institute of Certified Carpenters.—Visit to the Guildhall, E.C., 3 p.m.

MONDAY, MARCH 18.

Royal Institute of British Architects.—Ninth General Meeting (business and ordinary). (1) Election of candidate for membership. (2) Mr. C. Harrison Townsend on "The Art of Pictorial Mosaic." In addition to lantern illustrations, a collection of specimens and photographs mosaic-work will be exhibited, 8 p.m. Society of Arts (Cantor Lectures).—Major Phil Cardew, R.E., on "Electric Railways," II, 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. C. Lyndale on "House Drainage," 8 p.m. Liverpool Architectural Society.—Mr. Neville Hanson on "The Restoration of Ordsall Hall," 6 p.m. Leeds and Yorkshire Architectural Society.—Mr. Francis Bond on "French and English Abbots," (2) Election of officers and exhibition of Institute drawings, 6.30 p.m.

TUESDAY, MARCH 19.

Institution of Civil Engineers.—Paper to be further discussed:—"The Aesthetic Treatment of Bridge Structures," by Mr. Joseph Husband, 8 p.m. Institution of Junior Engineers.—Mr. A. H. Barkley on "Water Engineering," IV, 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Professor Henry Robinson on "Water Supply: Source of Supply and Distribution," 8 p.m.

WEDNESDAY, MARCH 20.

British Archeological Association.—Rev. W. S. Lacy on "Chaucer as an Illustrator of Medieval English Literature," 8 p.m. St. Paul's Ecclesiological Society.—A paper entitled "Notes on the Brasses of Kent. Part II. Ladies and Civilians," will be read by Mr. Mill Stephenson, F.S.A., 7.30 p.m. Society of Arts.—Mr. Percy T. Macquid on "Evolution of Form in English Silver Plate," 8 p.m. Builders' Foremen and Clerks of Works Institution.—Ordinary meeting of the members, 8 p.m. Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection in the District of St. George, Hanover-square, 2 p.m.

THURSDAY, MARCH 21.

Some Cities of Modern Italy—Mantua.

O pass direct from Milan to Mantua, although the two cities are within the same province and have many characteristics in common, is like entering an abandoned church from the noisy modern street. Mantua is one of the old Italian cities least touched by the changed spirit of modern times. It jealously preserves the traditions of its historic past—its Lombard arcaded streets, its huge rambling palaces abandoned to emptiness and a few squatting villas, whose presence can only be accounted for by the evident neglect to which these buildings have been subject since the days of the Austrians. The disused private palaces of the city, with their grass-grown courts, decaying woodwork, and rusty iron gates, give it a very forlorn appearance. The enormous fortifications of the Napoleonic era, long since out of date, are entered by drawbridges, whose chains and machinery have apparently been appropriated for the sake of the old iron. Seldom visited by the tourist, the architectural treasures of the city are but little known, although the extraordinary creations attributed to Giulio Romano (a sort of creature copyist of Michelangelo) have a certain celebrity, very few people nowadays think them worth the trouble of a visit. Mantua, although it possesses no modern buildings, has a certain title to notice in a series of sketches of modern Italy, on account of the work being carried out in its name by the "Ufficio Regionale." This is the most estimable of modern institutions in Italy, planted, about two years ago, one of its divisional offices in the old palace of the Gonzaga, under the direction of Signor Arch. Signor Patricolo. Signor Patricolo has already done a great deal, but his labours only show what an enormous amount of

artistic work still remains buried under the successive layers of plaster and colour-wash which encrust the palace in every direction. It is truly a case of exploration more than restoration (the latter hated word is not permitted within the formulas of the U. R.). Operations were commenced in 1898 by scraping off the plaster fronts of the palace, with the greatest care, and as Signor Patricolo expresses it, "a page of history appears." The lower portions of the palace, with its arcades and the balconied windows shown in a very old picture preserved in Milan, have now come to light, and represent the thirteenth century; the upper portions of the palace are the Gonzaga additions of the fourteenth century. All these fronts will now be carefully preserved as they stand, without any "restoration," but with only such small repairs as may be absolutely necessary to ensure their stability. A very interesting discovery recently made inside the palace consists of a suite of rooms, a small building at one time almost detached, built for the celebrated Isabella d'Este about 1490. This apartment had actually been lost sight of, and was merely known from records as the "camera picta." Now, in the course of investigation, the whole suite of rooms has emerged from a collection of outbuildings of recent times in which it had become buried. It consists of a small court surrounded by a colonnade of delicate Ionic marble architecture, with a series of rooms radiating out of it, most of which are decorated in a very curious manner with a mosaic of crystals and coloured marbles on the walls. From these decorations the apartment has taken the name of "la grotta." All the marble work and decorations had been smothered up so completely with plaster, and alterations by partitions, &c., during the last two or three centuries, that their discovery excited a very considerable amount of surprise. The badges and monograms of Isabella are preserved amongst some of the fresco decorations.

Another very important work connected with this palace is at present being carried

out by the department—the isolation of the very beautiful fourteenth century Castle of St. George, situated at the eastern extremity of the buildings and of the city. Considering the extremely flat nature of the site of Mantua and its surroundings, this castle presents a wonderfully imposing appearance. Situated on the line of earthwork fortifications (there are no mediæval city walls), it is approached by a very long bridge spanning one of the curious lakes, or rather swamps, which surround the city. The castle would appear to have been built as the stronghold of the mediæval palace, and between the two were originally gardens, which have been built over to a great extent in later times. These later buildings, of a poor, sordid description, have covered up until recently the fine old red brick mediæval towers, the tops of which, with deep machicolations and embrasures, were only just visible. During the last few months the castle has been almost entirely freed from these unsightly additions, and now stands in a most singular state of preservation, surrounded by the ancient moat; but its walls are, of course, much seamed and marked with the traces of the buildings which have been removed. The castle, consisting of a square mass, with four square angle towers and a projecting gateway, all in red brick, with tile roofs over every part, will be left exactly as it stands, untouched but for certain repairs to windows and doors necessary to render it habitable and usable as the provincial "Archivio," for which purpose it is admirably adapted. Nothing in the shape of so-called "restoration" will be attempted, and so another monument will be added to that interesting series which is being cared for under the auspices of the newly-instituted "Ufficio Regionale per la Conservazione dei Monumenti in Lombardia."

Before very long Mantua will become an interesting and attractive city, with its recovered palace and its imposing castle. The sentiment which is guiding this recovery is an entirely modern one, and would have been unintelligible to the "restorers" of forty years ago. The city has, fortunately,

been preserved for better times, and its exceedingly interesting buildings are now in good hands. The dirt and sordid squalor of the immediate past is being removed, whilst at the same time everything of the slightest historical or artistic interest is now carefully left exactly as and where it is found, and however broken or defaced such things may be, they are preserved without any question of "restoration."

THE DECORATIVE TREATMENT OF THE PIANOFORTE.

WE publish this week four illustrations of decoratively treated pianofortes, all made by Messrs. Broadwood (to whom we are indebted for the loan of the photographs from which the illustrations are taken), but designed by various architects or decorative artists whose names are appended to the illustrations.

We do not consider that any apology can be considered necessary for introducing such designs among the illustrations to an architectural journal. The designing of furniture is in its nature closely connected with architectural design; and a pianoforte is one of the largest and most important pieces of furniture to be found in a modern house. Moreover, the use and object of the instrument give it a suggestiveness beyond that which belongs to most articles of furniture. It is the medium for giving voice to the productions of another art, and that one of the most poetic and certainly the most abstract of all the arts. It should surely claim a treatment worthy of so high a function.

Unfortunately, till very recently, the make of the outward and visible form of the piano has been entirely in the hands of the average cabinet-maker, who has had no object in view but solidity and a certain costliness and finish of mere material and surface. The operative portion of a grand piano represents a considerable weight, which seems to require strong supports, and this need has been supposed to be sufficiently met by the adoption of those thick elephantine legs, of a design suggesting the old forms of cheap decanter-stopper, with which we are only too familiar. It is, moreover, a costly instrument, and may therefore fittingly be enclosed in costly wood; but costliness has in general been the object rather than design, and polished walnut or polished ebony have been supposed to provide, in their own intrinsic appearance, all that the purchaser could desire, without the attempt to intrude any special design into the case. And it must be remembered that the majority of persons who go to choose a piano go to choose it as a musical instrument, and (not unnaturally) think more of the tone than of any other quality of its make.

The piano, like the organ, is in a different category in regard to form from most musical instruments. In the whole of the violin tribe of instruments, as well as in all the wind instruments played by the lips, the form of the instrument is that which is necessary for the production of its special sound. There is considerable beauty in a violin; but, except in regard to the scroll head, the beauty arises entirely from the fine character of the curvatures and lines which its shape naturally

takes; the peculiar shape being a necessary condition for the production of the tone required. In the piano the actual sound-producing parts are not visible, but are encased, for the same reason that a violin is put away into a case when not in use—for necessary protection from dust and atmospheric influence; only, as the mechanical portion of the piano is too heavy and too complicated to be moved about or put in and out of a case, its case has to be a permanent one. Under these conditions it can, of course, as the members of the Architectural Association were informed the other day by Messrs. Broadwood, be made in any outward shape we please. But in dealing with a grand piano, where the stringing and the frame naturally assume a harp-like form, it seems in accordance with the fitness of things that the case should follow that form. A rectangular shape would mean a considerable waste of space, and would moreover deprive the exterior outline of its special and peculiar character. The grand piano outline may be an awkward one to place in a room, and an awkward one to treat as a piece of furniture; but that is the outline arising out of the construction of the interior, and it is desirable to retain it.

Admitting that the general structural form of the grand pianoforte should be retained, the decoration should obviously be subordinated to this form, and should be designed so as to follow the lines and spaces of the structure, and give solidity to the supports while giving them some better decorative treatment than that of the common form of "decanter-stopper" legs to which we have referred. The painting of elaborate pictorial subjects on the outside and inside of the top, which has been carried out in some cases, is really not so much decorating a piano as making it a panel to paint pictures on; the purpose of the instrument is apt to be lost under the application of this kind of pictorial decoration; the piano becomes in fact quite subordinate to the decoration, and we are inclined to think that this kind of pictorial decoration is generally preferred (where it is preferred) by those who attach very little importance to the musical functions of the instrument; they want an ornamental piece of furniture, not a piano. And in no case should the keys be the subject of any decoration whatever. They are for use, not show, and the clearly marked contrast of the ordinary black and white keys is a necessity to the pianist who (if he is a master of his craft) does not look much at the keyboard, but who requires from time to time just to catch sight of the group of black keys at one or other part of the keyboard as a guide in a long skip from one position to another. To reverse the order of treatment and make the usually white keys dark and the "semitones" light in colour, merely because many old instruments were made in that way, is absurd; it is putting decorative treatment before practical use, and making a gratuitous puzzle for the eye of the player. Any kind of inlay ornament on the keys is also entirely out of place; in process of time it wears irregularly and spoils the surface, at the same time confusing the eye of the player. The surface of the keys, for use, cannot be too smooth and unbroken.

In the pianos we illustrate the keyboard of only one is shown, which has the

ordinary black and white keys, and we hope all the others are the same; indeed, we presume that Messrs. Broadwood understand their business as pianoforte makers too well to consent to any but the normal treatment of the keyboard. Mr. A. C. Blomfield's design No. 1, is in nearly every respect excellent; the lines of structure are all followed in decoration, and the supports are treated in an architectural manner which is graceful and appropriate while having every appearance of firmness and stability. The only point we take exception to is that in carrying out this architectural treatment in perhaps a slightly too conventional manner, the break of the "cornice" worked on the edge of the lid, so that when the lid is lifted, as shown in the illustration, the cornice is divorced from the entablature, and moreover shows in shape of projections on the edge of the lid, which, in that position, have no meaning and look decidedly out of place. This detail might have been avoided by a little modification in the treatment of the design. We do not know where the line comes from which is inlaid on the under side of the lid:—

"Soft is the music that would charm for ever, but it seems a very weak quotation to put on a musical instrument, and is particularly out of place in that position, seeing that the lid is only raised in order to increase the power of the sounds. Is it intended as a hint to the player to put the lid down again?"

The upright grand, No. 2, designed by Mr. Gilbert Ogilvy, is very pleasing in decorative treatment, but it is a form of case for the instrument which appears to us to have no advantage whatever, unless the object is to make something which, when closed, will look as little like a piano as possible. The flap doors standing open on each side are merely a nuisance to the player, suggesting a feeling of not having elbow room, and we do not see that a form of piano has anything whatever to recommend it either in an æsthetic or practical sense.

The piano No. 3, designed by Mr. Lutyens, has the merit of simplicity and absence of pretence in the decorative treatment, but the design of the supports suggests that, had it first made them too thin for stability, the architect felt under the necessity of bracing them together to ensure a firmness which their unaided proportions would not supply. We do not think the result is happy, though there is no doubt a novelty and grace in the treatment of the curved braces.

The semi-grand No. 4, by Mr. Allcock, decorated with simple and graceful inlay designs, is in an excellent taste; but the designer, in adopting thin legs coupled together, has rather sacrificed stability of appearance to elegance. The pianoforte, as already observed, is a heavy affair, and when it has to be moved all over the floor, which is sometimes necessary, the side strain on the legs is very considerable, and they ought to be strong enough to stand it. If that piano were moved lengthways, the end legs would be subject to more strain than they seem able to bear. Moreover, absolute stability of instrument is of the greatest importance to the player; solid-looking supports are therefore demanded both for practical and æsthetic reasons; and the movement

avour of paring down the legs of a piano to thin and what are supposed to be elegant proportions seems a mistake.

NOTES.

The Monument to Queen Victoria. THE proposal to erect the memorial to our late Queen in front of Buckingham Palace perhaps as good a one in regard to taste as could be made; but it ought to be once pointed out, in the most emphatic manner, that to render any important monument of the kind effective, the question of its position on the ground will need very careful consideration, or else some rearrangement of the ground will be necessary. At the time when the Marble Arch was first erected in front of Buckingham Palace the courtyard between it and the Palace was laid out in a decorative manner, and the then straight canal in St. James's Park ceased and was axial with the centre of the Palace. Now the straight canal has been replaced by an irregular sheet of water which is not central with anything, and the axis of the Mall is not in a line with the axis of the Palace. Unless we are to see repeated the blunder so constantly made in London, of erecting monuments, arches, and buildings of monumental character, without the slightest regard to axial position and as if they were thrown on the ground by accident, it must be obvious that if the proposed monument is to occupy a position axial with the line of the Mall, it must be kept entirely disconnected from the Palace, otherwise its position will appear absurd; if it is to be central with the Palace, it must be kept as close as possible to the latter, and entirely disconnected from the Mall. Considering the wretched architectural character of the front of Buckingham Palace, it may be suggested that one part of the scheme might very well be, to erect a new façade to Buckingham Palace itself—a façade worthy of the position and its associations, and which would form a portion of the memorial, the special monument to the Queen standing closely in front of and even connected architecturally with the new façade. Otherwise, any architectural and sculptural monument erected immediately in front of the Palace would only intensify the mean and commonplace character of the Palace façade.

Frescoes of S. Maria Antiqua. FEAR has been expressed that the remarkable frescoes of the seventh and eighth centuries which adorn this recently-discovered church in the Roman Forum must suffer severely from exposure to the air and lose much of their extraordinary freshness. We are in a position to state that every precaution is being taken for their due preservation. Not only is a skilled artist at work making coloured facsimiles—a Herculean task considering the extent of the frescoes—but under the direction of Signor Boni, a process of *sterilizing* the plaster is being carried out and effectively prevents any further fading. Every one interested, not only in mediæval antiquities but more especially in the influence of classical tradition on Christian art, should study these remarkable frescoes. The earlier ones are distinctly Pompeian in manner, and the transition to a rigid Byzantine style can clearly be seen. It is, indeed, a marvellous piece of good fortune

that has preserved for us with such wonderful freshness a fresco such as that of the Crucifixion, securely dated by the inscribed figure of Paul I. (A.D. 757-767) marked as contemporary art by the *square nimbus*.

The Workmen's Compensation Act. THE broadening effect of the recent decision of the House of Lords on the Workmen's Compensation Act is very well instanced by the case of *Dredge v. Conway, Jones, & Co.*, which was decided last week by the Court of Appeal. The man who was injured was whitewashing and stopping the ceiling of a staircase, and he was standing on a mixed erection made of planks resting on ladders—one of those makeshift affairs with which every householder who has had the interior of his house whitewashed is familiar. The County Court Judge decided that the house was not being constructed or repaired by means of a scaffolding within the meaning of the Act. This decision has now been overruled by the Court of Appeal, on the authority of the House of Lords, in *Hoddinot v. Newton*. In other words, as we stated at the time of the last decision, the judges must now construe the Act from the point of view of including as far as possible all building or similar operations within it. Why in the first instance the Act could not have been drafted so as to secure this result without the expenditure of so much money in litigation it is difficult to imagine. Even yet, with the most liberal construction, it is possible for some workmen to be excluded from its benefits, and we feel certain that it would be most desirable that Parliament should amend it by striking out all its limitations, more especially that in regard to the limit of 30 ft. in the height of buildings. Nearly all workmen are now affected by it, and it is better that there should not be even a limited exclusion.

Polyphase Machinery. At the Institution of Electrical Engineers last week, Mr. Eborall's paper on "Polyphase Substation Machinery" attracted a very crowded audience. As all electricians at the present time are very anxious to become acquainted with the theory and practice of polyphase working, which has become the standard system on the Continent and in America, this partly accounts for the large attendance. Mr. Eborall's paper was a very meritorious one, and, although nothing very novel was described, it ought to prove useful to engineers, as he discusses very carefully the practical difficulties in the way of successful working. We pointed out last year that in his paper on induction motors he had left out of account the shape of the pressure wave. In this paper it is mentioned more than once, and he also deserves credit for having avoided the fallacy of a power factor of unity. He mentions that at Prague, a town of 250,000 inhabitants, there is a very successful municipal electric station providing current for lighting, power, and traction. The lighting and power supply is done by polyphase currents, whilst the electric trams get their direct current from substations operated by the polyphase currents from the central station. As the pressure on the lighting circuits is kept almost absolutely constant notwithstanding the variable loads on the traction circuit, this is a conclusive proof of

the possibility of such a combined station. The economies that can be effected by having only one central station will be obvious to engineers, and the municipal undertaking at Prague is an assured financial success. Mr. Field, one of the engineers of the tramways system of the Glasgow Corporation, who has, therefore, practical experience of the working of polyphase currents and rotary converters, described several devices he has adopted for ensuring steady working. Dr. Silvanus Thompson stated that in his opinion rotary converters, &c., were only makeshifts; the true system was to use three-phase currents throughout—to use, for example, three-phase motors on the electric-cars, and thus get rid of all the electrolytic troubles caused by leakage of the direct currents from the rails.

Society of Painter-Etchers. THE nineteenth exhibition of the Society of Painter-Etchers, now on view at the Gallery of the Society of Water-Colour Painters, shows indications of a tendency to return more generally towards the practice of pure line etching—what we call genuine etching. There is a larger proportion of this class of etching, and less of the attempts to produce special effects which do not properly belong to the etcher's art. There are none of Mr. Law's overworked productions in the style proper to engraving, nor any of Mr. Strang's essays in the grotesque; though Mr. R. Spence, in his four odd and incongruous scenes in the life of J. Fox (8 to 11) seems rather to have taken his cue from Mr. Strang. Among the most striking works in the room are, as usual, the collection of dry-point portraits of ladies by the eminent French master of the burin, M. Helleu; all of them admirable in the freedom yet certainty of line; the only drawback is the total want of expression in the countenances—whether because the sitters had none, or because the artist could not render it, we cannot determine. A fine example of free and powerful dry-point work is also M. Legros' "Solitude" (25). Many of the best examples of the art of etching are to be found not among the larger and more prominent works, but among the small plates which might be passed over by a hasty observer. Among these may be mentioned Mr. Pimlott's "Building a Boat" (6), Mr. Van Raalte's "Old Wooden Bridge, Rye" (59), one of those which shows the characteristic quality of etching in dealing with a subject in which the darks are all concentrated on the main object and the rest only indicated, the whole done with as few lines as possible; Mr. Charlton's "The Street Corner" (108), a snow scene in an old city; the same artist's "Low Tide" (123); Mr. Evershed's Italian subjects, especially "St. Peter's from the Pincio" (162) a perfect little work, executed with the greatest care and delicacy but with nothing overdone; Mr. Holmes May's "Wayside Sketch" (166); and Mr. Barrett's "Slip Top, Staithe" (177). What we call the "scratchy" style of etching is illustrated in such examples as Mr. Burridge's, 46 and 49, where the sky is all a scribble; freedom of line without a definite aim. Among architectural subjects Mr. Cameron has several from Italy which have a quality of their own; M. Kéjov's Paris sketches are rather weak; Mr. Haig's interior of Barcelona Cathedral (53) is a fine example of clean

vertical line shading; Mr. Wallace Rimington's interior of "St. Stephen's, Vienna" (207), in a different style of execution, is also very effective; Mr. Pott's view of the portico of St. Martin-in-the-Fields is out of drawing, and the columns are too thin. Among other works worth special notice are Mr. Knight's "Original Mezzotints," especially No. 206; Mr. W. Monk's "The Firs, Hampstead" (120), with the tree-trunks treated white against the background; Mr. Holroyd's "Study of Pine Trees" on Lord Tennyson's estate (72); and Mr. Bauerle's "Danaë" (41—dry-point), a very graceful half-length; his larger work, "Goblin Market" (43), is not so effective in conception as Rossetti's original illustration to the poem. A selection of "Etchings of the Norwich School," by Crome, Cotman, and Daniell, forms a feature in the exhibition; they are not mostly very remarkable works, but are interesting historically, as showing how little sense of special style in etching existed in England at that period.

THE eighty-sixth annual exhibition of the Institute of Painters in Water-Colours.

Painters in Water-Colours at their Galleries in Piccadilly, though it perhaps can hardly be said to contain any one work of the first importance, is as a whole one of the best we have seen, containing especially a considerable number of interesting studies in landscape. Of the figure subjects there are few that interest us; the best are Mr. Frank Dadd's picture of officers of the Queen Anne or early Georgian epoch choosing "Horses for the King" (229), and Mr. Collins's pre-historic "Duel" (15); and Mr. Henry Stock sends a very pretty child portrait (50) and a Titianesque study of "Pain Bringing Wings to a Soul" (279), which at least aims high, and is fine in colour. But among landscapes there is much to enjoy. The various small but rather highly finished works by Mr. Pyne are a little too finished, but all pleasing. In the first room Mr. Ferrier shows a fine view of Edinburgh Castle from the Greyfriars Churchyard (10); Mr. Weedon, who in style is almost a double of the late Mr. Wimperis, exhibits "Glen Logan, Ross-shire" (40) and several drawings in the same broad and fine water-colour style. Mr. Stratton's "A Quiet Evening" (82) is a small work of much feeling. Mr. Macbride's "On the Kennet" (94) is rather woolly in manner, but a work not to be slighted; nor, in a very different way, Mr. Rivers's "After Rain" (102), a village street scene with a touch of evening sunset light in the sky, very quiet and unpretentious, but poetic in feeling. Mr. Arthur Severn's large picture of a "Spate in the Highlands" (134), powerful in its way, is somewhat spoiled by the perspective of the bridge being unsatisfactory, the place of the piers on the water-level not coinciding with the direction shown by the line of the parapet. Among the works in the centre room is Mr. Knight's beautiful "Marshland" (277), Mr. Wetherbee's "Night" (294—the clouds are rather too solid); and Mr. Gregory's "The Brink of a Discovery" (288), a charmingly painted Thames-side scene which does not fully explain its title. In the third room are the largest and most important landscapes, among which Mr. Bernard Evans's "Storm in Wharfedale" (464) is very fine in spite of a certain yellowish conventionality

of colour. Here also are several fine landscapes by Mr. Orrock, in his well-known style; Mr. Knight's "Morning Light" (449); Mr. Davies's "Across the Ilkley Moors" (441), a very fine landscape which, without being hard or realistic in style, looks as if you could walk over it and into the distance; Mr. David Green's "A Breezy Common" (417), another inspiration from Mr. Wimperis, or appearing such; Miss Ethel Kirkpatrick's clever picture "The Lantern" (402), and several admirable little works by Mr. Nisbet, among which "November Evening" (350), is especially good—a grand landscape reduced to a small scale. Among architectural subjects Mr. Fulleylove has a carefully studied "Interior of St. Paul's" (272); Mr. Shoosmith's view of the "Place Eau de Robec, Rouen" (49), which rather reminds one of Prout; Mr. Macquoid shows us a fine view of "The Old Castle, Dieppe" (134), with the bridge across the moat leading up to it; and in "Waiting for Master" (273) Miss Violet Linton has contrived to produce quite an interesting little picture out of the brick walls of a cottage and a small white dog keeping watch in the doorway.

WE are officially informed that the King has graciously consented to continue to be the

patron of the Royal Institute of British Architects, and to offer, as was done by her late Majesty for over fifty years, an annual Royal gold medal, to be presented on the nomination of the Royal Institute to a distinguished architect or architectural writer of any nationality. For this present year, however, the gold medal remains, we believe, in abeyance.

STOCKPORT UNION INFIRMARY COMPETITION.

It is somewhat surprising that the designs submitted in this competition do not reach a higher average of merit. The conditions of the competition were fair; the premiums offered were, considering the labour involved in the preparation of the designs, more generous than in many other competitions; the name of the assessor (Mr. Thomas Worthington, F.R.I.B.A., Manchester) was mentioned in the instructions to architects; and the site was an almost exact rectangle, with the longer sides fronting north-west and south-east, and therefore lent itself to a simple and satisfactory disposition of the buildings. The requirements included an administrative block suitable for an infirmary of 500 beds, male and female ward-blocks for 300 beds or thereabouts, "lying-in" wards for about ten beds, nurses' home for thirty nurses, mortuary, porter's lodge, and receiving wards. The buildings were to be planned in such a manner that additional pavilions could be conveniently erected, so as to bring the total accommodation up to 500 beds.

The instructions make it clear that the administrative block must be practically in the centre of the site, and connected by a central corridor with the male ward-blocks on one side and the female on the other. The two double ward-blocks contemplated in the scheme to be first carried out were to be three stories high, each double block to contain on each floor two twenty-four-bed wards and two two-bed wards, together with the usual duty-rooms, conveniences, storerooms, lifts for food and beds, &c. The obvious arrangement of the ward-blocks would be to place them at right angles to the main central corridor, one-half of the double block in front of the corridor and one-half in the rear, and this arrangement has been adopted by all the competitors with one exception. The lying-in wards were to be provided "in a building attached to the females' pavilion," and this instruction has been complied with by most of the competitors, the most notable exception being the design which has gained the first premium. Another explicit instruction,

which has been disregarded by many of the competitors, is that which stated that the receiving wards and stores for patients' own clothing must be "adjacent" to the porter's lodge. Some latitude, however, was allowed to architects, permission being given to deviate from the instructions "as regards details," but the same clause contains a request that the instructions be adhered to "as far as possible."

One other requirement remains to be noticed, as it represents a departure from ordinary hospital design, and has furnished a difficult problem for the competitors to solve. This is that the bathrooms, lavatories, water-closets and sinkrooms "must be placed at the corridor end" of each large ward; the qualifying words "if possible" are added, but the competitors, with few exceptions, have accepted the instruction as important and definite, and have attempted to carry it out, although generally, it must be confessed, with indifferent success. It would almost seem that the assessor, in making his award, has considered the satisfactory solution of this problem to be a vital point.

The first premium of 150*l.* has been gained by Messrs. Giles, Gough, & Trollope. Their design (No. 11) is shown on eleven stretchers, and is on the whole worthy of the first place, although it cannot be said to be perfectly satisfactory. The administrative block is in the centre of the front, and is divided into two portions by the main corridor, which runs from it (right and left) to the ward-blocks. The medical officer's apartments are planned on the assumption that he may be a married man; some of the competitors appear to think that medical officers have all taken vows of celibacy. The kitchen department is a one-story building behind the main corridor, and economy and convenience are studied by placing the two Lancashire heating boilers coal-stores, workshops, &c., in a basement under the kitchen department; the basement is approached by an inclined road at the back. The female double ward-block is placed about 65 ft. to the left (that is to say, to the south-west) of the administrative block, and another double block of similar plan but only two stories high is shown at a similar distance to the left of the first block; this represents the future extension of the infirmary on the female side. The lying-in ward is still farther to the left, and is about 50 yards from the female ward-block now to be erected; according to the instructions the lying-in wards "must be provided in a building attached to the females' pavilion,"* although we agree with Messrs. Giles, Gough & Trollope that such an arrangement is not the best, and we are quite certain that a more convenient position could have been found than that shown in their design.

The nurses' home is at the extreme left of the frontage, and is brought well forward from the central corridor. A double ward-block for males is provided for present requirements on the right of the administrative block, and a similar block (but only two stories high) is shown further to the right for future erection. The porter's lodge and receiving wards are placed in the right front corner of the site and the mortuary in the right back corner.

The planning of the porter's lodge leaves much to be desired. It is wedged between the male and female receiving wards, in such a manner that the kitchen forms a passage between the two wards. The kitchen is not a large one, but it contains five doors and two windows. The receiving wards contain three beds each, and are conveniently planned with separate waiting and examination halls, bath-rooms, water-closets, and clothes stores for the two sexes.

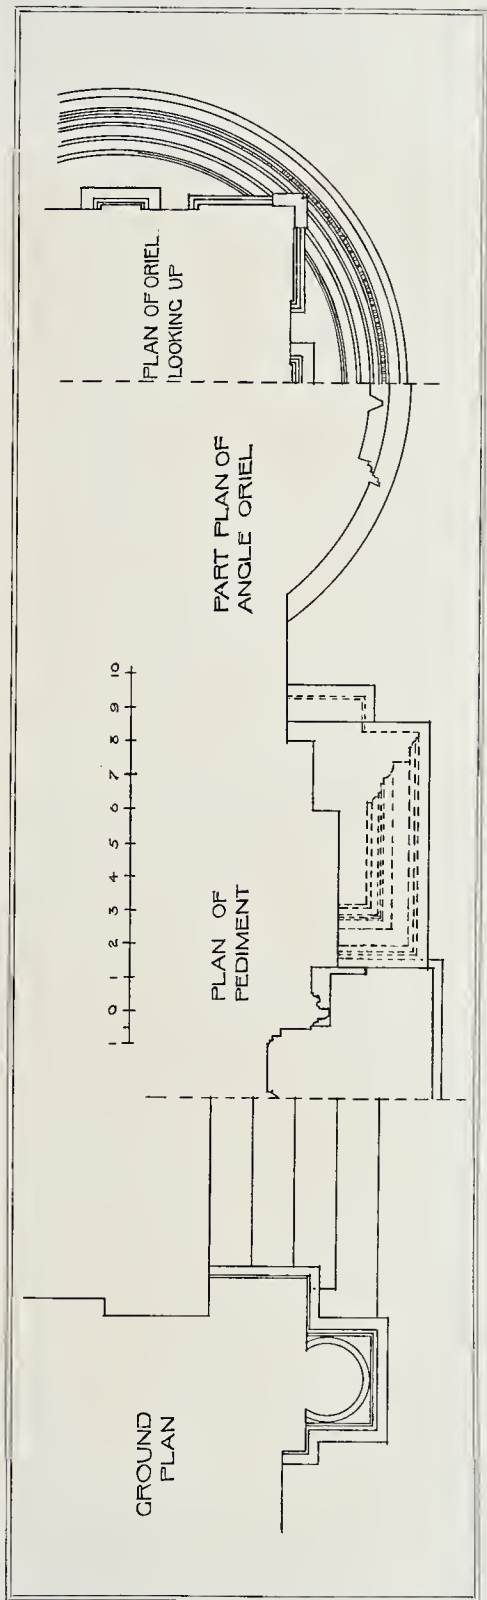

The large wards in the pavilions measure 77 ft. by 24 ft. by 12 ft. high, and the water-closets and sinkroom for each ward are cleverly arranged so as to be entered by a doorway in the canted angle of the ward, and by another doorway in a short corridor approached from the ward corridor. This short corridor is provided with a window. The two doorways already mentioned lead into a cross-lighted lobby, from which the conveniences are entered. The bathroom is entered both from the short corridor and from the ward corridor, and after the bathroom are the lavatory, linen closet, and storeroom. The nurse's duty-room is placed between the main ward and the two-bed ward, and has a ladder adroitly planned in one corner. This arrangement of the ward conveniences is the best submitted; the assess-

PRINCIPAL ENTRANCE TO NEW SCOTLAND YARD — DRAWN AND MEASURED BY MR. HARRY JONES.

to them is convenient, and they do not prevent a window being placed between the end of the ward and the first bed. An alternative plan is submitted showing a dayroom for patients adjoining each two-bed ward, and entered from the ward corridor. A balcony or verandah is shown on part of the south-west side of each ward; this is an advantageous position, being more sheltered and more sunny than the ends of the wards.

The details of this design are carefully considered, and although there is room for improvement in some respects, it is, on the whole, the best design submitted in the competition. The instructions specified that the buildings must be heated by steam and open fires or stoves. This condition has been observed. The drawings show a rather too simple scheme of ventilation by means of Tobin tubes, and extract flues (in the walls) leading from grates near the ceilings. As the reports are not exhibited with the drawings we do not know the estimated cost of carrying out the design. The limit stated in the instructions was 130l. per bed. The elevations are simple; the three-storied administrative block is the only part of the buildings in which architectural embellishment has been attempted.

Mr. H. Percy Adams, of London, has gained the second premium (100l.). This design (No. 12) comprises nine stretchers, and is an able contribution. The general arrangement of the buildings on the site is in the main similar to that adopted by Messrs. Giles, Gough, & Trollope, but with the following variations: the boiler-house is a separate building behind the kitchen department, and the mortuary is in the rear of the boiler-house; the lying-in ward is attached to the free end of the rear half of the female double pavilion; the nurses' home is on the line of the main central corridor at the south-western extremity, and not (as in the accepted design) placed some distance in front of the corridor; the entrance-gates are opposite the centre of the administrative block, with the porter's lodge on the right and the receiving wards on the left.

The twenty-four-bed wards measure 78 ft. 6 in. by 24 ft., and are planned with balconies at the free ends. As in the accepted design, the duty-room is placed between the large ward and the two-bed separation ward, but the latter is on the opposite side of the ward corridor. At the entrance end of each ward a corridor branches off at right angles to the ward corridor and extends beyond the walls of the ward so that cross lighting and ventilation can be obtained; this corridor leads to the sink-room and water-closets (two for the patients and one for the nurses), which are placed in a square tower planned normal to the wards. This arrangement admits a window between the end wall of the ward and the first bed. The lavatory, bathroom, and larder follow on the same side as the branch corridor. In the angles formed by the main corridor and the rear ward corridor are placed the stairs and bed-lift (in one angle), and a general store, service lift, and room for pairs and movable bath (in the other angle).

The lying-in ward can only be approached through one of the large female wards, and although this position is in accordance with the instructions, it cannot be considered satisfactory. The nurses' home is simply planned, but the internal effect of the octagonal hall in the middle of the longitudinal corridor and of the staircase at one end would be decidedly pleasing and homelike; the smoke-flues, however, from the ground-floor rooms would have to be twisted a good deal to get them into the chimney-breasts on the first floor.

The receiving block has two five-bed wards on the ground floor, with two bathrooms, waiting-room, attendant's room, and hall and staircase between them; the patients' clothing stores are on the first floor.

The administrative block is well planned, but the apartments for the medical officer are insufficient for a married man. The elevations are of a rather quaint character, and the whole design bears evidence of great skill and knowledge.

Mr. C. W. Harvey, the winner of the third premium (50l.), owes his success entirely to the meritorious planning of his design (No. 6A), and not to draughtsmanship or architectural character. The administrative block covers a somewhat large area, but is, on the whole, well arranged, although a vegetable scullery is lacking, and the servants' bedrooms are not happily placed. The block plan is remarkably similar to that of Mr. Adams, but two receiving

wards are shown adjoining the main corridor, between the administrative block and the male and female pavilions. An alternative site for the receiving wards is suggested close to the entrance gates in the centre of the front. The nurses' home can only be described as a dreary building, without any of the charms of a home, either in plan or in elevation, but it contains the necessary accommodation, and the corridors are well lighted and ventilated. The conveniences for the main ward-blocks are so planned that there is no window between the end wall of the ward and the first bed, and the kitchen larder prevents such a window being placed on the opposite side of the ward. As in the first premiated design, the conveniences can be entered either from the main ward or from the ward corridor. Mr. Harvey's arrangement of the conveniences is better than most of the arrangements submitted, but is not equal to those shown by Messrs. Giles, Gough, & Trollope, and by Mr. Adams. The separation wards, storerooms, bathrooms, stairs, and lifts are well arranged, and the planning generally bears evidence of careful thought. Dayrooms are shown at the free ends of the wards. The lying-in ward is attached to the rear of the female pavilion, as in Mr. Adams's design.

Design No. 1 has the lying-in ward immediately behind the administrative block, while the boiler-house is at the south-west end of the main central corridor, and is therefore badly placed for satisfactory working. The ward conveniences are not well planned, and the storerooms are too small. Some necessary rooms are omitted from the administrative block.

The most conspicuous feature of Design No. 2 is a tower 24 ft. square, and about 140 ft. high to the top of the final. Further extravagance is shown in the duplication of the staircases and lifts in the pavilions, and the planning is faulty in other respects.

Design No. 3 has many good features, but is lacking in compactness, and would prove somewhat costly in execution. The administrative block is planned on clear lines, and the boiler-house is placed behind the kitchen department. The ward conveniences and subsidiary rooms are fairly well arranged. Verandahs are shown on the sunny side of the wards, and dayrooms at the free ends.

Design No. 4, shown on nine stretchers, is well drawn, and the elevations are among the most satisfactory submitted, but the planning shows a lack of knowledge of hospital requirements. This is also true of design No. 5. The ward corridors are deficient in light and air, and small lying-in wards are placed on each floor of the female pavilion—an arrangement which would not be convenient for the maternity nurses; this competitor has placed the conveniences at the free ends of the wards. No fewer than twelve stretchers are submitted by the author of design No. 6, and in this case also the conveniences are placed at the free ends of the wards. The conveniences are similarly placed in design No. 7, and the lying-in wards follow the unsatisfactory arrangement of those in No. 5. In No. 8 the conveniences are placed at the corridor end of each ward, but are only accessible from the wards, and do not admit of a window between the end wall and first bed; the duplication of the staircases and bed-lifts in the double blocks is unnecessary.

Design No. 9 is decidedly above the average, and is illustrated by a well-drawn set of fourteen stretchers. The elevations are not without merit, but the tower is an unnecessary and costly feature. Two receiving wards are provided, as in the third premiated design, and the lying-in ward is attached to the main central corridor, as in the first premiated design, but in a more convenient position. The ward conveniences are placed at the corridor ends of the wards, but are not well arranged, and the ward store-rooms are too small. In the administrative block the dispensary is at a considerable distance from the medical officer's room; but, taken as a whole, the design is certainly a good one, although somewhat costly.

In design No. 10 the ward conveniences are placed near the main central corridor, about 50 ft. from the doors of the wards. The author of No. 13 has succeeded in illustrating his design on five stretchers only; it is a good production, but unsatisfactory in several respects, such as the length of the unlighted portions of the ward corridors. The authors of No. 14 have submitted two designs marked

A and B; in the latter the ward conveniences are at the free ends, but in the former they are arranged at the corridor ends as requested in the instructions. This is one of the few designs where this problem has been solved in a fairly satisfactory manner, but the design is so seriously defective in other respects as to be hopelessly out of the running. Design No. 15 shows careful thought, and is above the average.

The reports submitted by the competitors are not attached to the drawings, and it is, therefore, impossible for us to state the estimated cost of the designs, but the three premiated designs appear to be among the least expensive.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute of British Architects was held on Monday evening at No. 9, Conduit-street, Regent-street, W., the President, Mr. W. Emerson, occupying the chair.

Mr. Alex. Graham, Hon. Secretary, said he regretted to announce the decease of Mr. Newton Edward Jennings, M. Inst. C.E., of Melbourne, Victoria, who was elected a Fellow of the Institute in 1867.

The Royal Gold Medal.

The President said that, as they were aware, on the decease of her Majesty Queen Victoria the gift of the gold medal naturally lapsed, as the medal was a personal gift of her Majesty. As had been previously announced, the medal could not be awarded this year, because the time for its presentation came immediately after her Majesty's decease. After that sad event, some time naturally elapsed before they could approach his Majesty the King to ask him to extend his patronage to the Institute, and to present annually the gold medal; but at the right time they wrote to the proper quarter, and had just received an answer from Sir Dighton Probyn, who wrote that he was commanded to reply that his Majesty would be happy to continue his patronage to the Institute, and also to offer the gold medal, as was done by her Majesty.

The Architects' Benevolent Society.

The Chairman also said he desired to say a few words about the Architects' Benevolent Society, the annual meeting of which was held recently. The funds of the Society were in anything but a satisfactory condition, but for all that he had heard it stated that the Society was in so prosperous a condition that it could not get sufficient applicants for the funds at its disposal. He did not know how such a report could have got about, for it was absolutely untrue, and at the last meeting there were so many applicants (to many of whom it would have been advisable to give sums of not less than 20l. or 25l.) that they were not able to give more than 5l. in some cases in consequence of the smallness of their funds. Moreover, last year the Society wound up with a debt of between 40l. and 50l. The Society made an appeal last year to 5,000 architects to add to the funds, but only ninety responded. He did not think that redounded to the honour of the profession, and if each of the gentlemen written to had given half-a-crown or five shillings, the Society would have been helped very much. Mr. Macvicar Anderson had been so impressed by the necessity for increasing the funds of the Society that he very generously offered to give 50l. to cancel the debt, and had promised to increase that sum to 100l., provided 950l. could be raised amongst members of the profession. A sum of 100l. had since been raised by three gentlemen, and in addition Mr. Waterhouse had promised, and in addition the Chairman, very much hoped that the members of the Institute would do what they could to raise the money before the end of the year.

The Art of Pictorial Mosaic.

Mr. J. H. Brewerton, of Bournemouth, having been elected a Fellow,

Mr. C. Harrison Townsend read a paper on "The Art of Pictorial Mosaic," of which the following is an abstract:—

In introducing his subject, Mr. Townsend remarked on the paucity of published matter dealing with the history and practice of mosaic-work as a whole. M. Gerspach's "La Mosaïque," and Professor Middleton's short article in the "Encyclopædia Britannica," represented the only endopædia towards a

general history or a comparative criticism of the art. For the purposes of the present paper he proposed to consider the subject from the period when Christianity claimed the aid of mosaic-work. The earliest examples handed down to us are of the fourth century. Ciampini's theory that the Church of St. Costanza in Rome had been originally a temple of Bacchus was based on the nature of the ornament; but M. Mintz holds that the mosaics are of Christian origin, though under strong Pagan influence. A fragment of mosaic found in the cemetery of St. Callisto, Rome, and now in the Vatican, is apparently of the fourth century, and is interesting as being probably the earliest representation of the traditional features of Christ. The home of the martyrs Pudentiana and Praxedes, consecrated by the Pope in the second century, was largely altered in the fourth to adapt it to the purposes of a church, when the very beautiful mosaic work, still existing though much restored, was executed on the vault of the apse. This work, which shows the high level to which mosaic art had attained in the fourth century, may be regarded as a compendium of the early or Roman manner, untinged by the influence, later to be predominant, of the Greek canons and ideals. Constantine, after his removal of the seat of empire to Constantinople in 330 A.D., especially favoured the mosaic artist, and during his reign and that of his immediate successors a great number of churches in the eastern part of the Empire were beautified by this art. St. George's, Thessalonica, was cited. The mosaics in the Baptistery at Naples are of the fourth century, which closed under the growing influence and domination of the Eastern or Byzantine.

In the fifth century (c. 422 A.D.) the Empress Galla Placidia, widow of Constantine II., made Ravenna her seat, and it is to her that the city owes three of its treasures—the Baptistery of the Orthodox, the Chapel of the Archbishop, and the Mausoleum of the Empress herself. Describing and illustrating the mosaic work in these buildings, the author drew attention to the pagan symbols introduced in the Christian subjects represented, and remarked on the distinctively Roman treatment of the forms depicted. The very beautiful work in the Mausoleum of Galla Placidia seems, with its absence of gloom yet its dignity of invention, its Roman forms yet its Christian thought, to form the typical example of the fusion of the new and the old creeds. Other examples of fifth-century work still existing were referred to—viz., those at St. Ambrogio, Milan, and St. Sabina, Rome, and the series of mosaics on the Triumphal Arch of St. Maria Maggiore. These latter are particularly important among the early works of Byzantine art, and show the last effort for many centuries towards dramatic representation, before pictorial art became crystallised into conventional and traditional forms. The fairly precise reminiscences of the fifth century contained in the mosaic work of the Basilica of St. Paolo fuori le Mura, which retains the scheme of the original mosaics of Pope Leo I. (440-461), show how the earlier—Roman—symbolism was passing away.

The sixth century is rich in material for study, in both the Eastern and Western portions of the Empire. The gorgeous mosaics at St. Sophia, Constantinople, completed under Justinian in 550, lay concealed for many centuries under coats of whitewash. But in 1847 and 1848 an opportunity of studying the Byzantine mosaics occurred, and Salzenburg made his well-known series of drawings of the old work. Judging from these, there seems to have been a consistent scheme of decoration, a general tone of harmonious quiet colour, with silver largely used for the high lights, and soft green or blue folds in the drapery, and throughout a feeling of the antique or Roman style as it began to be influenced by the sterner, more rigid canons of the East. Touching the present condition of the mosaics of St. Sophia, the author stated that five years ago he examined, with the aid of strong glasses, the ceiling of the gallery, and came to the conclusion that the present whitewash serves as substitute for now absolutely vanished mosaics! The author then passed to sixth-century mosaics at Ravenna, describing those at the Baptistery of the Arians, or St. Maria in Cosmedin; St. Apollinare Nuovo, built in 500 A.D. for the use of the unorthodox, and converted into a Roman Catholic church in 570, traces of both influences being present in its treatment; St. Vitale, built A.D. 526, and utilised as a model for St. Sophia,

Constantinople; and St. Apollinare in Classe, still, for all its sadness of decay, a magnificent contribution to the history of the art. Regarding the art at Rome at this period, the dominance of the Northern races, after the accession of Theodoric in 493, had led to the selection of subjects appealing to and models selected from the strenuous and vigorous Northerner rather than the dreamy and ascetic Eastern. The work is characterised by freshness of treatment, but with a kind of grim hardness in the type of countenance selected—the Roman ideal at base, but with an all but barbaric respect for physical strength.

Seventh and eighth century examples—St. Agnese fuori le Mura and St. Theodore, Rome—were briefly described.

The achievements at Rome and Constantinople during the ninth century must be contemplated in the light of the great dispute of the preceding century as to the representation in religious subjects of the human or divine-human form, and the effect that the various Church rulings had exercised on Christian pictorial art. The result was to check the art along the particular lines affected, but to lead to a reaction during the following century, and the ultimate production of many great and important works. Works of the date referred to included the mosaic in the sanctuary of St. Ambrogio; the very beautiful and gorgeous mosaics of the Church of St. Prassede, Rome; and those at St. Marco and St. Cecilia, Rome.

From the second quarter of the ninth century till near the middle of the twelfth the art underwent in Rome a period of absolute stagnation. During this period, however, notable work was done at St. Mark's, Venice—work in which a Greek or Byzantine influence is manifest. At Torcello, in the twelfth century, a magnificent mosaic was placed on the apse ceiling.

The existence of a purely Sicilian school in Sicily is doubtful; it would rather seem that the Normans, under Roger II., called to their service Greek artists. There is much similarity of sentiment between the St. Mark's and the Sicilian work. Reference was made by the author to work of the twelfth century carried out in the following buildings: La Martonara, Palermo; the Cappella Palatina; the Cathedral at Cefalu, in which the characteristics of Sicilian work, and its affinity with that done at the same time in Venice, are evident; the Monastery of Daphne, near Athens; the Church of the Holy Sepulchre, Jerusalem; and the Church of the Nativity, Bethlehem.

In the Western world the twelfth century produced at Rome the apse of St. Maria in Trastevere, the character of the work still Roman rather than Greek or Byzantine; St. Francesca Romana, often ascribed to the ninth, but, as De Rossi maintains, really of the twelfth century—a very unusual and beautiful design; St. Clemente, Rome, dated by M. Gerspach as of the thirteenth century, but which the author placed as early in the twelfth, the work exhibiting a treatment rather apart from the usual motifs of Roman work.

In the thirteenth century the great scheme at St. John Lateran was executed for the Pope Nicholas IV. by the master-artist Jacopo di Torrita or Torriti, the design being signed by Jacopo and his worthy assistant, Camerone. The author next discussed the mosaic decoration carried out in the same century in the Baptistery at Florence and in the Cathedral at Pisa, and the further prosecution in the thirteenth and fourteenth centuries of the mosaic scheme for St. Mark's, Venice.

At Torcello the school of mosaic work showed a pronounced difference of aim and style from that of the same period in Venice. In this more Byzantine manner was executed the strange composition on the west wall of the cathedral—a work more probably of the fourteenth century than of the twelfth, to which M. Gerspach assigns it. The Greek mosaists had now become widely spread over the north of Italy, and had done notable work at Florence, Pisa, Siena, and Orvieto.

Rome saw two important works achieved in the fourteenth century, of which perhaps the principal was the completion of the fine work in the apse of St. Maria Maggiore, commenced by Jacopo de Torriti, and of the panels below it executed by Gaddo Gaddi.

In the fifteenth century Baldovinetti executed one of the overdoor spaces at the Baptistery, Venice, and his pupil and Michelangelo's master, Domenico Ghirlandajo, commenced in the cathedral the decoration of the Chapel of St. Zenobio. The really important works of this

century occur in the Chapel of the Mascoll at St. Mark's, Venice. These represent the principal legends of the Virgin, and in composition, colour, and execution are all admirable. It is with these panels that one approaches the end of the art of mosaic work from this point one sees the mosaicist, designer and executant in one, make room, to the ultimate destruction of his art, for the painter who called to his aid the "dull mechanic" hand of a workman to represent servilely painted pictures by means of cubes of glass.

The state of design rapidly became worse and worse. The seventeenth and eighteenth centuries saw work accepted and praised, though it transgressed, in its realism, its exaggerated movement, its rendering of accidentals, all the rules and canons that should regulate mosaic work. But it was reserved for the nineteenth century to strike the worse note of imitation and not only to execute indifferent mosaic, but to falsify the history of the Church as recorded by and on its walls, by treating the mosaic designs as pseudo-thirteenth-century work.

The author concluded with some observations on recent mosaic art in England. He cannot be said that some of the works are successes, save as to execution. The artist seems unwilling to suppress, as the loyal mosaicist should, many of the attributes of which, under other circumstances, he might justly be proud. The author expressed his conviction, however, that it would have been impossible to find in either France or Italy an artist who would have carried out work recently executed in England without falling still more egregiously into the errors which the great examples of the past showed to be present therein.

Mr. Walter Crane, in moving a vote of thanks to Mr. Townsend "for his admirable and interesting historical account—from the earliest period down to the present time," said the comprehensive way in which the lecturer had compressed so much within the limits of his paper was no small part of the difficulty of such a paper. Mr. Townsend called the subject the art of pictorial mosaic; he (the speaker) supposed that the question of "pictorial" or "decorative" was a mere matter of the interpretation of words. One might say that the mosaics which were most decorative (judging from the lantern views they had seen) were the least pictorial—he did not say in all cases, but in most cases. He was conscious of a certain loss in the views of the mosaics they had seen—a loss as to colour, he meant. It struck him that a photograph very imperfectly represented the real beauty of a mosaic, and one only got a kind of skeleton in some of the representations they had seen. The mosaic which appeared to be the most decorative of those they had seen, in the sense of pattern, was the procession of virgins (from St. Apollinare Nuovo), which consisted of a series of repetitions. There was a saying attributed to William Morris that mosaic was like beer: a little of it was no good. In view of the many experiments that had been made in the application of mosaic to buildings, he felt that was true. It was no good putting little snippets here and there, and calling that mosaic decoration. Though it indicated great sacrifice on the part of the architect to leave the surfaces of his building plain so as to give scope to the decoration, still mosaic did seem to be one of those arts in which, if it were to be done with justice, to the field must be left clear. Mr. Townsend showed a slide representing a work of the early fourteenth century—an example of mosaic treatment which the lecturer considered reached the limits of pictorial decoration, and he then spoke of the restraint of the designer. The mosaic designer of that period worked on precisely the same lines as the painter; the designer introduced perspective and a considerable amount of architectural background, just as the painter would have done; there was no necessity for any difference between the two. In the present day, however, a mosaic artist had to separate himself, as a rule, from all that the contemporary painter was doing, and to put himself into a totally different world—not necessarily the antique world—but, at any rate, he had to satisfy architectural necessity, and was put under what was called "restraint," and had to sacrifice a great deal that was popular and current in the pictorial art of the day. He (the speaker) very heartily echoed the wish of Mr. Townsend that we might have more decoration in our cities and towns, especially in this

grey world of London, which (in some parts at least) might be very much gilded inside, but had little gold outside. He hoped that mosaic one day would take the place of the poster on our exterior walls.

Mr. K. Anning Bell, in seconding the vote of thanks, expressed his amazement at the analytical power shown by Mr. Townsend in separating the centuries. He had seen most of the mosaics referred to, but his mind was quite confused as to their dates; he had always looked at them from the craftsman's point of view, not from the historical standpoint. Viewed historically, it appeared that the Art of Mosaic, as shown by the earlier Roman examples, was taken originally from painting, and the earlier work showed less appreciation of mosaic in its proper treatment than that of the middle period did. There were several points in the middle period which appeared to him to show a more elastic aim. After the eleventh and twelfth centuries the mosaicists seemed to be carried away again by the idea of painting. In the middle period there was not any painting. In the third century the Roman work showed that the mosaicists were men brought up as painters, and they carried the same idea of art into mosaic as they had in their painting. That was carried on by their pupils for some little time, but gradually mosaic dominated, and in the period when there was no painting to call painting—in the tenth, eleventh, and twelfth centuries—mosaic was found at its very best. When painting became prominent again, as it did in the fifteenth century, mosaic began to deteriorate. As to the technique, there was a great deal left to be done which the old masters did not quite touch in their day. He had seen, he believed, all the Italian and Sicilian work, and some little of that done in Egypt—not pictorial, but good work, and charmingly designed. They did not appear ever to have considered much the value to be got from the difference in the size of the tesserae and the difference in size of the interstices. No end of value could be got by varying the interstices, placing them further apart and making the tesserae large or small. One could get the emphasis on a piece of work like a face by putting the tesserae quite close and making the particular feature a solid mass with the surroundings rather looser. In that way attention was drawn to the part which was a solid mass, and quality could be got by making the other bits—trees or drapery, &c.—vary with the looseness of the tesserae. Such features of the work could also be made to vary by the size of the tesserae: thus they had two methods of getting variety to play with, but the tesserae must not be made big. He had tried big tesserae, and they looked like tiles, and the effect was most unpleasant. For exterior work they could afford to have the tesserae larger than for interior work. In interior work mystery was the essential beauty of mosaic, whereas for exterior work they could not get mystery, and they should not strive for it. In doing the work inside a low light was wanted, at least a vague and not a direct light—a side light which softened it; and as many lights as possible—not one. The best churches designed for mosaic that he knew were St. Mark's, Venice, and the Capella Palatina at Palermo. These each had the lights low in the dome, but in an ordinary church with nave and transepts it was not quite so effective in getting the colour. This applied, perhaps, mostly to gold, and in gold mosaic work (and the old work was mostly gold mosaic), in order to show its beauty to the greatest extent, a curved surface was needed, such as over domes; but on the flat it was not quite so successful, and one always felt that the whites, the greens, and blues tell as of greater value than the gold itself. He thought, from the workman's point of view, just as in the case of the old work, one must look at it and see if one liked it: the old mosaicists experimented, as we do. He had seen them try red and gold and yellow and gold; the red sometimes came off, but yellow never did. Yellow and gold were like white and silver—each knocks out the other. As to placing the tesserae, he thought they could not make their work satisfactory without placing them from the front on to the wall; they could not do the thing on bits of paper face downward, as had often been done recently. Another point was that the colours carry rather differently: the colours themselves seem to tell differently, from the spectator's point of view, from what one would expect from a close view, and they tell differently

also according to the different make of the glass itself. The artist buys a lot of glass stuff to use for his mosaic, and he finds that some of it will carry the colour further than other bits, so that he must look to that himself. The man who executes the work will try to match the artist's cartoon as far as a piece of transparent glass can match a piece of water-colour—which is very slightly; but when one gets fifty, seventy, or one hundred pieces, some will carry further than others. Some glasses hold the light more; some are more opaque; some, being transparent, hold a shadow from the piece above; and, apart from the texture of the glass, the colours themselves carry very differently. In outside work gold was seldom a success; even in the old things that he had seen the gold did not do with the outside at all—the remaining half dome at St. Mark's excepted; but the effect of a half dome was practically that of an interior, and the light was reflected from below: it wanted mystery and a vague soft glow to make it look at all well. In the case of gold mosaic the best result in the work was got by using cool colours, and that seemed quite natural. If there was a large mass of gold it dominated everything as a warm colour, and what was wanted with it was a cool colour. He found that, doing work without gold, he wanted warmer neutrals.

Mr. T. R. Spence said Mr. Townsend had not mentioned one of the most magnificent examples of mosaic work from a decorative point of view, and that was the dome in the shrine of Omar, Jerusalem, which stood in the Temple area. It seemed to him to be a very fine thing as a piece of decorative mosaic, and it was treated entirely with ornament. It was a very difficult matter to treat a dome with figures; they should be worked really into the ornament. He did not think that any dome could be treated successfully in storied figure subjects; the decorative intention should be dominant. He quite agreed with Mr. Anning Bell that gold should always be used in the interior, because much greater tone was got from the variety of light and shade.

Mr. J. D. Crace said he would like to join in expressing thanks to Mr. Townsend for his excellent paper, which was so especially interesting from the historical point of view. There were one or two technical points which had struck him, and one was the importance, as the old mosaicists recognised, of carrying gold (in the case of a gold background) into the subject, and not confining it entirely to the ground—allowing it to go, for instance, into the drapery of figures; it was only in that way that the figures would ever be saved from being detached from the ground itself. Everyone must have been struck, in looking at the lantern views they had seen, by the entire absence of mouldings, and one could not be too much impressed with the fact that moulding and mosaic did not go together, and that the mosaic treatment must be kept distinct from what one might call architectural expression in the more delicate sense, and from that point of view he thought it was fair to deprecate the use of mosaic in little patches, and as it had been used in this country only too frequently during the last thirty years—especially in little patches on the level of the eye. That was what mosaic was absolutely unfitted for, for if it was opposite the eye one saw the glare of the gold and nothing else, and if against the light, one saw practically no subject at all. The earlier examples of mosaic work were very few. Mr. Townsend did not allude to the examples from Pompeii, where there were one or two instances of the early *Illostromata*, as they were called. Pliny spoke of mosaic having first come into use in the form of pavement in the time of Sylla, and went on to say that "since that time mosaics have leapt from the floor to the vaulted roofs of our houses." That showed that mosaic must have been in very early use as a form of decoration, and its use appeared to have been almost continuous, although its mechanical treatment varied very little, considering the variations in the details of the art.

Colonel Prendergast said the paper had been one of the most interesting they had heard in that room; it was a most careful exposition of a subject about which none of them knew very much. But he would very much like to hear something on another aspect of that important subject, *i.e.*, its technique.

The Chairman, in putting the vote of thanks to the meeting, said Mr. Townsend's extremely interesting paper was entitled "The Art of Pictorial Mosaic," but the lecturer had given

them a history of pictorial mosaic. He (the chairman) would also like to hear something more of the technique of the art. It would be most interesting to devote another evening to a paper on that side of the subject, and he would propose that next session this should be done.

The vote of thanks having been heartily agreed to,

Mr. Townsend, in reply, said he had to treat the subject from either the historical or the technical point of view, for there was material enough for two papers. He hoped that the proposal that had been made to devote an evening to the practical side of the question would be acted upon.

The Chairman said that the paper by Mr. Francis Bond, which was to have been read at the next meeting on April 1, would be postponed until April 22, and the Art Committee's paper, arranged for April 22, would be read on a later date in the session. The meeting on April 1 would be devoted to a discussion on "An Amended Form of Conditions of Building Contracts."

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION:

ROWTON HOUSES.

THE usual fortnightly meeting of this Association was held on Friday last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., the President, Mr. W. H. Seth-Smith, in the chair.

The minutes of the last ordinary general meeting and a special general meeting having been read and confirmed, Messrs. R. H. Murray and C. R. Pinsent were elected members of the Association.

Mr. R. S. Balfour, hon. secretary, proposed the following votes of thanks: to Mr. J. F. Bentley for permitting the visit to the new Catholic Cathedral at Westminster on Feb. 16; to Mr. F. B. Wade for permission to visit the School of Art Needlework on the 2nd inst., and to Messrs. Broadwood & Sons, *re* the visit to their pianoforte exhibition on the 9th inst.

The votes of thanks having been agreed to, Mr. H. B. Measures read the following paper on "Rowton Houses" —

Rowton Houses (the subject of my paper this evening) are the outcome of a desire upon the part of Lord Rowton to provide decent accommodation for a large body of men who at the time were practically unprovided for. Lord Rowton had for many years been deeply interested in the many-sided problem of the housing of the working classes, and during his researches in the poorest districts he was greatly impressed by the need of some decent provision for the numbers of men who had no homes of their own, and generally used the common lodging-house.

From the commencement he appears to have set before him as an ideal that anything that was done must be on a business basis of "self-support." There was to be no question of a "charity scheme," but that those who used the buildings should do so with the knowledge that the charges made entitled them to what they enjoyed. The idea was generally scouted as impossible of realisation, and, in addition, that the class of men would neither appreciate nor use in a proper manner any such endeavours upon their behalf. Lord Rowton was fortunate in infecting Sir Richard Farrant with his enthusiasm, with the result that he added the weight of his experience, and it was finally decided to build Rowton House, Vauxhall, containing 475 beds, which was opened to the lodgers in 1893. The opening proved that Lord Rowton's estimate of the possibilities of such a scheme was correct; it was also a financial success, and has continued to be so. A company was formed with Lord Rowton as chairman for the purpose of extending the building operations. The Vauxhall House was taken over, and the building at King's Cross, with its 677 beds, was opened in 1895. This was followed by the house at Newington, with 805 beds, in 1897; another at Hammersmith, having 800 beds, in 1899, and the building in course of erection at Whitechapel, which should be ready for occupation this year.

Time will not permit of a detailed description of each Rowton House, I therefore propose to describe the house at Newington Butts, containing as it does practically all the essential features of a building of this description and,

moreover, because the site is one which both in frontage, depth, and general disposition, is as near as possible an ideal site for the purpose of providing accommodation for 800 men.

It is situated in a very crowded neighbourhood, frequented by the class of men who have in the past had to crowd into small houses as the lodger, or go to a common lodging house, with all its degrading surroundings. For the workman the position is one affording exceptional facilities for access to the heart of London, consequent upon the proximity of railways, including the South London and the tram and bus routes in all directions.

The site has a frontage of 214 ft. overlooking a well-laid-out public recreation ground, the site of the disused churchyard of St. Mary Newington, and is approached by a wide footway from Newington Butts. The depth of the site from front to back is an average of 138 ft.

The building is set back from the forecourt railing a distance of 10 ft., and as the ground floor is 4 ft. above paving, ample light is obtained for that portion of basement which is on the front of the building; at the back the main building is set back a distance of 25 ft. from the boundary. This gives a considerable space for light and air, whatever the adjoining owners may hereafter do on their land and, in addition, the dimension just enables the building to be erected to the height shown on section, without coming within the Building Act angle of $63\frac{1}{2}$ deg.

The central courtyard above ground floor has a width of 58 ft. 6 in.; this is wider than I have been able to obtain at either Calthorpe-street or Whitechapel, the latter being 49 ft. 6 in. wide, which I consider gives ample width, but is not so convenient for planning the ground-floor rooms as a width of, say, 60 ft. You will note that in all the plans, the plan of cubicle floor is based upon an elongated letter U; this I consider to be the most satisfactory form for planning, and preferable to an enclosed quadrangle; with the latter it may be possible to produce a large central staircase, but I do not advocate such in preference to those shown. The shape adopted gives an abundance of light, sunlight, and fresh air into the courtyards, and lends itself to the disposition of staircases at the extremity of each arm. I need hardly point out to you that with the staircases planned as on all the drawings before you, it is impossible for a man to be trapped in the event of fire, a thing that is likely to happen with a central staircase unless panic stairs are provided—these are expensive and would probably be overlooked in case of need.

The elevations are built in pressed Leicester bricks and mingled gaults, and the dressings in pinky buff terra-cotta. The whole of the interior walling is built with gault bricks, excepting where glazed brickwork is used. The brickwork throughout the building is in Portland cement.

The floors are breeze with steel joists, the breeze covering the underside of joists $2\frac{1}{2}$ in., the top screeded over joists for flooring.

The front roof is constructed of breeze slabs 4 in. thick, with angle iron therein, and the slating nailed direct on to the slabs, all other roofs are flat, of breeze and steel construction, covered with asphalt.

For administrative purposes the house is divided into five sections as follows:—

1. Lodgers' day-rooms;
2. Lodgers' cubicles;
3. Catering section, which includes sleeping accommodation for females employed in shop, kitchen, and scullery;
4. Bed-makers;
5. Superintendent's apartments, with separate accommodation for the office clerk.

If you will allow me for the purposes of this paper, I will assume that you are accompanying me upon a tour of inspection, following very much the course that a lodger would take. On entering the building, an office is provided in the vestibule; here the lodger makes application for a bed ticket, for which he is charged sixpence; this frees him to the use of all the day-rooms of the house and separate sleeping accommodation for one night. If he desires to do so, an opportunity is allowed him of renewing his bed ticket up to 9 o'clock at night, before which hour no new lodgers are booked, or he may take a bed by payment of 3s. 6d. for a week. A lodger can renew his cubicle from day to day, or by the week, so that he has the exclusive use of it. The office front and fittings in same are in polished teak, and a safe is provided for the custody of

any valuables or money given in charge of the clerk. Opposite the office window turnstiles are fixed; they serve as a "moral barrier," it being impossible to use them for checking purposes, as the lodgers are in and out of the building at all times. The space beyond the vestibule is a provision not only to give room where there is much traffic, but, in addition, to give sitting accommodation in what is a favourite place with the lodgers to watch the arrivals. These spaces and the corridors leading from them, past all the day rooms to the two cubicle and basement staircases have glazed brick walls from floor to ceiling, with a dado in chocolate and cream coloured bricks and ivory above. The floor is cement and granite chippings. Water for drinking is laid on to point shown on plans.

The dining-room has a floor space of 5,300 ft., and seating accommodation is provided for 440 men at tables; a number of extra seats and wooden easy chairs are placed in the room. The walls have a glazed brick dado in chocolate and cream, 4 ft. 9 in. high, with plastering above dusted to tint. The floor is of oak blocks laid herringbone. Tables and seats are teak, carried on cast-iron standards, the length being 7 ft., giving a provision for eight at each table. Four large cooking ranges, with ovens, hot plates, and grills are provided. These you will note are placed out of the line of traffic, and are built into glazed brick chimney breasts from floor to ceiling; this is necessary, as plaster work becomes discoloured in a very short period.

The portion of dining-room between the front and back wings is, in addition to windows, top-lighted and ventilated by four lantern lights, the whole of sidelights in which open for ventilation; in addition, all the windows are hinge-hung to fall in above transoms, and casement-hung below, the latter being secured by a latch and usually only opened for cleaning purposes; ventilation flues are also provided in walls.

A lodger may purchase cooked or uncooked food at the shop, or he is at liberty to bring his own purchases from outside and have the free use of the ranges, cooking utensils, and lodgers' scullery for the preparation of such food. You will note by reference to the photographs in the room that the walls are hung with framed engravings of many popular pictures, a feature in the furnishing which appears to be much appreciated. Between the two large sections of the dining-room a lodgers' scullery is provided, with walls built in glazed brickwork from floor to ceiling, fitted up with glazed fireclay sinks and teak draining boards. Sanitary pails are under each sink for the reception of potato peelings, tea leaves, &c.; hot and cold water is carried to each sink, and, in addition, a supply of boiling water is provided for tea-making, &c. This scullery is an essential, as otherwise the dining-rooms would be used for this purpose.

The crockery and service room between the dining and smoking rooms is built in glazed brickwork from floor to ceiling and fitted up with shelving. This is provided for those who cook their own food, and is furnished with pots, frying-pans, teapots, plates, cups and saucers, which are at the lodger's service, and which he leaves where used by him, to be collected by porters, who send them down the lift shown to basement scullery.

The shop has a teak front with sliding sashes, and is fitted up with counters in teak, hot plates, urns, and drawers and shelving for the varied assortment of articles sold. A tobacco licence is held. The prices charged are practically what would be paid outside at the cheapest class of coffee-house. The lift shown delivers into a service lobby outside kitchen and also into the scullery on basement, and the staircase gives access to same.

The smoking-room is approached from corridor and from dining-room. The floor space is 1,600 ft., and is fitted up and finished in a manner corresponding with dining-room; the seating at tables is for 112, with an additional seating accommodation in wooden easy chairs. The chimneypieces are in glazed faience, and large open fires are maintained. Although this room is called the smoking-room, smoking is allowed in any portion of the building used by lodgers during the day. This room is at times of pressure—say on Sundays—used as an overflow dining-room with service from shop where bay is shown.

At the back of building is the reading-room. This is an L-shaped room with an area of 2,550 ft.; the walls have glazed brick dado

with plastering above as in dining-room, the chimneypieces in glazed faience. Seats at tables provide for about 170 men, and a large number of easy chairs are provided around the fireplaces. It is very seldom that one can visit the house without finding each fireplace with its semicircle of men, reading, talking, or having a nap. You will notice that in all these rooms the doors are set into a recessed lobby; this allows them to open outward without projecting into the corridor, and, in addition, it is possible for the superintendent to obtain a view of the room while standing in this lobby to see that order is maintained.

The walls are hung with pictures, and two large teak bookcases filled with the works of a variety of authors are provided. Books are lent to lodgers on application to the superintendent. Games, such as draughts, dominoes, &c., are placed in the room.

Adjoining the dining-room you will note the locker corridors. The position assigned to these is the most convenient where planning will permit, as they are used for storage of food to a great extent. In the house under notice they are 1 ft. 6 in. cube, with a shelf dividing into two parts. Of these lockers there is a provision of 800; they are arranged in tiers four in height, and each locker is ventilated and numbered and has a separate key. Above these lockers a number of larger lockers of double the cubic capacity are provided for those who require additional space. Provision is made in them for a stick or umbrella, and a shelf similar to the smaller lockers. The charge for a small locker or a large is 6d. and 1s. respectively, and upon the return of key, 5d. and 1s. respectively is returned, which to a regular lodger is to all intents a charge of 1d. or 2d. for a year or more. In the locker corridors small tables are placed against the piers for brushing or sorting articles in lockers. The corridors are lighted and ventilated at ends by windows in addition to top lighting and ventilation.

The water-closets and urinals for day use are placed at the rear of building, and are disconnected from it by a ventilated lobby. The walls, partition walls, and divisions to urinals are all ivory glazed brickwork. The roof over is in lantern form, glazed from end to end, in T-iron bars, with vertical pivoted louvres. There are forty-one water-closets being a provision of one for every twenty men. The division and front walls are 6 ft. 3 in. high with a moulded capping and open above; each water-closet is fitted with a flushing cistern, having an iron supply pipe to pan. The pan and trap used are of the short hopper type. Glazed brick "soap size" is used for risers, and the whole of the space inside same, around pan and trap, up to the top of pan is filled in solid with cement concrete. This is found to be a perfectly effective means of avoiding breakages, wilful or otherwise. The seats are teak, bedded and screwed down on to the concrete. The doors are kept up 3 in. above floor for ventilation. The door stops and the hinges are slightly out of the perpendicular; the effect of which arrangement is that, excepting when the door is bolted, it automatically opens back on to the division wall, and by that means a lodger is always able to find which water-closets are unoccupied. The door frames are doweled down to 2-in. cement base blocks. The floor of water-closets is laid with a fall towards door, and constructed in concrete with granite chippings. The urinals are white glazed fireclay backs, finished on the front edge with 9-in. double bull-nose divisional piers, which are carried to a height of 5 ft. The top of urinal backs is covered down with slate overlapping copper sparge pipe with automatic flushing. This mode of construction has been found to stand, undamaged, the hard wear in each house. Adjoining these water-closets, near the foot of main staircase, a room is provided for fumigating bedding or other articles.

At the extreme end of back corridor a staircase is constructed, giving access to the roof over the portion of ground floor rooms within the centre courtyard; this roof is at first floor level and is paved with asphalt, fenced in, and provided with seats as an open-air lounge, and smoking space; it appears to be a much appreciated feature.

Basement.—The two main staircases are continued down at the end of ground floor corridors to the basement, a corridor leading from each into the lavatory. In passing I might say that the whole of the basement,

Roulton House, Newington Butts. General View.

where used by the lodgers, is built in glazed brickwork from floor to ceiling, and all the floors are cement concrete finished in cement and granite chippings.

The lavatory has a dado in French grey and ivory, with ivory above. There are eighty basins, fitted with hot and cold water supply, the construction being as follows:—Each set of ten is carried on three divisional walls with angle-iron bearers to carry slate top; the basins are white enamelled fireclay, with outer rim bearing on iron bar on edge, bearers shaped to basin and bolted to outer angle irons. Immediately under the slate top two horizontal water pipes, hot and cold, are carried from rising mains, on main walls, through to end division, with a plug for clearing in the event of a stoppage; branches rise vertically to gun-metal screw-down cocks. Iron waste pipes are used, discharging over channel in floor; for basins, loose turned wood plugs are used. The floor is laid with falls to the channels under these lavatories. Towel rails are fitted at ends of ranges and on walls with round towels supplied thereto. Central over each range of basins and running longitudinally a hat and coat rail is fixed.

A portion of lavatory is screened off by a glazed screen and fitted up with white glazed fireclay feet washing baths, with teak draining boards between each. Hot and cold water is carried to each, and the wastes discharge over a channel similar to the lavatories. I consider this room to be a great boon to the men, and it is much used by them. Towels are provided. In the front corridor leading from lavatory to the foot of main staircase you will note there are bath and dressing rooms; the walls are divisional walls 6 ft. 6 in. high, in glazed work, and the baths are white glazed fireclay, with a riser of glazed brickwork and finished with a teak top. I might mention here that baths uncased were tried in the first house, but the space around them, next to the walls, too often proved a receptacle for discarded underwear. Hot and cold water is laid on to each bath. A lodger pays 1d. for a bath ticket, which includes soap and towel; the water is turned into bath by the attendant. A chair completes the furnishing of bathrooms.

The dressing-rooms are to all intents and purposes as bathrooms, minus the bath. As no lodger is allowed in his cubicle during the daytime, it was considered and found to be necessary to provide accommodation to enable him to change his garments.

In the corridor connecting front and back staircase you will find a room described as "the lodgers' washhouse." Here, and particularly on Sunday, many wash the whole of their wardrobe of underwear, for which purpose white glazed fireclay washing-troughs are fixed on walls, with hot and cold water supply and draining-boards. A wringer is part of the equipment, with tables for the folding or sorting of garments. A Gill stove, surrounded by a galvanised-iron framework clothes-horse, is used for drying. In the same corridor, adjoining the lodgers' washhouse, is the porter's day room. This is fitted with lockers, tables, and easy-chairs for the officials' use during their leisure and at meal times. On the opposite side of corridor two rooms are allotted to a repairing shoemaker and a tailor, who find constant employment from the lodgers. Returning to the main back corridor, you will note a space between porter's room and lavatory; this is used as a boot-cleaning and clothes-brushing space, tables and foot-rests being placed therein. Opposite this space is another partly in use, the unused portion being a provision for extra locker accommodation, that in use being a parcel-room. A lodger with tools, boxes, or other belongings too large for lockers can, by payment of a small fee, store them here, and have access, in company with an official, from time to time. The barber's shop is fitted up for the purpose, and provides constant employment for a barber. The knife-cleaning room and the fitter's room adjoin, the latter being fitted with vice, &c., for minor repairs.

In the furnace-room two boilers supply the whole of the hot water used by lodgers for lavatories, baths, &c.; these are connected to two cylinders, each of 250 gallons' capacity, placed in linen and blanket store. A drying-room, fitted with galvanised iron frame-work, is built upon the setting of boilers, and utilises waste heat for drying purposes.

In the passage outside, at left end of buildings, 11 ashes and refuse from day rooms is fed in sanitary pails for removal by autho-

rities by the steps shown in area. All area walls and voids are in glazed brickwork.

Section II.—Cubicle Floors.—Returning to the ground floor of building, you will note the two main staircases giving access to the cubicle floors; these are carried up the full height of building, with steps of a uniform width of 4 ft. 6 in. to the flat roofs at top, where a gang-way is railed in from one staircase to the other, enabling lodgers in case of fire to ascend one staircase and descend by the other. The staircase is built in ivory glazed brickwork the full height, and the steps are formed of Portland cement with two angle-irons in each; the balusters and handrail are wrought iron. On each landing, approached by a door of same, is a sink space with hot-water supply for cleaning purposes, and cold for drinking, carried to a glazed fireclay sink. On each side of sink space a watercloset is formed, constructed as those previously mentioned, for night use only. A fire hose cupboard, fitted with hose-piping and nozzle, occupies the space marked FH on plan, the corresponding cupboard opposite being used for storage of brooms, &c., for cleaning of cubicles.

Taking the cubicle floor as a general scheme you will observe that it consists of a central corridor 4 ft. wide, extending around the U-shaped building, from staircase to staircase. It is divided by partition walls into sections, varying (according to convenience in planning) of from twelve to sixteen cubicles in each. Where possible, I endeavour to plan in sections of sixteen, for a reason which I will explain when dealing with lighting. Among other reasons, for the subdivision of cubicle floors into sections, are the checking and possible isolation of an outbreak of fire; another advantage is that, in a case of infectious or contagious disease, the isolation and efficient disinfection can be arranged without closing the whole of one floor of cubicles. Swing doors between each section conduce to quietness between each section; fanlights yellow these open for ventilation. The flooring is over these open for ventilation. The flooring is yellow, nailed direct upon the screeded breeze floor. The staircase in the internal angle of front section admits of the women bedmakers obtaining access to the various floors without passing through any of the lodgers' day rooms. The space where staircase is shown on first floor is occupied on all the other floors by a linen room, with lift from clean and soiled linen rooms in basement. This is placed as near centre of cubicle corridors as possible to avoid labour in carrying. On each floor, including one on each staircase, there are five fitted fire-hose boxes, with glass panel in door for access to bolt.

A typical section of cubicles is planned eight on each side of corridor, handed right and left from the centre of section. This method of handing from the centre is one that I consider most essential; it enables each bed to be against a cubicle partition on the other side of which is the passage space of the next cubicle, and not the bed; any reversal of this arrangement means that sleeping next to a restless or noisy sleeper would be a most unpleasant experience. You will also note that every cubicle in the building has its own window opposite the door, leaving a pier against the head of sleeper; those of you who have had the misfortune to sleep with the head immediately under the chilled atmosphere at a window will realise that this is not a small point in planning. The windows all have a high bottom bead permitting the raising of sash for ventilation at meeting rails, and the sashes are double hung and of an uniform width of 1 ft. 6 in. in the brickwork, carried up to within a few inches of ceiling. The framing for cubicle partitions is 3 in. chamfered frames filled in with 1½ V-jointed and tongued boarding, painted to a cream shade and twice varnished. The cross partitions are 7 ft. 6 in. high, and the partition next corridor 6 ft. 6 in. high, the height of cubicle floors from floor to ceiling is 9 ft. The door of cubicle is kept up 2 in. above floor for ventilation, and has a bow handle outside and bolt inside. At the foot of bed three hat and clothes hooks are fixed with a shelf projecting over and covering same, making it impossible for garments to be lifted off hooks over the partitions at night by other lodgers (a necessary safeguard). The cubicles are, excepting where breaks on elevations increase their length, uniform in size throughout the building, the minimum standard of 5 ft. wide by 7 ft. 6 in. being adopted, the beds are 6 ft. 3 in. by 2 ft. 6 in. over all, the space at the end next

corridor permitting the drawing out of bed for making and the hanging of clothes on pegs; the minimum floor space of each cubicle is, therefore, 37 ft. 6 in., and the cube air space, taking half the corridor for each cubicle, is a minimum of 427 ft. 6 in. I may add here that to provide for ventilation, independent of the windows in cubicles, which the occupants may keep closed, windows are planned at the end of corridors, and these, the fanlights over swing-doors, and the staircase windows enable the officials to let a current of fresh air through the various sections. With reference to the cubicle partitions, I have had various opinions from architectural friends as to the material used, some advocating wood material and others another. I can but give the result of experience extending over several years' user of these partitions, and it is, that although there have been several attempts to set them on fire by setting a light to the bedding, they have charred only; they are not troublesome in dealing with an occasional case of vermin. I have been surprised myself to find that they are free of carving or writing and that any damage by the shifting of bed has been of the nature of an indentation of the surface only, whereas, where plaster is used on the external and other walls, damage is done which is not easy to make good. While speaking on this matter, I would claim your indulgence, when viewing a Rowton House outside, for the regularity of windows and piers; I have told you my reasons for the arrangement of windows and piers so far as they affect the sleeper. From time to time I am asked, Why don't you group your windows? If I yield to that temptation, the result is elevation. Personally, I think the sleeper comes first, and that the elevator should truthfully proclaim it. On the top floor of building, at the back of sloping roof, you will notice a row of cubicles. These are of one side of corridor only (excepting in cubicle where they are on both), and the dormers in front are a provision for cross ventilation. On each floor two rooms are reserved for officials, who sleep there and are responsible for order. They are fitted as small bedrooms, and the space from top of partitions to ceiling is glazed for privacy. The staircases are lighted by a point on transom of door leading to sink space. This gives in addition sufficient light into sink space and water-closets through glazing of fanlights and doors. Taking a typical section of sixteen cubicles, two gas points are sufficient for lighting. Each is set opposite the second cubicle partition from door, and thus lights four on each side. There is not sufficient light for reading in bed, but ample for undressing.

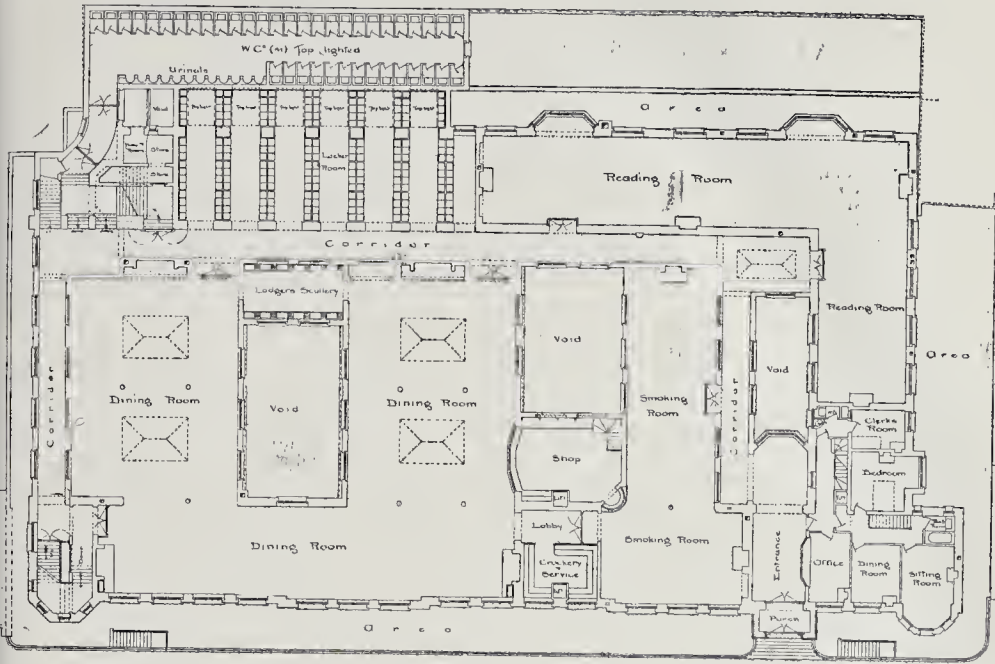

The gas points on staircases and at points on ground-floor corridors are a light all night, and in addition at the change of direction corridors on cubicle floors a point is also placed all night that a lodger may be able to find his way out at any time. The other gas points are controlled from the office when necessary.

The furniture of a cubicle consists of an iron bedstead, spring mattress, a mattress cover, horsehair mattress and pillow, two twin sheets, a blanket under same, and any reasonable number over, with a quilt, a wooden chair, and a chamber utensil.

A lodger can go to bed at any time after seven o'clock by presenting his ticket to an official at the foot of one of the staircases. One staircase only is generally used, and found sufficient. He then finds on each floor direction-board giving the numbers of cubicles on that floor. Wrought-iron gates bar access to the cubicles during the day, and at night, except by passing an official, these gates are secured by a weak chain and padlock, which the weight of one man will easily break. It is found to answer its purpose as a moral barrier, and if weakness removes possible danger in case of fire. No lodger is allowed to remain in cubicle after nine o'clock in the morning, at which hour the bedmakers take possession of the various floors.

Section 3.—Catering Department.—The whole of this department is placed in the basement and is accessible only by way of the tradesmen's entrance, by passing through the office lobby or from the Superintendent's private residence.

The kitchen is built in glazed work from floor to ceiling, and has a wood block floor excepting where cooking apparatus is fixed, where red adamantine tiling is laid. In addition to a large range, steam and gas-cooking

The Rowton House, Newington Butts. Ground Plan (no Scale).

Scale of  Feet

The Rowton House, Newington Butts. Cross Section.

apparatus is provided; a kitchen store is provided for cooks' use and dwarf cupboards and dresser. Adjoining is the scullery, built in glazed work, with cement floor, fitted with large white glazed fireclay and teak sinks with draining-boards and a large range of plate-racks. A lift from here opens into the lodgers' crockery store above and another into the shop. The larder, the walls of which are tiled, is disconnected from the kitchen by a service passage (in which is placed the lift for kitchen and larder service to shop), slats and other shelving is fitted up in same. A staircase from shop, constructed in teak, gives access to service lobby and also to the corridor to stores and female staff-rooms. A store is provided for storage of spare crockery.

The large store-room, adjoining this corridor, is for groceries and provisions generally; it is fitted with flour, sugar and other bins, and shelving. The linen and blanket store has the hot-water cylinders therein, as previously mentioned, and is fitted from floor to ceiling with racks for storage; in the passage portion of the store a bench extends in front of windows for the purpose of sorting linen, &c., this is then despatched by lift in corridor to the upper floors. Kitchen coals, meter-room, and water-closet for catering staff is provided. The staff sleeps on the premises, under the reading-room, and has a sitting-room and five bedrooms; the walls of these are plastered, papered, and furnished with pictures, and the floors are wood block. A private door at basement level enables the Superintendent's wife to obtain access for supervision.

Section 4.—Bedmakers.—The bedmakers are not resident upon the premises; they enter the building by the door at side of office and descend to their room, in basement, by a staircase in full view of the office; this staircase is carried up as previously mentioned to the first floor of cubicles. A room known as the bedmakers' room is provided at the foot of stairs, fitted with a small range for preparation of their meals, tables and chairs. Adjoining this room is a cloakroom, fitted with sink, and a water-closet opening out of same; a door gives access to the soiled linen-room, which is built in glazed brickwork from floor to ceiling and has a cement floor. The lift delivers from all cubicle floors into here, and the dirty linen is checked into baskets and taken direct away to laundry.

Having given you a somewhat detailed description of what I have termed an ideal site I now propose, I trust without wearying you, to describe in a general manner the three other houses, of which drawings are before you. Taking them in their order of erection, you will thus the better judge where experience has dictated alterations of the general scheme.

King's Cross House.

This is erected upon a site which presented a good many problems in planning. You will note that it has quite a fair share of troublesome angles, added to which the paving around has a rise of 8 ft. from the entrance to the staircase end of the frontage in Calthorpe-street. In consequence, the basement floor is at a level varying from 8 ft. to 16 ft. below paving. Despite this, I can assure you the setting-back of frontage in Calthorpe-street 8 ft., and the facing of the heavy retaining wall with white glazed bricks, coupled with the use of ivory glazed work in the basement, has secured an amount of good lighting which, from a casual view of the plan, one would hardly expect.

There is a frontage of 200 ft. to Calthorpe-street and 125 ft. to King's Cross-road, with a superficial area of 17,180 ft. A portion of the foundation work was troublesome, although interesting, as on the west side (the left hand boundary) the old Fleet ditch followed the line of boundary. This necessitated the removal of a large quantity of particularly offensive mud and the filling up with concrete and carrying a thick slab some distance from the ditch on to firmer soil, as a very heavy weight consequent upon the staircase comes at this part.

Generally the construction and materials throughout are as at Newington.

You will observe the arrangement of Superintendent's residence, office, and entrance are planned in the same relationship, and also the provision of bedmakers' staircase for access to cubicles and their room in basement. There is also the same complete isolation of lodgers' portion of building from all other parts.

The house has cubicles for 677 lodgers.

The smoking-room has seating accommodation at tables for 128 men; the floor area is 1,600 ft. The crockery store is somewhat on the small side, and more provision is made in other houses.

The dining-room has seating accommodation at tables for 376 men, the floor area is 4,000 ft.; this room was planned in my first scheme of an L-shape, but it was decided that it would prove advantageous to increase the accommodation for lodgers who dined in the building and also to make special provision for those who wished to prepare their own food. The smaller section of dining-room was added, and the lodgers' scullery, with the result that this room is more generally used by those who prepare their own food. The lockers which had previously been planned here were placed in basement, the site being too small to permit of the retention on ground-floor. The reading-room has seating accommodation for 112 men at tables; the floor area is 1,528 ft.

As some of the tables in these day-rooms have seats on one side only, it is quite possible by the use of a few chairs in each room to seat every lodger at a table, independent of the usual seating around fireplaces.

Basement.—The lavatory has eighty basins; this is rather excessive, and in the other houses that number is found to be sufficient for 800 men; a basin of one basin for ten men is ample. The baths, feet-washing and lodgers' wash-house are on lines similar to Newington. Water-closets are provided for day use in proportion of 1 in 20; there are too many urinals.

The catering section and accommodation is proportionate to Newington. The vaults on site existed, and are used for coals, crockery, and meter-room.

Cubicles.—In general planning, sizes, and construction these are as Newington, with the exception that the staircases are not quite so ample, and but one water-closet for night use is placed on each of the various floors. Railed communication across the roofs is provided.

Hammersmith.

This building is erected upon a site within 200 yards of Hammersmith-broadway. The site consists of two parallelograms, the smaller of which forms the frontage to Hammersmith-road, the frontage to which is 65 ft. by a depth of 102 ft. to its junction with the larger, which has a width of 160 ft. by a greatest depth of 276 ft.; the total superficial area is 44,000 ft.

The site is one which is but seldom to be found in the London district, and, despite the small frontage, is one that lent itself admirably to the purpose of my building. The space was sufficient to permit the erection of a building upon the back portion, reserving large areas for light and air, while utilising a portion of the frontage for business premises with a reserved entrance to Rowton House. The site had been originally occupied by an old house known as Oak House and the land at rear was garden ground undisturbed; immediately below the surface a beautiful bed of sand and gravel gave a good foundation, and it therefore proved possible to place the whole of the accommodation other than cubicles upon one level, sinking a small basement for furnaces, bedmakers' room, and parcels-room only. To the west was vacant land, now covered with low buildings belonging to the Road Car Company, which secures good lighting in that direction, in addition to that on site of buildings; on the east, at present a passage known as Rose and Crown lane separates that boundary from a row of two-story cottages, while a width of an average of 30 ft. is reserved on site of buildings to protect light in the event of a rebuilding scheme for these cottages.

Materials and construction, excepting in a few minor details, as at Newington. The superintendent's residence is here a three-story building above pavement, the lower story being used for office, and is situated in relation to entrance and access from same as in other houses. The bedmakers use the front main staircase with a separate staircase down to their room; the catering staff enter at side of office and are isolated from the lodgers' section. The ground-floor main corridor has been made 2 ft. wider than Newington.

The smoking-room has seating accommodation for 164 men at tables; the floor area is 2,428 ft., it is top-lighted, in addition to large bay window; the fireplace in bay is covered down at sill level and the window runs over it. The dining-room has seating accommodation for 404 men at tables; the floor area is

5,722 ft. The reading-room has seating accommodation for 176 men, and a floor area of 3,128 ft.

The table accommodation in these rooms provides a seat for every lodger, exclusive of easy and other chairs. Lavatories, water-closets, baths, and feet-washing are proportioned as at Newington.

The lockers here are all 3 ft. 1 in. high by 1 ft. 6 in. square, with shelf and space for umbrella; they are placed three in height and may be taken as a new standard of size.

Cubicles.—In consequence of the length of site, it was found possible to throw out an arm from the usual U shape towards the north, with sufficient lighting, east and west, for the cubicles. This gave such increased accommodation on each floor that the building was built to a height one story lower than Newington or King's Cross, and still provides accommodation for 800 men. The lengthening to the north made a third staircase necessary—a staircase which, moreover, is convenient for access to the centre of cubicle floors, and is therefore most generally used.

Whitechapel.

This, the latest of the Rowton Houses, is in course of erection in Fieldgate-street, which runs parallel with Whitechapel-road, and is immediately behind the St. Mary, Whitechapel, station. It has a frontage to Fieldgate-street of 192 ft., and a back frontage of 239 ft., by a depth from front to back of 128 ft., giving a total area of 29,539 ft. While this gives an area somewhat in excess of the Newington site, the departure from the rectangular form, and the decrease in depth, gave me some little difficulty in planning the day rooms and catering, and other portions of the buildings. For cubicle planning the site is good, and permits of the omission of one story as compared with Newington, yet giving an accommodation of over 800 beds. To plan the day rooms on a ground floor with a basement under, would have provided excessive space in basement, and also increased the height above paving of building by a height of about 6 ft. I have therefore planned the entrance on paving level, and placed all the usual ground floor accommodation down on a sub-ground floor, the ceiling of which is 6 ft. 6 in. above paving. The only room displaced by this arrangement is the reading-room, which will be approached from entrance hall by a staircase rising 7 ft. only.

The entrance planning is as in other houses with these differences—the clerk has his bedroom, approached from the office by a staircase over the entrance; the superintendent's residence is two stories in height, and underneath his lower story a third story is obtained, by lowering the floor (in the height of two stories of main building) and forming a basement containing bedmakers' room and porters' room approached by separate staircases; the bedmakers' by the wooden staircase at end of entrance, and the porters' by a staircase from lower ground floor level under staircase to reading-room; parcel-room adjoins porters' room.

The dining-room is chiefly top-lighted, and seats 464 men at tables; the floor area is 5,832 ft. The smoking-room accommodates at tables 112 men and has an area of 1,960 ft. The lockers are of the size mentioned for the Hammersmith House and provision is made for one for each lodger.

Lavatory, bath, feet-washing, and water-closets are practically the same. The staircase up to reading-room gives access to the roofs, over the rooms in central courtyard; these will be railed in as a smoking lounge. The reading-room seats at tables 144 men in addition to easy chairs, &c., and has an area of 2,430 ft. You will note that on the same floor cubicles are planned, the central corridor leading to a staircase at each end. The upper floors of cubicles are served by three staircases; that at corner of building 1 anticipates will be the one in general use.

In conclusion, I would lay some stress upon one or two points. In obtaining a site it is doubtful whether one which permits of less than 400 beds is worth entertaining, as expenses all round are proportionately heavier than on a larger site. The site must be within walking distance of the heart of London, as many lodgers obtain casual employment only, and often at late hours. Do not have too many rules and regulations for the lodger. They are not necessary. I have copies of those in use at the Rowton Houses, and as you will see, most of them are directions rather than rules.

You may take it that the men know they have got a good thing, and that for another lodger to treat it otherwise is to call into existence a broad hint that police are not required to maintain order in that house.

The Chairman, in inviting discussion, said that they all felt that Mr. Measures, who seemed to have a monopoly of this class of building, was a master of his subject, and his comprehensive and exhaustive paper gave many interesting particulars. He might remark that he had received a letter from M. Chas. Lucas, asking for a copy of Mr. Measures' paper, in which M. Lucas said that there was nothing in Paris like Rowton Houses, and he would like some information on the subject. The occupation of the residents of these buildings had, he believed, been studied, and it was gratifying to know that there was not an architect or surveyor making use of the buildings, although nearly every other profession seemed to be represented. There were some very important questions connected with the movement for the provision of such buildings; one was, what effect an increase of this work would have on pauperism in London?—whether it really increased or diminished it? That was a most interesting social problem, and it rather seemed to him that such accommodation must have the effect of bringing to London from the provinces a class of casual workers who, when too old to earn even the small pittance that enables them to make use of these dwellings, would be driven into the workhouses, and in that way help to increase the burden of taxation. He would like to ask Mr. Measures whether intoxicating liquors were sold in these buildings.

Mr. Thomas Blashill, in proposing a hearty vote of thanks to the lecturer, said he had visited the Glasgow lodging-houses, which were pioneer buildings of this kind, and although they did a very useful work, still they were in many ways inferior to the Rowton Houses. He had been very much struck with the extremely good way in which everything was done in Rowton Houses—not only as to construction, but also as to finish; the amount of glazed work and good hard wood, for instance, that was used, gave quite a sumptuous appearance to the buildings. He would like to ask Mr. Measures how they managed to get such good work done at these buildings at a price which apparently recouped the investors, even though no more than sixpence per night was charged per head for accommodation. The London County Council built one of these lodging-houses as a kind of experiment at the time when there were none of these Rowton Houses, and the question they had to deal with was, What kind of building would be suitable? The result of a competition (which Messrs. Gibson & Russell won) was the Parker-street dwellings, Drury-lane—a building entirely different in style from the Rowton Houses. The basis of the idea for that building seemed to have been taken from a Sailors' Home in Wells-street, in which the idea seemed to be to provide something like the hull of a ship for the hall, with two or three galleries—the cubicles opening from the galleries. In the Parker-street buildings there were none of the luxuries which were provided at the Rowton Houses, except that some one provided books for the use of the lodgers. It was very good of Mr. Measures to give them so much valuable detail in regard to these buildings, for detail in such cases was of very great importance. He had heard a slight objection to these buildings on the part of a lodger who used the ordinary kind of lodging-house, viz., that there was an absence of the homeliness which he had been accustomed to. In regard to the remarks made as to the need of these buildings for architects, he might say that he had been much struck by the air of comfort in these buildings, and that there appeared to be nearly everything one wanted—perhaps, though, the cubicles would be a little efficient. He had met several gentlemen from various parts of Europe who had referred to the need in their towns of buildings of this kind and of the difficulty of lodging single men personally, he thought that provision of buildings of this kind was likely to be increased to a very great extent, for it seemed to be one way of solving the housing problem.

Mr. A. T. Bolton, in seconding the vote of thanks, said he had seen two of these buildings, and he could bear testimony to the great attention to detail that had been given by Mr. Measures in solving the problem of providing accommodation for single workers. One point

which had not been referred to by the lecturer had, he understood, been of extreme importance, and that was the width overall of the building, which was only 10 ft. A point which struck one in visiting these buildings was the central corridor, which looked narrow, in spite of the fact that the cubicles did not reach to the ceiling. If the corridors could have been 4 ft. 6 in. or a little more it would, he thought, be better, seeing what a length the corridor had. As to the architectural aspect of these buildings, he felt that they afforded a curious instance of how several structures of the same kind might lead to an advance in the treatment of a particular class of buildings. The last Rowton House, at Hammersmith, and the one at Newington were very much more interesting than the previous ones. The back of the Newington building had, in his opinion, an expression of its own with its enormous extent of blank wall of great height and all those uniform windows. It conveyed an idea of a building of a special character and purpose, and he wished that Mr. Measures had had the courage to treat the front in the same way, though no doubt the architect had felt he must make a concession to the man in the street by breaking up the façade and having some gables. As to Mr. Blashill's point about the finish of the buildings and the character of the work, that was probably due to some extent to the fact that the Rowton Houses Company were their own builders, and would, in order to save in natural repairs, secure the best materials possible. He thought the Association should try to arrange a visit to one of these buildings, because there were many points of interest which could be better understood by a personal visit than by a description.

Mr. C. H. Brodie asked if any progress had been made in the matter of providing similar houses for women.

Mr. H. V. Lancaster, in supporting the vote of thanks, asked if it had been found necessary to provide any artificial form of ventilation for the large dayrooms and dining-rooms?

Mr. Blashill said he should like to add a few words. There was a lodging-house for women in Glasgow, but he did not know whether the organisers of it had experienced any difficulty as to its working. People in London who had considered the subject had felt that there were difficulties in regard to the admission of women to such buildings. In a large provincial town where a house for women was run by the Wesleyan Connexion he put the difficulty before those connected with the lodging-house, and asked whether they were able to keep clear of objectionable characters. "Oh, no," he was told; "they are the very people we want to catch." That indicated that the scheme was rather charitable and philanthropic; what was wanted was a scheme run on municipal lines. He was told that the County Council intended to build such a house.

The Chairman said it had often occurred to him that something on the line of Rowton Houses, but with separate bedrooms, not cubicles, might be done for poor clerks and young fellows who were not able to earn more than 15s. to 17. a week. There were a large number of young and respectable men in London to whom a scheme of that kind would be a great boon. He did not know whether Sir Richard Farrant or any one else could do something for such young fellows. [Mr. Brodie: One exists already near St. Pancras Station.] The Chairman: Oh, yes, Hampden House; but that is not quite the sort of thing I mean, nor is the neighbourhood quite desirable. He would like to ask why cards were excluded from the houses, and he would like to know what, in Mr. Measures' experience, was the comparative wear of oak blocks and deal blocks. He would also like to know what the minimum cost of living was in these buildings, and if social entertainments were got up for the inmates? He understood that the houses were not classed under the Registered Lodging House Act [Mr. Measures: That is so.], and he did not quite recollect the reason for the decision of the Courts. In a somewhat similar building he had used Dashwood's terracotta partitions between the beds, and, as far as he could gather, the material had proved very satisfactory. It was absolutely vermin-excluding, and was strong and inexpensive. With the vote of thanks to Mr. Measures he was sure they would desire to associate the names of Lord Rowton and Sir Richard Farrant for allowing so much information to be made public.

The vote of thanks having been put to the meeting and heartily agreed to.

Mr. Measures, in reply, said as to the class of tenants using the buildings, there were men of every class, from the man in corduroys to the one in frock coat and silk hat; so far as it was possible to judge, the latter had to practice more economies than the former in the matter of living, despite the small outlay for accommodation, a fact which pointed to a greater wage earning difficulty. Intoxicants were not permitted on the premises because it would never do to run the risk of having drunken men in their houses. Cards and gambling went together, and they could not be permitted. As to the wear of oak blocks, he did not think they had to renew any of the oak blocks yet. Social entertainment was not provided, apart from facilities for reading, chess, draughts, &c., though at Newington at Christmas the lodgers got up an entertainment among themselves, and some of them showed a surprising amount of talent. As to the cost of living in addition to the cost of bed, a lodger could actually live in one of those buildings for between sixpence and sevenpence a day, but for a shilling a day he could be said to live in luxury. As to the dwellings being registered under the Common Lodging Act, he was not able to say much about that; but as a stigma was undoubtedly attached to a common lodging-house, it was very much desired by Lord Rowton to avoid that; and though the London County Council had said the buildings were common lodging-houses, the law had taken a different view. The expression, "a poor man's hotel," was the best designation for the places. As to the good work shown in the construction of these houses, the company were their own contractors and there was no inducement to scamp work. He could honestly say that everybody connected with Rowton Houses, from Lord Rowton down to those who had charge of the works, was keenly interested in the work, and that interest showed in the work that was done. As to the width of the cubicle floors, 10 ft. was the standard size from wall to wall inside. Every cubicle partition and sash was the same from bottom to top of building; and in repetitions like that there were bound to be some economies. If cubicle corridors were made 4 ft. 6 in., the extra width would be taken out of the sleeping apartments, and that, he thought, would not be at all desirable. As to houses for women, there was a good deal of talk about provision of that kind, and he would like to try the experiment of providing a building. Women required more room than men in their sleeping apartments, and more room meant more cost. The women could not be turned into the basement to wash, and that meant the provision of washing conveniences in the cubicle blocks, and that again meant more expense. There was a difficulty, too, in dealing with women in their relationship with other women. In a lodging-house for men and women within thirty miles of London, discrimination of class was exercised in the admission of women, with the consequence that the house was a failure on the women's side. As to ventilation, they had no artificial system; they could not afford to spend money in that way, and they relied on the windows. As to a visit of the Association to one of these buildings, he had no doubt that it would be possible to arrange a visit to the Whitechapel building when it was finished, later in the year.

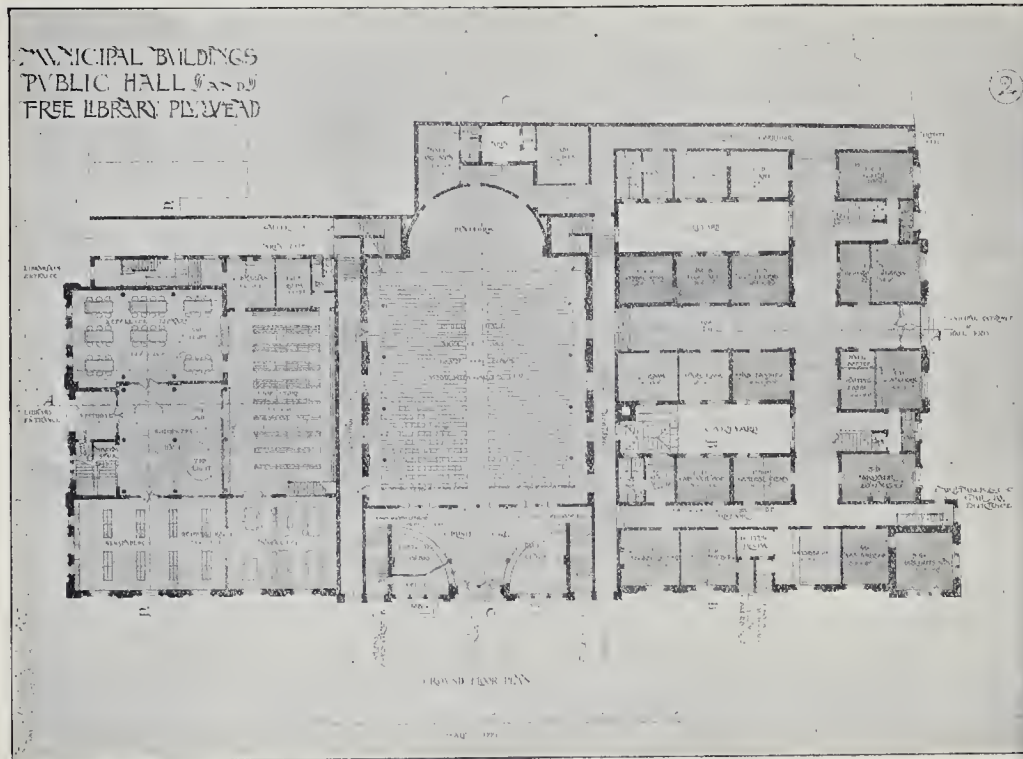

The Chairman announced that the next meeting would be held on the 29th inst., when papers would be read by Mr. H. D. Searles-Wood and Mr. H. R. Appelbee on "Small Suburban Houses," illustrated by lantern slides.

The meeting then terminated.

COMPETITIONS.

COTTAGES, TANFIELD.—The first premiated design in the competition for cottages at Tanfield, Durham, was sent in by Mr. Thos. Robinson, Burnopfield, Durham; and the design placed second was by Mr. G. T. Wilson, Blackhill, Durham.

PROPOSED RESTORATION OF MERCAT CROSS, ST. ANDREWS, FIFESHIRE.—It is proposed to restore the old Mercat Cross at St. Andrews in commemoration of the proclamation of King Edward. Mr. David Henry, F.S.A., of St. Andrews, has been consulted in the matter.

Illustrations.

PRINCIPAL ENTRANCE TO NEW SCOTLAND YARD.

ILLUSTRATION of a portion of Mr. Norman Shaw's celebrated building is reproduced from a very well executed tinted elevation by Mr. Harry Jones.

There have been many views of New Scotland Yard published, but a measured drawing of a part of the structure in detail is rather a novelty, and may be an interesting possession to some of our readers.

SOME RECENT DESIGNS FOR PIANOFORTES.

THESE designs are commented on in a critical sense in the second article in the present issue. It is only necessary here to briefly enumerate them.

No. 1 is designed by Mr. A. C. Blomfield, and is executed in Spanish mahogany inlaid with coloured woods; the interior of the lid is similarly inlaid on a ground of satinwood.

No. 2 is an upright grand designed by Mr. Gilbert Ogilvey; the case is of oak, with inlay decorations of black oak, pearl shell, ivory, and satin-wood, on a ground of richly coloured pollard oak.

No. 3 is a drawing-room grand designed by Mr. E. L. Lutyens, in an oak case with wrought steel pedal work and music desk.

No. 4 is a semi-grand designed by Mr. C. C. Allom, decorated with engraved inlay of coloured woods. The internal metal work is silvered and lacquered.

All the instruments illustrated were made by Messrs. Broadwood. No. 3 was exhibited in the English Royal Pavilion at the Paris Exhibition.

DESIGN FOR MUNICIPAL BUILDINGS FOR PLUMSTEAD.

THIS was a competition design submitted by Messrs. Russell, Malloes, and Grocock, the perspective view of which was exhibited in last year's Royal Academy. We append a

plan of the ground floor of the building as proposed.

It was intended that the walls generally should be carried up in stocks from the Sittingbourne district; the exterior elevations to be faced with red bricks and Portland stone dressings, and the internal courts on the ground floor faced with white glazed bricks.

The estimated cost, at the rate of 10d. per cubic ft., was 41,500l.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS.

By the invitation of Messrs. Broadwood the Architectural Association were enabled, on Saturday, the 9th inst., to view an interesting collection of pianos, comprising specimens of the earliest types down to those of the most recent construction and design. Mr. Rose, in a short speech, summarised the history and evolution of the instrument from its constructional aspect, and a tour through the showrooms showed examples of nearly every style of decoration since its invention. Of the earlier types perhaps the Sheraton and Chippendale appealed most to the members, by reason of their simplicity and dignity, though the inlaid work and carving of all was both chaste in design and admirably executed. Of the modern examples, the drawing-room grand, designed by Mr. Lutyens, which won the Grand Prix at the Paris Exhibition, claimed first attention. Jacobean in design and executed in dark oak with steel fittings, it was full of interest and quiet dignity, and was a standing argument in favour of the retention of the constructional form of the instrument in the treatment of its shell. The richly panelled casing was carried by about twenty legs, grouped at different points of support and connected at their feet with curved stiffening pieces; but, in spite of their number and disposition, one could not help being struck by the extreme slenderness of their proportions compared with the weight they had to carry; and the consequent impression of instability was not entirely dispelled by actual experiment. Of the upright grands one of the most pleasing was designed by Mr. Ogilvey, in oak inlaid

with pearl and coloured woods with polished iron fittings. To the same class belong three of Mr. Baillie Scott's—two in fumigated oak with copper fittings, and one in green-stained oak with steel fittings.

All these pianos when shut resemble a cabinet, and there is no visible indication that they are anything else. Perhaps the structural shape of an upright piano does not commend itself to modern design—though one wonders that they all seemed to strike one at first sight with a sense of "something that is gone." The same thought is suggested by the rather unusual octagonal and square shapes of the most recent designs; a sense of injustice, as it were, on the part of the body to the soul of the instrument. It may be that this objection is purely sentimental, the outcome of obsolete associations and meaningless traditions. Mr. Rose explained that a piano can be made to *any* given shape, but as the "harp" form apparently remains constant, we must presume that this would be effected by a process of "padding" in the frame. A vote of thanks was passed by the members for a very interesting visit.

The third spring visit took place on March 16 to Stanhope House. Judging from the outside, it would appear at the first glance that the sentiments which inspired the Gothic revival of the sixties and seventies is still extant. As a distinct contrast from what we now look upon as being an orthodox treatment of a modern exterior, Mr. Romaine Walker's effort in Park-lane suggests that "Mediævalism" has been a conditional factor of the design.

The grey Forest of Dean stone in which the elevations are entirely worked is a study in effect compared with the surrounding buildings. The colour is a variety; there is a lack of life in this stone which, to our minds, does not lend itself to elaborate dressings. There may be the corresponding advantage of durability which justified its use.

The house, which occupies a confined corner-site, is planned to meet the usual requirements and great skill has been shown by the architect.

THE BUILDER, MARCH 23, 1901.

SOME RECENT DESIGNS FOR PIANOFORTES.

No. 4.—SEMI-GRAND PIANOFORTE: DESIGNED BY MR. CHAS. C. ALLOW.

in overcoming the intricate problems of the lighting of the staircases and the lifts.

Generally speaking, the interior is a contradiction to the outside, and with the exception of the vestibule, dining-room, and library, an "Adam" treatment predominates. The vestibule is successfully panelled and carved, following out the traditions of the exterior.

The staircase and hall, in white marble plaster modelling and a polished steel balustrade, conveys to the visitor an entirely satisfactory treatment, and it is well carried out.

The drawing-room, which occupies the whole of the front of the first floor, also suggests the Adam period. The wall surfaces generally, also a low dado, are covered with a monotone green hanging. We think an improved effect could have been obtained in this room if the ceiling decoration could have been brought more into sympathy with the three bays.

Looking towards the windows, a curtain arch, without which the Gothic element is incomplete, should have been adopted, or the ceiling should have been carried up to the stonework of the windows. This has been done on the second and third floor levels with good results.

The second and third floor levels are similar and contain comfortable suites of bedrooms with bathroom on each floor. The tiling of the bathrooms is excellent, both as regards the design of the tiles and the texture of the material, and it is seldom that tiling is seen to such advantage.

The basement is mainly in glazed brickwork, and the fittings of the various departments are teak. The kitchen is in Dutch tiles, with teak fittings, and the glazing is in lead lights.

Mr. Romaine-Walker attended the visit, and kindly explained to the members present the working of the design.

ARCHÆOLOGICAL SOCIETIES.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.—An evening meeting of this Society was held at the London Institution, Finsbury Circus, on Monday, 11th inst., when Canon Benham occupied the chair. Mr. T. W. Shore read a paper entitled "Anglo-Saxon London and its Neighbourhood," a continuation of a former paper which he had read, showing the importance of the City in Saxon times. The next paper was written by Mr. John Terry, the City Clerk of the Works, "On a Recently Discovered Portion of the Roman Wall," but, owing to the unavoidable absence of Mr. Terry, the paper was read by Mr. Charles Welch, hon. sec. The portion of the Roman wall spoken of was recently discovered at No. 8, Old Bailey, adjoining the Sessions House, but before describing it the paper gave a short account of the wall from the time of its erection *circa* A.D. 306. It ran from the river to Ludgate, then to Newgate, and on to a point between St. Bartholomew's and Christ's Hospital, and so on to Aldersgate, Cripplegate, and Bishopsgate, whence it was carried south to near where the White Tower now stands. The portion now discovered at the Old Bailey was about 8 ft. high and 8 ft. 3 in. thick above the foundation, which was 14 in. wider. From the base of the foundation there was 3 ft. 6 in. of rubble work of large ragstone. Then came three courses of tiles, and then 2 ft. 7 in. of smaller ragstone and two courses of tiles, on the top of which was other rubble work. The interior of the wall was ragstone, roughly thrown in, and grouted with lime mortar of excellent quality, the whole forming a hard concrete mass. The inner face, where not mutilated, was in a good state of preservation, but the outer face showed the effects of the water of the old Fleet Ditch. Mr. Terry next mentioned the spots where portions of the wall had been discovered at different times: that at Bishopsgate, 1707; the Minories in 1811; Playhouse Yard, Blackfriars, 1843; and others at Fish-street-hill, and Broken Wharf to Lambeth-hill. He had also written another paper on the bastion at Cripplegate. When the Corporation refused to repair this bastion, he personally superintended the work. It was a piece of the wall which had many times undergone repair, chiefly of an injudicious character. Originally the face of the wall was of ragstone, but at one time or other a mixture succeeded it, and now ragstone had been reintroduced to harmonise with the remainder. In getting out the decayed portions of the wall a mis-

cellaneous collection of broken stones was brought to light, together with a portion of the head of a Gothic window and several pieces of gravestones. At the time when the recent repairs were being done it was thought advisable to inspect the wall below the ground level, and excavations were made to a depth of 18 ft. The lower portion of the wall to the height of about 4 ft. was in excellent condition, and judging by the materials, was of Roman origin. Above this height the wall was of a different character, several kinds of stone being used, intermixed with Roman tiles and flints in occasional layers of oyster shells. The mortar was of an inferior nature to that below. Although Roman materials were used, there was not the slightest sign of the work being Roman. The many repairs this bastion had received were due in a great measure to the fact of its being placed at an angle of the wall, and consequently being a chief point in assault. Mr. Terry next referred to the discovery of a red brick tunnel or drain, an illustration of which was shown to the meeting. This, he said, was built in Roman cement and was splendidly constructed. It varied from a height of 4 ft. 6 in., and was 2 ft. 6 in. wide. At intervals chambers of a height of 12 ft. to 14 ft., covered over with large flat stones, were attached. The tunnel was investigated to a distance of about 200 ft., and then it was found to be broken up for the purpose of houses being built above it. It was also found that it had several branch drains. The main portion followed the line of the old City, in what must have been a ditch. He thought it was constructed for the purposes of a drain, for the floor was circular in formation. It was probably built in 1648 to take the water of the ditch. Had it been built for another purpose, the floor would have been flat. In Harrison's "Notes of London Churches," the following description appears to identify this culvert, and to supply some explanation of its present position:—

"Moredich, from Bishopsgate to Moregate, was arched over with a great number of brickworks, and then filled up, and made plaine ground over it in the year 1638 and soe left. But the rest of the ditch from Moregate to Cripplegate was arched over as the other in 1648, and left by the City at great rates but long leases of the ground, and one condition that they shall build such houses as they appointed them and in such a time. There are many faire houses built their already, this year 1658."

Mr. George Potter exhibited some excellent illustrations of the old Roman Wall from the earliest period to latter-day discoveries.

ARCHITECTURAL SOCIETIES.

BRISTOL SOCIETY OF ARCHITECTS.—The ordinary monthly meeting was held at the Fine Arts Academy, Queen's-road, Clifton, on Monday evening last, Mr. W. L. Bernard, F.R.I.B.A., in the absence of the President, in the chair. After the routine business, Mr. Archibald Dawnay, Assoc. Mem. Inst. C. E., read a paper on "Constructional Steelwork as applied to Building." The paper dealt very fully with the origin and development of cast iron construction in the early part of the last century, and thence onward to the rolled wrought ironwork and more recent steel construction of the present day. The lecture was illustrated by a very admirable series of full-sized drawings of the different forms of stanchions, girders, &c., employed in large buildings.

DUNDEE INSTITUTE OF ARCHITECTURE.—A lecture to the student section of the Dundee Institute of Architecture, on the "Ecclesiastical Architectural Antiquities in Fife," was delivered in the Technical Institute on the 9th inst. by Mr. Charles G. Soutar. After briefly tracing the influences which affected ecclesiastical art in Scotland generally, from the time the Irish influence was superseded by that of Rome, through the various stages of the Gothic art, he took up severally the principal examples of structures showing these influences found in Fife, amongst which were the following in the order of their foundation:—The Monasteries in St. Andrews, Church of St. Regulus, Cathedral of St. Andrews, Balmerino Abbey, Abdie Church, Newburgh, Leuchars Church, St. Monance Church, Crail Church, Cupar Church, St. Salvador's or College Church, St. Andrews, and Dairsie Church. These were treated both from an historical and architectural point of view, and were illustrated by numerous lantern slides and drawings.—*Dundee Advertiser.*

SANITARY INSPECTORS' ASSOCIATION:

ANNUAL DINNER.

THE eighteenth annual dinner of the Sanitary Inspectors' Association was held on Friday evening last week at the Royal Venetian Chamber, Holborn Restaurant. Archdeacon Sinclair presided, and among those present were the Rev. C. W. Whitfield, M.A., the Master of the Carpenters' Company, Mr. W. H. Dickinson, L.C.C., Dr. G. Groves, D.P.H., Dr. F. G. Allan, D.P.H., Dr. Howard, the Mayor of Deptford, St. Pancras, Finsbury, and Poplar, Alderman Redfern (Stockport), Councillor Wilson (Bury), Mr. W. H. Grigg (Chairman of Council), Messrs. E. Gibbs, C. Gordon, A. Richardson, H. Lovegrove, E. Lewis Thomas, T. Cato Worlford, A. Mills, T. Ashdown, T. G. Dee, E. Tidman, and J. Young.

After the toast to the King, the Mayor of St. Pancras proposed "The Houses of Parliament," which was responded to by Alderman Redfern.

"The Defenders of the Empire" was then submitted by the Mayor of Finsbury.

Dr. Groves, in reply, said a corps of medical officers and sanitary inspectors should have been sent to South Africa. He could not conceive of anything more scandalous than the number of deaths from enteric fever during this war.

Dr. Howard, who had served in the Crimea, also responded, remarking that the mistakes of the past would teach us to be fully prepared in the future.

Dr. Groves, in proposing "Local Government," referred to the question of the security to the sanitary inspectors of the tenure of their office. It was unfair to appoint a sanitary inspector for twelve months, or for two or three years, so that he could be dropped at the end of that period. This was frequently done outside London, especially in the rural districts. If a sanitary inspector appointed under these circumstances became a bad friend to owners of property who were members of the Local Authority he was bound to be dropped at the end of his term, and an inspector dropped in that way did not get another appointment.

Alderman Dickinson, L.C.C., in response, likened local government to a locomotive, the three principal factors of which were the machinery (the officials), the driver (the members of the Authorities), and the motive force (the electors). He said he was glad to find that Local Authorities now insisted upon having skilled men as sanitary inspectors, because their work was very trying and responsible. The Authorities themselves had undergone a great process of improvement, and if they had carried out their duties twenty or thirty years ago as well as they did now we should not have had the terrible state of overcrowding which existed now.

Alderman Redfern and Councillor Wilson also responded.

Archdeacon Sinclair submitted "The Sanitary Inspectors' Association." He said the Association had fully justified its existence by the many things it had already achieved. Their general objects were very praiseworthy. They met together to discuss and to receive instruction in regard to the various sanitary Acts of Parliament, and such subjects had been dealt with as the source of the water supply of London, the smoke nuisance, and the inspection of lodging houses. One important object they had was a general promotion of sanitary science; and another was to purchase property—and he hoped they would become wealthy and prosperous—while another was to receive gifts. During the past year they had held an exhibition at Lincoln, which had been very successful. The Association had already 600 members, and he learned from the Secretary that this number was monthly increasing. There was no question that the duties of the sanitary inspector were very trying, as they had a large amount of prejudice, stupidity, and superstition to contend with. He trusted that their tenure of office would soon be amply secured. In conclusion, he wished it had been the duty of the sanitary inspectors to see to the ventilation of our churches and public buildings. Acting for the Bishop of London he had inspected churches before they were consecrated, and he rarely found that sufficient attention had been paid to ventilation. Perhaps this was one of the two reasons why people went to sleep in church. He then presented the medals and certificates earned in connexion with the Lincoln Exhibition. A silver medal was

awarded to Messrs. Oates & Green, of Halifax; a bronze medal to Messrs. Guest & Chrimes, and one to Messrs. Wilson & Stockdale. Certificates were awarded to Mr. Charles Duckering, Messrs. Arnold & Co., Mr. E. F. Nurdock, and Messrs. F. Lockerbie & Wilkinson.

Mr. W. H. Grigg, in responding to the toast, said he was glad to know that the medical officers were doing all in their power to assist sanitary inspectors in regard to their tenure of office. They had included this in their Bill, and he thought it would be advisable for the inspectors to drop their Bill and press forward that prepared by the medical officers.

The toasts of "The Chairman" and "The Visitors" concluded the list.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A HOME Counties District Meeting of the members of the Association of Municipal and County Engineers was held at the Council Offices, Wimbledon, on Saturday, March 16. Mr. C. H. Lowe, C.E., Hampstead, President occupied the chair, and there were present Messrs. W. Weaver, Kensington; J. P. Barber, Islington; R. J. Thomas, Aylesbury; W. H. Harpur, Cardiff; J. Parker, Hereford; — Martin, Wandsworth; A. H. Campbell, East Ham; — Cooper, Wimbledon; — Ainsworth, Teddington; — Jenkins, Walton; — Parr, Willesden; — Brookes, &c.

The President, in opening the meeting, informed the members that the Council had taken steps to express the feeling of the members of the Association with respect to the lamented death of her late Majesty Queen Victoria, by conveying a vote of condolence to the King and Royal family in the loss which they and the nation had sustained. As to the orphan fund, he was pleased to say that it had been carried to a successful issue, and the Committee had been enabled to make a grant from the fund, so that it was now in working order.

Mr. Cooper, Engineer to the Urban District Council, then gave a short description of the various public works which had been carried out since the previous visit of the Association in 1898. The railway-station bridge, which was now being demolished, was erected about 1866. It has a clear width between the parapets of 30 ft., the girders from the parapets being 7 ft. 6 in. by 2 ft. continuous, but the flanges were not thickened where the bending moment was greatest. These parapets carried the entire structure; the bottom flanges were covered, being seriously affected by the fumes from locomotives. The bridge now being constructed would be 50 ft. in width between the parapets, the carriage-way being 30 ft. in width, with 10 ft. paths on either side. The carriage-way was carried on eight 1 ft. 6 in. by 2 ft. girders, and each path on three similar girders. The contract for the work was let to Messrs. Firbank at 12,628l. The eastern portion of the bridge had been erected and carried traffic during the demolition of the old bridge. When the Association visited Wimbledon in April, 1898, the buildings forming the depot were in course of erection. They were now completed and occupied, providing stabling for thirty-nine horses, with six isolation loose boxes, store block, and residence for the storekeeper and housekeeper. They had lately acquired an additional acre of land on the east side of Ashcombe-road, which they hoped to connect up by sidings. The seven buildings forming the Isolation Hospital had been in use since September of last year. The administration block was built to accommodate a staff of twenty persons, and the cooking was done there for the other wards. There was a large ward with twenty-two beds, a twelve-bed ward, and two isolation rooms on the Local Government Board type. Then there was a lodge laundry, ambulance, and mortuary. There was only one peculiarity about the scheme, and that was the bringing of the steam from the sewage pumping station, where steam at 50 lb. pressure could be obtained. The steam was conveyed in a 3-in. cast-iron main for a distance of about half a mile, and the loss in pressure was about 5 lb. At present their tank accommodation at the sewage works was less than half a day's dry weather flow. When the proposed new tanks were completed they would have rather more than a day's dry weather flow. The new tanks would consist of four tanks, 110 ft. long by 30 ft. in width. They could be used either

separately or in series. The sludge taken from the tanks would go into a large sludge tank, and it was proposed to raise it by an ejector to the present sludge tank in order to allow of pressing. He proposed trying an experiment, as soon as he got them, by using one as a septic tank, and seeing how they could get on with it. He had lately constructed ten artisans' dwellings. They were let at 7s. 6d. a week each, which just covered the cost, and interest on and repayment of loan in thirty years. He was also preparing plans for other artisans' dwellings, in which he was trying to put in bathrooms. Some of them were in flats, in which there would be bathrooms, but he found it very difficult to introduce bathrooms in the others, without doing away with a bedroom or else materially increasing the rent.

Mr. James said he understood there was more accommodation for women than for men at the isolation hospital, which was very unusual. He would like to know whether that was because the children were treated in the women's wards.

Mr. Ainsworth, Teddington, asked the cost of the artisans' dwellings, and whether the rent of 7s. 6d. covered every expense to the Local Authority.

Mr. Jenkins, Walton, did not consider the provision of a bathroom to be necessary in an artisan's dwelling. It was possible to have a bath in the kitchen or scullery.

Mr. Gladwell asked the cost per head of the isolation hospital, and separately the cost of the land and buildings, as the cost of land varied so much in different districts.

Mr. Harpur, Cardiff, who moved a vote of thanks to Mr. Cooper for his description of the works he was carrying out, said they had not erected any artisans' dwellings in Cardiff up to the present time, but there was a cry for such dwellings. His difficulty was, if he put up any such dwellings, how to do it so as to let them at about 4s. a week. The ordinary speculative builder in Cardiff provided houses in any number which let at 6s. 6d. to 7s. 6d. per week, and if they were to provide any dwellings for the labouring classes they must let at a less rent than that. His own opinion was that the ordinary builder would provide houses there was a demand for, but necessarily he must get a profit upon his outlay. When they as Local Authorities had paid for the upkeep of the building and interest on and repayment of loan, he did not see how they could do better than the ordinary builder. It was a very difficult problem, and one constantly brought to the front, but how it was to be met by Local Authorities who had to repay the principal in thirty years, and still not burden the ratepayers, he did not see.

Mr. J. Parker, Hereford, who seconded, said that most of the municipalities had entirely misunderstood the housing problem. It was not dwellings for artisans they had to build, but for labourers. From the slums they were ousting tenants who were paying 2s., 2s. 6d., or 3s. a week rent. It was quite true they were miserable hovels. He saw no hope of building dwellings which would meet the requirements of the Local Government Board and their own by-laws at such a rent. The lowest they could do was 4s. 6d. per week, and that did not meet the problem for the poorest class of tenants. Mr. Boulnois had come nearest to a solution at Liverpool.

The vote of thanks was accorded with acclamation.

Mr. Cooper, in reply, said the answer respecting the wards at the Isolation Hospital was self-evident, and the gentleman who asked the question answered it himself. It was that the children went into the women's ward. As to cost, the administration block was constructed so as to be sufficient when further pavilions were erected. At present the cost per bed was high, but when the hospital was completed he anticipated that the cost per bed would not amount to 400l. The artisans' dwellings they had erected cost 270l. each. Cottages were letting in Wimbledon at 9s. 6d. per week, so that they were giving a better cottage with more room in it at 2s. per week less than the rent of the district. As to the question of a bathroom, he could not agree with Mr. Jenkins, and would much prefer not to have food cooked in a kitchen where persons had been bathing themselves. As regarded cost, the dwellings worked out at a rent of about 1s. 6d. per room per week, as there were three bedrooms, kitchen, and sitting-room, leaving out the small scullery.

The members then proceeded to inspect the

bridge over the railway near to the station and the depot at Queen's-road, with the proposed extension on the east side of Ashcombe-road. Luncheon was served at the Baths, Worple-road, Mr. C. H. Lowe presiding, and the afternoon was devoted to inspections of the destructor at Streatham and the electric lighting station at Fulham.

DWELLINGS FOR THE WORKING CLASSES.

AT Carpenters' Hall, London-wall, E.C., on Thursday last week, Mr. W. E. Riley, the Superintending Architect to the London County Council, gave a lecture upon "Dwellings for the Working Classes." Mr. R. M. Beachcroft, L.C.C., presided.

Mr. Riley, whose lecture was illustrated with limelight views, said that the earliest efforts in connexion with this important question were initiated by the late Lord Shaftesbury, who introduced two Bills into Parliament in 1851 dealing with lodging-houses, in which term were included block dwellings. The Housing of the Working Classes Act of 1890, with its more recent amendment, formed the basis of the operations now performed in London and most provincial towns. The lecturer first illustrated overcrowding by pictures of the Boundary-street area before the improvement, Mill-lane, Deptford, and the Churchyard, St. Pancras, and he explained that a large number of persons were displaced in consequence of houses being pulled down for private enterprise and new buildings not being provided soon enough. He pointed out the details of an improvement scheme carried out by the Council and the huge expenditure involved in clearing the site. The Council had a very difficult task in providing cheap dwellings when there was no outside financial aid. Many of the big owners of dwellings bought their land from the old Metropolitan Board of Works at a cheap rate, and in some cases philanthropists had contributed large sums. The cost of land with the Council, taking into consideration the clearing of the site, was very heavy, and apart from the small profit which had to be shown, and the rates and taxes to be paid, they had to provide a sinking fund so as to hand the building over free in fifty-nine years. If the term was extended to ninety-nine years, or if there was no sinking fund at all, as in the case of some companies, how much less could be the amount of rent charged! But it must not be overlooked when considering the amount of rent which a family paid in an overcrowded place that when that family moved into one of the Council's buildings and paid more rent, they had more rooms and a greater air space. Mr. Riley then showed pictures of the various types of buildings used in the re-housing of the poor, including the dwellings erected by the Council at Millbank, Boundary-street, and those to be erected on Reid's Brewery Estate. He pointed out the difference between the associated tenements and the self-contained tenements; the domestic offices in the former being shared by two or three tenants. The former was generally considered the cheaper system. Plans of the Tottenham Estate were also shown, the rentals of which would range from 6s. to about 11s. 6d. The elevation was very picturesque, somewhat similar to the buildings already erected by the Council at East Greenwich. The lecturer also referred to the lodging-house for rent to be erected at Mill-lane, Deptford, which he said would be very similar to those erected by Lord Rowton, and to the lodging-houses built by the Glasgow Corporation for men and women and for families, in which the scale of charges was very low. In conclusion, he stated that in the Council's buildings every effort was made to prevent fire, and he showed pictures of the fire-resisting floors and the arrangements in the domestic offices.

A vote of thanks was afterwards moved by the Chairman, and carried.

HULL ROYAL INFIRMARY.—The report of the Hull Royal Infirmary shows that during last year plans were prepared by Messrs. Botterill, Son, & Bilson for an extension of the Nurses' Home, capable of accommodating twenty-two nurses. These plans have now received the approval of the Board, and it is proposed to proceed at once with the work at an estimated cost of about 4,000l., including furnishing.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The seventh meeting of the Discussion Section of the Architectural Association for this session was held at 56, Great Marlborough-street, W., on the 13th inst., Mr. R. H. Weymouth, vice-chairman of the section, in the chair. Mr. P. G. Maule read a paper on the subject of "The Architect and the Garden," which we will print in another issue. Mr. J. S. Blunt proposed a vote of thanks to the author for his paper. Mr. F. G. W. Buss seconded, and the discussion was continued by Messrs. W. A. Forsyth, W. A. Pite, R. H. Weymouth, and R. Weir-Schultz. Mr. R. Weir-Schultz, who attended as Special Visitor, gave a most interesting comment on the paper.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Erection of Homerton Sub-Fire Station.—On the recommendation of the Fire Brigade Committee it was agreed that the tender of Messrs. Martin, Wells, & Co. to execute for 8,120l. the work of erecting the Homerton sub-station be accepted.

Tenders.—The Asylums Committee reported the acceptance of the following tenders:—Additions to gas-holder plant.—Messrs. Newton, Chambers, & Co., Limited, -412l. Combined hot-plate and cupboard.—Messrs. J. & F. May, 95l.

Committees.—The standing and special committees were then elected. The following gentlemen will comprise the Building Act Committee:—

Messrs. C. Goddard Clarke, W. Davies, G. Dew, W. Goodman, R. W. Granville-Smith, G. A. Hardy, F. Hemphill, H. Jephson, G. B. Longstaff, R. Parker, Lieut. Colonel C. Probyn, H. R. Taylor, D. S. Waterlow, E. White.

The Historical Records and Buildings Committee was elected as follows:—

Messrs. J. A. Baines, J. W. Benn, W. W. Bruce, W. J. Collins, F. Dolman, J. D. Gilbert, R. W. Granville-Smith, H. A. Harben, E. J. Horniman, W. Leaf, J. F. Little, W. E. Mullins, G. H. Radford, G. S. C. Swinton, Sidney Webb.

Notices of Motion.—There were two notices of motion. One was in the name of Mr. Spokes, which desired the Local Government Committee to find out who were the shareholders in the companies owning gas, tramways, water, in London. A motion by Mr. Hubbard was in favour of third-class season tickets. Both were carried without discussion, and the Council adjourned at an early hour.

THE LONDON BUILDING ACT, 1804. THE TRIBUNAL OF APPEAL AND THE LINE OF FRONTAGE.

The Tribunal of Appeal under the London Building Act, 1804, sat at the Surveyors' Institution on Tuesday to hear an appeal by Mr. R. Elsey Smith, on behalf of Mr. E. C. Christmas, against the certificate of the Superintending Architect of Metropolitan Buildings, dated January 18, under sections 22 and 29 of the Act, defining the general line of buildings on the south side of Sydenham Park between the vacant land at the eastern end of the street and Sydenham Park-road. The Tribunal consisted of Messrs. Arthur Cates (chairman), A. H. Hudson, and J. W. Penfold. The grounds of appeal, as outlined by Mr. Vestbury Preston, the appellant's solicitor, showed that during 1900 the appellant, under the sanction of the London County Council, altered Burton Villa, Sydenham Park-road, the flank wall of which crosses Sydenham Park, and is distant 46 ft. from the centre of the roadway and parallel to it. The boundary wall next to Sydenham Park was set back to a distance of over 20 ft. from the centre of the road, a strip about 3 ft. 6 in. wide being given up to the use of the public without compensation. In August, 1900, the appellant applied to leave to erect a house adjoining No. 50, Sydenham Park, the main front to line with the flank of Burton Villa as altered. His application was refused by the London County Council. Another application was made for leave to erect a house with the front wall set back 48 ft. from the centre of the road. This application was made on the 13th of October 1900, and was refused. The Superintending Architect was then asked to define the frontage line, and he did so by certificate dated January, 1901. The appellant was aggrieved by the terms of the

certificate and appealed to the Tribunal under Section 25 of the Act. In arguing that the terms of the certificate should be modified, it was pointed out that the main front of 54, Sydenham Park-road was not as defined by the Superintending Architect, but 4 ft. nearer to the centre of the road, and that No. 52, a considerable structure, was in advance of the building line as defined. While Section 27 provided that the erection of the additions to Burton Villa did not, in consequence, affect the appellant's line in that part or adjoining parts of the road, there was, at the same time, nothing in that section to prevent the frontage thus created being considered in dealing with the frontage for future buildings, and it was reasonable that it should be thus considered. There being no other line established by this building, the line as defined by the Superintending Architect was not, it was contended, warranted by the circumstances. The appellant asked that the Tribunal should vary the certificate to a line running parallel with the centre of the road at a distance of 45 ft. from the centre, or at such other distance as the Tribunal considered reasonable.

Mr. Andrews, for the Superintending Architect, contended that the correct line of frontage was from the recess portions of No. 54 and the fronts of Nos. 50 and 52, Sydenham Park-road. Moreover, when application was made for the alteration of Burton Villa, which was a corner house, it was contemplated that the intervening spaces should be regarded as garden ground, but that the appellant had taken advantage of the previous consent by the County Council to alter the line of frontage.

After bearing evidence, the Tribunal directed that the certificate of the Superintending Architect should be so varied that the general line of building in Sydenham Park-road on the south side should be 45 ft. back from the centre of the road opposite the north-eastern angle of No. 54 to a point 46 ft. back from the centre of the road opposite the angle of Park Mansions at the corner of Sydenham Park. The Tribunal made an order for twenty guineas costs against the London County Council.

To the Editor of THE BUILDER.

THE ARCHITECTURAL ASSOCIATION DAY CLASSES SCHEME.

SIR,—In your leading article of the 16th inst., in which you so ably sum up the advantages to be anticipated from this movement, you raise the question as to whether it will be necessary or desirable to carry on the evening school concurrently with the day classes.

The committee are not of opinion that the day classes will appreciably affect the evening work, for the reason that a large proportion of the Architectural Association students are assistants who cannot take advantage of any classes excepting those commencing after 6.30. The present students, moreover, who are pupils, are scarcely more free to attend a day course of training outside the office.

Eventually, of course, the evening schools may be modified in proportion to the success of those held in the daytime.

W. HOWARD SETH-SMITH.

BRICKLAYERS AND THEIR WORK.

SIR,—I trust in fairness to the operatives you will find space for these few lines. Much has been said about the idleness of workmen, more especially bricklayers; and whilst admitting that there are a few misguided men, who would cheerfully ruin an employer, yet the greater majority of men do a fair day's work. The reason brickwork was done at such absurd prices was because it was scamped and the workers were sweated. Ten years ago men could be bought body and soul for a halfpenny per hour or a few pots of beer; but since men drink less, they think more, and refuse to become beasts of burden, toiling at high pressure and going home fit only for bed. I have not only gone home tired, but got up tired, knowing I had to slave under a broiling sun, for bricklaying, although looking easy, is laborious; and when we come to think that a rod of

work weighs 15 tons and is equal to a wall 272 ft. long by 14 in. by 1 ft. high and has to be skillfully constructed to a prearranged form, the present cost is not out of the way. A BRICKLAYER.

WILLIAMS & COOKE.

SIR,—In your report of the above case in last week's issue it is stated that our Mr. Greenwood said that "the best slates came from Portugal and Penrhyn," whereas what he said was "Port Dinorwic and Penrhyn." We presume the similarity of the first syllable accounts for the error.

Again, in his evidence he stated that the "roughest" slates were used for damp courses, which does not necessarily mean the "worst."

Your report does not make it clear that the allegation that Portinadoc slates were ordered was entirely abandoned by the defence, and we will, therefore, thank you to publish this letter.

JOHN WILLIAMS & CO.

The Student's Column.

SANITARY FITTINGS AND PLUMBING II.—BATH WASTES AND OVERFLOWS, &c.

IMPROVEMENTS in bath wastes and overflows have in the main followed the same lines as the improvements in the corresponding parts of sinks and lavatories. The tendency has been to make the various parts more accessible for cleansing, to increase the size of the waste-outlet in order that the bath may be emptied more quickly and the waste-pipe and trap be self-cleansing, and to render the parts as simple and as easily adjusted as possible.

In some towns—Manchester, for example—the by-laws require that every bath shall be fitted with an overflow-pipe carried through an external wall, and left with the end exposed, so that any waste of bath-water can be detected by the water inspectors without entering the building. It is not customary to place a trap on such a pipe, as the flow of water through it would be so irregular that the trap would probably be unsealed by evaporation. An untrapped pipe, however, will serve as an air-trap unless some method of closing the opening is adopted. The simplest arrangement consists in fixing a flap-valve (fig. 1) on the end of the pipe; A is a copper valve and tube with curved spring on the top to prevent the valve opening too far. B is a brass valve with union for iron pipe, and C a brass valve for connection with lead pipe. The overflow-pipe is connected to the bath by means of a brass union and grating as shown in fig. 2, Chapter 7.

This kind of overflow is commonly adopted in cheap baths, a plain hole being left in the iron or other material to receive the grating. In towns where the connexion of the overflow and waste-pipe is not prohibited, a pipe is often taken from the overflow grating and connected with the waste-pipe. The joint ought to be between the bath and the trap, as shown in fig. 2, but the writer has known several cases where ignorant plumbers have fixed the trap close to the bath and connected the overflow pipe to the waste-pipe at some point beyond the outlet of the trap. A free current of air can therefore pass up the waste-pipe to the junction with the overflow pipe, and then up the latter to the bath room. As the waste-pipe of a bath is often to some extent fouled with soapy or other matter, the air may be contaminated, and, unless the foot of the pipe is properly disconnected, still fouler air from the drains may be carried into the house.

With grated overflows of the type already described, the waste is generally an ordinary washer with fly-nut, union, and bent tail (fig. 3), fitted with a plug and chain. The plug may be of brass, either solid or sunk, or of indiarubber (with or without metal core), or of vulcanite. In the case of baths, which (being fixed at a low level) are liable to severe blows from falling plugs, it is highly desirable that the plugs should be as light and soft as possible; this is especially necessary for japanned and metal-enamelled baths, as a single blow from a hard and heavy plug may destroy the enamel at the point of impact and expose the metal beneath. For this reason indiarubber and vulcanite plugs are to be preferred; the extra cost is very small.

The plugs for baths are made in various sizes—1½ in., 1¾ in., 2 in., 2½ in., 3 in., and even 4 in. The waste shown in fig. 3 has the following dimensions for a 2½ in. plug—diameter

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 6.

Fig. 7.

Fig. 8.

Fig. 9.

Fig. 10.

Illustrations to Student's Column.

of flange, 4 in.; and diameter of screw, 2½ in. It is made in brass (either plain or nickel-plated) or in white metal. The waste with tapered tail, shown in fig. 4, Chapter 7, is well adapted for baths; the plug is 3 in. in diameter (either brass or vulcanite), and the tail is tapered from 3 in. to 2¼ in. This waste ensures a rapid discharge from the bath and a thorough scouring of the trap and waste-pipe. Bath plugs ought not to be less than 2 in. in diameter, or the waste-pipes less than 1½ in.

Sometimes in cast-iron baths a cast-iron trap is provided at the outlet. Many of these are dip-traps, and are far from satisfactory. If an ordinary chain and plug is used the overflow pipe from the bath must be carried through an external wall for the reasons already stated, or made to discharge over a lead safe from which a pipe must be carried through the wall, and finished with a flap valve. The brass bath-trap shown in fig. 4 is of better shape, and has a 3-in. rubber or vulcanite plug with cross-bars below, and a trap tapering to 2 in. at the outlet. The flange is 4½ in. in diameter, and the screw 3½ in., the total height being 8 in. The trap is provided with a cleansing screw.

Instead of the lead overflow pipe and trap shown in fig. 2, other metals may be used. In Milne's "Exposed Combined" bath-fittings (fig. 5), the principal parts are of gun-metal, either polished or nickel-plated. These fittings are made in three sizes, having respectively 2½-in., 3-in., and 4-in. vulcanite plugs, 2-in., 2½-in., and 3-in. cast-brass traps, with 1-in., or 1¼-in. couplings for anti-siphonage pipes, 2-in., 2½-in., and 3-in. overflows and standards, and 1-in. or 1¼-in. solid-drawn copper supply pipes (13 B.W.G.). A perforated soap-tray, 4½ in. in diameter forms the top of the over-

flow standard, and can be unscrewed for cleaning the standard and trap.

In many cast-iron baths the overflow-tube forms part of the casting; fig. 6 is an example. The trap is of cast iron 2½ in. in diameter and glass-enamelled inside, and forms a connexion with the foot of the overflow-tube. The plug is of the safety type, and is actuated by a spindle passing through the outlet grate, which is fitted with a bayonet catch so as to be easily removed when the valve or trap requires cleaning. It is an advantage to have the grating above the plug, as the openings in it can be more easily kept clean than when the grating is in the washer below the plug. A slab of porcelain is fitted across the foot of the bath to form a tray for soap, sponges, &c. This tray drains into the bath through the perforation A; another perforation B is made near the back of the slab, so that a brush can be passed through to clean the overflow-tube.

The overflow in Shank's "Perfecto" bath (fig. 7) is merely a modification of the last. The upper part of the foot of the bath is made with a slope, so that the overflow is vertical and more easily cleaned. The overflow pipe is oblong in section, and is of glass-enamelled cast iron, swelling out at the foot to fit the 2½-in. glass-enamelled cast-iron trap, which is fitted with a brass union for connexion to the lead waste-pipe. A special feature of the bath is the waste arrangement, with valve working horizontally and actuated by a spindle and knob, and with a hinged nickel-plated brass grating. The porcelain soap-tray supported by the taps is quite detached from the bath itself, so that every part of the bath and tray can be easily cleaned. Instead of the porcelain tray, a nickel-plated brass soap-and-sponge

holder is sometimes used and has the advantage of being easily removed.

Standing wastes and overflows are largely used for baths. Fig. 10 shows the ordinary type. The standing overflow, of copper or brass, is placed in a tube at the foot of the bath, and has generally a rubber covering at the end to make a tight joint on the valve seating. It is raised by means of a chain (or spindle) and knob. Doulton's improved overflow (fig. 9) has a standing overflow placed in a recess at the foot of the bath, the overflow can be removed by lifting it upwards after raising the waste-pull. A porcelain soap-dish is fitted across the foot of the bath. The trap is of glass-enamelled cast-iron, 2 in. in diameter, and the outlet grating is of large size flush with the bottom of the bath.

As a rule the fittings are arranged at the foot of the bath, but cast-iron and other baths are now made with the fittings arranged at the front, a position which is often advantageous when the bathroom is small. The combined bath and lavatory shown in fig. 8 is also useful in similar situations. The bath is of cast iron, painted, japanned, or enamelled in various ways, and the lavatory basin is of enamelled iron, made to tip up and discharge the contents into the bath. The hot and cold water is supplied through a swivel arm, which can be turned to fill either the basin or the bath. A soap dish is cast at one corner on the roll edge.

HONORARIUM TO CITY ARCHITECT, EDINBURGH.
At a recent meeting of the Edinburgh Town Council it was decided to grant an honorarium of £1000, to Mr. Morham, the City Architect, for extra work at the new City Chambers and the City Hospital.

GENERAL BUILDING NEWS.

RESTORATION OF LICHFIELD CATHEDRAL.—A special thanksgiving festival has just been held at Lichfield to mark the completion of the restoration of the cathedral. The Birmingham *Weekly Mercury*, in a brief review of the restorations which the past nine years have witnessed, says that the central tower and spire have been repaired; new mullions have been placed in the two windows of the Lady Chapel, and its buttresses have been repaired; the south transept has been repaired; the north transept has been thoroughly renovated and a new window, on the exact lines of the original, now adorns it; the parapets and clearstory in the choir and Lady Chapel have been repaired, as have also the library buttresses; and the north aisle of the nave has been secured against further decay, though the proposed repairs to this part of the building have not been carried out, the Dean and Chapter being anxious to leave it undisturbed because of its special antiquarian beauty and interest. Internally the Lady Chapel has been adorned with a reredos of triptych form, carved by the peasants of Oberammergau from a design by the artist, and the choir has been constructed at the various entrances to the Consistory Court, where may be seen part of the wall of the second church which occupied the site before the cathedral was built; and sacristy fittings have been added. St. Chad's Chapel, which for a long time had been used as a munition room, has been restored to its original purpose at a cost of 12,000l., was originally asked for in order to carry out the works that were considered absolutely necessary, but so generously were subscriptions made that nearly 24,000l. was received, and the Chapter funds and other sources also yielding more money than had been expected, the Dean and Chapter were enabled to undertake further desirable restorations. Repairs to the fabric absorbed 15,000l., for some parts were found to be worse than was expected, and other contingencies swelled the cost. Mr. R. Bridgeman, of Lichfield, has executed all the repairs to the fabric, both in wood and stone, under the direction of Mr. J. O. Scott, the architect. The raising of the roofs to their original pitch, and the restoration of the stone groining in the nave, which were recommended by Mr. Scott and Mr. Christian, though not regarded as a necessary work of pressing importance, were included in the scheme. They remain to be effected if at any time money for the purpose is placed in the Chapter's hands. The work is estimated at 5,000l. A request for 3,000l. for ornamental objects, such as statuary, carved woodwork, and stained glass, was met by the contribution of nearly 9,000l., so that here again the Chapter were able to undertake more than was at first contemplated. Eighteen windows have been filled with stained glass, at a cost of about 4,400l., and forty-seven statues—twenty-two of alabaster and the remainder of stone—have been added, so that no niche which was ever filled is now vacant. Large and small, there are more than 200 statues. Twelve more figures are to be executed in alabaster and placed in the open arcade on each side of the reredos. The fund for statuary and stained glass was obtained in large sums from a few donors, but in order that the many others who desired to do so might have a share in the decorative work, the memorial window to Bishop Hackett was chosen as the object to which the offerings and collections throughout the festival should be devoted. The window has cost about 200l. It is just above Bishop Hackett's tomb in the south aisle, and depicts the Cathedral as he found it in 1601, with the central spire in ruins and the roof battered in.

BAPTIST CHURCH, KIRKDALE, LANCASHIRE.—On the 6th inst. the foundation-stone of the new Walton-lane Baptist Church, Kirkdale, was laid. The new buildings occupy a site at the corner of Walton-lane, Fountains-road, and Barry-street, directly facing the Airedale-road entrance to Stanley Park. The buildings, which are Classic in style, freely treated, will consist when completed of a basement schoolroom, 49 ft. by 45 ft., with accommodation for 400 persons. On the same floor there will be five classrooms and conveniences, with two staircases. The whole of the basement will be well lighted, the chapel being raised considerably above the surrounding footwalk. The schools will be approached by two flights of stone steps, 6 ft. wide, from Fountains-road and Barry-street, and this floor will be laid with pitch-pine wood blocks. The ground floor consists of a chapel, 54 ft. by 43 ft., with side transepts, and will have accommodation for 400 adults. On this floor there are to be two vestries. The main entrances to the chapel are from Walton-lane and Fountains-road, and lead into entrances containing the gallery staircases, and then to a vestibule before entering the chapel. The gallery, which is situated on three sides of the chapel, will provide seating accommodation for 310 persons. The side galleries will have two rows of pews, and the end gallery and transepts seven and eight respectively. The pulpit will be placed in the chancel, with the baptistry immediately in front. The main front of the chapel will face Walton-lane, with a main gable flanked on each side with staircase wings and porches. The three principal elevations will be carried out in red pressed Accrington

brick, with Cefn stone dressings. The whole of the building will be heated with a low-pressure system of hot water. The building is to be lighted throughout with electricity. The total cost, exclusive of land, is about 5,000l.; and the contractors are Messrs. Tougl & Billing, of Liverpool, and the architects, Messrs. Richard Owen & Son.

CHAPEL, ST. JOSEPH'S ORPHANAGE, MOUNTJOY-STREET, DUBLIN.—Within the last year an addition has been made to St. Joseph's Orphanage by the erection of a little chapel for the use of the sisters of the community and children of the orphanage. The new chapel, which is dedicated to St. Joseph, consists of nave, 60 ft. long by 22 ft. 6 in. wide, in which is the nuns' choir and a space for the accommodation of the children. The sanctuary is 16 ft. long by 16 ft. wide. There is a side chapel and sacristy accommodation. The principal entrance to the nave is at the west end. The nave is lighted on the sides by lancet windows, having trefoil cusped heads. The sanctuary is lighted at the side by a two-light tracery window, and the window over the high altar in the sanctuary gable is a four-light window, filled in with tracery. The windows have moulded labels overhead. There is an organ gallery at the west end of nave, with a panelled ornamental front. This gallery is approached by a staircase carried up in an octagonal turret lighted by loop-hole windows and surmounted by an embattled parapet. The high altar is of white statuary marble. The altar table is supported on coloured marble shafts, with carved and moulded caps and moulded bases, and the centre panel in the frontal of the altar is filled with a sculptured group representing Christ blessing the little children. The reredos has richly moulded arches with coloured marble shafts, having carved and moulded caps and moulded bases, and carved and moulded cornice. The tabernacle and canopy are also of white statuary marble, with coloured marble shafts. There is a basement under the chapel comprising refectory, kitchen, serving-room, scullery. The building is in the Gothic style of the Early English period. The walls generally are built of brickwork, and the doors, windows, and buttresses have dressings of chiselled limestone, while the walls of the basement story are carried up in granite. The contractor for the work is Mr. Kevin Toole. The stained glass artist, and the high altar executed by Mr. Edmund Sharp. The building was carried out from the plans, and under the superintendence, of Mr. Wm. H. Byrne, architect, Dublin.

WESLEYAN CHAPEL, MANSFIELD.—The opening of a new chapel in connexion with the Wesleyan Methodist denomination at Mansfield took place on the 6th inst. The building, the foundation-stones of which were laid in July last, is situate at the junction of Rosemary-street and Byron-street. The original scheme was to erect a chapel capable of accommodating 600, but as yet the nave only has been completed, providing room for 300 people. Mr. J. E. Goodacre, of Mansfield, was the architect, the contract being executed by Messrs. Vallance & Blythe, Mansfield, at a total cost of 2,358l. 2s.

NEW WESLEYAN CHURCH, BEESTON, NOTTINGHAM.—The foundation-stones of this church were laid on the 6th inst. The premises comprise church with nave, transept, and choir gallery, and school in the rear portion of the site. In the church, which has a gallery round three sides, there is accommodation for about 750 persons. Ample vestry accommodation is provided for the minister, choir, &c. The organ will be placed behind the choir gallery and the rostrum in front. The school premises consist of a large assembly room, an infants' school, an adults' classroom, a ladies' room, and seven classrooms, which are grouped round the large room and open out into it. The exterior, designed in the Decorated style of Gothic architecture, is of pressed brick with facings and tracery windows of rich design in stone. The entrance front faces Chilwell-road, and at the south-west corner is placed a tower and spire rising to a height of about 100 ft. The interior woodwork of the roof and pews is pitch pine, the roof being wagon-headed in shape. The tracery windows will be filled with ornamental tinted leaded lights. The cost of the entire building will be about 6,000l., and the church portion is at present in course of erection. The architect is Mr. W. J. Morley, of Bradford and Harrogate.

BOARD SCHOOL, BALBY, YORKSHIRE.—The memorial stone of a board-school which is being erected at Balby was laid on the 13th inst. Mr. F. W. Masters, of Doncaster, is the architect, the contractors being Messrs. Gill & Son. The lighting is being carried out by Messrs. Farr & Son.

THE BUILDING TRADE IN DUNDEE.—Not for many years has the outlook in the building trade in Dundee in all its branches been so gloomy and unpromising as is now the case. After a period of unexampled prosperity a reaction has set in, and operations are almost at a standstill, with no prospect of an improvement now or in the near future. Both employers and men are feeling the pinch keenly. Of the latter nearly a fourth are unable to find regular employment. This unsatisfactory state of affairs is, in the opinion of the employers, due in a great measure to the almost prohibitive prices of material, as well as, in a lesser degree, to the prevailing high rate of wages demanded by the employees, both circumstances inducing speculators to postpone their transactions

till such a time as these can be more favourably and profitably carried through. The best index to the position and prospects of the building trade is the state of the property market. Not only are the prices which obtained two or three years ago still maintained, but there seems to be no disposition on the part of any one to purchase property. Within the last twelve or eighteen months, also, the rate of interest has increased from 3 to 3½ per cent. Three years ago one could borrow as much money as one desired at 3 per cent.; in fact, there was a scramble amongst investors to lend at that rate. Now the accepted scale is 3½ per cent., and, unless in cases where loans have been granted for a fixed time, the proprietors are being called upon to pay the higher rate. Again, there are indubitably a great many houses standing empty, and these are the most modern and high-class dwellings, for which abnormal rents are charged. Another thing which influences investors to hold aloof is the uncertainty that prevails as to what the future will produce with regard to the rates of material and wages, and it is believed that if these rates could be settled on any basis of continuity, it would go a long way towards stimulating the industry.—*Dundee Advertiser.*

ALBERT WORKS, LAMBETH, S.E.—On February 25 a foundation-stone was laid at these works to commemorate their reconstruction owing to the widening of the London and South-Western Railway Company's line. The works belong to Mr. B. E. Nightingale, builder and contractor, and have been practically rebuilt from the design of Mr. Alfred E. Nightingale, architect. They consist of a range of stores, saw, planing, and moulding mills, fitted with new and modern machinery, a new chimney shaft of over 100 ft. high, offices, boiler, and engine-houses, rain-water reservoir tank, new gables and flats, yard foremen's and timekeeper's offices, and new dwelling for caretaker.

CHURCH HALL, FETTERCAIRN, KINCARDINESHIRE.—A church hall is to be erected at Fettercairn from plans by Mr. D. Wishart Galloway, of Brechin. The contractors are as follows:—Mason, Mr. D. Douglas, Edzell; joiner, Mr. Ritchie, Thornton; plumber, Mr. Fox, Edzell; plasterers, Messrs. Burness & Son, Montrose; slaters, Messrs. Lindsay & Son, Montrose.

VOLUNTEER DRILL HALL, PORTSMOUTH.—The drill hall which has been erected in Stanhope-road, Portsmouth, for the 3rd Volunteer Battalion of the Hampshire Regiment, was opened on the 6th inst. The building is of dark red brick with Bath stone dressings. The central hall measures 144 ft. by 118 ft., the floor being laid with tarpaving by Messrs. Bradshaw, of Southsea. The walls are coloured with Appinall's water paint. The hall will be illuminated by eight electric arc lamps, the fittings having been executed by Messrs. Frye, Harris, & Co., of London. The small hall is fitted as a gymnasium, its dimensions being 76 ft. by 42 ft. The floor of this hall is of Elnor's pitch-pine blocks. The lighting will be by incandescent lamps. The building contains also a dining-room, kitchen, &c., besides the officers' quarters. The plans were prepared by Major A. H. Bone, of Portsmouth. Mr. J. Crockerell, of Southsea, was the builder, his foreman being Mr. J. F. Flux. The clerk of works was Mr. G. Felton Lancaster.

PROPOSED NEW HOSPITAL AT HAMPSHIRE.—Sir Richard Temple presided recently at the Hampstead Town Hall at the annual meeting of the Hampstead Hospital, and announced that the council of the hospital had secured a site at Hampstead-green for the proposed new hospital. Mr. Keith D. Young had been appointed architect of the new building, which was to contain fifty beds, and to cost 20,000l.

WESLEYAN CENTENARY HALL, CITY.—The Wesleyan Centenary Hall in Bishopsgate-street Within is being pulled down. New premises for the Wesleyan Methodist are to be erected on the site. The architect is Mr. Cuthbert.

ART GALLERY, WHITECHAPEL.—The art gallery which has been erected in Whitechapel was opened on the 12th inst. A reproduction of a design for the building by Mr. C. Harrison Townsend, the architect, appeared in our issue for May 30, 1896.

SANITARY AND ENGINEERING NEWS.

ENGINEERING CONGRESS, GLASGOW.—A Congress of Engineers is to be held in connexion with the Glasgow Exhibition from September 3 to 10, under the presidency of Lord Kelvin, Sir Douglas Fox being chairman of the London Committee. The Congress will be arranged under the following sections:—(1.) Railways.—Chairman, Sir Benjamin Baker; Hon. Secretary, Mr. R. Elliott Cooper, 8, The Sanctuary, Westminster, London, S.W. (2.) Waterways and Maritime Works.—Chairman, Sir John Wolfe Barry; Hon. Secretary, Mr. L. F. Verpon-Harcourt, 6, Queen Anne's-gate, Westminster, London, S.W. (3.) Mechanical.—Chairman, Mr. William H. Maw; Hon. Secretary, Mr. Edgar Worthington, Institution of Mechanical Engineers, Storey's-gate St. James's Park, London, S.W. (4.) Naval Architecture and Marine Engineering.—The Institution of Naval Architects: Chairman, the Earl of Glasgow; Hon. Secretary, Mr. George Holmes, 5, Adelphi-terrace, London, W.C. (5.) Iron and Steel.—Chairman, Mr. William Whitwell; Hon. Secre-

tary, Mr. Bennett H. Brough, 28, Victoria-street, Westminster, London. S.W. (6) Mining.—The Institution of Mining Engineers: Chairman, Mr. James S. Dixon; Hon. Secretary, Mr. James Barrowman, Stancaere, Hamilton, Scotland. (7) Municipal.—Chairman, Mr. Charles H. Lowe; Hon. Secretary, Mr. Thomas Cole, 11, Victoria-street, Westminster, London, S.W. (8) Gas.—Chairman, Mr. George Livesey; Hon. Secretary, Mr. J. W. Helps, Gasworks, Croydon, London. (9) Electrical.—Chairman, the President of the Institution of Electrical Engineers; Hon. Secretary, Mr. W. G. McMillan, 28, Victoria-street, Westminster, London, S.W.

STAINED GLASS AND DECORATION.

WINDOW, DONNINGTON WOOD CHURCH.—Recently the chancel window of St. Matthew's Church, Donnington Wood, Salop, was filled with stained glass as a memorial to the late vicar. The subjects are:—"The Crucifixion," in the centre, St. John and Mary on either side; below, on the base, St. Matthew and Chad and Aidan. The subjects are placed under canopies of a light treatment, the colours being confined to the backgrounds mostly. The window was designed and executed by Mr. T. W. Camm, of Smethwick.

NEW WINDOWS, GATESHEAD CHURCH.—The large three-light windows in the north and south transepts of St. Helen's Church, Gateshead, have just been filled with stained glass by Messrs. Percy Bacon & Bros., of London. They consist of single figures under canopies, representing on the one side the four Evangelists, on the other the major prophets, two figures being placed one over the other in the centre light. The one is erected to the memory of Edward Joyce, who built the church, and the other to the Rev. W. H. Sissons, the late vicar.

FOREIGN.

FRANCE.—The Municipal Council of Paris has officially taken possession of the smaller Art Palace on the Champs Elysées, and has under consideration a scheme for its decoration presented by M. Girault, the architect of the building.—A marble bust of the Duc d'Aumale has been placed in the Salle des Séances of the Institut.—The Committee for the Gambetta Monument, which is to be erected at Bordeaux, has accepted the sketched design by M. Dalou, which represents Gambetta standing with his arms crossed, having on his right an allegorical group representing National Defence, and on the left another representing Wisdom coming to the support of Liberty. At the base of the pedestal are sculptured the armorial bearings of Bordeaux, backed by a trophy of flags.—A new firemen's barracks is to be built at Montmartre, behind the church of the Sacré Cœur.—The Chamber of Deputies is occupied with an important scheme for the improvement of the port of Bastia (Corsica), at an estimated expense of 1,250,000 fr.—M. Detaille has presented to the Carvalet Museum a picture representing the Porte Maillot in the month of November 1870, during the siege of Paris.

—A hôtel is to be built at Marseilles for the Société des Architectes de Bouche du Rhone, on a site on the Prado left to them for that purpose.—M. Adrien Chancel, architect, and "Inspecteur-Général de l'Enseignement du Dessin," has died suddenly at Perpignan, during a tour of inspection. M. Chancel, who was born in 1853, has had a brilliant career. He was a pupil of Constant Dufeux and of Moyaux, carried off many prizes at École des Beaux-Arts, and in 1877 obtained the Second Grand Prix in Architecture. He received medals in the Salons of 1879 and 1884, and a medal of the Third Class in the 1889 exhibition. In 1894 he obtained the cross of the Legion of Honour. He had distinguished himself in various public competitions, especially in that for the commemorative monument for Versailles, and was the selected architect for the new Mairie of Ivry-sur-Seine. Among his numerous works may be mentioned the restoration of the cathedral at Auch, and the erection of the Salle des Fêtes and the monumental grille of the Palais des Elysées, to which he was officially attached as architect. He was a remarkable draughtsman, and an architect with a great deal of perception in design.—The death is also announced, at the age of eighty-one, of the painter Charles Jalabert, an old pupil of Delarocche. He was at first chiefly known as a painter of religious and historical subjects, and in the Salon of 1855 his picture of "Christ on the Mount of Olives" was much remarked. But his subsequent and greater success was in portraiture. Among his principal works of this class may be named the portraits of the Duchesse d'Albe, Mme. de Montigo, the Comtesse de Paris, the Duchesse d'Aumale, and the Princesse de Nemours. He was elected "Officier" of the Legion of Honour in 1867. For the last few years his name had been nearly forgotten by the general public.

INDIA.—The Government of India has agreed to make a contribution of 45,000 rupees from Imperial revenues towards the cost of enlarging and improving St. Mark's Church, Bangalore. The consulting architect to the Madras Government is to carry out the work.—The Indian Government has decided to erect a large girder bridge over the

Swat river, and has already called for detailed estimates.—Large military buildings are being erected at Manipur for the permanent garrison; the cost is estimated at seven lakhs of rupees.—Mr. C. H. Stevens, of Bombay, is the successful competitor for the best design for the new military secretarial buildings in Calcutta.

RUSSIA.—We learn that the granite industry of Finland has of recent years been so successful that new quarries have been opened up in several places, particularly by the Finnish Stone Industry Company, of Helsingfors. Mr. J. Sederholm, chief of the Geological Survey of Finland, has been mainly instrumental in this, and the endeavour is to bring into the Russian market the fine-grained granites found near the town of Nystad, to the north of Abo. At the present time three different kinds are being quarried, one of silver-grey tint, suitable for rubble and pavement work; another of brownish-grey tint, which occurs in thick masses; and the third light grey, especially suitable for architectural purposes, and which is now being employed in the construction of the Finnish National Theatre, at Helsingfors.—Messrs. C. Cammell & Co., of Sheffield, are about to establish large works at Odessa, for the manufacture of edge tools and hardware generally.

UNITED STATES.—The death is announced of Mr. Benjamin Silliman, a well-known architect of New York. He studied architecture for some years at Charlottenburg, near Berlin, before practising in America. Amongst the notable buildings designed by him are the Morse building, and Temple-court, both in New York City.—Another celebrated architect, Mr. Thomas R. Jackson, of New York, has recently died. He was born in London in 1826. Amongst important works designed by him are the Old Academy of Music, the Old Vaudeville Theatre (now the Star Theatre), Tammany Hall, and the Jerome Park clubhouse. At one time Mr. Jackson was appointed Superintendent of the Federal buildings in New York.—The Board of Regents of New York University has had for three years in preparation a list of photographs of paintings, statues, and works of architecture, suitable to be hung in schools; the work is now approaching completion.

MISCELLANEOUS.

OVERCROWDING IN THE EAST END.—A conference on the housing question was held on the 14th inst. in the boardroom of the Whitechapel Guardians, Mr. James Brown presiding. A paper on overcrowding was read by the Rev. W. H. Davies, who pointed out that the average population for the whole of London was thirty-seven per acre. In Whitechapel there were 195 persons to the acre, while in Spitalfields the figures were 330. The immigration of the poor aliens and people from the country was unquestionably answerable for much of the overcrowding. The increase of rents was largely due to the alien, but they must not forget that that class had introduced new and useful industries.—After discussion, a resolution was passed to the effect that the conference could not emphasise too strongly the evils of overcrowding, and it was the duty of the authorities to deal with such promptly and effectively. A resolution was also moved affirming that the clearances carried out and the new buildings erected had not met the needs of the classes affected, but the motion was not pressed. A resolution to the effect that every person having any interest in inhabited houses should be registered was adopted, as also one recommending that the value of a site should remain as an asset for all time, and that the period of repayment should be extended beyond the period of sixty years. It was also affirmed that no clearances for public or private purposes should be allowed until provision had been made for the population dispossessed.

THE PYX CHAPEL, WESTMINSTER.—In the House of Commons on the 14th inst. Mr. G. T. Kenyon asked the First Commissioner of Works to state by whose authority the custody of the Pyx Chapel had been transferred from the Board of Trade to the Office of Works; what was the object gained by the transfer; and whether he could give any assurance that the chapel would not be submitted to any process of restoration, or improved away altogether, as was the case with the Rolls Chapel.—Mr. Akers-Douglas: The transfer of the Pyx Chapel was made by leave of the President of the Board of Trade, with the approval of the First Lord of the Treasury. The object is to place the chapel in charge of the authority who has already the care of the Chapter House adjoining, and whose function it is to maintain buildings of national interest. The chapel will not be submitted to any process of restoration.

DISCOVERIES AT FURNESS ABBEY.—The excavations at the ruins of Furness Abbey, which have been going on for some years under the direction of Mr. St. John Hope on behalf of the Cumberland and Westmoreland Archaeological and Antiquarian Society, have been renewed within the past few days, and the guide, Mr. Jesse Turner, while working in the refectory, has come across a sub-vault of Norman dormitories, or burial-place, in the south wall. At another point, the remains of a very fine fire-place have been discovered.

ELECTRIC LIGHTING, DARLINGTON.—The Corporation electric lighting at Darlington was inaugurated on the 11th inst. The electrical engineers were Messrs. R. V. Lunn.

MUSEUMS ON SUNDAY.—The Sunday opening of the South Kensington Museum, the branch Museum at Bethnal Green, and the Geological Museum in Jermyn-street, will be, till further notice, from 2 to 6 p.m.

PUBLIC IMPROVEMENTS, NOTTINGHAM.—At the Guildhall, Nottingham, recently, Colonel Luaro R.E., held a Local Government Board inquiry into an application by the City Council for permission to borrow 34,000l. for purposes of street improvement and the reconstruction of Carrington-street bridge. The Town Clerk (Sir Samuel Johnson) explained that 24,000l. was required for the purchase of property in Parliament-street in connexion with the proposed widening of that thoroughfare. The reconstruction of the Carrington-street bridge would cost 10,000l., the remainder of the loan asked for. Evidence as to the structural work was given by Mr. A. Brown, the City Engineer.

NORWICH MASTER BUILDERS' ASSOCIATION.—The second annual dinner of the Norwich Master Builders' Association was held on the 14th inst. at the Royal Hotel, Norwich. Mr. G. E. Haves, President, occupied the chair. The "Health of the King" having been proposed from the chair, the military and naval toast was proposed by Mr. E. Reeve and responded to by Mr. H. Harper Smith. The President then gave the toast of "Prosperity to the City of Norwich." Mr. Norman Cunneill, in reply, remarked that sometimes the citizens were apt to think, looking to the decay of the city's old manufactures, that things were going backward; but it had to be admitted that in place of those which had disappeared others had sprung up—trades so important that they were continuing the prosperity of Norwich, and would, he believed, long continue to do so.—"The Health of the Architects and Surveyors" was proposed by Mr. J. S. Smith (the vice-chairman), who said that if building work was to be successful there must be co-operation between the builder and the architects and surveyors. Whilst every consideration should be given to the employer and his wishes, the work should be conducted in such a way that the builder should be fairly remunerated, and the building contracts should be so drawn that they did not press too harshly upon the contractor, who had to incur enormous risks and liabilities. As far building contracts, it was felt by the Association that every builder's contract should provide for the architect, so that in the event of any dispute arising it could be fairly and easily adjusted to the satisfaction of both parties. Happily, in Norwich, the two interests got on fairly well. Take the clause respecting the granting of certificates. The architects were never found too slow in granting the first certificate, nor too fast in granting the final one.—The toast was acknowledged by Mr. E. Boardman, Mr. J. B. Pearce, and Mr. A. E. Collins. Mr. Collins said that Norwich ought to be proud of its architects in practice and its builders in business. Building work was carried on in Norwich in a very creditable style. There was a substantiality about it that was not to be found in many cities. "The Norwich Master Builders' Association" was proposed by Councillor Barnard, who said that he had some thirty years' experience of the master builders of Norwich, and that capable business men no one could wish to be associated with. The President, in response, said it was now three years since the Association established itself in Norwich, and in that time they had made themselves a power in the city. "The Merchants of Norwich" was proposed by Councillor W. T. Scaries. The Mayor (Mr. J. Dawson Paul), Mr. F. Havers, and Mr. G. Jewson responded, and the toast list closed with the health of "The Visitors," proposed by Mr. J. Youngs.

HAMPSTEAD HEATH PROTECTION.—The fourth annual general meeting of the Hampstead Heath Protection Society was held in the Drill Hall, Heath-street, Hampstead, on the 19th inst., when it was resolved to oppose the proposed Tube Railway under Hampstead Heath. Sir Richard Tople, who proposed a strongly-worded resolution against the tunnel, could not understand why it was wanted. The station at Lily Hill was near the Heath, and it gave ample access to it. He saw great danger to the fauna and flora of Hampstead Heath in the proposal. The resolution was seconded by Mr. Pooley, and carried. The Earl of Mansfield presided at the meeting, and it was stated that a petition against the proposal would be sent to the House of Lords.

THE MUNICIPAL YEAR-BOOK.—"The Municipal Year-Book for 1901" (Edward Lloyd Limited, Salisbury-square, E.C.) has been improved and made more convenient for reference by placing towns (about which so much interesting and useful information is given) in alphabetical order, instead, as was done in previous issues, of dividing them into three categories—great towns, country boroughs, and other incorporated towns. Under the heading of the towns a short general sketch is given of the main features of the municipal work, and in most cases in addition will be found information respecting baths, free libraries, markets, refuse and sewage disposal, technical education, &c. Information as to trams, water, &c., is also given, at the end of the book. A long list of Urban District Councils (other

than town councils) is also included in the work, as well as an account of municipal government in Scotland and local government in Ireland. Altogether it is an admirable handbook to municipal government.

CROYDON AND DISTRICT BUILDERS' FEDERATION ANNUAL DINNER.—The annual dinner of this Association took place on Tuesday evening, February 19, at the Greyhound Hotel, Croydon, Mr. S. Page, President, in the chair. Mr. Alderman Taylor proposed the toast of "The Federation," and in his reply, the President mentioned the continual increase in the number of fine buildings erected in the main streets of the town (to make way for which most of the old narrow streets were gradually disappearing), and the improved appearance of the town from year to year. Passing over the work of the committee during the past year, he devoted the remainder of his remarks to the uselessness, and need of abolishing, the present system of security for contracts for public works, pointing out the trouble and worry added thereby to the builders' burden, especially now that the insurance companies, without exception, refused to secure the builder, even when largely increased premiums were offered. Mr. D. W. Barber proposed the London Master Builders' Association, pointing out that the thanks of builders generally were due to the London Association for their help and encouragement in all matters relating to their mutual benefit during the past year.

NEW MAP OF LONDON.—Mr. Edward Stanford sends us a new map of London, or at least a map in which new existing or proposed lines of railway or tramway are inserted. It is more especially for the use of those who are interested in any way in new schemes that are before Parliament. In the corner is a list of plans for Metropolitan railways, tramways, and miscellaneous improvements, deposited with the London County Council up to November 10, for consideration during the session of 1901. These are numbered, and the lines of route or the districts affected are correspondingly numbered on the map.

BUILDING TRADES FEDERATION.—In their Report on the six years' work of the Birmingham District Building Trades Federation, the Executive say that for four years they have been able to report a state of trade eminently satisfactory. The war has doubtless been one of the causes of a change for the worse, which has visited all the branches of the building industry in our district. The last year of the nineteenth century will, however, compare favourably with any since the Federation came into existence. Two societies have been added to their number, the wood carvers, Branch 19, and the hot-water fitters, Branch 5, making the total sixteen, which is second to none in the kingdom. In the spring of the year the operative plasterers and masons succeeded in obtaining in a peaceful manner an increase of wages. During the summer an effort was made to obtain funds to assist the building trades' gift to the nation. Many of the members of their societies heartily contributed. The architects, builders, builders' merchants, and employees worked harmoniously. The result was gratifying, the sum forwarded having been greater than from any other provincial town. Their relations with the master builders were never better. The working rules and wages now prevalent were not likely to be disturbed for at least another year. There is, however, a feeling that a uniform working time for all trades should be the ideal. Probably efforts to bring this about will be made in the near future. Financially their position is better than the most sanguine could have expected six years ago. Sevenpence a year per member enabled them to manage the organisation and to show a balance in the bank of more than a 600*l.*—*Birmingham Post.*

ST. JAMES'S-SQUARE.—We hear that the War Office authorities have taken as offices the upper floors of the building recently erected on the west side of the square, at the corner of King-street, by Messrs. Holloway Brothers, contractors, from the designs of Messrs. Rolfe & Matthews. The new edifice, erected in 1898-9, stand on the site of Cleveland House, which was pulled down in the winter of 1869-7, and had been occupied during a long period by the Duke of Cleveland, to whose estates Henry, Lord Bernard, succeeded after the death of the fourth Duke in August, 1891.

A RECORD OF THE PARIS EXHIBITION.—The volume dealing with the Paris Exhibition, which has been appearing in monthly parts in connexion with the *Art Journal*, has now been separately issued with a carefully compiled index. A considerable portion of the volume is devoted to reproductions of the work produced by the skilled manufacturers of the world, and there is ample material for critical comparisons of the artistic eminence of every country.

SANITARY CHRONICLES OF ST. MARYLEBONE.—The annual report of the Medical Officer of Health (Dr. Wynter Blyth) states that a recurring nuisance during the summer months is the non-removal of stable manure. The borough, owing to the extension of suburban districts, is continually being, as it were, removed farther and farther from the country districts, where the manure is required. The railway rates for such an article as stable manure are prohibitory, and at certain seasons it is only possible to get manure removed by paying a relatively high

price. It may, however, be stated generally that the stable manure was better and more regularly removed in 1900 than in any previous year.—The St. Marylebone Shelter, established for the purpose of receiving for short periods families temporarily turned out of their homes during the operation of disinfection, has been used ten times, and has afforded accommodation for seventeen adults and two children. During the year the medical officer has paid 460 first visits and 1,662 visits of re-inspection to workshops and laundry workshops. In the course of these visits he found several workshops which had not previously been visited by any inspector. The cubic measurement of each new workshop has been taken, and ventilation and sanitary conditions investigated before placing on the register. Improvement in ventilation has been effected in twelve workshops; three have been discontinued as unsuitable; ten gas stoves used for heating irons have been removed from the workshops or provided with means for carrying off the fumes generated. In three wash-houses a ventilating hood with a pipe fixed over the copper. Of the 1,318 workshops on the register, 1,004 are lighted by gas, 204 by electricity, and 110 by lamps. The more general adoption of electric lighting for workshops is hindered by the fact that gas has warming powers which electric lights have not. Dr. Blyth refers to the very harmful practice so much in vogue of warming the rooms by burning gas. He thinks that, in the interests of the workers, there should be a definite regulation that, should gas be used for warming purposes, it should only be through the medium of properly ventilated stoves.

METROPOLITAN PUBLIC GARDENS ASSOCIATION.—The eighteenth report of this Association states that the income of the Association during 1900 has amounted to 4,484*l.* 18. 6*d.*, against 4,865*l.* 13*s.* 1*d.* in 1899, showing a decrease of 381*l.* 12*s.* 5*d.* This is mainly attributable to the adverse effect of the war in generally diverting and lessening contributions. Since the commencement of 1900 the Association has laid out four new recreation-grounds, and has assisted in the formation of many others. Thirty-six new members have been elected, making a total of 870. Among the works carried out by the Association during the past year the following may be mentioned:—The Christ Church disused burial-ground in Blackfriars Bridge-road was laid out by the Association at a cost of about 400*l.* The parish churchyard of Plaistow, to which a valuable plot of adjacent land was added, has been laid out by the Association at a cost of 450*l.*, 10*0d.* of which was given by Mr. Threlfall. The Camberwell Vestry having secured a strip of vacant land in Sumner-road, it was laid out by the Association as a public playground at a cost of about 300*l.*, of which the Vestry paid half. When the last report of the Association was issued about 2,500*l.* was still required to make up the sum (50,000*l.*) needed for the purchase of the Dollis Hill estate. The whole of the ground has now been secured, the Association having paid over the sum, 519*l.* 11*s.*, collected for the purpose. During the year the scheme for acquiring the Alexandra Park and Palace for the public has progressed so favourably that the whole of the 150,000*l.* required has been collected. The size of the estate is 173 acres. It was found necessary to introduce a Bill into Parliament for placing the park and palace in the hands of trustees nominated by the contributing bodies. The Association took an active interest in the passage of this Bill, and secured important amendments therein for the free access of the public to all parts of the park. In regard to work in hand, the Association is laying out Leyton-square, Camberwell, S.E., as a public recreation-ground; and has promised to lay out, or to assist in laying out, if their maintenance is secured, Marian-square, Hackney-road; St. Giles' disused burial-ground, Hackney-road; the Swedish disused burial-ground, Prince's-square, E.; West-square, St. George-the-Martyr, Borough; Hoxton-square, the garden of the Wesleyan Church, Camberwell-road; and the eastern end of the Churchyard of St. Mary, Bow; and the southern portion of the Churchyard of All Saints, Poplar. The balance of the money collected for the purchase of the Golden's Hill Estate has been deposited with the Association. It amounts to 245*l.*, and forms the nucleus of a fund for any future extension of Hampstead Heath. The neighbouring property, known as Telegraph Hill, being for sale, steps are being taken towards its possible acquisition, and the Association is also inquiring into the question of the proposed electric railway under the Heath.

THE DUKE OF BEAUFORT'S MONMOUTHSHIRE ESTATES.—On March 26 and 27 current will be offered for sale by auction at Monmouth various properties situated in and around Monmouth belonging to the Duke of Beaufort. The several lots comprise the Duke's seat, Troy House, with 1,670 acres, upon the banks of the Wye and Trothy, and the ruins of Monmouth Castle. Amongst the many buildings in Wales and the borderland which are attributed to Inigo Jones is reckoned Troy Mitchell, near Monmouth, built shortly before his death in 1652, for Edward, second Marquis of Beaufort; confer Madden, "Privy Purse Expenses." Monmouth Castle, reputedly of Saxon origin, was rebuilt by William Fitz-Baderon, one of the Conqueror's followers; Edward I. erected the

Monks, Dixton, Wyebridge, and Over-Monnow-bridge gates, and rebuilt the castle walls. The honour, castle, and manor of Monmouth, with those of Lancaster, were bestowed upon the Earls of Gainsborough, one of whom, John of Gainsborough, lived there some while, and there his grandson, Henry V., was born. During the Civil War Sir William Waller captured the castle from Lord Herbert, who had garrisoned it for the King.

EXPENDITURE ON PUBLIC BUILDINGS.—The Lords Commissioners of his Majesty's Treasury have sanctioned the expenditure of the following items (subject to the approval of the House of Commons) on public works and buildings during the financial year commencing on April 1 next:—**Marlborough House:** Installation of electric light, on account, 1,000*l.* (total cost, 11,000*l.*); probable expenditure to March 31, 1901, 6,800*l.*; construction of scullery for guardroom, 300*l.*; warming enclosure at grand entrance, 150*l.*; Royal Mews, Pinlickie: New fittings and washing tanks, 450*l.*; warming large coach-house, &c., 100*l.*; Windsor Castle: Installation of electric light, further on account, 1,000*l.*; erection of permanent shelter for fire appliances, 150*l.*; construction of underground cellar at canteen, 125*l.*; Windsor Home Park: Alterations to lodge, Datchet-road entrance, 130*l.*; St. James's Palace (partly in occupation of his Majesty): Installation of electric light, on account, 1,000*l.*; preparation of Nos. 77 and 78, Pall Mall, for occupation as a Grace and Favour residence, in substitution for Bushey House, which is to be occupied as a National Physical Laboratory, 3,000*l.*; Kensington Palace: Completion of lightning conductors, 125*l.*; Hampton Court Palace: Re-erection of ornamental iron screens, 1,000*l.*; erection of sheds, fences, &c., 230*l.*; Hampton Court Gardens: Reconstruction of glass houses, 1,000*l.*; New Gardens: New pumping-house, mains, &c. (total, 2,575*l.*), on account, 600*l.*; annexe to Museum 3, 360*l.*; additional stabling (450*l.*), on account, 100*l.*; Temperate House, flag pavement, 100*l.*; ditto, soft water supply, 225*l.*; melon ground, new wall, 100*l.*; herbarium, new wing, on account, 500*l.*; Richmond Park: Public conveniences (600*l.*), on account, 250*l.*; Green park: Widening of Piccadilly (works within the park only), 500*l.*; Houses of Parliament Buildings: Providing water purifiers for steam boilers, 950*l.*; providing hydraulic lift for removal of ashes from boiler-room, 120*l.*; For the Gladstone monument (erection and erection) in Westminster Abbey, 2,100*l.*; For alterations and additions to Lambeth County Court, 1,200*l.*; British Museum: Improving the lighting of Ethnographical Gallery, 350*l.*; works and alterations of a minor character, 300*l.*; Natural History Museum: Further on account of the installation of electric light throughout the building (total estimated cost, 7,500*l.*), 500*l.*; adaptation of new room for taxidermist, 150*l.*; enclosing a portion of the open basement, 150*l.*; works and alterations of a minor character, 300*l.*; Science and Art Buildings, South Kensington: Erection of shed to protect blast and reverberatory furnaces, &c., 175*l.*; Custom House: Extension of refreshment room, 300*l.*; alterations to hydraulic lift, 175*l.*; erection of a new dwelling-house at the Customs Storage Depot (late Burning Ground), Rotherhithe, 650*l.*; erection of an office at Victoria Dock, 100*l.*; additions and alterations of a minor character at the Custom House and outlying offices, 300*l.*; Post Office.—General Post Office, West, additional space for cable and instrument work, 950*l.*; Mount Pleasant, enlargement of telegraph factory, Block E, 12,000*l.*; new sorting office at Clapham, 4,300*l.*; branch post office at West Brompton, 2,675*l.*; sub-district post office at West Kensington, 2,000*l.* (towards a total estimated cost of 18,325*l.*); Civil Service Commission, Burlington Gardens: For preparation and adaptation of the premises vacated by the London University for occupation by the Commission, 7,500*l.*; Duke of York's Royal Military School: For provision of a gymnasium, 5,000*l.*; Horse Guards: Conversion of residential rooms into office-rooms for Inspector-General of Fortifications, 1,150*l.*; Patent Office Extension: Acquisition of site and erection of buildings, 30,500*l.* (to complete the total estimated cost of 162,500*l.*); Royal Mint: For the erection of new die and medal department, 1,800*l.* (to supplement the 0,250*l.* already expended under this head); War Office, Winchester House: Alterations and re-arrangement for the accommodation of the Intelligence Department of the War Office, 5,500*l.*

PUBLIC CREMATORIA.—The Leeds City Council will promote a Bill in the course of the present session of Parliament, which provides for powers to make certain local improvements, at an estimated cost of 100,000*l.*, to include additional waterworks, a crematorium, and the acquisition of the house on the Harehills Estate, and the purposes of the Judges' lodgings. The Corporation of Hull have recently opened a crematorium at Hull that has been constructed at a cost of 2,500*l.*, and is, we believe, the first building of its kind erected by a municipal body in England.

CAPITAL AND LABOUR.

NORTH STAFFORDSHIRE BUILDING TRADE.—The annual report of the North Staffordshire Builders' Association, of which Mr. J. Bowden, Mayor of Burslem, is secretary, states that 95 per cent. of the builders in the district are members, all of whom

22,860.—SKETCHING-EASELS: H. W. Roberts.—The easel combining a carrying-rod, a board whereof the lower end fits against the body of the artist, and an upper sketching-board that a string loop joins to the carrying-rod. The board is held in its place with an eye screwed into the rod, and lies upon cord, webbing, or some similar support, so that the artist passes around himself and then secures to the carrying-rod.

22,884.—CONSTRUCTION OF FLOORS, WALLS, CEILINGS, &c.: F. Kemnitz.—A network of metal ropes or wires that are laced between hooks, eyes, or bent rods clamped on to the flanges of the standards or joists is embedded in concrete, cement, or artificial stone, provision being made for intensifying the tension of the wire network. For holding up the cement until it has become set boards may be dispensed with by laying wire netting, which has been coated with a compound of cow-hair, glycerine, and glue, beneath the tightened network.

22,895.—A CUTTER-HEAD FOR PLANING AND MOULDING OF WOOD: R. Perrin.—The cutter-head is fashioned with two transverse slots, in which the cutters of, say, a rotary planing machine are clamped with wedges that are pressed outwards with cutters tightened with nuts, which are held against the block by dovetailed flanges that do not impede their turning. If only one of the slots is thus adjusted a ring fence is attached to the head, the ring being held with pins clamped in the other slot.

22,895.—A FASTENING FOR WINDOWS AND DOORS: J. B. Podmore.—A plate, on to which an arm is pivoted, is fitted with a stay against the neck of which a projection impinges when one moves back the arm into its free position. For drawing the sashes into place one turns a thumbscrew, which is at the end of the arm, down on to a counter-sunk plate, which, however, can be discarded if the contrivance is used for fastening a door.

22,907.—LOCKS FOR DOORS: F. J. Gibbons.—For locks that have two differently-sized keyholes for masters' and servants' keys, as in an asylum or a similar building, the inventor attaches a long gating to one of the tumblers, so that when the door has been double-locked with the master's key the tumbler falls down and blocks the servants' keyhole. The use in the servants' keyhole of the master's key is prevented with collars upon the barrels of the key and external bosses upon the keyholes. The invention is claimed as being applicable alike for latch-locks, which are turned on one side of the door with a handle, and for dead bolt-locks.

22,938.—BORING AND SIMILAR MACHINES: R. Lang and W. B. Lang.—In order that the saddles of a horizontal boring-machine or a radial drilling-machine may be less liable to become twisted, the inventors provide guides upon one side of the carrying standard or frame; the bed-saddle and the spindle-saddle have side-bearings upon the corresponding edges respectively, and the saddles are retained upon the slides by the remaining other members of the frame.

22,997.—A WRENCH FOR PIPES, NUTS, &c.: W. H. Robinson.—The serrated stem upon which the adjustable jaw slides is made in one piece with the fixed jaw, and the former jaw is secured by two toothed dogs, the dogs being forced on to the stem with springs and lifted out of engagement with a stirrup. In order that they shall press against the adjustable jaw and so relieve the strain upon the pivot end, the dogs are shouldered near the pivot. An increase of grip is obtained with the turning of the wrench by means of the action of an inclined slide worked with a spring upon the face of the adjustable jaw. In another shape a plate having a bevelled stem projects from the movable jaw into the impulsion of a spring, and a spring dog is put in the jaw so that the dog will engage with the stem as the incline on the stem passes aside with the pressure of the jaw upon the work.

23,006.—CANS FOR WORKMEN'S USE: F. Böhm.—The can, devised for carrying and warming food, has an outer casing through which a lamp can be inserted from underneath, the opening may be closed air-tight if desired, with a slide. The trap is to be extinguished by turning a plate which will shut holes in the lid of the casing; and the lid of the can is fastened with a bayonet adjustment.

23,054.—A SAFETY APPLIANCE FOR HOISTS AND LIFTS: F. Eastwood.—A disc is fitted on to the upper end of a fixed cylinder whose other end is shut with a similar disc, and long links join the two discs together, the power being exerted in a line through the two discs. In order to ensure some amount of separate angular movement, each of the discs is keyed into the shaft with a wide keyway; as the load is ascending the discs fail to grip the cylinder, because during that time the connecting links are parallel to the shaft, but upon cessation of the power the upper disc becomes turned, by the load, in relation to the lower disc, whereby the links are inclined to one another and bring the discs into frictional contact with the cylinder.

23,066.—GULLY TRAPS: J. Place & Sons and W. H. Place.—In order that the capacity of the gully shall not be diminished, the inventors fashion the trap in one piece with a containing vessel or receiver; they also provide at the top an opening to serve for purposes of cleaning the trap.

23,113.—A WATER HEATER FOR DOMESTIC USE: T. P. Shaw.—At the lower end of the drum are a diaphragm and a casting in the shape of a ringed dish; the opening through the former is placed out of centre with the wall. There is also a flattened diaphragm, and the openings are joined with tapering and elliptical tubes respectively, the latter having ends with nipples. A block at the lower end of a tube, with passages through which water will drip from the top of the block, constitutes a water-trap for the casing. With the apparatus is recommended the employment of a movable gas-burner, from which the passage of the products of combustion may be controlled with dampers, expansion being met with a stuffing-box connexion upon the branch pipe.

23,141.—A SWITCHING CONTRIVANCE FOR USE WITH CRANES, HOISTS, AND OTHER LIFTING GEAR: G. Goddard.—The object of the invention is to provide means of exhausting the load to stop at any required point. By one method two sets of conducting strips are affixed on to the wall of the well in such a manner that the spaces of one set shall be opposite the strips of the other set, contact being made with a continuous conductor. Contact is made or broken by moving the handles of contact-levers or triggers that bear against the strips, or switches may be used for breaking contact. The cage has projecting levers to be struck by triggers or switches which are geared to the main switch, so that it may be kept "on" with an electro-magnet. At the breaking of circuit the switch is returned to the "off" position by a weight. With the specification should be read No. 5,423 of 1898.

23,157.—AN AUTOMATIC SPRINKLER: J. Bulcher.—For a system of sprinklers wherein an electro-motor controlled with a thermostat, regulates the supply of water. The sprinkling nozzle is set above a thermostat, which consists of a flexible chamber that will expand as the fire warms the air within it. As the thermostat expands, it closes an electrical circuit, which in starting the electro-motor opens a valve in the supply-pipe, whereupon an electro-magnet is excited to open the sprinkling-valve. The contraction of the thermostat, as the temperature falls, serves to close the circuit, and the valve upon the service-pipe becomes again shut through the further turning of a crank, which the electro-motor sets in motion.

23,211.—APPARATUS FOR BASCULE BRIDGES: J. P. Cowing.—The rollers, having various diameters, which support the flanged segmental end of the bridge are journaled in base-blocks upon the pier, and on the end of the bridge are segmental rails set in gear with toothed wheels that are driven with a motor and pinions; when the bridge is not being used the bridge and load are supported in part by skew-backs which are secured to the pier, when it is lifted upwards the end roller is stopped with a curved stopping-block; a counter-weight brings the centre of gravity of the bridge to the centre of the segmental end, being arranged in balance upon the opposite sides of a line or plane passing through the centre of gravity, and if the weight is partly without and partly within the segmental bearing surface it is taken by a recess formed in the pier; another form an endless chain is used for connecting the end rollers and in that case a rotary motion is communicated to the segmental end by means of frictional contact, the end rollers being driven with toothed gearing.

23,300.—AN APPLIANCE FOR MEASURING-INSTRUMENTS: A. A. Common.—For an exact adjustment of the line of collimation in the telescopes of measuring and similar instruments, the inventor has devised an eccentric ring which will turn an eccentric cell upon which he mounts the object glass. He also contrives that the eccentric ring shall turn in another ring around it so as to constitute an extension of the telescope; for an adjustment of the two rings he passes a Tommy through slots in the surrounding ring and thence into holes in the edges of the two rings, he provides a short tube to be fastened with a screwed ring as a covering for the slots after the adjustment has been completed.

23,319.—ELECTRICITY METERS: L. B. Atkinson.—The invention concerns current meters. A surrounding coil moves in a closed vertical glass tube a float, having a thin stem and containing an iron or steel wire. The float is weighted so as to maintain the stem in a vertical line, and air is introduced above the liquid—such as water or ether—with which the glass tube is partly filled. By another method the stem is placed downwards in two unmixable liquids within the tube. The invention applies to several modifications of the initial arrangements, including a bulb at the base of the glass tube for a correction of variations in density with temperature, as the expanding liquid effects a compensating rise of the level of the surface of the liquid; the use (for a liquid of water that has been saturated with ammonium sulphate or chloride, or other salt more readily soluble at increased temperatures, together with an excess of the salt within the tube) and the substitution for the float of a cylinder having flattened ends, in a coloured liquid, in order that a scale may indicate the position of either end of the cylinder. The appliance is described as being adapted for purposes of a maximum current indicator, and of measuring electro-motive force or current.

MEETINGS.

FRIDAY, MARCH 23.

Architectural Association Discussion Section.—Mr. S. L. Crasbie on "The Exhibition Cathedral," 7 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. O. L. McDermott on "The Hunstet Railway, and Bridge over the River Aire," 8 p.m. Institution of Junior Engineers (Westminster Palace Hotel).—Engineering Question Night, 8 p.m. Institute of Sanitary Engineers (Incorporated).—Examination in Practical Sanitary Science.—Glasgow Architectural Association.—"Temporary Carriage Works," (1) Mr. R. Stuart on "Gabbert Sea-folds and Crane Seats"; (2) Mr. R. Wilson on "Centering"; (3) Mr. W. H. Baxter on "Temporary Stands," 8 p.m.

SATURDAY, MARCH 23.

Institute of Sanitary Engineers (Incorporated).—Examination in Practical Sanitary Science. Royal Institution.—Right Hon. Lord Rayleigh, M.A., on "Sound and Vibration," V. 3 p.m. Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Sewage Works, Sutton, 3 p.m. Edinburgh Architectural Association.—Visit to the Victoria Cabinet Works, Kircaldy. TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and living addresses.

Any communication to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and of to the Editor.

The Port of Bristol.

In spite of the maritime adventures and pursuits with which Bristol is associated, its geographical position is hardly one that would be chosen in the present day as the site of a great seaport. Yet the place, at the confluence of two rivers and within a few miles of an important estuary, is admirably adapted for the establishment and growth of a city. Bristol was probably best known as a fortified place in the earlier stages of its existence; then, as England gradually ceased to be the happy hunting-ground of peace and warlike seafarers from abroad, and the country itself began to settle down to more or less peaceful avocations, it became celebrated as a notable port, as well as a great commercial centre. Originally merely a hamlet in the Royal Manor of Barton, Bristol grew to be a county, and later a city. From the twelfth to about the middle of the eighteenth century it was undoubtedly, next to London, the most populous and the most important port in the whole kingdom. So far as respects to shipping, it also occupied the second position until outstripped by Liverpool, and since that event it has fallen to a much lower place. Probably in no other city have the physical features been so completely altered as in Bristol. Of the two rivers by which it was once almost encircled, the Frome, after being transferred to a new channel, has practically disappeared, and the Avon passes through the city in an artificial channel, the old course having been absorbed in the construction of the city dock, known as "The Float" or the "Float-Harbour." The original courses of the two rivers may be traced on plan No. 1, which represents the city about the year 1600. In the earlier part of the twelfth century it was described as almost the

richest city in the kingdom, for ships brought into it both home and foreign merchandise, it stood in a specially fertile district, and had the strongest site of any city in England. The same account goes on to say that twice in every twenty-four hours the waters of both rivers were turned back by a "quick and strong tide," so that a deep harbour was made, such as would receive a thousand ships, while the whole city seemed to "float on the waters, and to be seated on their banks." Although this language may be somewhat imaginative, and as to the last two similes a little contradictory, yet it must be clear that even at that early date both the city and the port gave evidence of considerable commercial prosperity. Until the year 1248 the only harbour was in the Avon, and the rapid ebb of the tide left vessels stranded on the bed of the river, thus frequently resulting in injury by straining action which they were not calculated to withstand. For the purpose of improving matters the citizens purchased a portion of the Canon's Marsh through which they cut a new channel, as shown on plan No. 2, this cut remaining almost unaltered to the present day, as a branch of the floating harbour. The old channel was filled up, and the completion of the undertaking—providing what was then thought to be a good harbour and quay—constituted the first real attempt at dock improvement in the Port of Bristol. This work is said to have cost the sum of 5,000*l.*, the equivalent of which is now variously estimated at anything between 25,000*l.* and 125,000*l.* Soon afterwards a new stone bridge was built connecting the northern and the southern parts of the town, and during the construction of the bridge the Avon was temporarily diverted through a new channel marked on the plan, the course of the cut being partly indicated in modern Bristol by the street known as Port Wall. A considerable enlargement of the walled area of the city was the result of these undertakings, and for the next few years there can be no doubt but that the building trades must have experienced a period of remarkable activity. Although

no radical alterations were made in the form of the harbour for several centuries, the prosperity of Bristol continued to grow year by year. About 1450, William Canynge, one of the merchant princes, had nine ships afloat, and employed 800 seamen, besides 100 carpenters and other workmen; whilst a merchant named Strange is said to have owned about twelve ships.

In 1735 Bristol was described as a densely populated city, the quay along the old wall being crowded with houses on both sides; and in the middle of the street, as far as could be seen, hundreds of ships, their masts as thick as they could stand by one another. Up to this time Bristol had things pretty much her own way, in spite of the harassing and restrictive policy of the Corporation and society or company known as the "Merchant Venturers." This body, working hand in hand with the Corporation, farmed the port dues, wharfage and other charges, whilst the city authorities, in a jealously conservative spirit, excluded all except freemen from trading, and did everything in their power to confine the shipping industry within the city boundaries. In earlier times, vessels engaged in trade were of light draught and insignificant dimensions; consequently access to the quays of Bristol was unattended by serious difficulties, although much delay and inconvenience was caused by the violent character of the tidal flow and ebb. About the middle of the eighteenth century, formidable opposition from other ports commenced, and a period of decline was entered. Partly owing to the natural disadvantages of the port, and partly in consequence of excessive local rates, a large portion of the West Indian trade was permanently diverted from Bristol, and further, loss of trade was experienced after the opening of canal communications between the Midland counties and ports less affected by tidal irregularities and more readily accessible from the sea. Then also the tonnage of vessels began to increase, a circumstance which tended still further to diminish the popularity of the western port.

Ever since the beginning of the nine-

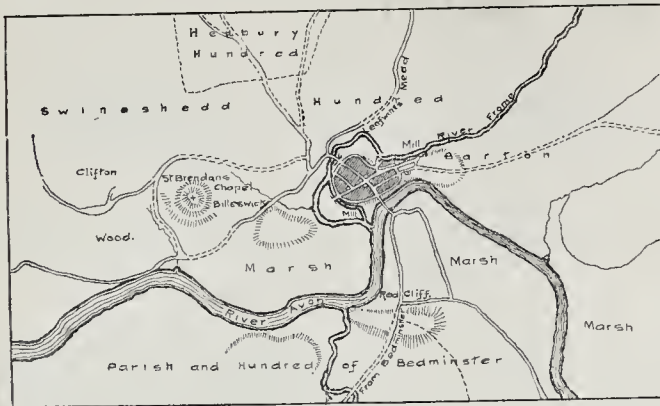

Fig. 1.—Plan of Bristol. A.D. 1066.

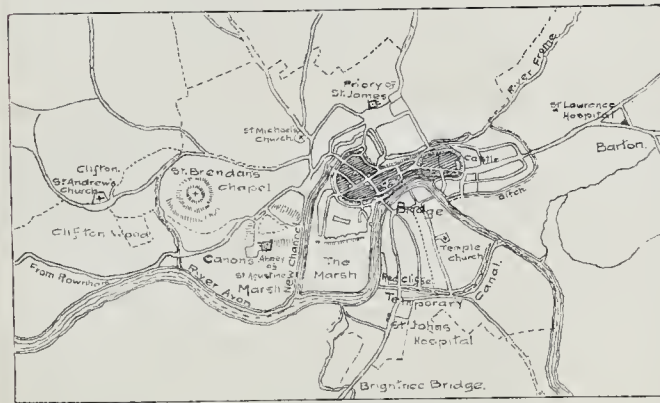

Fig. 2.—Plan of Bristol. A.D. 1250.

teenth century Bristol has been struggling to keep pace with the growing demands of the shipping trade, but with very indifferent success. Before the construction of the city docks, the accommodation was not essentially different from that made by the citizens in the year 1248, although improved quays and various facilities had been added from time to time. By a happy inspiration, it seems to have occurred to some one, about the year 1800, that the river harbour was really five and a half centuries behind the times. Consequently a Dock Company was formed in 1803 for the purpose of making an enclosed harbour in which vessels might float at all times without being thrown on their beam ends at the ebb of every tide. On June 1, 1804, the city harbour was commenced, being completed in 1809, at a total cost of 600,000*l.* The works comprised the building of new bridges; the formation of an artificial channel for the Avon from Totterdown to Rowham; the conversion of the Frome and Avon into a "floating harbour" by embanking and locking the old river courses; and the construction of Bathurst Basin, which, it will be seen by a comparison of Plans 2 and 3, occupies the site of the pool formerly existing near the outfall of the stream passing through Bedminster. Various additions were made in succeeding years, and in 1822 an Act was obtained for further improvements. Unfortunately the advantages

of these works were lost by mismanagement; the Dock Company was practically controlled by the Corporation and the Merchants' Venturers, who sought profits from high rates rather than from the expansion of trade. In 1825 some of the more oppressive dues were modified, but no real reforms were introduced until 1848, when—largely owing to the efforts of the Chamber of Commerce—the dock undertaking was purchased by the Corporation, and the port dues were at once reduced to more reasonable proportions.

The credit of originating trans-Atlantic steam navigation in 1838 was due to the Great Western Steamship Company of Bristol; but their great mistake was in attempting to establish a line of steamships with only one vessel. Liverpool at once followed with a fleet of four large steamers, securing the mail contract, and becoming the principal port for communication with the new world. The inadequate nature of the Bristol dock in 1844 is shown by the fact that when the Great Western Steamship Company had built a second vessel—the unfortunate *Great Britain*—she was too large to pass out into the river until the lock had been increased in size. Notwithstanding the unsuccessful attempt to establish regular trade with America, the general prosperity of the Port of Bristol continued to increase, and the improvement of dock accommodation became a matter of urgency. Various projects were discussed

from time to time, and about the year 1850 the Corporation came to the conclusion that the dockisation of the river was the best means for developing the port. Just as their forefathers tried to crowd all trade into the narrow limits afforded by the city walls and to conserve its benefits for a favoured few, so did the authorities at the time of which we speak propose to bottle up the Avon with the idea of obtaining the greatest possible benefits for the city from such ships as might be induced to enter the river. The object of the Corporation was a strictly proper one, but the means suggested for its attainment resulted from a mistaken policy, which, being perpetuated up to recent times, has done much to restrain the progress and prosperity of the port. In 1859 the first scheme for dockisation was prepared by Mr. Howard, the docks engineer. This proposal was submitted to Sir John Hawkshaw and Mr. Page, but, after consideration, it was disapproved, chiefly because a prejudicial effect on the anchorage of King Road was feared by those experts.

A few years later, a movement was made for the construction of a deep-water dock at Avonmouth, a scheme in which Sir John Fowler and Mr. Brunlees were professionally interested. At last, in 1877-80, the present Avonmouth and Portishead Docks were constructed, each by a separate company; and about the same time a considerable sum of money was expended by the Corporation on the improvement of the city docks. The three extensions proved of general benefit, but the city then became only one, and the much heavily handicapped, of three competitors for the profits to be derived from the shipping industry. This condition was terminated when, under "The Bristol Dock Act, 1884," the Corporation purchased the undertakings of the Bristol Port and Channel Dock Company, of the Bristol and Porthead Pier and Railway Company, and of the warehouse companies both at Avonmouth and Portishead. Two years later the Corporation obtained powers for making a new entrance lock to the Avonmouth dock, a new dock and graving dock communicating therewith, as well as some additional works in the floating harbour. Further Dock Acts were passed in 1893 and 1894 authorising various works and improvements in the city docks; but the scheme which it is now hoped will enable Bristol to compete successfully with other ports in the Channel, has only recently been formulated, and is the final outcome of successive proposals brought forward at different times during the last decade. When the late Mr. McKerrich, then the docks engineer, commenced the preparation of his scheme in 1894, the condition of the docks generally was not essentially different from that existing in 1884 although some of the improvements authorised had been added. The city docks included an area of about 80 acres, and there were three dry docks varying in length from 300 ft. to 380 ft., width from 38 ft. 6 in. to 45 ft., and in depth from 13 ft. to 15 ft. The entrance to the opening into the Cumberland Basin measured no more than 350 ft. long by 62 ft. wide. Avonmouth the main dock covered an area of about 16 acres; it was provided with a floating dry dock, of the pontoon type, about 350 ft. long; and the entrance lock measured 454 ft. long by 70 ft. wide, the depth of water on sill at ordinary spring tides be-

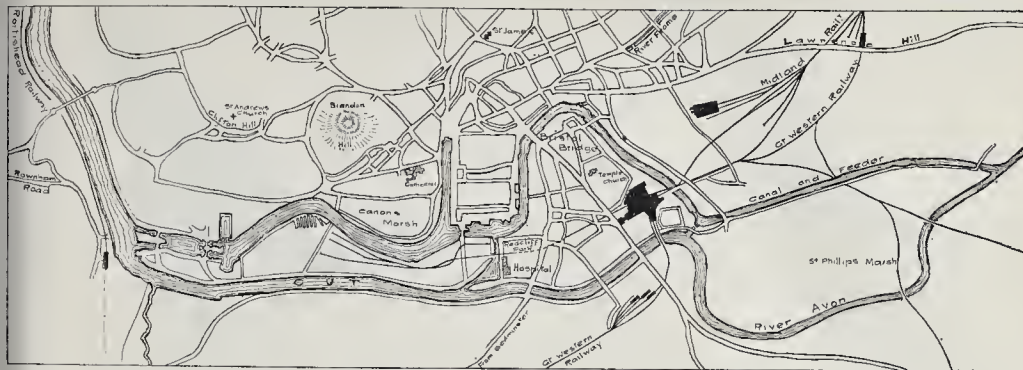

Fig. 3.—The Port of Bristol (City Decks). A.D. 1901.

8 ft., or at lowest neap tides 27 ft. The lock at Portishead, approximately equal in area to the Avonmouth Dock, was provided with a lock 444 ft. in length by 66 ft. in width, the depth of water on sill at ordinary spring tides being 33 ft. and in the dock 7 ft. A detailed consideration of the proposals put forward by Mr. McKerrich in 1894 is not necessary, but it may be useful to observe that they were to some extent based on conditions which have since been modified, and although providing for dockisation in accordance with the instructions of the Corporation, they included the construction of a large new dock at Avonmouth, with a graving dock, an entrance lock of ample size, and a low-water passenger pier. It was also pointed out by Mr. McKerrich that works of considerable extent would be required for dealing with sewage in the event of the river being docked. In the following year Sir John Wolfe Barry was invited to report upon these recommendations, and in his modified scheme of 1896 some alterations and additions were suggested. The net cost of dockisation was then estimated at £1,880,000, the low-water pier being estimated at £320,000, and the sewage works at £500,000. Sir John Wolfe Barry also considered the whole subject of harbour accommodation, and reported on three alternative methods of dealing with Transatlantic traffic; these are stated below with the estimated total cost of each, including wharf and other auxiliary works, but not a low-water pier or sewage works:—dockisation, £2,580,000; improvements at Avonmouth, £1,308,000; improvements at Portishead, £852,000.

When reporting upon the dockisation scheme Mr. McKerrich expressed the opinion that the Avonmouth improvement was to be preferred, but at that time Sir John Wolfe Barry was rather in favour of extensions at Portishead. No result followed the presentation of these reports, until in July, 1898, the Dock Committee decided to recommend the expenditure of £350,000 on the development of the Portishead Dock; and in the same year a decision was added to the Avonmouth lock, making it available for ships up to 480 ft. in length. Nothing further appears to have happened until October, 1898, when it was decided by the City Council that a special committee should be appointed to report within three months "as to the lowest possible cost at which the River Avon can

Fig. 4.—The Port of Bristol (Avonmouth Dock). Dockisation Scheme of 1900.

be docked, and accommodation be provided for the largest class of passenger and cargo steamers." A final report was made by the Docks Engineer in December, 1898, in which the total cost of the works was estimated at £1,782,000, but the progress of events was once more interrupted, this time by the regrettable death of Mr. McKerrich in January, 1899. Then in July, 1899, the Dockisation Committee requested the new Docks Engineer, Mr. W. W. Squire, and the general manager, Mr. Girdlestone, to report upon the recommendations of Mr. McKerrich. In the early part of October, 1899, the Dock Committee of the City Council appeared intent upon the Portishead extension, but at the same time they invited Sir John Wolfe Barry, Sir Benjamin Baker, and Mr. Hurtzig to consider the whole subject of dockisation in conjunction with Mr. Squire. The report presented by these eminent experts in May, 1900, makes it clear that dockisation is prac-

ticable as an engineering work, but it also hints at the grave objections which might be raised in connexion with any application to Parliament for powers to dockise the Avon. Amongst these objections two of the most important are—(1) interference with the drainage of some 900 square miles of country, and (2) restriction of the flow and ebb of the tidal volume of the river, with the possibility of prejudicially influencing the estuary in general and the anchorage of King-road in particular. As to the most suitable position for dock accommodation, the report says it would be difficult to prove that this should be provided in the heart of the city, and points out that without ruinous demolition of property it would be impossible to furnish facilities there for dealing with large vessels within the limits of time usual in competitive ports. Moreover, the doubt is expressed whether large vessels would readily undertake the up river journey, even if the accommodation

Fig. 5.—The Port of Bristol (Avonmouth and Portishead Docks). Dock Extension Scheme of 1901.

were provided at the city docks. A general representation of the dockisation scheme is to be found in plan No. 4, and it will be observed that the main idea is to afford ample provision at Avonmouth for large steamships, whilst the dockised river is regarded chiefly as furnishing an improved means of access to the city itself. The details of the proposal were as follows:—

1. A diversion of the Avon from below Pill Ferry to a new outfall, the new channel being about two miles in length and permitting the passage of three steamers abreast, drawing 23 ft. at neap tide, high water.

2. A reclamation embankment, about one mile in length, from the entrance lock of Avonmouth Dock to the northern side of the new outfall. This embankment would provide a new site of about 300 acres for dock and auxiliary purposes.

3. An entrance channel from King-road; an entrance lock, 850 ft. long by 85 ft. wide; and a graving dock of similar length.

4. A deep-water dock of 23 acres, and dock space in the river of 10 acres; 3,000 lineal feet of deep-water quays, shed area of 525,000 square feet, and other equipment.

5. A masonry dam across the diverted river, with large under sluices worked by machinery, and having an opening of 2,000 square feet.

6. Railway communication with the Port and Pier and the Severn Tunnel Junction railways, railway sidings to the length of 20,000 lineal feet, and a passenger station near the entrance channel.

7. An independent lock entrance into the dockised river for small vessels.

The cost of these works was estimated by the engineers at 2,775,000*l.*, this sum

being an advance of about 700,000*l.* on the amount suggested in 1896 by Sir John Wolfe Barry, but the difference was largely owing to the proposed river diversion.

A part of the report which is of permanent value is that referring to the increased cost of dredging necessitated by any scheme of dockisation. The calculations given in the report are based upon actual results obtained during recent years, and upon the undoubtedly correct assumption that the solid matters brought down from the Avon watershed would be nearly all deposited in the relatively still water of the dockised river, instead of being carried into the estuary, as at present. Making due allowance for the weight of material now removed, it appears that the additional expense for dredging entailed by dockisation would not be less than 29,000*l.* per annum.

It is highly probable that the report of 1900 had the effect of strengthening the hands of those who were opposed to the idea of turning the Avon into a ship canal; but the advocates of dockisation were by no means convinced of error, for on July 30, 1900, it was decided by the City Council that yet another report should be made by the Dockisation Committee, after consultation with Sir John Wolfe Barry, Sir Benjamin Baker, and Mr. Hurtzig. These eminent engineers were also to be requested to present another proposal which in their opinion would be adequate to the requirements previously stated, and would give equal accommodation to that in the dockisation scheme. The proposal was presented in due course, and an opinion was also given adverse to dockisation, not because it was impracticable, nor because of the greater outlay involved, but chiefly on account of various important questions

which in their opinion would constitute obstacles to the success of any application to Parliament for dockisation of the river. This dictum had the effect of setting dockisation definitely aside, and selection had then to be made between the Portishead extension favoured in 1896 by Sir John Wolfe Barry, and the Avonmouth extension, recommended in the final report made in October, 1900, by the three experts. With regard to the former proposal, it may be mentioned that Sir John Wolfe Barry has stated that in 1896 he was influenced by the belief that Bristol then especially desired accommodation for Atlantic liners rather than a general development of the port. Further, it is perfectly clear that the railway communications of Portishead are very inadequate, and no extension is to be recommended at that place unless accompanied by a thoroughly satisfactory understanding with the two great railway companies. At the present time Sir John Wolfe Barry is entirely in accord with his colleagues in recommending the Avonmouth site. As the matter now stands the Corporation has decided to adopt the proposals made in the October report, and these have already been included in a Bill, known as "The Bristol Docks and Railways Act, 1901," to empower the Mayor, aldermen, and burgesses of the city of Bristol to construct an additional dock, railway, and other works to extend the city and county of Bristol, and for other purposes. The works in question are shown on plan No. 5, and they include the following details:—

1. A diversion of the Avonmouth and Severn Tunnel Railway, commencing on the north-west side of Gloucester-road, and continuing for a distance of about 2,000 yards to the existing railway.

2. A diversion of the Bristol Port and Pier Railway, commencing at a point north-west of Richmond-terrace, and continuing for a distance of about 800 yards to the Avonmouth and Severn Tunnel Railway as diverted, including the provision of a new passenger station and a new road in substitution for those to be closed by the new works.

3. A reclamation wall, commencing by a junction with the northern approach pier to the lock, and continuing in a northerly direction, slightly on the seaward side of Dumball Island, and at its termination joining the existing sea embankment as indicated.

4. A reclamation embankment commencing by a junction with the southern approach pier to the lock, and continuing along the northern side of the outfall of the river Avon, and at its termination joining the approach works of the lock of the existing Avonmouth Dock.

These railway diversions and reclamation walls will provide an area of about 250 acres in extent, suitable for the construction of the new dock, lock, graving dock, sheds, railway sidings, and other requisite accommodation.

5. A dock to be at first constructed having 25½ acres of deep water space and a total available quay length of 3,200 lineal feet. The dock area will be surrounded by about 221 acres of land in the first instance; but the dock is so situated that the water space may be hereafter readily extended if required.

An extension, as indicated by dotted lines on the plan, would provide four additional berths for steamers of the largest class. This extension, consisting of two branch locks, would increase the total deep water area to 40 acres, and the surrounding land would be reduced to about 207 acres. It may be seen by the plan that still further extensions may be made should they become necessary. The quays bordering the dock will be wide and commodious, and readily adaptable to the timber, coal, or general trades, as may be most suitable. The walls will be founded upon hard marl, and there is ample room for the provision of sidings and railway connexions. The graving dock is to be situated as shown on the plan, and it will be 850 ft. in length by 90 ft. in width, thus affording accommodation for steamers of the largest class. The estimates provide for 3,200 lineal feet of deep water quays, sidings to the extent of 20,000 lineal feet, and 525,000 square feet of shed area.

6. A junction cut between the existing Avonmouth Dock and the proposed new dock to afford communication and provide a second entrance in case of need. It will be observed, however, that the value of this second entrance is qualified by the length of the lock of the existing Avonmouth Dock, which will not admit vessels longer than 480 ft. In this respect, therefore, the arrangement is less desirable than that included in the scheme of 1900, where the graving dock was available as an emergency entrance for vessels of the largest class.

7. An entrance channel from King-road, together with an entrance lock, 850 ft. long between the extreme gates and 85 ft. wide, with sills 8 ft. below the outer sills of the existing Avonmouth Lock.

This new lock will be practically on the

site proposed by Mr. McKurrich in connexion with his scheme for a new dock at Avonmouth. The present engineers consider that there is no difficulty in this site that cannot be overcome by modern methods of construction, and, bearing in mind all the circumstances of the case, they believe the lock to be in the best position that can be selected for the entrance to a dock on the Dumball Island site. The approach piers are designed so that passenger steamers can lie alongside and discharge passengers in close proximity to trains standing upon the piers. In the case of a steamer drawing 30 ft. of water this convenient system will be practicable for two hours before and after high water of ordinary neap tides. If facilities should be thought necessary for landing passengers at low water of spring or neap tides, the low-water pier proposed by Mr. McKurrich might be adopted, but its construction is not included in the present programme.

In addition to the works mentioned above, the Corporation propose certain road and street improvements, a deep-water wharf alongside the floating harbour, and other improvements in the city docks.

According to estimates prepared at the instance of the Corporation, the purchase of land and the execution of the works specified in the Act will be as follows:—

Avonmouth works.....	£1,428,885
Graving docks	250,000
Equipment and engineering ...	271,000
Road and street works	13,000
Works authorised by Dock Act,	
1897	114,600
Deep water wharf (city docks)	190,000
General purposes	182,722
Total.....	£2,450,207

The estimate for that portion of these works dealt with by Sir J. Wolfe Barry, Sir Benjamin Baker, and Mr. Hurtzig amounts to 1,804,700l. Thus it will be seen that the cost will be 970,300l. less than that of the Dockisation scheme, and another important saving is represented by the difference in the cost of dredging. The heavy annual outlay in respect of this item inseparable from dockisation will be avoided, as the only additional expenditure in connexion with the new dock will be the maintenance of the approach from King-road, the annual cost of which is estimated at between 4,000l. and 5,000l.

Regarded as a whole, the latest proposals appear to provide all the accommodation required at the present time, and to lend themselves to the execution of all such extensions as may be expected to be demanded for many years to come. Until quite lately the Local Authorities have clung very tenaciously to the idea that the city itself is the proper centre of the port. As the seat of various manufactures, Bristol is no doubt an important place; but it is still more important as a collecting depot for other and more populous districts. The old order of things, which made the city suitable as the site for a harbour, has long since passed away. The mouth of the Avon is now the true centre of future expansion, and is the place where Bristol may hope to lay the foundations upon which her prosperity and greatness may once more be built.

NEW SCHOOLS AT HARTLEPOOL.—The School Board of Hartlepool have instructed Mr. J. Mitchell Bottomley, of Middlesbrough and Leeds, to prepare a scheme for the proposed new Board school in Baltic-street, Hartlepool.

NOTES.

The Monument to Queen Victoria. IN the course of his speech at the Mansion House on Tuesday, Mr. Balfour, in referring to the proposed site near Buckingham Palace for a monument to Queen Victoria, observed that he hoped the memorial would involve something more than a mere monument—"some great architectural and scenic change in that part of London." This remark points in the direction of what we have already suggested—that in order to place any monument effectively in connexion with Buckingham Palace and the Mall, some rearrangement of the site would be necessary, so as to centralise the monument. Something very fine might be done if alterations are carried out on a large scale and in a right artistic spirit, and it is satisfactory to observe that Mr. Balfour at all events seems to have large and liberal ideas on the subject.

Bronze Statue at Naples. THE beautiful bronze statue recently discovered by Professor Orsi on the Barbatelli Estate, near Pompei, is not as yet exhibited to the public, but by the kindness of the Director of the Naples Museum, we were able to make a personal inspection. The statue is not, as has been erroneously reported in some accounts, "life size." It is about 4 ft. in length, and represents a nude ephebos in an extraordinarily perfect state of preservation. The paste eyes had fallen back into the head, but have been restored to their place, and give the statue, as in the case of the "charioteer" of Delphi, a wonderfully life-like air. Together with the statue were found two bronze scrolls, similar in character to those often held in the hands of figures in vase painting. It is conjectured that the youth held these scrolls in either hand, and that they may have served as supports for pendant lamps. One of the scrolls is large and heavy in proportion to the delicate hand that it is supposed supported it, but in any case they are not flowers or tree branches as has been stated. The statue shows clear signs that it has been coated with silver, as patina has only formed in places where the silver coat is worn away. In style, this exquisite figure recalls the manner of Polycleitos. It is ultimately to be placed in the Sala dei Bronzi in the Naples Museum.

The Government and London Water. THE rejection of the Bill of the London County Council for the purchase of the water companies again leaves the ratepayer at the mercy of these companies. In asking Parliament to reject this Bill the Government have acted contrary to the wishes of London, which desires to see some active step taken towards the municipalisation of the water supply. In place of the Bill of the County Council the Government can only give a hope of a Bill next Session. But why in a purely local matter should not London be allowed to carry out its own scheme? This is not a so-called Imperial matter, and yet the Government treat it as if it were one which concerned the whole of England. Representatives of the provincial towns vote against the Bill of the governing body of London, though they have no concern with the question at all. The proper course would have been to have allowed this Bill

to go before a Select Committee, and be discussed in its details before that tribunal. And we ask again, what is the use of lecturing the people of London on their want of public spirit when they are not allowed to manage their own affairs?

In the City of London Court last week the war—which has been blamed for many things—was held accountable for delay in the delivery of two trucks of bricks. They were consigned from Southborough to Messrs. Mills, of Westcombe Park, and the railway company took fourteen days to deliver one truck, and seventeen days the other. The length of the journey being only thirty miles, the bricks jogged along at the rate of something less than two miles a day, which, as the plaintiffs' counsel remarked, was slow, even for the Chatham Company. The latter were sued for 50*l.* damages, as the brick merchants were liable to penalties under a contract. In deciding the terms of a contract it is customary to provide for such eventualities as strikes and lock-outs; but when your material is once on rails you rely on it reaching its destination within a day or so. In this case, however, the company successfully pleaded non-liability on the ground that the line was at that time practically taken over by the War Office for the conveyance of munitions of war, and they were compelled to put all other traffic on one side. This is hard on the contractor, and we feel, with Mr. Commissioner Kerr, that as the Government had caused the delay, they ought to pay. But the Government will be called upon to pay for a vast amount of direct and consequential damage in connexion with the war, and would probably contest a claim of this nature. Messrs. Mills were given the option of having a special case stated, and more may therefore be heard of the matter, especially as it is by no means a solitary case.

The inquiry by the Board of Trade into the regulations proposed by the electric lighting companies was concluded last week. The companies, represented by their counsel, posed as aggrieved parties, because a few consumers, whom they supplied with current at 100 volts, refused to accept service at 200 volts. The reasons advanced by those objecting to the change were either that they were afraid of getting shocks from the increased pressure or that they were entitled to a substantial indemnity. The danger from shock was hardly touched upon at the inquiry, although from the facts stated in the next note it will be seen that it is no imaginary danger. The County Council based its arguments for indemnity on two grounds—namely, on the right of the consumers to veto the change, and on the fact that the 200-volt lamp is not as efficient as those made for lower pressures. We were astonished that electricians could be found who would not admit the inferiority of the 200-volt lamp as at present constructed. Many consumers who have had experience of both have very strong opinions as to the shortness of the life of the high-voltage lamps. The tests quoted by Professor Ayrton were conclusive as to the low efficiency of these lamps, and they agree with the results of experiments that we have made ourselves. It will be seen that

the companies have not made out that their increased pressure is an undoubted benefit to the public, and hence they have no claim to propose that certain persons should be deprived of their vested rights. The attitude that the London County Council has adopted towards this increased pressure is the right one, namely, that the only reasonable way of giving a solatium for the loss of a consumer's rights is that he should have a substantial reduction in the price in the shape of a discount. As Mr. Danckwerts, K.C., on behalf of the City Corporation, suggested, the analogy of compensation cases should be taken and those persons should be charged 10 per cent. less than anybody else.

The paper recently read by Mr. Connett on "Combined Trolley and Conduit Tramway Systems" to the Institution of Mechanical Engineers is of special interest, both to engineers and town councillors. Many towns at the present time are considering the question of electric traction, but are in doubt whether to adopt overhead traction, with all its known drawbacks, in crowded thoroughfares or to adopt an expensive scheme of conduit tramways. In this paper Mr. Connett describes several ways of combining an overhead trolley system in the suburbs with a conduit tramway for the central streets. These methods are not experimental, as Mr. Connett has already constructed some fifty miles of electric conduit tramways in Europe and America. In regard to the vexed question of whether the centre-slot or side-slot system should be adopted, it was interesting to hear that the municipal authorities in Buda-Pesth, Berlin, and Brussels, absolutely prohibit the centre-slot, whilst in Paris only about five per cent. of the conduit mileage is centre-slot. This objection is probably due to the additional rail in the centre of the streets required by the centre-slot, as every joint of a rail with the paving shortens the life of the latter. A valuable description is given of the shallow conduit designed for use on the Pont de l'Alma in Paris. It is important to know that it is quite possible to make the conduit shallow in places, as this will lead to many economies by avoiding the necessity of removing and lowering sub-surface obstructions. In Berlin the change from conduit to trolley is done without stopping the car. A wheel on the lower part of the plough runs up an inclined plane and so raises it through the slot to the groove of the wheel rail and then a turn of the crank by the motor man raises it clear of the track. Mr. Connett estimates the cost of the conduit to be 6,000*l.* more per mile than the cost of the overhead trolley and there has to be added to this the cost of removing sub-surface obstructions, which will vary greatly with the locality. He has certainly made out a very good case in favour of a combined trolley and open-slot system, and the conclusions to be deduced from his paper agree with the results arrived at by the Highways Committee of the London County Council.

Some extensive structural alterations are being made by Messrs. Patman & Fotheringham, contractors, for the proprietors of a serial publication at No. 142, Strand, which stands opposite the end of Catherine-street. The house, distinguished until lately by its sign of a half globe, is noteworthy as having

been occupied by the Chapmans when, in 1851, George Eliot first came to London. That house was her home during the two following years; whilst living there she wrote many essays for the *Westminster Review*, and did some editorial work that the Chapmans placed in her way. The premises were rebuilt some sixty-five years ago as "Wright's" Hotel. In more recent times they formed the offices of the International Life Assurance Company, and then of a well-known tourist-ticket agency. They stand on the site of the "Turk's Head" coffee-house, a favourite resort of Dr. Johnson, Boswell, Alexander Chalmers, Hewerdine, and many other literary celebrities. In his "Records of My Life" (vol. i.) John Taylor mentions that he often met Richard Parson at the "Turk's Head" in the Strand.

At the Fine Art Society's Gallery are two new exhibitions. Mr. S. J. Hodson's water-colour drawings of "Picturesque Towns on the Loire" and elsewhere, and a collection of water-colours by Mr. Eyre Walker, under the general title "By Woodland and Stream." Mr. Hodson's subjects are mostly architectural, and illustrate many picturesque buildings or collections of buildings; but they are rather formal in style and there is a want of clear and definite colour in them. Some of the views of towns comprehensively treated are among the best; for example, "Saumur from across the River" (8) and "General View of Angers" (9), a pile of houses climbing up the hill and topped by two thin spires. "The Castle, Vitre, Early Morning" (51), is a fine drawing with more effect in it than most of them. Among the street scenes "A Street in Vannes" (17) shows a curious old house built out of heavy and massive timbers; "The Hotel de Ville, Orleans" is a good example; the "Cheapside" is rather spoiled by the bad drawing of the Bow cupola. The collection of works by Mr. Eyre Walker is a beautiful one; every drawing is worth looking at, and some of them represent the highest quality of landscape-painting in water-colour. Among these specially attractive examples may be named "Semmerwater, Evening" (13) with the warm light on the hills and the rich bit of colour in the small lake reflections in the middle distance; "On the hills above Brendon" (19); a "Hillside, Llanbedr Woods" (27); "In Ashdown Forest" (30), a small landscape differing in tone and manner a little from the majority—it must be admitted that Mr. Walker rather runs to one tone in his landscape, which mostly have a kind of rich mellow autumnal tint pervading them; "On the Watershed of England" (47), a wide-sketching scene of undulating Yorkshire moor; and "Brambles and Ragwort" (56), a perfect little picture composed of a bit of foreground vegetation over which some distant white cliffs are seen faintly reflected in the sea. This is not one of the more important works in regard to scale and subject, but as a work of art it is perhaps the most complete and satisfying picture in the room, in the sense of making the most of the materials and keeping the balance of the whole.

The two well-known galleries next door to each other in the Haymarket, Mr. Maclean's and Messrs. Tooth & Sons, both have new

collections of pictures on view. At Mr. Maclean's the centrepiece is M. Lhermitte's large picture "The Reapers," which we have seen more than once before; a work rather inspired by recollections of Bastien-Lepage. A very fine view of "Whitby," by Mr. Albert Goodwin, is also among the collection in the principal room, and a powerful Highland scene by Mr. Hurt, who in this class of subject is, indeed, a kind of double of Mr. Peter Graham, but runs his original very close. Then there is Mr. Leader's "Old English Village Church," which we remember at the Academy some years ago, and Mr. Shaw's "Stormy Day in the Channel," which also we seem to know, or else a predecessor very like it. There is an example of Meissonnier, not quite at his best, but superior to the best of most other painters as far as execution goes, at any rate. Among the works in the outer room is a large specimen of James Maris, "Katwyk, Holland," with a grand sky but his usual depressing effect of dingy colour, and a calm sea picture by Mr. Fritz Thaulow, "Fishing Boats off Dieppe, Moonlight," in which at all events there is no lack of fine colour.

MESSRS. ARTHUR TOOTH & SONS have the good fortune to include in their present exhibition one of the best pictures that Eugène Delacroix ever painted, "L'Amour qui vole," a cupid flying off with some property of a seated nude female figure who may represent Venus, though she is not very goddess-like: but the drawing and painting of this figure are so perfect that for the moment one is tempted to forget the essentially cold and academic character of Eugène Delacroix's art in admiration for the perfection with which, in this case at least, he has worked out his own ideal. Next to it hangs an exceedingly clever picture by M. Théodore Hermann, a name we do not recall—three ecclesiastics with countenances delightfully expressive of their enjoyment of a particularly good bottle of wine; the costumes and accessories are painted with the most brilliant though not obtrusive naturalism. It is a kind of subject that is not worth the talent displayed over it, but the talent is indisputable. Among other works are Sir L. Alma-Tadema's charming little picture "The Flag of Truce"; "On the Alert," by Rosa Bonheur, a small painting of two stags which at once shows a master hand; a good specimen of Van Dyck's always excellent but constantly repeated dish of cows and landscape; and a powerful though rather loaded woodland scene, "Forest Pastures" by Mr. Ch. Courbet. The small room contains some interesting water-colours; two beautiful little works by Mrs. Allingham, others by Varley, David Cox, and Sutton Palmer, whose "Birches and Boulders" shows a quite exceptionally good study of foreground detail; and a figure by W. Hunt, "A Beggar Boy," which shows Hunt at his best in regard to qualities of pathos and expression as well as execution.

A COLLECTION of oil-paintings by Mr. Rex Vicat Cole forms the latest addition at Messrs. Dowdeswell's galleries. These are exhibited under the title "A Year in Wharfedale;" the central and largest painting, "Spring Delights," is the one which was exhibited at

the last Royal Academy and which we noticed in our article on the pictures of last year. The rest of the collection—forty-eight pictures in all—is of rather unequal value; the greens are rather crude in some of them, and some of the effects of colour and sunlight seem a little theatrical. Those we admire most are among the August pictures—"Ower Fell," "Bolton Abbey from the Woods," with the river making a silver ribbon at the bottom of the vale; "Barden Moor," and also the September picture "On Barden Fell." A frame of beautiful drawings of details of leaves and sprays is exhibited, which are to form part of the illustrations of the forms and growth of trees for a book on "British Trees" which the artist has in preparation. The present set of sketches form complete illustrations of the Guelder Rose.

The Institute of Architects has issued its next year's prizes, issued by the Institute of Architects, is of more than usual interest. The subject for the Soane Medallion is a swimming-bath, the interior of which is to be treated in an architectural and monumental manner. A swimming-bath interior, with its water surface and consequent reflections, is really an exceptional chance for a fine architectural effect, as the Romans knew so well, though we never get an opportunity for such a treatment now; it ought to be a pleasure, at least, to do it on paper. For the Tite Prize the subject is a memorial chapel in the Italian style, for which the main lines of the plan are given, leaving the details to be worked out at the pleasure of the competitors. The subject for the Essay Prize is "The Employment of the Order in Renaissance and Modern Architecture"; a subject which gives a chance for some able and thoughtful student of architecture to produce an essay which may be of permanent value as a contribution to the higher architectural criticism.

THE SURVEYORS' INSTITUTION: THE PRESENT CONDITION OF THE BUILDING INDUSTRY.

An ordinary fortnightly meeting of this Institution was held on Monday evening, at No. 12, Great George-street, Westminster, the President, Mr. John Shaw, occupying the chair. Some donations to the library having been announced, and a vote of thanks to the donors having, on the motion of the chairman, been agreed to, the discussion on Mr. Thomas Blashill's paper, on the "Present Condition of the Building Industry," was resumed. Mr. P. E. Pilditch said that he was surprised that Mr. Blashill had been able to invest the subject, which to many would be regarded as dry, with so many of the attributes of poetry. The paper consisted of two parts, the first of which dealt with the relations of the architect and the surveyor with the client and with the builder, and the latter part dealt with a subject of even greater importance, not only to the profession, but to the nation—viz, the question of labour and its present effectiveness, and its effect upon the building industry. As to the suggestion made by Mr. Blashill as to having all details ready before starting a building, that would be a beneficial thing if it could be done, because it would give the builder a greater opportunity to give closer estimates, but he could not help thinking that it was a counsel of perfection, and one that those in practice would find it difficult to give effect to. In most jobs the employer rarely made up his mind to start building until the last moment; moreover, clients themselves always liked to exercise their own individuality upon the details of the work to be carried out. If all

the details were prepared beforehand, it frequently happened that if, when the client saw those details in the course of being carried out, they were not exactly as he would like them to be, he had the work delayed. Moreover, there was always a very useful margin of time during the first weeks or months, during which the foundations were being prepared, which gave an opportunity for the details to be worked out quietly by the architect. Therefore he did not think Mr. Blashill's idea was practical in most cases, though he quite agreed that double the time given to the drawings at the beginning would save much time in the execution of the work. He did not quite agree with Mr. Blashill when that gentleman said that the quantities, if properly priced, should form the basis of a settlement. He did not quite understand that, because the quantities were priced by the builder, and if accepted as part of the contract, must be the basis of the settlement of account at the end. Who was to say if they were properly priced? It frequently happened that a builder had special reasons for pricing some things high and some low, and it would be impossible to depart from the basis of the contract accepted by the builder himself in settling the account. Another exceedingly interesting point raised by Mr. Blashill was as to sub-contractors being under the direct orders of the architect, and provision being put in contracts for that purpose. He had tried that system and its antithesis and there was something to be said for each. He thought the most important matters, such as the iron work, the large fittings (such as lifts) should be under the direct control of the architect; and as to the point made by Mr. Blashill, of the builder not getting his proper profits, he did not see how that could be. When the builder was pricing his quantities and had the amount of the provision before him, it was always open to him to add to the provision, and if he cut out his profits, surely he did so at his own risks, and must take the consequences. With regard to the suggestion as to the direct employment of workmen and the carrying out of work by an employer without the intervention of a contractor, he had a case some time ago in which a client determined to adopt that course under specially advantageous circumstances. The result was entirely unsatisfactory, and although the employer gained something in the way of his relation to the workman, and was able to give the workmen a farthing or a halfpenny an hour more than the trades-unions rate of the time, in order to get the work done quickly, he was not able to make up for the delay in other ways. As there was no contract, there was no builder to keep a check on the alterations made from time to time to suit the whim of the employer, and in the end the work took nine months longer than a contractor would have taken, and cost from 25 to 30 per cent. more than a contractor would have done it for, that result being partly because the employer had none of the large plant and facilities which the contractor had. The long experience that the large contractors had had was of great use to architects and surveyors, and employers who engaged them. In regard to that all-important subject of labour, public as well as professional attention had been directed for some time to the question of the effectiveness of present day labour, and its influence not only upon individuals and trades, but also upon the national interests. Every speaker in the discussion so far had, with one exception, had to find some fault with the British workman in the building trades, against whom there seemed to be two serious complaints. The first was the indifference, loss of value, and lack of keenness of the present worker, and a good deal had been said as to that. Mr. Taylor, who spoke at the last meeting as the representative of the workmen, said that the practice of "St. Monday" was dying out. That did not coincide with his (the speaker's) experience. He had made some calculations, and in his experience (and taking the most favourable kind of jobs from the point of view of the workman, viz, large jobs, in the heart of London, where the best class of workmen could be got) quite 10 per cent of the men did not go to work on Monday. Last Christmas-day fell on Tuesday, and on two jobs that he had in hand at that time the contractor decided that in order to get over the difficulty of the Christmas holiday (for it was not only a difficulty of Saturday and Sunday, but of all holidays) it was

decided to close the works for the whole week, so that there should be no excuse for the men not coming to work at the proper time on the following Monday. Unfortunately, the result was the same as on the previous Christmas, where the works were not closed in the same way, and rather over 10 per cent. of the men failed to turn up. This seemed to be an ineradicable tendency on the part of the British workmen of to-day. The second point he had to refer to, which was even more serious, was the tendency of the men and the unions to act in the belief that to benefit themselves by raising wages the workmen should reduce the output. Now, unquestionably this tendency did exist, notwithstanding what had been said to the contrary, and it was shown in many ways, and very clearly in regard to the extra price charged for overtime. In all the trades, with two exceptions, in the building trade, if the builder wanted a man to work a quarter or half an hour after five o'clock, whatever pressure there might be that man had to be paid rate-and-a-quarter, and that, of course, made overtime prohibitive, unless the employer was prepared to pay more for the work. The two exceptions were the plumbers and labourers, who worked up to seven o'clock in case of necessity without the extra 25 per cent. overtime. He did not understand why the unions did not permit the men (the individual man was perfectly ready to do so) to stay on a job a longer time when necessary (up to, say, one hour per day), without extra pay. If that were done, it would be a benefit to the men as well as the employer. The extra charge for overtime might very well mean a large extra cost to the work, especially as the men did not give anything in the way of greater efficiency in labour for the extra money received. This conviction on the part of the men and the unions that in reducing output they were keeping up wages was a most serious matter, and deserved the serious attention of the unions, whom he did not altogether blame in the steps they had taken to safeguard the interests of the men, and their influence had undoubtedly benefited the men and the employers and general public; but so far as that influence abetted the tendency to limit output so as to increase wages, it was bad. The unions were responsible for another fact, and that was admitting into their ranks incapable men who, when admitted, had to be paid the union rate. It might be said that that was more a matter for the unions, but that was not so, because it very much concerned the employer, and it really affected the general public, if an indifferent bricklayer had to be paid 10s. an hour, or the same as the best and most capable man. During the last carpenters' strike many inferior men were let into the trade-union, and for the rest of their lives they would be entitled to receive the highest rate of wages, though they might not be worth more than three-quarters of that rate. Wages had risen during the last thirty years from 8d. to 10s. per hour, but there was a good deal to be said for that increase. The increase of rents for workmen's cottages had been from about 6s. to 10s. per week; the emoluments of other classes and the general standard of wealth had also risen; and the workman was entitled to his increase for those reasons; but the question was whether the work had risen in effectiveness. From what he could learn, the average workman of the present-day (and by that he did not mean the old worker of twenty-five years ago, living and working now) did not do such good work, and his effectiveness had gone down 30 per cent.; and in so far as that was a fact, the case for the increase of wages was not made out. He did not mean to say that that was so with all workmen in the building trades, and he knew of an instance of an ironworker, a fitter, an excellent workman, who was only receiving 8d. an hour, which was a case, on the other side, of a man getting less than he was entitled to. But he feared that workmen were not the only class who had shown a desire for greater comfort in return for less exertion. We were suffering from the results of the unexampled prosperity of the past few decades, and other classes had shown indications of the same tendency as the workmen. Perhaps the period of sharp competition now to be expected would wake up the workman, traveller, and manufacturer alike.

Mr. T. M. Rickman, Past President, said that one of the most important matters Mr. Blashill had touched upon was that of labour. All of them who were engaged in building work

must have spent time in watching workmen at their work, and with a little experience one could tell the kind of stone, for instance, a man was working on by the character of the blow he inflicted upon it, and the workman's character by the effect of that blow. Within the last fifty years machinery had been brought to bear on the trades of joiners, carpenters, plumbers, and masons, and much that used to be done by muscular exertion was done by machinery, and the workman was now expected to work more with his head. Most people would have supposed that with such a great diminution of physical exertion there would have been a much larger amount of work done per man per day, but they had heard that hours of labour had been reduced, the amount of work eminently reduced, and the wages largely increased. Forty years ago an intelligent joiner he knew was hoping soon to get 1*l.* a week on which he would marry. There were few joiners now who got much less than 2*l.* per week, and for much shorter hours. What he thought all must have hoped would have followed the reduction of hard physical exertion was that workmen would have exercised their wit and endeavoured to do good and full work and make a position in the world for themselves. He was afraid the men had not progressed in that way. The position of the architect as arbitrator had been referred to; he thought that no man could become an efficient judge unless he had been in the habit of taking a side, and that on both sides. Now a building surveyor was in that position; he was sometimes engaged by the builder and sometimes by the architect and which ever side he worked for he endeavoured to do his best for it. An architect had seldom that opportunity; he was called upon to act as arbitrator between the builder and the client and seldom acted for the builder exclusively. For that reason he thought that as a rule the building surveyor was a more proper person to act as arbitrator than one engaged exclusively in architecture. He had been much struck in studying buildings, ancient or modern, by the fact that whatever the material used it dated itself. One could tell in any modern building when cast-iron fell out of use and wrought-iron came in; and by looking at the saw marks one could tell whether timber had been worked by a circular or straight saw. In that way one could tell within a few years the date when a building was erected. The mark of present-day buildings was that of machinery. The question between employers and architects was largely one of time, and the use of machinery was a question of time—the time of the workmen as well as the time taken to build—and many questions between architects and surveyors were questions of time. If an architect was allowed more time, he would prepare his drawings in detail, and as he (the speaker) used to prepare drawings when he was in his articles; every detail was made and no questions were asked as to any detail in the course of the work. Such details were very important, and if they were supplied to the builder at the beginning he would be able to make his arrangements accordingly; if they were not, there was no time to do what was really necessary if the work was not to be delayed. It was very much the same in regard to divisions of trade; if the client could make up his mind, and give the architect reasonable time to prepare his design, many troubles as to sub-contractors would be avoided.

Mr. E. Dru Drury said that, as to the want of time—the little time which the employer gave them to carry out work—he might mention two experiences he had had, one of preparing designs, specifications, and quantities, and putting up new factory buildings in three months (which showed the difficulty one had to contend with on the ground of time); and the other where the ample time of six months was given to rebuild certain premises. As to the British workman, he was thoroughly in favour of the workman combining for his own protection. That was what every one did, even architects and surveyors. But the objection to trades-unions was as to unwritten laws, and any one who knew anything of the unions knew that there was a great deal of that. It had been said that a bricklayer now would lay 470 bricks per day, which was a very liberal estimate. He had been assured that by a building surveyor and foreman that it was a good result for a bricklayer to lay 400 bricks, but that he could easily

lay 800. Of course, the bricklayer would tell them that in laying 400 bricks he had lifted so many tons, and that he ought not to lay more; but was that to be the standard for all? What appeared to him to be the evil was the levelling-down principle of trade unionism. As mentioned by Mr. Blashill, the average workman had no incentive to do his best and there was no doubt that that was perfectly true. Architects, surveyors, and others, when they were article'd, looked forward to the time when they would become principals, but the British workman was condemned by the unwritten law of trades-union to keep down to the level of his less capable fellow workmen, notwithstanding what Mr. Taylor might say. There had been a great falling off in apprenticeship, but there appeared to be a desire for a reintroduction of the system. In the *Times* some time ago eleven secretaries of trade societies wrote advocating apprenticeship in order that craftsmen might properly learn their trades and remarking that technical schools, though very well in the way, did not supply the want; they were not within reach of the great majority of young men serving their time, but they were very good adjuncts to apprenticeship. A gentleman of his acquaintance was asked recently to talk the surveying class at a technical school, but he refused when he heard that the object was to turn out young men so that when they had gone through their course they would be able to take surveyors' places. That gentleman had served three years as an article'd pupil, without pay, in an architect's office, and he did not think it desirable or possible to turn out young men in three months to compete with full qualified gentlemen.

Mr. W. Shepherd said that, from a contractor's point of view, he could hardly appreciate Mr. Blashill's desire for more consideration to be shown to the client or employer. In his experience, and it was not slight, the employer was the source of much trouble in regard to building contracts. As a rule, the client knew pretty well what he wanted and how much he was prepared to spend, but in nine cases out of ten the client's ideas of cost were altogether inadequate, and the architect was in an impossible position when asked by the client to give an estimate as to cost. It was a very difficult thing for an architect to estimate the cost of buildings, however great his experience might be, and in his opinion every job had its own price, and it was not possible to adopt any rule of thumb for arriving at the value of a particular building. In many cases the amount of the tender was in excess of the amount the client was prepared to spend, and the architect had to modify his design in order to come within the limit of cost imposed by the client, and very often things were taken out from the design which had subsequently to be re-introduced. All this indicated the difficulties which arose in consequence of the action of the client. He did not think that Mr. Blashill recognised to the full extent the importance of the quantity surveyor, and he thought that with our modern methods, the quantity surveyor was a necessity, and endeavoured to do what was just to all parties. He agreed with every word that Mr. Rickman had said as to the building surveyor being more fitted to act as arbitrator in building disputes than any other professional man who had to do with building. As to the possibility of doing away with sub-contractors, or to the inconvenience of them, he thought the word "sub-contractor" was a misnomer: what was meant was the specialist. As had been said, the question of time had much to do with this, and if the client gave the architect sufficient time to show clearly everything that was required for the completion of the building, it would be to the client's interest to let the general contractor deal with these specialists. He was positive that the specialist got an enhanced price when the architect went direct to him, and he knew practically there was to be no competition. In regard to the labour question, he was very much interested in Mr. Taylor's speech on the last occasion. He thought Mr. Taylor was to be complimented on his candour, and from the labour point of view there was not much to be found fault with in Mr. Taylor's remarks. It was within his, the speaker's, knowledge that Mr. Taylor was appointed to settle a dispute between two trades as to who should do certain work, and Mr. Taylor, a bricklayer by trade, decided the case against the bricklayers, and brought a good deal of trouble

upon himself in consequence. To a certain extent Mr. Taylor dissociated himself from the collective opinion of his class, and altogether of much exception could be taken to what he said, although he seemed to rely upon his imagination in one or two cases. In fact, the speaker, did not think there was any deep-laid conspiracy on the part of the men to diminish the output or to do the minimum of work. The trouble was not due to that at all, and if the matter were looked at carefully the trouble would be found to be due to collectivism. As to what Mr. Taylor said about it being customary, on works where he had been, for the younger men to take a longer stretch so as to help the older men, if Mr. Taylor meant that that was at all general he felt that that was not according to fact. He remembered when there was practically but one trade-union, and that was the Operative Stone-masons, which was not instituted for the purpose to which modern unions applied themselves. In its early stages it was simply a benefit society, and so far it was a useful institution. It was, he believed, in 1858 or 1859 that the funds of this society were applied, on the occasion of the great lock-out, and a few years before, at the building of the Houses of Parliament, in an endeavour to get a rise of wages. If a member of the Masons' Union had been promoted from banker to fore-man, he received a notice in those days from the society that he was not to attend any of the lodge meetings; but it was otherwise now, for societies such as the Bricklayers', Plasterers' and Joiners' endeavoured to force foremen into their ranks, so as to have them under their control; and if a foreman exercised any preference in giving employment to competent workmen he was a marked man in his society. He (the speaker) had known many instances of a foreman being summoned to his lodge and fined because he was exacting more work than what was considered to be right. How all this was to be altered he did not know, especially as now, in the case of building contracts for Public Authorities, it was a condition that the workmen were to be paid trades-union rates, and the employers were to be those recognised by the unions. That meant that every incompetent man employed on a work got the full rate, and while that was so, what incentive was there to man to excel either in the quality of workmanship or the amount he did?

Mr. Arthur Vernon said there were three important points which he would like to refer to, and which he would put in the order of their importance, the first of which was the relation of capital to labour. Most of them had had painful experience of labour troubles, and they could not feel that some of Mr. Taylor's views were consistent with the facts. There was something entirely wrong with the present state of labour. John Stuart Mill said that he did not believe that the labouring masses would ever be content to work for wages, and he remarked that the great drawback was that the workman tried to get all he could for as little labour as possible. The remedy, Mill thought, was some form of partnership, either with capitalists or among themselves. That was the great problem that had to be worked out by public opinion and necessity. What we had to do was to see that men were not limited in their output, and were not dragged down to the common level, but each left free to earn what he could. That seemed to be the only solution in our country, of the problem of the condition of the labour market. Trades-unions, such, could not be objected to, and he saw no harm in them, for he sympathised with any arrangement that made for the well-being of the labourer. With regard to the rapid increase of cost in buildings in the country as well as in London, that was a national calamity, for it obstructed general progress. Some cottages for labourers he had built in the country a good many years ago cost from 6d. to 6½d. per cubic foot. Exactly the same buildings erected to fit the modern by-laws cost from 6d. to 8d. per cubic foot. That increased cost was due to a rise of about 20 per cent. which could be equally divided between capital and labour, and so to the local by-laws, which were absolutely unnecessary in country districts in many cases. As to the relations between architect and employer, he would like to remind them that nine out of every ten buildings erected gave rise to trouble, and it was only the difficult cases he heard of. In the great majority of cases employers, architects, and builders got on very well indeed, and with very little friction. In

forty years' practice he had never had a suit at law with either builder or employer, though he had been very near it once or twice.

The Chairman, in closing the discussion, said they were greatly indebted to Mr. Blashill for his admirable paper and to those gentlemen who had taken part in the discussion. He believed that the paper and the discussion would be of value to the building trade and the Institution.

Mr. Blashill, in reply, said he would have been glad to have had more discussion from the workman's point of view and from workmen. He had tried to treat the whole question as a question among colleagues, because not one of them connected with the industry could easily be dispensed with, and all should work together with as little friction as possible. He had been misunderstood to say that he thought the quantity surveyor should write the specification. He thought the quantity surveyor would write a more logical document, but that the architect would know best what ought to be put into it. As a matter of fact, the architect ought to write the specification, and not trust to the quantity surveyor for it. He still thought that builders ought to be encouraged to do the ironwork in a building, because architects could get it tested just as well as they could test timber. Mr. Mann had asked how he (the speaker) would ascertain the proper prices to settle up the account. That was a difficult matter, because the builder did not like the prices in the tender to be seen by the architect. It had been his practice to have left to his judgment the settlement at the end of the prices, in contracts, for extras and additions; but every builder would not be satisfied with that arrangement. On the other hand he thought it was quite inadmissible, as a matter of business, to leave it entirely to the builder, because even if the builder did not intentionally go wrong in the prices, there was the liability of mistakes. Why should not the quantity surveyor be allowed to look through the prices? As to labour, he did not see how Mr. Taylor made it out that there was any relation between the increase of wealth of a country and the labour of individuals; but it was a very difficult question to deal with. We should get into a fog if we made any comparison between the two things. Mr. Taylor's account of the conduct of the workmen was fair on the whole, although it reminded him of the historic complaint of a man who was convicted of some crime by two men who had seen him do it, although he could have brought forward in his defence twenty men who had not seen him do it! The fair workman may not always see the things done that were complained of, but he was afraid many of those things were done. Mr. Taylor threw some doubt on the statement which had been quoted from Lord Brassey's paper, as to some work which should have cost 2½s., but which actually cost 5s. He (the speaker) ought to have mentioned that Messrs. Lucas, for whom the work was done, gave full particulars at the time that they gave their statement. The work was for the railway station, with hotel buildings, at York, and there was no doubt that what the firm said was perfectly fair. As to the diminution of the work, no one suggested—certainly no one could prove—that the trades-unions did directly, by written law, advocate the diminution of work. But that was not all. A builder had written to him saying that during the last ten years the increased cost of labour had been from 75 to 100 per cent., and that accorded with information from various sources. If the increased cost of labour had been so much, and the increased cost of wages only 10 per cent., where had the remainder gone? No one seriously denied that there was loitering of some kind, and if there had been any one ready to deny that, he should have been prepared with a good deal of evidence. Any one interested in the subject he would recommend to read the works on Trades-Unions and on the Social Democracy by Mr. and Mrs. Sidney Webb, which dealt very fairly with the subject. They mentioned the system of working slowly, and they mentioned it to blame it—it was called in the north "going canny," i.e., going cunning, or shifty; and the existence of a thing that had a name could not very well be denied; and it was thoroughly well known to exist. This sort of thing was reprobated by Henry Fawcett, who referred to it in strong terms in his "Political Economy." He said: "These restrictions [upon work] can on no grounds be defended," and he went on to say:

"A much greater wrong is caused by preventing men following the employment they have selected. There is no right to which all men and women have a more indefeasible claim than that of an absolute freedom to follow those pursuits in which they are best qualified to succeed. The laws of a free country ought to secure to every one this right, for if it is denied, individual freedom ceases to exist." He (the speaker) thought that apprenticeship might have been dealt with a little more in the discussion, especially as there were people who had great belief that the system would be revived, and that well-conducted boys would work three or four years in shops and become competent workmen. He hoped it might be so. As to a system of partnership for the men, why did not the men develop something of the kind? If workmen did not like the existing system, they were not bound to it, and if they thought they could work better in co-operative partnership, why did they not do so? No client, architect, or surveyor—and, he should think, no builder—would be afraid of such a thing.

The Chairman announced that the next meeting will be held on April 15, when Mr. Walter C. Ryde will read a paper on "The Rating of Public-houses."

The meeting then terminated.

BUILDING BY-LAWS IN RURAL DISTRICTS.*

A DEPUTATION appointed by the Council of the Royal Institute of British Architects waited on Mr. Grant Lawson, Parliamentary Secretary to the Local Government Board, on Tuesday, the 12th inst., to lay before him the views of the Institute on the question of administration of building by-laws in rural districts, which had already been expressed to the Local Government Board in October, 1899, when Mr. T. W. Russell received the representatives of the Institute.

The deputation consisted of the following gentlemen:—Mr. W. M. Fawcett (Past Vice-President), Professor T. Roger Smith (F.), Mr. Lacy W. Ridge (F.), Mr. H. D. Searles-Wood (F.), Mr. E. Guy Dawber (A.), and Mr. W. J. Locke, Secretary.

The points submitted to Mr. Grant Lawson had been summarised as follows:—

1. That there has been of late a great increase of interference by public bodies and their officials with buildings in country places.
2. That this has arisen from the Local Government Board having permitted, and in fact encouraged Rural Authorities to take to themselves "urban powers."
3. That such an assumption of powers by a local authority is an unnecessary and vexatious infringement of the liberty of the individual subject.
4. That it is undesirable, except perhaps in public buildings, that Local Authorities should relieve private persons from their responsibility for the soundness and sufficiency of their building construction.
5. That there is no desire on the part of the Royal Institute of British Architects to limit the application of such by-laws as are strictly sanitary in their object.
6. That there is no objection to by-laws as to the width of streets being generally applicable, as they would remain inoperative while a district remained rural.
7. That a complete and efficient by-law as to party walls would sufficiently protect each individual from the danger of fire from his neighbour's premises in country places, in uncrowded districts, and wherever streets are laid out with the width and spaces required by the by-laws.
8. That in such places the minute requirements of the by-laws against fire, founded as they are on the legislation originally passed for overcrowded London after the Great Fire, are unnecessary and vexatious. They are frequently rendered grotesque by the erection of large structures in wood under the form of balconies and verandahs.
9. That the Local Authorities are practically dependent on the Local Government Board for assistance and direction in framing by-laws.
10. That the scheme of the R.I.B.A. is that the Local Government Board should arrange their model by-laws in divisions, and sanction in each district only such as are really needed therein, and so protect the public from vexatious interference in building.
11. That this is a matter to be met wholly by administration within the Board, and does not require legislation.

R.I.B.A. Suggestions for Legislation.

1. That the system for dealing with party walls

* Extracted from the "Journal" of the Royal Institute of British Architects, March 23, 1901.

by the appointment of three surveyors as re-enacted in the London Building Act, 1894, has proved successful during a long period.

That it is desirable that it should be extended to the growing suburbs around the districts of the London County Council, to such towns as are without special legislation on the subject, and to England and Wales generally.

2. That it would be desirable to establish a tribunal of appeal in connexion with the Local Government Board for settling differences which arise as to the meaning of by-laws and building regulations.

That to be of value the tribunal must act with speed and have technical knowledge.

Mr. Grant Lawson, replying to arguments in support of the above points, said that both the President of the Local Government Board and himself were agreed that evils did exist in the present system of administration of building by-laws, and that there should be a difference in the codification of by-laws for rural and for urban districts. The proposals of the Royal Institute had received careful consideration, and since the appointment of Mr. Walter Long and himself efforts had been made as far as possible to adopt them. Mr. Lawson first desired to point out that it was not the function of the Local Government Board to take the initiative in the question of district by-laws; the Board only approved by-laws submitted to them by Local Authorities. It was not in the power of the Board to compel a Local Authority to adopt any particular set of by-laws. As regards encouraging local bodies to take "urban powers," the Board only did so in cases where very insanitary conditions rendered such a course desirable. With regard to meeting the views of the Institute, the Board had drawn up a set of proposed model by-laws for Rural District Councils, on which he invited the opinion of the Institute. These by-laws were scheduled as follows:—

- (a) Interpretation of terms.
- (b) Exempted buildings.

(c) Structure of walls and foundations of new buildings for purposes of health. With respect to the sufficiency of the space about buildings to secure a free circulation of air, and with respect to the ventilation of buildings.

(d) With respect to the drainage of buildings.

(e) With respect to water-closets in connexion with buildings, and with respect to the keeping of water-closets supplied with sufficient water for flushing.

(f) With respect to earth-closets and privies in connexion with buildings.

(g) With respect to ashpits in connexion with buildings.

(h) With respect to cesspools in connexion with buildings.

(i) With respect to the closing of buildings or parts of buildings unfit for human habitation and to the prohibition of their use for such habitation.

(j) As to the giving of notice; as to the deposit of plans and sections by persons intending to construct buildings; and as to inspection by the Council.

(k) Penalties.
(l) As to the power of the Council to remove, alter, or pull down any work begun or done in contravention of the by-laws.

(m) Repeat of by-laws.

Mr. Grant Lawson pointed out that these proposed by-laws were mainly sanitary in their application, and that regulations as to materials and structural details were omitted.

With regard to the request of the Institute for an extension by legislative means of the party-wall system in London to all districts in England and Wales where no special legislation existed, Mr. Lawson said that he could not promise any action this summer, but he would add the subject to the list of Bills which the Local Government Board hoped to introduce at some period during the continuance of the present Government.

The deputation having thanked Mr. Lawson for the courteous action of the Local Government Board in submitting the draft model by-laws for the consideration of the Institute, and

also for the sympathetic manner in which he had received them, then withdrew.

The questions are now before the original committee of 1899, who are preparing a report to the Council.

OLD HOUSES, CRIPPLEGATE, E.C.

ADJOINING the north side of St. Giles' Church, Cripplegate, is a group of old buildings which will probably soon be pulled down. The sketch shows the frontage towards Fore-street. On the right is the entrance to the churchyard of St. Giles' Church, the spandrels of the arch ornamented with an hour-glass and scythe on one side, and a skull and cross-bones on the other. Two hour-glasses are placed as a finish to the pediment, and on a panel below are the names of the churchwardens—Edward Dobson, John Clarke, Isaac Bennett, and Thomas Comry—and the date, AN. DNI. 1600. Eastward are four houses, known as the "four shoppes," with a bay window of two stories to each. The shops themselves have been modernised, and the windows in the bays have been altered. Eastward again is the arched passage leading to the north porch of St. Giles' Church. This forms part of the Quest House, which is partly built over it. Beyond is the chance of the church, now exposed by the demolition of some buildings eastward. The "shoppes" have a quaintly gabled frontage towards the churchyard constructed almost entirely of wood.

SANITARY OFFICERS.—The Local Government Board have sanctioned the appointment of Dr. W. A. Bond, Medical Officer of Health of Holborn, and of Dr. J. J. Allan, Medical Officer of Health of the City of Westminster. They have also sanctioned the appointments of the following sanitary inspectors in the undermentioned Metropolitan Boroughs:—Mr. J. Johnson, Poplar; Mr. W. J. Storer and Mr. E. J. Dillon, St. Pancras.

WESTMINSTER ABBEY.

At Carpenters' Hall, London Wall, E.C., on Thursday last week, Professor T. Roger Smith, the Master of the Carpenters' Company, gave a lecture upon "Westminster Abbey." The chair was taken by Mr. A. Preston, who mentioned that it was eighteen years ago since he brought forward the proposition to hold these lectures, and they had been held continuously ever since. Their success was largely due to the efforts of Professor Roger Smith and the late Professor Banister Fletcher. Professor Roger Smith, whose lecture was illustrated by limelight views, said that a month once asked his guests what they considered the greatest English work of art. The replies were various. One guest suggested Handel's "Messiah," another Turner's great series of landscapes in the National Gallery, and a third mentioned a piece of sculpture. The host, however, disagreed with them, and claimed that Westminster Abbey was the greatest English work of art. He pointed out that its associations were most varied and dear to the English mind, and by its beauty it held a high place among the famous buildings of the world and the highest among those of Great Britain. The early history of the Abbey was lost in tradition, but it was certain that a church stood on the site before the time of Edward the Confessor, who pulled the building down and rebuilt it, so that it was not too much to assert that for considerably more than a thousand years prayers had been offered at this spot. As rebuilt by Edward the Confessor the church covered almost the same ground as it did now, but it was far less lofty. This building was consecrated about 1065, and the other buildings which formed the Abbey itself were erected at the same time, and the church was known as a Benedictine abbey. The taste in architecture changed rapidly and repeatedly between the twelfth and sixteenth centuries, and so complete had the change been between 1165 and the accession of King Henry III. in 1216 that the building had become quite out of fashion. Henry III. commenced to rebuild it in 1220, the rapid growth in architectural taste being a sufficient inducement for him to undertake the task at the time when the work presented far more difficulties than now, and when the cost of the erection was infinitely more formidable. The beginning of the thirteenth century, however, was a great church-building era in Western Europe, men's minds having been stirred by the Crusaders. After the death of Henry III. the work of rebuilding was carried on by successive monarchs, but not with the same energy. Other changes in taste had taken place, and the Abbey showed the effect of them, but not in a marked degree, the heights and proportions fixed in the thirteenth century being adhered to. The lecturer then showed views of the Abbey. The first was a ground plan, and he pointed out where the old gate-house used to stand which was a considerable number of years was used as a State prison. The next views depicted the interior of the Abbey from various standpoints—the end of the north transept, which had practically been rebuilt in our own time; the outside of Henry VII. Chapel, which possessed great interest as being a specimen of essentially English style; the flank wall of this chapel, giving a view of part of the cloister and showing some of the buttresses which support the walls and resist the pressure of the roof; and a view of the avenue in the cloisters where the monks played in order to lighten the tedium of their life. A picture of the Chapel of the Pyx was next shown, and Professor Roger Smith explained that this was the place where the image used to be tested. He said every precaution had been taken in the way of locks, but as an additional safeguard a skin, which was believed to be a human skin, had been placed over the door. Views of the Chapter House were given, with the Jerusalem Chamber, in which the Old and New Testaments were revised. The lecturer then showed views in the Abbey itself—the beautiful transepts, the organ screen, the choir stalls, the altar, the Chapel of Edward the Confessor, the Coronation chairs, and the outside of the special place where in olden times were kept the wax effigies of notable persons which, when those persons died, were taken round the streets as proof of their death. There were still six or seven remaining in various stages of decay, the least decayed being that of Nelson. Views were also given of some of the stuary, which

the lecturer said was sometimes out of keeping with the style of the building, but the Abbey was so lofty and beautiful that these did not have any effect.

A vote of thanks concluded the proceedings.

THE ART OF FRESCO PAINTING IN ITALY.

IN connexion with the Incorporated Institute of British Decorators, Dr. George C. Williamson, the editor of Bell's Handbooks of the Great Masters, delivered a lecture on Monday evening at the Painters' Hall, Little Trinity-lane, City, upon "The Art of Fresco Painting in Italy." The President of the Institute, who was in the chair, mentioned that during the two years since the Institute had been incorporated, the membership had reached 350.

Dr. Williamson said the subject was so vast that he was obliged to omit the early history of fresco altogether. In the first place it was necessary to explain exactly what fresco work was. Fresco buono, or true fresco, was painted upon wet plaster with colours that were mixed with water or lime-water, and there was also fresco secco, which was painting upon dry plaster. Tempera painting in Italy, although not true fresco, was often done. Generally some fluid or gelatinous substance was used with the colours, such as egg, size, or gum. Fresco and tempera painting were very ancient arts; paintings on plaster were found in Egypt, Babylon, Greece, and very largely in the tombs of Etruria, and apparently it was a favourite form of indoor mural paintings. There were certain broad advantages and disadvantages with regard to buono and secco fresco. The disadvantage of the secco was that it would not bear exposure to the weather, and that the colours could be rubbed off; but, on the other hand, it could be painted leisurely. With buono fresco the work had to be done hurriedly, and only a certain portion of plaster was put on at a time, so that the artist could paint upon it before it dried. The painting upon wet plaster was the most lasting, as the colours crystallised with the plaster. There was no true fresco work in England, but there was some partly fresco and partly tempera in some of the ancient churches. In Italy the art assumed far greater importance than it ever did in England, even down to the time of Raphael. In the thirteenth century Giotto was practically the great beginner of the art of fresco painting in Italy. His pictures in Florence of the "Slaughter of the Innocents," "Chastity," "Obedience," and others showed his great ability to tell a story, and his desire to do so clearly by introducing as few figures as possible. The drawing was crude and the figures stiff, but he showed a strong wish to put as much character as possible in the faces. In the early part of the fourteenth century fresco showed a considerable improvement. There was an effort on the part of Orcagna, Altichieri, Fra Angelico, &c., to show the pictorial importance of a picture—a stronger attempt at dramatic power, and an effort to represent all the figures as taking part in the central scene. At this time a good deal of the work was done in tempera. Fra Angelico was one of the greatest painters in fresco work. His "Crucifixion," with the figure of St. Dominic at the foot of the Cross, was full of sweetness and simplicity. His picture of our Lord as a pilgrim, and the representation of the Lord's Supper, which was to be seen in the Convent of St. Mark, were also splendid specimens of the work of this devout artist. The background to his pictures was always a representation of parts of the convent in which he lived and worked. Following him came Masolino, whose picture, "Tribute Money," showed two or three different scenes in one fresco; and Benozzo Gozzoli, who introduced a great deal of colour, and natural objects. Coming down to 1470 we saw more and more tempera work, and the introduction of the classical style. Then about this period it was the habit of rich families to entrust an artist to decorate their private chapels with frescoes. Contemporary portraits were introduced in the pictures, sometimes representing the donors as taking part in scenes which happened hundreds of years before. The golden period followed, commencing with Leonardo, who made the experiment of painting with oil, with a very deplorable result. At this time, also, sketches were first made, and the cartoon, pounce, and stylus were used. Then came the

great Raphael, in whose time fresco work reached its highest point, and next the period of Michelangelo, when pagan art was carried into sacred subjects. Fresco work afterwards deteriorated very much with the Venetians, who simply used it to decorate the outside of palaces and private dwellings, and it became mythical, without detail and without power.

In the course of the lecture views were shown illustrating the work of Giotto, Orcagna, Altichieri, Masolino, Fra Angelico, Benozzo Gozzoli, Lippi, Raphael, Leonardo, Luini, Michelangelo, Correggio, &c.

The Master of the Painters' Company proposed a vote of thanks to the lecturer.

The Bishop of Rochester seconded, and the vote was carried.

WASHINGTON AND ITS NEIGHBOURHOOD.

THE following is the historical sketch of the history of the architectural development of the city of Washington and its surroundings, drawn up by Mr. Glenn Brown, the Secretary of the American Institute of Architects, and referred to in our Note on page 206 ante. We give it as an example for other cities and governments. It will be observed that Mr. Brown comments strongly on the mistakes which have been made through allowing improvements to fall into the hands of isolated persons, each working his own pleasure, instead of proceeding on a broadly defined general scheme:—

"The original plan of the city of Washington was matured by Peter Charles L'Enfant, after studied investigation of the site by George Washington and himself, and after a careful consideration of the existing as well as many proposed plans of the Old World cities. In the preparation of this plan the location of the buildings and parks were mapped out on broad and effective lines, so as to attain harmony as well as utility in grouping the whole scheme into one unit.

Prominent points were selected for the principal buildings and proposed monuments. Stretching from the site of the Capitol to the site of a proposed monument, the broad reach of the Mall was planned, and crossing at right angles to this site was the axis of the Executive Mansion and park. Radiating streets from central points with buildings or monuments at the end of pleasing vistas formed another feature of special beauty. The fundamental idea of the scheme was a dignified, formal, and artistic approach and setting for these principal architectural monuments. The plan does not appear to have been copied from any existing city. The radiating streets and vistas of modern Paris were all devised under the two Napoleons, and L'Enfant's and Washington's plan was drawn in 1791.

The plan of the streets with their noble vistas and the outlines of the park system were executed, and the Capitol and Executive Mansion were built on the sites selected. From this point in the development of the city of Washington to the present day the idea of a general and harmonious scheme seems to have been forgotten, and the landscape of each section of the Mall has been treated as if it were an individual park and had no bearing or effect upon the Capitol, Monument, or Executive Mansion. Although these parks may in one or two instances be beautiful in themselves, the object and end of the original designer has been ignored, and the country has lost the opportunity of seeing one of the grandest architectural and landscape effects which has ever been devised.

The general design suggested buildings on the north and south of the Mall which was evidently intended to be an open space with boulevard ornamented with planting, sculpture, and objects of art similar to the grand openings in Versailles and Fontainebleau, which gives such magnificent views of the buildings and forms such a far-reaching vista of exquisite beauty. Instead of following this grand scheme as devised, our Government buildings in Washington have been located wherever whim, fancy, or local interest dictated at the time of their erection. The effectiveness of vistas on the avenues has been destroyed; the utility, unity, and grandeur of massing or grouping such structures has been ignored, parking destroyed, and the building of noble structures scattered without design or reason. This is much to be regretted, as the money expended

on such buildings could have easily produced unsurpassed effects.

The early Presidents—Washington, Jefferson, and Madison—took an active and painstaking interest in the design of our early buildings, as well as in the general plan of the city. Being cultured men, they in no instance failed to search out and employ the most talented men in the profession to take charge of Government work, and did not fail to insist upon adhering to Thornton's plan of the Capitol, Hoban's plan of the Executive Mansion, and L'Enfant's plan for the city. They did not seek for novelty in details, but strenuously insisted on the execution of the work in accordance with the academic forms of architecture as practised in that day. In after years the buildings and park treatment were delegated to separate individuals, who appear to have thought their own project the only one to be considered, and all unity of effect has been lost. Since the time of L'Enfant we have added to the park system the Riverside Park by reclaiming the flats, the Zoological and Rock Creek parks, and the Arlington estate, on the south side of the Potomac, by purchase.

We now need for Government and municipal service many new structures for Washington City. The old park system is undeveloped except in limited places, and in no instance with reference to the buildings. The new park system is undeveloped, and the sites for contemplated buildings, bridges, and statuary are unselected. The proper grouping of buildings so as to expedite the work of the various departments, to attain prompt and easy communication between departments of the Government in which business requires frequent interchange of duties, is as important as a system of grouping to attain artistic effect. The executive departments should be of easy access to the Executive Mansion and to each other. The various scientific departments should form another group, the courts probably another group, and buildings necessary for the convenience of Congress should be grouped in connexion and harmony with the Capitol.

Now is the time, on the hundredth anniversary of the foundation of the Capitol, to consider the propriety of another plan on which future buildings shall be erected, by which parks shall be laid out so as to enhance the effect and beautify the buildings, and by which grouping of monuments may add to the effectiveness of the whole. Now is the time for a general plan for connecting the park system, as well as devising the broad principles on which all parks shall be treated, which shall have a formal treatment, which shall be treated broadly for river and distant effects, and which shall be treated naturally because of their natural and picturesque beauties. To attain this end we feel that it is necessary to put the method of securing, selecting, and supervising such a scheme in the hands of a body of men eminent in the professions of architecture and landscape architecture, as this work is purely a question of artistic judgment in the departments of architecture and landscape treatment.

The artists of this country have shown themselves capable of producing effects surpassing those of other nations in the temporary work at the World's Columbian Exposition, where the work was laid out and carried into execution by a board of architects, landscape architects, and sculptors. It is a sad commentary on our present methods that we have in Washington no work by the architects, painters, or sculptors who have accomplished work on a par with similar work in other portions of the world. While in the earlier periods of our history the various classes of work in Washington were always represented by the most distinguished men in their various branches, in recent years our men honoured abroad in Paris are unhonoured in our capital city.

By a commission of the character called for in this resolution we would have a body capable of selecting the designs, or the men who would be most capable of producing the effects to be desired.

The opportunity is too great to be cast aside. No country has a building more noble, grand, or beautiful than the Capitol, a shaft more imposing than the Monument, a free space between these buildings greater than the Mall; with such an opportunity to treat it so as to enhance the effect of the Capitol, the Monument, and the Executive Mansion; No country has such a monumental structure as the proposed Memorial Bridge; let this

be located so as to enhance most effectively the treatment of the Mall.

There are few more pleasing bits of landscape than the broad Potomac, stretching south of Riverside Park, with the hills of Virginia and Maryland on either side, with the beautiful colours of foliage in spring, summer, and autumn. How to treat this so as to enhance and emphasise the natural effects is a worthy subject for the highest genius. The National Zoological Park and Rock Creek Park are picturesque in the highest degree. Great skill, as well as a love for nature, requires that nothing should be done to jeopardise their natural beauties, but make them accessible and bring them into view, so they may be enjoyed. The most advantageous methods of connecting these parks needs also careful consideration.

We believe that the ends suggested in this Report can only be attained by the appointment of a commission such as is embodied in this resolution."

CONFERENCE OF AUSTRALIAN ARCHITECTS.

A CONFERENCE of architects was held at Sydney commencing on the last day in December, 1900. The Conference met on December 31, at the Institute's rooms, Vickery's Chambers, 82, Pitt-street, and on the motion of Mr. Edward Davies, President of the South Australian Institute of Architects, Mr. John Barlow, F.R.I.B.A., President of the Institute of Architects of N.S.W., was unanimously elected chairman of the Conference. On the motion of Mr. H. A. Wilshire, Messrs. Thos. Watts, Past-President of the Royal Victorian Institute of Architects; E. Davies, President of the South Australian Institute of Architects; C. W. Chambers, President of the Queensland Institute of Architects; and W. F. Cavanagh, Vice-President of the West Australian Institute of Architects, were unanimously elected Vice-Presidents of the Conference. Mr. A. B. Black, Hon. Treasurer of the South Australian Institute of Architects, moved, and Mr. A. B. Wilson, A.R.I.B.A., Queensland Institute of Architects, seconded, that Mr. G. Sydney Jones be elected Hon. Secretary of the Conference, which was carried unanimously.

The following delegates were present:—From the R.V.I.A.: Messrs. Thos. Watts, W. R. Butler, J. A. B. Koch, D. C. Askew and F. A. Fitts; From the S.A.I.A.: Messrs. E. Davies, A. B. Black, M. S. Clark and Sydney Jackman; From the Q.I.A.: Messrs. C. W. Chambers, A. B. Wilson, R. S. Dods, W. C. Voller and E. M. Myers; from the I.A. of N.S.W.: Messrs. J. Barlow, G. Sydney Jones, G. Allen Mansfield, H. C. Kent, Jas. Nangle and others.

After some formal business had been transacted, the proceedings were adjourned until Wednesday, January 2, when the chair was occupied by Mr. John Barlow, and papers on the "Proposed Federation of Australian Architects" were read by the Chairman and Messrs. E. Davies, C. W. Chambers, and Charles Rosenthal, A.R.V.I.A.

In the discussion which followed, the Chairman said that it was for the meeting to determine whether the Federation of Architects proposed was to take the form of a Federal Council or a Federal Institute.

Mr. A. B. Wilson said a very good suggestion had been thrown out by Mr. Rosenthal that Commissions should be appointed, although it seemed to him that they must not go too fast in this matter, but must feel their way carefully. The idea of a central institute was also a good suggestion. The speaker found that the best return he could get for his subscription to the R.I.B.A. was a copy of the Transactions, as it gave one an idea of what was being done in Great Britain, and information could be obtained by this means which otherwise would be lost altogether. The question of the Federal Council had been occupying their minds for a considerable time, and he would like to know if the Government of New South Wales had in any way recognised the Institute of Architects.

Mr. Watts thought the difficulty would be to bring about this federation. He himself thought it a very desirable thing. All knew that union was strength, and he had found in Victoria, before the Institute had been founded there, that architects were without any influence at all, but as soon as they had formed themselves into a society they spoke with more authority, and brought themselves to bear upon

the Government and all bodies contemplating building. Being separated by such immense distances was, to his mind, the difficulty in their co-operating, for if they did form such an association each colony would have to appoint delegates. However, they were to get united, and make their influence felt and wishes known in the different colonies.

Mr. Askew said when they all became federated they would have to work in all the colonies and not separately, and, therefore, they must have uniform charges. If the council were formed it would be the final court of appeal, and the institute of each state would have to submit to it. He would suggest that representatives from each colony be appointed to thresh the matter out, and report to the Conference at a later date.

Mr. Rosenthal said it would mean weeks and perhaps months of labour before a proper system could be arrived at, but he thought that the question of an Australian Institute should be considered. Let them all bear the same name and be members of the one brotherhood.

Mr. Watts moved and Mr. Chambers seconded:—

"That, in the opinion of this meeting, it is desirable that the architects of Australia form a Federal Institute."

The motion was carried unanimously.

Mr. Tolhurst moved and Mr. Askew seconded:—

"That the chief delegates from each state be appointed by this meeting to form an outline scheme of what is proposed to take before the Conference, for the purpose of submitting the same to the Institutes of the respective states."

Mr. Addison moved the following amendment:—"That one delegate from each colony be appointed to the committee."

The amendment was not seconded, and the motion on being put was carried.

Mr. Chambers proposed and Mr. Davies seconded:—

"That the report of the delegates upon the Federal Institute of Australasia be received on Saturday morning at ten o'clock."

The motion was carried unanimously.

Papers on "The Promotion of Architectural Education and a Travelling Scholarship" were then read by Mr. A. B. Black, on behalf of Mr. R. J. Haddon, Mr. Rosenthal, and Mr. Blacket, F.I.A. of N.S.W. (read by the Hon. Secretary).

On reassembling in the afternoon, the discussion on the question of "The Promotion of Architectural Education and a Travelling Scholarship," was resumed.

Mr. Butler, speaking upon the matter of Federal Scholarships, moved:—

"That this Conference heartily approves of the suggestion to establish a Federal Scholarship, and desires that the Federal Council shall give the matter its first consideration."

Mr. Chambers seconded the motion, which was carried unanimously.

Papers on the subject of "Investigating the Strength of Australian Building Materials" were read by Mr. A. B. Wilson and Mr. Nangle.

Mr. Wilson then moved, and Mr. J. J. Clark seconded:—

"That should the proposed Federal Institute become an accomplished fact this Conference communicate with the Federal Institute asking them to take the question of obtaining information as to the quality of Australian building materials into their early consideration."

The motion was carried unanimously. At the third sitting on January 4, the following paper on "The Conduct of Competitions" was read by Mr. G. H. M. Addison:—

"This Congress has presumably been inaugurated with the one main object of forming an Australian Federal Institute. To help towards this end, it is well that we should exchange views on the general principles underlying those subjects which at an early date will have to be dealt with by the Council of the Australian Federal Institute. Not the least important of these will be the conduct of competitions. It is our misfortune that, owing to our profession having no authoritative recognition, there has been no general body powerful enough to enforce such a high ethical professional code as exists in the legal and medical professions. Nothing seems to me to stand so seriously in the way of the formation of such an ethical code as the lax conduct of competitions. A struggling architect, whose one chance of immediate prosperity is to win an important competition, is too often

aced with this difficulty, viz., that the conditions are such that he must leave the chance untouched, waste his time in a hopeless effort, or adopt means towards success against which his better nature revolts. Probably we have all of us at times been shocked by hearing some of those whose education and professional standing should make them leaders of correct thought, openly excusing doubtful practices in connexion with competitions. This reason, if there were no other, should be sufficient to put the question of competitions in the front rank if those to be discussed by the Federal Council. In this relation the first question will be as to how far the Federal Institute should countenance competitions at all. It is certain that in the past but few first-class architectural results have been achieved by competitions, and few committees or individuals who have since organised a competition are prepared to repeat the experience. This is due primarily to the absurdly loose way in which conditions of competitions are drawn up, but, to a certain extent also, to a defect in the system itself. The competing architect has not a free hand in solving the problem before him, but is subject to restrictions placed upon him by some one who may often be less capable than himself, and who generally will have given much less attention to the question than incumbent on a competing architect. Consequently a design is produced below the full powers of the designer. Competitions, on the other hand, offer the young architect an earlier opportunity of showing his ability than would otherwise be likely to accrue to him, and also have some effect in rousing the older practitioners out of long, successful practice. It will probably be conceded then that while competitions for ordinary buildings should generally be discouraged, for public buildings they are an advantage when wisely conducted, and for such buildings no pains should be spared to gain perfection. Probably the best results could be obtained by having first a competition for plans only, and after paying well for these, issue the accepted plans, with as much criticism as is deemed necessary, in a competition for the completed building. The successful objects in the two competitions might then be appointed conjointly to carry out the work. In any case the aim in formulating conditions could be in the first instance to minimise the work of the competing architects. Whether this best result is accomplished by eliminating perspectives doubtful. Perspectives give the simplest method of showing the real effect of the finished building, which can only be got from plans by a very practised critic. Conditions often fail in their desired object by being precise in laying down under penal conditions the accommodation demanded. In most cases a description of the accommodation required, leaving the architect a free hand in providing it, would lead to better results. The estimating of cost is one of the great difficulties facing the adjudicator, and the results too often lead to disappointment. Fairness to competing architects, the conditions should indicate what method of estimation of cost is to be adopted. A professional adviser appointed by the Federal Institute, whose decision should be final at least regarding the payment of premiums, is an essential stipulation, and it would be well if such an adviser revised the conditions before they were issued. The question so often raised regarding the states of the right of civil servants to compete does not seem to me an important one. To enter a competition may be looked upon as tantamount to applying for the work, which no other service should be a bar, in the case of Government work, however. It is clear that no Government servant, by his position, has a knowledge of the preliminary work done in connexion with such a competition would feel justified in competing above points, which seem to me the most content, I have merely touched upon. I content, in that in such a gathering as this, and in a short time at our disposal, we cannot hope to more than express our opinions on main principles, leaving details for discussion in smaller committees. The practical suggestion in which I will close is that the Federal Institute carefully lays down principles on all points necessary to satisfactory conditions of competition. That it then be insisted upon that conditions for any competition be submitted to the local Institute and be endorsed by them as satisfactory, embodying those principles, before members of the Institute shall

compete. It must not be forgotten that competitions are impossible if architects will not compete, and by loyalty to each other we can soon remove all the evils of the system that are capable of removal."

Mr. Clark said he was not prepared at that juncture to enter into a discussion on the question of competitions. His general experience, which might embrace half-a-dozen Government competitions, had been that the work was always thrown away. If they could in some way or another touch upon the principle of the Government giving the work out, as proposed by their President, to architects, it would seem to him to be the only method of meeting the case effectually.

Mr. Butler thought it was hopeless for them to enforce any rules with regard to the conduct of competitions, and that it was best for them to follow exactly on the lines of the British Institute of Architects.

Mr. Askew moved, and Mr. Tolhurst seconded:—

"That one of the first matters to be dealt with by the Federal Council be the consideration of drafting conditions of competitions, especially with relation to the designing of important Government works."

The motion was carried unanimously.

On resuming the sitting in the afternoon, papers were read on "The Question of the Amount of Work carried out by State Governments to the detriment of Architects in Private Practice" by Messrs. A. B. Black and William Kenwood, R.I.A., N.S.W.

Mr. Butler thought the cause of the present state of things was largely because in the early days there were very few skilled architects in the colonies, and the sooner they could formulate their Federal Institute, train their men better, create a School of Architecture, and show the Government that they could do work better than the Government, they might be able to do more with the latter.

Mr. Clark moved, and Mr. Askew seconded, and it was agreed: "That it be an instruction to the Federal Council of Australian Architects to bring under the notice of the Federal Government the advantages of distributing the Government buildings throughout the profession instead of being confined exclusively to the Government Departments."

At a subsequent sitting a letter was received from the Builders' and Contractors' Association of New South Wales advocating uniform conditions of contract.

Mr. Cavanagh thought the suggestion was an excellent one, and he moved: "That the letter from the Builders' and Contractors' Association be acknowledged, and it is recommended that it receive the early consideration of the Federal Council." The motion was carried unanimously.

The Committee's report as to the formation of a Federated Institute of Australian Architects read as follows:—

1. It having been decided that the various State Institutes combine under federation, the delegates suggest that the Federated Institute be named "The Institute of Australasian Architects," and that steps be taken to obtain a Royal Charter entitling the use of the prefix "Royal."

2. Delegates suggest that the expenses of management of the R.I.A.A. be met by a percentage of the subscriptions collected by the State Institute.

3. That a committee of five members of the Institute of Architects of New South Wales be appointed by the delegates to draw up rules, regulations, and code of by-laws, and submit to the several Institutes for approval or amendment as soon as possible, and that any amendments or suggestions made by any Institute be submitted to each of the other Institutes for consideration, and returned by them in due course to the Federal Committee.

4. The objects to be:—

(a) The advancement of architecture.
(b) Uniformity of Australasian practice.
(c) Examination of applicants for membership after six months from incorporation.
(d) The general settlement of all matters affecting the mutual actions of State Institutes.

It was agreed that Clause 1 be passed.

A short discussion was entered into on Clause 2 regarding the payment of subscriptions, it having been suggested that the fee be *per capita*.

Mr. Black moved and Mr. Cavanagh seconded:—

"That Clause 2 be amended to read as follows:—'Delegates suggest that the expenses of management to the Royal Institute of Australian Architects be met by a levy *per*

capita of the subscriptions quoted by the State Institute.'"

The amendment was carried unanimously. Mr. Askew moved and Mr. Rosenthal seconded:—

"That Clause 3 be amended to read as follows:—'. . . and that the committee above mentioned be composed of Messrs. J. Barlow, Kenwood, and Jones, of the Institute of New South Wales, and two other members to be nominated by the Council of the New South Wales.' This was agreed to.

Mr. Cavanagh moved an amendment to Clause 4 (Section c), to read as follows:—

" . . . but that the Council be allowed to waive the examination in the case of any architect whose work may be of such a nature in their opinion as to entitle him to be admitted to the privileges of full membership."

The Chairman said it would be an insult to men coming from England and America to ask them to submit to any examination of any kind.

Mr. Cavanagh thought a man should be compelled to reach a certain standard before he could become a member. This was what they required to give them the standing in the eyes of the public that they should have.

Mr. Kenwood was sure that on the present occasion they were trying to elevate their profession, and if they were going to elevate their profession they must do it by examination. He certainly believed that they would not have to submit all their Fellows at the present time to that means, but in the future every one would have to undergo an examination.

Mr. Rosenthal agreed with the system of examination, and said that it might never occur that a man from England or any other part of the world would be asked to submit to this examination.

The motion was carried unanimously.

Mr. Addison moved an amendment to Clause 4 (Section d), which was seconded by Mr. Black:—

"That each Institute in the federation be allowed to enjoy the fullest measure of self-government subject only to the fiat of the general body in all matters affecting the welfare of the profession generally." This was agreed to.

It was moved by Mr. Butler, seconded by Mr. Askew, and supported by Mr. Chambers, that the following be an addenda to Clause 3:—

"That the Committee appointed to draw up the draft regulations for the formation of the R.I.A.A. be named the Federal Institute Committee, and that it be asked to arrange for an Inter-State Conference of Architects in Melbourne at the time of the opening of the first Federal Parliament and submit draft regulations to that meeting." This was also agreed to.

Mr. Tolhurst moved, and Mr. Addison seconded, and it was agreed:—

"That the President and Secretary, with power to add to their number, be requested to prepare and present an address to His Excellency the Governor-General expressing all the sentiments embodied in the draft address herewith."

At the conclusion of the proceedings a vote of thanks was passed to the Chairman.

Mr. Cavanagh, on behalf of Western Australia, referred to the splendid way in which they had been treated, and congratulated the Institute of Architects in New South Wales for doing the greatest action that had been done yet in connexion with the profession of architecture in Australia. They had started to erect the profession of architecture on a sound basis, and hoped to establish it in Australia even on better ground than they had in the United Kingdom.

Mr. Barlow thanked them heartily for the warm manner in which they had recognised the work which the Institute of Architects of New South Wales had done.

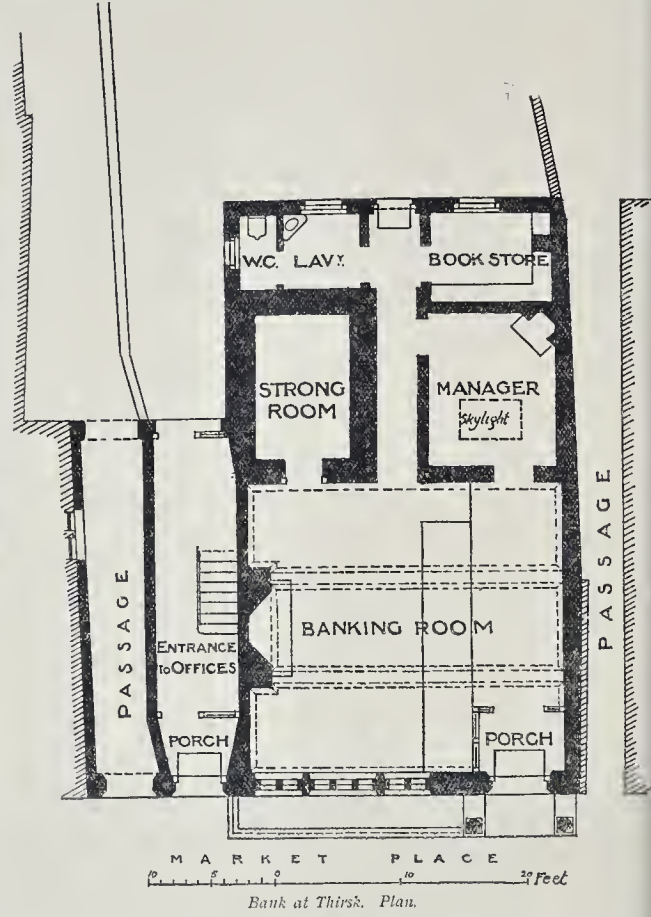

After votes of thanks to the honorary secretary (Mr. Sydney Jones), the proceedings closed.

On Thursday, January 3, the Institute of Architects of New South Wales gave a banquet in honour of the delegates to the Conference of Architects. The function was held at the Café Français, Mr. John Barlow being in the chair.

[We are indebted to the *Building, Engineering, and Mining Journal* of Sydney for the above report of the proceedings of the Conference.]

Illustrations.

PUGIN STUDENTSHIP SKETCHES.

THIS sheet of sketches is reduced from one of the frames of drawings sent in to the Institute of Architects by Mr. H. W. Cotman, who gained the Pugin Studentship this year.

In regard to the sketches Mr. Cotman writes:—"This sheet of drawings indicates the variety of work submitted by me in this competition last year. I think nearly every pencil sketch I ever did went in, except when both sides of the paper were sketched on and one had to be sacrificed.

The doorway at Audenarde, of which the lower part is represented at South Kensington (and also at the Crystal Palace), is by Paul van Schelden, 1531. The upper part is rather coarse and out of keeping with the rest, which is exceedingly refined and playful in detail. The children's figures are beautifully proportioned. There are doors in each of the three sides opening into the council chamber.

The Italian chimney-piece is in the South Kensington Museum. The supporting men under the brackets are rather weak, being on tip-toes. The detail is curiously fanciful and in bold relief.

The little walnut table is one of the most interesting things in the woodwork corridor at the South Kensington Museum.

The west front of Wells Cathedral, the result of a week end trip, needs no comment." Mr. Cotman is quite right as to the variety of his sketches. They formed, when all exhibited together, a collection very noteworthy in this respect.

PRESBYTERIAN CHURCH, NEW HAVEN, CONNECTICUT.

THE exterior of this church is designed in Italian Renaissance; it is finished in granite and limestone, with pressed buff brick; all cornices and the lanterns of the towers will be of copper.

The basement, which is entered by two doorways in the tower, has a large vestry, room, reading-rooms, &c., connecting directly with the Sunday schoolroom on the rear of the lot.

The audience-room is without gallery, and great attention has been given to studying out the details of all parts of the interior treatment. This room has an inclined floor, and will seat 700 people.

The organ is also of special design, by the architect, Mr. F. R. Comstock, of New York City.

NEW TOWN HALL, HITCHIN.

We give a view and plan of this pleasing little Town Hall, which has been carried out from the designs of Mr. G. Lucas, of Hitchin (who obtained the commission as the result of a competition), with Mr. E. W. Mountford as consulting architect.

In the design the main object was to bring the building into line with such fine houses as the old Brewery House in Sun-street, or the smaller houses of like character in Bridge-street, as well as others about the town. In this way the work was kept as inexpensive as possible for a building of this size and importance, and it was hoped to bring out a note of harmony between the old and the new, suiting the building to its surroundings. The roof is carried by steel trusses, which do away with all thrust, and reduce the load to a dead weight.

The body of the hall provides for fifteen rows of twenty chairs each, and fifteen rows of benches each with twenty-two seats. The gallery has six rows of benches, each providing twenty-four seats, and two smaller ones, giving a total capacity of 780 seats, exclusive of stage and standing room.

The following is a list of the various firms engaged in the building, or from whom articles were obtained:

General contractor, Mr. S. Rodhouse; mason's work, Mr. James Pepper, Hitchin and Shefford; bricks, Messrs. Wheatley, Henlow; steel roof trusses, Messrs. Drew, Bear, Perks, & Co., London; roof tiles, Mr. A. F. Love, Sandy, Beds; plasterer, Mr. Thomas Walker, Arlesey; gas-fittings and general ironmongery, Mr. George Redhouse, Baldock;

heating apparatus, Messrs. C. Kite & Co., London; stoves, rain-water heads, gas pedants and brackets, Messrs. T. Elsley, Limited, London; ornamental plaster work, Mr. Gilbe Seal, London; iron casements, Messrs. Crittal & Co., Braintree; plumbing, lead-glazing, and glass domes, Messrs. Jenkin, London; lavatory fittings, Messrs. J. Tyl & Sons, Limited, London; iron railings and chains for hall, Messrs. Galward & Son, Limited, Hitchin; tiles for fireplaces, Messrs. M. Van Straaten & Co., London; speaking tubes, Messrs. Sheath Bros., London; door furniture and panic bolts, Messrs. Charles Smith & Sons, Limited, London and Birmingham; glazing in yard, Messrs. Rendle & Co., Limited, London; asphalt for flats, Val & Travers Company, London; gallery seats and fittings in cloakroom, Mr. Joyner, Hitchin; benches for hall, Mr. Taylor, Luton; curtain throughout, Mr. F. W. Phillips, Hitchin; incandescent gas bye pass supply, Mr. W. I. Phillips, Luton.

TWO COUNTRY BANKS.

THE Bank at Thirsk for the Yorkshire Banking Company, stands on the east side of the old-fashioned market-place. It is built of Portland stone, with a red-tile roof. There are two suites of offices, which are let off on the first floor, and the caretaker-rooms over.

The contractors were:—Masons, Messrs. Wm. Nicholson & Sons; plumbers, J. Lindley, plasterer, T. Moore; tilers, Messrs. Watson & Worsnop—all of Leeds; and joiner, J. D. Rucroft, of Thirsk. The Bank panelling and fittings, which are of walnut, were made by Christopher Hodgson, of Northallerton.

The bank at Hunslet is a small branch of the Yorkshire Banking Company in the busy manufacturing district of Leeds, and distant

about a mile from the head office. The front is constructed of Ancaster stone and purpose made brick. The banking premises occupy the whole of the ground floor, and the rooms above form the caretaker's house.

The contractors were: Brick and stone, Messrs. Wm. Thompson & Sons; joiner, Mr. Banks Mawson; plumber, Mr. George Thompson; and plasterer, Messrs. Mountain & Sons.

Messrs. Bedford & Kitson, of Leeds, were the architects for both the buildings.

COMPETITIONS.

HOLBECK'S NEW LIBRARY, LEEDS.—The competitive plans for a new branch library in Holbeck were recently exhibited at the Leeds Art Gallery. Most of the eleven competing architects have introduced a tower or turret into the design. In the first premiated design (Mr. W. Bakewell's) provision is made on the lower ground floor for a boys' reading room, with attendants' and store rooms. Above there is a general reading room with an area of 2,036 square feet, and adjoining it a lending library (790 square feet), a ladies' room (310 square feet), book store, and librarian's room. The book accommodation is for 15,000 volumes, with the possibility of extending that limit by means of a gallery to 27,000 volumes. The second premiated design was by Messrs. Buttery & Bird.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The seventh ordinary meeting in connexion with the Leeds and Yorkshire Architectural Society was held in the Society's rooms, Park-street, Leeds, on the 18th inst. A lecture was to have been delivered by Mr. Francis Bond, but that gentleman being unable to be present, the business was purely formal, and comprised the election of the following officers for the coming session:—President, Mr. T. Butler Wilson; vice-presidents, Mr. C. B. Howdill and Mr. R. Wood; hon. treasurer, Mr. W. H. Thorp; hon. librarian, Mr. W. H. Beavers; hon. secretary, Mr. H. S. Chorley; Council, Messrs. F. W. Bedford, G. F. Bowman, A. E. Dixon, A. Hill, S. D. Kitson, and W. G. Smithson. Messrs. H. Ambler and H. E. Illingworth were elected hon. auditors. The prize drawings from the Royal Institute of British Architects were on view.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On Saturday morning last the members of this Association journeyed to Kirkcaldy, where they visited the Victoria Cabinet Works, permission for which had been granted by Messrs. A. H. McIntosh & Co. The party was under the leadership of Mr. George Ferguson, who explained the various processes and machinery. In the afternoon the Adam Smith and Beveridge Memorial Halls were visited by permission of Mr. W. L. Macindoe, Town Clerk, where Mr. James B. Dunn, the architect, acted as leader and described the different parts.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—At the meeting on the 20th inst.—Dr. W. de Gray Birch in the chair.—Mr. Patrick, Hon. Secretary, read some notes of a discovery made at Lancaster on the 13th inst., communicated by Mr. T. Cann Hughes. The discovery consists of two urns, probably Saxon. The larger of the two was in a fragmentary condition, but the smaller one is intact. They are both of imperfectly dried clay of a reddish colour, and bear handmarkings. No ashes or coins were found. The urn and the fragments have been deposited in the museum in the Storey Institute, together with a tracing showing the exact spot where they were found. The locality, at the junction of Alfred and De Vitre-streets, is quite a new one, not at all in the centre of the town, but not far from a former site of a monastic establishment. The find is not otherwise important. With reference to the recent quinquenary of the poet Chaucer, the Rev. W. S. Lach-Szyna read an interesting paper upon "Chaucer as illustrating English Mediæval Life." He said there were three great lights illustrating Mediæval English Life—Wycliffe, Chaucer, and Piers Ploughman. The former takes the clerical standpoint as a sort of English Savonarola, denouncing the

vice, dissipation, and coarseness of the upper classes in Church and State in the days of Richard II., and suggesting the reforms which, in his opinion, were necessary. Chaucer takes the more congenial lay view of a satirist and poet. Piers Ploughman raises a jeremiad against mediæval defects and shortcomings, but in characteristic allegorical mode so fashionable in his time. There are many points in which the personality of Chaucer resembles that of Dickens—both are humorists, both have a hearty hatred of humbug and hypocrisy, both stoop to depict the poor and the ignorant, and both have vast powers of description. Chaucer, however, rises to a higher stage of elegance of description, and his imagination is of a far more gorgeous kind than that of Dickens. In Chaucer, we have both the light and shadow of mediæval England; we see tournaments and pageants, fine knights and ladies, in baronial halls and the rough middle-class burgher; the artisan, in his rude humble home, and the peasant emerging from barbarism. The people of England have not really changed much since Chaucer's day; many of us must often have met amongst our private friends a majority of the personages in the "Canterbury Tales." The author considered that a historic lesson was to be learnt from that fact, that although costumes, habits, and fashions might differ, the "john Bull" of the end of the fourteenth century was very like his descendant of the end of the nineteenth. He wished that that lesson could be more enforced in history lessons at our schools, for children are often taught to look on the Englishman of mediæval times as a being quite strange and foreign to the people they meet with at home or in the streets.—An interesting discussion followed the paper, in which Major Frere, Mr. Kershaw, Mr. Compton, Mr. Patrick, and the Chairman took part.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The fourth lecture of the course of six on "Works Management" was given by Mr. A. H. Barker at the Westminster Palace Hotel on Tuesday, 19th inst., Mr. E. King, the Vice-Chairman of the Institution, presiding. Proceeding with the question of the relation of the manager to the various subordinate officials, the lecturer considered in detail the methods of transmitting orders to the works, describing the books necessary in connexion therewith. Systems for dealing with correspondence were treated, the filing of letters, drawings, specifications, &c., being described. Complete and accurate indexing was very essential to success. The duties of the store-keeper were entered into to show their bearing on the proper keeping of the costs accounts. The great desirability of a fair trial being given to new material, devices, &c., which might be brought under the notice of the manager was pointed out. Accurately conducted experiments were, however, imperative, the results to be recorded and tabulated for future reference. The various methods of remunerating workmen for work done were then fully considered, the difficulties of the piecework system being dwelt upon. The premium method needed the exercise of much organising talent on the part of the management, or it would lead to great confusion.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

—The tenth general meeting (business) of the session of this Institute will be held on Monday next, to consider amendments to the Institute form of conditions of contract. The Council, having finally withdrawn from further negotiation with the Institute of Builders, no longer bring forward the amended clauses with a view to securing a uniform form of contract agreed upon by both Institutes; but they submit them to the consideration of the general body; with a view to such amendments being incorporated in the Royal Institute Form of Contract as may be found desirable. As the Council do not propose these amended clauses, they have been printed *in extenso*, including the suggested arbitration clause, for the information of members. We printed the amended clauses in our issue for December 8 last.

GOOD FRIDAY WEEK.—In consequence of the Easter Holidays, next week we go to press a day earlier than usual. All communications for the Editor must reach him by first post on Wednesday morning, except lists of tenders, which will be received up to 10 a.m. of the same day.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Hackney Borough Council 30,000*l.* for electric light installation; the Hammersmith Borough Council 13,530*l.* for electric light installation; the Lewisham Borough Council 1,000*l.* for asphalt paving works; the Stepney Borough Council 5,165*l.* for street lighting; the Lewisham Borough Council 6,000*l.* for library buildings; the Islington Guardians 4,700*l.* for works at the workhouse at St. John's road; and the Stepney Guardians 15,000*l.* for the erection of schools.

Office Accommodation.—On the recommendation of the Establishment Committee, it was agreed:—

"That the estimate submitted by the Finance Committee be approved; and that an expenditure of a sum not exceeding 8,000*l.* be authorised for carrying out the structural alterations for the purposes of connecting the premises Nos. 25, 26, and 27, Cooper-street, with the main building, and of providing additional office accommodation. That Standing Order No. 184, relating to jobbing works, be suspended in order to enable the following recommendation to be considered: That the work be carried out by the Works Department at prime cost, plus 15 per cent. for plant, establishment, and general charges."

Housing.—The Housing of the Working Classes Committee brought up the following paragraph:—

"On February 12, 1901, the Council authorised us to advertise for tenders to be delivered to the Council on 26th inst. for the erection of the dwellings on the Duke's-court site, Drury-lane, for the accommodation of 610 persons of the working classes to be displaced by the carrying out of the Clare Market, Strand, scheme. We now submit the working drawings, bills of quantities, specification, and architect's estimate amounting to 26,285*l.* in respect of the three blocks of dwellings, which will be known as Sheridan, Beaumont, and Fletcher buildings. The architect's estimate is made up as follows:—

Buildings.....	£24,965
Architect's expenses, including articles supplied by the Council and provision for contingencies.....	1,000
Quantity surveyor's fees.....	290
Trial holes (already voted).....	30
	26,285

The dwellings will consist of three blocks of five-story dwellings, which will provide accommodation for 610 persons in 130 tenements, of these ten will be of one room, seventy-five of two rooms, thirty-five of three rooms, and ten of four rooms. One hundred and twenty tenements will be entirely self-contained, and the remaining ten will have private water-closets, but sculleries common to two tenements. We have had before us estimates of the probable receipts and outgoings in respect of the dwellings, and we are satisfied that the erection of the buildings will not involve any charge on the county rate. We propose to hold a meeting to consider the tenders which will be referred to us by the Council for consideration on the 26th inst. This will enable us to submit a tender for acceptance at the same time that the Finance Committee report on the estimate of the cost of the erection of the buildings. We recommend that the working drawings, specification, bills of quantities in respect of Sheridan, Beaumont, and Fletcher-buildings, and the estimate of 26,285*l.* submitted by the Finance Committee in connexion therewith be approved."

Mr. A. L. Cohen pointed out that the charge made by the Guinness Trust was 2s. 1½ per room, while the Four Per Cent. Industrial Dwellings Company charged iron 2s. 6½d. to 3s. 0½d., but in the latter case a bathroom was provided. He contended that, until the Council gave their architect instructions to prepare plans for houses which would allow of a rent of 2s. a room being charged, the difficulty would never be solved. He moved that the Report be referred back, so that fresh plans might be prepared which would allow of the classes being housed whom it was their duty to house.

Mr. Campbell seconded the amendment. Dr. Collins said the rents to be charged by the Council were from 3s. to 4s. for one room, 6s. to 6s. 6d. for two rooms, 8s. to 8s. 6d. for three rooms, and 10s. to 10s. 6d. for four rooms.

Mr. Bruce said that the two sites cost 80,000*l.*, and had to be written down by the Finance Committee for housing purposes to 9,600*l.*

Mr. Beachcroft said the question was not what they charged per room, but the fact that

the Council very rightly and properly prevented overcrowding in the dwellings, and compelled people who would otherwise take two rooms to take three rooms instead. It seemed to be foolish to write down the value of the site and then to make it appear that no charge would fall on the rates, by charging 3s. a room to people who could only afford to pay 2s.

Mr. Hunter declared that when the Government put the Council upon the same footing as the companies they could build quite as cheaply. They had asked an outside architect to design buildings for them, but while he provided for 500 persons the Home Secretary would only allow for 300. Yet the architect told the Council that those plans were superior to any of those prepared for the private companies.

Dr. Collins said the Committee had instructed their architect to prepare plans of the simplest design, and it was the way in which the plans had been received by the Home Office which had caused the increased cost.

The amendment was defeated, and the report afterwards adopted.

It was reported that Ruskin Buildings, Millbank estate, are now practically completed. Ruskin Buildings is the more northerly of the two blocks of buildings which face the central open space and which are similar buildings with plan reversed. The block is divided into four houses containing eighty-five tenements and 215 rooms, giving accommodation for 430 persons.

The Committee brought up a report containing the following recommendation:—"That the tender of Messrs. Martin, Wells, & Co., amounting to 23,600*l.*, for the erection of Sheridan, Beaumont, and Fletcher Buildings, be accepted."

[This was agreed to. The tender is 1,365*l.* below the architect's estimate.]

The same Committee reported as follows:—

In pursuance of the resolution of the Council of October 23, 1900, as to applications involving displacements of the working classes, we reported on January 29, 1901, that our attention had been drawn by the Building Act Committee to an application made under the Act by Messrs. W. Bradford & Sons on behalf of Messrs. Mann, Crossman, & Paulin, for sanction to a scheme for the widening of Brady-street, Bolt-street, Foster-street, and Thomas-passage, Whitechapel-road, in connexion with the extension of their brewery. Application has now been made for sanction to an amendment of the scheme, by which eight more houses, occupied by persons of the working classes, will be cleared away; and upon the basis of two persons per room, thirty-eight more persons will be displaced, and it does not appear that any provision is made for rehousing them. In accordance with the resolution of the Council of January 29, 1901, efforts have been made, but without success, to induce Messrs. Mann, Crossman, & Paulin to make some provision for rehousing the persons displaced. Our attention has also been drawn by the Building Act Committee to an application from Mr. Max Clarke on behalf of Spratt's Patent, Limited, for consent to the erection of a warehouse on the west side of Fave-street, Bromley-by-Bow, Poplar. In this case eight houses, recently occupied by persons of the working class, are being demolished. Upon the basis of two persons per room, sixty-four persons will be displaced, and no provision appears to be made for the rehousing of any of them.

The following table shows the displacements, of which we have received particulars, to date:—

Date when report made to the Council.	Houses removed.	Houses to be erected.	Number of persons displaced.	Number of persons proposed to be rehoused.	Number of persons unprovided for.
Nov. 13, 1900 ..	216	141	1,728	1,692	36
Jan. 22, 1901	29	—	312	—	312
Jan. 29, 1901	16	—	936	—	936
March 26, 1901	8	—	64	—	64
				Total...	1,436

The Building Act.—A discussion took place on the recommendation of the Building Act Committee to consent to plans of an extension of Messrs. Spratt's premises at Poplar [see above paragraph].

Mr. Yates moved that consent be not given unless a guarantee was given that the sixty-four persons disoused would be rehoused.

Mr. Strauss seconded the amendment.

Mr. Goddard Clark (Chairman of the Building Act Committee) said in deference to the Council he would take the matter back, but he did not think anything could be done, because

the applicants might go to a higher tribunal, and the Council might get a slap in the face.

Sir Arthur Arnold remarked that it was a most foolish policy to try and go behind the law in that way. It might be that they disagreed with the law, but their proper course should be to try to get it altered.

A similar amendment with regard to another recommendation of the Building Act Committee respecting the extension of the premises of Messrs. Mann, Crossman, & Paulin was defeated.

Widening of Narrow-street, Limehouse.—On the recommendation of the Improvements Committee, it was agreed that the estimate of 9,326*l.*, submitted by the Finance Committee, be approved, and that a contribution be made by the Council on the usual conditions of one-half of the net cost of the widening of Narrow-street, Limehouse, between the Barley Mow public-house and Three Colt-street, and of Three Colt-street at No. 107, proposed to be undertaken by the Council of the Metropolitan Borough of Stepney.

Sewer Works.—On the recommendation of the Main Drainage Committee, it was agreed that the estimate submitted by the Finance Committee be approved; that the tender of Mr. Cliff Ford, amounting to 12,911*l.* 5*s.* 8*d.*, for the extension of the middle-level sewer to Mitre-bridge and the construction of a new sewer in Scrubs-lane, as well as a length of sewer in connexion with the overflow from the Counter's Creek sewer, be accepted.

Boys' Home, Lowestoft.—On the recommendation of the Industrial and Reformatory Schools Committee, it was agreed that the supplemental estimate submitted by the Finance Committee be approved, and that the additional expenditure of 1,000*l.* in respect of the erection of the Shipping Agency building at Lowestoft, and quantity surveyor's fees, clerk of works' wages, &c., be sanctioned. That, subject to the result of the usual inquiries being satisfactory, the tender of Mr. J. Ashby, Mill-road, Lowestoft, of 3,958*l.* 10*s.* 8*d.* for the erection of the building, be accepted.

New Entrance Gates, Battersea Park.—The Parks and Open Spaces Committee recommended, and it was agreed, that the estimate of 1,990*l.* submitted by the Finance Committee be approved, and that an expenditure of that amount be sanctioned for the construction of four sets of wrought-iron entrance gates, with stone piers, at Battersea Park, the work to be carried out by the Works Department without the intervention of a contractor.

Appointment of an Architect as Arbitrator.—The Theatres and Music Halls Committee reported as follows, the recommendation being agreed to:—

"On February 12 last we reported to the Council the fact that a notice of appeal had been received from Messrs. Fladgates & Co., on behalf of the owners, against the sealed notice from the Council requiring certain structural alterations to be made to the Vaudeville Theatre, Strand. The Council then instructed the Clerk to apply to his Majesty's First Commissioner of Works for the appointment of an arbitrator to hear and determine the appeal. A letter has now been received from his Majesty's Office of Works stating that Mr. W. Emerson, P.R.I.B.A., has been appointed to hear and determine the appeal. We recommend that the solicitor be authorised to take all necessary steps to support the Council's requirements before the arbitrator."

Theatres, &c.—On the recommendations of the same Committee, sanction was given to the following applications:—

Arrangements at the London Music Hall (Mr. F. Matcham).

The means of communication between the Lyric Theatre, Shaftesbury-avenue, and the proposed new offices (Mr. J. G. Buckle).

The reconstruction of the dressing-room block at the Oxford Music Hall, Oxford-street (Messrs. Wylson & Long).

Proposed new doorway at the St. James's Theatre, King-street, St. James's (Mr. A. B. Jackson).

Gates proposed to be erected at the St. Olave and St. John Institute, Tooley-street (Mr. H. Stock).

Tramways and Tubs.—Dr. Cooper moved:—

"That it be an instruction to the Highways Committee to consider (a) the routes along which extensions of the London tramways system ought to take, having regard to the needs of the inhabitants in every part of the county; (b) the establishment of a tramway centre or centres to which extensions shall converge; (c) the railway extensions required to perfect the London overhead railway

system; (d) the extensions required to perfect the London tube or underground railway system; and to report to the Council their conclusions at the earliest possible date."

Mr. Sidney Low seconded the motion, and with the consent of the mover, added the following words:—

"And that it be a further instruction to the Highways Committee to secure that the views of the London County Council on the question of tube or underground railway schemes now before Parliament shall be properly represented before the Joint Committee of both Houses formed to consider the subject."

The motion, as amended, was agreed to. The Council shortly afterwards adjourned.

METROPOLITAN ASYLUMS BOARD.

The fortnightly meeting of this Board was held on Saturday, Sir E. Galsworthy presiding.

A letter was read from the Local Government Board stating that, with considerable hesitation, they were issuing an order authorising the expenditure of a sum not exceeding 125,691*l.* on the erection of the proposed White Oak School, and sanctioning 118,691*l.* of this amount to be defrayed by a loan repayable in thirty years and the remaining 7,000*l.* by a loan repayable in fifteen years.

The Works Committee submitted a statement showing that up to the present 52,701*l.* 14*s.* 3*d.* had been spent in erecting the new health offices on the Victoria Embankment. The original estimate was 49,543*l.* The amount already spent on the superstructure was 44,900*l.*, exclusive of the ventilating tower. It was now necessary to obtain sanction to raise the extra expenditure beyond the 43,400*l.* already authorised, and a recommendation that application be made to the Local Government Board to raise a further loan of 11,000*l.* was approved.

With regard to the proposed additions alterations to the laundry at Leaveland Asylum, the Works Committee reported that Messrs. Newnam & Newnam, the architect, had been directed to prepare an amended plan with a view to the better separation of the sexes and more efficient administration under supervision of the laundry generally.

The Works Committee also submitted a report respecting the proposed South-east Hospital. In November last a revised estimate whereby the cost was reduced from 319,400*l.* to 284,300*l.*, and the cost per head from 39*s.* to 35*s.* 2*d.*, was submitted to the Local Government Board. Beyond a bare acknowledgment of the letter, the Managers had heard nothing from the Board, and Messrs. Treadwell & Martin, the architects, had written complaining of the delay, and pointing out that, unless instructions were received by them forthwith, there would be very little chance of the work being commenced at all during the present year. The Managers adopted the suggestion of the Committee that the Local Government Board should be pressed to give their final decision at an early date.

On the recommendation of the Works Committee the tender of Messrs. McCormick & Sons, in 84,577*l.* for the erection of High Wood School, Brentwood, was accepted.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage and Projections.

Woolwich.—Re-building of the houses, with shop on the ground floor, on the north side of Wellington-street, Woolwich, between Mulgrave-place and Brewer-street (Mr. H. P. Monckton for Capt. R. A. Ogilby).—Consent.

Bow and Bromley.—A block of stable buildings the west side of Leven-road, Bromley (Mr. R. Kingham for the London General Omnibus Company, Limited).—Consent.

Greenwich.—A hotel, with stables, on the south-east side of Beaconsfield-road, Westcombe Park, Greenwich, at the corner of Mycene-road (Mr. M. L. Saunders for Mr. F. Pell).—Consent.

Hackney South.—One-story shops on part of the forecourts of Nos. 206 to 226 (even numbers on

Inclusive, Morning-lane, Hackney (Mr. W. Hall for Mr. T. W. Webber).—Consent.

Hammersmith.—Extension of the period within which the erection of buildings with oriel windows upon a site on the west-side of Queen-street and the south side of Sussex-place, Hammersmith, was required to be commenced, be granted (Mr. H. G. Brace for Mr. W. Moss).—Consent.

Hampstead.—Dwelling-house on the north side of Ashcroft-road, Hampstead, to abut upon Fregal (Mr. A. C. H. Watkin for Mr. W. Davis).—Consent.

Hampstead.—Residential flats on the west side of West End-lane, Hampstead, between Douglas Mansions and Carlton Mansions (Messrs. Palgrave & Co. for Messrs. Herbert Reeves & Co.).—Consent.

Islington, East.—Retention of a one-story stable building at the rear of No. 95, Hornsey-road, Islington, abutting on Shelburne-road (Mr. C. G. Champion for Messrs. Watson & Clarke).—Consent.

Kensington, South.—An addition to No. 28, Argyle-road, Kensington, to abut upon Essex-villas (Messrs. Hussey & Walcott for Mr. J. E. Wald).—Consent.

Lewisham.—Two houses on the west side of Newlands Park, Sydenham (Mr. E. Bates for Welford's Surrey Dairies, Limited).—Consent.

Marylebone, East.—Movable wood and glass screens at the sides of a stone portico at the entrance to No. 5, Cavendish-square, St. Marylebone (Messrs. Smees & Cobay for Mr. F. C. Hunter).—Consent.

St. George, Hanover-square.—Wood and glass inclosures to an open portico at the entrance to No. 46, Grosvenor-street, St. George, Hanover-square (Messrs. A. Blomfield & Sons for Mr. E. Speyer).—Consent.

St. George, Hanover-square.—An open portico in front of a building, Nos. 19 and 19A, Hanover-square, St. George, Hanover-square (Mr. J. Hudson for Messrs. Ashdown, Limited).—Consent.

Wandsworth.—Retention of a gas-meter house in the playground of the Sunny Hill-road school, Sreamtham, abutting on Valley-road (Mr. T. J. Bailey for the School Board for London).—Consent.

Wandsworth.—An extension of the period within which the erection of one-story shops upon part of the forecourts of Nos. 151 to 160 (odd numbers only, inclusive), Balham High-road, Wandsworth, was required to be completed, be granted (Messrs. Gibbon & Moore).—Consent.

Kensington, South.—Three-story bay window in front of No. 4, Douro-place, Kensington (Mr. A. Addeley).—Consent.

Deptford.—Two lamps to overhang the public way at the White Hart public-house, Grove-street, Deptford, at the corner of New-road (Messrs. Humphreys-Davies & Co. for Messrs. Style & Winch, Limited).—Refused.

City of London.—An iron and glass shelter at the entrance to De Keyser's Royal Hotel, Victoria Embankment City (Mr. H. C. Morris for De Keyser's Royal Hotel, Limited).—Refused.

Chelsea.—An iron sign at the first floor level in front of No. 13, King's-road, Chelsea, to project over the public way (Mr. H. D. Bryan for Messrs. Scott, Cuthbertson, & Co. and Messrs. Cotterell Brothers).—Refused.

Dulwich.—The erection, on three sites on the south side of East Dulwich-road, Camberwell, one of the sites abutting also upon Oakhurst-grove, of buildings (Mr. W. E. Deane for Mr. A. J. Walke).—Refused.

Hampstead.—A greenhouse at the nursery on the eastern side of Haverstock-hill, Hampstead (Mr. J. D. Hunter for Mr. J. Russell).—Refused.

Kensington, North.—One-story shops and an entrance-way on the forecourt of Norland Castle, Queen's-road, Notting Hill, at the corner of Norland-road North (Mr. A. Gordon for the Salvation Army).—Refused.

Width of Way.

Bow and Bromley.—A building, to be used as a slate factory, on the north-east side of Bow Common-lane, Bromley, nearly opposite Thomas-street, with the forecourt boundary fence at less than the prescribed distance from the centre of Bow Common-lane and without the site of the slate factory being covered with a layer of good concrete at least 6 in. thick (Mr. R. H. Kerr for Mr. J. Burroughes).—Consent.

Camberwell, North.—Two dormitories and a boiler-house of a temporary character at the rear of the guardians' offices, Peckham-road, Camberwell, with the boundary fence at less than the prescribed distance from the centre of Havil-street (Mr. E. T. Hall for the Guardians of the parish of St. Giles, Camberwell).—Consent.

Clapham.—A one-story building, to be used as a children's reading-room, at the rear of the public library, Lavender-hill, Battersea, at less than the prescribed distance from the centre of Green-lane (Mr. W. M. Wilkins for the Council of the Metropolitan Borough of Battersea).—Consent.

Hackney, South.—A one-story addition to a building at the rear of No. 10, Tower-street, London-fields, Hackney, at less than the prescribed distance from the centre of Martello-terrace (Mr. A. Rider for the Tower Fur Company).—Consent.

Hoxton.—Retention of a warehouse building on the north side of Bowling-green-walk, Pitfield-street, Hoxton, at less than the prescribed distance from the centre of the street (Mr. H. W. Dobb for Mr. W. B. Benjafield).—Consent.

Poplar.—Buildings, to be used as offices and warehouses, at Glasshouse-wharf, Orchard-place, Blackwall, at less than the prescribed distance from the centre of the street (Messrs. J. and S. T. Clarkson for Messrs. Fowler, Limited).—Consent.

Wandsworth.—A two-story warehouse at Baltic-wharf, Brewhouse-lane, Putney, at less than the prescribed distance from the centre of the street (Messrs. W. Douglas & Sons).—Refused.

Space at Rear.

Holborn.—A block of residential flats on the site of Nos. 94 to 97 (inclusive), Great Russell-street, and No. 21, Bloomsbury-street, Holborn, with an irregular open space at the rear and with portions of the building to extend above the diagonal line directed by Section 41 of the Act to be drawn (Mr. A. Burr for Mr. H. J. Pearce).—Refused.

St. George-in-the-East.—A modification of the provisions of Section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of two-story additions at the rear of Nos. 42 to 54 (even numbers only inclusive), and Nos. 49 and 51, Burross-street, St. George-in-the-East, by reason of which the buildings will have irregular open spaces at the rear (Mr. E. Crosse for Mr. J. Rubenstein).—Refused.

Wandsworth.—A modification of the provisions of Section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a two-story stable and a cart-shed on a piece of land on the south side of Atheldene-road, Wandsworth, at the rear of houses on the east side of Garrett-lane, without an open space at the rear (Mr. J. Bird).—Refused.

Line of Frontage and Space at Rear.

St. Pancras, East.—That the application of Mr. O. Fleming for the Fire Brigade Committee of the Council, for an extension of the periods within which the erection, on the site of No. 69, Euston-square and Nos. 172 and 174, Euston-road, St. Pancras, of a fire brigade station, with a projecting five-story bay-window and a bose hoist, and with an irregular space at the rear, was required to be commenced and completed, be granted.—Agreed.

Line of Frontage and Width of Way.

Norwood.—Three blocks of residential flats on a site on the south side of Thurloe Park-road, Tulse-hill, at the corner of Avenue Park-road (Mr. J. W. Abraham for Mr. Perrin).—Refused.

Lines of Frontage and Construction.

Poplar.—An overhead transporter, to be constructed of steel and wood, across East Ferry-road, Poplar, near its junction with Glengall-road, with an iron roof over the portion of the transporter spanning East Ferry-road (Millwall Dock Company).—Consent.

Hackney, North.—Two open play-sheds at the proposed schools, Northwood-road, Hackney, with one of such sheds in advance of the general line of buildings in Northwood-road (Mr. T. J. Bailey for the School Board for London).—Refused.

Width of Way and Construction of Buildings.

St. George-in-the-East.—A play-shed in the play-ground of the Berner-street School, St. George-in-the-East, at less than the prescribed distance from the respective centres of Batty-street and Fairclough-street (Mr. T. J. Bailey for the School Board for London).—Consent.

Limchouse.—Retention of an open wood and iron shed erected on the south side of St. Paul's-road Limehouse, near the railway viaduct crossing that road, and the erection of an addition to such shed (Mr. A. H. Barker).—Refused.

Width of Way, Line of Frontage, and Space at Rear.

Woolwich.—The re-building of Nos. 2, 3, and 4, Frances-street, Hill-street, Woolwich (Mr. H. E. Monckton for Captain R. A. Ogilby, Mr. J. D. Buckley and Mr. T. Gwillim).—Consent.

Formation of Streets.

Whitechapel and Bethnal Green, South-West.—That an order be issued to Messrs. W. Bradford and Sons sanctioning the widening of Brady-street, Bath-street and Foster-street, Bethnal Green, and the widening and adaptation for carriage traffic of Thomas-passage (for Messrs. Mann, Crossman and Paulin).—Agreed.

Lewisham.—That an order be issued to Mr. J. W. Webb refusing to sanction the formation or laying out of new streets for carriage traffic on part of the Crofton Park estate, Crofton Park-road, Brockley.—Agreed.

Wandsworth.—That an order be issued to Messrs. Marler & Co. refusing to sanction the formation or laying out of a street for carriage traffic out of the north-west side of Mitcham-lane, Sreamtham (for Colonel R. J. Aspinall).—Agreed.

Separation of Buildings.

City of London.—The formation of two openings at the first floor level in the party-wall between Nos. 97 and 99, Gresham-street, City (Mr. C. E. Sayer for Messrs. Coates, Son & Co.).—Refused.

The recommendations marked † are contrary to the view of the Local Authorities.

SANITARY FITTINGS AND PLUMBING.

12.—BATHS (continued).

INLETS.—At one time it was a common practice to admit the water to a bath through the waste-outlet. This was effected by connecting the hot and cold supply-pipes to the waste-pipe between the waste-outlet and the waste-valve. This arrangement is now generally condemned for two good reasons. In the first place, the waste-pipe is often seriously fouled with the last soapy drainings from the bath, and when the water is again turned on it carries back into the bath some of this objectionable matter. The second reason is that, if the waste-valve is left open (as it usually is), one or both of the taps may be left running and the water will escape unnoticed through the waste-pipe. It is for the latter reason that water companies object to the arrangement.

The most obvious method of admitting water is by means of two taps, one for hot water and the other for cold. These ought to be at or near the foot of the bath, so as to be out of the bather's way, and ought not to project far over the edge of the bath. Hot water admitted in this way gives off a good deal of steam, and to reduce this to some extent the taps are sometimes connected with a mixing-box (fig. 1), from which a single stream of tepid water issues into the bath. The same end is gained by admitting the water into the bath at a low level, as shown in fig. 3 (p. 269). Fig. 6 on the same page shows a single-stream inlet connected at about half the depth of a porcelain bath. The objection to low-level inlets is that they may be fouled by dirty bath-water, and the regulations of many sanitary authorities now require that the inlets must be placed so that the orifices are above the highest water-level of the bath—that is to say, above the overflow grating or above the top of the standing overflow.

For asylums, hospitals, prisons, and some other institutions, it is not desirable that the fittings should be under the control of the bathers, and in such cases the taps and waste may be so designed that they can only be actuated by a special key, which is in the possession of the attendant. Such an arrangement is shown in fig. 2, where A is the cold-water supply, B the hot-water supply, C the keyhole and key by which the water is turned on, D the waste spindle, with keyhole at E, F the overflow, and G the cast-iron casing in which the fittings are enclosed. The hot and cold supplies are in this case controlled by a single key, the cold water being started by the first movement of the key, and the hot water being turned on by a further movement. This prevents the scalding of the bather, but if the "hot" water is for any reason at an abnormally low temperature it may prevent a sufficiently warm bath being obtained. In one illustration the waste discharges into a floor-channel, a method often adopted where two or more fittings (baths and lavatories) are fixed in close proximity; a trap can, however, be connected with the waste-pipe if desired. Another method of withdrawing the fittings from the control of the bather is to carry the spindles or levers through the wall or partition at the foot of the bath so that they can be actuated by the attendant in the passage outside.

Special Baths.—The ordinary plunge bath is often fitted with a hood containing pipes and other fittings by which the water can be admitted in a shower, spray, wave, and other ways. The "shower" is admitted through a rose placed over the head of the bather at the outlet end of the bath. The "douche" is a stream of water admitted through a nozzle in the centre of the shower rose. The "wave" is a stream of water admitted through a wide but shallow orifice at the back of the hood so as to play upon the hips of the bather. The "spray" consists of a number of very fine jets of water admitted through perforations in tiers of horizontal pipes or in a series of vertical pipes placed at intervals around the hood. Sometimes a "sitz" or ascending spray fitting

Illustrations to Student's Column.

is placed in the bottom of a plunge bath, but as this inlet is below the water-level of the bath it cannot be recommended, for the reasons already given. A sitz bath ought to be a separate fitting.

The spray, douche, and shower are the special forms of inlet most commonly adopted, and a bath fitted with these is shown in fig. 3, A being the hot-water supply-pipe, B the cold-water supply, C the shower supply, D the douche supply, E the spray supply (connected with six horizontal spray-pipes), F the plunge supply, G the overflow and waste, and H the hot and cold mixing-box, with taps and dial-plate. This bath is intended to be cased with wood, but independent baths containing these fittings are also made, and are certainly preferable on sanitary grounds. A door is arranged in the outer metal casing for access to the pipes immediately behind the mixing-box. In cheaper baths a single spray-pipe is fitted around the top of the hood. The plunge bath may be of cast iron, enamelled fireclay, or other material; the hood is generally of plate zinc or copper, finished to match the bath.

The bath shown in the illustration has parallel sides, and the hood is on the same lines. This shape does not entirely prevent splashing over the edges of the plunge outside the hood, and the keyhole-shaped bath (fig. 4) is a decided improvement in this respect.

Sometimes the metal hood is omitted, and the skeleton of pipes left exposed. A water-proof curtain can be suspended on rings around the pipes to prevent splashing. The pipes are generally of copper, polished, tinned, or nickel-plated.

For industrial schools, and other institutions where a large number of persons must bathe in a short time, and where water must be economised, the plunge-bath is often superseded by a skeleton of spray pipes with shower above. The water for a range of baths of this kind may be controlled by the attendant at a single mixing box, to which a thermometer may be attached so that the temperature can

be properly regulated. The floor may be dished or widely channelled, or may have an enamelled fireclay bath-tub sunk in it, as shown in fig. 5. This bath is somewhat elaborate, and has seven heights of 3/4-in. copper spray pipes, 1 1/4-in. vertical supply pipe at the back, four 1 1/4-in. vertical supporting tubes, wave fitting at A, shower at B, and waste-valve at C; the valves are under the control of the bather.

The control of the water supply to combined baths of the kind illustrated in fig. 2 was originally effected by two taps (hot and cold) for each kind of inlet, that is to say, two for the plunge, two for the shower, and so on. The next step in advance was made by having a mixing-box to which the hot and cold supplies were connected, and from which pipes, controlled by valves or taps, led to the different fittings. In a bath containing plunge, spray, shower, and douche, eight taps would be required under the former arrangement, and six under the latter. The most modern arrangement requires only three taps for any number of fittings. By turning the hot and cold taps, the water is run into a small mixing chamber, to which the pipes supplying the different parts of the bath are attached. On the face of the mixing-chamber a dial is formed, containing a central spindle and knob to which an indicator or pointer is fixed. The dial is marked with the words "plunge," "shower," "douche," &c., and the supply of water is admitted to either of these fittings by simply turning the pointer to the word on the dial. Only one inlet can be in operation at one time.

Sitz baths are shaped somewhat like arm-chairs, the essential feature being a rose in the sunk bottom, through which a spray of hot and cold water can ascend. A rose is often placed also in the back of the bath to give a horizontal spray, and above this a slit is sometimes provided for a "wave" inlet. The bath must be fitted with waste and overflow gratings. The

supply for the ascending spray ought not on any account to pass through the waste-pipe of its way to the bath. Sitz baths are made of enamelled fireclay, cast-iron, plate zinc, copper, and may be independent or enclosed in wood. The fittings are in all essentials similar to those of good plunge and spray baths.

Bidets are small baths on which a person can sit. The principal feature is an ascending spray near the centre of the basin. Fig. 4 shows a pedestal bidet in white ware or vitreous porcelain, fitted with outlet grating and staling waste and overflow similar in design to those used in many lavatory basins. The porcelain pedestal is better than a wood enclosure.

Foot-baths are useful in schools and other places, the best material being glazed fireclay. Enamelled iron is also used. Fig. 7 is a section of a fireclay foot-bath, with supply nozzle, overflow, and waste-plug. The overflow is accessible for cleansing, and this is certainly a disadvantage. The length of the bath is 19 in. the other dimensions are figured on the drawing. This bath is intended to be laid on the floor. In the case of a range of baths, the wastes may discharge into a single pipe trapped beyond the furthest fitting, and carried through a wall at the other end for ventilation. Access to the pipe will be facilitated if it is placed below the ceiling of the room under the floor. Sometimes the baths are raised on feet so that the total height is about 16 in. or 17 in. a floor-channel can then be arranged to receive the waste water.

Other special baths are used in hydropathic establishments, but these need not be discussed.

Bath-heaters.—In houses where there is hot-water supply or where this supply is sufficient, some method of heating bath water is necessary. Usually an appliance known as a "geyser" is adopted for the purpose, being the heating agent. The shell is generally of copper and the internal parts of copper or zinc. Much has been written about the dangers of geysers of this kind, and n

leaths have undoubtedly been caused by the products of combustion, when these have not been carried away by a ventilating flue. The products of combustion include carbon dioxide, sulphur compounds, &c., but the most dangerous is undoubtedly carbon monoxide. While, however, many deaths have been caused by unventilated geysers, it is perfectly true that many geysers have been fixed without ventilators, and have not proved in any appreciable degree injurious. The writer has practically tested this by standing in an unventilated bathroom (with the door and window closed) on several occasions during the whole of the time a bath was being filled, and the geyser in full operation; not the slightest discomfort was felt. Other persons have had the same experience, and this is undoubtedly one reason why plumbers and others continue to fix geysers without ventilation flues.

But it must not be forgotten that there are geysers and geysers, and that their effects differ very widely according to the difference in construction. They may be classed in two divisions—(1) those in which the products of combustion come in contact with the water, and (2) those in which the water and products of combustion are kept entirely separate. Geysers of the former class are the cheaper of the two, and are also the safer, as the water condenses a large portion of the products of combustion. It is with geysers of this class that the writer has experimented; he would not care to carry out similar tests with geysers of the other type. Then, again, some geysers have ordinary open-flame burners, while others have bunsen burners; and, finally, the gas supplied by different companies varies very much in the amount of contained impurities. It is, therefore, bad logic to argue that, because one geyser has been safely used without a ventilation flue, geysers of all kinds and in all places may be left unventilated.

The great disadvantage of geysers in which the products of combustion come in contact with the water is that the water is fouled. If the burners are of the open-flame type and not carefully regulated to prevent smoke, the fouling may be so serious as to render the water unsuitable for bathing, and in any case it is unsuitable for drinking. Even at the best, when it appears almost perfectly clean, it often feels slightly greasy to the touch, and contains impurities which, uniting with the soap, leave dark sticky deposits on the bath which are very difficult to remove. The geysers also require to be frequently taken to pieces and cleaned if the water is to be even moderately pure.

As far as the water supply is concerned, those geysers are the best in which the water does not come in contact with the products of combustion; and bunsen burners are better than open-flame burners, as they produce less smoke and consume less gas for the same amount of heat. Geysers of this type, however, must invariably have adequate ventilation flues.

In cheap geysers the water and gas have separate taps, and it is therefore possible to tight the gas and turn it on to the full before the water is turned on, or to leave the gas burning after the water has been turned off. In either case, the geyser may be damaged, if not absolutely ruined. The extra cost of fitting the geyser with a device by which the water and gas are controlled by a single tap is only a few shillings, and this arrangement ought always to be adopted.

In some geysers, the gas-lever contains a small branch-jet and tap; on the tap being turned the branch-jet can be lit, and this pilot-light can be then turned by the main lever into the body of the geyser, where it lights the large heating burners. In more expensive geysers, the whole of the burners are attached to a door, so that they can be swung outwards. This is a better arrangement, as the burners can be cleaned and kept in proper condition.

Geysers in which the water and products of combustion are kept entirely separate, not only preserve the water in its original purity, but allow it to be discharged at a higher level according to the pressure of the supply, as the water-receptacle is really a closed vessel, or a series of vessels, and performs the office of the ordinary bath boiler in a kitchen range. Geysers of this kind are often fitted with a rising pipe and shower-rose. The discharge pipe from the geyser is fitted with a cock, and the rising pipe is con-

nected between the cock and the geyser; when the cock is closed the water rises to the shower-rose, which acts, therefore, as an expansion pipe. Hot water may also be conveyed from the geyser to a lavatory, housemaid's sink, or other fitting; but if all the outlets are controlled by taps, an expansion pipe must be provided to relieve the pressure in the closed water receptacle of the geyser. Where, however, different fittings are to be supplied with hot water, a special kind of water heater ought to be used, in which a considerable volume of water can be stored and kept hot by a number of comparatively small flames kept constantly burning.

Sometimes the gas-burners are placed in a chamber under the bath, so as to warm the water after the bath has been filled, or during the process of filling; but this arrangement is not applicable to baths of every material, and in any case it is apt to damage the bath. Cast-iron baths have also been made with small furnaces under them, but for the same reason (and others) they cannot be recommended.

OBITUARY.

MR. F. BOREHAM.—We regret to announce the death, on the 25th inst., in his sixty-second year, of Mr. Frederick Boreham, of No. 23, Highbury-grange and Nos. 73 and 75, Finsbury-pavement, London. Mr. Boreham was elected an Associate member of the Royal Institute of British Architects in 1871. Amongst his later architectural works we may mention his plans and designs for an enlargement of Shirley's Hotel, No. 37, Queen-square, Bloomsbury; the Congregational church in Snakes-lane, at the corner of Ray Lodge-road, Woodford, built by Mr. C. North, whose contract amounted to 2,344; and the new Wesleyan church, with school, at Crowborough, Kent, built by Mr. G. Beard, of that place, of Bath and local stone. In October last Mr. Boreham gained the second premium (there were nineteen competitors in all) for his designs and plans for the new Wesleyan church in Durham-road, Sunderland.

GENERAL BUILDING NEWS.

CHURCH, HORFIELD, GLOUCESTERSHIRE.—The new Franciscan Church of St. Bonaventure has been erected near the Friary, Horfield. The site of the new church adjoins the Friary, and the building was erected at an expenditure of about 4,000. The design is Early English, and the building consists of a nave, chancel, side chapels, aisles, baptistry, confessionals, a choir at the west end, and another choir for the Friars over the chapel on the Gospel side, pierced with arched openings into the chancel. The nave consists of five bays. The bays at the west end are flanked by the tower on the Apostleside and by the baptistry on the Gospel side. The nave is divided from the aisles by an arcade supporting the main principals of the roof, which has a span of 48 ft., and covers both nave and aisles. The arches of the nave are over 30 ft. high. The chancel is divided from the nave by an arch 37 ft. in height, and is lit by three lancet windows in the bay of the aisles. The confessionals are placed on the Gospel side of the church, with openings formed through the aisle wall. The west end of the nave is pierced with three lancet windows. The entrance door is in the centre of the nave wall, and there is a smaller door in the tower, opening into the porch. The organ chamber is approached by circular stairs, built at an angle of the tower. The baptistry is apsidal in form, and is lighted by a lancet window in each bay. The tower, baptistry, and west end bay were not included in the contract for 3,800. The total length of the church is 90 ft., the width of the nave being 22 ft., the width across the church 48 ft., and the height from floor to roof 50 ft. The church is built of rubble stone with Bath stone dressing, and facings of blue stone. It will accommodate about 350 persons. The whole was designed by Messrs. Pugin & Pugin, including the Friary. The contractors were Messrs. R. W. Wilkins & Sons, of Bristol, and Bro. Patrick acted as clerk of works.

PRIMITIVE METHODIST CHURCH, LONGTON, STAFFORDSHIRE.—The Longton Central Primitive Methodist body has just opened a new building in Stone-road. The new building has been erected by Messrs. A. H. & J. W. Moore, of Longton, at a cost of about 4,000. The main building is a chapel, with gallery, having sitting accommodation for 600 people. Adjoining there is a schoolroom, and under the chapel there is a suite of classrooms and vestries.

REOPENING OF ST. MARY QUAY CHURCH, IPSWICH.—St. Mary Quay Church at Ipswich was reopened after restoration on the 15th inst. The work was carried out in three sections. The first section included repair of the roofs of the nave, north aisle, organ chamber, and south porch, the work being carried out by Mr. S. A. Kenny. The second section included the new oak block floors to the benches, new floors to the passages, and the general cleaning

and recoloring. This part of the work was carried out by Mr. A. Sadler. The remaining section of the work consisted in a street improvement, and was carried out by Mr. W. Pipe (part of the graveyard being given up to the road, and the boundary wall re-erected). The work has cost about 3,000. The church was closed early in 1898, the building being pronounced unsafe by the Architect and Diocesan Surveyor, Mr. E. F. Bishopp.

CONVENT CHAPEL, WORTHING.—The blessing of the chief stone of the new chapel which is being erected in the grounds of Notre Dame de Sion, Worthing, for the use of the inmates of the Convent, took place on the 19th inst. Built of brick, with Bath stone dressings, to the designs of Messrs. Elphick & Howell, of London, the new structure is estimated to cost some 4,000, when completed. Provision has also been made for a recreation-room underneath the chapel. As the building is intended to be for the use of the inmates of the convent, the main entrance to the chapel is from the cloisters, but a separate entrance to the sacristy is also provided from the garden for the use of the priests. The floor both of the chapel and the recreation-room underneath is to be laid with maple wood blocks, and the Fawcett system of fireproof flooring has been employed.

PRESTONFIELD CHURCH, EDINBURGH.—It is proposed to erect Prestonfield Church, in Dalkeith-road, alongside the present iron building. In the meantime only a part of the building is to be erected, sufficient to meet present requirements. The plan includes a nave (the part now proposed to be built), capable of accommodating 500 persons, without galleries; a north and south transept and a circular apse, which will give additional accommodation for 300, thus making a total of 800. On the south side and near the west end of the church there will be a circular tower. This tower will on the ground floor form an entrance porch, having a projecting doorway to the outside. The octagonal part of the tower will be finished with an ornamental parapet, and the whole will be crowned by a low octagonal stone spire. The pulpit will stand against the pier at the junction of the north transept and apse, which will contain the communion table. The organ will be at the west end. There is room on the site for a church hall and other offices. In the meantime a session-house and vestry are to be provided, below which will be situated the heating chamber. The architects are Messrs. MacGibbon & Ross.

PUPIL TEACHERS' INSTITUTE, GOVAN.—The new Pupil Teachers' Institute, which has been erected within the grounds of Bellahouston Academy by the Govan Parish School Board, was opened on the 22nd inst. The building is two stories in height, and has a frontage to Paisley-road. The style is Scotch Baronial, and is in harmony with the Academy building. There are four classrooms and a physical laboratory on the ground floor, with access to each from a central hall, also headmaster's room, male and female teachers' classrooms and lavatories. On the upper floor there are four classrooms, which will be used for art and clay modelling, and, in addition, a chemical laboratory and lecture-room. The art rooms are divided by patent folding doors forming three classrooms, but can be thrown into one large room if required. At the rear of the main building there has been erected a workshop and a cookery-room. The institute is illuminated throughout with electric light. The estimated cost of the buildings, which were designed by Messrs. Bruce & Hay, architects, is 10,500.

BOARD SCHOOL, HALIFAX.—A new infants' school has just been opened in the Queen's-road, Halifax. The building, which is one story in height, has been erected from plans by Messrs. Walsh and Nicholas. It comprises a central hall 62 ft. long by 30 ft. wide, six classrooms and two babies' rooms, with cloakroom and other conveniences. Included in the scheme, but in a separate block, there are also a cookery and manual workshop, to be used by the boys and girls attending Queen's-road School. The school is provided with the electric light, and is ventilated on the plenum system. Altogether, including the site, the cost incurred represents a total of 8,800.

THEATRE, NEWCASTLE.—The Town Improvement Committee of the Newcastle Corporation had plans before them on the 20th inst. for a proposed new theatre in Westgate-road, between the Tyne Theatre and Blenheim-street. They had been prepared by Mr. D. C. Wylson, of London, and provide for a building with a frontage of 69 ft. to Westgate-road and extending 150 ft. back. There are to be six entrances from Westgate-road and exits to Temple-street from the stage. Accommodation is to be provided for about 2,500—1,535 in the gallery. There is to be a public balcony in front of the building, stretching the whole length, and extending 8 ft. over the footway. The architect having adopted some minor alterations suggested by the committee, the plans were approved.

BOARD-ROOM, NEWTON, HANTS.—A new board-room is being erected in East-street, Newton. The new building is to be erected of Kingsteignton limestone, with Bath dressings, by Mr. Lewis Bearn, of Highweek, from designs by Mr. S. Segar. It will be 41 ft. long, 30 ft. wide, and 20 ft. high. Adjoining will be three rooms, containing waiting-room for applicants for relief, gentlemen's and

ladies' cloakrooms, and lavatories. Over the rooms will be the caretaker's-room, offices, and nurses' sitting-rooms. The existing board-room is to be adapted as receiving wards for males and females.

TECHNICAL INSTITUTE, CONSETT, DURHAM.—The new technical institute at Consett, which has been built and finished at a cost of about 5,000*l.*, has just been opened. The institute occupies a site at the north end of the town, facing into Park-road—the main thoroughfare between Consett and Blackhill. The building is set back from the road 16 ft., and the site is fronted by a wrought-iron palisade. The exterior walls are faced with deep red pressed brick and Dunhouse stone dressing. The principal entrance has a deeply recessed arched doorway, with carved spandrels forming the chief feature in the facade, and leads through a vestibule, with ornamental glass screen, into the entrance hall, from which direct access is obtained to the whole of the ground floor rooms. Right and left of the entrance are ladies' and gentlemen's retiring-rooms, with lavatory accommodation. Immediately opposite is the secretary's or headmaster's room, with large store-room adjoining. On the left side of the hall are two class-rooms, and on the right side of the hall is the physics laboratory. The whole of the hall is the physics laboratory. The first floor consists of a chemical laboratory, storeroom, balance-room, and preparation-room, lecture-room, classroom, and an art-room. The second floor, which has been designed with the view of being adapted for use as an art-room, with storeroom, cloakroom, &c., in the future, will at first be utilised as caretaker's apartments. Detached from the main building is a large room, 47 ft. by 16 ft. wide, to be devoted to the teaching of manual instruction. The general contractor for the building is Mr. Edward Taylor, of Durham, and the painting was entrusted to Mr. Joseph Siddie, of Consett. The wrought-iron work has been executed by Mr. J. R. Crimmon, of Gateshead, and the stained glass by Messrs. Reed & Millican, of Newcastle. The architect is Mr. C. E. Oliver, of Consett, and Mr. John Simpson, of Blackhill, acted as clerk of the works.

FOREIGN.

FRANCE.—The subject set by M. Pascal to the ten candidates for the Prix de Rome is characteristic; it is "An American Academy on the Banks of the Seine at Auteuil."—M. Louis Bonnier has been elected President of the "Société des Architectes Diplômés" for 1901.—Mme. de Neuville, the widow of the military painter, has left to the Louvre several pictures by her late husband, as well as his portraits by Duez and Mathey. She has also left her jewellery to the Académie des Beaux-Arts, to found an "Alphonse de Neuville" prize for the encouragement of young artists who are not well off.—Parliament has authorised the City of Paris to spend nearly 8 million francs on the enlargement of the reservoirs of the Avre at Saint Cloud and for the removal to Auteuil of the pumping-machine at Chaillot, as well as on other works connected with sanitation.—Parliament has authorised the construction of a bridge over the Tancarville Canal, at the Pointe du Hode, at a cost of 140,000 francs.—The chateau of Versailles is at last cleared of the scaffolding which for several years have partly hidden the façade towards the gardens.—M. Peynot, the sculptor, has just completed the model for a monument to François, the landscape-painter, to be erected at Plombières. The monument, the architectural portion of which will be by M. Godefroy, comprises a stele supporting a bust of the painter, flanked by two female figures, in 1874, and has lately published its proceedings to the end of 1898. In these twenty-four years it has done much excellent work, having rescued many interesting and beautiful fountains which were in neglected streets and transferred them to worthy localities. It has also saved a vast number of frescoes, cleaned off the whitewash with which they had been smeared, and opened them to the public for exhibition. Above all, it has saved a noble gateway of Alfonso of Aragon from destruction. Quite recently a collection of Capo di Monte china in Naples, said to be the finest in the world, has been dispersed. The Italian Government appointed a committee of experts to examine the collection, and they selected a number of standard specimens from each period of the manufacture. These have been photographed, and from the photographs coloured pictures will be executed. The result should be a valuable work on the history of Neapolitan ceramics.—*Times.*

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The business of the late Mr. C. B. N. Shewin, timber merchant, of Hatton-garden and Farringdon-road, has been converted into a private company under the title of "C. B. N. Shewin & Sons, Limited."—Mr. M. H. Hadland, surveyor, has removed his office from New Bridge-street to St. Clement's House, St. Clement's-lane, Lombard-street, E.C.

A CENTRAL TOWER FOR TRURO CATHEDRAL.—At a meeting of Truro Cathedral General Committee on the 21st inst. it was announced that the donor of 10,000*l.* for the erection of a central tower was Mr. J. H. Dennis, Arrowe Hall, Cheshire, formerly of Redruth. Mr. Dennis wished the designation of the tower should be the Victoria Tower.

LONDON GEOLOGICAL FIELD CLASS.—The season of Saturday afternoon excursions, conducted by Professor H. G. Seeley, F.R.S., will commence on April 27. Visits will be made on each Saturday to places both north and south of London to examine the geological features of the Thames basin. Further

particulars can be obtained from the Hon. General Secretary, Mr. R. Herbert Bentley, 43, Gloucester-road, Brownswood Park, N.

MEDICAL HOURS.—Medical inspection had been made at Hounslow Barracks, which is finished inside with "compo-board" by the British Compo-Board Company, instead of the usual matchboarding. We should think this would be an improvement on the boarding, both in the sense of appearance and of sanitary fitness.

SALARIES IN THE OFFICE OF WORKS.—It appears from the detailed statement furnished to Parliament in explanation of the estimate of 46,450*l.* for the salaries and expenses of the office of the Commissioner of his Majesty's Works and Public Offices that there are in the surveyors' division two principal surveyors, one receiving 1,200*l.* a year and the other 1,000*l.*; five surveyors at 500*l.* a year each, rising by annual increments of 25*l.* to 800*l.*, two of whom are in receipt of another 100*l.* a year each in respect of extra duties; nine first-class assistant surveyors at 310*l.*, rising by annual increments of 15*l.* to 450*l.*; sixteen second class assistant surveyors at 150*l.*, rising by increments of 10*l.* to 300*l.*; two draughtsmen at 210*l.*, rising by increments of 10*l.* to 250*l.*; nine first-class clerks of works at 250*l.*, rising to 300*l.* (with some allowances in respect of extra duties); and twelve second-class clerks of works at 150*l.*, rising to 200*l.*. All these officers who serve up to the age limit of retirement become in due course entitled to superannuation. The first-class assistant surveyor employed in China and Japan occupies an official residence, receiving the salary of a surveyor, and has besides a foreign service allowance of 100*l.* per annum, the maximum of salary and allowance being limited, however, to 750*l.* Another of these officers has a personal allowance of 100*l.* per annum; technical assistants as required, and it is notified that no fresh appointments will be made to the rank of permanent draughtsmen. Twelve of the second-class clerks of works receive an annual allowance not exceeding one-sixth of salary in lieu of apartments; one has an official residence. One of the first-class clerks of works, being in charge of the Embassy buildings at Constantinople, &c., receives an extra acting allowance of 100*l.* per annum and has a residence. The number of first-class clerks of works is to be reduced from nine to eight eventually, and the number in the second class will then be increased from twelve to thirteen.

THE PRESERVATION OF ARTISTIC REMAINS IN ITALY.—The adequate preservation from destruction by individual owners of ancient buildings and monuments is one of peculiar difficulty in a country like Italy, which is full of remains of the highest interest. In discussing this subject in his last report our Consul in Naples says that, year by year, now a church, now a gateway of a castle, or even the castle itself is declared to be a national monument. Treasures bought by dealers from remote villages are constantly pounced upon, and permission to export them is refused. No picture may leave the country without being submitted to experts, who have to decide whether it forms part of the historical art of the country or is itself of such artistic value as to necessitate its retention. At Naples, and probably in all the important towns of Italy, there is a special commission consisting of sixteen members, presided over by the Syndic, who are appointed for four years. It is the duty of this commission to discover interesting things in the city which have not been noticed before, to prevent the disfigurement of those already under their care, and to keep the whole in repair. The Naples committee was established in 1874, and has lately published its proceedings to the end of 1898. In these twenty-four years it has done much excellent work, having rescued many interesting and beautiful fountains which were in neglected streets and transferred them to worthy localities. It has also saved a vast number of frescoes, cleaned off the whitewash with which they had been smeared, and opened them to the public for exhibition. Above all, it has saved a noble gateway of Alfonso of Aragon from destruction. Quite recently a collection of Capo di Monte china in Naples, said to be the finest in the world, has been dispersed. The Italian Government appointed a committee of experts to examine the collection, and they selected a number of standard specimens from each period of the manufacture. These have been photographed, and from the photographs coloured pictures will be executed. The result should be a valuable work on the history of Neapolitan ceramics.—*Times.*

STRAND IMPROVEMENTS.—On the 25th inst. at the Westminster Guildhall, before Mr. John Troutbeck, High Bailiff, and a jury, the case of "Hughes's Trustees v. the London County Council" was decided. It was a claim for compensation for the compulsory acquisition of the freehold of the premises, 25, Holywell-street, at 28 and 29, Newcastle-street, in connexion with the Strand improvement scheme. In opening the claimants' case Mr. C. A. Cripps, K.C., said that the jury would have noticed that the property which they had just viewed was in a very dilapidated condition, and the claimants were therefore only claiming in respect of the value of the land. The superficial area of the Holywell-street portion was 912 ft., and they had put the value at

6s. 6d. per foot. In Newcastle-street there was an area of 1,365 ft., which their surveyors would set was worth 5s. a foot. Witnesses would be called to prove that the total value was between 10,000*l.* and 20,000*l.*, but under their betterment scheme the London County Council were entitled to something like 3,000*l.* out of that sum, so his clients' claim came out at about 16,500*l.* Mr. Charles Augustus Lar (Jones, Lang, & Co.), surveyor of King-street, Newcastle, said he was of opinion that the who of the property was worth about 16,377*l.* E agreed with the price per foot mentioned by learned counsel, and would give twenty-nine year purchase. By Mr. Boyle: He did not think twenty years' purchase would meet the requirement of the case. Mr. P. E. Filditch, of Pall Mall agreed with the previous witness's figures, with the exception that he thought twenty-eight year purchase was fair. Mr. Benjamin Breach (Far brother, Ellis, & Co.), of Fleet-street, said his estimate amounted to 16,207*l.* This closed the claimants' case. Mr. Boyle, K.C., on behalf of the London County Council, said that was marvellous how property increased in value when it was wanted for a public improvement. He contended that the outside sum the jury ought to award was 10,500*l.* Mr. Edward Farmer (Debenham, Tewson, Farmer, & Co.), gave evidence to the effect that the claimants would be fairly compensated if they received 10,500*l.* Mr. Furber (Furber & Price), of Warwick-court, Gray's Inn, confirmed Mr. Farmer's evidence and figures. Mr. James Green (Weatherall & Green), of Chancery-lane, said his total was 10,517*l.*, or 7*l.* more than the two preceding witnesses. The jury retired to consider their verdict. After twenty-five minutes' deliberation they awarded the claimants 13,800*l.*

THIS HOUSE'S QUESTION.—ROCHDALE.—conference on housing reform, promoted by the local Trades Council, was held recently in the Rochdale Town Hall. Mr. James Firth, Secretary of the Trades Council, moved:—"That, in view of the overcrowding and bad housing conditions that prevail in our midst, this conference urges on the Town Council the adoption of Part III. of the Housing of the Working Classes Act, 1890, and the vigorous use of the powers they already legally possess." It further urges the formation at once of a local housing committee, on the widest possible basis, to further this object, and that this resolution be forwarded to the Town Clerk." Archdeacon Wilson, in summing up the discussion, said in suggestion that the Corporation should become possessed of the whole of the houses of the working classes was surely so gigantic that it might well be relegated to a very distant time. It is only a portion of the land and some of the dwellings were in the hands of the Town Council, would they be devoted to a particular class, and would the class for which they were intended go into them? That was the case in London, in the Peabody and other buildings. They were used by a higher class. If restriction had been invented yet which would limit those buildings to the people for whom they were intended. He asked whether it was justifiable to spend money out of the rates for the benefit of a class. At present they were attempting to do with the question by side attacks, and in Rochdale not wholly unsuccessfully. There were 24,000 houses built and owned or built and sold by the cooperative societies, or built with money advanced from them. Those premises had been erected at a cost of over five millions. The Archdeacon emphasised a suggestion made by the Rev. H. Edmonds that the council should take the lead in these matters upon the Sanitation authorities. There should be a public register, he said, of all the houses to let, and should be the duty of the inspector to report upon those houses as they fell vacant, and say whether they were fit for habitation. All sanitary regulations should be made compulsory. The action of trades-unions had largely increased the cost of building by limiting the work done. In one case a cottage was built for 108*l.*, which would have cost 150*l.* if done by contract. The reason was that the people built it themselves, and put into it as much work as they could instead of as little as they could. Unless our trades-unions adopted a more sound basis of economics than at present there was trouble before England, and it would not be confined to the building trade. The amended resolution as given above and an amendment were put to the vote, and the resolution was carried by a majority of 10. Afterwards it was carried almost unanimously.

INSTITUTE OF BRITISH DECORATORS.—The annual meeting of the Northern District of Institute of British Decorators was held at the Great Northern Hotel, Leeds, on the 22nd inst., business being the election of officers and committee for the ensuing year. The following were appointed:—Chairman: Councillor John Smith, Sheffield; vice-chairmen: Alderman Kendall, Huddersfield; Mr. Thomas Preston, Burnley; George G. Laidler, Newcastle-on-Tyne; and Mr. George F. Allan, Stockton; treasurer: Mr. Geo. Spencer, Bradford; committee: Messrs. J. G. C. Newcastle; James Tetlow, Huddersfield; J. F. Cliffe, Bolton; W. H. Cunliffe, Blackburn; and J. Cantrill, Manchester; secretary: Thomas Fox, Padiham. It is the intention of the committee to arrange for lectures to be delivered next winter by some of the principal towns comprised in the Northern District.

BRISTOL MASTER BUILDERS' ASSOCIATION.—On the 10th inst. the annual dinner of the Bristol Master Builders' Association was held at the Royal Hotel. Mr. George Emphreys presided, and there were present the Right Hon. the Lord Mayor of Bristol (Mr. J. Colthurst Godwin), Mr. August Krauss (President of the National Federation of Building Trades' Employers of Great Britain and Ireland), Mr. Tom T. Lindrea (President of the Bristol Chamber of Commerce), Mr. Frank Willis (President of the Bristol Society of Architects), and others. The loyal and patriotic toasts having been honoured, Mr. Frank N. Cowlin proposed "The Right Hon. the Lord Mayor and the Corporation of the City of Bristol." The Lord Mayor, in responding, said that if they were to hold their own with the cities of the world, they must extend their locks at Avonmouth in order to grapple with the trade. He hoped they would send some of the builders to the Council in addition to Mr. Bastow. He would like to see Mr. Krauss, Mr. Cowlin, and some others take their part as members of the Corporation. Alderman Pearson proposed "The Trade and Commerce of Bristol," and Mr. T. Lindrea responded. Mr. E. Walters proposed "The Architects and Engineers," and spoke of the good relations which existed between them and the builders. Mr. Frank Willis, Mr. Henry Williams, and Mr. J. Scoones replied to the toast. Mr. Bastow (in the absence of Mr. Arthur Lee) proposed "The National Federation of Building Trades' Employers of Great Britain and Ireland." In a toast, in responding to the toast, said that the toast he had to respond to might appear to some of them a new one, but it was not so; with the New Year the National Association of Master Builders changed their title to the National Federation of Building Trades' Employers of Great Britain and Ireland. For a long time it had been felt that federations were badly wanted, and they were glad to see their federation was getting stronger every day, and that kind associations, particularly in the north, joined their federation. They had drawn up new rules, had a first mode of electing their council, and had much improved their contract form, which they hoped would meet with approval from architects, engineers, and municipal councils, as fair contract would do away with a lot of differences between builders and their clients. The four federation centres had now over six thousand members, and the question arose as to a crest. Several designs were submitted but none of them was approved, but last week he received a suggested design of crest from their honourable vice-president, Mr. J. S. Jones, Liverpool, which was very artistic, and most likely would be accepted. That crest he would have to bring forward at their next half-yearly meeting at Glasgow. He was glad to inform them that they had an emergency committee consisting of two members of each federation—Mr. Church, Bristol, and Mr. Long, North, represent the West of England centre. Through that committee he had good hope that some differences, if they did occur between themselves and their employees, might be settled without strikes. At their last half-yearly meeting in London he said all strikes must come to an end sooner or later, and therefore why not try to settle disputes without strikes? Only last year 150,000l. was lost in wages in the building trade alone, and they hoped that would not be the case this year. The building trade strike in Chicago, which lasted twelve months, and which must have cost an enormous sum of money, was settled last month. The principal provisions in the agreement were: No limitation of days' work; no restriction on the use of machinery or tools; no restriction on the use of materials manufactured by non-unionists except prison-made; use of apprentices allowed; foreman to be agent of employer instead of unions; workmen to work for whom they please; employers to be allowed to hire or discharge whom they pleased; wages to be 6s. 0d. per hour. When reading that he thought it should be very satisfactory to both parties.—Mr. G. Wilkins proposed "The South-Western Building Trades' Employers' Federation and Local Unions Associations." The toast was spoken to by Alderman H. J. Spiller (Taunton) and C. H. Long (Bath). Mr. G. H. Fernin submitted "The Bristol Master Builders' Association." The President, in responding, said it was now some six or seven years ago (since he had the honour to preside over the annual dinner, and it is that time they had seen many changes, and they could not but deplore the death, during the past year, of their esteemed late vice-president, Mr. G. M. Gosling, a gentleman of large experience in the building trade, and whose loss was a severe blow to the Association.—Mr. E. Walters then took the chair as President of the Association amidst much applause.

NORTH STAFFORDSHIRE BUILDERS' ASSOCIATION.—The annual dinner of the N.S. Builders' Association was held at the Grand Hotel, Hanley, recently. The chair was taken by Mr. J. Gallimore, President of the Association. "The King," on the initiative of the President, having been accepted, the following toasts were proposed: "The Local Governing Bodies." The Mayor of Hanley, the Mayor of Stoke, and the Mayor of Newcastle responded. The Mayor of Longton, the brother of a builder, and "The Master Builders' Association." By way of reply, the Secretary of the Association (Mr. Owen) read the annual report, which stated that

95 per cent. of the builders in the district are members of the Association, all of whom have insured their workmen at special low rates against liability for accidents of all kinds. The Association would no doubt form the nucleus for a North Stafford Builders' Provident Institution of a Builders' Exchange. The stonemasons had given notice of an advance of 3d. per hour. The Association has offered them 3d. The labourers have also given notice for an advance, but as the notice was not sent as per rule or custom, the employers have decided not to entertain it. The bricklayers of Leek have also given notice for an advance. During the last thirty years wages in the building trade in this district have risen 90 per cent. and building materials 40 per cent., 25 per cent. of this took place two years ago. The Association is anxious to have a uniform contract, similar to the one used by the National Builders' Association which contains an arbitration clause, and of which contract 2,000 were used in England during the last half-year. Some difficulty has arisen owing to the law having decided that an estimate as now sent in shall or may form a contract. The following form of tender is, however, being prepared to meet this, and the architects are to be requested to use them:—"This estimate, if accepted, is subject to an approved written contract, and is not to be taken as in itself to constitute a contract." Something like this was necessary, as errors of all sorts sometimes occurred in tenders, and an opportunity should be given to rectify them. Councillor Yosall, J.P., gave "The Architects and Surveyors." Mr. Lyman, Mr. Dain, Mr. Scrivener, Mr. Wood, and Mr. Snape responded. Councillor Cartledge proposed "The Magistrates," and Messrs. E. Walley and W. Grant acknowledged it. Councillor P. H. Bennion gave "The Building Trade," and referred to the splendid organisation of to-day as compared with the utter disorganisation of a few years ago; to the fact that there was less of the cut-throat competition and a waning desire to fill jobs at anything but a paying price; to the good wages paid for labour and to the vanishing jerry builders. Mr. Gallimore replied.

SUTTON PLACE, NEAR GUILDFORD.—The recent sale of the contents of Sutton Place, including some one example of seventeenth and eighteenth century furniture, produced a total of 4,000l. It seems a pity that the house, which, we read, has been rented by a well-known newspaper proprietor, should have been thus deprived of its equipment, which so well harmonised with the house itself. The annals of Sutton Place, with architectural drawings to scale by Mr. C. F. Hayward and Mr. A. Gladding, have been compiled by Mr. Frederic Harrison in a handsome volume published seven years ago. Built in 1530 by Sir Richard Weston, an adventurer and a courtier who had travelled abroad, it is chiefly interesting as a very early example of a large residence erected without any view to its defence, and of an attempt to incorporate Italian detail in English workmanship with the copious use of terra-cotta as at Layer Marney. The gate-tower front was destroyed in the latter part of the eighteenth century. There now remain three sides of the main quadrangle and a smaller court entered from one of the wings. The quadrangle is distinguished by its high Tudor windows having cusped heads and flat-pointed doorways with dressings of terra-cotta blocks, fashioned as masonry, and enriched with ornament after the Italian style, which are freely introduced amongst the jambs, transoms, mullions, and mouldings of our own native masons' work. Around the courtyard, which is 80 ft. square, are about forty apartments, the hall being on the side opposite the former entrance tower.

CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on Thursday, March 21, at the Society's house, Dean's-yard, Westminster, in the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, namely: building the first portion of the proposed new Church of St. Michael and All Angels, Ocklyng, in the parish of St. Mary, Eastbourne, 100l.; and towards enlarging or otherwise improving the accommodation in the churches at Ravensthorpe, St. Saviour, near Dewsbury, 100l. in lieu of a former grant of 25l.; Bewcastle, St. Cuthbert, near Carlisle, 15l.; Little Oakley, St. Mary, near Harwich, 50l.; and Whicham, St. Mary, near Carnforth, Cumberland, 20l. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Churwell, in the parish of Morley, near Leeds, 25l.; and Willesden St. John the Baptist, Middlesex, 50l. The following grants were also paid for works completed: Hales, St. Margaret, Norwich, 15l.; Westcliff, St. Alban, Southend, Essex, 50l.; Belsford, St. Peter and St. Paul, near Horncastle, Lincoln, 25l.; and South Ossett, St. Aidan, near Wakefield, 20l. In addition to this the sum of 270l. was paid towards the repairs of thirty-one churches from trust funds held by the Society. The annual general court of the Society will be held at 3 p.m. on Friday, May 17, at the Church House, Dean's-yard, Westminster, when the chair will be taken by the Archbishop of Canterbury, President of the Society.

LEGAL.

DISPUTE BETWEEN A BUILDER AND THE CORPORATION OF BRISTOL.

THE case of Krauss v. the Mayor and Corporation of Bristol came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Collins and Romer, on the 25th inst., on the appeal of the defendants from an order of Mr. Justice Grantham refusing to refer to arbitration a dispute between the plaintiff, a builder, and the Corporation, in reference to a certain contract in connexion with the Bristol Lunatic asylum. The action was brought for alleged delay and interference with the plaintiff in executing his contract, thus causing him loss of time and additional expense. The Corporation contended that the matter in dispute was one to be referred under contract to arbitration, and that whatever delay was occasioned to the plaintiff was owing to his having laid down unseasoned wood which the architect had rejected. For the plaintiff it was submitted that the action was one in regard to a matter outside ordinary disputes, and that he was prevented from proceeding with his contract because the isolation hospital of the asylum had not been supplied with the heating apparatus in good time, and of another contractor not supplying the grates at the proper time, thus delaying the laying down of the floor of the hospital. Counsel for the plaintiff contended that such issues as were raised by the present case could not properly be determined by arbitration, but it was a proper cause for the King's Bench Division.

In the result their Lordships held that the matters in dispute ought to be settled by arbitration, and made an order accordingly. They therefore allowed the appeal with costs, and stayed the action.

CASE UNDER THE BUILDING ACT.

AT Greenwich Police-court, on the 20th inst., Walter Hill & Co., Limited, of Southampton-row, W.C., were summoned by the London County Council for erecting on the forecourts of certain houses in Sydenham a structure in contravention of Part III. of the London Building Act. Mr. Chilvers appeared for the Council, and Mr. Bethune was counsel for the defence. Mr. Chilvers said that the structure, which was erected without the consent of the Council, was an advertising hoarding 12 ft. in height and 336 ft. in length, and was entirely in advance of the general building line. The attention of the Council was drawn to the structure in September last year. Mr. Bethune argued that the hoarding differed in no respect from an ordinary builder's hoarding, and that it practically enclosed vacant land, as the houses, which belonged to the Leathersellers' Company, were in a bad condition and, with one exception, unoccupied. The houses were about to come down. Times were bad enough just now, and he did not think the owners could be blamed for seeking to get some income from the hoarding. He argued that the hoarding was not a structure to which the Act applied, and that it was a temporary erection. Evidence was called on both sides, and eventually Mr. Kennedy said that there was a degree of permanence about the erection, which had been standing six months and was very likely to remain. He regarded the hoarding as a structure, and could not recognise it as enclosing only vacant land. There would be an order to remove the structure with fourteen days, and the defendants would be fined 40s. and five guineas costs.—Times.

CARPENTER'S CLAIM FOR COMPENSATION UNDER THE WORKMENS COMPENSATION ACT.

THE case of Whitehead v. Reader came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Collins and Romer, on the 26th inst., for judgment on the appeal of the defendant, the employer, from the award of the County Court Judge of Coventry under the Workmen's Compensation Act, 1897, awarding the applicant, a carpenter and joiner, compensation at the rate of 12s. 6d. a week, being one-half of his average weekly earnings, for an accident which happened to him whilst in the employ of the defendant.

It appeared that the applicant was sharpening one of his tools at a grindstone, which was worked by a leather band which passed over shafting connected with a gas-engine. The band slipped off the stone, and the applicant, in trying to replace it, sustained personal injuries. The case for the defendant was that the applicant had orders not to touch the machinery, and in trying to replace the band was acting contrary to orders. It was also contended on the defendant's behalf that the accident did not arise out of and in the course of applicant's employment, on the authority of Lowe v. Pearson. The County Court Judge, however, decided that the case of Lowe v. Pearson did not apply, and made an award in favour of the applicant, as before stated. Hence the present appeal of the employer.

The Master of the Rolls, in giving judgment, said that the only point on the appeal was whether the injury to the applicant arose out of and in the

course of his employment. It was clear that the man was employed on a factory within the meaning of the Act. It appeared to his lordship that the injury, *prima facie*, arose out of and in the course of the applicant's employment, but the man had been told not to touch the machinery, and it was said that this caused the injury not to have arisen out of and in the course of his employment. The question was, did disobedience to this order cause the man not to have been injured in the course of his employment? He thought not. It could not be said that every disobedience to an order terminated a man's employment. Disobedience might or might not give a defence to a master under the clause relating to serious and wilful misconduct. He thought that the learned County Court Judge was right in holding that the case of "Lowe v. Pearson" had no application to the present case. That was not a case of any employment at machinery at all, and the applicant in that case clearly went outside his employment and, in addition, disobeyed the express orders of his master. In the present case the applicant's course of employment was to grind tools at the grindstone, and though he was told not to touch the machinery, still he was in the course of his employment when, in trying to adjust the band after it came off, he was injured. In his opinion the County Court Judge was right in coming to a conclusion in favour of the applicant, and the appeal must be dismissed.

The Lords Justices concurred, and the appeal was accordingly dismissed with costs. Their Lordships refused a stay of execution pending an appeal to the House of Lords.

CASE UNDER THE EMPLOYERS' LIABILITY ACT.

AT the Southwark County Court on Tuesday, before his Honour Judge Addison, K.C., and a jury, Messrs. J. Aird & Sons, Belvedere-road, Lambeth, were sued by Wm. Moore, labourer, of York-road, Teddington, who sought to recover compensation under the Employers' Liability Act for alleged personal injuries. Mr. Turrel was counsel for plaintiff, and Mr. Scarlett for the defendants. Mr. Turrel said the plaintiff, when in the service of the defendants, was employed on the River Diversion Works which were being executed at Kempton Park. On September 19 last he was sent to work in a trench about 27 ft. deep in which a 48-in. main was being laid. The sides of the trench were supported by struts, and a ladder reached from the bottom to within some feet of the top, so that the men had to climb up part of the way by means of the struts. The plaintiff called the attention of the foreman to the fact that the ladder was too short, but no notice was taken of the complaint. On the day mentioned he descended by the ladder and worked by himself in the trench until dinner-time. When the call was made he walked to where the ladder had been, but found that some one had drawn it away. Consequently he started to climb the struts, and when he had nearly reached the top a "punch" which he caught hold of gave way, and he fell to the bottom. He alighted on his feet, and being a heavy man and fifty years of age, he was much shaken and upset. He ultimately got out of the trench by crawling through the pipe a distance of about 240 yards. He did not speak to any one about the accident, and finished his work, although feeling very ill. He kept his own counsel for ten days, but at the end of that time he had become so ill that he had to give up and take to his bed. Then a letter was written to the defendants informing them of the accident and his condition. He was attended by a doctor, and he was unable, as the result of the accident, to do any work for a period of sixteen weeks. His wages averaged 32s. per week. He relied in this case on the first subsection of Section I. of the Act in that there was a defect in the ways, works, machinery, or plant connected with or used in the business of the defendants, notice of which defect had been given.

The plaintiff was called, and bore out counsel's statement, adding that there was not a ladder at that part of the works 21 ft. 6 in. or 34 ft. long. He had never seen men climb up by the struts when ladders were available.

Dr. Atkinson, of Hampton Hill, said he examined the plaintiff on September 29, and came to the conclusion that he was ruptured. He, however, subsequently discovered, when in consultation with the defendants' doctor, that this was not so. The plaintiff did suffer great pain in his arm. He was surprised that plaintiff could continue work for ten days after such a fall.

Thomas Challis, defendants' foreman, declared that there were two ladders over 30 ft. in length which the plaintiff could have used, and that not a word about any fall was mentioned until the letter from the plaintiff was received. He did not notice anything unusual about the plaintiff, who was not at work by himself at any time.

Several witnesses were called, who stated that they were working with the plaintiff on the day of the alleged fall, but they did not notice anything wrong with the plaintiff or that his clothes were more muddy than usual.

Before the completion of the defendants' evidence his Honour stopped the case, remarking that there was every circumstance of grave suspicion

against the plaintiff. It would be a terrible thing if men were allowed to make such complaints ten days after an alleged accident and maintain action upon them.

The jury expressed the opinion that they were quite satisfied that plaintiff had no case, and the action was, therefore, struck out, with costs against the plaintiff.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

23,406.—KILNS FOR DRYING AND BURNING TILES, POTTERY, &c.: G. Müller and P. Pfeiffer.—Wagons are drawn through the heating-chamber in order that the green goods with which they are loaded may be exposed to hot gases flowing from the furnace through flues to the exhausters, and be then exposed to the heated air which is drawn by exhausters. The goods are next transferred to other carriages and conveyed through the burning chamber; they are allowed to become cool whilst the following charge is being dried in the heating chamber.

23,413.—ARMATURES FOR DYNAMO ELECTRICAL MACHINES: M. H. Robinson and M. H. P. R. Strakey.—In the case of a dynamo-electrical machine wherein the armature or revolving portion is directly coupled on to the fly-wheel of the engine, the inventors discard the customary dynamo-shaft, and they, instead, cast the spider or boss with a central extension so that it shall form a journal to run in the bearing.

23,451.—A SAFETY APPLIANCE FOR WINDOWS: J. J. Harley.—The inventor's object is to provide means of controlling the opening of window-sashes in asylums and similar buildings and of frustrating attempts to remove the sashes from their frames. They place L-shaped pieces of the sash in engagement with corresponding projecting pieces inserted into the pulley stile. When the sash has been caused to slide so that those pieces are clear from one another it can be removed; for the L-shaped pieces may be substituted a stud upon the frame that will engage with a slot either in a metal plate upon the sash-stile or in the sash-stile itself.

23,458.—CONSTRUCTION OF FIREPROOF CEILING: M. H. H. Phillips.—The inventor fashions slabs or blocks (which may be hollow or solid), so that they shall be askew in a diagonal direction, or in the direction of their length or breadth, and shall have their abutting surfaces curved, or plane, or zig-zagged, with grooves in their sides for taking keys of mortar or iron rods. The blocks are formed with inclined sides, so that a ceiling may be built up without the use of props and centres.

23,498.—A PLUG FOR TAMPING BORE-HOLES AND STOPPING PIPES: J. Bovier.—An expansible plug, that may be afterwards removed, is made up of a set of split cones. Where two cones are used, having a groove for the fuse, a tube is joined to one end wedge and a rod is screwed on to the other. On the end of the tube is a nut, through which is passed a screwed sleeve that presses against stops on the rod, whereby as the rod is turned up the wedges can be driven either asunder or together. The rod, sleeve, and nut have handles, and the tube is retained against the hole with a washer and a clamp.

23,510.—TREADS AND RISERS OF STAIRS: E. Wood & Co. and H. P. Butler.—Pressed steel plates having flanges at their ends and non-slipping upper surfaces, with corrugations and projections, constitute the treads, whereof the front edges may be extended downwards up to the next tread so as to make a riser, or be turned downwards to make the stair-nosing. The inventors bolt or rivet the risers on to the tread-flanges, and similarly fasten the flanges to the stringers. End-plates can be used for joining the flanged treads, and the risers can be cut away for making a partly open staircase.

23,514.—A BRAKE MECHANISM FOR HOISTS, &c.: W. T. Eades and E. Allday.—A pinion, or a train of wheels imparting the slow motion, communicates movement from the first motion shaft, and the pinions of the train are arranged upon a common boss, a collar, having a cam-shaped end in engagement with a corresponding end upon a sleeve that moves loosely upon a fixed shaft and is held in a bearing, being screwed within the boss. During the operation of lifting, the sleeve and the collar turn together in unison without separating from one another lengthwise, but as the load begins to fall the power being removed—it exerts an expanding force between the collar and the sleeve, and so puts the brake into play. Stopping-pins limit the extent of the displacement lengthwise of the sleeve. A sheave and a weighted chain, or a spring, may be employed instead of a lever (for controlling the pressure) of which the boss is threaded upon the screw-threaded end of the fixed shaft.

23,576.—RADIATORS FOR HEATING BUILDINGS: M. M. Brophy.—Hot water is admitted near the top of the radiators which have hinged sections or leaves, one of which is pivoted upon a hollow foot on to which the supply and return pipes are secured. The foot and the socket are joined by means of a flanged connecting ring, that will turn upon the bearing surface of the foot, and is kept in its place with a gland. At the free end of the radiator is a roller or bearing-wheel for meeting inequalities in the floor, the wheel being mounted in a box that

slides within an outer fixed casing. Uniform sustaining power in any direction is afforded by a spring and pivoted levers that are linked to a bridge-piece, and to meet the case of a very uneven floor a trunnion is placed in the upper socket of the floor of the radiator, whilst the pivot support is attached to the higher part of the radiator; if it desired to take out the leaf the trunnion can be moved away.

23,584.—A METHOD OF SECURING SCREWS, BRICK OR STONE WORK: W. F. Löffelhardt.—Fixing a screw into bricks or stone are devised means, the hole in the screw is inclined, the tongues, plates from which project, are inclined, the spikes for engagement respectively with the sides of the cross-bar, the screw is turned in and with the thread of the screw. A split screw socket can be produced by joining some of the plates together at their inner ends, and the outsides of the plates may be roughened; in the latter mode the tongues may be discarded.

23,590.—AN APPLIANCE FOR SHUTTING DOORS: J. Kelly and T. Kelly.—The door-plate is fashioned in one piece with a cross-bar that is laid between two cams in which are grooves that take lugs upon the cross-bar, chains join the cams to two cross-levers which are pivoted on either side of the door plate and are also linked to compound spring which are bolted on to an inner casing; the inner casing is secured within the outer casing which is fastened on to the floor.

23,611.—JOINERS' CRAMPS: H. Lawson.—A clamp devised for making door-frames, window-sashes, and similar wooden work, has four slotted arms hinged to nut-pieces at their crossing, a fitted with adjustable jaws to be closed or opened with a right and left-handed screw. The jaws will be forced towards one another for clamping a frame as the nut-pieces are moved asunder; the screw can be adjusted upon its bar-support a thumb-nuts serve to adjust the jaws upon the frame.

23,612.—FLUSHING APPARATUS: L. H. Lloyd.—By this contrivance the water is collected in a hole or receiver to which is attached a discharge valve that is worked by the hand, the customary tipping tank not being employed, or a float will serve as an automatic working of the valve. An opening provided for a direct discharge of over-flow water into the basin.

23,616.—WINDOW SASHES: A. McKinnon.—Cords passed around pulleys in order that they may balance one another join the sashes together. In the window head are made in a movable form, and for purposes of pulling down the upper sash without opening the lower one the inventor secures one end of the cord to a pierced sliding-bar, which a spring bolt keeps in its position; when that bolt is drawn backwards the tension upon the cord is maintained with a spring on the sliding-bar. Recesses in the frame take the parting beads, which can be moved outwards, when they are lowered, with fixed ends or pins, whilst the inside beads can be detached, the head orintel being hinged that it may be turned out of the way. Rods which carry the pulleys, passed through their pivoted plates into segments guide-slots cut in fixed plates; the rods remain horizontal under normal conditions, but when a wish to turn the sashes the rods are to be tilted with a wire or rod and crank. Modified form of the invention is specified.

23,623.—FLY COCKS: C. Meyer.—For a rod with a lifting motion a screwed collar is fitted on to the plug, and a nut fastens the handle of the cock on to the collar which operates within the body of the valve; the opening of the valve by turning of the handle raises the plug off its seat and the plug is again depressed as the valve is closed.

23,663.—ALTERNATING-CURRENT MOTORS: Burke.—An iron core which has notches constituting an armature for induction motors, a series of independent closed circuit conducting elements (each embracing teeth) being inserted in the notches.

23,667.—PROCESS OF MOULDING BRICKS: E. St. Hubert.—The hopper from which the material fed to the moulds is fitted with a cut-off slide (which is worked by a handle) and a feeding screw stampers. Three horizontal discs cast in one with a cylindrical casing constitute the rotating mould table, which is carried between guide rollers, and is driven with bevel wheels or gears. The pressing plungers are carried on vertical rods which have roller guides and friction rollers running upon a fixed cam ring. Fixed rods which act through horizontal sliding rods, shut close the hinged lids of the moulds. An end chain and bevel gearing from the driving shaft work the feeding screw.

23,689.—A METHOD OF DRYING BRICKS: L. Neffens.—The bricks, tiles, &c., are laid upon perforated floor of a drying chamber, underneath which are the heating pipes. An insulating space formed in the roof, and the carrying gable stone brick has a central cavity for the insulating material together with a pierced projection for the heated air. For a saddle-shaped roof the stone or brick is made with two pierced projections.

23,732.—A CUT-OFF FOR GAS VALVES: J. M. Arnold.—An automatic cut-off valve in the plug-cock. The inventors fit a hollow plug-cock in the valve; and a cut-off valve in the plug-cock. A spring presses from above upon the cut-off valve, which

stained by a rod that has its cap embedded in the fusible composition placed within the top...

23,753.—ELECTRICITY CURRENT METERS: E. C. ... A maximum current indicator comes a method of registering the highest pressure...

23,774.—BRICKS FOR THE FLOORS OF KILNS: ... The inventors fashion nequr bricks for the floors of kilns with side ribs...

MEETINGS.

FRIDAY, MARCH 29. Architectural Association.—Mr. H. D. Seales-Wood...

SATURDAY, MARCH 30. Architectural Association.—Spring Visit to the new buildings of the Prudential Assurance Company...

MONDAY, APRIL 1. Royal Institute of British Architects.—(1) Election of candidates for membership...

TUESDAY, APRIL 2. Institution of Civil Engineers.—Mr. E. Sandeman on "The Burrator Works for the Water Supply of Plymouth..."

WEDNESDAY, APRIL 3. Royal Archaeological Institute.—(1) Mr. W. H. St. John Hope on "The Guelbertine Priory of Watton, Yorkshire..."

THURSDAY, APRIL 4. Civil and Mechanical Engineers' Society.—Mr. A. Janssen on "The Proportions of Cylinders for Multiple Expansion Engines..."

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Leuchie and Clackmannau Towers.

RECENT SALES OF PROPERTY:

Table listing estate exchange reports for March 14, including properties like Holbeach Marsh, Stamford Hill, and various other estates with their respective values.

Main table of property listings with columns for location, area, and price. Includes entries for Barnsbury, Old Ford, Hatfield, and many other areas.

Table of property listings with columns for location, area, and price. Includes entries for Barnsbury, Old Ford, Hatfield, and many other areas.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials such as Bricks, Hard Stocks, Rough Stocks, and various types of bricks and tiles.

NOTE.—The cement and lime is exclusive of the ordinary charge for sacks.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Nature of Work.	By whom Advertised.	Premiums.	Designs to be delivered
*Fire Station	Manchester Corporation	300l., 200l. and 100l.	June 24
*Shops and Houses, Parkgate	Darlington Corporation	Not stated.	No date

CONTRACTS.

Glasgow International Exhibition.

WHATEVER may be urged against the frequency of great international exhibitions, the success of Glasgow's former venture of 1888 seems sufficient warrant for her Exhibition of 1901. The circumstances are very different from those obtaining then, and the position of the centre-piece in the present year is an Art Gallery, whose origin was a handsome surplus yielded by the former formation, is an encouragement, almost an assurance, of something more than a summer and the temporary fillip to local trade the record of this second effort. The site is the previous one in Kelvin Park, but more ground has been secured. Across Dumbarton-road, which its boundary, is placed the machinery reached by a bridge; and this, with the central hall and the concert hall, all apart, are two large restaurants, constitute temporary buildings of the Exhibition. The art gallery, designed by Messrs. Mackenzie and Allen, occupies a central position connected by covered passage with the main avenue, but otherwise it is decorated by any temporary decoration. Its structure is in red sandstone, but no attempt has been made in the surroundings to echo any of its features; rather they serve as a foil, in their colour and character, to emphasise its presence. The Exhibition buildings proper are mainly dealing here. Though they are unavoidably disconnected, it must be noted that something more might have been done by way of symmetrical alignment, not only with the gallery, but with the approaches, the river, and its bridges. The lines of walks and buildings seldom meet, and this is only too obvious from the points of view which afford a panorama of the

whole grounds. The general aspect of the buildings is one of brightness and gaiety. Excepting the domes and roofs, gilt-tiled or painted, all is of plaster left white. This system (following the lead of recent exhibitions) has much to commend it in preference to painted wood boarding. The present is by far the largest use made in this country of this material, and it is not unlikely that this may lead to its employment, with some modification, for more permanent and yet light structures. It is applied to the framing of the buildings in large plates, for ease in handling kept to about 5 ft. by 3 ft. 6 in., though this size is often increased. The plates are formed by slight stretchers of wood, with additional strips as required, laid on a metal table; plaster is then poured on and a sheet of thin sacking embedded; more plaster is added and a return ply of the canvas pressed in if required for stronger work, and in a few minutes the plate can be nailed into position, and bear very considerable vibration without fracture. The joints require, of course, to be filled up with plaster, and at the same time a thin finishing coat is applied over the whole surface, which is finally painted. How far paint will form a protection from frost and weather to ordinary stucco this present experiment can only help to show. The upper surfaces of the cornices, it should be said, are of felt. This use of plaster lends itself admirably to modelled work, not fashioned *in situ* but done in pieces just as the other, and this quality has been fully taken advantage of. Throughout the spirited ornament and especially the modelled figures of Mr. Albert Hodge will be noted and admired. The architectural style chosen is Renaissance of a Spanish type; only here and there is seen a slight breaking away from historical precedent, in one case taking the form of Italian Gothic, and elsewhere that of the very latest German "arts and crafts" decoration. Of course, it may be urged that an extraordinary requirement should have been met by a treatment other than that associated with enduring structures;

but the illogicality of columns and cornices in hollow plaster simulating stone is not much greater than that of the stereotyped features of the entablature derived from a wooden prototype, and allowance must be made for a popular delight—not necessarily vulgar—in a scenic display of architectural forms beautiful in themselves, and suggestive to many of more than meets the eye. Mr. Miller's effort is the group of dome and tower, forming the centre-piece of the industrial hall. The dome shows a little more than the half-sphere, rising from a square plateau, at the corners of which are towers, but so far from the dome as to require low cupolas to fill up the diagonal space, the resulting group is therefore of considerable intricacy and richness. The dome is of sufficient exterior bulk, and, as it has no inner shell, just high enough for interior effect. The cupolas, and the open belvedere between the towers form a tea room, reached by elevators, thus usefully taking advantage of a fine position for outlook. One may regret that so much elaboration has been concentrated on this part of the erection, to be demolished after six months' use with the rest, but the first intention was that the dome should be retained as a winter palace when the surrounding buildings were cleared away. This idea, however, has been abandoned, and properly so, for so large an erection would encumber the park, and its near proximity to the Art Gallery would be a disadvantage to both. In front of the dome, towards the river, is a piazza—a costly feature in respect of the lettable floor space sacrificed to it, but one which amply justifies itself as a dignified architectural adjunct. Its side to the river is an open colonnade, with a great archway: all constructed decoration, but more than defensible. As effective as any part of the whole design is the wall-face extending between the eight pavilions that mark the corners of the two squares into which the industrial hall is divided by the dome and piazza. It is in stretches of a dozen bays or so of arched windows between pilasters; beneath is a perfectly plain story; above, a

cornice and pierced parapet, all very well illustrating the value of repetition of parts. The pavilions have red-tiled roofs, greatly projecting eaves, and semi-spherical domes, felt-covered, and painted green like copper. The great dome is entirely gilt. It is in these pavilions that the anachronisms in style referred to appear, the great coved cornice resting on nondescript pilasters, which are altogether out of scale, being much too large. The arched cove has an outward bulge, and this feature is repeated with exaggeration at the great entrance from the piazza.

There is much variety of design in the many towers. Those at the ends of the Great Avenue are square, rising to an open belvedere, with a circular centre tower rising higher. Slight vagaries in style here are the vaulted covering above and the heads themselves of the window lights, which are of ogee shape with Gothic-esque labels. Other smaller towers are circular, some tapered; all have covered roofs; all have far projecting shelf-like eaves that

with their white undersides light up very well.

The machinery hall has only one frontage, that to Dumbarton-road, consisting of a central gable and two lesser ones on either side. Twin towers flank the centre, where the covered way bridges the road and connects by the Grand Avenue with the rest of the Exhibition.

The concert hall is a rotunda, and accommodates over 4,000 persons. A balcony extends the depth of a circular aisle, and the roof is a saucer-dome (externally felt, painted green) with an eye for light. There is no break in the circle for an organ recess, the face of the instrument lining with the columns that form the aisle. There is a square annexe for the entrance, with a central and two side staircase towers. Here occur some Italian Gothic tracery and Venetian trefoiled battlements; but the imported features are quite in scale. At the opposite diameter is a large restaurant, in its great extent an afterthought of the Executive, which quite inexcusably involved

the demolition of an interesting old Kelvingrove House, against the protest of the Glasgow Architectural and Archaeological Societies and all citizens of taste. The restaurant will be removed with the concert hall; its metal construction does not permit of this, but it remains to be seen if its fragile wallings will stand.

Regarding the materials of construction, change was made during the progress of the works, wood largely taking the place of iron, because of difficulty in getting the latter. Only the centre aisle roof, the industrial and machinery halls, the concert hall and the concert hall are of metal. The principals are made up of light iron, with various combinations, and take the form of elliptical arches; in the larger instances the foot is contracted to a pivot at the ends to permit of contraction and expansion. The other roofs are of ordinary wood. The extent of glass is about three times the floor area. The floor itself is close-boarded, less cold and more cleanly than open

ing. Laminated wood construction is only employed at the Grand Avenue, where semi-circular principals in four thickness of 1-in. "stuff" give an architectural effect more pleasing than the truss roofs.

It has been an aim to give as uninterrupted a floor space as possible, and this practical end has been attained. The fewness of roof supports is quite remarkable; but the spectacular result is most disappointing, for the actual extent cannot be grasped in the jumble of exhibits, of all shapes and sizes, through lack of division into courts. What is required is that the roof supports should be emphasised, whether as colonnade or arcade, anything to give scale and vista—a row of useless "Venetian" masts would do this—and so give the advantage to exhibits of frames to pictures of a size the eye can grasp.

This very openness of the industrial hall accentuates the solidity of the towers surrounding the dome, and the four arches between, of deep soffit. Attached to the pendentives are great modelled winged figures standing in the prows of galleys. Up to the first cornice all is plain white, above in the drum a conventional landscape is painted, interrupted by the windows that light the tearoom. Above is the range of lucarnes, and over all the unbroken hemisphere with floating figures painted on it. Under the dome is a statue of his Majesty, modelled by Mr. Hodge. This part, then, alone of the interior is treated architecturally; all around is a riot of heterogeneous exhibits. It will be gathered that the principal artistic merit of the buildings is external, and the architect, Mr. James Miller, is to be congratulated on his conception, satisfying as a composition and made interesting by clever detail.

NOTES.

The Monument to Queen Victoria
It is understood (though not officially announced) that five architects have been selected to submit designs for a structure to be erected in front of Buckingham Palace as a monument to the late Queen, viz., Mr. T. G. Jackson, Mr. Aston Webb, Mr. Ernest George, Sir Thomas Drew, and Dr. Rowand Anderson. We have no fault, of course, to find with the selection of names as far as it goes; but it is rather a limited one, and we do think that in the first instance there should be a sketch competition open to all English architects and sculptors—for the architects ought to work in conjunction with the sculptors for such a monument, as would certainly be the case in France; and we repeat that if such a structure as is apparently contemplated be set up in front of Buckingham Palace, it will make the Palace front look ridiculous. The Palace façade and the whole laying out of the adjoining site ought to be integral elements of the design; and it will be a failure if they are not made so.

The Use of Water-Gas in London.
The substitution of carburetted water-gas for coal-gas in the public gas supply in certain parts of the Metropolis is proceeding apace. The report of the Commercial Gas Company shows that during the last half-year 83,945 tons of coal were carbonised, and 1,758,190 gallons of oil were also used for gas manufacture, the total make of gas being 1,406,501,000 cubic feet. Apparently, therefore, about

40 per cent. of the total output of gas consisted of carburetted water-gas. It is evident that the recommendations of the Departmental Committee which sat in 1899 to inquire into the use of water-gas are being quietly ignored, and the nature of the gas supplied is being changed without any reference to the wishes of the consumers. We do not say that carburetted water-gas should not be supplied if it can be more cheaply manufactured; but we do say that, in view of its greater gravity and the large proportion of poisonous carbonic oxide it contains, consumers should be warned to examine the soundness of their gas-fittings, and the statutory minimum limit of gas pressure should be raised. It is not in London only that water-gas is replacing coal-gas. The recent increases in the price of coal have caused it to be introduced in most of the large towns throughout the United Kingdom.

The Sanitary Condition of Factories.

WE have said many times that, however desirable improvements in sanitary legislation may be, the first need is that Sanitary Authorities should carry out the law. If they would do this further legislation would be little required. No stronger instance of the obstructive tendency of the existing authorities can be found than the recent case of Tracey v. Pretty & Sons, which can be found in the March number of the "Law Reports." Messrs. Pretty were the owners of a corset factory at Ipswich, and the factory inspector gave notice to the Sanitary Authorities that there was a deficiency of sanitary accommodation at this factory. The authority, however, took no proceedings as they should have done, and the inspector thereupon gave notice to Messrs. Pretty, under the Factory and Workshop Acts, that they must provide proper sanitary accommodation. Again nothing was done, the owners of the factory taking no steps to remedy the defects, and thereupon proceedings were taken before the justices to recover the legal penalties for this neglect. At the hearing of the case these gentlemen decided that they could go into the merits of the case, with the result that they found the accommodation sufficient and dismissed the summons, with costs. Upon the question of fact it is sufficient to quote from the judgment of Mr. Justice Grantham:—"If it was necessary to show the reasonableness of the requirements of the inspector, and the ignorance of magistrates of the usual accommodation provided in factories, I might add that whereas one water-closet for every seventy persons was considered by the magistrates sufficient in this case, yet in London and all the principal towns in England one in twenty to one in thirty is the minimum number provided." No words could be more condemnatory of the action of the Local Authority and of the local magistrate than this judgment. When the case came before the Queen's Bench Division it was held that the justices had no jurisdiction to enter into the merits of the question, and that their decision must be quashed. This judgment, therefore, greatly strengthens the hands of factory inspectors in regard to sanitary matters, but it also shows that for the improvement of the sanitary condition of many places in England pressure upon the Local Authorities is absolutely necessary.

The Temperature of Workshops.

THE value of the supervision of the Central Government is well exemplified by a case which was recently decided in one of the London Police-courts. The owner of a workroom which was used by a number of girls was summoned for not keeping it at a proper temperature as required by the Factory and Workshops Act. It was proved that the temperature was less than 60 deg., and this, upon the evidence, the magistrate held to be a non-compliance with the Act of Parliament. Sixty degrees, he said, was the lowest temperature at which a room occupied by workers sitting still should be kept. The owner was accordingly convicted. Warmth is as necessary as food or drink, and such a decision as this marks the onward movement in regard to sanitary regulations. Yet one cannot but smile at the conviction of this person, for what hundreds of people in England engaged in sedentary occupations are obliged for a long time to endure a temperature less than 60 deg. There are numbers of comparatively comfortable houses which in this country are never kept, and cannot be, at a temperature which is seasonable. In spite of our mild climate, there is probably greater discomfort suffered from cold than in any country in the world. Private persons must be allowed to do what they will with their own, but railway companies and other corporations which do business with the public should be compelled by statute to keep the interior of their buildings at a proper temperature.

Manchester Fire Station Competition.

THIS competition was advertised in our columns last week; it will have been noticed that nothing was said as to an assessor being employed, a point which could not be discovered without depositing two guineas for a copy of the Conditions. No architect in his senses (none of any standing at least) would go into such a competition unless an assessor were appointed; and it is, of course, exceedingly unfair that people should be expected to risk two guineas to discover whether an assessor has been appointed or not. A correspondent who has risked his two guineas, however, writes to us to say that the Conditions include the following: (1) the Corporation do not undertake to place the work in the hands of the architect to whom the first premium is awarded; (2) the remuneration, if they do employ him, is to be at the rate of 3 per cent. instead of the usual commission. The Corporation of Manchester must be very badly advised if they suppose that any architect of standing will go into a competition on such terms. Our correspondent adds—"I have just stopped payment at the bank of the deposit cheque of two guineas"; and probably those architects who may read this will keep their two guineas in their pockets.

A CORRESPONDENT, writing St. Mary's Hall, Coventry, sends us an alarming advertisement from the Coventry Times, signed by the City Engineer, inviting tenders for work to be done on the old and interesting fourteenth-century building called St. Mary's Hall, which, the advertisement states is to be "restored and renovated." As far as we gather from the advertisement, the City Engineer has the work in hand. Surely in

cornice and pierced parapet, all very well illustrating the value of repetition of parts. The pavilions have red-tiled roofs, greatly projecting eaves, and semi-spherical domes, felt-covered, and painted green like copper. The great dome is entirely gilt. It is in these pavilions that the anachronisms in style referred to appear, the great coved cornice resting on nondescript pilasters, which are altogether out of scale, being much too large. The arched cove has an outward bulge, and this feature is repeated with exaggeration at the great entrance from the piazza.

Again nothing was done, the owners of the factory taking no steps to remedy the defects, and thereupon proceedings were taken before the justices to recover the legal penalties for this neglect. At the hearing of the case these gentlemen decided that they could go into the merits of the case, with the result that they found the accommodation sufficient and dismissed the summons, with costs. Upon the question of fact it is sufficient to quote from the judgment of Mr. Justice Grantham:—"If it was necessary to show the reasonableness of the requirements of the inspector, and the ignorance of magistrates of the usual accommodation provided in factories, I might add that whereas one water-closet for every seventy persons was considered by the magistrates sufficient in this case, yet in London and all the principal towns in England one in twenty to one in thirty is the minimum number provided." No words could be more condemnatory of the action of the Local Authority and of the local magistrate than this judgment. When the case came before the Queen's Bench Division it was held that the justices had no jurisdiction to enter into the merits of the question, and that their decision must be quashed. This judgment, therefore, greatly strengthens the hands of factory inspectors in regard to sanitary matters, but it also shows that for the improvement of the sanitary condition of many places in England pressure upon the Local Authorities is absolutely necessary.

The Temperature of Workshops. THE value of the supervision of the Central Government is well exemplified by a case which was recently decided in one of the London Police-courts. The owner of a workroom which was used by a number of girls was summoned for not keeping it at a proper temperature as required by the Factory and Workshops Act. It was proved that the temperature was less than 60 deg., and this, upon the evidence, the magistrate held to be a non-compliance with the Act of Parliament. Sixty degrees, he said, was the lowest temperature at which a room occupied by workers sitting still should be kept. The owner was accordingly convicted. Warmth is as necessary as food or drink, and such a decision as this marks the onward movement in regard to sanitary regulations. Yet one cannot but smile at the conviction of this person, for what hundreds of people in England engaged in sedentary occupations are obliged for a long time to endure a temperature less than 60 deg.! There are numbers of comparatively comfortable houses which in this country are never kept, and cannot be, at a temperature which is seasonable. In spite of our mild climate, there is probably greater discomfort suffered from cold than in any country in the world. Private persons must be allowed to do what they will with their own, but railway companies and other corporations which do business with the public should be compelled by statute to keep the interior of their buildings at a proper temperature.

Manchester Fire Station Competition. THIS competition was advertised in our columns last week; it will have been noticed that nothing was said as to an assessor being employed, a point which could not be discovered without depositing two guineas for a copy of the Conditions. No architect in his senses (none of any standing at least) would go into such a competition unless an assessor were appointed; and it is, of course, exceedingly unfair that people should be expected to risk two guineas to discover whether an assessor has been appointed or not. A correspondent who has risked his two guineas, however, writes to us to say that the Conditions include the following: (1) the Corporation do not undertake to place the work in the hands of the architect to whom the first premium is awarded; (2) the remuneration, if they do employ him, is to be at the rate of 3 per cent. instead of the usual commission. The Corporation of Manchester must be very badly advised if they suppose that any architect of standing will go into a competition on such terms. Our correspondent adds—"I have just stopped payment at the bank of the deposit cheque of two guineas"; and probably those architects who may read this will keep their two guineas in their pockets.

A CORRESPONDENT, writing from Coventry, sends us an alarming advertisement from the *Coventry Times*, signed by the City Engineer, inviting tenders for work to be done on the old and interesting fourteenth-century building called St. Mary's Hall, which, the advertisement states is to be "restored and renovated." As far as we gather from the advertisement, the City Engineer has the work in hand. Surely in

such a case the Coventry authorities ought to call in the assistance of an architect acquainted with Gothic architecture, and not leave the treatment of the building to an engineer.

The Poultry Cross, Salisbury. THIS well-known monument, a conspicuous object in the quiet streets of Salisbury, seems to be threatened with the same kind of treatment as St. Mary's Hall at Coventry, mentioned above: It is to be repaired, under the direction of the City Engineer, at the hands of a local firm of "monumental masons and sculptors," who execute "all kinds of memorials in granite, marble, or stone." It is moreover to be treated with "fluat" to prevent its further decay; an operation which must be preceded by the removal of all lichens, &c.; in short, the older portions must be scoured to a raw new surface. It is gratifying to find that a protest was raised by a member of the Town Council (Mr. Pye-Smith) against any attempt at a wholesale restoration, or anything beyond making good the decayed portions; and an amendment to this effect was carried, but only by the Mayor's casting vote. The Cross, it is true, was so much restored fifty years ago that much of its archaeological value is gone; but it still retains some of the ancient work, and such a monument ought not to be left to be dealt with by an engineer and a firm of masons. The Council have at their very doors a most competent archaeological architect, Mr. Doran Webb, of Salisbury; why do they not consult him?

St. Paul's Church, Ball's Pond. THE Ecclesiastical Commissioners have agreed, it is stated, to contribute 500*l.*, and an appeal is made for further subscriptions, towards the proposed reparation and improvement of this church. The sum required is estimated at 2,500*l.* The alterations include the restoration of the outer stone and brick work, an enlargement of the choir vestry, the decoration of the interior, repairs of the organ (by Russell, 1828, improved by Willis, and enlarged by Robson, 1875), a new choir, &c. The district church of St. Paul, standing at the junction of Essex and St. Paul's roads, was built in 1826-8 after Sir Charles Barry's plans and designs, in pursuance of what is known as the "Million" Act of 1818, 58 Geo. III., cap. 45. Under a subsequent Act of 2 Will. IV., cap. 26, it was decreed that a sum of 1,000*l.* a year, derived from the endowment, which is now greatly increased in value, of Richard Cloudesley's "Stoney Field" or "Fourteen Acres" trust (1517) in Islington, should be shared equally by the three district churches of St. Paul, St. John, Holloway, and Holy Trinity, Cloudesley-square, and the Islington Chapel-of-Ease in Holloway-road. In our article of January 5 last upon Sir Charles Barry's works we commented upon the architectural features of St. Paul's Church, which was erected during the rectorship of the Rev. D. Wilson.

Portman Market. IT is stated that the new market, erected at a cost of about 40,000*l.*, will be formally opened on Thursday, 18th instant. Plans and designs for the new buildings were prepared by Messrs. Gordon, Lowther, & Gunton for the Portman Market, Limited, a company that was constituted for taking a lease of the property from Lord Portman; the purchase price

of the lease and existing market rights were fixed by the vendor at 40,000*l.* The site, being that of the original market, is in Church-street, St. Marylebone parish, and covers an area of 43,500 ft. superficial, opposite the goods terminus of the Great Central Railway, with entrances from Salisbury, Carlisle, and Church streets. The market was established there under the provisions of an Act 11 Geo. IV., cap. 71, and additional powers were obtained in terms of an amending Act of 2 and 3 William IV., cap. 113.

Sketches and Studies by Millais. THE announcement of an exhibition of pictures, drawings, and studies by Millais, at the Society of Fine Arts Gallery, does not seem to have excited the interest that one might have expected, for the attendance at the private view last Saturday was smaller than usual on these occasions. It may be admitted also that the collection was to some extent disappointing, as the majority of the sketches for well-known pictures were of an exceedingly slight description, and could hardly be called "studies." Mr. J. G. Millais, in his short preface to the catalogue, remarks indeed on the fact that Millais, except during his "pre-Raphaelite" period, did not think it necessary to make highly-finished designs for his principal figures; "as a rule he was content, before making a big picture, to cover odd sheets of paper with scores of outlines for it." Many of these are here—the slightest possible experiments in the grouping and pose of the figures; and certainly the finished pictures convey no idea of what of great force and intensity—Millais evidently put his whole heart into this picture; and there is a small highly-finished drawing for the "Ophelia." The drawings made when the artist was still a child—"Turks Robbing a Chest," drawn at the age of nine, and the study of a man's head and two feet, when he was under eight, are remarkable examples of precocious talent; the foreshortened feet are like the work of a practised artist. Very remarkable, too, is the large water-colour of a scene from "Peveril," crowded with figures and very well composed. The sketch for the "Booth of Raleigh" shows that the broad-brimmed hat of the sailor, in the finished picture, was an afterthought; in the sketch he is bareheaded; it was a most happy alteration, by which the effect of the picture gains immensely. The sheet of designs made in 1852 for Ruskin, to show "how natural forms may be made to conform to architecture," is curious, and the border is a noteworthy piece of illumination design, but one cannot wish that the other suggestions (animals worked into the lines of window-tracery, &c.) had ever been carried into execution. Among the complete drawings is the exquisite and delicate little pencil-and-tint work called "Reverie," a perfect little picture in itself. The oil-paintings lent are "Sir Isumbard," which one is always glad to see again; the early picture of "Cymon and Iphigenia," which might have been painted by Etty; and "The Woodman's Daughter," a remarkable work of the early period, which has not been often exhibited: the figure of the little girl is quite in Millais'

best way. Among the few finished drawings are the very fine and powerful conception, "Virtue and Vice," and the pen-drawing entitled "The Race Meeting," showing a keen power of satire such as one would hardly expect from the evidence of Millais' finished pictures only. He might, had he chosen that path, have been the modern Hogarth; but on the whole we may be glad that he did not.

LETTER FROM PARIS.

THE "Commission des Grands Travaux Départementaux" decided last week to ask Parliament to vote a credit of 7,200,000*l.* for the purposes of various important works to be done shortly in the Seine department, a portion of which will be 350,000*l.* for the work of purifying the river Seine from the Marne to the Bièvre; 240,000*l.* for the construction of old age hospitals; 800,000*l.* for new buildings for schools and colleges; 28,000*l.* for restoring and rearranging the Palais de Justice; 120,000*l.* for a school of arts and trades; 100,000*l.* for the completion of an asylum at Maison-Blanche; 300,000*l.* for the construction of a new asylum for idiots; 180,000*l.* for the transfer of the St. Lazare Prison near Paris; 600,000*l.* for various works of architecture; 1,200,000*l.* for new bridges and roads; 360,000*l.* for the construction of a seventh departmental asylum; and various other works. The credits will probably be voted in July next, and such important works will be a boon to the vast army of the unemployed at Paris since the Exhibition.

The "Jury des Habitations à Bon Marché" has now made the awards in connexion with the competition amongst architects, householders and others for sanitary and economical dwelling-houses constructed since January, 1896, at Paris and in the Seine department. The prize of 80*l.* for the best example of collective dwellings was carried off by the "Société Civile du Groupe des Maisons Ouvrières" for a dwelling in the Rue Jeanne d'Arc at Paris, and a gold medal was awarded by the Municipal Council to the architect, M. G. Guyon. Prizes of 40*l.* each were awarded to the owners of various collective dwellings at Paris, and silver medals to the respective architects, MM. Torlet, Dupuy, Goujon, Hennequin, Duquesne, Chabrol, Contrat, and M. Guyon, the architect of the premiated building above-mentioned. In the section of small family dwellings, medals were awarded to the architects, MM. Contelet, Senet, and Meriot. M. Charles Lucas, architect and member of the jury, one of the chief organisers of the competition, read a most interesting report, and announced that a second competition would take place in 1904, under the auspices of the departmental committee, for collective dwellings, hotels and furnished houses, and small family dwellings. The departmental committee of the Bouches du Rhone has decided to open a competition at Marseilles for a type of cheap dwellings.

The jury appointed to decide the competition for the best and most artistic façades of houses recently erected at Paris, mentioned in the last letter, should have made its award last week, but has decided to make one more visit to the various competing buildings before doing so.

M. Albert Maignan, painter, and M. Guilbert, architect, gave a private view a few days ago at the uncovering of the magnificent fresco which M. Maignan has just completed in the dome of the Chapel of the Rue Goujon, raised in memory of the victims of the Bazar de la Charité. The chapel, which was inaugurated in its incomplete state last year, will be opened towards the end of this month in a finished state.

The jury of the section of painting of the Société des Artistes Français has accepted 1,500 out of 6,000 works of painting sent in, not including the paintings "hors concours," of which there are about 600. The Société des Beaux Arts on its side has accepted only 225 paintings out of 3,000 sent in. The votes of the jury of architecture will take place on April 9.

The Empress Eugénie has sent 400*l.* towards the restoration of the old church of Reuil, where are interred the remains of Empress Josephine and Queen Hortense. The foundation-stone of this building, erected in 1584, was laid by the titular King of Portugal; the splendid entrance-porch is due to the munifi-

ence of Cardinal Richelieu, and was the work of Le Mercier, architect of the entrance-door of the Sorbonne.

M. Henri Jouin, secretary of the Ecole des Beaux Arts, has made a careful inventory of the historical statues and monuments raised by subscription in the cemeteries of Paris, with a view of obtaining the immediate restoration of those which have much suffered through carelessness and neglect. M. Grébaux, Municipal councillor, has obtained a vote of money for the proper restoration of the most artistic and best known of these sepulchral monuments.

The "Société des Amis des Monuments Parisiens" are holding a meeting to discuss the following questions:—The exterior aspect of the new stations of the Metropolitan Railway—these stations, designed in modern style, are exciting much adverse criticism; the reservation of the balustrading around the galleries; the restoration of the railings around the Cathedral of Notre Dame; and the delay made by the authorities in re-establishing the site of the Esplanade des Invalides and the ground occupied by the recent Exhibition.

The rather sudden demise of the well-known painter, M. Jean Charles Cazin, is announced. Born in 1841 at Samer, he devoted himself to art at an early age; he first exhibited at the Salon of 1865, and for the next ten years gave himself almost entirely up to the teaching of drawing. He was professor of drawing at the Ecole Libre d'Architecture at Paris, then became director of the Ecole des Beaux Arts at Paris, passing later on to South Kensington, where he was professor of drawing, returning to Paris in 1875, he began to exhibit more frequently at the Salons, attracting great attention by his very personal style. His best known works are the "Flight to Egypt," the "Journey of Tobias," "Hagar and Ishmael" (which won him a first medal at the Salon of 1881), "Judith," and a number of landscapes, mostly on a small scale, but remarkable for breadth of style. He was, at his death, vice-president of the Société Nationale des Beaux Arts. He was entrusted with the completion of the mural paintings of the Pantheon, commenced by M. Puvion de Chavannes. The arrangement of the five large rooms at the Louvre Museum destined to receive the important collection of the Garde Meuble, and form a museum of furniture from the style of Louis XV. to that of the Empire, is nearly completed, and in a few days the removing and installation of the furniture will take place. The walls of these rooms have been decorated in a manner to bring into value their magnificent ceilings. Several splendid examples of tapestries, Beauvais, and Aubusson tapestry, as well as some magnificent Sevres vases are ready in place.

The question of constructing a new hall for the meetings of Parliament at the Palais Bourbon has been again brought forward. In 1898 a vote of 120,000 was voted for this work; and the official architect of the Chambre des Deputés was asked to prepare a scheme for a new hall to be constructed in as perfect a manner as possible as regards heating, lighting, and ventilation. The architect seems to have left the matter in abeyance, for it was proposed to obtain competition schemes from various architects.

The various proposals for the utilisation of the Cirque des Champs Elysees not having proved acceptable, the Municipal Council has voted an annual rent of 2,000l. for the building, and will choose the most advantageous offer that may be made; in the absence of any such offer the building will be at once demolished. The scheme for transforming the Champ des Mars presented by M. Bouvard, architect to the City of Paris, will probably be decided upon and accepted before the end of the present session. M. Bouvard proposes to disengage the facade of the Ecole Militaire by demolishing the Galerie des Machines, and to form a large garden or park leading from the Ecole Militaire as far as the Seine and the gardens of the Trocadero, lined on either side by fine private and flat dwelling-houses. All these houses will be built from one design, the ground floor of each opening on to a covered gallery or arcade with captured columns surrounding the whole of the Champ de Mars, and accessible to visitors to the gardens. The gardens will be "à la française," and will contain a lake 900 ft. long by 330 ft. wide, which will be opened to the public in the winter time; an elliptical course and the lake will be reserved for cyclists

Fig. 1.

Fig. 2.

and automobiles, and the whole will include alleys for riders, a theatre and restaurants. This scheme, if put into execution, will greatly improve the quarter and form an agreeable separation between the somewhat rough and dirty quarter of Grenelle and the better quarter of the 7th arrondissement.

LUXFER PRISMS, AND PRISMATIC LIGHTING THEORY AND APPLICATION.*

LUXFER PRISMS as they now exist are the result of an exhaustive study of the refraction and reflection of light, and in opening the subject for your consideration, I wish to review some of the elementary laws of these phenomena.

Refraction.

The velocity of light is about 186,000 miles per second as it passes through space on its way from the sun to the earth, that is, through the ether or a vacuum. If it passes through any other medium, such as air or glass, its velocity differs from the above value. The ratio of the velocity of light in vacuo to its velocity while passing through a particular substance is termed the index of refraction for that substance. When light is refracted it is decomposed, due to the fact that the velocities of the various colours in the given substance are not uniform, so that one colour suffers a greater or less change of direction. The violet rays travel slower than the red, so that the index of refraction is greater for the violet than for the red. In determining the index of refraction for any body the yellow rays are usually taken. The index of refraction for the glass of which Luxfer Prisms are made is about 1.53, which indicates that the velocity of the yellow rays in this glass is about two-thirds of their velocity in vacuo, or about 120,000 miles per second. The index of refraction for air is 1.0003, which for our purpose we may regard as unity.

It is a matter of every-day experience that the direction of a ray of light through media of uniform density is a straight line. It is in recognition of this fact that the savage has learned to aim his arrow and the modern marksman his long-distance rifle. This truth was realised long before the nature of light was suspected. Modern science has shown light to consist of a series of waves which are perpendicular to the direction of propagation, or to the ray itself; and, if we could see the waves, their cross-section would probably remind us very much of the waves coming in on the sea shore. What is emphasised here is that the wave fronts are perpendicular to the direction in which they travel.

When light passes from one medium to another we have seen above that its velocity is changed. Its direction is also changed. We shall now see that the change of direction of the ray is a result of the change of velocity. In Fig. 1, let J-K and A-M represent waves of light moving in the direction indicated by the arrows, and falling upon the surface of glass S-T. In a short time after the wave has taken the position A-M, the part of the wave which was at C will have passed through the distance C-B with the velocity of light in air. During the same time the part of the wave which was at A will have passed through a distance about two-thirds as long as C-B. If we strike an arc G-H from A as centre, with a radius two-

thirds of the distance C-B, we are quite sure that the part of the wave formerly at A will be found somewhere upon this arc. The wave fronts J-K and A-M are practically straight lines, and we know by experience that the wave fronts, after passing through a plane surface, are still straight lines. If we draw through B a tangent to the arc G-H, this line B-H will fulfil all the conditions above for the wave front at the second instant of time considered, and by a more elaborate discussion may be shown to be the actual position of the wave front.

It will be noticed that the direction of the wave has changed. If V_1 is the velocity of light in air and V_2 is the velocity of light in glass,

$$\frac{V_1}{V_2} = \frac{CB}{AH} = \frac{VP \sin CAB}{ABH \sin HAG} = \frac{\sin i}{\sin r}$$

where i is the angle of incidence CBF of the ray striking the glass, and r is the angle of refraction HAG of the ray after entering the glass.

Above we defined the index of refraction as the ratio of the two velocities $\frac{V_1}{V_2}$. We now find that this index of refraction is equal to the ratio of the sines of incidence and refraction. This definition is the one which is used in all mathematical work in light, and in what follows we shall use for our law of refraction,

$$n = \frac{\sin i}{\sin r}$$

The Paths of Rays through Prisms.

Let ABC (Fig. 2) represent a section through a refracting prism, and let the light fall upon the prism in the direction DB. We wish to find the direction which the light takes in the prism. Construct at B, as centre, two circles, the ratio of whose radii is equal to the index of refraction. The path of the incident ray strikes the inner circle at E. Project E perpendicular to AB, striking the larger circle at F. FB is the direction of the ray in the prism. For,

$$\sin i = \frac{EG}{EB}$$

$$\sin j = \frac{FH}{FB}$$

$$EG = FH$$

$$n = \frac{FB}{EB} = \frac{\sin i}{\sin j}$$

i is the angle of incidence, therefore j is the angle of refraction.

To find the direction in which the light leaves the prism, project F perpendicular to the face CB, striking the smaller circle at the point K. KB is the direction in which the light leaves the prism. The reasoning is similar to the above.

Let us find the prism angle required to change light from one given direction to another given direction. In Fig. 3, AB represents the surface of the prism. The light falls upon this surface in the direction DB, and we wish to throw this light in the direction B'I. Project E perpendicular to AB, striking the outer circle at A. Produce B'I, striking the smaller circle at G. Draw BH perpendicular to FG. ABH is the prism angle required.

Fig. 4 shows the path of the ray DE through the reflecting prism ABC. FB is drawn parallel to DE. F is projected perpendicular to AB. G is projected perpendicular to the reflecting surface BC. H is projected perpendicular to the refracting surface AC. JB is the direction of the ray on leaving the prism.

* A paper read before the Northern Architectural Association, February 6, by Mr. R. A. Wood, B.S., M.E.

Prism Curve Table.

Upon the prism curve table, Fig 5, the curve marked J was constructed in the following manner:—A diagram similar to Fig. 2 was made for a prism having an angle ABC equal to 30 deg., and a large number of rays DB were drawn striking the prism, and the direction of each of these upon leaving the prism was ascertained. For instance, it was found that the light coming at an angle of 80 deg. from the vertical leaves the prism 7 deg. above the horizontal; that a ray coming at an angle of 74 deg. from the vertical leaves the prism in a horizontal direction; that a ray striking at an angle of 59 deg. from the vertical leaves the prism at an angle of 15 deg. below the horizontal. These various points were plotted on squared paper similar to that used in the curve table, and the smooth curve marked J on the prism curve table was drawn through these points. The curves for the other prisms were drawn in the same manner.

The numbers on the lower line of the prism curve table, 20, 30, 40, &c., are the zenith distances of the rays striking the prism plates. The numbers at the left side of the table are the directions in which the rays leave the prisms. H indicates the horizontal direction, the numbers below H indicate degrees below the horizontal, and the numbers above H indicate degrees above the horizontal. For instance, a ray striking the 50 deg. prism at an angle of 60 deg. from the vertical, leaves the prism in a horizontal direction. The ray striking this prism at an angle of 65 deg. from the vertical leaves 7 deg. above the horizontal, and the ray striking this prism at an angle of 50 deg. from the vertical leaves at an angle of 11 deg. below the horizontal. The prism curve table saves us the trouble of making a diagram such as Fig. 3 whenever we wish to change light from one direction to another. For instance, if we wish to throw light coming from an angle of 55 deg. from the vertical into a direction 1 deg. below the horizontal, we see at once that the 55-deg. prism will answer this purpose.

To Determine What Prisms to Place in a Window.

The general method of lighting by means of Luxer Prisms, is to throw the light from the sky directly into the room. We treat the sky itself as a luminous surface. We do not derive our light from the sun directly. If we did this, we should need to change our prisms every hour of the day. The sky itself is very bright in comparison with ordinary objects. The light from the sky ordinarily falls upon a window and goes straight through and reaches the floor at a point not very far distant from the window. The floor is of a dark colour reflecting perhaps only one-tenth part of the light falling thereon, so that perhaps nine-tenths of the light is lost upon reaching the floor. If prisms are placed in the window the light is thrown directly back into the room before striking the floor. The first object which this light strikes is the one which we wish to illuminate, and in general it is of a light colour. The prism plate in the window practically takes the place of a skylight. It is to be thoroughly understood that prism plates placed in windows do not increase the quantity of light entering the room. They simply re-distribute the light in such a manner that it is utilised to a much better advantage.

Uniform Plate.

In determining the proper prism to place in any window, we must know both the direction in which the light falls upon the prism and the direction in which we wish to have the light leave the prism. If we know the direction in which the lowest light falls upon the prism, we know for ordinary cases that the other directions lie between this and the vertical, and if we know the direction in which we want the highest light thrown in the room, the other directions in which we wish light will be between this and the vertical in a downward direction. If we throw the light which falls upon the prisms in the lowest directions so that it leaves the prisms in the highest direction desired, then, in most cases, the other rays of light falling upon the prisms between the lowest direction and the vertical will illuminate other parts of the room which we wish lighted and our problem is substantially solved.

In Fig. 6, let L_1 be the lowest direction in which light falls upon the prism plate, and let

Fig. 3.

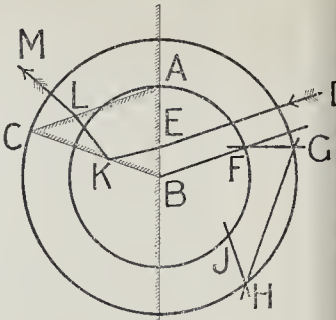

Fig. 4.

Fig. 5.

A be a desk which it is desired to illuminate and which is the object farthest back in the room and highest up from the floor that we wish to illuminate. If such a prism is placed in the window that the light L_1 (striking the lowest prism in the window) takes the direction D, (the direction from the lowest prism to the desk), then the desk A will be lighted by every prism in the window; for, although the light L_2 , which is parallel to L_1 and striking the upper prism of the window, goes above the desk A, there will be some other ray L_3 higher than L_2 which will take the direction D_3 and strike the desk. All the other rays above L_3 will go lower than D_3 and into the part of the room which we wish to illuminate, and practically all the light striking the window will be utilised.

If there is no prism which will throw the lowest ray directly upon the point desired it is usually best to select the one which throws the light above the point. In rough work it is sufficient to throw the light in a horizontal direction, and in rooms which require a general illumination it is better to throw the light rather high than to confine it too nearly to the floor. For the general effect of the window plate upon people inside the room, it is commonly best if there is light enough to spare to arrange the prisms so that none of them will appear dark to a person in any part of the room.

Plate of Varying Prisms.

It may happen, in case the prism plate is quite deep and in case the desk A is quite near the window, that it will be desirable to place a prism in the top of the plate which is different

from that placed in the bottom of the plate. Suppose that we wish to place prisms in upper sash 5 ft. deep, the zenith distance being 51 deg., and we wish to light a desk 20 ft. from the window, the top of which is 10 deg. below the level of the lower edge of the upper sash and 17 deg. below the upper part. Looking to the left of our table, finding the line of 10 deg. below the horizontal, and following it to the right, we find it intersects the vertical line marked 51 upon the L prism curve. If, therefore, we place the L prism in this window, the desk will be lighted satisfactorily, and the bottom of the remaining light will fall between the desk and the window. It may be noticed, however, that the K prism curve crosses the 51 deg. angle at 17 deg. below the horizontal. So that if we put L prisms in the lower half of a window and K prisms in the upper half, we shall accomplish the same result so far as the desk is concerned, and shall not throw so much light over the desk, but will save this for a space between the desk and the window, an area which we wish to illuminate.

Light Near the Window.

Referring now to the intensity curve table will be noticed that the space which becomes brightest in a room is now left practically without light. The lowest light from the prism is 25 deg. below the horizontal, from the N prism 32 deg., &c. It is evident, therefore, that there is a dark area in a room near the window. In order to obviate this difficulty it is absolutely necessary in almost all cases to insert a few prisms of low angle in the prism plate. For instance, given a zenith distance

Fig. 6.

Fig. 7.

Fig. 8.

will then be divided by section lines, the intersections of which will determine points upon that surface. At the intersections of these lines let lines be drawn perpendicular to the plane of the lines. We now have three series of lines, Fig. 7, which may be taken as representing the principal edges of any building which may form an obstruction to the light which comes to the proposed prism plate. Thus a horizontal line would represent the top of such a building. On the diagram the horizontal lines are lettered "P." One of the vertical lines referred to, marked "T," would represent the side of the building. One of the last set of lines, lettered "W," would represent the retreating edge of the building.

Let us now imagine each of the three sets of lines to which we have above referred as constituting a source of light, that is, as being composed of molten platinum, so that as one viewed the surface each line would be distinctly visible. If we further use our imagination and consider that this triple system of lines be projected upon the back wall of the room to be lighted by means of the prism plate, we would have upon such back wall a distorted reproduction of the system due to the refraction of the straight lines into curved lines. If the prism plate were composed of prisms termed 202 M the result would be in effect such as is shown in fig. 8, which upon examination is seen to consist of three sets of lines, the T lines which represent the shadows of the vertical edges of buildings, the P lines and W lines representing the shadows of the horizontal and retreating edges respectively.

When uppermost edges of the buildings upon the opposite side of the street form a regular or straight line, the prism table referred to previously could be used, but when the horizon consists of an irregular line of buildings, for instance, when there is a tall building directly opposite the window and lower buildings to the left, it becomes necessary to use the back wall image. In the first place, the zenith distance of the uppermost horizontal edge of the building must be determined. Let us suppose this to be 55 deg., and that this line extends to the right indefinitely, and to the left until it intersects a vertical plane at an angle of 10 deg. with the principal plane to the prism plate. This line may now be traced upon the back wall image, and is shown as a heavy dotted P line. At this side angle of 10 deg. we assume that the high building terminates, thus exposing a vertical edge extending downward, and that the remainder of the horizon to the left is formed by a building the zenith distance of which is 60 deg. The vertical edge above referred to is found upon the diagram and is shown in heavy dotted lines, further the horizontal line is found to be as shown. The irregular line thus determined may now be traced upon the back wall, which is another vertical plane supposed to be at the rear of the prism plate a unit's distance or the distance represented by the width of the street. This shows accurately the dividing line between the illuminated part of the back wall and the dark part of the same, and it may be at once seen whether the various desks, &c., which are required to be lighted are within the range of illumination by the prism plate. If it be found that the prism plate examined does not throw the light high enough in the room, it will be necessary to further examine a plate supposed to be formed of prisms of a higher angle, and it may yet be found that the desired illumination is not

40 deg. we should probably choose either the 65 deg. or the 70 deg. prism for the body of the prism plate. Suppose it is 65 deg. The light from this prism goes down as low as 28 deg. below the horizontal, but for the last few degrees the light is not very brilliant, as indicated by the intensity curve to be explained later. In order to illuminate the area left dark, it will be necessary to insert either some J or K prism lenses. The quantity of the low-angle prisms can be obtained roughly by considering the area to be lighted by these and by the body of the prism plate. If the area to be lighted by the body of the prism plate is on the average 30 ft. from the window, and if the area to be lighted by the low-angle prisms is on the average 10 ft. from the window, then, since roughly the intensity of the light varies inversely as the square of the distance from the window, the proportion of the two window lights should be about as 100 is to 900. The proportion ordinarily used is from 10 per cent. to 20 per cent. As a matter of choice in the case illustrated above between the J and the K prisms, probably the K should be selected, simply as a matter of appearance. If the J prism were selected it would be possible to select a point in the room such that there would be a line of prisms across the window, all of which would be dark.

The method of using the intensity curve table rapidly is to select the prism, trace this

curve down to the left-hand side, and then trace the horizontal line to the right back to the zenith distance and select the proper prism curve at that point for the low angle prism light. In many cases, even where the light is not required up close to the window, it is still advisable to insert a few of these prism lights of low angle in order to relieve the monotony of the uniform prism plate. This effect is seen both from the inside and the outside.

Back Wall Images.

The curve already described under the heading of "Prism Curve Table" is used for determining the distribution of light in the principal plane, that is, the plane perpendicular to the elements of the prisms. It does not, however, show anything definite concerning the light which passes through the prism plate in any other plane, and we, therefore, must make use of what is termed back wall images in order to determine the distribution of this side light. If the observer stand looking through the window to be treated, directly at the wall on the opposite side of the street, he may divide the surface exposed to view by a horizontal line at the level of his eyes and by another vertical line in a plane perpendicular to the prism plate. Let other lines be drawn parallel to the two lines mentioned and at distances of 5 deg. apart. The vertical plane forming the surface of the opposite building

obtained owing to the higher building referred to above. It will then be possible to overcome the shadow of the high building by using tilted prisms, that is to use prisms the elements of which are tilted at an angle of from 30 to 60 deg. with the horizontal. Such prisms utilise the side light more effectively. Since there is a back wall image for each prism whether horizontal or tilted, it is always possible to determine the distribution effected, and by the use of judgment to quickly determine the best prisms to be used under the existing conditions of light.

Prism Table.

The angles obtained from the use of fig. 2 are tabulated for the prisms J, K, L, M, N, O, S, and P, and are shown in fig. 9. To illustrate

Fig. 9.

the use of this table suppose we require to find the proper prism to use in a window facing on a street 40 ft. wide, the buildings on the side opposite the window extending to a height of 31 ft. above the window; by laying out the width of street and the height of building on a drawing board, or by reference to a table of trigonometric functions, we find the zenith angle to be 52 deg. Entering the table in fig. 9 with this angle, and assuming that we require the highest light to be about horizontal, we find that the prism which most nearly answers the purpose is the N, which throws the 52 deg. light 2° deg. above the horizontal.

Luxfer Prism Protractor.

This is a very ingenious invention, the object of which is to approximately and quickly determine the prism which may be placed in a window in order to throw the light into the room in a horizontal direction. It consists of a transparent celluloid disc with the diagram, fig. 10, impressed upon its surface. A section through the window, the street, and the opposite building is laid out on paper to scale; a line is then drawn from the lower edge of the prism plate to the top of the building opposite; the protractor placed upon the diagram in proper position, as shown, at once indicates the prism to be used. The candle-power of the prism and the page in the "Luxfer Prism Manual," which very exhaustively describes the prism and the way in which the light will be distributed by it. This protractor, of course, deals only with light in the principal plane, and cannot be used in cases of a very irregular horizon.

Canopy Curves.

The diagrams and tables considered up to this point have referred to sash or refracting prisms, but it is also necessary to study the distribution of light by the canopy or reflecting prisms. This distribution depends mainly upon two values, viz.:—The zenith distance and the slope of the canopy, this latter being

the internal angle between the canopy and the vertical. The intensity of the light coming from a canopy prism under the various conditions of slope and zenith distance has been

Fig. 10.

determined by the use of a photometer. The measurements so obtained are plotted and curves formed by reference to which the proper slope of the canopy may be found when the zenith distance is down.

Luxfer Prism Candle-power.

The first question asked by one considering the use of Luxfer Prisms is—how much light will they give? and it is in order to give an intelligent reply to this query that a table of Luxfer Prism candle-powers has been evolved (fig. 11). The first problem to be solved in this

PRISM CANDLE-POWERS.

Fig. 11.

connexion is the c.p. of the source of light, in other words the c.p. of the sky. This has been determined by actual measurement, and for the purpose a series of observations extending over a period of five months has been made at the Chicago Luxfer Prism Laboratories. Observations were taken three times a day at 9 o'clock, 12.30, and 4.30. The result has been used as a basis upon which to estimate the c.p. of a square foot of the various sorts of Luxfer Prisms most in use. The results are tabulated as follows:—

J	prisms, 13 c.p. per sq. ft.

A	" z.d., 15 " 4 " "

It is found by experience that a certain candle-power in a room of given length and width is necessary in order to produce a desired illumination. The values of the required candle-power for various sized rooms

varying in length from 20 ft. to 100 ft. is shown in tabular form. If we have a room 25 ft. wide and 40 ft. deep, we find by entering the table with these values a required candle-power of 730, and if the zenith distance be such that "M" prisms will light the room, the candle-power of "M" prisms under proper conditions being 10 per square foot, the required area in square feet of prism plate to give a first class illumination is 73. This, of course, will give the required degree of illumination in the back part of the room. If it is necessary to illuminate the room to such a high degree, a less area of prisms may be used with satisfactory results.

It will be seen by the foregoing that the object of the designers of Luxfer Prisms has been to properly distribute the light which is available, and that in the case of refracting prisms they do not attempt the impossible task of increasing the amount of light entering a window. In the case of the 303 "A" prism which is used as an outside canopy or reflector the result is produced not only by a better distribution of light, but by an actual increase of light entering the window.

In the case of basement lighting the same principle applies as in lighting by means of vertical window prisms, the object being to effect a better distribution of the light, making the glass area of the pavement light as large a percentage of the total area of the light as possible.

Fig. 12 shows a suggested section, where a light well has to be used, for getting the

Fig. 12.

maximum amount of light into the building. The skylights to the basement, ground, and first floors would be glazed with Luxfer Prisms, and the upper sashes of second, third, and fourth floors. The dotted lines show how the light would be deflected by the prisms.

THE ARCHITECTURAL ASSOCIATION.

The ordinary fortnightly meeting of this Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W. Mr. H. T. Hare presided in the absence of the President, Mr. W. H. Seth-Smith.

The minutes of the last meeting having been read and confirmed, Messrs. W. Boyd, H. Lawrence, H. Prince, and E. R. Sladen were elected members of the Association.

The Chairman announced that Mr. H. D. Searles-Wood had consented to act as a trustee of the Travelling Studentship Fund.

House List.

The meeting having approved of the nomination,

The Chairman read the House List for the next session, as follows:—President, Mr. W. H. Seth-Smith; vice-presidents, Messrs. G. H. Carvell and E. Guy Dawber; committee (ten to be elected), Messrs. H. R. Appelbee, C. H. F. Compyn, A. C. Dickie, R. H. Weymouth, F. B. Clapham, W. H. Raffles, W. A. Pite, A. H. Goslett, W. J. Tapper, Hon. A. McGarrel Hogg, L. Amblar, A. Bolton, W. A. Forsyth, H. T. Hare, Arnold Mitchell, G. H. Fellowes Prynne, and E. Howley Sim; hon. treasurer, F. G. F.

Hooper; hon. librarian, F. J. Osborn-Smith. Other officers—C. H. F. Comyn and W. A. Jeckells, assistant librarians; Messrs. R. S. Balfour and H. P. G. Maule, hon. secretaries; Messrs. E. Greenop and G. M. Nicholson, hon. auditors; Mr. W. H. Jamieson, hon. solicitor; and secretary and registrar, Mr. D. G. Driver.

The Chairman said that it was open to any member of the Association to nominate other names before the next meeting.

The Chairman also announced that the following reply had been received from the King on the address of condolence recently submitted by the Association:—

"SIR.—I am commanded by the King to convey to you hereby his Majesty's thanks for the loyal and faithful address from the members of the Architectural Association, expressing their sympathy with his Majesty and the Royal Family on the occasion of the lamented death of her Majesty Queen Victoria.—I am, sir, your obedient servant,

C. T. RITCHIE."

Small Suburban Houses.

Mr. H. D. Searies-Wood then read the following paper on "Small Suburban Houses"—"I have no idea how the Committee intended this subject to be divided between Mr. Appelbee and myself, but as I suppose the most useful purpose would be served by each of us speaking from his own experience the things that he has learnt, I propose to deal with houses of the rental value of from 80l. to 200l., Mr. Appelbee having kindly undertaken to treat a houses of the terrace and small semi-detached types.

There is one catch phrase current which it seems impossible to keep out of any conversation at the present time; I mean the reference to the man in the street. Well, I take it that the majority of him live in either one or other these various types of house.

One of the peculiarities of the suburban man is that he seems to wear the neighbourhood out in the first term of the tenancy, and thus happens that the oldest inhabitant in most suburbs has been in occupation about seven years. Now, this being the case, it is obvious that in planning these houses they need to be designed to suit the multitude, and not individual tastes.

The man in the street is a man of social bits, with a fairly large circle of acquaintances. Let us take a typical family, consisting of a father and mother, with a grown-up family of four, two boys and two girls. The father and two boys playing golf and billiards, the other and girls devoted to cards. Now, what would be the proportion of the various rooms in such a family, supposing we fix the rental at 200l., and give an acre and a half of ground at 25l. per acre per annum. This gives in round figures 3,000l. on a per cent. basis as the cost of the house.

The relative size of the several reception-rooms is the first consideration. The views of the man in the street and his wife are to differ in regard to which should be the larger, the drawing-room or the dining-room, but over this difficulty sometimes by making a drawing-room, dining-room, and billiard-room all the same size, and it makes a very satisfactory house, but I find it better to give advantage to the drawing-room as being the room in which most of the social functions take place, and the general living-room. Now it is difficult to convince the mere man of this case. Pipes and the old clothes are to the heart of every man lose some of their flavour or comfort in the surroundings of a drawing-room, and hence, as I say, the mere man is apt to rebel at the drawing-room being larger than the dining-room; but my experience is that in the inevitable compromise a drawing-room comes out the larger room. In houses of this kind I find that the luxury of a large hall cannot be afforded; it is a beautiful feature in large houses, but where it can be obtained by the sacrifice of size in the dining-room and drawing-room, I am convinced it does not pay. (I generally lay a parquet or in the drawing-room, though nowadays carpets are generally given in the various public halls that are found in most suburban districts.) I had some few years ago to advise a man as to advancing their money to build a hall house for a young couple who were just married, who thought they would like a quaint little house built out of the wife's trust money, when the plans were submitted to me I reported that in the event of the house being let considerable additions would have to be made. I remember one of the features was a large entrance-hall, which was

obtained by making the dining and drawing-room a combination. The drawing-room one end of the room, and the dining-room the other end. In spite of my advice the house was built and occupied by the young couple for, I think, about two years, and they then took an ordinary house in the country, the quaint conceit remaining empty for over a year, and was then let to a tenant who insisted on the trustees adding another wing with a dining-room and some other accommodations that by no stretch of the imagination could be considered quaint. This incident has often occurred to me when I have seen similar designs in the professional papers, and I wonder what alterations will be made in the course of time, and such thoughts as these have a chastening influence whenever I feel disposed to attempt the unusual. I hope I shall not be misunderstood. I have a great admiration for the work of many of our talented architects whose houses will always interest; but small suburban houses must to a certain extent follow the more or less stereotyped plan which, after all, is the concentrated experience of many generations of builders.

I personally have a great objection to that form of hall which consists of a passage from the front to the back of the house. It quite, to my mind, destroys the comfort of the hall, and in small houses I think what is called the garden entrance is unnecessary. I like also, if possible, to shut off the staircase from the hall.

The position of the billiard-room in relation to the house wants careful consideration. I always try and make a separate approach to the billiard-room from the outside. In the suburbs it is usual to have certain evenings in the week for billiards, when it is understood that your friends will drop in without a special invitation for a friendly game, or to play in a handicap. If there is a separate entrance these visitors can come into the room without disturbing the other members of the family, and can leave without rousing the household if the billiard-room is kept open late. It always seems to me that a billiard-room in a small house such as we are now considering is an expensive feature, if you look at it in the light of the largest reception-room in the house being devoted to a game which on the average is not played for more than four hours a week.

To obviate this, I have found Burnett's patent machinery for lowering the table into a pit and allowing a floor to be laid over the space makes this room available for other purposes of entertainment. This machine consists of four screws which work in a steel frame, and are connected by means of bevel cogs so as to all work together and thus prevent the travelling table jamming; the screws bring the table up to the steel bed plate, and the table comes up each time to a dead level. When the table is lowered a beam of oak is laid across the opening and the flooring, made in convenient widths, is laid down on the beam and the ends caught by a hinged board secured with cups and screws which hold the false floor in its place. It takes about twenty minutes to get the table down and the false floor laid, and about thirty minutes to get the table back again and the false floor stowed away in the pit.

I find it suits the man in the street to give him a dining-room, drawing-room, and billiard-room, the last taking the place of the small sitting-room usually called the morning-room or library on the ground floor. The billiard-room in this case has usually a writing-desk in it where the men of the family do what writing they have to do, and, in fact, use it as a general morning-room. This room should always be heated by hot-water pipes. Nothing is more miserable than to go into a cold billiard-room after dinner, and the open fire is apt to make one set of cushions softer than the others. If this plan is adopted the ladies want a room upstairs for work, and this can often conveniently be made in the attic, and when so placed piano or violin practice can be indulged in without stint for fear of the feelings of the rest of the household.

The relative position of the kitchen to the dining-room is another point which regulates the plan to a great extent so as to avoid as much as possible having to cross the house in serving the meals; but it is a moot point whether, in the sized dining-rooms that are usual in the class of house under consideration, two doors—one from the hall and one from the service passage—are not more conducive to draught than the convenience of the service warrants. But I am not in favour of hatches.

The dining-room should never be less than 15 ft. for the convenience of serving round the table. A recessed fireplace on the side is also a pleasant feature, and gives interest to the room.

The kitchen should be so placed that the housemaid's pantry can be reached without passing through the kitchen. This pantry should be as large as possible, and all the glass and silver should be washed and cleaned in it.

The kitchen should also be a good size. It should be remembered that, in addition to the work of preparing the food, it is the living-room of the servants. It is not usual, in houses of the size we are considering, to provide a servants' hall, and therefore the kitchen should be made larger to suit the double purpose. Good light on the right-hand of the range is very important, and a cheerful outlook, if possible. In these houses I always make the boilers in the ranges of the kitchen and scullery both work the hot-water system, so that when in the summer the cooking is done on the smaller range, there is still a circulation of hot water over the house. I find it a good plan also to have a copper cylinder on the floor on the first floor as well as the hot tank in the cistern room. This cylinder heats the linen-closet and gives a good storage of hot water.

If the family are given to taking cold baths in the morning there is a great run on the bathroom, and I find that a second bathroom is a good feature, if possible; but if not, a spray bath on the head of the slipper bath enables the bath to be used much more quickly.

The staircase is one of the few opportunities in a house of this character that offer scope for a little careful detail. Of the three types of stairs—the open well, the dog leg, and the stairs between walls—I fancy the last gives a little more mystery to the planning, the upper floor not being disclosed until the half space is turned. A second staircase is a good feature, if it can be arranged.

For the family we are planning for, eight bedrooms, a dressing-room and a workroom at least are needed. As a comparison, taking the area of the rooms on the ground floor as 100, the following is the proportion of the plan marked A:—

Billiard-room...	24	Bedroom...	12
Drawing "	19	"	7
Dining "	15	"	16
Hall	11	"	15
Kitchen	9	"	9
Scullery	5	"	9
Staircase	4	"	5
Housemaid's pantry, cupboards, water-closet, and lobby	13	"	9
	100		82

We have been considering a plan for a house of the rental value of 200l. Now let us see what reductions are required for one of 80l.

We will take the ground as a third of an acre. This would represent a plot 60 ft. by 240 ft., and the ground rent would be 13l. 10s. This leaves, on a 5 per cent. basis, 1,300l. for the house.

I make the dining-room 16 ft. by 16 ft., with a large bay, the drawing-room 16 ft. by 15 ft., with folding doors into the hall, which is arranged so as to be used as a morning-room, or in conjunction with the drawing-room. The vestibule is approached through the housemaid's pantry, thus allowing the servant to answer the door without passing through the hall. The housemaid's pantry is arranged with a large gas-stove, so as to make it a summer kitchen. The kitchen is a fair size, with a scullery as a place for dish-washing only.

On the first floor are four bedrooms, corresponding in area to the four rooms on the ground floor, the bathroom and water-closet being over the vestibule. In the attic are two bedrooms, dressing-room, linen-closet, and cistern-room. I think it is very important, from a sanitary point of view, to put the cistern in such a position that it can be readily and easily examined.

Making the same comparison as before, the areas are:—

Dining-room	30
Drawing-room	28
Hall	10
Staircase	6

A SMALL SUBURBAN HOUSE

H. R. APPELBEЕ, Architect.

Kitchen	13
Scullery	4
Housemaid's pantry	6
Lavatory	3
100	

This house, with reduced area, still gives good accommodation for reasonable social usages, and in both you will see the endeavour has been to work out the plans with the minimum amount of passage-ways. I think that this has been overdone myself, and both plans would be improved by more space in the staircases; but this would have been at the expense of the rooms.

In giving the percentage areas I have been endeavouring to arrive at the just proportion between the various rooms in houses such as we have under consideration. It appears to me that it would be a useful table if we could arrange some such scale. The problem appears to me to be as follows: Given the rental value of the house and no conditions as to the size of particular rooms being imposed, what has been found to be the relative area of each room as the result of experience?

Of course, having fixed the areas for the ground floor, the other floors must follow more or less these dimensions. The comparison also depends on the houses compared being equally well built.

I have now described two plans at either end of my scale. The intermediate plans show a gradual increase in the scale of the accommodation, and you will find that as you rise from the lower to the higher rent the tenants become much more exigent. The question, I think, that would be most profitable to discuss is whether modern planning is

abreast with the spirit of the age. Most buildings designed for particular purposes nowadays are highly specialised. Do our domestic buildings compare successfully with these specialised buildings in suiting the requirements of the persons occupying them, or are they governed by considerations other than the needs of the tenants, such as the reproduction of old buildings whose appropriateness to modern usage is rather open to question?

Mr. H. R. Appelbee then read the following paper on the same subject:—

It is impossible in the time at my disposal to-night to do more than glance at a few of the points which influence the design of small suburban houses. My illustrations are limited to houses of not more than ten rooms, and of these I have excluded the very smallest where it is probable no servant would be kept. Also excluded are houses having rooms for special purposes, such as doctors' and artists'.

The first point to influence the design is the site. It is obvious that all, especially in London, cannot have the advantages of building on gravel or high land, but the selection of a particular road is open to most. Personally, I would not care to own a house in a road running east and west, or, even worse, north-west to south-east, unless the site is large enough to permit side lighting as well as from front and rear.

Rooms should be so arranged that the sun may enter at least once every twenty-four hours. This is not always possible; but to arrange living-rooms where it is impossible, even during long summer days, seems to me little short of criminal. Great care is, however,

necessary, as different rooms require the sun at different times of the day, the general rule being that it follows with our day's work; of bedrooms should face the east or south-east, the breakfast-room south-east, the drawing-room south to south-west, the kitchen south-east, while a study or library north, with a sunny window as well, or east. In a terrace house the fronts should be south-east and north-west; in others where side light is also obtainable more latitude is permissible.

As to prospect, it is nearly always the same thing for the dweller near a large town—buildings everywhere. There should, however, be trees both in the road in front and in the garden, and creepers on the house itself.

The next point that will come under consideration is the cost, which will fix the size and number of the rooms and the amount that can be expended on their fittings and decorative estimates by cubing or areas is apt to be very misleading. For example, the areas of all from the sitting-rooms to the pantries may be increased by 50 per cent., while the cost is only increased about 20 per cent., assuming that the heights are kept the same and the fittings, the same quality.

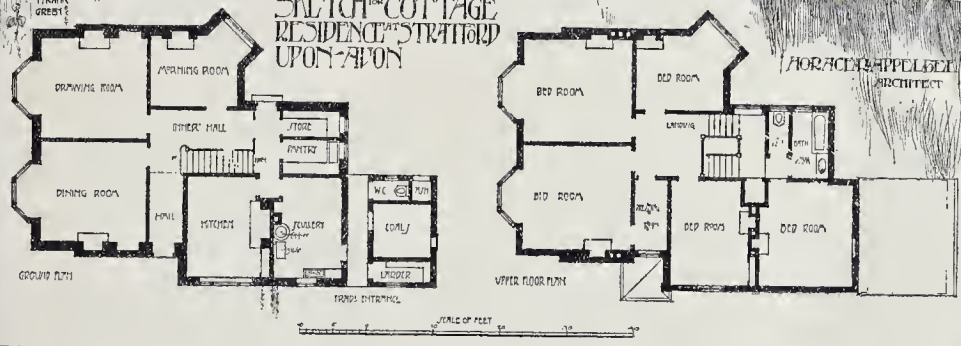

To illustrate this take a terrace house 16 ft. between the party walls and 25 ft. from front to back:

- area = 25 ft. by 16 ft. = 400 sq. ft.
- Enlarge to 20 ft. from party wall to party wall and 30 ft. from back to front:
- area = 30 ft. by 20 ft. = 600 sq. ft.
- Assume the heights to be the same and compare the cost.
- Party walls 50 ft. and 60 ft. long = 20 p

SKETCH FOR COTTAGE RESIDENTIAL STRATFORD UPON-AVON

MORACE & PPELBEY ARCHITECT

nt increase, front and back walls 32 ft. and 30 ft. — say 20 per cent. increase (is really a little less). Skittings and cornices will follow the walls. The finish to floors and ceilings and the roofing will obviously show a 50 per cent. increase. The joists of the upper floors will, however, show more, and more depth being required owing to increase of span, and will be found to require in the particular instance quoted an additional 20 per cent. Many items require no increase whatever, e.g., range, copper, stoves, and mantels. With the drainage and plumbing work, which is very expensive, the main items of manholes, vertical oil pipes and service pipes, bath and water-closet apparatus and sinks are not increased, and it is only the horizontal pipes between them and these to the very small amount of 5 per cent.

For the purpose of this paper I have analysed the bill of quantities of a 1,450 l. house, and I find on the above principles

About £240 with no increase =	£240
" 930 " 20 per cent. " =	1,107
" 280 " 50 per cent. " =	420
And for extra depth of floor joists, say...	13
£1,450	£1,780

between 22 per cent. and 23 per cent. increase of cost for 50 per cent. additional accommodation. This point is somewhat emphasised because its not having been realised seems to account for much of the cramped accommodation we shall find in the plans appended.

While on the subject of cost, a word of warning should be said on what is perhaps the greatest architectural sin of the Victorian æra, viz., the façade built in a more expensive manner than the return faces. This arrangement gives a thin cardboard-like effect and

entirely destroys architectural solidity. It would be cheaper as well as more artistic to build the main front of similar materials to the sides and back. Perhaps a new reign and new century will alter this.

The first sketches should always show the principal furniture, and the relationship of doors, windows, and fireplaces should be considered with regard to each other and to the furniture.

Inside v. Outside Chimneys.—If the fires are well grouped, two or, at the most, three chimney-stacks will be required. If they are on inside walls, the house is more economically warmed, and there is less chance of a draught from a cold flue. On the other hand, a compact plan usually brings the internal doors together around a small hall or landing, and in order to prevent the doors spoiling the sitting space around the fires or the plan from becoming straggling, the chimney breasts have usually to be planned in the outside walls.

The Casement v. the Double-hung Sash.—The double-hung sash is unquestionably convenient for lighting, ventilation, cleaning, and it is easy to keep clear of blinds or curtains; it is easily made weathertight and is simple to fasten, but it probably requires more skill to make its appearance equal to that of a casement. The mullioned window, especially when long and low and without a transome, is undoubtedly picturesque. The casements are difficult to keep weathertight unless they open outwards, in which case one at least of an odd number of lights can never be cleaned from the inside of the room, and they interfere with flowers on the window-sill. An even number of lights for cleaning purposes must have all to open in pairs. Opening inwards overcomes the cleaning, which is perhaps the greatest difficulty, but makes others with blinds,

curtains, or a window-seat, and the absence of the weathertight qualities.

The Dining-room in a house of this class is the most important room, and in planning this the furniture should be sketched in, and its dual use as room for meals and the family sitting-room taken into consideration. A dining-table varies from 3 ft. 6 in. to 4 ft. 6 in. wide, and there should be room for one 6 ft. to 7 ft. long, and more at times, and a sideboard, one or two armchairs, often a couch or settee; and if there is no study, the books of the house and a writing-table will be here also. The room, therefore, should not be too small (as it often is), and in this room in particular it is well to remember that doubling the area will not double the cost of a room. The best aspect for this room is south-east. Where this room is general living-room as well as dining-room, a large bay or transept, making the room "L"-shaped, gives an interesting as well as convenient room. The bay is purely living-room, the other end of the "L" having the fireplace, and may be considered as belonging to each branch of the "L" in turn.

The Drawing-room in small houses should be generally somewhat smaller than the dining-room, and is pleasant if it has the afternoon sun.

A Third Sitting-room is a useful addition, and if on special occasions it can be thrown into connexion with one of the others, so much the better. It serves as a breakfast-room the day the dining-room is "turned out" (in one house I know the hall serves this purpose well, callers being unlikely at so early an hour). Its chief use will vary very much in different houses, as breakfast-room, morning-room, library, and den.

Bedrooms, &c.—Roughly one-third of our

time is spent in bed and, therefore, the bedrooms of the house should have particular care in their planning. An adult should have from 1,200 to 2,500 cubic ft. of air per hour, equal to a room nearly 20 ft. by 13 ft. by 9 ft., therefore the necessity for ensuring the repeated change of air in a room is obvious. Not only an exit flue but an inlet is required. A deep bottom bead on a sash window enables air to enter at the meeting rail. I do not think the casement can be made to give this advantage. Sun also is very essential to keep the room sweet and healthy and should enter early in the day. A bedroom hot in the evening from a setting sun is disliked by most people. If the room is near an internal angle of the building, see that the window is not commanded by one in the return wall. In planning the room, show the principal furniture, the bed, with the light, if possible, from the side and space for a wardrobe. The dressing-table should have the back of the mirror to the window or between the windows if there are two; consideration should also be given to the morning opening of the window without having to move furniture first. In artificially lighting this room one light should be so arranged with regard to the dressing table, that the light falls on the dresser's face and not on the mirror. In a small room, if the bed occupies the position already suggested, this one light will probably serve the whole room. If electric, it is convenient to be able to switch it on and off from either the door or while lying in bed.

Bath, Lavatory, and Water-closet.—In connexion with the bedrooms the bath-room will be much used; in these small houses it assumes a much greater relative importance than in large houses. In addition to the bath there should be a fitted lavatory, both to have hot and cold water (this arrangement means a great saving of labour in the house by lessening the amount of hot and cold water carried to each bedroom, and subsequent removal of slops). Some polished copper hot water rails for airing towels are useful, and help to warm the room. The bath most commonly used has a roll top edge and no casing; this seems to me a great mistake. As a rule, casings should be omitted whenever possible, that every part may be kept clean, but a bath is so big in bulk and has usually to be placed against the wall so that no one can possibly reach over to clean the vertical space between the side of the bath and the wall. The shallow space between the bottom of the bath and the floor is almost as bad. Splashing over of water, often soapy, is inevitable, and the dust clings.

As near as possible to the bathroom should be the upstairs water-closet, but never in it, although one sees illustrations of this. These two apartments seem to be the most difficult of all to arrange; they should be near the bedrooms, since the bathroom partially acts as a dressing-room, yet so retired that persons using the water-closet should not advertise their movements all over the rest of the house, and to this end do not permit any borrowed light from one or the other to a neighbouring passage, and be very careful in the selection of the water-closet apparatus and the water waste preventer that they may be as silent as possible. Next it is most important to remember that a water-closet is not merely an apartment 6 ft. by 4 ft. or thereabouts which may be partitioned off anywhere. It must not be overlooked that it is often 30 ft. high; in other words, the soil-pipe is an essential part of it, and if you place a water-closet on the principal front near or over the entrance door, this soil-pipe and the ventilation pipe which extends it, will spoil the effect of everything. Bath and lavatory wastes are nearly as bad. Over the scullery, or some of the adjacent pantry or kitchen parts, is the natural place; but see that the water-closet is not over the larder—a point to which it always seems to gravitate. All places having water supplied to them should be as near to one another as possible, for economy of pipe work and also because of accidental overflows; a long distance, too, from the kitchen boiler to the bath or lavatory generally means that the circulating pipes have to cross hall or sitting-room; and as few people care to see them exposed here, they get boxed up in floors and other improper and inaccessible places. To sum up this part, the bathroom and water-closet should be regarded as very large, their wastes extending down to the drains, their supply and ventilation pipes go up to the cistern and ridges of roof, and the bath has also a horizontal extension to the kitchen boiler.

The Kitchen, Offices, and Servants' Quarters in small London houses are usually very cramped and deficient—at least, to those like myself who have had some country training first. The points about increase of size should be borne in mind here in particular. The kitchen is also the servants' living-room, and therefore should have as good an outlook as possible, and some sun, preferably in the early morning. Adjoining should be the scullery, primarily intended for the keeping and cleansing of the cooking utensils and the rougher part of the preparation of the food, but many other duties are now thrust on to it. It is the place where nearly all the dirty work of the house is done, such as cleaning boots and knives, trimming lamps, washing up greasy plates and dishes; it is also frequently fitted with a gas stove, and becomes the chief cooking place in hot weather.

It needs a copper for the rougher laundry work that is always done at home, it is also the storage place for brushes and brooms, and we are frequently asked to believe that a space about 6 ft. square is all that is necessary. The larder must be placed so that it can be kept cool and away from the steam of the scullery copper. A lock-up store should be provided, where the lady of the house will keep extra groceries in reserve and where best dinner and other services and glass are kept. An exceedingly useful addition, even in the smallest house, is a china or housemaid's pantry provided with a lead-lined sink. Here tea and breakfast services are washed and stored, also plate and glass. Table-linen is also kept here. By attending to the lighter work here, the mistress and young ladies of the house can assist without interfering with the servants. If planned as an ante-room between the kitchen and main house, it will also act as a ventilated disconnecting lobby, and help to prevent an unavoidable cookery smell extending all over the house.

The Stairs may be made the most picturesque part of the house, but they must be practical also; they will have to be used by the very young and the infirm. Winders are often dangerous, and should never be curved on plan (as they often are at the foot of the stairs) if it is intended to carpet them. Bulky furniture will also have to go up and down and at times a coffin.

The Plan.—The width of the site is the next point that will determine the plan. Narrow sites must make the house one of a row; at 25 ft. it is possible to make it "semi-detached"; 40 ft. to 50 ft. is the least on which the smallest detached house will look well.

The varieties of plan possible are more than, I think, is commonly supposed. In a terrace-house the simplest is to put two rooms on a floor facing the front and back of the site, respectively, a part of one being cut off for the staircase, or the staircase may be put in between them. In these cases the kitchen and offices occupy a basement story, two sitting-rooms on the ground floor, with probably two floors of sleeping-rooms over. Constructively cheap, owing to small amount of foundation and roofing (which the increased thickness of walls will not outweigh). They are very inconvenient, owing to the amount of stairs. There is, of course, three times as much staircase in a four-story house as in one of two stories. The first variation is to bring the kitchen to the ground floor in a wing behind the stairs, with the result that the look-out from one sitting-room is quite spoiled, the scullery or coals enjoying the view. Another arrangement transposes sitting-room and kitchen department, opening the kitchen from the centre of the house. In both these types the getting in and out of coals and dust is a great difficulty unless there is a back way. In the Midlands it is a common practice in small houses of this kind to make a passage at the side common to two houses for this purpose, and as a tradesmen's entrance.

Larger terrace houses are obtained by placing the drawing-room or a study upstairs and an additional floor of bedrooms. If this is done, great care must be taken with the approach. Most of us can probably call to mind examples where the stair is too narrow, and the bath and water-closet department too conspicuous *en route*. All terrace houses are open to many objections—the difficulty of getting sunshine to all rooms has been mentioned, and the difficulty with coals and dust where there is no basement. To these must be added that the drains, with rare exception, must pass under the building, and

the transmission of sound from one house to another is very considerable. Piano playing, singing, the running of children up and down stairs, and even conversation may be heard. As generally planned, the sitting-rooms of different houses have only a thin wall between them, and the front doors of two houses adjoin as at AA. The passage of sound, of course, can be lessened by the arrangement at B, where the rooms have the staircase between, but the cost is greater, there being more brickwork, and the light and air to the centre part of the house is much damaged. In the London district there is also the aesthetic objection, that the party-walls must show above the roof and they are very difficult to treat in a satisfactory way. In many of the London district external walls within 10 ft. of another house have also to have parapets above the roof. These points much affect the design. For example, a series of gables with their ridge over the centre of each house, and parallel to the party-walls, would work out in most distressing and expensive manner wide-fronted terrace houses, i.e., those having two rooms on the front, have not been mentioned, as except on plots very shallow from road to back, or with a sharp fall to the road where the long type is not easily fitted, they are not much in request. The chief advantage of dwelling in a suburban as against living more in town in a terrace or house of equal value lies in having garden or open space around the dwelling and the desirability of this and of access to a wheelbarrow, &c., make the detached or partially detached house a necessity, and the latter, moreover, get us over many of our previous difficulties.

On narrow plots the semi-detached house, very like the terrace house already described. The front doors can, however, be put at the side away from the party-wall and thus secure greater privacy, but this generally requires wider plot. These pairs of symmetrical planned houses seem to me to be among the most unsatisfactory designs ever produced. A symmetrical elevation to the road has a greater pier instead of opening as the central feature and this is usually capped by the end of a parapet of the party-wall, which goes up all sorts of irregular turns so much higher than all the roofs, turrets, dormers, &c., with 4 ft. or so of it. Sooner or later the houses drift into different ownership, and one pair his woodwork white and the other black, and the disaster is complete. The remedy is simple: do not plan a symmetrical pair.

Larger detached and semi-detached houses are so varied in plan they are difficult to classify; a few actual examples were therefore shown on the screen, with some slight comment on each. We give some of the points far as they are intelligible apart from the illustrations.

Terrace house, 20 ft. frontage; ground falls sharply to rear of plot; drawing-room placed at back on first floor and only ten steps above dining-room at entrance level. Kitchen are thus half-basement so far as levels are concerned, but are themselves entirely above ground. Kitchen gets a good look-out.

Semi-detached house; frontage 40 ft. An attempt to get rid of the usual run of houses in this locality with the door in the middle and a room on either side. Here we have a hall 8 ft. wide, sitting-rooms to the south-east, and both to the front as being the most interesting outlook.

House of 33 ft. frontage, showing ingenious arrangement of the back wing. Scullery, larder, coals, &c., are less in height than the principal rooms, and a sort of mezzanine over them is approached from the half-larder up-staircase.

The mezzanine contains bathroom, water-closet, and a good sized linen-room; these return are kept very low, and the servants' bedroom is placed over. This part of the house is, therefore, three floors high against the elsewhere, but the top floor of the wing is or some six steps above the general first floor. This placing of the servants' bedroom would I think, be generally appreciated both by servant and mistress.

Detached house for corner site; frontage 32 ft.; house entered through a large sitting-room hall. An exceptional appearance is given by placing the main cornice of wood at the level of the first floor window-cills, and above this Mansard roof, the upper story being the half in the roof. As the lower slope of the roof commences near the outside edge of the

cornice (top member of which is the rain-water gutter), it is possible to obtain inside a height of 6 ft. before any slope begins, and even then it is 75 deg., the steeper pitch of the Mansard and brickwork being fitted in between the rafters. All the external walls are as solid as usual, 6 ft. from the floor.

A corner site house; principal front of about 70 ft. had excellent view across the Avon. Principal sitting-rooms both face this way, and the entrance was from the side road. Attempt made to keep all the water services together, and to so arrange the bath wastes and soil pipes that they do not disfigure the principal fronts.

Mr. S. Flint Clarkson said he desired to propose a hearty vote of thanks to Messrs. Searles-Wood and Appelbee for their papers. With much that they had said most people would be in agreement, but there were one or two points to which exception could be taken. He objected to Mr. Searles-Wood's theory of proportions, which he thought was impossible of application. In the case of a middle-sized house, for instance, of from 100 ft. to 120 ft. per year, the relative proportions of a few parts only could be suggested, as some parts must have at least a certain area in the smallest house of the kind. Take a house of the above rental for father and mother, four children, and two servants; if the dining-room were represented as 1 (say about 10 ft. by 15 ft. minimum) the drawing-room might be about 1.2; but the morning-room must be at least 1.70 superficial feet, the kitchen 2.70 superficial feet, the scullery at least 0.95 superficial feet, the pantry at least 0.80 superficial feet, and the larder at least 0.60 superficial feet. That was to say, they were not varying to the size of the principal rooms. The principal bedroom might be, in relation to a dining-room of 1, about .9, but each dressing-room must be at least 0.80 superficial feet. The second bedroom might be, in relation to a dining-room of 1, about .8, but each of the bedrooms or the daughters and sons of the household must be at least 1.70 superficial feet and the servants' bedroom the same, and the bathroom and boxroom each at least 0.80 superficial feet. There were frequently only four parts which could have the same relative size in several houses, the sizes of the other parts could not be settled by proportion. If this system of proportion could be carried out, buildings could be designed somewhat on the principle that music was ground out by the barrel-organ, the fingers instead of the brains being used. He did not believe in the possibility of this at all, and he thought it was utterly impossible with the varying needs of many kinds of people that this should be done. In reference to the production of pairs of houses, exactly like, that was partly due to the way towns often came into existence, i.e., by accident. Three people seemed to be responsible for the production and arrangement of suburban towns, viz., the land speculator, the financial agent, and the estate agent. These three personages determined what should be the character of a suburb, and no one else appeared to be approached in the matter. Consequently all manner of shapelessness resulted from the formation of roads in order that more frontage and more money could be obtained. This was a monstrous state of affairs, and some attempt should be made to alter it. He had been greatly impressed by the manner in which Burnhamstead had been laid out on the east as compared with the west and the north. The eastern part had been thought out by one whom they all respected, viz., Mr. Benjamin Ferrey, who cut roads through the pine woods in a rational way, and arranged that buildings should be set back a considerable distance. But across the valley the usual arrangement had been carried out, and there would be found roads going out on the main road and coming back with a loop like a fish-hook, at perhaps a distance of only one hundred yards. As to the duplication of semi-detached houses, the building speculator was chiefly responsible, but architects denounced him by not showing what might be done. As to the question of three stories, this was an extremely difficult thing, when it came to the practical working out of the problem, to determine how to get the proper bedroom accommodation for the ordinary detached house, but strong objection was taken by any occupants to two flights of stairs. What was needed to overcome the difficulty was a larger ground story. In regard to aspect, this was more curiously misapprehended

than the question of aspect for the class of houses under discussion. It was said that, although another aspect might be given to the dining-room, probably the best aspect was the north. He disagreed with that altogether, for the dining-room in a large number of cases was also the living room of a family, and they should get as much sun as possible. He held that the right aspect for it was south-east by south. In regard to the height of rooms, he advocated 10 ft. for the ground story, 9 ft. 6 in. for first floor, and 8 ft. 6 in. for the story above.

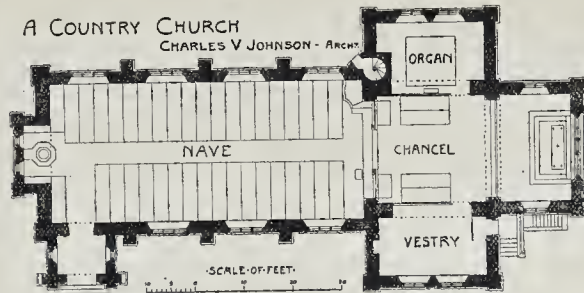

Mr. Henry Lovegrove seconded the vote of thanks and said he did not know how they would define "small," for opinions would differ according to the wealth of owners. The question of the size of drawing-rooms and dining-rooms was often discussed by the ladies of a house; the ladies asked that the drawing-room should be the largest room, for receptions, whereas the master of the house naturally felt that the dining-room was, to middle-class families to a certain extent, not only the dining-room, but the general sitting-room for the family, and he quite agreed with Mr. Clarkson that the best aspect should be chosen for that room. He could not agree with Mr. Searles-Wood about the garden entrance. By all means have the garden entrance if it could be afforded, because people were inclined to come in from the garden without properly wiping their boots, and this in wet weather was very undesirable. The method described by Mr. Searles-Wood of lowering the floor of a billiard-room was a good one, and perhaps the best solution of the difficulty. He quite agreed with Mr. Clarkson as to the height of rooms being 10 ft. for ground floor and 9 ft. 6 in. for first floor, but the question was very much affected by cost, especially now, when bricks and labour cost so much. He would like to ask Mr. Searles-Wood to give them the cost per foot cube of the houses he had referred to. The great drawback to architects designing houses for the middle classes was the cost. An architect might design a house which would cost 1,200 ft., but in an adjoining street a similar house could be built by the speculative builder for 900 ft. or 1,000 ft. As to the double-hung sash, while the casement was externally very picturesque it was extremely inconvenient, for wet and draught could not be kept out when it opened outside, and when it opened inside it interfered sadly with blinds and curtains. He preferred the double-hung sash, especially as it could be made more or less picturesque by showing nearly all the frame and having very stout sash bars. As to water waste preventers, he knew of a case where they had been a nuisance, but the difficulty had been solved by having a piece of pipe fixed on the inlet pipe so that there was no sound when the water flowed, as the pipe was so near the bottom of the water waste preventer. The best place for the bath and water-closet was over the scullery, for the scullery ceiling was not of much importance if anything went wrong with the upstairs arrangements. They would all agree with Mr. Clarkson in wishing that all houses could be built from architects' designs. Scarcely one house in a thousand in the London district was designed by an architect. Houses were all alike in many streets, and they were run up wholesale, for, unfortunately, if decent houses were erected under contract from architects' designs they could not be made to pay.

The Chairman, in putting the vote of thanks to the meeting, said that the subject was a very important one to the younger members of the Association, for he supposed that nine out of every ten architects began their serious work by designing a small house. The more, therefore, the subject were discussed and studied the better for those just entering upon their careers. The field that was open for invention in the design of small houses was practically unlimited, but at the same time the subject was such a familiar one, that there was great risk, especially with young men, of getting into a groove and thinking that there was no possibility of arriving at any new arrangement. With regard to the smaller terrace house, there was not the least doubt that the plan which put the drawing-room in the back wing and the kitchen looking down the narrow alley was a very great advance upon the more usual arrangement; but at the same time there were disadvantages in it. Mr. Appelbee had shown a plan where there was a small back passage between the two houses which served as a tradesman's entrance; that, of course, meant a

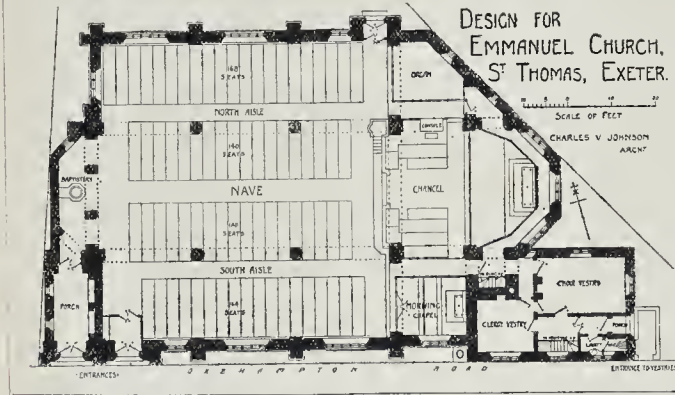

serious defect in that type of house. The drawing-room at the back in that class of house generally became a very long narrow room with a window at the end, and it seemed to him that something might be done to improve the proportions of that room. Mr. Searles-Wood had given them some rules as to proportion, but it seemed a mistake to try and lay down hard-and-fast rules on such a matter, because people had different ideas as to proportions, and it was not desirable to get into a groove. Still, it seemed to him that the drawing-room should be a larger room than the dining-room in most houses, because in the dining-room people sat still, while in the drawing-room they more or less moved about, and wanted more room. He thought the billiard-room should hardly ever have a top light in a private house. As had been said, the room was almost always used at night, and if used on odd occasions in the day time the fittings which lighted the table at night cast an objectionable shadow on the table, and it was a mistake to adopt any other arrangement than that of lighting by windows. If the windows were properly arranged, there ought to be no objection to the side light on account of shadow. The vexed question of casements v. sashes was one on which there would never be any agreement, he was afraid. It was certainly a matter of taste, to a large extent, but in his opinion there were serious defects in sash windows which, from the artistic point of view, it was impossible to overcome. When one was designing in a more or less picturesque style, one very often wanted to have a long low window, and that was absolutely impossible with a sash. There was also a very radical difficulty in a sash, which could not possibly be got over; and that was that the glass in the upper half of the sash was on a very different plane from the glass in the lower half, and that always seemed to be a very objectionable thing. He knew there were difficulties as to cleaning casements and various points of that sort, but he never came across a casement which could not with a little thought be cleaned from the inside. He supposed that every one would agree that pairs of houses should not be absolutely alike. Generally, when they were designed alike, it was merely an excuse for laziness, because it was an easy matter to get a little variety in the design of the two, although they might be planned exclusively on the same lines. With regard to the height of rooms he differed from what had been said by Mr. Clarkson, for he thought that 10 ft. was rather overdoing it in most cases. He would take as a minimum 8 ft., and there were many rooms which looked better 8 ft. than 10 ft. high. It was easier to treat rooms and decorate them when they were kept to rather low proportions. He supposed that the majority of the members of the Association were familiar with one of the prettiest estates round about London, i.e., Bedford Park estate. A study of the plans of some of the houses on that estate, designed by Mr. Norman Shaw, would well repay the time spent, for there was a great deal of originality shown in the arrangement of them, and they were nearly all planned on the most common sense lines, without extravagance. There was a great deal to be learnt from them, and they showed what could be done in the way of variety.

The vote of thanks having been agreed to, Mr. Searles Wood, in reply, said he certainly did not mean to suggest by what he had said as to proportion anything in the nature of a stock article; but it seemed to him that it ought to be borne in mind whether or not, in a design, they were to do something original or commonplace. To a certain extent, if they wanted to be reasonable, they ought to design something that would have a value in the market, in view of the fact that the house was likely to change hands. What he wanted to arrive at for the sake of the man in the street was something in regard to the proportions of rooms, like the multiple photographs of celebrities—half a dozen celebrities being photographed on to one another in order to produce a good common type. As to the prices of the houses, the lower one on plate cost 3,000 ft., and the upper one 1,240 ft. The others were about 2,000 ft. each. As to the height of the rooms, it was rather a pretty feature to make a difference in the height of the rooms. As to the vexed question of casements and sashes, he supposed that most architects knew that a hinge could be got which allowed a casement to be reversed, and that got over the difficulty of cleaning.

A COUNTRY CHURCH
CHARLES V JOHNSON - ARCHT.

DESIGN FOR
EMMANUEL CHURCH,
ST THOMAS, EXETER.

Mr. Appelbee said that if they acted on Mr. Clarkson's advice and gave a south-east by south aspect for the principal rooms, the other side of the house would not get much sun. As he had pointed out, the cost per foot cube was really unreliable, except for houses of almost identical size and shape. Assuming 8d. as the price per foot for the 1,450^{ft}. house he had mentioned, the one with 50 per cent. larger area would be found to work out well under 7d. Reference had been made to water waste preventers which made no noise when they filled; but what about emptying? He would like to know of one silent then.

The Chairman announced that the next meeting would be held on April 19, when Mr. M. A. Green would read a paper on "Eighteenth Century Architecture of Bath," illustrated by lantern views.

The meeting then terminated.

Members' Soirée.

Owing to a variety of circumstances, the Committee has decided this year to postpone the soirée and annual play.

Illustrations.

THE GLASGOW EXHIBITION BUILDINGS.

THESE illustrations are reproduced from sketches made specially for this journal by Mr. Alexander M'Gibbon, Glasgow, whose admirable drawings of the Scottish cathedrals, formerly published in a series in our pages, will be remembered by our readers.

The buildings are described and criticised in the first article of this issue, to which the reader is referred.

SMALL SUBURBAN HOUSES.

THESE sketch plans and elevations of small suburban houses formed a portion of the illustrations to Mr. Searles-Wood's paper on the subject read at the Architectural Association, and reported on another page.

TWO DESIGNS FOR CHURCHES.

A COUNTRY CHURCH.

This church was designed to seat 260 persons in the nave. The walls were to be built

of hammer-dressed squared-coursed rubble, with finely-tooled weatherings, copings, &c., and to be plastered internally for colour decoration. The ceilings of the chancel and the nave were to be of polygonal section, with moulded ribs and plaster panels for decoration in colour. The ceiling in the tower over the choir was to be of oak, with panels formed by moulded ribs. Around the nave a dado was intended, which, with the seating, was to be stained green. The flooring under the seats was to be of pitch pine in narrow widths, and in the gangways, &c., tiled.

DESIGN FOR EMMANUEL CHURCH, EXETER.

THIS design was prepared for and submitted in competition. The requirements were, that the church should seat 600 persons, be capable of being built in sections, and of being easily extended. The design shows a nave with aisles and a chancel, together giving accommodation for 616 persons. A morning chapel and a baptistry are also provided, the latter with a separate approach. Clergy and choir vestries are arranged at the east end of site. In consequence of the low level of the site, special provision was made to exclude flood water. The walls were to be of local red limestone in hammer-dressed squared-coursed rubble, with a 2-in. cavity and an inner 9-in. lining of brickwork. The dressings were to be in Douling stone, finished with a finely dragged surface. The chequered work at the east end was to be in red limestone and Douling stone set alternating. The walls were to be plastered internally; the roofs to be open-timbered, ceiled at collar, with moulded ribs to form panels, and externally covered with tiles. The floor to nave was to be of encaustic tiles, the floor of chancel of marble in 6-in. squares. The cost was estimated at 6,000^l.

C. V. JOHNSON.

THE BUILDING TRADES EXHIBITION.—We are informed that this exhibition, which will open on the 17th inst. at the Royal Agricultural Hall and remain open until the 22nd inst., will be the largest and most representative in point of exhibitors of its kind. Every foot of the ground floor space has been allotted. As already mentioned, special sections are this year being devoted to fire prevention and smoke abatement. Visits to the ball, as in previous years, will be paid by professional institutions interested.

ROYAL INSTITUTE OF BRITISH ARCHITECTS:

FORM OF CONDITIONS OF CONTRACT.

THE tenth general meeting of this Institute for the present session was held on Monday last at No. 9, Conduit-street, Mr. E. A. Gruning Vice-President, presiding.

The minutes of the last meeting having been taken as read, Mr. Alex. Graham, Hon. Secretary, announced the death of Mr. Frederick Boreham, who was elected a Associate in 1871.

The following candidates, recommended for election by the Council, were declared elected—Mr. Robert Stephen Ayling, Westminster, as Fellow, and Mr. Norman Thorp Clapham, as Associate.

The Chairman said the next business was to consider the amendments to the Institute form of conditions of contract. As the meeting would be aware, it had been impossible to come to any arrangement with the Institute of Builders on the arbitration clauses which was satisfactory to the members of that body. The Council therefore submitted the amended clauses to the meeting for consideration afterwards they would be remitted to the Council, so that they could be put in proper form for reprint on the contract as it would be issued in future by the Institute alone.

Mr. Maurice B. Adams asked whether Clause 32 was the same as before.

The Chairman: Yes, it is exactly the same. Continuing, the chairman said he thought it would be most convenient if they took the discussion on the clauses *seriatim*, taking Clause 1 first.

Mr. E. T. Hall said he would move the acceptance of the amended Clause 1:—

"1. That the works shall be carried out in accordance with the directions, and to the reasonable satisfaction of the architect, in accordance with the said drawings and specification, and in accordance with such further drawings, details, and instructions in explanation of the same as may from time to time be given by the architect. If the work shown on any such further drawings or detail or necessary to comply with any such instructions, directions, or explanations, be, in the opinion of the contractor, in excess of that comprised in the contract, he shall, before proceeding with such work, give notice in writing to the architect to the effect that he proposes to do so. In the event of the architect and contractor failing to agree as to whether or not there is any excess, and of the architect deciding that the contractor is to carry out the said work, the contractor shall accordingly do so, and the question whether or not there is any excess, and if so the amount thereof, shall, failing agreement, be settled by the arbitrator as provided in Clause 3 and the contractor shall be paid accordingly. The contract drawings and specification shall remain in the custody of the architect, and shall be produced by him at his office as and when required by the employer or by the contractor."

If carefully studied the clause would be seen to be identical with the previous one, excepting that the latter part, which was the concluding part of the old Clause 12, had been transferred to No. 1, simply because in sequence it came better there than in Clause 12, which dealt with variations. It was practically no change from the present form of conditions.

Mr. Adams said he would be very pleased to second the motion. He thought it would be useful to them if they ascertained why the amendments were put forward, for it was distinctly stated that the Council did not propose them.

The Chairman said a special meeting of the Council was appointed to see the builders ascertain whether they could not agree upon a joint form of contract. During the discussion it was found that a great many of the clauses would be better amended than altered, and having gone through that amount of work the Council thought they might as well utilise the labour of the committee by putting them before the Institute, and that was how the amendments arose. It was proposed to adopt the clauses so far as regarded their sense, but was not necessary to accept them verbally. That would apply to all the clauses that might be accepted or rejected afterwards.

The clause was then agreed to.

Mr. Hall said he would move Clause 12.

"12. The contractor shall, when authorised by the architect, or as provided by Clause 5, vary in any way of extra or omission from the drawings and specification; such authorisation is to be sufficient proved by any writing or drawing given by the architect."

* In our issue for December 8 last we printed the original clauses and the clauses as amended.

architect, or by any subsequent written approval of him. No claim for an extra shall be allowed unless it shall have been executed under the provisions of Clause 5, or by the authority of the architect as herein mentioned. Any such extra is hereinafter to be as an authorised extra.

The alteration there was this: Under the old Clause 12 it said "the contractor shall not vary from the drawings except by the authority of the architect." One or two solicitors to members of the Institute had drawn attention to the fact that there was nothing in the contract which said that the builders should vary in order of the architect, and it had been said that it was quite possible a builder might refuse to vary at all and that there was no power given to them to compel him to vary. Therefore, instead of it being put in a negative form, it now read that the contractor shall vary. So far as he knew, that was the only difference in Clause 12 and the old Clause 12. He had already explained, the latter part of the old Clause 12 had gone into the new Clause 1.

Mr. H. Hardwicke Langston seconded the acceptance of the clause.

Mr. Brodie said that, on behalf of the Contracts Committee—more or less unofficially because the amended clauses had been issued before the last meeting of his committee took place—he had a slight addition to propose to the clause. Mr. Hall was quite right in saying that attention had been called to the fact that the old conditions there was no power given the architect to compel the carrying out by the builder of extra works. An actual case was brought before his committee, and they reported on it to the Council, and he was glad to see that an alteration in the direction they wished had been proposed. But he did not think it went quite far enough because it only said "that the contractor shall when authorised," and he would propose that the words "instructed or" be inserted there so that the clause should read, "the contractor shall when instructed or authorised by the architect," and that would necessitate the insertion of the words "instruction or" in front of the word "authorisation" here it occurred in the first part of the clause.

Mr. Hall asked what was the difference between "instruction" and "authorise."

Mr. Brodie said a client might give an order which the architect might authorise, because an architect would instruct off his own bat.

Mr. T. E. Colcutt said it seemed to him that the clause as it stood provided for everything they wanted.

The amendment not being seconded, it fell to the ground, and the amended clause was accepted.

Mr. Hall moved Clause 17 as amended, viz.:

"17. Any defects, shrinkage, or other faults which may appear within _____ months from the completion of the works, arising in the opinion of the architect from materials or workmanship not in accordance with the drawings and specification or the instructions of the architect, or any damage or pointing by frost appearing within the like period, shall, upon the directions in writing of the architect, and within such reasonable time as shall be specified therein, be amended and made good by the contractor at his own cost, unless the architect shall decide that he ought to be paid for the same; and in case of default the employer may employ and pay other persons to mend and make good such defects, shrinkage, or other faults or damage, and all expenses consequent thereon or incidental thereto shall be borne by the contractor and shall be recoverable from him by the employer, or may be deducted by him from any moneys due or that may become due to the contractor. Should any defective work have been done material supplied by any sub-contractor employed by the works who has been nominated or approved by the architect, the contractor shall be liable to the good in the same manner as if such work or material had been done or supplied by the contractor, and be subject to the provisions of this clause and the preceding clause."

The only change arose in this way. The old Clause read "Should any defective work have been done or material supplied by any sub-contractor or other person employed on the works." The objection the builders raised to this was this. Supposing the employer brought on the works a sub-contractor with whom the head contractor had no relation whatever, was not just that he (the head contractor) could be responsible for anything done by the sub-contractor. They felt that was a perfectly fair objection and, therefore, the words "or other person" were omitted. It, therefore, in

effect meant that if any defective work was done by the chief contractor or any of his sub-contractors—the persons mentioned in the specification—he was to be responsible, but he was not to be responsible if it was done by a person with whom he had no relation whatever.

Mr. Slater seconded the motion.

Mr. Langston said he considered the contractor was placed in a wrong position by the clause. The contractor was made to be liable for the failings of servants not his own.

The Chairman: No; you are mistaken. It is the very object of the amended clause to prevent that.

Mr. Langston: It says, "Should any defective work be done or material supplied by any sub-contractor employed on the works who had been nominated or approved by the architect, the contractor shall be liable." He did not wish to exclude the contractor from his responsibility, but he thought if a contractor was to be liable for work he had not done, as that clause would make him, he ought at least to be a consenting party to the nomination and approval by the architect.

The Chairman pointed out that this was in Clause 20.

Mr. Langston said Clause 20 read, "Who may at any time be nominated, selected, or approved by the architect." That, he contended, was simply forcing a condition on the contractor without the contractor being really a party to the condition.

Mr. Hall remarked that Mr. Langston did not read enough of Clause 20, or he would see that his objection was met.

Mr. Langston said Clause 20 went on to say that no such sub-contractor should be employed against whom the contractor should make what the architect considered a reasonable objection. But it all came to this—Unless they made the contractor a consenting party to the appointment of the nomination of the architect, the words in the clause were not good in English law. The amendment he wished to suggest was that Clause 17 should be linked in some way with Clause 20, and that the contractor should be an approving party of the nomination. The contractor should not have the sub-contractor forced upon him. When the question was before them the last time he remembered some remarks of the chairman to the effect that the contractor, having received or arranged for a profit from the sub-contractor's work, he was then held to be liable as getting such a profit. But there were lots of cases where the contractor did not carry any profit into his tender from such work.

The Chairman: If he does not, that is his own fault.

Mr. Langston said he was aware of that, but he put it to them as practical men, whether it was really not outside common sense for any one individual to be answerable for the faults of the servants of another individual unless he was a consenting party thereto. He was of opinion that it did not in Clause 20 make it emphatic that the contractor was a consenting party. The clause certainly did not want much altering. He would suggest that the words, "With the consent of the contractor," should be inserted in Clause 17, after the sentence, "nominated or approved by the architect."

The Chairman observed that it appeared to him that was provided for in Clause 20. That clause said that no sub-contractor should be employed on the works against whom the contractor should make what the architect considered a reasonable objection. He considered that that perfectly covered the contractor's liability.

Mr. Langston said that in the case of a firm supplying the iron or steel work, or the decoration or plumbing work, what trouble he would have if things went wrong. They had to write to the contractor and the contractor then wrote to the sub-contractor, and nothing was rectified until the clerks got into communication.

The Chairman said that if Mr. Langston would give him his amendment he would put it to the meeting.

Mr. Langston moved that the words "such nomination or approval being consented to by the contractor" be inserted in the clause after the words "approved by the architect."

Mr. E. W. Hudson seconded the amendment.

Mr. Hall said Mr. Langston was talking as if the contractor was asked to be responsible for the work of other persons, but the whole

essence of his condition of contract was that the contractor was responsible for everything in the building. He might have sub-contractors under him, but there was no privity of contract between the employer and sub-contractor. The contract was between the employer and the contractor; it was only ministerially that the architect appointed or suggested or nominated a sub-contractor. The builders had agreed to this, and it would be a most dangerous thing to alter. In fact, if Mr. Langston's suggestion were carried the builder could, if he thought fit, stop the whole contract by refusing to consent to the appointment of a sub-contractor. Let them look what that meant if they had a cantankerous builder, who would simply say, "I will not accept this nomination." If he did that, where were they? The contractor would then accept no liability at all, although he was being paid by the employer to deliver up the building complete within a given time.

Mr. Slater suggested that the whole of the objection of Mr. Langston would be met if they put after the words "approved by the architect," the additional words "subject to Clause 20."

Mr. Brodie thought that if the builders had agreed to the clause they were quite capable of looking after themselves.

Mr. Langston considered it a case where builders required to be protected against themselves.

The Chairman: I do not think there is any need for that at all.

Mr. Langston agreed that the words suggested by Mr. Slater would meet the case, and he was willing to accept them, for he was certain that if the clause remained as it was printed, it would be a continual bone of contention. The builders might have agreed to it—possibly their solicitors had so advised them, seeing that it was a hole made for a quarrel.

Eventually it was agreed that the words "as provided in Clause 20" be inserted after the words "or approved by the architect."

The clause as thus amended was agreed to.

Mr. Hall moved the adoption of the amended Clause 20, as follows:—

"20.—All specialists, merchants, tradesmen, or others executing any work, or supplying any goods for which prime cost prices or provisional sums are included in the specification, who may at any time be nominated, selected, or approved by the architect, are hereby declared to be sub-contractors employed by the contractor; but no such sub-contractor shall be employed upon the works against whom the contractor shall make what the architect considers reasonable objection, or who will not enter into a contract with the contractor upon terms and conditions consistent with those in this contract, and securing the due performance and maintenance of the work supplied or executed by such sub-contractor, and indemnifying the contractor against any claims arising out of the misuse by the sub-contractor or his workmen, of any scaffold erected or plant employed by the contractor, or that may be made against the contractor in consequence of any act, omission, or default of the sub-contractor, his servants or agents, and against any liability under the Workmen's Compensation Act, 1897, or any amendment thereof."

He remarked that the change was radical, but he considered very essential. Unfortunately, he had been professionally engaged in a very heavy lawsuit, and the clause was the outcome of that. The point involved was this: in a large contract of his the builder had, on the advice solely of his legal adviser—there was no dispute before the end of the contract—raised the point of getting damages. The builder took the point that any sub-contractor nominated or approved by the architect, *ipso facto* became the contractor of the employer, and that the builder was absolutely relieved of any responsibility for anything he did; and not only that, but if the sub-contractor caused delay, the employer was liable in damages to the builder for the delay caused, and in the case he had referred to the builder claimed 12,000*l.* for delays by the nominated sub-contractor. In the Division Court he (Mr. Hall) had won the case, and they were now awaiting the decision of the Appeal Court. It was to avoid such a contingency again that the clause was amended, and the Builders' Council had agreed to the alterations. It was contended before the Council of the Builders' Institute that what the amended clause provided was the practice, and the builders assented to that, and therefore the words had been introduced. He considered it most important that the alteration should be made.

Mr. Hudson seconded the motion, and it was carried.

Mr. Slater said he would move the amended Clause 21, which simply brought in the Workmen's Compensation Act. Clause 21 was:—

"21. The contractor shall be responsible for all structural and decorative damage to property, and for injury caused by the works or workmen to persons, animals, or things, and shall hold the employer harmless in respect thereof, and also in respect of any claim made under the Workmen's Compensation Act, 1897, or any amendment thereof, by any person in the employ of the contractor. He shall also be responsible for all injuries caused to the buildings, the subject of this contract, by frost or other inclemency of weather, and shall reinstate all damage caused by the same, and thoroughly complete the whole of the works."

Mr. Adams seconded the motion, and asked whether it might not be well to make the contractor responsible for deficient watching. Of course the contractor put down something for watching, but naturally wanted to minimise things under that head. At the same time many things got damaged by persons intruding on to the premises. He suggested whether perhaps it might not be well to have the words "efficient watching" introduced, although he did not know but what such a contingency was already covered by the form of contract.

The Chairman thought that was rather a matter to be put in the specification.

The amended clause was then carried.

Mr. Hall proposed the adoption of amended Clause 28, viz.:—

"28. The provisional sums mentioned in the specification for materials to be supplied or for work to be performed by special artists or tradesmen, or for other works or fittings to the building, shall be paid and expended at such times and in such amounts and to and in favour of such persons as the architect shall direct, and sums so expended shall be payable by the contractor without discount or deduction, or (without prejudice to any rights of the contractor existing under the contract referred to in Clause No. 20) by the employer to the said artists or tradesmen. The value of works which are executed by the contractor in respect of provisional sums, or in additional works, shall be ascertained as provided by Clause 13. At the settlement of the accounts the amount paid by the contractor to the said artists or tradesmen, and the said value of such works executed by the contractor, shall be set against all such provisional sums or any sum provided for additional works, and the balance, after allowing *pro rata* for the contractor's profits at the rates contained in the contractor's original estimate, shall be added to or deducted from the contract sum, provided that, in estimating the amounts paid as last herein provided, no deductions shall be made by or on behalf of the employer in respect of any damages paid by the sub-contractor to the contractor, the intention being that the contractor and not the employer shall have the benefit of any such damages."

In the old clause it said: "At the settlement of the accounts the amount paid by the contractor to the said artists or tradesmen," &c. Supposing a contractor entered into a sub-contract and made the sub-contractor liable in damages to him for any breach or undue delay, as the clause was contained in the old form, the employer, and not the contractor, got the benefit of that. But that was not their intention. Their intention was that under such a sub-contract the damages should be paid to, and become the property of, the contractor, and they had endeavoured to give effect to that now. In the old clause, unfortunately, the wording was such that the damages went to benefit the employer. He was not giving his own opinion, but the opinion of judges, and therefore they had endeavoured to correct what was a great hardship to the builder, and a hardship which they—the architects—never intended. The builders had agreed to the change, as it was manifestly in their interests to do so.

Mr. Slater seconded the motion, and it was carried.

Mr. Hall moved Clause 29 as amended, viz.:—

"29. The contractor shall permit the execution of work by any other artists or tradesmen who may be engaged by the employer."

There was a difference, he said, from the old clause which they should very carefully note. In the old form it stated that the contractor should, unless otherwise stated in the specification, provide and erect all necessary scaffolding and plant for the due execution by the artists and tradesmen referred to in the preceding clause of the work entrusted to them. That was now omitted from the clause, for it was held that that was a matter which should

go into the specification. Personally, he thought it would have been better in the clause, but still that was not before them. As long as they did not forget to put it into the specification it would be all right.

Replying to a question by Mr. Adams, the chairman pointed out that if the old clause stood in the contract, how was the builder to estimate the amount of scaffolding to be put up for the sub-contractor of whose work he knew nothing. It was far better that any scaffolding provided for special purposes should be described in the specification than by a general item in the contract.

Mr. Adams then seconded the proposition. Mr. Langston asked if the clause was quite clear. For instance, in the event of the interior being filled up with scaffolding and plant, the architect could permit either artists or tradesmen to go over it.

The Chairman said that really was a matter which must be dealt with in the specification. It was impossible to specify those things in general terms in a clause of the contract.

The proposition was then agreed to. Mr. G. F. Fellowes Prynne moved the rejection of the amended Clause 32, and this was seconded by Mr. Adams and agreed to.

Mr. Prynne then moved the adoption of the old clause, with the figure "16" inserted between "9 and 16," so that the clause should read as follows:—

"32.—Provided always that in case any dispute or difference shall arise between the employer or the architect on his behalf and the contractor, either during the progress of the works or after the determination, abandonment, or breach of the contract, as to the construction of the contract or as to any matter or thing arising thereunder (except as to the matters left to the sole discretion of the architect under Clauses 4, 9, 16, and 10, and the exercise by him under Clause 18 of the right to have any work opened up), or as to the withholding by the architect of any certificate to which the contractors may claim to be entitled, then either party shall forthwith give to the other notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of

or, in the event of his death or unwillingness or inability to act, of

his death or unwillingness or inability to act, of a person to be appointed on the request of either party by the president for the time being of the Royal Institute of British Architects, and the award of such arbitrator shall be final and binding on the parties. Such reference, except on the question of certificate, shall not be opened until after the completion or alleged completion of the works, unless with the written consent of the employer or architect and the contractor. The arbitrator shall have power to open up, review, and revise any certificate, opinion, decision, requisition, or notice, save in regard to the said matters expressly excepted above, and to determine all matters in dispute which shall be submitted to him, and of which notice shall have been given as aforesaid, in the same manner as if no such certificate, opinion, decision, requisition, or notice had been given. Upon every or any such reference the costs of and incidental to the reference and award respectively shall be in the discretion of the arbitrator, who may determine the amount thereof, or direct the same to be taxed as between solicitor and client or as between party and party, and shall direct by whom and to whom and in what manner the same shall be borne and paid. This submission shall be deemed to be a submission to arbitration within the meaning of the Arbitration Act, 1889."

He considered that the suggestion in the amended clause which made it possible for the contractor to call for an arbitration was a most dangerous thing. The architect was often now placed in a difficult position, and what would it be if the builder at any time was dissatisfied and could call for an arbitration in the middle of the work? Then again the architect's position would be entirely undermined. Say that an architect condemned a certain amount of timber, and the builder then and there demanded an arbitration! It was extremely difficult in the country to get an arbitrator down at a moment's notice to arbitrate on the timber, and it would cause certain delay; but besides that, the arbitrator might have a certain difference of opinion as to the material which the architect was using or condemned, and the arbitration might go against the architect, however experienced he might be. In that case the position of the architect would be entirely weakened in the eyes of his client. A man might be an excellent arbitrator, but he might not be a judge of material in the same way as an experienced architect would judge. Another point was that the

builders would accept any condition they put if the architects would accept this point, for the one aim of the builders was to get an arbitration on materials. But, on the other hand, the present power of the architect was practical, the only power he possessed under the contract. It had been said that there were architects who condemned viciously, but he thought they were very few and far between, and they as a Institute could not provide a contract which would satisfy the requirements of men who were thoroughly experienced or vicious in character. Their idea was to keep that which they believed to be fair for men thoroughly experienced in their professional work, and they could not undertake to draw up conditions for those who were incompetent or vicious.

At the request of Mr. Hall, the Clause 10 giving the architect power to condemn material, was read.

Mr. Hudson remarked that that certainly ought to be included.

Mr. Hall said the admission of the reference to Clause 16 in the Clause 32 would involve some alteration in Clause 16. At the end of Clause 16 it said: "And in respect of a matters hereunder the architect's decision shall be final."

The Chairman said that was very possible, but in need not be discussed now, as it would come up again.

The clause as amended was then adopted.

Mr. Pryce Cuxson said he would like to suggest an amendment in Clause 13 in regard to that portion which provided that "a copy of such measurements and valuation shall be given to the contractor." Those words had frequently cropped up in his practice as a surveyor, and they had sometimes been attempted to be construed to mean that the contractor had power to call upon the surveyor to furnish a copy of his dimensions. He did not believe that those who framed the clause had any such intention, but yet when read very carefully was quite capable of that interpretation. Moreover, he believed he was correct in saying that it was not the usual practice for quantity surveyors in London to supply contractors with copy of the variation account unless they paid the cost of copying such bill.

The Chairman said he must stop the discussion of that matter, which was simply a question of practice between surveyors and builders.

Mr. Hall said he believed that Mr. Pryce Cuxson wished to suggest that the words should be "a copy of the bill" instead of a copy of the measurements.

Mr. Brodie said he would strongly support the suggestion of Mr. Pryce Cuxson that the words should read "and a copy of the bill of such measurement and valuation be given to the contractor," because that was what he meant.

Mr. Pryce Cuxson said he also wanted to add the words after contractor "prepared by him."

The Chairman said he could not accept that addition because he did not think they had any power to deal with the quantity surveyor and the builder.

Mr. Adams said he thought if they put quantity surveyors down, they should put down what they should do. He had had precisely the same difficulty brought before him.

The Chairman: I have no objection to you saying what they shall do, but I have an objection to your saying anything about the payment between the builder and quantity surveyor, therefore he refused to put the amendment in the form in which Mr. Pryce Cuxson had moved it.

Mr. Slater said he did not think there could be the slightest objection to altering the words so that it should read "a bill or statement," and if that would be an improvement in the contract by all means let them have it.

Mr. Hall said that after all was said and done they were imposing something on the surveyor by the clause. They were saying that under the contract he was bound to supply and, of course, in that contract must bound without payment. He thought the words "bill or statement" met the difficulty.

The Chairman: I have no objection whatever to take that.

After some further discussion the clause was amended so as to read: "and a copy of bill or statement and valuation shall be given to the contractor."

The Chairman announced that the Council would bring up an amended draft at a special meeting to be held on the 15th inst. H

Further announced that at that special general meeting a recommendation would be considered from the Council that Mr. W. Emerson, resident, be requested to allow himself to be nominated as President for the ensuing year of office, and that, consequently, by-law 26 be suspended. He further announced that the next ordinary general meeting of the Institute would be held on Monday, April 22, when Mr. Francis Bond would read a paper on "The Classification of Romanesque and Gothic Architecture."

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

THE eighth meeting of the Discussion Section of the Architectural Association for this session was held at 50, Great Marlborough-street, W., on the 22nd ult., Mr. C. H. Strange, architect, in the chair. The paper of the evening was entitled, "Lincoln Cathedral," and was by Mr. L. Stanley Crosbie. Mr. Crosbie introduced his subject by a brief examination of the causes, geographical and historical, which led to the foundation of the city and the See, tracing the course of events from the mission of St. Paulinus to the establishment of the See of Sidnacester, the ancient cathedral of which yet stands in the village of Upton, ten miles to the north-west of Lincoln, following on with the account of the removal of the bishop's seat to Dorchester-on-Thames, and then the final foundation of the cathedral of See in Lincoln city by Remigius, the brother of the Norman King, in about 1076. He then gave a short sketch of the evolution of the cathedral, the accidents of war, and earthquake, which caused the wreck of the Norman structure of the first foundation, and then of the second foundation by St. Hugh on the present plan and scale, giving but the west front of the Norman. After summing up the historical section of his paper, Mr. Crosbie proceeded to deal with the more salient points of the structure which would appear to challenge criticism or excite special interest, claiming to regard the Minster in the light of an architectural whole, rather than dealing with the archeological examination of parts. The peculiar beauties of the views and glimpses of the cathedral, both as seen in the air as also in the far distance, and the significant share the hill and the contour of the surrounding country has in the fame of the Minster, were enlarged upon, while at closer quarters the unique west front was criticised in some detail. The author of the paper gave his opinion that while the defects of this church abused front were obvious, and should not be overlooked, there was yet so much to be sought and interest, so vivid a page of history and human effort displayed here, that the chance of worth was entirely in its favour, and in putting on one side for the moment its great breadth of effect and impressive endeavour.

With the aid of photographs and some sketches Mr. Crosbie went on to point out the grouping at the east end, the elaborate and beautiful "Bishop's Door," the Galilee porch, the transcript gables with their famous circular windows, the "Bishop's Eye," and the "Dean's Eye." He also drew attention to the excellent Norman work in the western towers and spires, and after alluding to several items of interest in the external architecture, proceeded to describe the interior, quoting the words of Mr. Penrose, describing the exquisite proportions of the nave, and drawing attention to the comparative smallness of the nave piers, producing so noticeable an effect of lightness and grace. The splendid choir stalls and the far famed angel-choir also received attention. He spoke of the few fine examples of thirteenth century glass yet remaining in the cathedral, and deplored the existence and mention of the ugly glass which forms so serious a disfigurement to the glorious east window. Mr. Crosbie then gave some description of the cloisters, and defended them in the charge of paucity and meanness soon brought against them on the ground that, though undoubtedly small, this was largely remedied for by the suitable proportions of the cloister, as compared with the area of the cloister, and the additional greatness of scale which accrued to the Minster by way of comparison. A few descriptive passages were read to the close and the surrounding build-

ings, notably the palace, the precentory, and the chantry, concluded the paper.

Mr. R. H. Weymouth opened the discussion and proposed a vote of thanks to the author for his paper. Mr. W. H. Seth Smith seconded, and the discussion was continued by Messrs. H. J. Leaning, A. S. Tayler, R. W. Mulready, G. R. C. Harding, C. H. Strange, and W. B. Hopkins.

COMPETITIONS.

MUNICIPAL BUILDINGS, SOUTH SHIELDS.—The plans selected for the new municipal buildings in South Shields were prepared by Mr. Ernest E. Fetch, A.R.I.B.A., 20, John-street, Adelphi, London, W.C.

ADDITIONS TO POLICE COURTS, BRISTOL.—Out of the seventeen sets of drawings sent in competition for the proposed alterations and additions to the Police Courts, Bristol, the designs premiated are those respectively of Mr. Henry Williams, architect, Clare-street, Bristol; and Messrs. Buckland & Farmer, architects, Paradise-street, Birmingham.

ARCHAEOLOGICAL SOCIETIES.

SURREY ARCHAEOLOGICAL SOCIETY.—The forty-sixth annual meeting of this Society was held on Saturday, March 23rd, at the Castle Arch, Guildford, Surrey, to receive the report and balance-sheet of the Council. Viscount Midleton, the President of the Society, occupied the chair, and moved the adoption of the report and statement of accounts of the Society. In fulfilment of the promise made in last year's report, a complete and bound volume of the Society's collections (Vol. XV.) was duly issued to all members not in arrear with their subscriptions. In this volume are valuable papers by Mr. J. Lewis André, Mr. H. E. Malden, M.A., Mr. Mill Stephenson, the Rev. T. S. Cooper, Mr. A. Ridley Bax, Mr. Philip M. Johnston, and Mr. Cecil T. Davis. The catalogue of church plate is, with the exception of certain appendices, now brought to its conclusion by Mr. Cooper. The Council, while it congratulates the members on this evidence of the Society's increased prosperity, and is decided to repeat this policy of issuing a complete volume for the year during the present year, feels that, if the practice is to become permanent, it must still further urgently appeal to them to enlist the interest of their friends in the Society's work, and thus help to obtain new members. Considerable as has been the increase in the number of members during the past two or three years, the Council is persuaded that this number does not yet adequately represent the number of those who are interested in the archeology of the county. The excavations at Waverley Abbey were continued last summer, under the superintendence of the Rev. T. S. Cooper and Mr. Henry Horn-castle, with even more important and satisfactory results than hitherto. Mr. Harold Brakspear has given much valuable time and experience to bear on doubtful and difficult points. The work has been at times very perplexing, owing to the many and unexpected walls and footings found of the Norman abbey mixed up with and sometimes made use of in the later buildings. In the previous year Mr. Brakspear discovered the little presbytery of the Norman church in and forming part of the south transept of the later church planned by William de Brade-water. The long, narrow Norman nave has now been traced below the cloister. The original cloister was at some time considerably enlarged and carried across the cellarium as well as the nave of the first church. The arrangement of the Frater and its pulpit is interesting, as it shows the former to be of two dates at least. The plan of the infirmary hall and kitchen is now clear, and it has become evident that there was no building between this portion of the abbey and the river. Some very interesting features, too, have come to light in the direction of the monks' dormitory. Much of the Norman work here remains, with the south wall on a line with that of the Frater; later the dormitory was extended southwards at a higher level almost to the river bank. At the north end the doorway leading from the cloister and the fine broad steps ascending to the dormitory have been exposed, and close by a winding staircase which probably formed the approach to the treasury. The plan of Brade-water's church also is now nearly complete.

There is still a good deal to be done west of the cellarium, where the guest-houses, the infirmary of the conversi, and possibly a gateway may be looked for. This is of almost greater importance than the work already done, since these buildings of the outer court have never been worked out properly anywhere. Both at Fountains and Furness the remains of them are anything but complete, and at the former it is known there were a number of buildings of which no trace can be found. The Society has therefore the opportunity of adding materially to what is already known of the plan of a Cistercian abbey, an opportunity which may not present itself again. It is much to be hoped that the owner of the site will allow the excavations to be extended. In the event of his doing so, the Council must again appeal for subscriptions to carry to a satisfactory conclusion that which is undoubtedly the most important work the Society has ever taken in hand. Mr. George Martineau has resigned his seat on the Council, and Mr. Frank B. Eastwood, of High Clandon, has been duly elected to fill the vacancy. The Council has also appointed Mr. Thomas Howse, F.L.S., to act as hon. librarian of the Society. The number of members is 383: viz., annual, 289; life, 93; honorary, 1. During the year 27 new members have been elected: viz., annual, 26; and life, 1. By death the Society has lost 8 members: viz., 5 annual and 3 life. By resignation: 4 members. Mr. More-Molyneux seconded the motion, and the report and balance-sheet were adopted unanimously. On the motion of Mr. Garraway Rice, Messrs. F. A. Crisp, F. B. Eastwood, Edwin Freshfield, W. More-Molyneux, Ralph Nevill, Sir F. Pollock, Hart, Colonel John Davis, and Lieut. Colonel W. Marsden were re-elected members of the Council. Viscount Midleton moved the re-election of Mr. M. S. Giuseppe as hon. secretary, with a vote of thanks for his services during the past year, which was adopted. The auditors, Messrs. W. F. Potter and Cecil T. Davis, and the hon. librarian, Mr. T. Howse, were also unanimously re-elected. The meeting closed with a vote of thanks to Lord Middleton for presiding.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening last, Mr. Charles Mason, President, in the chair, a paper was read on "The Production of Metallic Bars and Tubes under Pressure," by Mr. Perry F. Nursey, Past President, who stated that his purpose was to describe the various processes and apparatus employed in the manufacture of bars and tubes by forcing metal through dies by pressure. The primary application of this principle, he observed, was to the manufacture of lead pipes; but before describing the methods of their production he referred to some water-pipes made by the Romans which he inspected at Bath some years since during some excavations in the Roman baths there. They measured about 18 in. wide by 4 in. deep, and were made from a dish strip of lead which constituted the top, whilst a flat strip, having its edges turned up over the edges of the upper strip, formed the bottom. He then referred to the early manufacture of lead pipes, which were made by either drawing or rolling cylinders of lead down to the required diameter on a mandrel which formed the bore. Lead pipes were also made by bending sheet lead over a mandrel and soldering the edges. These unsatisfactory methods were in time superseded by the lead pipe press, in which molten lead is placed in a heated container, and when cooled down to plasticity is forced through a die by hydraulic pressure. By this means, instead of only short lengths of pipes being made, as with the old methods, pipes of any required length are produced. The author described the process of manufacture as he had witnessed it at the Farrington Works of Messrs. Pontifex, in Shoe-lane, London. He then described the improved lead pipe press of Mr. Alexander Wylie, as made by Messrs. Wilson & Sons, of Johnstone, Glasgow, which is a considerable advance upon the ordinary lead pipe press. In the later examples, instead of the container being kept hot by a fire or a ring of gas jets it is jacketed and steam-heated. An important adaptation by Mr. Wylie of this press to the encasing of telegraph cables in lead pipes was next described. Before this press was devised the cable used to be attached

to the core of the pipe-press, and the pipe as produced pushed forwards over it. This method had several drawbacks, the most serious of which was damage to the cable by heat. This was remedied to some extent by passing the pipe through cold water before it reached the cable, but this was insufficient to produce a good result. Another method employed was to make the pipe and draw the cable into it. In Mr. Wylie's press the cable passes horizontally through a core, the process of covering being rapid, continuous, and effective. Turning next to the extrusion process of Mr. Alexander Dick, the inventor of Delta metal, the author stated that by its means all kinds of bars from a simple round wire to complex sections, which it was impossible to roll, and also tubes of any section, were produced by causing metal heated to plasticity to flow through a die under hydraulic pressure. Considerable difficulty had been encountered by Mr. Dick in designing the apparatus in which a metal offering a far higher resistance than lead, and pressed at a far higher temperature than that metal, had to be dealt with. Lead, with its melting point of 620 deg. Fahr., is pressed out at a comparatively low temperature and pressure, whilst in Mr. Dick's process copper and its alloys—far less ductile metals than lead—with their melting points of about 2,000 deg. Fahr., are operated upon at a very high temperature, namely that of plasticity, or about 1,000 deg. Fahr. Mr. Dick's method consists in charging the hot metal into a horizontal container, at the front end of which is the die. Upon hydraulic pressure being applied at the rear end of the container the plastic metal is forced through the die, issuing therefrom either as bars or tubes. The author stated that he had inspected Mr. Dick's highly ingenious apparatus in operation at the Delta Metal Works, Pomeroy-street, New Cross, London, where he had seen it produce both bars and tubes. An important feature in the bars thus produced is that the quality of the metal is greatly improved. It acquires increased density, and is perfectly homogeneous, extruded bars of a given metal giving higher results when tested for tensile strength than rolled bars of the same metal, whilst it works best in the lathe or the screwing machine at speeds twice, and even three times, as great as those employed with ordinary metal. This was shown by the remarkable results of tests made for the author by Alfred Herbert, Limited, of Coventry, in one of their Hexagon Turret lathes.—The paper was well illustrated by drawings of the various machines described, and by specimens of extruded metallic bars and tubes, and the various turned and screwed test pieces.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Batterseth Borough Council 3,615*l.* for building and paving works; Stepney Borough Council, 10,000*l.* for electric light installation; and the Hampstead Borough Council, 4,385*l.* for a dust destructor.

Standing Orders—Contracts.—The General Purposes Committee brought up a report containing the following paragraph:—

"The Council on February 19 last referred it to us to consider and report as to the advisability of amending the standing orders as to contracts in order to provide that the trades to be employed in the more important sections of any works to be carried out under contract should be specified in a schedule to be added to the contract.

The question was raised by the Asylums Committee, and in their report they stated that difficulty had arisen at the Horton Asylum in consequence of the casing and capping in connection with the electric light installation being fixed by workmen of the Amalgamated Society of Carpenters and Joiners claiming that the work should be done by carpenters. The Asylums Committee stated that they had asked the contractors to employ carpenters for this work, but that in the absence of any stipulation in their contract they had declined to do so, and that the Committee were unable to insist upon the contractors complying with their request. To meet similar cases in future, the Committee accordingly made the suggestion that in future it would be well to specify in contracts the trades to be employed in the more important sections of the work for the carrying out of which the contract was entered into. Having carefully considered the question, we are of opinion that it would be

inexpedient to amend the standing orders in the direction referred to. We recommend that the Council do concur in this view."

It was moved by Mr. Dew, seconded by Mr. Taylor, that the paragraph be referred back. After a brief discussion, the amendment was defeated, and the Committee's recommendation was carried.

The Housing Question—Lordship-lane Estate, Tottenham.—A long debate then took place on the following recommendations of the Housing of the Working Classes Committee:—

"(a) That the estimate of 91,500*l.* submitted by the Finance Committee be approved; and that the Council do acquire, under Part III. of the Housing of the Working Classes Act, 1890, and the Housing of the Working Classes Act, 1900, about 225 acres of land at Tottenham, Wood Green, and Edmonton, known as the Lordship-lane estate, at 400*l.* per acre, subject to the Council accepting the areas appearing on the ordnance survey, paying vendors' surveyors' fee, and all expenses of sale and purchase, and taking the land subject to existing tenancies and title.

"(b) That the solicitor be instructed to prepare the necessary agreement, and that the seal of the Council be affixed thereto when ready."

The Committee also submitted a detailed report on the scheme, the greater part of which was printed in our issue for March 2.

The Chairman of the Committee (Mr. Waterlow) having described the scheme, Mr. Peel moved to add the following words:—"On the clear understanding that if the Council does proceed with the buildings, the cottages may be so constructed that the rents demanded should be within the means of the class earning less than 30*s.* a week."

Mr. Williams seconded, but the amendment was defeated, and the Committee's recommendations were agreed to.

Lot's-road Pumping Station.—The Drainage Committee recommended, and it was agreed, after discussion,

"That the estimate of 15,000*l.* submitted by the Finance Committee be approved; that the erection of the engine-house and other buildings, as well as the execution of the remainder of the underground work on the site of the proposed new pumping station at Lot's-road, Chelsea, be carried out without the intervention of the contractor in accordance with the drawings prepared by the engineer; and that the drawings, specification and estimate of 35,300*l.* be accordingly referred to the manager of works for the purpose."

Line of Frontage—Sorting Office, Brixton.—The Building Act Committee brought up a report containing the following paragraph:—

"We have been in communication with H.M. Office of Works with reference to the frontage of a proposed post-office sorting-office on a site at the rear of No. 322, Brixton-road, Stockwell, fronting on Wynne-road. Section 202 of the London Building Act, 1894, exempts from the provisions of the London Building Act, 1894, any building, structure, or work vested in, or in the occupation of, any department of His Majesty's Government; and therefore the Council has no power to require that the line of frontage should be kept. In October, 1898, we received a communication from the Post-office calling attention to the purchase of the site, and stating that although the Postmaster-General would not desire to adopt a building line contrary to the wishes of the Council, yet that in the present case, in order to provide sufficient accommodation, it would be necessary to build up to the pavement in Wynne-road. After negotiations, however, with His Majesty's Office of Works, that department has submitted a plan showing the setting back of the front of the proposed building about 5 ft. from the inside of the pavement on the south side of Wynne-road. The general line of buildings on the south side of the road is well defined, and is set back 8 ft. 6 in. from the public way. Having regard to all the circumstances, we have accepted the proposal, which we consider satisfactory, and we report the facts for the information of the Council."

Ground Plan and Annual Map of London.—The Corporate Property Committee recommended, and it was agreed,—

"That, subject to the passing of the annual maintenance votes, the further expenditure be authorised of the sums included in the Corporate Property Committee's estimate, viz., 600*l.* and 500*l.*, and of the sum included in the Local Government Committee's estimate, viz., 530*l.*, during the year ending March 31, 1902, in connexion with the ownership, and detail-sections of ground plan of London and of the annual map of London respectively."

Christ's Hospital.—The Historical Records and Buildings Committee stated that they had given consideration to proposals contained in the Bill now before Parliament with reference

to Christ's Hospital, Newgate-street. They felt that the entire removal of the buildings on the area would result in the demolition of several features of distinct historical and antiquarian interest. This would be an undoubted loss to London, and they have asked the Parliamentary Committee to take steps to oppose the Bill.

Buildings of Historical or Architectural Interest.—The same Committee recommended, and it was agreed, that the first part of register of buildings of historical or architectural interest in London be placed on sale at 10*s.* 6*d.* per copy.

Holborn to the Strand—Paving, &c., near St. Clement Danes Church.—The Improvements Committee recommended, and it was agreed, that the working drawings, specification, and estimate of the cost (6,202*l.*) of the paving and other works in the Strand near the churches of St. Clement Danes and of St. Mary-le-Strand be referred to the Works Manager with a view to the work being carried out without the intervention of a contractor, it being understood that the work around St. Clement Danes be proceeded with by night and day.

Carr's Restaurant.—The same Committee recommended, and it was agreed,

"That, in connexion with the Holborn to Strand improvement, the approval of the Council be given to the action of the Improvements Committee (a) in approving the design No. 3 submitted to the Improvements Committee on March 27, 1901, by Mr. George Cox for the elevation of the new Carr's restaurant on the north-eastern frontage of the proposed crescent road close to the Law Courts; and (b) in extending the period during which Mr. Cox is permitted to retain possession of the land referred to in Section 47, Sub-Section 3, of the London County Council (Improvements) Act, 1899."

Sewer Work.—On the recommendation of the Main Drainage Committee, it was agreed that subject to the passing of the annual maintenance votes for 1901-2, the expenditure of 6,450*l.* be sanctioned for the execution of repairs to the Ravensbourne and Sydenham sewer between Loampit Vale and Catford Bridge, and that the work be carried out by the Works Department as a jobbing work.

Tender.—On the recommendation of the Public Control Committee, it was agreed that the tender of Messrs. Parkinson and W. & B. Cowan, Limited, for the sum of 1,680*l.* for the supply and fixing of plant at the Newington gas-meter testing office be accepted.

New Theatre, Islington.—The Theatres and Music-halls Committee reported that they had considered an application by Mr. F. Matcham, on behalf of Mr. F. W. Purcell, for a certificate under the Metropolitan Management and Buildings Acts Amendment Act, 1878, in respect of a theatre which is proposed to erect in the Holloway-road, Islington, and which will be known as the Marlborough Theatre. The total length of the boundaries of the site is 536 ft. of which 78 ft. will front to Holloway-road, which is 83 ft. in width, with an additional forecourt 58 ft. deep in front of the theatre, 190 ft. to a new footway (Macredy-place) 20 ft. in width, and 78 ft. to a 10-ft. passageway communicating at one end with Macredy-place and at the other with Warlters-road, which is 20 ft. in width. The theatre is planned to accommodate 1,946 persons, and subject to certain conditions the plans may be considered by the Committee, be considered as fulfilling the Council's requirements.

The Council, having transacted other business, adjourned for the Easter recess.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage and Projections.

Greenwich.—The retention of a lavatory and water-closet addition to No. 11, Kidbrook Park-road, Lee, to abut upon Harvey-road (Mr. T. Holl for the Bowater Decorating and Sanitary Company)—Consent.

Dulwich.—Wood and tile pents at the entrance to fourteen houses on the south side of Woodwarde-road, East Dulwich (Messrs. Allen & Hoar for Mr. J. Frampton)—Consent.

Dulwich.—Bay-windows to fourteen houses on the south side of Woodwarde-road, East Dulwich

Messrs. Allen & Hoar for Mr. J. Frampton).—Consent.

Paddington, North.—A one-story porch in front of a proposed parish hall on the east side of Lacroome-road, St. Peter's Park, Paddington (Mr. S. Alder for the Rev. W. P. Legg).—Consent.

Width of Way and Lines of Frontage.

Kensington, South.—A two-story addition to No. 9, Victoria-road, Kensington, to abut upon St. Ivan's-road (Messrs. C. Liney & Sons for Mr. J. Jarvis).—Consent.

St. Pancras, West.—A one-story addition to the Regent's Park Riding School, on the north-east side of Park Village East, Regent's Park, adjoining the York and Albany Hotel (Mr. W. Woodward for Mr. B. Perry).—Consent.

Stam.—The rebuilding of Nos. 35, 36, and 37, King-street, and No. 8, Little Marlborough-street, Oldens-square, St. James's (Mr. A. Burr for Mr. T. Evans).—Consent.

Width of Way and Space at Rear.

Battersea.—Four houses, with shops on the ground floor, on the site of Nos. 148 to 158 (even numbers only, inclusive), Falcon-road, Battersea, with a portion of the northernmost house and the boundary line thereof at less than the prescribed distance from the centre of a passage-way leading from Falcon-road to Clapham Junction, and with irregular open spaces at the rear of such houses (Messrs. Readwell & Martin for Mrs. J. Taverner).—Consent.

Dwellings for the Working Classes.

Kennington.—That the Council do make an order follows:—Whereas Mr. S. Bircham, of Waterloo station, S.E., on the 7th day of March, 1901, under a provision of Section 42 of the London Building Act, 1894, delivered on behalf of the London and South Western Railway Company, at the County Hall, plans of four blocks of intended dwellings, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon street, on the site of Nos. 48 to 72 (even numbers only, inclusive), South Lambeth-road, Kennington, the corner of Miles-street. . . . Now the Council do hereby order that the deposited block plan and block sections, so far as Section 42 of the said Act is concerned.—Agreed.

Alteration to Building.

Dutch.—A box-room in the roof of No. 21, Madella-road, Herve Hill, without the walls of the building being thickened so as to make such walls comply with the first schedule of the Act (Mr. J. J. Christian).—Consent.

GENERAL BUILDING NEWS.

RESTORATION OF ASHTON CHURCH, DEVONIRE.—The parish church at Ashton was re-opened the 16th ult., after partial restoration. The work of restoration was carried out by Mr. Herbert Ad, of Exeter, the architect being Mr. E. C. Nutting, of Marlborough. The wagon-shaped spire and all the timbers, with the exception of part of the moulding of the purlins and principal ribs, which were bidden with lath and plaster, have been renovated. The ribs, purlins, rafters, &c., have been repaired in English oak, and are now exposed. The lead gutter has been recast, and the 6 date 1688 replaced upon it together with the new roof. The outside roofs have been covered with the best Westmorland green slates.

HOSPITAL, ST. ANDREWS, FIFE.—A hospital is to be built on a site at the east end of Abbey Park, St. Andrews. Plans have been prepared by Mr. Charles F. Anderson, St. Andrews.

MISSION CHURCH, BARNSELY.—The foundation of the new mission church of St. Mary Magdalene, at Measbro' Dyke, was laid on the 25th ult. Messrs. Senior & Clegg were the architects.

VOLUNTEER DRILL HALL, BLAYDON, DURHAM.—Drill hall for the 5th Detachment V.B. Durham Infantry was opened at Blaydon on the 27th ult. The hall measures 90 ft. by 40 ft. The contractor was Mr. M. A. Armstrong, of Blaydon. J. M. A. Graham, of Newcastle, is the architect.

EPISCOPAL CHURCH, GUARDBRIDGE, FIFE.—An Episcopal church has been built at Guardbridge in plans by Mr. Charles F. Anderson, St. Andrews.

BUSINESS PREMISES, HAMPTSTEAD-ROAD.—An addition has been made to Messrs. Oetzmann & Co.'s premises at the corner of Hampstead-road and Diamond-street. Mr. Fred. Eales was the architect.

MISSION HALL, BRADFORD.—A mission hall for Methodists is to be erected in Leeds-road, Bradford, in plans by Mr. W. J. Morley, of Bradford. **OSBORNE STORES, EDINBURGH.**—A new bonded warehouse is to be erected at St. Leonard's, from is prepared by Messrs. Leadbetter & Fairley, architects, Edinburgh. The present area is to be leased, and the new premises will extend to an area of 750 ft., with an average width of 70 ft. The eastern portion of the buildings will be occupied by bonded warehouses five floors in height. This

part will measure 304 ft., and will average 65 ft. in width. The northern portion, measuring 245 ft. by 71 ft., will be occupied as cellars, bottle-washing premises, &c., on the ground floor, and the second flat is to be used as the dispatch department. The centre of the building will consist of vatting and mixing cellars, a large covered court, offices for the company and Excise, &c. The elevation to the Queen's Park will be built of stone. The reconstruction of the premises is expected to cost about 25,000.

HOUSES FOR THE WORKING CLASSES, DARLINGTON.—According to the *Darlington Star*, Messrs. Robert Stephenson & Co., Limited, have prepared plans for the erection of 582 houses on land east of the North-Eastern Railway at Thompson-street, adjoining the new engine works, now in course of erection at Darlington. Thompson-street is to be extended eastwards to Salter's-lane, and thereby direct access will be afforded to the villages of Haughton-le-Skerne, Burdon, and Harrowgate. The length of the intended new streets is as follows:—40 ft. wide streets, 3,614 yd.; 80 ft. street, 203 yds.; and the length of 15 ft. wide back streets will be 2,300 yds. Four classes of houses are provided for, viz. 376 with a frontage of 16 ft. each, 116 with a frontage of 18 ft. each, fifty-nine with a frontage of 21 ft., each, and 31 semi-detached cottages, also with a frontage of 21 ft. each cottage. The latter will front the 80-ft. street above referred to, which forms one approach to the works, and which is to be planted with trees to form an avenue. The general plan of this intended addition to the town of Darlington is, first, by an eastward extension of Thompson-street to Salter's-lane, out of which said extension nine streets will be carried southwards for a distance of about 90 yards, and these latter streets will be cut across by other two streets, which will be roughly parallel with Thompson-street extension, the 80-ft. wide avenue being the central one of those running northwards out of Thompson-street extension. Two considerable areas of land, each to be planted round with trees, have been reserved for pleasure or recreation grounds. The accommodation to be provided will be as follows:—First, in the cottages of 16-ft. frontage, sitting-room, with bay window, 11 ft. 6 in. square; kitchen, 15 ft. 3 in. by 12 ft.; scullery (with set pot), 8 ft. 6 in. by 6 ft.; ample pantry accommodation, paved yard, and conveniences. Upstairs, three bedrooms, 15 ft. 3 in. by 11 ft. 6 in., 15 ft. 3 in. by 12 ft., 11 ft. 2 in. by 6 ft., and a bath. In elevation, the roof to bay window is carried across the full frontage of the cottage, supported on ornamental brackets. The entrance is provided with a screen door, glazed in coloured glass. The walls are to be built of light-coloured open clampbricks. The cottage of 18-ft. frontage will have two sitting-rooms (one of them with a bay window), 13 ft. square and 15 ft. by 11 ft. respectively; kitchen 12 ft. by 9 ft.; scullery (with set pot), 9 ft. square; ample pantry accommodation, large paved yard and conveniences. Upstairs, four bedrooms, 13 ft. by 11 ft., 15 ft. by 11 ft., 13 ft. by 9 ft., and 9 ft. by 6 ft. respectively. There is also a bathroom, with lavatory basin, and separate water-closet. In elevation, the screen door is set back from a porch. The eaves are made to overhang on the projecting spars. The roof will be in red tiles. The cottage of 21 ft. frontage will have two bay-windowed sitting-rooms, 16 ft. by 14 ft. and 15 ft. by 13 ft. 4 in.; kitchen, 15 ft. by 11 ft.; scullery, 11 ft. by 8 ft.; good pantry and larder; detached washhouse in yard, which is cemented, leaving spaces for flower borders. Upstairs, two bay-windowed bedrooms, 16 ft. by 13 ft. and 15 ft. by 13 ft.; two smaller bedrooms, 14 ft. 6 in. by 11 ft., and 11 ft. 6 in. by 6 ft. 6 in. There is a bathroom, with lavatory basin, and a separate water-closet. There are two attics, 20 ft. by 10 ft. and 13 ft. by 10 ft. Half way on the roof is a low three-light rectangular window. The semi-detached cottage will have a dining-room 14 ft. 6 in. by 12 ft. 6 in., and a parlour 14 ft. 6 in. square, both bay-windowed; kitchen, 14 ft. by 11 ft.; scullery and pantry, 11 ft. by 8 ft.; also the usual outbuildings, a paved yard, and ornamental flower borders. Upstairs there will be two bay-windowed bedrooms, each 14 ft. 6 in. by 12 ft. 6 in.; a bathroom, lavatory, and water-closet, 11 ft. by 7 ft.; and two attic bedrooms, 14 ft. 6 in. by 12 ft. 6 in. and 8 ft. by 7 ft. 6 in. The elevation consists of four bay windows, two on the ground floor and two above, with the two entrance doors between those on the ground floor. The upper bay windows are each roofed back against an ornamental gable, pierced with ventilating opening, and surmounted by finial. The front wall is brought forward over the entrance doors to form a porch. There are two rectangular roof lights.

BUNGALOWS, &C., MAIDENHEAD.—Building operations are about to be commenced on the Fishery Estate, Maidenhead. The first road parallel to the river is to be at once constructed and an ornamental bridge over the creek erected. Designs for several of the bungalows to be erected on the estate have been prepared by the architects for the estate, Messrs. Palgrave & Co., Westminster, under whose direction the developments are to be carried out.

UNITED METHODIST FREE CHURCH, SHERNHALL-STREET, WALTHAMSTOW.—This church was opened

on the 28th ult. The buildings are erected on a prominent site at the corner of Sherhall-street and Oliver-road, the style being Early Decorated Gothic. The church is flanked on one side by a bold square tower, which rises to a considerable height. A large church parlour is placed alongside the church on the opposite side. The facings are of red brick with Bath stone dressings; the roofs are of green slates; moulded triple arches of Bath stone, supported by Norwegian granite shafts with carved caps, divide the nave from the apse, where the choir and organ are accommodated. The choir has a traceried stone front or dwarf screen. The pulpit occupies the space under the central arch, and is the centre from which all the seating radiates (the seats being circular on plan), so that all the congregation immediately face the preacher. The roof is of hammer-beam construction, with open-timber spandrels of tracery work. The metal work is all of wrought iron and copper. The church will accommodate about 750 persons in a mixed congregation, all on the ground floor. Provision is made for future end gallery to accommodate about 100 persons. The contract was let to Mr. J. P. Carter, Grays, Essex, for 5,600l. The architects whose design was selected in competition are Messrs. George Baines and Reginald Palmer Baines, Clement's Inn, Strand, W.C.

BATH ABBEY RESTORATION SCHEME.—At the Guildhall, Bath, on the 28th ult., a meeting on behalf of the fund for repairing the abbey was held under the chairmanship of the Mayor (Mr. T. B. Silcock). The Rev. Canon Quirk submitted a statement from the Executive Committee, which now reported that the last bit of work on the west front was in hand. But other necessary work had been found, and the architect (Mr. T. G. Jackson) had pointed out the condition of the flying buttresses on the south-east choir, and that the pinnacles and battlements were loose and decayed. The five buttresses on that part of the church were in a bad state. Two of them must be at once completely rebuilt, and the remaining three could only be saved after considerable repair and restoration. He estimated that each buttress would cost 350l., and the various smaller repairs 200l. In addition, a dangerous defect had been found in the wooden roof of the choir, and to strengthen that portion of the church the cost would be 250l. Towards that increased expenditure the committee had in hand a sum of 500l., over and above the liability of previous contracts. It was considered that an additional sum of 2,000l. would be required to meet the cost of the extra necessary repairs. The committee had now decided to appeal to the public at large for 2,000l., with a supplementary estimate of 600l. to carry out the repairs.

FLATS, PUTNEY.—A building is in course of erection at the corner of the Flatt, Lower Richmond-road, Putney, facing the river, and will be called "University-mansions." It will consist of self-contained residential flats of iron and steel construction, and will be fireproof. An electric lift will be erected in the well of the principal staircase and give access to five flats on each floor. The ground floor is to be adapted to shops, the corner being bank premises. Messrs. Palgrave & Co., Westminster, are the architects, and Messrs. Whitehead & Co., Limited, are the general contractors. The cost (with the site) is about 30,000l.

FOREIGN.

FRANCE.—The City Council of Paris has decided on transforming the Hôtel de Lauzun into a museum in which will be placed the curious collection of engravings now at the Carnavalet Museum. The building will be preserved in its existing state, but will be provided with furniture of the seventeenth and eighteenth centuries, so as to form a historical museum of this class of work.—The Government has presented to the "Musée de l'Armée" an important collection of water-colours by Pierre Leconte and Armand Dumaresco, representing the French military uniforms under the First Empire, the Restoration of July, and the Second Empire.—The Académie des Beaux-Arts has elected M. Venturi, archaeologist, of Milan, as its foreign corresponding member, in place of Verdi.

—The Committee of the Louvre has purchased for the gallery an important work by Raeburn.—The church of St. Clothilde, at Reims, recently built from the designs of M. Gosset, has just been formally consecrated.—M. Dailion, the sculptor, has just completed the model for the bronze statue of Pasteur to be erected in the little town of Arbois. M. Debric, the architect, has been commissioned to design the pedestal, which will be decorated with two bas-reliefs in bronze commemorating Pasteur's discoveries, and will be surrounded by a decorative balustrade.—We have to record the death of M. Charles Cazin, an artist distinguished both in figure subjects and landscape. He died at a small town in the Department of the Var, where he had gone to winter for his health. He was suffering from a disease of the heart known to be incurable. Cazin was born in 1841 at Samer. He was entrusted with the commission of completing Puyvis de Chavannes' unfinished frescoes at the Panthéon. At the New Salon Cazin was President of the Section of "Objets d'Art," which in fact owed its initiation to him. He was "Com-

mandeur" in the Legion of Honour, and received a gold medal at the recent International Exhibition. Some further remarks in regard to him are included in the "Letter from Paris" in the present issue.

MISCELLANEOUS.

THE STUDENT'S COLUMN.—Our Student's Column article ("Sanitary Fittings and Plumbing") is unavoidably held over until next week.

LYCH GATE, NORTHMOLTON CHURCH, DEVONSHIRE.—A lych gate has been erected at Northmolt Church. The walls are of local stone, with dressings of Dartmoor granite. The woodwork is of English oak and the roof of tiles. The masonry Southmolt, the oak work being by Messrs. Harry Hems & Sons. The lych gate was designed by Mr. James Crocker, of Exeter.

THE INSTITUTE OF SANITARY ENGINEERS (INCORPORATED).—At a meeting of the Election Committee held on the 13th ult., the following gentlemen were elected as Associates:—F. Eovey, Holloway; J. Buckleide, Hillingdon; J. Whittaker, Fleasington. At the examination in sanitary engineering, held on the 22nd and 23rd ult., the following passed qualifying for Associateship:—W. J. Lane, Croydon; R. J. McKenn, Manchester.

HOUSING SCHEME NEAR BIRMINGHAM.—Mr. George Cadbury has conveyed to trustees an estate of about 350 acres in the parishes of Northfield and King's Norton, in Worcestershire, known as Bourneville, about four miles from Birmingham. It is to be devoted to the purpose of ameliorating "the condition of the working class and labouring population in and around Birmingham and elsewhere, by the provision of improved dwellings, with gardens and open spaces, and by giving them facilities, should the trustees think it desirable to do so, for purchasing or acquiring the necessaries of life, and by such other means as the trustees may in their uncontrolled discretion think fit." About one-third of the estate has already been laid out. Three hundred and seventy cottages have been built, the majority of which are let, but 145 have been sold on terms advantageous to the purchasers. The peculiar feature of Mr. Cadbury's scheme is that the net proceeds of the rent-roll are to be wholly devoted to the extension of the scheme, and that model villages for artisans be multiplied on this automatic principle.

EAST RIDING ANTIQUARIAN SOCIETY.—A meeting of the East Riding Antiquarian Society was held at the Bayle Gate, Bridlington, on the 25th ult., when the Rev. E. Maule Cole read a paper on "Norman Work in Wold Churches." He pointed out, in the first place, that the chalk wolds of the East Riding were but little known, although more of the most beautiful and unique scenery, and greater wealth of all Norman churches, was to be found there than perhaps in any other part of Yorkshire. The period of the eleventh and early part of the twelfth century was a great age for the building of churches. At Cottam he found that only the old Norman font remains, although there was some stone work remarkably well preserved, dating back even to Saxon times. Old Norman remains of churches were also to be found at Cowlam, Driffield, Little Driffield, and Fridaythorpe. At North Grimston Church were to be seen specimens of the most ancient statuary existing in England. The chancel arch of this church was of plain Norman work, but the chief glory of the church was its font, which was very massive and most beautifully carved. Of the eleventh century church at Kirby the tower alone remained, and at Kilham the Norman doorway remained. Of Kirkburn, statements had been made respecting its being erected in 1119, but from a careful consideration of all its features, the rev. gentleman said he did not think it was built before 1150. The speaker went on to say that Weaverthorpe was thoroughly Norman in design. The church at Wetwang he continued, was undergoing careful restoration, and many interesting features were being discovered. He considered this church the oldest on the Wolds—certainly of eleventh century date. There was doubtless an ancient Saxon church here, but there were obviously no remains, as Saxon churches were generally constructed of wood. Of the church at Wharram-le-Street, the tower was almost the only part remaining of the original church, and it was very ancient. In fact, according to the *Builder*, there were reasons for supposing it to be of pre-Conquest date. The chief glory of Wold Newton was the carving over the doorway. The south doorway of Thwing was very interesting, and there were many masons' marks remaining on the outside of Thwing corresponding with Weaverthorpe. No old church on the Wolds had any foundation to speak of except at Thwing, where the foundations were great boulders. In the opinion of the rev. gentleman the churches on the Wolds, so far as there existed remains which might be taken as a criterion, were built in the following relative order:—Last quarter of the eleventh century, Wharram-le-Street and Kirby Grindalthe; first quarter of the twelfth century, Weaverthorpe, Wold Newton, Thwing, Little Driffield, Fridaythorpe, and North Grimston; second quarter of the twelfth century, Wetwang, Kilham, Garton, and

Kirkburn; last quarter of the twelfth century, Great Driffield. The Rev. C. V. Collier, F.S.A., followed with a paper on "Some Curious Papers Relating to Old Bridlington."

BOROUGH SURVEYORSHIP APPOINTMENT.—The question of reappointing officers was considered by the Borough Council, Hammersmith, on Wednesday evening last week. Mr. H. Mair, the present Surveyor, was appointed Borough Surveyor with an increase to his salary of 100l. per annum.

NORTH GATE OF CARDIFF.—Some ten or twelve years ago the late Marquess of Bute obtained the consent of the Cardiff Corporation to rebuild the North Gate of Cardiff, or, as it is sometimes written, the "Senghnydd Gate," on the North-road. What his lordship proposed to do was to reproduce, as far as possible, the structure which existed when Cardiff was a walled town, and from an architectural or antiquarian point of view the gateway would be an interesting monument of the past. Over the archway there was to be a passage leading to the Whitefriars' Abbey and the Castle gardens. The foundations for the gateway were laid, but a dispute with the masons put a stop to the work, and all that can now be seen on the North-road are the hoardings which surround the work on each side of the road. The Cardiff Corporation, having purchased Cathays Park for the erection of a Town Hall, Law Courts, and other public buildings, are anxious that the chief access to that park should not be impeded by a sort of Temple Bar, and they have approached Sir William Thomas Lewis with the object of getting the present Marquess of Bute's sanction to abandon the re-erection of the North Gate.—*Western Mail.*

SOME PROJECTED METROPOLITAN IMPROVEMENTS.—In the course of the current Session the London County Council will apply for leave to introduce their Money Bill to define the amounts which they may expend for various purposes in respect of which capital expenditure is necessary during the financial year beginning on April 1 next, and (on account of the next financial year) during the following six months. Amongst the fresh objects to which the proposed measure relates we may cite the widening and reconstruction of certain county bridges, including Waterloo Bridge; the lighting of Westminster Bridge with electricity; sites and buildings for the Council new given; the establishment of a working epileptic colony at Horton; reformatories for inebriate persons; workshops and technical schools; new main and intercepting sewers; a new pumping station; a service of passenger and parcel boats, with piers and landing places on the Thames; electrical testing plant and a shipping agency in connexion with industrial schools. The Bill extends also to the purchases of property, compensation and rehousing of dispossessed persons, under the Council's various Acts of 1898-1900 in respect of the construction of the Thames Tunnel between Rotherhithe and Ratcliffe (for which an estimate of 846,750l. for the acquisition of property was adopted by them on October 23); an extension of Roebampton-street, Westminster; the widening of York-road, Battersea; Albert Embankment; Mare-street, Hackney (estimate, 669,750l.); Gravel-road, (227,800l.); Archway-road, Highgate (6,000l.); Kenilworth-road (10,450l.); Battersea Rise (46,000l.); Wandsworth-road; High-street and Gardner's-lane, Putney (45,030l.); Nine Elms-lane (171,300l.); St. John-street, Clerkenwell (92,400l.); Southampton-row, Bloomsbury; High-street, Kensington; and elsewhere: together with the rebuilding of the old Gravel-lane, St. George-in-the-East; Rosemary Branch; and Col and Milton, St. George's, and an improvement of St. George's place, Knightsbridge, under their General Powers Act of this current year. In the matter of open spaces the Council seek for powers to acquire the "Brickfield" at Limehouse, to enlarge the present recreation-ground at Newington, to purchase Albert-square, Ratcliffe, and to acquire land for the extension of Brockwell Park at Herne Hill. They further propose to acquire some land at Plumstead with a view to adapting it for purposes of small holdings; to erect more coroners' courts; to remove certain existing gates, bars, and other obstructions in streets; and to obtain powers to expend money "in connexion with historical buildings." We may here add that at their meeting on January 15 the Council agreed to an estimate of 89,000l. for the erection of buildings, &c., to accommodate 100 insane male epileptic patients, with staff, in eight villas and other blocks upon an area of about 127 acres at Horton, and to a supplementary estimate of 96,500l. on behalf of the improvement (on the north side) of High-street, Kensington. They lately agreed to contribute 5,918l. (one-half of the net cost) towards the widening of King-street, Hammersmith, between No. 197 and St. Peter's Boys' School, both properties being included, and 4,300l. (one-third of the net cost) towards the widening of Great Church-lane, between No. 61 and Fulham Palace-road; to widen Central-street, St. Luke's (estimate, 81,250l.); and to widen Mansell-street, as an approach to the Tower Bridge, from High-street, Whitechapel, at a net estimated

cost of 91,100l., including 75,100l. for the property to be taken and 7,500l. for the rehousing of persons displaced.

ELECTRIC LIGHTING, &c., EASTBOURNE.—On the 28th ult. at the Town Hall, Eastbourne, Mr. E. A. Sandford Fawcett held a Local Government Board inquiry into applications by the Eastbourne Town Council for loans of 50,882l. for purposes of electric lighting and 15,500l. for the new Low Level Drive and Park. The consulting electrical engineer, Mr. Hayter, who was unable to attend, was represented by Mr. G. A. Zeden. The Town Council propose to erect new electric lighting works on a site at Roselands.

THE BUILDERS' ACCIDENT INSURANCE, LIMITED.—The twentieth annual general meeting of the Builders' Accident Insurance, Limited, was held at the company's offices, 31 and 32, Bedford-street, Strand, W.C., on Wednesday, March 27, the chairman, Mr. Stanley G. Bird, presiding. The secretary, Mr. R. S. Henshaw, having read the minutes of the last meeting, the following report of the directors and the accounts for the year 1900 were received and adopted:—"The directors have the pleasure to present their report and the accounts for the twelve months ending December, 1900. During the period under review the company has received notice of 1,177 accidents. Although there has been some falling off in the premium income during the year, attributable to various causes, yet the directors are satisfied, from the financial result of the year, that the care which they have exercised in taking and discriminating risks has not been without advantage to the company, which is now in a very satisfactory position. The directors intend to propose certain terms on the renewal of existing policies which will be referred to the members as advantageous to the members and meet with the approval of all insurers. The directors have decided to enlarge the scope of the policy relating to risk of accidents to the public, and also to undertake the driving risk. The remuneration of the directors for the period will, in accordance with the articles of association, be left to the members at the general meeting. The directors regret to record the retirement of Mr. J. C. White from the board in consequence of ill-health. In accordance with the articles of association the following directors retire and are eligible for re-election, namely:—Messrs. T. Barnsley, Woodman Hill, A. Krauss, Wm. Nicholson, and G. H. Trollope." The general business then having been transacted, the meeting terminated with a vote of thanks to the chairman.

HOUSING OF THE WORKING CLASSES, MANCHESTER.—A deputation of the Birmingham City Council visited Manchester recently for the purpose of inspecting the labourers' dwellings erected in this city by the Manchester Corporation, and to confer with the authorities in regard thereto. The visitors were met at the station by the chief of the department, and proceeded at once to the Oldham-road block, consisting of 285 tenements with sixteen shops, the number of persons accommodated therein being 848. The buildings are five stories high, enclosing a large open quadrangle 4,500 square yards in extent. The dwellings on the upper floors are entered from balconies extending round all sides of the quadrangle, which are approached by stone staircases 5 ft. wide in straight flights leading immediately from the street. The tenements are arranged in pairs, and consist principally of two rooms, viz., a living room and a bedroom, 174 sq. ft. and 108 sq. ft. respectively. Tenements of only one room are also provided, the arrangement being about 100 sq. ft. All the rooms are 9 ft. high, and each tenement is provided with a well-ventilated food store and coal-locker. Each pair of two-roomed tenements is entered from a common lobby, and in a convenient place off this lobby a water-closet and sink is provided for joint use. Laundries and spacious drying rooms have been formed in the roof, well lighted and ventilated, and easily approached from the staircases. From Oldham-road the party proceeded to Sanitary-street, where they inspected labourers' dwellings of a different type, for 425 persons, and also Pollard-street, where a further block of buildings has been erected for 448 persons on a similar plan to the first-named block. From there the visitors were taken to the Harrison-street lodging-house for men, which occupies an area of 15,375 square yards, and consists of a building of three stories high. Great interest was shown in the lavatories, wash-house, baths, and lockers which are provided for the lodgers, in addition to boot-cleaning-room, and barbers', tailors', and boot-makers shops, which are at the disposal of the lodgers. There is a large smokeroom 60 ft. by 21 ft., dining-room 55 ft. by 39 ft., reading-room 50 ft. by 28 ft. Adjoining the dining-room are the lodgers' kitchen, scullery, and shop, the latter having communication with dining room and smokeroom by means of serving windows. Dormitories, containing forty-nine cubicles, are situated on the ground floor at the rear of the entrance hall and on the south-east side. The first and second floors are entirely set apart for sleeping accommodation, and each floor contains 157 cubicles 5 ft. wide by 7 ft. 3 in. long, divided by varnished wood partition 6 in. clear of the floor and 3 in. from the ceiling. The space between the ceiling and the top of the screens is filled in with open wire lattice work, thus affording a through current of air along

* The several estimates cited were adopted by the Council at their meeting on October 23 last (see the *Builder* of October 27, 1900.)

dormitory. Each cubicle is provided with a low opening direct into the open air. The dormitories are heated by means of steam radiators at the end of each wing and against the staircases, and ventilated by air trunks taken high each floor and the roof to an exhaust fan fed by electricity. The building is lighted by electricity throughout, and contains accommodation for 253 men, and is within a penny tram of the city.

SOCIETY OF ORDAINED SURVEYORS.—The final examining board of this Society, which has headquarters in Edinburgh, has met on five sessions during the past session. The examiners' final examination, held in February, 1900, tested that one candidate, remitted for examination by the Town Council, had passed the examination, and that the other candidate, remitted for examination by the Sheriff, had failed. The result reported to the Town Council that the candidate remitted by the Council had passed the examination, and the candidate subsequently took oath and signed the bond of caution, the cost of which, in terms of Rule 11, was defrayed by the Council. In the preliminary examination, held in March, 1900, one candidate came forward for re-examination in one subject and succeeded in passing, and two candidates came up for examination, of whom two were exempted altogether from examination on account of their having gained the requisite leaving certificates. One candidate was exempted from examination in two subjects, and one candidate from examination in one subject, and gained leaving certificates in these subjects. The result of the examination was that seven candidates either passed or were exempted from full preliminary examination, and that one candidate failed in three subjects and one in two. The examination, as last year, was conducted by Mr. Robert Robertson, M.A., Headmaster of Ladies' College, Queen-street. For the final examination held in October, 1900, one candidate came forward, remitted by the Town Council for examination. The examiners, Messrs. Lawrie, and Reid, reported that he had failed to pass the examination. For the forthcoming preliminary examination in April, 1901, three candidates have presented themselves, and one candidate has come forward for re-examination in one subject. For the final examination one candidate has come forward for examination and one candidate has failed.

CLERKS' BENEVOLENT INSTITUTION.—The annual general meeting was held on Tuesday 26th ult., when Mr. G. Appleton (of Messrs. Appleton & Appleton), the new President, was introduced by the retiring President, Mr. H. Holloway. Report and balance-sheet for the past year were read, approved, and passed. Special notice taken of the good offices of Mr. Treasurer, Messrs. the hon. auditors, and the hon. solicitors. The institution is now paying annual pensions of £20 to twenty-five builders' clerks' widows, maintaining and educating three orphans, and giving a considerable sum yearly in "temperance relief."

ELECTRIC LIGHTING BOARD SYSTEM.—The "E.L.B." system was demonstrated by the tentatives of the Electric Lighting Boards many before the members of the Royal Institution their meeting on Friday evening last week, and all its latest improvements, including its strips and man-necessaries, were shown. Those present were: Lord Rayleigh, Sir Bramwell, Sir Fredk. Abel, Professor Sylvester Thompson, Professor Dewar, Professor Perry, and their leading scientists.

APPOINTMENT.—The Westminster City Council has granted fifty-six applications for the office of City Engineer and Surveyor, the salary of which is £1,000 a year. At a recent meeting of the Council a resolution was bestowed on Mr. James W. Wetherby, the Borough Engineer of Wolverhampton.

MONUMENTS PRESERVATION SOCIETY.—A meeting of the Executive Committee of the Commons and the Preservation Society was held at 1, Great Street, Westminster, on Monday afternoon, 26th ult. It was reported that a footpath, giving access to Epping Forest near Waverley, had been recently obstructed, and that a right of way, ran from Daws Hill, Stone, past Gilwell Park and Ludgate House Forest, and it afforded the shortest route for passengers between Sewardstone and London, and opened up a very pretty district. It was stated that the Society had collected voluminous evidence, upon which a case was prepared and laid before the Court by Mr. Rawlinson, K.C., and advised that there was a strong *prima facie* case for a right of way. Up to the present, the Waltham Holy Cross Urban District Council had declined to take the necessary steps under the Local Government Act, 1890, to secure section of any public rights which may exist, and resolved, on the motion of Sir Robert Hunter, proposed by Lord Farrer: "That the Commons Preservation Society extremely regrets the refusal of the Waltham Holy Cross Urban District Council to assert the public rights in question of the footpath in question, and expresses its sympathy to give any support in its power to any

local bodies or individuals who may be willing to contest the case." The report of the Board of Agriculture upon application for provisional orders for the regulation of Skipwith Common, Yorks, and the enclosure of Skipwith Common Fields, was considered. It appeared from inquiries made by the Society that the regulation of the Common, 826 acres in extent, would counterbalance the proposed enclosure of the Common Fields, the area of which is 321 acres, and it was decided not to oppose the proposal. A further report of the Board of Agriculture on an application for the enclosure of the heath lands and common fields in the parish of Sutton, Northampton, was also considered. It was stated that if the scheme was adopted 477 acres of common fields and 133 acres of open heath lands would be enclosed, while the only public allotments contemplated 5 acres for recreation and 4 acres for allotments. It was felt that, whatever might be said for the enclosure of the common fields, the heath land should be preserved, or an equivalent area of land allotted, for open space purposes, and it was determined to take such steps in Parliament as might be necessary to endeavour to give effect to the Society's views. The Secretary reported that since the last meeting of the Committee over forty fresh cases had been referred to the Society for advice or assistance.

THE PRESERVATION OF STONEHENGE.—The recent fall of stones on Stonehenge having led to much public discussion, Sir Edmund Antrobus, of Amesbury Abbey, Wiltshire, invited the Society of Antiquaries, the Wiltshire Archaeological Society, and the Society for the Protection of Ancient Buildings to advise him with regard to the better preservation of the famous monument. A committee representing these three bodies met on the 26th ult., under the presidency of Viscount Dillon, the President of the Society of Antiquaries, at which meeting the following resolutions were passed:—"1. That this Committee approves of the suggested protection of Stonehenge by a wire fence not less than 4 ft. high, following by two sides the existing roads, and crossing on the west from the 331-ft. level on the north road to the 332-ft. level on the south road shown on the Ordnance Survey map. 2. That the Committee recommends, without prejudice to any legal question, that the Local Authorities be requested to agree to divert the existing trackway or roadway from Netberavon, now passing through the earth circle, so as to pass from the 302-ft. level to the 331 and 332-ft. levels in the Ordnance Survey map immediately west of Stonehenge. 3. That stones 6 and 7, with their lintel, and stone 56 (according to the numbering on Mr. Petrie's plan) be first examined with a view to maintaining them in a position of safety. 4. That in the opinion of this Committee stone 21 should be replaced, stone 21 be made safe, and the lintel of 21 and 22 be replaced in the most safe and conservative manner. The Committee also recommends the re-erection of stones 57 and 58 and their lintel 158. 5. That the instructions to custodians already in force be approved with a few suggested alterations. 6. That this Committee feels that it is impossible to overstate the value of the assistance which the County Council, the District Council, and the Parish Council of Amesbury can give to the efforts made to preserve this unique monument. 7. That these resolutions be sent to Sir Edmund Antrobus, with the earnest thanks of the Committee, for the part he is proposing to take in the preservation of Stonehenge."—*Standard*.

COUNTY ASYLUM, NAPSBURY, MIDDLESEX.—We read that Mr. Rowland Plumble, architect, has been entrusted with the work of the new County Asylum for Middlesex at Napsbury. There will be no separate buildings to admit of the most perfect classification of the patients.

DEVELOPMENT OF BRIGGATE, LEEDS.—The Leeds Estates Company have just let another contract to Messrs. Armitage & Hodgson, contractors, of Leeds, for the erection of a restaurant, covering an area of about 400 yards, the rebuilding of the Greyhound Hotel in Vicar-lane, and the Dolphin Hotel in Vicar-lane, and the putting up of fourteen shops in King Edward-street, and eleven in the Cross Arcade and Queen Victoria-street. Contracts of the value of between 70,000l. and 80,000l. are also in the hands of Messrs. William Nicholson & Sons.

MEMORIAL WINDOW, ST. MICHAEL'S CHURCH, BUDE.—A stained-glass memorial window has been erected in St. Michael's Church, Bude. It was designed by Mr. G. H. Fellowes Pytne, London.

ELECTRIC LIGHTING, BELFAST.—On the 27th ult., at the Municipal Buildings, Belfast, Mr. P. C. Cowan, M.Inst. C.E., held a Local Government Board inquiry into an application by the Corporation of Belfast for sanction to a loan of 95,000l. for electric lighting purposes. Evidence was given by Mr. McCowan, the Superintendent of the Electrical Department.

CAPITAL AND LABOUR.

BUILDING TRADE DISPUTE, COVENTRY.—Mr. Hudson, barrister, who was appointed by the Board of Trade to act in the building trade dispute at Coventry, sat on the 1st inst. Notice had been given by the Master Builders' Association of a reduction of 4d. per hour and shorter hours during the two mid-winter months. The carpenters,

joiners, and painters agreed to arbitration, but not the bricklayers and labourers, who were consequently locked out. Mr. Hudson found that the notice given was bad, being delivered a day too late, and that, therefore, the existing rules would stand.

CARPENTERS' STRIKE, YARMOUTH.—On the 1st inst. the carpenters and bricklayers of Yarmouth struck in consequence of the refusal of the employers to grant an increase in their wages of 1d. per hour.

BURY PAINTERS LOCKED OUT.—On the 30th ult., the dispute in the painting trade in Bury terminated in the men being locked out. Six months ago the men gave notice for a penny advance in wages, the notices expiring on April 1. Meanwhile the masters and men arranged matters so that the men made small concessions regarding the apprentice question and the overtime question, the masters agreeing to grant a halfpenny per hour advance in wages. The difference arose, however, with reference to the time for giving notice, the masters contending for any time. The men holding to the present practice, neither would give way, with the above-mentioned result.

CARPENTERS' STRIKE, DUDLEY.—The carpenters and joiners in Dudley and district came out on strike on the 1st inst., in consequence of the employers calling upon them to submit to a reduction in wages of from 8d. to 8d. an hour.

LEGAL.

UNION LABOURERS' ACTION AGAINST BUILDERS

The cases of Powell v. Handscomb & Smith, and Purkiss v. "Same," came before his Honour Judge Russell, at the Croydon County Court, on Tuesday afternoon, the 26th ult. The plaintiffs were bricklayers' labourers belonging to the Labourers' Union, suing the defendant builders for difference in wages, paid at 6d. per hour, 7d. per hour being demanded. Mr. Gardner, instructed by their Union, appeared for the plaintiffs; and the defendants were represented by Mr. Newnam, under instructions from the Croydon and District Master Builders' Federation.

It appeared that Powell had been engaged on the defendant's works for two weeks and a day and Purkiss for a few days only, both the men being started by the foreman of the job without any specific agreement as to the wages. The foreman gave evidence to the effect that the only time 7d. per hour was mentioned by plaintiffs before dismissal was when Powell approached him with a view to taking on the scaffolding at an increased rate of 3d. per hour. He also produced the defendants' wages book, showing that the whole of the remaining labourers in the works were receiving 6d. per hour.

Messrs. S. Page and D. Waller, builders, of the town, and Mr. E. J. Fairchild, secretary to the Federation, gave evidence as to the trade custom of setting on and payment, and also to prove that the before-mentioned arrangement as to the radius had never been acknowledged by the Croydon builders, who have an entirely independent organisation, comprising all the most important firms in the district, and whose maximum rate of wage has always been 3d. per hour less than the London union rate for all trades. The names of John Tidy and Messrs. Wenham Waters were put forward by the plaintiffs' solicitor as firms where Powell had previously worked in the town at the higher rate. The first was proved to be a piecework bricklayer or sub-contractor and the others the well-known firm of electrical engineers.

His Honour held that Powell, from the fact that he worked at the lower rate after receiving his wages the first week, had in effect agreed to it, and that both he and Purkiss, not inquiring as to the rate paid on the job, were set on by the foreman in accordance with the usual custom and entitled to the same rate of payment as the other labourers, which he held the evidence had proved to be 6d. per hour for that district. He, therefore, gave judgment for the defendants in both cases.

The defendants' solicitor stated his clients did not ask for costs.

WORKMEN'S COMPENSATION ACT:

CAN DEPENDENTS BRING A SECOND ARBITRATION?
At Marylebone County Court on Friday last week, before Deputy-Judge Cowper, an important application under the Workmen's Compensation Act was brought by Mrs. Kate O'Keefe, Crawford-street, Marylebone, on behalf of herself and children, the respondent being Mr. Henry Lovatt, builder and contractor, North End House, Fitzroy-avenue, Fulham, and Wolverhampton.

Mr. W. Thompson, counsel, appeared for the applicant, and Mr. F. Lowe, counsel, for the respondent.

The applicant's late husband, explained Mr. Thompson, had been in the employ of the respondent as a builder's labourer, and while working on a building in Bayswater-road, W., on February 1, 1899, fell from a scaffolding. Shortly afterwards the case came before Judge Stonor at Marylebone County Court, and the man was awarded compensation at the rate of 15s. a week. Subsequently the

unfortunate man died in consequence of the injuries which he sustained by the accident, and the present application was for leave to re-open the arbitration, with a view to an award of a lump sum being made to the man's dependents. On hearing of the man's death, the respondent ceased the payment of the compensation of 15s. a week.

Mr. Lowe contended that the Act did not provide for the dependents of a deceased person who had been awarded compensation under the Act—as in the present case—being entitled to a second arbitration.

Questions as to the interpretation of various portions of the Act were discussed at considerable length by counsel on either side.

Ultimately his Honour said that he had looked in vain for any clause in the Act which could be considered as entitling the dependents to bring a second arbitration under such circumstances as those in the present case. He therefore considered that the present application must fail.

It is understood that an appeal is likely to be made against the decision.

EMPLOYERS' LIABILITY ACT:

WHEN DO CRANE SKIPS BECOME DANGEROUS?

AT Brompton County Court on Monday, before Deputy-Judge Clement Lloyd and a jury, Thomas Dodge, a builder's labourer, 5, Merivald-road, Putney, S.W., sought to recover damages, under the Employers' Liability Act, from Mr. Charles Wall, builder and contractor, Ashburnham Works, Lot's-road, Chelsea, the claim being in respect of personal injuries sustained by plaintiff, owing, it was said, to negligence for which the defendant was responsible.

Mr. J. W. Moyses, counsel, appeared for the plaintiff, and Mr. C. F. Henle, solicitor, defended.

Mr. William Robert Pether, a civil engineer, was first called. He stated that on visiting the defendant's works shortly after the accident he was shown six crane skips, one of which was supposed to have been so defective as to cause the plaintiff's injuries. Each of these skips appeared to be in fairly good condition, with the exception of one which had new rivets at one of its corners, and also signs of having been hammered straight. In his opinion, it was not safe to set a man tipping skips who was not experienced at the work. The skip in question weighed about 4 cwt. when empty and about 24 cwt. when filled with earth.

The plaintiff stated that on December 17 last, having been in the employ of the defendant for about three or four weeks, he was working in a cutting at the new public baths, Walham Green. In the afternoon of that day his foreman, "Ring," came to him and said, "Dodge, go up and tip them skips; little Ginger" (another workman on the job) "has just met with an accident." He had never handled such skips before, and the foreman gave him no instructions as to how he should do the work. In accordance with the foreman's orders, he proceeded to tip the skips. The first that came up he tipped all right. The second skip which came up was loaded heavily on one side, and the side of the skip was bent in so much that the catch did not project outwards beyond the handle. In order to reach and release the catch he put his hand inside, between the handle and the side of the skip, the space here being large enough for him to have put in his head. He lifted the catch, the skip tipped over, but the corner of the skip, projecting outwards far beyond the side, caught his right hand against the bottom of the handle. The middle of his hand was seriously injured, and he had lost practically the whole of the use of his right forefinger. Since the accident he had only been able to do a few days' work per week.

Cross-examined: The only time that he had tipped skips prior to the accident was about sixteen years ago, when he assisted occasionally. These skips, however, were different from the one that caused the accident.

Other workmen corroborated as to the condition of the skip.
